1 Welcome to the Smart View User's Guide

2 Introduction to Smart View

Overview	2-1
Smart View Components	2-2
Ribbons	2-3
Smart View Panel	2-4
Installing Smart View	2-4
Translation Information	2-5
About this Guide	2-6

3 Managing Data Source Connections

Connections	3-1
Shared Connections and Private Connections	3-2
Connecting to Data Sources	3-3
Disconnecting from Data Sources	3-5
Creating Shared Connections	3-6
Creating Private Connections	3-7
Using the Private Connection Wizard	3-7
Using the Quick Connection Method	3-8
Saving Shared Connections as Private Connections	3-8
Private Connection URL Syntax	3-9
Modifying Connections	3-10
Modifying Private Connections	3-12
Modifying Connections within an Office Document	3-13

Modifying Connections for Financial Reporting Images and Fully-Formatted Reports	3-14
Deleting Connections	3-16
About Deleting Connection URLs	3-16
Deleting Connection URLs	3-17

4 Dimensions and Members

About Dimensions and Members	4-2
Dimension and Member Naming Limitation	4-2
Selecting Members from the Member Selector	4-2
Selecting Members from the POV Toolbar	4-6
Displaying the POV Toolbar	4-8
Selecting Members Using the Cell-Based POV	4-10
Entering Members in Free-Form Mode	4-11
Filtering by Attribute	4-12
Filtering by Subsets	4-12
Selecting Period-to-Date Members	4-13
Defining Member Name Display in the Member Selector	4-14
Duplicate Member Names	4-15
Numeric Member Names	4-16
Qualified Name Display in Alternate Hierarchies	4-16
Member Perspective	4-19
Aliases and Alias Tables	4-19
Selecting Alias Tables	4-20
Selecting an Alias Table for the Current Worksheet	4-20
Selecting an Alias Table for the Connection	4-20
Aliases from Different Alias Tables	4-20
Displaying Member Names and Their Aliases in the Grid	4-21
Displaying Aliases in the Member Selector	4-21
Viewing Dimension Properties	4-22
Member Information	4-23
The POV Manager	4-24
Selecting Members for the Default or Background POV	4-25
Members Linked to Smart Lists in the POV	4-25
Copying and Pasting a POV	4-25
Deleting a POV	4-26

5 Data and Data Cells

Refreshing Data	5-2
Refreshing from a Ribbon	5-2

Refreshing Individual Reports from Document Contents	5-3
Using the Submit Data Options	5-10
About the Submit Data Options	5-10
Submitting Data	5-11
Submitting Data Without Refreshing	5-12
Submitting Data Ranges	5-12
Calculating Data	5-13
About Calculating Data	5-13
Calculating Data in Essbase	5-14
About Calculating Data in Essbase	5-14
Running Essbase Calculations	5-15
Calculating Asymmetric Grids Using Tuples	5-18
Changing the Solve Order of a Selected POV	5-24
Working with Currencies	5-26
Changing Currency in Planning	5-27
Adjusting Values in Data Cells	5-27
Data Perspective	5-28
Drill-Through Reports	5-29
Drill-Through Report Guidelines	5-30
Setting the Drill-Through Launch Option	5-31
Accessing Drill-Through Reports	5-31
Viewing the Drill-Through Report Source POV	5-32
Linked Reporting Objects	5-34
Attaching a Linked Reporting Object to a Data Cell	5-34
Launching a Linked Reporting Object from a Data Cell	5-35
Linked Partitions	5-36
Cell Comments in EPM Cloud	5-37
Attachments	5-38
Cell History	5-39

6 Ad Hoc Analysis

About Ad Hoc Analysis	6-2
Starting Ad Hoc Analysis	6-2
Inserting Attribute Dimensions on the Sheet	6-3
Inserting Attribute Dimensions on the Sheet--Example	6-4
Notes About Inserting Attributes	6-6
Preserving Excel Formulas in Ad Hoc Grids	6-7
Preserving Excel Formulas Within and Outside of Essbase Ad Hoc Grids	6-8
Formatting Ad Hoc Grids	6-9
Using Smart View Formatting	6-9

Using Excel Formatting	6-10
Enabling Attribute Association Processing in Ad Hoc Grids	6-11
Zooming In and Out	6-13
About Zooming In and Out	6-13
Zooming In	6-14
Zooming Out	6-15
Setting a Default Zoom Level	6-15
Selecting Members to Display when Zooming	6-16
Enabling Double-Click Zooming	6-17
Zooming and Formatting	6-17
Zooming Operations in Cells that Contain Formulas	6-17
Specifying Ancestor Position in Ad Hoc Grids	6-18
Working with Excel Filters on Ad Hoc Sheets	6-21
Pivoting	6-22
Pivoting Dimensions Between Rows and Columns	6-23
Pivoting Dimensions Between the Grid and the POV Toolbar	6-23
Removing Selected Members From the Grid	6-24
Inserting Rows and Columns	6-28
Displaying and Suppressing Repeated Members	6-29
Multiple Grids on a Worksheet	6-30
About Multiple Grids on a Worksheet	6-31
Creating Multiple-Grid Worksheets	6-32
Converting Ad Hoc Worksheets to Multiple-Grid Worksheets	6-33
Renaming Ranges on Multiple-Grid Worksheets	6-33
Changing Connections in Multiple-Grid Worksheets	6-36
POV on Essbase Multiple-Grid Worksheets	6-37
Multiple-Grid Example: Butterfly Report	6-37
Cascading Reports and Ad Hoc Grids	6-38
Substitution Variables	6-41
Comments and Unknown Members on Essbase Sheets	6-41
Enabling Comment Display in the Sheet	6-42
Viewing Comments in the Sheet	6-43
Editing Comments	6-43
Deleting Comments	6-46

7 Data Forms

Working with Forms in Excel	7-1
Opening Forms in Excel	7-2
Excel Formulas in Forms	7-3
Working with User Variables	7-3

EPM Cloud Form Behavior in Smart View	7-4
Displaying the Floating Toolbar in Planning Forms	7-5
Saving Ad Hoc Grids as Forms	7-6
Performing Ad Hoc Analysis in Planning Forms	7-6
Using the Drop-down Member Selector on Row Dimensions in Forms	7-7
Inserting Charts	7-10
Working with Valid Intersections	7-13
About Valid Intersections	7-13
Working with Valid Intersections in Page Drop-down Lists	7-14
Working with Valid Intersections in Forms	7-18

8 General Operations

Smart View Operations	8-2
Using Undo and Redo	8-2
Specifying the Number of Undo and Redo Actions	8-2
Undo Support By Provider	8-3
Undo Support in Essbase	8-3
Undo Support in Planning	8-4
Undo Support in Narrative Reporting	8-6
Copying and Pasting	8-7
Copying, Pasting, and Refreshing Smart View Content	8-8
Copying Data Between Excel, Word, and PowerPoint	8-8
Viewing Cell POV and Server Information for Pasted Data Points	8-10
Excel Copy and Paste Guidelines	8-11
Importing Metadata in Office Applications	8-12
Importing Metadata into Copied Worksheets	8-14
Importing Metadata into Copied Word Documents	8-14
Importing Metadata into Copied Slides or Presentations	8-17
Entering Percentage Values in Forms and Ad Hoc Grids	8-19
Enabling Automatic Cell Width and Height Adjustment	8-21
Sheet Information	8-21
Sheet Information Support By Provider	8-23
Sheet Information Support in Essbase	8-23
Sheet Information Support in Planning	8-24
Document Contents	8-25
Shared Workbooks	8-31
Protected Worksheets	8-32
Opening Large Workbooks in Smart View	8-32
Printing POV Members in the Header and Footer	8-32
Opening Forms and Ad Hoc Grids from Web Applications (Web Launch)	8-33

Enabling and Disabling Smart View	8-34
Enabling and Disabling Smart View Using the Smart View Ribbon	8-34
Enabling and Disabling Smart View from Microsoft Office	8-34

9 Smart Query

About Smart Query	9-1
Creating a Smart Query	9-1
Defining Sets	9-2
Defining Set Filters	9-4
Building the Smart Query	9-4
Completing the Smart Query	9-6
Opening a Smart Query	9-7
Copying and Pasting	9-7
Copying Smart Query Definitions in Excel	9-7
Copying Smart Query Sets and Filters	9-8
Copying Smart Query Reports to Word and PowerPoint	9-8
Sharing Smart Query Definitions	9-8
Executing a Smart Query	9-9
Deleting a Smart Query	9-10

10 Smart Slices

About Smart Slices	10-1
Creating Reports with Smart Slices	10-1
Deleting Reports or Report Objects	10-4
Sliders	10-4
Creating a Slider from One Query	10-4
Creating a Slider from Joined Queries	10-5
Smart Slices, Ad Hoc Analysis, and Forms	10-5
Creating Smart Slices	10-6
Setting Smart Slice Data Boundaries	10-6
Setting Smart Slice Preferences	10-7

11 The Query Designer and MDX Queries

Working with Query Designer	11-1
About the Query Designer	11-1
Creating Queries	11-1
Editing Queries and Rerunning Reports	11-3
Filtering Data	11-4
Analyzing Time-Related Data in Query Designer	11-4

Working with MDX Queries	11-5
About Working with MDX Queries	11-5
Creating and Saving an MDX Query	11-5
Executing MDX Queries	11-7
Modifying Query Connection Information	11-8
Changing the Query List Display	11-9
Deleting MDX Queries	11-10

12 Smart Forms

About Smart Forms	12-1
Creating Smart Forms	12-3
Smart Form Example Scenario	12-4
Excel Functions Supported in Smart Forms	12-9

13 Task Lists

About Task Lists	13-1
Working with Tasks from the Smart View Panel	13-1
Opening a Task List	13-2
Viewing the Task List	13-2
Executing a Task	13-3
Completing a Task	13-3
Creating Task List Reports	13-3
Integrating Task Lists with Microsoft Outlook	13-4

14 Smart View and EPM Cloud

About Smart View and EPM Cloud	14-2
Planning Approvals	14-2
Changing Planning Unit Status	14-3
Finding Planning Units	14-4
Planning Unit Promotional Path	14-5
Planning Unit Annotations	14-5
Out of Office Assistant	14-6
Monitoring Planning Job Status	14-7
Searching for a Page in EPM Cloud Forms	14-9
Copying Versions	14-9
Dashboards	14-10
Composite Forms	14-11
Working with Business Rules	14-11
Launching Business Rules in Excel	14-12

Entering Runtime Prompts	14-13
Executing the Calculate Form and Calculate Currencies Business Rules	14-14
Spreading Data	14-15
Spreading Data for Time Periods	14-15
Spreading Data with Cell Locking	14-16
Spreading Values Using Grid Spread	14-16
Spreading Values Using Mass Allocation	14-17
Member Formula	14-19
Supporting Detail	14-19
Adding Supporting Detail	14-20
Working with the Supporting Detail Hierarchy	14-21
Viewing or Changing Supporting Detail	14-22
Synchronizing Supporting Detail with the Cube	14-22
Setting User Preferences	14-23
Saving Native Excel Formatting to EPM Cloud	14-24
Saving Excel Formatting on a Form	14-24
Viewing Formatting in Smart View	14-25
Clearing Formatting	14-26
Saving Excel Formatting From an Ad Hoc Grid	14-26
Supported Native Excel Formatting	14-27
Guidelines for Working with Native Excel Formatting and Planning Forms	14-28
Working with Multiple-Grid Worksheets in EPM Cloud	14-29
About Multiple Grids on a Worksheet	14-29
Creating Multiple-Grid Worksheets with EPM Cloud Sources	14-31
Converting EPM Cloud Single-Grid Worksheets to Multiple-Grid Worksheets	14-32
Renaming Ranges on EPM Cloud Multiple-Grid Worksheets	14-32
Changing Connections in EPM Cloud Multiple-Grid Worksheets	14-35
POV Behavior on EPM Cloud Multiple-Grid Worksheets	14-39
Smart View Behavior Options in EPM Cloud	14-39

15 Smart View and Profitability and Cost Management

About Smart View and Profitability and Cost Management	15-1
Running the Smart View Installer	15-2
Creating Data Source Connections to Profitability and Cost Management	15-3

16 Smart View and Reporting and Analysis

About Importing Reporting and Analysis Documents	16-1
Editing and Refreshing Documents	16-1
Refreshing Reporting and Analysis Documents	16-2

Financial Reporting Import Formats	16-3
Importing Financial Reporting Documents	16-3
Importing Financial Reporting Documents	16-4
Importing Financial Reporting Documents into Excel	16-4
Importing Financial Reporting Documents into Word and PowerPoint	16-7
Sliders	16-9
Creating a Slider from One Query	16-10
Creating a Slider from Joined Queries	16-10
Editing Financial Reporting Documents	16-11
Creating Templates in PowerPoint Documents	16-12
Refreshing PowerPoint Templates	16-12
Exporting Financial Reporting Reports	16-12

17 Smart View and Narrative Reporting

About Narrative Reporting	17-1
Setting Up Narrative Reporting in Smart View	17-3
Downloading and Running the Smart View Installer	17-3
Creating Connections to Narrative Reporting	17-5
Installing the Narrative Reporting Extension	17-7
Connecting to Narrative Reporting in Smart View	17-8
Using Narrative Reporting Home	17-12
Administering Report Packages in Smart View	17-16
About Administering Report Packages in Smart View	17-17
Creating Report Package Structures	17-17
About Creating Report Package Structures in Smart View	17-17
Creating Report Package Structures from Files in a Folder	17-19
Creating Report Package Structures from a File	17-22
Adding Doclets to Report Package Structures	17-25
Adding Sections to Report Package Structures	17-30
Editing Report Package, Doclet, and Section Properties	17-31
Authoring Doclets	17-31
About the Author Phase Process	17-32
About Doclets and Variables	17-33
Authoring Doclets in Smart View	17-35
Checking Out Doclets	17-36
Undoing Checkouts	17-41
Working with Doclets Locally	17-41
Uploading and Working with Page Attributes and Slide Masters	17-43
Checking In Doclets	17-48
Submitting Doclets	17-49

Working with Embedded Content from Reference Doclets	17-50
About Embedded Content From Reference Doclets	17-50
Adding Reference Doclets to a Report Package	17-51
Defining Named Ranges in Excel-based Reference Doclets	17-52
Validating Fonts in Reference Doclets	17-53
Adding Available Content to Excel-based Reference Doclets	17-54
Updating Excel-based Reference Doclet Content	17-57
Deleting Available Content from an Excel-based Reference Doclet	17-60
Embedding Content in a Doclet	17-62
Refreshing Embedded Content in a Doclet	17-66
Removing Embedded Content from a Doclet	17-67
Working with Embedded Content from Reference Files	17-69
About Embedding Content from Reference Files	17-69
Defining Named Ranges in Reference Files	17-70
Registering Reference Files with a Doclet	17-70
Embedding Reference File Content in a Doclet	17-74
Adding Content from Reference Files to Doclets	17-76
Managing Named Ranges for a Reference File	17-81
Updating Available Content in a Reference File	17-82
Remapping Content within Reference Files	17-82
Working with Variables	17-85
About Variables	17-86
Creating Static Variables	17-89
Creating Reference Variables	17-91
Inserting Variables in a Doclet	17-94
Editing Variables	17-96
Filtering Variables	17-98
Highlighting Variables in Doclets	17-99
Inspecting Variables	17-100
Unlinking Reference Variables	17-102

Welcome to the Smart View User's Guide

The User's Guide explains Oracle Smart View for Office features and options including concepts, processes, and examples. It covers Smart View releases 11.1.2.5.600 and later.

To find information:

- From the PDF file, navigate to topics from the table of contents, or use your reader's search functionality.
- From the online help, in the left frame of the browser window, use the Table of Contents to navigate to topics, or enter a search term in the search text box.

To find information for a specific Smart View release, go to the Enterprise Performance Management page on the Oracle Help Center:

<https://docs.oracle.com/en/applications/enterprise-performance-management/index.html>

Locate the Smart View for Office section and select a Smart View release library.

Introduction to Smart View

Related Topics

- [Overview](#)
Using Oracle Smart View for Office, you can view, import, manipulate, distribute, and share data from various data sources using Microsoft Excel, Word, Outlook, and PowerPoint.
- [Smart View Components](#)
The basic components of Oracle Smart View for Office, from which you connect to your data source and access Smart View functionality, are ribbons and the Smart View Panel.
- [Ribbons](#)
From Office applications, you access Oracle Smart View for Office functionality through ribbon commands.
- [Smart View Panel](#)
From the Smart View Panel, you can manage data source connections, access data and task lists, and create reports.

Overview

Using Oracle Smart View for Office, you can view, import, manipulate, distribute, and share data from various data sources using Microsoft Excel, Word, Outlook, and PowerPoint.

Note:

Smart View is not supported with shared workbooks. When the Excel option for sharing workbooks is enabled, Smart View operations are not supported. For example, attempting to perform a refresh in a shared workbook can cause an exception to occur.

To clear the shared workbook option in Excel, go to the **Review** ribbon, then click the **Share Workbook** button, and then clear the **Allow changes by more than one user at the same time** check box.

Watch this overview video to learn about using basic features in Smart View. The video references Planning as the data source, but the functionality shown is common to most Smart View providers.

[Overview video](#)

Smart View provides a common Microsoft Office interface for these cloud data sources:

- Planning
- Planning Modules
- Narrative Reporting
- Financial Consolidation and Close
- Profitability and Cost Management
- Strategic Modeling (requires the Strategic Modeling extension)
- Tax Reporting
- Oracle Analytics Cloud
- Oracle Analytics Cloud - Essbase

Smart View connected to Oracle Analytics Cloud - Essbase works with the Cube Designer extension.

Depending on the Oracle Enterprise Performance Management Cloud service you're connected to, Smart View works with these extensions:

- Financial Reporting extension
- Predictive Planning extension
- Planning Admin Extension
- Close and Supplemental Data Management extension
- Strategic Modeling extension

The extensions listed above are discussed in their respective guides (see the Oracle Help Center for more information).

Additionally, in this guide, references to Financial Reporting apply to both the on-premises and EPM Cloud versions of Financial Reporting.

Smart View Components

The basic components of Oracle Smart View for Office, from which you connect to your data source and access Smart View functionality, are ribbons and the Smart View Panel.

The components displayed depend on the Microsoft Office application that you have open.

Related Topics:

[Ribbons](#)

[Smart View Panel](#)

Ribbons

From Office applications, you access Oracle Smart View for Office functionality through ribbon commands.

Note:

Smart View is designed to work optimally with the ribbon structure of Microsoft Office 2010 or later.

The Smart View ribbon, which contains commands for common Smart View operations and for Oracle Hyperion Reporting and Analysis operations, is always present.

When you connect to a data source (other than Reporting and Analysis), the corresponding data source ribbon is also displayed. Each ribbon displays only the commands supported for that data source and mode. For example, in the following illustration for Planning, when you access a Planning form, the Planning ribbon is displayed; when you enter ad hoc analysis (see [Ad Hoc Analysis](#)), the Planning Ad Hoc ribbon is displayed.

The screenshot shows two overlapping windows of Microsoft Excel. The top window displays the 'Smart View' ribbon with various icons for data manipulation and analysis. The bottom window displays the 'Planning' ribbon and a spreadsheet with the following data:

	E	I	M	Q	R	S	T	U
	+Q1	+Q2	+Q3	+Q4	YearTotal			
1								
2	Units	5251	5012	5557	5103	20923		
3	ASP	3705	3705	3705	3705	3705		
4	Gross Margin %	210.00%	210.00%	210.00%	210.00%	210.00%		
5	4001: Total Revenue	2400530	2318315	2487115	2369270	9575230		
6	5000: Total Cost of Sales and Service	1705572	1645475	1760415	1679347	6790809		
7	-Gross Profit	694958	672840	726700	689923	2784421		

The ribbons are:

- **Smart View**
- **Essbase**
- **Planning**
- **Planning Ad Hoc**
- **FCCS (Financial Consolidation and Close)**
- **FCCS Ad Hoc**
- **TRCS (Tax Reporting)**

- **TRCS Ad Hoc**
- **Others**—If the administrator has installed and configured your Smart View system with extensions, there may be other ribbons; for example:
 - **Narrative Reporting**
 - **Narrative Reporting Ad Hoc**

Watch this video to see a tutorial on navigating in Smart View, including working with ribbons.

[Tutorial video](#)

Smart View Panel

From the Smart View Panel, you can manage data source connections, access data and task lists, and create reports.

From the Smart View Panel, you can manage data source connections, access data and task lists, open forms, and create reports.

The Smart View Panel, opened from the Smart View ribbon, is displayed by default on the right side of the Microsoft Office application. You can move, resize, or close the Smart View Panel from the down arrow in the title bar.

The Smart View Panel contains the following panes:

- **Home**—A panel that displays links to Shared Connections and Private Connections as well as a list of recently used items—ad hoc grids, forms, and tasks—that you can click to establish a connection.
- **Shared Connections**—A drop-down menu of available connections from Application Management and a tree view of the contents of the currently selected connection.
- **Private Connections**—A drop-down menu of available connections saved on the local computer and a tree view of the contents of the currently selected connection. You can also enter a URL to connect directly to a data source here.
- **Task Lists**—A tree list of tasks from which you can manage your tasks. This pane opens only when you select a task list from Shared Connections or Private Connections.
- **Action Panel**—A list of operations available based on the selection in the shared connection, private connection, or task list tree.
- **Document Contents**—A task pane in the Smart View Panel that provides a view of the connections and content existing in the current Office document.
- **Other**—If the administrator has installed and configured your Oracle Smart View for Office system with the Narrative Reporting extension, there will be a Narrative Reporting Home and an Narrative Reporting panel.

Installing Smart View

This topic contains links to instructions for installing Oracle Smart View for Office.

Oracle Enterprise Performance Management Cloud:

- Users: Downloading and Installing Clients
- Administrators: Downloading and Installing Clients

Oracle Analytics Cloud - Essbase: See [Download and Run the Smart View Installer](#)

Also, take note of the information in [Windows, Office, and Smart View Locale Settings](#) when installing Smart View.

Windows, Office, and Smart View Locale Settings

On your Smart View client machine, the following locale settings should match:

- Smart View language option
- Microsoft Office language
- Windows Regional Settings
- Windows operating system

Running Smart View in a language other than the language of the machine's Windows operating system, system locale, or Office language, may result in incorrect data being returned. For example, if the Windows operating system, system locale, and Office language are English, and you run Smart View in Russian, reports or chart data may display incorrectly.

Ensure that on your Smart View client machine, the locale settings noted above match.

Translation Information

This topic contains translation information for the Oracle Smart View for Office user interface and documentation.

The following items are translated:

- Smart View user interface is translated into Arabic, Chinese (Simplified and Traditional), Czech, Danish, Dutch, Finnish, French, French Canadian, German, Greek, Hebrew, Hungarian, Italian, Japanese, Korean, Norwegian, Polish, Portuguese, Portuguese (Brazilian), Romanian, Russian, Slovak, Spanish, Swedish, Thai, and Turkish.

 **Note:**

To change the language displayed on the Smart View user interface, open any Microsoft Office application (Excel, Word, PowerPoint, or Outlook), and follow these instructions:

1. From an Office application, select the Smart View ribbon, click **Options**, and select the **Advanced** tab.
2. In the **Language** drop-down list, select a new display language.
3. Click **OK** at the prompt, and then click **OK** to close the **Options** dialog.
4. Restart the Office application.

All Smart View-related user interface elements, such as ribbons, panels, and dialog boxes, will display in the new language.

Any other currently-opened Office applications must be restarted in order to display Smart View elements in the new language.

- The Smart View online help is translated into Chinese (Simplified and Traditional), Dutch, French, German, Italian, Japanese, Korean, Portuguese (Brazilian), and Spanish. When you use Smart View in any of these languages, the help is also displayed in that language.

When you use Smart View in any other translated language (for example, Arabic or Hebrew), the help is displayed in English.

Note that on the **Help** menu, the **Oracle User Productivity Kit** and **Documentation** items are not translated.

About this Guide

This guide contains information applicable to Cloud providers.

Throughout this guide, unless otherwise noted:

- References to Planning apply to Planning, with the following exception:
At the beginning of topics where supported data sources are listed, Planning for Planning is referred to as Planning.
- If a feature or functionality is supported by Planning, then it is also supported by Planning Modules.
- References to Oracle Hyperion Reporting and Analysis refer to the functionality accessed from the "Reporting Settings" option in Shared Connections.
- References to Financial Reporting apply to Financial Reporting for Planning.

Shared Connections and Private Connections

You connect to data sources through shared or private connections.

In most cases, you can connect to one provider data source per sheet, with the exception of Oracle Analytics Cloud and Oracle Analytics Cloud - Essbase. For these providers, you can connect to multiple instances of the same data source type per sheet, slide, or document.

- **Shared Connections**

You can create shared to connections to Oracle Enterprise Performance Management Cloud sources.

For EPM Cloud sources, there are two ways to use a shared connection:

- One cloud provider per shared connection.
For example, shared Connection "A" connects you to your Planning service instance; shared Connection "B" connects you to your Financial Consolidation and Close service instance.
- Multiple cloud providers per shared connection. This is referred to as integrated business process navigation flows in EPM Cloud. In this case, all supported cloud providers must reside on the same domain.

For example, your organization is hosting Planning Modules and Tax Reporting on the same domain. Connection "C" connects you to both service instances.

This type of connection applies only to these EPM Cloud services:

- * Planning
- * Planning Modules
- * Financial Consolidation and Close
- * Tax Reporting

EPM Cloud Service Administrators: See *Administering Planning*, "Connecting Subscriptions in EPM Cloud" for information on setting up integrated business process navigation flows.

Shared connections are either:

- Accessed from a host location and available to multiple users through the Smart View Panel.
- Stored on each Oracle Smart View for Office client machine *or* on a web server in an XML file created by a system administrator. The connections in the XML file are then available to the user through shared connections in the Smart View Panel.

See [Accessing Shared Connections from an XML File](#) in the *Oracle Smart View for Office Installation and Configuration Guide* for information on preparing and distributing this XML file.

You cannot edit or rename shared connections, but you can save them as private connections, which you can edit and rename.

- **Private Connections**

Private connections are those that you create by saving a shared connection to your local computer or by entering a URL to a provider data source. When you create a private connection, it becomes the active connection.

 **Note:**

When working with Oracle Analytics Cloud, Oracle Analytics Cloud - Essbase, and Narrative Reporting, you must use a private connection, or add the private connection information to a shared connection XML file, as described in [Accessing Shared Connections from an XML File](#) in the *Oracle Smart View for Office Installation and Configuration Guide*.

Connecting to Data Sources

For most data sources, you can connect to only one data source per worksheet.

The following exceptions apply:

- Oracle Analytics Cloud - Essbase—You can connect to multiple Essbase databases on a single worksheet, as described in [Changing Connections in Multiple-Grid Worksheets](#).
- Oracle Analytics Cloud—You can connect to multiple catalogs on a single sheet, as described in [Connecting to Multiple Oracle Analytics Cloud Data Sources](#).

Watch this overview video to learn about Oracle Smart View for Office connections.

[Overview video](#)

Watch this video to see a tutorial on navigating in Smart View, including connecting to a data source.

Tutorial video

To connect to a data source:

1. From the Smart View ribbon, click **Panel**.
2. From the Smart View Home panel or from the menu displayed when you click the arrow next to , do one of the following:
 - Select **Shared Connections** to open the Shared Connections panel, where you select a data source type from the drop-down menu. Once you select a data source type, the connections available for the selected data source are displayed in a tree list.

 **Note:**

- For examples of the shared connection URL syntax to use, see [Creating Shared Connections](#).
- Shared connections are not supported for Oracle Analytics Cloud, , Oracle Analytics Cloud - Essbase, or Narrative Reporting data sources. However, private connections to these sources can be added to the shared connection XML file, as described in the *Oracle Smart View for Office Installation and Configuration Guide*, [Accessing Shared Connections from an XML File](#)

- Click **Private Connections** to open the Private Connections panel, and select a connection from the drop-down menu.

When working with Oracle Analytics Cloud, , Oracle Analytics Cloud - Essbase, or Narrative Reporting, you must use a private connection.

- Click **Private Connections**, then enter a URL in the field, and then press Enter. For examples of the URL syntax to use, see [Private Connection URL Syntax](#).
- Click a connection name under **Recently Used**. You can click  to pin items to this list.

When accessing a cloud data source, the service domain name appears next to **Welcome** in the **Login** screen. If you need to change domains, click the **change domain** link, enter the new cloud Identity Domain name, and click **Go**. Then proceed to step 3.

3. **For cloud data sources:** In the **Login** screen, enter your user name and password.

For on-premises data sources: In **Connect to Data Source**, enter your user name and password for the data source.

4. In the Smart View Panel tree list, double-click the item—form, ad hoc grid, Smart Slice, task list, or catalog—that you want to open.

After the item is opened on the grid, you can easily locate it in the tree view. Click the arrow next to  and select **Locate Worksheet Connection**.

 **Note:**

Depending on how the administrator configured Smart View, you may or may not be required to enter your user name and password as you change data providers and Office applications.

Notes:

The following applies to Oracle Analytics Cloud - Essbase only:

- If external authentication is disabled, for security reasons, you must provide your user name and password each time you connect to a different application on the same server.
- Once connected to an Essbase database, users can view database notes associated with the database. To display database notes, from the Smart View Panel, right-click the name of the Essbase database, and then select **Database Note**. You cannot edit these database notes from Smart View. Database notes can be implemented in VBA by using the VBA function, `HypGetDatabaseNote` (see *Oracle Smart View for Office Developer's Guide*).

[Deleting Connections](#)

Disconnecting from Data Sources

You can disconnect from the current connection or from all connections.

To disconnect only from the *current* connection:

1. From the Smart View Panel, select the connection that is currently open in the tree list.
2. **Optional:** To find this connection quickly, click the arrow next to  and select **Locate Worksheet Connection**.
3. Right-click and select **Disconnect**.

Disconnecting from the current connection does not invalidate single-sign on (SSO).

To disconnect from *all* connected shared connections and private connections:

1. From the Smart View Panel, click .
2. Select **Disconnect All**.
This selection invalidates SSO, and you must log in again the next time you connect.

Creating Shared Connections

You create a shared connection using a connection URL provided to you by your Oracle Smart View for Office administrator.

When you have the connection URL information, you can complete the procedure in this topic.

To create a shared connection in Smart View:

1. From the Smart View ribbon ribbon, click **Options**.
2. In the **Options** dialog box, select the **Advanced** tab.
3. In the **Shared Connections URL** text box, enter the connection URL provided to you by your Smart View administrator.

The URL syntax for a cloud connection to a single cloud service is:

```
http(s)://<serviceURL>/workspace/SmartViewProviders
```

The URL syntax for a cloud connection to multiple cloud services on the same domain is:

```
http(s)://<serviceURL>/HyperionPlanning/SmartView
```

4. Click **OK** to close the **Options** dialog box.
5. Connect by following the procedure in [Connecting to Data Sources](#).

Creating Private Connections

There are several ways to create private connections.

- [Using the Private Connection Wizard](#)
- [Using the Quick Connection Method](#)
- [Saving Shared Connections as Private Connections](#)

See also [Private Connection URL Syntax](#).

Using the Private Connection Wizard

To create a private connection using the wizard:

1. From the Smart View ribbon, click **Panel**.
2. From the Smart View Panel, click the arrow next to , and then select **Private Connections**.
3. In the Action Panel, click **Create new connection** to display the Add Connection wizard.

Alternatively, click the arrow next to  and select **Create new connection**.

4. In **Add Connection - URL**, enter the URL for the private connection, then click **Next**.

Follow the syntax guidelines in [Private Connection URL Syntax](#).

5. In **Add Connection - Application/Cube**, navigate to the application and database to work with, select it, and then click **Next**.
6. In **Add Connection - Name/Description**, enter a friendly name for the connection and an optional description.
7. Click **Finish**.
8. **Optional:** To select a private connection, click the drop-down arrow in the connection text box in the Smart View Panel.

Private connections are listed by provider type.

[Using the Quick Connection Method](#)

[Saving Shared Connections as Private Connections](#)

Private Connection URL Syntax

Using the Quick Connection Method

You can create a private connection using the quick connection method if you know the URL. URLs are generally provided to you by your Oracle Smart View for Office administrator.

To create a private connection using the quick connection method:

1. From the Smart View ribbon, click **Panel**.
2. From the Smart View Panel, click the arrow next to , and then select **Private Connections**.
3. In the text box, enter the URL or the local storage directory for the data source to which you want to connect.

Figure 3-1 Text Box for Entering URL when Creating a Quick Connection

The URL syntax for the various data sources is listed in [Private Connection URL Syntax](#). Contact your system administrator for the URL to use.

4. Click .
5. Expand the tree in the Smart View Panel and navigate to the application and database that you want to work with.

If you are prompted to log in, enter your login credentials.

Example 3-1 Deleting the List of Quick Connections

To delete the entire list of quick connections, click the arrow next to , and then select **Clear Quick Connect URL Entries**.

Related Topics:

[Using the Private Connection Wizard](#)

[Saving Shared Connections as Private Connections](#)

[Private Connection URL Syntax](#)

Saving Shared Connections as Private Connections

Although you cannot create shared connections without administrative privileges, you can save them as private connections if they are enabled for private connections.

To create a private connection from a shared connection:

1. From the Shared Connections tree list, select an item to save as a private connection.
2. From the Action Panel, select **Add to private connections**.
This option is available only if the selected item is enabled for saving as a private connection.
3. **Optional:** From **Save as Private Connection**, edit the name and description of the connection.
4. Click **OK**.
The connection name is displayed in the following:
 - The Shared Connections tree list, indicated as private by a small arrow
 - The Private Connections drop-down menu
5. To ensure that the current worksheet is connected to the newly-created private connection, in the Smart View ribbon, click **Connections**, then **Active Connections**, and then select the check box next to the new connection name.
Alternatively, once you perform a Oracle Smart View for Office action (for example, select **Ad hoc analysis** from the Action Panel), the connection is automatically made.

[Saving Shared Connections as Private Connections](#)

Modifying Connections

You can modify connections in two different ways: modify a private connection or modify the connection information for individual entities within an Office document.

Additionally, you use the Edit Connection command to modify connections for Financial Reporting images and fully-formatted reports.

- **Modify a private connection.** You can modify a private connection to change the server, application, or database information for all data providers associated with the connection.

The connection information can be changed whether you are connected or not.

For example, you may be working in a test environment using a private connection. When you are ready to move to a production environment, you change the server information for that private connection to access the new environment.

This procedure is described in [Modifying Private Connections](#).

- **Modify the connection information for individual entities within a document.** You can modify the connection information for individual entities within a document using the Document Contents panel. You can change connections per sheet. Or, in a sheet containing multiple entities, you can change the server connection for one or more of the individual entities.

For example, while connected to Oracle Business Intelligence Enterprise Edition, you may have inserted a compound view containing 10 graphs. Now you would like to pull data from a different Oracle BI EE server for three of the graphs. Using the Document Contents panel, you can modify the connection information for the each of the three graphs to point to the new Oracle BI EE server.

This procedure is described in [Modifying Connections within an Office Document](#).

- **Modify the connection information for individual Financial Reporting images and fully-formatted reports images in Office documents.** Using the Edit Connection command accessed from the Smart View ribbon, you can change the connection information for entities in Excel, Word, and PowerPoint. This is useful when sharing an Office document between departments or when moving from a test to a production environment.

See [Modifying Connections for Financial Reporting Images and Fully-Formatted Reports](#).

 **Note:**

When you modify connection information, the new data source that you point to must contain all the dimensions and members of the previous data source. Any missing dimensions or members in the new data source will cause errors upon refresh.

[Connecting to Data Sources](#)

[Disconnecting from Data Sources](#)

[Shared Connections and Private Connections](#)

Shared Connections and Private Connections

Creating Private Connections

Modifying Private Connections

Use the Edit Connection wizard to modify a private connection.

To modify a private connection:

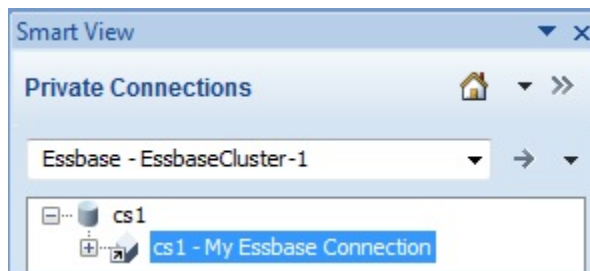

1. From the Smart View ribbon, click **Panel**.
2. From the Smart View Panel, click the arrow next to , and then select **Private Connections**.
3. Click the arrow in the text box to select a private connection to modify, and then click .

 **Note:**

You may modify the private connection even if you are already connected to it.

4. In the Smart View Panel, expand the tree to the connection name, and then select it.

Figure 3-2 Tree Expanded with Connection Name Selected in Smart View Panel

5. In the Action Panel, select **Modify connection**.
Alternatively, right-click the private connection name and select **Modify connection**.
6. In the **Edit Connection - URL** page, edit the URL as required, and then click **Next**.
Optionally, select the **Set as default connection** check box, and then click **Next**.
7. In the **Edit Connection - Application/Cube** page, and navigate the tree to the new application and cube, select it, and then click **Next**.
Alternatively, select the **Advanced Setup** check box and manually enter the new connection information in the **Server**, **Application**, and **Cube/Database** text boxes, and then click **Next**.

8. In the **Edit Connection - Name/Description** page, change the connection name and description as required, and then click **Finish**.

Modifying Connections within an Office Document

From the Document Contents pane, you can change connections for Oracle Smart View for Office objects within an Office document. This is useful when sharing an Office document between departments that point to different servers or when moving from a test to a production environment.

You can change the connection properties for all entities in a document that share the same connection information (for example, all worksheets or grids that point to the same application and database on a particular server). Or, in an Excel workbook, you can change the connection information sheet by sheet.

To modify connections from the Document Contents pane:

1. Open the Office document.

Note:

Narrative Reporting: To change the connection information for Smart View content in an Excel doclet, you must open the doclet from the report package and then check it out. See [Checking Out Doclets](#).

2. In the Document Contents pane, from the drop-down list box, perform an action:
 - Select a sheet from a selected document
 - Select a particular connection
 - Select **All Connections**

3. Select the **Modify Connection** link at the bottom of the pane.

Alternatively, right-click a connection name or sheet name and select **Modify Connection**. You can also modify connections as follows:

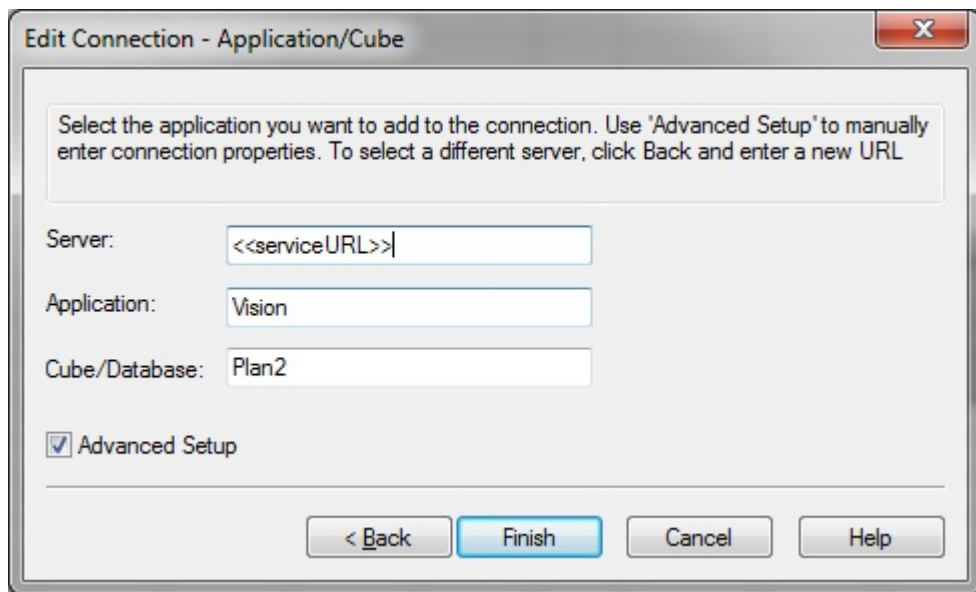

- To modify a connection for all sheets in the workbook, select the top-level tree node connection name in Document Contents
- To modify a connection for a specific sheet, select the connection name under the specific sheet-level tree node

The **Edit Connection - URL** page of the wizard is displayed.

4. In the **URL** drop-down list, select an existing connection or enter a new connection URL.
5. Click **Next** and in **Edit Connection - Application/Cube**, expand **Servers**, and navigate to the application and database to which you want to connect, depending upon the provider requirements.

Alternatively, select the **Advanced Setup** check box and manually enter the information for **Server**, **Application**, and **Cube/Database**, as the provider requires.

For example, [Figure 1](#) shows the entries for connecting to an cloud application and database.

Figure 3-3 Edit Connection - Application/Cube Advanced Setup

6. Click **Finish**.
7. Select the **Refresh** link at the bottom of the Document Contents pane.
8. To save the modified connection information, save the workbook.

The modified connection information is saved when you save the workbook.

 **Note:**

Narrative Reporting: Be sure to upload and check in the Excel doclet you're working with. The modified connection information is saved when you upload and check in the doclet. See [Uploading and Working with Page Attributes and Slide Masters](#) and [Checking In Doclets](#).

Modifying Connections for Financial Reporting Images and Fully-Formatted Reports

You can change connections for Financial Reporting fully-formatted reports or images within an Office document using the **Private Connections** dialog, which is accessed from the **Connections** button on the Smart View ribbon. This is useful when sharing an Office document between departments or when moving from a test to a production environment.

Before you begin, ensure the following:

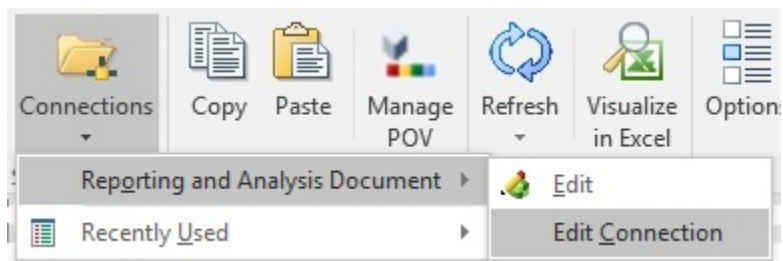

- The data source you're changing to must contain the same folder structure and report as the original data source.
- You are working with a Financial Reporting report as follows:
 - Excel: Fully-formatted reports or images
 - PowerPoint and Word: Images

 **Note:**

This procedure applies to Financial Reporting fully formatted reports in Excel, Word, or PowerPoint. To modify connections for Financial Reporting query-ready reports and function grids in an Office document, see [Modifying Connections within an Office Document](#).

To modify the connection for Financial Reporting entities:

1. Select a Financial Reporting entity in Word.
2. In the Smart View ribbon, select **Connections**, then **Reporting and Analysis Document**, and then **Edit Connection**.

3. In the **Private Connections** dialog box, select a data source from the drop-down menu, select the data source name in the tree, and then click **OK**.

 **Note:**

Depending on the release, the connection syntax differs for Financial Reporting data sources:

- Oracle Hyperion Reporting and Analysis - Release 11.1.2.4.7xx and earlier:

```
http(s)://servername:port/raframework/browse/listXML
```

- Oracle Financial Reporting Document Repository - Release 11.1.2.4.9xx and later:

```
http(s)://servername:port/hr/modules/com/hyperion/  
reporting/web/repository/HRRRepositoryXML.jsp
```

4. If you are prompted to log in, then provide your user name and password to the new data source.
The **Import Workspace Document** dialog is displayed.
5. In **Import Workspace Document**, when the **Finish** button is enabled, click it.
6. Refresh the Office document.
When the refresh is complete, a message notifies you of the number of pages that were updated.
7. Repeat this procedure for any other entities within the Office document

Deleting Connections

Delete connections in the Delete Connections URL dialog box.

Related Topics

- [About Deleting Connection URLs](#)
- [Deleting Connection URLs](#)

About Deleting Connection URLs

You can delete connections using the **Delete Connection URLs** dialog box.

You can delete the following connection URL types:

- Private connection URLs that were created using the [quick creation method](#)
- [Shared connection URLs](#)
- [Extension update URLs](#)

Understand these guidelines when deleting connection URLs:

- To delete connections URLs as described in [Deleting Connection URLs](#) Oracle Smart View for Office 11.1.2.5.620+ is required.
- To begin the process, the Smart View Panel must be in private connection mode, no matter the URL type that you're deleting.

- You cannot delete private connections that were created using the Private Connection Wizard.
- You must first click Delete, and then OK to accept the delete. Clicking Delete only does not fully delete the connection or extension update URLs.
- To cancel a delete operation, you can press the Escape key or clicking the X button in the top right corner of the dialog.
- Clicking the OK button without first clicking the Delete button is the same as cancelling the action; nothing will be deleted.
- When deleting shared connections URLs, the URL that is currently displayed in the Shared Connection URL field of the Options dialog, Advanced tab, will not be deleted.
- If a data source provider gives Smart View the URL from where extension updates can be obtained, this URL gets added to the local user's Smart View properties files. This occurs only when the user creates a private connection.

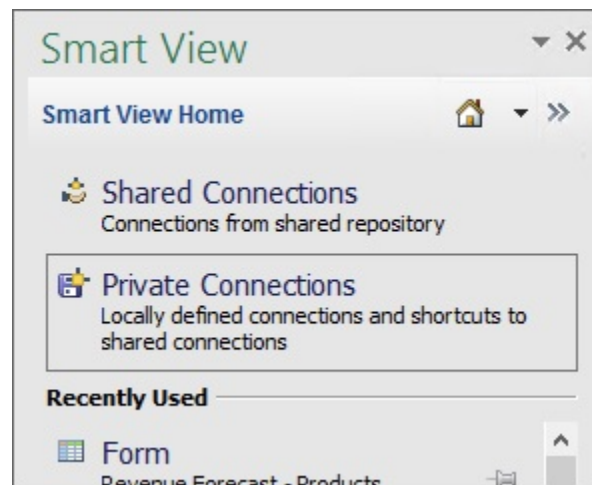

The user may want to delete URLs that are no longer used or that belong to a server that has been decommissioned to avoid Smart View querying those locations for updates.

If a URL that is deleted needs to be used again, that URL will be added back to the local user's properties file the next time a private connection is made to that provider.

Deleting Connection URLs

To delete connection URLs:

1. In the Smart View Panel, select Private Connections.

You can also select **Private Connections** from the drop-down menu on the Home button, :

2. Click the arrow next to  and select **Delete Connection URLs** from the drop-down list.

The **Delete Connection URLs** dialog box is displayed. Connections that were created using the quick connection method are displayed by default:

To select shared connection URLs for deletion, click the drop-down arrow and select **Shared Connection URLs**.

To select URLs for extension updates for deletion, click the drop-down arrow and select **Extension Updates URLs**:

3. In the **Delete Connection URLs** dialog box, select the check box next to the URLs to delete, and then click **Delete**.

To select all URLs of a given type for deletion, click the **Select All** button, and then click **Delete**.

 **Note:**

When deleting all shared connections URLs using the **Select All** button, the URL that is currently displayed in the Shared Connection URL field of the Options dialog, Advanced tab, will not be deleted.

To cancel any selected deletions, do not proceed to the next step, but instead, press **Escape** or click the X button in the top right corner of the dialog.

You can select URLs for deletion and click **Delete**, and then switch between URL types and make more selections and click Delete, before proceeding to the next step, where the deletions will be permanently accepted.

4. To accept the deletions, click **OK**.

Clicking **Delete** only does not fully delete the connection or extension update URLs. You must click **OK** to accept the deletions.

The POV (Point of View) is the starting point for forms, ad hoc grids, and functions.

About Dimensions and Members

Dimensions are data categories used to organize business data for retrieval and preservation of values.

Dimensions usually contain hierarchies of related *members* grouped within them. For example, a Year dimension often includes members for each time period, such as quarters and months.

You can select members for the grid from the Member Selection dialog box available from the data source ribbon, from the POV toolbar, or by entering the member name using free-form mode.

Related Topics:

[Dimension and Member Naming Limitation](#)

[Selecting Members from the Member Selector](#)

[Selecting Members from the POV Toolbar](#)

[Entering Members in Free-Form Mode](#)

Dimension and Member Naming Limitation

There are some limitations to consider when naming dimensions and members.

If you use Oracle Smart View for Office cell functions (described in [Functions](#)), then do not use the hash mark (#) or the semicolon (;) in member names, dimension names, or variable names. These characters are reserved for delimiters in Smart View cell functions.

Selecting Members from the Member Selector

You select members for a variety of purposes within Oracle Smart View for Office: ad hoc grids, functions, and the POV Manager.

The Member Selection dialog boxes in these locations may vary slightly, and not all options are always available. You can select members for one dimension at a time.

 **Note:**

Oracle Analytics Cloud - Essbase and Planning Ad Hoc:

To quickly add attribute dimensions onto an ad hoc or free-form grid, follow the instructions in [Inserting Attribute Dimensions on the Sheet](#). You can then use the instructions in this chapter to select and work with members from attribute dimensions.

Figure 1 shows the **Member Selection** dialog box with the Year dimension and its members as examples.

Figure 4-1 The Member Selection Dialog Box

To select members:

1. To display the **Member Selection** dialog box, which contains a tree list of available members for the dimension selected, do one of the following:
 - Select a dimension or member on the grid, and then from an **Ad Hoc** or data source ribbon, click **Member Selection**.
 - From an open dialog box enabled for member selection, click **Member Selection**.
 - On a blank worksheet, from the Smart View Panel, right-click a cube name and select **Member Selection**. Use this method to select members for functions and references (see [Functions](#)).

- Click on a user variable in a form.
2. From **Member Selection**, to change the dimension, click the **Dimension Selector** button (for example, ) and select a dimension.

 **Note:**

In Planning, with the **Smart View Ad Hoc Behavior** option set to **Standard**, and the Smart View **Member Name Display** option set to **Member Name and Alias**, the dimension displayed in the **Member Selection** dialog will show the default dimension, regardless of the dimension or member you selected for an alias column on the grid. Perform this step to select the dimension you require.

3. **Optional:** To find a specific member in the tree list, enter a member name in the search field and click .

Oracle Analytics Cloud - Essbase and Narrative Reporting accept asterisks (*) and question marks (?) as wild cards. The asterisk can be substituted for a group of characters; the question mark can be substituted for only one character.

For example, to search for all member names that start with the word, Total, To* and To?al are valid search strings; however, To? is not.

 **Note:**

The search string cannot begin with an asterisk. For example, *Total and *otal are not supported search strings.

4. **Optional:** Click the arrow in  and select an option to change the criteria for displaying members in both the right pane of the Member Selection dialog box and on the grid or form:

- **Oracle Analytics Cloud - Essbase:**
 - **Hierarchy**—Displays members in standard hierarchy format.
 - **Attribute**—Display members by attributes. See [Filtering by Attribute](#).
 - **Subset**—Display a subset of members based on a set of conditions. [Filtering by Subsets](#).
 - **Dynamic Time Series**—Display members by the latest period on which to base the to-date calculation. See [Selecting Period-to-Date Members](#).
- **Planning:**
 - **Hierarchy**—Displays members in standard hierarchy format.
 - **Attribute**—Display members by attributes in an ad hoc grid. See [Filtering by Attribute](#).
 - **Substitution Variables**—Display members based on selections made in the **User Variables** tab of the **Preferences** dialog box (Planning only).

 **Note:**

The **Substitution Variables** option displays when you access **Member Selection** from a user variable in a form.

- **Dynamic Time Series**—Display members by the latest period on which to base the to-date calculation. See [Selecting Period-to-Date Members](#).
 - **Narrative Reporting:**
 - Hierarchy**—Display members in standard hierarchy format.
5. **Optional:** To find a specific member or group of members in the tree list, click

and select one of these filters (filter options may vary by data source type):

- **Descendants** to select all descendants of the selected member
- **Descendants Inclusive** to include the selected member and all descendants of the selected member
- **Children** to select only the children of the selected member
- **Children Inclusive** to include the selected member and only the children of the selected member
- **Siblings** to select all siblings of the selected member
- **Siblings Inclusive** to include the selected member and all siblings of the selected member
- **LSiblings** to include only the members that appear before the selected member with the same parent
- **LSiblings Inclusive** to include the selected member and its left siblings
- **RSiblings** to include only the members that appear after the selected member with the same parent
- **RSiblings Inclusive** to include the selected member and its right siblings
- **Parent** to select only the parent of the selected member
- **Parent Inclusive** to include the selected member and only the parent of the selected member
- **Ancestors** to select all the ancestors of the selected member
- **Ancestors Inclusive** to include the selected member and all ancestors of the selected member
- **Level 0 Descendant** to display all descendants of the selected member that have no children
- **Level** to display the Level dialog box, where you select one level in the hierarchy of members
- **Generation** to display the Generation dialog box, where you select one generation in the hierarchy of members
- **UDA** to display the UDA dialog box, where you select a user-defined attribute (available only if defined by the administrator)

 **Note:**

Narrative Reporting does not support filters.

6. **Optional:** To choose display and selection options for members in the **Member Selection** dialog box, click  and perform an action:
 - To place a check in the check box next to the applicable members, choose from **Check Children**, **Check Descendants**, or **Check Base Members**.
 - To clear all check marks, select **Clear Checks**.
 - To view expanded or collapsed dimensions, select **Expand All** or **Collapse All**.
 - **Oracle Analytics Cloud - Essbase, Narrative Reporting, and Planning Ad Hoc only:** To view information about a member, select the member, then select **Member Information**.
 - To apply an alias table to the members in the **Member Selection** dialog box, select **Alias Table**, and then select an alias table.

Note that alias table selections made in the **Member Selection** dialog box apply only to the dialog box and not to the grid in the Office document.
7. Under **Members**, select the members that you want to use.
8. Click .
- The members are transferred from the member tree list to the selection tree list in the pane on the right.
9. **Optional:** If this is the first member selection that you make in a blank worksheet, select one of these buttons:
 -  to display the selected members vertically, in a column
 -  to display the selected members horizontally, in a row
10. Click **OK**.

The members selected are displayed in the grid.
11. From the ribbon, click **Refresh** to update the data to correspond to the selected members.

Selecting Members from the POV Toolbar

The POV is the default starting point for dimensions in a data source connection.

From the POV toolbar, you can select members and filters for the dimensions that you want to include in the grid and move members to and from the grid.

Each connection is associated with only one POV. However, the same connection to different worksheets within a workbook may have different POVs.

POVs can be managed as described in [The POV Manager](#).

 **Note:**

For Oracle Analytics Cloud - Essbase and Narrative Reporting connections, see [Displaying the POV Toolbar](#).

Placing Members and Dimensions from the POV Toolbar onto the Grid

To select dimensions and members from the POV toolbar:

1. Do one of the following:
 - Enter the name of a member over its corresponding dimension on the POV toolbar, and then click **Refresh** on the POV toolbar.
 - Click the down arrow next to a dimension on the POV toolbar, then click the ellipsis (...), and then select members as described in [Selecting Members from the Member Selector](#).

 **Note:**

In the **Member Selection** dialog box, it is possible to select more than 5000 members for the POV. However, be aware that the POV toolbar can only display the first 5000 selected members.

2. From the POV toolbar, right-click the down arrow next to the member and drag it to the grid.

To move a member or dimension back to the POV toolbar for editing, right-click its cell and drag it to the POV toolbar.
3. Repeat as necessary to place all dimension and members that you want to include on the grid.
4. To save these POV selections in the worksheet, you must refresh before you save the worksheet.
5. **Optional:** To hide the POV toolbar, click **POV** on the data source ribbon.

The **POV** button toggles to hide or display the POV toolbar. When you finish working with the POV toolbar, you can hide it until you need to display it again.

 **Note:**

Starting with Oracle Smart View for Office 11.1.2.5.520, when connected to duplicate member databases, the member name only should display by default in the POV. However, for workbooks saved in Smart View 11.1.2.5.510 and earlier, the qualified member name displays in the POV. To change the display of member names in the POV, open the **Member Selection** dialog box from the POV, then click **OK**.

Example 4-1 Example POV Usage

[Figure 1](#) shows, from left to right, a POV in the following conditions:

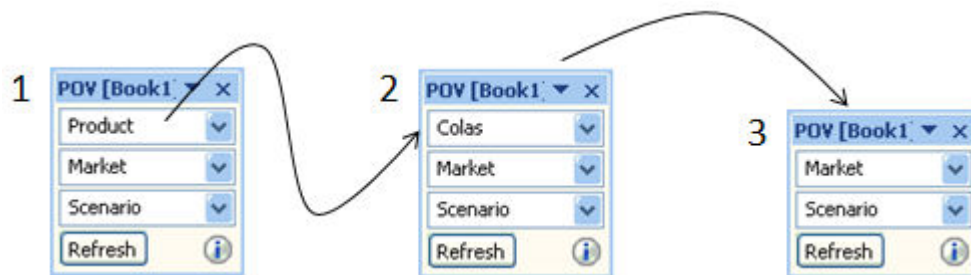

1. **Product**, **Market**, and **Scenario** are the starting dimensions in the POV.
2. **Colas** is selected as the **Product** member.

In the **Member Selection** dialog box, it is possible to select more than 5000 members for the POV. However, be aware that the POV toolbar can only display the first 5000 selected members.

Although only one dimension member at a time can display in the POV, note that in **Member Selection**, up to 5000 members can be selected for the drop-down list for a dimension in the POV. The members you select are accessible in the POV by clicking the drop-down arrow for the dimension.

3. **Colas** has been moved to the grid (and it can be moved back to the POV toolbar), so that only Market and Scenario remain in the POV.

Figure 4-2 The POV — using pov2

Displaying the POV Toolbar

You can choose whether to display all members on the grid and hide the POV toolbar or to display the POV toolbar containing the POV members.

Data source types: Oracle Analytics Cloud - Essbase, Narrative Reporting

By default, all members are displayed on the grid, and the POV toolbar is hidden. The members in the first row of the grid are called "page" dimensions. In this mode, you can format POV member cells the same as you do other member and data cells, and select members using the Member Selection button in the ribbon.

When you display the POV toolbar, the page dimensions move to the POV toolbar. When you hide the POV toolbar, the page dimensions move back to the first row of the grid.

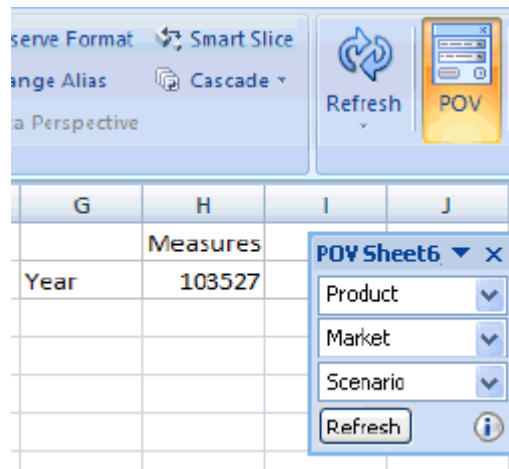

If you choose to display the POV toolbar containing the POV members, you can use the POV toolbar to select members and move them to and from the grid as described in [Selecting Members from the POV Toolbar](#).

To display the POV toolbar:

1. Select the Essbase or Narrative Reporting ribbon.
2. Click the **POV** button.

[Figure 1](#) shows the POV toolbar on the grid. **Measures** and **Year** are displayed on the grid; POV members **Product**, **Market**, and **Scenario** are displayed on the POV toolbar.

Figure 4-3 POV Toolbar Displayed

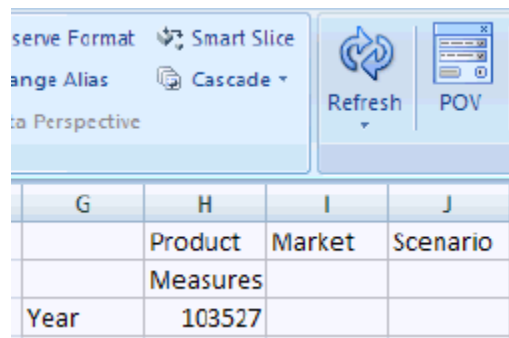

To hide the POV toolbar and display all members on the grid:

1. Select the Essbase or Narrative Reporting ribbon.
2. Click the **POV** button to toggle it off.

In [Figure 2](#), the **POV** button is toggled off, the POV toolbar is hidden, and all members are on the grid.

Figure 4-4 All Members Displayed on Grid

Note:

- In some cases, in workbooks with multiple sheets where each sheet contains a different query or template, if you drag the POV toolbar to the top of a sheet and dock it, you may see two POV toolbars on that sheet. This can occur on any number of sheets where the POV toolbar has been docked. Click the **X** in the right corner of one of the POV toolbars to close it, or refresh the sheet.
- You should hide the POV toolbar before editing the grid and refreshing, or an error can result upon refresh. For example, before adding a new row to the grid, click the **POV** button to toggle it off so that Page dimensions are displayed in row 1 of the sheet.

Selecting Members Using the Cell-Based POV

You can select members directly from cells in the page dimension row of a grid rather than using the POV toolbar.

Data source types: Oracle Analytics Cloud - Essbase, Narrative Reporting

The cell-based POV is available by clicking a page POV dimension cell, then selecting the down arrow, , that appears to the right of the cell; it works the same as the POV toolbar.

Figure 4-5 Selecting a Dimension Cell and Clicking the Down Arrow

	A	B	C	D
1		Product	arket	Scenario
2				
3	Year			
4				
5				
6				
7				
8				

Click the ellipsis button, , that appears in the cell-based POV and select members in the **Member Selection** dialog box, and then click **OK**. Now, look at the dimension cell again. The first member you selected appears in the dimension cell, and the other members are available by clicking the down-arrow in the cell-based POV and selecting them. After each selection, click **Refresh** to view the updated data.

Using the Oracle Essbase Sample Basic application and database as an example, for the Product dimension, if you select Root Beer, Cream Soda, and Fruit Soda in the **Member Selection** dialog box, then "Root Beer" appears in the dimension cell, as shown in [Figure 2](#). Click **Refresh** to view the data for Root Beer.

Figure 4-6 Using Cell-Based POV to Change the Product Dimension POV to Root Beer

	A	B	C	D
1		Root Beer	arket	Scenario
2		Measures		
3	Year	68677		

Now click the arrow next to the cell, , and make another selection from the cell-based POV; for example, Cream Soda ([Figure 3](#)).

Figure 4-7 Changing the POV to Cream Soda Using the Cell-Based POV

	A	B	C	D
1		Cream Soda	arket	Scenario
2		<div style="border: 1px solid #ccc; padding: 5px;"> Type to search ... </div>		
3	Year			
4		Root Beer		
5		Cream Soda		
6		Fruit Soda		
7				
8				

Click **Refresh** to update the data. Notice that the data has changed ([Figure 4](#)).

Figure 4-8 Refreshed Data for Cream Soda

	A	B	C	D
1		Cream Soda	arket	Scenario
2		Measures		
3	Year	23694		

You can also directly type a member name in the search field of the cell-based POV drop-down. In this case, you can select only one member at a time. Click **Refresh** to view updated data. Type another member name in the search field each time you want to change the POV.

You can still use the POV toolbar as before by toggling the **POV** button on the provider ribbon. The cell-based POV and the POV toolbar selections are automatically synchronized, regardless of where the selections are made. If you change to a different alias table, the cell-based POV is populated with the proper alias names.

Entering Members in Free-Form Mode

If you are familiar with the dimensions and members of your database, you can enter their names directly into cells using *free-form mode*.

You can use aliases from the alias table associated with the current grid in free-form mode.

Note:

Oracle Analytics Cloud - Essbase, Planning Ad hoc:

If you enter an alias from a different alias table, it will revert to the alias from the current alias table.

After connecting to a data source, you can enter member names as follows:

- By entering a member name in a blank cell
- By replacing a member name in a cell with a different member from the same dimension

You can still use the POV, member selection, and other ad hoc operations in free-form grids. See [Free-Form Mode](#).

Filtering by Attribute

In an ad hoc grid, you can filter by attributes in dimensions that contain attribute members.

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc, Financial Consolidation and Close Ad Hoc

To filter by attribute:

1. Select an attribute dimension on the grid, and then open **Member Selection** as described in [Selecting Members from the Member Selector](#).
2. Click  and select **Attribute**.
3. From **Attribute**, click .
4. From **Subset**, in **Dimension**, select a dimension; for example, Ounces.
5. In **Member**, select an attribute member, for example, Ounces_16.
6. Click  to display the attribute.
7. Optional: to change the displayed attribute, change the selections in Dimension and Attribute and click **Set**.
8. Click **OK**.

Your selections are displayed in the tree list in **Member Selection**, where you can select from among them for inclusion in the grid.

Filtering by Subsets

For dimensions that contain attribute members, you can select attributes and set conditions for them to display only those members that meet these conditions.

Data source types: Oracle Analytics Cloud - Essbase

To filter by condition:

1. Select an attribute member on the grid, and then open **Member Selection** as described in [Selecting Members from the Member Selector](#).
2. Click  and select **Subset**.
3. From **Subset**, in **Dimension**, select an attribute dimension; for example, Ounces.
4. In **Member**, select an attribute member; for example, True.

5. Click .
 6. In **Dimension**, select another attribute dimension; for example, Pkg Type.
 7. In **Member**, select another attribute member; for example, Bottle.
 8. Click .
- An AND condition statement is created; for example, [True] AND [Bottle].
9. **Optional:** To change the condition statement, highlight the AND condition statement and select **Operator**, and then **AND** or **OR**.
 10. **Optional:** Nest conditions by selecting more attributes, then **Add**, and then **Root**.
 11. Click **OK**.
- Your selections are displayed in the tree list in **Member Selection**, where you can select from among them for inclusion in the grid.

Selecting Period-to-Date Members

In time dimensions, you can set up period-to-date members, called Dynamic Time Series members, if defined.

For example, to see year-to-date data at the end of August, you can set up a Dynamic Time Series member that includes data for January through August.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting

To select a Dynamic Time Series member:

1. Select a time dimension on the grid, and then open **Member Selection** as described in [Selecting Members from the Member Selector](#).
2. Click  and select **Dynamic Time Series** to display available Time Series Members in the member tree list.
3. Select a time series member from the member tree list and click .
4. From **Select DTS Member**, select the latest period on which to base the to-date calculation; for example, **Aug**.
5. Click **OK**.
6. **Optional:** Repeat step 3 through step 5 as necessary to add other Dynamic Time Series members.
7. click **OK**.

The Time Series Member is displayed on the grid as, in this example, **Y-T-D(Aug)**. After you refresh, the year-to-date data through August is displayed.

Defining Member Name Display in the Member Selector

You can change how member names are displayed in the Member Selection dialog box by choosing a Member Name Display option.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Using this option allows you to display members in the Member Selection dialog box differently from how they are displayed on the sheet.

The selection you make in the Member Selection dialog box does not affect how members are displayed in the worksheet. Members in the sheet are displayed according to the setting you choose in the Member Name Display field of the Options dialog box, Member Options tab.

For example, if the provider you are connecting to permits the use of descriptions, you can choose to display member names *with* their descriptions in the worksheet using the Member Name Display field in the Options dialog box. Then, you can choose to display member names *without* their descriptions in the Member Selection dialog box.

 **Note:**

Oracle Analytics Cloud - Essbase, Narrative Reporting: Use alias tables to change the member name display. See [Displaying Aliases in the Member Selector](#).

To define how member names are displayed:

1. Display the **Member Selection** dialog box, as described in [Selecting Members from the Member Selector](#).
2. To change the dimension, click the **Dimension Selector** button in the top left of the dialog box and select a dimension.
3. Click the **Options** button, then select **Member Name Display**, and then select an option:
 - **Member Name Only** to display qualified names

 **Note:**

If you select **Member Name Only** in free-form mode, in an ad hoc grid, if you insert a column and type a member name in the new column and want to change the alias table for the sheet, you must first refresh the sheet before changing the alias table.

- **Member Name and Description** to display qualified names and descriptions (aliases) in the same cell.

 **Note:**

In Windows 8x, if you select **Member Name and Description**, you may get an "Invalid members" error when trying to save a journal. This can be the result of the size of the Excel window on screen. If this happens, try unfreezing panes in Excel using the **View**, then **Freeze Panes**, and then **Unfreeze Panes** command. You can also reduce the display size to 75% or 50% before opening or creating the journal.

- **Description Only** to display aliases only.

 **Note:**

If you select **Description Only** in free-form mode, qualified names are displayed initially. After you manually add, remove, or edit any comments and refresh, aliases are displayed.

The member names displayed in the Member Selector are changed according to your selection.

Duplicate Member Names

Different members or member aliases may have identical names.

Data source types: Oracle Analytics Cloud - Essbase, Narrative Reporting

For example, a database may have two members named "New York," one for New York City and one for New York State. Both members can appear as "New York" in the grid, but if you want to distinguish between them, you can display their qualified names instead. Qualified names include the member name and the names of its ancestors to the level that uniquely defines the member; for example, `[Market].[New York]`.

When you first perform an ad hoc query on a database that supports duplicate member names, the default for the **Member Name Display** display option for members in the both grid and the POV is **Member Name Only**

Perform the procedure in this topic to display qualified member names in the grid and POV.

 **Note:**

In Narrative Reporting, duplicate member names are allowed across dimensions, but they are not allowed within dimensions.

To display the qualified names of duplicate members:

1. From the Smart View ribbon, select **Options**, and then select **Member Options** in the left panel.

2. From the **Member Name Display** drop-down menu, select **Distinct Member Name**.
3. Click **OK**.
4. Refresh the grid.

Duplicate members in the grid are displayed as qualified names. In this example, New York City is displayed as [East].[New York]. New York State is displayed as a sibling of East, West, and South: [Market].[New York]:

	Period
	Stereo
[East].[New York]	15647
Boston	15644
Chicago	15285
East	46576
West	62839
South	24565
[Market].[New York]	22645
Market	133980

Numeric Member Names

Oracle Smart View for Office has issues processing numeric member names when connected to Essbase.

Data source types: Oracle Analytics Cloud - Essbase

To workaround this:

- Prefix numeric member names with an apostrophe (').
- Before entering numeric member names, select the member cells or an entire column, then use Excel to set the format of the selected cells to "Text."
- If you have already entered numeric member names, select the member cells or an entire column, use Excel to set the format of the selected cells to "Text," then press **F2** and **Enter** to trigger Excel to update the cell type.

Qualified Name Display in Alternate Hierarchies

Qualified name behavior for alternate hierarchies affects runtime and member selector behavior on forms and ad hoc grids.

Data source types: Planning, Planning Modules, Financial Consolidation and Close

About Qualified Member Name Display in Alternate Hierarchies

When connected to Planning, Planning Modules, or Financial Consolidation and Close, alternate hierarchies are supported in the Entity dimension. One entity can have multiple parents, and contribute differently to each parent. These members are

referred to as *partially shared* entities, where only a part of input data is shared across all instances of the entities.

In Oracle Smart View for Office, displaying partially shared members requires that member names and aliases are *qualified*, so that users can uniquely reference the specific instance of a member and can then enter appropriate values based on this context. Qualified names include the member name and the names of its ancestors to the level that uniquely defines the member. The most common example is the Percentage Contribution (PCON) metric used for weighted consolidations in Financial Consolidation and Close.

The qualified name behavior for alternate hierarchies is explained in these topics:

[Expected Runtime Behavior on Forms](#)

[Expected Runtime Behavior for Aliases on Forms](#)

[Expected Runtime Behavior on Ad Hoc Grids](#)

[Expected Runtime Behavior for Aliases on Ad Hoc Grids](#)

[Expected Member Selector Behavior on Ad Hoc Grids](#)

[Expected Member Selector Behavior on Forms](#)

Expected Runtime Behavior on Forms

Starting in 17.01, Planning, Planning Modules support the option to qualify member names as part of form design. This option, **Show Qualified Names**, is only exposed when you have a dimension enabled for Partial Share. This option has three possible values:

- Never
- As Needed
- Always

By default, to maintain backwards compatibility the "Never" option is selected. "Never" is also used when this option is not exposed. Note that this is a runtime option and does not impact design time member selectors. Here is the expected behavior on forms for each option:

- **Never**
 - PBCS, EPBCS: All member names are not qualified.
 - FCCS: All member names are not qualified.
- **As Needed**
 - PBCS, EPBCS: Base members are NOT qualified. Shared members are qualified.
 - FCCS: Both base members WITH SHARES and shared members are qualified. Base member without shares are not qualified.
- **Always**
 - PBCS: All members are qualified.
 - FCCS: All members are qualified.

Expected Runtime Behavior for Aliases on Forms

Alias behavior should behave the same as for member names with these exceptions:

- When showing qualified aliases both components (parent and child) must have aliases otherwise, the member name or qualified member name is returned as per selected option.
- Duplicate aliases are also qualified when "As Needed" or "Always" option is selected.

Expected Runtime Behavior on Ad Hoc Grids

Member names are qualified or not based on the Smart View **Member Name Display** option setting. There are two values to support the partial share feature: **Distinct Member Name Only** and **Member Name Only**. Here is the expected behavior for each option:

- **Member Name Only**
 - PBCS, EPBCS: All members are not qualified.
 - FCCS: All members are not qualified.
- **Distinct Member Name Only**
 - PBCS, EPBCS: Behaves the same as the "As Needed" option for forms above.
 - FCCS: Behaves the same as the "As Needed" option for forms above.

Expected Runtime Behavior for Aliases on Ad Hoc Grids

Alias behavior should be the same as in [Expected Runtime Behavior on Forms](#), but also subject to the Smart View ad hoc alias options.

- If the "None" alias table option is selected, then you should see same behavior for members in ad hoc grids as in [Expected Runtime Behavior on Forms](#).
- If an alias table is selected, then the aliases from that table should be used and ad hoc options for members apply. Note that alias behavior for aliases on forms applies as well based on Smart View ad hoc settings.

Expected Member Selector Behavior on Ad Hoc Grids

The Member Selector will work based on the setting in the Smart View "Member Name Display" option.

The Member Selector will display the qualified names for shared members by default.

Expected Member Selector Behavior on Forms

The Member Selector will work based on form settings for aliases and behave like the "As Needed" setting on forms.

Member Perspective

Use the Varying Attribute filter to specify member perspective for varying attributes when selecting members.

Data source types: Oracle Analytics Cloud - Essbase

Note:

Member perspective may not be enabled in your Oracle Smart View for Office system. Your options for member perspective are enabled and configured by the Administrator.

To specify member perspective:

1. From **Member Selection**, under **Filter**, select **Varying Attribute**.
2. In **Filter Arguments**, click .
3. Specify an attribute to set the perspective, and then click **OK**.
4. In **Varying Attribute Args** under **Varying Attribute**, click the ellipsis button.
5. In **Subset**, in **Dimension**, enter an attribute dimension.
6. In **Member**, enter an attribute member, and then click **Set**.
7. Click **OK**.
8. In **Varying Attribute Args**, under **Perspective**, click the ellipsis button.
9. From **Perspective**, select one of the following:
 - **Snapshot.** One set of independent dimension members to identify the members of base dimension associated with the varying attribute. Here the start and end tuple are same.
 - **Range.** A finite range of independent dimension members. A range can be specified only for continuous independent dimensions (“Year” is an example). For discrete independent dimensions, you can make only one selection.
10. Click **OK**.

Aliases and Alias Tables

Aliases are alternate names for database member names.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

Database member names are often stock numbers or product codes; their aliases can be more descriptive. For example, in the Sample Basic database, the alias name for the database member 100 is Colas. Aliases are stored in *alias tables* as part of a database. Dimensions can be associated with multiple alias tables.

You can select an alias table for the current worksheet or for a connection.

Selecting Alias Tables

Aliases from Different Alias Tables

Selecting Alias Tables

If more than one alias table has been created in the database, you can select an alias table for the current worksheet or for a private connection.

Selecting an Alias Table for the Current Worksheet

Selecting an Alias Table for the Connection

Selecting an Alias Table for the Current Worksheet

The alias table selected here applies only to the current worksheet and not to future connections.

To select an alias table for the current worksheet:

1. From a worksheet, connect to a data source.
2. From the Essbase or ad hoc ribbon, select **Change Alias** to display a list of available alias tables.
3. Select an alias table for the worksheet.

The new alias table is applied automatically.

Selecting an Alias Table for the Connection

You can select an alias table for private connections only. If you want to select an alias table for a shared connection, first save the shared connection as a private connection. See [Saving Shared Connections as Private Connections](#).

An alias table selected for a private connection is permanent until changed and will be used each time you use this connection.

To select an alias table for the connection:

1. From a worksheet, connect to a data source.
2. In the Smart View Panel private connections, right-click a connection name and select **Set Alias Table**.
3. Select an alias table for the connection.

The new alias table is applied the next time you open the connection.

Aliases from Different Alias Tables

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc, Narrative Reporting, Financial Consolidation and Close Ad Hoc, Tax Reporting Ad Hoc

If you enter a name from an alias table that is not associated with the current grid, its corresponding alias from the alias table that *is* associated with the current grid is displayed after you refresh. For example, if you enter `Qtr1` into a grid that is associated with the Long Names alias, then after you refresh, `Quarter1` is displayed.

Displaying Member Names and Their Aliases in the Grid

Data source types: Oracle Analytics Cloud - Essbase

If you are connected to an Essbase data source, you can display member names and their aliases from the currently selected alias table together in the same row.

 **Note:**

This feature applies only to row members and not to column members.

To display both member names and aliases:

1. From the Smart View ribbon, select **Options**, and then **Member Options** in the left panel.
2. Under **General**, for **Member Name Display**, select **Member Name and Alias**.

For row members, both member names and their corresponding aliases are displayed. In this example, Product database member names are shown in column A, and their aliases in column B.

	A	B	C
1			Year
2			Measures
3	100	Colas	28473
4	200	Root Beer	27954
5	300	Cream Soda	25799
6	400	Fruit Soda	21301
7	Diet	Diet Drinks	28826
8	Product	Product	103527

Displaying Aliases in the Member Selector

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close Ad Hoc, Tax Reporting Ad Hoc

You can display aliases for member names in the **Member Selection** dialog box.

To select alias tables for displaying member names in **Member Selection**:

1. Display the **Member Selection** dialog box, as described in [Selecting Members from the Member Selector](#).
2. To change the dimension, click the **Dimension Selector** button in the top left of the dialog box, and then select a dimension.
3. Click the **Options** button, then select **Alias Table**, and then select an alias table from the list.

The member names displayed in the Member Selector are changed according to your selection.

Viewing Dimension Properties

Using the **Insert Properties** command in the Essbase ribbon, you can quickly view the properties of a dimension in an ad hoc grid.

Data source types: Oracle Analytics Cloud - Essbase

To view the properties of a selected dimension:

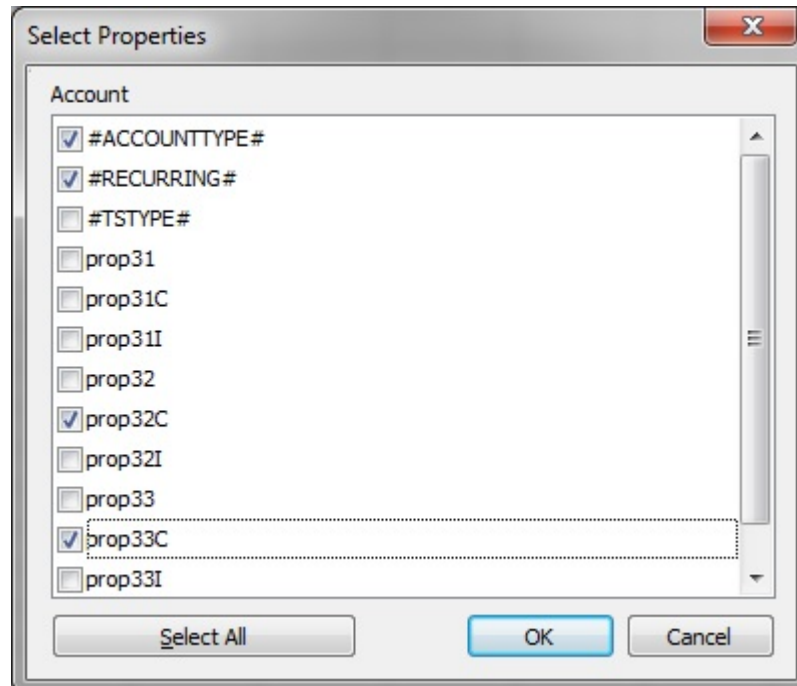

1. Ensure that you are working with an ad hoc grid connected to Oracle Analytics Cloud - Essbase.
2. In the Essbase ribbon, select **Insert Properties**.

The **Select Properties** dialog is displayed, listing the available properties for the dimension.

3. Using the check boxes, select the properties to view on the grid, as shown in [Figure 1](#).

Alternatively, click **Select All** to select all dimension properties.

Figure 4-9 Select Properties Dialog Showing Several Properties Selected

4. Click **OK**.

The selected dimension properties and their values are displayed in the columns to the left of the selected dimension. In the grid, the dimension properties column headings are designated as follows:

Dimension Name:Property Name

For example:

Account:#ACCOUNTTYPE#

Account:prop32C

In an example scenario, in the following grid, we select Account in cell A3:

	A	B
1		Dim1
2		Dim2
3	Account	#Missing

Then click **Insert Properties**, making the selections shown in [Figure 1](#).

The dimension properties are inserted in the columns to the left of the ad hoc grid. The ad hoc grid now starts in column E. Columns A through D contain the dimension property information.

	A	B	C	D	E	F
1						Dim1
2	Account:#ACCOUNTTYPE#	Account:#RECURRING#	Account:prop32C	Account:prop33C		Dim2
3	NONE	FALSE	prop32C	TRUE	Account	#Missing

You may continue working with the grid using ad hoc commands, such as **Zoom In** and **Keep Only**, while the dimension properties are displayed, as long as the properties have been inserted to the left of the grid.

Note:

This feature will be supported in an upcoming release of Oracle Analytics Cloud - Essbase.

Additionally, administrators must set up the database in Oracle Analytics Cloud - Essbase for dimension property viewing in Oracle Smart View for Office.

5. **Optional:** After viewing the dimension properties, you may delete the columns containing the dimension properties and still continue working in the ad hoc grid.

Member Information

You can view detailed information about any member on the grid. The information displayed depends on the data source type to which you are connected.

Data source types: Oracle Analytics Cloud - Essbase

To view member information:

1. Select a member in the grid.
2. From the data source ad hoc ribbon, select **Cell Information**.

Information is displayed on the following tabs. Only the tabs that are applicable to the member and connection are displayed.

- **Information:** A list of general information about the member such as dimension, level, generation, and so forth
 - **Aliases:** A list of alias tables and corresponding aliases associated with the member
 - **Attributes:** A table of the dimensions, members, and types of attributes associated with the member
 - **Formula:** The formula associated with the member
 - **Comments:** A list of comments associated with the member
 - **User Defined Attributes:** A list of user defined attributes (attributes of the member defined by the administrator)
3. **Optional:** To save the information in an Excel file, select **Save**.
 4. Click **Close**.

The POV Manager

The POV (Point of View) is the starting point for forms, ad hoc grids, and functions.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

Using the POV Manager in Oracle Smart View for Office, you can change the default POV for forms and ad hoc grids, and the background POV for functions.

Using the POV Manager, you can perform the following operations:

- Select members for the default POV and edit the default POV
- Select members for the background POV for functions
- Save a POV to a workbook
- Copy a POV and paste it to a different worksheet or workbook
- Edit a POV
- Delete a POV

Watch this video to see a tutorial on integrating data in Office applications, including working with the POV Manager.

[Tutorial video](#)

Related Topics:

[Selecting Members for the Default or Background POV](#)

[Copying and Pasting a POV](#)

[Deleting a POV](#)

Selecting Members for the Default or Background POV

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

In the POV Manager, you can select members as follows:

- To use as a default POV for the ad hoc grids of a given connection
- For the background POV for dimensions when you use functions

Oracle recommends a maximum of 1,000 members for the ad hoc POV.

Select members for or edit the POV before starting work on an ad hoc grid.

To select members for the default POV:

1. From the Smart View ribbon, select **Function**, and then **Manage POV**.
2. Expand the POVs list.
3. From the **Active** POV list, select the active connection for which you are changing the POV.
4. Click **Member Selector**, and then select the members that you want to use for the POV. See [Selecting Members from the Member Selector](#).

From the POV Manager, you can select only one member per dimension. If you use aliases, the POV Manager loses the selected members.

5. Click **Close**.
6. To refresh the worksheet, select **Refresh**.
7. To save the POV to the workbook, save the workbook.

Note:

After you start working on the ad hoc grid, select or change members as described in [Selecting Members from the Member Selector](#).

Members Linked to Smart Lists in the POV

In Essbase, if a member linked to a Smart List is in the POV, you may not be able to change some values in the Smart List for some members present in the Spreadsheet.

Copying and Pasting a POV

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

You can use the POV Manager to copy and paste a POV from one workbook to another if the data source is exactly the same for both workbooks. You must paste the copied POV to an unconnected worksheet; otherwise the POV has no effect.

To copy and paste a POV:

1. From the Smart View ribbon, select **Function**, and then **Manage POV**.
2. In the left window of POV Manager, expand **Active**, and then select the application connection that you want to copy.
3. From the POV Manager toolbar, click **Member Selector**, and then select members for the POV.
4. Save the workbook.
5. From the POV Manager toolbar, click **Copy**.
6. In the left window of the POV Manager, expand **Saved** to select the workbook and worksheet (which must be blank and unconnected) that you want to paste the POV into.
7. Click **Paste**.
8. Refresh the worksheet containing the copied POV.

Deleting a POV

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

To delete a POV that is saved in a workbook:

1. From the Smart View ribbon, select **Function**, and then **Manage POV**.
2. Expand the POV list.
3. From the **POV** drop-down list, select the worksheet that contains the POV that you want to delete.
4. Select the POV that you want to delete.
5. Click **Delete**.
6. Click **Close**.
7. To refresh the worksheet, select **Refresh**.

5

You can view the history of changes made to a data cell or range of data cells.

Refreshing Data

You can refresh data using the Refresh button on the Smart View ribbon, and you can refresh data in individual reports by using the Refresh link in the Document Contents pane.

Data source types: All

Note:

Refresh is not supported on protected worksheets.

Related Topics:

- [Refreshing from a Ribbon](#)
- [Refreshing Individual Reports from Document Contents](#)

Refreshing from a Ribbon

Data source types: All

In Excel, you can retrieve and refresh data for the current worksheet or for all worksheets in the workbook using the **Refresh** icon on the Smart View ribbon, shown in [Figure 1](#).

This type of refresh action applies to entire sheets, documents and slides and includes data in all ad hoc grids and reporting objects, such as function grids, tables, or charts.

Figure 5-1 Refresh Icon

Depending on the data provider to which you are connected, the Refresh icon can either be a split button with Refresh options or a simple, one-function Refresh button.

 **Note:**

- On ad hoc sheets, Excel filters are retained after refresh.
- To refresh individual reporting objects, such as function grids, tables, or charts, see [Refreshing Individual Reports from Document Contents](#).
- Selected POV members are reverted to dimension members after deleting some columns and refreshing a spreadsheet. To avoid this, click the POV button to hide the POV toolbar. Then ensure that you do not delete the column that contains the Page members.

To use **Refresh**, choose an option:

- To refresh the entire current worksheet, from any ribbon, click **Refresh**.
In Word or PowerPoint, when you click **Refresh**, all data points copied into the document or presentation are refreshed.
- **Oracle Business Intelligence Enterprise Edition only:** To clear the contents of the entire current worksheet and replace it with the latest members and data, click the down arrow in **Refresh**, and then select **Replace and Refresh**.

This option is used by other data providers and does not apply to Oracle Enterprise Performance Management Cloud.

 **Note:**

The **Replace and Refresh** option applies only to reports in Oracle BI EE and Financial Reporting.

- To refresh all worksheets in the current workbook, click the down arrow in **Refresh**, and then select **Refresh All Worksheets**.

Refreshing Individual Reports from Document Contents

Data source types: All

You can refresh data in individual reports by using the **Refresh** link in the **Document Contents** pane.

In Oracle Smart View for Office, reports consist of report queries and their associated reporting objects. These are listed in the **Document Contents** pane. From **Document Contents**, you can individually refresh report queries and their associated reporting objects, such as:

- Function grids
- Tables
- Charts
- Dynamic data points

 **Note:**

The procedures and examples in this topic discuss refreshing individual reports and reporting objects from the **Document Contents** pane. To refresh all reporting objects in worksheets or workbooks, documents, and slides or presentations, you can use the **Refresh** icon on the Smart View ribbon or a provider ribbon, as described in [Refreshing from a Ribbon](#).

To refresh individual reports in the **Document Contents** pane:

1. Navigate to the individual report query that contains the associated reporting objects to refresh.

The **Refresh** link,  Refresh, appears in **Document Contents** only after a reporting object has been inserted for an individual report query.

For example, in [Figure 1](#), a function grid is to be refreshed. Note that the "Demo" report query for the function grid is selected, not the function grid itself.

Figure 5-2 Report Query for Function Grid Selected for Refresh

2. In the **Document Contents** pane, click  Refresh.

You can also right-click on the report query and select  Refresh from the context menu, as shown in [Figure 2](#).

Figure 5-3 Refresh Using Right-Click Menu

The reporting objects for the selected report query are refreshed; the rest of the report queries and associated reporting objects remain unrefreshed.

See [Other Refresh Examples](#).

Example 5-1 Notes About Refreshing Individual Reporting Objects in Excel

- You can refresh report queries individually in Excel with the exception of report queries containing function grids.

For example, if two report queries contain function grids, then refreshing one query will revert the other query's function grid to the #NEED REFRESH (unrefreshed) state. This only occurs with function grids. The other reporting objects, such as tables or charts, will refresh normally.

For example, on Sheet 1 in [Figure 3](#), refreshing Report Query 1 will refresh the associated grid and function grid; however, the function grid associated with Report Query 2 will convert to the unrefreshed state while the chart refreshes normally. The report query and associated reporting objects on Sheet2 are unaffected.

Figure 5-4 Selecting a Report Query to Refresh in Excel Where Two Report Queries Contain Function Grids

To refresh all items on the sheet, including multiple function grids, select Sheet1 in the **Document Contents**, as shown in [Figure 4](#), and then click Refresh.

Figure 5-5 Selecting Sheet1 to Refresh All Reporting Objects on a Sheet from Document Contents

- In Excel, if a reporting object from a single report query is inserted on multiple sheets, then selecting the report query and clicking  Refresh will refresh the reporting object on each sheet where it appears.

Example 5-2 Other Refresh Examples

The examples in this section use a Word document to describe the refresh options available depending on the selection made in the **Document Contents** pane.

[Figure 5](#) shows a Word document selected in the **Document Contents** pane. Clicking  Refresh will refresh all report queries and their associated reporting objects in the document.

Figure 5-6 Word Document Selected for Refresh

[Figure 6](#) shows a report query selected in the **Document Contents** pane. The report query contains two reporting objects, a grid and an Office table. Clicking  Refresh will refresh only the selected report query and its two associated reporting objects; other report queries and their reporting objects in the document remain unrefreshed.

Figure 5-7 Report Query with Two Reporting Objects Selected for Refresh**Note:**

Refreshing an individual sheet or slide will refresh the report queries and reporting objects associated with the selected sheet or slide. For example, if you select a sheet that contains multiple report queries, all reporting objects associated with the multiple report queries on the selected sheet will be refreshed.

Refreshing an entire document will refresh all the report queries in the document and their associated reporting objects.

In [Figure 7](#), two reporting objects are associated with a report query, one reporting object is selected. Notice that  Refresh is not available.

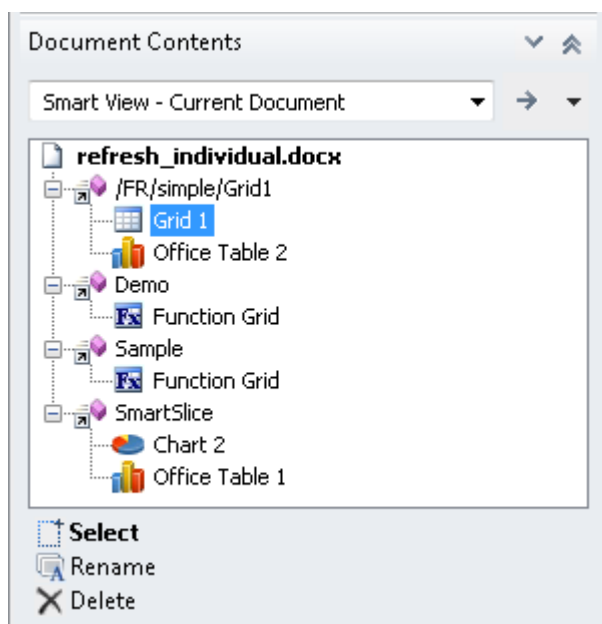

Figure 5-8 One of Two Reporting Objects Selected - Refresh Not Available

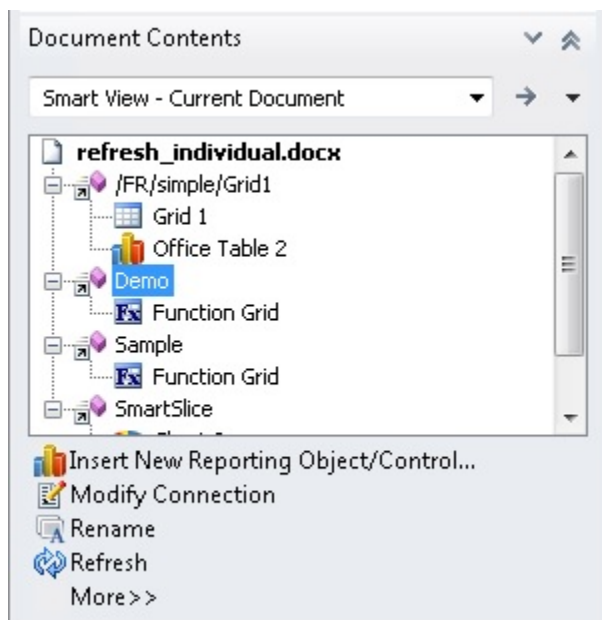

Figure 8 shows a report query selected in the **Document Contents** pane. The report query contains a single reporting object, a function grid. Clicking  Refresh will refresh only the selected report query and its associated reporting object; other report queries and their reporting objects in the document remain unrefreshed.

Figure 5-9 Report Query with Single Reporting Object Selected for Refresh

In Figure 9, a single reporting object associated with a report query is selected. Notice that  Refresh is not available.

Figure 5-10 Individual Reporting Object Selected - Refresh Not Available

Using the Submit Data Options

Submit Data options include: submit data, submit data without refresh, and submit data range.

Related Topics

- [About the Submit Data Options](#)
- [Submitting Data](#)
- [Submitting Data Without Refreshing](#)
Submit Data Without Refresh allows users to submit all data from the worksheet.
- [Submitting Data Ranges](#)

About the Submit Data Options

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close

You can update any type of data in the data source by submitting changed data from forms and ad hoc grids. If you make changes while disconnected, you can submit the changes after you reconnect.

Oracle Smart View for Office offers the following options for submitting data:

- [Submit Data](#)
- [Submit Data Without Refresh](#)
- [Submit Data Range](#)

 **Note:**

Submit Data functionality is generally supported by all data source types. However, refer to the individual Submit Data topics for specific data source support.

Watch this overview video to learn about the options for submitting data.

[Overview video](#)

Guidelines for the Submit Data Options

- When using the **Submit Data** option, you must refresh the grid before modifying the data when you are in free-form mode.
- When working with an aggregate storage database, you can only submit data from the lowest level (level 0) of a hierarchy.
- You can use the **Submit Data Without Refresh** and **Submit Data Range** options to submit cell data from cells that were modified by a user who does not have Smart View installed.
- In worksheets that support multiple grids, you can perform the **Submit Data** commands for only one grid at a time.

If you try to submit data for more than one grid at a time—that is, if you have selected cell ranges in more than one grid—the first range returned by Excel will be used to determine the selected grid and the submit will be performed only on that grid.

- If you are submitting data from forms:
 - In Planning forms, you can lock any cell or range of cells to protect the data until the data is refreshed or submitted.
 - Some cells may no longer exist in the form definition. This behavior may happen if form definition or access privileges have changed, or if rows or columns are suppressed. In these cases, only writable cells that exist in the new form definition are saved. This behavior applies to both cells and supporting detail changes, and also applies when working with forms while connected to or disconnected from the data provider.
 - When you are working in a form and you click **Submit Data**, you are actually writing data back to the latest POV selected in the POV toolbar. Oracle recommends performing a Refresh whenever you make changes to the POV. The refresh updates the data on the sheet to reflect the latest POV change.

Submitting Data

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

Watch this overview video to get acquainted with some basic Oracle Smart View for Office functionality, including submitting data.

[Overview video](#)

To submit data:

1. Connect to the data source.
2. **Optional:** To help you identify modified cells, set a cell style for dirty cells, as described in [Cell Styles](#).
3. Modify data as needed.
4. From any ribbon, select **Submit Data**.

All dirty cells on the worksheet are submitted.

Note:

If you are working with multiple grids on a worksheet, see [Guidelines for the Submit Data Options](#).

Submitting Data Without Refreshing

Submit Data Without Refresh allows users to submit all data from the worksheet.

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc

Submit Data Without Refresh includes all data cells that you have explicitly modified (made dirty) and those that were not modified. All data cells are marked dirty and submitted. Once the submit operation is complete, the entire grid will be refreshed.

To submit data without first refreshing:

1. Connect to the data source.
2. **Optional:** To help you identify modified cells, set a cell style for dirty cells, as described in [Cell Styles](#).
3. Modify data as needed.
4. From the provider ribbon, select **Submit Data**, then **Submit Data Without Refresh**.

Data for all cells on the sheet is submitted, whether or not the cells are dirty.

Note:

If you are working with multiple grids on a worksheet, see [Guidelines for the Submit Data Options](#).

Submitting Data Ranges

Data source types: Planning Ad Hoc, Financial Consolidation and Close Ad Hoc, Tax Reporting Ad Hoc

You can submit contiguous and non-contiguous single cells or cell ranges.

To submit data:

1. Connect to the data source.
2. Modify data as needed.

Alternatively, you may have opened a workbook that you received from a user who does not have Oracle Smart View for Office and modified the worksheet. Smart View cannot detect those cells as dirty, so you will need to be informed by that user which cells were modified or added.

3. **Optional:** To help you identify modified cells, set a cell style for dirty cells, as described in [Cell Styles](#).
4. Select the data ranges you want to submit.

You can select contiguous and non-contiguous single cells or cell ranges.

5. From the provider context ribbon (for example, the **Planning Ad Hoc** ribbon), select **Submit**, then **Submit Data Range**.

Only cell data from selected cells is submitted. If there are dirty cells on the sheet outside the range of selected cells, the modified value is not submitted and those cells will revert back to the value that was last stored with the provider.

 **Note:**

If you are working with multiple grids on a worksheet, see [Guidelines for the Submit Data Options](#).

Calculating Data

After submitting new or changed data, the data in the database must be calculated to reflect the changes.

Related Topics

- [About Calculating Data](#)
- [Calculating Data in Essbase](#)
- [Changing the Solve Order of a Selected POV](#)

About Calculating Data

After you submit new or changed data, you need to calculate the data in the database to reflect your changes. Your options for calculating data depend on your data source. To calculate data, you must have security access rights to the data.

For information on calculating business rules on forms in Oracle Enterprise Performance Management Cloud, see [Executing the Calculate Form and Calculate Currencies Business Rules](#).

About Calculating Data in Essbase

Data source types: Oracle Analytics Cloud - Essbase

In Oracle Smart View for Office, you can use a calculation script to calculate a database in Essbase or Oracle Analytics Cloud - Essbase. Calculation script types can be Essbase or MDX.

Additionally:

- Essbase and MDX calculation scripts are created by your Essbase administrator for your specific system.
- When launched, Essbase and MDX calculation scripts can prompt you to enter variable information, called runtime prompts.
- Essbase and MDX calculation scripts are supported for aggregate storage and block storage databases.
- MDX calculation scripts can contain multiple MDX queries.
- To change the solve order of a member POV before running a calculation, see [Changing the Solve Order of a Selected POV](#).
- **Oracle Analytics Cloud - Essbase only:**
 - Detailed tracing information can be provided upon execution of an Essbase calculation script. The tracing information is displayed only if your Oracle Analytics Cloud - Essbase administrator has configured the calculation script for tracing.
 - You can run calculations on asymmetric grids. To do this, your administrator must first prepare calculation scripts that specify selected tuples to calculate. To do this, your administrator must first prepare calculation scripts that specify selected tuples to calculate. See [Calculating Asymmetric Grids Using Tuples](#).
- **Administrators:**
 - Do not use the **Manage and Execute Queries** dialog to execute multiple MDX queries at once. Instead, use an MDX script and run it from the **Calculation Scripts** dialog.
 - Refer to the following guides for information on writing Essbase and MDX calculation scripts .
 - * **Oracle Analytics Cloud - Essbase:**
 - Using Oracle Analytics Cloud - Essbase, Calculate Cubes*
 - Using Oracle Analytics Cloud - Essbase, Analyze and Move Data with MDX*

Technical Reference for Oracle Analytics Cloud - Essbase, MDX

For Oracle Analytics Cloud - Essbase documentation, go to the Oracle Help Center here:

<https://docs.oracle.com/en/cloud/paas/analytics-cloud/books.html>

* **Essbase on-premises:**

Administering Oracle Analytics Cloud - Essbase, "Calculating Data" chapter

Oracle Essbase Technical Reference, "MDX" chapter

Find your Essbase version on the Oracle Help Center here:

<https://docs.oracle.com/en/applications/enterprise-performance-management/index.html>

- **Oracle Analytics Cloud - Essbase:** To define Essbase calculation scripts so that Smart View users can work with runtime prompts, refer to *Oracle Cloud Designing and Maintaining Essbase Cubes*, [Using Runtime Substitution Variables in Calculation Scripts Run in Smart View](#).
- For information on writing scripts for to calculate asymmetric regions in a database, see the Oracle Analytics Cloud - Essbase documentation.

Running Essbase Calculations

Data source types: Oracle Analytics Cloud - Essbase

To select and launch a calculation script:

1. Connect to the Essbase or Oracle Analytics Cloud - Essbase data source and create an ad hoc query or open an existing report file.
2. Select the data cell on which you plan to run a calculation script.
3. From the Smart View ribbon, select **Calculate**.

The **Calculation Scripts** dialog box is displayed.

4. At the top of the dialog, under **Cube**, select a database from the list of databases that belong to this application.
5. Under **Calculation Script**, select a script.

The **Cube** column shows the cube to which the calculation belongs, and the **Type** column shows the calculation type:

- **Script** signifies an Essbase calculation
 - **MDX Calc** signifies an MDX calculation.
6. If the calculation script includes runtime prompts, enter or select the input type specified by the runtime prompt, summarized in the following table.

 **Note:**

Depending on how the runtime prompts have been set up by your Essbase administrator, information for some prompts can be hand-typed. Ensure that the runtime prompt values that you enter are valid. You cannot launch a calculation script until all runtime prompt values are valid.

Table 5-1 Runtime Prompt Input Types

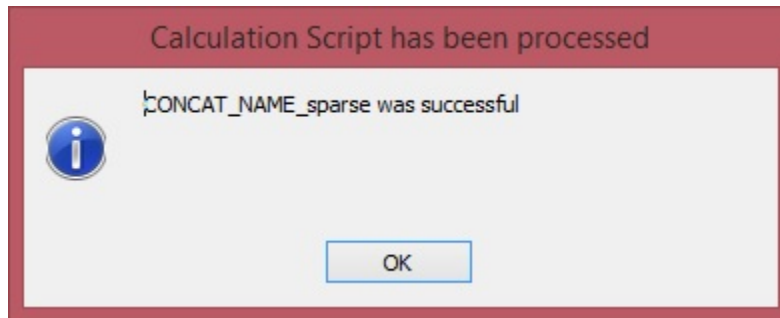

Icon	Expected Input Type
	<p>One member selection—One member in the dimension can be selected. Click  to choose a single member in the Member Selection dialog box.</p> <p>Alternatively, if the field is enabled for editing, you may manually enter the member name, enclosed in quotation marks; for example:</p> <p>"California"</p>
	<p>Multiple member selections—Two or more members in the dimension can be selected.</p> <p>Click  to choose multiple members in the Member Selection dialog box.</p> <p>Alternatively, if the field is enabled for editing, you may manually enter the member names, enclosed in quotation marks and separated by a comma; for example:</p> <p>"New York", "California"; "West", "Market"</p>

Table 5-1 (Cont.) Runtime Prompt Input Types

Icon	Expected Input Type
	<p>Text value—A text value; for example:</p> <p>MyGrid</p> <p>Member names must be enclosed in quotation marks, separated by commas, and include a final semicolon (;). For example, type:</p> <p>"New York", "California", "West", "Market" ;</p> <p>or</p> <p>"Oklahoma";</p>
	<p>Numeric value—A numeric value; for example, type:</p> <p>1000</p> <p>or</p> <p>-2</p>
	<p>Date value—A date value in the format required by your system; for example:</p> <p>mm/dd/yyyy</p> <p>or</p> <p>dd/mm/yyyy</p>

7. Click **Launch**.

A status message tells you if the calculation was successful. For example:

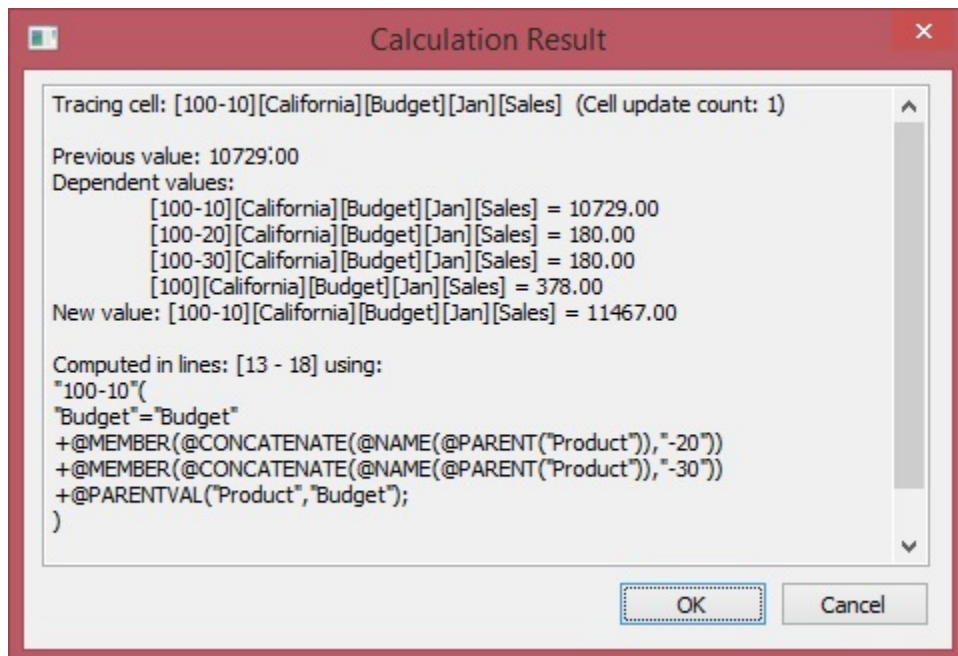

If the calculation was not successful, contact your Essbase or Oracle Analytics Cloud - Essbase administrator.

8. Click **OK** to close the message box
9. **Oracle Analytics Cloud - Essbase only:** If the calculation script was configuring for tracing, then view the information in the **Calculation Result** dialog box, and then click **OK** to close the dialog.

Alternatively, copy and paste the information from the **Calculation Result** dialog and save it in your favorite text editor.

The **Calculation Result** dialog box contains detailed information on the calculation that was executed when the script was launched. For example:

10. Note any changed data cells in the ad hoc grid or report.
11. Click **Submit** to submit the changed data back to the database.

Calculating Asymmetric Grids Using Tuples

Data source types: Oracle Analytics Cloud - Essbase

Tuple calculation for asymmetric grids lets Smart View users execute calculations for the specific scope of member selections in a grid or calculation script, avoiding over-calculation.

A calculation *tuple* is a way to represent a data slice of members, from one or more sparse dimensions, to be used in a calculation FIX statement.

By default, when multiple members from different dimensions are in a calculation FIX statement, or are part of the grid POV in Oracle Smart View for Office, the calculation scope is all possible combinations (a Cartesian-product) of all member combinations from different dimensions. This can result in more calculations than are needed when working with asymmetric grids. With tuple calculations, the scope of calculations can be more precise and efficient.

Administrators set up tuple calculations in Oracle Analytics Cloud - Essbase as they do other calculations that they create for users to run from Smart View, based on their specific data set and business needs.

As a Smart View user, you run tuple calculations for asymmetric grids as you would any other calculation. You may be asked to specify runtime prompts, depending on how your administrator set up the tuple calculation.

 **Note:**

You can run tuple calculations on asymmetric grids starting in Smart View release 11.1.2.5.800. Check that your Oracle Analytics Cloud - Essbase supports calculation tuples.

Administrators: Using the tuple calculation feature, you can define calculation scope as selected member tuples in an asymmetric grid. Special syntax in FIX statements helps you specify which tuples to calculate. Check the Oracle Analytics Cloud - Essbase documentation for more information on calculation tuples.

In Smart View, to run a tuple calculation on an asymmetric grid, follow the instructions for running a calculation in [Running Essbase Calculations](#).

Select a script written for tuple calculations on asymmetric grids. Your administrator can advise you which scripts you should run.

Example 5-3 Running Tuple Calculations on an Asymmetric Grid

The examples in this scenario are based on an example gallery template for tuple calculation. The gallery template is available in Oracle Analytics Cloud - Essbase versions that support calculation tuples.

Start with the asymmetric grid shown below. The grid is asymmetric because we do not see the same member hierarchies in the row and column dimensions.

Figure 5-11 Starting Asymmetric Grid - All Data Values = 1

	A	B	C	D	E
1			Jan	Actual	Marketing
2			Entity_1011	Entity_1012	
3			Pre-Flight	Sprint1	
4			Houston_Site	Chicago_Site	
5	Cola	New York	1	1	
6	Cola	Massachusetts	1	1	
7	Cola	Florida	1	1	
8	Cola	Connecticut	1	1	
9	Cola	New Hampshire	1	1	
10	Diet Cola	New York	1	1	
11	Diet Cola	Florida	1	1	

The asymmetric grid above is a slice of this symmetric grid, where the hierarchy members are uniform across rows and columns:

Figure 5-12 Starting Symmetric Grid - All Data Values = 1

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1			Jan	Actual	Marketing									
2			Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1
3			Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012	Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012
4			Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site
5	Cola	New York	1	1	1	1	1	1	1	1	1	1	1	1
6	Cola	Massachusetts	1	1	1	1	1	1	1	1	1	1	1	1
7	Cola	Florida	1	1	1	1	1	1	1	1	1	1	1	1
8	Cola	Connecticut	1	1	1	1	1	1	1	1	1	1	1	1
9	Cola	New Hampshire	1	1	1	1	1	1	1	1	1	1	1	1
10	Diet Cola	New York	1	1	1	1	1	1	1	1	1	1	1	1
11	Diet Cola	Massachusetts	1	1	1	1	1	1	1	1	1	1	1	1
12	Diet Cola	Florida	1	1	1	1	1	1	1	1	1	1	1	1
13	Diet Cola	Connecticut	1	1	1	1	1	1	1	1	1	1	1	1
14	Diet Cola	New Hampshire	1	1	1	1	1	1	1	1	1	1	1	1

We'll show the result of running three different types of calculations on the asymmetric grid, and then the effect those calculations have on the symmetric grid.

The scripts are configured to increment the data cells by 1 each time they are run, with different results on the symmetric grid for each type of calculation.

The first script we'll run calculates everything in the grid POV, not only the member combination shown in the grid below. In the asymmetric grid, after a refresh, all data cells now equal 2.

Figure 5-13 Asymmetric Grid After Running Default Calculation

	A	B	C	D	E
1			Jan	Actual	Marketing
2			Entity_1011	Entity_1012	
3			Pre-Flight	Sprint1	
4			Houston_Site	Chicago_Site	
5	Cola	New York		2	2
6	Cola	Massachusetts		2	2
7	Cola	Florida		2	2
8	Cola	Connecticut		2	2
9	Cola	New Hampshire		2	2
10	Diet Cola	New York		2	2
11	Diet Cola	Florida		2	2
12					

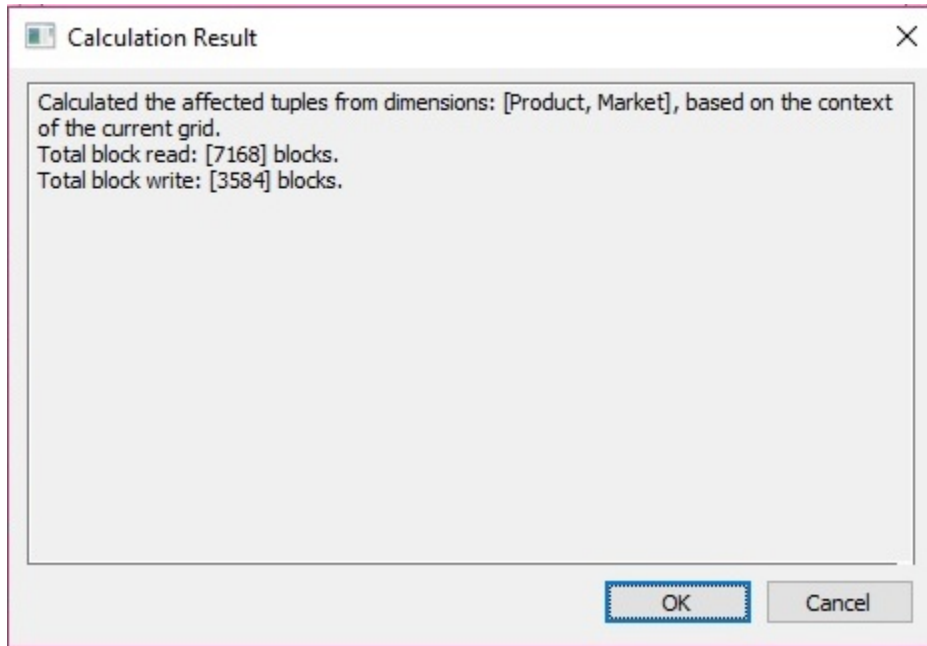

We submit the cells in the asymmetric grid, then go to the symmetric grid and refresh it. Note that on refresh, every Entity, Version, Scenario and Site for the Product/Market combination is calculated, even though they aren't on the asymmetric grid. This is because, by default, absent a tuple calculation, Essbase calculates the Cartesian product of the combinations seen in the grid. The result is that all cells in the POV are incremented by 1, so you will see a value of 2 in all data cells in the symmetric grid:

Figure 5-14 Symmetric Grid After Running Default Calculation on Asymmetric Grid and Refresh

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1			Jan	Actual	Marketing									
2			Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1
3			Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012	Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012
4			Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site
5	Cola	New York	2	2	2	2	2	2	2	2	2	2	2	2
6	Cola	Massachusetts	2	2	2	2	2	2	2	2	2	2	2	2
7	Cola	Florida	2	2	2	2	2	2	2	2	2	2	2	2
8	Cola	Connecticut	2	2	2	2	2	2	2	2	2	2	2	2
9	Cola	New Hampshire	2	2	2	2	2	2	2	2	2	2	2	2
10	Diet Cola	New York	2	2	2	2	2	2	2	2	2	2	2	2
11	Diet Cola	Massachusetts	2	2	2	2	2	2	2	2	2	2	2	2
12	Diet Cola	Florida	2	2	2	2	2	2	2	2	2	2	2	2
13	Diet Cola	Connecticut	2	2	2	2	2	2	2	2	2	2	2	2
14	Diet Cola	New Hampshire	2	2	2	2	2	2	2	2	2	2	2	2

Second, we'll run a more limited calculation on the asymmetric grid, shrinking the calculation scope to Product and Market grid tuples so that fewer intersections are calculated. The **Calculation Result** message shows us the scope of this calculation:

Figure 5-15 Calculation Result Dialog After Running Tuple Calculation on All Product and Market Tuples

Refresh, and all data cells in the asymmetric grid are incremented to 3. Submit the data on the grid.

Figure 5-16 Asymmetric Grid After Running Calculation on All Product and Market Tuples

	A	B	C	D	E
1			Jan	Actual	Marketing
2			Entity_1011	Entity_1012	
3			Pre-Flight	Sprint1	
4			Houston_Site	Chicago_Site	
5	Cola	New York	3	3	
6	Cola	Massachusetts	3	3	
7	Cola	Florida	3	3	
8	Cola	Connecticut	3	3	
9	Cola	New Hampshire	3	3	
10	Diet Cola	New York	3	3	
11	Diet Cola	Florida	3	3	
12					

In the symmetric grid, note on refresh that only the Product/Market tuples already included on the asymmetric grid are calculated, along with all Site/Version/Entity combinations. These are all the columns of rows 5 through 10, and row 12. These cells now show a data value of 3. The Product/Market tuples not shown in our

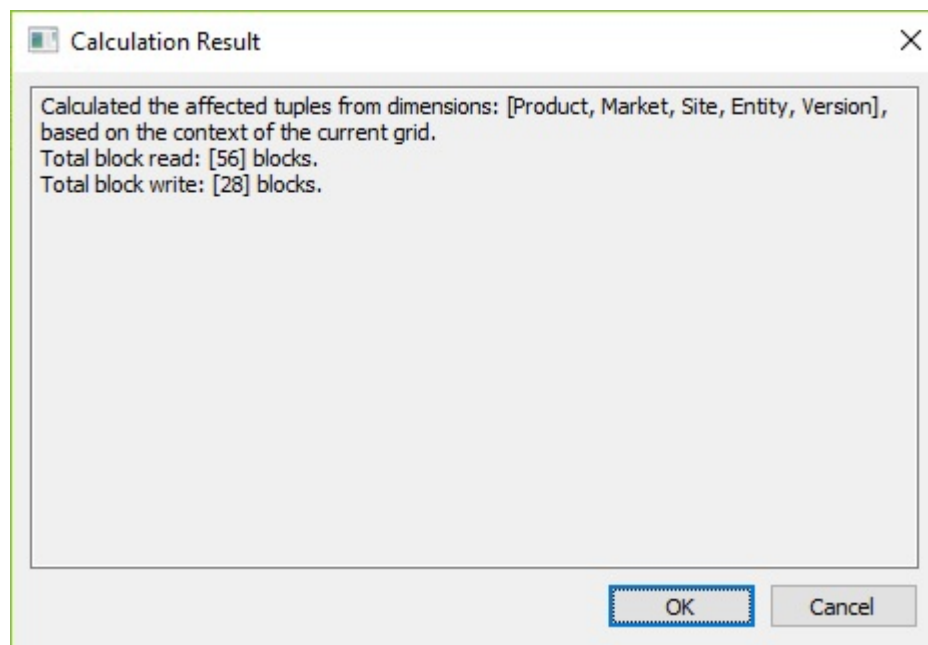

asymmetric grid are not calculated in the symmetric grid; their data cell value is still 2. For this calculation, only Product and Market combinations were specified for tuples. The tuples and all members for unspecified dimensions (those not specified in the FIX statement) are calculated.

Figure 5-17 Symmetric Grid After Running Calculation on All Product and Market Tuples on Asymmetric Grid and Refresh

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1			Jan	Actual	Marketing									
2			Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1
3			Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012	Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012
4			Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site
5	Cola	New York	3	3	3	3	3	3	3	3	3	3	3	3
6	Cola	Massachusetts	3	3	3	3	3	3	3	3	3	3	3	3
7	Cola	Florida	3	3	3	3	3	3	3	3	3	3	3	3
8	Cola	Connecticut	3	3	3	3	3	3	3	3	3	3	3	3
9	Cola	New Hampshire	3	3	3	3	3	3	3	3	3	3	3	3
10	Diet Cola	New York	3	3	3	3	3	3	3	3	3	3	3	3
11	Diet Cola	Massachusetts	2	2	2	2	2	2	2	2	2	2	2	2
12	Diet Cola	Florida	3	3	3	3	3	3	3	3	3	3	3	3
13	Diet Cola	Connecticut	2	2	2	2	2	2	2	2	2	2	2	2
14	Diet Cola	New Hampshire	2	2	2	2	2	2	2	2	2	2	2	2

Now run the last calculation, which is written to work only on the tuples shown in our asymmetric grid. The tuple calculation specifies that only the indicated Entity, Site, Market, Product, Version combinations on our asymmetric grid should be calculated. After running the calculation, the **Calculation Result** dialog shows an even smaller calculation scope:

Figure 5-18 Calculation Result Dialog After Running Calculation on Grid Product and Market Tuples

Values in all cells in the asymmetric grid are incremented to 4. Submit the data on this grid.

Figure 5-19 Asymmetric Grid After Running Calculation on Grid Product and Market Tuples

	A	B	C	D	E
1			Jan	Actual	Marketing
2			Entity_1011	Entity_1012	
3			Pre-Flight	Sprint1	
4			Houston_Site	Chicago_Site	
5	Cola	New York	4	4	
6	Cola	Massachusetts	4	4	
7	Cola	Florida	4	4	
8	Cola	Connecticut	4	4	
9	Cola	New Hampshire	4	4	
10	Diet Cola	New York	4	4	
11	Diet Cola	Florida	4	4	

Move to the symmetric grid and refresh. Remember, the tuple calculation specified that only the Entity, Site, Market, Product, Version combinations indicated on our asymmetric grid should be calculated. On the symmetric grid, you can see that only rows 5 through 10 and row 12 and columns C and M, are incremented to 4. These are the tuples that correspond to the data that was incremented in the asymmetric grid, and are highlighted in yellow below:

Figure 5-20 Symmetric Grid After Running Calculation on Grid Product and Market Tuples on Asymmetric Grid and Refresh

	A	B	C	D	E	F	G	H	I	J	K	L	M	N
1			Jan	Actual	Marketing									
2			Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Pre-Flight	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1	Sprint1
3			Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012	Entity_1011	Entity_1011	Entity_1011	Entity_1012	Entity_1012	Entity_1012
4			Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site	Houston_Site	Chicago_Site	Minneapolis_Site
5	Cola	New York	4	3	3	3	3	3	3	3	3	3	3	3
6	Cola	Massachusetts	4	3	3	3	3	3	3	3	3	3	3	3
7	Cola	Florida	4	3	3	3	3	3	3	3	3	3	3	3
8	Cola	Connecticut	4	3	3	3	3	3	3	3	3	3	3	3
9	Cola	New Hampshire	4	3	3	3	3	3	3	3	3	3	3	3
10	Diet Cola	New York	4	3	3	3	3	3	3	3	3	3	3	3
11	Diet Cola	Massachusetts	2	2	2	2	2	2	2	2	2	2	2	2
12	Diet Cola	Florida	4	3	3	3	3	3	3	3	3	3	3	3
13	Diet Cola	Connecticut	2	2	2	2	2	2	2	2	2	2	2	2
14	Diet Cola	New Hampshire	2	2	2	2	2	2	2	2	2	2	2	2

The examples in this section showed you the effects of three calculations on an asymmetric grid and a symmetric grid. We looked at the result of each calculation on each type of grid. We learned that by selecting tuples, you can focus calculations in the active Smart View grid, limiting their scope to specific slices of data in your cube.

Changing the Solve Order of a Selected POV

Data source types: Oracle Analytics Cloud - Essbase

Using the **Cell Information** command on the Essbase ribbon, you can view information about a data cell, such as its POV and data consolidation property. Additionally, you can change the solve order of the data cell at the member intersection, or POV, that you selected.

Solve order is a value that represents the order, or priority, of a member when a calculation is performed. Users can view and change the solve order by editing the solve order value in the **Data Cell Information** dialog box.

The selected data cell must contain a dynamic member in the POV.

To change the solve order of a data cell:

1. In an ad hoc grid or report, select a data cell.
2. In the Essbase ribbon, click  **Cell Information** to view the **Data Cell Information** dialog box.

For example, [Figure 1](#) shows a simple ad hoc query based on the Sample Basic application and database. We select cell B3, at the intersection of Qtr1 and Profit:

Figure 5-21 Simple Ad Hoc Grid Based on Sample Basic

	A	B	C	D	E
1		Product	Market	Scenario	
2		Profit	Inventory	Ratios	Measures
3	Qtr1	8201	117405	34.07707342	8201
4	Qtr2	1895	108026	30.01514991	1895
5	Qtr3	1877	130389	30.05844199	1877
6	Qtr4	1425	128079	29.642067	1425
7	Year	13398	117405	30.97552743	13398

The Data Cell Information dialog is displayed as follows, showing Qtr1 and Profit as the POV members of this intersection, with the operation calculation type for both set to Dense Consolidation: + (addition). Under **Result**, a detailed description of the current calculation result is displayed.

Figure 5-22 Data Cell Information Dialog Box

3. Select a member row in the **Data Cell Information** dialog and click **Edit**.
The cursor is placed in the **Solve Order** field, where you can type a new value. Alternatively, double-click the value in the **Solve Order** field and type a new value. Valid solve order values are between 0 and 127.
If you enter a value above 127, you will be prompted to enter a value between 0 to 127. Note that members with a solve order of zero, 0, will not be listed in the dialog.
4. **Optional:** To change the solve order value for any other members in the POV, repeat [step 3](#).
5. Click **OK** to commit all solve order changes.
6. Repeat this procedure to change the solve order of any other data cells.
7. Run the calculation you require, following the instructions in [Calculating Data in Essbase](#).

Working with Currencies

In forms enabled for currency conversion, you can enter data in a currency other than the base currency of a cell.

Related Topics:

[Changing Currency in Planning](#)

Changing Currency in Planning

In forms enabled for currency conversion, you can enter data in a currency other than the base currency of a cell. Currencies in the drop-down list can be designated as the local currency.

 **Note:**

To override the base currency for an entity, the cell must be displayed in the local currency, and its version must be bottom-up. The application must be a multi-currency application and the form should support multi-currency.

To enter cell data in a local currency other than the base currency for the cell:

1. In a form, select a local currency member for the cell.
2. **Optional:** To look up the currency's code, select **View**, then **Currency**. Available Currencies shows the application's currencies. Note the Currency Code for the currency you want to work with, and close the window.
3. In the right column, HSP_InputCurrency, type the new Currency Code in the data cell.

Typing the currency code in the data cell overrides the base currency for the entity.

4. Click **Submit** to submit the new currency code to the Planning server.
5. Enter the currency value in the left column, HSP_InputValue, of the data cell.
6. Click **Rules on Form** and select the Calculate Currencies rule to calculate and save the new currency value.

If the Calculate Currencies calc script is set to run when the form is saved, and the form is enabled for multiple currencies, the data value is displayed in the currency you selected.

Adjusting Values in Data Cells

You can adjust the value of one or more data cells by a specified number or percentage if the cells contain numerical data.

If you adjust the value of a cell that contains an Excel formula, the adjusted value overwrites the formula.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

To adjust data values:

1. Click the data cell that contains the value to adjust.
2. From the data source ribbon, select **Adjust**.
3. From **Adjust Data**, select an option then enter the number or percentage by which you want to adjust the value of the cell.

4. Click **Adjust Data**.

Data Perspective

Data perspective enables you to specify the perspective to use for viewing data of varying attributes, which are dimension attributes that vary with respect to independent continuous and discrete dimensions.

For example, suppose a cola product is sold in both cans and bottles in several different geographical markets over the course of a year. If the packaging (cans or bottles) varies depending on the market or changes from one type to the other during the year, the packaging type is a varying attribute. The data associated with the cola would be different depending on the time of year and the market.

Data source types: Oracle Analytics Cloud - Essbase

Note:

Data perspective may not be enabled in your Oracle Smart View for Office system. Your options for data perspective are enabled and configured by your Smart View administrator.

To specify data perspective:

1. From the **Essbase** ribbon, select **Data Perspective**.
2. From **Perspective**, under **Selection**, select an option (see [Data Perspective Illustration](#) for examples of options).
 - **Reality** to display the data with no perspective.
 - **Last** to display the data for the last level 0 member of each continuous independent dimension. For example, if Year is the continuous dimension and December is the last member of Year, then the data for December is displayed.
 - **Start** to display the data for the first level 0 member of each continuous independent dimension. For example, if Year is the continuous dimension and January is the first member of Year, then the data for January is displayed.
 - **Custom** if you want to specify both continuous and discrete members. For this option, select a **Varying Attribute** from the drop-down list. Then, for the dimensions listed under **Independent Dimension**, select members under **Members**. If you select **Set Dimensions Only**, all independent dimensions across all varying attribute are displayed, enabling you to apply a common perspective to all.
3. Click **OK**, then refresh the grid.

Example 5-4 Data Perspective Illustration

In our example of cola sold in cans and bottles, suppose the Administrator has specified the following attributes for the cola packaging types to reflect how the cola was sold in Texas and California markets during the year:

- Can: California, January—December year

- Can: Texas, July—December
- Bottle: Texas, January—June

Figure 1 illustrates the Reality perspective. The data shown for California and Texas is data for the entire year. Since bottles were not sold in California, no data is returned (indicated here by #Meaningless).

Figure 5-23 Data Perspective: Reality

	A	B	C	D
1		California	Texas	Market
2	Bottle	#Meaningless	405	405
3	Can	1587	234	1821
4	Pkg Type	1587	639	2226

Figure 2 illustrates the Last perspective and displays data for cans for California and Texas, but none for bottles, because bottles were sold only January through June in Texas.

Figure 5-24 Data Perspective: Last

	A	B	C	D
1		California	Texas	Market
2	Bottle	#Meaningless	#Meaningless	#Meaningless
3	Can	1587	234	1821
4	Pkg Type	1587	234	1821

Figure 3 illustrates the Start perspective and displays data for January. Bottles but not cans were sold in Texas in January, so only data for bottles is displayed. Cans but not bottles were sold in California in January, so only data for bottles is displayed.

Figure 5-25 Data Perspective: Start

	A	B	C	D
1		California	Texas	Market
2	Bottle	#Meaningless	639	639
3	Can	1587	#Meaningless	1587
4	Pkg Type	1587	639	2226

Drill-Through Reports

Predefined by administrators, drill-through reports are available to users from specified individual data cells.

See:

- [Drill-Through Report Guidelines](#)
- [Setting the Drill-Through Launch Option](#)
- [Accessing Drill-Through Reports](#)
- [Viewing the Drill-Through Report Source POV](#)

Drill-Through Report Guidelines

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

From Oracle Smart View for Office, you can drill through to the detailed data in a database as follows:

- Supported Oracle Enterprise Performance Management Cloud data sources: You can drill through from your application to detailed data in Data Management or Oracle Hyperion Financial Data Quality Management data sources.
- Supported EPM Cloud data sources: If you're using Oracle Enterprise Data Management Cloud to load data for drill-through reports, the **Drill-Through Launch** option gives you the choice of selecting whether to launch drill-through reports in a browser or on a new sheet, or to be prompted to make that choice at run time.

The **Drill-Through Launch** option is located on the **Advanced** tab of the **Options** dialog. For more information, see [Setting the Drill-Through Launch Option](#).

- Oracle Analytics Cloud - Essbase:
 - You can drill through to relational databases or to URLs.
 - You can select multiple cells for drill-through to relational data in Excel sheets.

Consider these guidelines when working with drill-through reports:

- A cell can be associated with multiple drill-through reports.
- Cells that contain drill-through reports can be indicated on the grid by a cell style (see [Cell Styles](#)).
- The data displayed in a drill-through report is dynamic.
- You cannot use alias names for drill-through; you must use member names.

From Smart View, when connected to a supported EPM Cloud data source, you can drill through from your application to detailed data in Data Management or FDM data sources. When connected to Oracle Analytics Cloud - Essbase, you can drill through to Oracle General Ledger, data in your relational database or to URLs.

 **Note:**

Drill-through is supported on Microsoft Internet Explorer with no additional browser add-on required.

Mozilla Firefox and Google Chrome require a browser-specific add-on for drill-through. If your default browser is Firefox or Chrome, follow the instructions on installing the add-on for these browsers in the *Oracle Smart View for Office Installation and Configuration Guide*, [Installing Browser Add-ons](#).

Setting the Drill-Through Launch Option

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

When connected to a supported Oracle Enterprise Performance Management Cloud service and using Oracle Enterprise Data Management Cloud to load data for drill-through reports, you can launch the reports in a browser or on a new Excel sheet.

Specify your launch preference using the **Drill-Through Launch** option, located in the **Options** dialog. **Advanced** tab.

To specify your drill-through launch preference:

1. In the Smart View ribbon, select **Options**, and then **Advanced**.
2. For **Drill-Through Launch**, select your preferred launch method:
 - **In Web Browser**—Always launch in a browser
 - **In New Sheet**—Always launch on a new Excel sheet
 - **Prompt Me to Choose Target**—Prompt me to choose browser launch or Excel sheet launch at runtime
3. Click **OK**.

 **Note:**

Advanced options are global options. Changes to global options become the default settings for all existing and new worksheets and workbooks so it is not necessary to use **Save as Default Options** or **Apply to All Worksheets** with global options.

4. Launch a drill-through report, as described in [Accessing Drill-Through Reports](#)

Accessing Drill-Through Reports

Depending on your data source connection, you can drill through to web pages or Excel sheets.

To access a drill-through report:

1. Select a data cell associated with a drill-through report.

Oracle Analytics Cloud - Essbase: You can select multiple cells for drill-through to relational data in Excel sheets.

 **Tip:**

If you want to display a list of available drill-through reports whenever you mouse over a cell, select **Display Drill-Through Report ToolTips** on the **Advanced** page of the **Options** dialog box.

2. From the data source ribbon, select **Drill-through**.
3. If there are multiple drill-through reports associated with the cell, select a report from the list and click **Launch**.

If only one drill-through report is associated with the cell, the drill-through report launches directly.

 **Note:****Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting:**

- If connected to a supported Oracle Enterprise Performance Management Cloud service and using Oracle Enterprise Data Management Cloud to load data for drill-through reports, the report is launched according to the selection you made in [Setting the Drill-Through Launch Option](#).
- If Internet Explorer is your default browser, then the first time that you click a drill-through cell and the browser launches, you will be asked to log in to your cloud service. After login, you may see an HTTP 403 or 500 error. Return to the sheet in Oracle Smart View for Office and click the drill-through cell again to launch the drill-through report.

Viewing the Drill-Through Report Source POV

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Use the **Sheet Info** command in the Smart View ribbon to view details about the cell intersection and POV of the cell from which the drill-through report was launched.

To view the source POV of a drill-through report launch cell:

1. Ensure that you have enabled drill-through launch on to a sheet.
In the **Options** dialog, **Advanced** tab, you should select either **In New Sheet** or **Prompt Me to Choose Target**. For more information, see [Setting the Drill-Through Launch Option](#).
2. Launch a drill-through report on to a new sheet, as described in [Accessing Drill-Through Reports](#).
3. Select the Smart View ribbon, and then select **Sheet Info**.

The POV of the intersection of the drill-through launch cell is shown in the **Sheet Information** dialog box. In the example POV shown in [Figure 1](#), we see these information categories related to the cell intersection:

- Row members
- Column members
- POV members
- Page members

We also see a **General** section showing that we're working with a drill-through sheet.

Figure 5-26 Sheet Information Dialog Showing POV for Drill-Through Launch Cell

The screenshot shows the 'Sheet Information' dialog box with the following sections and values:

Property	Value
Connection	
Server	oracle.com
Application	Vision
Form	SvcDeletable_Form
URL	http://.../HyperionPlanning/SmartView
Provider	Planning
Row	
Year	FY16
Version	No Version
Column	
Product	P_000
Scenario	Actual
POV	
Period	May
HSP_View	BaseData
Entity	110
Page	
Account	1110
General	
Sheet Type	Drill-through
Connected	No

Buttons: Delete, Save, Close

Note:

In Oracle Smart View for Office ad hoc mode, when drill-through is launched, the POV section of **Sheet Information** dialog shows the member names corresponding to the alias table selected on the ad hoc sheet.

4. **Optional:** Click **Save** to save the POV information in a separate sheet in the workbook.

 **Tip:**

Copy and paste the POV information from the new sheet to a permanent file for your own reference.

Linked Reporting Objects

A *linked reporting object* is a cell note, external file, or URL that is linked to a data cell in an Essbase database, and which can be retrieved by Oracle Smart View for Office users in Excel.

Data source types: Oracle Analytics Cloud - Essbase

You can set a cell style to identify cells that are associated with linked reporting objects. See [Cell Styles](#).

See also:

- [Linked Partitions](#)
- [Attaching a Linked Reporting Object to a Data Cell](#)
- [Launching a Linked Reporting Object from a Data Cell](#)

Attaching a Linked Reporting Object to a Data Cell

You can attach one or more linked reporting objects to a data cell.

To attach a linked reporting object to a data cell:

1. Ensure that you're working with a connected worksheet.

 **Note:**

If you are working with a saved ad hoc sheet or a grid layout that contains no data yet (for example, a free-form grid), you are not required to refresh the sheet first. Ensure that you are connected to the data provider, then right-click the correct database in the Smart View Panel, and then select **Set Active Connection for this Worksheet**.

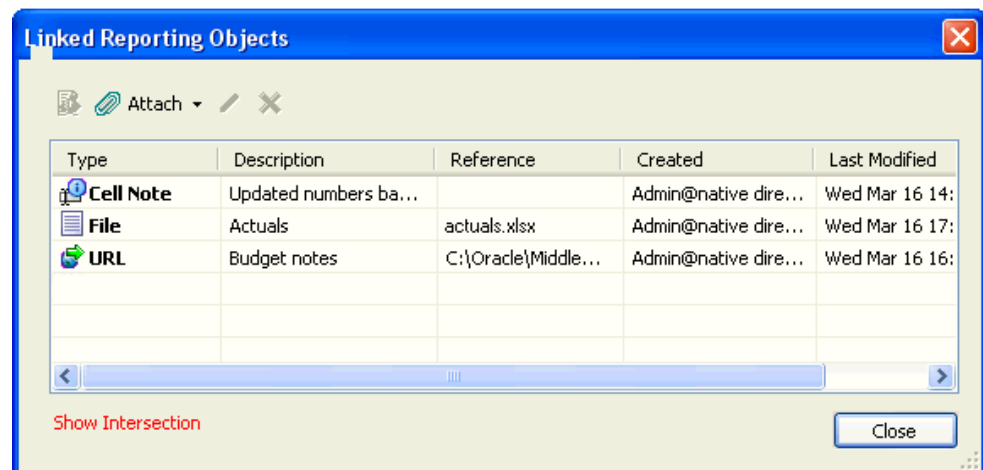

2. Select a data cell.
3. From the Essbase ribbon, select **Linked Objects**.
4. From **Linked Reporting Objects**, click  and select one of the following:
 - **Cell Note** to attach an annotation to the data cell
 - **File** to attach an external file to the data cell
 - **URL** to attach a URL to the data cell

The dialog box appropriate to your selection is displayed.

5. Enter information as follows:

- **Cell Note:** Enter text for the note. Then click **Close**. The first few words of the note are displayed in the **Description** column of the **Linked Reporting Objects** list.
 - **File:** Use the **Browse** button to navigate to the file that you want to attach to the data cell. You can add a brief description for the file. Then click **Close**.
 - **URL:** In **URL**, enter a URL for a web site, a network or local directory, or a document in a network or local directory. You can add a brief description for the URL. Then click **Close**.
6. Repeat the procedure to attach other linked reporting objects as needed.

The objects that you created are displayed in the **Linked Reporting Objects** list as shown here:

7. Refresh the grid to apply the cell style (if specified) to the cell.

To edit or delete a linked reporting object, use the **Edit** button  or **Delete** button . Deleting an object removes it from the database.

- [Linked Reporting Objects](#)
- [Launching a Linked Reporting Object from a Data Cell](#)

Launching a Linked Reporting Object from a Data Cell

To launch a reporting object from a data cell:

1. Ensure that you're working with a connected worksheet.

 **Note:**

If you are working with a saved ad hoc sheet or a grid layout that contains no data yet (for example, a free-form grid), you are not required to refresh the sheet first. Ensure that you are connected to the data provider, then right-click the correct database in the Smart View Panel, and then select **Set Active Connection for this Worksheet**.

2. Select the data cell that is associated with the linked object that you want to launch.
3. From the Essbase ribbon, select **Linked Objects** to display **Linked Reporting Objects**.
4. From **Linked Reporting Objects**, select the linked object to launch.
5. Click . The linked reporting object launches as follows:
 - Cell notes are displayed in the **Cell Note** dialog box.
 - Files are opened.
 - URL objects are opened in the default web browser.
 - Linked partitions—see [Linked Partitions](#).

Related Topics:

- [Linked Reporting Objects](#)
- [Attaching a Linked Reporting Object to a Data Cell](#)

Linked Partitions

A *linked partition* connects two databases by means of a data cell.

Using a data cell associated with a linked partition, you can navigate from the database connected to the current grid to a second database. Because the two databases may have different dimensions, you can see the data in different contexts. When you launch a linked partition, a new spreadsheet that displays the dimensions from the linked database opens. From there, you can drill down into the dimensions of the linked database.

Data source types: Oracle Analytics Cloud - Essbase

To launch a linked partition:

1. Select a data cell associated with a linked partition.
2. From the Essbase ribbon, select **Linked Objects**.
3. From **Linked Reporting Objects**, select the linked partition (displayed as **Linked** in the list).
4. Click .

The linked partition is launched in a new spreadsheet. From this spreadsheet, you can drill down to data in the linked database.

Cell Comments in EPM Cloud

You can add one or more comments per data cell; each data cell can contain comments from multiple users.

Data source types: Planning

In release 11.1.1.2.5.620 and later, Oracle Smart View for Office conforms to the character limit set in Planning. Depending on the permission level assigned to you by the administrator, you may be able to do any of the following in a data cell:

- Add comments.
- View the comments that you and other users have added.
- Delete comments that you have entered. You cannot delete comments added by other users.

Cells that contain comments can be associated with a cell style. See [Cell Styles](#).

Watch this overview video to get acquainted with some basic Smart View functionality, including cell comments.

[Overview video](#)

To add comments to a data cell:

1. Select one data cell or a range of data cells in an ad hoc grid.
Use the **Shift** key to select a range of data cells. Do not use the **Ctrl** key to select cell ranges.
2. From the Planning or Planning Ad Hoc ribbon, select **Cell Actions** and then **Comments**.
3. From **Comments**, click .
4. If you selected a range of cells in step 1, you can either enter comments for one cell at a time or apply a comment to all selected cells.
 - To enter a comment for one cell, select the cell from the drop-down menu.
 - To enter a comment for all selected cells, select **Apply to all selected cells**.
5. In the field at the right, enter a comment. If you want to format the comment, use HTML tags.
6. Click  to save the comment.
The comment is displayed in the list of comments to the left of the comment field. This list contains comments entered by all users.
7. Click **OK**.
8. **Optional:** To delete a comment, click . You can delete only the comments that you have entered.

Attachments

Documents can be attached to individual data cells by way of URLs or files.

Data source types: Planning

Each data cell can contain multiple documents attached by one or more users. Depending on the permission level assigned to you by the administrator, you may be able to do any of the following in a data cell:

- Attach documents.
- View the documents that you and other users have attached.
- Edit and delete documents that you have attached. You cannot edit or delete documents attached by other users.
- Attach URLs.

Cells that contain attachments can be associated with a cell style. See [Cell Styles](#).

Watch this overview video to get acquainted with some basic Oracle Smart View for Office functionality related to Planning, including working with attachments.

[Overview video](#)

To attach documents or URLs to a data cell:

1. Select one data cell or a range of data cells in a Planning ad hoc grid or form.
2. From the Planning ribbon or Planning Ad Hoc ribbon, select **Cell Actions** and then **Attachment**.
3. In the **Attachments** dialog, click the **Attach** button,  **Attach** ▾, and select **File** or **URL**.
4. If you selected **File** in [step 3](#), then, in the **Select File to Attach to Cell** dialog, navigate to the file that you want to attach, select it, and click **Open**.

The file is uploaded to the selected cell.

Note:

- Each file you attach must have a unique file name, whether you are attaching files to the same cell or to different cells in a range.
 - To attach files to cells in a range, select a cell from the drop-down list in the **Attachments** dialog, navigate to the file, select it, and click **Open** to upload the file to the selected cell. Repeat for each different file you want to attach to different cells in the range.
5. If you selected **URL** in [step 3](#), a new row is added where you enter the following information:
 - Click in the cell under **Description** to add a brief description.

- Click in the cell under **Reference** to enter the URL location of the document or web page that you want to attach.

 **Note:**

If you selected a range of cells, you can either attach URLs to one cell at a time or attach the same URL to all selected cells.

- To attach a URL to one cell in the range, select the cell from the drop-down menu, select **Attach**, then **URL**, and then enter the **Description** and **Reference**.
- To attach one URL to all selected cells in the range, select **Apply to all selected cells**.

6. If you attached only URLs, or attached a combination of URLs and files, then, to save your attachment selections, click .
7. Repeat this procedure to add attachments as you require.
8. **Optional:** To edit a **Reference** entry, click , edit the reference, and then click .
9. **Optional:** To delete an attachment, select the attachment in the list and click .
10. Click **Close**.

Launching Attachments

To launch an attached document in a new browser:

1. Select the cell that contains the attachment.
2. From the Planning or Planning Ad Hoc ribbon, select **Cell Actions** and then **Attachment**.
3. Click .

Cell History

You can view the history of changes made to a data cell or range of data cells.

For each change listed, the user who made the change, date, old value, and new value are displayed.

Data source types: Planning

 **Note:**

Cell history is available only if data auditing is enabled by the Planning administrator, as described in the *Administering Planning*.

To display cell history:

1. Select one data cell or a range of cells in a Planning ad hoc grid.
2. From the **Planning Ad Hoc** ribbon, select **Cell Actions** and then **Cell History** to display the **Change History** screen.
3. If you selected multiple cells in step 1, select one cell at a time from the drop-down menu in **Change History** to view its history.

You can set options in Oracle Smart View for Office to detect comments and unknown members on Essbase sheets.

About Ad Hoc Analysis

In ad hoc analysis, you use Oracle Smart View for Office functionality with Excel spreadsheets to retrieve and analyze data.

You do this by selecting members, using functions, and performing a variety of operations, including formatting, to design and build your reports.

Note:

Ad hoc operations are not supported on protected worksheets.

Starting Ad Hoc Analysis

Connect to a provider and select Ad Hoc Analysis to display the Ad Hoc ribbon for that provider and enable the ad hoc functionality.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting, Narrative Reporting

Note:

When you start ad hoc analysis with Essbase, Oracle Analytics Cloud - Essbase, or Narrative Reporting, the alias table named "Default" is selected by default.

Watch this video to see a tutorial on analyzing data using ad hoc analysis.

[Tutorial video](#)

To start ad hoc analysis:

1. From **Recently Used**, **Shared Connections**, or **Private Connections** on the Smart View Panel, select one of the following:

- Smart Slice
 - Form
 - Plan type
 - Cube or model
2. From the Action Panel, select **Ad hoc analysis**.

Alternatively, right-click the object in the Smart View Panel and select **Ad hoc analysis**.

The data provider ribbon is displayed.

 **Tip:**

If an error appears similar to "Ad hoc grid cannot be opened as there are no valid rows of data," then you should clear the suppress options in the **Data Options** tab of the **Options** dialog box. Ensure that all **Suppress Rows** and **Suppress Columns** options are cleared, and that the **Suppress missing blocks** option is cleared.

3. Use the ribbon buttons to perform ad hoc analysis on the current worksheet.

If you are familiar with the dimensions and members of your database, you can use *free-form mode* by entering dimension and member names directly into cell to design and create an ad hoc grid. See [Free-Form Mode](#).

Inserting Attribute Dimensions on the Sheet

When performing ad hoc analysis, you can use the Insert Attributes command to insert attribute dimensions or members on the worksheet.

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc

To insert attribute dimensions or members on a worksheet:

1. Connect to your database and perform an ad hoc analysis by either selecting the **Ad hoc analysis** option in the Action Panel, or typing members in free-form format on the worksheet.
2. In the Essbase ribbon or Planning Ad Hoc ribbon, click the **Insert Attributes** button,  **Insert Attributes**.
3. In the **Insert Attributes** dialog box, select the attribute dimensions to add to the sheet, and then click **OK**.

Optional: All attribute dimensions are selected by default. To add only a subset of attribute dimensions, perform one of the following tasks:

- Clear the check boxes next to the attribute dimensions to omit from the sheet.
 - Click **Deselect All**, and then select the check boxes next to the attribute dimensions to add to the sheet.
4. **Optional:** To select a single attribute member to add to the sheet (rather than the entire attribute dimension):
 - a. Click , next to an attribute dimension text box.

- b. In the **Member Selection** dialog box, select the check box next to the attribute member to add and click .

You can select only one attribute member per dimension.

- c. Click **OK**.
- d. Repeat these substeps for each attribute member to add to the sheet.

Note that you can also hand type an attribute member name in the attribute dimension text box; however, attribute member names must be correctly capitalized and spelled in order to be recognized by Oracle Smart View for Office. If you capitalize a member name incorrectly or otherwise misspell it, an error occurs.

Now you can work with the attribute dimensions in the same way you would if you had used the **Member Selection** dialog box or free-form to place attributes on the sheet. Along with the other dimensions, you can pivot the attribute dimensions between rows and columns on the grid, and pivot them between the POV and the grid.

Related Topics:

- [Inserting Attribute Dimensions on the Sheet--Example](#)
- [Notes About Inserting Attributes](#)

Inserting Attribute Dimensions on the Sheet--Example

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc

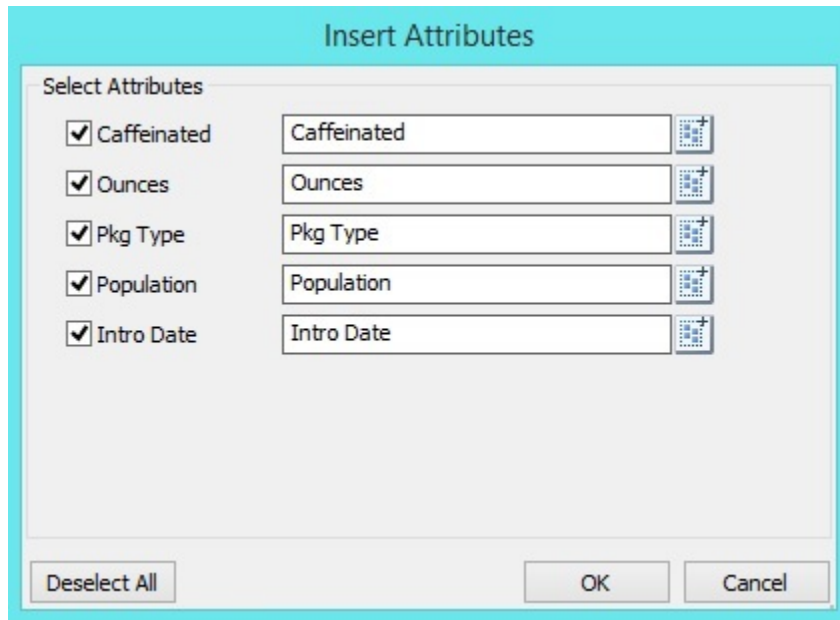

Using Essbase Sample Basic, from the Action Panel, select **Ad hoc analysis** to place dimensions, including page dimensions, on the worksheet, as shown in [Figure 1](#).

Figure 6-1 Initial Ad Hoc Grid

	A	B	C	D
1		Product	Market	Scenario
2		Measures		
3	Year	105522		

Now click **Insert Attributes**,  Insert Attributes.

In the **Insert Attributes** dialog box, note that all attribute dimensions are selected by default:

Click **OK** and you can see, as shown in [Figure 2](#), that the attribute dimensions Caffeinated, Ounces, Pkg Type, Population, and Intro Date have been added to the worksheet as page dimensions.

Figure 6-2 Ad Hoc Grid After Adding Attribute Dimensions

	A	B	C	D	E	F	G	H	I
1		Product	Market	Scenario	Caffeinated	Ounces	Pkg Type	Population	Intro Date
2		Measures							
3	Year	104745							

You can also choose to add attribute members, instead of attribute dimensions, to the sheet. In the **Insert Attributes** dialog box, click  for an attribute dimension and select an attribute member to use.

In the **Insert Attributes** dialog box, notice that the attribute dimensions Caffeinated, Pkg Type, and Populations, the attribute members Caffeinated_True, Bottle, and Medium are selected:

In [Figure 3](#), notice that the attribute members Caffeinated_True, Bottle, and Medium, along with the Ounces and Intro Date attribute dimensions, have been added to the worksheet as page dimensions.

Figure 6-3 Ad Hoc Grid After Adding Attribute Members and Dimensions

	A	B	C	D	E	F	G	H	I
1		Product	Market	Scenario	Caffeinated_True	Ounces	Bottle	Medium	Intro Date
2		Measures							
3	Year	9758							

See also [Notes About Inserting Attributes](#).

Notes About Inserting Attributes

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc

Keep in mind the following guidelines when inserting attributes:

- If an attribute is already present on the grid, then it will not be available for selection in the **Insert Attributes** dialog box.
- The grid must be in refreshed state. If the grid is in free-form state prior to refresh, then Oracle Smart View for Office prompts you to manually refresh.
- When the attributes are inserted on the grid, the grid is automatically refreshed.
- **Oracle Analytics Cloud - Essbase only:** If the POV toolbar is toggled off, and there is no page dimension row present in the sheet, then a page dimension row will be added to the top of the sheet when inserting the attribute dimensions.
- In the **Insert Attributes** dialog box:
 - You can select to insert the entire attribute dimension, or one attribute member from a dimension.

- If a member name is left blank in the attribute text box, then that dimension is in a deselected state and will not be inserted.
- If you have inserted a single attribute member using the **Insert Attributes** command and dialog box, you can use **Member Selection** to add other members from the same attribute dimension to the grid.
- **Insert Attributes** is supported only for Oracle Analytics Cloud - Essbase and Planning Ad Hoc.
- The **Insert Attributes** operation is not supported for Query Designer or Smart Slice design sheets.
- When filtering on attributes at the Generation 3 level in an attribute dimension, Smart View only displays members up to the Generation 2 level.

See also [Inserting Attribute Dimensions on the Sheet-Example](#).

Preserving Excel Formulas in Ad Hoc Grids

You can associate Excel formulas with member and data cells in ad hoc grids and set cell styles to identify such cells.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting, Narrative Reporting

By default, formulas are preserved when you perform ad hoc operations, except for **Pivot** and **Undo**.

Note:

- To achieve faster execution of queries, you can disable the preservation of formulas and comments. However, if you disable this option, formulas are overwritten when you perform ad hoc operations.
- **Narrative Reporting:** Only **Refresh** operations are supported when **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** is selected. Other ad hoc operations, such as **Zoom In** or **Keep Only**, are not supported.

See also:

- [Cell Styles](#) for information on setting cell styles for cells containing formulas
- Oracle Analytics Cloud - Essbase: [Preserving Excel Formulas Within and Outside of Essbase Ad Hoc Grids](#)

To specify preservation of formulas in ad hoc grids:

1. From the Smart View ribbon, click **Options**, and then **Member Options** in the left panel.
2. Do one of the following:
 - To preserve formulas in ad hoc grids, select **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)**.

- To disable preservation of formulas, clear **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)**. Do this only if you do not need to preserve formulas and you want faster execution of queries.

 **Note:**

Although the **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** option appears in **Member Options**, the selection you make applies to formulas in both member and data cells.

3. Click **OK**.

Preserving Excel Formulas Within and Outside of Essbase Ad Hoc Grids

Data source types: Oracle Analytics Cloud - Essbase

Formulas Within the Grid

Starting in Oracle Smart View for Office 11.1.2.5.810, formulas will be retained in Essbase grids after performing **Undo** or **Redo**.

 **Note:**

Ensure that you have selected the **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** option in the **Options** dialog, **Member Options** tab.

To retain the formulas, you must first perform a **Refresh** operation on the grid that contains formulas. The **Refresh** action adds the formulas to the undo buffer.

In some cases, an **Undo** doesn't work as expected after a zoom operation when formulas are outside of the grid. In this case, for more reliable formula preservation when performing **Undo** or **Redo** after a zoom operation, set up your grid as shown in [Formulas Outside the Grid](#).

Formulas Outside the Grid

For smoother functioning of Essbase ad hoc analysis when formulas are present outside of the grid, Oracle recommends that you add a simple comment in any blank cell of the last column. The formula will be retained when you refresh the grid. The formula will be lost on pivots and undo.

 **Note:**

Ensure that you have selected the **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** option in the **Options** dialog, **Member Options** tab.

In the example below, a formula is added to cell E4, outside of the grid. In order to preserve this formula during refreshes, a comment should be added to a blank cell in column E. In the example, the word "comment" is added to cell E1.

-	A	B	C	D	E	F
1			East		comment	
2			Scenario			
3			Profit			
4	Cola	Qtr1	5789		=C4	
5						

The comment is needed especially if you are performing an active ad hoc analysis. This helps Essbase and Smart View to keep the content lying outside the grid intact during refresh and other ad hoc operations such as **Zoom In** and **Zoom Out** or **Keep Only** and **Remove Only**. Without the comment, you may lose the formulas outside the grid when performing these ad hoc operations.

Formatting Ad Hoc Grids

You can use either Oracle Smart View for Office or Excel to control grid formatting.

Related Topics

- [Using Smart View Formatting](#)
Oracle Smart View for Office formatting consists of formatting selections made in the **Cell Styles** and **Formatting** tabs of the **Options** dialog box.
- [Using Excel Formatting](#)

Using Smart View Formatting

Oracle Smart View for Office formatting consists of formatting selections made in the **Cell Styles** and **Formatting** tabs of the **Options** dialog box.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting, Profitability and Cost Management

To set Smart View formatting options:

1. From the Smart View ribbon, click **Options**.
2. From **Options**, to set cell styles, select **Cell Styles** in the left pane.
Cell styles indicate certain types of member and data cells.
See [Cell Styles](#) for more information.

3. To set other Smart View formatting options, select **Formatting** from the left pane (**Use Excel Formatting** on this page is not a Smart View formatting option).
See [Smart View Options](#) for descriptions of options.
4. Click **OK**.

To apply Smart View formatting selections to data cells created by zooming:

1. From the grid, select a formatted data cell.
2. From the Essbase or Planning Ad Hoc ribbon, select **Preserve Format**.

Using Excel Formatting

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

If you use Excel formatting, your formatting selections, including conditional formatting, are applied and retained on the grid when you refresh or perform ad hoc operations.

When you use Excel formatting, Oracle Smart View for Office does not reformat cells based on your grid operations, and it does not mark cells as dirty when you change data values. Smart View does preserve the formatting on the worksheet between operations.

Using Excel formatting is generally preferable for highly formatted reports, and you must use Excel formatting for data sources whose application-specific colors are not supported by the Excel color palate.

To use Excel formatting on ad hoc grids:

1. From the Smart View ribbon, select **Options**.
2. From **Options**, select **Formatting** from the left pane.
3. Select **Use Excel Formatting**.
4. **Optional:** To copy parent cell formatting to zoomed-in cells, select **Move Formatting on Operations**.

With this option selected, formatting also stays with members when you pivot.

Note:

Formatting can affect performance, especially during ad hoc operations when **Move formatting on operations** is enabled. For this reason, selection of this option does not persist when moving between sheets in a workbook or between sessions, and its selection cannot be saved. See the description of **Move formatting on operations** in [Formatting Options](#) for more information on using this option.

5. Click **OK**.

Example 6-1 Excel Formatting and Merged Cells

To *preserve* the merged cell formatting during ad hoc operations (except Pivot and Undo), you must select both **Use Excel Formatting** and **Preserve Formulas and Comments in ad hoc operations** options.

To *replicate* merged cell formatting during ad hoc operations (except Pivot), you must select all of **Use Excel Formatting**, **Preserve Formulas and Comments in ad hoc operations**, and **Formula Fill** options.

Example 6-2 Excel Formatting and Member Indentation

With the **Use Excel Formatting** option selected, and the **Member Indentation** option set to **None**, row members retain their indentation. The loss of indentation applies only to column members.

Note that the **Indentation** option applies only to ad hoc sheets; it does not apply to forms. See "Indentation" in the table in [Member Options](#).

Note:

In a Windows 8.1, 32-bit with Office 2013, 32-bit environment, while performing ad hoc operations, Excel may become unresponsive to right-clicks within the sheet; for example, when attempting to pivot using drag-and-drop.

Enabling Attribute Association Processing in Ad Hoc Grids

Attribute association processing allows Essbase cells at intersections associated with attributes to display the value specified for the **#Invalid/Meaningless** option.

When you select **Enable Attribute Association Processing**, the attribute intersection cells that are called out have no association with the base dimension. In some cases, these cells may be varying attributes.

By default, the **Enable Attribute Association Processing** option is cleared. When cleared, the data values of attribute cells having no association to the base dimension are displayed as **#Missing**, instead of displaying the value specified in **#Invalid/Meaningless**.

Note:

When the **Enable Attribute Association Processing** option is selected, ad hoc query performance may be slower.

For example, suppose you create an ad hoc grid showing sales in bottles for all products in the Product dimension. For Cola and Diet Cola, bottles are not available, but bottles are available for all the other products in the Product dimension. In this case, the attribute Bottle has no association with Cola or Diet Cola.

With the **Enable Attribute Association Processing** option selected, cells for Cola and Diet Cola sales in bottles would display **#Invalid** by default, as shown in [Figure 1](#). Note that you could define your own label for these cells.

Figure 6-4 Ad Hoc Grid with Enable Attribute Association Processing Selected

	A	B	C	D	E
1			Jan	New York	Actual
2			Sales		
3	Cola	Bottle	#Invalid		
4	Diet Cola	Bottle	#Invalid		
5	Caffeine Free Cola	Bottle	1		
6	Old Fashioned	Bottle	1		
7	Diet Root Beer	Bottle	#Missing		
8	Sasparilla	Bottle	#Missing		
9	Birch Beer	Bottle	1		
10					

Clear the **Enable Attribute Association Processing** option, and cells at those same intersections, where the attribute is not associated with the base dimension, would display as #Missing, as shown in [Figure 2](#). In this case, you do not know which attribute cells are actually missing data, and which attribute cells have no association with the base dimension and, therefore, would never contain data.

Figure 6-5 Ad Hoc Grid with Enable Attribute Association Processing Option Cleared

	A	B	C	D	E
1			Jan	New York	Actual
2			Sales		
3	Cola	Bottle	#Missing		
4	Diet Cola	Bottle	#Missing		
5	Caffeine Free Cola	Bottle	1		
6	Old Fashioned	Bottle	1		
7	Diet Root Beer	Bottle	#Missing		
8	Sasparilla	Bottle	#Missing		
9	Birch Beer	Bottle	1		

To enable attribute data cells that have no association with the base dimension to display the label defined in **#Invalid/Meaningless**:

1. From the Smart View ribbon, select **Options**, and then select **Data Options**.
2. In the **Replacement** section:
 - Select **Enable Attribute Association Processing**.
 - For the **#Invalid/Meaningless** option, select **#Invalid** or specify a label to display in attribute cells that are not associated with the base dimension.

3. Run the ad hoc query and note the cells containing the value you specified for **#Invalid/Meaningless**; these are the attribute cells that are not associated with the base dimension.

Zooming In and Out

Zoom in on members in the grid to display data for their children and descendants.

About Zooming In and Out

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

You can zoom in on members in the grid to display data for their children and descendants.

Note:

Zoom In and Zoom Out operations are not supported in these cases:

- On member formula cells when connected to an aggregate storage database.

Zoom operations on member formula cells are supported only when connected to a block storage database.

- On views inserted from Oracle Analytics Cloud data sources.

In Oracle Analytics Cloud - Essbase connections, you can also zoom to display data for the following:

- Members of the same level, same generation, or sibling level as the selected member
- Members that are defined by the formula of the selected member when connected to block storage databases

[Enabling Double-Click Zooming](#)

Zooming In

You can zoom in on one cell at a time. In Oracle Analytics Cloud - Essbase and Narrative Reporting, you can also zoom in on a range of cells.

Zooming in to the Default Level

To zoom in to the default zoom level, which is specified as described in [Setting a Default Zoom Level](#), do one of the following:

- Select a member, and then click **Zoom In** on the data source ribbon. In Oracle Analytics Cloud - Essbase and Narrative Reporting, you can select a range of members.
- Double-click a member (double-click zooming must be enabled; see [Enabling Double-Click Zooming](#)).

Zooming in on Shared Members in Planning and Planning Modules

For 16.12 and earlier, Planning did not support shared members. When a member was placed on an ad hoc grid, it was always considered a base member, even if it was supposed to be a shared member.

Starting in 17.01, Planning supports shared members in ad hoc grids and recognizes whether a member is a base member or a shared member. Starting in 17.04, if your administrator enables zoom in on shared members in your application, then zooming in on shared members is supported in Oracle Smart View for Office. In this case, zooming in on shared members is effectively the same as zooming in on the corresponding base members.

Zooming in to a Selected Level

To zoom in to a selected level:

1. Select a member.

In Oracle Analytics Cloud - Essbase and Narrative Reporting, you can select a range of members.

2. From the data source ribbon, click the down arrow next to **Zoom In**, and then select one of the following options.
 - **Next Level** to retrieve data for the children of the selected members
 - **All Levels** to retrieve data for all descendants of the selected members
 - **Bottom Level** to retrieve data for the lowest level of members in a dimension

These Zoom In options are available for Oracle Analytics Cloud - Essbase only:

- **Same Level** to retrieve data for all members at the same level as the selected member

- **Sibling Level** to retrieve data for the siblings of the selected members
- **Same Generation** to retrieve data for all members of the same generation as the selected members
- **Formulas** to retrieve data for all members that are defined by the formula of the selected member. The formula can be a member equation or a consolidation to the parent

 **Note:**

When you zoom in on a page dimension, the page dimension is pivoted to a row dimension.

Zooming Out

Zooming out collapses the view according to the Zoom In Level option specified as described in [Setting a Default Zoom Level](#).

To zoom out:

1. Select a member.

In Oracle Analytics Cloud - Essbase and Narrative Reporting, you can select a range of members.

2. From the data source ribbon, click **Zoom Out**.

Related Topics:

- [Zooming In](#)
- [Setting a Default Zoom Level](#)
- [Enabling Double-Click Zooming](#)
- [Zooming Operations in Cells that Contain Formulas](#)

Setting a Default Zoom Level

You can specify a default level for zooming operations. This setting applies to the **Zoom In** button and to double-click zooming if it is enabled (see [Enabling Double-Click Zooming](#)).

To set a **Zoom In** default level:

1. From the Smart View ribbon, select **Options**, and then select **Member Options** in the left panel.
2. From the **Zoom In Level** drop-down menu, select one of the following levels:

- **Next Level** to retrieve data for the children of the selected members
- **All Levels** to retrieve data for all descendants of the selected members
- **Bottom Level** to retrieve data for the lowest level of members in a dimension

These Zoom In options are available for and Oracle Analytics Cloud - Essbase only:

- **Same Level** to retrieve data for all members at the same level as the selected member
- **Sibling Level** to retrieve data for the siblings of the selected members
- **Same Generation** to retrieve data for all members of the same generation as the selected members
- **Formulas** to retrieve data for all members that are defined by the formula of the selected member. The formula can be a member equation or a consolidation to the parent

3. Click **OK**.

Selecting Members to Display when Zooming

You can set options to specify which members are retained and displayed as you zoom in and out.

To set member display options for zooming:

1. From the Smart View ribbon, select **Options**, and then select **Member Options** in the left panel.
2. Under **Member Retention**, select:
 - **Include Selection** to display both the selected member and the members retrieved as a result of zooming. For example, zooming in on the selected member *Qtr1* retrieves data for *Jan*, *Feb*, *Mar*, and *Qtr1*. If not selected, only the members retrieved as a result of the zoom are displayed: *Jan*, *Feb*, and *Mar*.
 - **Within Selected Group** to zoom in only on the selected group of cells, leaving the unselected cells as is. This setting is meaningful only when there are two or more dimensions down the grid as rows or across the grid as columns. (This setting also applies to **Keep Only** and **Remove Only**.)
 - **Remove Unselected Groups** to remove all dimensions and members *except* the selected member and the members retrieved as a result of zooming.
3. Click **OK**.

Enabling Double-Click Zooming

In Oracle Smart View for Office, if double-clicking for ad hoc operations is enabled, you can zoom in to the default zoom level and zoom out by double-clicking in a member cell.

To enable double-clicking for zooming:

1. From the Smart View ribbon, select **Options**, and then select **Advanced** in the left panel.
2. Under **Mode**, select **Double-click for Operations**.

If you do not select **Double-click for Operations**, then double-clicking retains Excel functionality and puts the cell into edit mode.

3. Click **OK**.

Note:

In blank worksheets, double-clicking the first time retrieves the default grid and thereafter zooms in or out.

Related Topics:

Zooming and Formatting

You can apply the formatting of the cell that you zoom in on to the cells that are created by zooming. For Oracle Smart View for Office formatting, this ability applies to data cells. For Excel formatting, this ability applies to member cells.

Excel Formatting

To apply Excel formatting selections to member cells created by zooming, from the Smart View ribbon, select **Options**. Then select all these options:

- From the **Formatting** page, select these options:
 - **Use Excel Formatting**
 - **Move Formatting on Operations**
- From the **Member Options** page, select **Preserve Formulas and Comments in ad hoc operations (except Pivot)**

Zooming Operations in Cells that Contain Formulas

Data source types: Oracle Analytics Cloud - Essbase

If member or data cells are associated with formulas, you can propagate these formulas to the cells retrieved as a result of zooming in. For example, if member `Qtr1` is associated with a formula, then the formula can be propagated to `Jan`, `Feb`, and `Mar` when you zoom in on `Qtr1`.

To propagate formulas:

1. From the Smart View ribbon, click **Options**, and then select **Member Options** in the left panel.
2. Under **Comments and Formulas**, ensure that **Preserve Formulas and Comments in ad hoc operations (except pivot)** is selected.
3. Select **Formula Fill**.

 **Note:**

- With the **Formula Fill** option enabled, some zoom operations may be time consuming. For example, a zoom in to the bottom level of a large hierarchy (described in [Zooming in to a Selected Level](#)) may take a long time to complete.
- Although these options—**Preserve Formulas and Comments in ad hoc operations (except pivot)** and **Formula Fill**—appear in **Member Options**, they apply to formulas in both member and data cells.

4. Click **OK**.

- [Enabling Double-Click Zooming](#)

Specifying Ancestor Position in Ad Hoc Grids

Use the **Ancestor Position** option to specify the ancestor position for hierarchies as **Top** or **Bottom**. The **Ancestor Position** option is located in the **Member Options** tab of the **Options** dialog.

Data source types: Oracle Analytics Cloud - Essbase, Planning Ad Hoc, Planning Modules Ad Hoc, Financial Consolidation and Close Ad Hoc, Tax Reporting Ad Hoc

To specify the ancestor position for hierarchies in ad hoc grids:

1. Connect to your database.
For example, in Planning, you may connect to a cube or a form that is enabled for ad hoc. In Oracle Analytics Cloud - Essbase, you connect to an application and database.
2. In the Smart View ribbon, select **Options**, and then select **Member Options**.
3. In **Ancestor Position**, select **Top** or **Bottom**.

The default is **Bottom**.

4. Click **OK** to close the **Options** dialog.
5. Perform an ad hoc analysis by selecting the **Ad hoc analysis** option in the Action Panel.
6. Perform a zoom-in on a dimension or member and check the result.

For example:

- If you select **Top**, the resulting hierarchy layout should resemble the layout shown in [Figure 1](#).
 - If you select **Bottom**, the resulting hierarchy layout should resemble the layout shown in [Figure 2](#).
7. Continue ad hoc operations, such as zoom-in and pivoting.

 **Note:**

- Changing the **Ancestor Position** setting has no effect on the dimension and member layout in an existing grid. You will only see the change when you perform a zoom-in operation.
- In an existing grid, or in the middle of a series of ad hoc analysis operations, changing **Ancestor Position** option (from **Bottom** to **Top** or from **Top** to **Bottom**) can result in non-uniform hierarchy display in the grid.

Example 6-3 Zoom in Results Selecting Ancestor Position - Top

In this example, we zoom in on the Account dimension. After zooming in, the Account ancestor is shown at the top of its children members. Next, we zoom in on Statistics. After zooming in, the Statistics ancestor is shown at the top of its children members.

Working with Excel Filters on Ad Hoc Sheets

Excel filters are retained when performing ad hoc in cases where the ad hoc operation results in the same set of column dimensions.

Data source types: All supported Oracle Smart View for Office providers, cloud and on-premises, ad hoc only

For example, set filters on the members of the Measures dimension as follows:

	A	B	C	D	E	F
1		Product	Market	Scenario		
2		Profit Lo	Profi	Invento	Ratios	Measur
3	Year	8002	69896	115304	54.41338754	8002

If you zoom in on the row dimension, Year, the result set retains the Excel filters that were set in the column dimensions because the column dimensions and members didn't change.

	A	B	C	D	E	F
1		Product	Market	Scenario		
2		Profit Lo	Profi	Invento	Ratios	Measur
3	Qtr1	8002	16549	115304	54.53095513	8002
4	Qtr2	0	17945	130727	54.4949209	0
5	Qtr3	0	17927	170190	53.91647995	0
6	Qtr4	#Missing	17475	184980	54.73926891	#Missing
7	Year	8002	69896	115304	54.41338754	8002

However, if you zoom in on a column dimension member, such as Inventory, the set of columns in the result set changes, causing you to lose the Excel filters.

	A	B	C	D	E	F	G	H	I
1		Product	Market	Scenario					
2		Profit Loss	Profit	Opening Inventory	Additions	Ending Inventory	Inventory	Ratios	Measures
3	Year	8002	69896	115304	429774	203447	115304	54.41338754	8002

Guidelines

- Excel filters are retained for most ad hoc operations, such as Zoom In, Zoom Out, Remove Only, and Keep Only, Undo, and Redo, as long as the same set of column dimensions appear in the result set.
- Excel filters are also retained after a Submit or a Refresh.
- Excel filters are not retained for Pivot or Pivot to POV operations.
- Excel filter retention is not supported on multiple-grid sheets. For example, after creating filters in one grid, then moving to a second grid and creating filters on it, the filters on the first grid will be lost.

However, there may be some cases where the filters are retained. For example, if two adjacent grids both start on the same row, then the filters may be retained. Because of these variations, Oracle cannot assure that Excel filters will be retained on multiple-grid sheets.

Pivoting

Pivoting changes the orientation of the data on the worksheet. You can move dimensions between rows and columns and between the grid and the POV.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

Additionally:

- One or more dimensions can be pivoted from the grid to the POV toolbar.
- One dimension at a time can be pivoted from the POV toolbar to the grid.
- A single dimension, and even zero dimensions, can remain on the POV toolbar.
- You can select only one dimension or one member at a time to pivot between rows and columns on the sheet. In cases where multiple members from the same dimension are on the grid, then all members in the dimension will be pivoted.
- When you pivot a member from the grid to the POV, the member selected on the grid becomes the POV for that dimension. For example, if pivot Qtr2 of the Year

dimension from the grid to the POV, then Qtr2 becomes the POV for the Year dimension.

Pivoting Dimensions Between Rows and Columns

You can pivot a dimension or members between rows and columns. There must be two or more dimensions, or members from two or more dimensions, in the row or column that contains the dimension that you want to pivot. That is, you cannot pivot the last row dimension or the last column dimension on a grid.

When you pivot a member, the other members in its dimension are also pivoted.

When you pivot between rows and columns, Oracle Smart View for Office moves the selected dimension to the outermost row or column on the opposite axis. For example, when you select to pivot a dimension to a row, the system moves the dimension to the top of the grid.

Note:

When the **Use Excel Formatting** option is selected (as described in [Using Excel Formatting](#)), member and numeric formats may unexpectedly change after pivot operations. For example, member names may be centered and numeric values may be left justified. You can reset the grid to the proper format using the Excel formatting options.

To pivot a dimension or member:

1. Select a dimension or member.
2. From the data source ribbon, click **Pivot**.

Alternatively, you can drag a dimension from the row or column and drop it on the target row or column.

Row dimensions are pivoted to the topmost column dimension.

Column dimensions are pivoted to the left-most row dimension.

Note:

You pivot members by selecting them from the POV, as described in [Selecting Members from the POV Toolbar](#).

Pivoting Dimensions Between the Grid and the POV Toolbar

You can select to pivot a dimension out of the ad hoc grid to the Point of View (POV), or out of the POV to the grid. You can also pivot a member; if you do so, the other members in its dimension are also pivoted.

To pivot a dimension or members between the POV toolbar and the grid, perform one of the following tasks:

- To pivot a dimension *to* the POV, select the dimension in the grid. In the provider ribbon, click the arrow in the **Pivot** button, , and then select **Pivot to POV**.
Alternatively, right-click a dimension and drag it from the grid and drop it on the POV toolbar.
You can also pivot a member. Select one member only; you do not need to select multiple members. Selecting one member pivots all members in the dimension.
- To pivot a dimension *from* the POV to the grid, right click the arrow next to the dimension name in the POV toolbar, then drag the dimension and drop it on the grid.

Example 6-5 Pivoting Notes

- You can leave any number of dimensions on the POV; for example, 0, 1, or more dimensions can be left on the POV.
- After pivoting the last dimension from the POV toolbar to the grid, the POV toolbar is hidden. You can always bring it back by clicking the POV button in the provider ribbon.
- The grid must always contain at least two dimensions: one row dimension and one column dimensions. When there is only one row dimension and one column dimension on a grid, you must first pivot the replacement dimension on to the grid before you can pivot a dimension out of the grid.
For example, if you want to pivot the row dimension off of the grid, then you must first pivot the replacement row dimension on to the grid, and then pivot the unwanted row dimension off of the grid.
- You can manually type a dimension or member name to replace a dimension or member name in the grid or the POV toolbar.
Similarly, you can delete a dimension or member from the grid, refresh the grid, and the deleted dimension or member is moved from the grid and will display on the POV toolbar.
- You can pivot members by selecting them from the POV, as described in [Selecting Members from the POV Toolbar](#).

Removing Selected Members From the Grid

You can remove members and their associated data from the grid.

- To keep only the currently selected members, select the member cells that you want to keep. Then, from the data source ribbon, click **Keep Only**. All other members in the dimension are removed.
- To remove all members except the currently selected member cells, select the cells that you want to remove. Then, from the data source ribbon, click **Remove Only**.

Keep Only and **Remove Only** operate on all instances of the selected members in the grid within the selected group.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

About Keep Only and Remove Only

The results of **Keep Only** and **Remove Only** depend on how the selected group is evaluated within the grid. A group consists of two or more dimensions down the grid as rows or across the grid as columns.

To use the **Keep Only** or **Remove Only** command, the selected member must have a group of members associated with it. Members do not have to be from the same dimension to be considered a group. The selected member shouldn't be the lowest or last member of the group.

For example, in [Figure 1](#), you could think of New York, Florida, Connecticut, and New Hampshire as individual groups that all contain the January member. We want to keep the data for January for those four states. Yet, when we select Jan, and then click **Keep Only**, the grid doesn't change. This is because Jan is not its own group, it's actually a member of a group originating with the Market dimension, and also belongs to the New York, Florida, Connecticut, and New Hampshire groups.

Figure 6-8 Grid with Market Members in Column A, Year Members in Column B

	A	B	C	D
1			Product	Scenario
2			Measures	
3	New York	Jan	8722	
4	Florida	Jan	336	
5	Connecticut	Jan	321	
6	New Hampshire	Jan	44	
7	West	Feb	2394	
8	South	Year	13238	
9	Central	Year	38262	
10	Market	Year	213522	
11				

Try moving Jan to reposition it so that Jan is now a group, and the members New York, Florida, Connecticut, and New Hampshire belong to the Jan group, as shown in [Figure 2](#)

Figure 6-9 Grid with Year Members in Column A, Market Members in Column B

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	
7	Jan	West	2339	
8	Jan	South	997	
9	Jan	Central	2956	
10	Jan	Market	16234	
11	Feb	New York	99955	
12	Feb	Florida	361	
13	Feb	Connecticut	309	
14	Feb	New Hampshire	74	
15	Feb	West	2394	
16	Feb	South	1046	
17	Feb	Central	3063	
18	Feb	Market	107700	
19	Year	New York	116202	
20	Year	Florida	5029	
21	Year	Connecticut	3093	
22	Year	New Hampshire	1125	
23	Year	West	29861	
24	Year	South	13238	
25	Year	Central	38262	
26	Year	Market	213522	

Now select a Jan cell and click **Keep Only**. The resulting layout shows only the Market dimension members grouped under Jan.

Figure 6-10 Grid with Only Jan Group Members

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	
7	Jan	West	2339	
8	Jan	South	997	
9	Jan	Central	2956	
10	Jan	Market	16234	

You can further refine the report to show only the New York, Florida, Connecticut, and New Hampshire members. Select those members in the grid (see [Figure 4](#)).

Figure 6-11 Members Selected for Keep Only

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	
7	Jan	West	2339	
8	Jan	South	997	
9	Jan	Central	2956	
10	Jan	Market	16234	

And then click **Keep Only**. The result is shown in [Figure 5](#).

Figure 6-12 Grid with Only Jan Group Members New York, Florida, Connecticut, and New Hampshire

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	

Note that you can also achieve the result in [Figure 5](#) in another way. Select the West, South and Central members, and the Market dimension, as shown in [Figure 6](#).

Figure 6-13 Members Selected for Remove Only

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	
7	Jan	West	2339	
8	Jan	South	997	
9	Jan	Central	2956	
10	Jan	Market	16234	

And then click **Remove Only**.

Figure 6-14 Grid with Only Jan Group Members New York, Florida, Connecticut, and New Hampshire

	A	B	C	D
1			Product	Scenario
2			Measures	
3	Jan	New York	8722	
4	Jan	Florida	336	
5	Jan	Connecticut	321	
6	Jan	New Hampshire	44	

Remember that the **Keep Only** and **Remove Only** commands are always performed on the selected groups, evaluated within the grid.

Inserting Rows and Columns

In ad hoc grids, you can insert calculating and non-calculating columns and rows within or outside the grid.

Data source types: Oracle Analytics Cloud - Essbase

Inserted rows and columns, which may contain formulas, text, or Excel comments, are retained when you refresh or zoom in.

Always refresh the grid before inserting rows or columns.

Displaying and Suppressing Repeated Members

If you have stacked dimensions in an ad hoc grid, you can display or suppress repeated members.

Data source types: Oracle Analytics Cloud - Essbase

This topic describes using the **Repeated Members** option in the **Options** dialog box, **Data Options** tab, **Suppress Rows** group. This option only applies to Essbase data sources. To use the other data suppress options in the **Suppress Rows** and the **Suppress Columns** group, see [Data Options](#).

When working with stacked dimensions in an ad hoc grid, and the **Suppress Repeated Members** option is selected, Essbase positions the suppressed member label above the labels in the next row, up to the first column dimension, using the "proximity rule". With the proximity rule, when repeated members are suppressed, Essbase compares the stacked dimensions row by row. It groups the non-repeating, unsuppressed members under the closest suppressed member in the previous row. Essbase can then determine which member is being queried and retrieves the data accordingly.

The scenario that follows shows the proximity rule in action.

Using the Sample Basic database, select the **Ad hoc analysis** option. The Measures, Product, Market, Scenario, and Year dimensions are retrieved on the worksheet as shown in [Figure 1](#).

Figure 6-15 Sample Basic Initial Ad Hoc Analysis Grid

	A	B	C	D
1		Product	Market	Scenario
2		Measures		
3	Year	105522		

Arrange the dimensions so that there are three "stacked" dimensions and two dimensions side by side, according to [Figure 2](#).

Figure 6-16 Sample Basic Grid with Dimensions Arranged in a Stacked Configuration

	A	B	C
1			Measures
2			Market
3			Scenario
4	Product	Year	105522

By default, in the **Data** tab of the **Options** dialog box, the **Repeated Members** option in the **Suppress Rows** group is cleared. Zoom in on the Product and Year members,

then zoom in on the Market and Scenario dimensions. The resulting grid looks similar to [Figure 3](#).

Figure 6-17 Zooming in on the Dimensions in the Grid Before Selecting the Repeated Members Option

	A	B	C	D	E	F	G	H	I	J	K	L
1			Measures	Measures	Measures	Measures	Measures	Measures	Measures	Measures	Measures	Measures
2			East	East	East	East	East	West	West	West	West	West
3			Actual	Budget	Variance	Variance %	Scenario	Actual	Budget	Variance	Variance %	Scenario
4	Colas	Year	12656	13150	-494	-3.756653992	12656	3549	8890	-5341	-60.07874016	3549
5	Root Beer	Year	2534	4360	-1826	-41.88073394	2534	9727	10950	-1223	-11.16894977	9727
6	Cream Soda	Year	2627	2970	-343	-11.54882155	2627	10731	11670	-939	-8.046272494	10731
7	Fruit Soda	Year	6344	7910	-1566	-19.7977244	6344	5854	5670	184	3.245149912	5854
8	Diet Drinks	Year	2408	2730	-322	-11.79487179	2408	8087	10570	-2483	-23.4910123	8087
9	Product	Year	24161	28390	-4229	-14.89609017	24161	29861	37180	-7319	-19.68531469	29861

Note:

For ease of reading, the South and Central members were removed from the grid in [Figure 3](#) and [Figure 4](#).

Now, from the Smart View ribbon, select **Options**, then select the **Data** tab. In the **Suppress Rows** group, select the **Repeated Members** options. Then refresh the sheet. The resulting grid looks similar to [Figure 4](#). For each of the column dimensions in rows 1 and 2, where there were suppressed repeated members, the member label is centered above the labels in the next row.

The data in columns C, D, E, F, and G belong to the East member; the data in columns H, I, J, K, and L belong to West. Using the proximity rule, Scenario in column G belongs to East because it is only two columns from the East member, but three columns from the West member.

The Measures dimension label applies to the entire grid.

Figure 6-18 Refresh the Grid After Selecting the Repeated Members Option

	A	B	C	D	E	F	G	H	I	J	K	L
1							Measures					
2					East					West

4	Colas	Year	12656	13150	-494	-3.756653992	12656	3549	8890	-5341	-60.07874016	3549
5	Root Beer	Year	2534	4360	-1826	-41.88073394	2534	9727	10950	-1223	-11.16894977	9727
6	Cream Soda	Year	2627	2970	-343	-11.54882155	2627	10731	11670	-939	-8.046272494	10731
7	Fruit Soda	Year	6344	7910	-1566	-19.7977244	6344	5854	5670	184	3.245149912	5854
8	Diet Drinks	Year	2408	2730	-322	-11.79487179	2408	8087	10570	-2483	-23.4910123	8087
9	Product	Year	24161	28390	-4229	-14.89609017	24161	29861	37180	-7319	-19.68531469	29861

Multiple Grids on a Worksheet

In Oracle Analytics Cloud - Essbase, you can create multiple ad hoc grids on one worksheet.

- [POV on Essbase Multiple-Grid Worksheets](#)
- [Multiple-Grid Example: Butterfly Report](#)

About Multiple Grids on a Worksheet

Data source types: Oracle Analytics Cloud - Essbase

In Oracle Analytics Cloud - Essbase, you can create multiple grids on one worksheet. These grids can be connected to the same data source or to different Essbase data sources. You can retrieve data in these grids and shift them on the worksheet.

Note the following guidelines and limitations in worksheets that support multiple grids:

- You can submit data for only one grid at a time.
If you try to submit data for more than one grid at a time—that is, if you have selected cell ranges in more than one grid—the first range returned by Excel will be used to determine the selected grid and the submit will be performed only on that grid.
- If **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** is selected, you can preserve formulas on the sheet using the **Undo** option on the right-click **Smart View** context menu from within the grid. This option is only supported after a refresh has been performed once formulas are added to the sheet, and only for one undo action. This option is only supported for one undo action. The **Undo** option on the Smart View ribbon is not enabled for multiple-grid sheets. See [Preserving Excel Formulas Within and Outside of Essbase Ad Hoc Grids](#).
- Multiple-grid worksheets are not supported for Smart Slices.
- Do not use Microsoft Excel's Name Manager or Name Box to rename named ranges. Instead, use one of the following methods to rename named ranges:
 - Use the **Rename Range** command in the Document Contents pane of the Smart View Panel. See [Renaming Ranges on Multiple-Grid Worksheets](#)
 - Use the VBA function, `HypModifyRangeGridName`, described in *Oracle Smart View for Office Developer's Guide*.
- On multiple-connection multiple grid worksheets, ensure that there is enough space between grids to accommodate pivot and zoom operations on the individual grids.
A loss of metadata may occur on sheets with three or more database connections and where grids are placed too close together.
- To ensure that you are refreshing the desired range, use the **Document Contents** pane to first select the range, and then click the **Refresh** link in the pane. After refresh, select the range again from **Document Contents** to highlight the updated range.

- These items on the Essbase ribbon are disabled:
 - **Undo**
 - **Redo**
- These items on the Essbase ribbon are disabled:
 - **Pivot to POV**
 - **POV**
 - **Preserve Format**
 - **Data Perspective**
 - **View Comments**

Creating Multiple-Grid Worksheets

Data source types: Oracle Analytics Cloud - Essbase

To create a multiple-grid worksheet:

1. In Excel, connect to an Essbase data source.
2. From any location in the worksheet, select a range of cells.
You must select a range rather than only one cell.
3. From the Smart View Panel, right-click an application, and then select **Ad Hoc Analysis**.

 **Note:**

Multiple-grid worksheets are not supported for Smart Slices.

4. When prompted to change the worksheet to support multiple grids, select **Yes**.

 **Note:**

If you started with an ordinary single-grid worksheet, and want to add other grids to the sheet, see [Converting Ad Hoc Worksheets to Multiple-Grid Worksheets](#).

5. To create another grid on the worksheet:
 - a. Select a different range of cells.
 - b. From the Smart View Panel, right click an application, and then select **Ad Hoc Analysis**.
6. Repeat step [step 5](#) as necessary to add grids to the worksheet.

**Note:**

Starting in Oracle Smart View for Office 11.1.2.5.400, the creation of multiple-grid worksheets using refresh is no longer supported.

Converting Ad Hoc Worksheets to Multiple-Grid Worksheets

Data source types: Oracle Analytics Cloud - Essbase

To convert an existing ad hoc worksheet to a worksheet that supports multiple grids:

1. From any location in the worksheet, select a range of cells.
You must select a range rather than only one cell.
2. From the Smart View Panel, right click the application, and then select **Ad hoc analysis**.
3. At the prompt, select **Use sheet for multiple grid ad hoc**.

The second grid is added to the worksheet and the sheet now supports multiple grids

Renaming Ranges on Multiple-Grid Worksheets

Data source types: Oracle Analytics Cloud - Essbase

When you place ranges on a multiple-grid worksheet, Excel assigns each range a name by default. The strings used in the name ranges may not be particularly user friendly. For example, a range based on the Oracle Essbase Demo Basic database might look like this:

```
Demo_Basic_C2034305_D2AC_449B_B4AE_56EA047EDF05_1
```

A more user-friendly name would be helpful for all users of the workbook, but changing the name using the Excel Name Manager could cause a loss of metadata in Oracle Smart View for Office.

Use the **Rename Range** command in the Smart View Document Contents pane to change the name to a more descriptive or user-friendly name.

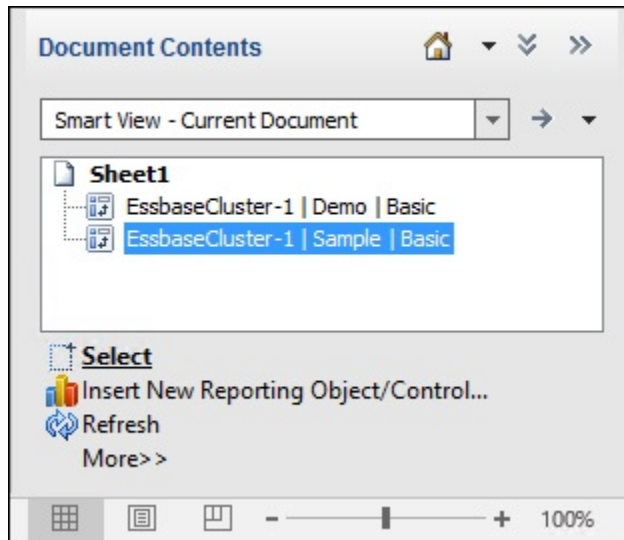

**Note:**

To change range names in multiple-grid worksheets, you *must* use the **Rename Range** command in the Document Contents pane.

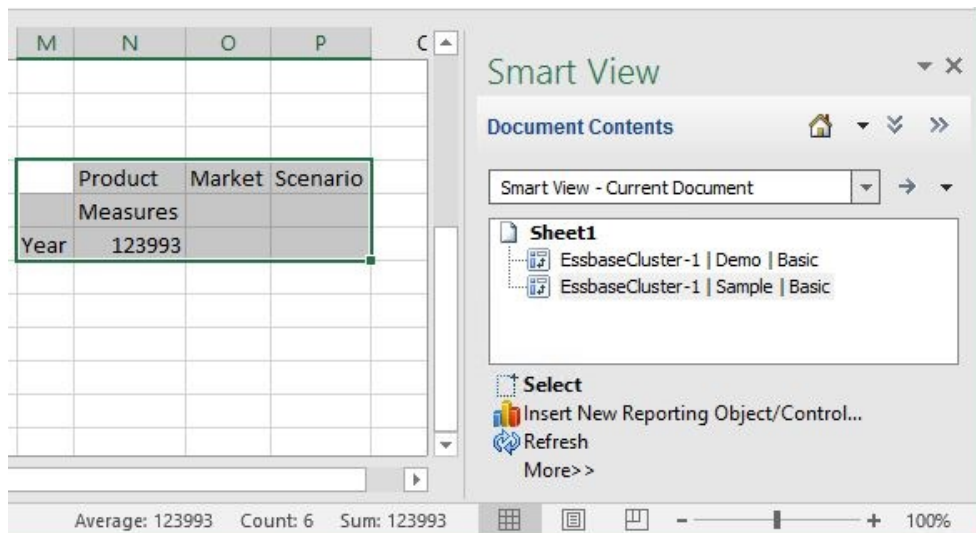

To rename ranges on a multiple-grid worksheet:

1. In the Document Contents pane, highlight the range to rename in the tree, and then click **Select**.

In the following example, `EssbaseCluster-1 | Sample | Basic` is highlighted in the tree.

Use the **Select** command to verify that you are working with the correct grid on the sheet. For example, after highlighting **EssbaseCluster-1 | Sample | Basic** and clicking **Select**, the Sample Basic grid on the worksheet is highlighted.

2. In the Action Panel, click **More**, and then select **Rename Range**.

The **Rename Range** dialog box is displayed, showing the default name that was assigned to the range by Excel.

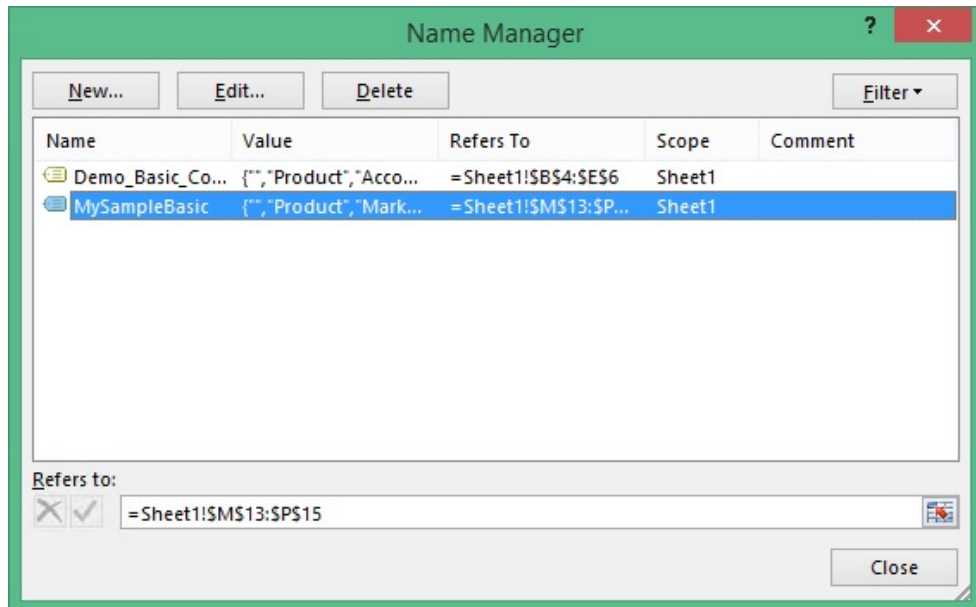

3. In **Rename Range**, type a new range name, and then click **OK**.

We're renaming the range `MySampleBasic`.

4. Verify that the range name is changed in the **Name Manager** in Excel.

Here is an example **Name Manager**, accessed from the Formula ribbon in Excel:

You can also view the changed range name in the Excel **Name Box** drop-down list.

Changing Connections in Multiple-Grid Worksheets

Data source types: Oracle Analytics Cloud - Essbase

To change the connection of a grid in a multiple-grid worksheet:

1. In the grid whose connection you want to change, select a range of cells, You must select a range rather than only one cell.
2. Using **Excel Name Manager**, delete the associated named range.
3. From the Smart View Panel, right click the application to connect to, and then select **Ad Hoc Analysis**.

POV on Essbase Multiple-Grid Worksheets

Data source types: Oracle Analytics Cloud - Essbase

The **POV** button is enabled for Essbase multiple-grid worksheets that contain only one grid, making it possible for you to toggle the button to show or hide the POV toolbar. The **POV** button remains disabled on multiple-grid worksheets that contain more than one grid.

On multiple-grid worksheets that contain one grid, the POV dimensions are displayed both in the grid and in the toolbar. On regular ad hoc worksheets, POV dimensions are displayed in the grid only if the POV toolbar is hidden.

Multiple-Grid Example: Butterfly Report

Data source types: Oracle Analytics Cloud - Essbase

Typically, Oracle Smart View for Office grids consist of member names on rows above and columns on the left of the data grid. Using the range retrieval capabilities of worksheets enabled for multiple grids, you can create grids with different layouts.

For example, you can create "butterfly" reports, with a column of members between two columns of data cells.

Figure 6-19 Butterfly Report

Diet Cola	East	Jan
Budget		Actual
\$190.00	Sales	\$200.00
\$80.00	COGS	\$84.00
\$110.00	Margin	\$116.00
\$20.00	Marketing	\$26.00
\$20.00	Payroll	\$23.00
	Misc	
\$40.00	Total Expenses	\$49.00
\$70.00	Profit	\$67.00
\$480.00	Opening Inventory	\$500.00
\$100.00	Additions	\$190.00
\$390.00	Ending Inventory	\$490.00
57.89	Margin %	58
36.84	Profit %	33.5
\$5.83	Profit per Ounce	\$5.58

Cascading Reports and Ad Hoc Grids

You can create separate reports for any or all of the members of one or more dimensions in a report based on an ad hoc grid or Smart Slice query.

You can then cascade these reports separately across the worksheets of an Excel workbook. For reports created in the Report Designer, you can also cascade reports across slides in a PowerPoint presentation. Worksheets or slides are created as needed to accommodate all reports.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close, Tax Reporting

Formulas, comments and other text, Smart Slice function grids, charts, tables, and sliders are included in cascaded reports.

Oracle Analytics Cloud - Essbase only: Cascading is supported for multiple-grid worksheets.

Note:

When extensions are enabled in Oracle Smart View for Office, cascading a report with a large number of members can cause Excel to stop responding. You may disable any extensions that are installed from the **Smart View Options** dialog box, **Extensions** tab. After disabling, restart Excel and repeat the cascade operation.

Watch this tutorial video to get acquainted with cascading while connected to Planning.

[Tutorial video](#)

To cascade an ad hoc grid or Smart Slice report:

1. Open an ad hoc grid or Smart Slice report on the worksheet.
2. From the **Essbase** ribbon or from the data provider ad hoc ribbon (for example, **Planning Ad Hoc**), select **Cascade**, and then one of the following:
 - **Same Workbook** to use the current workbook
 - **New Workbook** to use a new workbook
 - **Different Workbooks** to cascade each report to a different workbook
3. In **Select Cascade Members**, click  next to each dimension to launch **Member Selection**, where you select the members from each dimension for which you want to create reports.

One report will be generated for each member you select. A message indicating the number of reports to be generated appears in the bottom left of the dialog.

In the example dialog below, members were selected for the Product and Scenario dimensions. For Product and Scenario, after selecting members in **Member**

Selection, quotation marks are applied to the member names. For the Market dimension, because **Member Selection** was not launched and no members selected, then no quotation marks are applied. The message at the bottom of the dialog indicates that four cascaded sheets will be generated.

The screenshot shows a dialog box titled "Select Cascade Members". It contains a list of dimensions and their corresponding member names in text boxes. The "Product" dimension has the members "Product" and "Root Beer" enclosed in quotation marks and separated by a comma. The "Market" dimension has the member "Market". The "Scenario" dimension has the members "Scenario" and "Budget" enclosed in quotation marks and separated by a comma. At the bottom of the dialog, it indicates "Number of cascaded sheets: 4" and has "OK" and "Cancel" buttons.

 **Tip:**

To hand-type member names in the **Select Cascade Members** dialog, you must enclose the member names in quotation marks. This applies to both single name member names and member names containing a comma (,). For example, to select a member named "Laptops" and a member named "Tablets, Smartphones", type:

```
"Laptops", "Tablets, Smartphones"
```

Additionally, separate each member name with a comma, as shown.

 **Note:**

In the **Select Cascade Members** dialog box, JAWS is not reading the "Number of cascaded sheets" label and the number when reciting the dialog content. In JAWS, go to **Utilities**, then **Settings**, then **User**, then **Screen echo**, and then select **Echo all text**.

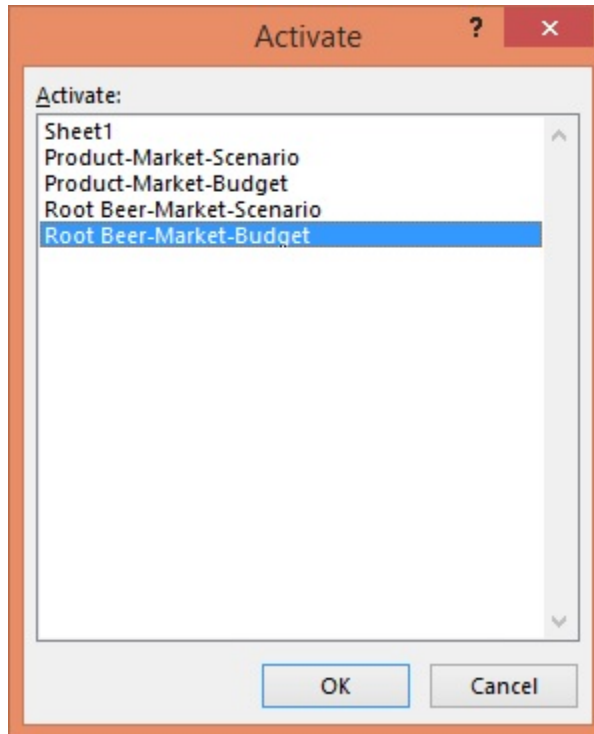

4. Click **OK** to begin cascading.

Depending on your earlier cascade selection, the resulting reports are created on separate worksheets in the current workbook or in a new one. Each worksheet tab is named for the dimensions and members of the report it contains. Click a worksheet tab to view a report.

To see a list of all the worksheets, right-click the left or right arrow at the bottom left of Excel:

In our example using the "Product", "Market", and "Scenario" dimensions, the following reports were created:

To display a specific report, select the report in the list, and then click **OK**.

 **Note:**

- To enable worksheet tab naming, do not use more than 31 characters for dimension, member, or alias names.
- Do not use any of the following special characters in dimension, member or alias names:
{ } () [] @ \ . - = < + ' " _ |
- Cascading may be very slow for large grids.
- When extensions are enabled in Smart View, cascading a report with a large number of members can cause Excel to stop responding. You may disable any extensions that are installed from the **Smart View Options** dialog box, **Extensions** tab. After disabling, restart Excel and repeat the cascade operation.

Substitution Variables

Substitution variables are global or per-application placeholders that represent variable values.

Data source types: Planning

The designation "&CurMnth" might be a substitution variable representing the current month. Application designers or administrators define and manage substitution variables and their corresponding values; Oracle Smart View for Office users can enter a substitution variable into the grid and retrieve its value by refreshing.

For example, say the value for substitution variable "&CurMnth" is August. When you enter &CurMnth into a grid, Smart View displays August after a refresh. Later, if the value is changed to September, then September is displayed after a refresh when you enter &CurMnth.

When connected to Planning, some substitution variables that you enter may represent ranges. For example, "&NewMnthPeriod" might represent the month range of October through December. Or, "&NewQtrPeriod" might represent the quarter hierarchies of Quarter 1 and Quarter 2.

For more information about substitution variables, see the Essbase, Oracle Analytics Cloud - Essbase, Planning, or Planning documentation, available in the Oracle Help Center.

To retrieve the value for a substitution variable:

1. Enter a substitution variable into a cell in the grid.

 **Note:**

Substitution variable names must begin with an ampersand (&).

2. From any ribbon, select **Refresh**.

The current value defined for the substitution variable replaces the substitution variable in the cell (and for any cells in the current worksheet that contain the substitution variable; for example, all instances of &CurMnth would be changed).

 **Note:**

When substitution variables are used, the last column (the right-most column) in forms is dropped or hidden when the form is opened in Smart View.

Comments and Unknown Members on Essbase Sheets

You can set options in Oracle Smart View for Office to detect comments and unknown members on Essbase sheets.

Data source types: Oracle Analytics Cloud - Essbase

When you are connected to an Essbase provider, you can enable options in Smart View that allow you to quickly detect:

- Unknown members on a grid
- Text typed outside the grid; for example, your own notes on a sheet

In Smart View, cells containing these types of data are referred to as *comments*.

You can set options in Smart View that allow you quickly and easily spot comment cells, including invalid, or unknown, members in the grid or pertinent notes you may have made on a sheet outside of the grid.

For example, in an Essbase database on the server, a member named "Oregon Coast" member is renamed "Oregon". Smart View tracks this change and shows it to you if you define a cell style to call out comments. Then, you can quickly note the change and correct it in the grid.

To call out comments on Essbase sheets, you set these options in Smart View

- **Preserve Comments and Unknown Members**
- **Enhanced Comment Handling**
- **Use Cell Styles**

Optionally, define a distinctive cell style for comments.

You can then easily identify comment cells on the sheet, and further select and work with them in the **Comment Edit** dialog box.

See the following topics for more information on working with comments on Essbase sheets:

- [Enabling Comment Display in the Sheet](#)
- [Viewing Comments in the Sheet](#)
- [Editing Comments](#)
- [Deleting Comments](#)

Enabling Comment Display in the Sheet

Data source types: Oracle Analytics Cloud - Essbase

To enable comment display in an Essbase sheet:

1. In the **Options** dialog box, perform these tasks:
 - a. In **Member Options**, select these options:
 - **Preserve Comments and Unknown Members**
 - **Enable Enhanced Comment Handling**

 **Note:**

The **Preserve Formulas and Comments in ad hoc operations (except pivot)** option must be selected to enable these options.

- b. In **Formatting**, select **Use Cell Styles**.

- c. In **Cell Styles**, expand **Common**, and then select the check box next to **Comment Cells**. Optionally, right-click **Comment Cells** and define a **Font**, **Background**, or **Border** for cells containing comments.
2. Click **OK**.
Optionally, click the arrow in the **OK** button and choose either **Save as Default Options** or **Apply to All Sheets**. These options are described in "Sheet Options" in [Smart View Options](#).

You are now ready for the steps in [Viewing Comments in the Sheet](#)

Viewing Comments in the Sheet

Data source types: Oracle Analytics Cloud - Essbase

To view comment cells in an Essbase sheet:

1. Be sure to complete the steps in [Enabling Comment Display in the Sheet](#)
2. Open a workbook containing a grid, connect to an Essbase provider, and click **Refresh**.
3. On the sheet, note the cells containing comments and unknown members.

In the example in [Figure 1](#), cell C4 is an unknown member and Oracle Smart View for Office marked the cell as a comment. The member name was probably changed in the underlying Essbase database. The comment style indicates to us that this member needs attention.

Additionally, a second comment in the sheet notes that the Oregon Coast member name needs to be changed to Oregon. This comment is a note someone made outside of the grid and confirms to us that the member name has been changed on the server and that the member needs to be manually updated in the grid.

Figure 6-20 Grid Showing Cells Marked with Comment Style

	A	B	C	D	E	F
1				Scenario		
2				Measures		
3	Qtr1	Colas	California	341		
4			Oregon Coast			Change to Oregon
5			Washington	170		
6			Utah	342		
7			Nevada	4		
8			West	1042		

4. Continue with [Editing Comments](#) or [Deleting Comments](#).

Editing Comments

Data source types: Oracle Analytics Cloud - Essbase

Be sure to complete the steps in [Enabling Comment Display in the Sheet](#).

 **Note:**

The procedure in this topic shows you how to edit comments on an Essbase sheet using the **View Comments** command and the **Comment Edit** dialog box in Oracle Smart View for Office. You can also edit comments directly in the grid, without using the Smart View interface elements in this topic.

To edit comments on an Essbase sheet:

1. If you have not already done so, open a workbook containing a grid, connect to an Essbase provider, and click **Refresh**.
2. Click **View Comments** in the Essbase ribbon.

Figure 6-21 View Comments Command in Essbase Ribbon

 **Tip:**

The **View Comments** command is enabled only when there are comments in the sheet.

The **Comment Edit** dialog box is launched. The example in [Figure 2](#) shows two comments in the sheet which can be edited.

Figure 6-22 Comment Edit Dialog Box

3. To edit the text in a row, first click in the row to highlight the editable text; for example, click in the "Oregon Coast" row to highlight it, as shown in [Figure 3](#)

Figure 6-23 Row Highlighted, Ready for Editing in Comment Edit Dialog Box

4. Edit the text as required; in this example, change "Oregon Coast" to "Oregon".

Figure 6-24 Changed Text in Comment Edit Dialog Box

5. Click **Apply Changes** and note the change in the grid.
In [Figure 5](#), cell C4 still shows as a commented cell, and will until the sheet is refreshed.

Figure 6-25 Grid After Clicking Apply Changes; Cell C4 Still Commented

	A	B	C	D	E	F
1				Scenario		
2				Measures		
3	Qtr1	Colas	California	341		
4			Oregon			Change to Oregon
5			Washington	170		
6			Utah	342		
7			Nevada	4		
8			West	1042		

6. Click **Refresh**; the comment style is cleared.

Figure 6-26 Grid After Refresh, Cell Style in Cell C4 Is Cleared; Member is In Sync with Server

	A	B	C	D	E	F
1				Scenario		
2				Measures		
3	Qtr1	Colas	California	341		
4			Oregon	185		Change to Oregon
5			Washington	170		
6			Utah	342		
7			Nevada	4		
8			West	1042		

Deleting Comments

Data source types: Oracle Analytics Cloud - Essbase

Be sure to complete the steps in [Enabling Comment Display in the Sheet](#).

Note:

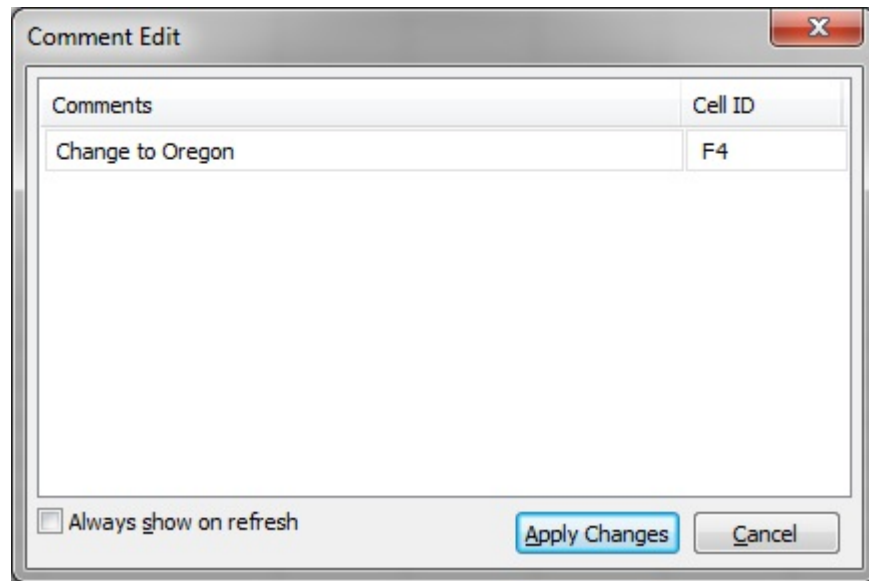

The procedure in this topic shows you how to delete comments using the **View Comments** command and the **Comment Edit** dialog box in Oracle Smart View for Office. You can also delete comments directly in the grid, without using the Smart View interface elements in this topic.

To delete comments:

1. If you have not already done so, open a workbook containing a grid, connect to an Essbase provider, and click **Refresh**.
2. Click **View Comments** in the Essbase ribbon (see [Figure 1](#)).

The **Comment Edit** dialog box is launched. The example in [Figure 1](#) shows one comment left on the sheet, which can be removed.

Figure 6-27 Comment Edit Dialog Box

3. To delete the entire comment, first click in the row to highlight the editable text; for example, click in the "Oregon Coast" row to highlight it, as shown in [Figure 2](#), then press the Delete key.

Figure 6-28 Comment Highlighted and Ready to be Deleted

After deletion, the text in the **Comments** column is removed, but the **Cell ID** is still displayed (see [Figure 3](#)).

Figure 6-29 Comment Deleted, Cell ID Remaining

4. Click **Apply Changes** and view the changes in the sheet.
In [Figure 4](#), cell F4 still shows as a commented cell, and will until the sheet is refreshed.

Figure 6-30 Sheet After Clicking Apply Changes; Cell F4 Still Commented

Working with Forms in Excel

Forms are grid displays in which you can enter data into the database from Excel and view and analyze data or related text.

Certain dimension member values are fixed, giving you a specific view into the data.

Using Oracle Smart View for Office, you can work with Planning, Planning Modules, Financial Consolidation and Close, and Tax Reporting forms in Excel.

 **Note:**

Excel worksheets are always protected to prevent entering data for read-only cells. Therefore, some Excel functions, such as AutoSum and F9, are disabled.

In forms opened in Smart View:

- You can modify data values but not the form structure in forms.
- Values submitted to the database from Excel must be non-formatted data.
- If a form is currently loaded in Excel and the administrator changes the form definition on the server side, Oracle recommends that you close the form and reload it. This action ensures that the newest form definitions are displayed.
- Customizations made to forms are preserved when you save or refresh only if they are made outside the grid or if they are made to thousands and decimal separators.

Unless otherwise noted, in this chapter:

- "Planning forms" refers to forms in Oracle Enterprise Performance Management Cloud (EPM Cloud).
- EPM Cloud refers to these services:
 - Planning
 - Planning Modules
 - Financial Consolidation and Close
 - Tax Reporting

Watch this video to see a tutorial on navigating in Smart View, including opening forms.

[Tutorial video](#)

Related Topics:

[Opening Forms in Excel](#)

[EPM Cloud Form Behavior in Smart View](#)

Opening Forms in Excel

You can open forms in Excel.

Data source types: Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

To open a form:

1. Connect to a data source.
2. In the Smart View Panel, perform an action:

- To open one form, expand the tree list and select the form you want to open. Then click **Open form** on the Action Panel.
 - To open multiple forms, expand the tree list and select a forms folder. Then click **Open forms** on the Action Panel. In **Select Form**, follow the instructions to open one or more forms.
3. To view any instructions that may be associated with the form, from the Planning ribbon, select **More** and then **Instructions**.

Excel Formulas in Forms

You can create Excel formulas in form cells inside or outside the grid if the cells are not read-only or locked.

Cells that contain cell text can contain Excel formulas, but cells containing supporting detail cannot.

Formulas are preserved in forms when you refresh the form even without saving the data, later open the saved worksheet, and when you expand or collapse rows and columns.

If you move a referential formula, its cell references are updated to reflect the new location.

In forms, you are prompted to save the workbook as an Excel file if you do any of the following (but you temporarily lose access):

- Change the current page
- Select a different form
- Connect to a different data source

Working with User Variables

User variables resemble buttons in the POV toolbar in Oracle Smart View for Office.

Data source types: Planning, Financial Consolidation and Close, Tax Reporting

When a Planning, Financial Consolidation and Close, or Tax Reporting form contains user variables, you can modify them in Smart View.

When you click on the user variable buttons, the Member Selection dialog box is displayed. You then select members applicable for the user variable. Any filters that apply to the selected user variable are loaded and viewable from the filter drop-down list. Once selections are made, you can easily change one or more of the user variable buttons, thus changing the POV of a form in Smart View.

Figure 1 shows an example of user variables in a Planning form, where Allocation Expense, Allocation Quarter, and My Segment are user variables that can be modified to change the POV of the form.

Figure 7-1 Example of User Variables in a Planning Form

To work with user variables for forms:

1. In the Smart View Panel, connect to a data source and open a form.
Notice the available user variables in the POV toolbar across the top of the sheet. Selectable buttons are enabled, non-selectable buttons are grayed out.
2. Click a user variable button to display the **Member Selection** dialog box.
3. From **Member Selection**, select one or members to add to the selected user variable button.

Planning: Alternatively, click the arrow in  and select **Substitution Variables** to select members as substitution variables.

4. In the **Filter** drop-down list, select an applicable filter (if filters are available).
5. Click **OK**.
6. Repeat step 3 through step 5 for all user variables buttons for which you want to select members and apply filters.
7. To use the user variable buttons, click each button for which you want to apply selected members, and make a selection from the drop-down list.
8. Click **Refresh** to view the updated form.

EPM Cloud Form Behavior in Smart View

Forms behave differently in Oracle Smart View for Office than they do in Oracle Enterprise Performance Management Cloud applications.

- Attributes in Planning forms are not displayed in Smart View.
- Saving ad hoc grids as forms is not supported for grids containing attributes.
- Multiple levels in an outline are displayed differently in Smart View than pages on the web application. Smart View displays up to four levels, while the web application displays up to two levels.
- If a Planning administrator hides a dimension in the row axis of a Planning form, this dimension does not display in the row header of the form in Smart View.
- If a Planning administrator has set up a form to use formatting from Planning, and not from Smart View, then no Smart View formatting options (from the Options dialog, Formatting tab) will be applied. This is true whether the **Use Cell Styles** or **Use Excel Formatting** option is selected in Smart View.
- In composite forms, sections that display as charts in the Planning web application will display as grids in Smart View.
- In Planning forms, the handling of decimal place settings between Excel, Smart View, and Planning may, at times, cause rounding issues in submitted data. This can occur even when the decimal precision is set to two decimal places in both Excel and Planning. For example, in a Planning form, you may enter 68.68, but Smart View sends the data to Planning as 68.6799999999, instead of 68.68.
- If row drop-down menus are enabled on a form, then Smart Push (which pushes data from different cubes into one form) cannot be used.
- Smart View does not support the use of dynamic members, or "members on-the-fly." Dynamic members can only be used in forms in the Planning web application.

- When you create a formula on members that calculates the value for a Summary Time Period and then you modify the data for the Summary Time Period member, sometimes Smart View considers that cell to be a dirty cell.
- In Smart View, the display order of business rules attached to a form differs from the display order in Planning.
- When two forms are on two separate worksheets, the rule variable on the first form changes to the default value after refreshing the page dimension on the second form. This may cause the business rule to invoke an incorrect value for a runtime prompt variable. If this happens, display the runtime prompt to see its value before submitting the rule for execution.
- In Smart View, the currency symbol in a cell is displayed differently from the Planning web interface when the Planning option, "Allow multiple currencies per entity," is set to true.
- Indentation of dimensions in a Planning form is displayed incorrectly.

See also: [Guidelines for Working with Native Excel Formatting and Planning Forms](#)

 **Note:**

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

Displaying the Floating Toolbar in Planning Forms

The floating toolbar is displayed when you click a data cell in a Planning form.

The floating toolbar provides quick access to these commands:

- Supporting Details
- Cell Comments
- Drill-through
- Attachments

To display or suppress the floating toolbar in Planning forms:

1. In the Smart View ribbon, click **Options**, and then select the **Advanced** tab.
You do not need to be logged in to set this option.
2. Perform an action:
 - To display the floating toolbar, select the **Display floating toolbar on forms** check box.
This check box is selected by default.
 - To suppress the floating toolbar display, clear the **Display floating toolbar on forms** check box.
3. Click **OK** to save your selection.

Saving Ad Hoc Grids as Forms

If you have been assigned the ad hoc grid creator role, you can save Planning ad hoc grids as forms.

Data source types: Planning, Planning Modules

Note:

In this topic, references to Planning forms only apply to Planning and Planning Modules.

To save a Planning ad hoc grid as a form:

1. With the Planning ad hoc grid active, from the Planning Ad Hoc ribbon, click **Save Ad Hoc Grid**.

Saving ad hoc grids as forms is not supported for grids containing attributes.

2. In **Save Grid As**, enter a name, path to the location where you want to save the grid, and optional description for the grid.

3. **Optional:** Select **Submit Formatting** to save any Excel formatting or cell style changes that have been applied to the grid.

See [Saving Native Excel Formatting to EPM Cloud](#) for additional notes and guidelines about saving formatting in Planning ad hoc grids and forms.

4. Click **OK**.

The saved grid is displayed in the Smart View Panel tree list in the location that you selected in step 2.

Performing Ad Hoc Analysis in Planning Forms

If you have been assigned the ad hoc user role by the administrator, you can perform ad hoc analysis on Planning forms that have been enabled for ad hoc by the administrator.

Note:

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

To perform ad hoc analysis in Planning forms:

1. Open the form.
2. Do one of the following:
 - From the Smart View ribbon, click **Analyze**. This button is enabled only if the current form has been enabled for ad hoc analysis.

- Select the form in the Smart View Panel and click **Ad hoc analysis** in the Action Panel.
3. See [Ad Hoc Analysis](#) for information about performing ad hoc analysis.

Using the Drop-down Member Selector on Row Dimensions in Forms

In forms, Planning administrators and form designers can set up easy-to-use drop-down member selectors on row dimensions.

Data source types: Planning

When drop-down selectors are enabled, the form users can directly select a member from the drop-down list on the row dimension in the form.

The drop-down member selector also allows users to add data to member rows that may have otherwise been suppressed.

When using the drop-down member selector, keep in mind the following:

- There is no visual notification as to which members have drop-downs enabled; you must click a dimension cell and, if a down arrow appears next to the cell, then there is a drop-down list enabled.
- The drop-down content (list of members) is controlled by the form definition for the corresponding segment.
- Selections are not retained. The drop-down selection will be lost on refresh. If you perform a Refresh after selecting a member from the drop-down, the selection is lost and the form returns to its original state.
- The drop-down selection will be lost on saving data. Modifying data cells and saving the Excel worksheet will not retain modified drop-down selections.
- Composite forms: Using the drop-down member selector with row dimensions is not supported.

This feature requires configuration in the Form Designer in the Planning web interface. The Planning administrator or form designer specifies the drop-down selectors as segment properties for particular dimensions. For example, suppose there are two dimensions placed on row axes, Entities and Line item; the member selector drop-down may be enabled for the Entity dimension members, for the Line item dimension members, or for both. Configuration is described in *Administering Planning Using the Simplified Interface*.

To use the drop-down selector in a Planning form, click on row dimension or member names in a form. If a drop-down arrow appears, click it to view and select members from the drop-down list, as shown in following illustration:

	A	B	C	D	E
1		-Q1			
			Jan	Feb	Mar
2	Product X	935	408	244	282
3	Envoy Standard Netbook	2619	1214	552	853
4	Type to search	1469	686	354	429
5		423	243	77	104
6	Product X	964	358	316	290
7	Sentinal Standard Notebook	6409	2908	1542	1958
8	Sentinal Custom Notebook				
9	Envoy Standard Netbook				
10	Envoy Custom Netbook				

Example

In this example, rows with #Missing values are suppressed, and you were tasked with inputting the values for the Sentinel Standard Notebook. It happens that in the database, the values for the Sentinel Standard Notebook for January through June are all #Missing. When you open the form, there is no row for Sentinel Standard Notebook.

	A	B	C	D	E	F	G	H	I
1		-Q1				-Q2			
			Jan	Feb	Mar		Apr	May	Jun
2	Product X	935	408	244	282	900	366	233	300
3	Envoy Standard Netbook	2619	1214	552	853	2560	873	794	894
4	Envoy Custom Netbook	1469	686	354	429	1932	738	505	689
5	Other Computer	423	243	77	104	543	258	179	106
6	Tablet Computer	964	358	316	290	992	368	326	298
7	-Computer Equipment	6409	2908	1542	1958	6927	2603	2036	2287

Use the drop-down member selector on a row and choose Sentinel Standard Notebook from the list.

	A	B	C	D	E	F	G	H	I
		-Q1				-Q2			
1			Jan	Feb	Mar		Apr	May	Jun
2	Product X	935	408	244	282	900	366	233	300
3	Envoy Standard Netbook	19	1214	552	853	2560	873	794	894
4	Type to search	86	354	429	1932	738	505	689	
5		43	77	104	543	258	179	106	
6	Product X	58	316	290	992	368	326	298	
7	Sentinal Standard Notebook	08	1542	1958	6927	2603	2036	2287	
8	Sentinal Custom Notebook								
9	Envoy Standard Netbook								
10	Envoy Custom Netbook								

Sentinal Standard Notebook now appears in place of Envoy Standard Netbook. Note that the data values in the row have not changed. You can type over the existing values to input the values you require. In this example, you would type 500 in each month column, January through June.

	A	B	C	D	E	F	G	H	I
		-Q1				-Q2			
1			Jan	Feb	Mar		Apr	May	Jun
2	Product X	935	408	244	282	900	366	233	300
3	Sentinal Standard Notebo	2619	500	500	500	2560	500	500	500
4	Envoy Custom Netbook	1469	686	354	429	1932	738	505	689
5	Other Computer	423	243	77	104	543	258	179	106
6	Tablet Computer	964	358	316	290	992	368	326	298
7	-Computer Equipment	6409	2908	1542	1958	6927	2603	2036	2287

In the Planning ribbon, click **Submit**. Note that the row for Sentinal Standard Notebook is added to the form as this row now contains values. Also, the values in the row for Computer Equipment are recalculated. Only the modified values are saved for the drop-down member that was changed. No inherited values from other members are changed.

Inserting Charts

Starting in release 11.1.2.5.700, you can insert forms as charts into Microsoft PowerPoint, giving you a graphical display of the information in the form.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Oracle Smart View for Office renders the form information as a chart in PowerPoint. You can use the chart tools in PowerPoint to change the chart design and format. You can insert a Smart View POV reporting object to change the POV of the chart.

Certain forms may or may not make ideal charts. Some form data may not present itself well in chart format. For example, a balance sheet form may not make a useful chart. However, a monthly revenue form may be a good candidate for the chart format. Oracle recommends investigating with the forms available to you and working with the forms designers to meet your requirements for charts.

Note:

- The Insert Chart functionality is not available in Word or Excel.
- Smart View does not support directly inserting stepped and curved line charts. When inserting a stepped or curved line chart, Smart View will substitute the closest match, a default line chart.

To insert and edit a chart in PowerPoint:

1. Launch PowerPoint and connect to the data source.
2. Navigate to the form and select it.
3. In the Action Panel, select **Insert Chart**.

Alternatively, right-click the form name and select **Insert Chart**; for example:

The chart is inserted on the slide, where it can be selected and edited; in the following example, the slide width has been stretched from its initial state:

4. **Optional:** To change the POV of the chart, insert the POV control and modify the POV.
 - a. In the Document Contents pane, select the data source for the chart, then select **Insert New Reporting Object/Control**.

In the following example, the data source is signified by the blue bar:

- b. In the **Insert New Reporting Object/Control** dialog box, click **POV**.

A read-only POV is placed on the slide; for example:

- c. Click the **Slide Show** icon in the task bar at the bottom right of the PowerPoint window to enter slide show mode where you can modify the POV.

- d. In slide show mode, use the drop-down lists in the POV toolbar to make the required changes.

- e. In the POV toolbar, click **Refresh**.
 - f. Repeat the steps to change the POV as needed; when finished, exit slide show mode.
You can press the **Esc** key to exit slide show mode.
5. Continue with any further chart design and format edits, and then save the PowerPoint presentation as needed.

Working with Valid Intersections

Related Topics

- [About Valid Intersections](#)
- [Working with Valid Intersections in Page Drop-down Lists](#)
- [Working with Valid Intersections in Forms](#)

About Valid Intersections

Data source types: Planning

Your Planning administrator can enable applications for valid intersections. In forms, valid intersections allow you to view or enter data only at predefined "valid" intersections.

For example, valid intersections might consist of a subset of Segment members which are valid only with a limited list of departments, or specific programs which are valid only for certain time periods.

Forms that are enabled for valid intersections can provide faster data entry and simplified plan validation resulting in higher quality Planning data, as well as easier maintenance of data entry forms. Data integrity is still maintained at "invalid" intersections.

When valid intersections are defined in an application, then cell intersections considered "invalid" are read-only.

 **Note:**

Planning Administrators: In this guide, the topics on valid intersections are primarily intended for Oracle Smart View for Office end users. For more information on setting up valid intersections in forms, see "Defining Valid Intersections" in *Administering Planning*.

Working with Valid Intersections in Page Drop-down Lists

Data source type: Planning

See also:

- [Working with Valid Intersections in Page Drop-down Lists](#)
- [Working with No Members in Page Drop-down Lists](#)

To select members when valid intersections are enabled in a form:

1. Open a form.

The form renders with member selections as specified in the form definition, adhering to your access rights for dimensions, and applies valid intersection groups with the most recently used as current selections.

2. Verify that the form is enabled for valid intersections by looking for the **<Clear Selection>** option at the bottom of the Page drop-down member selectors.

If an application is enabled for valid intersections, the **<Clear Selection>** option appears at the bottom of the Page drop-down member selectors.

For example, in [Figure 1](#), the **<Clear Selection>** option is highlighted in the Page drop-down list for the Entity dimension.

Figure 7-2 The <Clear Selection> Option in the Page Drop-Down Member Selector

		E	I	M	Q	R
		+Q1	+Q2	+Q3	+Q4	YearTotal
410:International Sales						
420:Sales East						
421:Sales NorthEast						
422:Sales Mid-Atlantic						
423:Sales SouthEast						
430:Sales South						
440:Sales Central						
450:Sales West						
403:Sales		54734	57683	61192	62086	235695
<Clear Selection>		3801	3801	3801	3801	3801
4	Gross Margin %	200.00%	200.00%	200.00%	200.00%	200.00%
5	4001:4001: Total Revenue	26904636	28966214	30579198	31412890	117862938
6	5000:5000: Total Cost of Sales and Service	18734770	20215569	21372769	22069802	82392910
7	-GP:Gross Profit	8169866	8750645	9206429	9343088	35470028

3. **Optional:** Select **<Clear Selection>** in all selectable Page drop-down lists and note that **<Select Member>** now appears in the Page member selectors.

For example, in [Figure 2](#), the **<Select Member>** option is displayed in the Page selector for both the Entity and Product dimensions.

Figure 7-3 The <Select Member> Option in the Page Drop-Down Member Selectors

T11		E	I	M	Q	R
A		+Q1	+Q2	+Q3	+Q4	YearTotal
1						
2	Units	54734	57683	61192	62086	235695
3	ASP	3801	3801	3801	3801	3801
4	Gross Margin %	200.00%	200.00%	200.00%	200.00%	200.00%
5	4001:4001: Total Revenue	26904636	28966214	30579198	31412890	117862938
6	5000:5000: Total Cost of Sales and Service	18734770	20215569	21372769	22069802	82392910
7	-GP:Gross Profit	8169866	8750645	9206429	9343088	35470028

4. Make selections in each Page drop-down list, and then click **Refresh**.

The form generally behaves as any Planning form; however, when working with valid intersections, the selections available to you in the Page selector for a dimension may depend on the member you chose in the Page selector for a different dimension.

Example 7-1 Working with Valid Intersections in Page Drop-down Lists

Valid intersection rules are set up by Planning administrators in the Planning web application. In [Figure 3](#), valid intersection rules are set up as follows.

- When the 403:Sales member is selected in the Entity dimension, all products in the Product dimension are available for selection.
- When the 410:International Sales member is selected in the Entity dimension, then the members P_260:Game, P_270:Camera, and P_280:Television are not available for selection. All other members are available for selection.
- When the 421:Sales NorthEast member is selected in the Entity dimension, then the members P_220:Software Suite and P_250:Network Card are not available for selection. All other members are available for selection.

Figure 7-4 Valid Intersections Rules Constructed in Planning Web Application

Region-Product Save and Close Cancel

Tap description to edit Add Rule Add Dimension

Entity	Product	
Children(403) 410, 421	IDescendants(P_TP)	✖
410	IDescendants(P_TP) P_260, P_270, P_280	✖
421	IDescendants(P_TP) P_220, P_250	✖

Now let's see how the rules set up in Figure 3 are exposed in Oracle Smart View for Office.

In the following examples, we'll demonstrate the valid intersection rules noted above. We'll select members in Entity and Product to change the point of view of the form, within the scope of the valid intersection rules.

0 shows a newly-opened form. The form has five dimensions. We can change the Page member on two of the dimensions.

Figure 7-5 Planning Form with Access to Member Selection on Two Dimensions

403:Sales P_TP1:Computer Equipment Plan:Plan FY15:FY15 Working:Working Refresh						
U18						
	A	E	I	M	Q	R
		+Q1	+Q2	+Q3	+Q4	YearTotal
1						
2	Units	54734	57683	61192	62086	235695
3	ASP	3801	3801	3801	3801	3801
4	Gross Margin %	200.00%	200.00%	200.00%	200.00%	200.00%
5	4001:4001: Total Revenue	26904636	28966214	30579198	31412890	117862938
6	5000:5000: Total Cost of Sales and Service	18734770	20215569	21372769	22069802	82392910
7	-GP:Gross Profit	8169866	8750645	9206429	9343088	35470028

According to the valid intersection rules:

- When the 403:Sales member is selected in the Entity dimension, all products in the Product dimension are available for selection. For example:

403:Sales <Select Member> Plan:Plan FY15:FY15 Working:Working Refresh						
T11 <Select Member>						
					Q	R
					+Q4	YearTotal
1						
2	Units				192	62086 235695
3	ASP				801	3801 3801

Example 7-2 Working with No Members in Page Drop-down Lists

The scenario shown in Figure 5, where there are no members to select from in the Product dimension Page drop-down list, might come about in at least a couple of different ways. For example, the Planning administrator may have configured any of the following:

- Defined a valid intersection rule that excludes members of the Product dimension when 440:Sales Central is selected for the Entity dimension.
- Defined a valid intersection rule that excludes P_260:Game, P_270:Camera, and P_280:Television when 440:Sales Central is selected for the Entity dimension, but the form is designed for only those three members.

In either case, when 440:Sales Central is selected for Entity, there are no Product members to select from in the Page drop-down list, and only **<Select Member>** is displayed.

Working with Valid Intersections in Forms

Data source type: Planning

See also:

[Working with Valid Intersections in Forms](#)

1. Open a form.
The form renders with member selections as specified in the form definition, adhering to your access rights for dimensions, and applies valid intersection groups with the most recently used as current selections.
2. Verify that the form is enabled for valid intersections by looking for the **<Clear Selection>** option at the bottom of a Page drop-down list.

See [Working with Valid Intersections in Page Drop-down Lists](#).

3. Enter and submit data in writable cells at valid intersections.

In [Figure 1](#), with the member 420:Sales East selected for the Entity dimension, cells for each product are writable. The cells for P_TP1:Computer Equipment and P_TP2:Computer Accessories are not writable as these cells roll up the total of the data in the product cells.

Metadata consists of Oracle Smart View for Office artifacts such as the POV, alias tables, and connection information.
- [Entering Percentage Values in Forms and Ad Hoc Grids](#)
In forms and ad hoc grids, note the guidelines outlined in this topic when entering values in cells defined as percentages.
- [Enabling Automatic Cell Width and Height Adjustment](#)
You can enable the automatic adjustment of Excel column width and row height to accommodate the contents of member and data cells.
- [Sheet Information](#)
In **Sheet Information**, you can view connection and other details for the current worksheet. You can also delete Smart View metadata from a sheet or workbook, save the metadata to another sheet, and copy list items from the dialog to another sheet or document.
- [Document Contents](#)
Document Contents is a task pane in the Smart View Panel that provides a view of—and allows you to perform actions on—the content existing in the current Office document.
- [Shared Workbooks](#)
Oracle Smart View for Office does not support Excel shared workbooks.
- [Protected Worksheets](#)
Oracle Smart View for Office operations, such as refresh and ad hoc, are not supported on protected sheets.
- [Opening Large Workbooks in Smart View](#)
Oracle Smart View for Office may stop responding when opening workbooks containing a large number of rows and columns, graphical objects, and Excel comments.
- [Printing POV Members in the Header and Footer](#)
You can print active POV members in the header or footer of an Excel document.

- [Opening Forms and Ad Hoc Grids from Web Applications \(Web Launch\)](#)
From your web application, you can open forms and ad hoc grids in Oracle Smart View for Office. This action is also referred to as *web launch*.
- [Enabling and Disabling Smart View](#)
Oracle Smart View for Office is enabled by default after installation.

Smart View Operations

Oracle Smart View for Office provides a set of operations common to all data source types.

These include basic operations, functions, and the ability to set preferences.

Using Undo and Redo

When connected to a data source provider, the Undo option in the Smart View ribbon, undoes the last user action in a cell.

Undo,  **Undo**, and **Redo**,  **Redo**, behave differently depending on the data source to which you are connected. Briefly:

- In ad hoc analysis with Narrative Reporting data sources, **Undo** undoes **Zoom In**, **Zoom Out**, **Keep Only**, **Remove Only**, or **Refresh** and restores the previous database view to the grid. Performing an **Undo** after modifying member data returns the sheet to its state before the last refresh, not to its state before the data modification.
- In forms, **Undo** undoes the last user action in a cell.
- In ad hoc grids for all providers, Excel formatting is not retained when performing an **Undo**.

See also [Undo Support By Provider](#).

Note:

You can only undo operations that are performed in Oracle Smart View for Office. You cannot undo operations that are performed on the provider server, such as calculation status.

Specifying the Number of Undo and Redo Actions

To specify the number of permitted undo and redo actions:

1. From the Smart View ribbon, select **Options**, then select **Advanced** in the left panel.
2. In **Number of Undo Actions**, specify the number of permissible **Undo** operations, 0 through 100.

This is also the number of **Redo** operations permitted.

3. Click **OK**. The setting takes effect after you refresh or perform a drill operation.

Copying and Pasting

You can copy and paste Oracle Smart View for Office ad hoc, data points, functions, and Oracle Business Intelligence Enterprise Edition content between Excel, Word and PowerPoint.

Related Topics

- [Copying, Pasting, and Refreshing Smart View Content](#)
- [Copying Data Between Excel, Word, and PowerPoint](#)
- [Viewing Cell POV and Server Information for Pasted Data Points](#)
- [Excel Copy and Paste Guidelines](#)

Copying, Pasting, and Refreshing Smart View Content

The following Oracle Smart View for Office content can be copied and pasted using the Copy and Paste buttons in the Smart View ribbon, and then refreshed using Smart View Refresh.

- Ad hoc—all applicable providers
- Data points—all applicable providers
- Functions—only HsGetValue (see also [Copying and Pasting HsGetValue Functions](#))
- Oracle Analytics Cloud content

Other content in Smart View will be pasted as static text, including forms such as Planning forms.

Chart copy and paste is only supported for Oracle Analytics Cloud charts. Charts based on other providers, such as Planning, do not always paste correctly. For example, if you insert a chart, then change the format (such as from bar chart to pie chart), and then copy and paste it, the chart will not paste correctly.

Copying Data Between Excel, Word, and PowerPoint

In Oracle Smart View for Office, you can copy data from Excel and paste it into Excel, Word, or PowerPoint. The data you copy and paste is dynamic between Office applications. You can copy and paste data from:

- Excel to Word and PowerPoint
- Excel to Excel (ad hoc only)
- Word to Word and PowerPoint
- PowerPoint to Word and PowerPoint

The data points retain their original Excel-based query information, enabling you to perform data analysis.

Notes

- Dynamic data points are maintained only in Word and PowerPoint. If you copy and paste data points within Excel, the data points are not linked to the Excel grid.
- When copying and pasting from Word to PowerPoint, or vice versa, data is displayed in a straight line. The tabular format is preserved only when copying data from Excel into Word or PowerPoint.
- Numeric formatting in Excel is preserved when data is pasted into Word and PowerPoint. Apply numeric formatting in Excel before copying and pasting data.

- If the name of the connection to the data source contains a semicolon (;), you may not be able to paste function data points.
- Copying and pasting data points is limited to use with grids and functions. You can copy data points from forms, but they will be pasted as static text.
- When you copy and paste a data cell within Excel, Smart View generates an HsGetValue function that appears in the Excel formula bar when the pasted cell is selected. Functions generated by Smart View contain the `svLink` syntax; for example:

```
= HsGetValue("", "Measures#Measures", "Year#Year",  
"svLink15131004130EOL", "Row0", "Col0")
```

When copied and pasted, functions containing the `svLink` syntax result in static text. These functions may, however, be used as a template for creating other HsGetValue functions, providing that you remove the `svLink` syntax and replace it with the POV dimensions and members you require.

- On computers where Smart View is installed, an error occurs when updating links in PowerPoint that were copied from Excel to PowerPoint.
- Formatting is not retained when copying and pasting cells from Excel to Word.
- Number formatting is not retained when copying data points from Excel to Word or PowerPoint.
- When working with Oracle Hyperion Financial Management ad hoc, and copying and pasting cells from Excel to Word, formatting is not retained even though the **Use Excel Formatting** option is selected.

Watch this video to see a tutorial on integrating data in Office applications, including copying and pasting data points.

[Tutorial video](#)

To copy and paste data *from* Excel, Word, or PowerPoint *to* Excel, Word, or PowerPoint:

1. Select a data cell or range (may or may not include members).
2. From the Smart View ribbon, select **Copy**.
3. Open a Word or PowerPoint document, or another Excel worksheet or workbook.
4. If asked if you want to create a connection, click **Yes**.
5. From the Smart View ribbon, select **Paste**.
6. Refresh.

Note:

If you paste data into a Word document and save it in a different format such as `.htm` or `.mht`, you cannot refresh the data in these other formats.

7. **Optional:** To change the POV in Word or PowerPoint after you paste the data, click **Manage POV** and follow the procedure in [Selecting Members for the Default or Background POV](#).

Retrieving Spreadsheets From Which Data Points Were Copied

To retrieve the Excel spreadsheets from which data points were copied:

1. In a Word or PowerPoint document into which Excel data points were pasted, select a data cell.
2. From the data source ribbon, select **Visualize in Excel**.
3. If asked to log on the data source, enter the user name and password.

Excel displays the spreadsheet associated with the data cells. You can perform ad hoc analysis on the data.

Viewing Cell POV and Server Information for Pasted Data Points

After copying and pasting data points from Microsoft Office applications, and then refreshing the Office document, you can select data points and view the POV and source server information.

This procedure applies to data points copied from Excel and pasted to Excel, Word, or PowerPoint, or copied and pasted between Word and PowerPoint.

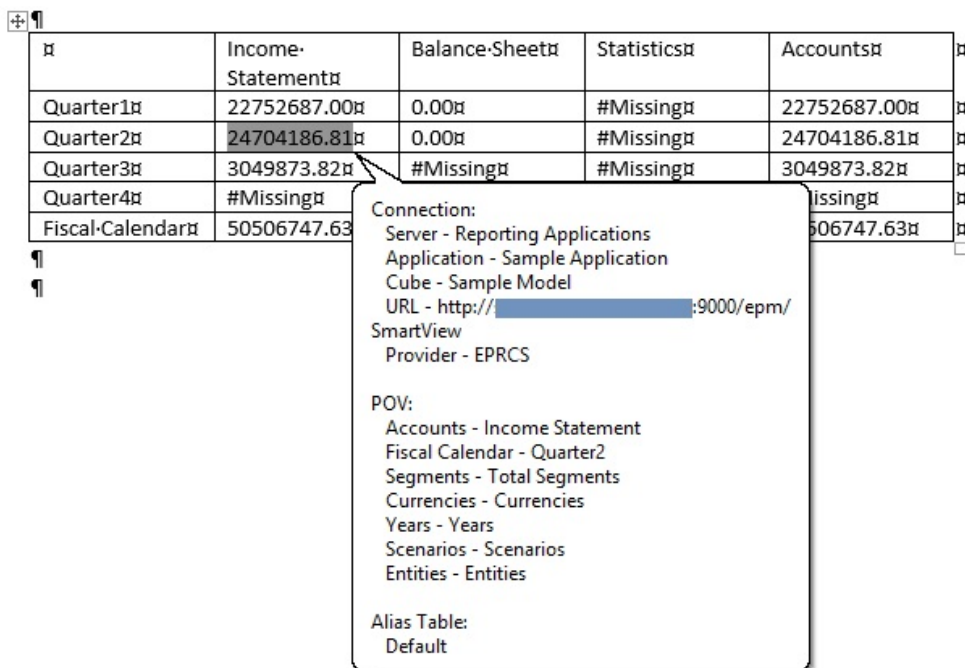

To view the POV and source server information of a pasted data point:

1. In the target Office document, select the data point.

For example, if you copied and pasted an ad hoc grid from Excel to Word, then in Word, select a data point within the pasted and refreshed grid. In some cases, double-clicking the cell may be sufficient, but if there a decimal point in the cell, then you must select it manually.

The cell POV and server information is displayed as hover text, as shown in [Figure 1](#).

Figure 8-1 Pasted Grid Showing Hover Text Over Selected Data Cell

2. To close the hover text, click anywhere on your screen.

Excel Copy and Paste Guidelines

- In data forms, after copying a cell, only a single paste is allowed. Pasting into subsequent cells is not supported.

Workaround: After pasting the cell once, you must copy the cell again in order to paste it into another cell.

- In forms or ad hoc grids with hidden columns, you will have unexpected results if you attempt to copy two or more consecutive cells from a range containing visible and hidden cells and paste them into a range of visible and hidden cells. The copied cells will be pasted to both the visible and hidden cells. This is Excel behavior.

For example, suppose you are working with the following Year hierarchy on a form:

```
Year
  Quarter
    Month
```

On the form, the Quarter members are collapsed, so that the only visible members are Year and Month. Copy the values from one of the rows under the four Quarter cells, and paste them onto another row in another grid or form under Quarter, where the Quarter members are also collapsed.

You may expect to see each of the four Quarter values pasted into the same position as on the previous sheet, but this is not the case. The cells will paste into the first visible cell and into the next three hidden cells (for example, Jan, Feb, Mar).

Consider also that some Planning forms may also have spreading enabled, which can affect how the values are updated in the cells.

- Office Copy and Paste is not supported for copying and pasting Oracle Smart View for Office objects—such as charts, tables, or the POV—between slides, pages, and sheets. Smart View does not always handle the invalid copy gracefully. For example, in PowerPoint, if a Smart View chart is copied using Office Copy and Paste, an error message is displayed upon Refresh. Follow these guidelines:
 - Do not use Office Copy and Paste to copy Smart View reporting objects. Instead, use Smart View Copy and Paste.
 - Do not copy and paste charts inserted using the Insert Chart command in PowerPoint. This applies to both Office Copy and Paste and Smart View Copy and Paste.
- Using the copy and paste functionality in Excel and then performing any Smart View operation (such as Refresh, Zoom In, or Submit) causes Smart View to stop responding in the following cases:
 - Copying a column to multiple columns if the column copied contains a Smart List or the database to which you're connected supports duplicate member names
 - Copying one Smart List cell to multiple cells

Copying one member cell to multiple cells if the database to which you're connected supports duplicate member names

Workarounds for Office 2010:

- While designing the ad hoc grid and copying and pasting columns or cells, ensure that the **Member Name Display** option is set to "Distinct Member Name Only." The **Member Name Display** option is in the **Member Options** tab of the **Options** dialog box.
- After pasting, save the workbook and reopen it, then perform the refresh.

Microsoft Fix for Office 2013 and 2016:

The copy and paste cases noted above work as expected in Office 2013 and 2016 if you have applied the updates described in the following Microsoft Knowledge Base (KB) articles:

- For Excel 2013:
<https://support.microsoft.com/en-us/help/3115455/august-9--2016--update-for-excel-2013-kb3115455>
- For Excel 2016:
<https://support.microsoft.com/en-us/help/3115438/august-9--2016--update-for-excel-2016-kb3115438>

If you are experiencing this issue on Excel 2013 or 2016, then you should install the appropriate KB update for your Excel version.

Importing Metadata in Office Applications

Metadata consists of Oracle Smart View for Office artifacts such as the POV, alias tables, and connection information.

Related Topics:

[Importing Metadata into Copied Worksheets](#)

[Importing Metadata into Copied Word Documents](#)

[Importing Metadata into Copied Slides or Presentations](#)

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting, Oracle Hyperion Reporting and Analysis

In a new Office document, you may want to make use of Smart View content in an existing document that contains not only the formatting and layout that you need, but data points as well. Instead of recreating the Smart View content from scratch, you can reuse the work that is already available.

When you use the Microsoft Office copy and paste commands to copy Smart View content within or between Office documents, the static data and formatting is copied; but the Smart View metadata is not copied.

By using the **Import Metadata** command, after the data is copied, you can import the metadata from the original Office document into the new Office document.

You can use the Office copy and paste commands to copy content within individual Office applications as follows:

- *From an Excel worksheet to another worksheet within the current Excel workbook or to a different workbook*
- *From a Word document to the same or different page within the current Word document or to a different Word document*
- *From a PowerPoint slide or presentation to a slide within the current PowerPoint presentation or a different presentation*

Note the following guidelines when copying, pasting, and importing:

- **Excel:**
 - You can import metadata in the following:
 - * Ad hoc mode, including Smart Slices
 - * Forms
 - * Functions
 - * Query-bound functions in sheets created by Smart View copy and paste
 - * Non-query-bound functions created by the Function Builder
 - * Worksheets that contain reports imported from Reporting and Analysis providers
 - You cannot import metadata in worksheets that contain Report Designer objects, but such workbooks can be replicated by cascading as described in [Cascading Reports and Ad Hoc Grids](#).

 **Note:**

This procedure should be performed only by advanced users.

- **Word:**
 - You can copy and paste graphs
 - You can copy and paste entire tables containing data points or copy and paste individual data points inline, within existing text
 - Metadata must be imported from the same object or shape that was copied.
 - Metadata is copied only for the copied objects or shapes, only rather than copying all the metadata present in the source Word document.
 - For the **Import Metadata** command to work, there must be at least one copied Smart View object in the destination document, whether it is the current Word document or a different one.
 - Copying the POV or slider within the same Word document will result in incorrect behavior in the document.
- **PowerPoint:**
 - You must select a single slide to begin the import process. Smart View displays an error message if you invoke the **Import Metadata** command when either no slide is selected or multiple slides are selected.
 - You must first copy objects before selecting the **Import Metadata** command; otherwise, Smart View prompts you with a message.

- The slide from which the object is copied and the slide from which the metadata is to be imported must be the same.
- Metadata is copied only for the copied objects or shapes, only rather than copying all the metadata present in the source slide.
- You can duplicate a slide containing a POV or slider, but importing the metadata will result in an error.
- Copying a POV or slider within the same presentation will result in incorrect behavior in the presentation.

Importing Metadata into Copied Worksheets

Data source types: Oracle Analytics Cloud - Essbase, Planning, Narrative Reporting, Financial Consolidation and Close, Tax Reporting, Oracle Hyperion Reporting and Analysis

Before you begin, be sure to review the content in [Importing Metadata in Office Applications](#).

Note:

This operation cannot be undone.

To import metadata to a copied worksheet:

1. Back up your work.
2. From the Smart View ribbon, select **Options**, then **Advanced**, and ensure that **Improved Metadata Storage** is selected.
3. Use Excel to copy a worksheet.

This operation copies the visible contents of the source worksheet but not the metadata (connection information, POV selections, alias tables, and such items) to the destination worksheet.

4. With the destination worksheet active, from the Oracle Smart View for Office menu, select **More**, then **Import Metadata** to display a list of all open workbooks and their corresponding open worksheets.
5. From the list, select the worksheet that contains the metadata that you want to import to the destination worksheet.
6. Click **OK**. You will be asked to confirm your selection.
7. Refresh.

8. To refresh the **Document Contents** pane, click 

Importing Metadata into Copied Word Documents

Data source types: Oracle Analytics Cloud, Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

Before you begin, be sure to review the content in [Importing Metadata in Office Applications](#).

 **Note:**

This operation cannot be undone.

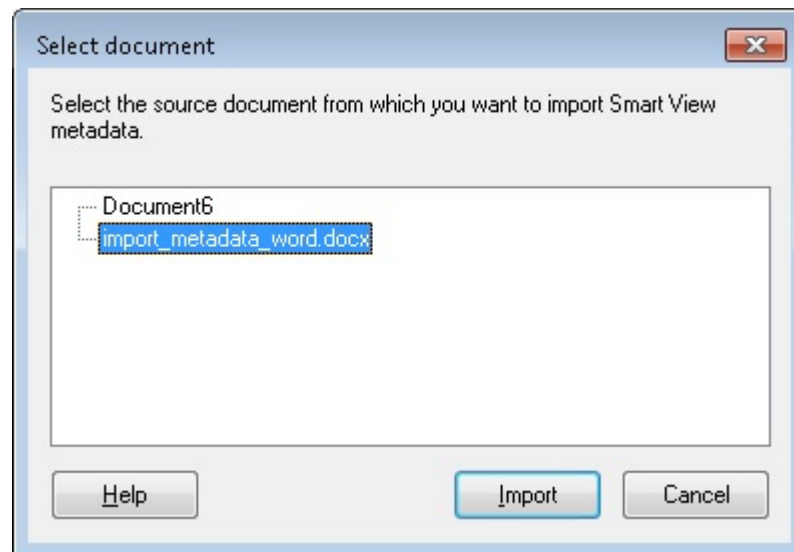

To import metadata into a Word document:

1. Back up your work.
2. From the Smart View ribbon, select **Options**, then **Advanced**, and ensure that **Improved Metadata Storage** is selected.
3. Use the Copy and Paste commands in Word to copy a Oracle Smart View for Office object, such as a graph or table.

This operation copies the visible contents of the source object, but not the metadata—for example, connection information, POV selections, alias tables, and other such items—to the destination document.

4. With the destination document active, from the Smart View ribbon, click **Import Metadata**,  Import Metadata.
5. In the **Select document** dialog box, select the slide or presentation that contains the metadata to import to the destination slide or presentation, and then click **Import**.

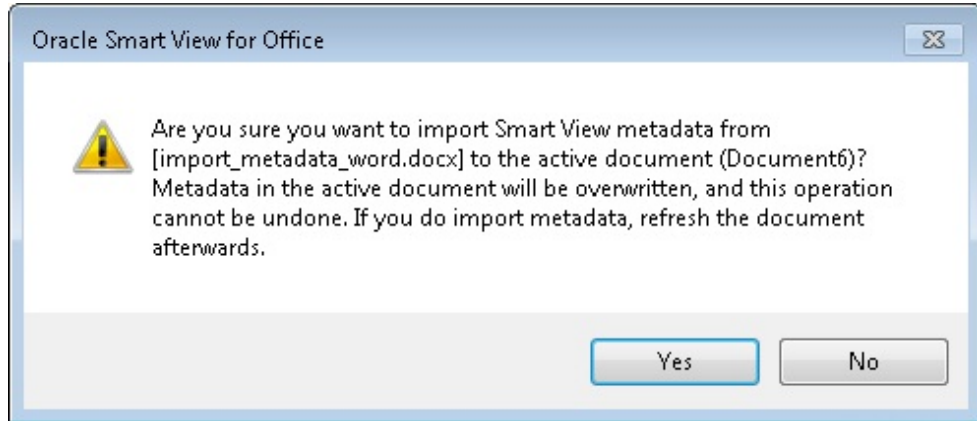

In the following example, import_metadata_word.docx is the document from which we want to import metadata.

 **Note:**

When importing metadata in Word, the active, or target, document is shown in the tree in the **Select document** dialog box. This is because, the active document can also be the destination document in cases where metadata is being import within a Word document.

A confirmation message is displayed.

6. Click **Yes** in the confirmation dialog box.
7. Refresh.

When successful, you will see that the **Document Contents** pane is updated with metadata for the document. An example is shown in [Figure 1](#).

Figure 8-2 Document Contents Pane After Importing Metadata

Importing Metadata into Copied Slides or Presentations

Data source types: Oracle Analytics Cloud, Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Narrative Reporting, Financial Consolidation and Close, Tax Reporting, Oracle Hyperion Reporting and Analysis

Before you begin, be sure to review the content in [Importing Metadata in Office Applications](#).

 **Note:**

This operation cannot be undone.

To import metadata into a PowerPoint slide or presentation:

1. Back up your work.
2. From the Smart View ribbon, select **Options**, then **Advanced**, and ensure that **Improved Metadata Storage** is selected.
3. Use the PowerPoint copy command to copy information in any of the ways supported by PowerPoint; for example:
 - Copy individual objects and paste to the destination slide. The destination slide could be a part of source presentation or different presentation.
 - Duplicate a slide.
 - Copy a complete slide and paste into the same presentation or a different one.
 - Drag any slide and drop to another presentation.
 - Copy and paste an entire presentation.

This operation copies the visible contents of the source slides but not the metadata—for example, connection information, POV selections, alias tables, and other such items—to the destination slide or presentation.

4. With the destination slide or presentation active, from the Smart View ribbon, click **Import Metadata**,  Import Metadata.
5. In the **Select slide** dialog box, select the slide or presentation that contains the metadata that you want to import to the destination slide or presentation, and then click **Import**.

Note that importing metadata from a presentation may be a time consuming operation, particularly for presentations with large number of slides and Oracle Smart View for Office metadata.

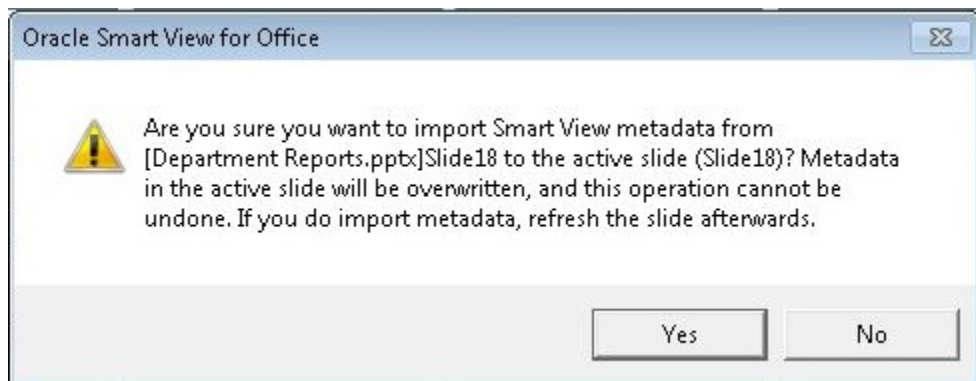

In the following example, Slide21 from Department Reports.pptx is the slide from which we want to import metadata.

 **Note:**

When importing metadata from a slide to the active slide, the active slide is not shown in the tree in the **Select slide** dialog box. This is because the active slide is the destination slide where metadata is to be imported and is, therefore, not available for selection. For the same reason, when importing metadata from a presentation to the active presentation, the **Import** button is disabled when the active presentation is selected in the **Select slide** dialog box.

A confirmation message is displayed.

6. Click **Yes** in the confirmation dialog box.
7. Refresh.

When successful, you will see that the **Document Contents** pane is updated with metadata for each slide. An example is shown in [Figure 1](#).

Figure 8-3 Document Contents Pane After Importing Metadata

Entering Percentage Values in Forms and Ad Hoc Grids

In forms and ad hoc grids, note the guidelines outlined in this topic when entering values in cells defined as percentages.

- When entering a percentage value directly into a cell, enter the percent sign along with the percentage value. For example, to express "twenty percent" numerically, in the form or grid cell, enter

20%

Be sure to include the % sign, as follows:

B5		20%											
	A	B	C	D	E	F	G	H	I	J	K	L	M
1		Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2	Days Sales Outstanding	45	45	45	45	45	45	45	45	45	45	45	45
3	Bad Debt % of Sales	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%
4	Days in Inventory	35	35	35	35	35	35	35	35	35	35	35	35
5	Prepaid Exp % of OpEx	20%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%
6	Days Payables Outstanding	60	60	60	60	60	60	60	60	60	60	60	60
7	Accrued Payroll % of Employee Exp	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%

- When entering a percentage value into the formula bar, enter the decimal point and the value, without the percent sign. For example, to express "twenty percent" numerically, in the formula bar, enter

.20

		.20											
		B	C	D	E	F	G	H	I	J	K	L	M
1	A	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2	Days Sales Outstanding	45	45	45	45	45	45	45	45	45	45	45	45
3	Bad Debt % of Sales	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%
4	Days in Inventory	35	35	35	35	35	35	35	35	35	35	35	35
5	Prepaid Exp % of OpEx	.20	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%
6	Days Payables Outstanding	60	60	60	60	60	60	60	60	60	60	60	60
7	Accrued Payroll % of Employee Exp	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%

In either of the above cases, after pressing **Enter**, 20% is displayed in a dirty cell. This changed cell value can be submitted.

		O10											
		B	C	D	E	F	G	H	I	J	K	L	M
1	A	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2	Days Sales Outstanding	45	45	45	45	45	45	45	45	45	45	45	45
3	Bad Debt % of Sales	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%
4	Days in Inventory	35	35	35	35	35	35	35	35	35	35	35	35
5	Prepaid Exp % of OpEx	20%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%
6	Days Payables Outstanding	60	60	60	60	60	60	60	60	60	60	60	60
7	Accrued Payroll % of Employee Exp	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%

You can use the **Decimal Places** option in the **Options** dialog, **Formatting** tab, for a more granular display of percentages. For example, in the grid below, the values in row 3 show 1%, but in the formula bar, we see the actual value of cell B3 is 0.5%.

		B3											
		B	C	D	E	F	G	H	I	J	K	L	M
1	A	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2	Days Sales Outstanding	45	45	45	45	45	45	45	45	45	45	45	45
3	Bad Debt % of Sales	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%	1%
4	Days in Inventory	35	35	35	35	35	35	35	35	35	35	35	35
5	Prepaid Exp % of OpEx	20%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%	15%
6	Days Payables Outstanding	60	60	60	60	60	60	60	60	60	60	60	60
7	Accrued Payroll % of Employee Exp	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%	25%

In the **Options** dialog, **Formatting** tab, change the **Decimal Places** option to 2, and refresh the grid. This has the effect of adding two decimal places to all values in the grid. This change may be helpful for viewing the fractional percentage values, but may not help with reading and interpreting the grid overall:

	A	B	C	D	E	F	G	H	I	J	K	L	M
1		Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
2	Days Sales Outstanding	45.00	45.00	45.00	45.00	45.00	45.00	45.00	45.00	45.00	45.00	45.00	45.00
3	Bad Debt % of Sales	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%	0.50%
4	Days in Inventory	35.00	35.00	35.00	35.00	35.00	35.00	35.00	35.00	35.00	35.00	35.00	35.00
5	Prepaid Exp % of OpEx	20.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%	15.00%
6	Days Payables Outstanding	60.00	60.00	60.00	60.00	60.00	60.00	60.00	60.00	60.00	60.00	60.00	60.00
7	Accrued Payroll % of Employee Exp	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%	25.00%

Follow these guidelines when entering fractional percentages:

- To enter a half percent numerically, in the form or grid cell, enter .5%
- To enter a half percent numerically in the formula bar, enter .005

In general, Oracle Smart View for Office mimics standard Excel behaviors in handling percentages. Read more about Excel and percentages in the Microsoft documentation [here](#).

Enabling Automatic Cell Width and Height Adjustment

You can enable the automatic adjustment of Excel column width and row height to accommodate the contents of member and data cells.

1. From the Smart View ribbon, select **Options**.
2. In **Options**, from the left panel, select **Formatting**.
3. Select the **Adjust Column Width and Row Height** check box.
4. Click **OK**.
5. From any ribbon, select **Refresh** to adjust columns in the current sheet.

If **Adjust Column Width and Row Height** is not selected, you can adjust the width of columns manually.

Sheet Information

In **Sheet Information**, you can view connection and other details for the current worksheet. You can also delete Smart View metadata from a sheet or workbook, save the metadata to another sheet, and copy list items from the dialog to another sheet or document.

1. From the Smart View ribbon, click **Sheet Info**.

Depending on the Oracle Smart View for Office data on the sheet, **Sheet Information** displays details on the following properties:

- **Connected**—Connection status; Yes if connected, No if not connected.
- **Sheet Type**—Ad hoc, Multiple grid ad hoc, or Form.
- **Server**—The name of the server to which the sheet is connected.
- **Application**—The application to which the sheet is connected.
- **Cube**—The cube, model, or database to which the sheet is connected.
- **URL**—The URL string of the data source provider to which the sheet is connected.

- **Provider**—The data source type to which the sheet is connected; for example, Planning, Oracle Hyperion Financial Management, or Analytic Services (Oracle Essbase).
 - **Provider URL**—The URL string of the data source provider to which the sheet is connected; this property is applicable to Analytic Oracle Hyperion Provider Services 11.1.1.4.x and earlier releases.
 - **Friendly Name**—For private connections only. The data source connection name specified by the user when creating or editing a private connection, or when adding a shared connection to private connections.
 - **Alias Table**—The current alias table.
 - **Associated Ranges**—For multiple grid sheets. The sheet name, application, database, and a unique identifier for each grid in the multiple grid sheet. Multiple grid worksheets apply to Oracle Analytics Cloud - Essbase data sources only. To use **Sheet Information** with multiple grid worksheets, see [Sheet Information Notes](#).
 - **Description**—For private connections only. The optional connection description entered by the person creating or editing the private connection.
 - **Form Name**—The name of the form to which the sheet is connected. This properties applies when connected to forms in Planning and Financial Management only.
 - **Last Retrieved**—The date and time that the last refresh was performed on the sheet.
2. **Optional:** Select the following options as needed.
- **Delete**—Provides these options for deleting Smart View metadata:
 - Delete worksheet metadata
 - Delete workbook metadata
 - Delete all metadata (deletes workbook metadata and all worksheets)
 - **Save**—Saves the **Sheet Information** content to an Excel spreadsheet.
3. **Optional:** To copy a selected item in the list to the clipboard, press **Ctrl+C**.
To copy the entire **Sheet Information** list, ensure that no items are selected in **Sheet Information**, then press **Ctrl+C**. If you have already selected an item in the list, then close **Sheet Information**, reopen it, and press **Ctrl+C**.
4. Click **OK**.
5. To view sheet information support by provider, sheet type, and connection status, see [Sheet Information Support By Provider](#).

Example 8-1 Sheet Information Notes

- Friendly names are for private connections only. The friendly name is the data source connection name specified by the user when creating or editing a private connection, or when adding a shared connection to private connections.
- When using the **Sheet Info** command with multiple grid worksheets:
 - To display information on all grids on a multiple grid worksheet, click anywhere outside of the grid boundaries, or select only one cell within a grid.

- To display information for only one of the grids on a multiple grid worksheet, select the entire grid, and do not select any cells outside of the grid boundaries.
- When connected to Planning, it is not necessary to use the **Set as Default Connection** option to associate the sheet with an active connective. The association is made automatically immediately after connecting.
- When you associate a connection to an ad hoc worksheet using **Set Active Connection**, members may disappear from the worksheet when you refresh. Instead of associating a connection, perform direct ad hoc analysis on the worksheet.

Document Contents

Document Contents is a task pane in the Smart View Panel that provides a view of—and allows you to perform actions on—the content existing in the current Office document.

The **Document Contents** pane displays Office objects in a tree format, allowing you to easily see and interact with the content in a workbook, presentation, or document, regardless of the provider or type of content and including content from extensions. Content is displayed based on the provider connection, or the document layout on sheets, slides, or pages.

Use the drop-down selection list to choose from content in your workbook. The drop-down list in [Figure 1](#) shows a workbook with connections to on-premises Essbase and on-premises Planning using a shared connection. A third connection is shown to on-premises Oracle Business Intelligence Enterprise Edition using a private connection.

The drop-down list for the workbook in [Figure 1](#) displays the content for the shared connection sheets, and options for viewing the content on the private Oracle BI EE connection sheet.

Figure 8-4 Document Contents Pane Showing the Drop-down List

Assuming we're on Sheet1, we select **Current Document** in the drop-down list in **Document Contents** and the content list changes to show that Sheet1 contains an Essbase ad hoc grid, an Essbase ad hoc query, and an Essbase chart; Sheet3 contains a Planning grid, a Planning ad hoc query, and a Planning chart.

Figure 8-5 Document Contents Pane Showing the Content of Sheet1 and Sheet3

To switch the view to Oracle BI EE, select **Document Hierarchy** under **Oracle BI EE** and the content view changes. [Figure 3](#) shows an example of Oracle BI EE content in **Document Contents** in Excel.

Figure 8-6 Document Contents Pane Displaying Oracle BI EE Content

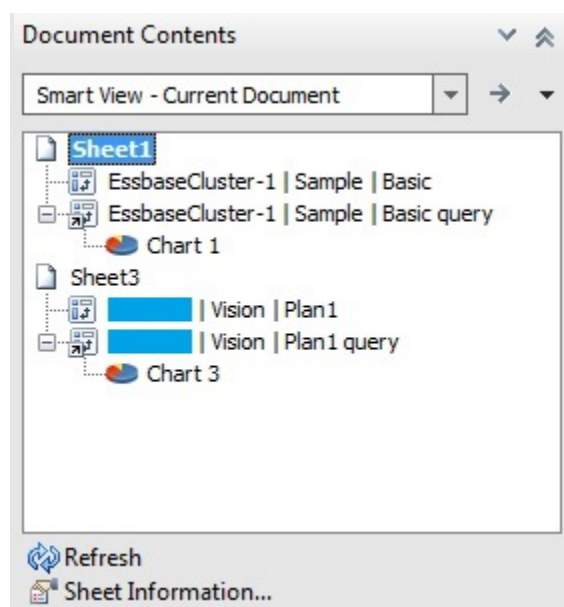

Depending on the provider, you can perform a subset of tasks on selected objects from the **Document Contents** pane.

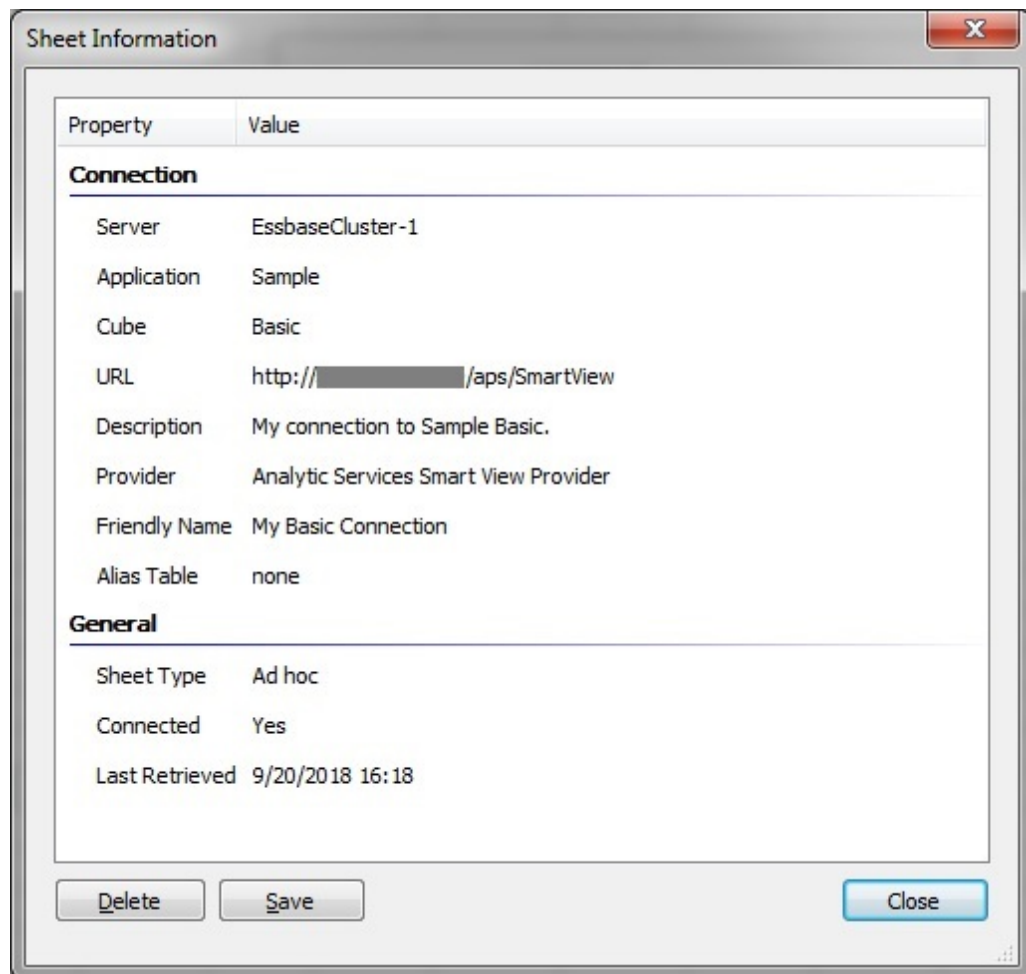

- For most providers, you can **Select**, **Refresh** or **Delete** content on a sheet, slide, or document.
- For most providers, you can insert reporting objects, and perform other tasks.
- For Oracle BI EE providers, you can perform additional tasks on individual views; for example, you can **Mask** a view, or review the properties of a view.

For example, in [Figure 6](#), Sheet1 shows the Oracle Essbase ad hoc grid, an Essbase ad hoc query, and an Essbase chart. You can also see the same artifacts on Sheet3 for Planning, but we're focusing on Sheet1. With the Sheet node selected for Sheet1, the **Refresh** and **Sheet Information** options appear at the bottom of the **Document Contents** pane.

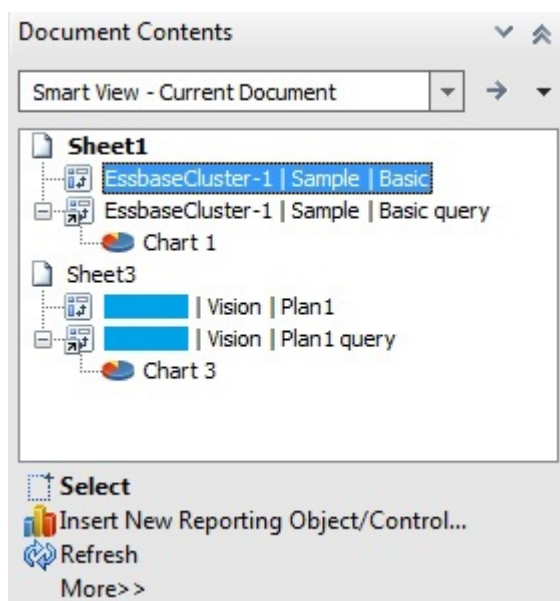

Figure 8-7 An Essbase Ad Hod Grid with the Sheet Node Selected in Document Contents

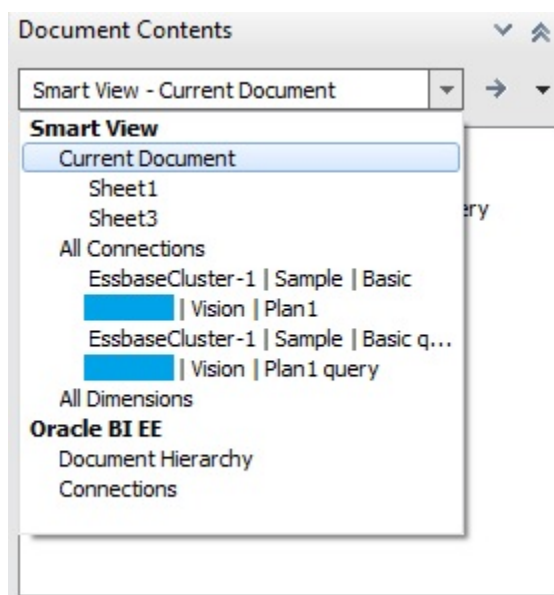

Click **Sheet Information** to view the **Sheet Information** dialog box ([Figure 5](#)), where you can also choose to **Save** or **Delete** metadata for the sheet or workbook.

Figure 8-8 Sheet Information Dialog Box for an Essbase Ad Hoc Grid

Select the object node in **Document Contents**, and the context changes showing the **Select, Insert New Report Object/Control, Refresh, Modify Connection, and Delete** options at the bottom of the pane ([Figure 6](#)).

Figure 8-9 An Essbase Ad Hoc Grid Selected in Document Contents

In general, content is grouped by Oracle Smart View for Office providers (Essbase, Oracle Hyperion Financial Management, Planning, and Oracle Hyperion Reporting and Analysis). Content from Oracle BI EE is grouped separately. In workbooks containing multiple objects from different data sources, you can switch the view using the **Document Contents** drop-down menu shown in [Figure 7](#).

Figure 8-10 Available Options in Document Contents Drop-Down Menu

Select the **All Connections** option and the **Document Contents** view changes to show objects sorted by provider ([Figure 8](#)).

Figure 8-11 Smart View Provider Content Listed by Provider in Document Contents

For Smart View provider content, such as Planning or Essbase objects, you can click in the tree area of **Document Contents** and then hover over an object icon to view connection properties, such as Server, Application, Cube, URL, Provider, POV and Alias Table, as shown in [Figure 9](#). Properties vary depending on the provider.

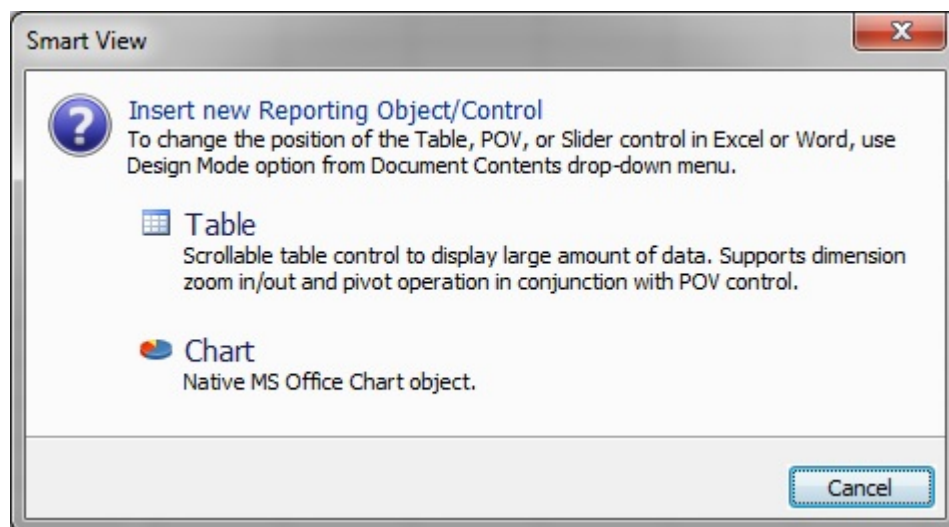

Figure 8-12 Connection Properties of an Essbase Ad Hoc Query

For Oracle BI EE content, select an Oracle BI EE object, and then use the **Properties** link at the bottom of **Document Contents** to launch the **View Properties** dialog, where you can view connection and other properties (see [Figure 3](#)).

For some providers, such as Essbase and Planning ad hoc, you can insert reporting objects such as a table native Office chart based on an ad hoc query or grid object.

Select the grid or query object in **Document Contents**, and then select **Inserting Reporting Object/Control**. You are prompted to choose from Table or Chart:

 **Note:**

When inserting 3-D charts for large datasets (for example, more than 3,000 cells) from the **Document Contents** pane, Microsoft Office consumes large amounts of memory and may fail.

To avoid this issue, Smart View renders the chart as 2-D.

For Smart Slices and Financial Reporting, you can insert reporting objects such as function grids and slider controls. Refer to the following for more information on inserting these types of reporting objects from **Document Contents**:

[Smart Slices](#)

[Smart View and Reporting and Analysis](#)

Shared Workbooks

Oracle Smart View for Office does not support Excel shared workbooks.

When the Excel option for sharing workbooks is enabled, Smart View operations are not supported.

To clear the shared workbook option in Excel, go to the **Review** ribbon, then click the **Share Workbook** button, and then clear the **Allow changes by more than one user at the same time** check box.

Protected Worksheets

Oracle Smart View for Office operations, such as refresh and ad hoc, are not supported on protected sheets.

For example, you cannot perform Zoom In or Keep Only on protected sheets.

Opening Large Workbooks in Smart View

Oracle Smart View for Office may stop responding when opening workbooks containing a large number of rows and columns, graphical objects, and Excel comments.

To alleviate this problem, enable the **Improve Metadata Storage** option by selecting **Options**, then **Advanced**, and then select the **Improved Metadata Storage** check box.

In addition, when working with larger workbooks, or performing an operation that results in a large data set, a "not enough resources" error may occur. To alleviate this problem, break up your workbook into smaller workbooks. Upgrading to Office 64-bit may resolve the issue.

Printing POV Members in the Header and Footer

You can print active POV members in the header or footer of an Excel document.

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Narrative Reporting, Financial Consolidation and Close, Tax Reporting

Note:

Printing POV members is not supported when connected to Oracle Hyperion Financial Management.

To print the active POV members in the header or footer of an Excel document:

1. In Excel, use your preferred method to add a custom header or footer.
For example, go to the Page Layout ribbon, then select **Print Titles**, then the **Header/Footer** tab, and then click **Custom Header** or **Custom Footer**.
2. In the header or footer text box, add the following statement:

```
POV: {}
```

You may also include any other text that you may require in the header or footer.

When you print the Excel document, the POV members are printed in the header or footer as specified, along with any other text you may have added.

 **Note:**

In Excel 2010 and 2013, after adding the `POV: {}` statement, the POV members do not display in Print Preview mode the first time you launch Print Preview. However, they will print. After printing the sheet, then return to Print Preview to view the POV members in Print Preview mode.

Opening Forms and Ad Hoc Grids from Web Applications (Web Launch)

From your web application, you can open forms and ad hoc grids in Oracle Smart View for Office. This action is also referred to as *web launch*.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

 **Note:**

Web launch is supported on Microsoft Internet Explorer with no additional browser add-on required.

Mozilla Firefox and Google Chrome require a browser-specific add-on for web launch. If your default browser is Firefox or Chrome, follow the instructions on installing the add-on for these browsers in the *Oracle Smart View for Office Installation and Configuration Guide*, [Installing Browser Add-ons](#).

To use web launch to open a form or ad hoc grid in Smart View:

1. In a supported Oracle Enterprise Performance Management Cloud web application, open a form or ad hoc grid.
2. From the form or ad hoc grid in the EPM Cloud web application, select **Actions**, and then **Open in Smart View**.

If not already open, Excel is launched and the form or ad hoc grid appears in Smart View along with the proper ribbon. For example, if you chose to open a Planning form in Smart View, then the Planning ribbon is displayed.

 **Note:**

Firefox and Chrome: Starting in release 11.1.2.5.720, rather than opening the file directly in Smart View, you are prompted as follows:

- **Firefox:** Select **Open** or **Save File**. Optionally, select **Do this automatically for files like this from now on to save your choice** to avoid making the selection on each web launch
- **Chrome:** Select **Open** or **Show in folder**. Optionally, select **Always open files of this type** to open Smart View files automatically.

Enabling and Disabling Smart View

Oracle Smart View for Office is enabled by default after installation.

You can disable Smart View within Smart View for all Microsoft Office applications on your computer or for Outlook alone.

Smart View may also be enabled through Office applications.

Enabling and Disabling Smart View Using the Smart View Ribbon

You can intentionally disable Oracle Smart View for Office from the Smart View ribbon for all Microsoft Office applications on your computer or for Outlook alone.

To disable Smart View for all Microsoft Office applications (including Outlook):

1. From the Smart View ribbon, select **Help**.
2. Select **About**.
3. Clear **Enable Add-in** to disable Smart View the next time you open an Office application.

The Smart View ribbon remains, containing only the **About** button.

To enable Smart View for all Microsoft Office applications (including Outlook):

1. Start Excel, Word, or PowerPoint.
2. From the Smart View ribbon, select **About**.
3. Select **Enable Add-in** to enable Smart View the next time you open an Office application.

To disable Smart View for Outlook only:

1. From the Smart View ribbon in Excel, Word, or PowerPoint, or from the Smart View menu in Outlook, select **Options**, then **Advanced** in the left panel.
2. Under **Display**, select **Disable Smart View add-in in Outlook**.

Enabling and Disabling Smart View from Microsoft Office

You can enable Oracle Smart View for Office from **Add-ins** in Excel Options. This method is useful in cases where Smart View is disabled unintentionally, through a Microsoft Smart View error.

To enable Smart View for all Microsoft Office applications (including Outlook):

1. Perform the task appropriate for your Office version:
 - **2016, 2013, 2010:** Go to **File**, then **Options**, and then **Add-ins**.
 - **2007:** Click the Office button in the top left corner of Excel, then select **Excel Options**, and then **Add-ins**.
2. From **Manage**, select **COM Add-ins**, and then **Go**.
3. In **COM Add-ins**, select the check box to enable the **Oracle Smart View for Office** add-in, and click **OK**.

About Smart Query

A Smart Query is a multidimensional analysis and reporting tool constructed from multiple sets of members and filters.

Data source types: Oracle Analytics Cloud - Essbase

Related Topics:

[Creating a Smart Query](#)

[Opening a Smart Query](#)

[Copying and Pasting](#)

Creating a Smart Query

Create a Smart Query by defining one or more sets of members from the dimensions in an application.

To each member set, you can define and apply composite filters to further refine the data to be returned by the Smart Query. Using these sets and their filters, you can

create a highly complex query by defining unions, complements, and intersections of data from the different sets.

Once a Smart Query is created, you can use it for ad hoc reporting and analysis. Use the ad hoc reports created from Smart Queries to submit data. Smart Queries can be saved, reused, and shared. Sets and filters can be saved individually for use in other Smart Queries.

You cannot submit data directly from a Smart Query.

Creating a Smart Query involves performing the following procedures:

1. [Defining Sets](#)
2. [Defining Set Filters](#)
3. [Building the Smart Query](#)
4. [Completing the Smart Query](#)

Defining Sets

To define a set:

1. From the Smart View ribbon, select **Panel** to open the Smart View Panel.
2. From the Smart View Panel, connect to an Essbase cube or application.
3. From the Action Panel, select **New Smart Query Sheet** to display the Smart Query Panel in place of the Smart View Panel.

You can select the arrow next to  to return to the Smart View Panel.

Default dimensions for the connection are displayed in the Smart Query Panel and on the worksheet. The Smart Query ribbon is displayed.

4. **Optional:** Pivot dimensions by dragging them from one area of the Smart Query Panel to another.
5. Select the name of a dimension under **Row**, **Column**, or **Point of View** to display it under **Sets for...**, where you define the set.

If the dimension exists in Row, Column, or Point of View, you can also start typing the dimension name in order to select it.

6. In **Sets for**, click the arrow next to the dimension name and choose **Select Base Members**.

For POV dimensions, the members you specify in this step are available for selection from drop-down menus in the Point of View section. You can also enter these names directly.

7. From the popup menu, select a member level to include in the set or select **Other** to open the **Member Selector**, where you can select specific members.
8. Click the arrow next to the dimension name and select **Add Custom Members** (not available to Point of View dimensions).
9. Select from among specified values for the set.

 **Note:**

When working with very long member names in Essbase, the Smart Query attempts to verify that the name works with Essbase. During the verification process, a numeric (for example, (1), (2), etc.) is appended to the long member name, signifying the number of verification attempts, up to 10 attempts. With each verification attempt, the numeric is incremented by one. Once the 10 attempts are completed, Smart Query proceeds with the last attempt, (9), so you can expect to see (9) appended to the member name.

Optional: Select **Other** to define members with MDX expressions (see the Essbase documentation) in **Custom Member Expression**.

MDX queries must be at least three characters long to accommodate the simplest member expression; for example, two operands and an operator. The **OK** button here is enabled only after the expression entered is validated.

Queries are given default names, but if you choose to rename an MDX query, do not use the following characters:

- Brackets ([])
- Double quotation marks (") or their XML-encoded representation (""," ""," ""," ""," """)
- Single quotation marks (') or their XML-encoded representation ("'," "'," "'," "'," "'")

10. **Optional:** To allow duplicate members in the set, click the arrow next to the set name and select **Allow Duplicates in Set** (not available to Point of View dimensions).

This setting applies only to the set for which it is selected. When there are multiple sets in a Smart Query, members are displayed in the grid for all sets in which they are selected even if **Allow Duplicates in Set** is *not* selected. For example, if Jan, Feb, and Mar are selected as members for one set, and Level 0 members of Year are selected in another set in the same query, then Jan, Feb, and Mar will each appear twice in the grid because they are members of both sets.

11. **Optional:** To rename the set, click the arrow next to the set name and select **Rename**.
12. To save a set, click the arrow next to the set name, then select **Repository**, and then **Save Set**.
13. In **Repository Item**, enter a name and description for the member set and click **OK**.
14. **Optional:** To add additional member sets for this dimension, click the arrow next to a set name and select **Add New Set** and repeat the procedure.
15. Select other dimensions from the Smart Query Panel and repeat the procedure as necessary to add members for other dimensions.

Related Topics:

[Defining Set Filters](#)

[Building the Smart Query](#)

Defining Set Filters

To define filters for a set:

1. From **Sets for...**, click the arrow next to a set name and select **Add Filter**.
A new filter is displayed under **Filters for Set...**
2. Click the arrow next to the filter name and select one of the following to define the filter:
 - Select Top/Bottom
 - Select Based on Value
 - Select Based on Value Specified by Members
 - String Match (This option does not support qualified member names.)
3. Repeat this procedure as necessary to add more filters to the set.

When you have created the sets and filters that you want to compose the Smart Query, proceed to [Building the Smart Query](#).

Building the Smart Query

To build a Smart Query, you apply composite filters to select unions, complements, and intersections of members from the different sets. Unions are selections of members that belong to either but not both of two sets. Intersections are selections of members that belong to all specified sets. Complements are selections of members of one specified set that are not members of another specified set.

You can use sets and composite filters in any combination to create highly complex Smart Queries.

Union of Sets

To select members that belong to either but not both sets, define two or more filters as described in [Defining Set Filters](#) from the dimension in **Sets for....** For example, in [Figure 1](#), the query will return only Product, Level 0 members that are *either* packaged in cans (Product = Can) *or* are caffeinated (Product = Caffeinated_True).

Figure 9-1 Union of Sets**Intersection of Sets**

Intersections include only the members that are common to all specified sets.

To select members common to all specified sets:

1. Define a filter for a set as described in [Defining Set Filters](#).
2. Click the arrow next to the filter name and select **Add Filter**.
3. **Additional Filters** and a subset filter are displayed.
4. Define the second filter.

In [Figure 2](#), the query will return only Product, Level 0 members that are caffeinated *and* packaged in a can.

Figure 9-2 Intersection of Sets**Complement of Sets**

To select only members of a set that are *not* members of another specified set.

1. From **Filters for...**, click the arrow next to a filter name and select **Add Filter**. **Additional Filters** and a subset filter are displayed.

2. Define the second filter.
3. Click the arrow next to **Additional Filters.** and select **Exclude**.

In [Figure 3](#), the query will return only Product, Level 0 members that are caffeinated but are not packaged in a can.

Figure 9-3 Complement of Sets

When you have built the Smart Query, proceed to [Completing the Smart Query](#).

Completing the Smart Query

To complete the Smart Query:

1. From the Smart Query ribbon, select options for the Smart Query as follows:
 - Indentation (see [Member Options](#))
 - Show Distinct Member Names (see [Member Options](#))
 - Suppress Rows with No Data (see [Data Options](#))

2. **Optional:** Select **Change Alias** to select an alias table.

The full names of duplicate and shared members are shown regardless of the selected alias table (if any). All other member names are shown according to the selected alias table.

3. To save the entire Smart Query definition, from the Smart Query ribbon, select **Save**.
4. In **Repository**, enter a name and description for the Smart Query.
5. Click **OK**.

Smart Queries are also saved within the workbook, so when you save a workbook, Smart Queries within it are also saved.

6. **Optional:** To perform ad hoc analysis, from the Smart Query ribbon, select **Analyze**.

Opening a Smart Query

You can open a Smart Query from a new worksheet or from an existing Smart Query worksheet.

Opening from a New Worksheet

To open Smart Query from a new worksheet:

1. From the Smart View ribbon, select **Panel** to open the Smart View Panel.
2. From the Smart View Panel, click the arrow next to , and then select **Smart Query**.
3. From the Smart Query Panel, select **Open Definition** to display the **Repository** list of available Smart Queries.
4. Select a Smart Query from the list.
5. Click **OK**.

Opening from an Existing Smart Query Worksheet

To open an existing Smart Query:

1. From the Smart Query ribbon, select **Open** to display the **Repository** list of available Smart Queries.
2. Select a Smart Query from the list.
3. Click **OK**.
4. When asked if you want to discard the existing Smart Query on the worksheet, click **Yes**.

The Smart Query is opened on the current worksheet.

Copying and Pasting

In Excel, you can copy an entire Smart Query definition from one worksheet to another, and sets and filters to other Smart Queries.

Copying Smart Query definitions can be used as a means of sharing queries between users.

Related Topics:

[Copying Smart Query Sets and Filters](#)

[Copying Smart Query Reports to Word and PowerPoint](#)

[Sharing Smart Query Definitions](#)

Copying Smart Query Definitions in Excel

You can copy a Smart Query definition to a different worksheet in the current workbook or in another workbook. If the worksheet into which you want to paste the

definition already contains a Smart Query definition, it will be replaced by the pasted definition.

To copy a Smart Query definition from one worksheet to another:

1. Open the Smart Query worksheet that you want to copy.
2. From the Smart Query ribbon, select **Copy**.
3. Open a new worksheet.
4. Do one of the following:
 - To copy the entire definition to a *blank* worksheet, from the Smart Query Panel, select **Paste**.
 - To replace a Smart Query definition, from the Smart Query ribbon of the worksheet to be replaced, select **Paste**.

Copying Smart Query Sets and Filters

To copy a set, under **Sets for...**, click the arrow next to a set name and select **Copy Set**. You can then copy the set within the current Smart Query or to a different Smart Query using **Paste Set** from the same menu.

To copy a filter, under **Filters for Set...**, click the arrow next to a filter name and select **Copy Filter**. You can then copy the set within the current Smart Query or to a different Smart Query using **Paste Filter** from the same menu.

Copying Smart Query Reports to Word and PowerPoint

You cannot copy a Smart Query definition from Excel to Word or PowerPoint directly, but you can copy a grid or partial grid defined by a Smart Query from Excel to Word or PowerPoint. To do so, from the Smart Query ribbon, select **Analyze**. Then copy data as described in [Copying Data Between Excel, Word, and PowerPoint](#).

Sharing Smart Query Definitions

You can share Smart Query definitions with other users.

The Smart Query definition includes definitions for rows, columns, POV, dimension sets, filters, sorting, and custom members.

The methods for sharing a Smart Query are:

- [Email Sharing](#)
- [Workbook Sharing](#)

The following topics explain each method.

Email Sharing

To share a Smart Query definition with other users via email:

1. In Excel, open the Smart Query worksheet containing the definition that you want to copy.
2. From the Smart Query ribbon, select **Copy**.
3. Open a blank email message and press **Ctrl-V**.

When pasted into an email message, the query definition will resemble a long line of alphanumeric characters.

4. Send the email message to the users you are sharing with.
5. Recipients of the Smart Query definition then perform the following tasks:
 - a. In the email, select the Smart Query definition string and copy it to the Windows clipboard (use **Ctrl+C** or the **Copy** command).
 - b. Open a blank worksheet in a new or existing workbook.
 - c. **Optional:** Connect to the appropriate data source.

If you do not connect to a data source, you will be prompted to do so when you paste the definition in the next step.

- d. From the Smart View ribbon for the active worksheet, click  .

The Smart Query populates the worksheet.

Workbook Sharing

To share a Smart Query in a workbook:

1. Save the Excel workbook that contains the Smart Query to share.
2. Send the Excel workbook to the users you are sharing with or place the workbook file in a shared network location and notify those users.
3. Recipients of the workbook containing the Smart Query definition then perform the following tasks:
 - a. Open the workbook either directly from the email or from the shared network location.
The Smart Query populates the worksheet.
 - b. In the Smart View ribbon, click **Refresh** to be prompted for login credentials in the **Connect to Data Source** dialog box.

Executing a Smart Query

Execute saved Smart Queries in the **Manage and Execute Queries** dialog box.

To execute a Smart Query:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries** to display the **Manage and Execute Queries** dialog box.
3. Select a Smart Query from the list in the left frame and click **Execute**.

The dialog box closes automatically and the Smart Query results appear on the sheet.

Deleting a Smart Query

You can delete Smart Queries from the list in the **Manage and Execute Queries** dialog box.

To delete a Smart Query:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries**
3. From the list in the left frame of the **Manage and Execute Queries** dialog box, select a Smart Query to delete.
4. Click the **Delete Query** button .
5. Click **Yes** at the prompt to confirm the delete request.
6. Click the **X** in the upper right corner or click **Cancel** to close the dialog.

10

Smart Slices

Related Topics

- [About Smart Slices](#)
A Smart Slice is a reusable perspective of a data source.
- [Creating Reports with Smart Slices](#)
Smart Slices are stored centrally and are available to users from the Smart View Panel.
- [Smart Slices, Ad Hoc Analysis, and Forms](#)
You can perform ad hoc analysis on a Smart Slice in Excel.
- [Creating Smart Slices](#)
Administrators and database administrators can create, modify, and delete Smart Slices.

About Smart Slices

A Smart Slice is a reusable perspective of a data source.

Data source types: Oracle Analytics Cloud - Essbase

It can be composed of a single member, a combination of single members, filters, or combination of single members and filters in any order. These components serve as boundaries to the data that users can view and work with in the Smart Slice. Any operation that can be done in Oracle Smart View for Office can be done within the confines of a Smart Slice.

An organization can have as many different Smart Slices as it needs to accommodate the specific data requirements of its users. For example, Smart Slices can be created for different sales geographical regions, different product lines, different time frames, or a combination of any of these dimensions.

You can view and work with any data within the boundaries of a Smart Slice, but not with data outside its boundaries. For example, in a Smart Slice that limits sales data to the Western region, you could drill down to data for California or Los Angeles, but could not navigate across to New York.

Creating Reports with Smart Slices

Smart Slices are stored centrally and are available to users from the Smart View Panel.

Data source types: Oracle Analytics Cloud - Essbase

An entire report is associated with an Excel workbook, a Word document, or a PowerPoint presentation. One report is associated with an Excel worksheet, a Word page, or a PowerPoint slide. For PowerPoint presentations, Oracle recommends one report type per slide.

You can create reports from entire Smart Slices or from subsets of data in a Smart Slice. Reports can then be displayed on an Excel spreadsheet, Word document, or PowerPoint slide. You can display as many reports from as many data sources as space will permit on one sheet.

To create a report from a Smart Slice:

1. From the Smart View ribbon, select **Panel**.
2. From the Smart View Panel, select a Smart Slice.
3. In the Action Panel, do one of the following.
 - To work with the Smart Slice as is, click **Insert Smart Slice into report**. The Smart Slice is displayed in Document Contents in the lower portion of the Smart View Panel.
 - To create a subset of the Smart Slice for local storage, click **Modify Smart Slice and insert into report** and use the Smart Slice Designer as described in [Creating Smart Slices](#).

 **Note:**

If you use **Modify Smart Slice** to create a Smart Slice, you must select the newly-created Smart Slice from the Smart View Panel tree list before performing ad hoc analysis.

4. Click  to refresh the **Document Contents** tree.
5. Select the Smart Slice in **Document Contents**, right-click and select **Insert New Reporting Object/Control**.
6. From the **Insert New Reporting Object/Control** dialog box, select one of these report types to place on the grid:

- **Function Grid** — a dynamic grid format

Function grids can be used with Word, PowerPoint, and Excel. When you refresh a function grid, data cells are refreshed; members are not. To refresh both data and members, you must reinsert the function grid into the sheet. For this reason, function grids are most useful for reports in which members remain reasonably static. For reports whose members may change more often, tables and charts are better report types. Although you can have multiple reports on a worksheet, you can have only one function grid.

You can use Excel formulas, for example SUM, with function grids. To retain such formulas as part of the function grid, you must leave one empty row between the grid and the cell containing the formula and include the empty row in the range of cells selected for the formula definition. This permits retention of the formula when refreshing the data results in a different number of rows in the grid.

To format a function grid, use Excel formatting capabilities.

- **Office Table**

Office tables can be used with Word and PowerPoint. Office tables display results in native Microsoft Office table format. When you refresh an Office table, both members and data are refreshed.

Office tables look and feel like part of the Word or PowerPoint document, but the members and data in the table cells are connected to the Oracle Smart View for Office provider. With Office tables, you can work with the Word or PowerPoint table formatting and styles that you are accustomed to. Insert a POV object into the report and you can change the POV of the Office table. Refresh the Office table after changing formatting or POV and the new POV is reflected in the results and custom formatting is retained.

You cannot zoom in or out in an Office table object, and you cannot perform other ad hoc operations or use free form.

- **Table**

Tables can be used with PowerPoint and Excel. Table reports display results in a grid format that floats on the document and can be moved and re-sized. When you refresh a table, both members and data are refreshed. Tables are useful for displaying large grids in a smaller space; their scroll bars enable you to quickly access rows and columns.

You can zoom in and out in a table report, but you cannot perform other ad hoc operations or use free form.

- **Chart**

Charts can be used with PowerPoint and Excel. In PowerPoint, contents of charts and tables are visible only in presentation mode. Chart reports display results in a chart format that floats on the document and can be moved and re-sized. When you refresh a chart, both members and data are refreshed.

7. **Optional:** To move or re-size a table or chart, in **Document Contents**, click the

down arrow next to , and from the menu, select **Toggle Design Mode**.

You can now move objects within the sheet, slide, or page.

8. To insert a report control, select the Smart Slice in **Document Contents**, right-click and select **Insert New Reporting Object/Control**.
9. From the **Insert New Reporting Object/Control** dialog box, select one of these report control types:

- **POV** — a report can contain only one POV
- **Slider** — a report can contain multiple sliders. See [Sliders](#).

A report can contain a POV or sliders, but not both.

10. Refresh.

11. **Optional:** To create a separate report for any or all of the members of one dimension in the report and cascade these reports separately across the worksheets of the workbook, see [Cascading Reports and Ad Hoc Grids](#).

 **Note:**

In reports that contain a chart and a table, cascading may cause the chart and table to overlap the next time you open the workbook.

Deleting Reports or Report Objects

To delete a report:

1. In **Document Contents**, click 
2. Select the object to delete from the link in **Document Contents**; for example, select a function grid or POV.
Selecting a report also deletes all its report objects.
3. At the bottom of the **Document Contents** pane, select **More**, then select **Delete**.

Sliders

[Figure 1](#) shows a slider. The slider displays a selected set of dimension members from a query; when you drag the slider marker to a member, its data is displayed in all reports associated with the query on the sheet. Sliders can contain dimensions from more than one query in the Report Designer if the dimensions have the same boundaries.

Figure 10-1 Slider

Related Topics:

- [Creating a Slider from One Query](#)
- [Creating a Slider from Joined Queries](#)

Creating a Slider from One Query

To create a slider:

1. Ensure that one or more report type is inserted in the worksheet for the query for which you want to create the slider.
2. From the report designer, click **Query View** and select **Query View**.
3. In the Report Designer, select the query on which to base the slider.
4. Click  and select **Slider** to open **Member Selection**.
5. Select a dimension, members, and filters for the slider and click **OK**.
The slider is displayed on the sheet.
6. **Optional:** To move or re-size the slider, click  and then move or re-size.

Creating a Slider from Joined Queries

You can create a slider that contains dimensions from multiple queries if, and only if, the dimensions from the different queries have the exact same boundaries.

To create a slider using a dimension from multiple queries:

1. Ensure that one or more report type is inserted in the worksheet for the query for which you want to create the slider.
2. Click **Query View** and select **Dimension View**. Notice that the Report Designer tree view is grouped by dimensions rather than by queries. Under each dimension are the queries that contain that dimension. If the dimensions do not contain the same boundaries, multiple sliders will be created to accommodate each of them. For example, if the Market dimension in one query contains a children filter and the Market dimension from another query contains a descendents filter, two Market sliders would be created.
3. In the Report Designer, select the dimension on which to base the query.

4. Click  and select **Slider** to open **Member Selection**.
5. Select dimension members, and filters for the slider and click **OK**.

The slider is displayed on the sheet.

6. **Optional:** To move or re-size the slider, click  and then move or re-size.

Smart Slices, Ad Hoc Analysis, and Forms

You can perform ad hoc analysis on a Smart Slice in Excel.

Data source types: Oracle Analytics Cloud - Essbase

Select the Smart Slice in the Smart View Panel and click **Ad Hoc Analysis** in the Action Panel. Data and POV from the Smart Slice is entered into the worksheet, and you can perform ad hoc analysis.

Note:

Essbase only: Multiple-grid worksheets are not supported for Smart Slices.

To use a form, select the Smart Slice in the Smart View Panel and click **Open Form** in the Action Panel. Only forms enabled by the administrator may be used for ad hoc analysis.

If you want to locate the Smart Slice source of the data in an ad hoc grid, click  and select **Locate Worksheet Connection**. The Smart Slice is highlighted in the Smart View Panel.

Creating Smart Slices

Administrators and database administrators can create, modify, and delete Smart Slices.

Data source types: Oracle Analytics Cloud - Essbase

In Essbase, if enabled by the administrator, all users can create, modify and delete Smart Slices.

Creating Smart Slices involves [Setting Smart Slice Data Boundaries](#) and [Setting Smart Slice Preferences](#).

Setting Smart Slice Data Boundaries

Data source types: Oracle Analytics Cloud - Essbase

To create a Smart Slice:

1. From the Smart View ribbon, select **Panel**.
2. Open the Smart View Panel and connect to a data source.
3. Do one of the following:
 - From the Action Panel, click **Create New Smart Slice**, then select an alias table from the list of alias tables.
 - With an ad hoc grid open, from the data source ribbon, select **Smart Slice**.

The Smart Slice Designer and a **New Smart Slice – Design** worksheet are displayed. You design the Smart Slice from the Smart Slice Designer; results are displayed on the worksheet.

On the Smart Slice Designer are **Rows**, **Columns**, **POV**, and **Attributes** sections for row, column, POV, and attribute dimensions.

4. From the Smart Slice Designer, use any of the following operations to create boundaries for the Smart Slice.
 - To select members for row or column boundaries, drag members from the **POV** to **Rows** or **Columns** as needed on the Smart Slice Designer. To remove row or column members, drag them to the **POV**. Changes are reflected immediately on the grid.
 - To select members for dimensions under **Rows**, **Columns**, or **Attributes**, section, click the name of the dimension to open the Member Selection dialog box.
 - To select members for the **POV** on the Smart Slice Designer, click the arrow next to the dimension name and select the ellipsis to open the **Member Selection** dialog box.
5. Click **Options** and set preferences as described in [Setting Smart Slice Preferences](#).
6. Click **Done**; **Member Selection** is displayed.
7. In **Member Selection**, select a dimension member to use as the default POV and click **OK**.

8. In the Smart View Panel, in **Enter a new name**, enter a name for the Smart Slice.
9. Click **OK**. The Smart Slice is displayed in the tree view of the Smart View Panel under its data source.

Setting Smart Slice Preferences

The preferences that you specify are stored as part of the Smart Slice definition, and they override the global preferences set in the Options dialog box.

To specify Smart Slice preferences:

1. From the Smart Slice Designer, click **Options**.
2. For each option, enter or select the preference from the drop-down menu.

Users can select the options that are enabled here. See [Smart View Options](#) for descriptions of the options.

Note:

Replacement labels for missing data and other preferences specified in the Smart Slice **Options** dialog box in this step are not applied to function grids based on the Smart Slice (as described in [Creating Reports with Smart Slices](#)). Instead, the options specified by Oracle Smart View for Office users in the **Options** dialog box are applied to function grids.

Note:

Smart View does not support number formatting of Function Grids imported from Smart Slices.

About the Query Designer

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close

The Query Designer is an Oracle Smart View for Office tool from which you can design the layout of a report by selecting dimensions, members, and attributes for rows, columns, and the POV from one interface. You can use the Query Designer to create a query from a blank connected worksheet, which uses the default report as a starting point, or extract a query from a saved report. The Query Designer is available only for ad hoc worksheets.

Creating Queries

Data source types: Oracle Analytics Cloud - Essbase, Planning, Financial Consolidation and Close

To create a query report:

1. Open a worksheet or an existing report in Excel and connect to a data source.

 **Note:**

Workbooks can contain Query Designer worksheets from multiple data sources. However, only one data source can be associated with each worksheet.

2. From the data source ribbon, select **Query**, then **Query Designer**.

The Query Designer and a query worksheet named “*Sheetname - Query*” (for example, Sheet1 – Query) are displayed. You design your query on this worksheet.

The following operations are disabled on the query sheet, but are re-enabled after you run the report:

- Formulas
- Asymmetric reports
- Comments
- Blank rows or columns
- Changes to alias tables
- Ad hoc actions such as zoom in and out, keep and remove only, and double-click

The following operations are unavailable in both query sheet and report sheet:

- Filtering of column members
- Changing data sources

If you are working with a duplicate member database, qualified member names are displayed on the query sheet, but only the member names are displayed after you run the report.

3. Use any of the following operations to design your query:

- To select members for the **Rows** and **Columns** dimensions displayed on the Query Designer, click the dimension name to open the Member Selection dialog box.
- To select members for **POV** dimensions displayed on the Query Designer, click the arrow next to the dimension name and select the ellipsis to open the Member Selection dialog box.
- To move a dimension from the **POV** to the grid, drag and drop it from the **POV** section to the **Columns** or **Rows** section in the Query Designer.
- To remove a dimension from the grid, drag and drop the dimension from the Columns or Rows section to the POV section in the Query Designer.
- To add or remove an attribute dimension, select a dimension from the Attributes drop-down menu and drag and drop to the **Rows** or **Columns** section of the Query Designer.
- Enter members directly into the grid.

 **Note:**

When working with databases that support duplicate member names, avoid using member names containing periods. Oracle Smart View for Office detects periods (.) as delimiters in Query Designer, resulting in an unknown member error. If the dimension or member names in your query contain a period, the member will be interpreted as two members, parent and child. For example, the member:

abcd.wxyz

would be interpreted as:

abcd
wxyz

4. From the Query Designer, click **Apply Query**. The resulting report is displayed in a new report sheet called “*Sheetname* - Report” (for example, Sheet1 – Report). Operations temporarily disabled in step 2 are re-enabled.

The report sheet replaces the query sheet, but you can retrieve the query sheet by repeating step 2.

5. To save the report, save as an Excel .xls or .xlsx file.

 **Note:**

In Oracle Analytics Cloud - Essbase, .xls or .xlsx files can be used as a data load data source.

 **Note:**

The Query Designer is not designed to work with Smart Slices.

Editing Queries and Rerunning Reports

Rerunning queries regenerates the report; any changes to the original report, such as zooming, comments, and formulas are lost. Formatting is also lost.

You can refresh reports, but this only refreshes the data. It does not rerun the report.

To edit a query and rerun a report:

1. Open the Query Designer query sheet to edit. If the query sheet is hidden, from the data source ribbon, select **Query** and then **Query Designer**.
2. Edit the query.
3. Select **Query** then **Run the Report**.

The report is updated.

Filtering Data

Data source types: Oracle Analytics Cloud - Essbase

Filtering data limits the amount of data returned to a specified top or bottom criterion. Top or bottom ranking enables you to view, for example, the top 10 products in sales for a given region.

To filter data:

1. In the Query Designer report worksheet, select a dimension.
2. From the Essbase ribbon, select **Query** and then **Data Filter**.
3. From **Data Filter**, under **Count**, select **Top** or **Bottom** and specify a number.
4. Under **Set**, click .
5. From **Member Selection**, select a row member for ranking, and click **OK** to return to **Data Filter**.
6. Under **Value**, click .
7. From **Member Selection**, select a column member to run the ranking against, and click **OK** to return to the **Data Filter** dialog box.
8. Click **OK**.

An MDX query in the form `TopCount({ [Qtr3] }, 10, [Measures].[Profit])`, that represents your data filtering settings is inserted into the grid. The example returns the top 10 most profitable products in quarter 3.

9. Click **Apply Query** to display query results.

Analyzing Time-Related Data in Query Designer

Data source types: Oracle Analytics Cloud - Essbase

Filtering data limits the amount of data returned to a specified top or bottom criterion. Top or bottom ranking enables you to view, for example, the top 10 products in sales for a given region.

Using Oracle Smart View for Office, you can analyze flash metrics such as sales of cost of goods sold against time-based metrics. This enables you to look for trends, find averages for different time periods, and so forth. To do this, you use linked attributes which enable periodicity of members. Periodicity is a shared pattern among time dimension members that make them meaningful for time-based analysis (January and April share periodicity as first months of quarters, for example). Day by month, day by week, and week by year are examples of linked attributes. You can also set ranges for linked attributes and apply filters.

To analyze time-related data in Query Designer:

1. Create a query.
2. From the Query Designer toolbar, select **Date-Time** dimension and drag it to the grid or within the toolbar.

3. Click **Date-Time** in the Query Designer toolbar to open **Member Selection**, where you can select members and apply Period, Range, and other filters.
4. Under **Attributes** on the Query Designer toolbar, select an attribute or linked attribute in the drop-down menu, then drag it to the grid or within the toolbar. Repeat as necessary for other attributes.
5. To select members and apply filters to an attribute, click the attribute name on the Query Designer toolbar to open **Member Selection**.
6. Click  on the POV toolbar.

Working with MDX Queries

Create and manage MDX query commands using the Manage and Execute Queries dialog box.

Related Topics

- [About Working with MDX Queries](#)
- [Creating and Saving an MDX Query](#)
- [Executing MDX Queries](#)
- [Modifying Query Connection Information](#)
- [Changing the Query List Display](#)
- [Deleting MDX Queries](#)

About Working with MDX Queries

Data source types: Oracle Analytics Cloud - Essbase

MDX users can bypass the Query Designer interface and create and manage MDX query commands using the **Manage and Execute Queries** dialog box.

In **Manage and Execute Queries**, you can perform the following tasks:

- Create a query
- Modify an existing query
- Save a query
- Modify a query's connection information
- Delete a query
- Execute a query

You can execute one MDX statement per query.

To execute multiple MDX queries at once, Essbase must create an MDX script, described in the *Oracle Essbase Technical Reference*. Oracle Smart View for Office users then run the script from the **Calculation Scripts** dialog, as described in [Running Essbase Calculations](#).

Creating and Saving an MDX Query

You can create an MDX query in the **Manage and Execute Queries** dialog box.

See the Oracle Analytics Cloud - Essbase documentation for information on MDX syntax.

To create an MDX query:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries** to display the **Manage and Execute Queries** dialog box.

Figure 11-1 Manage and Execute Queries Dialog Box

3. Click **Add Query** and type a valid MDX statement in the text box at the right.

For example:

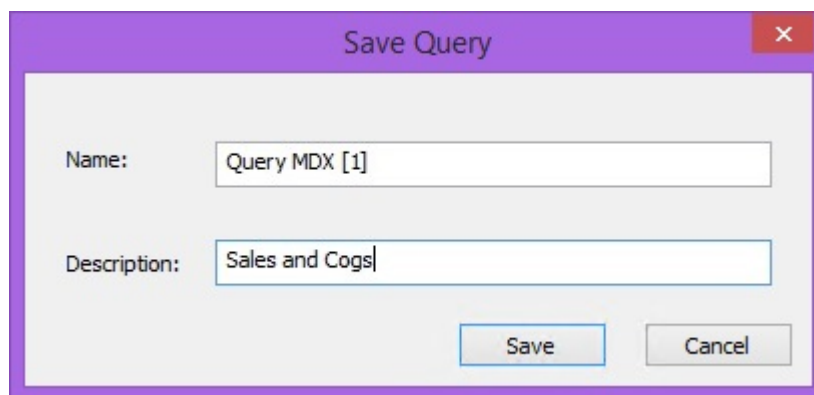

```
SELECT {[Sales], [Cogs]} on columns, Filter
([Product].Levels( 2 ).Members, AVG([Year].CHILDREN, 9001.0) > 9000.00)
on rows
```

Figure 11-2 MDX Query Syntax Entered in the Manage and Execute Queries Dialog Box

- Click the **Save Query** button and, in the **Save Query** dialog box, enter a name and optional description for the query.

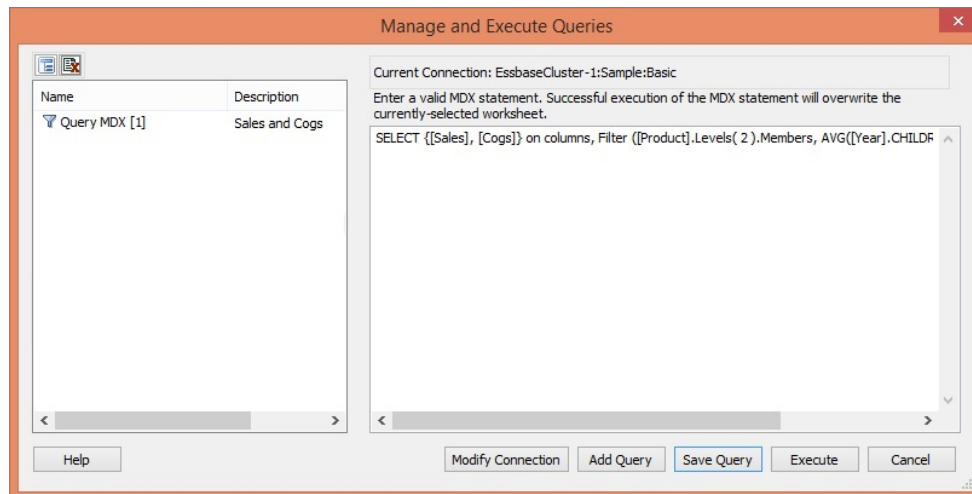

The default name for queries is Query1 [n]. You can change this name.

- Click **Save** to save the query.

The newly-saved query is now listed in the left text box of the **Manage and Execute Queries** dialog box.

Figure 11-3 Newly-Saved MDX Query Listed in the Manage and Execute Queries Dialog Box

You may continue by executing this query or modifying the syntax or connection information.

Executing MDX Queries

You can execute saved MDX queries or instantly execute a query you have just entered.

To execute an MDX query:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries** to display the **Manage and Execute Queries** dialog box.

Figure 11-4 Manage and Execute Queries Dialog Box

3. Perform an action:
 - To execute a saved MDX query, select the query from the list in the left frame and click **Execute**.
 - To execute an MDX query dynamically, click **Add Query**, type the MDX query in the text box at the right, and click **Execute**.

The query you enter dynamically will not be saved.

The dialog box closes automatically and the query results appear on the sheet.

 **Note:**

When executing an MDX query with a calculated member (WITH MEMBER...) in Excel, the calculated values appear successfully, but, if the grid is refreshed, then the column is converted to a comment column and all calculated values are lost. This occurs whether you are using the **Execute MDX** command in the **Essbase** ribbon, or the VBA function, HypMDXExecute.

Modifying Query Connection Information

You can modify the connection information associated with a given query to connect it to a different application and database.

To modify query connection information:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries**

3. In the **Manage and Execute Queries** dialog box, click **Modify Connection**.
4. In the **Edit Connection - URL** page, edit the URL as required, and then click **Next**.

Optionally, select the **Set as default connection** check box, and then click **Next**.

5. In the **Edit Connection - Application/Cube** page, and navigate the tree to the new application and cube, select it, and then click **Finish**.

Alternatively, select the **Advanced Setup** check box and manually enter the new connection information in the **Server**, **Application**, and **Cube/Database** text boxes, and then click **Finish**.

Changing the Query List Display

Use the **Change View** button to change how queries are listed in the in the left pane of the **Manage and Execute Queries** dialog box.

The query list display can be toggled from a flat alphabetical list of all queries associated with the connection, to a tree view where queries are listed by their associated applications and database.

To change the query list display:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries**
3. In the **Manage and Execute Queries** dialog box, click the **Change View** button, .

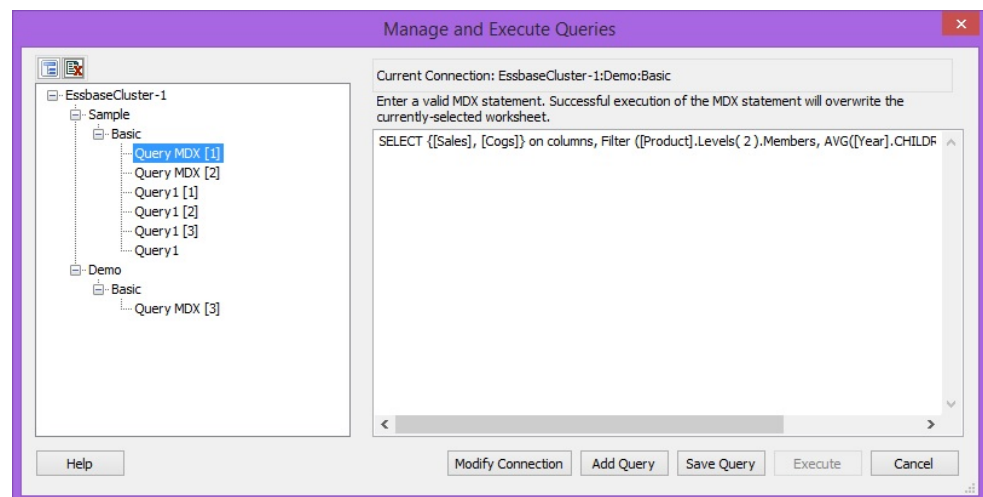

The default display is a flat alphabetical list. Clicking  changes the query list to a tree view, where queries are listed by their associated applications and databases, as shown in [Changing the Query List Display](#)

Figure 11-5 Queries Listed in Tree Format by Application and Database

4. **Optional:** Click  again to toggle the view back to an alphabetical list.

Deleting MDX Queries

You can delete MDX queries from the list in the **Manage and Execute Queries** dialog box.

To delete an MDX query:

1. In Excel, connect to an Oracle Analytics Cloud - Essbase data source.
2. From the Essbase ribbon, select **Manage and Execute Queries**
3. From the list in the left frame of the **Manage and Execute Queries** dialog box, select a query to delete.
4. Click the **Delete Query** button .
5. Click **Yes** at the prompt to confirm the delete request.
6. Click the **X** in the upper right corner or click **Cancel** to close the dialog.

Smart Forms start with an ad hoc grid.
- [Excel Functions Supported in Smart Forms](#)
Several Excel functions are supported in Smart Forms.

About Smart Forms

Create and manage Smart Forms in Oracle Smart View for Office.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Starting with an ad hoc analysis grid, you can customize the grid by adding business calculations to it, in the form of Excel functions and formulas. These calculations don't affect metadata in the rest of the source application. The business calculations that you create and save in the Smart Form can then be executed in both Smart View and the provider web interface; for example, in Planning. In Smart View, the formulas are evaluated by Excel; in the web interface, the formulas are evaluated by the provider.

For example, say you're analyzing Planning data in Smart View. You want to calculate the average profit margin for four products. You can add a row to the grid, with the grid label of "Average Profit Margin." In the new row, add an Excel function for average profit margin, selecting the profit margin data cells for each of the four products. If the profit margin for each product appears in column D of the grid, then your function may be `=AVERAGE(D5:D8)`. In Smart Forms, the Excel formulas and functions you add are referred to as *business calculations*. After you add the business calculation, the average profit margin is instantly displayed in the new row, but the new row will be saved only in the Smart Form, not the rest of the application.

To make this ad hoc grid with its grid labels and calculations available as a form in Planning, you select the **Save As Smart Form** option in the Planning ribbon in Smart View. Thereafter, in Planning or Smart View, you can open and use this Smart Form as a form, including any rows, columns, and business calculations you added. In Smart View, you can perform ad hoc against this Smart Form. You can even create a sandbox from a Smart Form.

The sections that follow provide descriptions and guidelines for working with Smart Forms.

Smart Forms

Smart Forms are a type of data form, created in Smart View and based on ad hoc grids, that have functionality not supported by regular data forms. Smart Forms support [grid labels](#), along with [business calculations](#) in the form of Excel formulas and functions. In Smart View, you can save these ad hoc grids to the applicable provider, such as Planning, as Smart Forms. The business calculations and grid labels, along with any empty rows and columns, are saved as a part the Smart Form definition. Additionally:

- Beside calculated cells and empty rows and columns functionality, Smart Forms support extended Excel formatting features including cell merging.
- Smart Forms can be used by end users in the same way as regular forms in the applicable web interface or in Smart View.
- Smart Form design, as with form design in the application web interface, is not available for end users. You must have the Admin or Interactive User role to save ad hoc grids as Smart Forms.

As with regular forms, the administrator must assign read/write access to Smart Forms for end users.

- In Smart View, you design Smart Forms in Excel worksheets, meaning you can clearly see the Smart Form layout, even an asymmetric layout. In the provider web interface, you would need to create separate rows and columns to achieve this.
- When connected using a shared connection, the following Smart View functions are supported in Smart Forms: HsGetValue, HsSetValue, and HsActive.

When connected using a private connection, Smart View functions are not supported.

Note: When you open an a Smart Form containing a Smart View function, click **Refresh** to update the function cells with their correct values.

- In the provider web interface, while in design mode:
 - You can assign business rules to Smart Forms.
 - You cannot modify the Smart Form grid layout, Excel formatting, or business calculations.
- Smart Form functionality is available for ad hoc grids created with Planning, Financial Consolidation and Close, and Tax Reporting. Check with your service administrator about the availability of Smart Forms in your service.

Business Calculations

In Smart Forms, the Excel functions and formulas that you add to an ad hoc grid are referred to as *business calculations*. When a grid is saved as a Smart Form, end users can execute the business calculations from the Smart View client, without adding members to the application metadata.

Business calculations are executed in Smart View utilizing Excel's calculation engine, and do not require queries to the provider. These runtime business calculations are supported in both Smart View and the data provider. Also note the following:

- Many Excel functions are supported in Smart Forms. If an Excel function is not supported, a message will notify you when you attempt to save the Smart Form.

- You can apply Excel formatting to the business calculation cells so that the figures display according to your preferences; for example, with dollar signs or decimal points.
- In the grid label row or column, you cannot enter only constants for the business calculation cells; for example, 1000 or 0.10 are not supported. If you want to use a constant in a calculated cell, be sure to prefix it with an equal sign (=); for example, =1000 or =0.10.

Grid Labels

Grid labels are used to provide placeholders in a grid for entering business calculations for corresponding data cell intersections. They are required in order to save an ad hoc grid with business calculations. Additionally:

- You enter grid labels manually in Excel in place of actual members in an ad hoc grid.
- Grid label names cannot match any actual member name in the data source application, or any member alias from any alias table. In case of a match, the actual member name or alias name will take precedence over the grid label name.
- Grid labels cannot consist of only blank spaces.
- Grid labels do not have any dimension properties.
- Grid labels are not visible in the Planning Dimension Editor and they are not sent to Oracle Essbase.
- Data cells created by the intersection of actual members with grid labels are referred to as *calculated cells*.

Creating Smart Forms

In Oracle Smart View for Office, you create Smart Forms by saving ad hoc grids that contain grid labels and business calculations.

Smart Forms are saved to Planning, Planning Modules, Financial Consolidation and Close, or Tax Reporting accordingly.

To create a Smart Form:

1. Follow the steps in [Starting Ad Hoc Analysis](#) to create an ad hoc grid.
Alternatively, open a form and, from the provider ribbon, click **Analyze** to convert the form to an ad hoc grid.
2. Add grid labels and business calculations (in the form of Excel formulas and functions), to the ad hoc grid.
See [Smart Form Example Scenario](#)
3. After you have added grid labels and business calculations to an ad hoc grid, in the provider ad hoc ribbon, click  **Save As Smart Form**.
4. In the **Save Grid As Smart Form** dialog box:
 - In **Grid Name**, provide a name for the Smart Form.
 - In **Grid Path**, browse to the location where you want to store the Smart Form.

You can also type a new folder name. The folder appears under the application in the Smart View Panel.

- **Optional:** Select **Submit Formatting** to save any custom Excel formatting changes that have been applied to the grid.

See [Saving Native Excel Formatting to EPM Cloud](#) for additional notes and guidelines about saving formatting in ad hoc grids and forms.

In the Smart View Panel, Smart Forms are designated with the  icon.

Smart Form Example Scenario

Smart Forms start with an ad hoc grid.

The ad hoc grid is created either by opening an Planning, Financial Consolidation and Close, or Tax Reporting form for ad hoc analysis or by starting ad hoc analysis at the Plan type level, as shown in [Figure 1](#).

Figure 12-1 Form Opened for Ad Hoc Analysis

Add a row by typing "entity2" for the Entity dimension, and the label "accountX" for the Account dimension on row 13, cells A13 and B13, creating on the row two grid labels. Cells C13:F13 will be calculated cells. In order to be used as grid labels, the member names "entity2" and "accountX" should not exist in any dimension and there should not be any alias with the same name in any alias table. However, note that in the basic ad hoc above, entity2 is a member name, so entity2 will be treated as a member.

11	entity2	account4		9	1	3	#Missing
12	entity2	account5		10	1	3	#Missing
13	entity2	accountX		18	=SUM(D10:D12)		

Figure 4 shows the business calculation in the Excel formula bar.

Figure 12-4 Business Calculation in the Excel Formula Bar

		D13		fx =SUM(D10:D12)		
	A	B	C	D	E	F
1			FY13	FY13	FY13	FY14
2			Jan	Feb	Mar	Apr
3	entity1	account1	#Missing	#Missing	3	10
4	entity1	account2	#Missing	#Missing	3	10
5	entity1	account3		3 #Missing	3	10
6	entity1	account4		4 #Missing	6	10
7	entity1	account5		5 #Missing	3	20000
8	entity2	account1		6 #Missing	3	20000
9	entity2	account2		7 #Missing	3	20000
10	entity2	account3		8	1	3 #Missing
11	entity2	account4		9	1	3 #Missing
12	entity2	account5		10	1	3 #Missing
13	entity2	accountX		18	3	

Upon refresh, entity2 in cell A13 will take on the properties of a member, accountX in cell B13 will take on the properties of a grid label, and cells C13 and D13 will take on the properties of business calculation cells.

Notes

- You must enter grid labels in order to save an ad hoc grid with business calculations in the form of Excel formulas and functions.
- If an empty space is entered instead of a grid label, the grid behavior is determined by generic ad hoc rules, such as replacing empty member cell with the same member from this dimension or displaying an error in case the grid becomes malformed.
- You can enter grid labels at any dimension location for an axis: innermost, outermost, or any location in the middle.
- You can enter business calculations only on rows and columns created by grid labels.
- You may type a member name in a grid label row, but it must be placed within the correct dimension. If the member name is entered out of place, and is already in use by the applicable data provider in another dimension, a message is returned upon Refresh, prompting you to change the label name.

Now you can save the ad hoc grid as a Smart Form, as described in [Creating Smart Forms](#). By doing this, our grid labels and business calculations are also saved to the applicable data provider.

The provider will identify “accountX” as a grid label on refresh by displaying it as an ad hoc “comment” row or column (blank cells background). The "entity2" label will take on the same properties as the other entity2 members in the grid, as this member name already exists in the provider database.

Other Examples

Using the Vision sample application, here is an example of a Smart Form, saved from an ad hoc grid, then later opened as a form in Oracle Smart View for Office.

In [Figure 5](#), the business calculation was constructed to show the average gross quarterly profit and average gross total profit for two years, FY13 and FY14. It also shows cell styles applied to the grid label and business calculations cells.

Figure 12-5 Originally an Ad Hoc Grid, Saved as a Smart Form, then Opened as a Form in Smart View

You can import task lists into Microsoft Outlook and use Outlook functionality to manage your tasks.

About Task Lists

Depending on the data source, open and manage tasks from the Smart View Panel in Excel or Outlook, or integrate task lists from the data source into Outlook and use Outlook functionality to manage tasks.

Data source types: Planning

- In Planning, you can manage tasks from the Smart View Panel in both Excel and Outlook, and integrate task lists into Outlook as described in [Working with Tasks from the Smart View Panel](#).
- In Oracle Hyperion Financial Close Management, you can integrate task lists into Outlook as described in [Integrating Task Lists with Microsoft Outlook](#).

Administrators manage and assign access permissions for task lists. For more information, see the administration documentation for your data source.

Watch this tutorial video to learn about task lists.

[Tutorial video](#)

Working with Tasks from the Smart View Panel

From the Smart View Panel, you can open and view task lists, execute and complete tasks, and create task list reports.

[Opening a Task List](#)

[Viewing the Task List](#)

[Executing a Task](#)

[Completing a Task](#)

Creating Task List Reports

Opening a Task List

Data source types: Planning

To open a task list from Excel:

1. From the Smart View ribbon or menu, click **Panel**.
2. If prompted, enter your user name and password.
3. From the Smart View Panel, do one of the following:
 - From Recently Used on Smart View Home, click the name of a task list.
 - From Shared Connections or Private Connections, navigate to the task list that you want to open, and then click **Open Task List** on the Action Panel.

To open a task list from Outlook:

1. Ensure that Outlook displays a Oracle Smart View for Office menu. If it does not, do the following:
 - a. Close Outlook.
 - b. In Excel, from the Smart View ribbon, click **Options**, then **Advanced** in the left panel.
 - c. Clear **Disable Smart View add-in in Outlook**.
 - d. Click **OK**.
 - e. Reopen Outlook.
2. Ensure that you are connected to a data source as described in [Managing Data Source Connections](#).
3. From the Outlook toolbar, click **Smart View**, and then select **Panel** to display the Smart View Panel.
4. From the Smart View Panel, do one of the following:
 - From **Recently Used** on Smart View Home, click the name of a task list.
 - From Shared Connections or Private Connections, navigate to the task list that you want to open, and then click **Open Task List** on the Action Panel.

Viewing the Task List

Data source types: Planning

A task list opened in the Task List pane of the Smart View Panel displays the following:

- The individual tasks in the task list. These may contain subordinate tasks. The status of the task – complete, incomplete, or overdue – is indicated by color-coding.
- A drop-down menu from which you can select any of the other task lists associated with the current application
- The Action Panel, which displays the actions that are available for the selected task

- Task Details, which opens when you click the double arrows
- A color-coded status bar for the task list

Executing a Task

Data source types: Planning

To execute a task:

1. Open the task list that contains the task to execute.
2. From the Action Panel, click **Execute Task**.
3. Task execution varies with the task and data source.

Completing a Task

Data source types: Planning

After completing task requirements, mark the task complete. To complete a task:

1. Complete the requirements of the task.
2. Open the task list that contains the task to complete.
3. Ensure that any dependent tasks are completed.
4. Select the task to mark complete.
5. From the Action Panel, click **Mark Complete**.

Creating Task List Reports

Data source types: Planning

To review the status of your process, you can create a detailed report of one or more task lists in an application in PDF or Excel worksheet format.

To create a task list report:

1. From the Smart View Panel, open a task list.
2. Right-click a task and select **Create Report**.
3. In Report Wizard, use the arrow keys to move all task lists to be included in the report from **Available Task Lists** to **Selected Task Lists**.
4. Click **Next**.
5. Use the arrow keys to move the users whose status you want to view from **Available Users** to **Selected Users**.
6. Click **Next**.
7. Select options to create your report.
8. Click **Finish**.

The report is created in PDF or Excel, depending on your selection in step 7.

Integrating Task Lists with Microsoft Outlook

You can import task lists into Microsoft Outlook and use Outlook functionality to manage your tasks.

Data source types: Planning

Changes to the status of tasks are sent back to the data source, but you cannot delete tasks in Outlook.

To import task lists into Microsoft Outlook:

1. Ensure that Outlook displays a Oracle Smart View for Office menu. If it does not:
 - a. Close Outlook.
 - b. In Excel, from the Smart View ribbon, click **Options**, and then **Advanced** in the left panel.
 - c. Clear **Disable Smart View add-in in Outlook**.
 - d. Click **OK**.
2. Open Outlook.
3. Click **Smart View** and select **Task List**.
4. Select **Shared Connections** or **Private Connections**.
5. From the Task List, click **Select application**.
6. In Select Application, from the drop-down menus, select the server and application associated with the task lists to import.
7. Click **OK**.

All task lists associated with the selected application are displayed in Task List.

8. Double-click a task list to display its individual tasks in Outlook Task Lists.

From here, you can apply Outlook functionality to your tasks. See the Outlook product documentation for information on working with tasks in Outlook.

Smart View and EPM Cloud

Related Topics

If an administrator sets up multiple page dimensions for a form, select the page with the required data from the page drop-down menu.
- [Copying Versions](#)
You can copy data from one bottom-up or target version of a selected scenario to another bottom-up or target version within the same scenario.
- [Dashboards](#)
Dashboards give you an overview to key information and let you change and save data.
- [Composite Forms](#)
You can open Oracle Enterprise Performance Management Cloud composite forms in Oracle Smart View for Office.
- [Working with Business Rules](#)
In forms and ad hoc grids, you can use business rules to calculate data in the database.
- [Spreading Data](#)
You can spread data for time periods, spread values using grid spread, and spread values using mass allocation.
- [Member Formula](#)
You can view the underlying formula in cells that contain a formula.
- [Supporting Detail](#)
Supporting detail serves as a built-in calculator for developing data that is not in the member outline.
- [Setting User Preferences](#)
You can set user preferences for an application.
- [Saving Native Excel Formatting to EPM Cloud](#)
Oracle Smart View for Office provides a way for users to save native Excel formatting back to Oracle Enterprise Performance Management Cloud business process as part of a form or ad hoc grid.

- [Working with Multiple-Grid Worksheets in EPM Cloud](#)
In Oracle Smart View for Office, you can retrieve multiple ad hoc grids on one worksheet. The grids can all be connected to the same data source, or each grid can be connected to a different data source.
- [Smart View Behavior Options in EPM Cloud](#)
Your administrator can set options in the web interface that affect Oracle Smart View for Office behavior.

About Smart View and EPM Cloud

Oracle Smart View for Office supports several Oracle Enterprise Performance Management Cloud features.

EPM Cloud includes the following data sources:

- Planning
- Planning Modules
- Financial Consolidation and Close
- Tax Reporting

This guide provides information about the EPM Cloud features that Smart View supports. For other EPM Cloud information, see the documentation and videos available on the Oracle Help Center.

Watch this overview video to learn about using basic EPM Cloud features in Smart View.

[Overview video](#)

Planning Approvals

Planning approvals is the submission, review, and approval process of a planning unit.

If you are assigned the Approvals role, you can perform the Approvals functions described here. For information about roles, see the administrator.

Data source types: Planning

Note:

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

Changing Planning Unit Status

Data source types: Planning

You can change the status of one or more planning units at a time.

To view or change the status of a planning unit:

1. Open the appropriate form.
2. From the Planning ribbon, select **Approvals**.
3. From **Manage Approvals**, select a **Scenario** and **Version**.
4. Click  to display the list of planning units to which you have access.
5. **Optional:** From the view mode button, select one of the following:
 - **Flat View** to display planning units as a list.
 - **Tree View** to display planning units as a hierarchy (available only to administrators).

From the Tree View, you can select **Start** to start a planning unit and **Exclude** to exclude a planning unit from the process.

- **My Planning Units** to display only the planning units that you own.
6. Select the planning unit or units whose status you want to change. If the list is too long to locate the planning unit easily, you can search or apply filters to the list as described in [Finding Planning Units](#).
 7. To view details for the selected planning unit, click **Planning Unit Details**.

The **Approval Status** tab displays a history of the process status, owner, actions taken, and the date and times the status changed.

The **Annotations** tab displays any comments that were entered for the planning unit. See [Planning Unit Annotations](#).

8. To change the planning unit status, click **Change Status**.

 **Note:**

If you change the status of a parent entity, all of its children change, too, unless they were excluded during the First Pass state or were approved.

9. From **Approvals - Change Entity's Status**, select an action and the next owner for the planning unit.
10. **Optional:** Enter comments under **Enter Annotation**.
11. Click **Submit**.
12. **Optional:** To validate the changed planning unit, click . You can validate only one planning unit at a time.

Related Topics:

- [Out of Office Assistant](#)

Finding Planning Units

Data source types: Planning

In **Manage Approval**, you can locate planning units easily by searching or by applying a filter to the list of planning units. You can use an auto filter or select members or generations as filter criteria.

To filter the list of planning units:

1. Open Manage Approval and select a scenario and version as described in [Changing Planning Unit Status](#).

2. Click  to enable filtering.

The filter bar, which contains filtering tools, is displayed just above the planning unit list.

3. Use one of the following procedures:

- **Search**

To search for a specific planning unit, enter its name in the **Planning Unit** field and click .

- **Auto filter**

- a. From the filter bar, click the arrow in the column header for **Approvals Status**, **Sub-Status**, or **Current Owner**.
- b. Select the column value to filter by. You can apply auto filters to more than one of these columns.

- **Filter by member selection**

- a. From the filter bar, click , and then select **Member selector**.
- b. Click , and then select members for the planning unit list
- c. Click  to filter the list.

- **Filter by generation**

- a. From the filter bar, click , and then select **Generation**.
- b. Click , and then select one or more generations to display in the planning unit list.
- c. Click  to filter the list.

- d. Click **OK**.

4. **Optional:** To undo your filter selections before applying the filter, click .

Planning Unit Promotional Path

Data source types: Planning

Planning units move from person to person and department to department based on the following:

- The owners and reviewers assigned to the planning unit
- The planning unit place in the hierarchy

To view the promotional path of a planning unit in graphical form:

1. From the Planning ribbon, select **Approvals**.
2. From **Manage Approvals**, select a **Scenario** and **Version**.
3. Click **Go** to display the list of planning units to which you have access.
4. Select a planning unit.

5. Click .

Related Topics:

Planning Unit Annotations

Data source types: Planning

You can add or view comments about data in a planning unit that is started. Annotations can vary by combinations of scenario, version, and entity members.

To add a planning unit annotation:

1. From the Planning ribbon, select **Approvals**.
2. From **Manage Approvals**, select a **Scenario** and **Version**.
3. Click **Go** to display the list of planning units to which you have access.

4. Select the planning unit for which you want to add an annotation. To filter the list, see [Finding Planning Units](#).
5. **Optional:** To view existing annotations for the selected planning unit, click **Planning Unit Details** and then the **Annotations** tab.

6. Click .
7. In **Approvals - Add Annotation**, enter a title and annotations (up to 1500 characters). On multibyte systems, Oracle recommends limiting annotations to 750 characters. You can enter URLs and links as well as text.
8. Click **Submit**.

Out of Office Assistant

Data source types: Planning

You can set up the Out of Office Assistant to reassign planning units that arrive while you are out of the office.

To set up the Out of Office Assistant:

1. From the Planning ribbon, select **Approvals**.
2. From **Manage Approvals**, select **Out of Office Assistant**.
3. From **Out of Office Assistant**, select **I am Currently Out of Office**.
4. From Select Action, select an action and next owner for planning units that arrive while you are out of the office.
5. **Optional:** Enter an annotation.
6. Click **Submit**.

Monitoring Planning Job Status

Use the Job Console to view the execution status of Planning jobs and delete them if needed.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Watch this tutorial video to get acquainted with some basic Oracle Smart View for Office functionality related to Planning, including a brief discussion on monitoring job status.

[Tutorial video](#)

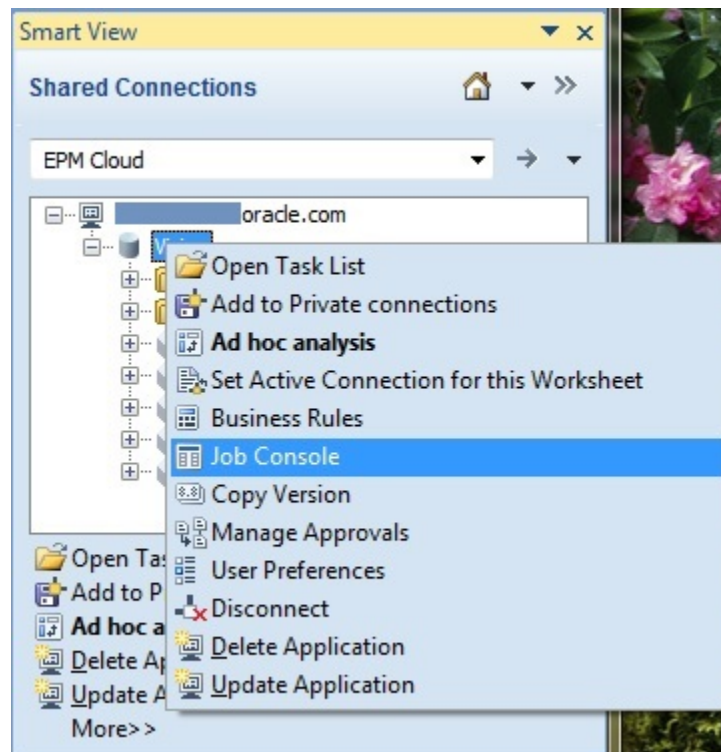

Tip:

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

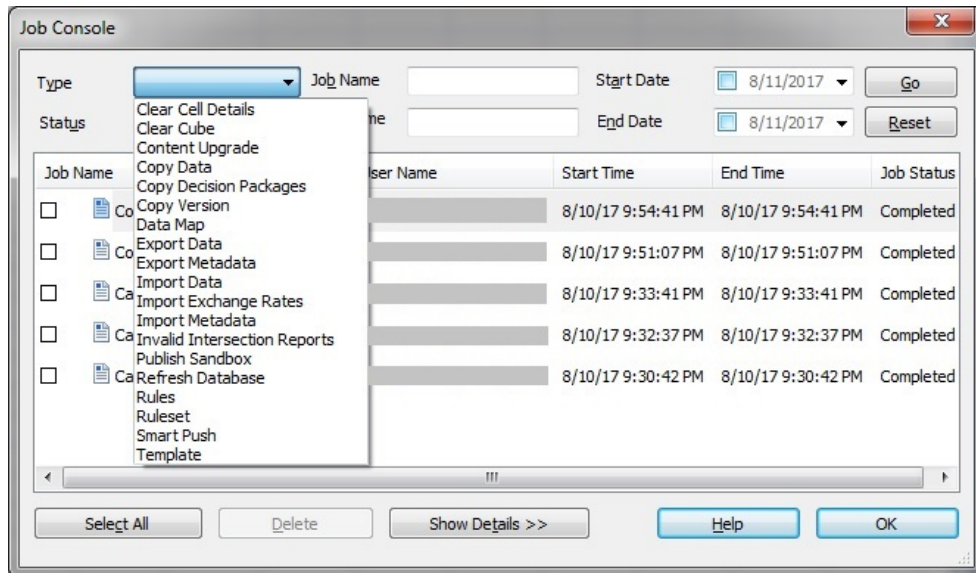

To check the execution status of jobs:

1. In the Smart View Panel, right-click the application name and select **Job Console** from the context menu.

Alternatively, select the application name, and in the Action Panel, select **More**, and then **Job Console**.

The **Job Console** is displayed.

By default, all job types and statuses are displayed in the **Job Console**.

The following steps show you how to filter jobs by job type or status, view details about jobs, and delete jobs.

 **Note:**

You cannot cancel or start jobs from the **Job Console**.

2. To filter the list of jobs in the **Job Console**, from the filter criteria area at the top of the dialog, use any of the following job criteria:

- **Type**—From the drop-down menu, select a job type. For example, some job types are:
 - Clear Cell Details
 - Copy Data
 - Refresh Database
 - Rules
 - Smart Push

This is a partial list of job types. Your administrator configures the job types available to you. Administrators can view all job types.

- **Status**—From the drop-down menu, select a job status. For example, some job statuses are:
 - Completed
 - Completed with Errors
 - Error
 - Processing

This is a partial list of job statuses. Your administrator configures the job statuses available to you. Administrators can view all job statuses.

- **Job Name**—Type a job name.
 - **User Name**—Type a user name.
 - **Start Date** and **End Date**—Click  and enter a start date and end date range using the calendar control.
3. Click **Go**.

The **Job Console** displays the jobs matching your selection criteria.
 4. **Optional:** To get more detailed information on job execution, , select the job and click **Show Details**.

To see details for all jobs in the list, click **Select All**, and then click **Show Details**.
 5. **Optional:** To delete a job , select the job and click **Delete**.

To delete all jobs in the list, click **Select All**, and then click **Delete**.
Deleting a job only deletes it from the list in the **Job Console**. It does not cancel a job.

Searching for a Page in EPM Cloud Forms

If an administrator sets up multiple page dimensions for a form, select the page with the required data from the page drop-down menu.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To search for a page in an Oracle Enterprise Performance Management Cloud form:

1. Click in the page dimension that you want to search to highlight it.
2. From the drop-down menu, select the page name containing the data with which you want to work.

Copying Versions

You can copy data from one bottom-up or target version of a selected scenario to another bottom-up or target version within the same scenario.

Data source types: Planning, Planning Modules

For example, you can create a Best Case version and copy some or all the data in that version to a Worst Case version to quickly create a starting point for the new version.

You can copy between bottom-up and target versions.

- When you copy to a bottom-up version, only the selected level 0 members are copied.
- When you copy to a target version, all selected members are copied.
- To protect data in approved planning units, copying a version does not copy to approved planning units.

 **Note:**

To successfully copy data, when specifying the copy data criteria, you must select at least one member for the Scenario, Account, Entity, Period, and Version dimensions.

To copy a version:

1. Perform an action to access the **Copy Version** dialog box.
 - From a Planning form, in the Planning ribbon, select **Copy Version**.
 - From an ad hoc grid, right-click the application name.
2. From **Scenario**, select the scenario to copy.
3. From **Copy From**, select the source version.
4. From **Copy To**, select the destination version.
5. Click **Go** to display the available entities (planning units) for the selected source version.
6. Use the arrow keys to select entities from **Available Entities**. You can copy entities with a Process Status of Not Started or First Pass.
7. **Optional:** To copy associated information, select any of these options:
 - **Copy Account Annotations.** Only annotations for selected entities are copied. If you are copying to a bottom-up version, only level 0 entities (and their annotations) are copied.
 - **Copy Cell text and Document links**
 - **Copy Supporting Details**
8. Click **Copy Data**.

 **Note:**

Wait for the Copy Version completion message before loading another web page.

9. Click **Cancel** to close the **Copy Version** dialog box.

Dashboards

Dashboards give you an overview to key information and let you change and save data.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

You can open Oracle Enterprise Performance Management Cloud dashboards in Oracle Smart View for Office.

To open a dashboard:

1. Connect to an EPM Cloud data source that contains dashboards.
 2. From the Connections tree list, double-click a dashboard (indicated by ).
- The dashboard opens in a new Excel workbook with each dashboard object displayed in a separate worksheet.

 **Note:**

- Smart View supports grid and chart type dashboard objects. Chart objects are displayed in grid format. All other dashboard types will be ignored.

For example, a dashboard consists of these components: one grid, one chart, one note, and one image. Open this dashboard in Smart View and notice that the workbook has only two sheets, one for the grid, and one for the chart that is displayed as a grid. The note and image components are ignored.

- Smart View supports a master form for the dashboard.

For more information on dashboards:

- **Administrators:** See the topics on designing dashboards in the *Administering* guide for your cloud service.
- **End users:** See the topics on using dashboards in the *Using* guide for your cloud service.

Composite Forms

You can open Oracle Enterprise Performance Management Cloud composite forms in Oracle Smart View for Office.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To open a composite form:

1. Connect to an EPM Cloud data source that contains composite forms.
2. From the Connections tree list, double-click a composite form (indicated by ).

The composite form opens in a new Excel workbook with each subform displayed in a separate worksheet.

Smart View supports master composite forms.

Working with Business Rules

In forms and ad hoc grids, you can use business rules to calculate data in the database.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Some business rules prompt you to enter information, called a *runtime prompt*. Others, called *template-based business rules*, prompt you to enter parameter information using a guided wizard.

Watch this overview video to get acquainted with some basic Oracle Smart View for Office functionality related to Planning, including a brief discussion of business rules.

[Overview video](#)

Related Topics:

[Launching Business Rules in Excel](#)

[Entering Runtime Prompts](#)

[Executing the Calculate Form and Calculate Currencies Business Rules](#)

Launching Business Rules in Excel

Data source types: Planning

To launch a business rule in Excel:

1. Open a ad hoc grid or form (single or composite).
2. Save any unsaved data.
Unsaved data is lost when you launch a business rule.
3. From the Planning ribbon, select **Calculate**, and then **Business Rules**.
4. From **Business Rules**, under **Plan Type**, select the plan type associated with the rule you want to use.
5. Select a rule from the rules listed for that plan type, and then click **Launch**.

If you select a template-based business rule, you define rule parameters using a guided wizard.

If the business rule includes runtime prompts, enter the information described in [Entering Runtime Prompts](#).

 **Note:**

Oracle Smart View for Office does not support the use of dynamic members, or "members on-the-fly". Dynamic members can only be used with business rules in the Planning web application.

If the calculation is successful, the values in the database reflect the results of the calculation.

 **Note:**

Planning administrators: During form design in Planning, rules with runtime prompts directly attached to a composite form with **Run on Save** enabled are not supported in Smart View. You should always attach rules to a simple form, enable **Run on Save**, then attach the business rules from the simple to the composite form. This way, all runtime prompt values are picked up correctly from the form context and the business rules launch successfully.

6. Click **Close**.
7. From the Smart View ribbon, select **Refresh**.

Related Topics:[Entering Runtime Prompts](#)[Executing the Calculate Form and Calculate Currencies Business Rules](#)

Entering Runtime Prompts

Data source types: Planning

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

When launched, a business rule can prompt you to enter variable information, called a *runtime prompt*. The business rule designer sets up runtime prompts.

To enter a runtime prompt:

1. Launch a business rule having a runtime prompt.
2. Enter or select the input type specified by the runtime prompt, summarized in the following table:

Table 14-1 Runtime Prompts and Expected Input

Icon	Expected Input Type
	One member selection
	Multiple member selections
	Numeric value (either entered or selected from cell drop-down menu)
	Text value—Use only with enhanced calculation scripts, not with graphical scripts
	Dimension from the database—Use only with enhanced calculation scripts, not with graphical scripts

Table 14-1 (Cont.) Runtime Prompts and Expected Input

Icon	Expected Input Type
	For Calculation Manager business rules only: A member or member combination that includes only one member from each dimension the designer has set for this runtime prompt (for example: Sales -> Actual -> Jan refers to the member intersection of Sales, Actual, and January)
	For Calculation Manager business rules only: A range of members, selectable from each dimension the designer has set for this runtime prompt (for example: IDescendants("Marketing"),FY08)

Ensure that the runtime prompts are valid. You cannot launch a business rule until all runtime prompt values are valid.

3. Click **Launch.**

If the calculation is successful, the values in the database reflect the calculation results.

Related Topics:

[Launching Business Rules in Excel](#)

[Executing the Calculate Form and Calculate Currencies Business Rules](#)

Executing the Calculate Form and Calculate Currencies Business Rules

Data source types: Planning

The Calculate Form business rule is created for each form to calculate subtotals. The Calculate Currencies business rule is created for forms that include multiple currencies in a row, column, or page to enable the conversion of values among available currencies.

The order in which business rules are launched is important and may affect the data. If you plan to launch both Calculate Form and the Calculate Currencies business rules, always run the conversions before subtotaling the form.

To launch the Calculate Form and Calculate Currencies business rules in Excel:

1. Open a form.

Any data that is not saved on the spreadsheet is lost when you launch the business rule.

2. From the Planning ribbon, select **Calculate, and then **Rules on Form**.**

The business rules associated with the form are displayed in the Business Rules dialog box.

3. Complete one or both of the following actions:

- To convert currencies, select **Calculate Currencies**

- To calculate subtotals, select **Calculate Form**
4. Click **Launch**.

If the calculation is successful, the values in the database reflect the results of the calculation.

Spreading Data

You can spread data for time periods, spread values using grid spread, and spread values using mass allocation.

Data source types: Planning

- [Spreading Data for Time Periods](#)
- [Spreading Values Using Grid Spread](#)
- [Spreading Values Using Mass Allocation](#)

Spreading Data for Time Periods

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

In a form, the spreading rules for time periods are set in the application as part of the as part of the dimension property settings. When you work with a form in Excel, and depending on how the form was set up by the administrator, data values can be spread, or distributed, in several ways:

- Spread the value of a summary time period to its base time periods or to the first parent or first child of the parent time period
- Spread values among children and parents proportionally, based on existing distribution
- Spread values based on the weekly distribution of a quarter, which could be 4-4-5, 5-4-4, 4-5-4, or None (as set up by the budget administrator)
- Temporarily lock the values of certain cells while spreading data over time periods (see [Spreading Data with Cell Locking](#))
- Spread values for different time periods using a different spreading rule for each separate time period on the same row or column dimension. For example, FY2013 can have formula fill, and FY2014 can have flow.

Notes

- You cannot spread data in a summary time period that includes members with mixed currency types.
- Excel formulas in child cells are ignored during spreading.

To spread data for time periods:

1. Open a form.

2. Select a cell and enter a new value.
The value is distributed according to the rules described in “Adjusting and Spreading Data” in the *Working with Planning*
3. Click **Submit** to save the new values.

Related Topics:[Spreading Data with Cell Locking](#)[Spreading Values Using Grid Spread](#)[Spreading Values Using Mass Allocation](#)

Spreading Data with Cell Locking

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

When spreading data over time periods, you can temporarily lock the values of one or more cells to preserve their values when other values are recalculated. You can spread data across time periods based on various calculations and visually review the changes before committing them to the database. For examples of spreading with cell locking, see the *Working with Planning*.

To temporarily lock values:

1. Open a form.
2. In the form, select the cell or group of cells that you want to lock.
3. From the provider ribbon, select **Lock**.

A color change indicates that a cell is locked. You can now spread or manipulate data in the other cells however you want, without affecting the locked cells.

4. To unlock a cell, refresh the grid.

Related Topics:[Spreading Values Using Grid Spread](#)[Spreading Values Using Mass Allocation](#)

Spreading Values Using Grid Spread

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

If your administrator has enabled Grid Spread, you can specify an amount or percentage to increase or decrease values across multiple dimensions on the grid, based on the existing values in the target cells. When calculating the spread data, read-only and locked cells and cells having supporting detail are ignored. Data integrity is ensured because values can be spread only to cells to which you have access.

To spread values using Grid Spread:

1. Put the cursor in the Subtotal or Total source cell whose value you want to spread to target cells.

2. From the provider ribbon or provider ad hoc ribbon, select **Adjust**, and then **Grid Spread**.
3. From the drop-down menu, select one of these options:
 - **Value** to increase or decrease values by a specified amount
 - **Percentage** to increase or decrease values by a percentage
4. Select **Increase By** or **Decrease By** and enter a value or percentage.
5. In **Spread Value**, enter the actual spread value that you want.

For example, if the **Current Value** is 100 and you want the spread value to be 125, enter 125 directly in **Spread Value** and do nothing with the **Increase By/Decrease By** options or text box in step 4.

Alternatively, you can enter 25 in **Increase By**, and 125 will be displayed in **Spread Value**.

 **Note:**

Entering a value in **Spread Value** has no effect on the **Increase By/Decrease By** text box. But when you enter a value in **Increase By/Decrease By**, the spread value is reflected in the **Spread Value** text box.

6. Select a spreading pattern:
 - **Proportional Spread** to spread the value proportionally, based on the existing values in the target cells (the default)
 - **Evenly Split** to spread the value evenly among the target cells
 - **Fill** to replace the value in all target cells

Your administrator can add other spreading patterns.

7. Click **Spread**. The specified value or percentage is spread across the target cells, replacing former values with new ones.
8. To save the new values, click **Save**.

Related Topics:

[Spreading Data with Cell Locking](#)

[Spreading Values Using Mass Allocation](#)

Spreading Values Using Mass Allocation

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Using mass allocation, you can spread data to all descendents of a source cell and across all dimensions. Spreading by mass allocation spreads data to cells not displayed on the grid and does not require that you have access to the target cells.

Mass allocation is available only for forms, which must be enabled for mass allocation by the administrator. You must be provisioned with the Mass Allocate role to use mass allocation.

 **Note:**

Mass allocation cannot be undone.

To spread values by mass allocation:

1. Put the cursor in the Total or Subtotal cell whose value you want to spread.
2. From the Planning ribbon, select **Adjust**, and then **Mass Allocate**.
3. Enter a new value in **Spread Value** to replace the current value, or from the drop-down menu, select one of the following options:
 - **Value** to increase or decrease values by a specified amount
 - **Percentage** to increase or decrease values by a percentage
4. Select **Increase By** or **Decrease By** and enter a value or percentage.
5. In **Spread Value**, enter the actual spread value that you want.

For example, if the **Current Value** is 100 and you want the spread value to be 125, enter 125 directly in **Spread Value** and do nothing with the **Increase By/Decrease By** options or text box in step 4.

Alternatively, you can enter 25 in **Increase By**, and 125 will be displayed in **Spread Value**.

 **Note:**

Entering a value in **Spread Value** has no effect on the **Increase By/Decrease By** text box. But when you enter a value in **Increase By/Decrease By**, the spread value is reflected in the **Spread Value** text box.

6. Select the **Spread Type** for allocating the specified value or percentage across the target cells:
 - **Proportional Spread** to spread the value proportionally, based on the existing values in the target cells (the default)
 - **Evenly Split** to spread the value evenly among the target cells
 - **Fill** to replace the value in all target cells
 - **Relational Spread** to spread into the selected cells based on values that exist in a different source location. Selecting this option displays the currently selected members for each dimension in the **Selected** column.

Your administrator can add other spreading patterns.

7. Click **Spread**. The new values are automatically saved.

Member Formula

You can view the underlying formula in cells that contain a formula.

Such cells can be indicated on the grid by a cell style specified in the Oracle Smart View for Office **Options** dialog box, **Cell Styles** tab.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

 **Note:**

In the Oracle Enterprise Performance Management Cloud web interface, the **Member Formulas** property must be enabled in the form before you can view formulas in Smart View. Users with the proper permissions should open the form for editing in the web, go to the **Layout** tab, then **Dimension Properties**, and then select **Member Formula**.

To view a member formula:

1. Open a form or ad hoc grid.
2. Select the member whose formula you want to view.
3. From the provider ribbon, select **More**, and then **Member Formula**.

Details of the formula are displayed.

 **Note:**

When a formula is used to reference a member on another sheet, no data is returned. For example, if the period is in the column on another sheet, and all other sheets reference that cell, no data is refreshed on the other sheets. In order to display the data that references a member on another sheet, the Excel cell format for the member formula cell should be set to "General."

Supporting Detail

Supporting detail serves as a built-in calculator for developing data that is not in the member outline.

It can include text, values, and operators that define how data aggregates.

Data source types: Planning

**Note:**

If you are unfamiliar with Planning, see the Planning documentation and videos available on the Oracle Help Center.

Related Topics:

[Synchronizing Supporting Detail with the Cube](#)

Adding Supporting Detail

Data source types: Planning, Planning Modules

Use the **Supporting Detail** window to set how detail items aggregate to cell values in a form.

Watch this overview video to get acquainted with some basic Oracle Smart View for Office functionality related to Planning, including adding supporting detail.

[Overview video](#)

To add supporting detail that calculates values in a form or ad hoc grid:

1. Open a form, and then select the cells.
You can select one cell or a range of contiguous cells in a row or column. The section cannot include a combination of rows and columns. Select cells that are in the local currency so that you can write to them.
2. From the Planning ribbon or Planning Ad Hoc ribbon, select **Cell Actions** and then **Supporting Detail**.

The **Supporting Detail** window reflects your cell selection.

3. Enter a description over the initial “untitled” text.
The text and its associated operator must be unique among children of the same parent. By default, you can enter up to 1,500 characters.
4. Use the buttons to create or change the indented hierarchy to reflect the desired structure and calculations.
For example, click **Add Child** to add a line item directly below the selected item.
5. Set the mathematical relationships among the line items by selecting an operator for each of them.

Select from these operators:

Operator	Function
+	Add

Operator	Function
-	Subtract
*	Multiple
/	Divide
~	Ignore

6. Enter data to set or calculate.

Enter numbers using the same scaling that was set up for the form.

7. Click **Submit**.

Values are dynamically calculated and aggregated before the data is submitted. Data on the form is also submitted.

[Viewing or Changing Supporting Detail](#)

[Synchronizing Supporting Detail with the Cube](#)

Working with the Supporting Detail Hierarchy

Data source types: Planning, Planning Modules

The supporting detail hierarchy should reflect the type of information that supports the cell values and the mathematical operators that create the relationships.

To create or change the supporting detail hierarchy:

1. In a form, select the cells with supporting detail.
2. From the Planning ribbon or Planning Ad Hoc ribbon, select **Supporting Detail**.
3. Create or change the rows in the hierarchy that provide the detail for the data values by putting the cursor on an item and clicking the options in this table:

Table 14-2 Supporting Detail options and Their Results

Option	Result
Add Child	Adds an item one level below the selected cell. You can add an unlimited number of children, but consider its potential performance impact.
Add Sibling	Adds an item at the same level as the selected cell. You can add an unlimited number of siblings, but consider its potential performance impact.
Delete	Removes the selected item
Delete All	Simultaneously removes all supporting detail
Promote	Moves the selected item to the next-higher level
Demote	Moves the selected item to the next-lower level

Table 14-2 (Cont.) Supporting Detail options and Their Results

Option	Result
Move Up	Moves the selected item to before its sibling predecessor
Move Down	Moves the selected item to after its sibling successor
Duplicate Row	Adds a row below the selected item, duplicating its structure (text, operator, and values)
Fill	For rows, copies the data from the current cell to the cells to its right
Refresh	Gets the latest stored database values, restoring the previously saved values, and possibly overwriting changes you just made.

4. Click **Submit**.

The submit operation stores the detail text, values, and aggregate values.

[Viewing or Changing Supporting Detail](#)

[Synchronizing Supporting Detail with the Cube](#)

Viewing or Changing Supporting Detail

Data source types: Planning, Planning Modules

Cells that contain supporting detail can be indicated on the grid by a cell style specified in the Options dialog box.

To view or change calculations or supporting data:

1. Open a form, and select the cells for which to view or add detail.

You can select one cell or a range of contiguous cells in a row or column. The section cannot include a combination of rows and columns. Select cells that are in the local currency so that you can write to them.

2. From the Planning ribbon or Planning Ad Hoc ribbon, select **Supporting Detail**.

3. View or change the line items or calculations that aggregate the data in the selected cells.

Related Topics:

[Adding Supporting Detail](#)

[Working with the Supporting Detail Hierarchy](#)

[Synchronizing Supporting Detail with the Cube](#)

Synchronizing Supporting Detail with the Cube

Data source types: Planning

In Oracle Enterprise Performance Management Cloud applications, when you delete supporting detail for a cell, you affect the associated value in the relational database. You specify how to handle the stored database value. You can set it to #Missing or leave it as it was before the supporting detail was deleted. This feature is useful if you want to use supporting detail as a scratch pad or calculator.

To synchronize supporting detail with the database:

1. Open a form.
2. In the form, click the cell that has the supporting detail you want to remove.
3. From the provider ribbon or provider Ad Hoc ribbon, select **Supporting Detail**.
4. In the **Supporting Detail** window, delete the information, and then click **OK**.
5. Select an option from the displayed message to specify how to handle the aggregate value of the deleted supporting detail stored in the cube:
 - To delete the value from the cube, click **Yes, set the value(s) to #Missing**.
 - To leave the data value in the cube as is, click **No, leave the value(s) as is**.

Setting User Preferences

You can set user preferences for an application.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To set user preferences for an application:

1. From the tree list in the Smart View Panel, select an application.
2. Right-click, and then select **User Preferences**.
3. From **Preferences**, specify options for the following
 - **Application Settings:** Manage email options, specify alias settings, set options for approvals, and specify out of office settings.

 **Note:**

Changes to the alias table require you to disconnect from the provider, and reconnect to take effect.

- **Display Settings:** Set number formatting, remember selected page members, allow a search if the number of pages exceeds a number you specify, set member indentation, use consolidation operators, perform partial grid fetch, specify number of members on each Dimensions Page, display specified record on each Assign Access Page, set date formatting.

- **User Variables:** Variables set up by the administrator to help you navigate large forms and grids.

Note:

User preferences for locale, date format, and decimal/numeric format set on forms from within the web application are not honored on forms in Oracle Smart View for Office.

Saving Native Excel Formatting to EPM Cloud

Oracle Smart View for Office provides a way for users to save native Excel formatting back to Oracle Enterprise Performance Management Cloud business process as part of a form or ad hoc grid.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Saved formatting is applied in both the business process browser interface and when the form is rendered within Excel. You can then choose how to display the formatting in Smart View. This functionality is in addition to the existing Smart View cell styles functionality.

See also [Cell Styles](#).

These formatting options are available in the **Formatting** group of the provider ribbon, shown in [Figure 1](#).

Figure 14-1 Formatting Options

Saving Excel Formatting on a Form

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To save Excel formatting on a form:

1. Open a form for editing in Oracle Smart View for Office.
2. Use native Excel formatting features to apply the formatting to the sheet.
3. On the provider ribbon, select **Save** from the **Formatting** group.
4. Go to [Viewing Formatting in Smart View](#) to choose a viewing option.

Viewing Formatting in Smart View

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Once a form is rendered within Excel, Oracle Smart View for Office provides the options to view the formatting on a sheet. These options are accessed from the **Apply** button within the **Formatting** group on the Planning Ad Hoc ribbon.

 **Tip:**

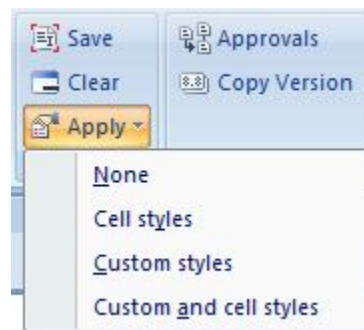

The **Apply** options are *viewing* options only and allow you to display the cell styles and native Excel formatting that were previously saved on a form.

To toggle between formatting view options on a Planning form:

1. Open a Planning form and click the **Apply** button within the **Formatting** group on the Planning ribbon (see [Figure 1](#)).

The Apply options are displayed. The initial state before any option is selected is that no option is selected. Once an option is selected, the last option selection will be preserved the next time the form is opened.

Figure 14-2 Apply Options

2. Select an option:
 - **None**—Applies no styles (Excel formatting or Smart View cell styles) to the sheet. Though cell styles or custom styles may exist on the sheet, neither are shown when selecting this option. They are preserved, however, if you want to display them later using the **Cell styles**, **Custom styles**, or **Custom and cell styles** options.

- **Cell styles**—Applies only Smart View cell styles to the sheet, as described in the "Cell Styles" topic.
- **Custom styles**—Applies only custom user-defined native Excel formatting to the sheet.
- **Custom and cell styles**—Applies both Excel formatting and Smart View cell styles to the sheet. Note that when you select **Custom and cell styles**, cell styles take precedent over custom Excel formatting.

Related Topics:

[Saving Excel Formatting on a Form](#)

[Saving Excel Formatting From an Ad Hoc Grid](#)

[Supported Native Excel Formatting](#)

[Guidelines for Working with Native Excel Formatting and Planning Forms](#)

Clearing Formatting

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To clear the formatting associated with a form or ad hoc grid, select **Clear** from the **Formatting** group on the Planning ribbon.

Selecting the **Clear** option removes any Excel formatting associated with the form or grid, both within Excel and within the web application. Note that you can still work with cell styles functionality since cell styles are not dependent on any custom formatting that is saved.

Related Topics:

[Saving Excel Formatting From an Ad Hoc Grid](#)

[Supported Native Excel Formatting](#)

[Guidelines for Working with Native Excel Formatting and Planning Forms](#)

Saving Excel Formatting From an Ad Hoc Grid

Data source types: Planning

To save formatting from an ad hoc grid:

1. Perform ad hoc analysis to create a grid to save.
2. Use Excel native formatting features to format the grid.
3. From the Planning Ad Hoc ribbon, select **Save Ad Hoc Grid**.
4. In the **Save Grid As** dialog box, select the **Submit Formatting** option when saving the ad hoc grid as a form.

You can now open the saved form and choose a viewing option as described in [Viewing Formatting in Smart View](#).

[Table 1](#) summarizes the native Excel formatting supported by forms in Oracle Smart View for Office, and whether the formatting is supported when the form is viewed in the Oracle Enterprise Performance Management Cloud web application.

Table 14-3 Supported Native Excel Formatting

Formatting	Smart View	EPM Cloud
Font	Font	Font
Font family	Yes	Yes
Font size	Yes	Yes
Bold	Yes	Yes
Italic	Yes	Yes
Strikethrough	Yes	No
Underline	Only single and Continuous	No
Text color	Red, Green, and Blue	Red, Green, and Blue
Background color	Plain, Solid, and Red, Green, and Blue	Plain, Red, Green, and Blue
Alignment	Alignment	Alignment
Vertical	Top, Center, and Bottom	No
Horizontal	Left, Center, and Right	No
Indent	Only Left Indent and five levels of indent	No
Word wrap	Yes	No
Borders	Borders	Borders
Border color	Yes, can be set differently for each cell's four borders, and Red, Green, and Blue	Yes
Border width	Yes, in points	Yes
Border style	None, Solid, double, Dotted, Dash, Dash-Dot, Dash-Dot-Dot	None, Solid
Number and date format	Number and date format	Number and date format

Table 14-3 (Cont.) Supported Native Excel Formatting

Formatting	Smart View	EPM Cloud
Number format	Decimal places, negative and positive suffixes and prefixes, negative and positive color, eight colors, Percentage, scientific format, presence of thousand separator	No
Date format	Long and Short Dates, Hours, Minutes, Seconds, AM and PM	No
Miscellaneous	Miscellaneous	Miscellaneous
Read-only	Yes	No
Column width and row height	Yes, in points	No

[Clearing Formatting](#)

[Saving Excel Formatting From an Ad Hoc Grid](#)

[Guidelines for Working with Native Excel Formatting and Planning Forms](#)

Guidelines for Working with Native Excel Formatting and Planning Forms

Data source types: Planning,

- When designing a grid, care should be taken to avoid conflicts between custom Excel formatting and Oracle Smart View for Office cell styles.
- For some ad hoc analysis operations, not all Excel formatting may be preserved. You may need to reapply formatting after performing certain operations.
- When a saved ad hoc grid is opened, Smart View tries to preserve the formatting that was saved on the Planning server. For further ad hoc operations, existing formatting options apply; for example, **Use Excel formatting** or cell styles.
- To preserve custom Excel formatting on ad hoc operations, select the **Use Excel Formatting** and the **Move formatting on operations** options on the **Formatting** page of the **Options** dialog box.
- Formatting can affect performance, especially during ad hoc operations when the **Move formatting on operations** option is enabled.
- Saving formatting is not recommended on large forms (for example, forms of 20,000 or more cells).
- There are differences between grids rendered in Smart View and those rendered in the browser in Planning. When a saved grid is rendered in Planning, some formatting may not appear exactly as it does in Smart View. Planning will attempt to approximate the Smart View formatting.

- The Planning administrator may have defined certain formatting on a form. Planning end users can overwrite this formatting and save it on the form. It can then be merged with the administrator's formatting based on the option selected for this form in Planning by the administrator. Refer to the Planning documentation for more information.
- Save formatting functionality is not supported on composite Planning forms.
- Ad hoc analysis started from a saved Planning grid will inherit the formatting options saved as part of the grid.

To use Smart View Cell Styles or the Use Excel Formatting option for an ad hoc grid generated from a saved grid, complete the following steps:

1. Open the saved Planning grid as a form.
 2. In the Planning ribbon, **Formatting** group, select **Apply**, and then **None**.
 3. Click **Save** to save the form back to the Planning server.
 4. Now use the saved form to perform ad hoc analysis.
- Excel formatting is intended for use with static grids. Using a dynamic POV with substitution variables placed on rows is not a supported case for saving form formatting. Changing the value in the dynamic POV replaces a significant part of row members with different members, resulting in a loss of formatting.

Working with Multiple-Grid Worksheets in EPM Cloud

In Oracle Smart View for Office, you can retrieve multiple ad hoc grids on one worksheet. The grids can all be connected to the same data source, or each grid can be connected to a different data source.

Related Topics

- [About Multiple Grids on a Worksheet](#)
- [Creating Multiple-Grid Worksheets with EPM Cloud Sources](#)
- [Converting EPM Cloud Single-Grid Worksheets to Multiple-Grid Worksheets](#)
- [Renaming Ranges on EPM Cloud Multiple-Grid Worksheets](#)
- [Changing Connections in EPM Cloud Multiple-Grid Worksheets](#)
- [POV Behavior on EPM Cloud Multiple-Grid Worksheets](#)

About Multiple Grids on a Worksheet

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

When connected to supported Oracle Enterprise Performance Management Cloud data sources, you can create multiple grids on one worksheet. These grids can be connected to the same data source or to different EPM Cloud data sources. For example, one grid can be connected to Planning and another can be connected to Tax Reporting. They can be sourced from cubes or from forms. You can retrieve data in these grids and shift them on the worksheet.

 **Note:**

Administrators: You enable multiple-grid ad hoc for Oracle Smart View for Office users by setting the **Smart View Ad Hoc Behavior** option to **Standard** in the service application settings. See the administration documentation for your service for more information.

Watch this overview video to learn about using multiple ad hoc grids in a worksheet in Smart View. The video references Planning as the data source, but the functionality shown is common to all EPM Cloud providers specified above.

[Overview video](#)

Guidelines and Limitations for Multiple-Grid Worksheets

Note the following guidelines and limitations in worksheets that support multiple grids:

- In order to create ad hoc grids from forms, you must have at least the User role. Check the role requirements for your individual cloud service.
- You can submit data for only one grid at a time.

If you try to submit data for more than one grid at a time—that is, if you have selected cell ranges in more than one grid—the first range returned by Excel will be used to determine the selected grid and the submit will be performed only on that grid.
- If the member option, **Preserve Formulas and Comments in ad hoc operations (except pivot and undo)** is selected, you can preserve formulas on the sheet using the **Undo** option on the right-click **Smart View** context menu from within the grid. This option is only supported after a refresh has been performed once formulas are added to the sheet, and for only one undo action. The **Undo** option on the Smart View ribbon is not enabled for multiple-grid sheets. See [Preserving Excel Formulas in Ad Hoc Grids](#).
- Do not use Microsoft Excel's **Name Manager** or **Name Box** to rename named ranges. Instead, use one of the following methods to rename named ranges:
 - Use the **Rename Range** command in the Document Contents pane of the Smart View Panel. See [Renaming Ranges on EPM Cloud Multiple-Grid Worksheets](#)
 - Use the VBA function, `HypModifyRangeGridName`, described in *Oracle Smart View for Office Developer's Guide*.
- On multiple-connection, multiple grid worksheets, ensure that there is enough space between grids to accommodate pivot and zoom operations on the individual grids, especially if working with large grids.

A loss of metadata may occur on sheets with three or more database connections and where grids are placed too close together.

- To ensure that you are refreshing the desired range, use the **Document Contents** pane to first select the range, and then click the **Refresh** link in the pane. After refresh, select the range again from **Document Contents** to highlight the updated range.
- When mixing Admin Extension grids and ad hoc analysis grids on a single sheet, the menu items on the ribbon reflect the last opened grid, regardless of the grid selected in the sheet.
- These items on the Smart View ribbon are disabled:
 - **Undo**
 - **Redo**
- These items on the applicable provider ribbon are disabled:
 - **Pivot to POV**
 - **POV**
 - **Preserve Format**
 - **Smart Slice**
 - **Save Ad Hoc Grid**
 - **Save As Smart Form**
 - **Insert Attributes**
 - **Grid Spread**
 - **Mass Allocate**
 - **More**
 - **Approvals**
 - **Copy Version**
 - **Run Report**
 - **Data Filter**

Creating Multiple-Grid Worksheets with EPM Cloud Sources

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To create a multiple-grid worksheet:

1. In Excel, connect to an Oracle Enterprise Performance Management Cloud data source.
2. From any location in the worksheet, select a range of cells.
You must select a range rather than only one cell.
3. From the Smart View Panel, perform an action:
 - Right-click a cube, and select **Connect**. Right click the cube again, and select **Ad hoc analysis**.
 - Right-click a form, and select **Ad hoc analysis**.

You cannot use composite forms or dashboards as sources for ad hoc grids.

4. Select **Yes** at the prompt asking to change the worksheet to support multiple grids.

 **Note:**

If you started with an ordinary single-grid worksheet, and want to add other grids to the sheet, see [Converting EPM Cloud Single-Grid Worksheets to Multiple-Grid Worksheets](#).

5. To create another grid on the worksheet:
 - a. Select a different range of cells.
 - b. From the Smart View Panel, right click a cube or a form, and then select **Ad hoc analysis**.
6. Repeat [step 5](#) as you require to add grids to the worksheet.

Converting EPM Cloud Single-Grid Worksheets to Multiple-Grid Worksheets

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

To convert an existing Oracle Enterprise Performance Management Cloud single-grid ad hoc worksheet to a worksheet that supports multiple grids:

1. From any location in the worksheet, outside of the existing grid, select a range of cells.
You must select a range rather than only one cell.
2. From the Smart View Panel, right-click a cube or a form, and then select **Ad hoc analysis**.
3. At the prompt, select **Use sheet for multiple grid ad hoc**.
The second grid is added to the worksheet. The sheet now supports multiple grids.
4. Repeat this procedure to add more grids to the sheet.

Renaming Ranges on EPM Cloud Multiple-Grid Worksheets

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

When you place ranges on a multiple-grid worksheet, Excel assigns each range a name by default. The strings used in the name ranges may not be particularly user friendly. For example, a range based on the Vision Plan1 cube might look like this:

```
Vision_Plan1_88CA3264_EDFE_4E99_86B9_FEEEBF95DB42_1
```

A more user-friendly name would be helpful for all users of the workbook, but changing the name using the Excel Name Manager could cause a loss of metadata in Oracle Smart View for Office.

Use the **Rename Range** command in the Smart View Document Contents pane to change the name to a more descriptive or user-friendly name.

 **Note:**

To change range names in multiple-grid worksheets, you *must* use the **Rename Range** command in the Document Contents pane.

To rename ranges on a multiple-grid worksheet:

1. If not already displayed, open the Document Contents pane.
For instructions on displaying the Document Contents pane, see step 1 in [Changing Connections in EPM Cloud Multiple-Grid Worksheets](#).
2. In the Document Contents pane, highlight the range to rename in the tree, and then click **Select**.

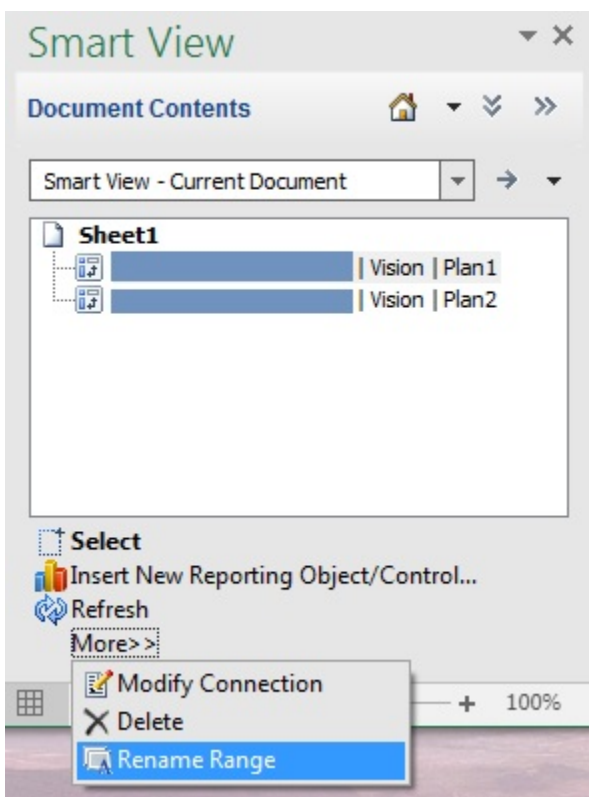

In the following example, `Vision | Plan 1` is highlighted in the tree.

Use the **Select** command to verify that you are working with the correct grid on the sheet. For example, after highlighting `Vision | Plan 1` and clicking **Select**, the `Vision Plan 1` grid on the worksheet is highlighted.

- In the Action Panel, click **More**, and then select **Rename Range**.

The **Rename Range** dialog box is displayed, showing the default name that was assigned to the range by Excel.

- In **Rename Range**, type a new range name, and then click **OK**.

We're renaming the range MyVisionPlan1Grid.

5. Verify that the range name is changed in the **Name Manager** in Excel.

Here is an example **Name Manager**, accessed from the Formula ribbon in Excel:

You can also view the changed range name in the Excel **Name Box** drop-down list.

Changing Connections in EPM Cloud Multiple-Grid Worksheets

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

From the Document Contents pane, you can change connections for individual grids within a multiple-grid worksheet. This is useful when sharing a workbook between departments that point to different servers or when moving from a test to a production environment.

You can change the connection properties for all entities in a workbook that share the same connection information (for example, all worksheets or grids that point to the same application and cube on a particular service). Or you can change the connection information sheet by sheet. To do this, see [Modifying Connections within an Office Document](#).

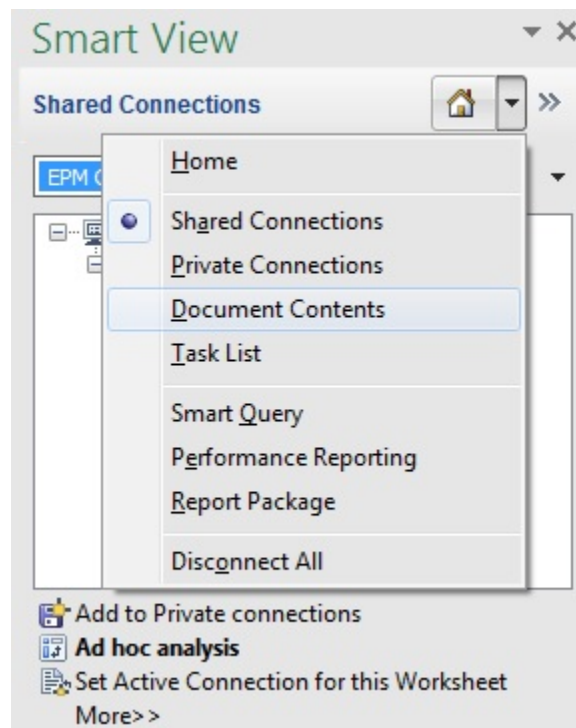

Use this topic to change connections properties on multiple-grid worksheets grid by grid.

To modify connections of a grid in a multiple-grid worksheet:

1. If not already displayed, open the Document Contents pane.

To open the Document Contents pane:

- a. In the Smart View Panel, click the arrow next to , and select **Document Contents**.

The Document Contents pane is displayed in the area of the Smart View Panel

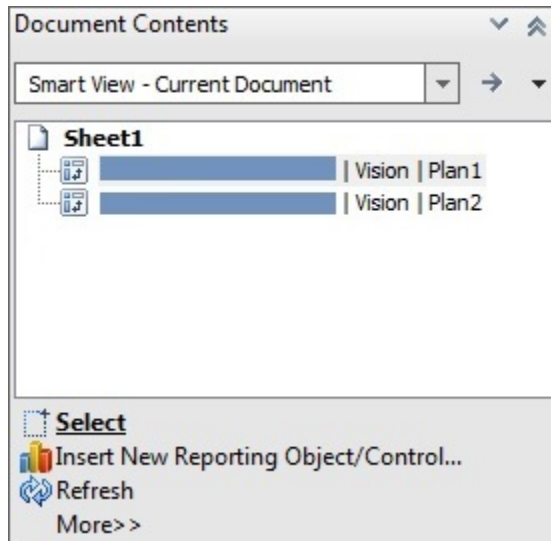

- b. To display both the library pane and the Document Contents pane in the Smart View Panel, click , located at the top of the panel next to .

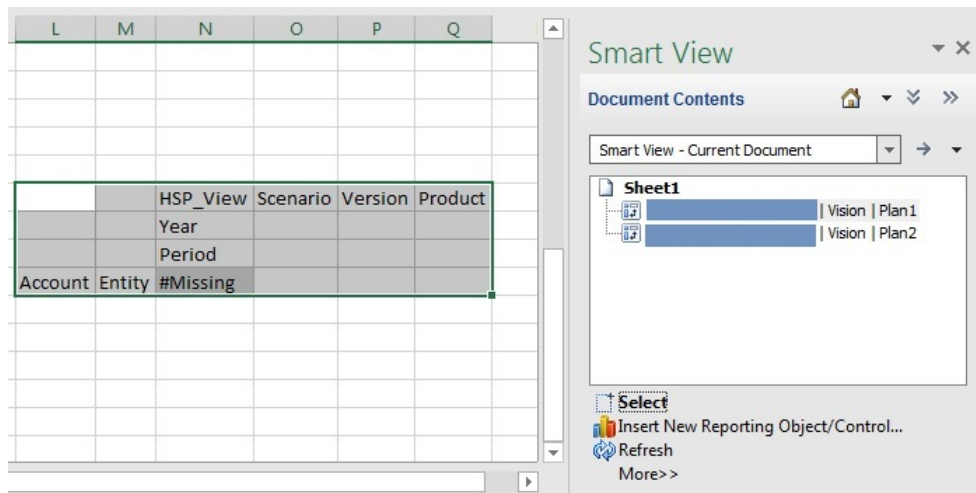

- In the Document Contents pane, highlight the grid to you want to work with in the tree, and then click **Select**.

In the following example, *Vision | Plan 1* is highlighted in the tree.

Use the **Select** command to verify that you are working with the correct grid on the sheet. For example, after highlighting *Vision | Plan1* and clicking **Select**, the *Vision Plan1* grid on the worksheet is highlighted.

- In the Action Panel, click **More**, and then select the **Modify Connection**.
Alternatively, right-click a connection name or sheet name and select **Modify Connection**.
The **Edit Connection - URL** page of the wizard is displayed.
- In the **URL** drop-down list, select an existing connection or enter a new connection URL, using [private connection syntax](#).
- Click **Next** and in **Edit Connection - Application/Cube**, expand **Servers**, and navigate to the application and database to which you want to connect, depending upon the provider requirements.

Alternatively, select the **Advanced Setup** check box and manually enter the information for **Server** (your service URL), **Application**, and **Cube/Database**, as the provider requires.

For example, [Figure 1](#) shows the entries for connecting to an Oracle Essbase application and cube.

Figure 14-3 Edit Connection - Application/Cube Advanced Setup

6. Click **Finish**.
7. In the Action Panel, click **Refresh**.
8. Repeat this procedure to modify the connection information for any other grids in the workbook.
9. To save the modified connection information, save the workbook.
The modified connection information is saved when you save the workbook.

POV Behavior on EPM Cloud Multiple-Grid Worksheets

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

The **POV** button is enabled for multiple-grid worksheets that contain only one grid, making it possible for you to toggle the button to show or hide the POV toolbar. The **POV** button remains disabled on multiple-grid worksheets that contain more than one grid.

On multiple-grid worksheets that contain one grid, the POV dimensions are displayed both in the grid and in the toolbar. On regular ad hoc worksheets, POV dimensions are displayed in the grid only if the POV toolbar is hidden.

Smart View Behavior Options in EPM Cloud

Your administrator can set options in the web interface that affect Oracle Smart View for Office behavior.

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

The Smart View behavior options are:

- [Smart View Suppression Behavior](#)
- [Smart View Ad Hoc Behavior](#)

Additionally, review the information in [Smart View Ad Hoc Behavior Setting and Saved Ad Hoc Grids](#).

Smart View Suppression Behavior

In the web application, your administrator can use the **Smart View Suppression Behavior** option to change suppression behavior when in the **Options** dialog, **Data Options**, both the **No Data/Missing** and **Zero** suppression options for rows, or columns, or both are selected.

If the **Smart View Suppression Behavior** option in the web application is set to:

- **Legacy**—Only suppresses rows or columns containing either all **No Data/Missing** or all **Zeros**. Does not suppress rows or columns containing a combination of **No Data/Missing** and **Zeros**.

For example, in Smart View, if both the **No Data/Missing** and **Zero** suppression options are selected for rows, and a row contains both zeroes and Missing labels, then the row is displayed; it is *not* suppressed.

- **Standard**—Suppresses rows or columns containing all **No Data/Missing** or all **Zeros**, or a combination of both.

For example, in Smart View, if both the **No Data/Missing** and **Zero** suppression options are selected for columns, and a column contains both zeroes and Missing labels, then the column is suppressed; it is *not* displayed.

See [Data Options](#) for general information on the suppression options available in Smart View.

Smart View Ad Hoc Behavior

In the web application, your administrator can choose to enable enhanced ad hoc features and behaviors in Smart View using the **Smart View Ad Hoc Behavior** option.

In the web application, the **Smart View Ad Hoc Behavior** options are:

- **Native**—Does not enable enhanced ad hoc features.
- **Standard** (default)—Enables enhanced ad hoc features.

The enhanced ad hoc features and behaviors are:

- **In-grid POV**—POV members are placed on the grid instead of in the POV toolbar. See [Selecting Members Using the Cell-Based POV](#).
- **Submit without refresh**—Using the default **Submit Data** button in the Smart View ribbon, all cells in a grid are submitted, including all data cells that have been explicitly modified (made dirty) and those that were not modified. For this operation, all data cells are marked dirty and submitted. Once the submit operation is complete, the entire grid will be refreshed. See [Submitting Data Without Refreshing](#).
- **Free-form support**—Supports empty columns and rows anywhere in a grid and changing the alias table. Additionally, supports member auto-refresh where deleted members are returned to the grid upon refresh. See [Free-Form Mode](#).

- Multiple-grid ad hoc—Supports multiple ad hoc grids on the same Excel worksheet. With multiple-grid ad hoc, you can submit data from any grid on the sheet. Grids based on aggregate storage cubes and block storage cubes are supported on the same sheet. Each grid is independent; for example, if required, you can change the alias table for only one grid on the sheet.

See [Working with Multiple-Grid Worksheets in EPM Cloud](#).

When the **Ad Hoc Behavior** option is set to **Standard**, the following features and functionality are not supported:

- Create Smart Forms
- Open a native mode grid in standard mode; open a standard mode grid in native mode (see [Smart View Ad Hoc Behavior Setting and Saved Ad Hoc Grids](#))
- Ad hoc features, such as Keep Only and Remove Only on multiple cell selection
- HSACTIVE is supported on multiple-grid sheets only when using a private connection; HSACTIVE on a multiple-grid sheet using a shared connection is not supported
- **Save Ad Hoc Grid** command
- Zoom In on Sibling, Same Generation, or Formula
- Preserve Formula is disabled in multiple-grid sheets

Smart View Ad Hoc Behavior Setting and Saved Ad Hoc Grids

The **Smart View Ad Hoc Behavior** option setting for your application affects which saved ad hoc grids users can open and work with.

When administrators switch the **Smart View Ad Hoc Behavior** option setting between **Native** and **Standard**, ad hoc grids built and saved in one mode cannot be used in the other mode.

For example:

- When the **Smart View Ad Hoc Behavior** option is set to **Standard**, users can only open and work with saved ad hoc grids that were created while the service was set to **Standard**. Opening a grid that was created while the service was set to **Native** mode will result in an error.
- When the **Smart View Ad Hoc Behavior** option is set to **Native**, users can only open and work with saved ad hoc grids that were created while the service was set to **Native**. Opening a grid that was created while the service was set to **Standard** mode will result in an error.

Administrators: Set the **Smart View Ad Hoc Behavior** option in the application configuration options page for your service. See the administration documentation for your service for more information.

Smart View and Profitability and Cost Management

Related Topics

- [About Smart View and Profitability and Cost Management](#)
To maximize profitability, a business must be able to accurately measure, allocate, and manage costs and revenue.
- [Running the Smart View Installer](#)
Before running the Oracle Smart View for Office installer, review the Smart View prerequisites.

After you install Oracle Smart View for Office, you can create connections to Profitability and Cost Management.

About Smart View and Profitability and Cost Management

To maximize profitability, a business must be able to accurately measure, allocate, and manage costs and revenue.

Profitability and Cost Management is an analytic software tool that manages the cost and revenue allocations that are necessary to compute profitability for a business segment, such as a product, customer, region, or branch. Profitability and Cost Management enables you to use cost decomposition, consumption-based costing and scenario-playing to measure profitability for effective planning and decision support.

Use the topics in this chapter to install and connect to Profitability and Cost Management:

- [Running the Smart View Installer](#)
- [Creating Data Source Connections to Profitability and Cost Management](#)

Then you are ready to begin working with data in Profitability and Cost Management. Information on using Oracle Smart View for Office with Profitability and Cost Management is contained throughout this guide:

- [Dimensions and Members](#)
- [Data and Data Cells](#)
- [Ad Hoc Analysis](#)
- [General Operations](#)
- [Smart Query](#)
- [Smart Slices](#)
- [The Query Designer and MDX Queries](#)
- [Smart View Options](#)
- [Functions](#)

- [Free-Form Mode](#)
- [Smart View Diagnostics and Health Check](#)

Running the Smart View Installer

Before running the Oracle Smart View for Office installer, review the Smart View prerequisites.

Smart View Prerequisites

- The latest release of Smart View
On the [Oracle Technology Network](#), **Downloads** tab, the latest release for Smart View is always certified.
- Microsoft Office
- Microsoft .NET Framework

Installing Smart View

1. Start Profitability and Cost Management in a web browser, and log in with your user name and password.
2. In the upper-right corner of the Profitability and Cost Management web interface, select the arrow next to your user name to display the user menu.
3. From the user menu, select **Downloads**, and then select **Smart View**.

4. In **Downloads**, under **Smart View**, click **Download From Oracle Technology Network**.

5. On the Smart View download page on Oracle Technology Network, click **Accept License Agreement**, and then click **Download Now**.

If the Oracle sign-in page is displayed, then sign in with your Oracle user name (usually your email address) and password.

6. Follow the steps for your browser to download the .zip file, and save it to a folder on your computer.
7. Go to the folder that you used in the previous step, and then double click `smartview.exe` to start the installation wizard.
8. Select a destination folder for Smart View, and then click **OK**.

For new installations, Smart View is installed by default in: `C:\Oracle\smartview`. If you are upgrading an installation of Smart View, then the installer defaults to the folder where you previously installed Smart View.

9. When the installation is complete, click **OK**.

Continue the setup process with [Creating Data Source Connections to Profitability and Cost Management](#).

Creating Data Source Connections to Profitability and Cost Management

After you install Oracle Smart View for Office, you can create connections to Profitability and Cost Management.

Connections require information about the server and port. Your cloud service administrator should provide you with the information you need to create the connection. Use the quick connection method to create a private connection to the cloud service.

To create a private connection using the quick connection method:

1. In Excel, select the Smart View ribbon, and then click Panel.

2. On the Smart View Panel, **Private Connections**.
3. Still in the Smart View Panel, in the text box, enter the URL for the data source to which you want to connect.

The URL syntax:

```
https://serviceURL/aps/smartview
```

4. Click Go,  or press **Enter**.
5. On the login window, enter your login credentials, and then select a data source from the drop-down menu.

You can now begin working with data in Profitability and Cost Management. See the functional areas listed in [About Smart View and Profitability and Cost Management](#) for more information.

Smart View and Reporting and Analysis

Related Topics

- [About Importing Reporting and Analysis Documents](#)
Using Oracle Smart View for Office, you can import Oracle Hyperion Reporting and Analysis documents into Microsoft Excel, Word, and PowerPoint.
- [Editing and Refreshing Documents](#)
The Smart View ribbon provides several edit and refresh options.
- [Refreshing Reporting and Analysis Documents](#)
Refreshing updates the report with the latest data.
- [Financial Reporting Import Formats](#)
You can import Financial Reporting documents as *fully-formatted* HTML, which you can display in Excel, or in *query-ready* HTML, which enables you to connect to run queries.
- [Importing Financial Reporting Documents](#)
You can import Financial Reporting documents into Excel, Word, and PowerPoint.
- [Exporting Financial Reporting Reports](#)

About Importing Reporting and Analysis Documents

Using Oracle Smart View for Office, you can import Oracle Hyperion Reporting and Analysis documents into Microsoft Excel, Word, and PowerPoint.

Note:

In this chapter:

- References to Financial Reporting apply to the Oracle Enterprise Performance Management Cloud version of Financial Reporting.
- References to EPM Cloud apply to these services: Planning, Planning Modules, Financial Consolidation and Close, and Tax Reporting.

Related Topics:

[Importing Financial Reporting Documents](#)

Editing and Refreshing Documents

The Smart View ribbon provides several edit and refresh options.

In Office, you can edit and refresh documents that were previously imported from Oracle Enterprise Performance Management Cloud services.

- Edit—change filters, POVs, or parameters of embedded EPM Cloud documents.
- Refresh—refresh the selected job with the latest EPM Cloud data. Only the job selected in Office is updated; not the entire Office document.
- Refresh All— update all jobs in the Office document.

General Edit and Refresh Behavior

- When you refresh an imported document in which pages have been deleted, only the remaining pages are refreshed. The deleted pages are not reinstated.
- If editing or refreshing results in fewer pages in an imported document, the removed pages display as blanks pages in Office.
- If editing or refreshing results in more pages in an imported document, those pages are appended to the document in Office.
- Formatting headings and comments are retained when you refresh in Word and PowerPoint but not when you refresh in Excel.

Maintaining Cell References During Document Refresh

In Excel, a customized worksheet that references imported document cells or ranges is updated when you execute a Refresh All on the imported documents. For example, imported worksheet A and B are referenced in customized worksheet C. When you execute Refresh All on worksheet A and B, worksheet C is refreshed with updated data from worksheets A and B.

Refreshing Reporting and Analysis Documents

Refreshing updates the report with the latest data.

Refresh Behaviors in Financial Reporting

- You must select a page in the report to refresh. In Word and PowerPoint, if you do not select any pages when refreshing, a message is displaying stating that no pages are updated.
- If you select Refresh, all pages of the report are refreshed. If you select Refresh All, then all reports in the document are refreshed.

To refresh Oracle Enterprise Performance Management Cloud documents in Excel, Word, or PowerPoint, perform an action:

- To update the selected Oracle Hyperion Reporting and Analysis document, including all pages associated with that document, select **Refresh** on the Smart View ribbon.
- To update all Reporting and Analysis documents, select **Refresh All** on the Smart View ribbon.

To refresh EPM Cloud documents in Excel, Word, or PowerPoint, perform an action:

- To update the selected Reporting and Analysis document, including all pages associated with that document, select **Refresh** on the Smart View ribbon.
- To update all Reporting and Analysis documents, select **Refresh All** on the Smart View ribbon.

Related Topics

[Editing Financial Reporting Documents](#)

Financial Reporting Import Formats

You can import Financial Reporting documents as *fully-formatted* HTML, which you can display in Excel, or in *query-ready* HTML, which enables you to connect to run queries.

Perform a **Refresh** on an imported report before you begin working on it in query-ready mode to ensure that the report and the POV are in sync.

When you import Oracle Hyperion Reporting and Analysis documents as query-ready HTML, the selected pages of the current data object are converted to HTML, and Oracle Smart View for Office-specific formatting is removed. Thus, Smart View can re-query the data source independent of the Web application.

When you import Reporting and Analysis documents as fully formatted HTML, the selected pages of the current data object are converted to HTML, and Smart View formatting definitions and calculated members are retained. Thus, Smart View cannot directly query the data source, but Smart View content can be leveraged by Microsoft Office applications.

Tip:

After importing an image in Word or PowerPoint, use the Office Format Picture option to format it; for example, to crop and resize. The Format Picture settings are preserved, even after you refresh the image.

Importing Financial Reporting Documents

You can import Financial Reporting documents into Excel, Word, and PowerPoint.

Importing Financial Reporting Documents into Excel

To import Financial Reporting documents into Excel:

1. From the Smart View ribbon, select **Panel**.
2. In the Smart View Panel, connect to an Oracle Enterprise Performance Management Cloud service .
3. Navigate to the Financial Reporting document that you want to import.
4. From the Action Panel, click **Open**.

The **Import Workspace Document** wizard is displayed.

 **Note:**

Some wizard screens do not apply to some documents.

5. In **Select a Document**, expand the repository, select a Financial Reporting document, and click **OK**.

The document is previewed in the **Import Workspace Document** window.

 **Note:**

Some options may not be available for some documents.

6. If **Preview User Point of View** is displayed, preview the current POV or change the members of the POV.

 **Note:**

To display this screen, select Preview for User Point of View in the preferences for your EPM Cloud service.

7. Click **Next**.
8. **Optional:** If you want to change the default value, in **Respond to Prompts**, make a selection for prompts, and click **Next**.

 **Note:**

This screen is displayed only if the document contains prompts.

9. **Optional:** In **Preview** from **Grid POV**, change the POV by selecting a POV.
10. Change the page dimension by selecting **Page**.
11. To import all pages of the document, select **All Pages**.
12. **Optional:** To refresh the Financial Reporting document using the EPM Cloud service Point of View, select **Refresh Using Workspace Point of View**.
13. In **Import Document As**, select an option:
 - **Fully-Formatted**—displays reports in a fully-formatted HTML.
 - **Query-Ready**—enables you to run ad hoc analysis on reports when connected to Oracle Hyperion Financial Management and Oracle Essbase data sources.

 **Note:**

Perform a **Refresh** on an imported report before you begin working on it in query-ready mode to ensure that the report and the POV are in sync.

- **Function Grid**—a dynamic grid format, allows you to further select a report option, as described in step 18.
14. To display each page on a separate Excel worksheet, select **Split Pages across worksheets**.

 **Note:**

This option available only if you selected **Fully-Formatted** in step 13.

15. Click **Finish**.
Your next steps depend on the option you selected in step 13:
If you selected:

- **Fully-Formatted**—the document is imported into the Office application, and you can only view the Reporting and Analysis document.
 - **Query-Ready**—the document is imported into the Office application, and you can now connect to a Financial Management or Essbase data source, where you can perform ad hoc analysis, such as retrieving, zooming, or pivoting data.
 - **Function Grid**—continue with step 16.
16. Click  to refresh the **Document Contents** pane.
17. Select the function grid object in **Document Contents**, right-click and select **Insert New Reporting Object/Control**.
18. From the **Insert New Reporting Object/Control** dialog box, select one of these report types to place on the grid:
- **Function Grid** — a dynamic grid format

When you refresh a function grid, data cells are refreshed; members are not. To refresh both data and members, you must reinsert the function grid into the sheet. For this reason, function grids are most useful for reports in which members remain reasonably static. For reports whose members may change more often, tables and charts are better report types. Although you can have multiple reports on a worksheet, you can have only one function grid.

You can use Excel formulas, for example SUM, with function grids. To retain such formulas as part of the function grid, you must leave one empty row between the grid and the cell containing the formula and include the empty row in the range of cells selected for the formula definition. This permits retention of the formula when refreshing the data results in a different number of rows in the grid.

To format a function grid, use Excel formatting capabilities.
 - **Table**

Table reports display results in a grid format that floats on the document and can be moved and re-sized. When you refresh a table, both members and data are refreshed. Tables are useful for displaying large grids in a smaller space; their scroll bars enable you to quickly access rows and columns.

You can zoom in and out in a table report, but you cannot perform other ad hoc operations or use free form.
 - **Chart**

Chart reports display results in a chart format that floats on the document and can be moved and re-sized. When you refresh a chart, both members and data are refreshed.
19. **Optional:** To move or resize a table or chart, in **Document Contents**, click the down arrow next to , and from the menu, select **Toggle Design Mode**. You can now move objects within the sheet, slide, or page. When you are ready to exit design mode, select **Toggle Design Mode** again.
20. Refresh.
21. **Optional:** To create a separate report for any or all of the members of one dimension in the report and cascade these reports separately across the worksheets of the workbook, see [Cascading Reports and Ad Hoc Grids](#).

 **Note:**

In reports that contain a chart and a table, cascading may cause the chart and table to overlap the next time you open the workbook.

 **Note:**

In Office 2016, when connected to Financial Reporting, Microsoft Word suspends or terminates unexpectedly after inserting several reporting objects in succession

Importing Financial Reporting Documents into Word and PowerPoint

 **Note:**

In this topic, references to Financial Reporting apply to the Oracle Enterprise Performance Management Cloud versions of Financial Reporting.

To import Financial Reporting documents into Word and PowerPoint:

1. From the Smart View ribbon, select **Panel**.
2. In the Smart View Panel, connect to a supported EPM Cloud data source.
3. Navigate to the Financial Reporting document that you want to import.
4. From the Action Panel, click **Open**.

The **Import Workspace Document** wizard is displayed.

5. In **Select a Document**, expand the repository, select a Financial Reporting document, then click **OK**.

The document is previewed in the **Import Workspace Document** window.

 **Note:**

Some screens do not apply to some documents.

6. If the **Preview User Point of View** screen is displayed, preview the current POV or change the members of the POV by selecting a member.

 **Note:**

To display this screen, select Preview for User Point of View in the preferences for your EPM Cloud service.

7. **Optional:** If you want to change the default value, in **Respond to Prompts**, make a selection for prompts, and click **Next**.

 **Note:**

This screen is displayed only if the document contains prompts.

8. In **Preview** from **Grid POV**, change the POV by selecting a POV.

 **Note:**

Some wizard screens do not apply to some documents.

9. Change the page dimension by selecting **Page**.
10. Select **All Pages** to import all pages of the document.
11. **Optional:** To refresh the Financial Reporting document using Point of View of the connected EPM Cloud service , select **Refresh Using Workspace Point of View**.
12. In **Import Document As**, select an option:
 - **Image**—To import the document as an image.
 - **Function Grid**—To import a dynamic grid format, which allows you to further select a report option, as described in step 16 (available in Word only).

13. Click **Finish**.

Your next steps depend on the option you selected in step 12:

If you selected:

- **Image**—The report is imported into the document as an image and you can only view the Reporting and Analysis image in the Word.
- **Function Grid**—Continue with step 14 (Word only).

14. Click  to refresh the **Document Contents** pane.
15. Select the report object in **Document Contents**, right-click and select **Insert New Reporting Object/Control**.
16. From the **Insert New Reporting Object/Control** dialog box, select one of these report types to place on the page:
 - **Function Grid** —a dynamic grid format

When you refresh a function grid, data cells are refreshed; members are not. To refresh both data and members, you must reinsert the function grid into the sheet. For this reason, function grids are most useful for reports in which members remain reasonably static. For reports whose members may change more often, tables and charts are better report types. Although you can have multiple reports on a worksheet, you can have only one function grid.

You can use Excel formulas, for example SUM, with function grids. To retain such formulas as part of the function grid, you must leave one empty row between the grid and the cell containing the formula and include the empty row in the range of cells selected for the formula definition. This permits

retention of the formula when refreshing the data results in a different number of rows in the grid.

To format a function grid, use Excel formatting capabilities.

- **Office Table**

Office tables can be used with Word only. Office tables display results in native Microsoft Office table format. When you refresh an Office table, both members and data are refreshed.

Office tables look and feel like part of the Word document, but the members and data in the table cells are connected to the Smart View provider. With Office tables, you can work with the Word table formatting and styles that you are accustomed to. Insert a POV object into the report and you can change the POV of the Office table. Refresh the Office table after changing formatting or POV and the new POV is reflected in the results and custom formatting is retained.

You cannot zoom in or out in an Office table object, and you cannot perform other ad hoc operations or use free form.

- **Table**

Table reports display results in a grid format that floats on the document and can be moved and re-sized. When you refresh a table, both members and data are refreshed. Tables are useful for displaying large grids in a smaller space; their scroll bars enable you to quickly access rows and columns.

You can zoom in and out in a table report, but you cannot perform other ad hoc operations or use free form.

- **Chart**

Chart reports display results in a chart format that floats on the document and can be moved and re-sized. When you refresh a chart, both members and data are refreshed.

17. Optional: To move or re-size a table or chart, in **Document Contents**, click the

down arrow next to , and from the menu, select **Toggle Design Mode**.

You can now move objects within the sheet, slide, or page.

When you are ready to exit design mode, select **Toggle Design Mode** again.

18. Refresh.

 **Note:**

In Office 2016, when connected to Financial Reporting, Microsoft Word suspends or terminates unexpectedly after inserting several reporting objects in succession

Sliders

Figure 1 shows a slider. The slider displays a selected set of dimension members from a query; when you drag the slider marker to a member, its data is displayed in all reports associated with the query on the sheet. Sliders can contain dimensions from

more than one query in the Report Designer if the dimensions have the same boundaries.

Figure 16-1 Slider

- [Creating a Slider from One Query](#)
- [Creating a Slider from Joined Queries](#)

Creating a Slider from One Query

To create a slider:

1. Ensure that one or more report type is inserted in the worksheet for the query for which you want to create the slider.
2. From the report designer, click **Query View** and select **Query View**.
3. In the Report Designer, select the query on which to base the slider.
4. Click  and select **Slider** to open **Member Selection**.
5. Select a dimension, members, and filters for the slider and click **OK**.

The slider is displayed on the sheet.

6. **Optional:** To move or re-size the slider, click  and then move or re-size.

Creating a Slider from Joined Queries

You can create a slider that contains dimensions from multiple queries if, and only if, the dimensions from the different queries have the exact same boundaries.

To create a slider using a dimension from multiple queries:

1. Ensure that one or more report type is inserted in the worksheet for the query for which you want to create the slider.
2. Click **Query View** and select **Dimension View**. Notice that the Report Designer tree view is grouped by dimensions rather than by queries. Under each dimension are the queries that contain that dimension. If the dimensions do not contain the same boundaries, multiple sliders will be created to accommodate each of them. For example, if the Market dimension in one query contains a children filter and the Market dimension from another query contains a descendents filter, two Market sliders would be created.
3. In the Report Designer, select the dimension on which to base the query.
4. Click  and select **Slider** to open **Member Selection**.
5. Select dimension members, and filters for the slider and click **OK**.

The slider is displayed on the sheet.

6. **Optional:** To move or re-size the slider, click  and then move or re-size.

Editing Financial Reporting Documents

Note:

In this topic, references to Financial Reporting apply to the Oracle Enterprise Performance Management Cloud versions of Financial Reporting.

To edit Financial Reporting documents in Excel, Word, and PowerPoint:

1. Open the Financial Reporting document to edit.

2. From the Smart View ribbon, click the arrow in , then select **Reporting and Analysis Document**, and then **Edit**.

The **Import Workspace Document** wizard is displayed.

Note:

Some wizard screens do not apply to some documents.

3. If the **Preview User Point of View** screen is displayed, preview the current POV or change the members of the POV.

Note:

To display this screen, select Preview for User Point of View in the preferences for your EPM Cloud service.

4. **Optional:** In documents that contain prompts, to change the default value, in **Respond to Prompts**, make a selection for prompts, and click **Next**.

Note:

Respond to Prompts is displayed only if the document contains prompts.

5. To change the POV, in **Preview** from **Grid POV** select a POV.
6. Click **Finish**.

Creating Templates in PowerPoint Documents

You can create PowerPoint template documents that can be saved by importing one or more Financial Reporting reports to the presentation. Every Create Template action creates a new PowerPoint slide with a report name to show where it will be placed when Refresh Template is used.

To create a template:

1. Open PowerPoint.
2. Connect to a Reporting and Analysis provider.
3. From the Smart View ribbon, select **Panel**, then **Reporting and Analysis Document**, and then **Create Template**.
4. In **Import Workspace Document**, select a Financial Reporting document.
 - **Optional:** To import all pages of the document, select **All Pages**. A separate slide is created for each page.
 - To import the current screen presentation, clear **All Pages**.
5. **Optional:** To use the the point of view for your Oracle Enterprise Performance Management Cloud service, select **Refresh Using Workspace Point of View**.
6. Click **OK**. The document name is imported into the PowerPoint presentation.

Refreshing PowerPoint Templates

To refresh a template:

1. Open the PowerPoint presentation containing the template.
2. Connect to a Reporting and Analysis provider.
3. From the Smart View ribbon, select **Panel**, then **Reporting and Analysis Document**, and then **Refresh Template**.
4. Edit and save the PowerPoint presentation as needed.

Exporting Financial Reporting Reports

When exporting a Financial Reporting report from Planning and Budgeting Cloud Workspace to Oracle Smart View for Office, the user POV for the report is not retained. The user POV defaults to the user POV used most recently in Smart View.

About Narrative Reporting

With Oracle Smart View for Office and the Narrative Reporting extension, you use familiar Microsoft Office tools to access and work with data in Narrative Reporting.

You and your colleagues work in a collaborative environment with static PDF files or with Word, PowerPoint, or Excel files containing refreshable data copied or embedded from Smart View. The Narrative Reporting workflow, consisting of clearly defined assignments and tasks, organizes input from many contributors in one document.

Some tasks are performed in the Narrative Reporting web interface, and others are completed in Smart View.

With Narrative Reporting:

- Use the web interface or Smart View to create a *report package* structure consisting of *doclets* of various types. In Smart View, create report packages in two ways
 - From a single Word or PDF document, and add more doclets to it later.
 - From a set of documents consisting of Word documents, PowerPoint presentation slides, Excel workbooks, and PDF files.
- Use the web interface or Smart View to add *regular doclets* to a Word-, PowerPoint-, or PDF-based report package.
- Use the web interface or Smart View to add Excel-based *reference doclets*, containing embeddable content, to a Word-, PowerPoint-, or PDF-based report package.
- Use the web interface to add *supplemental doclets*, such as Word documents, PowerPoint slides, Excel workbooks, and other file types, such as PDF, HTML, and TXT, to the report package.
- Use the web interface or Smart View to add a Word table of contents to a Word- or PDF-based report package.
- Use the web interface to assign user access and responsibilities, including timelines and due dates, for the authoring, review, and approval of each doclet, reference doclet, and supplemental doclet in the report package.

In Smart View, you also have the option of assigning author responsibilities when creating a report package structure.

- Use Smart View to author Office-based doclet content directly in Microsoft Office. Doclet content is authored in Word or PowerPoint. Embeddable content in reference doclets is authored in Excel. Supplemental doclet content is authored in the appropriate Office application.

You can work with doclets, reference doclets, and supplemental doclets in Smart View while connected to Narrative Reporting, or you can download doclets of any Office type and work with them locally.

Note that Office-based supplemental doclets and Excel-based reference doclets follow standard doclet workflow tasks, such as checkout, upload, and checkin.

- Download PDF doclets from the web or Smart View.
- Leverage Smart View's ability to access various data sources and include individual data points, formatted reports, variables, or embedded content within the doclet.

You can retrieve data from Narrative Reporting data sources and other Oracle Enterprise Performance Management System on-premises and cloud data sources.

- Collaboratively review and comment on assigned review instances either on the web interface or in Smart View.
- Sign off on the entire report package either on the web interface or in Smart View.
- Finalize the report package in the web interface.

When you work with the doclets, reference doclets, Office-based supplemental doclets, and reference files in an Narrative Reporting report package, you can use Smart View to copy and paste or embed data from Narrative Reporting data sources and other EPM System data sources, including on-premises and cloud data sources.

For example, you can incorporate data from Oracle Essbase and Planning in the same doclet. A doclet in a report package in Word or PowerPoint may contain a profit and loss statement that was created from an Essbase source along with an income statement report created from an Planning source. The data points for the areas that you copy or embed are retained in Word or PowerPoint, so you can refresh the doclet to keep the data up-to-date.

See the Narrative Reporting documentation on the Oracle Help Center for complete descriptions of Narrative Reporting, including overviews and procedural information.

Setting Up Narrative Reporting in Smart View

You can set up Narrative Reporting in Oracle Smart View for Office.

The topics in this section discuss setting up Narrative Reporting in Smart View. This is the workflow:

- [Download and run the Smart View installer.](#)
- [Set up a connection to Narrative Reporting.](#)
- [Install the Narrative Reporting extension.](#)

Watch this video to see a tutorial on setting up Smart View.

[Tutorial video](#)

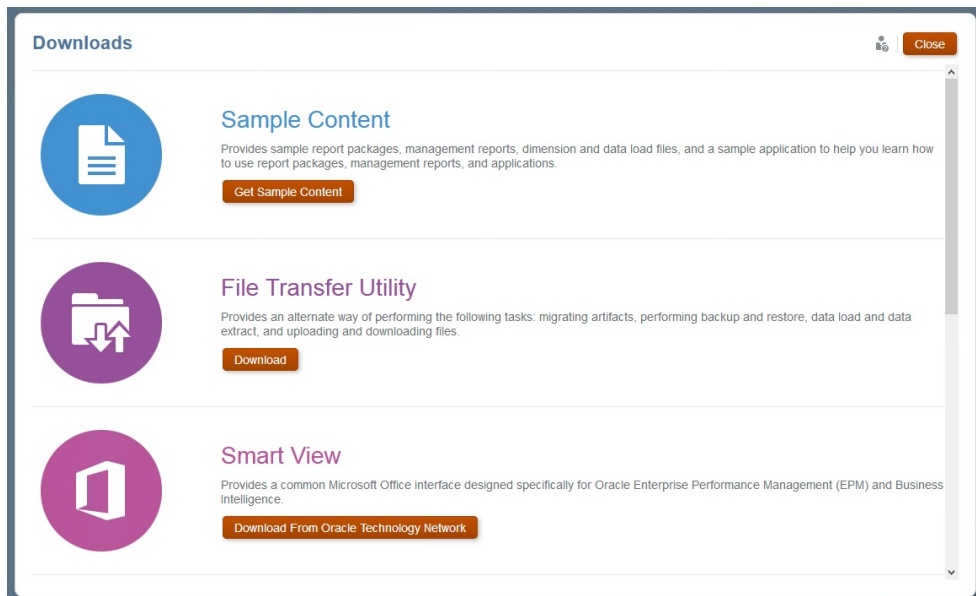

Downloading and Running the Smart View Installer

To download and run the Oracle Smart View for Office installer:

1. Start Narrative Reporting in a web browser, and log in with your user name and password.
2. In the upper-right corner of the Narrative Reporting web interface, select the arrow next to your user name to display the user menu.
3. From the user menu, select **Downloads**.

4. In **Downloads**, under **Smart View**, click **Download From Oracle Technology Network**.

5. On the Smart View information page on Oracle Technology Network, click **Download Latest Version**.
6. On the Smart View download page, click **Accept License Agreement**, and then click **Download Now**.

If the Oracle sign-in page is displayed, then sign in with your Oracle user name (usually your email address) and password.

7. Follow the steps for your browser to download the ZIP file, and save it to a folder on your computer; for example, you can save it in the `Downloads` folder or in a different folder of your choice.

8. Navigate to the folder that you used in step 7, and then double-click `SmartView.exe` to start the installation wizard.
9. Select a destination folder for Smart View, and then click **OK**.

For new installations, Smart View is installed by default in:

`C:/Oracle/SmartView`

 **Note:**

If you are upgrading an installation of Smart View, then the installer defaults to the folder where you previously installed Smart View.

10. When installation is complete, click **OK**.

The tab for the Smart View ribbon is displayed the next time you open Microsoft Excel, PowerPoint, or Word.

Continue the setup process with [Creating Connections to Narrative Reporting](#).

Creating Connections to Narrative Reporting

After you install Oracle Smart View for Office, as described in [Downloading and Running the Smart View Installer](#), you can create connections to Narrative Reporting.

Connections require information about your service URL. Your Smart View administrator should provide you with the information that you need to create the connection.

For the connection to Narrative Reporting, use the quick connection method in Smart View.

 **Note:**

Use the procedure in this topic to *create* connections.

Once connections are created, use the procedure in [Connecting to Narrative Reporting in Smart View](#) for connecting on a routine basis.

To create a private connection to Narrative Reporting using the quick connection method:

1. Open Microsoft Excel, Word, or PowerPoint, and select the Smart View ribbon.
2. From the Smart View ribbon, click **Panel**.
3. From the Smart View Panel, select **Private Connections**.

Alternatively, from the Smart View Panel, click the arrow next to the **Switch to**

button,  , and then select **Private Connections** from the drop-down list.

4. Still in the Smart View Panel, in the text box shown in [Figure 1](#), enter the service URL for the Narrative Reporting.

Figure 17-1 Quick Connection - Enter a URL

The URL syntax:

```
https://serviceURL/epm/SmartView
```

Your Smart View administrator should provide you with the URL for Narrative Reporting

5. Press **Enter**.

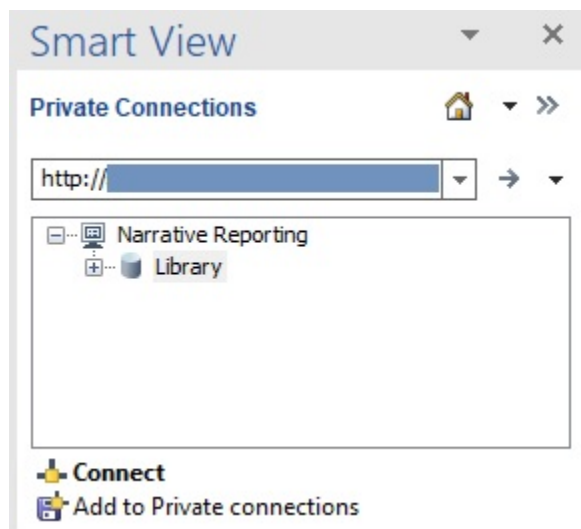

Alternatively, click the **Go** button,  next to the text box where you entered the service URL.

6. In the login window, enter your Oracle Cloud Identity Service Domain credentials, and click **Sign In**.
7. If the Narrative Reporting Home panel is displayed, select **Library** to launch the Smart View Panel (if the Home panel does not display, skip to the next step).

The Narrative Reporting Home panel will display if you have already installed the Narrative Reporting extension, and are creating other connections to Narrative Reporting. For example, an administrator may be creating connections to a test environment and to a production environment.

8. In the Smart View Panel, expand the **Narrative Reporting** node, then select the **Library** node, and then click **Connect**.

9. Perform an action:
 - If the **Extension Alerts** dialog is displayed, then click the **Go to Extension Dialog** button. The **Extension Alerts** dialog informs you of the latest Narrative Reporting and Disclosure Management extensions available for installation. To complete the extension update procedure, see [Working with Extension Alerts](#).
 - If the **Extension Alerts** dialog is *not* displayed, continue with [Installing the Narrative Reporting Extension](#)

Installing the Narrative Reporting Extension

Before you begin this procedure, complete the steps in [Creating Connections to Narrative Reporting](#).

To install the Narrative Reporting extension:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. Click the **Check for Updates, New Installs, and Uninstalls** link.
3. In **Select Location for Extension Updates**, select the connections to check for extension updates, and then click **Get Updates**.

Oracle Smart View for Office checks for all extensions that your administrator has made available to you.

To check for available extensions in all your connections, check **Select All**, and then click **Get Updates**.

The dialog box expands to display a message window providing you with the progress and status of the extension query.

 **Note:**

If you have connections to multiple products from Oracle Enterprise Performance Management System, Oracle Enterprise Performance Management Cloud, Oracle Business Intelligence Enterprise Edition, and Oracle Analytics Cloud, you may select only the check box that corresponds to your Narrative Reporting connection.

4. Locate the extension named **Narrative Reporting** and click the **Install** link,  **Install**, to launch the installer.
5. In the popup dialog asking "Apply this extension update?", click **Yes**, and then click **OK** to close the **Options** dialog, **Extensions** tab.
A dialog display the progress of the extension installation.
6. A message dialog is displayed informing you that the installation is successful and instructing you to restart Office; click **OK** in this dialog, and then close and restart Office.

For more information on extension installation, see the following topics:

- [Initially Checking for Available Extensions](#)
- [Installing Extensions](#)

After completing the procedure in this topic, you are ready to begin using Narrative Reporting with Smart View.

Connecting to Narrative Reporting in Smart View

You can connect to Narrative Reporting anytime you start Microsoft Excel, Word, or PowerPoint.

 **Note:**

Before you connect to Narrative Reporting, make sure you have completed the procedures in [Downloading and Running the Smart View Installer](#) and [Creating Connections to Narrative Reporting](#),

Watch this video to see a tutorial on setting up Oracle Smart View for Office and connecting to Narrative Reporting.

[Tutorial video](#)

To connect to Narrative Reporting:

1. Perform an action:
 - If you're working with Narrative Reporting report packages, launch Word or PowerPoint, depending on the content of the report package.

 **Note:**

Report packages can consist of either Word documents or PowerPoint slides, but not both.

- If you're working with Narrative Reporting models and reports, launch Excel.
2. Select the Smart View ribbon, and then click **Panel**.
 3. In the Smart View Panel, select **Private Connections**.
Alternatively, from the Smart View Panel, click the arrow next to the **Switch to** button, , and then select **Private Connections** from the drop-down list.
 4. In the text box shown in [Figure 1](#), click the arrow to display the drop-down menu and select your connection.

Figure 17-2 Quick Connection Arrow for Drop-down List

If you created your data source connection using the procedure in [Creating Connections to Narrative Reporting](#), then it should be listed under **Quick Connect URLs** in the drop-down list.

5. In the **Login** window, enter your **User Name** and **Password**, and then click **Sign In**.

The Narrative Reporting Home panel is displayed. Narrative Reporting Home allows you to quickly access your pending tasks and other work in which you are involved. From the Narrative Reporting Home, you can access:

- **Incomplete Tasks**—Incomplete tasks assigned to you.
- **Active Report Packages**—These are the active report packages for which you have outstanding tasks and responsibilities.
- **Recent Items**—Items you have recently accessed.
- **Library**—The library of items in Narrative Reporting, including report packages and reporting applications.
- **New Report Package**—Shortcut to the **New Report Package** dialog, where you define a report package structure.

[Figure 2](#) shows an example of Narrative Reporting Home.

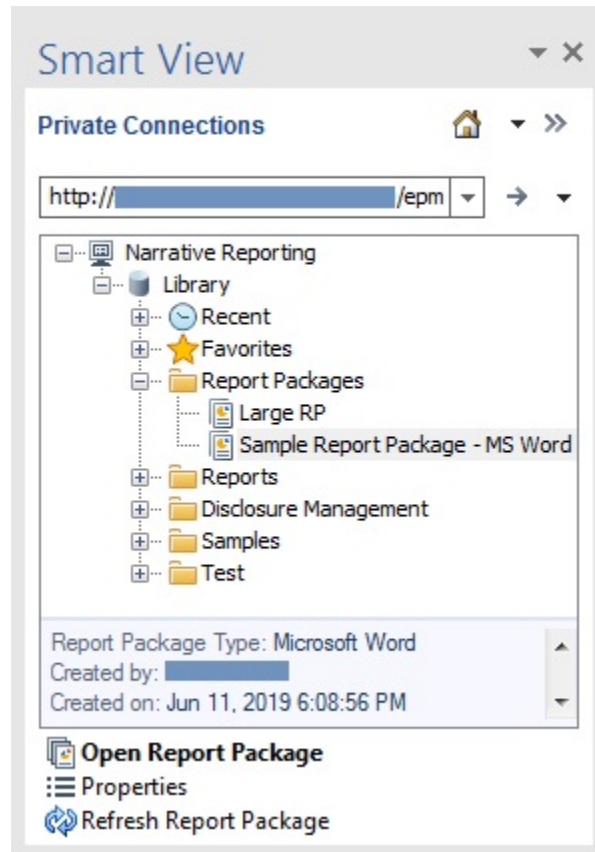

Figure 17-3 Narrative Reporting Home

 **Note:**

The next step explains how to access a report package or reporting application from the Narrative Reporting Library node by clicking **Library** in Narrative Reporting Home. You can also access report packages and tasks using **Incomplete Tasks**, **Active Report Packages**, and **Recent Items**. Those access methods are described in [Using Narrative Reporting Home](#).

6. Click **Library** and then perform an action:
 - To work with report packages in Word or PowerPoint:
 - a. Expand the **Narrative Reporting** node, then the **Library** node, then expand the **Report Packages** folder, and then select a report package.

You can also locate the report package by navigating to:

- The **Recent** folder, if you have recently accessed the report package in the Narrative Reporting web interface
- The **Favorites** folder, if you have designated the report package as a favorite in the Narrative Reporting web interface.
- A user-defined folder, if the report package was saved in a folder created in the Narrative Reporting web interface.

b. In the Action Panel, select **Open Report Package**.

Alternatively, you can right-click the report package name and select **Open Report Package**, or double-click the report package name to open it.

c. To work with report packages, continue with these topics in this chapter:

- [Authoring Doclets](#)
- [Performing Reviews](#)
- [Performing Sign Offs](#)

• To work with Narrative Reporting models in Excel:

- a.** Expand the **Reporting Applications** folder, and then expand an application, then select a model.

- b. In the Action Panel, click **Connect**.
Alternatively, you can right-click the model name and select **Connect**, or double-click the model name to connect.
- c. Refer to [Ad Hoc Analysis](#) chapter in this guide for information on working with the Narrative Reporting reporting application or applications from other Oracle providers.

 **Note:**

In Excel, you can also navigate in the Smart View Panel to **Narrative Reporting**, then **Library**, and select a report package. Smart View will launch the report package in Word or PowerPoint as applicable.

7. **Optional:** For a brief look at using Narrative Reporting with Smart View, see [Example: Working with Narrative Reporting Data in Smart View](#).

Using Narrative Reporting Home

After you create a connection to Narrative Reporting, you can use Narrative Reporting Home.

 **Note:**

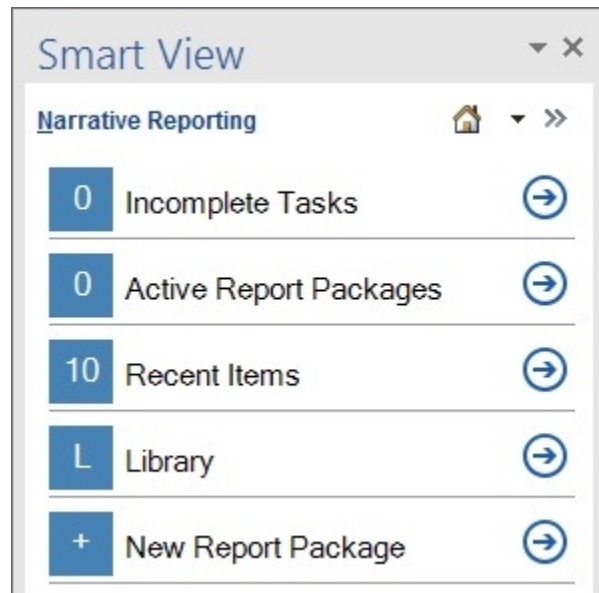

The procedures in this topic assume that you have created a connection to Narrative Reporting as described in [Creating Connections to Narrative Reporting](#), and connected, following the procedure in [Connecting to Narrative Reporting in Smart View](#)

To use Narrative Reporting Home:

1. Connect to Narrative Reporting as described in [Connecting to Narrative Reporting in Smart View](#) to display Narrative Reporting Home.

Figure 1 shows an example of Narrative Reporting Home.

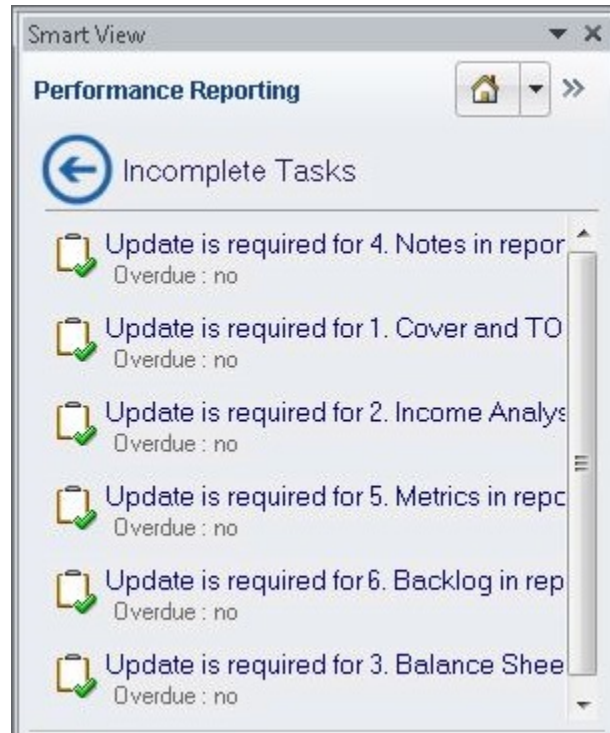

Figure 17-4 Narrative Reporting Home

2. To access tasks that require your attention:
 - a. In Narrative Reporting Home, click **Incomplete Tasks** or click the corresponding .

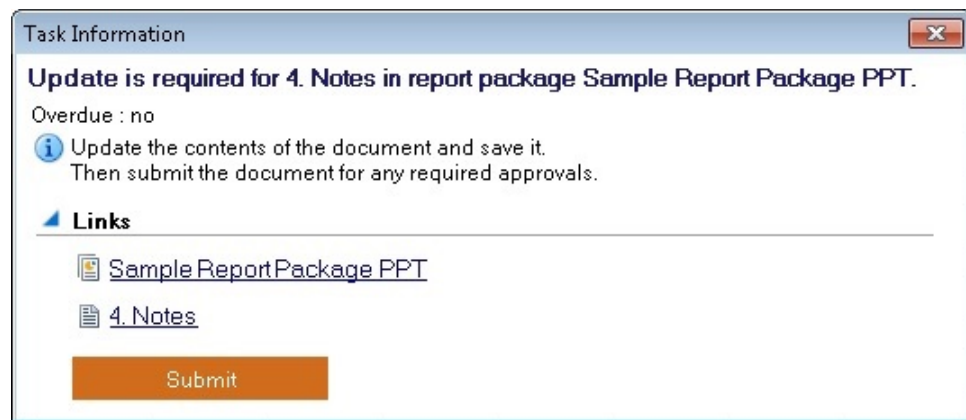

Each item in the **Incomplete Tasks** list consists of a link to help you access the task.

Figure 17-5 Narrative Reporting Home Displaying Incomplete Tasks

- b. In the **Incomplete Tasks** list, click a task link to open the **Task Information** dialog box, shown in [Figure 3](#)

Figure 17-6 Task Information Dialog Box

- c. Perform an action:
- In **Task Information**, select either a report package link or a specific doclet or supplemental doclet link.

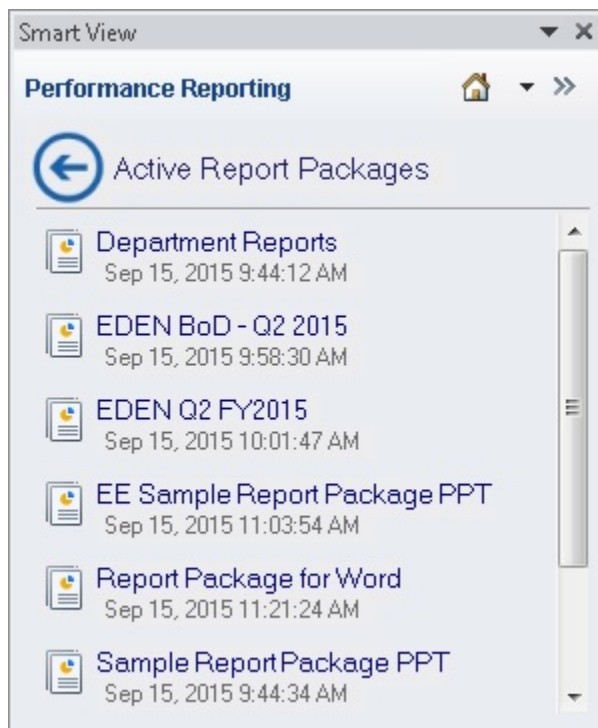

The report package, specific doclet, or specific Office-based supplemental doclet is opened for you in the correct Office application in the context of the task you selected. For example, if you are in Word, and click a link for a review task in PowerPoint, then the review instance is opened in PowerPoint.

Non-Office-based supplemental doclets are downloaded to your download directory where you can open them manually.

- If the doclet shown in **Task Information** is ready to be submitted, click the **Submit** button.
 - d. To exit **Task Information** without performing any actions, click the X in the top right corner of the dialog box.
 - e. To return to Narrative Reporting Home from the **Incomplete Tasks** list without performing any actions on tasks in the list, click .
3. To access active report packages for which you have a responsibility:
- a. In Narrative Reporting Home, click **Active Report Packages** or click the corresponding .

Each item in the **Active Report Packages** list consists of a link to a report package for which you have a responsibility.

Figure 17-7 Narrative Reporting Home Displaying Active Report Packages

- b. In the **Active Report Packages** list, click a link to open a report package. The report package is opened for you in the correct Office application in the context of your current responsibility. For example, if you are in Word, and click a report package link for which you have a review task in PowerPoint, then the report package is opened for you in PowerPoint with the review instance ready for you to select in the Report Center.

Alternatively, to return to Narrative Reporting Home from the **Active Report**

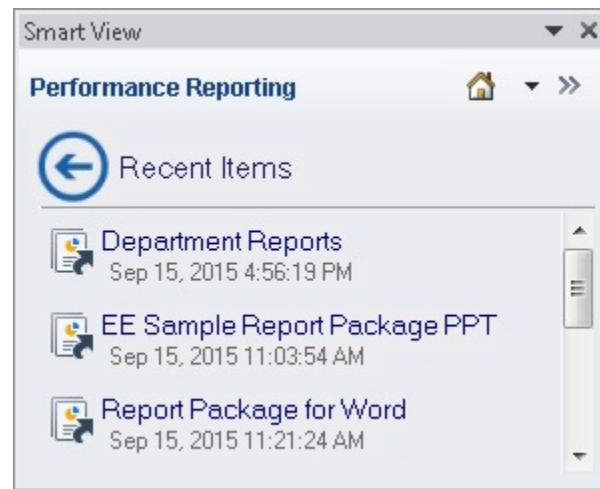

Packages list without opening any report packages in the list, click .

4. To access recently-opened items:
 - a. In Narrative Reporting Home, click **Recent items** or click the corresponding

Each item in the **Recent Items** list consists of a link to a report package that you have recently opened and for which you have a responsibility.

Figure 17-8 Narrative Reporting Home Displaying Active Report Packages

- b. In the **Recent Items** list, click a link to open a report package.

The report package is opened for you in the correct Office application in the context of your current responsibility. For example, if you are in Word, and click a report package link for which you have a review task in PowerPoint, then the report package is opened for you in PowerPoint with the review instance ready for you work with.

Alternatively, to return to Narrative Reporting Home from the **Recent Items** list

without opening any report packages in the list, click .

5. To access the Narrative Reporting library, see [Connecting to Narrative Reporting in Smart View](#).

Administering Report Packages in Smart View

You can administer report packages in Oracle Smart View for Office.

About Administering Report Packages in Smart View

With report packages in Narrative Reporting, you can structure the content of your report, assign responsibilities to content creators and reviewers, and manage their collaboration and workflow to produce a unified document.

Report packages are described in detail in [Learning About Report Packages](#), available in the Narrative Reporting library on the Oracle Help Center.

In Oracle Smart View for Office, report package owners can complete these report package administration tasks:

- Create report package structures based on either the structure of a folder containing subfolders and files or based on the heading structure of a single document.

See [Creating Report Package Structures from Files in a Folder](#) and [Creating Report Package Structures from a File](#).

- Add doclets, with or without author assignments, and add sections to report packages.

See [Adding Doclets to Report Package Structures](#) and [Adding Sections to Report Package Structures](#).

- Edit the name and description for report packages, doclets, and sections.

[Editing Report Package, Doclet, and Section Properties](#).

Additionally, report package owners and doclet authors can refresh report packages, including content in regular doclets and reference doclets. See [Refreshing Report Packages](#).

Creating Report Package Structures

About Creating Report Package Structures in Smart View

You can easily create a Word-, PowerPoint-, or PDF-based report package structure using Oracle Smart View for Office.

With the **New Report Package** command, available in Narrative Reporting Home, from the New Report Package command in the Action Panel of Narrative Reporting Library, or from the right-click context menu on user folders in the Library, you can use a folder structure or a file as the source of the new report package.

A subset of report package design and creation activities can be performed in Smart View. For example, you use the Narrative Reporting web interface to rearrange doclets

in the report package, define development phases, and assign users to those phases. But with Smart View, you can quickly accomplish the task of defining the structure of a report package by adding doclets (regular, supplemental, and reference) and sections in one step.

Smart View provides two methods for creating report packages:

- From a folder
Create a folder on a local or network drive. Under this folder, place subfolders and files for the report package. The content and structure of the folder, including subfolders and content of subfolders, becomes the doclets and sections of the report package structure. See [Creating Report Package Structures from Files in a Folder](#).
- From a file
Select a .docx or .pdf file as the basis of your report package structure. The headings in the file become doclets at the root level of the report package. See [Creating Report Package Structures from a File](#).

With either method, you have the option to specify name, description, and the type for each doclet (regular, supplemental, or reference), and assign author responsibilities, before importing the files to create the report package.

After import, the basic structure and content of your report package is defined. You can further refine the structure from Smart View by adding more doclets or sections to the report package and, optionally, assigning author responsibilities to them. Then continue with the Narrative Reporting web interface to complete the report package definition.

Watch this overview video to learn about creating Narrative Reporting report package structures in Smart View.

[Overview video](#)

Guidelines for Creating Report Package Structures in Smart View

- You must have the Report Admin role to see the **New Report Package** command.
- When creating a report package structure from a folder:
 - Word-, PowerPoint-, and PDF-based report packages are supported.
 - You must supply a style sample document. This can be a file that you plan to add to the report package structure as a doclet, or it can be a file you specially created to be your style sample file. But you need to select a style sample document when creating the report package structure.
 - Files within the folder structure cannot be 0 (zero) KB. A 0 KB file can result when creating a Word or PowerPoint file from Windows Explorer using the right-click menu. Remove any such files from your folder structure.
- When creating a report package structure from a file:
 - You can only create Word-based report packages.
 - Only .docx and .pdf files are supported as the source of the report package.

- Even if the file selected is a .pdf, the resulting doclets will all be of Word type (.docx). No sections will be created in the resulting report package, and all the generated doclets will appear at the root level.
- If you are using Smart View on Office 2010, only Word documents are supported, not PDF files.
- No style sample document is required. Smart View generates a style sample document based on the content of the Word document or PDF file.
- The following conditions will result in an error:
 - If any required fields are missing input in the **New Report Package** dialog
 - Report package type and doclet type mismatch; for example, if you try to define a PowerPoint file as a regular doclet in a Word-based report package.
 - For report package structures based on a folder structure:
 - * If any folders in the structure are empty. Remove any empty folders from your folder structure.
 - * If any files within the folder structure are 0 (zero) KB. A 0 KB file can result when creating a new Word or PowerPoint file from Windows Explorer using the right-click menu. Make sure the files are valid Office documents of non-zero file size.
 - For report package structures based on a file, if the file is empty, contains invalid content, or is password protected.
 - A report package with the given name already exists in the system; names must be unique.
 - The report package creator does not have permission to the specified library folder.

Creating Report Package Structures from Files in a Folder

Use Smart View to create an Narrative Reporting report package structure from files organized in a folder.

Note:

Before you begin, launch Oracle Smart View for Office and log in to Narrative Reporting.

To create a report package structure from files in a folder:

1. In Narrative Reporting Home, select **New Report Package** to launch the **New Report Package** dialog.

Alternatively, in Narrative Reporting Home, click Library, and navigate to the folder where you will save the report package, then right-click the folder and select **New Report Package**.

2. To create a new report package structure from a folder and its contents, click the radio button next to this icon:

3. Enter a **Report Package Name** and optional **Report Package Description**.
4. Select a **Report Package Type**: Word, PowerPoint, or PDF.
5. For **Location to save in Library**, click **Select**, then navigate to the Library folder in which to save the report package, and then click **Select** in the **Report Package Save Location** dialog.
6. For **Report Package Style Sample**, click **Select File**, then navigate to the Word or PowerPoint style sample file and select the file, and then click **Open**.
7. In **Select folder to import**, navigate to the folder that contains the files you want to use as the basis of the report package structure, then select the folder, and then click **OK**.

In the bottom portion of the dialog, the folder you selected, and its subfolders, is displayed in the left pane; the doclets and sections, which will be created from the files and subfolders, are displayed in the right pane, as shown in [Figure 1](#).

Figure 17-9 Options for Creating a Report Package Structure from a Folder

The example in [Figure 1](#) shows the **New Report Package** dialog before clicking the **Import** button. In the example, we're using the files in the Report Package files folder to create a report package structure that will be stored in the Monthly folder in the Library.

8. At the bottom portion of the dialog, in the right pane, to make any necessary changes to the doclet type, click the arrow in the cells under **Type**, and select a doclet type.

Use the folder structure in the left pane to drill down into folders, if present, to display more doclets and sections, and then make your changes in the **Type** column.

For example, after evaluation by Narrative Reporting, a Word document was designated a Regular doclet, but you want to change the designation to Supplemental.

 **Note:**

If you change the report package type at this point, Narrative Reporting reevaluates the type of each doclet per the new report package type. You can then make any changes you require as described in this step.

9. **Optional:** At the bottom portion of the dialog, in the right pane, click in the cells under **Name** and **Description** to change doclet and section names, and to add descriptions to the doclets and sections.

Use the folder structure in the left pane to drill down into folders, if present, to display more doclets and sections, and then make your changes in the **Name** and **Description** column.

Alternatively, you can change doclet and section names, and add descriptions to the doclets and sections later in Smart View; see [Editing Report Package, Doclet, and Section Properties](#).

10. Verify that the information you entered in the **New Report Package** dialog is correct, and then click **Import**.

When the import is completed, you are returned to Narrative Reporting Home, where you can click the link provided to open the report package in Smart View.

Figure 17-10 Narrative Reporting Panel with Link to New Report Package

Alternatively, if you invoked the **New Report Package** command by right-clicking on a Library folder, then click  to refresh the panel to view the new report package in that folder.

Creating Report Package Structures from a File

Use Smart View to create an Narrative Reporting report package structure from a Word or PDF file.

Note:

Before you begin, launch Oracle Smart View for Office and log in to Narrative Reporting.

To create a report package structure from a Word or PDF file:

1. In Narrative Reporting Home, select **New Report Package** to launch the **New Report Package** dialog.
2. To create a new report package structure from a PDF file or Word document, click the radio button next to this icon:

3. Enter a **Report Package Name** and optional **Report Package Description**.
4. In **Report Package Type**, Word is the default and only option available.
5. For **Location to save in Library**, click **Select**, then navigate to the Library folder in which to save the report package and select it, and then click **Select** in the **Report Package Save Location** dialog.
6. For **Document to split and import into a report package**, click **Select File**, then navigate to the file and select it, and then click **Open**.

Use the filter control at the bottom right of the **Open** dialog to filter by document type: Word (.docx) or PDF (.pdf).

The example in [Figure 1](#) shows the **New Report Package** dialog with the `Vision.pdf` file selected for splitting into individual Word files. In the example, the report package structure we're creating will be stored in the `Quarterly` folder in the Library.

Figure 17-11 Options for Creating a Report Package Structure from a Document, Before Generating Doclets

7. Click **Generate Doclets.**

A message is displayed informing you that the operation can take some time to complete. To continue, click **Yes** in the message box.

A second message is displayed informing you that the file will be converted into optimized, editable documents, and that the documents may not look exactly like the original file, but they can be edited later. To continue, click **OK** in the message.

Once the file generation process is complete, in the bottom of portion of the dialog, the temporary folder where the files are being stored is displayed in the left pane; the files that were created in the right pane, as shown in [Figure 2](#).

Also, a default style sample is provided based on the file that was just split.

Figure 17-12 Options for Creating a Report Package Structure from a Document, After Generating Doclets

- At the bottom portion of the dialog, in the right pane, to make any necessary changes to the doclet type, click the arrow in the cells under **Type**, and select a doclet type.

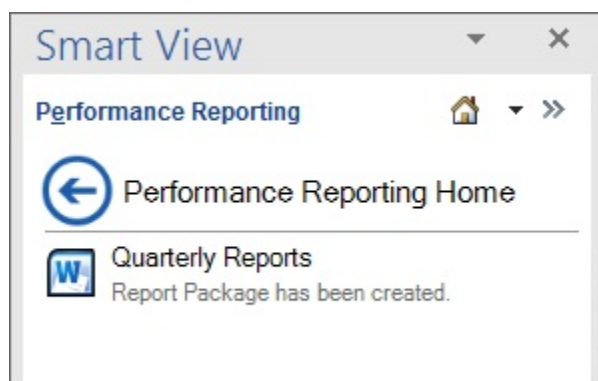

For example, after evaluation by Narrative Reporting, a Word document was designated a Regular doclet, but you want to change the designation to Supplemental.

- Optional:** At the bottom portion of the dialog, in the right pane, click in the cells under **Name** and **Description** to change doclet names and add descriptions to the doclets.

If required, you can add descriptions to the doclets later in Smart View; see [Editing Report Package, Doclet, and Section Properties](#).

- Verify that the information you entered in the **New Report Package** dialog is correct, and then click **Import**.

When the import is completed, you are returned to the Narrative Reporting Panel, where you can click the link provided to open the report package in Smart View.

Figure 17-13 Narrative Reporting Panel with Link to New Report Package

Alternatively, if you invoked the **New Report Package** command by right-clicking on a Library folder, then click  to refresh the panel to view the new report package in that folder.

Adding Doclets to Report Package Structures

You can add doclets to report package structures in the Report Center in Oracle Smart View for Office. In Word-, PowerPoint-, and PDF-based report packages, you can add doclets, supplemental doclets, and reference doclets.

For Word documents, you can add an entire Word file. Or, you can add a selected portion of text in an open Word document. The selected portion becomes the new doclet.

To add a doclet to a report package structure:

1. Open the Office application that corresponds to the Office document type that you will be working with.

For example,

- To add a Word document as a regular doclet in a report package, then open Word.
- To add an Excel workbook as a regular doclet in a PDF-based report package, then open Excel.
- To add a table of contents, or TOC-type doclet, to a PDF- or Word-based report package, then open Word.
- To add an Excel workbook as a supplemental doclet in a report package, then open Excel.

2. Connect to Narrative Reporting and open a report package, as described in [Connecting to Narrative Reporting in Smart View](#).

The report package may already contain doclets of any type, or may be empty.

3. Open the Office document to add to the report package structure.

You may open a saved Office document, or you may be working on a new Office document that has not yet been saved.

 **Note:**

You can only add documents of the Office Open XML format type .docx, .pptx, and .xlsx.

4. **Optional for Word doclets only:** To create a doclet from a portion of text within a Word document, select that text.
5. In the Report Center panel, perform an action:
 - Select the doclet in the report package structure before which the new doclet will be inserted.

The doclet will be inserted before the doclet that you select.
 - Select the section folder into which the new doclet will be added.

The doclet will be added as the last file in the section folder.
 - Navigate into a section folder and select the doclet before which the new doclet will be inserted.
 - If there are no doclets yet in the report package, click **root** in the Report Center panel.

If there are doclets in the report package, and you click **root**, then the doclet will be added as the last doclet in the report package.
6. In the Action Panel, click the **Add Doclet** link and in **Add Doclet to Report Package**, complete the following:
 - **Name**—Required. You can accept the file name as the doclet name or enter a new name. This is the name that will appear in the report package. Doclet names are limited to 80 characters.
 - **Type**—Required. Select a doclet type from the available options. The options available depend on the report package type. For example, in a Word-based report package, if you are adding a Word doclet, the available types are Regular and Supplemental; for an Excel doclet in a PDF-based report package, the available types are Regular, Supplemental and Reference.
 - **Table of Content Doclet**—Optional. Applies to Word documents in Word- and PDF-based report packages only. Select this check box if you plan to use the currently-opened Word document as a table of contents for the report package.
 - **Description**—Optional. Enter a doclet description.
 - **Exclude from Author Phase**—The state of the option (enabled or disabled) depends on whether an author phase has been defined for the report package.

These are the possible actions:

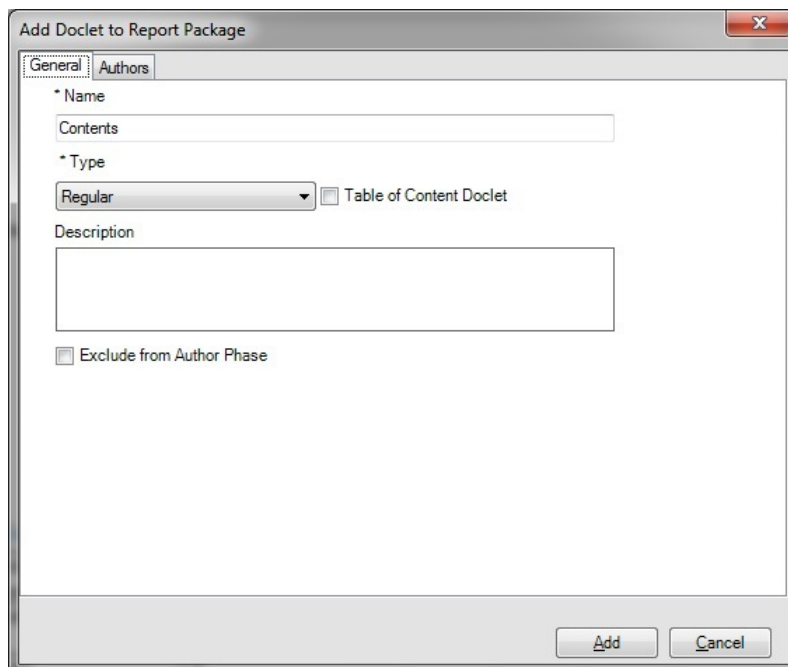

If the check box is disabled, then an author phase is *not* defined for the report package. No action is required.

If the check box is enabled, then an author phase *is* defined for the report package. Take an action:

 - Select this check box to exclude the doclet from the author phase, and then continue to [step 8](#).

- Clear the check box to assign authors to this doclet. Clearing the check box should automatically take you to the **Authors** tab of the dialog. Continue to the next step to add authors to this doclet.

This is the dialog with the check box enabled and cleared:

- **All Sheets Included**—Optional. Enabled and selected by default when adding an Excel workbook as a regular doclet to a PDF-based report package. Clearing the check box should automatically take you to the **Selected Sheets** tab of the dialog, where all sheets in the workbook are listed. Select the check box next to the sheets that you want to include in the report package.

If you're adding authors to this doclet, then continue to the next step. If you're not adding authors to this doclet, then proceed to [step 8](#)

Note that only worksheets and chart sheets are valid choices for inclusion in a report package. Hidden sheets, macro sheets, and dialog sheets are not valid choices for sheet selection. A message notifies you if a workbook contains only these sheets.

7. To add authors to this doclet:
 - a. In the **Authors** tab, click **Assign Authors** to launch the **Select Users** dialog box.
 - b. Select authors in the left pane of the dialog, and click the right arrow to move them to right pane.

Optional: To search for users, type a user name in the search field and click . You can also click the arrow on and use the filter options to narrow the search.

- c. After you've selected and moved all required authors to the right pane, click **OK** in the **Select Users** dialog box.

The user selections are now shown in the **Authors** tab of **Add Doclet to Report Package** dialog:

You can click the **Assign Authors** button again to make further changes to the author assignments.

8. Click **Add** to add the doclet to the report package structure.
9. At the prompt, click **Yes** to open the new to doclet for editing; otherwise, click **No**. Whether you click **Yes** or **No**, the doclet is added to the report package.

 **Note:**

If you click **Yes** at the prompt, then to edit the doclet, check it out.

Adding Sections to Report Package Structures

You can add sections to Word-, PowerPoint-, and PDF-based report package structures in the Report Center in Oracle Smart View for Office.

To add a section to a report package structure:

1. Open Office, connect to Narrative Reporting, and open a report package, as described in [Connecting to Narrative Reporting in Smart View](#).
2. In the Report Center, perform an action:
 - Select the doclet or section in the report package structure before which the new section will be inserted.
The section will be inserted before the doclet or section that you select.
 - Navigate into a section folder and select the doclet before which the new section will be inserted.
 - If there are no doclets or sections yet in the report package structure, click **root** in the Report Center panel.
If there are doclets or sections in the report package structure, and you click **root**, then the section will be added as the last artifact in the report package.
3. In the Action Panel, click the **Add Section** link and in **Add Section To Report Package**, complete the following:
 - **Name**—Required. Enter a section name. This is the section name that will appear in the report package.
 - **Description**—Optional. Enter a section description.

The screenshot shows a dialog box titled "Add Section To Report Package". It features a close button (X) in the top right corner. The main area contains two text input fields. The first field is labeled "* Name" and contains the text "Financial Reports". The second field is labeled "Description" and is currently empty. At the bottom right of the dialog, there are two buttons: "Add" and "Cancel".

4. Click **Add**.

Editing Report Package, Doclet, and Section Properties

You can edit the **Name** and **Description** properties for report packages, doclets, and sections in Oracle Smart View for Office.

To edit properties for report packages, doclets, and sections:

1. Open Office and connect to Narrative Reporting, as described in [Connecting to Narrative Reporting in Smart View](#).
2. To edit report package properties:
 - a. From Narrative Reporting Home, select **Library**, and then navigate to the report package in the Library panel and select it, but do not open it.
 - b. In the Action Panel, select the **Properties** link.
 - c. In **Report Package Properties**, double-click or press F2 in the **Report Package Name** and **Description** fields, and then type your changes.
3. To edit doclet or section properties:
 - a. From Narrative Reporting Home, select **Library**, then navigate to the report package in the Library panel, and then open it.
 - b. Navigate to the doclet or section and then select it.
 - c. In the Action Panel, select the **Properties** link.
 - d. In **Properties**, double-click or press F2 in the **Name** and **Description** fields, and then type your changes.
4. Click **Save**.

Authoring Doclets

As a doclet author, you provide report content in Oracle Smart View for Office.

About the Author Phase Process

Report packages are made up of subcomponents called doclets. There are three doclet types: doclets, reference doclets, and supplemental doclets. A report package owner assigns authors and approvers for each doclet of all types in a report package. The authors and approvers provide and approve content for the doclets.

The author phase follows this process:

1. The report package owner initiates the author phase in the Narrative Reporting web interface.
2. Notification messages are sent to authors to begin their work.
3. In Oracle Smart View for Office, authors open and then check out Office-based doclets of any type. They provide content, add content to reference files, embed available content from reference doclets, Management Reporting, and reference files, and then check doclets back in.

Authors use the web interface to check out and check in PDF doclets and supplemental doclets of non-Office type. From Smart View, authors download PDF doclets and non-Office supplemental doclets.

See [About Doclets and Variables](#) for more information.

4. When authors have finished their work, they submit doclets of all types for approval, if required.
5. If doclet approval is specified, notification messages are sent to approvers to review and either approve or reject doclets.
6. The report package owner marks the author phase complete.

As an author, in Smart View or in the Narrative Reporting web interface, you can work with:

- Doclets in Word, PowerPoint, Excel, or PDF format
- Reference doclets in Excel, from which you embed content in Word doclets
- Management Reporting charts and tables created in the Narrative Reporting web interface, from which you embed content in Word doclets
- Excel doclets in PDF-based report packages
- Excel-based reference files, which contain content that you may want to embed in a Word doclet
- Office-based supplemental doclets with the appropriate Office application
- PDF doclets and non-Office-based supplemental doclets, such as PDF or TXT files, which you download and open with the appropriate application (using the web interface to check out, upload, and check in)

The topics in this section discuss authoring and working with doclets, reference doclets, supplemental doclets, and reference files in Smart View.

About Doclets and Variables

Report packages are comprised of subcomponents called *doclets*, *reference doclets*, *reference files*, and *supplemental doclets*. Additionally, *variables* can be sourced from reference doclets and reference files.

- **Doclets**

Doclets contain the content you require for the report that you're creating with an Narrative Reporting report package. A report package can consist of one or more doclets. Word-based report packages contain Word-based doclets; PowerPoint-based report packages contain PowerPoint-based doclets. PDF-based report packages contain Word- and Excel-based doclets, along with PDF files; however, only the Word and Excel doclets can be authored.

Doclets participate fully in report package workflow, including all author phases, review phases, sign off, and report publishing.

- **Reference doclets**

Reference doclets can be used as containers to store content such as named ranges from an Excel file, or charts and graphs created from Management Reporting, which are consumed by one or more doclets in a report package.

Excel-based reference doclets are Excel files that serve as supporting files with content such as Oracle Smart View for Office grids or forms, or static Excel content, that you can register and then embed directly into Word-based doclets. You specify the embeddable content using Excel's Name Manager, then register the named ranges in Smart View.

Management Reporting-based reference doclets consist of tables and charts created and registered as available content in the Narrative Reporting web interface.

You can then embed content from either type of reference doclet directly into Word-based doclets. Using the embedding process, the layout and format of the content is maintained in the target doclet just as in the source reference doclet.

Both Excel- and Management Reporting-based reference doclets can be included in Word-based report packages. Embedded content is merged in the combined report and can be commented on during the review phase.

In Smart View, Excel-based reference doclets support the content management and workflow features of the author phase as follows:

- Reference doclets can be checked out, modified, uploaded, checked in, submitted for approval, and approved or rejected.
- Word-based doclets containing embedded content can be checked out, modified, uploaded, checked in, submitted for approval, and approved or rejected.
- Embedded content can be synced with updates made to named ranges in the reference doclet.
- Embedded content can be refreshed.

The workflow for Management Reporting-based reference doclets is maintained in the Narrative Reporting web interface; however, these content management and workflow features of the author phase are supported in Smart View as follows:

- Word-based doclets containing embedded content can be checked out, modified, uploaded, checked in, submitted for approval, and approved or rejected.
- Embedded content can be synced with updates made to named ranges in the reference doclet.
- Embedded content can be refreshed.

Note that reference doclets themselves are *not* available for commenting in the review or sign off phase; however, in a doclet, you can comment on the embedded content that was sourced from reference doclets, and the embedded content is part of the final published report.

- **Reference files**

Reference files are Excel workbooks that contain report content that you can embed into a Word doclet. The reference file is not listed as part of the report package in the same way that doclets, reference doclets, and supplement doclets are. Instead, when you embed content from a reference file into a Word doclet, that reference file becomes part of the properties of the doclet. When you check out the target Word doclet, Narrative Reporting tracks any changes you make to the reference file. You can then refresh the content you have embedded in the target Word doclet.

Note that reference files themselves are *not* available for commenting in the review or sign off phase; however, in a Word doclet, you can comment on the embedded content that was sourced from reference files, and the embedded content is part of the final published report.

- **Supplemental doclets**

Supplemental doclets are documents which assist in the development of the overall report, such as source and supporting files. Supplemental doclets can be of Office file types, such as Excel, Word, or PowerPoint; or of non-Office file types, such as PDF, TXT, or ZIP. Content from supplemental doclets is not merged into the combined report.

Supplemental doclets of any file type can be included in both Word-based and PowerPoint-based report packages. For example, Word-based supplemental doclets can be included in Word- or PowerPoint-based report packages.

In Smart View, supplemental doclets support the content management and workflow features of the author phase as follows:

- Office-based supplemental doclets can be checked out, modified, uploaded, checked in, submitted for approval, and approved or rejected.
- For supplemental doclets of non-Office file types, Smart View gives assigned authors easy access to download and view files. However, any other interactions with the files, such as checkout, upload, and checkin, must be performed through the Narrative Reporting web interface.

Note that supplemental doclets of any file type are *not* available for commenting in the review or sign off phase, and they are *not* part of the final published report.

- **Variables**

Report Package variables provide centralized maintenance of common text, numbers, dates, and data that are displayed in doclets throughout a report package. Variables can also be used to reference content between doclets, such as inserting Excel data from a reference doclet into a Word doclet.

Two types of variables are available:

- *Static variables* use static input that is defined by the user, such as a date labels or a set value, which can be used throughout the report package. These static variables can be easily updated, and all doclet instances of the variable value reflect the change. The static variables help to centrally maintain common dates, numbers and text across the Report Package document content.
- *Reference variables* are created by referencing another doclet within the report package as the source, and selecting the value for the variable, such as text in a Word paragraph or an Excel cell value. If the source document is subsequently updated, those changes are automatically updated in the inserted instances of the variable in the report package. Reference variables can be used to insert Excel cell values into a paragraph in a Word doclet, or to create Excel formulas to implement cross-footing rules for increased data accuracy, or to create directional words for the report narrative, such as "an increase" or "a decrease".

Authoring Doclets in Smart View

As a doclet author, you provide report content in Oracle Smart View for Office. The authoring process follows this workflow:

1. [Check out the doclet, reference doclet, or supplemental doclet.](#)

You can check out Office-based supplemental doclets.

2. Update the doclets.

Some suggested Smart View content development tasks:

- Copy and paste data points or data ranges, using Smart View Copy and Paste commands from Office-based documents and doclets into Word-based or PowerPoint-based doclets, as described in [Copying Data Between Excel, Word, and PowerPoint](#).
- Use the Office copy and paste commands to copy Smart View data and then import Smart View metadata, as follows:
 - Use the PowerPoint copy and paste commands to copy a slide or presentation into a PowerPoint-based doclet or supplemental doclet, then import the metadata from the original slide or presentation into the doclet, as described in [Importing Metadata into Copied Worksheets](#)
 - Use the Word copy and paste commands to copy Smart View artifacts from Word documents, then import the metadata from the original document into the doclet, as described in [Importing Metadata into Copied Word Documents](#).
 - Use the Excel copy and paste commands to copy Smart View artifacts from Excel worksheets, and import the metadata from the original worksheet into a reference doclet, as described in [Importing Metadata into Copied Worksheets](#)
- In Excel regular doclets in PDF-based report packages, edit sheet content. Additionally, you can specify the sheets to include in the final report package. See [Working with Excel Doclets in PDF-based Report Packages](#).
- In Excel-based reference doclets, make embeddable content available to doclet authors by specifying named ranges and registering them as a available

content with Narrative Reporting, as described in [Adding Available Content to Excel-based Reference Doclets](#).

- Embed content from Excel- or Management Reporting-based reference doclets into doclets in Word-based report packages, as described in [Embedding Content in a Doclet](#).
- Create static or reference variables, and insert them into Word-based doclets, as described in [Working with Variables](#)
- Refresh all Smart View data in individual doclets, reference doclets, and Office-based supplemental doclets using the **Refresh** command on the Smart View ribbon or a provider ribbon, as described in [Refreshing from a Ribbon](#).
- Refresh specific reports in doclets, reference doclets, and Office-based supplemental doclets individually as you require, as described in [Refreshing Individual Reports from Document Contents](#).
- Change the POV of a report in a doclet, reference doclet, or Office-based supplemental doclet, as described in [The POV Manager](#).

See [Example: Working with Narrative Reporting Data in Smart View](#) for a demonstration on working with Smart View in a Word-based doclet.

3. [Upload the doclet, reference doclet, or applicable supplemental doclet back to the report package.](#)
4. **Optional:** [Select to override doclet style sample attributes or slide masters.](#)
5. [Check in the doclet, reference doclet, or applicable supplemental doclet.](#)
6. [Submit the doclet, reference doclet, or applicable supplemental doclet.](#)

Watch this tutorial video to learn about authoring doclets in Word-based report packages.

Watch this tutorial video to learn about authoring doclets in PowerPoint-based report packages.

[Tutorial video](#)

Checking Out Doclets

This topic applies to Office-based doclets of all types, including reference and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

When you check out a doclet, reference doclet, or Office-based supplemental doclet, it is locked so that nobody else can modify it.

 **Note:**

In Oracle Smart View for Office, you can only download PDF doclets and non-Office-based supplemental doclets. To check out PDF doclets and non-Office supplemental doclets, use the Narrative Reporting web interface.

Before you begin this procedure, you should have already launched an Office application, connected to Narrative Reporting, and opened a report package, as described in [Connecting to Narrative Reporting in Smart View](#).

To check out a doclet, reference doclet, or supplemental doclet:

1. In the Report Center, select the doclet to check out.

Only doclets, reference doclets, and Office-based supplemental doclets can be checked out.

The Word-based report package shown in [Figure 1](#) contains a variety of doclet types, including doclets, Excel-based reference doclets, Word-, Excel-, and PowerPoint-based supplemental doclets, and supplemental doclets of type TXT, PDF, and ZIP. Note the following icons in the Report Center:

-  indicates a doclet
-  indicates a reference doclet
-  indicates a supplemental doclet

Figure 17-14 Report Package Containing Doclets, Reference Doclets, and Supplemental Doclets

2. In the Action Panel, select **Open and Check Out**.

Selecting this option opens the doclet and checks it out in one operation.

Alternatively, double-click the doclet name to open, then continue with [step 3](#).

Note:

When navigating within the doclet panel, the Action Panel menu items listed are relative to—and can change depending on—the item highlighted in the panel. If you are using the keyboard to navigate the doclet panel, note that even though you may have tabbed to a doclet panel item, it is not highlighted, or selected, until you press the space bar. Pressing the space bar highlights the item with a square border meaning that the item is now selected and in focus. Then, the Action Panel menu items will refresh and display relative to the item you've selected.

The Narrative Reporting ribbon is displayed in the Office application when you open:

- A doclet
- A reference doclet
- An Office-based supplemental doclet

[Figure 2](#) shows the Narrative Reporting ribbon for the author phase, in the initial state, before the doclet is checked out.

Figure 17-15 Narrative Reporting Ribbon for Doclet in Author Phase in Initial Unchecked-Out State

Note:

The availability of buttons in the Narrative Reporting ribbon depends on the permissions that are assigned to you; the phase that you are in—authoring, review, or sign off; and the operation you are performing.

3. In the Narrative Reporting ribbon, click **Check Out**.

Note:

If an Office-based doclet of any type is already checked out by another user, then the **Check Out** button is disabled.

The selected doclet is now locked for your use. You can work with it directly in Smart View while connected to Narrative Reporting.

In the doclet responsibilities list in the Smart View Panel, a lock icon and the user name are displayed for the doclet or supplemental doclet that is checked out.

In the Narrative Reporting ribbon, the **Check Out** button is replaced with the **Cancel Checkout** button, and the **Embed** button is added.

Figure 3 shows the Narrative Reporting ribbon for the author phase, after the doclet is checked out.

Figure 17-16 Narrative Reporting Ribbon for Doclet in Author Phase in Checked-Out State

Next steps for working with the checked-out doclets in Narrative Reporting:

- You can undo, or cancel, the checkout if you want to remove your lock on the doclet. Undoing the checkout allows other users to check out and update the doclet. See [Undoing Checkouts](#).
- If you must close Office before you are finished with your authoring changes, you do not need to check in the doclet, but you must upload it to retain the changes in progress. See [Uploading and Working with Page Attributes and Slide Masters](#).
- You can download the Office-based file and work with it offline, as described in [Working with Doclets Locally](#).

Undoing Checkouts

This topic applies to Office-based doclets of all types—regular, reference, and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

In Narrative Reporting, you can undo a checkout to remove the lock and allow other users to check out and modify the doclet. Changes that you made after checking out the doclet, even if you uploaded it, are discarded when you cancel the checkout. To keep your changes, select **Check In** instead.

To undo a checkout:

1. If the Office-based doclet is not already open, in the Smart View Panel, navigate to the doclet and double-click it.
2. In the Narrative Reporting ribbon, click **Cancel Checkout**.

Working with Doclets Locally

This topic applies to Office-based doclets of all types—regular, reference, and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

After checkout, you can work with a doclet directly in the appropriate Office application while connected to Narrative Reporting through Oracle Smart View for Office. If you must close the Office application, or disconnect from Narrative Reporting, you can upload the doclet before closing or disconnecting and the changes you made are saved for the next time you start Smart View and log on Narrative Reporting.

Alternatively, use the Office Save As command to save a doclet to a local or network folder and work with it locally or from your network folder, outside of the Narrative Reporting environment. The following procedures explain how to download a doclet to work with locally, and provide two methods for uploading the doclet back to Narrative Reporting.

 **Note:**

In the following procedures, "locally" refers both to locally-saved doclets, as well as doclets saved to a network folder location.

Downloading Doclets for Local Use

This procedure assumes that you want to work with a doclet, reference doclet, or supplemental doclet locally or on a network folder, while disconnected from Narrative Reporting in Smart View.

To download a doclet, reference doclet, or supplemental doclet to work with locally:

1. In the checked-out doclet, using the **File** menu in the Office application, select **Save As**.
2. Save the document to a local folder or network folder location, as you require.

 **Caution:**

You can save a document locally anytime. But be aware that if you do not check out the doclet before saving it locally, other users can still check it out and modify it. Then you won't be able to upload your version of the doclet without overwriting other users' changes. Oracle recommends checking out a doclet or supplemental doclet first before downloading it locally or to a network folder.

3. Modify the downloaded doclet in the native Office application.
4. Choose a method for uploading the doclet:
 - [Method 1: Uploading Locally-saved Doclets from Windows Explorer or from an Opened Doclet](#)
 - [Method 2: Uploading Locally-saved Doclets from an Office Application](#)

Method 1: Uploading Locally-saved Doclets from Windows Explorer or from an Opened Doclet

This procedure assumes that you have worked with a doclet, reference doclet, or supplemental doclet locally or on a network folder, while disconnected from Narrative Reporting in Smart View. You can double-click your doclet file in Windows Explorer or your desktop, connect to Narrative Reporting, Refresh, and then Sync.

To upload a locally-saved doclet, reference doclet, or supplemental doclet:

1. In Windows Explorer, navigate to the offline doclet file and double-click it to launch the appropriate Office application.

You can also start with an already-opened offline doclet file.
2. Connect to Narrative Reporting, as described in [Connecting to Narrative Reporting in Smart View](#)

Notice that the Narrative Reporting Home panel is displayed.
3. In the Smart View ribbon, click **Refresh**.

Notice that the Narrative Reporting ribbon is displayed.

4. In the Narrative Reporting ribbon, click **Sync**.

The Report Center panel is launched, the report package is opened, and the active doclet is highlighted in the report package list.

Assuming you checked out the doclet prior to downloading and saving it locally, note the state of the ribbon; the **Upload** and **Check In** buttons are enabled.

5. Click **Upload**.
6. Continue with [Uploading and Working with Page Attributes and Slide Masters](#).

Method 2: Uploading Locally-saved Doclets from an Office Application

This procedure assumes that you have worked with a doclet, reference doclet, or supplemental doclet locally or on a network folder, while disconnected from Narrative Reporting in Smart View. The difference between this method and Method 1 is that you must connect to Narrative Reporting before opening your doclet file in Smart View.

To upload a locally-saved doclet, reference doclet, or supplemental doclet:

1. Open the appropriate Office application, but do not open the locally-saved doclet yet.
2. Connect to Narrative Reporting, as described in [Connecting to Narrative Reporting in Smart View](#), and open the report package to which your locally-saved doclet belongs.
3. In the Office application, open the locally-saved doclet by using the **File, Open** command.

This action loads the Narrative Reporting ribbon. Note the state of the ribbon; the **Upload** and **Check In** buttons are enabled.

4. Click **Upload**.
5. Continue with [Uploading and Working with Page Attributes and Slide Masters](#).

Uploading and Working with Page Attributes and Slide Masters

- [Doclets in Word-based Report Packages](#)
- [Doclets in PowerPoint-based Report Packages](#)
- [Office-based Supplemental Doclets in Report Packages](#)

Doclets in Word-based Report Packages

This topic applies to Word doclets in a Word-based report package.

For Microsoft Word-based report packages, you are asked to specify style sample attributes to override during the doclet upload or check-in process.

When a Word-based report package is created in Narrative Reporting, a style sample document is uploaded. It contains the page attributes that the report package owner wants the final report to have. These attributes include the page header and footer, orientation and size, margins, numbering, and alignment.

When you upload a doclet, the system checks the doclet against the style sample document to compare the attributes. An alert is displayed next to the attributes that differ from the style sample.

Figure 17-17 Upload File Dialog Box

By default, the system overrides the doclet attributes with the style sample attributes when the doclet is uploaded. For example, if the style sample orientation is portrait mode and the doclet is in landscape mode, then the doclet's orientation will be changed to portrait mode to match the style sample. [Figure 1](#) shows the **Upload File** dialog box with an alert next to the **Orientation** attribute.

To keep the doclet in landscape mode, select the **Orientation** check box. When you select an attribute, the system uses the attribute from the doclet rather than the attribute from the style sample.

To upload a Word doclet and select style attributes to override:

1. If the doclet is not already open, in the Smart View Panel, navigate to the doclet and double-click the doclet name.

To upload changes, you must have the doclet checked out.

2. In the Narrative Reporting ribbon, click **Upload**.

Upload

Alternatively, to upload and check in the doclet, in the Narrative Reporting ribbon, select **Check In**, and then **Upload and Check In**.

Whether you select the Upload command or the Upload and Check In command, the Upload File dialog is displayed.

3. In the **Upload File** dialog box (see [Figure 1](#)), select the style attributes that you want to override, and then click **OK**.

Style attributes in the doclet that differ from the style sample for the report package are noted with an exclamation point.

4. Proceed to [Checking In Doclets](#).

Alternatively, you can continue working on the checked-out doclet and repeat the upload procedure in this topic as many times as you require, and then proceed to [Checking In Doclets](#).

Doclets in PowerPoint-based Report Packages

This topic applies to PowerPoint doclets in a PowerPoint-based a report package.

For Microsoft PowerPoint-based report packages, when a report package is created, a style sample document is uploaded that contains the slide masters and slide layouts that the report package owner wants the final report to have. These slide masters determine the overall look and format of the presentation. When you upload a doclet, the system scans the doclet and highlights the slide masters in use. The icon indicates slide masters that are not in the style sample document.

Note:

The doclet slides must be sized the same as the report package style sample slides in order to upload the doclet. For example, if your doclet slides are sized for On-Screen Show (4:3) and the report package style sample slides are sized for On-Screen Show (16:9), you must resize your doclet slides before you can upload the doclet.

To upload a PowerPoint doclet and select a slide master:

1. If the doclet is not already open, in the Smart View Panel, navigate to the doclet and double-click the doclet name.

To upload changes, you must have the doclet checked out.

2. In the Narrative Reporting ribbon, click **Upload**.

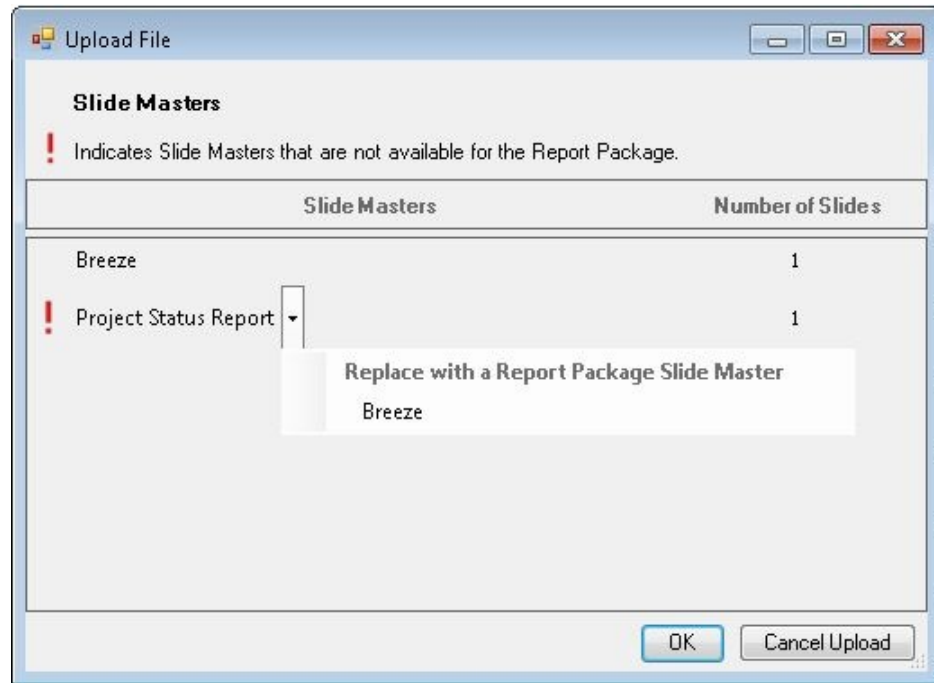

Alternatively, to upload and check in the doclet, in the Narrative Reporting ribbon, select **Check In**, and then **Upload and Check In**.

Whether you select the Upload command or the Upload and Check In command, the Upload File dialog is displayed.

3. If the doclet uses the same slide master as the style sample document, click **OK** in the **Upload File** dialog box, the proceed to step [5](#); otherwise, proceed to step [4](#).
4. If the doclet contains a slide master that is not in the style sample document, perform one of the following:

- To replace the doclet slide master with the report package slide master, click the name of the doclet slide master, and then select the report package slide master to replace it with.

The system maps the doclet slide layouts to the report package slide master to maintain a uniform look for the presentation.

- To preserve the doclet slide master, click **OK** to upload the doclet.
 If you preserve the doclet slide master, the system adds it to the merged presentation to ensure that the slides will render correctly. However, that slide master is available for use by that doclet only. The doclet slide master is not available to other doclets. If you want the doclet slide master to be used by other doclets, the report package owner must add it to the report package style sample document.

5. Proceed to [Checking In Doclets](#).

Alternatively, you can continue working on the checked-out doclet and repeat the upload procedure in this topic as many times as you require, and then proceed to [Checking In Doclets](#).

 **Note:**

When you upload a doclet to the report package, the system resets all slides to their default layouts. If you have modified any slides from the default slide master layout, those modifications are reset back to the default. For example, if you have changed the size of a text box on a slide to make room for an image, the text box is reset to its original size when you upload the doclet. However, you can add additional layouts to the doclet slide master, and those new layouts are persisted within the doclet. Therefore, if you want to preserve the modified text box size, you must add that layout to the doclet slide master.

As an example, you are working with a doclet with a slide layout called Title and Content that contains a text box that spans the entire slide. You want to resize the text box to cover half of the slide so that you can add an accompanying image. If you were to resize the text box, add the image, and upload the doclet, the system would reset the slide back to the Title and Content default layout, and the text would overlap the image. Instead, add a new slide layout (called, for example, Title, Text, and Image) with the resized text box. When you upload the doclet, the new slide master is copied over and persisted for that doclet.

Office-based Supplemental Doclets in Report Packages

This topic applies to Office-based supplemental doclets.

You upload Office-based supplemental doclets for checking in. However, in the upload process, you do not have to overwrite styles or slide masters. You simply upload.

Other supplemental doclet file types, such as ZIPs or PDFs, are not checked out in Oracle Smart View for Office; they are only opened or downloaded. Therefore, they do not need to be uploaded.

To upload an Office-based supplemental doclets:

1. If the doclet is not already open, in the Smart View Panel, navigate to the doclet and double-click the doclet name.

To upload changes, you must have the doclet checked out.

2. In the Narrative Reporting ribbon, click **Upload**.

Alternatively, to upload and check in the doclet, in the Narrative Reporting ribbon, select **Check In**, and then **Upload and Check In**.

Whether you select the Upload command or the Upload and Check In command, the Upload File dialog is displayed.

3. Proceed to [Checking In Doclets](#).

Alternatively, you can continue working on the checked-out supplemental doclet, repeat the upload procedure in this topic as many times as you require, and then proceed to [Checking In Doclets](#).

Checking In Doclets

This topic applies to Office-based doclets of all types, including reference and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

Note:

To check in PDF doclets and non-Office supplemental doclets, use the Narrative Reporting web interface.

After you have finished modifying an Office-based doclet, you must check it back in so that your changes are incorporated into the report package and other users can view your changes.

Note:

Before you check in a doclet, you must first upload it. You can perform an upload and check in in one step using the procedure in this topic. To upload only, see [Uploading and Working with Page Attributes and Slide Masters](#). If you were working with doclets locally, first see [Working with Doclets Locally](#).

To check in a doclet, reference doclet, or Office-based supplemental doclet:

1. If not already open, in the Smart View Panel, navigate to the doclet and double-click it to open it.
2. From the Narrative Reporting ribbon, select **Check In**, and then **Check In**.

Alternatively, if you haven't yet uploaded the doclet, select **Check In**, and then **Upload and Check In**.

In the Smart View Panel, the lock icon is removed from the doclet in the doclet responsibilities list, indicating that it is no longer checked out.

 **Note:**

After you have checked out and downloaded an Office-based doclet to work with locally, you must upload the new version before you can check the it back in. If you want to discard the changes that you made and revert back to the original version of the doclet, click **Cancel Checkout** instead (see [Undoing Checkouts](#)).

Submitting Doclets

This topic applies to Office-based doclets of all types, including reference and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

After finishing their work, authors submit Office-based doclets to the report package owner or, if approval is required, to the doclet approver.

To submit a doclet, reference doclet, or Office-based supplemental doclet:

1. If not already open, in the Smart View Panel, navigate to the doclet and double-click it to open it.
2. In the Narrative Reporting ribbon, click **Submit**.

 **Tip:**

In cases where multiple authors are assigned to a doclet, ensure that all authors are finished with their work before submitting the doclet.

If approval is required, the current responsibility for the doclet is updated with the doclet approvers. If no approval is required, the current responsibility field is empty.

 **Note:**

If the doclet is not already checked in, then the **Submit** operation also checks it in for you.

After you submit a doclet, you can no longer check it out, although you can still open and inspect it from Oracle Smart View for Office or the Narrative Reporting web interface.

Note that once a doclet is submitted, the report package owner can check it out for further updates.

Working with Embedded Content from Reference Doclets

Embedded content from a reference doclet allows commonly-used report content to be defined and then embedded in one or more doclets within your report package.

Related Topics:

[About Embedded Content From Reference Doclets](#)

[Adding Reference Doclets to a Report Package](#)

[Removing Embedded Content from a Doclet](#)

About Embedded Content From Reference Doclets

What is embedded content? Embedded content starts with common report content created by reference doclet authors and contained in a reference doclet. This common content becomes available content to doclet authors. Using Oracle Smart View for Office or the web, doclet authors embed content into doclets that are part of the published report in Word- or PowerPoint-based report packages.

As a reference doclet author, you create report content, and then define it as available content. In Excel-based reference doclets, you use Excel's named range functionality. In Management Reporting-based reference doclets, you use the Narrative Reporting web interface. After upload and checkin, the content is ready for doclet authors to consume.

As a doclet author, you might think of a reference doclet as a data source of embedded content. A report package can contain multiple reference doclets. You can embed the available content from multiple reference doclets in multiple doclets in a report package.

Whenever a reference doclet author checks in a reference doclet, Smart View or the web interface, the system automatically refreshes any doclet that has embedded content.

Whenever a doclet author checks in a doclet that has embedded content, the system automatically refreshes the embedded content in the doclet.

As the underlying data source of the report is updated, you can view the changes the next time you open or refresh the reference doclets and doclets containing embedded content.

 **Note:**

For reference doclet authors: Reference doclets are part of a report package, and they are maintained within the report package. Reference doclets have the same support as any other doclet in a report package such as workflow, security, and versioning.

The basic process flow for working with reference doclets and embedded content is as follows:

1. In the web interface, the report package owner adds Excel- and Management Reporting-based reference doclets to the report package. See the Narrative Reporting documentation for details.

The reference doclets can already contain report content and, in the case of Excel-based reference doclets, named ranges. Reference doclet authors and doclet authors can also add named ranges later, during the authoring process.

2. In Smart View or from the web interface, Excel-based reference doclet authors create report content and define named ranges for data and other content, such as tables, graphs, and charts, to include in a report package. They can validate fonts used in the reference doclet to ensure that formatting is retained when content is embedded in doclets.

In the web interface, Management Reporting-based reference doclet authors can add tables or graphs in the report as available content.

Multiple available content objects can be created within a single reference doclet. For example, you can create more than one named range in a reference doclet.

3. Reference doclet authors

Reference doclet authors upload and check in reference doclets, thus making the report content available to doclet authors.

4. Doclet authors embed content from the reference doclets in their assigned doclets.

In Smart View, you begin the process with [Defining Named Ranges in Excel-based Reference Doclets](#).

In the Narrative Reporting web interface, see the Management Reporting documentation.

Adding Reference Doclets to a Report Package

This task is completed by report package owners using the Narrative Reporting web interface.

To begin working with embedded content, the report package owner adds Excel- or Management Reporting-based reference doclets to a report package. Reference doclets are the containers to which reference doclet authors add report content and make it available to doclet authors for embedding.

 **Note:**

- You must have report package owner privileges to add reference doclets to a report package.
- The reference doclets you add can already contain report content and named ranges, or you can add them later, during the authoring process.

To add reference doclets to a report package:

1. Follow the procedures described in Narrative Reporting documentation.
2. In Oracle Smart View for Office, open the report package and verify that the reference doclet is included.

Reference doclet authors are now ready to begin working with the Excel-based reference doclets, as described in [Defining Named Ranges in Excel-based Reference Doclets](#).

To begin embedding content from reference doclets in a doclet, go to [Embedding Content in a Doclet](#).

Defining Named Ranges in Excel-based Reference Doclets

This topic applies only to Excel-based reference doclets.

The reference doclet author creates report content and then defines named ranges around that content in the reference doclet. In general, range names can be created using the New Name dialog box, accessed either from the Name Manager or the Define Name items on the Formula ribbon of Excel. Find out more about range names in the Microsoft documentation.

You can define named ranges before adding a reference doclet to a report package.

Alternatively, you can define named ranges during the author phase, as described in this topic.

 **Note:**

Prior to beginning this procedure, ensure that the author phase has been initiated.

To define named ranges for Excel-based reference doclets:

1. Open the report package.
2. Open, and then check out the reference doclet.
The reference doclet should open in Excel. If you opened the report package in Word or PowerPoint, Excel is launched when opening the reference doclet.
3. Create the report content.
4. Add range names to selected report content.

You can add range names to any or all report content in the reference doclet. You decide which content you want to make available to authors of the report package.

A named range is valid when the named range:

- Exists within an Excel workbook.
- Is not a hidden name.
- Refers to a range of cells in a worksheet which is not hidden.
- Is not referring to a formula or constant.
- Does not have a dynamically calculated reference, for example the reference must point to an absolute range of cells, rather than relying on a reference formula or another named range to dynamically determine the range.
- Does not contain any errors, for example a “#REF!” error.

Remember, named ranges become available content in the report package.

5. **Optional:** As you add named ranges and edit content in reference doclets, complete the steps in [Validating Fonts in Reference Doclets](#) to ensure that fonts you are using in the reference doclet are also available in the Narrative Reporting service.
6. When you finish adding report content and named ranges to the report, and validating fonts, upload, and then check in the reference doclet.

The reference doclet must at least be uploaded in order to continue with the next step.
7. Continue with [Adding Available Content to Excel-based Reference Doclets](#).

Validating Fonts in Reference Doclets

The new Font Validation command, available on the Narrative Reporting ribbon, provides a quick and easy way to confirm that the tables within your Excel reference doclets will render properly when inserted into a doclet as embedded content.

All fonts used in tables within your reference doclets must be installed to your Narrative Reporting service. If a font is not available within the service, the system uses a substitute font. This substitution can introduce significant visual differences when the content is either viewed online or inserted into another doclet.

With the Font Validation command, you are informed if any of the fonts used in the Excel reference doclet are not available in Narrative Reporting. You can then notify your service administrator to install the missing font files. A message also notifies you if all font files are in sync.

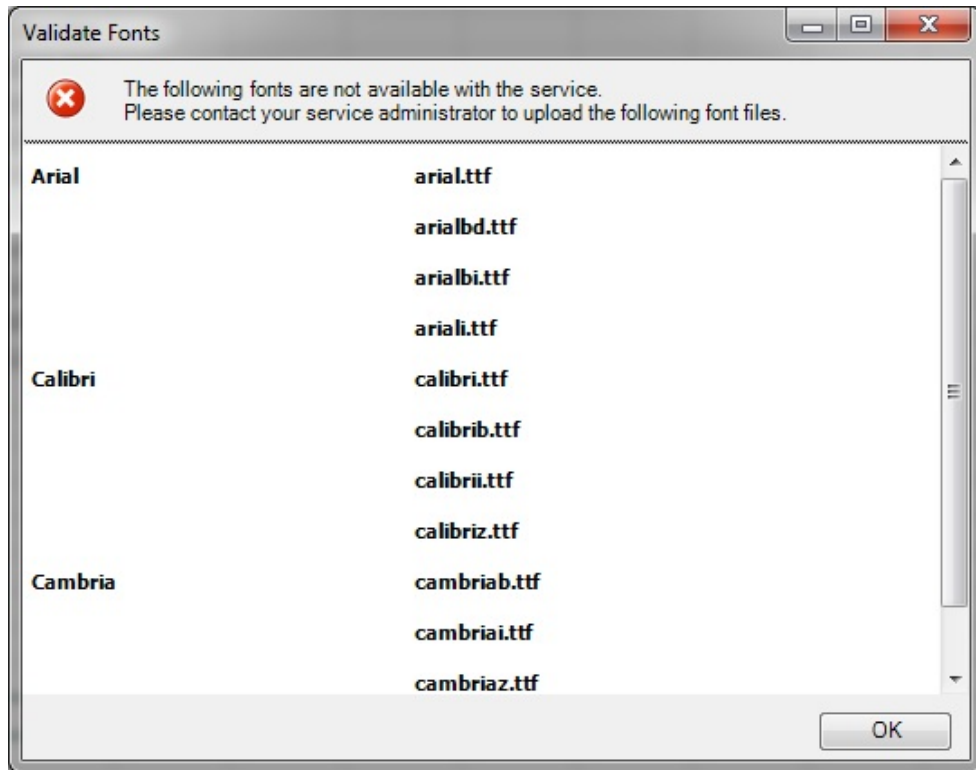

To validate fonts in a reference doclet:

1. From the report package, open a reference doclet.

You may check out the doclet, but it's not required to validate fonts.
2. Click the **Validate Fonts** icon:

If there is a discrepancy between the fonts used in the doclets and the fonts available in the service, the following dialog is displayed, listing the missing fonts:

3. Take note of the missing fonts, and click **OK**.
4. Request that your service administrator installs the missing fonts in your service.

 **Note:**

In some cases, the fonts listed are not used in the reference doclet. These are usually the default Excel fonts; for example, Arial, Calibri, and Calibri Light. If you know you are not using those fonts, you can use your discretion about notifying your service administrator to install them.

Adding Available Content to Excel-based Reference Doclets

This topic applies only to Excel-based reference doclets.

Reference doclet authors or approvers can add available content to a reference doclet. Available content is based on the named ranges specified in the reference doclets (as described in [Defining Named Ranges in Excel-based Reference Doclets](#)).

In Oracle Smart View for Office, you use the **Properties** dialog box to detect the named ranges and specify them as available content. When the reference doclet is checked in to the report package, an automated refresh is performed that updates any

changes that were made in the reference doclet and to any doclets that have embedded content that points to the reference doclet.

 **Note:**

- Prior to beginning this procedure, ensure that the author phase has been initiated.
- Doclet authors cannot add available content definitions.

To add available content to a reference doclet in Smart View:

1. Open the report package.
2. Open, and then check out the reference doclet.

The reference doclet should open in Excel. If you opened the report package in Word or PowerPoint, Excel is launched when opening the reference doclet.

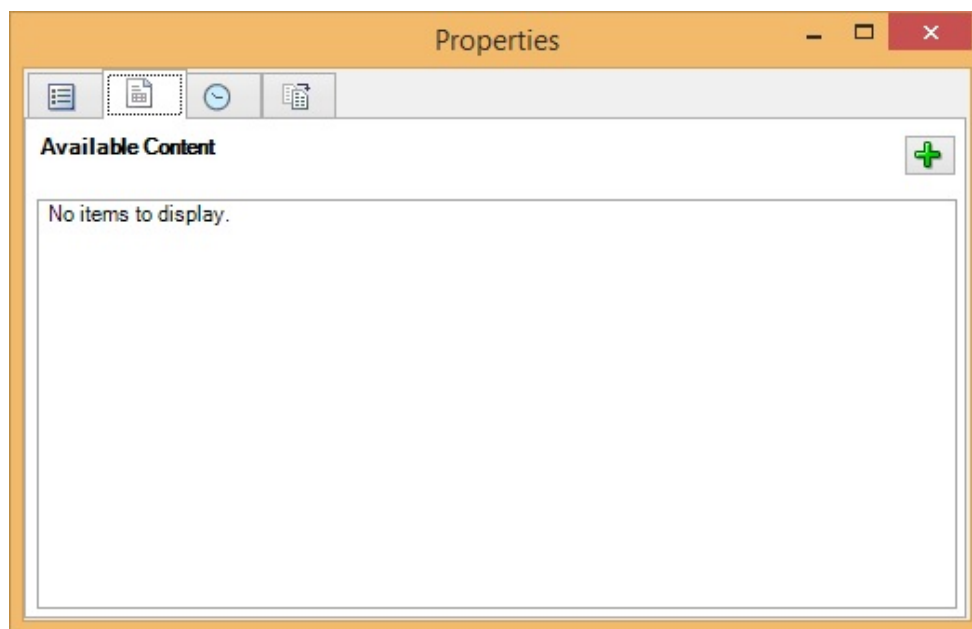

3. Click **Inspect** in the Narrative Reporting ribbon to launch the **Properties** dialog box.

Alternatively, with the reference doclet selected in the report package list, click the **View Properties** link to access the **Properties** dialog box.

4. Select the **Available Content** tab.

Figure 17-18 Properties Dialog Box - Available Content Tab

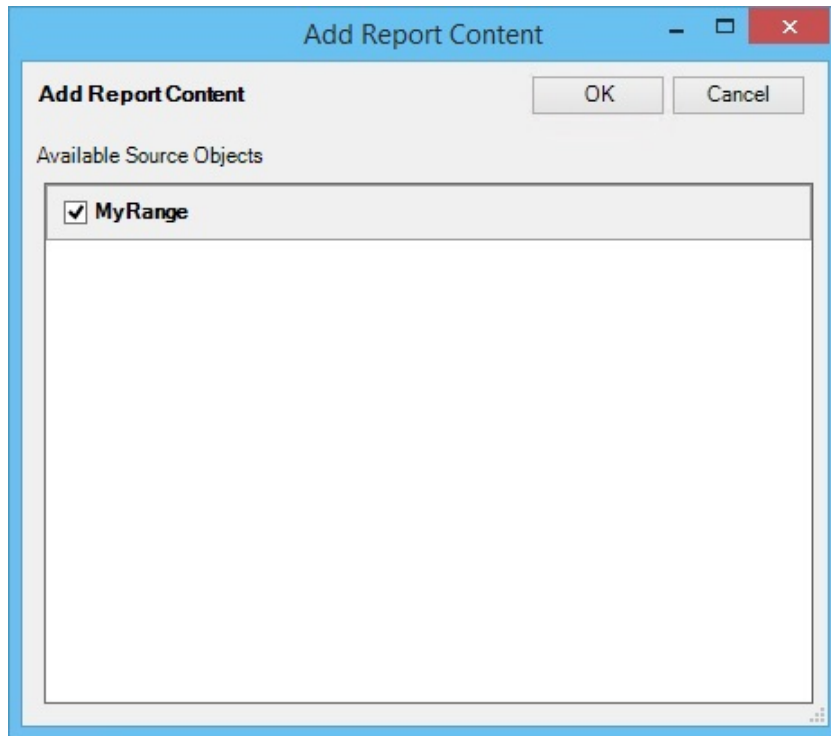

5. Click the **Add** button, , to launch the **Add Report Content** dialog box. In **Add Report Content**, all available content in the reference doclet is displayed.

6. Select the check box next to the content which you want to make available for embedding later.

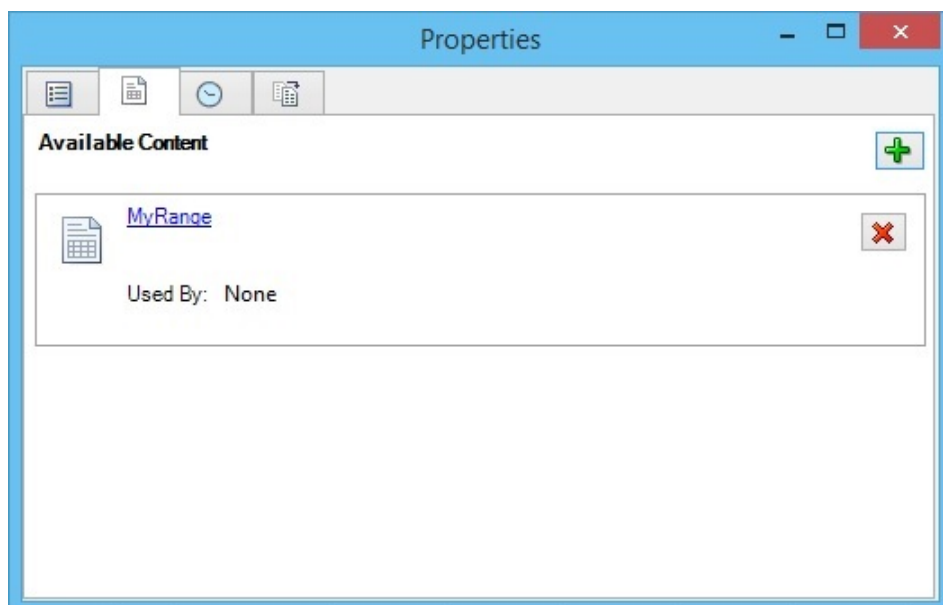

For example, in [Figure 2](#), the available range, "MyRange" is selected.

Figure 17-19 Add Report Content Dialog Box

7. Click **OK** to go back to the **Available Content** tab of the **Properties** dialog box.

Figure 17-20 Properties Dialog Box - Available Content Tab with Content Added

8. Click the **X** in the upper right corner of the dialog to close it.
9. Upload, and then check in the reference doclet.

The content you just added is now available for embedding into doclets.

10. Continue with [Embedding Content in a Doclet](#).

Optionally, to maintain or delete content in the reference doclet, continue with [Updating Excel-based Reference Doclet Content](#) or [Deleting Available Content from an Excel-based Reference Doclet](#).

Updating Excel-based Reference Doclet Content

This topic applies only to Excel-based reference doclets.

As the author or approver of Excel-based reference doclets, you can update and modify the available content in reference doclets during the author phase.

For example, you can refresh data or reformat content. Or, you may find that the available content that you defined needs to be remapped to different report content within the reference doclet. This may occur if the doclet source was updated, or if a named range was renamed or deleted, or if the wrong content was selected previously.

Note:

- Prior to beginning this procedure, ensure that the author phase has been initiated.
- To update Management Reporting-based content, use the Narrative Reporting web interface.

To update reference doclet content:

1. Open the report package.
2. Open, and then check out the reference doclet.
The reference doclet should open in Excel. If you opened the report package in Word or PowerPoint, Excel is launched when opening the reference doclet.
3. **Optional:** Perform Oracle Smart View for Office tasks, such as refresh the data points or change the POV in a report.
4. **Optional:** Perform Excel tasks, such as reformat a grid or chart.
5. **Optional:** Change the name or the description of available content:
 - a. In the Narrative Reporting ribbon ribbon, click **Inspect**.
 - b. In the **Properties** dialog box, select the **Available Contents** tab.
 - c. In **Available Contents**, click the link for the content you want to change.

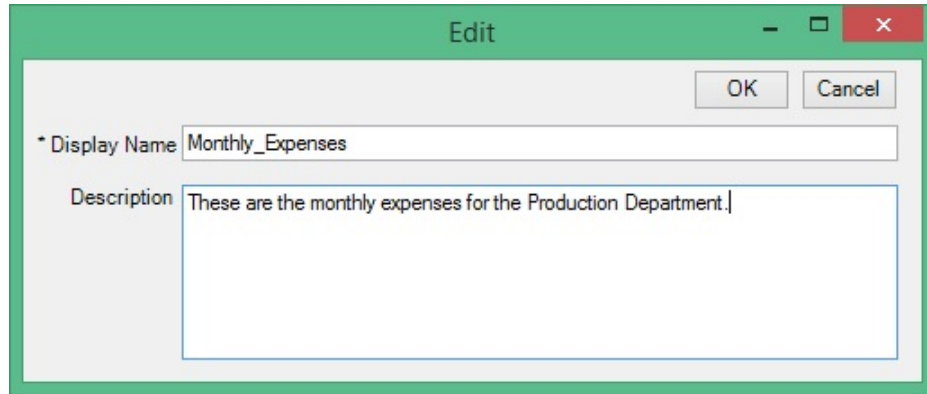

For example, we'll update the description for the Monthly_Expenses content, so we'll click the Monthly_Expenses link:

The **Edit** dialog box is displayed, where you can change the content name and description.

- d. In the **Edit** dialog, make any necessary changes to the content name and description.

In the example below, we've added a description.

- e. When finished, click **OK** to close the **Edit** dialog.

The updated description appears in the **Properties** dialog box:

- f. Repeat to make changes to any other content in the list.
6. **Optional:** To remap available content within a reference doclet:
- a. In the Narrative Reporting ribbon, click **Inspect**.
 - b. In the **Properties** dialog box, select the **Available Contents** tab.

- c. Click  next to the content to remap and select **Remap** from the drop-down menu.

For example, below we are selecting to remap Rev_GP2.

The **Remap** dialog is displayed.

- d. In the **Remap** dialog, click on the associated **Select** link for the content to remap.

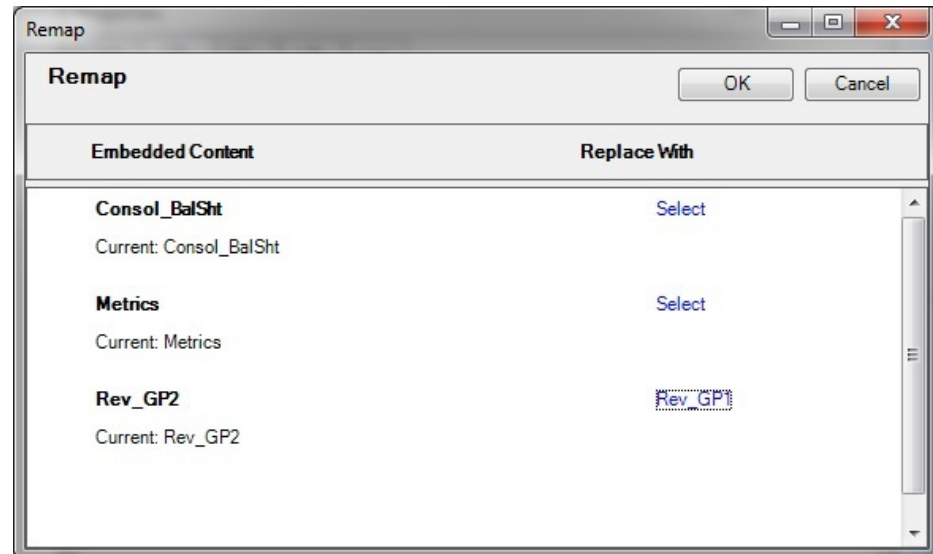

A list of available content that is not already mapped is displayed. In the following illustration, the list contains two items, Summary_IS and Rev_GP1.

Rev_GP2 is currently mapped to available content called Rev_GP2. We want to remap to the unmapped content called Rev_GP1.

- e. From the **Select** drop-down list, select an available content item to remap to. After you make a selection, the range you chose is shown in the **Replace with** column.

In the following example, the Rev_GP1 range is now showing in the **Replace with** column.

- f. Repeat [step 7.a.](#) through [step 7.c.](#) for each available content item that you want to remap.
- g. When you're finished remapping content, click **OK** to close the **Remap** dialog.
7. Click **X** in the upper left corner of **Properties** to close the dialog.
8. When finished with all updates to the reference doclet, upload it and check it in.

Deleting Available Content from an Excel-based Reference Doclet

This topic applies only to Excel-based reference doclets.

In the reference doclet, you can remove content from the list of available content, without deleting the range on which it was based. This way, if you need to add the content back at later, you can do so.

Be aware that if the available content is in use as embedded content in any doclets in the report package, deleting it from the reference doclet will cause broken links in those doclets.

To delete available content from a Management Reporting-based reference doclet, use the Narrative Reporting web interface.

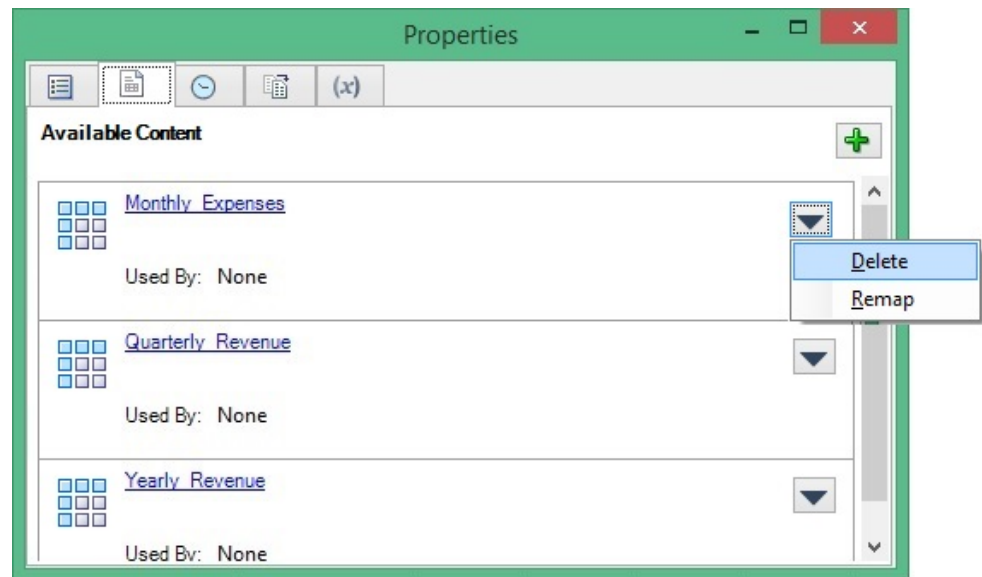

Note:

Before you begin, ensure that the doclet author phase is initiated.

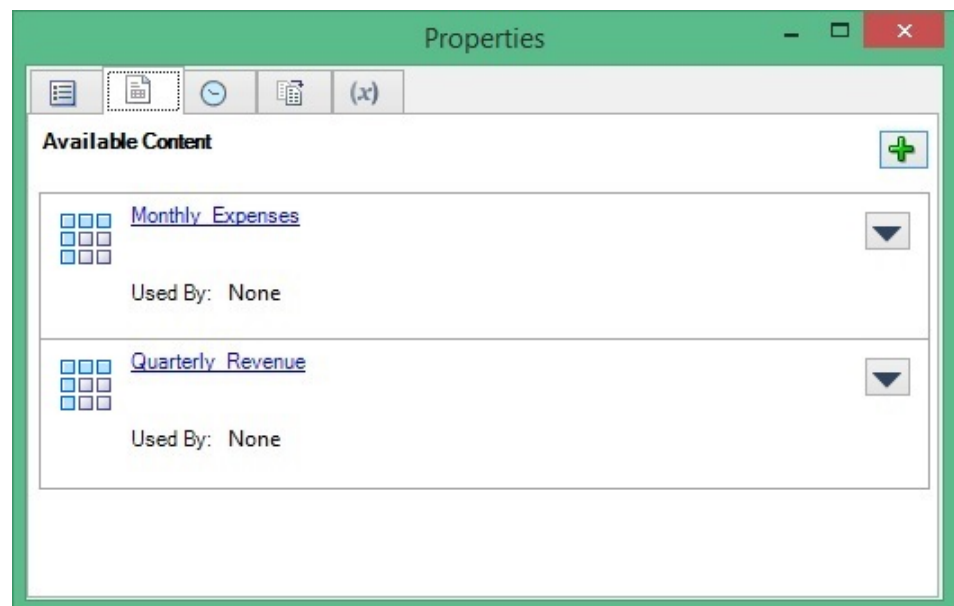

To delete available content from the reference doclet:

1. Check out the reference doclet.
2. In the Narrative Reporting ribbon ribbon, click **Inspect** to launch the **Properties** dialog box.
3. In **Properties**, select the **Available Contents** tab.

In the example below, there are three ranges listed as available content. We'll remove one of them Yearly_Revenue.

4. In **Available Content**, click the **Delete** button,  for the content to delete. The content is removed from the list of available content.

5. Repeat these steps for any other content to delete.
6. Click X in the upper left corner of **Properties** to close the dialog.
7. When finished, upload it and check it in.

You can always add content back to the reference doclet by following the procedure in [Adding Available Content to Excel-based Reference Doclets](#).

Embedding Content in a Doclet

Now that Excel- and Management Reporting-based reference doclets are added to a report package, report content has been created and named ranges defined, and available content has been identified, this content can be embedded. You can embed content in Word or PowerPoint doclets. For example, among the available content in the report package, there may be a chart or grid that an author wants to add to a doclet.

Note:

Before you begin, ensure that the doclet author phase is initiated.

To embed content in a doclet:

1. Open the doclet and check it out.
We'll call the doclet our "target" doclet.
2. Place the cursor at the point in the target doclet where the embedded content should be inserted.

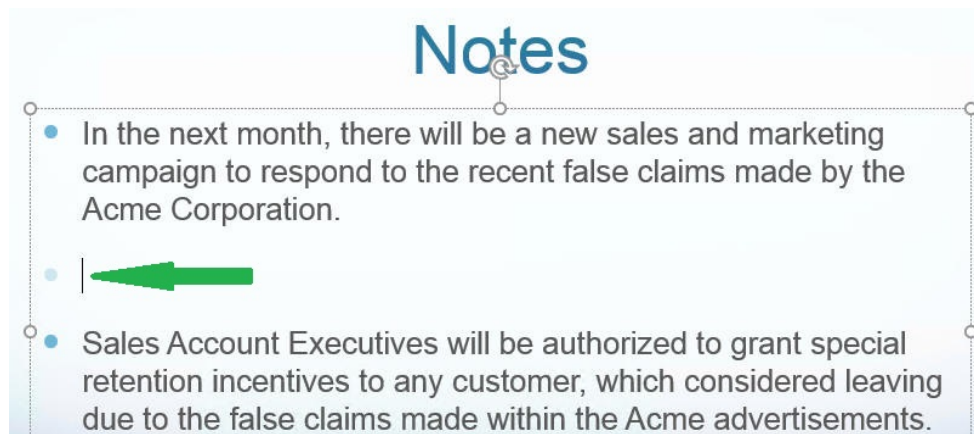

In [Figure 1](#), the solid green arrow shows the insertion point for the embedded content.

Figure 17-21 Example Target Word Doclet with Cursor at Insertion Point

■ **Operating-Expenses¶**
Actual-operating-expenses-were-<insert-data-point-here>,as-compared-to-Plan-operating-expenses-of-
<insert-data-point-here>.Table-1-summarizes-Operating-Expenses.¶
Table-1-Operating-Expenses¶

In a PowerPoint slide, depending on the slide format, you may be embedding a table or graph onto a slide containing no other text or graphics. In that case, you can simply click anywhere in the slide. If your embedded content must be inserted at a certain point in a slide within text, then position the cursor at the insertion point, as shown in [Figure 2](#)

Figure 17-22 Example Target PowerPoint Doclet with Cursor at Insertion Point

3. From the target doclet, click the **Embed** button in the Narrative Reporting ribbon.

Embed

The **Embed Contents** dialog box is launched.

4. In **Embed Contents**, select the range to embed.

In the example in [Figure 3](#), we see both Excel- and Management Reporting-based content in the list. We'll select **MyRange**, which happens to be Excel-based content.

Figure 17-23 Embed Contents Dialog Box

5. Click **OK**.

The selected range is inserted, or embedded, into the doclet.

 **Note:**

In PowerPoint, you can relocate and resize the embedded content on the slide. Once resized, the revised height of the image on the slide is retained on refresh, and the refreshed image will have the same aspect ratio as the source object.

An example of embedded content in a Word doclet is shown in [Figure 4](#). This figure assumes that in the Home ribbon in Word, the **Show/Hide** button in the **Paragraph** group is enabled.

Figure 17-24 Example Target Doclet After Embedding a Range

Operating Expenses¶

Actual operating expenses were <insert data point here>, as compared to Plan operating expenses of <insert data point here>. Table 1 summarizes Operating Expenses.¶

Table 1. Operating Expenses¶

	Actual¶	Plan¶	Variance¶	Variance-%¶
Total Compensation¶	\$64,845,803.24	\$115,166,742.59	\$50,320,939.35	43.69¶

Operating Expenses¶	\$235,370,183.29	\$417,326,387.97	\$181,956,204.68	43.60¶

- Repeat the steps above for all content you want to embed in the currently opened and checked-out target doclet.

 **Note:**

Embedded content must not overlay or overlap other instances of embedded content.

7. When your work is completed in the current doclet, upload it, and then check it in.
8. To refresh embedded content, see [Refreshing Embedded Content in a Doclet](#).

 **Note:**

If you place embedded content at the beginning of a Word doclet (the first line and first space of the Word document), you cannot embed content before the already-embedded content. You may embed content immediately after the already-embedded content, but not before it. To workaround this:

- Delete the embedded content and then re-embed the content in the correct order. To delete the embedded content, add a blank line after the embedded content, then select the blank line along with the embedded content, then right-click and select **Remove Content Control** from the context menu. Next, select the blank line and embedded content again, and then press **Delete**.
- Place a blank line at the beginning of the Word document to ensure that, if necessary, you can insert embedded content before the first instance of embedded content.

 **Note:**

If you embed content consisting of a multiple line grid at the beginning of a Word doclet (the first line and first space of the Word document), you cannot delete only the embedded content. Note that you can delete a single line grid that was embedded at the beginning of a Word doclet.

To workaround this, add a blank line after the embedded content, then select the blank line along with the embedded content, then right-click and select **Remove Content Control** from the context menu. Next, select the blank line and embedded content again, and then press **Delete**.

Refreshing Embedded Content in a Doclet

As a doclet authors, you can refresh the embedded content in your doclets to keep them in sync with the content in the reference doclets and the underlying data source. For example, source data can be updated or content can be reformatted.

To refresh embedded content in a doclet:

1. Open, and then check out the doclet that contains the embedded content.
2. Perform an action:

- To refresh embedded content only, without uploading in the same operation:
In the Narrative Reporting ribbon, select the arrow in the **Refresh** icon, and then **Refresh Embedded Content**.

You do not have to select the embedded content to refresh it. The **Refresh Embedded Content** command will refresh all embedded content in the checked-out doclet.

When you've finished the refresh, and made any other changes to the doclet, click **Upload**.

- To refresh and upload the doclet immediately:

In the Narrative Reporting ribbon, click **Upload**.

The upload action automatically refreshes any embedded content in the target doclet.

 **Note:**

PowerPoint: If you have resized embedded content, the revised height of the image on the slide is retained on refresh, and the refreshed image will have the same aspect ratio as the source object.

3. Check in the doclet.

 **Note:**

When closing a doclet, particularly if the embedded content consists of an image, you may encounter a message informing you that there is content left in your clipboard, and confirming that you want to close the doclet. You may select Yes in this message; however, if you want to keep the content of the Office clipboard, ensure that you have pasted the content into another Office document before proceeding.

Removing Embedded Content from a Doclet

As a doclet author, you can remove embedded content from doclets using the Cut command in Word or PowerPoint, or the Delete key on your key board.

To remove embedded content from a doclet:

1. Open the doclet that contains the embedded content, and check it out.
 This is the target doclet, not the reference doclet or any other doclet. The target doclet was discussed in [Embedding Content in a Doclet](#).
2. To remove embedded content from a PowerPoint doclet:
 - a. In the target doclet, click on the embedded content to highlight it, and then press the **Delete** key.
 - b. Edit the slide to make any adjustments to surrounding text, if required.
3. To remove embedded content from a Word doclet:
 - a. add a blank carriage return either before or after the embedded content.
 You will need an extra bit of plain text, such as an empty paragraph marker, when selecting the embedded content to delete.
 - b. Select the embedded content, along with the blank paragraph marker you created in the previous step.

Select the embedded content and the blank paragraph marker, in the same way that, using Word, you would select a table along with a line of text above or below it.

In the following image, the embedded content and the paragraph marker below it are selected. An extra blank paragraph marker at the bottom of the image is not selected.

Operating Expenses

Actual operating expenses were <insert data point here>, as compared to Plan operating expenses of <insert data point here>. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

	Actual	Plan	Variance	Variance-%
Total Compensation	\$64,845,803.24	\$115,166,742.59	\$50,320,939.35	43.69%
Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.65%
General Supplies	3,674,837.98	6,258,357.17	2,583,519.19	41.28%
Telecommunications	6,378,561.45	11,057,528.97	4,678,967.53	42.31%
Equipment Maintenance	14,993,537.06	26,272,058.13	11,278,521.07	42.93%
Fees Outside Services	100,996,742.28	180,334,457.05	79,337,714.77	43.99%
Employee HR	6,634,968.62	11,428,589.57	4,793,620.94	41.94%
Facilities Exp	13,031,228.94	22,994,537.25	9,963,308.31	43.33%
Utilities	2,159,896.85	3,820,238.43	1,660,341.58	43.46%
Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.80%
Operating Expenses	\$235,370,183.29	\$417,326,387.97	\$181,956,204.68	43.60%

- c. Press the **Delete** key on your keyboard.

Alternatively, you can use the **Cut** command from the Home ribbon in Word or PowerPoint.

The following image shows the selected embedded content and paragraph marker removed; one blank paragraph marker at the bottom of the image remains.

▪ **Operating Expenses**
Actual operating expenses were <insert-data-point-here>, as compared to Plan operating expenses of <insert-data-point-here>. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

4. Repeat these steps for all embedded content to remove from the current target doclet.
5. When your work is completed in the current doclet, upload it, and then check it in.

Working with Embedded Content from Reference Files

Embedded content from a reference file allows report content to be sourced from and defined in your own local or network Excel files, *outside* of the report package, and then embedded in one or more doclets within your report package.

About Embedding Content from Reference Files

A doclet author can create their own stylized report content in Microsoft Office Excel, such as grids and charts, and insert that content into doclets using reference files. The Excel report content is automatically updated in the associated doclet whenever the Excel file is modified. You identify embeddable content in the reference file using Excel's named ranges functionality. The named range can then be embedded in a doclet. The reference file is attached and saved to a doclet and is associated only with that doclet.

Reference files are similar to reference doclets in that you can define embeddable content in them. The difference is that a reference file is available to and associated with a single doclet only whereas a reference doclet is available to all doclet authors with access to the reference doclet. A single doclet can be associated with multiple reference files.

To summarize this feature in Narrative Reporting, a doclet author can:

- Develop stylized reports within a Microsoft Office Excel workbook, using Oracle Smart View for Office or other data access methods
- Define named ranges in the workbook; the named ranges become embeddable content candidates

- Integrate named ranges within doclets
- Easily update the reference file in Excel, which automatically updates the Microsoft Office Excel report content in the doclet with which it is associated
- Incorporate multiple ranges from the same or different reference files in a doclet

Defining Named Ranges in Reference Files

The reference file is an Excel file that can be located in a folder on a local drive or network drive, outside of the report package.

The doclet author creates Excel report content and then defines named ranges around that content. In general, range names can be created using the New Name dialog box, accessed either from the Name Manager or the Define Name items on the Formula ribbon of Excel. Find out more about range names in the Microsoft documentation.

This Excel file is a potential reference file.

Define named ranges in your reference file before you begin working with them in a doclet.

To define named ranges for reference files:

1. In Excel, create the report content.
2. Add range names to selected report content.

You can add range names to any or all report content in the reference file. You decide which content you want to make available.

A named range is valid when the named range:

- Exists within an Excel workbook.
- Is not a hidden name.
- Refers to a range of cells in a worksheet which is not hidden.
- Is not referring to a formula or constant.
- Does not have a dynamically calculated reference, for example the reference must point to an absolute range of cells, rather than relying on a reference formula or another named range to dynamically determine the range.
- Does not contain any errors, for example a “#REF!” error.

Remember, named ranges from your reference file become candidates for embedded content to you as the doclet author.

3. Save the Excel file.

Registering Reference Files with a Doclet

There is a two-part process for registering a reference file with a checked-out doclet, and then, separately, embedding the available content as needed throughout a doclet.

The procedure in this topic covers registering content from a reference file with a checked-out doclet. See [Embedding Reference File Content in a Doclet](#) for instructions on embedding content from the registered reference file.

 **Note:**

Before you begin, you should have established ranges in the target reference file, using Excel's Name Manager feature, as described in [Defining Named Ranges in Reference Files](#). The file should be closed when performing the procedure below.

You can also register available content and then embed the content in one procedure. For more information, see [Adding Content from Reference Files to Doclets](#).

To register a reference file with a doclet:

1. Open the report package.
2. Open, and then check out the doclet to which you want to register a reference file.
If the doclet is already checked out, you can also select the doclet in the report package panel, and then click **View Properties** to open the **Properties** dialog box.
3. Click **Inspect** in the Narrative Reporting ribbon to open the **Properties** dialog box.

4. In **Properties**, click the **Embedded Content** tab, , and then click the **Available Files** link.
5. On **Available Files**, click , and then on **Add Embedded Content File**, click .
6. Navigate to the Excel file to register as a reference file, select it, and click **Open**.

The **Add Embedded Content File** dialog box lists the content "registered" with the doclet in order to be made available for embedding. For example, in [Figure 1](#), the Excel file that was selected as a reference file contained three named ranges; therefore, these three named ranges can be registered as available content with the doclet.

Figure 17-26 The Add Embedded Content File Dialog Box Listing Available Content Items

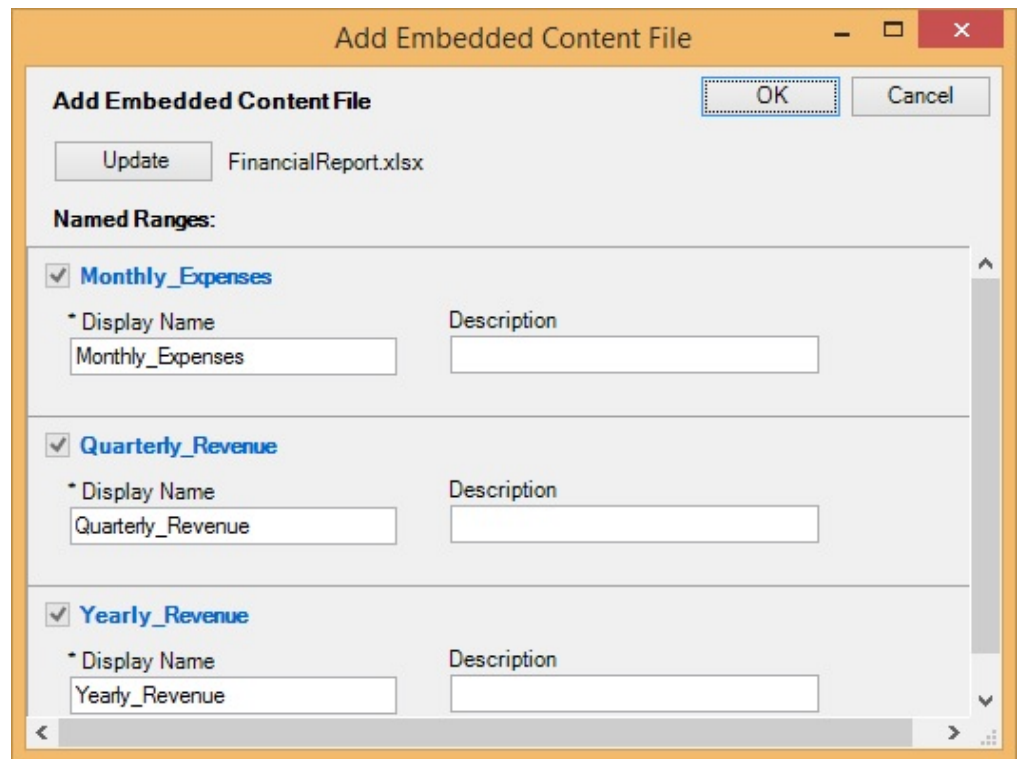

Remember, the available content is content that you specified as named ranges, as described in [Defining Named Ranges in Reference Files](#).

7. Click the range names that you want to make available for embedding in the doclet.

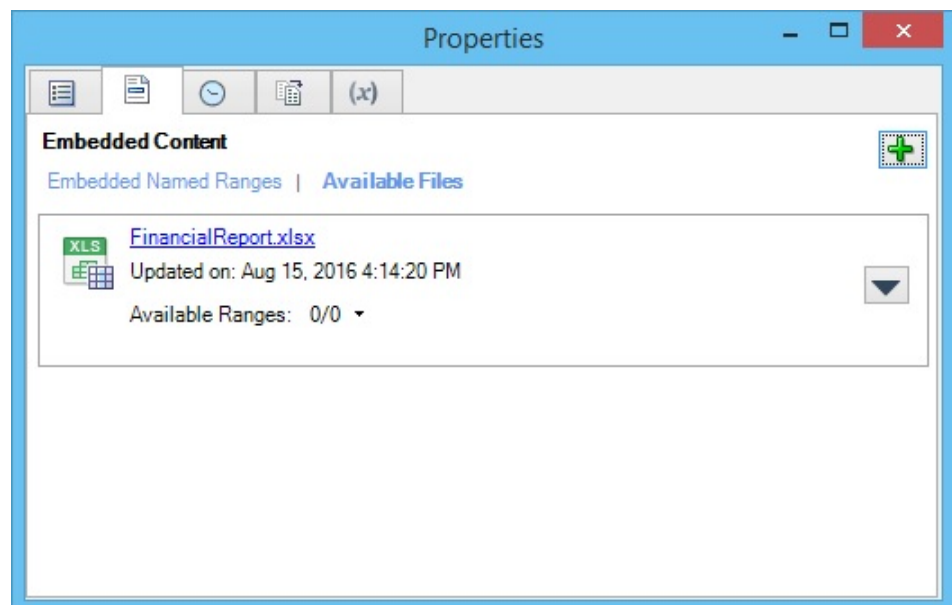

The check mark that appears next to the range name shows that the range is now registered with the doclet. For example, in [Figure 2](#), we selected all three available ranges to register them with the doclet.

Figure 17-27 The Add Embedded Content File Dialog Box After Registering Ranges

8. Click **Close** to close the **Add Embedded Content File** dialog box. You are returned to the **Embedded Contents** tab of the **Properties** dialog. The reference file is now registered with the doclet, as shown in

Figure 17-28 Properties Dialog, Embedded Content Tab, Showing Registered Reference File

Note that you can choose to embed content in the doclet at this point, from this dialog box. But this procedure is looking at registering content only. See [Embedding Reference File Content in a Doclet](#) for instructions on embedding available content from the registered reference file.

Embedding Reference File Content in a Doclet

In [Registering Reference Files with a Doclet](#), you registered named ranges from an Excel file that was outside of the report package, making that Excel file a reference file. The reference file can be located on a network drive or on your local machine.

Now we will embed content from the reference file into a doclet. The process is the same whether you are embedding content into a Word or a PowerPoint doclet.

To embed content from a reference file into a doclet:

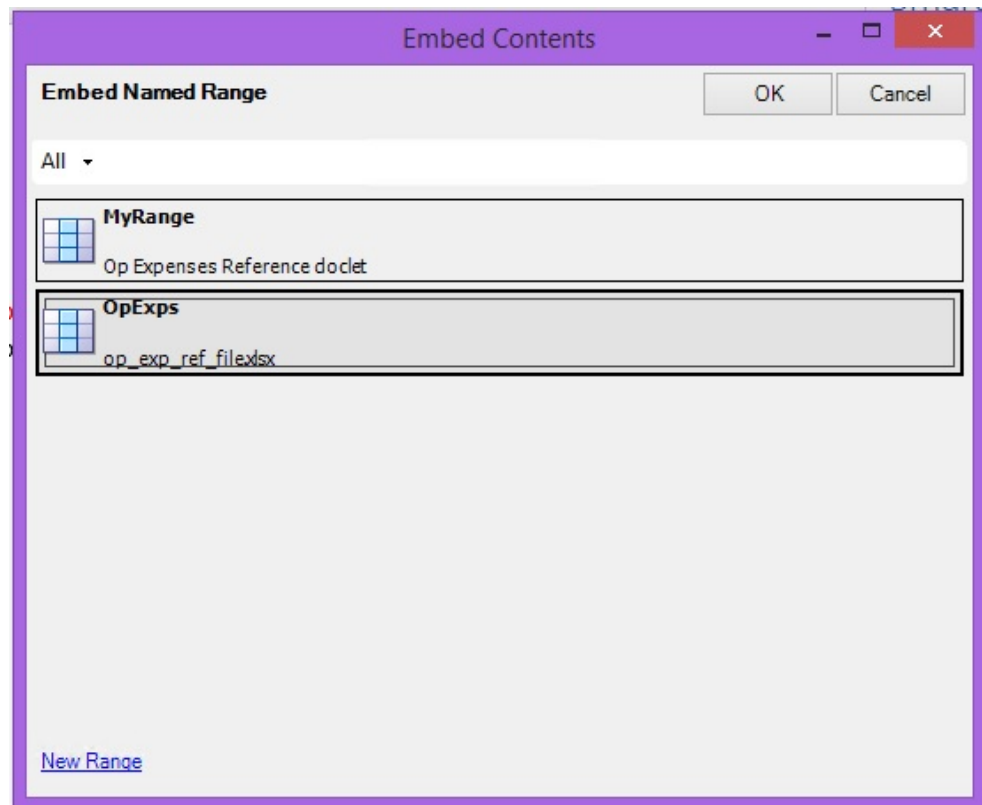

1. Ensure that the report package is opened.
2. If you have not done so already, open, and then check out the doclet to which you previously registered a reference file.

You must embed reference file content in the doclet to which you registered the content. You cannot embed the content into other doclets.

3. In the doclet, place your cursor at the point in the text where you want to embed the reference file content.
4. In the Narrative Reporting ribbon, click the **Embed** button to launch the **Embed Contents** dialog box.
5. In the **Embed Contents** dialog box, select the range to embed.

In [Figure 1](#)

Figure 17-29 Embed Contents Dialog Box, with a Range Selected

6. Click **OK** to embed the range into the doclet.

 **Note:**

In PowerPoint, you can relocate and resize the embedded content on the slide. Once resized, the revised height of the image on the slide is retained on refresh, and the refreshed image will have the same aspect ratio as the source object.

Figure 2 shows an Excel table embedded into a Word doclet under the heading, "Table 1. Operating Expenses."

Figure 17-30 Content from Reference File Embedded in Word Doclet**Operating Expenses**

Actual operating expenses were <insert data point here>, as compared to Plan operating expenses of <insert data point here>. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

Adding Content from Reference Files to Doclets

Now that you have defined named ranges in your reference file, you can define candidates for embedded content, and instantly embed content in your doclet. The process is the same whether you are adding content into a Word or a PowerPoint doclet.

To add content from a reference file to a doclet:

1. Open the report package
2. Open, and then check out the doclet.

Open the doclet to which you plan to add the reference file.

 **Note:**

You may want to position your cursor at the point where you want to insert the embedded content you will be defining and adding in this procedure.

3. In the Narrative Reporting ribbon, click the **Embed** button to launch the **Embed Contents** dialog box.

Figure 1 shows one named range available for embedding, sourced from a reference doclet.

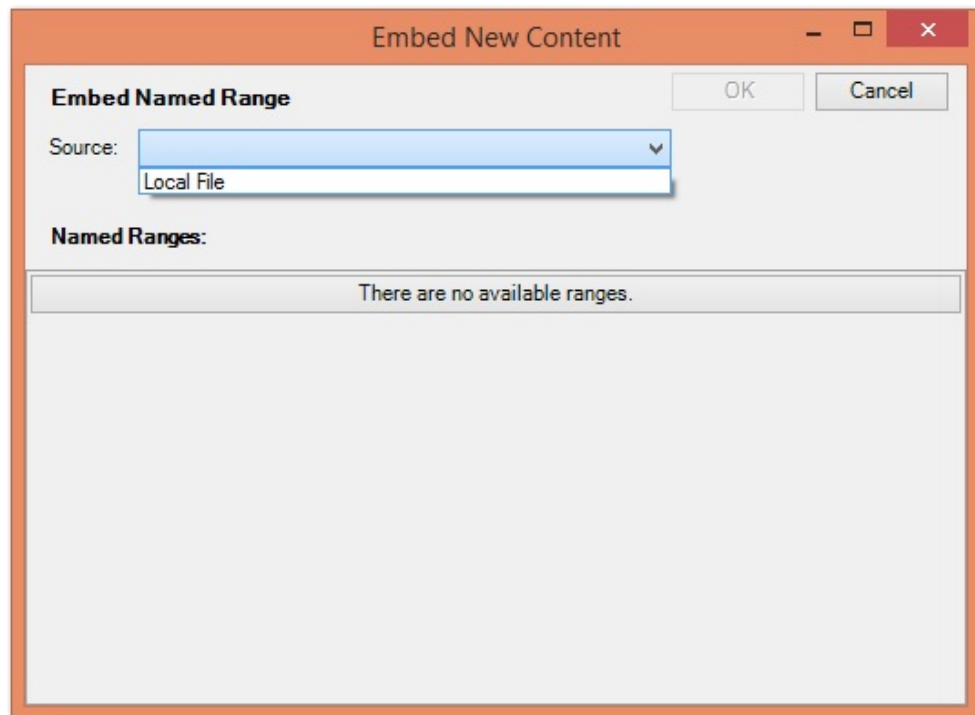

Figure 17-31 Embed Contents Dialog Box

4. Click **New Range** to launch the **Embed New Content** dialog box.
5. In **Embed New Content**, click the drop-down menu in **Source** and select **Local File**, as shown in [Figure 2](#).

If you have already added content from reference files, you will see the files listed in the **Source** drop-down menu.

Figure 17-32 Embed New Content Dialog Box

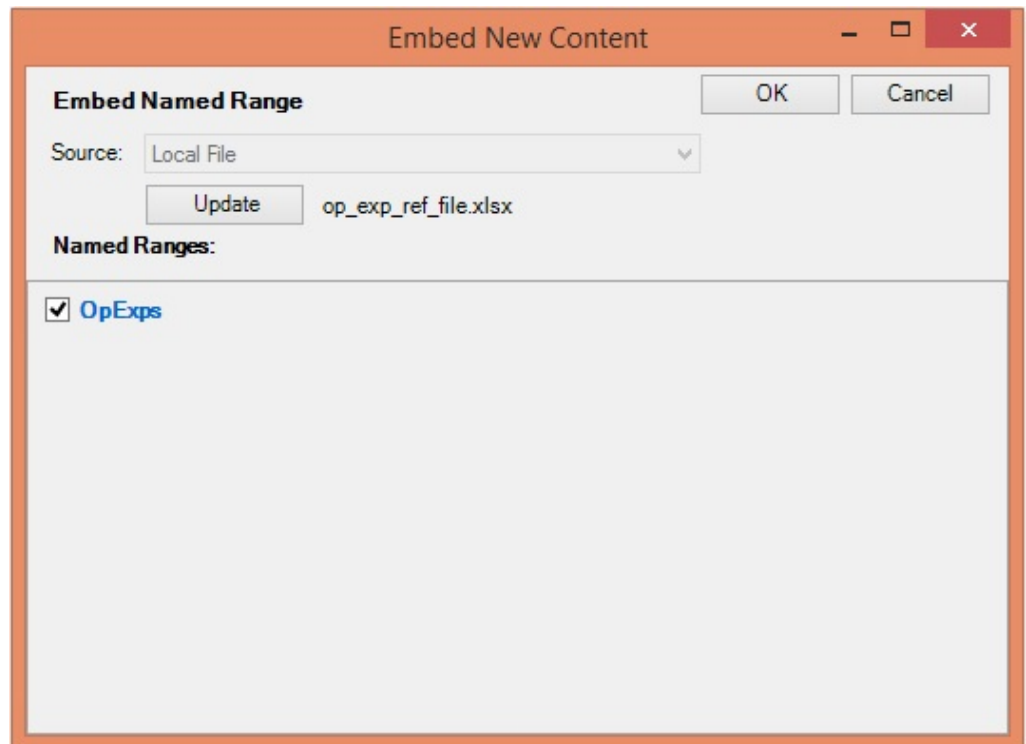

6. Click the **Choose File** button, browse to the location of the Excel file that you plan to use as a reference file, and then select the file.

The names ranges in the file are shown.

7. In the **Embed New Content** dialog box, select the check box next to the named ranges that you want to add as embeddable content.

In [Figure 3](#), there was one named range in the reference file, OpExps, and this range is selected.

Figure 17-33 Embed New Content Dialog Box with a Named Range Selected

8. Click **OK** to return to the **Embed Contents** dialog, and select the newly added range.

Figure 17-34 Embed Contents Dialog Box, with New Range Selected

9. Click **OK** to embed the range into the doclet.

The example in Figure 5 shows an Excel table embedded into a Word doclet under the heading, "Table 1. Operating Expenses."

Figure 17-35 Content from Reference File Embedded in Word Doclet

Operating Expenses

Actual operating expenses were <insert data point here>, as compared to Plan operating expenses of <insert data point here>. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

	Actual	Plan	Variance	Variance %
Total Compensation	\$64,845,803.24	\$115,166,742.59	\$50,320,939.35	43.69

Managing Named Ranges for a Reference File

As a doclet author, you can add or delete existing report content (named ranges) or rename a named range in a reference file. For example, as a doclet author, you can delete report content that is no longer in use.

To manage named ranges in a reference file:

1. Select and check out the doclet that contains the reference file you would like to modify.
2. Click **Inspect** in the Narrative Reporting ribbon to open the **Properties** dialog box.
3. In **Properties**, click the **Embedded Content** tab, , and then click the **Available Files** link.
4. To change the display name and description of named ranges in the reference file:
 - a. Click ▼ next to the reference file with the named ranges you want to work with, and select **Manage Report Content**.
 - b. In the **Manage Report Content** dialog, click on the reference file name link to expand it, and make any necessary changes to the **Display Name** and **Description** fields; then click **OK**.

5. To delete a reference file:
 - a. Click ▼ next to the reference file to delete, and select **Delete**.
 - b. At the prompt, click **Yes** to confirm the delete action.

Deleting the reference file means that any embedded content from that reference file remains in the doclet, but the links between the embedded content and the reference file is now broken. Any further changes you make to

the reference file will not be reflected in the embedded content in the doclet. For this reason, use care when deleting reference files.

6. When you are finished with managing named ranges and delete tasks, close the **Properties** dialog box, **Embedded Content** tab.
7. Upload and check in the doclet.

Updating Available Content in a Reference File

You may, as the reference file author, want to updating existing content in a reference file.

For example, you may need to refresh a profitability report table with new data. Any updates made in the reference file are automatically refreshed in the doclet that consumer the report content when the doclet is checked in.

To update content in a reference file:

1. Select and check out the doclet that contains the reference file you would like to modify.
2. Click **Inspect** in the Narrative Reporting ribbon to open the **Properties** dialog box.
3. In **Properties**, click the **Embedded Content** tab, , and then click the **Available Files** link.
4. Click ▼ next to the reference file with the content you want to work with, and select **Download**.

The file is downloaded by default your Downloads folder. You can close the **Properties** dialog in the doclet for now.

5. Open the file in Excel and make the changes you require, and then save the file.
6. Return to the report package and, in the Narrative Reporting ribbon, click **Inspect**, and in the **Properties** dialog, **Embedded Contents** tab, **Available Files**, click ▼ next to the reference file with the content you just modified with, and select **Upload**.
7. In the **Upload** dialog box, click **Choose File** and navigate to the location of the modified Excel reference file and select it, then click **Open**
8. Click **OK** to close the **Upload** dialog, and the close the **Properties** dialog.
9. To refresh the embedded content from the recently uploaded reference file, in the Narrative Reporting ribbon, select **Refresh**, and then **Refresh Embedded Content**.
10. Upload and check in the doclet.

Remapping Content within Reference Files

As a reference file author, you may find that the available content that you defined needs to be remapped to different report content within the file source. This may occur if the reference file was updated or a named range was renamed or deleted.

Additionally, remapping may be required if the wrong content was selected previously. You can remap the available content to other available content within the reference file.

 **Note:**

Prior to beginning this procedure, ensure that the author phase has been initiated.

To remap available content within a reference file:

1. Open the report package.
2. Open, and then check out the doclet which contains the reference file you want to update.

The impacted doclet is the doclet that is associated with a reference file in which you want to remap available content.

The doclet should open in Word or PowerPoint. If you opened the report package in Excel, Word or PowerPoint is launched when opening the impacted doclet.

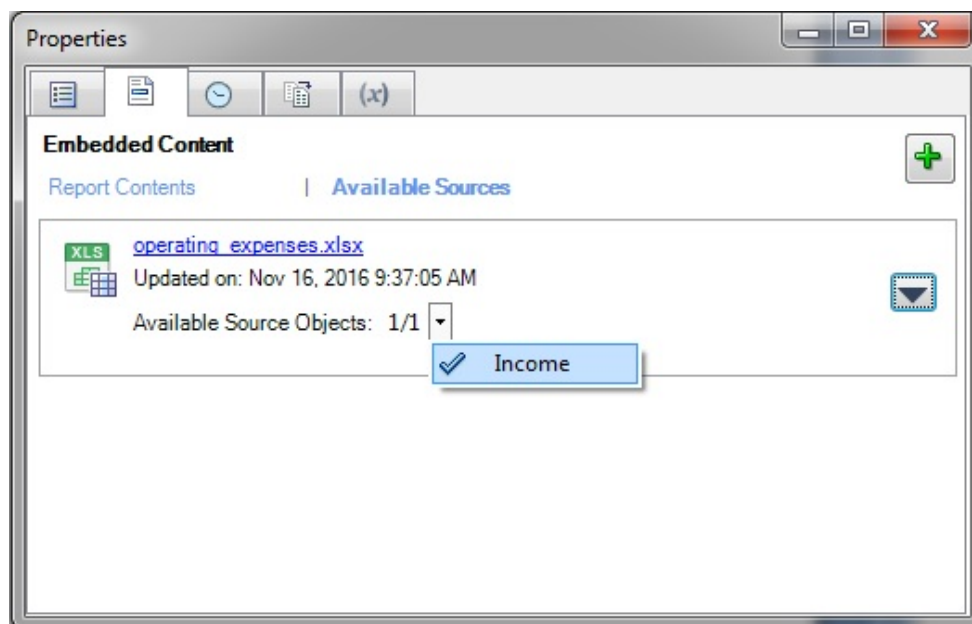

3. Click **Inspect** in the Narrative Reporting ribbon to launch the **Properties** dialog box.

Alternatively, with the doclet selected in the report package list, click the **View Properties** link to access the **Properties** dialog box.

4. Select  to display the **Embedded Content** tab of the **Properties** dialog.
5. In the **Embedded Content** tab, click the **Available Sources** link.

Note that you can view the available content in use by clicking on the arrow next to "Available Source Objects."

- Click  next to the content to remap and select **Remap** from the drop-down menu.

The **Remap** dialog is displayed.

- In the **Remap** dialog, click on the associated **Select** link for the reference file with content to remap.

A list of available content that is not already mapped is displayed. In the following illustration, the list contains one item, OpExp.

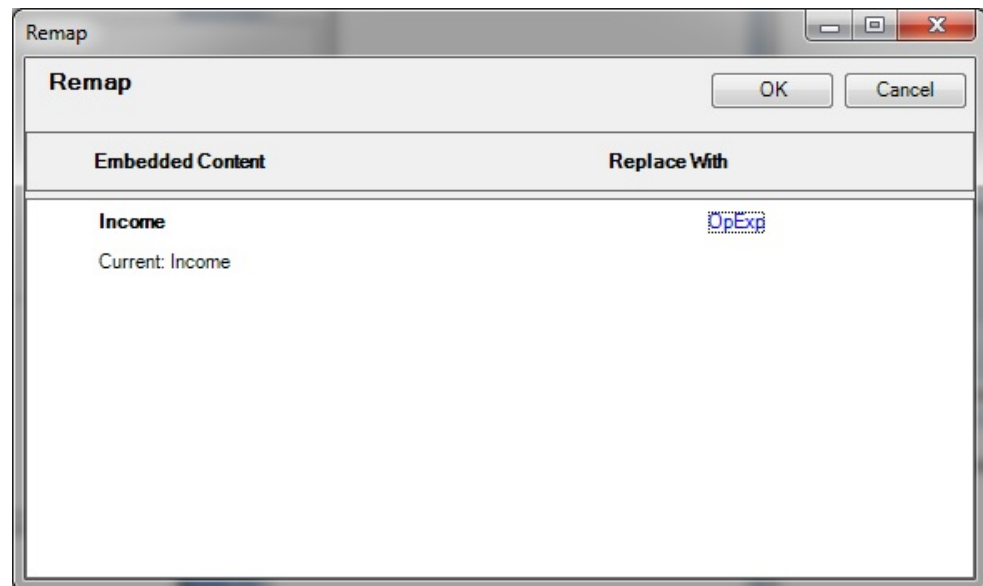

The "Current" item is mapped to the available content called Income. We want to remap to the content called OpExp.

- From the **Select** drop-down list, select an available content item to remap to.

After you make a selection, the range you chose is shown in the **Replace with** column.

In the following example, the OpExp range is now showing in the **Replace with** column.

9. Repeat [step 5](#) through [step 8](#) for each available content item that you want to remap.
10. When you're finished remapping content, click **OK** to close the **Remap** dialog, and then exit the **Properties** dialog.

Working with Variables

In a report package, variables provide centralized maintenance of common text, numbers and dates that are displayed in doclets throughout a report package. Variables can also be used to reference content between doclets, such as inserting Excel data from a reference doclet into a Word paragraph or PowerPoint text box.

[Tutorial video](#)

About Variables

Report package variables may be created using either Narrative Reporting on the web, or the Narrative Reporting extension for Oracle Smart View for Office. However, you can only define reference variable values in Smart View.

Once created, use Smart View to insert the variables into a doclet (in headers, tables, cells, or paragraphs).

Two types of variables are available:

- **Static** variables use static input that is defined by the user, such as date labels or a set value, which can be used throughout the report package. These static variables can be easily updated, and all doclet instances of the variable value reflect the change. The static variables help to centrally maintain common dates, numbers and text across the Report Package document content.

In the list of variables in the Smart View Panel, this icon, **(x)** represents static variables.

- **Reference** variables are created by referencing another doclet or reference file within the report package as the source, and selecting the value for the variable, such as text in a Word paragraph or an Excel cell value. Reference variables cannot be sourced from any PowerPoint content. If the source document is subsequently updated, those changes are automatically updated in the inserted instances of the variable in the report package. Reference variables can be used to insert Excel cell values into a Word or PowerPoint paragraph, or to create Excel formulas to implement cross-footing rules for increased data accuracy, or to create directional words for the report narrative, such as “an increase” or “a decrease”.

In the list of variables in the Smart View Panel, this icon, **(#)** represents reference variables.

Variables can be created by any report package owner or doclet author.

To view a list of all variables defined for a report package, first, open a report package. From the Report Package panel, change the drop-down from **Report Center** to **Variables**:

The list of available variables appears. You can view details such as variable type, the number of times the variable is used in the report package (the blue circle containing a number), and the source for reference variables, as shown in [Figure 1](#).

From the Variables panel, you can:

- Create a variable
- Edit a variable
- Select a variable to insert into a doclet
- Filter to view only static or reference variables
- Filter to view only those variables already in use in the report package

For report packages containing more than 50 variables, use these controls at the top of the panel to locate variables:

- Use the left and right arrows to navigate through the pages
- Use the page number drop-down list to jump to a specific page

Figure 17-36 List of Variables Defined for a Report Package

After the variable has been created, the variable is managed as follows:

- The report package owner can delete and edit all variables in the report package.
- A doclet author can only delete and edit variables that they created.
- For reference variables, any user with Write access to the source location of the variable value can update that variable value.

- Author users have Read access to variables that they did not create, so they can see a list of all variables and insert them into doclets to which they have Author access.

Creating Static Variables

A static variable is a string of text, such as a label or paragraph, which can be inserted into a report package doclet.

As an example, if you create a static variable for the current month called "CurrentMonth", you might enter the text, "August 2016". When you roll over to the report for the next month, it is a simple matter to update the text in the CurrentMonth variable to "September 2016," and the change is propagated to all instances of that variable throughout the report package.

The static variable can also be created and defined in the Narrative Reporting web interface; however, it must be inserted into the doclet using Oracle Smart View for Office.

Note:

Before you begin, ensure that you have opened a report package, and opened and checked out a doclet.

To create a static variable:

1. Open a report package, and in the drop-down list in the Report Package panel, select **Variables**

2. In the Report Package panel, click **Create New Variable**, **+**, and then select **Static Variable** from the drop-down list.

The report package panel displays **Create Static Variable**, where you enter the variable name and value, and an optional description:

The screenshot shows a software interface for managing report packages. At the top, it says 'Report Package' with a home icon and navigation arrows. Below that, 'Department Reports' is shown as 'In Progress'. A dropdown menu shows '(x) Variables'. Underneath, there's a 'Variables' section with navigation arrows, a counter '1', and a plus sign with a gear icon. The main part of the dialog is titled 'Create Static Variable' and contains three text input fields: 'Name', 'Description', and 'Value'. At the bottom right of the dialog are a green checkmark and a red 'X' button.

3. Define the variable as follows:
 - a. Enter a **Name** for the variable.
The name must be unique across variables within the report package, and should be descriptive of the variable to make it easier to find.
 - b. **Optional:** Enter a **Description** for the variable.
 - c. In the **Value** field, enter the text for the static variable.
 - Static variables can have a maximum size of 255 characters.
 - The text string can be a label or paragraph, and the entire string will be displayed as entered in the report package.

In the following example, the user created a static variable with the Name of "CurrentMonth", a Description of "The current month and year for the report", and a Value of "August 2016". This variable can be inserted in multiple locations showing the date of the current month in different usages, as shown below:

This screenshot shows the 'Create Static Variable' dialog box filled with example data. The 'Name' field contains 'CurrentMonth', the 'Description' field contains 'The current month and year for the report.', and the 'Value' field contains 'August 2016'. The dialog has a green checkmark and a red 'X' button at the bottom right.

This variable can be inserted in multiple locations showing the date of the current month in different usages; for example:

- Insert the static variable into the text displayed in an internal Operating Expenses doclet that reads "For the month of <<CurrentMonth>>".
- Insert the static variable into a paragraph in footnote of any of the doclets that reads: "During <CurrentMonth>>,"

The next month, to update all instances of the Current Month date in the report package, modify the variable value to use the new month; for example, September 2016. This option ensures that the change is implemented uniformly, and no incorrect dates for the value remain.

4. Click the **OK** button, .

To cancel creating the variable, click the Cancel button, .

5. Insert the variable into a doclet, following the procedure in [Inserting Variables in a Doclet](#).

Creating Reference Variables

Reference variables enable you to reference a source in another document (doclet or reference file) within the report package, such as a single Excel cell or selected Word text, and use them as reference variable value sources in your report package doclet. You can then insert the reference variable into one or more doclets. When the reference variable source value is updated, all inserted instances of the variable are automatically updated.

Note:

- Images and shapes are not supported as reference variable values.
- Reference variable values cannot be sourced from other reference variables.
- Reference variable values cannot be sourced from embedded content, where a range from an Excel reference doclet is embedded in Word or PowerPoint.
- Reference variable values sourced in Excel can have a maximum size of 255 characters.
- Reference variable values sourced in Word can have a maximum size of 2,000 characters. Reference variable values sourced in Word cannot be inserted into Excel if the number of characters is greater than 255.
- Reference variable values must be single line only. In an Excel spreadsheet, select only one cell. In Word, select text from only one line or one table cell.
- Reference variables cannot be sourced from any PowerPoint content.

For example, use Excel formulas in Oracle Smart View for Office to generate reference variable values:

- Use an IF function to return a string of "increase" or "decrease," or "above" or "below", if a data value increases or decreases between the current and prior period. Insert the Excel-based directional word variable or results into a Word paragraph.

```
=IF(B8<0,"below","above")
```
- Use an IF function, or simple subtraction, to compare the occurrence of a data value (such as "Revenues" or "Summary Income Statement") that is displayed multiple times throughout a report package.

```
'Summary Income Statement'!B4
```
- Use Excel formulas to calculate the variance or variance percent of changing data values from period to period, and insert that variance into a Word paragraph.

```
'Summary Income Statement'!B4-'Summary Income Statement'!C4
```

If the value source is updated, each instance of the variable will reflect the current information when the variable is updated in Smart View.

The name and description of the reference variable can also be created in the Narrative Reporting web interface; however, you must add the variable source and value in Smart View, and the variable must be inserted into the doclet using Smart View.

 **Note:**

Before you begin, ensure that you have opened a report package, and opened and checked out a doclet.

To create a reference variable:

1. Open a report package, and then open and check out a Word doclet, a Word doclet that contains a reference file, or an Excel reference doclet.

You can just open a report package to create a reference variable, without checking out a doclet, and define the reference variable name and description; but the doclet needs to be checked out to define a source value from the doclet as the reference variable value.

2. In the doclet or reference file, select the Excel cell or Word text or table cell to reference in your new reference variable.

For example, in the following grid, cell **B13** is selected. The value in cell, including the data source POV, is the value for our new reference variable.

	A	B	C	D	E
1		Fiscal Calendar	Entities	Total Segments	Currencies
2		Actual	Plan	Variance	Variance %
3	Total Compensation	\$ 64,845,803.24	\$ 115,166,742.59	\$ 50,320,939.35	43.69
4	Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.65
5	General Supplies	3,674,837.98	6,258,357.17	2,583,519.19	41.28
6	Telecommunications	6,378,561.45	11,057,528.97	4,678,967.53	42.31
7	Equipment Maintenance	14,993,537.06	26,272,058.13	11,278,521.07	42.93
8	Fees Outside Services	100,996,742.28	180,334,457.05	79,337,714.77	43.99
9	Employee HR	6,634,968.62	11,428,589.57	4,793,620.94	41.94
10	Facilities Exp	13,031,228.94	22,994,537.25	9,963,308.31	43.33
11	Utilities	2,159,896.85	3,820,238.43	1,660,341.58	43.46
12	Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.80
13	Operating Expenses	\$ 235,370,183.29	\$ 417,326,387.97	\$ 181,956,204.68	43.60

 **Note:**

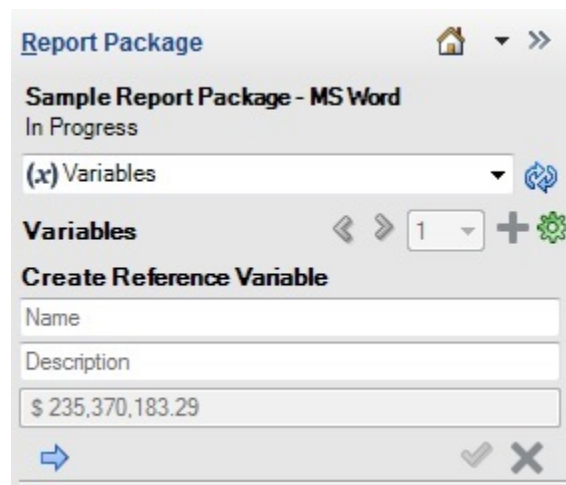

You can always change the reference variable value later.

3. In the drop-down list in the Report Package panel, select **Variables**.

4. In the Report Package panel, click the **Create New Variable** button, , and then select **Reference Variable** from the drop-down list.

The report package panel displays **Create Reference Variable**, where you enter the variable name and value, and an optional description. As you can see, the value is already pre-populated with the value we selected in step 2

5. Define the reference variable as follows:
 - a. Enter a **Name** for the reference variable.
The name must be unique across all variables within the report package, and should be descriptive of the variable to make it easier to find.
 - b. **Optional:** Enter a **Description** for the reference variable.
 - c. Click  to use the value of the currently selected cell as the reference value.
Optionally, you can select another cell on the sheet, verify that the value is changed in the Value field, and click .
6. Click the **OK** button, , to add the variable to the report package.
7. Upload and check in the doclet or reference file for the variable value to be added to the system.

 **Note:**

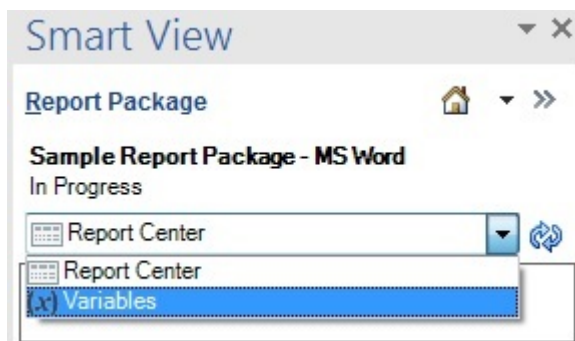

If the doclet or reference file is not checked in, the value will continue to be displayed in the variables panel as `Not Committed` for the current doclet and other doclets in Smart View. In the Narrative Reporting web interface, the value is displayed as `#Missing`.

Inserting Variables in a Doclet

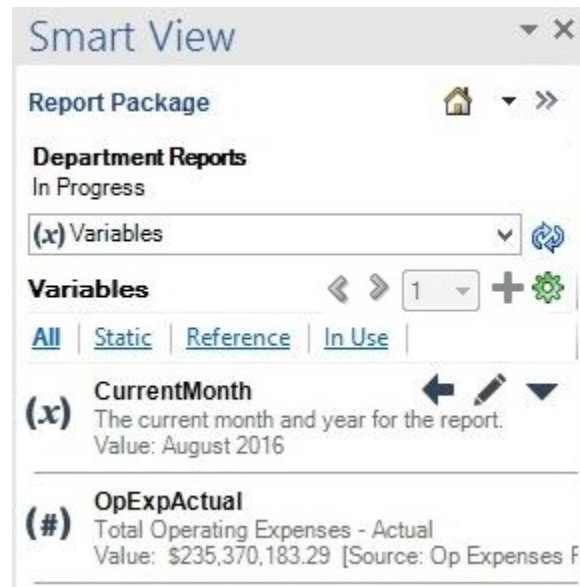

After static and reference variables are created and checked in, they are ready for authors to use in Word or PowerPoint doclets in headers, tables, cells, or paragraphs, or in Excel doclet cells.

To insert a variable into a doclet:

1. Open a report package, and then open and check out a doclet.
2. In the drop-down list in the Report Package panel, select **Variables**.

Once you select **Variables**, the list of available variables are displayed in the Smart View Panel. [Figure 1](#) shows a short list of variables. See [Figure 1](#) for another example list of variables in a report package.

Figure 17-37 Example List of Variables Available for a Report Package

3. In the doclet, select the point where you want to insert the variable.
4. From the list of variables, select the variable to insert.

When you select a variable in the list, three menu options for the variable are displayed, as shown in [Figure 1](#).

5. Click  to insert the variable at the selected point in the doclet.

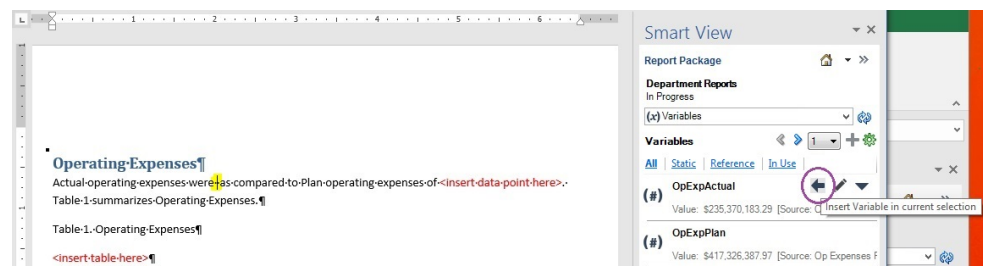

The example in [Figure 2](#) shows a portion of a Word doclet with the variable insertion point highlighted in yellow. The Insert Variable button, , is circled and the button tooltip text is displayed.

Figure 17-38 Word Doclet with Variable Insertion Point Highlighted

The example in [Figure 3](#) shows the result of inserting a static variable for the current month, defined as August 2016, into a Word doclet. Also, the figure \$235,370,180.29, shown in the paragraph text is actually a previously-inserted reference variable.

Figure 17-39 Word Doclet Showing the Result of Inserting a Static Variable for Current Month

▪ **Operating Expenses**
 Actual operating expenses for August 2016 were \$235,370,183.29, as compared to Plan operating expenses of <insert data point here>. Table 1 summarizes Operating Expenses.

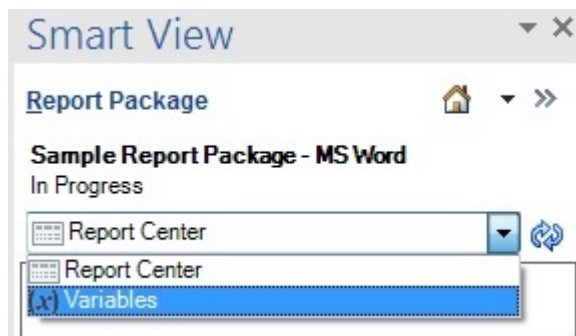

6. When finished inserting variables into the current doclet, upload and check in the doclet.
7. Repeat the steps in this procedure for each doclet that requires that you insert static and reference variables.

Editing Variables

Once created, you can easily edit static and reference variables in Oracle Smart View for Office.

To edit variables:

1. Open a report package.
 - If you plan to edit a static variable, you do not need to check out any doclets.
 - If you plan to edit a reference variable, open and check out the Word or Excel reference doclet or reference file from which the reference variable is sourced.
2. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

3. Select a variable and click the **Edit** button, .

The **Edit** button, , displays whenever you select a variable from the list.

In the following illustration, the CurrentMonth variable, a static variable, is selected.

After you click , the **Name**, **Description**, and **Value** fields are displayed. Here is an example of a static variable that is ready to edit:

Edit Static Variable ▼

CurrentMonth
The current month and year for the report.
August 2016

✔ ✕

4. Perform an action:

- To modify a static variable, type over the existing entries in the **Name**, **Description**, or **Value** fields as required, and then click .

The static variable is updated as soon as you click .
- To modify a reference variable:
 - a. Ensure that you have opened and checked out the reference doclet or reference file from which the reference variable is sourced.
 - b. Type over the existing entries in the **Name** and **Description** fields, as required.
 - c. To change the **Value** field, select the text in a Word doclet or the appropriate cell in the Excel reference doclet, and then click .

When editing a reference variable, remember these guidelines:

- Images and shapes are not supported as reference variable values.
- Reference variable values cannot be sourced from other reference variables.

- Reference variable values cannot be sourced from embedded content, where a range from an Excel reference doclet is embedded in Word or PowerPoint.
 - Reference variable values can contain only 255 characters.
 - Reference variable values must be single line only. In an Excel spreadsheet, select only one cell. In Word, select text from only one line or one table cell.
 - Reference variables cannot be sourced from any PowerPoint content.
- d. After you have finished editing the reference variables for the checked-out doclet or reference file, upload the source document and check it in.
- Once the doclets or reference files are checked in, the variables with their updated values are available to other report package authors.
5. Repeat the preceding steps for all variables that require editing.

Filtering Variables

For easier viewing, you can filter the list of a variables in a report package. The default filter is All, meaning all variables, static and reference, are displayed in the variables list.

Filtering categories are:

- All
- Static
- Reference
- In Use

To filter variables:

1. Open a report package, and then open a doclet.
You do not need to check out a doclet in order to filter variables.
2. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

3. Choose a filtering option by clicking the links at the top of the variable list:

- **All**—Displays all variable types, static and reference.
- **Static**—Displays only static variables.
- **Reference**—Displays only reference variables
- **In Use**—Displays only those variables that are in use in the currently-opened doclet.

To help to locate the variables in use in the current doclet, you may choose the highlight option on individual variables, as described in [Highlighting Variables in Doclets](#)

Highlighting Variables in Doclets

You can quickly view the instances of a variable in a doclet using the Highlight command for the selected variable.

To highlight a variable in a doclet:

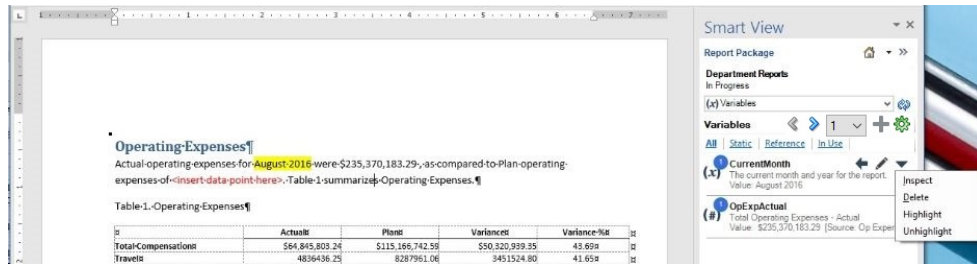

1. Open a report package, and then open a doclet.
You do not need to check out a doclet in order to highlight variables.
2. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

3. Select a variable from the list in the Smart View Panel.
4. Click the **Options** button, ▼ and, from the drop-down menu, select **Highlight**.

In [Figure 1](#), the CurrentMonth variable, a static variable, is selected in the Smart View Panel. After selecting **Highlight**, the CurrentMonth variable is highlighted in the doclet at the left.

Figure 17-40 Doclet with Highlighting Enabled for a Selected Variable

- To unhighlight the selected variable, click the **Options** button, ▼ and, from the drop-down menu, select **Unhighlight**.

Inspecting Variables

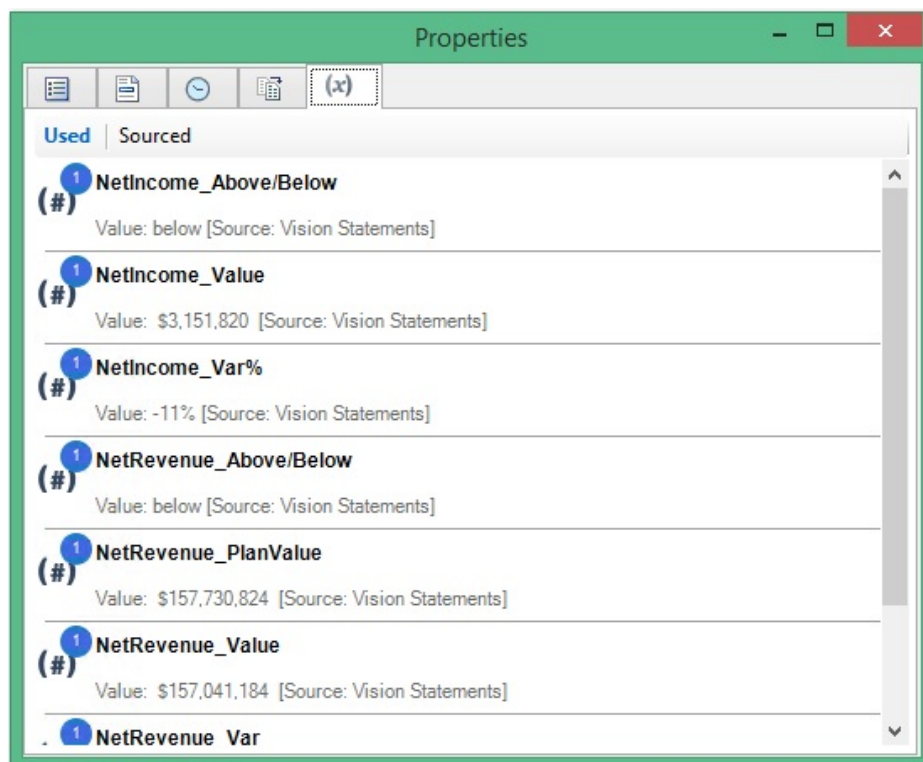

You can inspect for variables at the doclet level, or you can inspect individual variables selected from the variables list.

To inspect for variables:

- To inspect for variables in a doclet:
 - Open a report package, select a doclet, and, optionally, open it.
You can inspect for variables without opening the doclet.
 - In the report package panel, click **View Properties** to open the **Properties** dialog box.
If you opened a doclet, you can also click **Inspect** in Narrative Reporting ribbon to open the **Properties** dialog box.

- In the **Properties** dialog box, select the **Variables** tab, 

The **Variables** tab shows you the variables available in a doclet. The blue circle next to a variable contains the number of times that variable is in use in the doclet. For example, here is the variables tab from a doclet in a report package:

- d. Click the **X** in the top right corner to close the **Properties** dialog box.
2. To view the properties of an individual variable:
 - a. Open a report package, and then open a doclet.
You do not need to check out a doclet in order to highlight variables.
 - b. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

- c. Select a variable from the list in the Smart View Panel.
- d. Click the **Options** button, ▼ and, from the drop-down menu, select **Inspect**.
The **Properties** dialog box for the selected variable is displayed.

The Properties tab shows you basic information about the variable, including whether it is a static or reference variable. It also shows you the number of

times the variable is used in the report package. Following are the example properties of a static and a reference variable.

- e. Select the **History** tab,  to view who made changes to the variable, and what changes were made.
- f. Click the **X** in the top right corner to close the **Properties** dialog box.

Unlinking Reference Variables

Unlinking applies to reference variables only. When you unlink a reference variable, Narrative Reporting removes the association between the reference variable value and the source value in the doclet, and sets the value to #Missing.

To unlink a variable:

1. Open a report package, and then open and check out a doclet.
2. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

3. In the Smart View Panel, select the reference variable to unlink from the list and click the **Edit Variable** button, .

The **Edit Variable** button, , displays whenever you select a variable from the list.

4. In the variable editing area, click the **Unlink** button, .

A warning message is displayed to advise that the selected variable will be permanently removed from the doclet.

Though the variable values in the selected doclet are no longer managed by Narrative Reporting, the #Missing text remains in the doclet. If required, manually remove the #Missing text from the doclet.

5. Repeat the preceding steps for any other variables that you want to unlink.
6. When finished, upload check in the doclet.

Deleting Variables

You can delete variables from the report package.

To delete a variable from a report package:

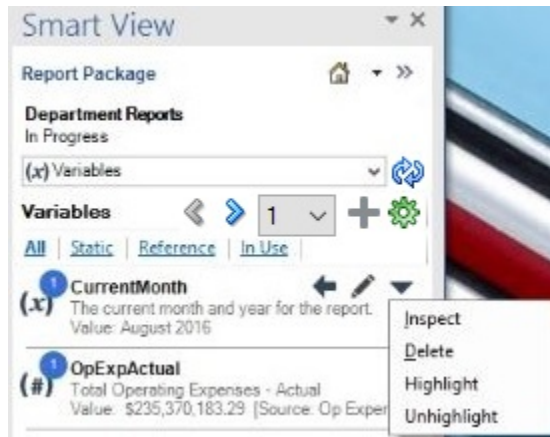

1. Open the report package from which you want to delete a variable.
2. In the drop-down list in the Report Package panel, select **Variables**.

The list of variables available in the report package is displayed in the panel.

3. Ensure that the variable is no longer used in the report package.

- Click the **Options** button, ▼ and, from the drop-down menu, select **Delete**.

A warning message is displayed, asking you to confirm the delete action.

- Click **Yes** in the warning message to permanently delete the variable.

Although the variable is removed from the listing on the variables list, the variable text is not automatically removed from the doclets. If required, you must search for each instance of the variable text in the doclets and manually delete it.

Note:

To reinstate a variable, you must re-create it, and then add the variable to all previously used locations.

Working with Excel Doclets in PDF-based Report Packages

In PDF-based report packages, you can specify Excel workbooks as regular doclets. Authors and administrators can edit the content in Excel doclets and select sheets that will become part of the final report package.

To work with Excel doclets in PDF-based report packages:

- In the PDF-based report package, open and check out the Excel doclet to work with.
- In the Narrative Reporting ribbon, click **Select Sheets**:

- In the **Select Sheets** dialog, use the check boxes to select the sheets to include in the final report package.

Alternatively, you can select the **All sheets selected** check box.

In [Figure 1](#), the **Select Sheets** dialog shows six worksheets available in the Excel doclet; however, only one, "World Wide," is selected for inclusion in the report package.

Figure 17-41 Select Sheets Dialog Showing One Sheet Selected for Inclusion in the Report Package

4. Edit the sheets in the doclet as you require.
For example, you can perform ad hoc analysis or apply formatting.
5. When finished editing the Excel doclet, [upload](#) and [check it in](#).

Working with Server-Initiated Refresh

Related Topics

- [About Server-Initiated Refresh](#)
- [Creating and Editing Data Source Connections](#)
- [Selecting Sheets for Server-Initiated Refresh](#)
- [Initiating Refresh from Narrative Reporting Web](#)
- [Guidelines for Working with Server-Initiated Refresh](#)

About Server-Initiated Refresh

With server-initiated refresh, you can easily refresh the Oracle Smart View for Office data queries in all of the Excel-based doclets and reference doclets within a report package using the Refresh options in the Narrative Reporting web application.

In Smart View, you specify which Excel doclets and reference doclets to refresh. You can choose all sheets within a workbook or select only the sheets you require. From the Narrative Reporting web application, you select to refresh data from all defined data sources or selected data sources.

Only one Narrative Reporting data source is allowed per report package. You can also source refreshable data queries from these Oracle Enterprise Performance Management Cloud data sources:

- Planning
- Planning Modules
- Financial Consolidation and Close
- Tax Reporting

Administrators set up data sources in the **Data Sources** folder in Narrative Reporting.

For more guidelines and requirements, see the topics in [Guidelines for Working with Server-Initiated Refresh](#):

- [Enabling Server-Initiated Refresh](#)
- [Requirements](#)
- [Workbook Size Limit](#)
- [Grid Design Considerations and Guidelines](#)
- [Supported and Unsupported Grid Types](#)
- [Workbook Use Case Scenarios](#)

For information on using server-initiated refresh, see:

- [Selecting Sheets for Server-Initiated Refresh](#)
- [Initiating Refresh from Narrative Reporting Web](#)

Creating and Editing Data Source Connections

In Narrative Reporting web, administrators define data sources for all data queries in all of the Excel-based doclets and reference doclets that will be used with server-initiated refresh.

Oracle Smart View for Office locates the URLs used for each data query on each sheet that users have selected for server refresh, and maps the URLs to the corresponding data sources defined in the **Data Sources** folder in Narrative Reporting. If the data source is not defined in Narrative Reporting web, then the content in Smart View will be ignored (not refreshed)

To create a data source connection in Narrative Reporting:

1. From the **Data Sources** folder in the Library, click **+**, and select **Data Source**.
2. In **Data Source Name**, enter a descriptive identifier for the data source, such as a combination of the source product, server, and application or database.
3. In **Type**, select the type of data source.

Currently, only the "Oracle Enterprise Performance Management Cloud" source is supported, which includes these business processes:

- Planning

- Financial Consolidation and Close
 - Tax Reporting
4. In **Server Name**, enter the only data source server name, including the HTTPS protocol.

For example, for Planning, if the data source URL is:

```
https://<servername>/HyperionPlanning
```

Then the server name is:

```
<servername>
```

5. In **Identity Domain**, enter the identity domain of the data source environment.
6. Enter the administrator user ID and password.

 **Note:**

You must log in to Narrative Reporting with the administrator credentials for the data source that you want to create a connection to. For example, if your Planning Modules administrator is **PlanAdmin**, you must log in to Narrative Reporting with the **PlanAdmin** credentials to create a data source connection to the Planning Modules data source. Enter User ID and Password credentials used for native authentication at the source. Single Sign-on with Identity Assertion technologies is not supported.

7. Click **Test Connection**.
8. After a successful connection, you can browse and select the application and cube by selecting ▼ for application name and cube name.

After selecting a cube, click on  to preview the dimension list.

9. **Optional:** To edit a data source connection, select the connection and then select **Edit** from the **Actions** menu. When you edit a connection, you can change the connection name, server, application and cube name.

 **Note:**

- You do not need to specify the data source server protocol (for example, `https://`) in the **Server Name** field.
- Changing the connection name does not affect any report objects that use the connection.
- Changing the server, application, or application or cube names causes any report objects that use the connection to point to the new destination.
- For security purposes, you must re-enter the administrator credentials when editing a data source.

Selecting Sheets for Server-Initiated Refresh

In Oracle Smart View for Office, you select sheets to be recalculated and refreshed during server-initiated refresh. You can include sheets from Excel doclets and Excel reference doclets.

To select sheets to include in server-initiated refresh:

1. If you haven't already done so, open your report package.
2. Open and check out the Excel doclet or Excel reference doclet that contains sheets that you want to include in server-initiated refresh.

 **Tip:**

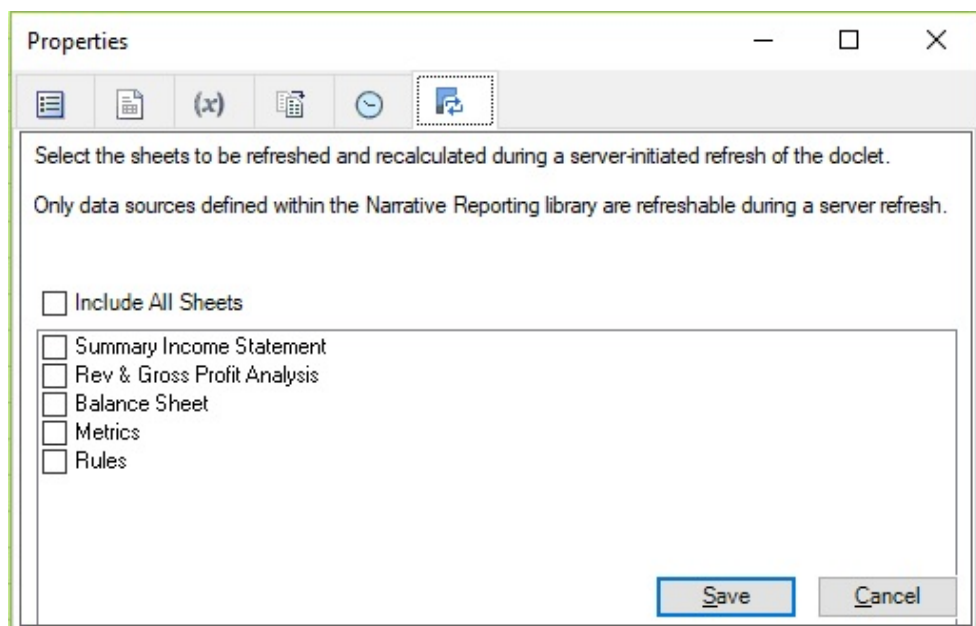

You must check out the doclet before you can select sheets.

3. Click **Inspect** in the Narrative Reporting ribbon to launch the **Properties** dialog box.

4. In the **Properties** dialog, select the **Opt In** tab.
By default, no sheets in the workbook are selected.

Figure 17-42 Initial Launch of Properties Dialog - Opt In Tab; No Sheets Selected

 **Note:**

The **Opt In** tab is visible only if your administrator has enabled server-initiated refresh in your service.

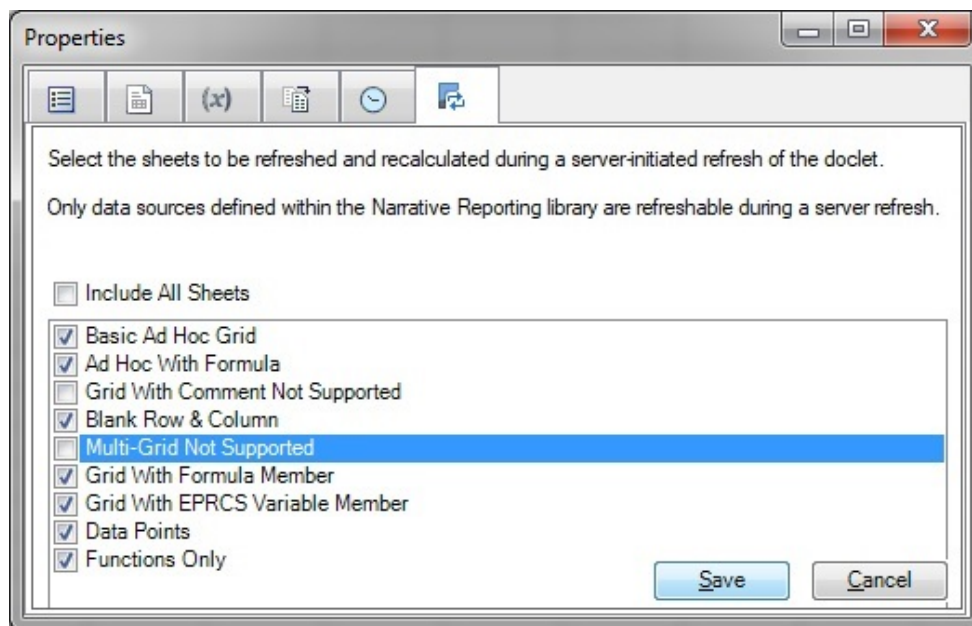

5. Perform an action to select sheets in the workbook for inclusion in server-initiated refresh of the doclet:
 - Select **Include All Sheets**
 - Select only the specific sheets you require

 **Note:**

The Excel doclet or reference doclet workbook must not exceed 3 megabytes in size. If the workbook exceeds 3 megabytes in size, all check boxes in the **Opt In** tab are disabled.

In the example below, two sheets that contain unsupported grid layouts are not selected for refresh:

Figure 17-43 Example Opt In Tab with Specific Sheets Selected for Server-Initiated Refresh

6. In the **Properties** dialog, click **Save**.
7. Upload and check in the doclet by selecting **Check In**, and then **Upload and Check In**.

The sheets you selected are now available for refresh the next time you access the report package in the Narrative Reporting web interface.

8. Repeat this procedure for any other applicable Excel doclets or Excel reference doclets in your report package.
9. To perform the server-initiated refresh on the selected doclets and sheets, go to the Narrative Reporting web interface.

Use the **Refresh** options on the **Actions** menu to choose whether to refresh all selected doclets, or choose to refresh doclets from a selected data source. See [Initiating Refresh from Narrative Reporting Web](#) for more information.

Initiating Refresh from Narrative Reporting Web

To refresh Excel-based doclets and reference doclets from the Narrative Reporting web interface:

1. Open the report package in the Narrative Reporting web interface.

Note:

For instructions on accessing report packages in the Library, see [Using the Library](#).

2. From the top right **Actions** menu, select **Refresh**, and then select **All** or select a data source from the drop-down list.

You can also refresh individual Excel-based doclets and reference doclet in Narrative Reporting.

Select an Excel-based doclet or reference doclet, click the arrow for the doclet, then select **Refresh**, and then select **All** or select a data source from the drop-down list.

Guidelines for Working with Server-Initiated Refresh

Related Topics

- [Enabling Server-Initiated Refresh](#)
- [Requirements](#)
- [Data Sources](#)
- [Workbook Size Limit](#)
- [Grid Design Considerations and Guidelines](#)
- [Supported and Unsupported Grid Types](#)

- [Workbook Use Case Scenarios](#)

Enabling Server-Initiated Refresh

Server-initiated refresh is enabled in the Narrative Reporting web application by default.

Requirements

To use the server-initiated refresh feature, the following components are required:

- Oracle Smart View for Office 11.1.2.5.810+
- Narrative Reporting extension for Smart View 19.04+
- Oracle Enterprise Performance Management Cloud 19.07+

Once enabled, the server-initiated refresh options appear in the Narrative Reporting web interface. In Smart View, once connected to the enabled service, the **Opt In** tab is available in the **Properties** dialog, where you specify sheets to refresh.

Data Sources

Administrators set up data sources in the **Data Sources** folder in Narrative Reporting. See [Creating and Editing Data Source Connections](#).

Workbook Size Limit

The Excel doclet or reference doclet workbook must not exceed 3 megabytes in size. If the workbook exceeds 3 megabytes in size, all check boxes in the **Opt In** tab of **Properties** dialog are disabled.

Grid Design Considerations and Guidelines

In order for server side refresh to work properly, certain considerations need to be designed in to your workbook. You may need to redesign or rebuild to fit these considerations.

Keep in mind the following considerations and guidelines when designing your grids:

- Lay out worksheet elements as follows:
 - Data query (ad hoc grid or form) is at the top of the sheet.
 - Formulas, functions, and comment cells are placed below the data query area, unless member or data cells that are part of the query reference a formula or function.
- The server-initiated refresh only recalculates and refreshes sheets containing Smart View content from the supported EPM Cloud sources.

From the Narrative Reporting web, you will not be able to select on-premises data sources for refresh, even if you selected an on-premises sheet in Smart View. On-premises data source content and non-Smart View content will be skipped.
- Report package variables may be inserted into the query POV directly or through a formula that references a cell location in the same sheet or in a different sheet within the workbook.
- HsGetValue functions, function grids, and dynamic data points must be created using Smart View 11.1.2.5.900 or later and refreshed once to save the connection information. Otherwise, the server-initiated refresh will not be able to evaluate the

functions, function grids, or data points and a #No Connection message will be returned.

If you're not using Smart View version 11.1.2.5.900 or later, then HsGetValue functions, function grids, and dynamic data points should not be included on selected sheets.

Grid Design Limitations

Keep in mind the following limitations when designing your grids:

- Do not include external formula references on sheets selected for refresh.
For example, do not include references to formulas in other network or local locations.
- VBA functions are not executed.
- User-defined macros are not executed.
- When a refresh is initiated, cell styles defined in the workbook are preserved.
During server-initiated refresh, only the latest data values are refreshed. Existing Smart View cell styles are preserved, and no cell styles modifications are made during the server-initiated refresh.

Supported and Unsupported Grid Types

This section contains descriptions and illustrations of supported and unsupported grid types. Consider the supported grid types when designing grids in your reference doclets.

Basic Ad Hoc Grid

In the example below, the sheet contains only a basic ad hoc grid. There are no formulas, functions, pasted data points, referenced cells, or other Smart View or Excel elements on the sheet.

Supported by: EPM Cloud, Narrative Reporting

	A	B	C	D	E	F
1		Years	Scenarios	Entities	Total Segments	Currencies
2		Income Statement	Balance Sheet	Statistics	Accounts	
3	Quarter1	33834533.78	-0.06	#Missing	33834533.78	
4	Quarter2	24743297.74	-0.03	#Missing	24743297.74	
5	Quarter3	3063752.89	#Missing	#Missing	3063752.89	
6	Quarter4	#Missing	#Missing	#Missing	#Missing	
7	Fiscal Calendar	61641584.41	#Missing	#Missing	61641584.41	

Ad Hoc Grid with Formula

You can place formula cell outside of the grid. In the example below, cell B9 contains a formula.

Supported by: EPM Cloud, Narrative Reporting

B9 : X ✓ fx =SUM(B3:B7)						
	A	B	C	D	E	F
1		Years	Scenarios	Entities	Total Segments	Currencies
2		Income Statement	Balance Sheet	Statistics	Accounts	
3	Quarter1	33834533.78	-0.06	#Missing	33834533.78	
4	Quarter2	24743297.74	-0.03	#Missing	24743297.74	
5	Quarter3	3063752.89	#Missing	#Missing	3063752.89	
6	Quarter4	#Missing	#Missing	#Missing	#Missing	
7	Fiscal Calendar	61641584.41	#Missing	#Missing	61641584.41	
8						
9		123283168.83				

Ad Hoc Grid with Comment

You can place text comments in cells outside of the grid. In the example below, cell A9 contains a formula.

Supported by: EPM Cloud

	A	B	C	D	E	F
1		Years	Scenarios	Entities	Total Segments	Currencies
2		Income Statement	Balance Sheet	Statistics	Accounts	
3	Quarter1	33834533.78	-0.06	#Missing	33834533.78	
4	Quarter2	24743297.74	-0.03	#Missing	24743297.74	
5	Quarter3	3063752.89	#Missing	#Missing	3063752.89	
6	Quarter4	#Missing	#Missing	#Missing	#Missing	
7	Fiscal Calendar	61641584.41	#Missing	#Missing	61641584.41	
8						
9	Comment					

Ad Hoc Grid with Blank Rows and Columns

You may use blank rows and columns with a grid.

Form-only Sheet

Supported by: EPM Cloud

- Sheet 2: Narrative Reporting data query
- Sheet 3: Oracle Hyperion Financial Management data query (on-premises data source)
- Sheet 4: No data query
- Sheet 5: Planning data query

Scenario 1—No sheets are selected for server-initiated refresh and recalculation

Upon inspection of the workbook, there should not be any data sources shown as refreshable as nothing has been selected.

From the server side, this is a non-refreshable doclet.

Scenario 2—Only Sheet 1 is selected

Upon inspection of the workbook, the only refreshable data source is Planning.

From the server side, only Planning is shown as a refreshable data source.

Upon refresh, only Sheet 1 will be refreshed and recalculated. Sheet 5, which is also an Planning sheet, would not be refreshed or recalculated.

Scenario 3—Sheets 1 and 2 are selected

Upon inspection of the workbook, the refreshable data sources are Planning and Narrative Reporting.

From the server side, both Planning and Narrative Reporting are shown as refreshable data sources.

Upon refresh, only Sheets 1 and 2 are refreshed and recalculated. Sheet 5 which is also an Planning sheet, is not refreshed or recalculated.

Scenario 4—Sheets 1, 2, and 3 are selected

Upon inspection of the workbook, the refreshable data sources are Planning and Narrative Reporting.

From the server side, both Planning and Narrative Reporting are as refreshable data sources.

Upon refresh, Sheets 1 and 2 are refreshed and recalculated. Sheet 3 is recalculated but the Financial Management query is not impacted. Sheet 5, which is also an Planning sheet, was not selected so it is not refreshed or recalculated.

Scenario 5—Sheet 1, 2, 3, and 4 are selected

Upon inspection of the workbook, the refreshable data sources are Planning and Narrative Reporting.

From the server side, both Planning and Narrative Reporting are shown as a refreshable data sources.

Upon refresh, Sheets 1 and 2 are refreshed and recalculated. Sheet 3 will be recalculated but the Financial Management query is not impacted. Sheet 4 is recalculated. Sheet 5, which is also an Planning sheet, is not refreshed or recalculated.

Scenario 6—All sheets selected

Upon inspection of the workbook, the refreshable data sources are Planning and Narrative Reporting.

From the server side, both Planning and Narrative Reporting are shown as refreshable data sources.

Upon refresh, Sheets 1, 2, and 5 are refreshed and recalculated. Sheet 3 is recalculated but the Financial Management query is not impacted. Sheet 4 is recalculated.

Scenario 7 – Sheets 3 and/or 4 are selected

Upon inspection of the workbook, there should not be any refreshable data sources returned to the server as the selected sheets do not contain any refreshable data sources.

From the server side, this is a non-refreshable doclet.

Inserting Links and Cross-References to Pages in Doclets

Use Microsoft Word bookmarks to link to and cross-reference page numbers in your doclet. You can cross-reference bookmarks as page numbers in a table of contents doclet, whether you inserted the cross-references manually or inserted a manual table of contents and edited the cross-references. If the page number containing the bookmark changes, then the page number cross-references also change.

This topic describes inserting the bookmarks and then the cross-references. The procedures can also be used to edit a manual table contents.

Inserting Bookmarks

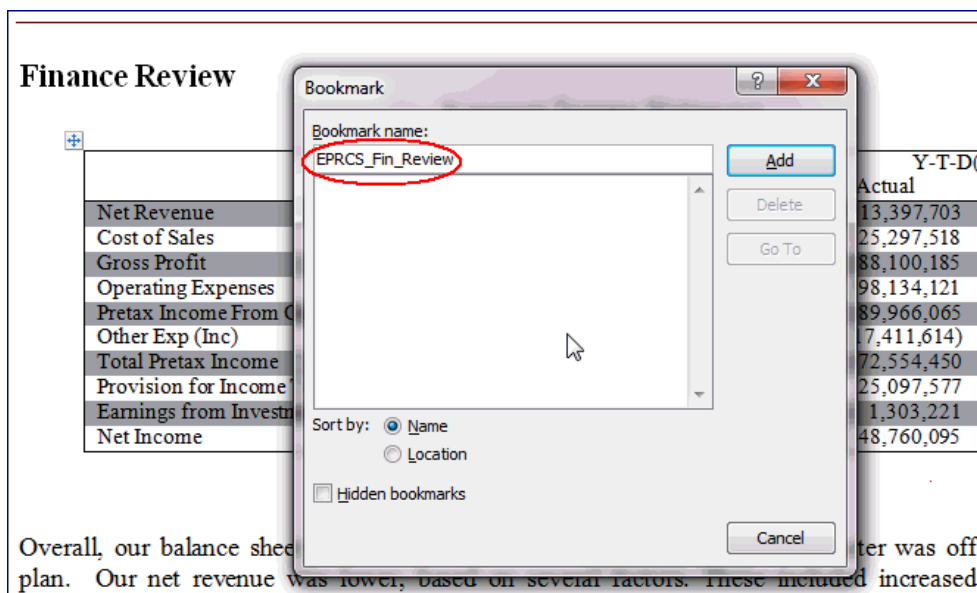

Before you add a cross-reference or a link, you must insert a bookmark at the location that you want to link to.

To insert a bookmark:

1. In a Word document, place your cursor at the location of the bookmark.

2. In the **Insert** ribbon, select .
3. In **Bookmark Name**, enter `EPRCS_` and a bookmark identifier. For example, `EPRCS_Fin_Review`.

4. Click **Add**.

The bookmark is created.

Inserting Page Number Cross-References or Links in Doclets

After you create the target bookmark, you can insert a page number cross-reference or a link to that bookmark in the document that you want to link from.

To insert page number cross-references:

1. In the document to link from, place the cursor where you want the cross-reference. In this example, we will add a page number cross-reference in the table of contents.

Table of Contents

Item	Page
Income Analysis	
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

2. Press **Ctrl+F9** to insert field brackets. Ensure that the insertion point stays between the brackets.

Table of Contents

Item	Page
Income Analysis	{ }
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

3. Enter `pageref`, followed by a space and then the bookmark name. For example, `pageref EPRCS_Fin_Review`.

Table of Contents

Item	Page
Income Analysis	{ pageref EPRCS_Fin_Review }
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

4. Upload and check the source and target doclets back into the report package.
5. On the **Preview** tab, select **Actions**, and then **Download Preview** to see the page cross-reference.
6. In the downloaded report package preview in Word, you must refresh the page reference field to reflect the page number.

 **Note:**

Word may display 'Error! Bookmark not defined'.

Table of Contents

Item	Page
Income Analysis	Error! Bookmark not defined.
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

7. Press **F9** to refresh the field information.

 **Note:**

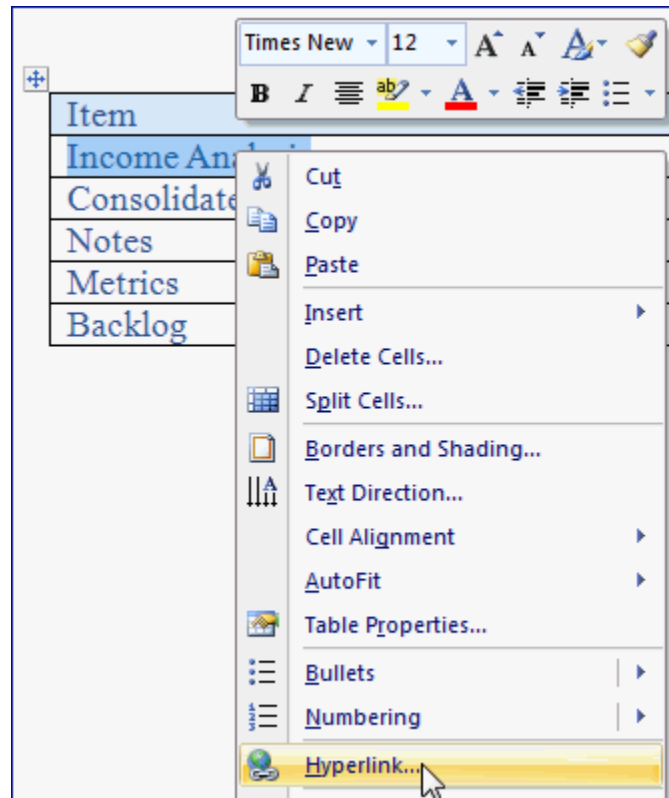

The field is updated to reflect the page number in the report package where you inserted the bookmark in the doclet.

Table of Contents

Item	Page
Income Analysis	2
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

To insert links:

1. Highlight the text to add the link to, and then right-click and select **Hyperlink**.

2. In the **Insert Hyperlink** dialog box, for **Address**, enter #, followed by the bookmark name. For example, #EPRCS_Fin_Review.

3. The link is added to the text that you selected. In this example, the link was added to the **Income Analysis** text.

Table of Contents

Item	Page
Income Analysis	
Consolidated Balance Sheet	
Notes	
Metrics	
Backlog	

4. Upload and check the doclet back into the report package.
5. On the **Preview** tab, select **Actions**, and then **Download Preview** to see the link.
6. Click the link to navigate to the bookmark location.

Vision Corporation Quarterly Report to the Board

Finance Review

Net Income	\$ 3,151,820	\$ 3,507,946	\$ 47,456,874	\$ 48,841,908

Table 1.1

Overall, our balance sheet performance for the most recently completed quarter was off from our operating plan. Our net revenue was lower, based on several factors. These included increased competition, lower average selling prices and aggressive negotiations from our vendors.

Working with Management Reports in Smart View

Related Topics

- [About Working with Management Reports in Smart View](#)
- [Importing Management Reports as Ad Hoc Queries](#)

About Working with Management Reports in Smart View

Management Reporting is a cloud-based reporting solution for creating Oracle Enterprise Performance Management Cloud financial and managerial reports. These reports enable users to insert charts and grids from multiple EPM Cloud sources, such as Planning and Oracle Analytics Cloud - Essbase, into a single report.

Management Report grids are tables that contain data from external data source connections. Administrators add grids to Management Reports, defining the dimension layout, selecting members, and then formatting the grid. Using text, dimensions, members, and formulas, administrators define the grid content.

In Oracle Smart View for Office for Excel, Narrative Reporting users can import the Management Report grids as ad hoc grids, and then perform supported ad hoc operations on the grids, directly against the data source, such as pivoting and member selection. The grids can be saved and then used as sources for embedded content in report package doclets.

Note:

For more information on Management Reporting, see [Designing with Management Reporting for Narrative Reporting](#), available on the Oracle Help Center, Narrative Reporting page, **Books** tab.

Importing Management Reports as Ad Hoc Queries

You can import Management Reports in to Oracle Smart View for Office as ad hoc queries, on which you can then further perform available ad hoc operations. The ad hoc grids you create can be saved and used as embedded content in your report package doclets.

Note:

Before you begin, launch Smart View in Excel and log in to Narrative Reporting.

To import a Management Report in to Smart View as an ad hoc query:

1. In Narrative Reporting Home, select **Library**.
2. Navigate to the **Narrative Reporting** node, then the **Library** node, and then the **Reports** folder.

All management reports available on the Narrative Reporting instance can be accessed from the **Reports** folder. Alternatively, if management reports are stored in a user-defined folder, you can navigate to that folder.

3. Expand a Management Report to view the available grids, and then select a grid.
4. In the Action Panel, click the **Import as ad hoc query** link.

Alternatively, right-click the grid and select **Import as ad hoc query**.

The Management Report grid is rendered as an ad hoc query in Smart View. The Narrative Reporting Ad Hoc ribbon and POV toolbar are displayed.

Note:

Formatting that is displayed when the report is viewed in the Narrative Reporting web application is not available when the grid is imported in to Smart View.

Additionally, Management Report grid text and formula rows and columns are not imported into Excel; only data is imported.

5. Perform ad hoc operations as required.

For example, you can:

- Zoom in on members
- If available, click the **POV** button in the data provider ad hoc ribbon to display or hide the POV toolbar
- Pivot POV dimensions or members to the grid
- Use **Member Selection** to change the grid point-of-view

See [Performing Ad Hoc Analysis with Narrative Reporting Data](#) for more information.

- Optional:** To view properties for a management report or individual grid, select the management report or grid in the tree, and then, in the Action Panel, select **Properties**.

Alternatively, right-click a management report or grid and select **Properties**.

- If you selected a management report, then the **Report Properties** dialog is displayed. You can view, among other details, the management report name, location, and description, and the report modification history.
- If you selected a grid, then the **Grid Properties** dialog is displayed. You can view the grid name, alias table used, the row and column dimensions, and the POV dimensions.

Working with an Automatic Table of Contents

When you insert a Microsoft Word table of contents into a doclet, you can choose either a manual, automatic, or custom type. For manual types, you can create page number links by using links and cross-references or by inserting a manual table of contents (see [Inserting Links and Cross-References to Pages in Doclets](#)). For automatic or custom types, the table of contents is updated whenever the doclet is merged into the report package. For example, preview the report package or the section that contains the table of contents to view the dynamically updated table of contents.

Note:

If you preview only the doclet that contains the table of contents, no entries are displayed in the table. You must preview the report package or the section that contains the doclet to see the updated table of contents.

Note:

Automatic and custom tables of contents are available for Microsoft Word report packages only.

Approving or Rejecting Doclets

This topic applies to Office-based doclets of all types—regular, reference, and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

As approver, you review and approve doclets after the author submits them. You also have access to the same functionality as the author, including:

- [Check Out](#)
- [Download and Update](#)
- [Upload](#)
- [Check In](#)

- [Inspect](#)

See:

- [Approving Doclets](#)
- [Rejecting Doclets](#)

Watch this tutorial video to learn about approving and rejecting doclets in Word-based report packages.

Watch this tutorial video to learn about approving and rejecting doclets in PowerPoint-based report packages.

[Tutorial video](#)

Approving Doclets

This topic applies to Office-based doclets of all types—regular, reference, and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

As approver, if you are satisfied that the doclet is correct, you approve it to complete it. If multiple approvals are required, you, as approver, submit the doclet for further approvals. After approval, authors can no longer check out the doclet, although they can still download and inspect it.

To approve a doclet, reference doclet, or Office-based supplemental doclet:

1. If not already open, in the Smart View Panel, navigate to the doclet and double-click it to open it.

Note:

In the Report Center, a green arrow, , signifies doclets that require your attention as approver.

2. In the Narrative Reporting ribbon, click **Approve**.

Approve

In the Smart View Panel, the approved doclet appears in the doclet responsibilities list with a green check mark:

If a doclet requires multiple levels of approval, the approved artifact appears in the doclet responsibilities list with the rubber stamp icon:

When a doclet is approved by all approvers, its status is updated to **Approved** in the Narrative Reporting web interface; the green check mark is displayed with the doclet in Oracle Smart View for Office.

Rejecting Doclets

This topic applies to Office-based doclets of all types, including reference and supplemental. Unless otherwise noted, the term *doclets* refers to all Office-based doclet types.

If a doclet is not ready for approval, you can either edit it yourself (check out the doclet, modify it, and check in the corrected version), or you can reject it to send it back to the author to edit.

To reject a doclet, reference doclet, or supplemental doclet:

1. If not already open, in the Smart View Panel, navigate to the doclet and double-click it to open it.
2. In the Narrative Reporting ribbon, click **Reject**.

When a doclet is rejected, its status is updated to **Rejected**, and the responsibility reverts to the author. The author must update the content and resubmit it for approval.

In the Smart View Panel, the rejected doclet appears in the doclet responsibilities list with a red X:

Inspecting Doclets

This topic applies to Office-based and non-Office-based doclets of all types, including reference and supplemental, and of all supported file formats.

For detailed information on doclets, reference doclets, and supplemental doclets, click **Inspect** in the Narrative Reporting ribbon.

The **Inspect** button launches the **Properties** dialog box.

From the **Properties** dialog box, you can also download previous versions of a doclet, reference doclet-, or Office-based supplemental doclet.

 **Note:**

All steps in the following procedure are optional.

To view information about a doclet, reference doclet, or supplemental doclet:

1. If the report package is not already open, in the Smart View Panel, navigate to the report package and open it.
2. Select a doclet, reference doclet, or supplemental doclet in the list and click the **Inspect** button in the Narrative Reporting ribbon.
3. In the **Properties** dialog box, view the information the **Properties** tab (the default tab).

The **Properties** tab displays basic information about the doclet, such as the file name, doclet type, and the user who created it.

Figure 17-44 Properties for a Doclet

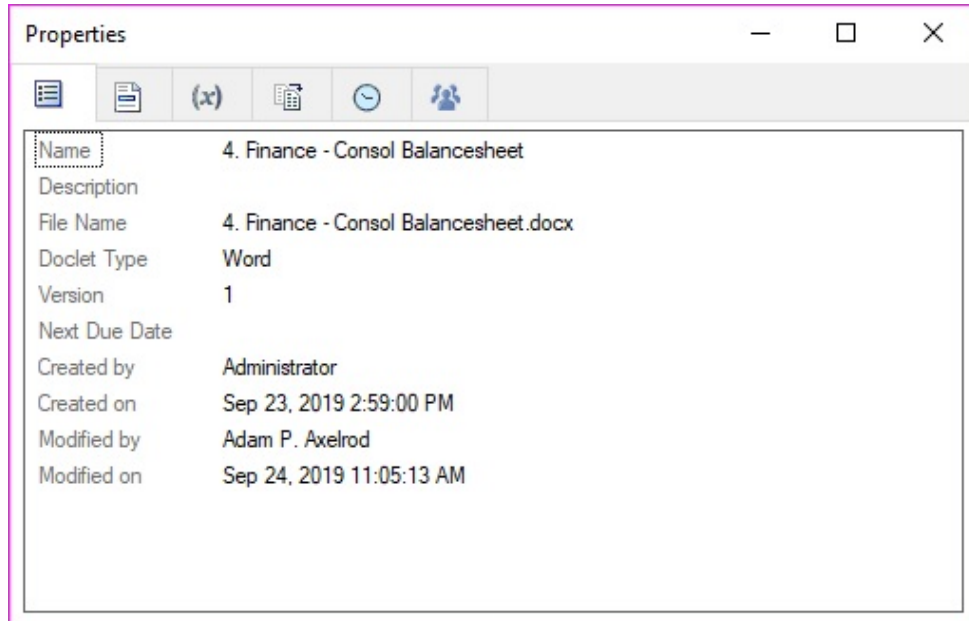

Figure 17-45 Properties for a Reference Doclet

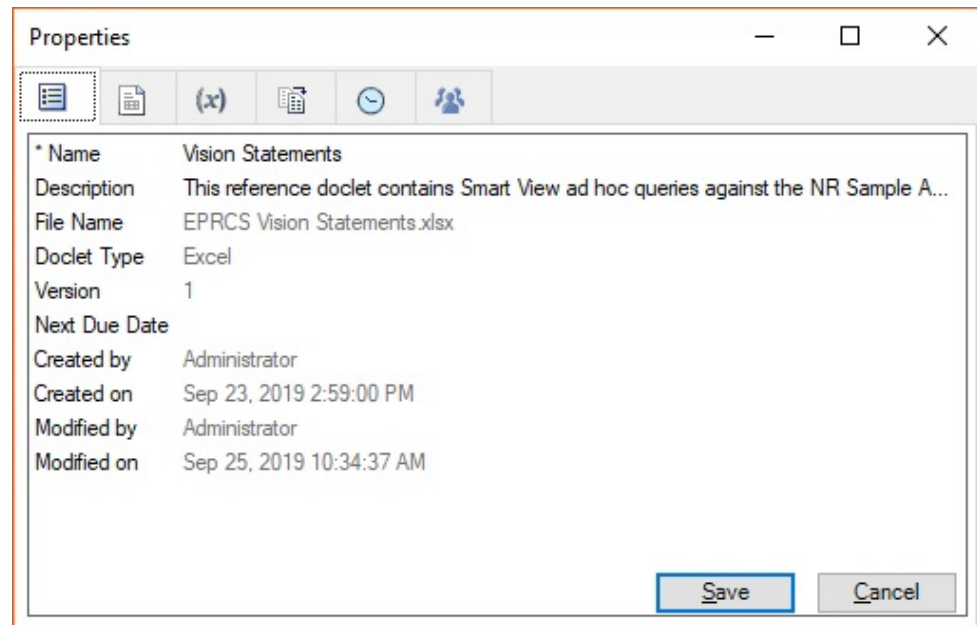

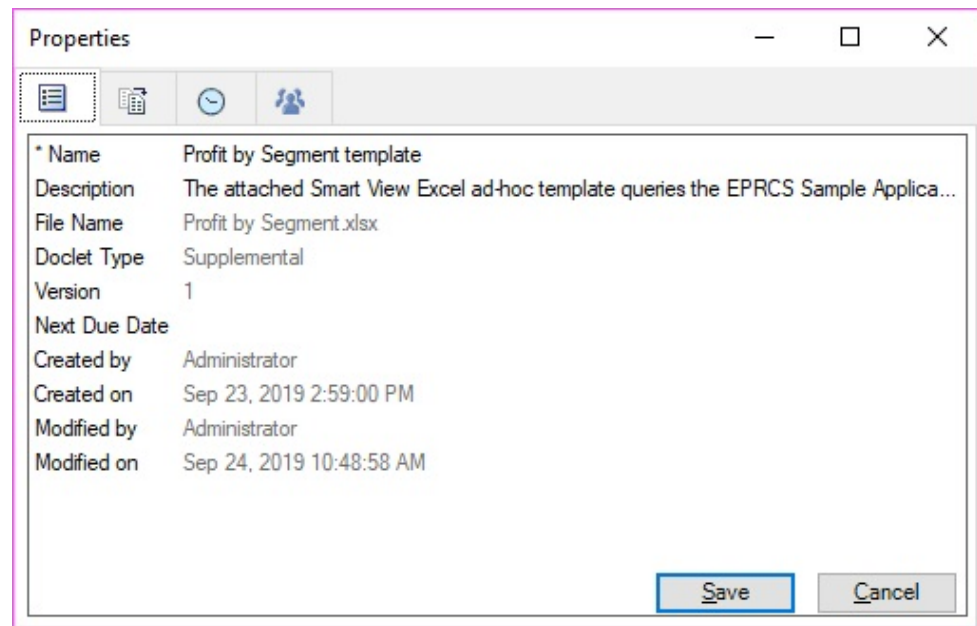

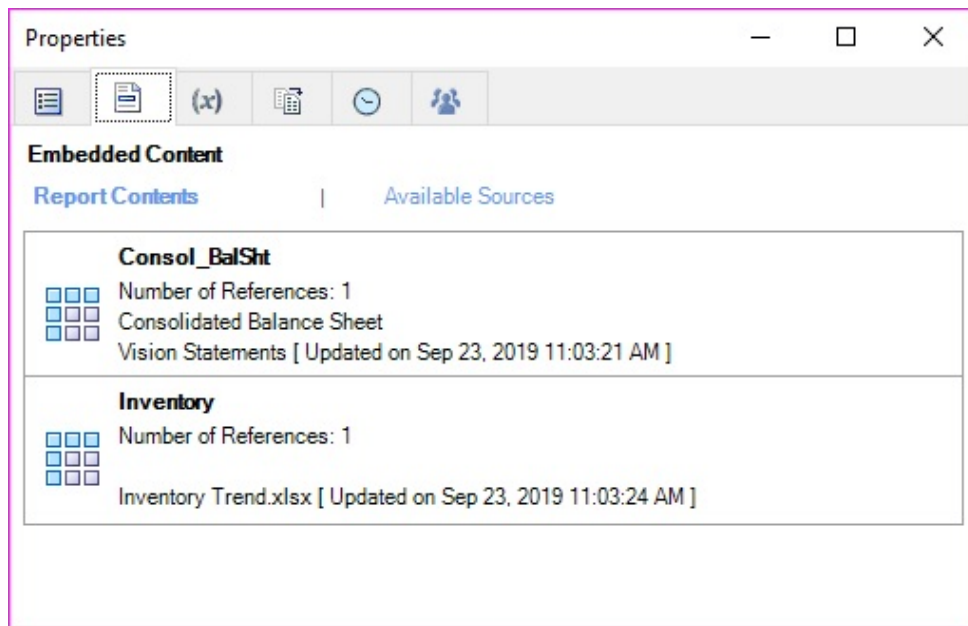

Figure 17-46 Properties for a Supplemental Doclet

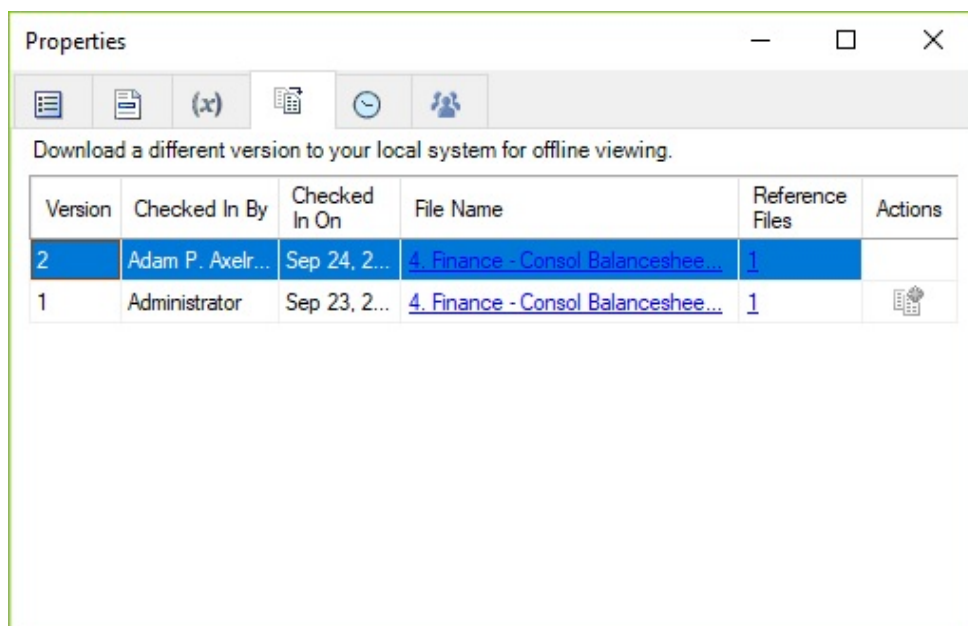

4. Click the **Embedded Content** tab, , to view a list of the embedded content that is being used in the doclet.

5. Click the **Version** tab, , to download previous versions of Office-based doclets.

As new versions of doclets are checked in, the previous versions are stored so that you can download and view them to see what changed.

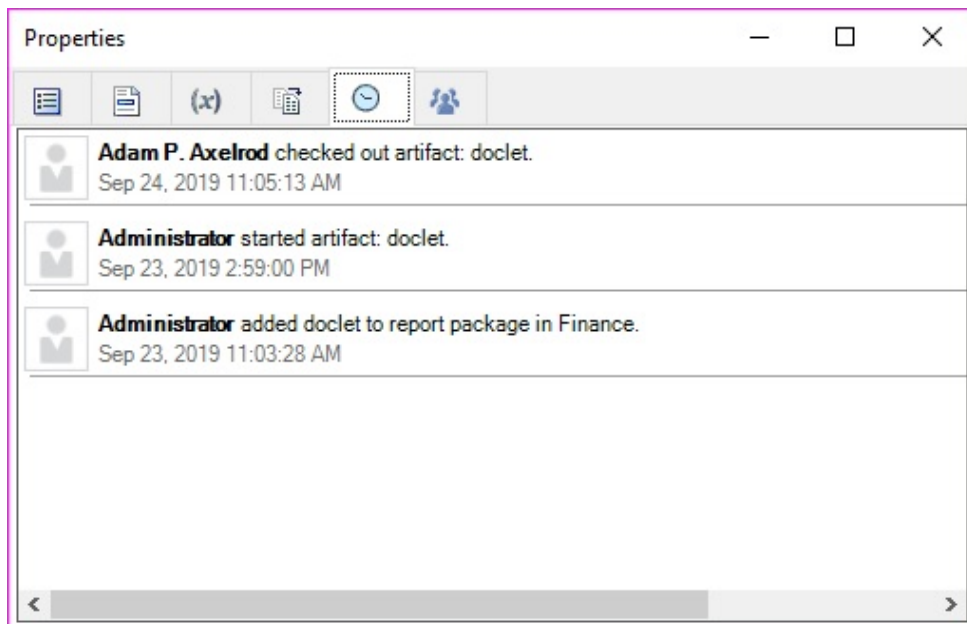

To download a previous version of a doclet, click the link next to the version that you want to view.

A message notifies you of the location of the downloaded doclet .

You may download any type of doclet; however, only Office-based doclets may have previous versions.

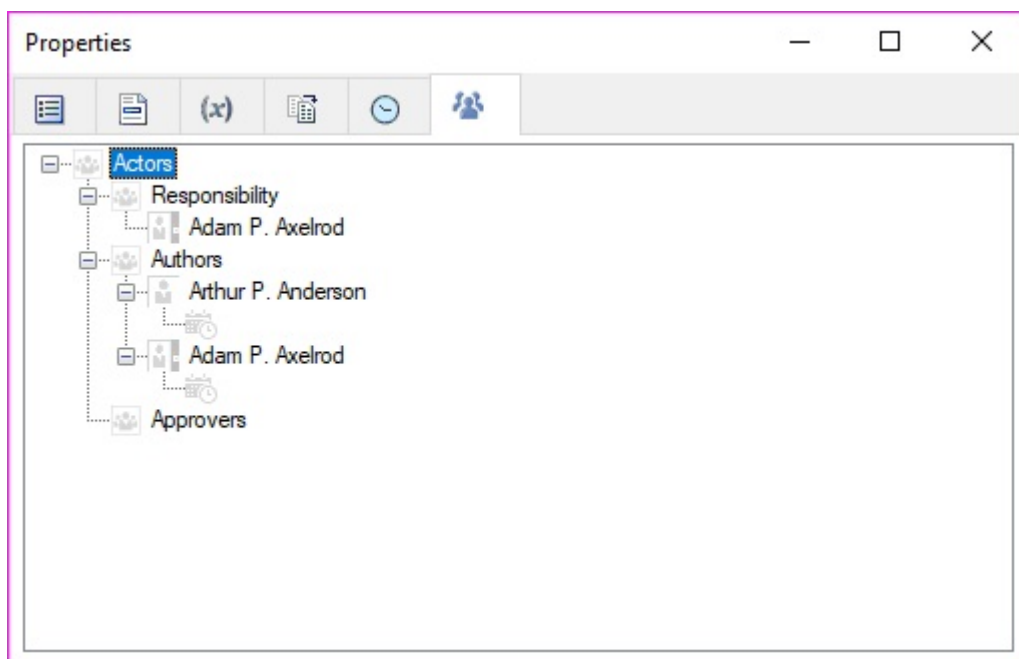

- Click the **History** tab, , to view audit information about the doclet, such as the user who last updated it (if applicable).

- Click the **Actors** tab, , to view the actors associated with the doclet.

The **Responsibility** node shows the user who has currently checked out the doclet. The **Authors** node shows the authors assigned to the doclet. The **Approvers** node shows the assigned approvers.

In the following illustration, the doclet is currently checked out by Adam P. Axelrod. There are two assigned authors, and there are no assigned approvers.

Reverting to a Prior Version of a Doclet

When authoring a doclet in a report package and your updates or the outcome is incorrect after previewing the doclet, you can revert back to a prior doclet version.

You can revert doclets, reference doclets, and supplemental doclets to previous versions.

To revert a doclet to a prior version:

1. Open the report package.
2. Open, and then check out the doclet.
The doclet is opened in the appropriate Office application.
3. Click **Inspect** in the Narrative Reporting ribbon to launch the **Properties** dialog box.

Alternatively, with the doclet selected in the report package list, select the **View Properties** link in the Action Panel.

4. In the **Properties** dialog, click the **Version** tab, .
5. In the **Version** tab, click  for the version of the doclet you want to make current.
In the following example, we want to make version 2 the current version, so we'll click  on the line for version 2.

A new work-in-progress version of the doclet is created based on the selected doclet file.

6. In the warning prompt, click **Yes** to confirm.

The report content in the new version is based on the prior version. However, any embedded content or variables contained in the prior version are refreshed to their current values.

 **Note:**

If you accessed the **Properties** dialog by selecting the **View Properties** link in the Action Panel, then you must close and reopen the doclet in order to see the reverted version.

7. Review the doclet to verify it is the correct content.
8. Upload and check the doclet back in to the report package to commit the changes to the report.

Performing Reviews

Perform reviews by entering comments and providing your feedback in a review instance in Oracle Smart View for Office.

- [About the Review Phase Process](#)
- [Working with Review Instances in Smart View](#)

About the Review Phase Process

The review phase enables report stakeholders to review and provide feedback on the content in the report package. Reviewers provide commentary on their assigned areas of the report package. This could be the entire report package or a subset consisting of sections or specific doclets. Reviewers can provide their feedback by using Oracle Smart View for Office to enter, review, and respond to comments.

The review phase process:

1. The report package owner creates the review instance, and then starts the review cycle in the Narrative Reporting web interface.
2. Notification messages are sent to reviewers to begin their work. If the review is [iterative](#), reviewers are notified to begin their work at the start of each iteration.
3. Reviewers view a document called a review instance in Smart View. A review instance includes only the reviewer's assigned content.

Review instances do not include supplemental doclets of any file type.

 **Note:**

Though reviewers see only their assigned content, all comments are made and retained against the single review instance.

4. Reviewers highlight content and post comments in plain text or in rich text format, which can include links and attachments.
5. Reviewers **collaborate** by adding to other comments in comment threads.
6. Reviewers mark their reviews complete, indicating to the report package owner that they are finished with their review. If the reviewer wants to add additional comments after marking the review complete, the reviewer can "Reopen for comments," indicating to the report package owner that they are not done with their review.

A report package may have multiple review cycles defined for it. All review cycles follow the same process.

Collaborative Review Process

As reviewers, you collaborate by viewing and adding to other reviewers' comments, creating comment threads. For example, a previous reviewer may have asked a question that you know the answer to. You can add to their comment to provide the answer.

Iterative Review Process

Reviews can be iterative, which means that a report package owner can schedule multiple review cycles depending on the type of review required.

For example, for a multiple draft review process, the review process may include:

- Multiple review cycles; with three drafts.
- Review assignments that vary by draft; for example:
 - First draft for manager level
 - Second draft for executive level
 - Third draft for CEOs, CFOs, and so on
- Review assignments that vary by area where you can assign users to review:
 - Entire report
 - Sections
 - Doclets

Key points to remember about the iterative review process:

- A new review instance incorporates content modifications.
- Comments persist across review cycles, so reviewers can see previous comments and how they were addressed.
- The review phase is complete when all review cycles are closed.

Working with Review Instances in Smart View

You perform reviews by entering comments and providing your feedback in a review instance in Oracle Smart View for Office. The review instance shows you a draft version of the areas of the report package that you have been assigned to review (see [Figure 1](#)). The review instance may consist of the entire report or a subset of the report content. Review instances do not include reference doclets or supplemental doclets of any file type.

Before you begin the review procedures, you should have launched Microsoft Word or PowerPoint, connected to Narrative Reporting, and opened a report package, as described in [Connecting to Narrative Reporting in Smart View](#).

Figure 17-47 A Portion of an Example Review Instance in Smart View with Word

The screenshot shows a Microsoft Word document with a Smart View panel on the right. The document content includes:

Operating Expenses
Actual operating expenses were \$ 235,370,183.29, as compared to Plan operating expenses of \$ 417,326,387.97. Table 1 summarizes Operating Expenses.

The Smart View panel on the right shows the Report Package Name, Review State, Content Selector, and Review Instance.

Watch this video to see a tutorial on working with review instances in Word-based report packages.

Watch this video to see a tutorial on working with review instances in PowerPoint-based report packages.

Selecting a Review Instance

When a report package is ready for review, an Narrative Reporting web interface message notifies reviewers that they can begin their work.

For example:

```
RReview is required for Sample Report Package - MS Word - Review Cycle 2
```

In this example, "Review Cycle 2" signifies that you will select "Review 02" in the Content Selector in Oracle Smart View for Office.

To select a review instance in Smart View:

1. In the Smart View Panel, verify that the required review instance is selected in the **Content Selector**.

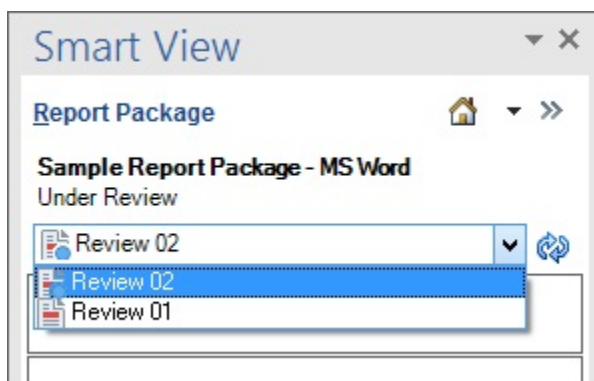

When you first open a report package, the active review instance is shown in the **Content Selector** by default. However, even if you intend to open the active review instance that is showing in the **Content Selector**, you must still manually select it.

Note:

If only one review cycle is defined for the report package, you must manually select the review instance in the **Content Selector**.

In [Figure 1](#), "Review 01" and "Review 02" are the available options. The dot next to "Review 02" signifies that this review instance is active and ready for your review comments. Notice that there is no dot next to "Review 01." This signifies that the review instance is closed to new review comments; however, you may open "Review 01" to view it.

Figure 17-48 Example of Review Instances in the Content Selector

2. If not already selected, select the required review instance.

When you select a review instance, your screen should resemble [Figure 1](#).

You can now begin working with review comments in the review instance.

Posting Comments

See these topics:

- [Posting a New Comment](#)
- [Posting a Reply to a Comment](#)

Posting a New Comment

To post a new comment:

1. Perform an action:

- **Comments on Text in Word:** To post comments on text in a Word-based report package, in the review instance, select the text to comment on, and in the Narrative Reporting ribbon, click **Add New Comment**.

- **Comments on Text in PowerPoint:** To post comments on text in a PowerPoint-based report package, place your cursor in the slide you want to comment on, and in the Narrative Reporting ribbon, click **Add New Comment**.

A pin is placed in the top left corner of the slide. Click the pin and drag it to position it on or near the text to comment on. Then, double-click the pin to open the **EPRCS Comments** text box.

 **Note:**

If text was selected before clicking **Add New Comment**, the pin will be placed at the top left corner of the selection.

- **Comments on Graphics in Word:** To post comments on graphics in a Word-based report package, in the review instance, select the graphic to comment on, and in the Narrative Reporting ribbon, click **Add New Comment**.

A pin is placed in the top left corner of the page that contains the graphic. Click the pin, and drag and drop it on the desired location within the graphic. Then double-click the pin to open the **EPRCS Comments** text box.

Select only the graphic. Do not select any paragraph markers, text, or empty spaces around the graphic.

- **Comments on Graphics in PowerPoint:** To post comments on graphics in a PowerPoint-based report package, in the review instance, select the graphic to comment on, and in the Narrative Reporting ribbon, click **Add New Comment**.

A pin is placed in the top left corner of the graphic. Click the pin, and drag and drop it on the desired location within the graphic. Then double-click the pin to open the **EPRCS Comments** text box.

Select only the graphic. Do not select any paragraph markers, text, or empty spaces around the graphic.

- **Comments on Embedded Content in Word:** To post comments on embedded content in Word, select a data or text cell *within* a single instance of embedded content, and in the Narrative Reporting ribbon, click **Add New Comment**.

For example, select data or text within an individual cell in an embedded content object. You may select a range of cells, but the pin is placed only on the first cell in the range (the upper left cell of the range).

To select an entire embedded content object for commenting, select some text from the row above the embedded content, along with the entire embedded content object.

You may add comments to only one embedded content object at a time. If you must add the same comment to other embedded content objects, you must add the comment separately to each embedded content object.

- **Comments in Automatic TOCs (Word only):** With the Narrative Reporting extension version 17.07+, commenting on automatic TOCs is not allowed. To add comments related to an automatic TOC, place the comment as close to the TOC as you can, and then refer to it in your comment.

With pre-17.07 versions of the Narrative Reporting extension, commenting on automatic TOCs is allowed in the heading or title only. You cannot comment in the body of the automatic TOC.

- **Comments in Manual TOCs (Word only):** Commenting is allowed on both the heading and the body of manual TOCs.

 **Tip:**

The selection area for comments cannot be empty. Select a graphic or at least one word or number when adding comments.

You cannot select an entire embedded content object *only* and then add a comment; that selection is considered an empty selection. You must select text above the embedded content, along with the embedded content, to be considered a valid selection area for comments.

2. In **EPRCS Comments**, enter a comment.

[Figure 1](#) shows an example of an **EPRCS Comments** text box with text selected for commenting.

Figure 17-49 EPRCS Comment Text Box in Word with Text Selected

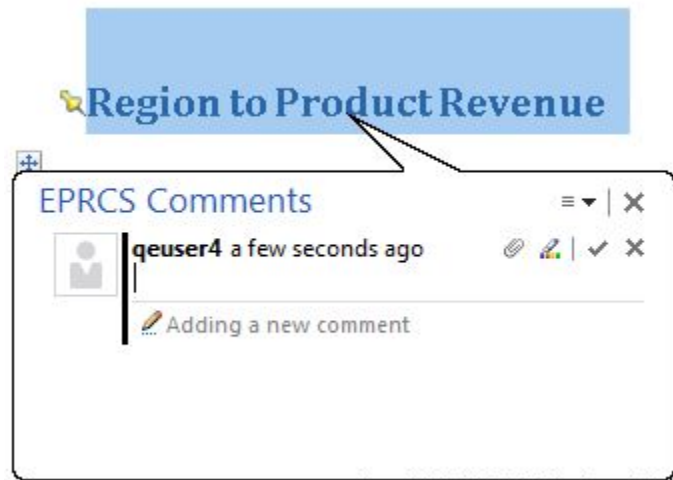

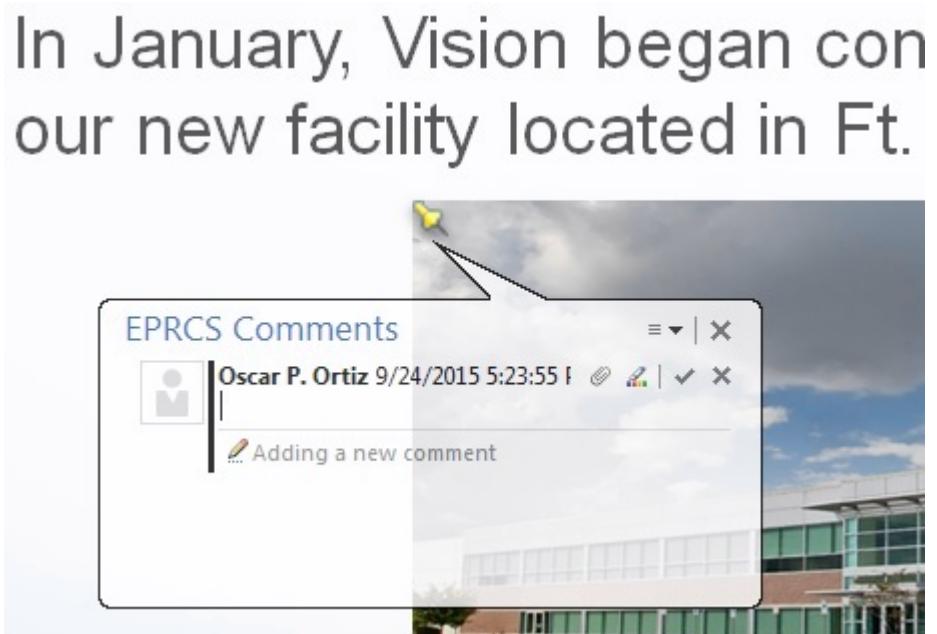

Figure 2 shows an example of an **EPRCS Comments** text box with a graphic selected for commenting in PowerPoint. Notice that the pin was placed in the upper left corner of the graphic.

Figure 17-50 EPRCS Comment Text Box in PowerPoint with Graphic Selected

 **Note:**

You can add URLs, text formatting, and attachments to comments. See [Editing and Deleting Comments](#) and [Attaching Supporting Files and Customizing Comment Text](#).

3. Click **Enter**, , to post your comment.

 **Note:**

A comment must contain text, an attachment, or both.

Your comment is added to the list of comments in the comments pane in the Smart View Panel, and an anchor icon, , is added to the review instance to indicate that there is a comment.

4. In the top right corner of the **EPRCS Comments** text box, click **Close**, , to exit.

Posting a Reply to a Comment

To post a reply to a comment:

1. In the Smart View Panel, double-click a comment in the list to launch the **EPRCS Comments** text box.
2. In the **EPRCS Comments** text box, click the **Reply** button, , and enter your reply.

 **Note:**

You can add text formatting and attachments to comment replies. See [Attaching Supporting Files and Customizing Comment Text](#) for more information.

3. Click the **Enter** button, , to post your reply.
4. Click **Close**, , to exit the **EPRCS Comments** text box.

Filtering and Sorting Comments

You can filter comments in the comment management panel. For example, you can show or hide comments, display open or closed comments, or display or hide a user's comments.

To filter and sort comments:

1. In the Narrative Reporting ribbon, click the **Refresh Comments** button to see new comments and replies.

2. **Optional:** Click the **Hide Anchor** or **Show Anchor** button to hide or display the comment anchors in the review instance.

Hide Anchor displays by default the first time you open a review instance, meaning that anchors are currently showing.

After clicking **Hide Anchor**, the button toggles to **Show Anchor**.

Anchors display throughout the review instance and mark the location where comments are entered. Anchors are signified by a pushpin icon. In [Figure 1](#), an anchor is circled in a portion of the review instance.

Figure 17-51 Anchor Example in Review Instance

Equipment Maintenance	14,993,537.06
Fees Outside Services	100,996,742.28
Employee HR	6,634,968.62
Facilities Exp	13,031,228.94
Utilities	2,159,896.85

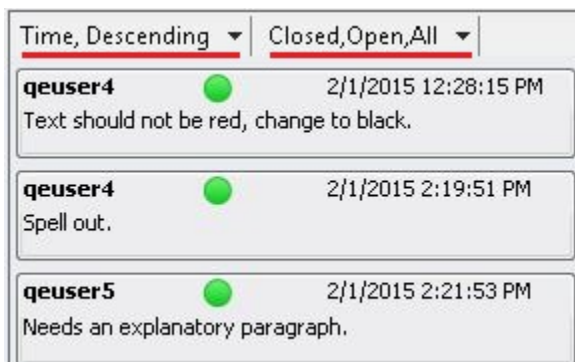

3. Click **Filter Comments**, **Filter Comments** ▾, and choose a display option:
 - **Open Comments**
 - **Closed Comments**
 - **All Comments**
 - **My Comments**

You can choose to display **Open Comments** and **Closed Comments** at the same time.

4. View the results of your selections in the comments list in the Smart View Panel.

Alternatively, you can choose filter and sort options by using the drop-down lists in the comments pane. The heading at the left is for sorting comments; the heading at the right is for filtering.

The following example shows comments sorted by time in descending order and, because the Open, Closed and All filters are selected, all comments are displayed:

5. **Optional:** Open a comment by clicking it in the list of comments in the Smart View Panel.

Editing and Deleting Comments

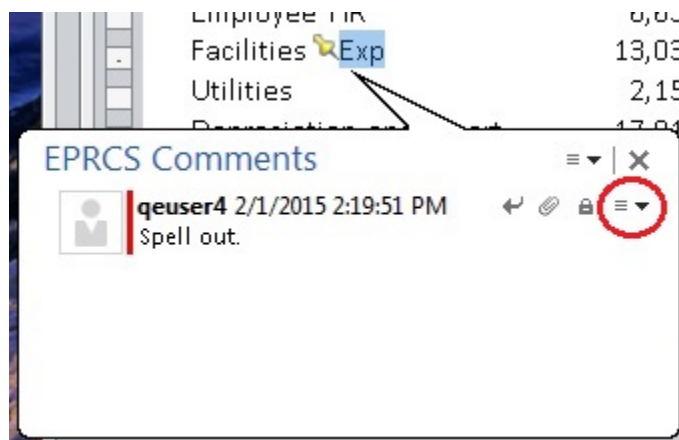

You can edit a thread entry when it is the last entry in the thread that you posted.

You can delete a comment that you posted. You can also delete a comment thread entry that you posted when it is the last entry in the thread.

To edit or delete a comment:

1. From the comment list in the Smart View Panel, click a comment that you started.
2. To edit a comment:
 - a. Click the drop-down list arrow as shown in [Figure 1](#), and then select **Modify**.

Figure 17-52 Comment Text Box with Drop-Down List Circled

- b. Edit the comment text.

 **Note:**

You can add URLs, text formatting, and attachments to comments. See [Attaching Supporting Files and Customizing Comment Text](#).

- c. Click **Enter**, , to update the comment.
 - d. Click **Close**, , to exit the **EPRCS Comments** text box.
3. To delete a comment, select either the comment or the last entry in a comment thread, then click the drop-down list arrow shown in [Figure 1](#) for the comment or the thread entry, and then select **Delete**.

 **Note:**

You can only delete the last entry in a thread. Deleting the last entry does not delete the entire comment thread.

4. To cancel modifications, click the **Cancel** or **Close** button, , in the **EPRCS Comments** text box.

Attaching Supporting Files and Customizing Comment Text

You can select a local file from your computer to attach to your comment. For example, you might want to associate a supporting document with one of your comments. Or, you may want to customize the text of a comment using the rich text editor. For example, you may want to make text bold or apply a different font color. You can also add a URL to a comment.

To attach files to a comment, customize comment text, or add a link to a web page:

1. In the Smart View Panel, in the comment list, double-click a comment that you started to launch the **EPRCS Comments** text box.
The comment you select must be the only or last comment in a thread.
2. To attach a file to your comment:
 - a. Click the **Manage Attachments** button, .
 - b. In **Manage Attachments**, click , then navigate to the file to attach and select it, and then click **Open**.
 - c. In the **Title** column, add a descriptive title for the file, and then press **Enter**; for example:

- d. Click **Save**, , to save the attachment and title text.

The statement "Comment has attachments" is added to the **EPRCS Comments** text box.

 **Note:**

The **Manage Attachments** button, , is enabled in all comments in a thread so that all users included in the review instance may view attachments associated with all comments.

- e. Repeat step 1 through step 2.d for all the files that you want to attach to the comment.
3. To apply custom formatting to comment text:
- In the **EPRCS Comments** text box, select the last comment in the thread, then click the drop-down list arrow shown in [Figure 1](#), and then select **Modify**.
 - Select the comment text to format.
 - Click the **Show Formatting Bar** button, , to add text formatting to the comment.
- Formatting options:
- Font style, size, and color
 - Bold, italics, and underlining
 - Align text to the left or right, or center it
- Click **Enter**, , to retain your changes.
4. To add a URL in a comment:
- In the **EPRCS Comments** text box, , enter the URL; for example, enter:

`http://www.oracle.com`

For URLs to be recognized, you must precede them with a valid URL protocol identifier, such as:

- `http://`
- `https://`

For example:

`http://www.oracle.com`

Oracle recommends testing URLs in a browser to ensure that they work before adding them to comments.

- b. Click **Enter**, .
5. Click **Close**, , to exit the **EPRCS Comments** text box.

Addressing and Closing Review Comments

When a comment is added to a review instance, the comment status is "Open." When the questions or concerns raised in a comment have been addressed, users can change the comment status to "Closed."

Addressing Comments

Some comments may be addressed with a simple reply to the comment. Other comments may require revisions to the original doclet. Any user, except for a viewer, can respond to or address comments. After you mark your review complete, it prevents you from adding new comments. However, you can still reply to existing comments. Following are examples of the actions that users can take in response to comments:

- Answer a question and then close the comment.
For example, if a review asked if a figure in a doclet represented an up-to-date number, a user with that knowledge can reply to the comment and mark it closed.
- Edit the doclet content and then close the comment.
For example, if a reviewer suggests an edit, another user can check out and edit the doclet, and then reply to the comment that the edit was made, and then close the comment.
- Send the doclet back to the doclet author for additional revisions.
For example, if a reviewer suggests that a doclet is using old data and needs to be updated with the latest figures, the report package owner can send the doclet back to the author. When a doclet is restarted, a notification is sent to the doclet author indicating that the doclet has been reopened, and the doclet status is changed to "Started." Note that the doclet due dates for authors and approvers may be changed by the report package owner. At this point, the doclet follows the same workflow as in the author phase (see [Authoring Doclets in Smart View](#)); it is edited and approved by the authors and approvers that were assigned in the author phase.

Closing Comments

To close a comment:

1. Double-click the comment in the comment list in the Review Center.
2. In the **EPRCS Comments** dialog box, click **Reply**, , and enter the reply text.

3. Click the **Mark Closed** button,  to close the comment.

A reply is added, noting that the comment is closed.

To reopen the comment to add additional comments, click **Reopen Comment**, .

Comparing Review Instances

In Oracle Smart View for Office, you can compare two review instances to see what changes occurred between review cycles, depending on the review cycles to which you have access. For example, you can compare between a selected version and the prior version, or you can compare between a selected version and any other earlier version.

This allows you, as a reviewer, to be more efficient by focusing your review only on the content that has been updated, rather than reviewing all your assigned content with each review cycle.

To compare review instances:

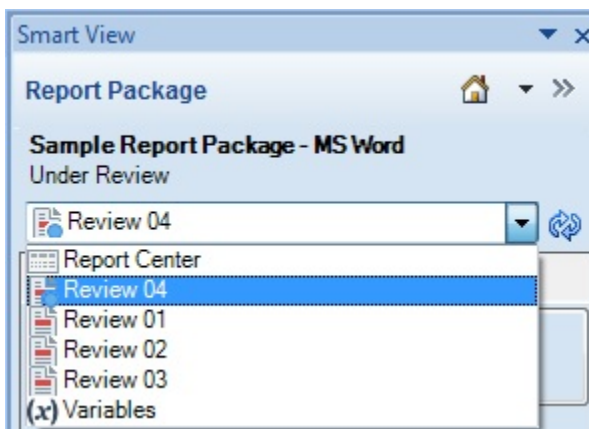

1. Open a report package.

You should have access to two or more review cycle instances in order to use the review instance compare feature.

2. In the **Content Selector**, select a review instance on which to base the compare.

The review instances listed depend on the review instances to which you have been assigned.

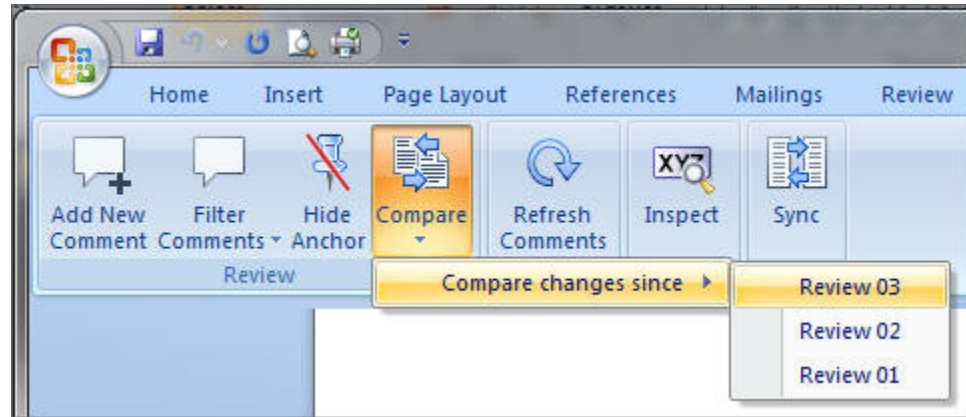

In the following example, there are four review instances listed. We'll select Review 04. Once you make a selection, the review instance opens in Word.

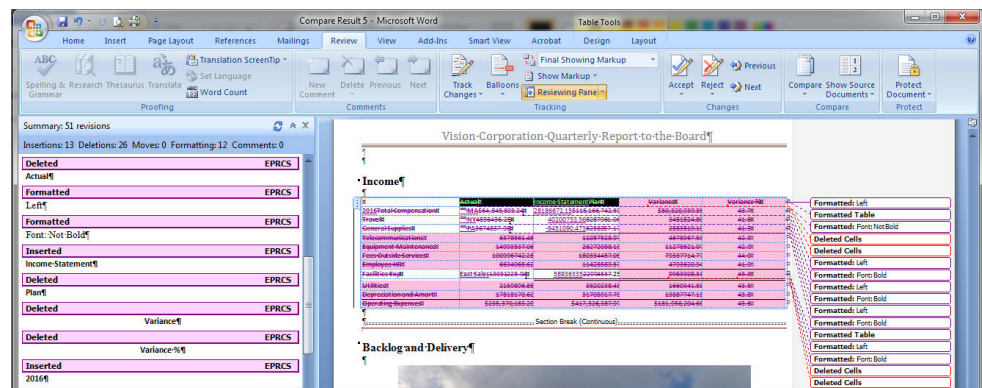

3. In the Narrative Reporting ribbon, click the arrow on the **Compare** button to view **Compare changes since**, then select a review instance from the drop-down list.

Depending on the review instance selection you make in the Content Selector, you will see a corresponding list of earlier review instance versions on the **Compare** drop-down list. If only one review instance exists, then there will be no earlier versions to compare to.

In the following example, we'll select Review 03. This means that we're going to look at the changes that occurred in Review 04 since Review 03.

Smart View downloads the two review instances and generates a detailed comparison document using Microsoft Word's comparison feature. You can use the Previous and Next button in Word's Review ribbon to navigate through the compare document.

The compare document is for viewing only. You do not need to use the Accept Changes functionality in order to keep any changes.

You can go back to the current review instance to add any necessary comments, and open and check out any doclets that you want to change.

4. When finished reviewing the changes, close the compare document.

Marking Reviews Complete

If you are satisfied with your review and you would like to notify the report package owner, mark your review complete.

After you mark your review complete, it prevents you from adding additional comments.

To mark your review complete:

1. Click **Mark Review Complete** in the Narrative Reporting ribbon.

 **Note:**

The button toggles to **Reopen for Comments**.

2. **Optional:** To add more review comments to the report package, click the **Reopen for Comments** button.

Working with Distributions

Distributions enable report package owners to send report content to stakeholders at any point in the report package development.

Related Topics

- [About Distributions](#)
- [Viewing Distributions](#)

About Distributions

Distributions enable a report package owner to send report content to stakeholders at any point in the report package development. As a recipient, depending on the options that the report package owner selects, you can view, download in native format, or download as PDF all of the report content that the report package owner assigns to you.

When a report package owner executes a distribution, notifications are sent to the recipients' email and the Messages tab on the Narrative Reporting web interface. The notifications contain links to access the distributed content from Narrative Reporting. You can click the links in the email to view or download the distribution from the web interface.

Or, you can launch Oracle Smart View for Office, open the report package, navigate to the Distributions panel, and view or download the distribution in PDF format from Office.

Report package owners can refer to *Reviewing, Signing, and Receiving Report Packages in Narrative Reporting* for information on setting up distributions.

Viewing Distributions

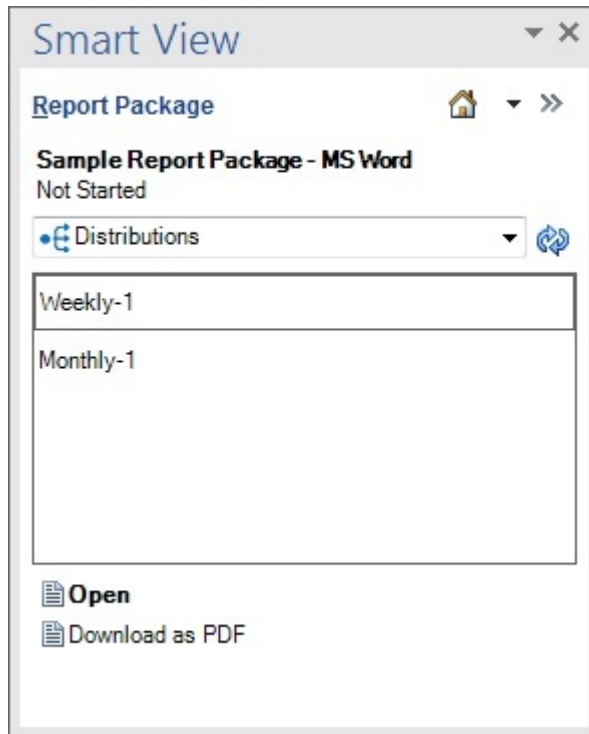

When a report package owner executes a distribution, notifications are sent to the recipients' email and the Messages tab on the web. The notifications contain links to access the distributed content. You can also log in to Oracle Smart View for Office and, depending on the options selected by the report package owner, download or open the PDF version of the distribution for viewing.

To view distributions:

1. Connect to Narrative Reporting and open a report package, as described in [Connecting to Narrative Reporting in Smart View](#).
2. In the Report Package panel, select **Distributions** from the drop-down list.

3. From the list of distributions in the Report Package panel, select a distribution.

4. Perform an action:
 - Click **Open** to view the distribution immediately.
 - Click **Download as PDF** to download the distribution and view anytime.

Performing Sign Offs

Signers review the finalized content of a report. They can either sign off on or reject the report.

Related Topics

- [About the Sign Off Phase](#)
- [Signing Off On or Rejecting a Report](#)

About the Sign Off Phase

The goal of the sign off phase is to gather final approvals from your key stakeholders. Stakeholders review finalized content and either sign off on or reject the report. All prior authoring and review phases must be complete, and all doclets must be checked in and completed as well. The sign off phase enables you to lock your report and ensures that approved content is not modified. This is beneficial for reports that rely on content to be locked down and to prevent changes.

The sign off phase follows this process:

1. The report package owner creates the sign off instance, and then starts the sign off phase.
2. Notifications are sent to signers to begin their work.

3. Signers review finalized content in the form of a sign off instance, and can either sign off on or reject the report.

 **Note:**

After all the signers provide their approvals, the report package is marked final.

Signing Off On or Rejecting a Report

The signers review the final report and can either sign off on or reject the report. Additionally, signers can attach a note with details on their action.

Before you begin the procedures in this topic, you should have launched Microsoft Word or PowerPoint, connected to Narrative Reporting, and opened a report package, as described in [Connecting to Narrative Reporting in Smart View](#).

Watch this video to see a tutorial on signing off in a Word-based report package.

[Tutorial video](#)

To sign off on or reject a report:

1. In the Smart View Panel, **Content Selector** drop-down list, ensure that **Sign Off** is selected.

Selecting **Sign Off** launches the sign off instance document, which you review to sign off on the report.

2. Do one of the following:
 - If you are satisfied with your review of the sign off instance document, click **Sign Off** in the Narrative Reporting ribbon.

When you sign off on the sign off instance document, the report package process is complete, and the report is ready for publication.

- If you are not satisfied with the sign off instance document, click **Reject Sign Off** in the Narrative Reporting ribbon.

The report package owner can take corrective actions to address issues.

3. **Optional:** Whether you are signing off on or rejecting the report in the sign off instance document, add a comment in **Add Note**, and then click **Sign Off** or **Reject Sign Off**.

After all signers approve the report, the report package status becomes "Final."

Refreshing Report Packages

You can refresh the contents of a report package by using the Refresh Report Package command in the Library pane of the Smart View Panel.

When you select **Refresh Report Package**, Oracle Smart View for Office takes the following actions for each doclet (regular and reference doclets) in the report package:

- Download
- Checkout
- Refresh of all data points, embedded content, and variables; this includes all data points or data sheets within Excel reference and supplemental doclets for all defined Smart View Panel sources
- Upload
- Checkin

Note:

When you perform a **Refresh Report Package**, you must have access to all the doclets, including those that contain Smart View queries. Furthermore, in order to refresh those queries, you may be prompted for login credentials to all the data sources that those queries are accessing.

To refresh a report package:

1. Ensure that you are in the Library pane of the Smart View Panel.

From Narrative Reporting Home, click Library, then expand the **EPRCS** node, then the **Library** node, then expand the **Report Packages** folder, and then select a report package.

In the following example, you could select the report package named "Sample Report Package - MS Word".

2. With the report package selected, from the Action Panel, click **Refresh Report Package**.

The **Refresh Report Package** prompt is displayed letting you know that the process can be time consuming.

3. Click **Yes** at the prompt.

Smart View begins the process of opening and checking out doclets; refreshing data points, data sheets in Excel reference doclets, embedded content, and variables; and then closing the doclets.

Focus will move between Office applications.

If the refresh is successful for all doclets, Smart View returns you to the Office application from which you began the process.

Working with Narrative Reporting Data in Smart View

You can use Oracle Smart View for Office to copy data from Oracle Enterprise Performance Management System and Oracle Business Intelligence on-premises and cloud data sources.

This includes Narrative Reporting data sources, and paste the data into doclets in a report package.

For example, you can incorporate data from Oracle Essbase and Narrative Reporting in the same doclet or different doclets within a report package. A doclet in a report package in Word or PowerPoint may contain a profit and loss statement report that was created from an Essbase source along with an income statement report created from an Narrative Reporting source. The data points for the areas that you copy are retained in Word or PowerPoint, so you can refresh the doclet to keep the data up to date.

The scenario in [Example: Working with Narrative Reporting Data in Smart View](#) demonstrates using ad hoc analysis in Excel to create a report, and then copying the data points from that report and pasting them into a doclet in Word.

Example: Working with Narrative Reporting Data in Smart View

The topics in this section provide a brief look at the following features of Narrative Reporting:

- [Performing ad hoc queries and retrieving data from Narrative Reporting data sources.](#)
- [Copying and pasting Narrative Reporting data into doclets. You can copy and paste data in the form of grids or data points.](#)

Performing Ad Hoc Analysis with Narrative Reporting Data

Narrative Reporting comes with a sample application that consists of a model containing seven dimensions. You create the sample application with a click of a button in the Narrative Reporting web interface.

When connected to the sample model in Oracle Smart View for Office, you can perform ad hoc queries that allow you to create data reports containing the information that you want to see. You can copy and paste data from the reports into doclets in Narrative Reporting report packages. You can copy and paste grids or individual data points into doclets.

The scenario in this topic shows you how to create an ad hoc grid and paste individual data points and an entire grid into a doclet, in preparation for the doclet being included in a report package in Narrative Reporting.

Watch this video to see a tutorial on analyzing data using ad hoc analysis.

[Tutorial video](#)

To create an ad hoc grid from an Narrative Reporting data source:

1. If you have not already done so, launch Excel, and set up a data source connection as described in [Creating Connections to Narrative Reporting](#).
2. In Excel, connect to the Narrative Reporting data source.
See [Connecting to Narrative Reporting in Smart View](#).
3. In the Smart View Panel, expand **Reporting Applications**, then **Sample Application**, and then right-click **Sample Model** and select **Ad hoc analysis**.

The initial dimensions and data are placed on the sheet. The Accounts dimension and Fiscal Calendar dimension are the active dimensions.

Note:

The dimensions , Entities, Total Segments, Currencies, Years, and Scenarios are in the POV and are not in the body of the grid. They can be used to change the data perspective of the grid; however, we are not showing that functionality in this scenario.

	A	B	C	D	E	F
1		Entities	Total Segr	Currencie	Years	Scenarios
2		Accounts				
3	Fiscal Cale	#####				

And the Narrative Reporting ribbon for ad hoc functionality is displayed:

4. Before proceeding, in the Smart View ribbon, click **Options**, select the **Formatting** tab, and ensure that these options are selected:
 - **Use Excel Formatting**
 - **Adjust Column Width and Row Height**
 Click **OK**.
5. Click the **Refresh** button in either the Smart View ribbon or the Narrative Reporting ribbon to see the effect of the formatting changes on the current grid:

	A	B	C	D	E	F
1		Entities	Total Segments	Currencies	Years	Scenarios
2		Accounts				
3	Fiscal Calendar	50506747.63				

The goal for our layout is to show the Accounts members in rows, and Scenarios members in columns, to create a simple operating expenses report.

- To move the Scenarios dimension to the column, right-click and drag the Scenarios dimension cell, and then drop it on the Accounts dimension cell.

	A	B	C	D	E
1		Entities	Total Segments	Currencies	Years
2		Scenarios			
3		Accounts			
4	Fiscal Calendar	50506747.63			

- To move the Accounts dimension to the row, right-click and drag the Accounts dimension cell, and then drop it on the Fiscal Calendar dimension cell.

	A	B	C	D	E	F
1			Entities	Total Segments	Currencies	Years
2			Scenarios			
3	Accounts	Fiscal Calendar	50506747.63			
4						

- Right-click and then drag the Fiscal Calendar dimension to the POV row, and then drop it on the Entities dimension.

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Scenarios				
3	Accounts	50506747.63				

In the previous grid, the Scenarios and Accounts dimensions are the active dimensions. The dimensions Fiscal Calendar, Entities, Total Segments, Currencies, and Years are in the POV. This is the desired dimension layout.

Now let's zoom into row and column members and use the Keep Only and Remove Only buttons on the Narrative Reporting ribbon to create the row and column layout that we want to see.

- Select the Scenarios dimension, and then either double-click or click **Zoom In** on the Narrative Reporting ribbon.

	A	B	C	D	E	F	G
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years	
2		Actual	Plan	Forecast	Variance	Variance %	Scenarios
3	Accounts	50506747.63	95734223.23	#Missing	-45227475.6	-47.24274567	50506747.63

- Press the **Ctrl** key, select the Forecast and Scenarios members, and then click the **Remove Only** button in the Narrative Reporting ribbon.

The grid should look like this:

	A	B	C	D	E	F	G
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years	
2		Actual	Plan	Variance	Variance %		
3	Accounts	50506747.63	95734223.23	-45227475.6	-47.24274567		

Now let's zoom in to the Operating Expenses member.

11. Select Accounts, and then either double-click or click **Zoom In** from the Narrative Reporting ribbon.

The result of the first zoom in:

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Actual	Plan	Variance	Variance %	
3	Income Statement	50506747.63	95734223.23	-45227475.6	-47.24274567	
4	Balance Sheet	#Missing	#Missing	#Missing	#Missing	
5	Statistics	#Missing	#Missing	#Missing	#Missing	
6	Accounts	50506747.63	95734223.23	-45227475.6	-47.24274567	

12. Continue to zoom in:

- a. Click **Zoom In** on the Income Statement member.
- b. Click **Zoom In** on the Net Income member.
- c. Click **Zoom In** on the Total Pretax Income member.
- d. Click **Zoom In** on the Pretax Income From Operations member.

The grid should look like this:

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Actual	Plan	Variance	Variance %	
3	Gross Profit	336361285.4	602930074.5	-266568789.1	-44.212223	
4	Operating Expenses	235370183.29	417326388	181956204.7	43.60045517	
5	Pretax Income From Operations	100991102.1	185603686.5	-84612584.38	-45.58777144	
6	Other Exp (Inc)	-20797054.5	-37816841.08	-17019786.58	-45.00583893	
7	Total Pretax Income	80194047.61	147786845.4	-67592797.8	-45.73668083	
8	Provision for Income Tax	29687299.97	52052622.17	22365322.19	42.96675415	
9	Minority Interest Income	#Missing	#Missing	#Missing	#Missing	
10	Net Income	50506747.63	95734223.23	-45227475.6	-47.24274567	
11	Income Statement	50506747.63	95734223.23	-45227475.6	-47.24274567	
12	Balance Sheet	#Missing	#Missing	#Missing	#Missing	
13	Statistics	#Missing	#Missing	#Missing	#Missing	
14	Accounts	50506747.63	95734223.23	-45227475.6	-47.24274567	

13. To keep only the Operating Expenses member, we'll select the Operating Expenses cell and click **Keep Only** from the Narrative Reporting ribbon.

The grid should look like this:

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Actual	Plan	Variance	Variance %	
3	Operating Expenses	235370183.3	417326388	181956204.7	43.60045517	
4						

14. Double-click or zoom in on the Operating Expenses member cell.
15. In the expanded grid, select members with #Missing in their rows, Operating Expense Synergies and Allocations, and click **Remove Only** from the Narrative Reporting ribbon.

The grid should look like this:

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Actual	Plan	Variance	Variance %	
3	Total Compensation	64845803.24	115166742.6	50320939.35	43.6939851	
4	Travel	4836436.25	8287961.057	3451524.802	41.64504126	
5	General Supplies	3674837.978	6258357.165	2583519.187	41.28110811	
6	Telecommunications	6378561.445	11057528.97	4678967.528	42.31476616	
7	Equipment Maintenance	14993537.06	26272058.13	11278521.07	42.92972028	
8	Fees Outside Services	100996742.3	180334457.1	79337714.77	43.99476177	
9	Employee HR	6634968.623	11428589.57	4793620.944	41.94411669	
10	Facilities Exp	13031228.94	22994537.25	9963308.314	43.3290229	
11	Utilities	2159896.852	3820238.434	1660341.582	43.46172656	
12	Depreciation and Amort	17818170.62	31705917.75	13887747.13	43.80175097	
13	Operating Expenses	235370183.3	417326388	181956204.7	43.60045517	
14						

Now let's format the left column.

16. For a left-aligned list, in the Smart View ribbon, click **Options**, and then click the **Member Options** tab.
17. In **Indentation**, select **None**, and then click **OK**.
18. In the Smart View ribbon or Narrative Reporting ribbon, click **Refresh**.

The grid should look like this:

	A	B	C	D	E	F
1		Fiscal Calendar	Entities	Total Segments	Currencies	Years
2		Actual	Plan	Variance	Variance %	
3	Total Compensation	64845803.24	115166742.6	50320939.35	43.6939851	
4	Travel	4836436.25	8287961.057	3451524.802	41.64504126	
5	General Supplies	3674837.978	6258357.165	2583519.187	41.28110811	
6	Telecommunications	6378561.445	11057528.97	4678967.528	42.31476616	
7	Equipment Maintenance	14993537.06	26272058.13	11278521.07	42.92972028	
8	Fees Outside Services	100996742.3	180334457.1	79337714.77	43.99476177	
9	Employee HR	6634968.623	11428589.57	4793620.944	41.94411669	
10	Facilities Exp	13031228.94	22994537.25	9963308.314	43.3290229	
11	Utilities	2159896.852	3820238.434	1660341.582	43.46172656	
12	Depreciation and Amort	17818170.62	31705917.75	13887747.13	43.80175097	
13	Operating Expenses	235370183.3	417326388	181956204.7	43.60045517	

Next, we want to remove the POV members from the first row of the report.

19. In the Narrative Reporting ribbon, click the **POV** button.

POV

Clicking the POV button causes the POV members move to the POV toolbar, which **floats** on the grid, as shown in [Figure 1](#).

Figure 17-53 POV Toolbar

	A	B	C	D	E	F	G
2		Actual	Plan	Variance	Variance %		
3	Total Compensation	64845803.24	115166742.6	50320939.35	43.6939851		
4	Travel	4836436.25	8287961.057	3451524.802	41.64504126		
5	General Supplies	3674837.978	6258357.165	2583519.187	41.28110811

Fiscal Calendar [v]

Refresh [i]

Note:

The POV toolbar can be moved around on the grid or docked by dragging the POV toolbar to the top, bottom, left, or right of the Excel window. You can prevent the POV toolbar from docking by holding the **Ctrl** key as you drag the toolbar.

Now let's apply formatting to the numbers in the grid. Number formatting will carry over when we copy the grid and paste it into Word.

20. Press and hold down the **Ctrl** key, and then select the dollar amounts in the first and last rows of the report, cells B3, C3, D3, B13, C13, and D13.

	A	B	C	D	E
2		Actual	Plan	Variance	Variance %
3	Total Compensation	64845803.24	115166742.6	50320939.35	43.6939851
4	Travel	4836436.25	8287961.057	3451524.802	41.64504126
5	General Supplies	3674837.978	6258357.165	2583519.187	41.28110811
6	Telecommunications	6378561.445	11057528.97	4678967.528	42.31476616
7	Equipment Maintenance	14993537.06	26272058.13	11278521.07	42.92972028
8	Fees Outside Services	100996742.3	180334457.1	79337714.77	43.99476177
9	Employee HR	6634968.623	11428589.57	4793620.944	41.94411669
10	Facilities Exp	13031228.94	22994537.25	9963308.314	43.3290229
11	Utilities	2159896.852	3820238.434	1660341.582	43.46172656
12	Depreciation and Amort	17818170.62	31705917.75	13887747.13	43.80175097
13	Operating Expenses	235370183.3	417326388	181956204.7	43.60045517

21. With cells B3, C3, D3, B13, C13, and D13 selected, in the Excel Home ribbon, in the **Number** group, click the **Accounting Number Format** button, \$.

If you are working in a non-American English environment, choose the default currency symbol for your locale.

22. In the Excel Home ribbon, make the following changes to the currency and variance percentage figures:
- Select only the figures in columns B, C, and D, and then, in the **Number** group, click the **Comma Style** button, ,.
 - Select only the figures in column E, Variance %, and then, in the **Number** group, click the **Decrease Decimal** button, $\rightarrow .00$, until only one decimal place remains.

You should now have a report similar to the one shown in [Figure 2](#).

Figure 17-54 Ad Hoc Report from Narrative Reporting Data Source

	A	B	C	D	E
2		Actual	Plan	Variance	Variance %
3	Total Compensation	\$ 64,845,803.24	\$ 115,166,742.59	\$ 50,320,939.35	43.7
4	Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.6

12	Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.8
13	Operating Expenses	\$ 235,370,183.29	\$ 417,326,387.97	\$ 181,956,204.68	43.6

This formatting will carry over to the report package doclet in Word. You'll add more formatting when you're authoring the doclet in Word (as described in [Copying and Pasting Narrative Reporting Data into Doclets](#)).

23. Save the report and continue with [Copying and Pasting Narrative Reporting Data into Doclets](#).

We'll show you how to copy and paste the dynamic data points from this report in to a doclet in an Narrative Reporting report package. This is a typical task that a doclet author performs during the authoring phase of the report package lifecycle.

Copying and Pasting Narrative Reporting Data into Doclets

For this demonstration, we'll work with an example Word-based report package called Department Reports. We'll use the data that we created in [Performing Ad Hoc Analysis with Narrative Reporting Data](#) to create refreshable data points in a doclet called "Operating Expenses." The doclet will contain text interspersed with data points, and the full grid.

 **Note:**

The procedure in this topic could also be performed in a PowerPoint-based report package.

To copy and paste Narrative Reporting data into doclets:

1. In Word, connect to the Narrative Reporting data source, and then open a report package, as described in [Connecting to Narrative Reporting in Smart View](#).
2. In the Smart View Panel, select the doclet to check out.

Figure 17-55 Smart View Panel Showing the Operating Expenses Doclets Selected

3. Double-click the doclet name to open it.

Figure 17-56 Doclet Opened from Smart View Panel, Ready to be Checked Out

4. In the Narrative Reporting ribbon, click **Check Out**.

You can now author in the doclet. The example doclet in [Figure 2](#) has placeholders within the paragraph for pasting data points. You can paste the entire grid below the table caption.

5. To copy and paste a data point:
 - a. Open and connect to the ad hoc grid that you created in [Performing Ad Hoc Analysis with Narrative Reporting Data](#).
 - b. Select the Actual total operating expenses figure in cell B13, and then click  **Copy** from the Smart View ribbon.

	A	B	F
2		Actual	
3	Total Compensation	\$ 64,845,803.24	
4	Travel	4,836,436.25	
5	General Supplies	3,674,837.98	
6	Telecommunications	6,378,561.45	
7	Equipment Maintenance	14,993,537.06	
8	Fees Outside Services	100,996,742.28	
9	Employee HR	6,634,968.62	
10	Facilities Exp	13,031,228.94	
11	Utilities	2,159,896.85	
12	Depreciation and Amort	17,818,170.62	
13	Operating Expenses	\$ 235,370,183.29	

 **Tip:**

You must be connected to the ad hoc grid, and you must use the **Copy** and **Paste** buttons on the Smart View ribbon so that the data you copy and paste remains dynamic between Office applications.

- c. In Word, position the cursor in the paragraph at the required location, and then, in the Smart View ribbon, click **Paste**.
The paste operation results in a placeholder, "#NEED_REFRESH".

In this scenario, a second data point for plan operating expenses is pasted into the paragraph.

6. To copy and paste a range:
 - a. Go to the ad hoc grid that you created in [Performing Ad Hoc Analysis with Narrative Reporting Data](#).

- b. Select the entire grid, including all members, and then click ; in the example in [Figure 3](#), you would select cells A2 through E13.

Remember that in [Performing Ad Hoc Analysis with Narrative Reporting Data](#), we moved the POV dimensions from row 1 to the POV toolbar. That's why the grid that we're copying from begins on row 2.

Figure 17-57 Entire Ad Hoc Report Selected for Copying

	A	B	C	D	E
2		Actual	Plan	Variance	Variance %
3	Total Compensation	\$ 64,845,803.24	\$ 115,166,742.59	\$ 50,320,939.35	43.7
4	Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.6
5	General Supplies	3,674,837.98	6,258,357.17	2,583,519.19	41.3
6	Telecommunications	6,378,561.45	11,057,528.97	4,678,967.53	42.3
7	Equipment Maintenance	14,993,537.06	26,272,058.13	11,278,521.07	42.9
8	Fees Outside Services	100,996,742.28	180,334,457.05	79,337,714.77	44.0
9	Employee HR	6,634,968.62	11,428,589.57	4,793,620.94	41.9
10	Facilities Exp	13,031,228.94	22,994,537.25	9,963,308.31	43.3
11	Utilities	2,159,896.85	3,820,238.43	1,660,341.58	43.5
12	Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.8
13	Operating Expenses	\$ 235,370,183.29	\$ 417,326,387.97	\$ 181,956,204.68	43.6

- c. In Word, position the cursor at the location that you require, and in the Smart View ribbon, click **Paste**.

The paste operation results in a table in which every cell is populated with the placeholder, "#NEED_REFRESH", as shown in [Figure 4](#).

Figure 17-58 Ad Hoc Grid Range Pasted Below Table Caption

Operating Expenses
Actual operating expenses were #NEED_REFRESH, as compared to Plan operating expenses of #NEED_REFRESH. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

	Actual	Plan	Variance	Variance-%
Total Compensation	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Travel	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
General Supplies	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Telecommunications	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Equipment Maintenance	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Fees-Outside Services	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Employee HR	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Facilities-Exp	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Utilities	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Depreciation and Amort	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH
Operating Expenses	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH	#NEED_REFRESH

The data points and range are ready to be refreshed.

7. Click **Refresh**, either in the Smart View ribbon or the Narrative Reporting ribbon.

The resulting doclet page should look like this:

Operating Expenses
Actual operating expenses were \$-235,370,183.29, as compared to Plan operating expenses of \$-417,326,387.97. Table 1 summarizes Operating Expenses.

Table 1. Operating Expenses

	Actual	Plan	Variance	Variance-%
Total Compensation	-\$-64,845,803.24	-\$-115,166,742.59	-\$-50,320,939.35	43.7
Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.6
General Supplies	3,674,837.98	6,258,357.17	2,583,519.19	41.3
Telecommunications	6,378,561.45	11,057,528.97	4,678,967.53	42.3
Equipment Maintenance	14,993,537.06	26,272,058.13	11,278,521.07	42.9
Fees-Outside Services	100,996,742.28	180,334,457.05	79,337,714.77	44.0

Facilities-Exp	13,031,228.94	22,994,537.25	9,963,308.31	43.3
Utilities	2,159,896.85	3,820,238.43	1,660,341.58	43.5
Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.8
Operating Expenses	-\$-235,370,183.29	-\$-417,326,387.97	-\$-181,956,204.68	43.6

8. Use the tools in Word to format the table in the doclet.
 - a. Select the entire table and from the **Layout** ribbon in Word, select **AutoFit**, and then **AutoFit Contents**.
 - b. Center and bold the headings.

- c. Right-align all the data values in the Actual, Plan, and Variance columns.
- d. Center the percentages in the Variance % column.
- e. Bold the totals in the Operating Expenses row.
- f. Clear the borders from the entire table.
- g. Add a single underline under the column headings and under the Actual, Plan, Variance, and Variance % columns in the "Depreciation and Amort" row.
- h. Add double underlines under the Actual, Plan, Variance, and Variance % columns in the "Operating Expenses" row.

After you've applied the Word formatting, the table should resemble the table in Figure 5.

Figure 17-59 Doclet Example Containing Formatted Word Table

Operating Expenses				
Actual operating expenses were \$ 235,370,183.29 , as compared to Plan operating expenses of \$ 417,326,387.97 . Table 1 summarizes Operating Expenses.				
Table 1. Operating Expenses				
	<u>Actual</u>	<u>Plan</u>	<u>Variance</u>	<u>Variance %</u>
Total Compensation	\$ 64,845,803.24	\$ 115,166,742.59	\$ 50,320,939.35	43.7
Travel	4,836,436.25	8,287,961.06	3,451,524.80	41.6
General Supplies	3,674,837.98	6,258,357.17	2,583,519.19	41.3
Telecommunications	6,378,561.45	11,057,528.97	4,678,967.53	42.3
Equipment Maintenance	14,993,537.06	26,272,058.13	11,278,521.07	42.9
Fees Outside Services	100,996,742.28	180,334,457.05	79,337,714.77	44.0
Employee HR	6,634,968.62	11,428,589.57	4,793,620.94	41.9
Facilities Exp	13,031,228.94	22,994,537.25	9,963,308.31	43.3
Utilities	2,159,896.85	3,820,238.43	1,660,341.58	43.5
Depreciation and Amort	17,818,170.62	31,705,917.75	13,887,747.13	43.8
Operating Expenses	\$ 235,370,183.29	\$ 417,326,387.97	\$ 181,956,204.68	43.6

Now that you've completed your authoring tasks in the doclet, you can upload it and check it in to make it available to other doclet authors.

- 9. Save the doclet in Word.
- 10. In the Narrative Reporting ribbon, click **Upload**.

- 11. In the **Upload File** dialog box, select the check box next to any style attributes that you want to override, and then click **OK**.

Style attributes in the doclet that differ from the style sample for the report package are noted with an exclamation point. In this case, there are no style attributes to override.

12. From the Narrative Reporting ribbon, click **Check In**.

The lock icon is removed from the doclet in the doclet responsibilities list, indicating that the doclet is no longer checked out.

This completes the example scenario. In summary, we showed you how to accomplish these tasks:

- Create an ad hoc report while connected to an Narrative Reporting data source.
- Format the figure and percentage data in Excel.
- Open a report package and check out a doclet for authoring.
- Copy and paste data points and ranges from the ad hoc grid in Excel to the doclet, creating a Word table.
- Format the table using Word formatting.
- Upload the doclet and check it in.

In a production environment, the next steps that you take depend on the requirements of the report package. You may need to [submit](#) the doclet for approval. You might need to [author](#) other doclets. Later, you may be asked to [review](#) portions or all of the report package. You can do all of these tasks in Oracle Smart View for Office.

Using the View Designer in Oracle Smart View for Office, you can create ad hoc views based on an Oracle Analytics Cloud subject area.

About Oracle Analytics Cloud and Smart View

With Oracle Smart View for Office, users can connect to Oracle Analytics Cloud and utilize the content created in Oracle Analytics Cloud dashboards and analyses.

In addition to working with this content, Smart View users can create content in the form of simple views with the View Designer, using Oracle Analytics Cloud as the data source. The views created can then be published to the Oracle BI Presentation Catalog, where they can be edited further.

Smart View offers Oracle Analytics Cloud users a cohesive and consistent experience across all Oracle Analytics Cloud content providers.

Note:

To use the Oracle Analytics Cloud-related features in Smart View, you must have Oracle Analytics Cloud 17.3.2 or later.

Features and Components of Oracle Analytics Cloud in Smart View

When connected to an Oracle Analytics Cloud data source in Oracle Smart View for Office, you can perform several actions.

- Connect to Oracle Analytics Cloud.
- Navigate through the Oracle BI Presentation Catalog.
- Connect to multiple instances of Oracle Analytics Cloud and switch between connections.
- Import pre-created views from the Oracle BI Presentation Catalog into Microsoft Excel, PowerPoint, and Word. For example, you can:
 - Insert views—Oracle Analytics Cloud tables, pivot tables, and graphs—into Excel as refreshable, editable objects.
 - Insert views from different connections into the same Office document.
 - Apply Excel formatting to Oracle Analytics Cloud data; formats are retained when you refresh.
- Copy Oracle Analytics Cloud Dashboard content and paste it into Smart View client documents. The data, metadata, and view layout are copied.
- Create simple views in Excel using Oracle Analytics Cloud as the source for metadata and data.
- Interact with content imported into Smart View documents, such as drill and prompt selections.
- Manage the imported content in Smart View, including content from multiple connections; for example, refresh, mask, copy and paste, and document contents.
- Mask data from Oracle Analytics Cloud objects in Excel so that users must log in to view the data. Masked objects can be viewed upon refresh.
- Program using Visual Basic. See the *Oracle Smart View for Office Developer's Guide* for more information.

Key components are:

- Ribbon—The Oracle Analytics Cloud ribbon contains Oracle Analytics Cloud commands for designing and publishing views in Smart View, inserting, and copying and pasting views from Oracle Analytics Cloud, editing prompts, masking data, editing, and setting preferences.
- Catalog—The catalog is an expandable tree list of the Oracle Analytics Cloud dashboards, analyses, and views that are available to you for insertion into Excel. Each analysis expands to display all views available from that analysis. Only views that are supported and defined in Oracle Analytics Cloud, and for which you have

permission, are displayed. You can refresh the catalog to display the latest list of available analyses and views.

Installing the Oracle Analytics Cloud Extension

How the Oracle Analytics Cloud extension is installed depends on whether you are an end user or an administrator.

Related Topics

- [For Smart View End Users](#)
- [For Smart View Administrators](#)

For Smart View End Users

To install the extension for Oracle Analytics Cloud:

1. Install Oracle Smart View for Office as instructed by your Smart View administrator.

 **Note:**

In some cases, your administrator may install Smart View automatically for you.

2. After Smart View is installed, and *before* you start Microsoft Excel, Word, or PowerPoint, ensure that you are logged in to your computer with your own user name.

 **Note:**

You must be logged in with your own user name, not an administrator's or anyone else's user name, in order to be able to correctly install and use the extension for Oracle Analytics Cloud.

3. Start Microsoft Excel, Word, or PowerPoint.

 **Note:**

To install the extension for Oracle Analytics Cloud, you can start Excel, Word, or PowerPoint; the extension installation is not launched from Outlook.

Smart View installs the extension upon the first startup of the Office product and registers the extension to the user that is currently logged in to Windows.

4. To verify that the extension for Oracle Analytics Cloud is installed, from Excel, Word, or PowerPoint, select the Smart View ribbon, then **Options**, and then **Extensions**, and confirm that the extension named "Oracle BI EE" is listed.

If the extension is not listed, contact your Smart View administrator.

For Smart View Administrators

After Oracle Smart View for Office installation, the Oracle Analytics Cloud extension is installed automatically the first time an Office application is launched. You must ensure that the intended end user is logged in to Windows before Office is launched.

Or, you can control how your Smart View end users install the Oracle Analytics Cloud extension via the **Extensions** page of the Smart View **Options** dialog box. See "Administering Extension Installations and Updates" in the *Oracle Smart View for Office Installation and Configuration Guide* for more information on setting up automatic or manual installations.

If you choose to set up automatic or manual installations, you should install Smart View in a test environment first, then refer to the `UpdateList.xml` file, found in the `extensions` folder of your Smart View installation. Use the entry in this file as a guideline for the Oracle Analytics Cloud entry you will add to the `UpdateList.xml` file, as described in "Configuring Manual Extension Updates" in the *Oracle Smart View for Office Installation and Configuration Guide*.

Working with Windows System Locales in Oracle Analytics Cloud

On each Oracle Smart View for Office client machine, Windows system locales must match that of Smart View in order for any data (numbers, dates, currencies, percentages) to be interpreted correctly.

The following are the applicable Windows system locales:

- Smart View language option
- Microsoft Office language
- Windows Regional Settings
- Windows operating system

When working with Oracle Analytics Cloud data sources, in cases of mismatched Windows system locales, data may display incorrectly, or formatting may be ignored and plain data rendered instead.

An example of a Windows system locale mismatch is the Windows operating system, Regional Settings, and Office language in English, and Smart View in Russian.

When locale mismatches occur, the Smart View log indicates a warning such as the following: "Encountered mismatched locale. Chart will use unformatted data values."

Connecting to Multiple Oracle Analytics Cloud Data Sources

You connect to Oracle Analytics Cloud data sources using private connections.

See [Creating Private Connections](#).

To connect using shared connections, the shared connection information must be stored in a file, as described in [Accessing Shared Connections from an XML File](#) in the *Oracle Smart View for Office Installation and Configuration Guide*.

Additionally, Oracle Smart View for Office supports multiple Oracle Analytics Cloud private connections on one Office worksheet, slide, or document.

For example, in one worksheet, you may insert two graphs from two different Oracle BI Presentation Catalogs and refresh the sheet. Each graph will be updated with the latest data from the two different servers.

When connected to multiple Oracle Analytics Cloud servers:

- Users can switch between those connections in the Smart View Panel and browse the respective catalogs.
- Users can insert views from the different connections into the same Office document.
- If View Designer is launched from the Smart View ribbon and no Oracle Analytics Cloud view is selected, then View Designer will be connected to the Oracle Analytics Cloud server that was last used.
- If Paste is invoked from the Smart View ribbon to paste content from Oracle Analytics Cloud, the paste action will use the Oracle Analytics Cloud connection that was last used.
- When refreshing a document containing views from different connections, the views will be refreshed against the servers from which they were inserted.
- There can be only one Excel pivot table view per Excel worksheet. Additionally, Excel pivot table views are always inserted onto a new worksheet. This is the expected behavior, whether you are working with a single data source connection or with multiple connections.

To connect to multiple Oracle Analytics Cloud private connections:

1. From **Smart View Home** or from the menu displayed when you click the arrow next to , click **Private Connections**
2. In the **Private Connections** panel, select a connection from the drop-down menu and, in **Connect to Data Source**, enter your user name and password for the data source.

Assume you have inserted a view from the Oracle Analytics Cloud catalog. Continue with step 3.
3. Move the cursor to a different part of the worksheet, slide, or document.
4. In the **Private Connections** panel, select a different connection from the drop-down menu.
5. In **Connect to Data Source**, enter your user name and password for the second data source.

You can now insert a view from the newly-connected data source into the Office document
6. Repeat step 3 through step 5 for any other data sources to which you want to connect.

Oracle BI Presentation Catalog

The Oracle BI Presentation Catalog, also referred to as the catalog or catalog tree, is displayed in the Smart View Panel.

The catalog tree displays a root node called "Catalog Root" and, by default, two folders called "My Folders" and "Shared Folders".

Figure 18-1 Oracle BI Presentation Catalog, or Catalog Tree

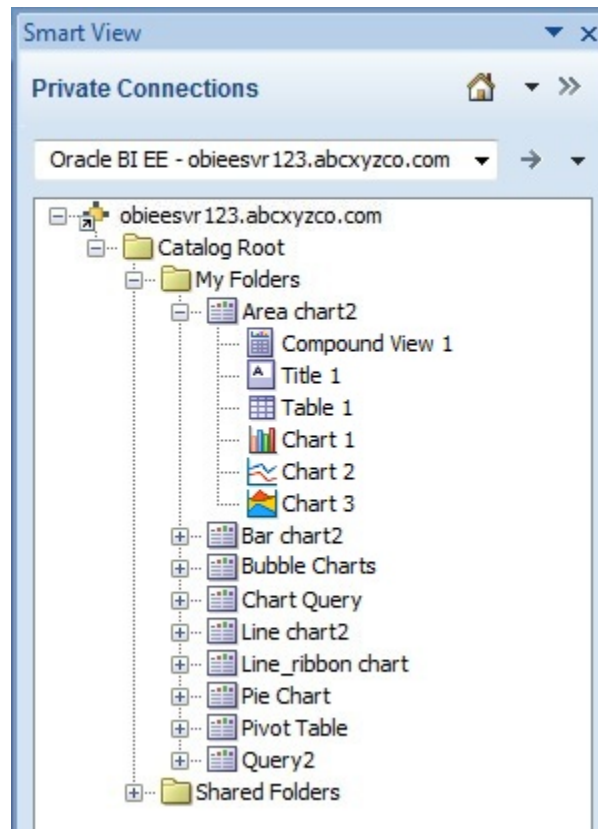

Items that you save to My Folders appear only to you when you expand the folder. Items that other users save to My Folders appear only to them.

Items that you save to Shared Folders can be viewed by all users who have logged on with BI Consumer privileges. If you have BI Consumer privileges, you can also view the items that other users have saved in Shared Folders.

To view the properties of any folder to which you have access, including the name of the folder creator and the creation date, right-click the folder in the catalog tree and select **View Folder Properties**.

The folders in the catalog tree contain a list of analyses, both from Oracle Analytics Cloud and Oracle Smart View for Office, as well as any subfolders created. Expand an analysis node (for example, "Area chart2" under **My Folders**) and the list of views that are stored there is displayed (for example, "Compound View 1" and "Table 1").

Figure 18-2 Catalog Tree Showing Views Under an Analysis Node

To view the properties of an analysis, including the name of the analysis creator, the creation date, and modification date, right-click the analysis in the catalog tree and select **View Analysis Properties**.

You can choose to edit any analysis in Oracle Analytics Cloud. If a view in the analysis was created in Smart View, you can also choose to edit the view in Smart View.

To edit an analysis in Oracle Analytics Cloud, right-click the analysis in the catalog tree and select **Edit Analysis in Answers**.

Selecting this option launches the default browser and opens the analysis editing wizard in Oracle Analytics Cloud. If you are not already logged onto Oracle Analytics Cloud, a login dialog box is displayed where you can enter your credentials. You must have BI Consumer privileges to edit an analysis in Oracle Analytics Cloud.

To edit a view in Smart View, right-click the view in the catalog tree and select **Load view in View Designer**.

In this case, the view must have been created in Smart View. See [Launching the View Designer](#) for other methods for accessing views for editing.

From the catalog tree, you can also insert table views, pivot table views, graph views, titles, and compound views into Smart View. See [Working with Oracle Analytics Cloud Analyses, Views, and Dashboards](#).

Working with Oracle Analytics Cloud Analyses, Views, and Dashboards

In Oracle Analytics Cloud, analyses are made up of individual views; dashboards are made up of analyses and individual views.

- [Editing Views Created in Oracle Analytics Cloud](#)

Supported Oracle Analytics Cloud View and Object Types

You can insert the following views into Oracle Smart View for Office clients (Excel, PowerPoint, and Word) from the catalog or by copying and pasting.

Note:

Drill operations are not supported on Oracle Analytics Cloud views inserted in Smart View. (Drill operations are referred to as Zoom In and Zoom Out in Smart View.)

- **Table Views**

Table views display data in table format, either in a format similar to the display in Oracle Analytics Cloud (also referred to as native format), or as an Excel table.

Using the **Insert** option, you can insert table views into all Smart View clients in native format. This format offers no sorting or filtering. Cells with the same data are merged into a single cell.

In Excel, using the **Insert as Excel Table** command, you can insert a table view as an Excel table. With this format, you can perform further analysis operations, such as sorting and filtering.

Notes:

- In Excel, you can insert multiple tables on a worksheet, but you cannot insert a table on top of an existing table. You can, however, do the following:
 - * To replace a table, select any cell within the table and click the Delete button on the Oracle BI EE ribbon. Then insert the table into the worksheet.
 - * To insert additional tables onto the worksheet, select a cell outside any table views or other view objects, and then insert the table.
- Excel may not recognize some custom formats in table views and Excel table views may not be recognized by Excel, resulting in an error when the view is inserted into Excel.

- **Pivot Table Views**

Pivot table views display data in the grouped format defined in Oracle Analytics Cloud, which is also referred to as native format. Features such as page item lists and group sectioning are maintained. Data can also be displayed in Excel pivot table format.

Using the **Insert** option, you can insert pivot table views into all Smart View clients in native format. As with inserting a table view, this format offers no sorting or filtering; cells with the same data are merged into a single cell.

In Excel, using the **Insert as Excel Pivot** option, you can also insert a pivot table view as an Excel pivot table. With this format, you may perform further analysis operations, such as pivoting, aggregating, drilling, sorting, and filtering.

Notes:

- When working with Excel pivot table views, only views with measure columns of numerical data type are supported.
- There can be only one Excel pivot table view per Excel worksheet. Additionally, Excel pivot table views are always inserted onto a new worksheet. This is the expected behavior, whether you are working with a single data source connection or with multiple connections.
- Excel may not recognize some custom formats in Pivot table views, resulting in an error when the view is inserted into Excel.
- Smart View does not have the “Graph Pivoted Results” functionality of Oracle Analytics Cloud. In order to view a graph of the same row, column and page dimensions of a particular pivot table, you must create a separate chart view in Oracle Analytics Cloud, and then insert that chart view in Smart View.

- **Graph Views**

Graph views display data by mapping the graph defined in Oracle Analytics Cloud to a graph type supported by Microsoft Office charts.

Using the **Insert as Image** option, you can insert graphs directly into Smart View clients as a static image. The image cannot be edited or refreshed.

Using the **Insert** option in all Smart View clients, you can edit and refresh graphs. Smart View attempts to match the graph style from Oracle Analytics Cloud as closely as possible, including graph properties such as visual effect (2D, 3D),

canvas size, chart title, subtitle, axis titles, legend and legend position, axis scale, data format (numeric, date, currency format), and title and label formatting.

If a matching Office chart type is not available, you can insert the graph view as an image. See [Supported Oracle Analytics Cloud Chart and Object Types](#) and [Unsupported Oracle Analytics Cloud Chart and Object Types](#).

- **Gauge Views and Funnel Graph Views**

In Oracle Analytics Cloud, gauge views and funnel graph views are separate object types from graph views.

Using the **Insert as Image** option, you can insert gauge and funnel views directly into Smart View clients as a static image. You cannot edit or refresh the image.

- **Title Views**

Title views display the title of a report, along with other information that is part of the Oracle Analytics Cloud title view.

Title views typically include title text, subtitle text, the analysis name, the date and time inserted, an optional logo, and an optional URL (for example, a help link). Title views are inserted into Smart View clients as a collection of text boxes and images grouped together as a single Office object.

- **Compound Views**

Compound views display data as an assembly of different views.

You can insert compound views into all Smart View clients. Smart View inserts all supported views that make up the compound view. Each type of view—table, pivot table, graph, gauge, funnel, filter, and title—is inserted into Smart View clients in its own default format.

In Word, all views are inserted next to and below each other filling pages in the active Word document.

In Excel or PowerPoint, users are prompted to choose between inserting all the views on one sheet or slide, or inserting each view on a separate sheet or slide.

Inserting Tables and Pivot Tables

The maximum number of rows and columns that you can insert depends on the version of Excel you are using. See Microsoft Excel documentation for worksheet size limits.

To insert a table or pivot table:

1. Place the cursor at the point in the Excel worksheet, PowerPoint slide, or Word page where you want the table or pivot table to begin.
2. In the catalog tree in the Smart View Panel, right-click a table or pivot table.
3. Select one of the following:
 - **Insert**—The selected table view or pivot table view is inserted in the format defined in Oracle Analytics Cloud. See [Figure 1](#) and [Figure 2](#)

If prompts are defined for the table or pivot table in Oracle Analytics Cloud, the **Prompt Selector** dialog box is displayed where you make selections on the data to display (otherwise, the table or pivot table is inserted directly). After the initial insert, you may edit the prompts by clicking the **Edit Prompts** icon in the

Oracle Analytics Cloud ribbon. See [Working with Prompts](#) for more information.

If page prompts are defined for the table or pivot table (view prompts in Oracle Analytics Cloud), you may edit them by clicking the **Edit Page Prompts** icon in the Oracle Analytics Cloud ribbon. See [Working with Page Prompts](#).

In Oracle Smart View for Office clients, the table is displayed in the form a grid.

- **Insert as Excel Table** (table views only)—The selected table view is inserted as an Excel table. Columns in the page prompt edge and section edge, if present, are moved to the top of the table as drop-down headings. Select this option when you want to use Excel operations to filter, define formulas, sort, and perform other Excel tasks.

When a table view is inserted as an Excel table, prompts that are defined in Oracle Analytics Cloud are not available.

The selected table is inserted on the worksheet.

Figure 18-5 Portion of a Table View Inserted as an Excel Table

	A	B	C	D	E
1	T05 Per Name Year	D1 Office	D2 Department	2- Billed Quantity	1- Revenue

15	2008	Mills Office	Operations Dept.	73890	713164.64
16	2008	College Office	Surplus Dept.	117934	1072744.45

- **Insert as Excel Pivot** (pivot table views only)—The selected pivot table view is inserted as an Excel pivot table. Columns in the page edge and section edge, if present, are mapped to the report filters area, and columns in the measures edge are moved to the values area. Select this option when you

want to perform further analysis, such as aggregating, pivoting, drilling, sorting, and filtering.

The selected table or pivot table is inserted on the worksheet. See [Figure 4](#).

Notes:

- When a pivot table view is inserted as an Excel Pivot table, prompts that are defined in Oracle Analytics Cloud are not available.
- When working with Excel pivot table views, only views with measure columns of numerical data type are supported.
- There can be only one Excel pivot table view per Excel worksheet. Additionally, Excel pivot table views are always inserted onto a new worksheet. This is the expected behavior, whether you are working with a single data source connection or with multiple connections.

Figure 18-6 Pivot Table Inserted as an Excel Pivot Table

You can edit tables and pivot tables as described in [Editing an Analysis in Oracle Analytics Cloud](#).

Inserting Graphs

When inserting graphs, Oracle Smart View for Office attempts to map the Oracle Analytics Cloud graph into a chart type supported by Microsoft Office 2007 charts. Further, Smart View attempts to match visual effects, such as 2D or 3D, and other graph properties such as canvas size, axis scale, data format, and formatting in terms of font styles and colors.

When a matching chart type is not available, the graph view can only be inserted as image.

See [Supported Oracle Analytics Cloud Chart and Object Types](#) and [Unsupported Oracle Analytics Cloud Chart and Object Types](#).

To insert a graph:

1. From the catalog, right-click a graph view.
2. Select an option:
 - **Insert**—The selected graph is inserted as an Excel chart, which can be edited, masked, and refreshed.

If prompts are defined for the graph in Oracle Analytics Cloud, the **Prompt Selector** dialog box is displayed where you make selections on the data to display (otherwise, the graph is inserted directly). After the initial insert, you may edit the prompts by clicking the **Edit Prompts** icon in the Oracle Analytics Cloud ribbon. See [Working with Prompts](#).

If page prompts are defined for the graph (view prompts in Oracle Analytics Cloud), you may edit them by clicking the **Edit Page Prompts** icon in the Oracle Analytics Cloud ribbon. See [Working with Prompts](#) for more information.

If no prompts are defined for this analysis, then the graph is inserted directly. See [Figure 1](#).

Figure 18-7 A Pie Chart View Inserted as an Excel Chart

You can edit graphs inserted this way as described in [Editing Views Created in Oracle Analytics Cloud](#).

- **Insert as Image**—The selected graph is inserted as an image of the graph, which cannot be edited or customized.

When a graph is inserted directly as an image, prompts, page prompts, and sections that are defined in Oracle Analytics Cloud are not available.

Note that gauge and funnel objects can only be inserted using the **Insert as Image** command.

Figure 18-8 A Pie Chart View Inserted as an Image

Once inserted, whether as an Excel chart or as an image, both types of graphs shown can be resized by stretching them.

 **Note:**

Due to a known Microsoft Office issue, when one or more charts are inserted in Word or PowerPoint 2010 (32-bit), the Excel instance that is launched in the background does not always close after refresh.

Supported Oracle Analytics Cloud Chart and Object Types

The following chart subtypes are supported:

- Line
- Bar: Vertical, Horizontal, Stacked Vertical, Stacked Horizontal, 100% Stacked Vertical, 100% Stacked Horizontal
- Area: Stacked, 100% Stacked
- Pie graph
- Bubble
- Scatter
- Line-bar Combination: Standard, Stacked
- Radar

The following graphs can only be inserted as an image:

- Time Series Line
- Pareto
- Waterfall

The following objects can only be inserted as an image:

- Gauge

- Funnel

Unsupported Oracle Analytics Cloud Chart and Object Types

The following view types are not supported:

- Performance Tiles
- Trellis views
- Map views
- Filters views—You can only view properties for filter views, using the **View Analysis Properties** command in the catalog tree.
- Selection Steps
- Column Selector
- View Selector
- Legend
- Narrative
- Ticker
- Static Text
- Logical SQL
- Create Segment
- Create Target List

Inserting Compound Views

To insert a compound view:

1. From the catalog, select the compound view to insert.
2. Right-click and select **Insert All Views**.
3. When prompted, choose an option:
 - **One object per sheet/slide** to insert each object in the compound view on a separate sheet in Excel, or a separate slide in PowerPoint.
 - **All objects on one sheet/slide** to display all objects on one Excel sheet or PowerPoint slide.

In Excel, objects are inserted on a new sheet or sheets, even if there are unused sheets in the workbook.

In Word, objects are placed adjacent to and below other objects on a sheet until the sheet is filled, and then continues filling as many sheets as required to hold all the objects.

The default display is selected for the table, pivot table, and graph view types; that is, the **Insert** action will be used automatically.

A message notifies you of unsupported view types in the compound view. Unsupported view types are not inserted.

 **Note:**

You may perform Refresh and edit prompt and page prompts for selected views. Unselected views from the compound view remain unchanged. See [Refreshing Views](#), [Working with Prompts](#), and [Working with Page Prompts](#).

Inserting Dashboards

Dashboards are displayed in the catalog tree as folders. A dashboard folder can be expanded to show dashboard pages; a dashboard page can be expanded to show the list of analyses included in that page. You can insert dashboard pages into Excel, PowerPoint, and Word.

To insert dashboard pages into Office applications:

1. From the catalog, right-click a dashboard page and select **Insert All Views**.
2. When prompted, choose an option:
 - **One object per sheet/slide** to insert each object in the dashboard on a separate sheet in Excel, or a separate slide in PowerPoint.
 - **All objects on one sheet/slide** to display all objects on one Excel sheet or PowerPoint slide.

In Word, objects are placed adjacent to and below other objects on a sheet until the sheet is filled, and then continues filling as many sheets as required to hold all the objects.

Default display is selected for the table, pivot table, and graph view types; that is, the **Insert** action is used automatically.

A message notifies of unsupported view types in the dashboard. Unsupported view types are not inserted.

 **Note:**

You may perform Refresh and edit prompt and page prompts for selected views. Unselected views from the dashboard remain unchanged. See [Refreshing Views](#), [Working with Prompts](#), and [Working with Page Prompts](#).

Working with Prompts

Prompts enable users to specify criteria that determines the content of the view that they are inserting. Oracle Smart View for Office supports both prompts and page prompts. See [Working with Page Prompts](#) for information on page prompts.

Prompts in Smart View are the equivalent of prompts in Oracle Analytics Cloud. Smart View only supports column prompts.

Prompts are defined at the analysis level in Oracle Analytics Cloud. Users are prompted to enter values for these prompts each time a view is inserted in Smart View.

If prompts are defined on an analysis in Oracle Analytics Cloud, then when you insert a table, pivot table, or graph view from the analysis into Smart View, you are prompted to select the data to be displayed for that view. When inserting a compound view from an analysis that has prompts defined, you are prompted to enter values only one time for all the views in that compound view.

For example, a prompt on Year is designated for an analysis, and the years 2010, 2011, and 2012 are available to choose from. When you insert a table, pivot table, or graph, you are prompted to select which year's data to display: 2010, 2011, or 2012. Or, you can choose to insert the compound view, and the prompt selection you make is applied to all the views inserted. After insertion, you can edit the prompts on each individual view to select another year's data to display.

Views can only be edited individually. The edit operation will prompt you for the values to be selected for each view that is being edited.

You may edit prompts in views that were inserted, or copied and pasted.

Note:

Prompts defined on hierarchical columns in Oracle Analytics Cloud are not supported in Smart View.

To edit prompts:

1. From the worksheet, select a view:
 - Graph views—Select the graph.
 - Table and pivot table views—Select a cell in the table.
2. From the Oracle Analytics Cloud ribbon, select the **Edit Prompts** button to display your original selections.

Figure 18-9 Edit Prompts Button

If the report definition has changed on the server, your selections are reset, and you must select all prompts and columns again.

3. In the **Prompt Selector**, modify the prompt selections.

Depending on how the prompt was set up in Oracle Analytics Cloud, you may be selecting data directly from a drop-down list on the **Prompt Selector**. You may also be picking values from the **Value Selector** dialog box.

[Figure 2](#) is an example of a **Value Selector**, where the years 2008, 2009, and 2010 were selected for display.

Figure 18-10 Value Selector Dialog Box Showing the Years 2008, 2009, and 2010 Selected

After you click **OK** in the **Value Selector**, the selections populate the first prompt in the example **Prompt Selector**. A second prompt in the example **Prompt Selector** requires that you directly enter an amount; in this example, the amount to display is Billed Quantity greater than \$5,000.

The completed **Prompt Selector** dialog then looks like [Figure 3](#).

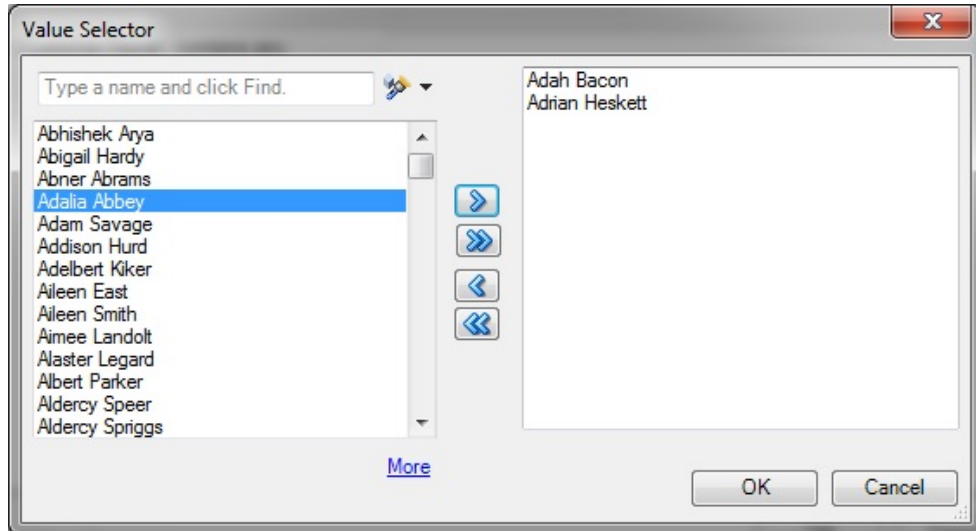

Figure 18-11 Filled-In Prompt Selector

In some cases, the data to choose from can be exceedingly long. To accommodate loading large amounts of data in the **Value Selector**, Smart View presents values in groups. Scroll and make selections from the first group shown, then click **More** to view and make selections from the next group. Continue

clicking **More** until you have viewed and made selections from the entire data list. [Figure 4](#) shows an example.

Figure 18-12 Value Selector Showing "More" for Large Amounts of Data

4. Click **OK** to close the **Prompt Selector**.

After you make selections and click **OK**, the view is immediately refreshed and reflects your selections.

5. Repeat this procedure to edit the prompts to change the output displayed.

Working with Page Prompts

Page prompts enable users to specify criteria that determines the content of the view that has been inserted. Oracle Smart View for Office supports both page prompts and prompts. See also [Working with Prompts](#).

Page Prompts in Smart View are the equivalent of view prompts in Oracle Analytics Cloud. View prompts are specified on individual views within an analysis. Smart View supports table prompts, graph prompts, and gauge prompts in Oracle Analytics Cloud; these types of prompts are called page prompts in Smart View.

Page prompts may vary on individual views within an analysis. An individual table view within an analysis may have a page prompt set on Year, and a pivot table view within the same analysis may have a page prompt set on Line of Business.

When you first insert a view that contains page prompts, a view state is selected by default. For example, if a prompt on Year is specified on a particular view within an analysis, and the years 2010, 2011, and 2012 are available to choose from, you are not prompted for these at the time of insertion. Instead, a default state of the view is inserted. For example, 2010 data may automatically be inserted, as the first year in the list of years available. You can then edit the page prompts to select another year's data to display for this view.

You may edit page prompts in views that have been inserted, or copied and pasted.

To edit page prompts:

1. From the worksheet, select a view:
 - Graph views—Select the graph.
 - Table and pivot table views—Select any cell in the table.
2. From the Oracle Analytics Cloud ribbon, select the **Edit Page Prompts** button to display the default page prompt selections for a particular view.

Figure 18-13 Edit Page Prompts Button

If the report definition has changed on the server, your selections are reset, and you must select all page prompts again.

3. In the **Page Selector**, modify the page prompt selections by selecting from the drop-down lists.

[Working with Page Prompts](#) shows a **Page Selector** dialog box, where users select a Year and a Line of Business. In the example, selections were made to display 2010 for the year, and Electronics for the Line of Business.

Figure 18-14 Filled-in Page Selector

4. Click **OK** to close the **Page Selector**.
After you make selections and click **OK**, the view is immediately refreshed and reflects your selections.
5. Repeat this procedure to edit the page prompts to change the output displayed.

Specifying Preferences for Refreshing Views

You can specify preferences for refreshing each view. The refresh preferences that you set for each view within a worksheet, slide, or page are saved along with the Office document (Excel workbook, PowerPoint slide presentation, or Word document).

To specify preferences for refreshing a view:

1. Ensure that one or more Oracle Analytics Cloud views are inserted into Oracle Smart View for Office.

2. In **Document Contents**, click  to refresh the content of the pane.

All views that were inserted into the active Office application are displayed in **Document Contents** in a tree format.

3. Select a view in **Document Contents**, and then select **Properties**.

4. In **Properties**, select an option from **Refresh Preferences**:

- **Refresh Data**—Refreshes only the data points in the selected view or analysis.

Any changes made to formatting in the sheet, slide, or page are retained.

- **Replace View**—Replaces the entire view, including any formatting changes set in Oracle Analytics Cloud.

If you select this option, your prompt and graph selections and custom formatting are lost upon refresh if the view definition has changed.

Note:

Oracle Business Intelligence Enterprise Edition title views are not included in refresh actions, so all customizations to a title view are retained when you refresh the worksheet or workbook.

- **Do not refresh**—Refreshing is not allowed.
5. Click **OK** to save the **Refresh Preference** selection.

Continue with [Refreshing Views](#).

Refreshing Views

You can refresh the data from Oracle Analytics Cloud in your inserted views. You have the option of refreshing selected views or refreshing all views, depending on the Office document type, as follows.

Excel

- Individual views
- Individual worksheets
- Entire workbook

PowerPoint

- Individual views
- Individual slides
- Entire presentation

Word

- Individual views
- Entire document

You can refresh views from the Document Contents pane, the Oracle BI EE ribbon, or the Smart View ribbon.

The refresh action is limited according to the Refresh Preference set for a selected view. See [Specifying Preferences for Refreshing Views](#) for information.

Note that when you refresh, title views are not included in refresh actions, so all customizations to a title view are retained when you refresh the Office document.

When there are multiple objects on an Office document, if you attempt to refresh the document without having already connected, then you will be prompted for your login credentials once for all objects. If you choose to cancel instead, the **Connect to Data Source** dialog box will appear for each object on the sheet, and you must click **Cancel** for each object. For example, if there are six objects on the sheet, the dialog box will appear six times, once for each object.

To refresh Oracle Analytics Cloud views from the **Document Contents** pane:

1. In **Document Contents**, ensure that **Oracle Analytics Cloud - Document Hierarchy** is displayed in the drop-down list box.
2. In **Document Contents**, click  to refresh the contents of the tree.

From **Document Contents**, you can refresh individual views in all Office applications, individual worksheets, and individual slides.

3. Perform an action:
 - To refresh a selected view in an Excel sheet, PowerPoint slide, or Word document, select the view object from the tree in **Document Contents**, and then select the **Refresh View** action from the right-click menu or click the **Refresh View** link at the bottom of the pane.
Repeat for each view that you want to refresh.
 - To refresh all Oracle Analytics Cloud views on a selected Excel worksheet or PowerPoint slide, select the sheet or slide from the tree in **Document Contents**, and then select the **Refresh** action from the right-click menu or click the **Refresh** link at the bottom of the pane.

Repeat for each sheet or slide that you want to refresh.

To refresh all Oracle Analytics Cloud views on a worksheet or slide, or an entire Word document, using the ribbons:

1. Perform an action:
 - Select the worksheet or slide to make it active.

- Place your cursor in the Word document to select it.
2. Click **Refresh** in the Oracle BI EE ribbon or the Smart View ribbon.

To refresh all Oracle Analytics Cloud views in an Excel workbook, PowerPoint presentation, or Word document:

1. Place your cursor anywhere in the workbook, presentation or document to select it.
2. Perform an action:
 - To refresh all Oracle Analytics Cloud views in an Excel workbook, click the down arrow in **Refresh** in the Smart View ribbon and select **Refresh all Worksheets**. [Figure 1](#) shows the Refresh icon with the arrow:

Figure 18-15 Refresh Icon with Down Arrow in Excel and PowerPoint

Alternatively, click the down arrow in **Refresh** in the Oracle BI EE ribbon and select **Refresh Workbook Data**.

- To refresh all Oracle Analytics Cloud views in a PowerPoint presentation, click the down arrow in **Refresh** in the Smart View ribbon and select **Refresh All Slides**.

Alternatively, click the down arrow in Refresh in the Oracle BI EE ribbon and select **Refresh Presentation Data**.

- To refresh all views in a Word document, click **Refresh** in the Oracle BI EE ribbon or the Smart View ribbon. The Refresh icon in Word does not contain a down arrow, as shown in [Figure 2](#).

Figure 18-16 Refresh Icon in Word

 **Note:**

If requested, provide your credentials for Oracle Analytics Cloud.

Masking Data in Views

You can mask data in the Oracle Analytics Cloud views that you insert in Office documents and in views you create using the View Designer. You have the option of masking data in:

- Selected views
- All views on sheet or a slide
- All views in an Office document

Using the Mask Data functionality in Oracle Smart View for Office, you can perform these actions:

- Select a single Smart View object in an Excel sheet or PowerPoint slide and mask data only in that object
- Mask data in the active Excel worksheet or PowerPoint slide
- Mask data in the active workbook, presentation, or Word document

You can invoke Mask Data from these locations:

- Document Contents in the Smart View Panel
- Oracle Analytics Cloud ribbon

Masking Data for an Individual View

To mask data in an individual view in an Excel worksheet or PowerPoint slide:

1. In Excel or PowerPoint, click  in **Document Contents** to refresh the contents of the tree.

Note:

Data in Word documents can only be masked in their entirety; you cannot mask data in individual views in Word.

2. Locate the view with data that you want to mask in **Document Contents**, and then select it.
3. Click the **Mask Data** link in **Document Contents**.
In a table object, cells are replaced with the text, "Need refresh"; in a graph, the area becomes blank and a small lock image is displayed.
4. Save the current workbook or presentation.
The masked state of the view remains intact after saving.
5. To display the data in the masked view, click  in **Document Contents**, select the view in the tree, and then click the **Refresh View** link.

Masking Data on a Sheet or Slide

To mask data on an Excel worksheet or PowerPoint slide:

1. Choose a method to select a sheet or slide:
 - Place the cursor directly in a sheet or slide
 - In **Document Contents**, click , locate the sheet or slide in the tree, and then select it.
2. Choose a method to mask data for all objects on the selected sheet or slide:

- In the Oracle Analytics Cloud ribbon, click the **Mask Data** button.

Figure 18-17 Mask Data Button

- In **Document Contents**, click the **Mask Data** link.

Data on the sheet or slide is masked.

 **Note:**

Data in Word documents can only be masked in their entirety; you cannot mask data on individual pages in Word.

3. Save the current workbook or presentation.
The masked state of the sheet or slide remains intact after saving.
4. To display the data in the masked sheet or slide, click  in **Document Contents**, select the sheet or slide in the tree, and then click the **Refresh** link.
Alternatively, place the cursor in the sheet or slide to refresh, and then click

Masking Data in an Entire Office Document

To mask data in an entire Office document:

1. From the Oracle Analytics Cloud ribbon in the opened Office document, perform an action:

- **Excel:** Click the down arrow in  and select **Mask Workbook Data**.

- **PowerPoint:** Click the down arrow in  and select **Mask Presentation Data**.

- **Word:** Click

Note:

Word documents can only be masked in their entirety; you cannot mask individual pages in Word.

2. Save the current Office document.

The masked state of the workbook, presentation, or document remains intact after saving.

3. To display the masked data, click in **Document Contents**, select the sheet, slide, or document in the tree, and then click the **Refresh** link.

Alternatively, place the cursor in the sheet, slide, or document to be refreshed, and

then click **Refresh**.

Viewing Properties of an Oracle Analytics Cloud Object

You can view various properties of a selected object.

To view the properties of an Oracle Analytics Cloud object:

1. Select an Oracle Analytics Cloud view.
Select an actual view object and not a sheet or slide.
2. Click the **Properties** link at the bottom of the **Document Contents** pane.

Copying and Pasting Oracle Analytics Cloud Objects Between Office Applications

You can copy Oracle Analytics Cloud objects within and between Office applications as follows:

- Graphs can be copied within and between any Office application.
- Tables and pivot tables can be copied within and between Word and PowerPoint.
- Tables and pivot tables cannot be copied within Excel, from Excel to another Office application, or from another Office application to Excel.
- Tables and pivot tables can only be copied and pasted by sections.

Copying and Pasting a Graph View

To copy and paste a graph view:

1. In Excel, Word, or PowerPoint, select the graph view to copy.

You can use Document Contents to locate the view, but then select the graph directly in the sheet, slide, or page.

2. From the **Oracle Analytics Cloud** ribbon, click  **Copy**.
3. Access the Office application and position the cursor where you want to paste the graph view.

For example, if you are pasting within an Office application (or if you are copying from Excel and want to paste into PowerPoint, open PowerPoint), position the cursor at the point within the Office document where you want to paste the object.

4. Click .
5. Repeat for all graphs that you want to copy and paste.

Copying and Pasting a Table or Pivot Table View

To copy and paste a table view or pivot table view:

1. In Word or PowerPoint, select the table view or pivot table view to copy.
You can use Document Contents to locate the view, but then select the table or pivot table directly in the slide or page.
2. From the **Oracle Analytics Cloud** ribbon, click .
3. Access the Office application and position the cursor where you want to paste the table or pivot table view.

For example, if you are pasting within an Office application (or if you are copying from Word and want to paste into PowerPoint, open PowerPoint), position the cursor at the point within the Office document where you want to paste the object.

4. Click .
5. Repeat for all tables or pivot tables that you want to copy and paste.

Editing an Analysis in Oracle Analytics Cloud

If the available view does not display the data required, or the data is not displayed as desired, you can edit the view in Oracle Analytics Cloud.

Note:

To edit a view in Oracle Analytics Cloud, you must have the required permissions.

To edit a view in Oracle Analytics Cloud:

1. From the Catalog, right-click the view, and then select **Edit Analysis in Answers**.
2. In the login screen, enter your credentials for Oracle Analytics Cloud.

The selected view is displayed in Oracle Analytics Cloud.

3. In Oracle Analytics Cloud, edit and save the view.
4. Return to the Office application.
5. From the **Oracle Analytics Cloud** ribbon, click **Refresh**, and verify that your changes are reflected in the view.

Copying and Pasting Views From Oracle Analytics Cloud to Office

You can copy and paste views from Oracle Analytics Cloud to Oracle Smart View for Office.

When you refresh pasted views, the data is refreshed, but the view definition is not, even if its definition has been modified in Oracle Analytics Cloud.

Note:

When copying and pasting views from Oracle Analytics Cloud to Smart View, some formatting may not be imported to Office.

To copy and paste a view:

1. Ensure that you are logged into Oracle Analytics Cloud.
2. From Oracle Analytics Cloud or Interactive Dashboards, launch the analysis that you want to copy.
3. Click the **Copy** link at the bottom of the analysis (displayed only if the analysis is enabled for copying).
4. Open an Office application, such as Excel, and connect to the appropriate Oracle Analytics Cloud data source.
5. From the **Oracle Analytics Cloud** ribbon, click  **Paste**.

Editing Views Created in Oracle Analytics Cloud

Related Topics

- [What Can and Cannot Be Edited](#)
- [Editing Pivot Tables Inserted into PowerPoint](#)
- [Other Guidelines](#)

What Can and Cannot Be Edited

Note the following when editing views that were created in Oracle Analytics Cloud:

- Table views and graph views that are inserted or pasted as Microsoft objects using the **Insert** command can be edited in Excel, PowerPoint, or Word.
- Table views that are inserted or pasted as lists, and graphs views that are inserted as images cannot be edited in Excel.

- Views that are inserted or pasted as images cannot be edited in PowerPoint.

Editing Pivot Tables Inserted into PowerPoint

Consider the following items when editing pivot table views that were created in Oracle Analytics Cloud.

Small Pivot Tables

For small pivot tables in PowerPoint, to change column width and row height, use the mouse to drag column and row borders to the desired height and width.

Large Pivot Tables

To adjust column width and row height in large pivot tables, especially where rows and columns are outside of the slide area, use PowerPoint's table editing tools in as follows:

1. Select the pivot table.
2. Select the **Layout** ribbon in PowerPoint.
3. Select a row or column in the pivot table.
4. Adjust height and width by changing the height and width values in the **Cell Size** group.

Other Guidelines

Note the following guidelines when editing views that were created in Oracle Analytics Cloud:

- Oracle Smart View for Office does not support duplication of charts or tables through the PowerPoint "Duplicate Slide" command.

In PowerPoint, after duplicating a slide containing a chart, any attempt to update the prompts of either chart result in the prompts for only the original chart being updated. The chart on the duplicate slide is never updated.

For a pivot table inserted into a PowerPoint slide then duplicated, if you change the prompt for either pivot table, only the pivot table original slide is updated, whether you changed the prompt in the original slide or the duplicate.
- Some modifications made to graphs using Microsoft Office formatting tools—such as changes to colors—may not persist when prompts are changed and the graph is refreshed. Smart View does not keep track of such formatting changes; this is done by Microsoft Office. When a graph series is removed, the format of the series is removed by Office as well. Changing prompts can cause the series count and order to change, which means the formatting will also change. This is expected behavior.

Working with Views Using the View Designer

Using the View Designer in Oracle Smart View for Office, you can create ad hoc views based on an Oracle Analytics Cloud subject area.

Views created in Smart View can be saved to the Oracle BI Presentation Catalog Oracle Business Intelligence and edited in either Smart View or Oracle Analytics Cloud.

View Designer is available in Microsoft Excel, Word, and PowerPoint.

Launching the View Designer

Depending on whether you are creating a view or editing a view, you can launch the View Designer using the methods described in this topic.

To launch the View Designer:

1. Perform an action:
 - To create a new view:
 - Right-click the **Catalog Root** node in the catalog tree, and then select **Create New View**.
 - Select the **Catalog Root** node in the catalog tree, and then select **Create New View** at the bottom of the Smart View Panel.
 - From the Oracle BI EE ribbon ribbon, click the View Designer icon.

Figure 18-18 View Designer Icon

You must already be connected to a view in the catalog tree to enable the **Oracle Analytics Cloud** ribbon.

- To edit a view (the view must have been created and inserted from View Designer):
 - From the catalog tree, select a view to edit that was created in View Designer and saved to the Oracle BI Presentation Catalog from Oracle Smart View for Office, and then select the **Load view in View Designer** link at the bottom of the Smart View Panel.
 - Select an existing view on a worksheet in the current or in a saved Office document and click the View Designer icon (see [Figure 1](#)).
 - To edit an Excel Pivot Table, click anywhere in the current or in a saved worksheet, even outside the boundaries of the Excel Pivot Table, and click the View Designer icon (see [Figure 1](#)).

Note:

You can only edit views that were created and inserted from the View Designer in Smart View. To edit views created in Oracle Analytics Cloud, you must use Oracle Analytics Cloud.

The **Design Layout** tab of the View Designer is displayed. [Figure 2](#) shows the Design Layout tab of the View Designer with selections made in the Page, Section, Row, Column, and Measures edges.

Figure 18-19 View Designer, Design Layout Tab for Pivot Table Layout

2. Continue the view design process by following the procedure in [Defining the View Type and Display Style](#).

Defining the View Type and Display Style

When you are creating a view, you define the view type and display style. This is done only once, during the view creation process. Once the view is created, you cannot edit these two settings.

To define the view type and display style:

1. If you have not already done so, invoke the View Designer (see [Launching the View Designer](#)).
2. In **View Type**, select the type of view that you are creating:
 - Table
 - Pivot Table (the default)
 - Line Graph

- Bar Graph
- Column Graph
- Area Graph
- Pie Chart
- Scatter Chart
- Stacked Column Graph

The selection that you make affects the options available in **Display Style** along with the fields in the layout area.

Note:

You cannot change this selection when editing the view either in Oracle Smart View for Office or Oracle Analytics Cloud.

3. In **Display Style**, select a **View Type** and **Display Style** option from [Table 1](#). Display style determines how the view is inserted into Excel.

Note:

You cannot change this selection when editing the view either in Smart View or Oracle Analytics Cloud.

Table 18-1 View Type Selected and the Display Style Available

View Type Selected	Display Style Available
Table	Excel Table Table
Pivot Table (default)	Excel Pivot Table (default) Pivot Table
Line Chart	Excel Chart
Bar Chart	Chart Image
Column Chart	
Area Chart	
Pie Chart	
Scatter Chart	
Stacked Column Chart	

4. Continue the view design process by following the procedure in [Defining the View Layout](#).

Defining the View Layout

Define the view layout during the view creation process. You can also edit the view layout of views created in View Designer.

To define or edit the view layout:

1. If you have not already done so, invoke the View Designer (see [Launching the View Designer](#)).
2. If you are creating a new view, complete the steps in [Defining the View Type and Display Style](#).

If you are editing a view, continue with step 3.

3. In the left pane of the View Designer, expand a subject area and the folders to view the columns that you want to work with.
4. Drag columns from the expanded subject area tree and drop them in the layout area.

The edges in the layout area vary depending on the selections that you made in the **View Type**, as described in [Table 1](#).

Table 18-2 View Type Selected and the Edges Available in the Layout Area of the View Designer

View Type Selection	Edges In Layout Area
Table	Page, Section, Row, Column, Measures Optional: In the Row edge, select the Row Grand Total check box.
Pivot Table (default)	Page, Section, Row, Column, Measures Optional: In the Row edge, select the Row Grand Total check box. Optional: In the Column edge, select the Column Grand Total check box.
Line Chart	Page, Section, Group By (X), Lines (X), Data: Lines (Y)
Bar Chart	Page, Section, Group By (X), Bars (X), Data: Bars (Y)
Column Chart	Page, Section, Group By (X), Columns (X), Data: Columns (Y)
Area Chart	Page, Section, Group By (X), Area (X), Data: Areas (Y)
Pie Chart	Page, Section, Pies, Slices, Slice Size
Scatter Chart	Page, Section, Group By (X), Vary by Color, Data
Stacked Column Chart	Page, Section, Group By (X), Bars (X), Data: Bars (Y)

5. **Optional:** Perform any of these tasks, as applicable, on the columns you have dragged to edges in the View Designer:
 - To move a column between edges, drag the column from one edge and drop it on another; for example, drag a column from the **Row** edge and drop it on the **Column** edge.
 - To reposition the column within the edge, click on a column name and select the **Up** or **Down** arrow.

- To add a subtotal to a column or row in an edge, right-click a column and select **Subtotal**.

 **Note:**

The **Subtotal** option is ignored when applied to the bottom column in an edge, even though the option is selectable in the drop-down menu.

- To add columns to filter criteria for this view, click on a column and select **Add to Filter**.

The columns that you select are added to the **Filter Expression** area of the **Define Filters** tab, where you can further define them. See [Defining the Filter Expression for Views in View Designer](#) for more information.

- To remove a column from an edge, click on the column and select **Remove**.

6. Optional: If you are working with a table or pivot table view, regardless of the display style:

- **Pivot Table view:** In the **Row** and **Column** edges, select or clear the **Row Grand Total** and **Column Grand Total** check boxes as you require.
- **Table view:** In the **Row** edge, select or clear the **Row Grand Total** check box.

7. Optional: If you are working with a pivot table view that has the pivot table display style, you can perform these actions with the **Measure Label** element:

- Reorder the **Measure Label** element within the **Column** edge.
- Move the **Measure Label** to any other edge *except* the **Measure** edge.

Notes about the **Measure Label** element:

- The Measure Label element represents the labels for all the Measures columns in the Measures edge. In the View Designer, the Measure Label element appears by default in the **Column** edge.
- Measure Label is only available when both the **View Type** and **Display Type** is **Pivot Table**.
- Experiment with moving the Measure Label element to another edge or reordering it within the Column edge. The result may be a more readable pivot table layout.
- Measure Label cannot be removed from the View Designer.
- Measure Label cannot be placed in the Measures edge.

8. To define filters, click the **Filters** tab and continue with [Defining the Filter Expression for Views in View Designer](#).

If you do not plan to define filters, click **OK**:

- If you are creating a new view, the view is inserted into Excel.
- If you are editing a view, the old view is removed and the updated view is inserted.

Defining the Filter Expression for Views in View Designer

Columns that you added for filtering in [Defining the View Layout](#) are automatically added to the Filter Expression area of the Define Filters tab in View Designer.

Whether you are creating a new view or editing an existing view, you can add more filter columns, and further define and refine filters on all columns.

To define or edit the filter expression for a view created in View Designer:

1. Complete the steps in [Defining the View Layout](#), selecting the **Define Filters** tab.
The columns that you added for filtering should be displayed on the **Define Filters** tab.
2. **Optional:** Add more columns to the **Filter Expression** area of the **Define Filters** tab.
3. Select a column in **Filter Expression**.
4. Select a corresponding filter operator from the drop-down list next to the column name.

The operator list from which you can choose is populated based on the type of column that you selected.

Guidelines for choosing an operator are described in [Filter Operators](#).

5. Specify a filter value in the last column by clicking and making a selection in the Value Selector.

For example, here is a set of filters based on the Sample Sales database:

The filters that you define are summarized in the **Filter Summary** pane. For example, for the filters defined in this step, the summary looks like this:

In some cases, the data to choose from can be exceedingly long. To accommodate loading large amounts of data in the Value Selector, Oracle Smart View for Office presents values in groups. Scroll and make selections from the first group shown, then click **More** to view and make selections from the next group.

Continue clicking **More** until you have viewed and made selections from the entire data list. [Figure 1](#) shows an example.

Figure 18-20 Value Selector Showing “More” for Large Amounts of Data

6. **Optional:** If required, click the logical operator button in **Filter Expression** and make a selection to change the operator:

- **AND**
- **OR**

The default logical operator is **AND**.

Changing the logical operator on one line of the filter expression automatically changes the operator for all lines in the expression so that the operator is the same for all lines.

7. **Optional:** To remove a line from the filter expression, right-click the column button in the line, and then select **Remove**, as shown in [Figure 2](#).

Figure 18-21 Remove Option that is Displayed When Right-clicking a Column in a Filter Expression

8. When you are finished defining filters, click **OK** to insert the view into Excel.

Filter Operators

Use the guidelines in [Table 1](#) when choosing an operator and specifying the required values. The operator list from which you can choose is populated based on the

function that you are performing (for example, creating a filter or creating a dashboard prompt) and the type of column that you selected.

Table 18-3 Guidelines for Choosing an Operator When Creating a Column Filter

Operator	Usage Guidelines
is equal to / is in	Valid for a column that contains text, numbers, or dates. Specify a single value or multiple values. Results include only records where the data in the column matches the value in the filter.
is not equal to / is not in	Valid for a column that contains text, numbers, or dates. Specify a single value or multiple values. Results include only records where the data in the column does not match the value in the filter.
is less than	Valid for a column that contains numbers or dates. Specify a single value. Results include only records where the data in the column is less than the value in the filter.
is greater than	Valid for a column that contains numbers or dates. Specify a single value. Results include only records where the data in the column is greater than the value in the filter.
is less than or equal to	Valid for a column that contains numbers or dates. Specify a single value or multiple values. Results include only records where the data in the column is less than or the same as the value in the filter.
is greater than or equal to	Valid for a column that contains numbers or dates. Specify a single value or multiple values. Results include only records where the data in the column is greater than or the same as the value in the filter.
is between	Valid for a column that contains numbers or dates. Specify two values. Result include only records where the data in the column is between the two values in the filter.

Table 18-3 (Cont.) Guidelines for Choosing an Operator When Creating a Column Filter

Operator	Usage Guidelines
is null	<p>Valid for a column that contains text, numbers, or dates. Do not specify a value. The operator tests only for the absence of data in the column. Results include only records where there is no data in the column.</p> <p>Sometimes it might be useful to know whether any data is present, and using the is null operator is a way to test for that condition. For example, suppose your business has a worldwide address book and you want to extract the United States addresses only. You could do this by checking for the presence or absence of data in the "State" field. This field should be unpopulated (null) for non-United States addresses and populated (not null) for United States addresses. You can obtain a list of United States addresses without the need to check the column for a specific value.</p>
is not null	<p>Valid for a column that contains text, numbers, or dates. Do not specify a value. The operator tests only for the presence of data in the column. Results include only records where there is data in the column.</p>
is ranked first	<p>Valid for a column that contains text or dates. Specify a single value. Results include only the first n records, where n is a whole number specified as the value in the filter.</p> <p>This operator is for ranked results. For example, you could use this operator to obtain a list that contains the first 10 brand names in alphabetical order.</p>
ranked last	<p>Valid for a column that contains text or dates. Specify a single value. Results include only the last n records, where n is a whole number specified as the value in the filter.</p> <p>This operator is for ranked results. For example, you could use this operator to obtain a list of the dates of the last 10 sales transactions.</p>
is in top	<p>Valid for a column that contains numbers. Specify a single value. Results include only the first n records, where n is a whole number specified as the value in the filter.</p> <p>This operator is for ranked results. For example, you could use this operator to obtain a list of the top 10 sales in dollars.</p>

Table 18-3 (Cont.) Guidelines for Choosing an Operator When Creating a Column Filter

Operator	Usage Guidelines
is in bottom	Valid for a column that contains numbers. Specify a single value. Results include only the last n records, where n is a whole number specified as the value in the filter. This operator is for ranked results. For example, you could use this operator to obtain a list of the customers reporting the fewest problems.
contains all	Valid for a column that contains text, numbers, or dates. Specify a single value or multiple values. Results include only records where the data in the column contains all of the values in the filter.
does not contain	Valid for a column that contains text, numbers, or dates. Specify a single value or multiple values. Results include only records where the data in the column does not contain any of the values in the filter.
contains any	Valid for a column that contains text, numbers, or dates. Specify a single value or multiple values. Results include only records where the data in the column contains at least one of the values in the filter.
begins with	Valid for a column that contains text, numbers, or dates. Specify a single value. Results include only records where the data in the column begins with the value in the filter.
ends with	Valid for a column that contains text, numbers, or dates. Specify a single value. Results include only records where the data in the column ends with the value in the filter.
is LIKE (pattern match)	Valid for a column that contains text. Specify a single value or multiple values. Requires the use of a percent sign character (%) as a wildcard character. You may specify up to two percent sign characters in the value. Results include only records where the data in the column matches the pattern value in the filter.
is not LIKE (pattern match)	Valid for a column that contains text. Specify a single value or multiple values. Requires the use of a percent sign character (%) as a wildcard character. You may specify up to two percent sign characters in the value. Results include only records where the data in the column does not match the pattern value in the filter.

Publishing Views

The ad hoc view definition that you create in View Designer can be published to the Oracle BI Presentation Catalog in Oracle Analytics Cloud after you have inserted it in Oracle Smart View for Office. When you publish an ad hoc view, a new analysis in Oracle Analytics Cloud is created with the default views of compound view and title view, along with the applicable user-created view.

When publishing a view that you were editing, you have the option of overwriting the view in the Oracle BI Presentation Catalog, or specifying a new name for the view and publishing the edited version, keeping two versions of the view in Oracle Analytics Cloud.

To publish a view to the Oracle BI Presentation Catalog:

1. Position the cursor within the view that you just created or edited in View Designer.
2. In the Oracle Analytics Cloud ribbon, click the **Publish View** icon ([Publishing Views](#)).

Figure 18-22 Publish View Icon

3. In **Save Report**, click  next to **Catalog Root**, and then navigate to the location in the Oracle BI Presentation Catalog where you will save the view.
4. In **Analysis Name**, provide a name.

If you are publishing an edited view, you have the option of overwriting the view you edited by providing the same name, or providing a new name and keeping the original version of the view intact.

5. Click **Save**.

The default naming convention is applied to the components of the view that is saved; for example, Table 1, Pivot Table 1, Chart 1, and so on.

Example 18-1 Notes

- If you are publishing a view that was created and then edited in Smart View, you may overwrite it.
- An error message is displayed if you attempt to overwrite an existing view in the Oracle BI Presentation Catalog if the view was created in Oracle Analytics Cloud.
- To view the changes made in Oracle Analytics Cloud, you must re-insert the view.
- Once published, you may make changes to the view as follows:
 - If the view was created in Oracle Analytics Cloud, then use Oracle Analytics Cloud.
 - If the view was created in Smart View, you may edit it either in Smart View or Oracle Analytics Cloud.

- You may refresh the data in views created in View Designer.
Ad hoc views created in View Designer remain as a snapshot and will not be kept in sync with the analysis published to the catalog.
- Changes made to the view in Oracle Analytics Cloud will not be reflected into the ad hoc view that you rendered in Excel. You must reinsert the view from the catalog tree into a new sheet in Smart View in order to view the changes that were made in Oracle Analytics Cloud.

Editing Views Created in View Designer

Related Topics

- [About Editing Views Created in View Designer](#)
- [Guidelines for Editing Views Created in View Designer](#)
- [Accessing the View to Edit](#)
- [Determining Where a View was Created](#)
- [Editing Views Created in View Designer](#)

About Editing Views Created in View Designer

Use the View Designer in Oracle Smart View for Office to edit the views you created or edited in View Designer.

Do not use the View Designer in Smart View in these cases:

- To edit the views you created in Oracle Analytics Cloud
- To edit views you created in Smart View and then edited in Oracle Analytics Cloud

The process flow for editing views involves the following tasks:

- Reviewing the information in [Guidelines for Editing Views Created in View Designer](#)
- [Accessing the View to Edit](#)
- [Determining Where a View was Created](#)
- [Editing Views Created in View Designer](#)

Guidelines for Editing Views Created in View Designer

- Only views created and inserted from the View Designer in Oracle Smart View for Office can be edited using the View Designer.
- Views created in Smart View may also be edited in Oracle Analytics Cloud. However, views created in Smart View and then further edited in Oracle Analytics Cloud cannot afterward be edited in View Designer.

Note:

To edit views created in Oracle Analytics Cloud, use the Oracle Analytics Cloud application (see [Editing an Analysis in Oracle Analytics Cloud](#)).

- When you use View Designer to edit a table view or pivot table view, Smart View performs a replace operation, effectively replacing the view on the sheet with the newly-edited view; that is, the table on the sheet is deleted and a new table is inserted. If the new table has more rows or columns than the previous table, any content or formulas that you may have added to the sheet prior to editing the view in View Designer may be removed and you will need to add them again.

Accessing the View to Edit

Note:

This procedure applies to views that were created in View Designer.

To access views to edit:

1. Access a view in one of following ways:
 - **During the design session**—For example, after you created the view in View Designer and clicked OK to insert the view, select the view in the Office document and click the View Designer icon to relaunch the View Designer for editing.
 - **From a view in a saved Office document**—Select the view in the Office document and click the View Designer icon to relaunch the View Designer for editing.
 - **From a published view in the Presentation Catalog**—Use the **Load view in View Designer** command to load the view from the catalog tree into the View Designer in Oracle Smart View for Office. When you select a view, the **Load view in View Designer** command is available in the Action Panel or from the right-click menu.

Remember, to select a view to edit from the catalog tree, *do not* try to insert it first into the Office document. Be sure to use the **Load view in View Designer** command when you want to edit.
2. Continue with the processes described in [Determining Where a View was Created](#) to determine if you should edit the view in View Designer.

Note:

Do not use View Designer in Smart View to edit views that were created in Oracle Analytics Cloud. Views may not load in cases where the View Designer does not support the formatting and design features that were used to create the view in Oracle Analytics Cloud. For this reason, use the View Designer to edit only those views that were created and inserted using the View Designer in Smart View.

Determining Where a View was Created

You need to know if a view was created in the View Designer in Oracle Smart View for Office if you want to edit it in Smart View.

If you are unsure whether a view on a sheet was created in Smart View or Oracle Analytics Cloud, you can verify the origin of the view in the Document Contents pane.

To determine the origin of a view:

1. Open the Office document containing the view.
2. Locate the view in the Document Contents pane, then right-click the view name, and then select **Properties**.
3. Check that the value in the **View Source** field is **AdHocDesigner**.

The possible values are:

- **AdHocDesigner**—View originates from the View Designer in Smart View
- **Catalog**—View originates from the Oracle BI Presentation Catalog in Oracle Analytics Cloud
- **CopyFromAnswers**—View was copied from Oracle Analytics Cloud and pasted into the Smart View Office document

The views marked **AdHocDesigner** are the only views that should be edited in View Designer.

Note that, in some cases, views created in Oracle Analytics Cloud may be loaded in to the View Designer in Smart View. Keep in mind that when you attempt to work in View Designer with views from Oracle Analytics Cloud, you are doing so at your own risk; editing these views in View Designer is not supported. Oracle only supports using the View Designer to edit those views that were created and edited using the View Designer in Smart View.

4. If the **View Source** property is **AdHocDesigner**, the view can be edited in View Designer.

If the **View Source** is **Catalog** or **CopyFromAnswers**, edit the view in Oracle Analytics Cloud.

Editing Views Created in View Designer

Refreshing Data in a View Created in View Designer

You may refresh views created in View Designer in the same way you refresh views that were inserted into an Office application from the catalog tree.

See [Specifying Preferences for Refreshing Views](#) and [Refreshing Views](#) for information.

Smart View and Oracle Analytics Cloud - Essbase

An audit trail tracks user activity on an Oracle Analytics Cloud - Essbase cube.

About Smart View and Oracle Analytics Cloud - Essbase

Oracle Analytics Cloud - Essbase is a subscription-based business analytics solution that is built for and deployed on Oracle Cloud.

Using Oracle Smart View for Office, you can interact with Oracle Analytics Cloud - Essbase data in Microsoft Office to analyze, model, collaborate, and report.

Use the topics in this section to install and connect to Oracle Analytics Cloud - Essbase:

- [Running the Smart View Installer](#)
- [Creating Data Source Connections to Oracle Analytics Cloud - Essbase](#)

Then you are ready to begin working with data in Oracle Analytics Cloud - Essbase. Information on using Smart View with Oracle Analytics Cloud - Essbase is contained throughout this guide:

- [Dimensions and Members](#)
- [Data and Data Cells](#)
- [Ad Hoc Analysis](#)
- [Enabling Attribute Association Processing in Ad Hoc Grids](#)
- [General Operations](#)
- [Smart Query](#)
- [Smart Slices](#)
- [The Query Designer and MDX Queries](#)
- [Smart View Options](#)

- [Functions](#)
- [Free-Form Mode](#)
- [Smart View Diagnostics and Health Check](#)

Information on using Audit Trail is in this chapter. See [Tracking User Activity with Audit Trail](#).

Running the Smart View Installer

Before running the Oracle Smart View for Office installer, review the Smart View prerequisites.

Smart View Prerequisites

- The latest release of Smart View
On the [Oracle Technology Network](#), **Downloads** tab, the latest release for Smart View is always certified.
- Microsoft Office
- Microsoft .NET Framework

Specific version requirements are noted in *Using Oracle Analytics Cloud - Essbase*. See "Smart View Prerequisites" in [Download and Run the Smart View Installer](#) for more information.

Installing Smart View

1. Log into Oracle Analytics Cloud - Essbase.
2. On the Applications home page, click Utilities.

3. On the **Utilities** page, select **Smart View for Essbase**.
4. On the Smart View download page on Oracle Technology Network, click **Accept License Agreement**, and then click **Download Now**.

If the Oracle sign-in page is displayed, then sign in with your Oracle user name (usually your email address) and password.

5. Follow the steps for your browser to download the .zip file, and save it to a folder on your computer.
6. Go to the folder that you used in the previous step, and then double click `smartview.exe` to start the installation wizard.
7. Select a destination folder for Smart View, and then click **OK**.

For new installations, Smart View is installed by default in: `C:\Oracle\smartview`. If you are upgrading an installation of Smart View, then the installer defaults to the folder where you previously installed Smart View.

8. When the installation is complete, click **OK**.

Continue the setup process with [Creating Data Source Connections to Oracle Analytics Cloud - Essbase](#).

Creating Data Source Connections to Oracle Analytics Cloud - Essbase

After installing Oracle Smart View for Office, you can create connections to Oracle Analytics Cloud - Essbase.

Connections require information about the server and port. Your cloud service administrator should provide you with the information you need to create the connection. Use the quick connection method to create a private connection to the cloud service.

To create a private connection using the quick connection method:

1. In Excel, select the Smart View ribbon, and then click Panel.
2. On the Smart View Panel, click the arrow on the Switch to button , and then select **Private Connections** from the list.
3. Still in the Smart View Panel, in the text box, enter the URL for the data source to which you want to connect.

The URL syntax:

```
https://server/essbase/smartview
```

4. Click Go, , or press **Enter**.
5. On the login window, enter your login credentials, and then select a data source from the drop-down menu.

You can now begin working with data in Oracle Analytics Cloud - Essbase. See the functional areas listed in [Smart View and Oracle Analytics Cloud - Essbase](#) for more information.

Tracking User Activity with Audit Trail

An audit trail tracks user activity on an Oracle Analytics Cloud - Essbase cube.

- [Refresh the List of Audit Trail Entries](#)
- [Starting an Ad Hoc Grid from an Audit Trail Entry](#)

About Audit Trail

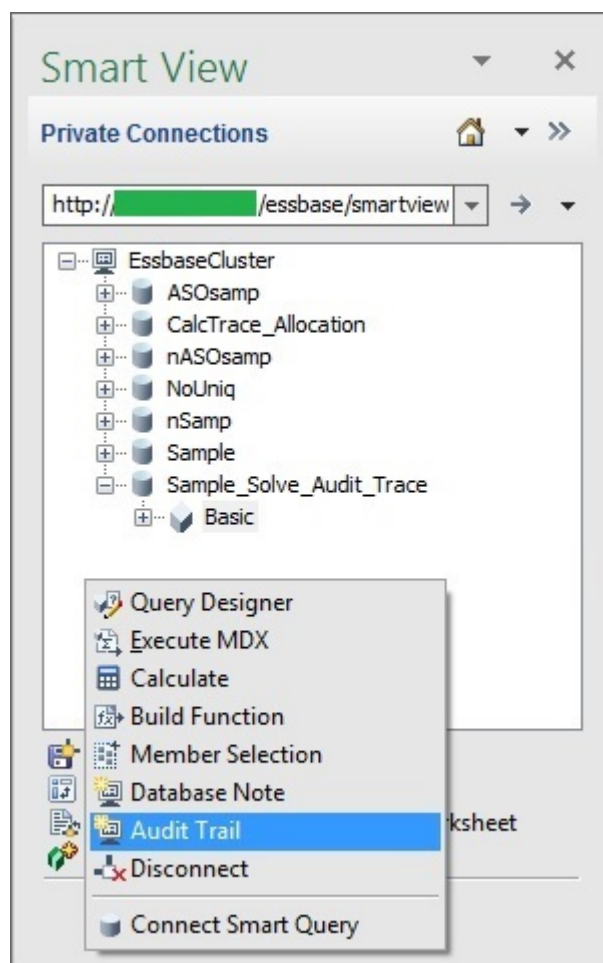

Data source type: Oracle Analytics Cloud - Essbase

An audit trail tracks user activity on an Oracle Analytics Cloud - Essbase cube.

In Oracle Smart View for Office, data entry or input can be tracked when connected to Oracle Analytics Cloud - Essbase. For example, when Audit Trail is activated, then updating and submitting data in all writable cells in an ad hoc grid would be tracked and displayed as a list items of in the audit trail.

Smart View logs audit trail activity in a pane within the Smart View Panel. After connecting to a cube, you access the Audit Trail pane by selecting **Audit Trail** from the Action Panel.

Figure 19-1 Audit Trail Selected from the Action Panel Context Menu

The Audit Trail pane is displayed within the Smart View Panel. For example:

Figure 19-2 Example Audit Trail Pane

For each user activity tracked, the following information is stored:

- User ID
- Date/Time
- Type of Operation
- Comments/Linked Reporting Objects (LRO)
- New Value
- Old Value
- POV Members

Only Date/Time, New Value, LRO, and POV are displayed in the Audit Trail pane. Selecting an log entry within Audit Trail provides additional information at the bottom of

the pane. And you can export the details of the entry to view all available information for that entry.

You can also refresh the list of log entries in the Audit Trail pane, and launch a selected entry on a separate sheet to view the POV for that entry.

Launching Audit Trail

You launch the Audit Trail pane from the Action Panel in the Smart View Panel.

To launch the Audit Trail pane:

1. Sign on to your Oracle Analytics Cloud - Essbase data source using a private connection, and connect to the cube.

See [Connecting to Data Sources](#) for more information.

2. In the Action Panel, select **More**, and then select **Audit Trail** from the popup menu.

The Action Panel is located at the bottom of the Smart View Panel, and contains action items specific to the data source and cube to which you are connected.

When you select **More**, a popup menu is displayed where you can select **Audit Trail**.

The Audit Trail pane is displayed in the bottom portion of the Smart View Panel

Now you can work with the items in the **Audit Trail** pane using these three buttons at the bottom of the pane:

3. Perform an action:

- Export the contents of the audit trail onto a separate sheet
See [Export Audit Trail Content to a Sheet](#).
- Refresh the list of items in the **Audit Trail** pane
See [Refresh the List of Audit Trail Entries](#)
- Launch an ad hoc sheet based on an item in the audit trail list
See [Starting an Ad Hoc Grid from an Audit Trail Entry](#)

Export Audit Trail Content to a Sheet

You can export the items in an audit trail, including the detail for each entry, to an Excel sheet which you can save and analyze.

To export audit trail content to a worksheet:

1. Launch the **Audit Trail** pane for a particular Oracle Analytics Cloud - Essbase cube, as described in [Launching Audit Trail](#).

2. At the bottom of the **Audit Trail** pane, click **Export to Sheet**, .

All entries, along with the additional detail that is not displayed in the **Audit Trail**, are exported to a new worksheet. Details include:

- User ID
- Date/Time
- Type of Operation
- Transaction ID
- Scenario
- Comments/Linked Reporting Objects (LRO)
- New Value
- Old Value
- POV Members

The entries on the sheet can be sorted and filtered. Some columns may need to be widened in order to view the headings and entries.

Following is an example of the content of an audit trail when it is first exported to a sheet:

	A	B	C	D	E	F	G	H	I	J	K	L	M
1	User	Date/Time	Cell No	New Value	Old Value	Operation	Scenario	Transaction	Member	Member	Member	Members	Members
2	<user>	#####		200	99	INPUT		0 Jan	Sales	100-10	New York	Actual	
3	<user>	#####		949	645	INPUT		0 Feb	Sales	100-10	New York	Actual	
4	<user>	#####		99	2200	INPUT		0 Jan	Sales	100-10	New York	Actual	
5	<user>	#####		1212	4860	INPUT		0 Jan	Sales	100-10	Market	Scenario	
6	<user>	#####		112	111	INPUT		0 Jan	Sales		100 East	Actual	
7	<user>	#####		111	2105	INPUT		0 Jan	Sales		100 East	Actual	
8	<user>	#####		[http://www.oracle.com] with			INPUT		0 Jan	Misc	Product	Market	Budget
9	<user>	#####		[TestFunction.xlsx] with descri			INPUT		0 Jan	Misc	Product	Market	Actual
10	<user>	#####		[Some Cell Note Here] is attach			INPUT		0 Jan	Misc	Product	Market	Scenario
11	<user>	#####		23	75	INPUT		0 Jan	Misc	Product	Market	Scenario	
12	<user>	#####		21321	17378	INPUT		0 Jan	Margin	Product	Market	Scenario	

Some columns may need to be widened in order to view the headings and entries.

3. You can save the worksheet, or just close it.

Refresh the List of Audit Trail Entries

After launching **Audit Trail**, you may have performed several actions that were logged in the audit trail. To view the latest entries, you must refresh the **Audit Trail** pane.

To refresh the **Audit Trail** pane:

1. Launch the **Audit Trail** pane for a particular Oracle Analytics Cloud - Essbase cube, as described in [Launching Audit Trail](#).

2. After performing various actions on the sheet, click Refresh, .
3. View the recent entries that have been added to the **Audit Trail** pane.

Starting an Ad Hoc Grid from an Audit Trail Entry

You can start an ad hoc grid by selecting an entry from the list in the **Audit Trail** pane. The ad hoc grid will be structured according to the POV of the selected audit trail entry.

To start an ad hoc grid from an entry in the audit trail list:

1. Launch the **Audit Trail** pane for a particular Oracle Analytics Cloud - Essbase cube, as described in [Launching Audit Trail](#).
2. Select an entry in the **Audit Trail** pane and, at the bottom of the pane, click **Ad Hoc on Selected POV**, .

An ad hoc grid based on the POV of the selected entry is launched onto the active worksheet.

For example, suppose we selected this entry, where the new value is 200, and the POV is Feb, Sales, 100-10, New York, and Actual, as noted under the entry list:

Clicking the  would result in the following ad hoc grid:

	A	B	C	D
1		Feb	Sales	Cola
2		New York		
3	Actual	200		

3. Work with the grid as you would any other ad hoc grid.
4. Repeat these steps for any other audit trail entries, as you require.

Setting Smart View Options

Set Oracle Smart View for Office options in the **Options** dialog.

Click the **Options** button on the Smart View ribbon to open the **Options** dialog.

Figure 20-1 Options Button on the Smart View Ribbon

Watch this video to see a tutorial on navigating in Smart View, including Smart View options.

[Tutorial video](#)

Global Options and Sheet Level Options

Oracle Smart View for Office provides two types of options: *global* options and *sheet* options.

- [Global Options](#)
- [Sheet Options](#)

Global Options

Global options are options that apply to the entire current workbook, including any *new* worksheets added to the current workbook, and to workbooks that are created later.

Changes to global option settings also affect *existing* worksheets and workbooks, and other Office documents.

The following are global options:

- [Advanced Options](#)
- [Extensions](#)
- [Cell Styles](#)

Note:

Use the **OK** button when saving global options. Changes to global options become the default settings for all existing and new worksheets and workbooks so it is not necessary to use **Save as Default Options** or **Apply to All Worksheets** with global options. **Save as Default Options** and **Apply to All Worksheets** are used with the sheet level option settings only.

Sheet Options

Sheet level options are options that are specific to the worksheet for which they are set. Sheet options are applicable only in Excel. You do not set sheet options in Word or PowerPoint.

Three options are available for saving sheet level options:

- **OK**—The sheet level option changes apply only to the current sheet in the current workbook. The changes do not apply to existing sheets or to new sheets in the current workbook. They do not affect any existing workbooks or new workbooks.
In PowerPoint or Word, **OK** only applies to selections made on the **Advanced** tab (which are global options, not sheet options).
- **Save as Default Options**—The sheet level options changes are also the default option settings for *new* worksheets in the current workbook and for any *new* workbooks, and any other new Office documents. Changes to sheet level option settings do not affect *existing* worksheets or workbooks.

For example, in Excel, assume you made changes to member options and selected **Save as Default Options**. You must access each existing worksheet individually, and make those same changes, if you want the changes to be propagated to existing worksheets in the workbook. This allows for different sheet level options on different worksheets. However, the changes are automatically propagated to any new worksheets you create within the current workbook and to any new workbooks.

 **Note:**

The **Save as Default Options** option is not available in PowerPoint or Word.

- **Apply to All Worksheets**—The sheet level options changes apply to all *existing* worksheets with Oracle Smart View for Office content within the current workbook. They do not apply to any new worksheets within the current workbook, to other *existing* workbooks, or to *new* workbooks.

For example, assume you made changes to member options and selected **Apply To All Sheets**. The changes are propagated to all existing worksheets with Smart View content within the current workbook. This allows for quick updating of sheet level options in the current workbook. However, these changes are not propagated to any new worksheets in the current workbook, to existing workbooks, or to new workbooks.

 **Note:**

The **Apply to All Worksheets** option is not available in PowerPoint or Word.

Save as Default Options and **Apply to All Worksheets** are accessed in Excel by clicking the arrow in the **OK** button in the **Options** dialog box (see [Figure 1](#)).

Figure 20-2 Save as Default Options, Accessed from the OK Button

The following are sheet level options:

- [Member Options](#)
- [Data Options](#)
- [Formatting Options](#)

Member Options

Member Options control the display of member cells.

Member options are sheet level options, which are specific to the worksheet for which they are set.

 **Note:**

Not all data providers support all the options listed in [Table 1](#). Refer to the Subtopics listed above to find the options supported for a particular provider.

To set options for the display of member cells as described in [Table 1](#), click **Options** on the Smart View ribbon, and then select **Member Options** in the left panel. When you are finished, make a selection for saving the changes:

- **OK**
- **Save as Default Options**
- **Apply to All Worksheets**

 **Note:**

The **Apply to All Worksheets** option is not available in PowerPoint or Word.

See [Sheet Options](#) for a complete description of the above options.

Table 20-1 Member Options

Option	Description
General	General

Table 20-1 (Cont.) Member Options

Option	Description
Zoom In Level	<p>From the drop-down menu, select one of the following to specify a default zoom level for ad hoc analysis:</p> <ul style="list-style-type: none"> • Next Level to retrieve data for the children of the selected members • All Levels to retrieve data for all descendants of the selected members • Bottom Level to retrieve data for the lowest level of members in a dimension • Sibling Level to retrieve data for all members at the same level as the selected member • Same Level to retrieve data for the siblings of the selected members • Same Generation to retrieve data for all members of the same generation as the selected members • Formulas to retrieve data for all members that are defined by the formula of the selected member. The formula can be a member equation or a consolidation to the parent.
Member Name Display	<p>From the drop-down menu, select one of the following to specify how to display member names in cells:</p> <ul style="list-style-type: none"> • Member Name or Alias to display member names only or, if an alias table is being used, alias names only. <p>Oracle Essbase and Narrative Reporting: Note that this is the default when connected to duplicate member databases and launching Query Designer (Essbase only) or an ad hoc grid. This is the default even if you have chosen the Distinct Member Name Only option and set it as the default.</p> <ul style="list-style-type: none"> • Distinct Member Name Only to display fully qualified names. • Member Name and Alias to display member names and their aliases. • Description Only to display aliases.
Indentation	<p>From the drop-down menu, select one of the following to specify how hierarchy levels are to be indented:</p> <ul style="list-style-type: none"> • None • Subitems to indent descendants. Ancestors are left-justified in the column. • Totals to indent ancestors. Descendants are left-justified in the column.

Table 20-1 (Cont.) Member Options

Option	Description
Ancestor Position	<p>From the drop-down menu, select one of the following to specify ancestor position in hierarchies:</p> <ul style="list-style-type: none"> • Top to display hierarchies in order from highest to lowest level • Bottom to display hierarchies in order from lowest to highest level
<div style="border-left: 2px solid #0070C0; border-right: 2px solid #0070C0; border-bottom: 2px solid #0070C0; padding: 10px;"> <p> Note:</p> <p>Essbase (on-premises) does not support the Ancestor Position options.</p> </div>	
<p>Member Retention</p>	
Include Selection	<p>Display the selected member and the members retrieved as a result of the operation.</p>
Within Selected Group	<p>Perform ad hoc operations only on the selected group of cells, leaving unselected cells as is. This setting is meaningful only when there are two or more dimensions down the grid as rows or across the grid as columns. For Zoom, Keep Only, and Remove Only.</p>
Remove Unselected Groups	<p>For Zoom In or Zoom Out, remove all dimensions and members except the selected member and the members retrieved as a result of zooming.</p>
<p>Comments and Formulas</p>	

Table 20-1 (Cont.) Member Options

Option	Description
Preserve Formulas and Comments in ad hoc operations (except pivot and undo)	<p>Preserves formulas and comments on the grid during queries. You can clear this option to make queries run faster, but if you do, formulas and comments are removed or ignored.</p> <p>Note that formulas are <i>not</i> preserved for pivot or undo operations, regardless of whether or not this option is selected.</p> <p>This option must be selected if you select Formula Fill or Enable Enhanced Comment Handling.</p>
	<div data-bbox="1162 695 1459 961"><p> Note:</p><p>This option applies to formulas in both member and data cells.</p></div>
Formula Fill	<p>Propagates formulas associated with member cells to the members retrieved as a result of zooming in.</p> <p>If Preserve Formulas and Comments in ad hoc operations except pivot and Use Excel Formatting are both selected, propagates cell formatting to the members retrieved as a result of zooming in.</p>
	<div data-bbox="1162 1272 1459 1539"><p> Note:</p><p>This option applies to formulas in both member and data cells.</p></div>

Table 20-1 (Cont.) Member Options

Option	Description
Preserve Comments and Unknown Members	<p>Essbase only: Your spreadsheet may contain members that do not match database members. Selecting this option allows you to refresh an ad hoc grid with no warning message about comments or unknown members.</p> <p>To display messages about comments and unknown members, ensure that this option is cleared.</p> <p>Note that when this option is cleared, both the Enable Enhanced Comment Handling option in this dialog and the View Comments option in the Essbase ribbon will not be available for this ad hoc sheet.</p>
Enable Enhanced Comment Handling	Enables you to review and correct comments and member names in ad hoc grids that contain comments.
Preserve Formula in POV Change	Preserves formulas in cells when you refresh or make changes to the POV. Otherwise, any formulas in the grid are lost.

Enable Enhanced Comment Handling	No
Preserve Formula in POV Change	No

Data Options

Data Options control the display of data cells.

Data options are sheet level options, which are specific to the worksheet for which they are set.

Note:

Not all data providers support all the options listed in [Table 1](#). Refer to the Subtopics listed earlier to find the options supported for a particular provider.

To set options for the display of data cells as described in [Table 1](#), click **Options** on the Smart View ribbon, and then select **Data Options** in the left panel. When you are finished, make a selection for saving the changes:

- **OK**

- **Save as Default Options**
- **Apply to All Worksheets**

 **Note:**

The **Apply to All Worksheets** option is not available in PowerPoint or Word.

See [Sheet Options](#) for a complete description of the above options.

See also:

- [Data Options Supported for EPM Cloud Forms and Ad Hoc](#)
- [Data Options Supported for Essbase Ad Hoc](#)
- [Data Options Supported for Narrative Reporting Ad Hoc](#)

Table 20-5 Data Options

Option	Description
Suppress Rows	To streamline the grid, you can suppress rows that contain types of data that you do not need to view. Notes: <ul style="list-style-type: none"> • In suppressed rows, cell references to Excel formulas are not updated. • Planning: See Data Options Supported for EPM Cloud Forms and Ad Hoc for information on using the No Data/Missing and Zero row suppression options.
No Data/Missing	Suppress rows that contain only cells for which no data exists in the database (no data is not the same as zero. Zero is a data value.) If you later clear No Data/Missing , suppressed values are returned only from that point on. You must zoom out and then zoom in on a member to retrieve values that were suppressed while this option was selected. In multiple-grid sheets, submitting data values ' 0 and &nd does not work properly when the No Data/Missing is set to ' 0 or &nd.
Zero	Suppress rows that contain only zeroes.
No Access	Suppress rows that contain data that you do not have the security access to view.
Invalid	Suppress rows that contain only invalid values.
Underscore Characters	Suppress rows that contain underscore characters in member names (not available in Smart Slice operations).
Repeated Members	Suppress rows that contain repeated member names, regardless of grid orientation.

 **Note:**

This option is supported by Oracle Hyperion Financial Management only.

Table 20-5 (Cont.) Data Options

Option	Description
Suppress Columns	To streamline the grid, you can suppress columns that contain types of data that you do not need to view. Notes: <ul style="list-style-type: none"> In suppressed columns, cell references to Excel formulas are not updated. The Suppress Columns options are not available when connected to an Oracle Essbase data source. The Suppress Columns options are not supported when performing ad hoc with Financial Management data sources. Planning: See Data Options Supported for EPM Cloud Forms and Ad Hoc for information on using the No Data/Missing and Zero column suppression options.
No Data/Missing	Suppress columns that contain cells for which no data exists in the database (no data is not the same as zero. Zero is a data value.) If you later clear No Data/Missing , suppressed values are returned only from that point on. You must zoom out and then zoom in on a member to retrieve values that were suppressed while this option was selected.
Zero	Suppress columns that contain only zeroes.
No Access	Suppress columns that contain data that you do not have the security access to view.
Replacement	Replacement
#NoData/Missing Label	Data cells may contain missing or invalid data, or data that you do not have permission to view. In such cells, by default, Oracle Smart View for Office displays #Missing, #Invalid, or #No Access, respectively, but you can change these labels. To do so, in any of these fields, enter one of the following: <ul style="list-style-type: none"> Text of your choice (or leave the default). Text labels have the advantage of being descriptive, but they cause Excel functions to fail. #NumericZero to specify numeric zero (0) replacement labels. With #NumericZero, you can use functions, but you cannot submit zeroes to the database (even if the zeroes are actual zeroes and not replacement labels) unless you select the Submit Zero option below. Calculations that are dependent on a cell with a numeric zero label compute correctly and take the value of the cell as zero. Note: When you enter #NumericZero, ensure that the Submit Zero option is selected to ensure that the parent data is deleted when spreading data for time periods. <p>The #Missing replacement label allows you to clear data values from cell intersections. For example, to clear the sales data for New York, manually type #Missing in the cell where Sales and New York intersect, and click Submit. This clears the data value from the database. Subsequent queries on that database will show #Missing at the intersection of Sales and New York.</p>
#NoAccess Label	
#Invalid/Meaningless	
Submit Zero	If you chose #NumericZero for the #Missing label above, select this option if you want to be able to submit zeroes to the database.
Display Invalid Data	Display actual data even if it is invalid, rather than #Invalid/ Meaningless or other replacement text. If no data exists, the cell is left blank.

Table 20-5 (Cont.) Data Options

Option	Description
Enable Essbase Format String	If the administrator has created specific formatting for the display of numerical data, view data in this formatting.
Use Expense Type	Essbase only: Inverts the signage (positive to negative or negative to positive) for data in columns related to revenue, liability, and owner's equity accounts. Supported for aggregate storage databases only. To use this option, ensure that your Essbase administrator has set up your application to display expense type signage.
Enable Attribute Association Processing	Oracle Analytics Cloud - Essbase and Essbase only: Select to display #Invalid or #NumericZero for cells that are empty only because they are not associated with the context attribute or varying attribute. By default, the Enable Attribute Association Processing option is cleared, and the empty cells display as #Missing. See also, Enabling Attribute Association Processing in Ad Hoc Grids .
Mode	Mode
Cell Display	Applies to Financial Management (on-premises) only.
Navigate Without Data	Speeds up operations such as Pivot, Zoom, Keep Only, and Remove Only by preventing the calculation of source data while you are navigating. When you are ready to retrieve data, clear Navigate Without Data .
Suppress Missing blocks	Suppress blocks of cells for which no data exists in the database.

The sections that follow list the Data Options supported by provider.

Option	Ad hoc
Suppress Missing blocks	No

Advanced Options

Advanced Options are settings for administrative and other advanced tasks.

Advanced options are global options, which apply to the entire current workbook, including any *new* worksheets added to the current workbook, and to any workbooks and worksheets that are created henceforth. Changes to global option settings become the default for all existing and *new* Microsoft Office documents.

It is not necessary to use **Apply to All Worksheets** or **Save as Default Options** with these options.

 **Note:**

Not all data providers support all the options listed in the table.

To set options for the administrative and other advanced tasks as described in [Table 1](#), click **Options** on the Smart View ribbon, and then select **Advanced** in the left panel. When you are finished, click **OK**.

Table 20-9 Advanced Options

Option	Description
General	General

Table 20-9 (Cont.) Advanced Options

Option	Description
Shared Connections URL	<p>Specify a default URL for all connections. Use the following syntax:</p> <pre>http(s)://serviceURL/workspace/SmartViewProviders</pre>
	<div data-bbox="1084 548 1380 987"><p> Note:</p><p>For Oracle Smart View for Office online help to be available, this field must contain a valid URL for Oracle Enterprise Performance Management Cloud service.</p></div>
Number of Undo Actions	<p>The number of Undo and Redo actions permitted on an operation (0 through 100). See Using Undo and Redo.</p>
Number of Most Recently Used Items	<p>The number, 15 or fewer, of your most recently used connections to be displayed on Smart View Home and the Open menu on the Smart View ribbon.</p>
Delete All MRU Items	<p>Delete all items in your most recently used list, including those that are pinned to the list.</p>
Logging	Logging

Table 20-9 (Cont.) Advanced Options

Option	Description
Log Message Display	<p>All error, warnings, and informational messages from the connected data source are displayed when they occur, but you can choose which of these message levels to record in a log file. Select a message level to display and record:</p> <ul style="list-style-type: none"> • Information: All messages, including warnings and errors — recommended to diagnose problems. May adversely impact performance. • Warnings: Warnings and error level messages. May adversely impact performance. • Errors: Error messages only — recommended for general use. Has minimal impact on performance. • None: Suppress all messages. • Extended Info: Information-level messages plus all server responses and requests. Adversely impacts performance.
Route message to files	Save log messages in a file. Click the ellipsis button to change the location of the log file.
Clear Log File on Next Launch	Clear the log file starting with the next log message generation, which will be seen after Excel is closed.

 **Tip:**

The log file can quickly grow quite large in size, particularly if the message level is set to "Warnings" or "Information". If **Route message to files** is selected, and **Clear Log File on Next Launch** is cleared, you should periodically clear the contents of the Smart View log file manually. The large file size can adversely affect performance.

Table 20-9 (Cont.) Advanced Options

Option	Description
Show Diagnostics Group on Smart View Ribbon	Displays the Diagnostics group options on the Smart View ribbon. See Smart View Diagnostics and Health Check for information on using the diagnostics tools.
Display Language	Display Select a language in which to display Smart View. You must restart the Office application when you change languages. Default is the language specified when Smart View was installed.
Display Smart View Short Cut Menus Only	Display only Smart View menu items on shortcut menus. Otherwise, shortcut menus display both Excel and Smart View items.
Disable Smart View in Outlook	Disable Smart View in Outlook if you do not want to use Smart View task lists in Outlook.
Enable Ribbon Context Changing	Display the active data provider ribbon automatically after you use a button on the Smart View ribbon.
Display floating toolbar on forms	Display the floating toolbar when clicking a data cell in Planning forms. The floating toolbar provides quick access to these commands: <ul style="list-style-type: none"> • Supporting Details • Cell Comments • Drill-through • Attachments The default is to display the floating toolbar (the check box is selected). To suppress the floating toolbar display, clear this check box.
Disable options that are not valid for the active connection	Disable options in the Options dialog box that are not valid for the active connection.
Sort Items in Smart View Panel	Sort items in the Smart View Panel by category first, and then in order within categories. The order is first numerical, then alphabetical. For example, when this option is selected, the Task List folder is sorted below the Root folder. The items in the Task List folder are sorted in order first numerically, then alphabetically. When this option is cleared, items in the Smart View Panel are sorted according to the order returned by the provider.
Display Drill-Through Report ToolTips	Display by default lists of available drill-through reports for cells whenever you mouse over them.
Show Progress Information After (seconds)	Specify the time, in seconds, after which the Smart View Progress status bar appears when an operation begins.

Table 20-9 (Cont.) Advanced Options

Option	Description
Compatibility Reduce Excel File Size	Compatibility Compress the metadata maintained in Excel files containing Smart View workbooks.

**Note:**

This option pertains to interoperability between different versions of Smart View.

If all users in your organization are on Smart View 9.3.1.6 or higher, then this option should always be selected.

Clear this option in the following situations:

- You send an Excel workbook to users on Smart View releases earlier than 9.3.1.6, or to users on Microsoft Office 2002 and earlier regardless of Smart View release. In these workbooks:
 - Grids that contain functions must be refreshed before data can be displayed.
 - In ad hoc mode, POV settings are lost; the behavior is similar to that of a fresh ad hoc grid.
- You open a workbook sent from users on Smart View release earlier than 9.3.1.6, or on Microsoft Office 2002 and earlier regardless of Smart View release

Table 20-9 (Cont.) Advanced Options

Option	Description
Improve Metadata Storage	<p>Allow for more efficient storage of internal data structures.</p> <p>When this option is cleared, Smart View maintains two copies of metadata for compatibility purpose, which may result in slower overall performance.</p>
	<div style="border: 1px solid #0070C0; padding: 10px; background-color: #E6F2FF;"> <p> Note:</p> <p>This option pertains to interoperability between different versions of Smart View.</p> </div>
	<p>If all users in your organization are on Smart View 9.3.1.6 or higher, then this option should always be selected.</p> <p>Clear this option in the following situations:</p> <ul style="list-style-type: none"> You send an Excel workbook to users on Smart View releases earlier than 9.3.1.6, or to users on Microsoft Office 2002 and earlier, regardless of Smart View release You open a workbook sent from users on Smart View releases earlier than 9.3.1.6, or from users on Microsoft Office 2002 and earlier, regardless of Smart View release
Refresh Selected Functions and their dependents	Execute dependent functions on the same sheet before executing the selected functions.
Mode	Mode
Use Double-click for Operations	Double-clicking retrieves the default grid in a blank worksheet and thereafter zooms in or out on the cell contents. If not selected, double-clicking retains standard Excel functionality and puts a cell into edit mode.

Formatting Options

Formatting options control the textual display of members and data.

Formatting options are sheet level options, which are specific to the worksheet for which they are set.

 **Note:**

Not all data providers support all the options listed in [Table 1](#). Refer to the Subtopics listed above to find the options supported for a particular provider.

To set options for cell formatting as described in [Table 1](#), click **Options** on the Smart View ribbon, and then select **Formatting** in the left panel. When you are finished, make a selection for saving the changes:

- **OK**
- **Save as Default Options**
- **Apply to All Worksheets**

 **Note:**

The **Apply to All Worksheets** option is not available in PowerPoint or Word.

See [Sheet Options](#) for a complete description of the above options.

Table 20-10 Formatting Options

Option	Description
Formatting	Formatting
Use Thousands Separator	Use a comma or other thousands separator in numerical data. Do not use # or \$ as the thousands separator in Excel International Options.
Use Cell Styles	Use formatting that is defined in Cell Styles or by the data provider. Overrides any user formatting. This option is disabled when Use Excel Formatting is selected. See Cell Styles .

Table 20-10 (Cont.) Formatting Options

Option	Description
Use Excel Formatting	Use Excel rather than Oracle Smart View for Office formatting and retain Excel formatting for ad hoc operations. This option is disabled when Use Cell Styles is selected.

 **Note:**

In ad hoc grids for all providers, Excel formatting is not retained when performing an Undo.

Move Formatting on Operations

See [Using Excel Formatting](#).

Copy parent cell formatting to zoomed in cells and retain this formatting even if the cell location changes after an operation. This option is disabled by default, and it is enabled, but not selected, when **Use Excel Formatting** is selected.

Formatting can affect performance, especially during ad hoc operations when **Move formatting on operations** is enabled. For this reason, the selection of **Move Formatting on Operations** persists on a per-sheet, per-session basis. The selection cannot be saved. If you plan to use Excel formatting, then you must reselect **Move Formatting on Operations** every time you open a workbook, every time you move to a new sheet within a workbook, and whenever you return to the original sheet, even if you previously selected it on that sheet, and even within the same session. It must also be reselected every time you open a new or existing workbook.

You may use **Save As Default** to save the **Use Excel Formatting** selection, but it will not save the **Move Formatting on Operations** selection.

The following message is displayed each time you select **Move Formatting on Operations**:
Enabling this option may affect performance and will be reset once the sheet is changed.
See [Using Excel Formatting](#).

Table 20-10 (Cont.) Formatting Options

Option	Description
Retain Numeric Formatting	When you drill down in dimensions, retains the Excel formatting you have set when selecting the Excel Home ribbon, then Format , and then Format Cells . For example, if you chose to display negative numbers in red, then negative values will be displayed in red as you drill down on any member. This option is enabled when Use Cell Styles is selected.
Adjust Column Width and Row Height	Adjust column widths and row heights to fit cell contents automatically.

Table 20-10 (Cont.) Formatting Options

Option	Description
Scale	<p data-bbox="878 331 1377 443">Applies to ad hoc and forms. Overrides the setting defined in the form definition. Choose a positive or negative scaling option, and then click Refresh.</p> <p data-bbox="878 457 1068 485">Positive scaling:</p> <p data-bbox="878 491 1377 548">Divides original values by factors of 10. For example:</p> <ul data-bbox="878 554 1377 957" style="list-style-type: none"> <li data-bbox="878 554 1377 695">• 1—All original values are divided by 10: <i>cell value / 10</i> For example, $100/10=10$, so 10 will be displayed. <li data-bbox="878 701 1377 821">• 2—All original values are divided by 100: <i>cell value / 100</i> For example, $100/100=1$, so 1 will be displayed after refresh. <li data-bbox="878 827 1377 957">• 3—All original values are divided by 1000: <i>cell value / 1000</i> For example, $100/1000=0.1$, so 0.1 will be displayed after refresh. <p data-bbox="878 963 1377 1020">The pattern is similar for the remaining positive scaling options.</p> <p data-bbox="878 1026 1377 1138">Note that 0 will be displayed if the Decimal Places option is set to Default or 0. However, for a value such as 0.1 to display, the Decimal Places option must be set to 1.</p> <p data-bbox="878 1144 1081 1171">Negative Scaling:</p> <p data-bbox="878 1178 1377 1234">Multiplies original values by factors of 10. For example:</p> <ul data-bbox="878 1241 1377 1709" style="list-style-type: none"> <li data-bbox="878 1241 1377 1409">• -1—All original values are multiplied by 10: <i>cell value * 10</i> For example, $100*10=1000$, so 1000 will be displayed. <li data-bbox="878 1415 1377 1535">• -2—All original values are multiplied by 100: <i>cell value * 100</i> For example, $100*100=10000$, so 10000 will be displayed after refresh. <li data-bbox="878 1541 1377 1709">• -3—All original values are multiplied by 1000: <i>cell value * 1000</i> For example, $100*1000=100000$, so 100000 will be displayed after refresh. <p data-bbox="878 1715 1377 1774">The pattern is similar for the remaining negative scaling options.</p>

 **Note:**Work with the
Decimal Places

Table 20-10 (Cont.) Formatting Options

Option	Description
	<p>option to achieve the desired display result.</p>
Decimal Places	<p>Applies to ad hoc and forms. Overrides the setting defined in the form definition. Specify a decimal scale for the data values. For example, in Smart View, assume the decimal option selected is "1". All values will change one decimal place to the right. If the original value is 50.56, then after refresh the value will be displayed as 50.5. Similarly, if option selected is "3", then the displayed value will be 50.560.</p> <p>For forms, if Default is selected, then the form definition setting is applicable.</p>
	<p> Note:</p> <p>Work with the Scale option to achieve the desired display result.</p>
Form Repeat Member Labels	<p>Form</p> <p>Facilitates the readability of Planning and Oracle Hyperion Financial Management forms by allowing member names to appear on each row of data.</p> <p>In forms where repeated members are merged into one cell, member names may be out of the screen view, necessitating much back and forth scrolling between the member names and the row data. Selecting Repeat Member Labels helps make forms easier to read and use.</p>

The sections that follow list the Formatting Options supported by provider.

Formatting Options Supported for Planning Forms and Ad Hoc

Adjust Column Width and Row Height	Yes
Scale	Yes
Decimal Places	No
Repeat Member Labels	No

Cell Styles

Cell Styles control the display of certain types of member and data cells.

On the **Cell Styles** page, you can specify formatting to indicate certain types of member and data cells. Because cells may belong to more than one type—a member cell can be both parent and child, for example—you can also set the order of precedence for how cell styles are applied.

Cell style options are global options, which apply to the entire current workbook, including any *new* worksheets added to the current workbook, and to any workbooks and worksheets that are created henceforth. Changes to global option settings become the default for all existing and *new* Microsoft Office documents.

It is not necessary to use **Apply to All Worksheets** or **Save as Default Options** with these options.

Note:

Refer to the topics listed below to find the options supported for a particular provider.

- [Cell Style Options Supported for Planning Forms and Ad Hoc](#)
- [Cell Style Options Supported for Essbase Ad Hoc](#)

Watch this overview video to get acquainted with some basic Oracle Smart View for Office functionality related to Planning, including specifying cell styles.

[Overview video](#)

To specify a style:

1. Expand the list of available cell types.
2. Select a cell type.
3. Select **Properties** and specify a font, background color, or border.
Smart View allows the setting of only one style per cell type.

For example, you may set a background style *or* a font style for Parent members, but you cannot set both a background *and* font style for Parent members.

4. To re-order precedence of cell styles, use the **Move Up** and **Move Down** buttons or drag and drop the cell styles.
5. Click **OK**. The setting takes effect after you refresh or perform a drill operation.
6. **Optional:** To revert cell styles or precedence to the default styles of the connected Smart View provider, click **Default Styles**.
7. **Optional:** To set your selections on this page as default settings, click the arrow in the **OK** button, and then select **Save as Default Options**.

Note:

There are no cell styles defined for Narrative Reporting.

Linked Objects	Yes

Extensions

Extensions lists the extensions that are currently installed on your computer.

Extension options are global options—set from Excel, Word, or PowerPoint—which apply to the entire current document, including any *new* worksheets added to the current workbook, new slides added to the current presentation, or new pages added to the current document, and to all Microsoft Office documents that are created

henceforth, including Excel workbooks and worksheets, PowerPoint presentations and slides, and Word documents. Changes to global option settings become the default for all existing and *new* Microsoft Office documents.

The first time users open the **Extensions** tab of the **Options** dialog box, it contains a list of the extensions that are currently installed to leverage Oracle Smart View for Office functionality for other Oracle products. See [Supported Extensions](#) for a complete list of supported extensions. Other extensions that can be downloaded and installed are made visible using the **Check for Updates, New Installs, and Uninstalls** link on the dialog box.

Watch this overview video to learn about working with extensions in Smart View:

[Overview video](#)

From Excel, Word, or PowerPoint, complete these tasks in the **Extensions** tab:

- [Enabling and Disabling Extensions](#)
- [Working with Extension Alerts](#)
- [Initially Checking for Available Extensions](#)
- [Installing Extensions](#)
- [Updating Extensions](#)
- [Enabling Logging for Extension Installations](#)
- [Overriding the Default URL for the Extension Download](#)
- [Uninstalling Extensions](#)

Note:

- You can enable and disable extensions, and install, update, and uninstall extensions from Excel, PowerPoint, or Word.
- It is not necessary to use **Apply to All Worksheets** or **Save as Default Options** with these options.
- In some Oracle Enterprise Performance Management Cloud products, you can download and install certain extensions from the browser. See *Downloading and Installing Clients in Getting Started with Oracle Enterprise Performance Management Cloud for Users* for more information.

Supported Extensions

There are two types of extensions that can be installed with Oracle Smart View for Office, provider extensions and per-user extensions.

Provider Extensions

Provider extensions are dependent on, or integrated with, Oracle Enterprise Performance Management System server components. Examples are the Disclosure Management and Financial Reporting extensions.

Smart View supports provider extensions for the following EPM System products:

- Disclosure Management
- Financial Reporting
- Predictive Planning extension for Planning
- Oracle Planning Admin Extension for Planning, Financial Consolidation and Close, and Tax Reporting
- Oracle Crystal Ball Enterprise Performance Management
- Narrative Reporting
- Oracle BI EE extension for Oracle Analytics Cloud
- Cube Designer extension for Oracle Analytics Cloud - Essbase
- Close and Supplemental Data Management extension for Financial Consolidation and Close and Tax Reporting
- Strategic Modeling extension

Narrative Reporting and Oracle Business Intelligence Enterprise Edition are documented in this guide. The other extensions listed above are documented in the applicable Oracle product guide.

The following extensions are packaged with Smart View:

- Smart Query
The Smart Query extension is packaged with Smart View and it gets installed automatically with Smart View.
- Oracle BI EE
The Oracle BI EE extension installs differently than other extensions. See [Installing the Oracle Analytics Cloud Extension](#) for details.

Per-user Extensions

Per-user extensions are not dependent on EPM System server components. Per-user extensions may be extensions created in-house by your Smart View administrator or extensions that the administrator has obtained from Oracle or another organization.

All installed extensions, whether packaged with Smart View or not, should be enabled automatically when you start Smart View. See [Enabling and Disabling Extensions](#).

Per-user extensions are not documented in this guide.

Refer to the following sections for information on installing, updating, and uninstalling extensions.

Enabling and Disabling Extensions

To enable an extension:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. Locate the extension in the list and select the **Enable** check box.
After you select the check box, the label changes to **Enabled**.
3. **Optional:** To disable an extension, locate the extension in the list and clear the **Enabled** check box.

 **Note:**

When extensions are enabled in Oracle Smart View for Office, cascading a report with a large number of members can cause Excel to stop responding. To avoid this, from the Smart View Options dialog box, Extensions page, disable any extensions that are installed; then, restart Excel and repeat the cascade operation.

Working with Extension Alerts

The **Extension Alerts** dialog helps you to keep your installed Narrative Reporting and Disclosure Management extensions up-to-date. If you haven't already installed these extensions, the dialog informs you that they're available for install.

Data source types: Narrative Reporting

To view the **Extension Alerts** dialog:

1. Connect to Narrative Reporting.
 - a. Open Office, select the Smart View ribbon, and then click **Panel**.
 - b. In the Smart View Panel, select **Private Connections**, then choose your

connection from the drop-down list, and then click .

If any extensions are already installed (Narrative Reporting, Disclosure Management, Disclosure Management - HVX), then select **Library** in Narrative Reporting Home to view the tree and expand the Library node.

If no Narrative Reporting extensions are installed, then in the tree, select the Library node.

- c. In the Action Panel, click **Connect**.

Upon connection, Oracle Smart View for Office compares the extension versions available on the provider environment with the versions installed on your computer. If there are extensions to install or update, the **Extension Alerts** dialog is displayed. This dialog informs you of the Narrative Reporting and Disclosure Management extensions available for installation or update.

Figure 1

Figure 20-3 Extension Alerts Dialog Showing Extensions Available for Installation

2. Review the list of available extensions and then perform an action:
 - Click **Go to Extension Dialog** to continue with the extension installation and update process.
 - Click **Close** to close this dialog. You can perform the extension installation and update process at any time.

See [Updating Extensions](#) to complete the extension installation and update process.

If this is a new Smart View installation, see [Initially Checking for Available Extensions](#).

3. **Optional:** To disable the **Extension Alerts** dialog from displaying upon connecting, perform either of the following actions:
 - In the **Extension Alerts** dialog box, select the **Do not show this dialog again** check box.
 - In the **Options** dialog, **Extensions** tab, select the **Suppress extension alerts for updates when connecting** check box.

To enable **Extension Alerts** to display upon connection, go to the **Options** dialog, **Extensions** tab, and clear the **Suppress extension alerts for updates when connecting** check box.

Initially Checking for Available Extensions

After Oracle Smart View for Office is first installed, complete the procedure in this topic to check for all available extensions.

Complete the procedure in [Updating Extensions](#) to check for updates to your installed extensions.

 **Note:**

Your Smart View system administrator controls the extensions available for you to install, and whether installation is automatic or optional.

To check for extensions after first installing Smart View:

1. Start Excel, Word, or PowerPoint.
2. From the Smart View ribbon, select **Options**, and then **Extensions**.
3. Click the **Check for Updates, New Installs, and Uninstalls** link.
4. In **Select Location for Extension Updates**, select the data source connections to check for extension updates, and then click **Get Updates**.

Smart View checks all selected data source connections for extensions that your administrator has made available to you.

To check for extensions in all your data source connections, check **Select All**.

The dialog box expands to display a message window providing you with the progress and status of the extension query.

 **Note:**

If you have connections to multiple products from Oracle Enterprise Performance Management System, Oracle Enterprise Performance Management Cloud, Oracle Business Intelligence Enterprise Edition, and Oracle Analytics Cloud, you can select the connection locations for only those extensions that you want to update at this time. For example, you may only want to check for an update for your Narrative Reporting extension. In that case, select only the check box that corresponds to your Narrative Reporting connection.

5. Click **Close** to close the **Select Location for Extension Updates** and return to the **Extensions** tab of the **Options** dialog box.
6. Perform an action:
 - Follow the prompts to close the active Office application. Also, check the Windows Task Manager and close any other Office applications or processes that are running, including Outlook. Then restart Office.

If your administrator has set up extensions to automatically install after checking for updates, and closing and reopening Office, then you do not need to do anything further.
 - If your administrator has set up optional extension installation, then continue with step 6 in [Installing Extensions](#).

Installing Extensions

If an extension is available for you to install, you can install it from the **Extensions** tab of the **Options** dialog box.

 **Note:**

Your Oracle Smart View for Office system administrator controls which extensions are available to you, and whether installation is automatic or optional. If installation is automatic, then you need only follow the instructions in [Initially Checking for Available Extensions](#). If installation is optional, follow the instructions in this topic.

Additionally, the Oracle BI EE extension, which is compatible with Oracle Analytics Cloud, installs differently than other extensions. See [Installing the Oracle Analytics Cloud Extension](#) for details.

To install an extension:

1. Start Excel, Word, or PowerPoint.
2. From the Smart View ribbon, select **Options**, and then **Extensions**.
3. Click the **Check for Updates, New Installs, and Uninstalls** link.
Smart View checks for any new or updated extensions and required extensions.
4. In **Select Location for Extension Updates**, select the data source connections to check for extension updates, and then click **Get Updates**.
Smart View checks all selected data source connections for extensions that your administrator has made available to you.
To check for extensions in all your data source connections, check **Select All**.
The dialog box expands to display a message window providing you with the progress and status of the extension query.
5. Click **Close** to close the **Select Location for Extension Updates** and return to the **Extensions** tab of the **Options** dialog box.
6. Review the list of extensions and where you see  **Install**, click the **Install** link to launch the installer.

Required per-user extensions are designated as follows:

7. Follow the prompts to install the extension.

 **Tip:**

You will be prompted to close the active Office application. All Office applications must be closed in order to complete the extension installation correctly. Check the Windows Task Manager and close any other Office applications or processes that are running, including Outlook.

Updating Extensions

If an extension is available for you to update, you can update it from the **Extensions** tab of the **Options** dialog box.

Note:

Your Oracle Smart View for Office system administrator controls the extensions available to you and your options for updating extensions. If installation is automatic, then you need only complete the first three steps in this topic. If installation is optional, complete all the steps in this topic.

To check for extension updates and install them:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. To update extensions, perform one of these tasks:
 - Click the **Check for Updates, New Installs, and Uninstalls** link to immediately check for updates to all your available extensions and any new extensions.
 - Select the **Check for updates when Microsoft Office starts** check box.
Smart View performs a check for extension updates each time you start an Office application.
3. In **Select Location for Extension Updates**, select the data source connections to check for extension updates, and then click **Get Updates**.
Smart View checks all selected data source connections for extension updates that your administrator has made available to you.
To check for extension updates in all your data source connections, check **Select All**.
The dialog box expands to display a message window providing you with the progress and status of the extension update query.
4. Click **Close** to close the **Select Location for Extension Updates** and return to the **Extensions** tab of the **Options** dialog box.
5. Perform an action:
 - Follow the prompts to close the active Office application. Also, check the Windows Task Manager and close any other Office applications or processes that are running, including Outlook. Then restart Office.
You do not need to do anything further.
 - If your administrator has set up optional extension installation updates, then continue with step 6.
6. Review the list of extensions and where you see  **Update Available**, click the **Update Available** link to launch the installer.
7. Follow the prompts to install the extension.

When updates are available, you are prompted to download the extension installer, close the Office application, and run the installer.

 **Tip:**

All open Office applications must be closed in order to complete the extension installation correctly. Check the Windows Task Manager and close any other Office applications or processes that are running, including Outlook.

After restarting the Office application, the extension appears as **Enabled** in the **Extensions** page of the **Options** dialog box.

Enabling Logging for Extension Installations

To create a log of the extension installation process:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. Select the **Enable logging for extension installations** check box.
3. In the **Advanced** tab of the **Options** dialog box, complete these steps:
 - a. Ensure that the **Log Message Display** level is set to at least **Warnings**.
 - b. Select the **Route Messages to File** check box and note the location of the log file.
4. Proceed to install or update an extension, as described in [Installing Extensions](#) and [Updating Extensions](#).

Overriding the Default URL for the Extension Download

Your Oracle Smart View for Office administrator may move an extension installer to a non-default location and then notify you of the installer location. If this happens, complete the following procedure.

 **Note:**

The non-default location of an extension installer can be a URL, or a local or network folder.

To override the default download URL or folder location:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. Select the **Override default download URL** check box.

The text box and browse button are activated, as shown in [Figure 1](#).

Figure 20-4 Override Default Download URL Check BoxA screenshot of a software interface showing a checked checkbox labeled 'Override default download URL'. Below the checkbox is a text input field with a small square button containing three dots (a browse button) to its right.

3. Enter a URL in the text box, or click  and navigate to the local folder or the network folder specified by your Smart View administrator.

The `UpdateList.xml` file is automatically appended to either the URL or the folder specified.

Uninstalling Extensions

The **Remove** link,  **Remove**, appears next to any extension names that you are authorized to uninstall.

Note:

Your Oracle Smart View for Office administrator determines which extensions you are authorized to uninstall.

To uninstall an extension:

1. From the Smart View ribbon, select **Options**, and then **Extensions**.
2. Click the **Check for Updates, New Installs, and Uninstalls** link.
Smart View checks for any extensions that can be removed.
3. In the extensions list, locate the extension to uninstall and click the **Remove** link,  **Remove**.

You are prompted that the extension will be uninstalled when the Office application is restarted. All Office applications must be closed to completely remove the extension.

4. Close all Office applications, including Outlook, and restart.

Tip:

All open Office applications must be closed in order to complete the uninstallation correctly. Check the Windows Task Manager and close any other Office applications or processes that are running, including Outlook.

21

Functions

Related Topics

- [Using Functions](#)
If you are familiar with the contents of your database, you can use Oracle Smart View for Office functions to perform operations on specific data in Excel cells.
- [Creating Functions](#)
You can create Oracle Smart View for Office functions manually or by using the Function Builder.
- [Running Functions](#)
You can run most Oracle Smart View for Office functions automatically using **Refresh** commands. For HsGetValue, use the **Submit Data** command.

These are some common error codes displayed in functions.

Using Functions

If you are familiar with the contents of your database, you can use Oracle Smart View for Office functions to perform operations on specific data in Excel cells.

Note:

When using the Smart View functions in [Table 1](#), do not use the hash mark (#) or the semicolon (;) in member names, dimension names, or variable names. These characters are reserved for delimiters in the functions noted in this chapter.

Table 21-1 Smart View Functions and Supported Providers

Function	Description	Supported Providers
HsGetValue	Retrieves data from a data source.	<ul style="list-style-type: none"> • Oracle Analytics Cloud - Essbase • Planning • Planning Modules • Financial Consolidation and Close • Tax Reporting • Narrative Reporting
HsSetValue	Sends values to the data source.	<ul style="list-style-type: none"> • Oracle Analytics Cloud - Essbase • Planning • Planning Modules • Financial Consolidation and Close • Tax Reporting
HsGetSheetInfo	Retrieves detailed information about the current worksheet.	Provider-independent
HsAlias	Displays the alias of the specified dimension member.	<ul style="list-style-type: none"> • Planning • Planning Modules • Financial Consolidation and Close • Tax Reporting
HsDescription	Displays the description for the default member.	<ul style="list-style-type: none"> • Oracle Analytics Cloud - Essbase • Planning • Planning Modules • Financial Consolidation and Close • Tax Reporting
HsGetVariable	Retrieves the associated value for a substitution variable.	Oracle Analytics Cloud - Essbase

Creating Functions

You can create Oracle Smart View for Office functions manually or by using the Function Builder.

Note that not all functions are available to all providers. See [Table 1](#) for a list of functions and the supported providers.

Related Topics:

- [Creating Functions in the Function Builder](#)
- [Creating Functions Manually](#)

Creating Functions in the Function Builder

In the Function Builder, you select a function and specify the connection and members that you want the function to use. The Function Builder then creates the function using the proper syntax and enters it into the selected cell. You can edit these functions.

The selections available to you in a given Function Builder field are limited by your selections in other fields of the Function Builder. For example, only the connections supported by the selected function are displayed, and only the dimensions supported by the function you select are displayed.

A cell reference can be selected for each function argument. If you know argument input values, you can create functions in offline mode. Type-in functionality is available for each argument.

Function Descriptions

Note:

You can use functions that were created in the Function Builder prior to Release 11.1.2.2.310. However, starting with Release 11.1.2.2.310, the Function Builder uses commas (,) to separate member list arguments rather than semicolons (;). Both characters are supported by the new Function Builder, but when you modify a function created in the previous version, you are prompted to convert to the new comma-separated format. If you choose not to convert, then none of your modifications to the function are applied.

To create functions using the Function Builder:

1. Connect to the appropriate data source.

Function Builder supports shared or private connections.

Oracle Analytics Cloud - Essbase: If you are using a private connection, and your function is going to use an alias table, you must verify that the correct alias table or the "Default" alias table is set for the connection. In the Smart View Panel, right-click the database name, and select **Set alias table**. Ensure that the correct alias table is selected, and then refresh the sheet.

2. In the sheet, select the cell in which you want to enter the function.
3. In the Smart View Panel, navigate to the database on which you want to base the function, right-click the database name, and then select **Build Function**.

Accessing the Function Builder in this way will prepopulate the **Connection** field of the **Function Arguments** dialog box with specific connection information, as described in step 4.

Alternatively, from the Smart View ribbon, select **Functions**, and then **Build Function**.

When you access the Function Builder in this way, the **Connection** field in the **Function Arguments** dialog box is blank. You may provide connection information, as described in step 4. Or, if there is an active connection on the sheet, select HSACTIVE from the drop-down list.

- In **Select Function**, select a function from the list and click **OK**.

Figure 21-1 Function Builder, Select Function Dialog Box

 **Note:**

Not all functions are available to all providers. See [Table 1](#) for a list of functions and the supported providers.

The **Function Arguments** dialog box is displayed with the **Connection** field automatically populated with connection information in one of the following formats.

- For shared connections:

```
WSFN|ProviderType|Server|Application|Database
```

The `WSFN` parameter above signifies that this function is a workspace function and uses a shared connection. Workspace functions support Oracle Enterprise Performance Management Cloud connections.

- For private connections:

```
PrivateConnectionName
```

To manually enter the connection info, use the syntax above.

- In **Function Arguments**, for each argument in the selected function, do one of the following:

- Click the right-most button, .

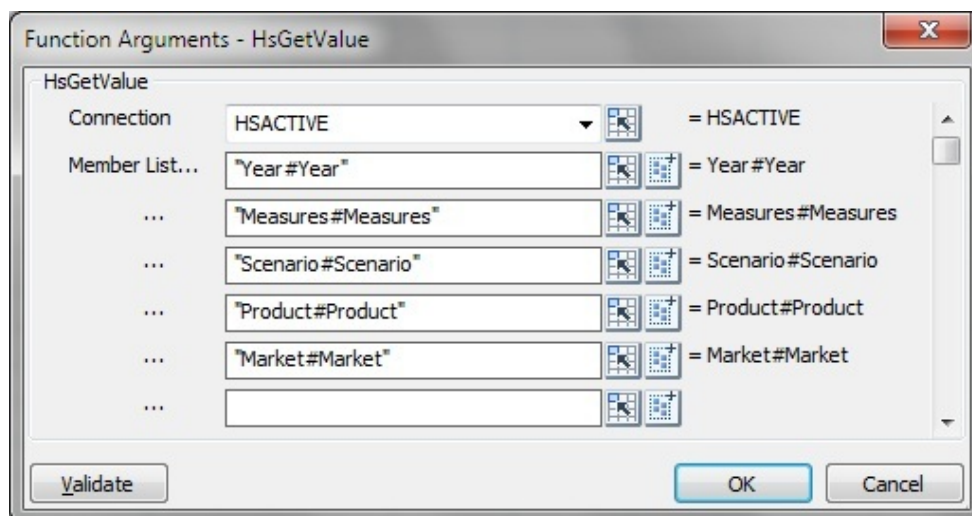

For example, for HsGetValue, click  to select members from **Member Selection**; for HsLabel and HsGetVariable, select from drop-down lists of labels or variables.

Oracle Analytics Cloud - Essbase: Note that when variable names are duplicated, their fully qualified name is displayed in the drop-down list. This helps to identify variables defined at the global, application, and database levels.

- To type arguments manually, enter the argument in the text box. For example, to type a member, use the format: dimension#member; such as Year#Qtr1 or Year#Jan.
- To use cell references, follow the procedure in [Using Cell References](#).

Figure 2 shows a completed **Function Arguments** dialog box for the HsGetValue function.

Figure 21-2 Function Builder, Function Arguments Dialog Box for HsGetValue Based on the Essbase Sample Basic Database

The arguments listed in **Function Arguments** vary depending on the function selected in the previous step.

Notes:

- For HsGetSheetInfo, use a cell reference. See [Using Cell References](#) for more information.
- For HsSetValue only: Select **Data** or **Cell Reference** and enter the value to submit.
- For HsGetText and HsSetText only:
 - Select **Comments** or **Cell Reference**, and then enter the cell text to submit
 - Select **Cell Text Label**, and then select a label from the drop-down menu
- If an active worksheet connection is available, you can select **HSACTIVE** from the **Connection** drop-down list.

- Click **Validate** and correct any errors that may be noted.

Some of the errors you may see are:

- Connection offline or invalid
- Invalid selection
- Member name is invalid or not matching selected alias
- Dimension name is invalid or not matching selected alias
- Incomplete Dimension#Member combination
- Generic "Error" in cases of missing quotation marks or other minor syntax errors

Figure 3 shows errors in the Function Arguments dialog box with after clicking the **Validate** button. In the following example from the Oracle Hyperion Financial Management Simple application, there are errors in the syntax for two of the Dimension#Member combinations. The first error is that the Dimension name is invalid or not matching the selected alias. The second error is that the member name is invalid or not matching the selected alias.

Figure 21-3 Function Builder Validation Errors

- When the function validation is successful, click **OK** to insert the function in the selected cell.
- To execute the function, follow the procedure in [Running Functions](#).

Using Cell References

You can enter references to single cells for connection, label, data/text, or variable arguments. You can also enter references to two contiguous or noncontiguous cells for dimension/member references. References cannot be made to cell ranges of more than two cells.

To use cell references:

- Follow the steps in [Creating Functions in the Function Builder](#) to open the **Function Arguments** dialog box.
- In the **Function Arguments** dialog box, for each argument in the selected

function, click the **Cell Reference** button, .

Depending on the type of argument selected, a Cell Reference dialog box is displayed.

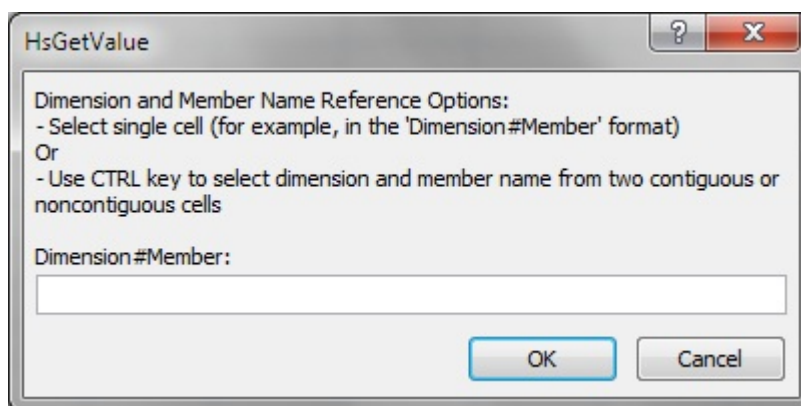

- If you select a connection, label, data/text, or variable argument, the **Select Single Cell Reference** dialog box is displayed.

Figure 21-4 Select Single Cell Reference Dialog Box

- If you select a member list argument, the **Cell Reference** dialog box for a dimension and member name cell reference is displayed.

Figure 21-5 Dimension and Member Name Cell Reference Dialog Box

3. In the grid, perform an action:
 - For the **Single Cell Reference** dialog box, depending on the type of argument, click a single cell to reference; for example, a cell containing a variable.
- [Figure 3](#) shows the **Single Cell Reference** dialog box with a cell selected for a label argument.

Figure 21-6 Cell Reference Dialog Box with Single Cell for Label Argument Selected

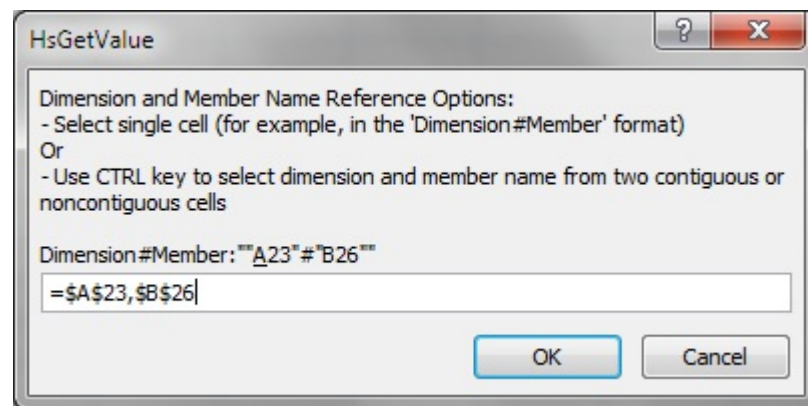

- For the **Dimension and Member Name Cell Reference** dialog box, do one of the following:
 - Click a single cell to reference; for example, a cell that contains both a dimension and a member name.
 - Pressing the **Ctrl** key, select two contiguous or noncontiguous cells; for example, a dimension and a member cell.

You may press **Ctrl**, click in two cells from different areas of the worksheet or two adjacent cells. Each cell selection must be performed by a single click while the **Ctrl** key is still pressed.

Figure 4 shows the **Dimension and Member Name Cell Reference** dialog box with two noncontiguous cells selected.

Figure 21-7 Cell Reference Dialog Box with Two Noncontiguous Cells Selected

4. Click **OK** in the **Cell Reference** dialog box.

In **Function Arguments**, the text field for the argument contains the referenced cell or cells in the format shown in Table 1.

Table 21-2 Cell Reference Formats

Cell Reference	Format in Function Arguments
Single cell	" "&A3&" " See "Notes" below this table for a full explanation.
Two contiguous cells	" "&A3&"#"&B3&" "
Two noncontiguous cells	" "&A5&"#"&B9&" "

Notes:

- For a single cell reference, if the member name that you selected in step 3 is displayed as dimension#member in the grid, then the argument selection is complete. For example, if the member is displayed in the grid as Year#Qtr 2 in cell A3, then " "&A3&" " is complete.

If only the member name is displayed in the grid, then you must manually enter the dimension name followed by # between the first two sets of double

quotation marks. For example, if the member is displayed as Qtr2 in cell A3, then you must enter `Year#` between the quotation marks: `"Year#"&A3&"`

- If an argument text field contains text before you select a reference cell, the cell reference text is appended to this text. Therefore, delete any unwanted text in the field before selecting a cell for reference.
- If a date cell is directly referred as input, then convert the input to the proper date format using a Text function as follow; in this example, cell B3 contains a proper date:

```
=HsSetValue(TEXT(B3,"dd/mm/yyyy"),"ConnectionName", "dim#member"...)

```

5. Click **OK** to insert the function in the selected cell.
6. Refresh.

Creating Functions Manually

See Microsoft documentation and support site for information about character and other Excel function limitations.

To create a function manually:

1. In Excel, click the cell in which you want to enter the function.
2. Enter an equals sign: =
3. Enter the function name; for example, enter `HsSetValue`
4. Enter parameters for the function according to rules described in [Syntax Guidelines](#), using the information specific to each function in [Function Descriptions](#).
5. To refresh the worksheet, from the Oracle Smart View for Office menu, select **Refresh**.

Functions are validated only when you refresh them.

Example 21-1 Syntax Guidelines

See [Function Descriptions](#) for the syntax of individual functions.

- To work with a shared connection, you must add to the function the WSFN identifier, which specifies a workspace function, along with a connection string. The format is:

```
"WSFN|ProviderType|Server|Application|Database", "POV"

```

For example, in the `HsGetValue` function for a shared connection to an Oracle Essbase data source, the WSFN identifier and connection string is added to the function as follows:

```
=HsGetValue("WSFN|Essbase|myserver|Sample|Basic", "Market#South")

```

For *ProviderType*, use one of the following case-sensitive strings:

- `Essbase` (for Essbase on-premises only; Oracle Analytics Cloud - Essbase requires private connection syntax)

- HP (for Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting)
- Private connection parameters can have these values:
 - **Empty**: the default connection
 - **HsActive**: the active associated connection
 - The user-defined name for a private connection

If you specify a private connection, it must precede the POV.

- The POV is composed of *dimension#member* pairs, for example:

```
Entity#Connecticut
```

- Parent-child relationships are designated by a period, (.); for example:

```
Entity#UnitedStates.Maine
```

- The connection and each POV *dimension#member* pair can be split into separate function parameters, each parameter enclosed in quotation marks, ("), and separated by a comma, (,); for example:

```
"My_connection", "Entity#UnitedStates", "Account#Sales"
```

Alternatively, the connection can be separated from the POV by a comma, (,), with the entire POV enclosed in quotation marks, ("), and with each *dimension#member* pair separated by semicolon, (;); for example:

```
"My_connection", "Entity#UnitedStates;Account#Sales"
```

Running Functions

You can run most Oracle Smart View for Office functions automatically using **Refresh** commands. For HsGetValue, use the **Submit Data** command.

To run functions and retrieve values:

1. Open the worksheet that contains the functions you want to run.
2. Do one of the following:
 - For HsSetValue, from the Smart View ribbon, select **Submit Data**.
 - For other functions, select one:
 - To run functions and update all worksheets in the workbook, from the Smart View ribbon, select **Refresh all Worksheets**.
 - To run functions and update only the active worksheet, select **Refresh**.

 **Note:**

When a worksheet that contains saved functions is opened on a different computer from the one on which it was created, the functions include the full path of the original computer. Smart View automatically updates these function paths when you open the worksheet if all three of the following conditions are met.

- The worksheet is unprotected.
- The Excel option **Ask to update automatic links** is cleared.
- When you open a workbook, if prompted to update link automatically, select **Continue** or **Cancel**. Do not select **Edit Links**.

Otherwise, you must manually update functions using the Excel **Links** option.

Fixing Links in Functions

You may need to fix broken links in functions.

Broken links can occur when you uninstall Oracle Smart View for Office on one drive and install it on another drive, or send a Smart View file to a user who installs it on a different drive.

To fix broken links in functions:

1. From the Smart View ribbon, select the arrow next to **Functions**.
2. From the drop-down menu, select **Fix Links**.

Copying and Pasting HsGetValue Functions

You may copy cells and ranges of cells containing the HsGetValue function from one Office application and paste them into Excel, Word or PowerPoint.

Note these guidelines when copying and pasting functions:

- Only cells containing the HsGetValue function may be copied and pasted. You may not copy and paste cells containing other functions.
- The data point generated will use the connection-level alias.
- Any cell references in the function will be replaced with its evaluated values. For example, if a function contains "Year#" "&A2&" for the dim#member combination, and cell A2 contains "Qtr2", then the function generated will have "Year#Qtr2" as the extracted value.
- Any POV changes applied on the data point query from the POV Manager will be applied only to the dimensions not present in the data point.
- Function XML may be exported from legacy applications.
- The following copy/paste scenarios are supported:
 - Functions from a single connection with no cell references.
 - Functions from a single connection with cell references.

- Functions from multiple connections
- Visualize in Excel—a grid with single intersection will be generated using the function POV.
- Functions with case insensitive connection names.
- The following copy/paste scenarios are *not* supported:
 - Functions from an ad hoc grid (these will be pasted as static values).
 - Nested formulas.
 - Formulas with arithmetic operations; for example, divide or multiply.
 - Other Excel functions; for example, IF or SUM.
 - Functions containing the `svLink` syntax. These are functions generated by Oracle Smart View for Office as a result of a Smart View copy and paste. Copying and pasting these functions results in static text.

To copy and paste functions:

1. Select the cell or range of cells to copy and perform an action:

- In Excel, click  .

- In Word and PowerPoint, click  .

2. If not already open, launch the Office application to which you want to paste the copied function cells.

3. Perform an action:

- In Excel, select the cell where the copied functions will be pasted and, in the Smart View ribbon, click  .

- In Word or PowerPoint, place the cursor at the point in the page or slide where

the copied function will be pasted and, in the Smart View ribbon, click  .

4. Refresh the sheet, page, or slide.

Function Descriptions

Oracle Smart View for Office provides these functions. Click a function name to access description, syntax, and examples.

[HsGetValue](#): Retrieves data from a data source for a given Point of View.

[HsSetValue](#): Sends values to the data source for a given Point of View.

[HsGetSheetInfo](#): Retrieves detailed information about the current worksheet.

[HsDescription](#): Displays the description for the default Point of View member.

[HsAlias](#): Displays the alias of the specified dimension member.

HsGetValue: Retrieves the value for a substitution variable.

HsGetValue

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting, Narrative Reporting

Description

HsGetValue retrieves data from the data source for selected members of a dimension.

When HsGetValue retrieves no data, the value specified for the #NoData/Missing Label replacement option is used (see [Table 1](#)).

When users select Refresh or Refresh All, only HsGetValue is called. When users select Submit, HsSetValue is called first, and HsGetValue is then called only if HsSetValue returns successfully.

The HsGetValue function supports the use of one attribute dimension and member with Essbase data sources. In Oracle Smart View for Office 11.1.2.5.710+, HsGetValue extends attribute support to Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting data sources (see [Example with Attribute](#)).

In Smart View 11.1.2.5.720+, HsGetValue can be used to return enumerated data types, such as Smart List, text, and dates (see [Example with Smart List](#)).

Syntax

Private connection:

```
HsGetValue("PrivateConnectionName", "POV")
```

Shared connection:

```
HsGetValue("WSFN|ProviderType|Server|Application|Database", "POV")
```

For detailed syntax information, see [Creating Functions Manually](#).

Example 21-2 Example without Attribute

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting, Narrative Reporting

In this example, HsGetValue returns the value from the HFM01 application for the default POV.

Private connection:

```
=HsGetValue("HFM01", "Scenario#Actual", "Year#2004", "Period#July", "View#YTD",  
"Entity#UnitedStates.Connecticut", "Value#USD", "Account#Sales", "ICP#[ICP  
None]", "Custom1#GolfBalls", "Custom2#Customer2", "Custom3#[None]", "Custom4#In  
creases")
```

Shared connection:

```
=HsGetValue( "WSFN|HFM|hfm_svr|HFM01|
HFM01", "Scenario#Actual", "Year#2004", "Period#July", "View#YTD", "Entity#UnitedStates.Connecticut", "Value#USD", "Account#Sales", "ICP#[ICPNone]", "Custom1#GolfBalls", "Custom2#Customer2", "Custom3#[None]", "Custom4#Increases" )
```

Example 21-3 Example with Attribute

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

In this example, HsGetValue returns the value from the Vision application, Plan1 database, and the POV includes an attribute dimension and member, Entity_Regions#NA_Reg.

Note:

HsGetValue supports only one attribute dimension and member per function.

Private connection:

```
=HsGetValue("Vision", "Account#Amount", "Period#Jan", "Years#2017", "Scenario#Annual Contract", "Version#Final", "Entity#AR02-Argentina-IS_Adjustments", "Package#Depreciation", "Currency#Local Currency", "Entity_Regions#NA_Reg" )
```

Shared connection:

```
=HsGetValue( "WSFN|HP|serviceURL|Vision|
Plan1", "Account#Amount", "Period#Jan", "Years#2017", "Scenario#Annual Contract", "Version#Final", "Entity#AR02-Argentina-IS_Adjustments", "Package#Depreciation", "Currency#Local Currency", "Entity_Regions#NA_Reg" )
```

Example 21-4 Example with Smart List

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

In this example, HsGetValue returns a Smart List value from the Vision application, Plan1 database. The Smart List in this case is looking for the Driver value for Cleaning and Maintenance. Possible values that can be returned are "% of Revenue," "Units," "FTE Hours," "Sales Calls," "Trips," "Square Feet," and "None."

Private connection:

```
=HsGetValue("Vision", "Account#7440: Cleaning and Maintenance", "Period#x-----"
```

```
x", "HSP_View#BaseData", "Year#FY15", "Scenario#Plan", "Version#Driver", "Entity
#No Entity", "Product#No Product")
```

Shared connection:

```
=HsGetValue("WSFN|HP|serviceURL|Vision|Plan1", "Account#7440: Cleaning and
Maintenance", "Period#x-----
x", "HSP_View#BaseData", "Year#FY15", "Scenario#Plan", "Version#Driver", "Entity
#No Entity", "Product#No Product")
```

HsSetValue

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Description

HsSetValue sends a data value from a worksheet to a data source for selected members of a dimension. To send data to a data source, you must have the appropriate load rule and have write access for the data source.

In Smart View 11.1.2.5.810+, HsSetValue can be used to send enumerated data types, such as Smart List, text, and dates.

Syntax

Private connection:

```
HsSetValue (dollar amount, "PrivateConnectionName", "POV")
```

Shared connection:

```
HsSetValue (dollar amount, "WSFN|ProviderType|Server|Application|
Database", "POV")
```

For detailed syntax information, see [Creating Functions Manually](#).

Example 21-5 Basic Example

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

In this example, HsSetValue sends the value from cell H4 to the HFM01 application.

Private connection:

```
HsSetValue(H4,
"HFM01", "Scenario#Actual;Year#2004;Period#"&B$2&";View#<Scenario
View>;Entity#UnitedStates.Connecticut;Value#<Entity
Currency>;Account#"&$A4&";ICP#[ICP
None];Custom1#GolfBalls;Custom2#Customer2;Custom3#[None];Custom4#
Increases")
```

Shared connection:

```
HsSetValue(H4, "WSFN|HFM|hfm_svr|HFM01|
HFM01", "Scenario#Actual;Year#2004;Period#&B$2&";View#<Scenario
View>;Entity#UnitedStates.Connecticut;Value#<Entity
Currency>;Account#"&$A4&";ICP#[ICP
None];Custom1#GolfBalls;Custom2#Customer2;Custom3#[None];Custom4#
Increases")
```

Example 21-6 Example with Smart List

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

In this example, the syntax is similar to that used for text, but the text but has to match one of the text values in the Smart List.

Private connection:

```
HsSetValue("Trips", "Vision", "Account#7110: Advertising", "Period#x-----
x", "HSP_View#BaseData", "Year#FY16", "Scenario#Forecast", "Version#Driver", "En
tity#International Sales", "Product#No Product")
```

Shared connection:

```
HsSetValue("Trips", "WSFN|HP|serviceURL|Vision|Plan1", "Account#7110:
Advertising", "Period#x-----
x", "HSP_View#BaseData", "Year#FY16", "Scenario#Forecast", "Version#Driver", "En
tity#International Sales", "Product#No Product")
```

Example 21-7 Example with Text

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Private connection:

```
HsSetValue("Enter Some Text", "Vision", "Account#7110:
Advertising", "Period#Jun", "HSP_View#BaseData", "Year#FY16", "Scenario#Plan", "
Version#Commentary", "Entity#International Sales", "Product#No Product")
```

Shared connection:

```
HsSetValue("Enter Some Text", "WSFN|HP|serviceURL|Vision|
Plan1", "Account#7110:
Advertising", "Period#Jun", "HSP_View#BaseData", "Year#FY16", "Scenario#Plan", "
Version#Commentary", "Entity#International Sales", "Product#No Product")
```

Example 21-8 Example with Date

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Private connection:

```
HsSetValue("01/03/2003","Vision","Account#Request Date","Period#x-----
x","HSP_View#BaseData","Year#FY16","Scenario#Plan","Version#Working","Entit
y#No Department","Product#No Product")
```

Shared connection:

```
HsSetValue("01/03/2003","WSFN|HP|serviceURL|Vision|Plan1","Account#Request
Date","Period#x-----
x","HSP_View#BaseData","Year#FY16","Scenario#Plan","Version#Working","Entit
y#No Department","Product#No Product")
```

Example 21-9 Example with Date Using TODAY Function for Today's Date

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

You can also use the TODAY function for today's date.

Private connection:

```
HsSetValue(TEXT(TODAY(),"mm/dd/yyyy"),"Vision","Account#Request
Date","Period#x-----
x","HSP_View#BaseData","Year#FY16","Scenario#Plan","Version#Working","Entit
y#No Department","Product#No Product")
```

Shared connection:

```
HsSetValue(TEXT(TODAY(),"mm/dd/yyyy"),"WSFN|HP|serviceURL|Vision|
Plan1","Account#Request Date","Period#x-----
x","HSP_View#BaseData","Year#FY16","Scenario#Plan","Version#Working","Entit
y#No Department","Product#No Product")
```

HsGetSheetInfo

Data source types: Provider-independent

Description

HsGetSheetInfo retrieves detailed information about the current worksheet, as described in [Table 1](#).

Table 21-3 HsGetSheetInfo Details

Numerical Equivalent	String Equivalent	Sheet Information
1	Connected	Connection status
2	Sheet Type	Ad hoc or form
3	Server	The server to which the sheet is connected
4	Application	The application to which the sheet is connected

Table 21-3 (Cont.) HsGetSheetInfo Details

Numerical Equivalent	String Equivalent	Sheet Information
5	Cube	The cube to which the sheet is connected
6	URL	The URL to which the sheet is connected
7	Provider	The data source type to which the sheet is connected
8	Provider URL	The provider to which the sheet is connected; applicable for Oracle Hyperion Provider Services connections
9	Friendly Name	The data source connection name
10	Alias Table	The current alias table
11	User	The user name
12	Description	The connection description

Syntax

```
HsGetSheetInfo("<string equivalent>")
```

```
HsGetSheetInfo("<numerical equivalent>")
```

For detailed syntax information, see [Creating Functions Manually](#).

Example

In this example, HsGetSheetInfo tells you whether the worksheet contains an ad hoc grid or a form.

```
HsGetSheetInfo("Sheet Type")
```

HsDescription

Data source types: Oracle Analytics Cloud - Essbase, Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Description

HsDescription displays the description of the specified dimension member.

Oracle Analytics Cloud - Essbase only: HsDescription returns the alias name of the specified dimension member.

Syntax

Private connection:

```
HsDescription ("PrivateConnectionName", "Dimension#Member")
```

Shared connection:

```
HsDescription ( "WSFN|ProviderType|Server|Application|  
Database", "Dimension#Member" )
```

For detailed syntax information, see [Creating Functions Manually](#).

Example

In this example, HsDescription displays the description for Custom 4.

Private connection:

```
HsDescription( "HFM01", "Custom4#Increases" )
```

Shared connection:

```
HsDescription( "WSFN|HFM|hfm_svr|HFM01|HFM01", "Custom4#Increases" )
```

HsAlias

Data source types: Planning, Planning Modules, Financial Consolidation and Close, Tax Reporting

Description

HsAlias displays the alias of the specified dimension member.

Syntax

Private connection:

```
HsAlias( "PrivateConnectionName", "Dimension#Member", "OutputAliasTable",  
"MemberNameFromAliasTable" )
```

Shared connection:

```
HsAlias( "WSFN|ProviderType|Server|Application|  
Database", "Dimension#Member",  
"OutputAliasTable", "MemberNameFromAliasTable" )
```

Note:

For detailed syntax information, see [Creating Functions Manually](#).

Notes

- The connection and Dimension#Member parameters are required.

- For private connections, the OutputAliasTable parameter is optional. If OutputAliasTable is empty, then the connection level alias will be used for OutputAliasTable.
- It is optional to specify which alias table the member is from. If MemberNameFromAliasTable is empty, then the original member name from the outline will be used.
- If the member name is not found in the alias table specified in MemberNameFromAliasTable, then the original member name from the outline will be used.
- The HsActive keyword within the HsAlias function can only be used on a sheet with an ad hoc grid.
- Copy and Paste either from Oracle Smart View for Office or Excel is not supported. Only static text will be pasted.

Example

Private connection:

```
HsAlias("Planvision","Scenario#Actual", "German", "Default",)
```

Shared connection:

```
HsAlias("WSFN|HP|svr|Vision|Plan1","Scenario#Actual", "German", "Default")
```

HsGetVariable

Data source types: Oracle Analytics Cloud - Essbase

Description

HsGetVariable retrieves the associated value for a substitution variable.

You cannot use HsGetVariable with Smart Slices.

Syntax

HsGetVariable can use the default connection name, a private connection name, a shared connection, or an Excel named range on a multiple-range grid, as follows:

- **Default connection:** `HsGetVariable("substitution variable name")`
- **Private connection:** `HsGetVariable("PrivateConnectionName", "substitution variable name")`
- **Shared connection:** `HsGetVariable("WSFN|ProviderType|Server|Application|Database", "substitution variable name")`
- **Named range on a multiple-range grid:** `HsGetVariable("range name", "substitution variable name")`

For detailed syntax information, see [Creating Functions Manually](#).

Examples

- Default connection: `HsGetVariable("CurMonth")`

- **Private connection:**
`HsGetVariable("myprivateconnection_Sample_Basic", "CurMonth")`
- **Shared connection:** `HsGetVariable("WSFN|Essbase|esbsvr|Sample|Basic", "CurMonth")`
- **Named range:**
`HsGetVariable("myprivateconnection_Sample_Basic", "CurMonth")`

 **Note:**

An ampersand (&) is generally used to refer to a substitution variable, but is optional in this function.

 **Note:**

HsGetVariable does not support non-ASCII variable values.

Common Function Error Codes

These are some common error codes displayed in functions.

#NO CONNECTION - You are not connected or logged on to a data source.

#INVALID - Invalid metadata. Invalid cells that contain a value display the value as zero.

#LOCKED - The cell is locked.

#NO ACCESS - You do not have access to this cell.

#NO DATA - The cell contains NoData. You can select to display zeros instead of NoData. Cells use the Replacement text that you specify in the Options dialog box.

#INVALID INPUT - The HsSetValue data value is not valid, for example, a text string.

#READ ONLY - This is for the HsSetValue function only when the cell is Read-only.

#NEEDS REFRESH - Data needs to be refreshed.

#INVALID DIMENSION - An invalid dimension is specified in the function.

#INVALID MEMBER - An invalid dimension member name is specified in the function.

#NAME - Excel does not recognize text in a formula. When you forward a worksheet that contains functions to a user who does not have Oracle Smart View for Office, they can view the same data as the functions on the worksheet. When the user edits or refreshes the function, it changes to #Name.

About Free-Form Mode

In ad hoc analysis, if you are familiar with the dimensions and members of your database, you can use *free-form mode* by typing dimension and member names directly into cells.

You can still use the POV, member selection, and other ad hoc operations in free-form grids.

The components of Oracle Smart View for Office grids are described in [Table 1](#).

Table 22-1 Smart View Grid Components

Grid Component	Description
Row Dimension	A dimension or member placed down one column across one or more rows in a worksheet
Column Dimension	A dimension or member placed on a row across one or more columns in a worksheet
Comments	Text added by the user
Data Region	Areas of the grid that contain data for dimensions or members
Blank Region	Areas of the worksheet that contain no entries

Related Topics:[Free-Form Guidelines](#)[Free-Form Grid Examples](#)[Comments in Free-Form Grids](#)[Formulas in Free-Form Grids](#)[Creating Free-Form Reports](#)[Creating Asymmetric Reports](#)[Actions That May Cause Unexpected Behavior](#)

Free-Form Guidelines

Consider these guidelines when working in free-form mode.

- Grids do not need to start in cell A1.
- A grid must have at least one row dimension and one column dimension.
- Each row dimension can contain members of only one dimension. Each column dimension can contain members of only one dimension.
- Members of one dimension can be entered only in **one** of the following regions:
 - In the same row
 - In the same column
 - Anywhere in the page dimension region (Oracle Analytics Cloud - Essbase only)
- The page dimension region can contain members of different dimensions, but no two members in the page dimension region can belong to the same dimension (Oracle Analytics Cloud - Essbase only).
- Dimensions entered into the page dimension region override any corresponding default or existing dimensions in the page dimension region. For example, if the page dimension contains a Year dimension, and you enter Qtr1, then Qtr replaces Year in the page dimension (Oracle Analytics Cloud - Essbase only).

- The replacement labels specified in the **Data Options** page of the **Options** dialog apply in free-form mode.
- Numerical entries are identified as data in the data region, and as comments outside the data region. If you want to use a number as a member name, precede it with a single quotation mark; for example, '100.
- Precede member names that contain spaces between words with a single quotation mark.
- When connected to a database that supports duplicate member names, select **Distinct Member Name** on the **Member Options** page of the Oracle Smart View for Office **Options** dialog box to display fully qualified member names in the worksheet. To enter duplicate members, use this syntax for qualified member names:

```
[Income].[Other]
[Expenses].[Other]
```

- Aliases from the current alias table are permitted in free-form grids, but aliases from other alias tables are treated as comments.
- In an ad hoc grid, if you insert a column and type a member name in the new column, and want to change the alias table for the sheet, you must first refresh the sheet before changing the alias table.
- If a member name contains a comma (,), enclose the entire name in quotation marks (" ").

Use this syntax:

```
"mbr_name , mbr_name"
```

For example:

```
"Tablets, Smartphones"
```

Free-Form Grid Examples

Review the examples in this section when working in free-form mode.

Related Topics

- [Simple Grids](#)

Simple Grids

Data source types: Oracle Analytics Cloud - Essbase, Planning

Simple Grids in Essbase

In Oracle Analytics Cloud - Essbase and Oracle Smart View for Office, free-form behavior is such that the POV members are placed on the first row of an Excel sheet. Column and row dimension members are placed on the grid starting after the POV row rows. This means that all the POV members become part of the grid.

Figure 1 shows a valid simple grid in Essbase, where Year is the row dimension, and Measures is the column dimension, beginning in row 1.

Figure 22-1 Simple Grid in Essbase with Only Column and Row Dimensions

	A	B	C	D	E
1		Profit	Inventory Ratios		Measures
2	Qtr1				
3	Qtr2				
4	Qtr3				
5	Qtr4				
6	Year				

Figure 2 shows what happens after clicking **Refresh** in a connected sheet. As described previously, row 1 is populated with the POV dimensions of Product, Market and Scenario. The row and column dimensions begin on row 2.

Figure 22-2 Result of Ad Hoc Analysis Command on Simple Grid in Essbase

	A	B	C	D	E
1		Product	Market	Scenario	
2		Profit	Inventory Ratios		Measures
3	Qtr1	-6823	1234	33.31103991	-6823
4	Qtr2	27107	119776	55.38705141	27107
5	Qtr3	27912	#Missing	55.00356413	27912
6	Qtr4	25800	142483	55.41720586	25800
7	Year	73996	1234	51.44275158	73996

Figure 3 shows a valid simple grid in Essbase, where Product is the page dimension in row 1. Year is the row dimension and Measures is the column dimension, beginning on row 2.

Figure 22-3 Simple Grid in Essbase with Dimension in Row 1

	A	B	C	D	E
1				Product	
2		Profit	Inventory Ratios		Measures
3	Qtr1				
4	Qtr2				
5	Qtr3				
6	Qtr4				
7	Year				

Figure 4 shows what happens after clicking **Refresh** in a connected sheet. In this case, because the Product dimension was already placed on the sheet, it is moved to

row 2. The POV dimensions are placed on row 1. The row and column dimensions begin on row 3.

Figure 22-4 Result of Ad Hoc Analysis Command on Simple Grid in Essbase with Dimension in Row 1

	A	B	C	D	E
1		Market	Scenario		
2		Product	Product	Product	Product
3		Profit	Inventory	Ratios	Measures
4	Qtr1	-6823	1234	33.31103991	-6823
5	Qtr2	27107	119776	55.38705141	27107
6	Qtr3	27912	#Missing	55.00356413	27912
7	Qtr4	25800	142483	55.41720586	25800
8	Year	73996	1234	51.44275158	73996

Simple Grid in Planning

Figure 5 shows a valid simple grid in Planning, where Year is the row dimension and Account is the column dimension.

Figure 22-5 Simple Grid in Planning

	A	B
1		Year
2	Account	3

Two Column By Two Row Layout

Figure 6 is a basic two columns by two rows layout showing the Product and Market dimensions in the first row and column, and members of Sales and Year in the second row and column.

Figure 22-6 Two Columns by Two Rows Layout

	A	B	C	D	E	F
1			Product	Product	Product	Product
2			Profit	Inventory	Ratios	Measures
3	Market	Qtr1				
4	Market	Qtr2				
5	Market	Qtr3				
6	Market	Qtr4				
7	Market	Year				

Comments in Free-Form Grids

Review the guidelines in this section when working with comments in free-form grids.

Data source types: Oracle Analytics Cloud - Essbase, Planning

 **Note:**

Oracle Analytics Cloud - Essbase: You cannot add comments on worksheets that are enabled for multiple grids.

Comments can be placed as follows:

- Between row dimensions
- Between column dimensions
- Between page dimensions
- Between dimensions and data cells
- Interleaved with members of page dimensions
- Interleaved with members of row, column and page dimensions

Further, comment rows and comment columns can be interleaved with row and column dimensions.

- To the left, right, top, bottom of the grid.

Comments cannot be placed in data cells or in cells that intersect row and column dimensions in the upper right corner.

When working with comments in Planning, note that comments are supported both inside and outside of the grid boundaries.

 **Note:**

Comments are not saved to the provider server in the free-form worksheet. For example, if you use the Save Ad Hoc Grid command with a Planning free-form or ad hoc grid, the formulas are not saved. However, you can retain the comments in a worksheet by performing a Save in Excel and saving the workbook.

For information about unexpected behavior that may occur, see [Actions That May Cause Unexpected Behavior](#).

6	a6	Market	Qtr2					h6
7		Market	Qtr3					
8		Market	Qtr4					
9		Market	Year					
10			c10	d10				

Grid with Complex Comments

Data source types: Oracle Analytics Cloud - Essbase

Figure 1 shows an example of a combination of the page region, attributes, and comments on a single grid.

Figure 22-8 Grid with Complex Comments

	A	B	C	D	E	F	G	H
1	Pkg Type							
2	Budget							
3		B3	C3	D3				
4				Product	Product		Product	Product
5					E5	F5	G5	
6				Profit	Inventory		Ratios	Measures
7	Market		Qtr1					
8	Market		Qtr2					
9		B9			E9	F9	G9	
10	Market		Qtr3					
11	Market		Qtr4					
12	Market		Year					
13								
14				D14	E14	F14		

Invalid Placement of Comments

Data source types: Oracle Analytics Cloud - Essbase

Row and column dimension regions can be interleaved with comment rows and comment columns. [Figure 1](#) shows a grid that is invalid because the comment in cell C2 does not belong to either a comment row or a comment column. (Both row 2 and column C have dimension members.)

Figure 22-9 Invalid Placement of Comments

	A	B	C	D
1		100-10	100-30	100
2		Measures	Comment	Measures
3	Year			

Comments Inside and Outside of Grid Boundaries

Data source types: Planning

[Figure 1](#) shows a grid with a comment in cell B5, inside the grid boundaries. These comments are retained in retrieval and zoom operations, but are not saved in Planning.

Figure 22-10 Grid with Comments Inside Grid Boundaries

	A	B	C	D
1				
2				FY15
3				Period
4		Entity	Account	#Missing
5		Comment Row		
6		Entity	Account	#Missing

[Figure 2](#) shows a grid with comments in cells A3, and C1, outside of the grid boundaries. These comments are retained in retrieval and zoom operations, but are not saved in Planning.

Figure 22-11 Grid with Comments Outside of Grid Boundaries

	A	B	C
1		Year	Comment Column
2	Account	3	
3	Comment Row		

Formulas in Free-Form Grids

Review the guidelines in this topic when working with formulas in free-form grids.

Data source types: Oracle Analytics Cloud - Essbase, Planning

You can enter Excel formulas in cells that can contain comments.

 **Note:**

Excel formulas are not saved to the provider server in the free-form worksheet. For example, if you use the Save Ad Hoc Grid command with a Planning free-form or ad hoc grid, the formulas are not saved. However, you can retain formulas in a worksheet by performing a Save in Excel and saving the workbook.

Figure 1 shows a grid from an Essbase data source with Excel formulas in cells C8 and F8.

Figure 22-12 Formulas in Essbase Free-Form Grid in Excel

	A	B	C	D	E	F
1			Product	Product	Product	Product
2			Profit	Inventory	Ratios	Measures
3	Market	Qtr1				
4	Market	Qtr2				
5	Market	Qtr3				
6	Market	Qtr4				
7	Market	Year				
8			=SUM(C3:C6)			=SUM(F3:F6)

Figure 2 shows a grid from a Planning data source with Excel formulas in cells B8 and C7.

Figure 22-13 Formulas in Planning Free-Form Grid in Excel

	A	B	C
1		Product	Formula on Column
2		Entity Alias	
3		Version	
4		Scenario	
5		Period	
6		Year	
7	Account	3	=SUM(B7*10)
8	Formula On Row	=SUM(C7+B7)	

For information about unexpected behavior that may occur, see [Actions That May Cause Unexpected Behavior](#).

Duplicate Aliases in Free-Form Mode

Review the guidelines and examples in this topic when working with duplicate aliases in free-form mode.

Data source types: Planning

Planning supports duplicate aliases for members from different dimensions and for members within dimensions.

To use duplicate aliases, you must have, at a minimum, Oracle Smart View for Office 11.1.2.5.600, and you must be connected to Planning version 16.06 or later.

The guidelines are:

- Duplicate aliases are supported across dimensions and within dimensions.
- Aliases can have the same name as a member.
- Member names are still required to be unique so that they can be used in rules and form design to avoid name collisions.

When typing a duplicate alias name in free-form mode, and then refreshing, a message appears asking you to resolve the duplicate. You can do this either by using the Member Selector to select the correct alias name or by hand-typing the qualified name in this format:

```
[parent_member_name].[alias]
```

or

```
[parent_alias].[alias]
```

Only duplicate alias names are supported, not duplicate member names; therefore, using the parent member name as a qualifier should be sufficient in many cases.

However, if [parent_alias] is also a duplicate, then the qualified name should be extended up to the first unique ancestor, in this format:

```
[grand_parent_member_name].[parent_alias].[alias]
```

or

```
[grand_parent_alias].[parent_alias].[alias]
```

For example, suppose a database has the following Market and Geography dimension hierarchies, with duplicate alias names at the Region, State, and City level. In this scenario, East, New York (state), and New York (city) are duplicate alias names, as follows:

Market	Geography
East	East
New York	New York
New York	New York

You want to enter the city, New York, from the Market dimension into a free-form grid. To do this, you could select the city, New York, from the Market dimension in the Member Selector. Or, you could type the qualified name as follows:

[Market].[East].[New York].[New York]

Attribute Dimensions in Free-Form Grids

Review the guidelines and examples in this topic when working with attribute dimensions in free-form mode.

Data source types: Oracle Analytics Cloud - Essbase

Figure 1 shows an example of both page region and attribute usage. In this example, Pkg Type (an attribute dimension attached to the base member Product) and Budget are page dimensions. By drilling down on Pkg Type you can do attribute based analysis on measures as it relates to specific Product attributes. This can be further used to create a cross-tab analysis of product SKUs by attribute.

Figure 22-14 Attribute Dimensions in Free-Form Grids

	A	B	C	D	E	F
1	Pkg Type					
2	Budget					
3						
4			Product	Product	Product	Product
5			Profit	Inventory	Ratios	Measures
6	Market	Qtr1				
7	Market	Qtr2				
8	Market	Qtr3				
9	Market	Qtr4				
10	Market	Year				

Alternatively, to quickly add attribute dimensions onto a free-form grid, follow the instructions in [Inserting Attribute Dimensions on the Sheet](#). You can then use the member selection instructions in the [Dimensions and Members](#) to select and work with members from the attribute dimensions.

Creating Free-Form Reports

Follow the procedure in this topic to create a free-form report.

Data source types: Oracle Analytics Cloud - Essbase, Planning

To construct a free-form report:

1. Open a worksheet and connect to a data source.
2. In the worksheet, enter member names according to the rules specified in [Free-Form Guidelines](#).
3. Oracle Analytics Cloud - Essbase: Members may have duplicate names (for example, both East and West markets may contain a member named Portland —

Maine and Oregon). To enter a duplicate member name, use **Member Selection** to select members.

4. Refresh the grid, or select **Ad hoc analysis**.
5. Perform further ad hoc operations and formatting as needed.

Retrieving Attribute Dimensions in Free-Form Mode

Follow the procedure in this topic to retrieve attribute dimensions in a free-form report..

Data source types: Oracle Analytics Cloud - Essbase

In structured grid processing operations, attribute dimensions are not shown. In free-form, you can type an attribute dimension member in the grid and it will be processed and validated. Only the attribute dimension member that you added will be displayed and used during processing and validation; the remaining attribute dimension members will not be included. Structured grid operations that follow this free-form request will retain the attribute dimension member.

If the base dimension exists in the worksheet, you can also retrieve an attribute member by typing the name directly in the worksheet.

To retrieve an attribute dimension in free-form using **Member Selection**:

1. In a blank worksheet, select a cell.(The worksheet must be blank.)
2. From the data source ribbon, select **Member Selection**.
3. In the **Dimension Name Resolution** dialog box, select the attribute dimension.
4. To orient members vertically in the worksheet starting from the cell you selected in step 3, select the **Vertical Orientation** check box.

This check box is cleared by default; meaning that members will be oriented horizontally across the sheet from the cell you selected in step 3.

5. Click **OK** to launch the **Member Selection** dialog box.
6. Select the members to place on the worksheet.

Note:

You can also add attribute dimensions and members to the sheet.

Creating Asymmetric Reports

Follow the procedure in this topic to create asymmetric free-form report..

Data source types: Oracle Analytics Cloud - Essbase, Planning

Reports can contain symmetric or asymmetric column groups. The symmetry the symmetry of column groups is determined automatically, based on the members you select.

Symmetric reports, as shown in [Figure 1](#), are characterized by repeating, identical groups of members.

Figure 22-15 Symmetric Report

East						West					
Budget			Actual			Budget			Actual		
Qtr1	Qtr2	Qtr3	Qtr1	Qtr2	Qtr3	Qtr1	Qtr2	Qtr3	Qtr1	Qtr2	Qtr3

Asymmetric reports, as shown in [Figure 2](#), are characterized by groups of nested members that differ by at least one member. There can be a difference in the number of members or in the names of members.

Figure 22-16 Asymmetric Report

East						West		
Budget			Actual			Budget		
Qtr1	Qtr2	Qtr3	Qtr1	Qtr2	Qtr3	Qtr1	Qtr2	Qtr3

You can create asymmetric reports as follows:

- Enter member names in free-form mode.
- Zoom in with **Within Selected Group** selected on the Member Options page of the Options dialog box.
- Suppress rows that contain missing values, zero values, or underscore characters during data retrievals.

 **Note:**

Retrieving data into an asymmetric report may take a long time on large reports.

Actions That May Cause Unexpected Behavior

Review this topic to learn about actions that may cause unexpected behavior in free-form reports.

Oracle Smart View for Office tries to preserve all comments, formulas, and customized report layouts. Some exceptions that may result in unexpected behavior are when the following actions are performed:

- Zoom in on a page dimension
- Pivot a dimension from the POV to a row or column
- Drag and drop a dimension from the POV to the worksheet
- Pivot a row dimension to a column dimension
- Switch the location of a row dimension to another row
- Switch the location of a column dimension to another column

- Change member aliases using the Change Alias Table command
- With Oracle Analytics Cloud - Essbase data sources, cutting and pasting from Microsoft Word into an Excel worksheet may cause unexpected behavior because of hidden characters. If this happens, contact your administrator, who can identify the issue through logs.

You can perform a "health check" on your system to optimize performance.

About Smart View Diagnostics and Health Check

The Oracle Smart View for Office Diagnostics tools to help you collect information for Oracle Support. **Health Check** can help you to optimize Smart View performance and quickly review information about your system.

While working with Smart View, an issue may arise that you cannot resolve on your own. Use the tools in the **Diagnostics** group in the Smart View ribbon to create and collect files and screenshots to send to Oracle Support. The files and screenshots you collect are used by Oracle Support to troubleshoot and resolve your issue.

You can also use the **Health Check** dialog to optimize performance and to get information about your machine, Microsoft Office version, Smart View version, and the extensions you have installed.

[Performing a Health Check On Your System](#)

Displaying the Diagnostics Group in the Smart View Ribbon

You can choose to display or hide the **Diagnostics** options in the Smart View ribbon.

When you first install Oracle Smart View for Office and open it, the **Diagnostics** options are not displayed.

To display the **Diagnostics** group of options:

1. Open the Office application where you are experiencing the issue.
2. From the Smart View ribbon, select **Options**, and then select the **Advanced** tab.
3. In **Advanced**, select **Show Diagnostics Group on Smart View Ribbon**, and then click **OK** to close the **Options** dialog box.

The **Diagnostics** group is automatically displayed in the Smart View ribbon (see [Figure 1](#)). You do not need to restart the Office application.

Figure 23-1 Tools in the Diagnostics Group in the Smart View Ribbon

4. Repeat this procedure in each Office application where you are experiencing the issue.

Note:

You must enable the **Diagnostics** group in each Office application individually. The **Diagnostics** group will not display in other Office applications until you enable it.

5. **Optional:** When finished using the **Diagnostics** tools, to hide the **Diagnostics** group in the Smart View ribbon, clear the **Show Diagnostics Ribbon Tab** check box in the **Advanced** tab of the **Options** dialog box.

Customizing Diagnostics Features

You can customize certain features of the Diagnostics tools.

The procedure in this topic walks you through each of the options available in the **Diagnostic Options** dialog box.

 **Note:**

All steps in the following procedure are optional.

To customize the **Diagnostics** tools:

1. In the **Diagnostics** group in the Smart View ribbon, select **Diagnostics Options**. The **Diagnostics Options** is displayed, as shown in [Figure 1](#).

Figure 23-2 Diagnostics Options Dialog Box

2. To hide data values in the Office document, select **Mask Data**. Select this option if data values in your output should be hidden for confidentiality purposes.

 **Note:**

Selecting either **Mask Data** or **Mask Members** (see next step), or both, can impact performance significantly on large grids; for example, on grids of 10,000+ cells.

3. To hide member names in the Office document, select **Mask Members**. Select this option if member names in your output should be hidden for confidentiality purposes.
4. To direct the diagnostics output files to a folder other than the default, in **Route diagnostics output to**, click  and navigate to the folder location to store the files.

You can also enter the folder location manually.

The default folder location is:

```
C:\Users\username.domain\AppData\Roaming\Oracle\SmartView\Diagnostics
```

5. To allow automatic screenshots for each warning or error message that is displayed, select an option:

- **Errors**
- **Warnings**

If you do not want automatic screenshots, select **Never** (the default).

6. To collect data on memory usage, select the **Include memory data** check box.

 **Note:**

When diagnostics is enabled and the **Include memory data** option selected, Oracle Smart View for Office performance will be slower, in some cases up to two times slower than normal.

You should select this option only if you are running into memory issues. For example, on 32-bit machines, if Smart View terminates abnormally or takes an excessive amount of time to load large spreadsheets, then you should select **Include memory data** when collecting diagnostics.

7. Click **Save** to save your option selections.

Using the Smart View Diagnostics Tools

Use the Oracle Smart View for Office Diagnostic tools to collect data about your issue in the form of log files and screenshots.

The data you collect is stored in a session folder (either in the default diagnostics folder location or a location you designate in [Customizing Diagnostics Features](#)). When you are finished collecting diagnostic data, you use the diagnostic tools to zip up the files. Then you transmit the ZIP file to Oracle Support for analysis.

The procedure in this topic explains how to collect the diagnostic data, zip it up, and forward it to Oracle Support.

To use the Smart View Diagnostics tools:

1. Click .

When you click , a message is displayed regarding restarting Microsoft Office. You are not required to restart Office; however, Oracle recommends that you do so. Restarting Office enables the diagnostics tools to collect more information, including the steps that led to the issue you may be experiencing.

 **Note:**

After you click the , the button toggles to

2. If you restarted Office, perform the steps in Smart View that led to the issue you are diagnosing.

3. Click  **Take Screenshot** to take screenshots that you feel will be helpful in documenting your issue.

 **Note:**

The screenshot includes the entire screen, not just the application. Be sure to minimize any confidential information that you may have on your screen so that it is not included in the screenshot.

4. Click  **Save Document** to save the currently-opened Office document to the diagnostics folder for the current session.

You can perform multiple saves of the document, if necessary. Oracle recommends that you save the document at different points during the work you are doing in order to best demonstrate and show your issue. Each time you save, Smart View adds a suffix to the file name, (0), (1), (2), etc.; no documents are overwritten.

The documents are stored in the current diagnostics session folder; the default location is:

```
C:\Users\username.domain\AppData\Roaming\Oracle\SmartView\Diagnostics
```

5. When you are finished gathering the diagnostics you require to adequately document your issue for Oracle Support, click  **Create Archive** and in the **Create Archive** dialog box, specify a folder to store the archive and a file name, or use the default folder location and file name.

The files are stored in your system's *My Documents* folder as follows:

```
My Documents\Documents
```

The file is named in the following format:

```
SmartView_Diagnostics_ddmmyyyy.zip
```

6. Email the diagnostics zip file to your Oracle support representative.

Cleaning Up the Diagnostics Folder

Once you have transmitted your diagnostics zip file to Oracle Support, you can clear the files in the diagnostics folder.

 **Note:**

Clearing the diagnostics folder while Diagnostics is running clears all folders except for the current session folders for currently-opened Microsoft Office applications. Clearing the diagnostics folder when Diagnostics is not running clears all diagnostics folders, including all the latest session folders.

Clearing All Diagnostics Folders Except the Current Session Folders

To clear all diagnostics folders except the current session folders:

1. Verify that Diagnostics is running.
2. Click .

This action clears all diagnostics folders except those created for the currently-running Office applications.

Clearing All Diagnostic Folders, Including the Latest Session Folders

To clear all diagnostics folders, including the latest session folders:

1. If you have not already done so, in the **Diagnostics** group in the Smart View ribbon, click .
2. Close any opened Office applications, including the one in which you are experiencing an issue.
3. Open any Office application and click .

This action clears all diagnostics folders including the latest session folders for Office applications.

Performing a Health Check On Your System

You can perform a "health check" on your system to optimize performance.

With the Health Check, you can also get information about your machine, such as certain registry settings, Microsoft Office version, Oracle Smart View for Office version, and the extensions you have installed.

 **Note:**

The Health Check feature is only available when using Smart View with Excel.

To perform a health check:

1. From the Smart View Panel in Excel, click the arrow next to **Help**, and then select **Health Check**.
2. Review or update the information in the **Health Check** dialog box.

The following information about your system is displayed. You cannot edit this information.

- **Version Information**—Operating System, Excel Version, Smart View Version, Internet Explorer Version
- **Hardware Information**—RAM Memory, Processor, Smart View Installed Drive Space
- **Excel Add-ins**—Depends on the Excel add-ins that are installed
- **COM Add-ins**—Depends on the COM add-ins that are installed

Some of the following information can be changed. If you change any settings, click **Update Settings** to apply the changes.

- **Registry Information**

HTTP session timeouts can occur when working with large queries that take a long time to run, or when you are experiencing slower internet connections. To reduce timeout occurrences, you can set timeout values. (If you change any of the timeout values, you must restart all Microsoft Office applications in order for the new value to be applied.)

- **KeepAlive Timeout**—The default value is 900 seconds. To change the value, click in the **Fix/Update/Info** column, enter a new value, and then click **Update Settings**.
- **Receive Timeout**—The default value is 900 seconds. To change the value, click in the **Fix/Update/Info** column, enter a new value, and then click **Update Settings**.
- **ServerInfo Timeout**—The default value is 900 seconds. To change the value, click in the **Fix/Update/Info** column, enter a new value, and then click **Update Settings**.
- **Current Resolution**—Read only. The current resolution of the system display.
- **USER Process Handle Quota**—Read only. The number of process handles. Process handles regulate Oracle Smart View for Office's access to system resources.
- **Enable Per Process System DPI**—Windows 10 Display Settings only. For drag-and-drop to work correctly if you use Office applications at a scaling level different than 100%, select **Enable**. The default value is **Disabled**.

If you're using a high DPI display as your primary monitor and a regular DPI display as your extended monitor, drag and drop may not work on the extended regular DPI display monitor. This is due to mouse drivers giving incorrect coordinates for mouse actions, resulting in faulty drag-and-drop behavior.

- **Browser Emulation Mode**—When enabled, this setting adds the required registry key to all Office applications (Excel, Word, PowerPoint, Outlook) so that certain browser-based screens render properly. The default value is **Enabled**.
- **Smart View Options**
 - **Undo Buffer**—The number of Undo and Redo actions permitted on an operation. The default value is 9. To change the value, click in the **Fix/**

Update/Info column, enter a new value, and then click **Update Settings**. You can enter a value between 1 and 100. (See [Using Undo and Redo](#)).

- **Improve Metadata Storage**—This option pertains to interoperability between different versions of Smart View. It allows for more efficient storage of internal data structures.

The default value is "Checked." If all users in your organization are on Smart View 9.3.1.6 or higher, then this option should always be checked.

When this option is "Unchecked," two copies of metadata are maintained for compatibility purposes, which may result in slower overall performance. Uncheck this option in the following situations:

- * You send an Excel workbook to users on Smart View releases earlier than 9.3.1.6, or to users on Microsoft Office 2002 and earlier, regardless of the Smart View release.
- * You open a workbook sent from users on Smart View releases earlier than 9.3.1.6, or from users on Microsoft Office 2002 and earlier, regardless of the Smart View release.

Note: If you change this option to "Unchecked," the value in the **Fix/Update/Help Link** column changes to "Fix." If you are having issues with your system and want to optimize performance, you should "fix" this setting by changing the value back to "Checked."

- **Graphic Setting**

The following two options improve the user experience by helping to reduce flickering in Microsoft Office:

- **Disable Windows Transitions on Addin Task Panes**—The default value is "Enabled." To disable this option, click in the **Fix/Update/Help Link** column, select **Disable**, and then click **Update Settings**.

Note: If you change this option to "Disabled," the value in the value in the **Fix/Update/Help Link** column changes to "Fix." If you are having issues with your system and want to optimize performance, you should "fix" this setting by changing the value back to "Enabled."

- **Disable Animations**—This setting disables Office animations. The default value is "Enabled." To disable this option, click in the **Fix/Update/Help Link** column, select **Disable**, and then click **Update Settings**.

Note: If you change this option to "Disabled," the value in the value in the **Fix/Update/Help Link** column changes to "Fix". If you are having issues with your system and want to optimize performance, you should "fix" this setting by changing the value back to "Enabled."

3. **Optional:** Click **Export to Excel** to export the Health Check information to a new Excel spreadsheet.
4. Click **Close** to close the **Health Check** dialog box.

 **Note:**

If you change any of the information in the **Health Check** dialog box, and want to get back to the default values, click **Recommended Settings**. A dialog box displays the recommended settings. To accept these settings, click **OK**.
