Get Help

There are a number of ways to learn more about your product and interact with Oracle and other users.

Get Help in the Applications

Some application pages have help icons  to give you access to contextual help. If you don't see any help icons on your page, click your user image or name in the global header and select Show Help Icons. If the page has contextual help, help icons will appear.

Get Training

Increase your knowledge of Oracle Cloud by taking courses at [Oracle University](#).

Join Our Community

Use [Cloud Customer Connect](#) to get information from industry experts at Oracle and in the partner community. You can join forums to connect with other customers, post questions, suggest [ideas](#) for product enhancements, and watch events.

Share Your Feedback

We welcome your feedback about Oracle Applications user assistance. If you need clarification, find an error, or just want to tell us what you found helpful, we'd like to hear from you.

You can email your feedback to oracle_fusion_applications_help_ww_grp@oracle.com.

Thanks for helping us improve our user assistance!

1 Overview

This playbook covers the concepts and tasks to load payroll localization data.

It includes the guidelines for initializing balances and loading the statutory deductions components.

2 Load Payroll Localization Data

Initializing Balances

Overview of Balance Initialization for India

In addition to the general guidance provided in the Overview of Balance Initialization topic, consider the following when initializing balances for India.

- For the Professional Tax balances, you need to set the **Area1** context.
 - a. To set the **Area1** context for the dimensions **Core Relationship Area1 Tax Year to Date** and **Core Relationship Area1 Half Year to Date**, pass the state code context under **AreaOne**.
 - b. Derive the corresponding **AreaOne** value (lookup_code) for a particular state from the lookup **ORA_HRX_IN_PT_STATES**. For more details on the area code for professional tax, see *Balances to Initialize for India*.
- For social insurance balances, you need to set the **Organization** context, **hr_all_organization_units_vl.organization_id**.

Set the Organization context for the dimension **Relationship Organization Tax Year to Date**, by passing the **ContextOneName** as **Organization ID** and the corresponding Organization_ID from **hr_all_organization_units_vl** as the **ContextOneValue** value, for the below social insurance balances:

- Employer LWF Contribution
- Employee LWF Contribution
- Employer NPS Contribution
- Employee NPS Tier 1 Contribution
- Employee NPS Tier 2 Contribution
- NPS Computation Salary
- Employee PF Contribution
- Employee Voluntary PF Contribution
- Employee PF Contribution Arrears
- Employee Voluntary PF Contribution Arrears
- Employer PF Contribution

- For earnings, tax related and **Taxable House Rent Allowance** balances, the **Tax Unit** context needs to be set. Set the **TaxUnitName** context to initialize the dimension **Relationship Tax Unit Tax Year to Date** for the following balances:
 - Earnings
 - Income Tax This Pay
 - Surcharge This Pay
 - Health and Education Cess This Pay
 - Taxable House Rent Allowance
- For initializing the Professional Tax (PT) balances, here are the points to note:

Deduction Frequency in State	Salary Projection	Considerations
Monthly	Monthly	The Period to Date(PTD) value of PT computational salary for that state, is used to decide the PT slabs and deduction amount. For example: Nagaland The professional tax amount already deducted is considered for Deductions u/s 16.
Monthly	Annual	The Tax Year to Date(TYTD) value of PT computational salary for that state is used to decide the PT slabs and deduction amount. For example: Odisha The professional tax amount already deducted will be considered for Deduction u/s 16 and PT computational salary value for that state, is used to project the annual salary for PT calculation.
Annual	Annual	The TYTD value of PT computational salary for that state is used to decide the PT slabs and deduction amount. The professional tax amount already deducted is considered for Deductions u/s 16 and PT computational salary value for that state, is used to project the annual salary for PT calculation. For example: For Bihar, PT is deducted in the September payroll run. If payroll is being run from October onward, then initialize professional tax (amount which has been already deducted) for Deductions u/s 16 and PT computational salary value for Bihar to project the annual salary for PT calculation. This is because PT will not be deducted after September for Bihar. If payroll is set to be run in September or prior, then we can initialize the PT computational salary for that state along with professional tax as 0. In case of change in PT slabs in current system, exemption in Deductions u/s 16 will be provided as per the slab in current payroll. Any other PT that needs to be deducted is adjusted manually.
Half Yearly	Half Yearly	The THYTD value of PT computational salary for a state is used to decide the PT slabs and deduction amount.

Deduction Frequency in State	Salary Projection	Considerations
		Ideally, we expect the deduction month at TRU to be kept same in both legacy and in Fusion. For example, if the deduction month is set to June for the first half year, and PT has already been deducted in the legacy system and the PT amount initialized as of 01-June, then when the payroll runs for June, the PT amount will be deducted in current system. This needs to be adjusted manually.
Monthly	Half Yearly	The THYTD value of PT computational salary for a state is used to calculate the PT slabs and deduction amount. If the first payroll run in Fusion is in June, PT will be deducted as per the slab the employee falls in the month of June. Any change needs to be done manually. Initialize the below dimensions in case of Half-Yearly projections: Professional Tax Core Relationship Area1 Half Year to Date PT Computational Salary for <State> Relationship Tax Half Year to Date

- For the ESI balances, the **ESI Eligible Salary** is used to decide the eligibility of the employee. Based on the month from which ESI eligibility needs to be checked, the corresponding month balance can be initialized. For example, if the first payroll run is in August, and the employee eligibility needs to be decide based on April salary, then initialize the value for the dimension: **Relationship Last April 1 Month**.

Since ESI is deducted every month, we don't account for what was already deducted in legacy system. We expect it to be deducted correctly and reported. We're only initializing the eligibility salary.

- For calculating the Gratuity balances, both the government sector employees and private sector, who are covered by the Gratuity Act are considered. As the last month's salary is used for gratuity calculation, the dimension **Relationship Last Month** can be initialized for the balance **Gratuity Computation Salary**.

For private sector employees not covered by the Gratuity Act, the last 10 months salary is used for gratuity calculation. Hence the balance value **Gratuity Computation Salary** for the last 10 months can be initialized. For example: Relationship Last July 1 Month, Relationship Last June 1 Month and so on.

- For the leave encashment balance **Leave Encashment Computation Salary**, if the employee's termination date falls on the last day of the month, then initialize the dimension for the previous 9 months, and calculate the value using the current month's salary and previous 9 months' salary.

If the employee's termination date doesn't fall on the last day of the month, then initialize the dimension for the previous 10 months, and calculate the value using the previous 10 months' salary.

- For the retrenchment compensation balance **Retrenchment Compensation Computation Salary**, if the employees' termination date falls on the last day of the month, then preceding two months dimension needs to be initialized. If the employees termination date doesn't fall on the last day of the month, then preceding three months dimension needs to be initialized.

- For calculating the Commuted Pension balance, if gratuity amount needs to be considered then initialize the **Gratuity Amount** balance. Similarly, the correct month's dimension needs to be initialized, if you run payroll in the second half of the financial year.

Note: If you initialized any of the below balances with a value, then you need to initialize the **Earnings** balance with the same amount. The salary in section 17 reflects the termination payment amount.

- Gratuity Amount
 - Leave Encashment
 - Retrenchment Compensation Amount
 - Commuted Pension
 - VRS Amount
- For HRA, the below balances need to be initialized, with each month's correct value:
 - Salary for House Rent Allowance Exemption
 - Taxable House Rent Allowance
 - House Rent Allowance Balance
 - For **Taxable House Rent Allowance** ensure that the value in **Relationship Tax Unit Tax Year to Date** matches the sum of the individual months value.

Example. If Relationship Tax Unit Tax Year to Date is 2400, then

Relationship Last April 1 Month -- 600

Relationship Last May 1 Month -- 600

Relationship Last June 1 Month -- 600

Relationship Last July 1 Month -- 600 is a valid combination.

Balances to Initialize for India

The India Legislative Balances are balances that Oracle Payroll Cloud uses to perform tax reporting and payroll tax calculations.

Balance initialization is required for the following categories of balances for India:

- Earnings balances
- Allowance balances
- Social Insurance balances
- Leave Travel Allowance balances
- Termination and Superannuation
- HRA related balances

Example of Loading Earnings Balances for India

In this example, you create balance initialization records to initialize earnings balances for India.

Load the Initialize Balance Batch Header

Use the InitializeBalanceBatchHeader.dat file to create the batch header.

```
METADATA|InitializeBalanceBatchHeader|BatchName|UploadDate|LegislativeDataGroupName  
MERGE|InitializeBalanceBatchHeader|BALANCE_INIT_EARNINGS|2023/08/01|ZHRX_IN_LDG
```

Load the Initialize Balance Batch Lines

In the following example, several balances are being initialized for the same employee. The employee is identified by their payroll relationship number, employment terms number and assignment number.

Attribute	Value
PayrollRelationshipNumber	966169008890480
TermNumber	ET966169008890480
AssignmentNumber	E966169008890480

The employee's payroll and tax reporting unit must also be specified on every initialize balance line.

Attribute	Value
PayrollName	IN MONTHLY PAYROLL 2021
TaxUnitName	ZHRX_IN_TAX_TRU

Load these details to initialize the Earnings balance to 6000:

Attribute	Value
LineSequence	1
BalanceName	Earnings
DimensionName	Relationship Tax Unit Tax Year to Date
Value	6000
ContextOneName	
ContextOneValue

Statutory Deductions

Overview of India Payroll Relationship Calculation Cards

Statutory deduction cards store all the values required for HCM payroll processing for an employee. It also includes information required for the reports.

A default card is automatically generated when an employee record is created by the New Hire flow and the license is set to Payroll, or Payroll Interface. The employee will have up to 6 tax reporting units based on the Tax Reporting Unit (TRU) type.

Considerations and Prerequisites

The product license needs to be set to Payroll or Payroll Interface, for the statutory deduction cards to be created automatically when a new employee is entered using the New Hire task. You need to add the association details and create the required components. There might be cases where this information must be loaded in bulk:

During Data Migration:

Employee information must be uploaded into Oracle Fusion Payroll, to ensure that contributions are calculated correctly. If HCM Data Loader is used to migrate employee records, a default statutory deduction card is automatically created. Usually, the default won't reflect the employee's actual tax calculation information, and therefore the card must be updated.

Many information fields must be provided for purposes such as:

Ongoing bulk updates:

Bulk loading of new hire data: If you've to do a mass upload of New Hire information, a default Statutory Deduction card is automatically generated (if the new hire records are created through HCM Data Loader).

It's recommended to have a good understanding of the Statutory Deductions card and the information it contains before trying mass upload as it has a direct impact on statutory deductions and reporting.

Statutory Deduction Card Record Types

The Statutory Deduction card is uploaded with HCM Data Loader using the Global Payroll Calculation Card business object. This generic object hierarchy provides record types to support the various country-specific requirements.

The IN Statutory Deductions uses the following record types:

Component	Functional Description	File Discriminator
Calculation Card	Defines the calculation card type and the employee assignment that it captures information for.	CalculationCard
Card Component	Used to group and segregate data required by the calculation card. The following sections describe the card components applicable to this calculation card and the child records that are required for each card component.	CardComponent
Component Detail	Provide a component detail record for each flexfield context required by each card component.	ComponentDetail
Card Association	Associates the calculation card with the Tax Reporting Unit the employee reports to.	CardAssociation
Card Association Detail	Associates card components with the employee's assignments.	CardAssociationDetails

Mapping Calculation card components to the responsive user interface

The TRU information is updated using the card association record. The different TRUs to be associated with the card for India, include Provident Fund(PF) TRU, Professional Tax (PT) TRU, Income Tax (IT) TRU, Employee State Insurance (ESI) TRU, Labour Welfare Fund(LWF) TRU and National Pension Scheme(NPS) TRU.

The Statutory Deductions summary information is updated using the <|Statutory Deductions> card components, with the Assignment information being defined on the card association detail records.

Employee details are updated using the <Investment Declaration > card component detail record.

Guidelines for Loading the Statutory Deduction for India

You need to have one Calculation Card record for every India employee you're maintaining Statutory Deduction data for.

Even if you're updating an existing Statutory Deduction card and the calculation card itself isn't being updated, you need to still include the calculation card record to group other related data supplied in the file.

Calculation Card Attributes

The Statutory Deduction Calculation Card uses these attributes:

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
SourceSystemId	CardSequence, AssignmentNumber, DirCardDefinitionName, LegislativeDataGroupName	A unique identifier for the Statutory Deductions calculation card. For new calculation card supply the source key attributes. You can also identify calculation cards with the user key attributes.
SourceSystemOwner	N/A	The name of the source system owner used to generate the source system ID.
LegislativeDataGroupName	N/A	The name of the legislative data group for the calculation card.
DirCardDefinitionName	N/A	The name of the card definition. Specify 'Statutory Deductions'
AssignmentId(SourceSystemId)	AssignmentNumber	Either supply the source system ID, or assignment number that identifies the employee assignment this calculation card is for.
EffectiveStartDate	N/A	The start date of the calculation card, typically the employee's start date.
CardSequence	N/A	A number to uniquely identify this card when multiple calculation cards for the same card definition exist for the employee. Not required when source keys are used.

Common Card Component Attributes

Card components commonly use these attributes:

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
SourceSystemId	CardSequence, ComponentSequence, DirCardDefinitionName, LegislativeDataGroupName, DirCardCompDefName And PayrollStatutoryUnitName Or TaxRepUnitName	A unique identifier for the card component. For new card components supply the source key attributes. You can also identify card components with the user key attributes.
SourceSystemOwner	N/A	The name of the source system owner used to generate the source system ID.
LegislativeDataGroupName	N/A	The name of the legislative data group for the card component definition.

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
DirCardId(SourceSystemId)	CardSequence, DirCardDefinitionName, LegislativeDataGroupName And PayrollStatutoryUnitName Or TaxRepUnitName	When using source keys, supply this attribute with the value supplied for the calculation card's SourceSystemId attribute. Otherwise, supply the user key attributes with the same values as the parent calculation card.
EffectiveStartDate	N/A	The start date of the card component. If updating an existing card component, the effective start date must be original start date of the card component.
EffectiveEndDate	N/A	The end date is optional for the card component.
DirCardCompDefName	N/A	The component definition name. Review the guidance for card component being loaded for the value to supply.
ComponentSequence	N/A	The number to uniquely identify this card component when multiple card components with the same DirCardCompDefName exist. Not required when source keys are used.

These attributes are supplied against the CardComponent file discriminator.

Common Component Detail Attributes

The component detail record type enables upload of data into flexfield segments.

In addition to the attributes defined here, include the necessary flexfield segment attribute values for the flexfield contexts used by the card component. See the guidance for the card component being loaded.

You can find the flexfield segment attribute name for this flexfield context using the View Business Objects task.

The component details use these attributes:

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
SourceSystemId	CardSequence, ComponentSequence, DirInformationCategory, LegislativeDataGroupName, DirCardDefinitionName, DirCardCompDefName And PayrollStatutoryUnitName Or TaxRepUnitName	A unique identifier for the component detail record. For new component detail records supply the source key attributes. You can also identify card components with the user key attributes.
SourceSystemOwner	N/A	The name of the source system owner used to generate the source system ID.

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
LegislativeDataGroupName	N/A	The name of the legislative data group for the card component definition.
DirCardCompId(SourceSystemId)	CardSequence, ComponentSequence, DirCardDefinitionName, LegislativeDataGroupName, DirCardCompDefName And PayrollStatutoryUnitName Or TaxRepUnitName	The parent card component should be referenced using the same key type used to identify the parent record. When using source keys, supply this attribute with the value supplied for the card component's SourceSystemId attribute. Otherwise, supply the user key attributes with the same values as the parent card component.
EffectiveStartDate	N/A	The start date of the component detail, or update to the component detail if you're providing date-effective history. This must be after or equal to the EffectiveStartDate provided for the parent card component.
EffectiveEndDate	N/A	The optional end date of the component detail, or if you're providing date-effective history the last day of the date-effective changes.
DirCardCompDefName	N/A	The name of the card component this detail is for. This is used to identify the flexfield context and should be supplied even when a source key is used to identify the parent card component. Supply the same value as supplied to this attribute on the parent card component.
DirInformationCategory	N/A	The code for the flexfield context. Refer to the guidance for the card component for valid values.
FLEX:Deduction DeveloperDF	N/A	Supply the same value as for the DirInformationCategory attribute.

Note: When supplying values to lookup validated flexfield segments, you can provide the lookup meaning using the '_Display' suffixed attribute name, but it's recommended that you supply the lookup code to remove potential translation issues.

Common Calculation Value Definition Attributes

The Calculation Value Definition record type specifies the value definition name for the override value.

The Calculation Value Definition record type uses these attributes:

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
SourceSystemId	CardSequence, ComponentSequence, DirCardDefinitionName, LegislativeDataGroupName, DirCardCompDefName, ValueDefinitionName And	A unique identifier for the calculation value definition record. For new records supply the source key attributes. You can also identify calculation value definition records with the user key attributes.

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
	PayrollStatutoryUnitName Or TaxRepUnitName	
SourceSystemOwner	N/A	The name of the source system owner used to generate the source system ID.
LegislativeDataGroupName	N/A	The name of the legislative data group for the card component definition.
SourceId(SourceSystemId)	CardSequence, ComponentSequence, LegislativeDataGroupName, DirCardDefinitionName, DirCardCompDefName And PayrollStatutoryUnitName Or TaxRepUnitName	The parent card component should be referenced by using the same key type used to identify the card component. When using source keys, supply this attribute with the value supplied for the card component's SourceSystemId attribute. Otherwise, supply the user key attributes with the same values as the parent card component.
EffectiveStartDate	N/A	The start date of the parent card component or the date the calculation value definition starts, if later.
DirCardCompDefName	N/A	The name of the card component this value definition is for. This is used to identify the value definition and should be supplied even when source keys are used to identify the record. Supply the same value as supplied to this attribute on the parent card component.
ValueDefinitionName	N/A	The name of the value being overridden. See the guidance for the card component being loaded for the list of applicable value definitions.

These attributes are supplied against the CalculationValueDefinition file discriminator and must be supplied along with a CardComponent record for the parent **Income Tax** card component and a CalculationCard record for the owning **Statutory Deductions** card.

Enterable Calculation Value Attributes

The Enterable Calculation Value provides the override value for the value definition. It references the Calculation Value Definition record which defines the Value Definition being overridden.

The Enterable Calculation Value record type uses these attributes:

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
SourceSystemId	CardSequence, ComponentSequence, DirCardDefinitionName, LegislativeDataGroupName, DirCardCompDefName, ValueDefinitionName And PayrollStatutoryUnitName	A unique identifier for the enterable calculation value record. For new records supply the source key attributes. You can also identify calculation value definition records with the user key attributes.

HCM Data Loader Attribute	Alternative User Key Attributes	Functional Description
	Or TaxRepUnitName	
SourceSystemOwner	N/A	The name of the source system owner used to generate the source system ID.
LegislativeDataGroupName	N/A	The name of the legislative data group for the override value.
ValueDefnIdSourceSystemId)	CardSequence, ComponentSequence, DirCardDefinitionName, LegislativeDataGroupName, DirCardCompDefName, ValueDefinitionName And PayrollStatutoryUnitName Or TaxRepUnitName	Identify the parent Calculation Value Definition record using the same key type used to identify the calculation value definition. When using source keys, supply this attribute with the value supplied for the calculation value definition's SourceSystemId attribute. Otherwise, supply the user key attributes with the same values as the parent record.
EffectiveStartDate	N/A	The effective start date of the parent calculation value definition record, or the update to the override value if supplying date-effective history.
EffectiveEndDate	N/A	The optional end date of the override value, or if you're providing date-effective history, the last day of the date-effective changes.
Value1	N/A	The value for the value definition identified by the parent calculation value definition record. Unlike other calculation cards, if you supply a value definition but have no value for it supply '-999999999' to indicate a null value.

These attributes are supplied against the EnterableValueDefinition file discriminator. You must supply an EnterableValueDefinition record for each CalculationValueDefinition record supplied.

Guidelines for Loading the Investment Declaration Card Components

The Investment Declaration card component is used to capture information that impacts the income tax calculation for employees.

Investment Declaration Card Component Hierarchy

The Investment Declaration card component uses the Investment Declaration flexfield context. Data for this is loaded using the Component Detail record type. The card component also has one override, which is supplied using the Calculation Value Definition and Enterable Calculation Value record types.

Refer to Guidelines for Loading Statutory Deduction Cards topic for the attributes to supply for each of these record types.

Card Component Name

When defining the card component, specify a value of 'Investment Declaration' for the DirCardCompDefName attribute on the Card Component, Component Detail and Calculation Value Definition records.

Component Detail Attributes

In addition to the common attributes for the component details record include the necessary flexfield segment attribute values for the flexfield context: Income Tax Organization Information (HRX_IN_DIR_INCOME_TAX)

You can find the flexfield segment attribute name for this flexfield context using the View Business Objects task.

Investment Declaration Value Definition

The card component uses value definitions to supply override values.

Value Definition Name	Functional Description
Other Income Information	Captures the other income information from the previous and current year to calculate the supplemental earnings.
House Rent Information	Captures the house rent information
Self Occupied or Let-out Property Information	Captures the details of the house property that's self occupied or rented out.
Chapter VIA Deductions	Captures all the Chapter VI A deduction information.

Guidelines for Loading the Proof Submission Card Components

The Proof Submission card component is used to capture information that impacts the income tax calculation for employees.

Proof Submission Card Component Hierarchy

The Proof Submission card component uses the Proof Submission flexfield context. Data for this is loaded using the Component Detail record type. The card component also has one override, which is supplied using the Calculation Value Definition and Enterable Calculation Value record types.

Refer to Guidelines for Loading Statutory Deduction Cards topic for the attributes to supply for each of these record types.

Card Component Name

When defining the card component, specify a value of 'Proof Submission' for the DirCardCompDefName attribute on the Card Component, Component Detail and Calculation Value Definition records.

Component Detail Attributes

In addition to the common attributes for the component details record include the necessary flexfield segment attribute values for the flexfield context: Income Tax Organization Information (HRX_IN_DIR_INCOME_TAX)

You can find the flexfield segment attribute name for this flexfield context using the View Business Objects task.

Proof Submission Value Definition

The card component uses value definitions to supply override values.

Value Definition Name	Functional Description
Other Income Information	Captures the other income information from the previous and current year to calculate the supplemental earnings.
House Rent Information	Captures the house rent information
Self Occupied or Let-out Property Information	Captures the details of the house property that's self occupied or rented out.
Chapter VIA Deductions	Captures all the Chapter VI A deduction information.

Guidelines for Loading Proof Approval Card Components

Proof Approval Card Component Hierarchy

The Proof Approval card component uses the Proof Approval flexfield context. Data for this is loaded using the Component Detail record type. The card component also has one override, which is supplied using the Calculation Value Definition and Enterable Calculation Value record types.

Refer to Guidelines for Loading Statutory Deduction Cards topic for the attributes to supply for each of these record types.

Card Component Name

When defining the card component, specify a value of 'Proof Approval' for the DirCardCompDefName attribute on the Card Component, Component Detail and Calculation Value Definition records.

Component Detail Attributes

In addition to the common attributes for the component details record include the necessary flexfield segment attribute values for the flexfield context: Income Tax Organization Information (HRX_IN_DIR_INCOME_TAX)

You can find the flexfield segment attribute name for this flexfield context using the View Business Objects task.

Proof Approval Value Definition

The card component uses value definitions to supply override values.

Value Definition Name	Functional Description
Other Income Information	Captures the other income information from the previous and current year to calculate the supplemental earnings.
House Rent Information	Captures the house rent information
Self Occupied or Let-out Property Information	Captures the details of the house property that's self occupied or rented out.
Chapter VIA Deductions	Captures all the Chapter VI A deduction information.

Example of Loading IN Statutory Deduction Card for Investment Declaration

This example creates the investment declaration information for the existing statutory deductions card belonging to an employee assignment.
