Index

Preface

Welcome to *Oracle Key Vault RESTful Services Administrator's Guide* . This guide explains how to use the Oracle Key Vault RESTful services to manage endpoints, wallets, security objects, deployment, and Oracle Key Vault general tasks such as performing backup operations.

- Audience
- Documentation Accessibility
- Related Documents
- Conventions

Audience

Oracle Key Vault is meant for users who are responsible for deploying, maintaining, and managing security within the enterprise. These users can be database, system, or security administrators. This guide can be used by any information security personnel who is responsible for protecting enterprise data residing in database servers, application servers, operating systems, and other information systems.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
italic	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
`monospace`	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

Changes in This Release for Oracle Key Vault

This Oracle Key Vault release introduces new features that enhance the use of Oracle Key Vault in a large enterprise.

- Changes for Oracle Key Vault Release 21.7
  Oracle Key Vault release 21.7 introduces several new features.

- Changes for Oracle Key Vault Release 21.6
  Oracle Key Vault release 21.6 introduces several new features.

- Changes for Oracle Key Vault Release 21.5
  Oracle Key Vault release 21.5 introduces several new features that affect this guide.

- Changes for Oracle Key Vault Release 21.4
  Oracle Key Vault release 21.4 introduces several new features that affect this guide.

- Changes for Oracle Key Vault Release 21.3
  Oracle Key Vault release 21.3 introduces one new feature that affects this guide.

Changes for Oracle Key Vault Release 21.7

Oracle Key Vault release 21.7 introduces several new features.

- RESTful Services Utility Changes to Support SSH Keys Management
  Starting with release 21.7, you can use the Oracle Key Vault RESTful services utility to create and register SSH keys and manage SSH Server wallets and SSH Server endpoints.

RESTful Services Utility Changes to Support SSH Keys Management

Starting with release 21.7, you can use the Oracle Key Vault RESTful services utility to create and register SSH keys and manage SSH Server wallets and SSH Server endpoints.

The following Oracle Key Vault RESTful services utility commands have been updated to support the SSH key pair creation and registration of SSH private and public keys:

- `okv managed-object key-pair create`

- `okv managed-object private-key register`

- `okv managed-object public-key register`

A new option **--ssh-user** is added to these commands. Use of this option makes the underlying public and private key objects identified as the SSH keys.

To support the creation of SSH Server endpoint and SSH Server wallet, following commands have been updated:

- `okv admin endpoint create`

- `okv manage-access wallet create`

Changes for Oracle Key Vault Release 21.6

Oracle Key Vault release 21.6 introduces several new features.

- Endpoint IP Address Attribute Added to endpoint get RESTful Command
Oracle Key Vault supports endpoint IP address in the `endpoint get` RESTful
command.

- Sign and Verify Operations in Oracle Key Vault
Starting with Oracle Key Vault release 21.6, sign and verify operations can be
performed using Oracle Key Vault's RESTful services, or the Oracle Key Vault
client tool `okvutil`:

Endpoint IP Address Attribute Added to endpoint get RESTful Command

Oracle Key Vault supports endpoint IP address in the `endpoint get` RESTful
command.

The endpoint IP address that was used at enrollment time is now recorded, and
displayed with the `okv admin endpoint get --endpoint` *endpoint_name* command.

Sign and Verify Operations in Oracle Key Vault

Starting with Oracle Key Vault release 21.6, sign and verify operations can be
performed using Oracle Key Vault's RESTful services, or the Oracle Key Vault client
tool `okvutil`:

Both of the Oracle Key Vault RESTful API and Oracle Key Vault client utility `okvutil`
provide sign and verify functionality.

The new or updated commands are as follows:

- `okv crypto data sign`

- `okv crypto data sign-verify`

- `okv crypto data sign`

- `okv crypto data sign-verify`

- `okvutil sign`

- `okvutil sign-verify`

Changes for Oracle Key Vault Release 21.5

Oracle Key Vault release 21.5 introduces several new features that affect this guide.

- Support for Cluster Management and Monitoring using RESTful Services Utility
Starting in Oracle Key Vault release 21.5, you can deploy, manage, and monitor
the multi-master cluster using RESTful services utility.

- Support for System Resources Monitoring using RESTful Services Utility
  Starting in Oracle Key Vault release 21.5, you can obtain the current and historical utilization metrics of the system resources such as CPU and memory using RESTful services utility. These system metrics would help you appropriately configure system resources for the Oracle Key Vault servers to meet the performance and scalability requirements of your deployment.

- RESTful Services Utility Commands to Support from Nested JSON Level
  Starting in Oracle Key Vault release 21.5, you can now specify custom-attributes and certain KMIP attributes as the command line options when using RESTful services utility to create, register, fetch and locate security objects.

- Support for Text Output Format in RESTful Services Utility
  Starting in Oracle Key Vault release 21.5, several RESTful services utility commands are enhanced to support the output in the **text** format.

Support for Cluster Management and Monitoring using RESTful Services Utility

Starting in Oracle Key Vault release 21.5, you can deploy, manage, and monitor the multi-master cluster using RESTful services utility.

Using the RESTful Services Utility, you can now perform several cluster management operations including creating a cluster, adding or deleting a node, enabling or disabling a node. You can also monitor and manage the cluster services and replication links between nodes using RESTful services utility.

The new commands are as follows:

- `okv cluster node create`

- `okv cluster node status`

- `okv cluster node add`

- `okv cluster node abort-pairing`

- `okv cluster node enable`

- `okv cluster node disable`

- `okv cluster node cancel-disable`

- `okv cluster node update`

- `okv cluster service start`

- `okv cluster service stop`

- `okv cluster service monitor`

- `okv cluster link enable`

- `okv cluster link disable`

- `okv cluster link monitor`

Related Topics

- Cluster Management Commands

Support for System Resources Monitoring using RESTful Services Utility

Starting in Oracle Key Vault release 21.5, you can obtain the current and historical utilization metrics of the system resources such as CPU and memory using RESTful services utility. These system metrics would help you appropriately configure system resources for the Oracle Key Vault servers to meet the performance and scalability requirements of your deployment.

Using the RESTful services utility, you can obtain the information about the:

- Configured system resources (CPU and memory)
- CPU and memory utilization metrics over a specified period, including load averages

The new or updated commands are as follows:

- `okv metrics server get`
- `okv server status get`
- `okv server info get`

Related Topics

- [Monitoring Commands](#)

RESTful Services Utility Commands to Support from Nested JSON Level

Starting in Oracle Key Vault release 21.5, you can now specify custom-attributes and certain KMIP attributes as the command line options when using RESTful services utility to create, register, fetch and locate security objects.

In earlier releases, commands that use the attributes or custom-attributes could only be executed using the JSON input method only. The RESTful services utility is now enhanced to support the passing of attributes and custom-attributes as the command line options for the commands to create or register security objects. These commands also support simplified variants of the complex input.

The KMIP attributes "activation date" and "deactivation date" are now exposed as the command line options `--activation-date` and `--deactivation-date` respectively. You can pass the custom-attributes using the new command line option --custom-attribute. Several RESTful services utility commands also support simplified and complex format on name and custom attribute.

The following commands have been updated to accommodate this enhancement:

- `okv managed-object key create`
- `okv managed-object key register`
- `okv managed-object secret register`
- `okv managed-object certificate register`
- `okv managed-object certificate-request register`

- `okv managed-object opaque register`
- `okv managed-object public-key register`
- `okv managed-object private-key register`
- `okv managed-object object fetch`
- `okv managed-object object locate`

Related Topics
- Security Object Commands

Support for Text Output Format in RESTful Services Utility

Starting in Oracle Key Vault release 21.5, several RESTful services utility commands are enhanced to support the output in the **text** format.

In previous releases, the RESTful services utility commands always produced output in the JSON format. Now, you can use the new command line option **–output_format** to generate the command output in the text format. The **text** output format helps simplify the creation of automation scripts such as when the output of a command serves as input for another command.

Supported values for the --output_format option are:

- json (default value)
- text

The following commands have been updated to accommodate this enhancement:

- `okv managed-object certificate get`
- `okv managed-object certificate register`
- `okv managed-object certificate-request get`
- `okv managed-object certificate-request register`
- `okv managed-object key create`
- `okv managed-object key get`
- `okv managed-object key register`
- `okv managed-object object activate`
- `okv managed-object object destroy`
- `okv managed-object object locate`
- `okv managed-object object revoke`
- `okv managed-object opaque get`
- `okv managed-object private-key register`
- `okv managed-object public-key get`
- `okv managed-object public-key register`
- `okv managed-object secret get`
- `okv managed-object secret register`

ORACLE

- `okv managed-object wallet add-member`

- `okv managed-object wallet delete-member`

- `okv managed-object wallet list`

Changes for Oracle Key Vault Release 21.4

Oracle Key Vault release 21.4 introduces several new features that affect this guide.

- [RESTful Services Utility Commands to Support the Extractable Attribute for Symmetric Encryption Keys](#)
  Starting in Oracle Key Vault release 21.4, to strengthen the protection of symmetric keys, you now can restrict these keys from leaving Oracle Key Vault by setting the extractable attribute.

- [Support for Cryptographic Operations in RESTful Services Utility](#)
  Oracle Key Vault release 21.4 adds the support for performing cryptographic operations within Oracle Key Vault.

- [Support for Policy Based Automatic Purging of Old Oracle Key Vault Backups in RESTful Services Utility](#)
  Starting in Oracle Key Vault release 21.4, you can create a policy to schedule the removal of one or more remote backups.

- [Enhancements to Endpoint, Endpoint Group, and Wallet-Related RESTful Services Utility Commands](#)
  Starting in Oracle Key Vault release 21.4, additional commands are available to enable you to perform more operations with endpoints, endpoint groups, and wallets.

- [Support Endpoint Configuration Using the RESTful Services Utility](#)
  Starting in Oracle Key Vault release 21.4, you can update the endpoint configuration parameters and endpoint settings for keys and secrets of an endpoint using the RESTful service utility command `okv admin endpoint update`.

- [RESTful Commands to Set Date and Time Accommodate ISO 8601 Standard](#)
  Starting in Oracle Key Vault release 21.4, the *duration* time interval settings will follow a subset of the ISO 8601 standard, and the fixed format for date and time settings are compatible with ISO 8601 when using RESTful commands.

- [Support for Command Line Help for the RESTful Services Utility](#)
  Starting in Oracle Key Vault release 21.4, you can find the command line help information about the RESTful services utility commands.

RESTful Services Utility Commands to Support the Extractable Attribute for Symmetric Encryption Keys

Starting in Oracle Key Vault release 21.4, to strengthen the protection of symmetric keys, you now can restrict these keys from leaving Oracle Key Vault by setting the extractable attribute.

The following commands have been updated to accommodate this enhancement:

- `okv managed-object attribute get`

- `okv managed-object attribute get-all`

- `okv managed-object attribute list`

- `okv managed-object attribute modify`

- `okv managed-object key create`

- `okv managed-object key register`

- `okv managed-object object locate`

Related Topics

- Access Management Commands
  You can use the access management commands to manage wallets and endpoint groups.

Support for Cryptographic Operations in RESTful Services Utility

Oracle Key Vault release 21.4 adds the support for performing cryptographic operations within Oracle Key Vault.

You can use either RESTful services utility commands or C and Java SDK to perform encryption and decryption operations.

This enhancement accommodates the use of symmetric keys that have been configured to not be extracted from Oracle Key Vault.

The new commands are as follows:

- `okv crypto data decrypt`

- `okv crypto data encrypt`

Related Topics

- Support for Cryptographic Operations in RESTful Services Utility
  Oracle Key Vault release 21.4 adds the support for performing cryptographic operations within Oracle Key Vault.

Support for Policy Based Automatic Purging of Old Oracle Key Vault Backups in RESTful Services Utility

Starting in Oracle Key Vault release 21.4, you can create a policy to schedule the removal of one or more remote backups.

The following commands have been updated:

- `okv backup destination create`

- `okv backup destination update`

The following commands are new:

- `okv backup destination delete-backup`

- `okv backup destination-policy create`

- `okv backup destination-policy delete`

- `okv backup destination-policy get`

- `okv backup destination-policy list`

- `okv backup destination-policy list-purged-backups`

- `okv backup destination-policy update`

- `okv backup destination resume-policy`

- `okv backup destination suspend-policy`

Related Topics

- Backup, Schedule, and Restore Commands
  You can use the backup, schedule, and restore commands to automate Oracle Key Vault appliance backups.

Enhancements to Endpoint, Endpoint Group, and Wallet-Related RESTful Services Utility Commands

Starting in Oracle Key Vault release 21.4, additional commands are available to enable you to perform more operations with endpoints, endpoint groups, and wallets.

The new commands are as follows:

- `okv admin endpoint get`

- `okv admin endpoint list`

- `okv admin endpoint list-objects`

- `okv admin endpoint resume`

- `okv admin endpoint suspend`

- `okv manage-access endpoint-group get`

- `okv manage-access endpoint-group list`

- `okv manage-access wallet add-object`

- `okv manage-access wallet get`

- `okv manage-access wallet list`

- `okv manage-access wallet list-objects`

- `okv manage-access wallet remove-object`

The commands to list objects for an endpoint (`okv admin endpoint list-objects`) and a wallet (`okv admin wallet list-objects`) provide an option to show or hide the wallet membership of the objects. Omitting wallet membership information of objects can improve command's performance.

Related Topics

- Administration Commands
  You can use the administration commands to manage client wallets and endpoints.

- Access Management Commands
  You can use the access management commands to manage wallets and endpoint groups.

Support Endpoint Configuration Using the RESTful Services Utility

Starting in Oracle Key Vault release 21.4, you can update the endpoint configuration parameters and endpoint settings for keys and secrets of an endpoint using the RESTful service utility command `okv admin endpoint update`.

The endpoint configuration parameters includes various PKCS#11 settings and endpoint settings for keys and secrets includes the `extractable` attribute setting for the new symmetric keys.

Related Topics

- okv admin endpoint update Command
  The `okv admin endpoint update` command updates the settings of an endpoint.

- RESTful Services Utility Commands to Support the Extractable Attribute for Symmetric Encryption Keys
  Starting in Oracle Key Vault release 21.4, to strengthen the protection of symmetric keys, you now can restrict these keys from leaving Oracle Key Vault by setting the extractable attribute.

RESTful Commands to Set Date and Time Accommodate ISO 8601 Standard

Starting in Oracle Key Vault release 21.4, the `duration` time interval settings will follow a subset of the ISO 8601 standard, and the fixed format for date and time settings are compatible with ISO 8601 when using RESTful commands.

You can specify the following formats:

- `duration` (follows a subset of the ISO 8601 standard)

- `timestamp` (is in a format that is compatible with the ISO 8601 standard)

- `now` (represents the current time when a command is run)

You can use these formats in the following combinations:

- `timestamp`

- `now`

- `timestamp` + `duration`

- `now` + `duration`

The `timestamp` format that has been used in previous releases is still supported.

The following commands have been updated for this enhancement:

- `okv backup schedule create`

- `okv backup schedule update`

- `okv managed-object attribute add`

- `okv managed-object attribute delete`

- `okv managed-object attribute modify`

- `okv managed-object certificate-request register`

- `okv managed-object key register`

- `okv managed-object object locate`

- `okv managed-object opaque register`

- `okv managed-object private_key register`

- `okv managed-object public-key register`

- `okv managed-object secret register`

Related Topics

- How to Set the Date and Time in RESTful Services Utility Commands
  You specify the date or timestamp, and duration using the supported formats.

- Access Management Commands
  You can use the access management commands to manage wallets and endpoint groups.

- Backup, Schedule, and Restore Commands
  You can use the backup, schedule, and restore commands to automate Oracle Key Vault appliance backups.

Support for Command Line Help for the RESTful Services Utility

Starting in Oracle Key Vault release 21.4, you can find the command line help information about the RESTful services utility commands.

This enhancement enables you to find the detailed help information about the various categories, resources, and actions that are supported for all Oracle Key Vault RESTful services utility commands. The help information shows the command's syntax, and definitions for the available categories, resources, and actions as well as the configuration parameters that are applicable to all the commands.

Related Topics

- Getting Help Information for RESTful Services Utility Commands
  At the command line (but not in JSON), you can find detailed help information for each component of an `okv` RESTful services utility command.

Changes for Oracle Key Vault Release 21.3

Oracle Key Vault release 21.3 introduces one new feature that affects this guide.

- Enhancements for RESTful Services Utility Commands Used for Registration
  In Oracle Key Vault release 21.3, RESTful services utility commands that are used for the registration of managed objects will have additional attributes.

Enhancements for RESTful Services Utility Commands Used for Registration

In Oracle Key Vault release 21.3, RESTful services utility commands that are used for the registration of managed objects will have additional attributes.

The affected commands are as follows:

- `okv managed-object certificate register`

- `okv managed-object certificate-request register`

- `okv managed-object key register`

- `okv managed-object opaque register`

- `okv managed-object private-key register`

- `okv managed-object public-key register`

- `okv managed-object secret register`

In previous releases, these commands provided two attributes, `name` and `contactInfo`. In this release, in addition to these two attributes, the following new attributes are included:

- `activationDate`

- `deactivationDate`

- `processStartDate`

- `protectStopDate`

Related Topics

- Security Object Commands
  Endpoints can make use of the security object commands to operate on the managed objects.

1

Introduction to Oracle Key Vault RESTful Services

The Oracle Key Vault RESTful services utility commands enable you to perform many Oracle Key Vault tasks, such as managing endpoints or performing backups, at the command line.

- About Oracle Key Vault RESTful Services
  The Oracle Key Vault tasks that you can automate using RESTful services include the management of endpoints, wallets, security objects, deployment operations, and backup operations.

- General Process for Using Oracle Key Vault RESTful Services
  After you enable the RESTful services, in some cases, you will use JSON to perform the Oracle Key Vault RESTful services tasks.

- Required Privileges for Using RESTful Services
  The required RESTful services privileges are consistent with the privileges required to perform the same task in the Oracle Key Vault management console.

1.1 About Oracle Key Vault RESTful Services

The Oracle Key Vault tasks that you can automate using RESTful services include the management of endpoints, wallets, security objects, deployment operations, and backup operations.

Though the Oracle Key Vault management console user interface is sufficient for managing these features, the process of completing these tasks is a manual one, with Oracle Key Vault administrators having to click through the user interface. A large distributed enterprise deployment often requires automation through scripting to enable mass deployment. The Oracle Key Vault RESTful services utility commands enable you perform all of these tasks in a way that facilitates faster deployment with less human intervention.

With Oracle Key Vault RESTful services, you can run a single service command from the command line. For most of the Oracle Key Vault RESTful services utility commands, you can specify command line options as a JavaScript Object Notation (JSON) input file. The reference sections in this guide provide examples of generating and modifying JSON input template for each command. The output of the RESTful services utility commands is in JSON format. To run the service commands from the command line, you will need to set certain configuration parameters. You can simplify the execution of RESTful services utility commands by having these commonly used parameters in the RESTful services configuration file. These parameters cover areas that are universal, such as the name of the RESTful administrator who needs to run the command. Oracle Key Vault also provides a logging properties file to customize how logging is handled. In order to run the RESTful service utility, the endpoint must have at minimum Java Runtime Environment version 1.7.0.21 installed.

After you use RESTful services to perform Oracle Key Vault tasks, you should disable the RESTful services to minimize the number of entry points to Oracle Key Vault.

1.2 General Process for Using Oracle Key Vault RESTful Services

After you enable the RESTful services, in some cases, you will use JSON to perform the Oracle Key Vault RESTful services tasks.

To configure the Oracle Key Vault RESTful services, you will follow these general steps:

1. Enable RESTful services from the Oracle Key Vault management console.

   This step entails ensuring that the endpoint meets the system requirements, and then using the Oracle Key Vault management console to enable the network services and the RESTful services functionality.

2. Download the RESTful service utility `okvrestclipackage.zip`.

   This file contains an `okvrestcli.jar` file, the RESTful services command line utility script, a configuration file, and the default logging file.

3. Customize the following configuration and logging files to work with your environment:

   - `okvrestcli.ini` contains properties that are specific to your environment, such as the name of the user who will run the RESTful services utility commands.

   - `okvrestcli_logging.properties` determines how logging is handled.

After the Oracle Key Vault RESTful services have been configured, you can begin to use the RESTful services utility commands right away. You can run the commands individually, using different methods. In most cases, the RESTful services utility commands support JSON formatting.

Related Topics

- Running RESTful Services Utility Commands Using the JSON Syntax
  The RESTful services utility commands support JSON syntax, and after you have generated the JSON output, you can use it in combination with a command line execution of the command.

1.3 Required Privileges for Using RESTful Services

The required RESTful services privileges are consistent with the privileges required to perform the same task in the Oracle Key Vault management console.

Based on the activity that you want to perform, the required privileges are as follows:

- **Creating endpoints:** System Administrator role or the Create Endpoint system privilege

- **Managing endpoints:** System Administrator role or the Manage Endpoint object privilege for the endpoint

- **Creating endpoint groups:** Key Administrator role or the Create Endpoint Group system privilege

- **Managing endpoint groups:** Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

- **Managing wallets and keys:** Key Administrator role or wallet privileges
  There are three modes for wallet privileges:

    – Read-only access (`RO`)

    – Read-and-modify access (`RM`)

    – Manage-wallet access (`MW`)

  You can grant wallet privileges in any of the following combinations:

    – `RO`

    – `RM`

    – `RO_MW`

    – `RM_MW`

  For example, if an endpoint is assigned only read-only (`RO`) and read-and-modify (`RM`) wallet access, then you cannot use the `okv managed-object wallet add-member` on the endpoint because this command requires manage-wallet access (`RM_MW`).

- **Managing security objects:** Key Administrator role

- **Executing commands to check the status of and information about clusters or primary-standby deployments:** System Administrator role

- **Managing Backup and Restore:** System Administrator Role

To simplify administration tasks, you can create a user who has one or more of these roles. Typically, this user is an administrator who must self-register their databases with Oracle Key Vault by using scripts that will need to perform the actions that need these privileges.

You do not need to have endpoint administrator privileges to use the Oracle Key Vault RESTful services.

2

Getting Started with Oracle Key Vault RESTful Services

After you download the RESTful services utility and customize its configuration files, you can begin to use the Oracle Key Vault RESTful services utility commands.

- Enabling or Disabling Oracle Key Vault RESTful Services
  You enable and disable RESTful services from the Oracle Key Vault management console.

- Oracle Key Vault RESTful Services Configuration and Logging Files
  Oracle Key Vault provides two files, `okvrestcli.ini` and `okvrestcli_logging.properties`, that you can use to specify required or optional settings for when you run RESTful services utility commands.

- Getting Help Information for RESTful Services Utility Commands
  At the command line (but not in JSON), you can find detailed help information for each component of an `okv` RESTful services utility command.

- Running Oracle Key Vault RESTful Services Utility Commands
  Oracle Key Vault provides a variety of ways to run RESTful services utility commands.

- Naming Guidelines for Objects
  The naming guidelines affect the following Oracle Key Vault objects: users, user groups, endpoints, endpoint groups, and virtual wallets.

- How to Set the Date and Time in RESTful Services Utility Commands
  You specify the date or timestamp, and duration using the supported formats.

- Using RESTful Services with LDAP Users
  Both regular Oracle Key Vault administrators and properly authorized LDAP users can log in to a server to run Oracle Key Vault RESTful services utility commands.

2.1 Enabling or Disabling Oracle Key Vault RESTful Services

You enable and disable RESTful services from the Oracle Key Vault management console.

- Enabling RESTful Services
  After checking the endpoint requirements, and enabling network services, you can enable RESTful services, download the RESTful software utility, and then customize its configuration files.

- Disabling RESTful Services
  You should enable RESTful services for short periods during when administrative tasks are performed.

2.1.1 Enabling RESTful Services

After checking the endpoint requirements, and enabling network services, you can enable RESTful services, download the RESTful software utility, and then customize its configuration files.

- Step 1: Check the Endpoint System Requirements
  Before you can provision endpoints with the RESTful command-line interface, you must have the tools to transfer data securely across the network.

- Step 2: Enable Network Services
  You must configure web access for RESTful clients by their IP addresses to access the Oracle Key Vault server.

- Step 3: Enable RESTful Services
  After you have enabled the network services, you can enable the RESTful services.

- Step 4: Download the RESTful Services Utility
  The RESTful services utility is in the `okvrestclipackage.zip` file.

- Step 5: Configure the RESTful Services Utility
  After you have downloaded the RESTful services utility, you must modify a couple of files that are included in its zip file.

2.1.1.1 Step 1: Check the Endpoint System Requirements

Before you can provision endpoints with the RESTful command-line interface, you must have the tools to transfer data securely across the network.

1. Log in to the endpoint host as an endpoint administrator.

2. Ensure that you have the following tools:

   - OpenSSL 1.0.1p or later

   - JAVA 8 or later. If you plan to deploy RESTful services on a database server with Oracle Database release 12.2.0.1 or later, then you can use the embedded Java Runtime Environment (JRE) in `$ORACLE_HOME/jdk/jre`. For database installations from Oracle release 12.2.0.1 and later, set `JAVA_HOME` to `$ORACLE_HOME/jdk/jre`, and add `JAVA_HOME/bin` to the `PATH`. For earlier database releases, download and install JAVA 8 or later, and then set `JAVA_HOME` and `PATH` appropriately. OpenJDK is not supported.

2.1.1.2 Step 2: Enable Network Services

You must configure web access for RESTful clients by their IP addresses to access the Oracle Key Vault server.

You can allow all IP addresses or restrict access to a subset of IP addresses that you designate in this step. Note, that this option will also restrict access to the Oracle Key Vault management console.

1. Log in to the Oracle Key Vault management console as a user with the System Administrator role.

2. Select **System**, then **Settings** from the left sidebar.

The Settings page appears. Go to the Network Details section.

3. For **Web Access** select *one* of the IP address options for the RESTful client:

- **All** to allow all IP addresses.

- **IP address(es)** to designate a set of IP addresses. After you select this option, enter the IP addresses in the next field, separating each IP address by a space.

4. Click **Save**.

2.1.1.3 Step 3: Enable RESTful Services

After you have enabled the network services, you can enable the RESTful services.

In a multi-master cluster environment, enabling RESTful services on one node will enable it for the entire cluster.

1. Log in to the Oracle Key Vault management console as a user with the System Administrator role.

2. Select **System**, then **Settings** from the left sidebar.

   The Settings page appears. Go to the System Configuration section, then to the RESTful Services section within it.

3. Check the box to the right of **Enable**.

4. Click **Save**.

2.1.1.4 Step 4: Download the RESTful Services Utility

The RESTful services utility is in the `okvrestclipackage.zip` file.

In addition to the new RESTful service utility introduced in the Oracle Key Vault 21.1 release, Oracle Key Vault continues to support earlier implementation of the RESTful service utility that you can download as Classic RESTful Service Utility.

- Use one of the following methods to download the Oracle Key Vault RESTful services utility `okvrestclipackage.zip` file:

  – From the Home page of the Oracle Key Vault management console:

    1. Log in as a user with the System Administrator role.

    2. Select the **System** tab.

    3. In the left sidebar, select **Settings**.

    4. Under System Configuration, select **RESTful Services**.

    5. In the RESTful Services dialog box, select **Download**.
       To download the Oracle Key Vault Classic RESTful Service Utility, click **Download Classic Utility**. For information about using this version, see the release 18.6 version of *Oracle Key Vault Administrator's Guide*

    6. In the Opening okvrestclipackage.zip dialog box, select **Save** to save the `okvrestclipackage.zip` file locally.

  – From the Endpoint Enrollment and Software Download of the Oracle Key Vault management console:

    1. Connect to the Oracle Key Vault management console.

The login page to the Oracle Key Vault management console appears. ***Do not log in.***

2. In the lower-right corner of the login page under **Login**, click **Endpoint Enrollment and Software Download**.

3. Click the **Download RESTful Service Utility** tab.

4. Click the **Download** button.
   To download the Classic RESTful Service Utility, click **Download Classic Utility**.

5. Download the `okvrestclipackage.zip` to a secure location.

– Using a command-line HTTP client such as `wget` or `curl`. In a primary-standby configuration, enter the IP address of the primary database. For example:

```
wget --no-check-certificate https://ip_address:5695/
okvrestclipackage.zip
curl -k https://ip_address:5695/okvrestclipackage.zip -o
okvrestclipackage.zip
curl -O -k https://ip_address:5695/okvrestclipackage.zip
```

2.1.1.5 Step 5: Configure the RESTful Services Utility

After you have downloaded the RESTful services utility, you must modify a couple of files that are included in its zip file.

1. Move the `okvrestclipackage.zip` file to the Oracle Key Vault home directory (`OKV_HOME`) in the endpoint.

   You can move the zip file to any secure location, but having it in the Oracle Key Vault home directory in the endpoint is convenient for managing the Oracle Key Vault RESTful files in a central location. This guide assumes that you downloaded the zip file onto the endpoint.

2. Unzip the `okvrestclipackage.zip` file.

   For example:

   ```
   unzip okvrestclipackage.zip
   ```

   The following directory structure is created:

   • Directory where you placed the `okvrestclipackage.zip` file, such as the `OKV_HOME` directory

     – `bin`

       * `okv`

       * `okv.bat`

     – `lib`

       * `okvrestcli.jar`

     – `conf`

       * `okvrestcli.ini`

       * `okvrestcli_logging.properties`

3. In the RESTful services command line utility script, set the `OKV_RESTCLI_CONFIG` variable.

   `OKV_RESTCLI_CONFIG` sets the location of the `okvrestcli.ini` configuration file. The RESTful services command line utility script for Linux platforms is `okv` and the utility script for Microsoft Windows is `okv.bat`.

4. Set the `JAVA_HOME` environment variable to a Java Runtime Environment (JRE) installation with the minimum version 1.7.0.21.

Next, you are ready to modify the `okvrestcli.ini` and `okvrestcli_logging.properties` configuration files for your environment.

Related Topics

- Oracle Key Vault RESTful Services Configuration and Logging Files
  Oracle Key Vault provides two files, `okvrestcli.ini` and `okvrestcli_logging.properties`, that you can use to specify required or optional settings for when you run RESTful services utility commands.

2.1.2 Disabling RESTful Services

You should enable RESTful services for short periods during when administrative tasks are performed.

RESTful Services are disabled by default. After you have performed administrative tasks using the RESTful services, you should disable RESTful services.

1. Log in to the Oracle Key Vault management console as a user with the System Administrator role.

2. Select **System**, then **Settings** from the left sidebar.

   The Settings page appears. Go to the System Configuration section, then to the RESTful Services section within it.

3. Un-check the box to the right of **Enable** in the **RESTful Services** section.

4. In the System Settings page, click the **Save**.

2.2 Oracle Key Vault RESTful Services Configuration and Logging Files

Oracle Key Vault provides two files, `okvrestcli.ini` and `okvrestcli_logging.properties`, that you can use to specify required or optional settings for when you run RESTful services utility commands.

- okvrestcli.ini Configuration File
  The `okvrestcli.ini` file enables you to control global settings that are used in the Oracle Key Vault RESTful services utility commands.

- okvrestcli_logging.properties Log File Parameter Settings
  The `okvrestcli_logging.properties` log file determines how logging is handled for Oracle Key Vault RESTful services activities.

2.2.1 okvrestcli.ini Configuration File

The `okvrestcli.ini` file enables you to control global settings that are used in the Oracle Key Vault RESTful services utility commands.

- **About the okvrestcli.ini Configuration File**
  The `okvrestcli.ini` file enables you to configure commonly used settings when you run Oracle Key Vault RESTful services utility commands.

- **okvrestcli.ini Configuration Parameters**
  The `okvrestcli.ini` parameters cover settings such as the name and password of a user, the location of the `okvclient.ora` file, and so on.

- **[DEFAULT] and Named Profiles in the okvrestcli.ini File**
  The `[DEFAULT]` and named profile sections of the `okvrestcli.ini` file enable you to maintain different sets of configuration parameter settings that can be applied when executing commands in different contexts.

- **Precedence Order of okvrestcli.ini Parameters**
  When you run an Oracle Key Vault RESTful service command, the configuration parameter values are determined on the basis of an order of precedence.

- **Using an Alternative Configuration File**
  You can use an alternative parameter configuration file from the `okvrestcli.ini` configuration file.

2.2.1.1 About the okvrestcli.ini Configuration File

The `okvrestcli.ini` file enables you to configure commonly used settings when you run Oracle Key Vault RESTful services utility commands.

These are settings such as the user's name or the IP address of an Oracle Key Vault server. The RESTful service utility requires these kinds of configuration parameters in the `okvrestcli.ini` file to be set for each command execution. The settings that you set in this file are automatically applied to all Oracle Key Vault RESTful services utility commands without the need for you to manually enter them at the command line each time that you want to run the command.

The configuration parameters in the `okvrestcli.ini` are grouped together in different sections called named profiles. Each section includes the profile name and list of the parameters that are associated with the profile. When you run the command with a named profile (using the `--profile` *profile_name* parameter), the configuration parameters listed under the named profile apply for the execution of the command. The configuration parameters listed under the `[DEFAULT]` profile represent default parameter settings that apply when either no named profile is specified or the parameter is not listed under the named profile.

By default, the `okvrestcli.ini` is in the same location where you downloaded the Oracle Key Vault RESTful services utility, in the `OKV_HOME/conf` directory of the endpoint.

Related Topics

- **Using an Alternative Configuration File**
  You can use an alternative parameter configuration file from the `okvrestcli.ini` configuration file.

2.2.1.2 okvrestcli.ini Configuration Parameters

The `okvrestcli.ini` parameters cover settings such as the name and password of a user, the location of the `okvclient.ora` file, and so on.

The `okvrestcli.ini` parameters are as follows:

- `server`: Determines the target Oracle Key Vault server where command is sent for execution. Enter the IP address of this server. Server information can also be obtained from the `okvclient.ora` file when you set the `okv_client_config` parameter.

  In a multi-master deployment of an Oracle Key Vault cluster, Oracle Key Vault dynamically updates the server information in the endpoint's configuration file `okvclient.ora` based on the endpoint's cluster subgroup setting, as well as any changes to the cluster topology or the state of the Oracle Key Vault cluster nodes. Using the server information from endpoint's `okvclient.ora` enables Oracle Key Vault to automatically select the best Oracle Key Vault node to run the REST commands without you having to constantly update the `SERVER` parameter in `okvrestcli.ini`.

- `okv_client_config`: Specifies the full path of the `okvclient.ora` file for an endpoint. By default, this file is located in the `$OKV_HOME/conf` directory. This parameter is mandatory if you want to run managed-object RESTful services utility commands, which must always be run with the identity of an endpoint. The Oracle Key Vault RESTful services utility uses only the following information from the `okvclient.ora` file:

  - server information: IP address or host name of Oracle Key Vault server(s).

  - `SSL_WALLET_LOC`: location of the wallet that the endpoint uses.

  This is a string value and is required.

- `user`: Specifies the Oracle Key Vault user who is executing the RESTful services command. The user must have appropriate privileges to run the command.

  Oracle Key Vault does not use the `user` parameter when the RESTful services utility commands for the managed-object category are run. These commands are always run with the identity of an endpoint that is set with the `okv_client_config` parameter.

- `client_wallet`: Specifies the absolute path to a wallet which contains user credentials. This wallet can be used to log into the Oracle Key Vault server without having to manually specify the user's password. The user information is obtained from the `user` parameter. The `client_wallet` parameter enables implementation and use of automation scripts that need to run in an unattended mode.

  Oracle Key Vault does not use the `client_wallet` parameter when the RESTful services utility commands for the managed-object category are run. These commands are always executed with the identity of an endpoint that is set with the `okv_client_config` parameter.

- `password`: Specifies the password of the user executing the RESTful services utility commands. If `client_wallet` is specified, then the `password` parameter is not required. If both `client_wallet` and `password` parameters are specified, then the `password` parameter takes precedence over `client_wallet`.

  Oracle Key Vault does not use the `password` parameter when the RESTful services utility commands for the managed-object category are executed. These commands are always executed with the identity of an endpoint that is set with the `okv_client_config` parameter.

- `log_property`: Specifies the full path of the Java logging property file. If this parameter is not set, then when you execute a RESTful command, Oracle Key Vault generates a log file with the default name in the current directory with the `INFO` level along with the message in a log file saying `log_property` is not configured. The default log property file is a part of the downloaded `okvrestclipackage.zip` file. This file enables you to customize the log file and its format. This is a string value and it is optional.

2.2.1.3 [DEFAULT] and Named Profiles in the okvrestcli.ini File

The `[DEFAULT]` and named profile sections of the `okvrestcli.ini` file enable you to maintain different sets of configuration parameter settings that can be applied when executing commands in different contexts.

The `okvrestcli.ini` file is organized as one or more named profile sections. A named profile section represents a collection of configuration parameter settings that are logically group together. A named profile section includes:

- Named profile section header denoted as `[profile_name]`

- Listing of configuration parameters under the name profile header

You apply the configuration parameter settings listed under a named profile by specifying the profile name in the command line with parameter `--profile profile_name`.

The `[DEFAULT]` profile lists the default values of the `okvrestcli.ini` parameters. The parameter settings under the `[DEFAULT]` profile apply when either no named profile is specified during command execution or the parameter is not listed under the named profile, and assuming you do not specify the parameter in the command line.

The following example shows the use of profiles that is suitable for connecting to Oracle Key Vault using identities of different endpoints. This is useful in an environment where you have isolated PDB endpoints configured on the same host. This `okvrestcli.ini` file has a named profile for each PDB endpoint that points to respective `okvclient.ora` file.

```
[DEFAULT]
log_property=/usr/local/okv/logging.property
server = 192.0.2.191

[HR_PDB]
okv_client_config=/usr/local/okv/hr_ep/okvclient.ora

[FIN_PDB]
okv_client_config=/usr/local/okv/finance_ep/okvclient.ora

[SALES_PDB]
okv_client_config=/usr/local/okv/sales_ep/okvclient.ora
```

To create a key using `HR_DB` endpoint, you use the `[HR_DB]` profile:

```
okv managed-object key create --profile HR_DB --algorithm AES --length
256 --mask "ENCRYPT,DECRYPT" --wallet hr_wallet
```

This command uses the `okv_client_config` parameter from `[HR_DB]` profile. Other configuration parameters (for example, `log_property` and `server`) are applied from the `[DEFAULT]` profile.

This example shows the use case of using profiles in a multi-master cluster environment where you create a profile for each node in the cluster to use settings that are specific to that node. The following example contains profiles for three nodes in a cluster:

```
[DEFAULT]
log_property=/usr/local/okv/logging.property
user=okvadmin
server=192.0.2.191

[NODE1]
server=192.0.2.191

[NODE2]
server=192.0.2.192

[NODE3]
server=192.0.2.193
```

To run a command on `NODE2`, you use the `[NODE2]` profile:

```
okv server status get --profile NODE2
```

This command uses the server entry from `[NODE2]` profile. The other configuration parameter settings are used from the `[DEFAULT]` profile.

Before you work with `[DEFAULT]` settings and profiles, ensure that you understand the precedence order of the `okvrestcli.ini` parameters.

Related Topics

- Precedence Order of okvrestcli.ini Parameters
  When you run an Oracle Key Vault RESTful service command, the configuration parameter values are determined on the basis of an order of precedence.

2.2.1.4 Precedence Order of okvrestcli.ini Parameters

When you run an Oracle Key Vault RESTful service command, the configuration parameter values are determined on the basis of an order of precedence.

Parameter Precedence Order

The order of precedence for `okvrestcli.ini` configuration file parameters (except for the `server` entry) is as follows:

1. Parameter value is specified by the user in the command line.

2. Parameter value is specified in the profile section. User includes the `--profile` parameter in the command line.

3. Parameter value is specified in the `[DEFAULT]` profile. User makes no reference in the command line.

Examples of How Parameter Precedence Works

The following examples show how parameter precedence works for the following `okvrestcli.ini` file, which contains different settings for the `user` parameter under the `[DEFAULT]` and `[HR]` profiles.

```
[DEFAULT]
user= psmith

[HR]
user=jgreenberg
```

- **Example 1:** To specify the default user, `psmith`, simply omit any reference to this user from the command line.

  ```
  okv manage-access endpoint-group add-endpoint --endpoint-group
  epg_1 --endpoint ep_1
  ```

- **Example 2:** To override the default user and specify user `jgreenberg`, who is in the `HR` profile, specify the `HR` profile in the command line.

  ```
  okv manage-access endpoint-group add-endpoint --profile HR --
  endpoint-group epg_1 --endpoint ep_1
  ```

- **Example 3:** To override all the `user` settings in `okvrestcli.ini`, include the `--user` setting in the command line.

  ```
  okv manage-access endpoint-group add-endpoint --user kjones --
  endpoint-group epg_1 --endpoint ep_1
  ```

server Parameter Precedence Order

The `server` parameter has a slightly different precedence behavior from the other `okvrestcli.ini` parameter settings, because in addition to the `okvrestcli.ini` file, its setting can come from the `okvclient.ora` file. The location of the `okvclient.ora` file is specified with the `okv_client_config` parameter in `okvrestcli.ini`. The `server` entry that is specified directly takes precedence over the `server` entry from the `okv_client_config` parameter.

The order of precedence for the `server` entry is as follows:

1. `server` parameter value is specified by the user in the command line.

2. Server information is obtained from the `okvclient.ora` file. User specifies this file by including the `okv_client_config` parameter in the command line.

3. `server` parameter value is specified in the profile section. User includes the `--profile` parameter in the command line.

4. Server information is obtained from the `okvclient.ora` file, which is set by the `okv_client_config` parameter from a profile section. User specifies this profile by using the `--profile` parameter in the command line.

5. `server` parameter value is specified in the `[DEFAULT]` profile. User makes no reference in the command line.

6. Server information is obtained from the `okvclient.ora` file that is specified with `okv_client_config` parameter in the `[DEFAULT]` section. User makes no reference in the command line.

Examples of How the server Parameter Precedence Order Works

The following examples show how the `server` parameter precedence works based on various ways that this parameter can be set:

- **Example 1:** Assume that the `okvrestcli.ini` configuration file has the following setting:

  ```
  [DEFAULT]
  server=192.0.2.190
  ```

  To use this default setting (that is, to use IP address 192.0.2.190), omit any reference to it from the command line.

  ```
  okv manage-access endpoint-group add-endpoint --endpoint-group epg_1 --
  endpoint ep_1
  ```

- **Example 2:** Assume that the `okvrestcli.ini` configuration file has the following setting:

  ```
  [DEFAULT]
  okv_client_config=/usr/local/okv/okvclient/okvclient.ora
  ```

  The `okv_client_config` parameter points to an `okvclient.ora` file that contains the `server` setting that you want to use. Because `okv_client_config` is in the `[DEFAULT]` section, to use this `okvclient.ora`, omit the reference to it from the command line.

  ```
  okv manage-access endpoint-group add-endpoint --endpoint-group epg_1 --
  endpoint ep_1
  ```

- **Example 3:** Assume that the `okvrestcli.ini` configuration file has the following settings for the default and for a profile called `[NODE_1]`:

  ```
  [DEFAULT]
  okv_client_config=/usr/local/okv/okvclient/okvclient.ora

  [NODE_1]
  server=192.0.2.191
  ```

  To override the default server setting from `okv_client_config` with the `[NODE_1]` profile setting of 192.0.2.191, include the `--profile` parameter in the command line.

  ```
  okv manage-access endpoint-group add-endpoint --profile node_1 --endpoint-
  group epg_1 --endpoint ep_1
  ```

- **Example 4:** Assume that the `okvrestcli.ini` configuration file has the following settings:

```
[DEFAULT]
server = 192.0.2.191

[HR]
okv_client_config=/usr/local/okv/hr_ep/okvclient.ora
```

    To override the default and use the server setting in the `okvclient.ora` file, as with Example 3, include the `--profile` parameter in the command.

```
okv manage-access endpoint-group add-endpoint --profile hr --
endpoint-group epg_1 --endpoint ep_1
```

- **Example: 5:** Assume that the `okvrestcli.ini` configuration file is as follows:

```
[DEFAULT]
server = 192.0.2.191

[HR]
okv_client_config=/usr/local/okv/hr_ep/okvclient.ora
```

    To override all of these settings, directly specify the appropriate server IP address setting in the command line.

```
okv manage-access endpoint-group add-endpoint --server 192.0.2.192
--endpoint-group epg_1 --endpoint ep_1
```

    This works with the `okv_client_config` parameter setting as well.

```
okv manage-access endpoint-group add-endpoint --
okv_client_config /usr/local/okv/okvclient/okvclient.ora --endpoint-
group epg_1 --endpoint ep_1
```

    The following example uses both a named profile (`HR`) and the `--server` parameter. The `--server` parameter overrides the `server` information from the `okvclient.ora` file specified in the `[HR]` profile.

```
okv managed-object key create --profile HR --server 192.0.2.192 --
algorithm AES --length 256 --mask "ENCRYPT,DECRYPT" --wallet
hr_wallet
```

2.2.1.5 Using an Alternative Configuration File

You can use an alternative parameter configuration file from the `okvrestcli.ini` configuration file.

By default, Oracle Key Vault uses the `okvrestcli.ini` configuration file to control commonly used settings for the Oracle Key Vault RESTful services utility commands.

You can create your own version of this configuration file and specify it in the command line execution.

- To use a different configuration file, include the `--config` parameter when you run the command. Add the `--config` parameter before the command-specific parameters, as follows:

  ```
  okv managed-object key create --config full_path_to_conf_file --algorithm
  AES --length 128 --mask "ENCRYPT,DECRYPT,EXPORT"
  ```

  Follow the same precedence rules that you would follow for the `okvrestcli.ini` file. For example, suppose the new configuration file has a profile that you want to use called `[HR]`. You would specify it as follows:

  ```
  okv managed-object key create --config full_path_to_conf_file --profile
  hr --algorithm AES --length 128 --mask "ENCRYPT,DECRYPT,EXPORT"
  ```

- okvrestcli.ini Configuration Parameters
  The `okvrestcli.ini` parameters cover settings such as the name and password of a user, the location of the `okvclient.ora` file, and so on.

- [DEFAULT] and Named Profiles in the okvrestcli.ini File
  The `[DEFAULT]` and named profile sections of the `okvrestcli.ini` file enable you to maintain different sets of configuration parameter settings that can be applied when executing commands in different contexts.

- Precedence Order of okvrestcli.ini Parameters
  When you run an Oracle Key Vault RESTful service command, the configuration parameter values are determined on the basis of an order of precedence.

2.2.2 okvrestcli_logging.properties Log File Parameter Settings

The `okvrestcli_logging.properties` log file determines how logging is handled for Oracle Key Vault RESTful services activities.

Modifying the `okvrestcli_logging.properties` is optional. If you do not configure it, then Oracle Key Vault creates and updates a default logging file when you run the RESTful services utility commands.

By default, the `okvrestcli_logging.properties` file is in the location you downloaded the Oracle Key Vault RESTful services utility, in the `OKV_HOME/conf` directory of the endpoint.

The parameter settings for `okvrestcli_logging.properties` are as follows:

- `java.util.logging.FileHandler.pattern` specifies one of the following patterns for generating the output file name. The default is `%h/java%u.log`.

  - `/` is the local path name separator.

  - `%h` is the value of the `user.home` system property.

  - `%g` is the generation number to distinguish rotated logs.

  - `%u` is a unique number to resolve conflicts.

  - `%%` translates to a single percent sign `%`.

- `java.util.logging.FileHandler.limit` specifies an approximate maximum amount to write (in bytes) to any one file. If this is zero, then there is no limit. The default is 200000.

- `java.util.logging.FileHandler.count` specifies how many output files to cycle through. The defaults is 5.

- `java.util.logging.FileHandler.formatter` specifies the name of a `Formatter` class to use. The default is `java.util.logging.XMLFormatter`.

- `java.util.logging.ConsoleHandler.level` specifies the default level for the handler. The default to `INFO`.
  The available logging levels are `ALL`, `TRACE`, `FINEST`, `FINER`, `FINE`, `CONFIG`, `INFO`, `WARNING`, `SEVERE`, and `OFF`.

  Any logging at `INFO` and above provides complete details. If you set the logging level to `SEVERE`, then you will only see messages with the `SEVERE` logging level, which generally correspond to serious problems. To diagnose the issue, you may need more details and that can be obtained with levels that produce more information, not just the occurrences of the serious issues.

An example of these settings is as follows:

```
handlers= java.util.logging.FileHandler

# default file output is in user's home directory.
java.util.logging.FileHandler.pattern = /usr/local/okv/okvrest.log
java.util.logging.FileHandler.limit = 200000
java.util.logging.FileHandler.count = 1
#java.util.logging.FileHandler.formatter =
java.util.logging.XMLFormatter
java.util.logging.FileHandler.formatter =
com.oracle.okv.rest.log.OkvFormatter

# Limit the message that are printed on the console to INFO and above.
java.util.logging.ConsoleHandler.level = FINER
#java.util.logging.ConsoleHandler.formatter =
java.util.logging.XMLFormatter
java.util.logging.ConsoleHandler.formatter =
com.oracle.okv.rest.log.OkvFormatter
```

2.3 Getting Help Information for RESTful Services Utility Commands

At the command line (but not in JSON), you can find detailed help information for each component of an `okv` RESTful services utility command.

- okv category Component Help Information
  Entering `okv -help` or `okv --help` returns help information for the `category` component of the `okv` command.

- okv resource Component Help Information
  Entering `okv` *category* `--help` returns detailed information about the `resource` components for the specified *category*.

- okv action Component Help Information
  Entering okv *category resource* --help returns detailed information about the action
  component of an okv command with the specified *category* and *resource*.

- okv option Component Help Information
  Entering okv *category resource action* --help returns detailed information about the
  option component of an okv command with the specified *category*, *resource*, and
  action.

2.3.1 okv category Component Help Information

Entering okv -help or okv --help returns help information for the category component of
the okv command.

Syntax: okv --help or okv -help

Example Input: okv --help or okv -help

Example Output:

```
Oracle Key Vault REST CLI Version 21.5.0.0.0 Built 11/09/2022 17:44
Usage: okv <category> <resource> <action> [<rest-cli-parameters>]
[<parameters>]

Command:
  <category> :
    managed-object            -        Commands that endpoints can execute
to manage security objects.
    backup                    -        Administration commands to manage
Oracle Key Vault appliance backup and restore.
    admin                     -        Administration commands to manage
client wallets and endpoints.
    manage-access             -        Access management commands to manage
wallets and endpoint groups.
    server                    -        Monitoring commands to retrieve
static or dynamic information about an Oracle Key Vault server.
    cluster                   -        Monitoring commands to retrieve
static or dynamic information about a cluster or a cluster node.
    primary-standby           -        Monitoring commands to retrieve
static or dynamic information about the Oracle Key Vault primary-standby
configuration.
    crypto                    -        Commands to perform cryptographic
operations.
    metrics                   -        Commands to perform metrics
operations.

<rest-cli-parameters>:
    --client_wallet <arg>      Client wallet.
    --config <arg>             OKV REST CLI configuration file
                               (okvrestcli.ini) location.
    --from-json <arg>          Input file in JSON.
    --generate-json-input      Generate JSON input template file.
    --help                     List available options.
    --okv_client_config <arg>  OKV Client configuration file
                               (okvclient.ora) location.
```

```
--output_format <arg>         Command output format, 'text' or 'json
 --password <arg>              User password.
 --profile <arg>              Profile name in configuration file
                               (okvrestcli.ini).
 --server <arg>                OKV server IP address or hostname.
 --user <arg>                  Username.
 --version <arg>               Version for backward compatibility.
```

`rest-cli-parameters` shows the list of parameters that apply to all commands.

2.3.2 okv resource Component Help Information

Entering `okv category --help` returns detailed information about the `resource` components for the specified `category`.

Syntax: `okv category --help`

Example Input: `okv admin --help`

Example Output:

```
Oracle Key Vault REST CLI Version 21.4.0.0.0 Built 12/13/2021 01:19
Usage: okv admin <resource> <action> [<rest-cli-parameters>]
[<parameters>]

Command:
  <category> : admin
  <resource> :
    endpoint                 -       Commands to manage
endpoints.
    client-wallet            -       Commands to manage client
wallets.
```

2.3.3 okv action Component Help Information

Entering `okv category resource --help` returns detailed information about the `action` component of an `okv` command with the specified `category` and `resource`.

Syntax: `okv category resource --help`

Example Input: `okv admin endpoint --help`

Example Output:

```
Oracle Key Vault REST CLI Version 21.4.0.0.0 Built 12/13/2021 01:19
Usage: okv admin endpoint <action> [<rest-cli-parameters>]
[<parameters>]

Command:
  <category> : admin
  <resource> : endpoint
  <action> :
    create                   -       Add a new endpoint to the
Oracle Key Vault.
```

```
    delete                      -        Remove an endpoint from the Oracle
Key Vault.
    update                      -        Update the settings of an
endpoint.
    check-status                -        Display the current state of an
endpoint. The state will be either ACTIVE or PENDING.
    get                         -        Retrieve information about an
endpoint.
    list                        -        Display a list of
endpoints.
    download                    -        Download the endpoint software
(okvclient.jar) to the specified directory.
    provision                   -        Download and install the endpoint
software in the specified directory.
    re-enroll                   -        Re-enroll a previously enrolled
endpoint.
    suspend                     -        Suspend an
endpoint.
    resume                      -        Resume an
endpoint.
    get-enrollment-token        -        Retrieve an enrollment token for a
registered endpoint.
    re-enroll-all               -        Re-enroll all previously enrolled
endpoints.
```

2.3.4 okv option Component Help Information

Entering `okv` *category resource action* `--help` returns detailed information about the `option` component of an `okv` command with the specified *category*, *resource*, and *action*.

Syntax: `okv` *category resource action* `--help`

Example Input: `okv admin endpoint provision --help`

Example Output:

```
Oracle Key Vault REST CLI Version 21.4.0.0.0 Built 12/13/2021 01:19

Usage: okv admin endpoint provision [<rest-cli-parameters>] <parameters>

The okv admin endpoint provision command downloads and installs the endpoint
software for an endpoint in the specified directory.

Command:
  <category> : admin
  <resource> : endpoint
  <action>   : provision

Required Parameters:
    --endpoint <arg>   Name of the endpoint.
    --location <arg>    Path to the location where to install the endpoint
                        software. For Transparent Data Encryption (TDE)
                        environments, specify WALLET_ROOT/okv as the
                        installation directory.
```

```
Optional Parameters:
    --auto-login <arg>     Enter on of the following values:
                           TRUE: to enable auto-login authentication
                           FALSE: (default) to store the endpoint
                           credentials that are used to connect to the
                           Oracle Key Vault server in a password-
protected
                           wallet. When --auto-login is set to FALSE,
then
                           you will be promoted to enter a password
                           interactively.
```

2.4 Running Oracle Key Vault RESTful Services Utility Commands

Oracle Key Vault provides a variety of ways to run RESTful services utility commands.

- RESTful Services Utility Command Syntax
  The RESTful services utility command syntax operates using the `okv` command.

- Ways of Running RESTful Services Utility Commands
  You can run the Oracle Key Vault RESTful services utility commands either by directly specifying command-specific parameters in the command line, or by using the JSON syntax.

- Creating a Script to Automatically Enroll Oracle Databases as Endpoints
  You can create a script that database administrators can run to automatically enroll Oracle Database endpoints in Oracle Key Vault.

2.4.1 RESTful Services Utility Command Syntax

The RESTful services utility command syntax operates using the `okv` command.

The syntax used for RESTful services utility commands is as follows:

```
okv category resource action rest-cli-configuration-parameters command-
parameters
```

In this specification:

- `category` refers to the type of command you are executing, such as `managed-object`, `admin`, `cluster`, or `backup` commands.

- `resource` is a type of resource on which you are executing the command, such as `endpoint`, `wallet`, or `certificate`.

- `action` is the action to perform on the resource, such as `create`, `add`, `locate`, or `delete`.

- `rest-cli-configuration-parameters` include parameters such as `--user`, `--client_wallet`, and so on, that you specify in the REST CLI configuration file. These parameters apply to all commands.

- *command-parameters* are parameters that a command may need, such as the `--description` or `--email` parameters when you create an endpoint

In this guide, commands are identified using `okv` followed by *category*, *resource*, *action*, and if the command requires them, *rest-cli-configuration-parameters command-parameters*. For example, to create an endpoint, you would use the `okv admin endpoint create` command. This command's full syntax is as follows:

```
okv admin endpoint create --endpoint endpoint_name --description
"description" --email email_address --platform platform --type type --unique
TRUE|FALSE
```

The Oracle Key Vault RESTful services utility commands syntax follows the these rules:

- It requires that you specify the command in this order: *okv category resource action rest-cli-configuration-parameters command-parameters*. You must specify the *category*, *resource*, and *action* in the order shown here. REST CLI configuration parameters must be specified before any command-specific parameters.

- It enables the configuration file (`okvrestcli.ini`) to be identified by using the `OKV_RESTCLI_CONFIG` environment variable. You set this variable in the RESTful services command line utility script `okv` itself. This frees you of the necessity of having to specify this configuration file every time that you run the command.

> **Note:**
>
> For backward compatibility, the RESTful services utility command line interface that existed before Oracle Key Vault release 21.1 is still supported. You can download `okvrestclipackage.zip` to use that interface.

Most of the RESTful services utility commands support JSON input. In this guide, the commands that support JSON provide an example of how to use JSON.

2.4.2 Ways of Running RESTful Services Utility Commands

You can run the Oracle Key Vault RESTful services utility commands either by directly specifying command-specific parameters in the command line, or by using the JSON syntax.

- Running RESTful Services Utility Commands Using the Command Line
  You run the RESTful services utility commands from the command line by specifying all command-specific parameters in the command line.

- Running RESTful Services Utility Commands Using the JSON Syntax
  The RESTful services utility commands support JSON syntax, and after you have generated the JSON output, you can use it in combination with a command line execution of the command.

- Specifying the RESTful Services Utility Commands Output Format
  You can use the REST CLI parameter --output_format to choose the output format between JSON and text.

- Naming Conventions for Parameters Specified at the Command Line and in JSON Files
  The command parameters when specified on the command line use a different naming convention from the naming convention that is used in the JSON syntax.

2.4.2.1 Running RESTful Services Utility Commands Using the Command Line

You run the RESTful services utility commands from the command line by specifying all command-specific parameters in the command line.

For example, `okv manage-access endpoint-group add-endpoint` has the endpoint-group and endpoint parameters:

```
okv manage-access endpoint-group add-endpoint --endpoint-group
endpoint_group_name --endpoint endpoint_member
```

When specifying REST CLI configuration parameters in the command line, you must specify REST CLI configuration parameters before any command-specific parameters. In the following example, `--profile hr` is one of the `rest_cli_configuration_parameters`, and it is followed by the `command_parameters` for the `okv managed-object key create` command.

```
okv managed-object key create --profile hr --algorithm AES --length
128 --mask "ENCRYPT,DECRYPT,EXPORT"
```

*   [Naming Conventions for Parameters Specified at the Command Line and in JSON Files](#)
    The command parameters when specified on the command line use a different naming convention from the naming convention that is used in the JSON syntax.

2.4.2.2 Running RESTful Services Utility Commands Using the JSON Syntax

The RESTful services utility commands support JSON syntax, and after you have generated the JSON output, you can use it in combination with a command line execution of the command.

To run the RESTful services command using JSON input, you must first prepare a JSON input file with the command-specific parameter values and then run the command using parameter `--from-json json-input-file.json`.

The recommended process of running RESTful services utility commands using JSON input is as follows:

1. Generate JSON input designed specifically for the command, by running the command with the `--generate-json-input` parameter. For example:

    ```
    okv managed-object key create --generate-json-input
    ```

    The generated JSON input for this command is as follows:

    ```
    {
      "service": {
        "category": "managed-object",
        "resource": "key",
        "action": "create",
        "options": {
    ```

```
            "algorithm": "#3DES|AES",
            "length": "#112,168(3DES)|128,192,256(AES)",
            "mask": [ "#ENCRYPT", "#DECRYPT", "#WRAP_KEY", "#UNWRAP_KEY",
"#EXPORT",
                "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
                "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
                "#TRANSLATE_UNWRAP" ],
            "wallet": "#VALUE",
            "attributes": {
                "extractable" : "#TRUE|FALSE"
            }
        }
    }
}
```

2. Save generated input to a file and then edit it so that you can perform the task. You must modify the values that begin with #. For this example, you could call the file `create_key.json` and then edit it to use the following values:

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "create",
    "options": {
      "algorithm": "AES",
      "length": "256",
      "mask": [
        "ENCRYPT",
        "DECRYPT"
      ],
      "wallet": "hr_wallet",
      "attributes": {
          "extractable" : "FALSE"
      }
    }
  }
}
```

3. To perform the action, run the `okv managed-object key create` command with the `--from-json` parameter to specify the name of the JSON input file that you just edited.

   For example, to run the `okv managed-object key create` command by using the default configuration settings:

```
okv managed-object key create --from-json create_key.json
```

   When using JSON input, you can also specify command parameters in the command line. The command parameters specified in the command line have higher precedence over the same parameters specified in the JSON input file.

- **Example 1:** To create a key but with a different length than what is specified in the JSON file `create_key.json`, specify the `length` parameter in the command line:

  ```
  okv managed-object key create --from-json key_create.json --
  length 128
  ```

  Overriding command parameters in the command line allows use of the same JSON file for running the same command but with different parameters without having to modify the JSON input file.

- **Example 2:** To apply the same attribute values for multiple managed objects, you specify the attribute settings in the input JSON file and specify the UUID of the object in the command line. Consider the following JSON input file `add_attributes.json`:

  ```
  {
    "service" : {
      "category" : "managed-object",
      "resource" : "attribute",
      "action" : "add",
      "options" : {
        "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
        "attributes" : {
          "contactInfo" : "psmith@example.com",
          "deactivationDate" : "2024-12-31 09:00:00",
          "name" : {
                      "value" : "prod-hrdb-mkey",
                      "type" : "text"
           },
          "protectStopDate" : "2024-09-30 09:00:00"
        }
      }
    }
  }
  ```

  To apply this attribute to an object with UUID `2359E04F-DA61-4F7C-BF9F-913D3369A93A`, you run:

  ```
  okv managed-object attribute add --from-json add_attributes.json
  --uuid 2359E04F-DA61-4F7C-BF9F-913D3369A93A
  ```

Related Topics

- [Naming Conventions for Parameters Specified at the Command Line and in JSON Files](#)
  The command parameters when specified on the command line use a different naming convention from the naming convention that is used in the JSON syntax.

2.4.2.3 Specifying the RESTful Services Utility Commands Output Format

You can use the REST CLI parameter --output_format to choose the output format between JSON and text.

By default, the output of RESTful services utility commands is in the JSON format. However, for certain commands, you can specify the `--output_format text` to produce the command output in the text format.

For example: Below command returns the UUID of the newly created key as the text output:

```
okv managed-object key create --output_format text --algorithm AES --length
25609285F83-CC1F-4FAF-BF6C-E2262733F369
```

> **Note:**
>
> The `--output_format text` is only supported for these commands:

- `okv managed-object certificate get`
- `okv managed-object certificate register`
- `okv managed-object certificate-request get`
- `okv managed-object certificate-request register`
- `okv managed-object key create`
- `okv managed-object key get`
- `okv managed-object key register`
- `okv managed-object object activate`
- `okv managed-object object destroy`
- `okv managed-object object locate`
- `okv managed-object object revoke`
- `okv managed-object opaque get`
- `okv managed-object private-key register`
- `okv managed-object public-key get`
- `okv managed-object public-key register`
- `okv managed-object secret get`
- `okv managed-object secret register`
- `okv managed-object wallet add-member`
- `okv managed-object wallet delete-member`
- `okv managed-object wallet list`

2.4.2.4 Naming Conventions for Parameters Specified at the Command Line and in JSON Files

The command parameters when specified on the command line use a different naming convention from the naming convention that is used in the JSON syntax.

The parameters in the JSON syntax use the camelCase naming convention (for example, `walletUser`, `clientWallet`). The naming convention for the parameters in the command line use follows these rules in general:

- The parameter name is prefixed by two hyphens (for example, `--user`)

- Each word is separated by a hyphen (for example, `--endpoint-group`)

- All words are in lowercase (for example, `--endpoint`)

The corresponding command line parameter names for the parameters `walletUser` and `clientWallet` from the JSON syntax are `--wallet-user` and `--client-wallet`, respectively.

2.4.3 Creating a Script to Automatically Enroll Oracle Databases as Endpoints

You can create a script that database administrators can run to automatically enroll Oracle Database endpoints in Oracle Key Vault.

An Oracle Key Vault administrator can create a set of scripts and files that database administrators can later download from a shared location, and run on their database servers to automatically on-board their databases into Oracle Key Vault, without any further intervention by the Oracle Key Vault administrators. As the Oracle Key Vault administrator, you will package the following:

- Oracle Key Vault RESTful services package

- `ewallet.p12` and `cwallet.sso` wallet files

- `run-me.sh` script

The following procedure explains how to create these components.

1. Download the RESTful services package and store it in your working directory, where you will also create the other files.

   ```
   curl -O -k https://Oracle_Key_Vault_IP_address:5695/
   okvrestclipackage.zip
   ```

2. If you have not done so already, then create a user and grant the Create Endpoint privilege to it.

   Use the Oracle Key Vault management console to create this user. For the procedure in this topic, this user will be named `restuser_ron` and will have the Create Endpoint privilege. A user with the System Administrator role creates the `restuser_ron` account and then grants the user the Create Endpoint privilege. Finally, the `restuser_ron` user must log in and change the one-time password to a permanent password. If you are preparing your Oracle Key Vault cluster to on-board ADB-on-ExaCC, additionally, the key administrator needs to grant the Create Endpoint Group privilege to `restuser_Ron` .

3. Unzip the downloaded `okvrestclipackage.zip` file into a directory where you will create the other files.

After you unzip the `okvrestclipackage.zip` file, you can use the `tree` command to see the contents of the unzipped directory structure.

```
$ tree
bin
-- okv
-- okv.bat
lib
-- okvrestcli.jar
conf
-- okvrestcli.ini
-- okvrestcli_logging.properties
```

4. Edit the `bin/okv` file.

   For example:

   ```
   #!/bin/bash
   export OKV_RESTCLI_DIR=$(dirname "${0}")/..
   #export OKV_RESTCLI_CONFIG=$OKV_RESTCLI_DIR/conf/okvrestcli.ini
   if [ -z "$JAVA_HOME" ]
   then
     echo "JAVA_HOME environment variable is not set."
     exit 1
   fi

   if [ -z "$OKV_RESTCLI_CONFIG" ]
   then
     echo "OKV_RESTCLI_CONFIG environment variable is not set."
     exit 1
   fi

   export OKV_RESTCLI_JAR=$OKV_RESTCLI_DIR/lib/okvrestcli.jar
   $JAVA_HOME/bin/java -jar $OKV_RESTCLI_JAR "$@"
   ```

   In this specification:

   - Uncomment the line `export OKV_RESTCLI_CONFIG=$OKV_RESTCLI_DIR/conf/okvrestcli.ini`.

5. Edit the `conf/okvrestcli.ini` file.

   For example:

   ```
   [Default]
   log_property=/usr/local/okv/conf/okvrestcli_logging.properties
   server=192.0.2.181
   okv_client_config=/usr/local/okv/conf/okvclient.ora
   user=restuser_ron
   client_wallet=/home/oracle
   ```

   In this specification:

   - `server` is the IP address of the Oracle Key Vault server (for example, `192.0.2.181`).

   - `user` is the is the user name of the Oracle Key Vault user that you created in Step 2.

- `client_wallet` is an absolute path to a wallet that will contain the permanent password of the `restuser_ron` user. Because you are including the `user` option, the command will pick up the user's credentials from the wallet to establish a connection with the Oracle Key Vault server.

6. Run the following command, which creates a wallet and inserts the password of the `restuser_ron` user into it.

```
okv admin client-wallet add --client-wallet /home/oracle --wallet-
user restuser_ron
Password: restuser_ron_password
```

This command creates the password-protected wallet `ewallet.p12` and the auto-login wallet `cwallet.sso` in the `/home/oracle` directory.

7. Create a script similar to the `run-me.sh` script, which is part of the package that an Oracle Key Vault administrator creates for the database administrators to download.

The `run-me.sh` creates the shell script `okv-ep.sh`, which contains unique names for the virtual wallet and the associated endpoints. Use the naming convention that your site normally uses for names of wallets and other components.

```
$ more run-me.sh
#!/bin/bash
export EP_NAME=${ORACLE_SID^^}_on_${HOSTNAME/.*}
export WALLET_NAME=${ORACLE_SID^^}
curl -Ok https://192.0.2.181:5695/okvrestclipackage.zip
unzip -Vj okvrestclipackage.zip lib/okvrestcli.jar -d ./lib
cat > /home/oracle/okv-ep.sh  << EOF
#!/bin/bash
mkdir -pv ${ORACLE_BASE}/product/okv
okv manage-access wallet create --wallet ${WALLET_NAME} --unique
FALSE
okv admin endpoint create --endpoint ${EP_NAME} --description
"$HOSTNAME, $(hostname -i)" --type ORACLE_DB --platform
 LINUX64 --subgroup "USE CREATOR SUBGROUP" --unique FALSE --strict-
ip-check TRUE
okv manage-access wallet set-default --wallet ${WALLET_NAME} --
endpoint ${EP_NAME}
expect << _EOF
    set timeout 120
    spawn okv admin endpoint provision --endpoint ${EP_NAME} --
location ${ORACLE_BASE}/product/okv --auto-login FALSE
    expect "Enter Oracle Key Vault endpoint password: "
    send "change-on-install\r"
    expect eof
_EOF
EOF
chmod +x okv-ep.sh
more ./okv-ep.sh
```

In this specification:

a.   `export ...` creates the endpoint name from
     `uppercase(ORACLE_SID)_on_`*`short_hostname`* and a `WALLET_NAME` from uppercase
     (`ORACLE_SID`). In an Oracle Real Application Clusters (Oracle RAC) environment,
     replace `ORACLE_SID` with an uppercase (`ORACLE_UNQNAME`).

b.   `curl ...` downloads the correct, current version of the Oracle Key Vault RESTful
     services package when the database administrator executes the `run-me` script.

c.   `unzip ...` extracts only the `okvrestcli.jar` file and places it into the `./lib`
     directory.

d.   `mkdir -pv ${ORACLE_BASE}/product/okv` creates the installation directory for Oracle
     Key Vault client software. For Oracle Database release 18c and later, this is equal to
     `WALLET_ROOT/okv`. (`/product/okv` is an example directory.)

e.   `okv manage-access wallet create` creates a (shared) virtual wallet in Oracle Key
     Vault. Here, the wallet name equals `uppercase($ORACLE_SID)`.

f.   `okv admin endpoint create` creates an endpoint, named after the endpoint created
     in the `export` command in step a, with `type=ORACLE_DB, platform=LINUX64`, free
     text *`fully_qualified_hostname`*, *`IP address`*. The `--subgroup` option determines
     the preferred Oracle Key Vault read-write pair that the database endpoint will connect
     to first. Here, it is the Oracle Key Vault subgroup where the endpoint will be enrolled.

g.   `okv manage-access wallet set-default` sets the default wallet, associating the
     endpoint created in step f with the shared wallet created in step e.

h.   `expect` executes the `okv admin endpoint provision` command and automatically
     inserts a password when prompted. The benefit of using `expect` is that the password
     cannot be retrieved using the `ps` command.

8.   Duplicate the `run-me.sh` script so that you will have a primary script and a secondary
     script, to be used for different situations.

     The primary script will be used for single-instance databases and the first Oracle RAC
     instance. The secondary script will be used for the remaining Oracle RAC nodes of a
     primary database and all nodes of the corresponding standby Oracle RAC database. This
     secondary script will associate the endpoints with the shared wallet that was created on
     the first instance.

     a.   Rename the `run-me.sh` script to `primary-run-me.sh`.

     b.   Copy `primary-run-me.sh` to a new file named `secondary-run-me.sh`.

     c.   Open `secondary-run-me.sh` and remove the following line:

     ```
     okv manage-access wallet create --wallet ${ORACLE_SID^^} --unique
     FALSE
     ```

9.   Make the scripts executable.

     ```
     $ chmod +x primary-run-me.sh
     $ chmod +x secondary-run-me.sh
     ```

10. Test each of the scripts to ensure that they can create a `okv-ep.sh` file.

     ```
     $ ./primary-run-me.sh
     $ ./secondary-run-me.sh
     ```

11. Confirm that the names for the virtual wallets and endpoints follow your naming convention by executing the following command:

```
$ more okv-ep.sh
```

12. Create two `.zip` file packages for each of the scripts.

    Each package must have the following contents:

    - `primary.zip` contains `primary-run-me.sh`, `ewallet.p12`, `cwallet.sso`, as well as the `bin` and `conf` directories. Do not include the `./lib` directory. The `./lib` library will be created and populated on demand when the `primary-run-me.sh` script is executed.

    - `secondary.zip` contains `secondary-run-me.sh`, `ewallet.p12`, `cwallet.sso`, as well as the `./bin` and `./conf` directories. Do not include the `./lib` directory. The `./lib` library will be created and populated on demand when the `secondary-run-me.sh` script is executed.

13. Make these two `.zip` files available to the database administrators for them to download from a shared file server.

14. Instruct the database administrators where to download and run the scripts:

    - Run the `primary-run-me.sh` script on single-instance databases or the first Oracle RAC instance. For an Oracle Data Guard environment, run the script on the lead node of the primary Oracle RAC database.

    - Run the `secondary-run-me.sh` script on all the remaining Oracle RAC nodes of a primary database and all nodes of the corresponding standby Oracle RAC database.

- Step 4: Download the RESTful Services Utility
  The RESTful services utility is in the `okvrestclipackage.zip` file.

2.5 Naming Guidelines for Objects

The naming guidelines affect the following Oracle Key Vault objects: users, user groups, endpoints, endpoint groups, and virtual wallets.

The naming conventions for these objects are as follows:

- You can include the following characters in the names of endpoints, endpoint groups, user groups, and virtual wallets: letters (`a–z`, `A–Z`), numbers (`0-9`), underscores (_), periods (.), and hyphens (–).

- You can include the following characters in the names of users: letters (`a–z`, `A–Z`), numbers (`0-9`), and underscores (_).

- In most environments, the maximum number of bytes allowed for the name length is 120 bytes. If you have an Oracle Key Vault cluster with version 18.4 and older, the maximum object names length is 24 bytes.

- The names of users, user groups, endpoints, and endpoint groups are not case sensitive. For example, `psmith` and `PSMITH` are considered the same user in Oracle Key Vault.

- The names of virtual wallets are case sensitive. For example, `wallet_hr` and `WALLET_HR` are considered two separate wallets in Oracle Key Vault.

2.6 How to Set the Date and Time in RESTful Services Utility Commands

You specify the date or timestamp, and duration using the supported formats.

Duration Format

The *duration* format specifies a time period or a time interval. This format is based on a subset of the ISO-8601 standard. The syntax is as follows:

```
P nD T nH nM nS
```

In this specification:

- `P` is the duration designator (for period) placed at the start of the duration representation.

- `n` is a numeric value.

- The capital letter following the `Pn` is a date or time value. Date value is as follows:

  - `D` means the day of the week.

- `T` indicates that the remaining values represent time values, as follows:

  - `nH` means `n` hour.

  - `nM` means `n` minutes.

  - `nS` means `n` seconds.

Examples:

- 10 minutes: `PT10M`

- 2 hours 30 minutes: `PT2H30M`

- 5 hours: `PT5H`

- 3 days: `P3D`

- 45 seconds: `PT45S`

- 5 hours, 10 minutes: `PT5H10M`

Date and Time Formats

The date and time formats that are used in the RESTful services utility are in UTC. The four ways of setting the date and time are as follows:

- *timestamp*. This format is compatible with ISO 8601. This example translates to "start the activation date at 9 a.m. on December 31, 2024":

```
"activationDate" : "2024-12-31 09:00:00",
```

- `NOW`. The following example sets the activation date to the current time when the command is run:

  ```
  "activationDate" : "NOW",
  ```

- *timestamp+duration*. This example translates to "start the activation date at 1 p.m. on December 31, 2024":

  ```
  "activationDate" : "2024-12-31 09:00:00+PT4H",
  ```

- `NOW`+*duration*. The following example translates to "set the activate date 10 minutes from now":

  ```
  "activationDate" : "NOW+PT10M",
  ```

2.7 Using RESTful Services with LDAP Users

Both regular Oracle Key Vault administrators and properly authorized LDAP users can log in to a server to run Oracle Key Vault RESTful services utility commands.

When an LDAP user runs the Oracle Key Vault RESTful services utility commands, Oracle Key Vault first authenticates the user before command is run. The user's authorization that is effective for the session is determined during authentication process.

- When executing a RESTful service command, provide the user name and domain name of the user with the `--user` parameter using the following methods:

  - The LDAP user name in any of the supported formats (shown below) and the domain name separate by a vertical-bar (`|`).

    * *sAMAccountName|LDAP_domain_name*
      Example: `psmith|hr.example.com`

    * *NetBiosDomainName\\sAMAccountName|LDAP_domain_name*.
      Example: `hr\\psmith|hr.example.com`

      The double backslash (`\\`) interprets `hr\\psmith` as `hr\psmith`.

    * *userPrincipalName|LDAP_domain_name*
      Example: `psmith@hr.example.com|hr.example.com`

  - The user principal name of the LDAP user.
    Example: `psmith@hr.example.com`

Related Topics

- [Required Privileges for Using RESTful Services](#)
  The required RESTful services privileges are consistent with the privileges required to perform the same task in the Oracle Key Vault management console.

3
Administration Commands

You can use the administration commands to manage client wallets and endpoints.

- **Client Wallet Management Commands**
  You can use the client wallet management commands to manage client wallets that store user credentials. The client wallet management commands support LDAP and database users only.

- **Endpoint Management Commands**
  The endpoint management commands enable you to perform endpoint-related tasks such as creating or provisioning endpoints.

3.1 Client Wallet Management Commands

You can use the client wallet management commands to manage client wallets that store user credentials. The client wallet management commands support LDAP and database users only.

- **okv admin client-wallet add Command**
  The `okv admin client-wallet add` command adds the user's credentials to the client wallet. Oracle Key Vault creates the client wallets `ewallet.p12` and `cwallet.sso` if they do not exist.

- **okv admin client-wallet delete Command**
  The `okv admin client-wallet delete` command deletes a user's credentials from a client wallet.

- **okv admin client-wallet list Command**
  The `okv admin client-wallet list` command lists the users whose credentials are stored in the client wallet.

- **okv admin client-wallet update Command**
  The `okv admin client-wallet update` command updates the user's password in the client wallet.

3.1.1 okv admin client-wallet add Command

The `okv admin client-wallet add` command adds the user's credentials to the client wallet. Oracle Key Vault creates the client wallets `ewallet.p12` and `cwallet.sso` if they do not exist.

Required Authorization

None

Syntax

```
okv admin client-wallet add --client-wallet client_wallet_location --wallet-user
user_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "client-wallet",
    "action" : "add",
    "options" : {
      "clientWallet" : "#VALUE",
      "walletUser" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--client-wallet` / `clientWallet`	Required	Location of the client wallet (that is, the directory where client wallet is created)
`--wallet-user` / `walletUser`	Required	User name

JSON Example

1. Generate JSON input for the `okv admin client-wallet add` command.

   ```
   okv admin client-wallet add --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "add",
       "options" : {
         "clientWallet" : "#VALUE",
         "walletUser" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `client_wallet_add.json`) and then edit it so that you can specify the client wallet location and the user whose password you want to add to the wallet.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "add",
       "options" : {
         "clientWallet" : "/home/oracle/okv_client_wallet",
         "walletUser" : "psmith"
       }
     }
   }
   ```

3. Run the `okv admin client-wallet add` command using the generated JSON file.

```
okv admin client-wallet add --from-json client_wallet_add.json
```

When prompted, enter the password for the user. After you enter the password, output similar to the following appears:

```
Password: password
{
  "result" : "Success"
}
```

> **Note:**
>
> Prior to Oracle Key Vault release 21.7, when the client wallet file does not have write permission to the user, 'okv admin client-wallet add' gives the success message even though it did not add the user to the wallet client file. Starting with Oracle Key Vault release 21.7, RESTful Services Utility commands reports the permission issue with an error message

3.1.2 okv admin client-wallet delete Command

The `okv admin client-wallet delete` command deletes a user's credentials from a client wallet.

Required Authorization

Read-write permissions on the client wallet

Syntax

```
okv admin client-wallet delete --client-wallet <client_wallet_location> --wallet-user
<wallet_user_name>
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "client-wallet",
    "action" : "delete",
    "options" : {
      "clientWallet" : "#VALUE",
      "walletUser" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--client-wallet` / `clientWallet`	Required	Location of the client wallet (that is, the directory where client wallet is created)

Parameter/Template Parameter	Required?	Description
`--wallet-user` / `walletUser`	Required	User name

JSON Example

1. Generate JSON input for the `okv admin client-wallet delete` command.

   ```
   okv admin client-wallet delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "delete",
       "options" : {
         "clientWallet" : "#VALUE",
         "walletUser" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `client_wallet_delete.json`) and then edit it so that you can specify the name of the user to remove from the wallet and the client wallet location.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "delete",
       "options" : {
         "clientWallet" : "/home/oracle/okv_client_wallet",
         "walletUser" : "psmith"
       }
     }
   }
   ```

3. Run the `okv admin client-wallet delete` command using the generated JSON file.

   ```
   okv admin client-wallet delete --from-json client_wallet_delete.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

3.1.3 okv admin client-wallet list Command

The `okv admin client-wallet list` command lists the users whose credentials are stored in the client wallet.

Required Authorization

Read file permissions on the client wallet

Syntax

```
okv admin client-wallet list --client-wallet client_wallet_location
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "client-wallet",
    "action" : "list",
    "options" : {
      "clientWallet" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--client-wallet` / `clientWallet`	Required	Location of the client wallet (that is, the directory where client wallet is created)

JSON Example

1. Generate JSON input for the `okv admin client-wallet list` command.

   ```
   okv admin client-wallet list --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "list",
       "options" : {
         "clientWallet" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `client_wallet_list.json`) and then modify it to include the client wallet location.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "list",
       "options" : {
         "clientWallet" : "/home/oracle/okv_client_wallet"
       }
     }
   }
   ```

3. Run the `okv admin client-wallet list` command using the generated JSON file.

   ```
   okv admin client-wallet list --from-json client_wallet_list.json
   ```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "walletUsers" : [ "psmith", "psmith" ]
  }
}
```

3.1.4 okv admin client-wallet update Command

The `okv admin client-wallet update` command updates the user's password in the client wallet.

Required Authorization

Read-write file permissions on the wallet

Syntax

```
okv admin client-wallet update --client-wallet client_wallet_location --wallet-
user user_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "client-wallet",
    "action" : "update",
    "options" : {
      "clientWallet" : "#VALUE",
      "walletUser" : "#VALUE"
    }
  }
}
```

Parameters

Parameter	Required?	Description
`--client-wallet` / `clientWallet`	Required	Location of the client wallet (that is, the directory where client wallet is created)
`--wallet-user` / `walletUser`	Required	User name

JSON Example

1. Generate JSON input for the `okv admin client-wallet update` command.

   ```
   okv admin client-wallet update --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "client-wallet",
       "action" : "update",
   ```

```
    "options" : {
      "clientWallet" : "#VALUE",
      "walletUser" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `client_wallet_update.json`) and then edit it so that you can specify the user whose password you want to update to the wallet and the client wallet location.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "client-wallet",
    "action" : "update",
    "options" : {
      "clientWallet" : "/home/oracle/okv_client_wallet",
      "walletUser" : "psmith"
    }
  }
}
```

3. Run the `okv admin client-wallet update` command using the generated JSON file.

```
okv admin client-wallet update --from-json client_wallet_update.json
```

When prompted, enter the password for the user. After you enter the password, output similar to the following appears:

```
Password: password
{
  "result" : "Success"
}
```

Related Topics

• okv admin client-wallet list Command
  The `okv admin client-wallet list` command lists the users whose credentials are stored in the client wallet.

3.2 Endpoint Management Commands

The endpoint management commands enable you to perform endpoint-related tasks such as creating or provisioning endpoints.

• okv admin endpoint check-status Command
  The `okv admin endpoint check-status` command displays the current state of an endpoint. The state will be either `ACTIVE` or `PENDING`.

• okv admin endpoint create Command
  The `okv admin endpoint create` command adds a new endpoint to Oracle Key Vault.

• okv admin endpoint delete Command
  The `okv admin endpoint delete` command removes an endpoint from Oracle Key Vault.

• okv admin endpoint download Command
  The `okv admin endpoint download` command downloads the endpoint software (`okvclient.jar`) to the specified directory.

- **okv admin endpoint get Command**
  The `okv admin endpoint get` command retrieves detailed information for an endpoint, such as its endpoint group and associated wallets.

- **okv admin endpoint get-enrollment-token Command**
  The `okv admin endpoint get-enrollment-token` command retrieves an enrollment token for a registered endpoint.

- **okv admin endpoint list Command**
  The `okv admin endpoint list` command lists the endpoints along with their associated information such as creation time, certificate expiry, and default wallet.

- **okv admin endpoint list-objects Command**
  The `okv admin endpoint list-objects` command lists security objects that are associated with a specified endpoint.

- **okv admin endpoint provision Command**
  The `okv admin endpoint provision` command downloads and installs the endpoint software in the specified directory.

- **okv admin endpoint re-enroll Command**
  The `okv admin endpoint re-enroll` command re-enrolls a previously enrolled endpoint.

- **okv admin endpoint re-enroll-all Command**
  The `okv admin endpoint re-enroll-all` command re-enrolls all previously enrolled endpoints.

- **okv admin endpoint resume Command**
  The `okv admin endpoint resume` command resumes a suspended endpoint.

- **okv admin endpoint suspend Command**
  The `okv admin endpoint suspend` command suspends an endpoint.

- **okv admin endpoint update Command**
  The `okv admin endpoint update` command updates the settings of an endpoint.

3.2.1 okv admin endpoint check-status Command

The `okv admin endpoint check-status` command displays the current state of an endpoint. The state will be either `ACTIVE` or `PENDING`.

This command is meant primarily for multi-master cluster environments. However, it is still valid for other deployments and can be used to check the existence of an endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint check-status --endpoint endpoint_name|--locator-id UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
```

```
      "action" : "check-status",
      "options" : {
        "endpoint" : "#VALUE",
        "locatorID" : "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint`/ `endpoint` or `--locator-id`/ `locatorID`	Optional	The name of the endpoint or the locator ID (universally unique ID (UUID)) of the endpoint that you want to check. The `--locator-id`/ `locatorID` is required only if you are using a multi-master cluster environment.
		You must specify either the `--endpoint`/ `endpoint` value or the `--locator-id`/ `locatorID` value, not both.
		To find existing endpoints, run the `okv admin endpoint list` command.
		To find the locator ID, check the output of the `okv admin endpoint create` command that was used to create this endpoint.

JSON Example

1. Generate a JSON input template for the `okv admin endpoint check-status` command.

   ```
   okv admin endpoint check-status --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "check-status",
       "options" : {
         "endpoint" : "#VALUE",
         "locatorID" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `check-status_ep.json`) and then edit it to so that you can check the endpoint. Specify either the `endpoint` value or the `locatorID` value, but not both.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "check-status",
       "options" : {
         "locatorID" : "1AC9B321-6540-4F2B-809B-95FD7416999E"
       }
     }
   }
   ```

3. Run the `okv admin endpoint check-status` command using the generated JSON file.

```
okv admin endpoint check-status --from-json check-status_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "ACTIVE",
    "endpoint" : "HR_DB_EP"
  }
}
```

The output includes the name of the endpoint if the endpoint object is in `ACTIVE` state. The endpoint name shown here may be different from what was specified at the endpoint creation time. If the endpoints with the same name are created on multiple cluster nodes, then Oracle Key Vault performs naming conflict resolution and it renames all but one endpoints by appending `_OKVnode-id` to the endpoint name. For example, if you named the endpoint `hr_db_ep`, and there is a naming conflict, then the name could be `hr_db_ep_okv01`.

On deployments other than multi-master cluster, this command returns `Success` if the endpoint exists and output does not include entries showing the endpoint name and its state.

3.2.2 okv admin endpoint create Command

The `okv admin endpoint create` command adds a new endpoint to Oracle Key Vault.

After you add the endpoint, the endpoint will be in the **Registered** state.

Required Authorization

System Administrator role or the Create Endpoint system privilege

Syntax

```
okv admin endpoint create [--description <description>] [--email <email>] --
endpoint <endpoint> [--platform <platform>] [--ssh-server-host-name <ssh-server-
host-name>] [--strict-ip-check <strict-ip-check>] [--subgroup <subgroup>] [--
type <type>] [--unique <unique>]
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "create",
    "options" : {
      "endpoint" : "#VALUE",
      "description" : "#VALUE",
      "email" : "#VALUE",
      "platform" : "#LINUX64|SOLARIS64|SOLARIS_SPARC|HP-UX|AIX|WINDOWS",
      "type" : "#ORACLE_DB|ORACLE_NON_DB|ORACLE_ACFS|MYSQL_DB|SSH_SERVER|OTHER",
      "subgroup" : "#VALUE|NO SUBGROUP|USE CREATOR SUBGROUP",
      "strictIpCheck" : "#TRUE|FALSE",
      "unique" : "#TRUE|FALSE",
```

```
            "sshServerHostName" : "#VALUE"
        }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	The name of the endpoint that you want to add. See Naming Guidelines for Objects. To find existing endpoints, run the `okv admin endpoint list` command.
`--description` / `description`	Optional	A user-friendly description of the endpoint. If the description contains spaces, then you must enclose it within double quotation marks.
`--email` / `email`	Optional	Email address of the endpoint administrator. Enclose this value in double quotation marks.
`--platform` / `platform`	Optional	The endpoint platform. Allowed values are: • `AIX` • `HP-UX` • `LINUX64` • `SOLARIS64` • `SOLARIS_SPARC` • `WINDOWS` The default value is: • `LINUX64`
`--type` / `type`	Optional	Type of the endpoint. Allowed values are: • `MYSQL_DB` • `ORACLE_ACFS` • `ORACLE_DB` • `ORACLE_NON_DB` • `SSH_SERVER` • `OTHER` The default value is: • `ORACLE_DB`
`--subgroup` / `subgroup`	Optional	For multi-master cluster environments, defines the affinity that an endpoint will have to a specific Oracle Key Vault cluster subgroup. Values are as follows: • Enter the name of a multi-master cluster subgroup. To find subgroups, in the Oracle Key Vault management console, select the **Cluster** tab, then **Management** in the left navigation bar. Subgroups for the cluster are listed under Cluster Information. • `NO SUBGROUP` creates an endpoint that will have no Oracle Key Vault cluster subgroup affinity. • `USE CREATOR SUBGROUP` creates an endpoint with affinity to the Oracle Key Vault cluster subgroup to which the node belongs where the endpoint is created.

Parameter/Template Parameter	Required?	Description
`--strict-ip-check` / `strictIpCheck`	Optional	Controls whether the Oracle Key Vault server checks the incoming IP address for a given endpoint. • `TRUE` enables Oracle Key Vault to check the incoming IP address of an endpoint. If the IP address does not match with the one that was used when the client endpoint software was installed, then Oracle Key Vault does not allow the connection. • `FALSE` disables this check and allows the incoming connection for the endpoint to come from any IP address. > **✎ Note:** > The default value is `TRUE`.
`--unique` / `unique`	Optional	In a multi-master cluster environment, creates the endpoint as a unique endpoint. In a multi-master cluster, it is possible that an endpoint with the same name could be created from two different nodes. If that happens, then endpoint names may conflict. The Oracle Key Vault conflict resolution scheme will keep one endpoint with the given name and rename other endpoints with the conflicting names to a name using this format: *given_ep_name_OKVnode_id*. Valid settings are as follows: • `TRUE` appends `_OKVnode_id` to the given name and thus prevent the conflict for this endpoint name. The endpoint is immediately usable. • `FALSE` (default) causes Oracle Key Vault to begin a checking process to find if the endpoint name is unique. A unique ID is returned. You can use this ID to check the status of the endpoint creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the endpoint will fail. If the status is `ACTIVE`, then the endpoint is usable. To check the status, run the `okv admin endpoint check_status` command. If the name that you provided is already used in another node, then the name for this endpoint will have `_OKVxx` appended to it. For example, if you named the endpoint `ep12`, and there is a naming conflict, the name could be `EP12_OKV01`.
`--ssh-server-host-name` / `sshServerHostName`	Optional	The hostname or IP address of the host where you want to deploy the `SSH_SERVER` endpoint. This option can only be used with the `SSH_SERVER` type endpoint..

JSON Example

1. Generate JSON input for the `okv admin endpoint create` command.

    ```
    okv admin endpoint create --generate-json-input
    ```

    The generated input appears as follows:

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "create",
    "options" : {
      "endpoint" : "#VALUE",
      "description" : "#VALUE",
      "email" : "#VALUE",
      "platform" : "#LINUX64|SOLARIS64|SOLARIS_SPARC|HP-UX|AIX|WINDOWS",
      "type" : "#ORACLE_DB|ORACLE_NON_DB|ORACLE_ACFS|MYSQL_DB|SSH_SERVER|OTHER",
      "subgroup" : "#VALUE|NO SUBGROUP|USE CREATOR SUBGROUP",
      "strictIpCheck" : "#TRUE|FALSE",
      "unique" : "#TRUE|FALSE",
      "sshServerHostName" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `create_ep.json`) and then edit it so that you can create the endpoint.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "create",
    "options" : {
      "endpoint" : "hr_db_ep",
      "description" : "HR database endpoint",
      "email" : "psmith@example.com",
      "platform" : "LINUX64",
      "type" : "ORACLE_DB",
      "subgroup" : "USE CREATOR SUBGROUP",
      "strictIpCheck" : "TRUE",
      "unique" : "FALSE"
    }
  }
}
```

3. Run the `okv admin endpoint create` command using the generated JSON file.

```
okv admin endpoint create --from-json create_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "PENDING",
    "locatorID" : "1AC9B321-6540-4F2B-809B-95FD7416999E"
  }
}
```

You can use the `locatorID` from above output with the `okv admin endpoint check-status` command to display the current state of the endpoint object. If the object status is `ACTIVE`, this command also displays the object name after the conflict-name resolution.

3.2.3 okv admin endpoint delete Command

The `okv admin endpoint delete` command removes an endpoint from Oracle Key Vault.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint delete --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "delete",
    "options" : {
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv admin endpoint delete` command.

   ```
   okv admin endpoint delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "delete",
       "options" : {
         "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `delete_ep.json`) and then edit it so that you can delete the endpoint.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "delete",
    "options" : {
      "endpoint" : "sales_db_ep"
    }
  }
}
```

3. Run the `okv admin endpoint delete` command using the generated JSON file.

```
okv admin endpoint delete --from-json delete_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

3.2.4 okv admin endpoint download Command

The `okv admin endpoint download` command downloads the endpoint software (`okvclient.jar`) to the specified directory.

If you want to both download and then install the endpoint software, then use the `okv admin endpoint provision` command.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint download --endpoint endpoint_name --location download_location
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "download",
    "options" : {
      "endpoint" : "#VALUE",
      "location" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command

Parameter/ Template Parameter	Required?	Description
`--location`/ `location`	Required	Absolute path to the download directory for the endpoint software. For example, if you specify `/tmp`, then the endpoint software is downloaded to `/tmp/endpoint_name/okvclient.jar`.

JSON Example

1. Generate JSON input for the `okv admin endpoint download` command.

   ```
   okv admin endpoint download --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "download",
       "options" : {
         "endpoint" : "#VALUE",
         "location" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `download_ep.json`) and then edit it so that you can create the endpoint.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "download",
       "options" : {
         "endpoint" : "hr_db_ep",
         "location": "/opt/downloads/okv"
       }
     }
   }
   ```

3. Run the `okv admin endpoint download` command using the generated JSON file.

   ```
   okv admin endpoint download --from-json download_ep.json
   ```

   A successful download of the `okvclient.jar` file displays the following output:

   ```
   {
     "result" : "Success"
   }
   ```

Related Topics

• okv admin endpoint provision Command
  The `okv admin endpoint provision` command downloads and installs the endpoint software in the specified directory.

3.2.5 okv admin endpoint get Command

The `okv admin endpoint get` command retrieves detailed information for an endpoint, such as its endpoint group and associated wallets.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint get --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "get",
    "options" : {
          "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv admin endpoint get` command.

   ```
   okv admin endpoint get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "get",
       "options" : {
             "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_ep.json`) and then edit it to specify an endpoint.

   ```
   {
     "service" : {
   ```

```
        "category" : "admin",
        "resource" : "endpoint",
        "action" : "get",
        "options" : {
                "endpoint" : "hr_db_ep"
        }
    }
}
```

3. Run the `okv admin endpoint get` command using the generated JSON file.

```
okv admin endpoint get --from-json get_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "administratorEmail" : "",
    "certificateExpirationTime" : "2023-10-29 14:48:46",
    "creationTime" : "2021-11-02 14:48:46",
    "defaultWallet" : "",
    "description" : "",
    "effectiveEndpointConfiguration" : {

"expirePkcs11PersistentCacheOnDatabaseShutdown" : "FALSE",
                                    "serverPollTimeout" : "PT0.3S",

"pkcs11ConfigurationParameterRefreshInterval" : "PT10M",
                                    "pkcs11InMemoryCacheTimeout" : "PT1H",

"pkcs11PersistentCacheRefreshWindow"\" : "PT30M",
                                    "pkcs11PersistentCacheTimeout" :
"PT24H",

                                    "pkcs11TraceDirectoryPath" : "/tmp"
                                    },
    "effectiveEndpointSettingsForManagedObjects" : {
      "extractableAttribute" : {
        "symmetricKey" : "TRUE"
      }
    },
    "endpoint" : "HR_DB_EP",
    "endpointConfiguration" : {
      "expirePkcs11PersistentCacheOnDatabaseShutdown" : "FALSE",
      "serverPollTimeout" : "",
      "pkcs11ConfigulationParameterRefreshInterval" : "",
      "pkcs11InMemoryCacheTimeout" : "",
      "pkcs11PersistentCacheRefreshWindow" : "",
      "pkcs11PersistentCacheTimeout" : "",
      "pkcs11TraceDirectoryPath" : ""
    },
    "endpointGroupMembership" : [ {
      "endpointGroup" : "EPG_HR",
      "description" : ""
    } ],
    "endpointSettingsForManagedObjects" : {
      "extractableAttribute" : {
        "symmetricKey" : ""
      }
    },
    "ipAddress" : "100.70.00.00",
    "platform" : "LINUX",
```

```
        "selfEnrolled" : "FALSE",
        "status" : "ENROLLED",
        "strictIpCheck" : "TRUE",
        "type" : "ORACLE DATABASE",
        "walletAccess" : [ {
          "access" : "RO",
          "type" : "VIA ENDPOINT GROUP",
          "wallet" : "HR_WALLET"
        } ]
      }
    }
```

The output under `effectiveEndpointConfiguration` and
`effectiveEndpointSettingsForManagedObjects` represents the settings that are used
for the endpoint configuration (hence, the use of `effectiveEndpoint...` in the name).
They are determined based on the endpoint-specific settings and the global endpoint
specific settings.

3.2.6 okv admin endpoint get-enrollment-token Command

The `okv admin endpoint get-enrollment-token` command retrieves an enrollment token
for a registered endpoint.

The enrollment token is a one-time token that is generated during the endpoint creation
(registration). Oracle Key Vault uses this token to download the software and install the
endpoint. The `okv admin endpoint get-enrollment-token` is useful for the cases where the
endpoint administrator (and not the Oracle Key Vault administrator) must download and
provision the endpoint. These endpoint administrators, who generally are not Oracle Key
Vault users, use the Oracle Key Vault management console to download the endpoint
software by providing the token. The `okv admin endpoint get-enrollment-token` command
enables the Oracle Key Vault administrator to retrieve the token using the RESTful services
utility, and then pass it securely to an endpoint administrator through an out-of-band channel
(for example, email).

This command will work only for endpoints that are in the **Registered** state.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint get-enrollment-token --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "get-enrollment-token",
    "options" : {
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the registered endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv admin endpoint get-enrollment-token` command.

   ```
   okv admin endpoint get-enrollment-token --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "get-enrollment-token",
       "options" : {
         "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_token.json`) and then edit it so that you can get the enrollment token.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "get-enrollment-token",
       "options" : {
         "endpoint" : "hr_db_ep"
       }
     }
   }
   ```

3. Run the `okv admin endpoint get-enrollment-token` command using the generated JSON file.

   ```
   okv admin endpoint get-enrollment-token --from-json get_token.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "token" : "Si71duR2mGQ8naSZ"
     }
   }
   ```

3.2.7 okv admin endpoint list Command

The `okv admin endpoint list` command lists the endpoints along with their associated information such as creation time, certificate expiry, and default wallet.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint list --limit number_of_endpoints
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "list",
    "options" : {
     "limit" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--limit` / `limit`	Optional	Number of endpoint objects to list.
		Enter any whole number from `1` and higher. If the limit is specified, then Oracle Key Vault fetches the number of objects up to the specified limit. If the limit is not specified, then Oracle Key Vault fetches up to 10,000 objects. If you specify a value that is greater than 10,000, then Oracle Key Vault will attempt to fetch that value, depending on the server, client, and network resources. In the output that you retrieve, the `fetchedObjectCount` value lists the actual number of objects that are fetched. For example, if you specify `100` as the limit but there are only 50 objects fetched, then Oracle Key Vault sets `fetchedObjectCount` to `50`. If you omit this parameter, then Oracle Key Vault retrieves up to 10,000 objects. For another example, if the limit is 100 and `fetchedObjectCount` is `100`, then this means that there are more objects. To fetch all objects, you need to run this command with an increased value for the `--limit` parameter. If `fetchedObjectCount` is less than the specified limit, then it means that you have retrieved all the available objects.

JSON Example

1. Generate a JSON input template for the `okv admin endpoint list` command.

   ```
   okv admin endpoint list --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "list",
    "options" : {
      "limit" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `list_ep.json`) and then edit it to specify the number of objects to fetch.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "list",
    "options" : {
            "limit" : "2"
    }
  }
}
```

3. Run the `okv admin endpoint list` command using the generated JSON file.

```
okv admin endpoint list --from-json list_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "endpoints" : [ {
      "commonNameOfCertificateIssuer" : "CA",
      "createdBy" : "OKVADMIN",
      "creationTime" : "2021-07-13 15:26:47",
      "defaultWallet" : "HR_WALLET",
      "description" : " ",
      "endpoint" : "HR_DB_EP_1",
      "endpointCertificateExpiration" : "2023-07-13 15:26:47",
      "enrollmentToken" : "",
      "ipAddress" : "",
      "platform" : "LINUX",
      "status" : "ENROLLED",
      "type" : "ORACLE DATABASE"
    }, {
      "commonNameOfCertificateIssuer" : "CA",
      "createdBy" : "OKVADMIN",
      "creationTime" : "2021-06-25 19:22:36",
      "defaultWallet" : "",
      "description" : "",
      "endpoint" : "HR_DB_EP_2",
      "endpointCertificateExpiration" : "2023-06-25 19:22:36",
      "enrollmentToken" : "",
      "ipAddress" : "192.0.2.143",
      "platform" : "LINUX",
      "status" : "ENROLLED",
      "type" : "ORACLE DATABASE"
    } ],
    "fetchedObjectCount" : "2"
```

```
        }
      }
```

3.2.8 okv admin endpoint list-objects Command

The `okv admin endpoint list-objects` command lists security objects that are associated with a specified endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint list-objects --endpoint endpoint_name --limit number_of _objects --
exclude-wallet-membership TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "list-objects",
    "options" : {
        "endpoint" : "#VALUE",
        "limit" : "#VALUE",
        "excludeWalletMembership" : "#TRUE|FALSE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

Parameter/Template Parameter	Required?	Description
`--limit` / `limit`	Optional	Number of objects to list.
		Enter any whole number from `1` and higher. If the limit is specified, then Oracle Key Vault fetches the number of objects up to the specified limit. If the limit is not specified, then Oracle Key Vault fetches up to 10,000 objects. If you specify a value that is greater than 10,000, then Oracle Key Vault will attempt to fetch that value, depending on the server, client, and network resources. In the output that you retrieve, the `fetchedObjectCount` value lists the actual number of objects that are fetched. For example, if you specify `100` as the limit but there are only 50 objects fetched, then Oracle Key Vault sets `fetchedObjectCount` to `50`. If you omit this parameter, then Oracle Key Vault retrieves up to 10,000 objects. For another example, if the limit is 100 and `fetchedObjectCount` is `100`, then this means that there are more objects. To fetch all objects, you need to run this command with an increased value for the `--limit` parameter. If `fetchedObjectCount` is less than the specified limit, then it means that you have retrieved all the available objects.
`--exclude-wallet-membership` / `excludeWalletMembership`	Optional	Controls whether wallet membership is shown for each object. • `TRUE` disables the showing of wallet membership for endpoint objects. • `FALSE` (default) enables the showing of wallet membership for endpoint objects.

JSON Example

1. Generate a JSON input template for the `okv admin endpoint list-objects` command.

   ```
   okv admin endpoint list-objects --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "list-objects",
       "options" : {
           "endpoint" : "#VALUE",
           "limit" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `list-obj_ep.json`) and then edit it to specify an endpoint the number of records.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "list-objects",
       "options" : {
           "endpoint" : "sales-ep,
   ```

```
        "limit" : "8"
      }
    }
}
```

3. Run the `okv admin endpoint list-objects` command using the generated JSON file.

```
okv admin endpoint list-objects --from-json list-obj_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "fetchedObjectCount" : "8",
    "managedObjects" : [ {
      "creatingEndpoint" : "HR_DB_EP",

```

3.2.9 okv admin endpoint provision Command

The `okv admin endpoint provision` command downloads and installs the endpoint software in the specified directory.

This directory should have read, write, and execute permissions for the owner and its group. For example, if the Oracle Key Vault endpoint software is installed in an Oracle Database server, then this endpoint installation directory should have read, write, and execute permissions by the `oracle` user and the `oinstall` group. This ensures that processes can access directories appropriately at run time.

You must meet the following prerequisites to run this command:

* You must be a user with System Administrator role or the Manage Endpoint object privilege for the endpoint.

* You must ensure that the soft link `/usr/bin/java` points to `$ORACLE_HOME/jdk/jre/bin/java`.

- You must know how the installation process determines the location of the `okvclient.ora` file.

If you only want to download the endpoint software but not install it, then use the `okv admin endpoint download` command.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint provision --endpoint endpoint_name --location software_location --auto-login TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "provision",
    "options" : {
      "endpoint" : "#VALUE",
      "location" : "#VALUE",
      "autoLogin" : "#TRUE|FALSE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint.
		To find existing endpoints, run the `okv admin endpoint list` command.
`--location` / `location`	Required	Path to the location where to install the endpoint software. For Transparent Data Encryption (TDE) environments, specify `WALLET_ROOT`/okv as the installation directory.
`--auto-login` / `autoLogin`	Optional	Enter one of the following values:
		• `TRUE` to enable auto-login authentication
		• `FALSE` (default) to store the endpoint credentials that are used to connect to the Oracle Key Vault server in a password-protected wallet. When `--auto-login` is set to `FALSE`, then you will be prompted to enter a password interactively.

JSON Example

1. Generate JSON input for the `okv admin endpoint provision` command.

   ```
   okv admin endpoint provision --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "provision",
    "options" : {
      "endpoint" : "#VALUE",
      "location" : "#VALUE",
      "autoLogin" : "#TRUE|FALSE"
    }
  }
}
```

2. Save the generated input to a file (for example, `provision_ep.json`) and then edit it so that you can download and install the endpoint software.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "provision",
    "options" : {
      "endpoint" : "hr_db_ep",
      "location" : "/u01/opt/oracle/product/okv",
      "autoLogin" : "TRUE"
    }
  }
}
```

3. Run the `okv admin endpoint provision` command using the generated JSON file.

```
okv admin endpoint provision --from-json provision_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

Related Topics

- okv admin endpoint download Command
  The `okv admin endpoint download` command downloads the endpoint software (`okvclient.jar`) to the specified directory.

3.2.10 okv admin endpoint re-enroll Command

The `okv admin endpoint re-enroll` command re-enrolls a previously enrolled endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint re-enroll --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "re-enroll",
    "options" : {
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint.
		To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv admin endpoint re-enroll` command.

   ```
   okv admin endpoint re-enroll --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "re-enroll",
       "options" : {
         "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generate input to a file (for example, `re-enroll_ep.json`) and then edit it so that you can re-enroll the endpoint.

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "re-enroll",
       "options" : {
         "endpoint" : "hr_db_ep"
       }
     }
   }
   ```

3. Run the `okv admin endpoint re-enroll` command using the generated JSON file.

   ```
   okv admin endpoint re-enroll --from-json re-enroll_ep.json
   ```

   Output similar to the following appears:

```
{
  "result" : "Success"
}
```

3.2.11 okv admin endpoint re-enroll-all Command

The `okv admin endpoint re-enroll-all` command re-enrolls all previously enrolled endpoints.

Required Authorization

System Administrator role

Syntax

```
okv admin endpoint re-enroll-all
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "re-enroll-all"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv admin endpoint re-enroll-all` command.

   ```
   okv admin endpoint re-enroll-all --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "re-enroll-all"
     }
   }
   ```

2. Save the generate input to a file (for example, `re-enroll-all_ep.json`).

3. Run the `okv admin endpoint re-enroll-all` command using the generated JSON file.

   ```
   okv admin endpoint re-enroll-all --from-json re-enroll-all_ep.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

3.2.12 okv admin endpoint resume Command

The `okv admin endpoint resume` command resumes a suspended endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint resume --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "resume",
    "options" : {
     "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the suspended endpoint.
		To find the names of suspended endpoints, run the `okv admin endpoint list` command, and in the output, look for the endpoints that have a status of `Suspended`.

JSON Example

1. Generate JSON input for the `okv admin endpoint resume` command.

   ```
   okv admin endpoint resume --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "resume",
       "options" : {
        "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `resume_ep.json`) and then edit it to specify the suspended endpoint.

   ```
   {
     "service" : {
   ```

```
      "category" : "admin",
      "resource" : "endpoint",
      "action" : "resume",
      "options" : {
       "endpoint" : "hr_db_ep"
      }
    }
  }
```

3. Run the `okv admin endpoint resume` command using the generated JSON file.

```
okv admin endpoint resume --from-json resume_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

3.2.13 okv admin endpoint suspend Command

The `okv admin endpoint suspend` command suspends an endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint suspend --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "suspend",
    "options" : {
          "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv admin endpoint suspend` command.

```
okv admin endpoint suspend --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "suspend",
    "options" : {
            "endpoint" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `suspend_ep.json`) and then edit it to specify the endpoint to suspend.

```
{
  "service" : {
    "category" : "admin",
    "resource" : "endpoint",
    "action" : "suspend",
    "options" : {
            "endpoint" : "hr_db_ep"
    }
  }
}
```

3. Run the `okv admin endpoint suspend` command using the generated JSON file.

```
okv admin endpoint suspend --from-json suspend_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

3.2.14 okv admin endpoint update Command

The `okv admin endpoint update` command updates the settings of an endpoint.

Required Authorization

System Administrator role or the Manage Endpoint object privilege for the endpoint

Syntax

```
okv admin endpoint update
--endpoint current_endpoint_name
--name new_endpoint_name
--description "description"
--email email_address
--platform platform --type type
--subgroup "subgroup_value"
--unique #TRUE|FALSE
--strict-ip-check #TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "admin",
```

```
        "resource" : "endpoint",
        "action" : "update",
        "options" : {
          "endpoint" : "#VALUE",
          "name" : "#VALUE",
          "description" : "#VALUE",
          "email" : "#VALUE",
          "platform" : "#LINUX64|SOLARIS64|SOLARIS_SPARC|HP-UX|AIX|WINDOWS",
          "type" : "#ORACLE_DB|ORACLE_NON_DB|ORACLE_ACFS|MYSQL_DB|OTHER",
          "subgroup" : "#VALUE|NO SUBGROUP|USE CREATOR SUBGROUP",
          "unique" : "#TRUE|FALSE",
          "strictIpCheck" : "#TRUE|FALSE",
          "endpointConfiguration" : {
            "expirePkcs11PersistentCacheOnDatabaseShutdown" : "#TRUE|FALSE",
            "serverPollTimeout" : "#VALUE",
            "pkcs11ConfigurationParameterRefreshInterval" : "#VALUE",
            "pkcs11InMemoryCacheTimeout" : "#VALUE",
            "pkcs11PersistentCacheRefreshWindow" : "#VALUE",
            "pkcs11PersistentCacheTimeout" : "#VALUE",
            "pkcs11TraceDirectoryPath" : "#VALUE"
          },
          "endpointSettingsForManagedObjects" : {
            "extractableAttribute" : {
              "privateKey" : "#TRUE|FALSE",
              "symmetricKey" : "#TRUE|FALSE"
            }
          }
        }
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint that you want to update.
		To find existing endpoints, run the `okv admin endpoint list` command.
`--name` / `name`	Optional	A new name for the endpoint. Ensure that you follow the naming guidelines for objects. See Naming Guidelines for Objects.
`--description` / `description`	Optional	A user-friendly description of the endpoint. If the description contains spaces, then you must enclose it within double quotation marks.
`--email` / `email`	Optional	Email address of the endpoint administrator. Enclose this value in double quotation marks.
`--platform` / `platform`	Optional	The endpoint platform. Allowed values are: • `AIX` • `HP-UX` • `LINUX64` • `SOLARIS64` • `SOLARIS_SPARC` • `WINDOWS`

Parameter/Template Parameter	Required?	Description
`--type` / `type`	Optional	Type of the endpoint. Allowed values are: • `MYSQL_DB` • `ORACLE_ACFS` • `ORACLE_DB` • `ORACLE_NON_DB` • `OTHER`
`--subgroup` / `subgroup`	Optional	For multi-master cluster environments, defines the affinity that an endpoint will have to a specific Oracle Key Vault cluster subgroup. Values are as follows: • Enter the name of a multi-master cluster subgroup. To find subgroups, in the Oracle Key Vault management console, select the **Cluster** tab, then **Management** in the left navigation bar. Subgroups for the cluster are listed under Cluster Information. • `NO SUBGROUP` creates an endpoint that will have no Oracle Key Vault cluster subgroup affinity. • `USE CREATOR SUBGROUP` creates an endpoint with affinity to the Oracle Key Vault cluster subgroup to which the node that the endpoint is created in belongs.

Parameter/Template Parameter	Required?	Description
`--unique` / `unique`	Optional	In a multi-master cluster environment, creates the endpoint as a unique endpoint. In a multi-master cluster, it is possible that an endpoint with the same name could be created from two different nodes. If that happens, then endpoint names may conflict. The Oracle Key Vault conflict resolution scheme will keep one endpoint with the given name and rename other endpoints with the conflicting names to a name using this format: *given_ep_name_OKVnode_id*. Valid settings are as follows: • `TRUE` appends *_OKVnode_id* to the given name and thus prevent the conflict for this endpoint name. • `FALSE` (default) causes Oracle Key Vault to begin a checking process to find if the endpoint name is unique. A unique ID is returned. You can use this ID to check the status of the endpoint creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the endpoint will fail. If the status is `ACTIVE`, then the endpoint is usable. To check the status, run the `okv admin endpoint check_status` command. If the name that you provided is already used in another node, then the name for this endpoint will have *_OKVxx* appended to it. For example, if you named the endpoint `ep12`, and there is a naming conflict, the name could be `EP12_OKV01`.
`--strict-ip-check` / `strictIpCheck`	Optional	Controls whether the Oracle Key Vault server checks the incoming IP address for a given endpoint. • `TRUE` enables Oracle Key Vault to check the incoming IP address of an endpoint. If the IP address does not match with the one that was used when the client endpoint software was installed, then Oracle Key Vault does not allow the connection. • `FALSE` disables this check and allows the incoming connection for the endpoint to come from any IP address.

Parameter/Template Parameter	Required?	Description
/endpointConfiguration	Optional	Each `endpointConfiguration` setting represents an endpoint configuration parameter. You must use the JSON syntax to add an endpoint configuration parameter(s). You cannot specify these endpoint configuration parameter(s) at the command line.

Values that you can enter are as follows:

- `expirePkcs11PersistentCacheOnDatabaseShutdown` sets whether the PKCS#11 persistent cache for a given endpoint database automatically expires upon shutdown of the endpoint database.
  - `TRUE` (default) enables `expirePkcs11PersistentCacheOnDatabaseShutdown`.
  - `FALSE` disables `expirePkcs11PersistentCacheOnDatabaseShutdown`.

  For any endpoint-specific configuration parameters, you can also set them to an empty value (default) which signifies the absence of an endpoint specific parameter. In this case, the endpoint inherits this parameter from the global endpoint.

  You remove an endpoint-specific configuration parameter by specifying an empty value for it. After an endpoint-specific parameter is removed, the endpoint starts inheriting the setting from the global endpoint.

- The following timeout parameters:
  - `serverPollTimeout` specifies the server poll timeout.
  - `pkcs11ConfigurationParameterRefreshInterval` sets the frequency at which a long-running process will re-read the `okvclient.ora` configuration file.
  - `pkcs11InMemoryCacheTimeout` sets how long a master encryption key is available in the in-memory cache.
  - `pkcs11PersistentCacheRefreshWindow` extends the time the master encryption key remains available for use in the persistent cache after its persistent cache timeout period has expired.
  - `pkcs11PersistentCacheTimeout` sets how long the master encryption is available in the persistent cache.

Parameter/Template Parameter	Required?	Description
		You can use different ways to set these timeout values, which use the duration format based on the ISO-8601 standard. Examples are as follows: `"serverPollTimeout" : "PT0.3S",` *-- 300 millseconds* `"pkcs11InMemoryCacheTimeout" : "PT10M",` *-- 10 minutes* `"pkcs11PersistentCacheTimeout" : "PT5H",` *-- 5 hours* `"pkcs11PersistentCacheRefreshWindow" : "P1D",` *-- 1 day* • `pkcs11TraceDirectoryPath` sets the path of the trace files

Parameter/Template Parameter	Required?	Description

`/ endpointSettingsForMan agedObjects`	Optional	`extractableAttribute` enables you to specify whether symmetric keys can be extracted from Oracle Key Vault. You must use the JSON syntax to add or modify this setting. You cannot specify this setting at the command line. The setting is as follows:
		
		• `symmetricKey`
		  – `TRUE` allows the `symmetricKey` object value to be extracted from Oracle Key Vault.
		  – `FALSE` prevents the `symmetricKey` object value from being extracted from Oracle Key Vault.
		• `privateKey`
		  – `TRUE` allows the `privateKey` object value to be extracted from Oracle Key Vault.
		  – `FALSE` prevents the `privateKey` object value from being extracted from Oracle Key Vault.
		
		For any endpoint-specific settings, you can also set them to an empty value (default) which signifies the absence of an endpoint specific setting. In this case, the endpoint inherits this setting from the global endpoint.
		
		You remove an endpoint specific-setting by specifying an empty value for it. After an endpoint-specific setting is removed, the endpoint starts inheriting the setting from the global endpoint.
		
		The default value for the `symmetricKey` and `privateKey` setting is inherited from the global endpoint configuration. If you provide an empty value in `endpointConfiguration` or `extractableAttribute`, then it will remove the corresponding configuration.

JSON Example

1. Generate JSON input for the `okv admin endpoint update` command.

   ```
   okv admin endpoint update --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "admin",
       "resource" : "endpoint",
       "action" : "update",
       "options" : {
         "endpoint" : "#VALUE",
         "name" : "#VALUE",
   ```

```
         "description" : "#VALUE",
         "email" : "#VALUE",
         "platform" : "#LINUX64|SOLARIS64|SOLARIS_SPARC|HP-UX|AIX|WINDOWS",
         "type" : "#ORACLE_DB|ORACLE_NON_DB|ORACLE_ACFS|MYSQL_DB|OTHER",
         "subgroup" : "#VALUE|NO SUBGROUP|USE CREATOR SUBGROUP",
         "unique" : "#TRUE|FALSE",
         "strictIpCheck" : "#TRUE|FALSE",
         "endpointConfiguration" : {
           "expirePkcs11PersistentCacheOnDatabaseShutdown" : "#TRUE|FALSE",
           "serverPollTimeout" : "#VALUE",
           "pkcs11ConfigurationParameterRefreshInterval" : "#VALUE",
           "pkcs11InMemoryCacheTimeout" : "#VALUE",
           "pkcs11PersistentCacheRefreshWindow" : "#VALUE",
           "pkcs11PersistentCacheTimeout" : "#VALUE",
           "pkcs11TraceDirectoryPath" : "#VALUE"
         },
         "endpointSettingsForManagedObjects" : {
           "extractableAttribute" : {
             "privateKey" : "#TRUE|FALSE",
             "symmetricKey" : "#TRUE|FALSE"
           }
         }
       }
     }
   }
```

2. Save the generated input to a file (for example, `update_ep.json`) and then edit it to update the endpoint.

```
{
  "service": {
    "category": "admin",
    "resource": "endpoint",
    "action": "update",
    "options": {
      "endpoint": "hr_db_ep",
      "description": "",
      "platform": "LINUX64",
      "email": "",
      "type": "ORACLE_DB",
      "strictIpCheck" : "TRUE",
      "endpointConfiguration" : {
          "expirePkcs11PersistentCacheOnDatabaseShutdown" : "TRUE",
          "serverPollTimeout" : "PT5M",
          "pkcs11ConfigurationParameterRefresh" : "PT11M",
          "pkcs11InMemoryCacheTimeout" : "PT20M",
          "pkcs11PersistentCacheRefreshWindow" : "PT30M",
          "pkcs11PersistentCacheTimeout" : "PT40M",
          "pkcs11TraceDirectoryPath" : "/users/psmith/work"
      },
      "endpointSettingsForManagedObjects" : {
          "extractableAttribute" : {
              "symmetricKey" : "FALSE"
          }
        }
      }
    }
  }
}
```

3. Run the `okv admin endpoint update` command using the generated JSON file.

```
okv admin endpoint update --from-json update_ep.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
}
```

Access Management Commands

You can use the access management commands to manage wallets and endpoint groups.

- okv manage-access endpoint-group add-endpoint Command
  The `okv manage-access endpoint-group add-endpoint` command adds an existing endpoint to an endpoint group.

- okv manage-access endpoint-group check-status Command
  The `okv manage-access endpoint-group check-status` command checks the naming conflict resolution status of an endpoint group in a multi-master cluster.

- okv manage-access endpoint-group create Command
  The `okv manage-access endpoint-group create` command creates a new endpoint group.

- okv manage-access endpoint-group delete Command
  The `okv manage-access endpoint-group delete` command deletes an endpoint group.

- okv manage-access endpoint-group get Command
  The `okv manage-access endpoint-group get` command retrieves detailed information about an endpoint group, such as its member endpoints and wallet access.

- okv manage-access endpoint-group list Command
  The `okv manage-access endpoint-group list` command retrieves a list of endpoint groups and their associated information.

- okv manage-access endpoint-group remove-endpoint Command
  The `okv manage-access endpoint-group remove-endpoint` command removes an endpoint from an endpoint group.

- okv manage-access endpoint-group update Command
  The `okv manage-access endpoint-group update` command changes the name and description of an endpoint group, and can be used to ensure that the endpoint group name is unique.

- okv manage-access wallet add-access Command
  The `okv manage-access wallet add-access` command grants an endpoint or an endpoint group a level of access to a wallet.

- okv manage-access wallet add-object Command
  The `okv manage-access wallet add-object` command adds a security object to a wallet.

- okv manage-access wallet check-status Command
  The `okv manage-access wallet check-status` command checks the naming conflict resolution status of a wallet in a multi-master cluster.

- okv manage-access wallet create Command
  The `okv manage-access wallet create` command creates a wallet.

- okv manage-access wallet delete Command
  The `okv manage-access wallet delete` command deletes a wallet.

- okv manage-access wallet get Command
  The `okv manage-access wallet get` command retrieves information about a specified wallet, such as the default wallet name and the wallet access.

- okv manage-access wallet get-default Command
  The `okv manage-access wallet get-default` command gets the default wallet that has been associated with an endpoint.

- okv manage-access wallet list Command
  The `okv manage-access wallet list` command lists wallets on which some level of access is granted to the user.

- okv manage-access wallet list-objects Command
  The `okv manage-access wallet list-objects` command retrieves the security objects that are members of the specified wallet.

- okv manage-access wallet list-endpoint-wallets Command
  The `okv manage-access wallet list-endpoint-wallets` command lists the wallets that are associated with an endpoint.

- okv manage-access wallet remove-access Command
  The `okv manage-access wallet remove-access` command removes the access that an endpoint or an endpoint group has to a wallet.

- okv manage-access wallet remove-object Command
  The `okv manage-access wallet remove-object` command removes a security object from a wallet.

- okv manage-access wallet set-default Command
  The `okv manage-access wallet set-default` command sets the default wallet for an endpoint.

- okv manage-access wallet update Command
  The `okv manage-access wallet update` command updates a wallet.

- okv manage-access wallet update-access Command
  The `okv manage-access wallet update-access` command updates the level of access that an endpoint or an endpoint group has to a wallet.

4.1 okv manage-access endpoint-group add-endpoint Command

The `okv manage-access endpoint-group add-endpoint` command adds an existing endpoint to an endpoint group.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group add-endpoint --endpoint-group
endpoint_group_name --endpoint endpoint_member
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "add-endpoint",
    "options" : {
      "endpointGroup" : "#VALUE",
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group`/ `endpointGroup`	Required	Name of the endpoint group. To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group add-endpoint` command.

   ```
   okv manage-access endpoint-group add-endpoint --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "add-endpoint",
       "options" : {
         "endpointGroup" : "#VALUE",
         "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `add_ep_to_group.json`) and then edit it to add the endpoint to an endpoint group.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "add-endpoint",
       "options" : {
         "endpointGroup" : "epg_hr",
         "endpoint" : "hr_db_ep"
   ```

```
      }
    }
  }
```

3. Run the `okv manage-access endpoint-group add-endpoint` command using the generated JSON file.

```
okv manage-access endpoint-group add-endpoint --from-json
add_ep_to_group.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

4.2 okv manage-access endpoint-group check-status Command

The `okv manage-access endpoint-group check-status` command checks the naming conflict resolution status of an endpoint group in a multi-master cluster.

This command is meant primarily for multi-master cluster environments. However, it is valid for other deployments and can be used to check the existence of an endpoint group.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group check-status --endpoint-group
endpoint_group_name|--locator-id UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "check-status",
    "options" : {
      "endpointGroup" : "#VALUE",
      "locatorID" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint_group`/`-endpointGroup` or `--locator-id`/`locatorID`	Required	The name of the endpoint group or the locator ID (universally unique ID (UUID)) of the endpoint group that you want to check. The `--locator-id`/`locatorID` is required only if you are using a multi-master cluster environment.
		You must specify either the `--endpoint-group`/`endpointGroup` value or the `--locator-id`/`locatorID` value, not both.
		To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.
		To find the locator ID, check the output from the `okv manage-access endpoint-group create` command that was used to create this endpoint group.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group check-status` command.

   ```
   okv manage-access endpoint-group check-status --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "check-status",
       "options" : {
         "endpointGroup" : "#VALUE",
         "locatorID" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `check-status_epg.json`) and then edit it so that you can check the endpoint group's status. Specify either the `endpointGroup` value or the `locatorID` value, but not both.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "check-status",
       "options" : {
         "locatorID" : "67E0906F-95EE-4A95-A496-D7DAEA5EDC5F"
       }
     }
   }
   ```

3. Run the `okv manage-access endpoint-group check-status` command using the generated JSON file.

   ```
   okv manage-access endpoint-group check-status --from-json check-status_epg.json
   ```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "ACTIVE",
    "endpointGroup" : "EPG_HR"
  }
}
```

Output includes the name of the endpoint group if the endpoint group object is in `ACTIVE` state. The endpoint group name shown here may be different from what was specified at the endpoint group creation time. If the endpoint groups with the same name are created on multiple cluster nodes, then Oracle Key Vault performs naming conflict resolution and it renames all but one endpoint groups by appending `_OKVnode-id` to the endpoint group name. For example, if you named the endpoint group `EPG_HR`, and there is a naming conflict, then the name could be `EPG_HR_OKV01`.

On deployments other than multi-master cluster, this command returns `Success` if the endpoint group exists and output does not include entries showing the endpoint group name and its state.

4.3 okv manage-access endpoint-group create Command

The `okv manage-access endpoint-group create` command creates a new endpoint group.

Required Authorization

Key Administrator role or Create Endpoint Group system privilege

Syntax

```
okv manage-access endpoint-group create --endpoint-group endpoint_group_name --
description "endpoint group description" --unique TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "create",
    "options" : {
      "endpointGroup" : "#VALUE",
      "description" : "#VALUE",
      "unique" : "#TRUE|FALSE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group` / `endpointGroup`	Required	Name of the endpoint group. See Naming Guidelines for Objects.
		To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.
`--description` / `description`	Optional	A user-friendly description of the endpoint group enclosed within double quotation marks
`--unique` / `unique`	Optional	Applies to a multi-master cluster environment only. This `--unique` parameter creates the endpoint group as a unique endpoint group. In a multi-master cluster, it is possible that an endpoint group with the same name could be created from two different nodes. If that happens, then the endpoint group names may conflict. The Oracle Key Vault conflict resolution scheme will keep one endpoint group with the given name and rename other endpoint groups with the conflicting names to a name using this format: *given_epg_name_OKVnode_id*.
		Valid settings are as follows:
		• `TRUE` appends `_OKVnode_id` to the given name and thus prevent the conflict for this wallet name. The endpoint group is immediately usable.
		• `FALSE` (default) causes Oracle Key Vault to begin a checking process to find if the endpoint group name is unique. A unique ID is returned. You can use this ID to check the status of the endpoint group creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the endpoint group will fail. If the status is `ACTIVE`, then the endpoint group is usable. To check the status, run the `okv admin endpoint-group check-status` command. If the name that you provided is already used in another node, then the name for this endpoint group will have `_OKVxx` appended to it. For example, if you named the endpoint group `epg12`, and there is a naming conflict, the name could be `EPG12_OKV01`.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group create` command.

   ```
   okv manage-access endpoint-group create --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "create",
    "options" : {
      "endpointGroup" : "#VALUE",
      "description" : "#VALUE",
      "unique" : "#TRUE|FALSE"
    }
  }
}
```

2. Save the generated input to a file (for example, `create_epg.json`) and then edit it so that you can create the endpoint group.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "create",
    "options" : {
      "endpointGroup" : "epg_hr",
      "description" : "HR endpoint group",
      "unique" : "FALSE"
    }
  }
}
```

3. Run the `okv manage-access endpoint-group create` command using the generated JSON file.

```
okv manage-access endpoint-group create --from-json create_epg.json
```

Output for a multi-master cluster environment appears similar to the following:

```
{
  "result" : "Success",
  "value" : {
    "status" : "PENDING",
    "locatorID" : "67E0906F-95EE-4A95-A496-D7DAEA5EDC5F"
  }
}
```

You can use the `locatorID` from this output with the `okv manage-access endpoint-group check-status` command to display the current state of the endpoint group object. If the object status is `ACTIVE`, then this command also displays the object name after the conflict-name resolution.

4.4 okv manage-access endpoint-group delete Command

The `okv manage-access endpoint-group delete` command deletes an endpoint group.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group delete --endpoint-group endpoint_group_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "delete",
    "options" : {
     "endpointGroup" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group`/ `endpointGroup`	Required	Name of the endpoint group. To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group delete` command.

   ```
   okv manage-access endpoint-group delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "delete",
       "options" : {
        "endpointGroup" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `delete_epg.json`) and then edit it so that you can delete the endpoint group.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "delete",
       "options" : {
        "endpointGroup" : "epg_hr"
       }
     }
   }
   ```

3. Run the `okv manage-access endpoint-group delete` command using the generated JSON file.

```
okv manage-access endpoint-group delete --from-json delete_epg.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

4.5 okv manage-access endpoint-group get Command

The `okv manage-access endpoint-group get` command retrieves detailed information about an endpoint group, such as its member endpoints and wallet access.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group get --endpoint-group endpoint_group_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "get",
    "options" : {
            "endpointGroup" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group`/ `endpointGroup`	Required	Name of the endpoint group. To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group get` command.

```
okv manage-access endpoint-group get --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
```

```
            "resource" : "endpoint-group",
            "action" : "get",
            "options" : {
                    "endpointGroup" : "#VALUE"
            }
        }
    }
```

2. Save the generated input to a file (for example, `get_ep_group.json`) and then edit it to specify the endpoint group.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "get",
    "options" : {
            "endpointGroup" : "hr_ep_grp"
    }
  }
}
```

3. Run the `okv manage-access endpoint-group get` command using the generated JSON file.

```
okv manage-access endpoint-group get --from-json get_ep_group.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "createdBy" : "OKVADMIN",
    "creationTime" : "2021-07-14 13:09:14",
    "description" : "",
    "endpointGroup" : "HR_EP_GRP",
    "endpointGroupMembers" : [ {
      "description" : "",
      "endpoint" : "HR_DB_EP_1"
    }, {
      "description" : "",
      "endpoint" : "HR_DB_EP_2"
    } ],
    "walletAccess" : [ {
      "access" : "RO_MW",
      "wallet" : "HR_WALLET"
    } ]
  }
}
```

4.6 okv manage-access endpoint-group list Command

The `okv manage-access endpoint-group list` command retrieves a list of endpoint groups and their associated information.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group list --limit number_of_endpoints
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "list",
    "options" : {
            "limit" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--limit` / `limit`	Optional	Number of endpoint groups to list.
		Enter any whole number from `1` and higher. If the limit is specified, then Oracle Key Vault fetches the number of objects up to the specified limit. If the limit is not specified, then Oracle Key Vault fetches up to 10,000 objects. If you specify a value that is greater than 10,000, then Oracle Key Vault will attempt to fetch that value, depending on the server, client, and network resources. In the output that you retrieve, the `fetchedObjectCount` value lists the actual number of objects that are fetched. For example, if you specify `100` as the limit but there are only 50 objects fetched, then Oracle Key Vault sets `fetchedObjectCount` to `50`. If you omit this parameter, then Oracle Key Vault retrieves up to 10,000 objects. For another example, if the limit is 100 and `fetchedObjectCount` is `100`, then this means that there are more objects. To fetch all objects, you need to run this command with an increased value for the `--limit` parameter. If `fetchedObjectCount` is less than the specified limit, then it means that you have retrieved all the available objects.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group list` command.

   ```
   okv manage-access endpoint-group list --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "list",
    "options" : {
            "limit" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `list_ep_groups.json`) and then edit it to specify the number of records for the output.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "list",
    "options" : {
            "limit" : "3"
    }
  }
}
```

3. Run the `okv manage-access endpoint-group list` command using the generated JSON file.

```
okv manage-access endpoint-group list --from-json list_ep_groups.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
"value" : {
    "endpointGroups" : [ {
        "createdBy" : "OKVADMIN",
        "creationTime" : "2021-07-14 13:09:14",
        "description" : "",
        "endpointGroup" : "EPG_HR"
    }, {
        "createdBy" : "OKVADMIN",
        "creationTime" : "2021-07-16 19:29:03",
        "description" : "",
        "endpointGroup" : "SALES_DB_EPG"
    }, {
        "createdBy" : "OKVADMIN",
        "creationTime" : "2021-07-16 19:29:17",
        "description" : "",
        "endpointGroup" : "ORDERS_DB_EPG"
    } ]
  }
}
```

4.7 okv manage-access endpoint-group remove-endpoint Command

The `okv manage-access endpoint-group remove-endpoint` command removes an endpoint from an endpoint group.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group remove-endpoint --endpoint-group
endpoint_group_name --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "remove-endpoint",
    "options" : {
      "endpointGroup" : "#VALUE",
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group`/`endpointGroup`	Required	Name of the endpoint group that you want to remove. To find existing endpoints, run the `okv admin endpoint list` command.
`--endpoint`/`endpoint`	Required	Name of the endpoint that is associated with the endpoint group. To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group remove-endpoint` command.

   ```
   okv manage-access endpoint-group remove-endpoint --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
   ```

```
        "category" : "manage-access",
        "resource" : "endpoint-group",
        "action" : "remove-endpoint",
        "options" : {
          "endpointGroup" : "#VALUE",
          "endpoint" : "#VALUE"
        }
      }
    }
```

2. Save the generated input to a file (for example, `remove_ep_from_epg.json`) and then edit it to remove the endpoint from the endpoint group.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "remove-endpoint",
    "options" : {
      "endpointGroup" : "epg_hr",
      "endpoint" : "hr_db_ep"
    }
  }
}
```

3. Run the `okv manage-access endpoint-group remove-endpoint` command using the generated JSON file.

```
okv manage-access endpoint-group remove-endpoint --from-json
remove_ep_from_epg.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

4.8 okv manage-access endpoint-group update Command

The `okv manage-access endpoint-group update` command changes the name and description of an endpoint group, and can be used to ensure that the endpoint group name is unique.

Required Authorization

Key Administrator role or the Manage Endpoint Group object privilege for the endpoint group

Syntax

```
okv manage-access endpoint-group update --endpoint-group endpoint_group_name --
description "description" --name new_endpoint_group_name --unique TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "update",
    "options" : {
      "endpointGroup" : "#VALUE",
```

```
        "name" : "#VALUE",
        "description" : "#VALUE",
        "unique" : "#TRUE|FALSE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint-group` / `endpointGroup`	Required	Current name of the endpoint group. To find existing endpoint groups, run the `okv manage-access endpoint-group list` command.
`--description` / `description`	Optional	A user-friendly description of the endpoint group enclosed within double quotation marks
`--name` / `name`	Optional	New endpoint group name. See Naming Guidelines for Objects.

Parameter/Template Parameter	Required?	Description
`--unique` / `unique`	Optional	Applies to a multi-master cluster environment only. This `--unique` parameter creates the endpoint group as a unique endpoint group. In a multi-master cluster, it is possible that an endpoint group with the same name could be created from two different nodes. If that happens, then the endpoint group names may conflict. The Oracle Key Vault conflict resolution scheme will keep one endpoint group with the given name and rename other endpoint groups with the conflicting names to a name using this format: *given_epg_name_*`OKV`*node_id*. Valid settings are as follows:

• `TRUE` appends `_OKV`*node_id* to the given name and thus prevent the conflict for this wallet name. The endpoint group is immediately usable.

• `FALSE` (default) causes Oracle Key Vault to begin a checking process to find if the endpoint group name is unique. A unique ID is returned. You can use this ID to check the status of the endpoint group creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the endpoint group will fail. If the status is `ACTIVE`, then the endpoint group is usable. To check the status, run the `okv admin endpoint-group check_status` command. If the name that you provided is already used in another node, then the name for this endpoint group will have `_OKV`*xx* appended to it. For example, if you named the endpoint group `epg12`, and there is a naming conflict, the name could be `EPG12_OKV01`.

JSON Example

1. Generate JSON input for the `okv manage-access endpoint-group update` command.

   ```
   okv manage-access endpoint-group update --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "endpoint-group",
       "action" : "update",
       "options" : {
         "endpointGroup" : "#VALUE",
   ```

```
        "name" : "#VALUE",
        "description" : "#VALUE",
        "unique" : "#TRUE|FALSE"
      }
    }
  }
```

2. Save the generated input to a file (for example, `epg_update.json`) and then edit it so that you can update the endpoint group.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "endpoint-group",
    "action" : "update",
    "options" : {
      "endpointGroup" : "epg_hr",
      "name" : "epg_hr_global",
      "description" : "Global HR Endpoint Group",
      "unique" : "FALSE"
    }
  }
}
```

3. Run the `okv manage-access endpoint-group update` command using the generated JSON file.

```
okv manage-access endpoint-group update --from-json epg_update.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "PENDING",
    "locatorID" : "67E0906F-95EE-4A95-A496-D7DAEA5EDC5F"
  }
}
```

This example shows the output for renaming an endpoint group in a multi-master cluster. On renaming, an endpoint group is placed into the PENDING state for the duration of the naming conflict resolution.

You can use the `locatorID` from this output with the `okv manage-access endpoint-group check-status` command to display the current state of the endpoint group object. If the object status is ACTIVE, then this command also displays the object name after the conflict-name resolution.

Unless you renamed the endpoint group in a multi-master cluster, the status and `locatorID` entries are not included in the output.

4.9 okv manage-access wallet add-access Command

The `okv manage-access wallet add-access` command grants an endpoint or an endpoint group a level of access to a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or manage wallet (`MW`) permission on the wallet

Syntax

```
okv manage-access wallet add-access --wallet wallet_name --endpoint endpoint_name|--
endpoint-group endpoint_group_name --access RO|RM|RO_MW|RM_MW
```

JSON Input File Template

```
{
  "service": {
    "category": "manage-access",
    "resource": "wallet",
    "action": "add-access",
    "options": {
      "wallet": "#VALUE",
      "endpointGroup": "#VALUE",
      "endpoint": "#VALUE",
      "access": "#RO|RM|RO_MW|RM_MW"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--endpoint` / `endpoint` or `--endpoint-group` / `endpointGroup`	Required	Name of the endpoint or endpoint group. You can only specify either an endpoint or an endpoint group, but not both. To find registered endpoints, run the `okv admin endpoint list` command. To find endpoint groups, run `okv manage-access endpoint-group` list.
`--access` / `access`	Required	Enter one of the following values: • `RO` for read-only access • `RM` for read-and-modify access • `RO_MW` for read-only and manage-wallet access • `RM_MW` for read-and-modify and manage-wallet access

JSON Example

1. Generate JSON input for the `okv manage-access wallet add-access` command.

   ```
   okv manage-access wallet add-access --generate-json-input
   ```

   The generated input appears as follows. This output includes wallet access settings for both endpoints and endpoint groups. When you edit it, you must include either the endpoint settings or the endpoint group settings, but not both.

```
{
  "service": {
    "category": "manage-access",
    "resource": "wallet",
    "action": "add-access",
    "options": {
      "wallet": "#VALUE",
      "endpointGroup": "#VALUE",
      "endpoint": "#VALUE",
      "access": "#RO|RM|RO_MW|RM_MW"
    }
  }
}
```

2. Save the generated input to a file (for example, `add_access_wallet.json`) and then edit it so that you can add wallet access to the endpoint or endpoint group. The following example is for the wallet access to an endpoint only.

```
{
  "service": {
    "category": "manage-access",
    "resource": "wallet",
    "action": "add-access",
    "options": {
      "wallet": "hr_wallet",
      "endpoint": "hr_db_ep",
      "access": "RO"
    }
  }
}
```

3. Run the `okv manage-access wallet add-access` command using the generated JSON file.

```
okv manage-access wallet add-access --from-json add_access_wallet.json
```

Output similar to the following appears:

```
{
  "result": "Success"
}
```

4.10 okv manage-access wallet add-object Command

The `okv manage-access wallet add-object` command adds a security object to a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or have read-modify permission on the object and manage wallet (`MW`) permission on the wallet.

Syntax

```
okv manage-access wallet add-object --wallet wallet_name --uuid uuid
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "add-object",
    "options" : {
            "wallet" : "#VALUE",
            "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

JSON Example

1. Generate JSON input for the `okv manage-access wallet add-object` command.

    ```
    okv manage-access wallet add-object --generate-json-input
    ```

    The generated input appears as follows.

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "add-object",
        "options" : {
                "wallet" : "#VALUE",
                "uuid" : "#VALUE"
        }
      }
    }
    ```

2. Save the generated input to a file (for example, `add_obj_wallet.json`) and then edit it to specify the object to add to the wallet.

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "add-object",
    ```

```
        "options" : {
                "wallet" : "hr_wallet",
                "uuid" : "7432AED6-6628-4F43-BF7C-9D30023A4301"
        }
      }
    }
```

3. Run the `okv manage-access wallet add-object` command using the generated JSON file.

```
okv manage-access wallet add-object --from-json add_object_wallet.json
```

Output similar to the following appears:

```
{
  "result": "Success"
}
```

4.11 okv manage-access wallet check-status Command

The `okv manage-access wallet check-status` command checks the naming conflict resolution status of a wallet in a multi-master cluster.

This command is meant primarily for multi-master cluster environments. However, it is valid for other deployments and can be used to check the existence of a wallet.

This command uses a user name and password for the authentication.

Required Authorization

None, but the user only gets the status for the wallets to which he or she has access.

Syntax

```
okv manage-access wallet check-status --wallet wallet_name|--locator-id UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "check-status",
    "options" : {
      "wallet" : "#VALUE",
      "locatorID" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet`/`wallet` or `--locator-id`/`locatorID`	Optional	The name of the wallet or the locator ID (universally unique ID (UUID)) of the wallet that you want to check. The `--locator-id`/`locatorID` is required only if you are using a multi-master cluster environment.
		You must specify either the `--wallet`/`wallet` value or the `--locator-id`/`locatorID` value, not both.
		To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
		To find the locator ID, check the output of the `okv manage-access wallet create` command that was used to create this endpoint.

JSON Example

1. Generate JSON input for the `okv manage-access wallet check-status` command.

   ```
   okv manage-access wallet check-status --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "check-status",
       "options" : {
         "wallet" : "#VALUE",
         "locatorID" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `check_wallet.json`) and then edit it so that you can check the status of the wallet. Specify either the `wallet` value or the `locatorID` value, but not both.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "check-status",
       "options" : {
         "locatorID" : "81800CE6-6AAF-4EF5-A0FD-446ED6625F6A"
       }
     }
   }
   ```

3. Run the `okv manage-access wallet check-status` command using the generated JSON file.

   ```
   okv manage-access wallet check-status --from-json check_wallet.json
   ```

   Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "ACTIVE",
    "wallet" : "hr_wallet"
  }
}
```

Output includes the name of the wallet if the wallet object is in `ACTIVE` state. The wallet name shown here may be different from what was specified at the wallet creation time. If the wallets with the same name are created on multiple cluster nodes, Oracle Key Vault performs naming conflict resolution and it renames all but one wallets by appending `_OKVnode-id` to the wallet name. For example, if you named the wallet `HR_WALLET`, and there is a naming conflict, the name could be `HR_WALLET_OKV01`.

On deployments other than multi-master cluster, this command returns `Success` if the wallet exists and output does not include entries showing the wallet name and its state.

4.12 okv manage-access wallet create Command

The `okv manage-access wallet create` command creates a wallet.

This command uses a user name and password for the authentication.

Required Authorization

None

Syntax

```
okv manage-access wallet create [--description <description>] [--ssh-server-host-
user <ssh-server-host-user>] [--type <type>] [--unique <unique>] --wallet
<wallet>
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "create",
    "options" : {
      "wallet" : "#VALUE",
      "type" : "#GENERAL|SSH_SERVER",
      "description" : "#VALUE",
      "unique" : "#TRUE|FALSE",
      "sshServerHostUser" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command. Ensure that you follow the naming guidelines for objects.
`--description` / `description`	Optional	A user-friendly description for the wallet, enclosed within double quotation marks
`--unique` / `unique`	Optional	Applies to a multi-master cluster environment only. This `--unique` parameter creates the wallet as a unique wallet. In a multi-master cluster, it is possible that a wallet with the same name could be created from two different nodes. If that happens, then the wallet names may conflict. The Oracle Key Vault conflict resolution scheme will keep one wallet with the given name and rename other wallets with the conflicting names to a name using this format: *given_wallet_name_OKVnode_id*. Valid settings are as follows: • `TRUE` appends `_OKVnode_id` to the given name and thus prevents the conflict for this wallet name. The wallet is immediately usable. • `FALSE` causes Oracle Key Vault to begin a checking process to find if the wallet name is unique. A unique ID is returned. You can use this ID to check the status of the wallet creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the wallet will fail. If the status is `ACTIVE`, then confirm the name of the wallet after Oracle Key Vault performs name resolution for this name by executing the `okv manage-access wallet check-status` command. If the name that you provided is already used in another node, then the name for this wallet will have `_OKVxx` appended to it. For example, if you named the wallet `wallet12`, and there is a naming conflict, the name could be `WALLET12_OKV01`. If the name that you provided has no naming conflicts, then it will be accepted as the wallet name without any changes.
`--ssh-server-host-user` / `sshServerHostUser`	Optional	The user on the SSH Server for whom this wallet is intended to authorize SSH access. It can be used only for `SSH_SERVER` type wallet.

Parameter/Template Parameter	Required?	Description
`--type` / `<type>`	Optional	The type of wallet to create: • `GENERAL`: Holds any type of security object. • `SSH_SERVER`: Holds SSH public keys and is associated with Oracle Key Vault SSH Server endpoint. The default value is: – `General`

JSON Example

1. Generate JSON input for the `okv manage-access wallet create` command.

   ```
   okv manage-access wallet create --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "create",
       "options" : {
         "wallet" : "#VALUE",
         "type" : "#GENERAL|SSH_SERVER",
         "description" : "#VALUE",
         "unique" : "#TRUE|FALSE",
         "sshServerHostUser" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `create_wallet.json`) and then edit it so that you can create the wallet.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "create",
       "options" : {
         "wallet" : "hr_wallet",
         "description" : "wallet for HR endpoint",
         "unique" : "FALSE"
         "sshServerHostUser" : "#VALUE"
       }
     }
   }
   ```

3. Run the `okv manage-access wallet create` command using the generated JSON file.

   ```
   okv manage-access wallet create --from-json create_wallet.json
   ```

   Output for a multi-master cluster environment appears similar to the following:

   ```
   {
     "result" : "Success",
     "value" : {
   ```

```
      "status" : "PENDING",
      "locatorID" : "81800CE6-6AAF-4EF5-A0FD-446ED6625F6A"
    }
  }
```

You can use the `locatorID` from this output with the `okv manage-access wallet check-status` command to display the current state of the wallet object. If the object status is `ACTIVE`, then this command also displays the object name after the conflict-name resolution.

Related Topics

- Naming Guidelines for Objects
  The naming guidelines affect the following Oracle Key Vault objects: users, user groups, endpoints, endpoint groups, and virtual wallets.

- okv manage-access wallet check-status Command
  The `okv manage-access wallet check-status` command checks the naming conflict resolution status of a wallet in a multi-master cluster.

4.13 okv manage-access wallet delete Command

The `okv manage-access wallet delete` command deletes a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or manage wallet (`MW`) permission on the wallet

Syntax

```
okv manage-access wallet delete --wallet wallet_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "delete",
    "options" : {
      "wallet" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

JSON Example

1. Generate JSON input for the `okv manage-access wallet delete` command.

```
okv manage-access wallet delete --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "delete",
    "options" : {
      "wallet" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `del_wallet.json`) and then edit it to specify the wallet to delete from Oracle Key Vault.

```
{
  "service" : {
    "category" : "manage-access",
    "resource ": "wallet",
    "action" : "delete",
    "options" : {
      "wallet" : "hr_wallet"
    }
  }
}
```

3. Run the `okv manage-access wallet delete` command using the generated JSON file.

```
okv manage-access wallet delete --from-json del_wallet.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

4.14 okv manage-access wallet get Command

The `okv manage-access wallet get` command retrieves information about a specified wallet, such as the default wallet name and the wallet access.

This command uses a user name and password for the authentication.

Required Authorization

None

Syntax

```
okv manage-access wallet get --wallet wallet_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "get",
    "options" : {
      "wallet" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

JSON Example

1. Generate JSON input for the `okv manage-access wallet get` command.

   ```
   okv manage-access wallet get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "get",
       "options" : {
               "wallet" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_wallet.json`) and then edit it to specify the name of the wallet.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "get",
       "options" : {
               "wallet" : "hr_wallet"
       }
     }
   }
   ```

3. Run the `okv manage-access wallet get` command using the generated JSON file.

   ```
   okv manage-access wallet get --from-json get_wallet.json
   ```

   Output similar to the following appears:

ORACLE®

```
{
  "result" : "Success",
  "value" : {
    "createdBy" : "OKVADMIN",
    "creationTime" : "2021-07-30 19:40:59",
    "description" : "",
    "wallet" : "HR_WALLET",
    "walletAccess" : {
      "endpointAccess" : [ {
        "access" : "RO_MW",
        "defaultWallet" : "",
        "subjectName" : "HR_DB_EP1",
        "type" : "Direct"
      }, {
        "access" : "RO",
        "defaultWallet" : "TRUE",
        "subjectName" : "HR_DB_EP2",
        "type" : "Direct"
      } ],
      "endpointGroupAccess" : [ {
        "access" : "RO_MW",
        "subjectName" : "HR_DB_EPG"
      } ],
      "userAccess" : [ {
        "access" : "RO",
        "subjectName" : "Paul Hill"
      } ],
      "userGroupAccess" : [ {
        "access" : "RO",
        "subjectName" : "HR_GROUP_1"
      } ]
    }
  }
}
```

4.15 okv manage-access wallet get-default Command

The `okv manage-access wallet get-default` command gets the default wallet that has been associated with an endpoint.

This command uses a user name and password for the authentication.

Required Authorization

None, but the default wallet information for the endpoint is returned if the user has some level of access on that wallet.

Syntax

```
okv manage-access wallet get-default --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "get-default",
    "options" : {
      "endpoint" : "#VALUE"
```

```
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	Name of the endpoint.
		To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv manage-access wallet get-default` command.

    ```
    okv manage-access wallet get-default --generate-json-input
    ```

    The generated input appears as follows:

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "get-default",
        "options" : {
          "endpoint" : "#VALUE"
        }
      }
    }
    ```

2. Save the generated input to a file (for example, `get_def_wallet.json`) and then edit it to retrieve the default wallet that is associated with the specified endpoint.

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "get-default",
        "options" : {
          "endpoint" : "hr_db_ep"
        }
      }
    }
    ```

3. Run the `okv manage-access wallet get-default` command using the generated JSON file.

    ```
    okv manage-access wallet get-default --from-json get_def_wallet.json
    ```

    Output similar to the following appears:

    ```
    {
      "result" : "Success",
      "value" : {
        "defaultWallet" : "HR_WALLET"
      }
    }
    ```

4.16 okv manage-access wallet list Command

The `okv manage-access wallet list` command lists wallets on which some level of access is granted to the user.

Required Authorization

None

Syntax

```
okv manage-access wallet list --limit number_of_wallets
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "list",
    "options" : {
            "limit" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--limit` / `limit`	Optional	Number of wallets to list.
		Enter any whole number from `1` and higher. If the limit is specified, then Oracle Key Vault fetches the number of objects up to the specified limit. If the limit is not specified, then Oracle Key Vault fetches up to 10,000 objects. If you specify a value that is greater than 10,000, then Oracle Key Vault will attempt to fetch that value, depending on the server, client, and network resources. In the output that you retrieve, the `fetchedObjectCount` value lists the actual number of objects that are fetched. For example, if you specify `100` as the limit but there are only 50 objects fetched, then Oracle Key Vault sets `fetchedObjectCount` to `50`. If you omit this parameter, then Oracle Key Vault retrieves up to 10,000 objects. For another example, if the limit is 100 and `fetchedObjectCount` is `100`, then this means that there are more objects. To fetch all objects, you need to run this command with an increased value for the `--limit` parameter. If `fetchedObjectCount` is less than the specified limit, then it means that you have retrieved all the available objects.

JSON Example

1. Generate JSON input for the `okv manage-access wallet list` command.

```
okv manage-access wallet list --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "list",
    "options" : {
            "limit" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `list_wallets.json`) and then edit it to specify the number of records.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
```

```
            "action" : "list",
            "options" : {
                    "limit" : "3"
            }
        }
    }
```

3. Run the `okv manage-access wallet list` command using the generated JSON file.

```
okv manage-access wallet list --from-json list_wallets.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "fetchedObjectCount" : "3",
    "wallets" : [ {
      "createdBy" : "OKVADMIN",
      "creationTime" : "2021-07-13 15:22:02",
      "description" : "",
      "wallet" : "HR_WALLET",
      "type" : "GENERAL"
    }, {
      "createdBy" : "OKVADMIN",
      "creationTime" : "2021-07-30 19:40:59",
      "description" : "",
      "wallet" : "sales_wallet",
      "type" : "GENERAL"
    }, {
      "createdBy" : "OKVADMIN",
      "creationTime" : "2021-09-13 04:55:06",
      "description" : "",
      "wallet" : "ORDERS_WALLET",
      "type" : "GENERAL"
    } ]
  }
}
```

4.17 okv manage-access wallet list-objects Command

The `okv manage-access wallet list-objects` command retrieves the security objects that are members of the specified wallet.

Required Authorization

The user must have some level of access on the wallet.

Syntax

```
okv manage-access wallet list-objects --wallet wallet_name --limit
number_of_objects --exclude-wallet-membership TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "list-objects",
```

```
        "options" : {
                "wallet" : "#VALUE",
                "limit" : "#VALUE",
                "excludeWalletMembership" : "#TRUE|FALSE"
        }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--limit` / `limit`	Optional	Number of objects to list for the specified wallet.
		Enter any whole number from `1` and higher. If the limit is specified, then Oracle Key Vault fetches the number of objects up to the specified limit. If the limit is not specified, then Oracle Key Vault fetches up to 10,000 objects. If you specify a value that is greater than 10,000, then Oracle Key Vault will attempt to fetch that value, depending on the server, client, and network resources. In the output that you retrieve, the `fetchedObjectCount` value lists the actual number of objects that are fetched. For example, if you specify `100` as the limit but there are only 50 objects fetched, then Oracle Key Vault sets `fetchedObjectCount` to `50`. If you omit this parameter, then Oracle Key Vault retrieves up to 10,000 objects. For another example, if the limit is 100 and `fetchedObjectCount` is `100`, then this means that there are more objects. To fetch all objects, you need to run this command with an increased value for the `--limit` parameter. If `fetchedObjectCount` is less than the specified limit, then it means that you have retrieved all the available objects.
`--exclude-wallet-membership` / `excludeWalletMembership`	Optional	Controls whether wallet membership information for each object is include in the output.
		• `TRUE` excludes the wallet membership information for each object. Excluding the wallet membership information may improve the performance of this command if the wallet has large number of objects.
		• `FALSE` (default) includes the wallet membership information for each object.

JSON Example

1. Generate JSON input for the `okv manage-access wallet list-objects`
    command.

    ```
    okv manage-access wallet list-objects --generate-json-input
    ```

    The generated input appears as follows:

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "list-objects",
        "options" : {
                "wallet" : "#VALUE",
                "limit" : "#VALUE",
                "excludeWalletMembership" : "#TRUE|FALSE"
        }
      }
    }
    ```

2. Save the generated input to a file (for example, `list_wallet_obj.json`) and then
    edit it to specify a number of objects for the wallet.

    ```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "list-objects",
        "options" : {
                "wallet" : "hr_wallet",
                "limit" : "2"
                "excludeWalletMembership" : "FALSE"
        }
      }
    }
    ```

3. Run the `okv manage-access wallet list-objects` command using the
    generated JSON file.

    ```
    okv manage-access wallet list-objects --from-json list_wallet_obj.json
    ```

    Output similar to the following appears:

    ```
    {
      "result" : "Success",
      "value" : {
        "fetchedObjectCount" : "2",
        "managedObjects" : [ {
          "creatingEndpoint" : "HR_DB_EP",
          "creationDate" : "2021-07-26 20:19:32",
          "deactivationDate" : "2029-12-25 15:11:11",
          "displayName" : "X.509 Certificate: DN
    EMAILADDRESS=psmith@example.com, CN=vienna, OU=Security, O=Oracle, L=Reston,
    ST=VA, C=US",
          "name" : "ps1009",
          "protectStopDate" : "2029-12-25 15:11:11",
          "state" : "Pre-Active",
          "type" : "Certificate",
          "uuid" : "975F17DF-11C1-4F16-BFBC-28E9C200C99F"
        }, {
    ```

```
          "creatingEndpoint" : "EMP_DB_EP",
          "creationDate" : "2021-06-30 21:01:48",
          "deactivationDate" : "",
          "displayName" : "Symmetric Key: Name psc7",
          "name" : "ps100,ps3,psa5,psb6,psc7",
          "protectStopDate" : "",
          "state" : "Active",
          "type" : "Symmetric Key",
          "uuid" : "7432AED6-6628-4F43-BF7C-9D30023A4301"
        } ]
      }
    }
```

4.18 okv manage-access wallet list-endpoint-wallets Command

The `okv manage-access wallet list-endpoint-wallets` command lists the wallets that are associated with an endpoint.

This command uses a user name and password for the authentication.

Required Authorization

None, but this command returns information about only those wallets on which user has some level of access.

Syntax

```
okv manage-access wallet list-endpoint-wallets --endpoint endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "list-endpoint-wallets",
    "options" : {
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--endpoint` / `endpoint`	Required	The name of the endpoint.
		To find existing endpoints, run the `okv admin endpoint list` command.

JSON Example

1. Generate JSON input for the `okv manage-access wallet list-endpoint-wallets` command.

   ```
   okv manage-access wallet list-endpoint-wallets --generate-json-input
   ```

   The generated input appears as follows:

```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "list-endpoint-wallets",
        "options" : {
           "endpoint" : "#VALUE"
        }
      }
    }
```

2. Save the generated input to a file (for example, `list_ep_wallets.json`) and then edit it so that you can find the wallets that are associated with the specified endpoint.

```
    {
      "service" : {
        "category" : "manage-access",
        "resource" : "wallet",
        "action" : "list-endpoint-wallets",
        "options" : {
           "endpoint" : "hr_db_ep"
        }
      }
    }
```

3. Run the `okv manage-access wallet list-endpoint-wallets` command using the generated JSON file.

```
okv manage-access wallet list-endpoint-wallets --from-json
list_ep_wallets.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "wallets" : [ "WALLET10", "WALLET11" ]
  }
}
```

4.19 okv manage-access wallet remove-access Command

The `okv manage-access wallet remove-access` command removes the access that an endpoint or an endpoint group has to a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or manage wallet (`MW`) permission on the wallet

Syntax

```
okv manage-access wallet remove-access --wallet wallet_name --endpoint
endpoint_name|--endpoint-group endpoint_group_name
```

JSON Input File Template

```
{
  "service" : {
```

```
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "remove-access",
    "options" : {
      "wallet" : "#VALUE",
      "endpointGroup" : "#VALUE",
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

`--endpoint` / `endpoint`
 	
or
 	
`--endpoint-group` / `endpointGroup`
	Required	Name of the endpoint or endpoint group.
		
		To find existing endpoints, run the `okv admin endpoint list` command. To find endpoint groups, run `okv manage-access endpoint-group list`.

JSON Example

1. Generate JSON input for the `okv manage-access wallet remove-access` command.

   ```
   okv manage-access wallet remove-access --generate-json-input
   ```

   The generated input appears as follows. This output includes the entire output, for both the endpoint and endpoint group. When you edit it, you must include the entry for either the endpoint or the endpoint group, but not both.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "remove-access",
       "options" : {
         "wallet" : "#VALUE",
         "endpointGroup" : "#VALUE",
         "endpoint" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `remove_wallet_access_ep.json`) and then edit it so to remove wallet access from the endpoint or an endpoint group. The following example shows how to remove access from an endpoint.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "remove-access",
       "options" : {
         "wallet" : "hr_wallet",
         "endpoint" : "hr_db_ep"
       }
   ```

```
     }
   }
```

3. Run the `okv manage-access wallet remove-access` command using the generated JSON file.

   ```
   okv manage-access wallet remove-access --from-json
   remove_wallet_access_ep.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

4.20 okv manage-access wallet remove-object Command

The `okv manage-access wallet remove-object` command removes a security object from a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or have read-modify permission on the object and manage wallet (`MW`) permission on the wallet.

Syntax

```
okv manage-access wallet remove-object --wallet wallet_name --uuid uuid
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "remove-object",
    "options" : {
            "wallet" : "#VALUE",
            "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

JSON Example

1. Generate JSON input for the `okv manage-access wallet remove-object` command.

   ```
   okv manage-access wallet remove-object --generate-json-input
   ```

   The generated input appears as follows.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "remove-object",
       "options" : {
               "wallet" : "#VALUE",
               "uuid" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `remove_wallet_obj.json`) and then edit it to specify the object to be removed from the wallet.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "remove-object",
       "options" : {
               "wallet" : "hr_wallet",
               "uuid" : "7432AED6-6628-4F43-BF7C-9D30023A4301"
       }
     }
   }
   ```

3. Run the `okv manage-access wallet remove-object` command using the generated JSON file.

   ```
   okv manage-access wallet remove-object --from-json remove_wallet_obj.json
   ```

   Output similar to the following appears:

   ```
   {
     "result": "Success"
   }
   ```

4.21 okv manage-access wallet set-default Command

The `okv manage-access wallet set-default` command sets the default wallet for an endpoint.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or Manage Endpoint privilege for the endpoint and Full Wallet privileges on the wallet

Syntax

```
okv manage-access wallet set-default --wallet wallet_name --endpoint
endpoint_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "set-default",
    "options" : {
      "wallet" : "#VALUE",
      "endpoint" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--endpoint` / `endpoint`	Required	Name of the endpoint. To find existing endpoints, run the `okv admin endpoint list` command.

Example

1. Generate JSON input for the `okv manage-access wallet set-default` command.

   ```
   okv manage-access wallet set-default --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "set-default",
       "options" : {
   ```

```
        "wallet" : "#VALUE",
        "endpoint" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `set_def_wallet.json`) and then edit it to set the default wallet for the endpoint.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "set-default",
    "options" : {
      "wallet" : "hr_wallet",
      "endpoint" : "hr_db_ep"
    }
  }
}
```

3. Run the `okv manage-access wallet set-default` command using the generated JSON file.

```
okv manage-access wallet set-default --from-json set_def_wallet.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

4.22 okv manage-access wallet update Command

The `okv manage-access wallet update` command updates a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or manage wallet (`MW`) permission on the wallet

Syntax

```
okv manage-access wallet update --wallet wallet_name --name new_wallet_name --
description description --unique TRUE|FALSE
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "update",
    "options" : {
      "wallet" : "#VALUE",
      "name" : "#VALUE",
      "description" : "#VALUE",
      "unique" : "#TRUE|FALSE"
    }
```

```
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--name` / `name`	Optional	A new name for the wallet. See Naming Guidelines for Objects.
`--description` / `description`	Optional	A user-friendly description for the wallet, enclosed within double quotation marks
`--unique` / `unique`	Optional	Applies to a multi-master cluster environment only. This `--unique` parameter creates the wallet as a unique wallet. In a multi-master cluster, it is possible that a wallet with the same name could be created from two different nodes. If that happens, then the wallet names may conflict. The Oracle Key Vault conflict resolution scheme will keep one wallet with the given name and rename other wallets with the conflicting names to a name using this format: *given_wallet_name_OKVnode_id*.
		Valid settings are as follows:
		• `TRUE` appends `_OKVnode_id` to the given name and thus prevent the conflict for this wallet name. The wallet is immediately usable.
		• `FALSE` causes Oracle Key Vault to begin a checking process to find if the wallet name is unique. A unique ID is returned. You can use this ID to check the status of the wallet creation, whether it is in progress (`PENDING`) or complete (`ACTIVE`). If the status is `PENDING`, then it is not yet usable, so any actions performed on the wallet will fail. If the status is `ACTIVE`, then confirm the name of the wallet after Oracle Key Vault performs name resolution for this name by executing the `okv manage-access wallet check-status` command. If the name that you provided is already used in another node, then the name for this wallet will have `_OKVxx` appended to it. For example, if you named the wallet `wallet12`, and there is a naming conflict, the name could be `WALLET12_OKV01`.

JSON Example

1. Generate JSON input for the `okv manage-access wallet update` command.

```
okv manage-access wallet update --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "update",
    "options" : {
      "wallet" : "#VALUE",
      "name" : "#VALUE",
      "description" : "#VALUE",
      "unique" : "#TRUE|FALSE"
    }
  }
}
```

2. Save the generated input to a file (for example, `update_wallet.json`) and then edit it to update the name and description of a wallet. This example shows how to update the name of a wallet.

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "update",
    "options" : {
      "wallet" : "hr_wallet",
      "name" : "global_hr_wallet",
      "unique" : "false"
    }
  }
}
```

3. Run the `okv manage-access wallet update` command using the generated JSON file.

```
okv manage-access wallet update --from-json update_wallet.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "status" : "PENDING",
    "locatorID" : "81800CE6-6AAF-4EF5-A0FD-446ED6625F6A"
  }
}
```

This example shows the output for renaming a wallet in a multi-master cluster. On renaming, a wallet is placed into the PENDING state for the duration of the naming conflict resolution.

Unless you renamed the wallet in a multi-master cluster, the status and locatorID entries are not included in the output.

Related Topics

• okv manage-access wallet check-status Command
  The `okv manage-access wallet check-status` command checks the naming conflict resolution status of a wallet in a multi-master cluster.

4.23 okv manage-access wallet update-access Command

The `okv manage-access wallet update-access` command updates the level of access that an endpoint or an endpoint group has to a wallet.

This command uses a user name and password for the authentication.

Required Authorization

Key Administrator role or manage wallet (`MW`) permission on the wallet

Syntax

```
okv manage-access wallet update-access --wallet wallet_name --endpoint
endpoint_name|--endpoint-group endpoint_group_name --access RO|RM|RO_MW|RM_MW
```

JSON Input File Template

```
{
  "service" : {
    "category" : "manage-access",
    "resource" : "wallet",
    "action" : "update-access",
    "options" : {
      "wallet" : "#VALUE",
      "endpointGroup" : "#VALUE",
      "endpoint" : "#VALUE",
      "access" : "#RO|RM|RO_MW|RM_MW"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--endpoint` / `endpoint` or `--endpoint-group` / `endpointGroup`	Required	Name of the endpoint or endpoint group. You can only specify either an endpoint or an endpoint group, but not both. To find existing endpoints, run the `okv admin endpoint list` command. To find endpoint groups, run `okv manage-access endpoint-group list`.
`--access` / `access`	Required	Enter one of the following values: • `RO` for read-only access • `RM` for read-and-modify access • `RO_MW` for read-only and manage-wallet access • `RM_MW` for read-and-modify and manage-wallet access

JSON Example

1. Generate JSON input for the `okv manage-access wallet update-access` command.

   ```
   okv manage-access wallet update-access --generate-json-input
   ```

   The generated input appears as follows. This output includes wallet access settings for both endpoints and endpoint groups. When you edit it, you must include either the endpoint settings or the endpoint group settings, but not both.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "update-access",
       "options" : {
         "wallet" : "#VALUE",
         "endpointGroup" : "#VALUE",
         "endpoint" : "#VALUE",
         "access" : "#RO|RM|RO_MW|RM_MW"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `update_wallet_access_ep.json`) and then edit it to update the wallet access to an endpoint or an endpoint group. This example shows how to update access of a wallet to an endpoint.

   ```
   {
     "service" : {
       "category" : "manage-access",
       "resource" : "wallet",
       "action" : "update-access",
       "options" : {
         "wallet" : "hr_wallet",
         "endpoint" : "hr_db_ep",
         "access" : "RM"
       }
     }
   }
   ```

3. Run the `okv manage-access wallet update-access` command using the generated JSON file.

   ```
   okv manage-access wallet update-access --from-json update_wallet_access_ep.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

5

Security Object Commands

Endpoints can make use of the security object commands to operate on the managed objects.

- **okv managed-object attribute add Command**
  The `okv managed-object attribute add` command adds one or more attributes to a security object.

- **okv managed-object attribute delete Command**
  The `okv managed-object attribute delete` command deletes one or more attributes associated with a security object.

- **okv managed-object attribute get Command**
  The `okv managed-object attribute get` command retrieves an attribute or list of attributes of a security object.

- **okv managed-object attribute get-all Command**
  The `okv managed-object attribute get-all` command retrieves all attributes of a security object.

- **okv managed-object object fetch Command**
  The `okv managed-object fetch` command fetches a security object and its attributes together.

- **okv managed-object attribute list Command**
  The `okv managed-object attribute list` command retrieves the names of attributes associated with a security object.

- **okv managed-object attribute modify Command**
  The `okv managed-object attribute modify` command modifies attributes that are associated with a security object.

- **okv managed-object certificate get Command**
  The `okv managed-object certificate get` command retrieves a digital certificate.

- **okv managed-object certificate register Command**
  The `okv managed-object certificate register` command registers a certificate.

- **okv managed-object certificate-request get Command**
  The `okv managed-object certificate-request get` command retrieves a certificate request.

- **okv managed-object certificate-request register Command**
  The `okv managed-object certificate-request register` command registers a certificate request object with Oracle Key Vault.

- **okv managed-object custom-attribute add Command**
  The `okv managed-object custom-attribute add` command adds a custom attribute to a security object.

- **okv managed-object custom-attribute delete Command**
  The `okv managed-object custom-attribute delete` command deletes a custom attribute of a security object.

- **okv managed-object custom-attribute modify Command**
  The `okv managed-object custom-attribute modify` command modifies a custom attribute of a security object.

- **okv managed-object key create Command**
  The `okv managed-object key create` command creates a symmetric key.

- **okv managed-object key get Command**
  The `okv managed-object key get` command retrieves a symmetric key.

- **okv managed-object key register Command**
  The `okv managed-object key register` command registers a symmetric key.

- **okv managed-object object activate Command**
  The `okv managed-object object activate` command activates a security object.

- **okv managed-object object destroy Command**
  The `okv managed-object object destroy` command requests the server to destroy the key data for a security object.

- **okv managed-object object locate Command**
  The `okv managed-object object locate` command locates a security object.

- **okv managed-object object query Command**
  The `okv managed-object object query` command identifies supported operations and objects.

- **okv managed-object object revoke Command**
  The `okv managed-object object revoke` command revokes a security object.

- **okv managed-object opaque get Command**
  The `okv managed-object opaque get` command retrieves an object that contains opaque data.

- **okv managed-object opaque register Command**
  The `okv managed-object opaque register` command registers an opaque security object.

- **okv managed-object private-key get Command**
  The `okv managed-object private-key get` command retrieves a private key.

- **okv managed-object private-key register Command**
  The `okv managed-object private-key register` command registers a private key. You can use this command to also register an SSH private key.

- **okv managed-object public-key get Command**
  The `okv managed-object public-key get` command retrieves a public key.

- **okv managed-object public-key register Command**
  The `okv managed-object public-key register` command registers a public key. You can use this command to also register an SSH public key.

- **okv managed-object secret get Command**
  The `okv managed-object secret get` command retrieves the secret data from a security object of type secret.

- **okv managed-object secret register Command**
  The `okv managed-object secret register` command registers secret data such as passwords or random seeds.

- • okv managed-object wallet add-member Command
  The `okv managed-object wallet add-member` command adds a security object to a wallet as its member.
- • okv managed-object wallet delete-member Command
  The `okv managed-object wallet delete-member` command deletes the membership of the managed-object from a wallet.
- • okv managed-object wallet list Command
  The `okv managed-object wallet list` command lists wallets that have their access granted to the endpoint used to connect to Oracle Key Vault.
- • okv managed-object key-pair create command
  The `okv managed-object key-pair create` command creates a pair of public and private keys. You can use this command to also create an SSH key pair.

5.1 okv managed-object attribute add Command

The `okv managed-object attribute add` command adds one or more attributes to a security object.

To find the existing attributes for the security object, run the `okv managed-object attribute list` command. If you want to create a custom attribute, then use the `okv managed-object custom-attribute add` command.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object attribute add --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "add",
    "options" : {
      "uuid" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#NOW|YYYY-MM-DD HH:mm:ss"
      }
    }
```

```
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
		See, okv managed-object object locate Command

Parameter/Template Parameter	Required?	Description

`/ attributes`	Required	A JSON object with the list of attributes. You must use the JSON syntax to add an attribute. You cannot specify attributes at the command line. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		
		Attributes that you can enter are as follows:
		
		• `name` includes the following:
		  – `value` is the value name.
		  – `type` is either `text` or `uri`. The default type is `text` when the `name` attribute is used in the command line.
		• `contactInfo` : Contact information of the object. For example, an e-mail address.
		• The following date and time attributes:
		  – `activationDate`: Contains the date and time when using the Managed Object.
		  – `deactivationDate`: The date and time when the Managed Object should not be used for any purpose, except for decryption.
		  – `protectStopDate`: The date and time when a valid Managed Object is used to process cryptographically protected information, for example, decryption or unwrapping.
		  – `processStartDate`: The date and time after which a valid Managed Object should not be used for applying cryptographic protection, for example, encryption or wrapping.
		
		You can use different ways to set the date and time. Examples are as follows:
		
		`"activationDate" : "now"` *--starts immediately*
		`"activationDate" : "now+PT10M"` *-- starts 10 minutes from now*
		`"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time*
		`"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		
		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`

Parameter/Template Parameter	Required?	Description
		See Key Management Interoperability Protocol Specification Version 1.1 for more details about these attributes.

JSON Example

1. Generate JSON input for the `okv managed-object attribute add` command and save it as `add-attrib.json`.

```
okv managed-object attribute add --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "add",
    "options" : {
      "uuid" : "#VALUE",
      "attributes" : {
        "name" : {
         "value" : "#VALUE",
         "type" : "#text|uri"
                },
        "contactInfo" : "#VALUE",
        "activationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#NOW|YYYY-MM-DD HH:mm:ss"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `add_attribute.json`) and then edit it to include the attributes for the security object. For example:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "add",
    "options" : {
      "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "attributes" : {
        "contactInfo" : "psmith@example.com",
        "deactivationDate" : "2024-12-31 09:00:00",
        "name" : {
                "value" : "PROD-HRDB-MKEY",
                "type" : "text"
                },
        "protectStopDate" : "2024-09-30 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object attribute add` command using the generated JSON file.

```
okv managed-object attribute add --from-json add_attribute.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "attributes" : {
      "contactInfo" : "Added",
      "deactivationDate" : "Added",
      "name" : "Added",
      "protectStopDate" : "Added"
    }
  }
}
```

  You specify the date or timestamp, and duration using the supported formats.

5.2 okv managed-object attribute delete Command

The `okv managed-object attribute delete` command deletes one or more attributes associated with a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object attribute delete --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "attribute",
    "action": "delete",
    "options": {
      "uuid": "#VALUE",
      "attributes": {
        "name": {
          "value": "#VALUE"
        },
        "contactInfo": "#VALUE",
        "activationDate": "#VALUE",
        "deactivationDate": "#VALUE",
        "protectStopDate": "#VALUE",
        "processStartDate": "#VALUE"
      }
```

```
        }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid`/`uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`/ attributes`	Required	A JSON object with the list of attributes. You must use the JSON syntax to specify the attribute. You cannot specify attributes at the command line. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		Attributes that you can delete are as follows:
		• `name` (You must also specify the value of the `name` attribute instance that you want to delete.)
		• The following date and time attributes:
		– `activationDate`
		– `deactivationDate`
		– `protectStopDate`
		– `processStartDate`
		You can use different ways to set the date and time. Examples are as follows:
		`"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *--starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		To display the time in UTC format, use the Linux `date` command. For example:
		`$ date --utc "+%F %T"` `2021-03-15 20:31:37`

JSON Example

1. Generate JSON input for the `okv managed-object attribute delete` command.

   ```
   okv managed-object attribute delete --generate-json-input
   ```

The generated input appears as follows:

```
{
  "service": {
    "category": "managed-object",
    "resource": "attribute",
    "action": "delete",
    "options": {
      "uuid": "#VALUE",
      "attributes": {
        "name": {
          "value": "#VALUE"
        },
        "contactInfo": "#VALUE",
        "activationDate": "#VALUE",
        "deactivationDate": "#VALUE",
        "protectStopDate": "#VALUE",
        "processStartDate": "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `del_attribute.json`) and then edit it so that you can delete the attributes associated with a security object.

```
{
  "service": {
    "category": "managed-object",
    "resource": "attribute",
    "action": "delete",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "attributes": {
        "name": {
          "value": "PROD-HRDB-MKEY"
        }
      }
    }
  }
}
```

3. Run the `okv managed-object attribute delete` command using the generated JSON file.

```
okv managed-object attribute delete --from-json del_attribute.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "attributes": {
      "name": "Deleted"
    }
  }
}
```

  You specify the date or timestamp, and duration using the supported formats.

5.3 okv managed-object attribute get Command

The `okv managed-object attribute get` command retrieves an attribute or list of attributes of a security object.

Required Authorization

The endpoint must have read permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object attribute get --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE",
      "attributes" : [ "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME"],
      "customAttributes" : [ "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME",
"#ATTRIBUTE_NAME" ]
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

Parameter/Template Parameter	Required?	Description
/ attributes	Required	Array of attribute names. You must use the JSON syntax to specify the attributes. You cannot specify attributes at the command line. You can retrieve the value of multiple attributes by including additional optional ATTRIBUTE_NAME attributes. See the example.
		To find the existing attributes for the managed object, run the okv managed-object attribute list command. To retrieve the values of all existing attributes for the managed object, run the okv managed-object attribute get-all command.
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.
/ customAttributes	Optional	Array of custom attributes. You must use the JSON syntax to specify the custom attributes. You cannot specify custom attributes at the command line. To find the existing attributes for the managed object, run the okv managed-object attribute list command.

JSON Example

1. Generate JSON input for the okv managed-object attribute get command.

   ```
   okv managed-object attribute get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "attribute",
       "action" : "get",
       "options" : {
         "uuid" : "#VALUE",
         "attributes" : [ "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME" ],
         "customAttributes" : [ "#ATTRIBUTE_NAME", "#ATTRIBUTE_NAME",
   "#ATTRIBUTE_NAME" ]
       }
     }
   }
   ```

2. Save the generated input to a file (for example, get_attribute.json) and then edit it to retrieve the attributes associated with the security object.

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "attribute",
       "action" : "get",
       "options" : {
   ```

```
        "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
        "attributes": [
          "activationDate",
          "contactInfo",
          "cryptoUsageMask",
          "cryptographicAlgorithm",
          "cryptographicLength",
          "name",
          "objectType",
          "state",
          "extractable",
          "neverExtractable"
        ],
        "customAttributes" : ["x-ApplicationTag"]
      }
    }
  }
```

3. Run the `okv managed-object attribute get` command using the generated JSON file.

```
okv managed-object attribute get --from-json get_attribute.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "attributes": {
      "activationDate": "2020-11-21 01:00:00",
      "contactInfo": "psmith@example.com",
      "cryptoUsageMask": [
        "ENCRYPT",
        "DECRYPT"
      ],
      "cryptographicAlgorithm": "AES",
      "cryptographicLength": "256",
      "extractable" : "false",
      "name": [
        {
          "type": "text",
          "value": "PROD-HRDB-MKEY"
        }
      ],
      "neverExtractable" : "TRUE",
      "objectType": "Symmetric Key",
      "state": "Active"
    },
    "customAttributes": [
      {
        "index": "1",
        "name": "x-ApplicationTag",
        "type": "Text String",
        "value": "HR-Production"
      }
    ]
  }
}
```

5.4 okv managed-object attribute get-all Command

The `okv managed-object attribute get-all` command retrieves all attributes of a security object.

Required Authorization

The endpoint must have read permission on the object.

Syntax

```
okv managed-object attribute get-all --uuid UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "get-all",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

JSON Example

1. Generate JSON input for the `okv managed-object attribute get-all` command.

   ```
   okv managed-object attribute get-all --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "attribute",
       "action" : "get-all",
       "options" : {
         "uuid" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_all_attributes.json`) and then edit it to get all the attributes of the security object.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "get-all",
    "options" : {
      "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
    }
  }
}
```

3. Run the `okv managed-object attribute get-all` command using the generated JSON file.

```
okv managed-object attribute get-all --from-json get_all_attributes.json
```

Output similar to the following appears:

```
{
  "result" : "Success",  "value" : {
    "attributes" : {
      "activationDate" : "2022-10-28 18:58:34",
      "cryptoUsageMask" : [ "SIGN" ],
      "cryptographicAlgorithm" : "RSA",
      "cryptographicLength" : "2048",
      "digest" : {
        "algorithm" : "SHA-256",
        "digestValue" :
"9E6C6718C34FE44E3C91558CB83278CEC0706B8906BF0DED23A6117DC9EE6CD0",
        "keyFormatType" : "RAW"
      },
      "extractable" : "false",
      "fresh" : "Yes",
      "initialDate" : "2022-10-28 18:58:36",
      "lastChangeDate" : "2022-10-28 18:58:38",
      "neverExtractable" : "true",
      "objectType" : "Private Key",
      "processStartDate" : "2022-10-28 18:58:36",
      "state" : "Active",
      "uuid" : "06024832-066A-4F02-BF03-FA5B09E9A6AF"
    }
  }
}
```

5.5 okv managed-object object fetch Command

The `okv managed-object fetch` command fetches a security object and its attributes together.

Required Authorization

The endpoint must have read permission on the object

Syntax

```
okv managed-object object fetch --max max_value --object-group-member
```

object_group_member_type --state *state_value* --name *name_value* --custom-attribute
custom_attribute_value

JSON Input File Template

```
okv managed-object object fetch --generate-json-input
{
  "service" : {
    "category" : "managed-object",
    "resource" : "object",
    "action" : "fetch",
    "options" : {
      "max" : "#VALUE",
      "objectGroupMember" : "#FRESH|DEFAULT",
      "attributes" : {
        "name" : {
          "value" : "#VALUE"
        },
        "state" : "#PREACTIVE|ACTIVE|DEACTIVATED|COMPROMISED|DESTROYED|
DESTROYED_COMPROMISED",
        "objectType" : "#VALUE",
        "fresh" : "#YES|NO",
        "objectGroup" : "#VALUE",
        "contactInfo" : "#VALUE",
        "cryptographicAlgorithm" : "#VALUE",
        "cryptographicLength" : "#VALUE",
        "cryptoUsageMask" : "#VALUE",
        "certificateLength" : "#VALUE",
        "certificateType" : "#VALUE",
        "x509CertificateSubject" : "#VALUE",
        "x509CertificateIssuer" : "#VALUE",
        "digitalSigningAlgorithm" : "#VALUE",
        "digest" : {
          "digestValue" : "#VALUE",
          "algorithm" : "#VALUE",
          "keyFormatType" : "#VALUE"
        },
        "link" : {
          "linkType" : "#VALUE",
          "linkValue" : "#VALUE"
        },
        "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#YYYY-MM-DD HH:mm:ss",
        "initialDate" : "#YYYY-MM-DD HH:mm:ss",
        "lastChangeDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseOccurrenceDate" : "#YYYY-MM-DD HH:mm:ss",
        "destroyDate" : "#YYYY-MM-DD HH:mm:ss",
        "archiveDate" : "#YYYY-MM-DD HH:mm:ss",
        "extractable" : "#TRUE|FALSE",
        "neverExtractable" : "#TRUE|FALSE"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      } ]
    }
```

```
    }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--max`/`max`	Optional	Maximum number of objects that this command should return
`--object-group-member`/`objectGroupMember`	Optional	Enter one of the following group values: • `DEFAULT` • `FRESH`
`--state`/`state`	Optional	Enter one of the following states: • `PREACTIVE` • `ACTIVE` • `DEACTIVATED` • `COMPROMISED` • `DESTROYED` • `DESTROYED_COMPROMISED`

Parameter/ Template Parameter	Requir ed?	Description
/ attributes	Require d	Attributes names and their values of the object to locate. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.

Attributes that you can enter are as follows:

- `name` includes `value`.
- `state` is the state of the object.
- `objectType`, type of the object.
- `fresh` indicates whether the object is fresh or not. Enter either `YES` or `NO`.
- `objectGroup` is the object group or wallet name.
- `contactInfo` is the contact information for the object.
- `cryptographicAlgorithm` is the cryptographic algorithm of the object.
- `cryptographicLength` is the cryptographic length of the object.
- `cryptoUsageMask` is the usage mask of the object.
- `certificateType` is the type of the certificate object.
- `x509CertificateSubject` is the subject of the X.509 certificate.
- `x509CertificateIssuer` is the issuer of the X.509 certificate.
- `digitalSigningAlgorithm` is the digital signature algorithm of the object.
- `digest` is digest of the object, which includes:
  - `digestValue` is the value of the digest.
  - `algorithm` is the hashing algorithm.
  - `keyFormatType` is the format of the object.
- `link` is the link attribute of the object, and it includes:
  - `linkType` is the type of the link.
  - `linkValue` is the linked object UUID.
- The following date and time attributes:
  - `activationDate`
  - `deactivationDate`
  - `protectStopDate`
  - `processStartDate`
  - `activationDate`
  - `deactivationDate`
  - `processStartDate`
  - `protectStopDate`
  - `initialDate`
  - `lastChangeDate`
  - `compromiseDate`
  - `compromiseOccurrenceDate`
  - `destroyDate`
  - `archiveDate`
- `extractable` can be set as follows:
  - `TRUE` Allows the object to be extracted from Oracle Key Vault.

Parameter/ Template Parameter	Required?	Description

		– FALSE Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault.
		• neverExtractable tracks whether the extraction of the security object has always been restricted during its existence in the Oracle Key Vault server. Settings are as follows:
		– TRUE means that the security object was never extractable from Oracle Key Vault during the object's existence.
		– FALSE means the security object was extractable from Oracle Key Vault at least once during the object's existence.
		You can use different ways to set the date and time. Examples are as follows:
		
		`"activationDate" : "2021-12-20 10:30:00" --starts at this date and time`
		
		To display the time in UTC format, use the Linux date command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`

--custom attributes / customAttri bute	Optional	List of custom attributes of the object to locate. Custom attributes that you can enter are as follows: • name is the name of the custom attribute. • value is the value of the custom attribute. • type is either text or number. ```-Specifies custom defined attribute on security object. 2017-04-29 18:14:51"}' --custom-attribute '[{ "name": "x-OKV Certificate Expiration Date", "value" : "2017-04-29 18:14:51"}, { "name": "x-local-name", "value" : "HR"}] ' -Support simplified data format, name attribute(single instance), in command line --name KEY1 -Support simplified data format, custom attribute(multi instance),in commandline --custom-attribute "x-local-name:HR" --custom-attribute ' ["x-local-name:HR", "x-local-id:100"]'``` See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/ Template Parameter	Requir ed?	Description

`--name`		Specifies the name of a security object. The allowed values are :
		• `value`
		• `type`
		The default type:
		• `text`
		
		`-Support complex data format, name attribute in`
		`command line`
		`        --name '{"value" : "KEY1", "type" :`
		`"uri"}'or`
		`        --name '{"value" : "KEY1", "type" : "text}'`
		`-Support simplified data format, name attribute in`
		`command line. when type is "text" as a default:`
		`        --name KEY1`

`--custom-attribute`		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}'`
		`        --custom-attribute '[ { "name": "x-OKV`
		`Certificate Expiration Date",`
		`             "value" : "2017-04-29 18:14:51"},`
		`{ "name": "x-local-name", "value" : "HR"} ] '`
		
		`Support simplified data format, name`
		`        attribute(single instance), in command line`
		`--name KEY1`
		
		`Support simplified data format, custom`
		`attribute(multi instance),in commandline`
		`        --custom-attribute "x-local-name:HR"`
		`        --custom-attribute ' [  "x-local-name:HR","x-`
		`local-id:100" ]'`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Examples

1. Generate JSON input for the command.

```
okv managed-object object fetch --generate-json-input
```

The generated input appears as follows:

```
okv managed-object object fetch --generate-json-input
{
  "service" : {
    "category" : "managed-object",
    "resource" : "object",
    "action" : "fetch",
    "options" : {
      "max" : "#VALUE",
      "objectGroupMember" : "#FRESH|DEFAULT",
      "attributes" : {
        "name" : {
          "value" : "#VALUE"
        },
        "state" : "#PREACTIVE|ACTIVE|DEACTIVATED|COMPROMISED|DESTROYED|
DESTROYED_COMPROMISED",
        "objectType" : "#VALUE",
        "fresh" : "#YES|NO",
        "objectGroup" : "#VALUE",
        "contactInfo" : "#VALUE",
        "cryptographicAlgorithm" : "#VALUE",
        "cryptographicLength" : "#VALUE",
        "cryptoUsageMask" : "#VALUE",
        "certificateLength" : "#VALUE",
        "certificateType" : "#VALUE",
        "x509CertificateSubject" : "#VALUE",
        "x509CertificateIssuer" : "#VALUE",
        "digitalSigningAlgorithm" : "#VALUE",
        "digest" : {
          "digestValue" : "#VALUE",
          "algorithm" : "#VALUE",
          "keyFormatType" : "#VALUE"
        },
        "link" : {
          "linkType" : "#VALUE",
          "linkValue" : "#VALUE"
        },
        "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#YYYY-MM-DD HH:mm:ss",
        "initialDate" : "#YYYY-MM-DD HH:mm:ss",
        "lastChangeDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseOccurrenceDate" : "#YYYY-MM-DD HH:mm:ss",
        "destroyDate" : "#YYYY-MM-DD HH:mm:ss",
        "archiveDate" : "#YYYY-MM-DD HH:mm:ss",
        "extractable" : "#TRUE|FALSE",
        "neverExtractable" : "#TRUE|FALSE"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      } ]
    }
  }
}
```

2. Save the generated input to a file, for example, `fetch_obj.json`.

3. Run the command using the generated JSON file. For example:

```
okv managed-object object fetch --custom-attribute  --max  --name
--object-group-member --single-object --state
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : [ {
    "attributes" : {
      "activationDate" : "2022-07-01 15:54:38",
      "cryptographicAlgorithm" : "RSA",
      "cryptographicLength" : "2048",
      "cryptoUsageMask" : [ "ENCRYPT" ],
      "deactivationDate" : "2030-10-10 10:10:10",
      "digest" : {
        "digestValue" :
"B8ACE70487179C70DF3A6D320CA0D52FF7F4FB2D9E41E9542E7D8C0166B3D93",
        "keyFormatType" : "RAW",
        "algorithm" : "SHA-256"
      },
      "fresh" : "No",
      "initialDate" : "2022-07-01 15:54:38",
      "lastChangeDate" : "2022-07-01 17:57:24",
       "name" : [ {
        "type" : "text",
        "value" : "private_0701"
      } ],
      "objectType" : "Private Key",
      "processStartDate" : "2022-07-01 15:54:38",
      "state" : "Active",
      "uuid" : "95092BD2-B546-4F9A-BF0B-D8ECDC548546"
    }, "customAttribute" : [ {
      "name" : "x-NAME",
      "index" : "0",
      "type" : "Text String",
      "value" : "test4"
    }, {
      "name" : "x-ID",
      "index" : "0",
      "type" : "Integer",
      "value" : "1"
    } ],
      "object" : "-----BEGIN OPENSSH PRIVATE KEY-----
\nb3BlbnNzaC1rZXktdjEAAAAABG5vbmUAAAAEbm9uZQAAAAAAAABAAABlwAAAAdzc2gtcn\nNhAAAAAwE
AAQAAAYEAyYrcnHs6I51lHheg90qTripWIuVKszoluqnBG0+QRLdLKOMIJjajygXKlT\n04DJSrQliR45ok
i2s/dgyfsTqpvanjTj7W10O5X2poohlGojumNOmb2p52em55yABUcYOb\nK4Qf5sX4vDpc/
iUQAAABFkb3BhcmtAZG9wYXJrLW1hYw==\n-----END OPENSSH PRIVATE KEY-----\n"
  } ]
}
```

Example Using Output Format Text

```
okv managed-object object fetch --max max_value --object-group-member
object_group_member_type --state state_value --name name_value
```

5.6 okv managed-object attribute list Command

The `okv managed-object attribute list` command retrieves the names of attributes associated with a security object.

The `okv managed-object attribute list` command shows the key `customAttributes` if the object has one or more custom attributes. To find the custom attributes defined for the object, run the `okv managed-object attribute get-all` command.

Required Authorization

The endpoint must have read permission on the object.

Syntax

```
okv managed-object attribute list --uuid UUID
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "attribute",
    "action": "list",
    "options": {
      "uuid": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

JSON Example

1. Generate JSON input for the `okv managed-object attribute list` command.

   ```
   okv managed-object attribute list --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "attribute",
       "action": "list",
   ```

```
      "options": {
        "uuid": "#VALUE"
      }
    }
}
```

2. Save the generated input to a file (for example, `list_attributes.json`) and then edit it to retrieve the list of attributes for the security object.

```
{
  "service": {
    "category": "managed-object",
    "resource": "attribute",
    "action": "list",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
    }
  }
}
```

3. Run the `okv managed-object attribute list` command using the generated JSON file.

```
okv managed-object attribute list --from-json list_attributes.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "attributes" : [
        "activationDate",
        "contactInfo",
        "cryptoUsageMask",
        "cryptographicAlgorithm",
        "cryptographicLength",
        "deactivationDate",
        "digest",
        "extractable",
        "fresh",
        "initialDate",
        "lastChangeDate",
        "name",
        "neverExtractable",
        "objectType",
        "processStartDate",
        "protectStopDate",
        "state"
        "uuid"
      ],
    "customAttributes" : [ "x-ApplicationTag" ]
  }
}
```

5.7 okv managed-object attribute modify Command

The `okv managed-object attribute modify` command modifies attributes that are associated with a security object.

To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

```
okv managed-object attribute modify --generate-json-input
```

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "attribute",
    "action" : "modify",
      "options" : {
        "uuid" : "#VALUE",
        "attributes" : {
          "name" : {
            "value" : "#VALUE",
            "newValue" : "#VALUE",
            "newType" : "#text|uri"
                },
            "contactInfo" : "#VALUE",
            "activationDate" : "#VALUE",
            "deactivationDate" : "#VALUE",
            "protectStopDate" : "#VALUE",
            "processStartDate" : "#VALUE",
            "extractable" : "#TRUE|FALSE"
          }
        }
      }
  }
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

Parameter/Template Parameter	Required?	Description
`/attributes`	Required	Attribute names and their values. You must use the JSON syntax to specify the attribute. You cannot specify attributes at the command line. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.

Attributes that you can enter are as follows:

- `name` includes the following:
  - `value` is the existing name value.
  - `newValue` is the new name value.
  - `newType` is the new name value type. If you want to change the type only, then you must provide a `value` and `newValue`. The default value is `text`.
- `contactInfo`
- The following date and time attributes:
  - `activationDate`
  - `deactivationDate`
  - `protectStopDate`
  - `processStartDate`
- `extractable` can be set as follows:
  - `TRUE` Allows the object to be extracted from Oracle Key Vault.
  - `FALSE` Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault.

  As a user who has the Key Administrator role, you can modify the extractable attribute setting of an existing symmetric key or private key to either `TRUE` or `FALSE`. A user with read-modify access on an existing symmetric key can also modify its extractable attribute setting, however, this is allowed only to apply the stricter setting, that is, to set the value to `FALSE` to make the object non-extractable. Such users cannot modify the extractable attribute setting to make a symmetric key extractable if it is currently non-extractable. You can apply the extractable attribute setting to only symmetric keys, and not to other types of security objects.

You can use different ways to set the date and time. Examples are as follows:

```
"activationDate" : "now" --starts
immediately
"activationDate" : "now+PT10M" --
starts 10 minutes from now
```

Parameter/Template Parameter	Required?	Description
		`"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		To display the time in UTC format, use the Linux `date` command. For example:
		`$ date --utc "+%F %T"` `2021-03-15 20:31:37`
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

JSON Example

1. Generate JSON input for the `okv managed-object attribute modify` command.

   ```
   okv managed-object attribute modify --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "attribute",
       "action" : "modify",
       "options" : {
         "uuid" : "#VALUE",
         "attributes" : {
           "name" : {
             "value" : "#VALUE",
             "newValue" : "#VALUE",
             "newType" : "#text|uri"
           },
           "contactInfo" : "#VALUE",
           "activationDate" : "#VALUE",
           "deactivationDate" : "#VALUE",
           "protectStopDate" : "#VALUE",
           "processStartDate" : "#VALUE",
           "extractable" : "#TRUE|FALSE"
         }
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `modify_attributes.json`) and then edit it to modify the attributes that are associated with the security object.

   ```
   {
     "service" : {
   ```

```
         "category" : "managed-object",
         "resource" : "attribute",
         "action" : "modify",
         "options" : {
           "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
           "attributes" : {
             "name" : {
               "value" : "PROD-HRDB-MKEY",
               "newValue" : "PROD-GLOBAL-HRDB-MKEY",
               "newType" : "text"
             },
             "contactInfo" : "jscott@example.com",
             "deactivationDate" : "2024-07-31 09:00:00",
             "protectStopDate" : "2024-04-30 09:00:00",
             "extractable" : "FALSE"
           }
         }
       }
   }
```

3. Run the `okv managed-object attribute modify` command using the generated JSON file.

```
okv managed-object attribute modify --from-json modify_attributes.json
```

Output similar to the following appears:

```
{
     "result": "Success",
     "value": {
      "attributes": {
       "contactInfo": "Modified",
       "deactivationDate": "Modified",
       "name": "Modified",
       "protectStopDate": "Modified",
       "extractable" : "Modified"
     }
   }
}
```

  You specify the date or timestamp, and duration using the supported formats.

5.8 okv managed-object certificate get Command

The `okv managed-object certificate get` command retrieves a digital certificate.

Required Authorization

The endpoint must have read permission on the certificate object.

Syntax

```
okv managed-object certificate get --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service": {
```

```
      "category": "managed-object",
      "resource": "certificate",
      "action": "get",
      "options": {
        "uuid": "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the certificate.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object certificate get` command.

   ```
   okv managed-object certificate get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "certificate",
       "action": "get",
       "options": {
         "uuid": "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_cert.json`) and then edit it to retrieve the specified certificate.

```
{
  "service": {
    "category": "managed-object",
    "resource": "certificate",
    "action": "get",
    "options": {
      "uuid": "EEED2C4F-33D7-4F9A-BF02-52DD2225A43A"
    }
  }
}
```

3. Run the `okv managed-object certificate get` command using the generated JSON file.

```
okv managed-object certificate get --from-json get_cert.json
```

Output similar to the following appears:

```
{
 "result": "Success",
  "value": {
   "object": "-----BEGIN CERTIFICATE-----
\nMIIDdzCCAl+gAwIBAgICfVEwDQYJKoZIhvcNAQELBQAwazELMAkGA1UEBhMCdXMx\nEzARB <<
output truncated >> AYP\n4vwrDwBdNdGtj36GqjuCpz/xCVM9ieSRxJU8\n-----END
CERTIFICATE-----"
  }
}
```

Example Using Text as Output Format

```
okv managed-object certificate get --output_format text --uuid EEED2C4F-33D7-4F9A-
BF02-52DD2225A43A
```

Output

Output similar to the following appears:

```
-----BEGIN CERTIFICATE-----
\nMIIDdzCCAl+gAwIBAgICfVEwDQYJKoZIhvcNAQELBQAwazELMAkGA1UEBhMCdXMx\nEzARB << output
truncated >> AYP\n4vwrDwBdNdGtj36GqjuCpz/xCVM9ieSRxJU8\n-----END CERTIFICATE-----
```

5.9 okv managed-object certificate register Command

The `okv managed-object certificate register` command registers a certificate.

Required Authorization

None

Syntax

```
okv managed-object certificate register --output_format <text|json> --object
certificate_file_path --type certificate_type --sub-type certificate_sub_type --
algorithm cryptographic_algorithm --length key_length --mask cryptographic_usage_mask
--private-key-uuid private_key_uuid --wallet wallet_name --activation-date
activation_date --deactivation-date deactivation_date
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "algorithm" : "#RSA",
      "length" : "#1024,2048,4096(RSA)",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT",
                 "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
                 "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],
      "type" : "X_509",
      "subType" : "#USER_CERT|TRUSTPOINT",
      "privateKeyUUID" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#VALUE",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--object / object	Required	File path to the certificate object.
--type / type	Optional	Type of certificate. Enter the following value: X_509.
--sub-type / subType	Optional	Sub-type of the certificate. Choose from the following values: • USER_CERT • TRUSTPOINT
--algorithm / algorithm	Optional	Cryptographic algorithm of the public key contained in the certificate. If you omit this parameter, then the algorithm is retrieved from the certificate file that is being uploaded. Enter the following value: • RSA

Parameter/Template Parameter	Required?	Description
`--length` / `length`	Optional	Length of the public key contained in the certificate. If you omit this parameter, then the key length is retrieved from the certificate file that being uploaded. Choose from the following values: • `1024` • `2048` • `4096`
`--mask` / `mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `ENCRYPT` • `DECRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `WRAP_KEY` • `VERIFY` • `SIGN` The default values are: • `WRAP_KEY` • `VERIFY` • `ENCRYPT`
`--privateKeyUUID` / `privateKeyUUID`	Optional	Universally unique ID (UUID) of the private key associated with the certificate object. To find the unique identifier for the key, run the `okv manage-access wallet list-objects` command or the `okv admin endpoint list-objects` command.
`--wallet` / `wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description

`--name`		Specifies the name of a security object. The allowed values are :
		• `value`
		• `type`
		The default value is:
		• `text`
		
		`-Support complex data format,`
		`name attribute in command line`
		`        --name '{"value" :`
		`"KEY1", "type" : "uri"}'or`
		`        --name '{"value" :`
		`"KEY1", "type" : "text}'`
		`-Support simplified data format,`
		`name attribute in command line.`
		`when type is "text" as a default:`
		`        --name KEY1`

`--custom-attribute` / `customAttribute`		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}'`
		`        --custom-attribute`
		`'[ { "name": "x-OKV Certificate`
		`Expiration Date",`
		`        "value" : "2017-04-29`
		`18:14:51"}, { "name": "x-local-`
		`name", "value" : "HR"} ] '`
		
		`Support simplified data format, name`
		`    attribute(single instance), in`
		`command line --name KEY1`
		
		`Support simplified data format,`
		`custom attribute(multi instance),in`
		`commandline`
		`    --custom-attribute "x-local-`
		`name:HR"`
		`    --custom-attribute ' [  "x-`
		`local-name:HR","x-local-id:100" ]'`

Parameter/Template Parameter	Required?	Description
`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`. If you omit this parameter, then the deactivation date is retrieved from the certificate file that being uploaded.
		`If deactivationDate meets the date criteria,the date is overwritten with the provided date.` `notBefore <= activationDate < notAfter` `activationDate < deactivationDate`
		If `deactivation-date` does not meet the criteria an error message displays.
`--activation-date`		Specifies when to activate a security object. It has the following format.
		`"activationDate" : "now" `*`--starts immediately`* `"activationDate" : "now+PT10M" --starts 10 minutes from now` `"activationDate" : "2021-12-20 10:30:00" `*`--starts at this date and time`* `"activationDate" : "2021-12-20 10:30:00+PT10M" `*`--starts 10 minutes after this date and time`*
		If you omit this parameter, then the activation date is retrieved from the certificate file that being uploaded.
		`If activationDate meets the date criteria,the date is overwritten with the provided date.` `notBefore < deactivationDate <= notAfter` `activationDate < deactivationDat`
		If `activation-date` does not meet the criteria an error message displays.

Parameter/Template Parameter	Required?	Description
`--attributes`/ `attributes`	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		Attributes that you can enter are as follows:
		• `name` includes the following:
		– `value` is the name value.
		– `type` is either `text` or `uri`. The default value is `text`.
		• `contactInfo`
		•
		• The following date and time attributes:
		– `activationDate`
		– `deactivationDate`
		– `protectStopDate`
		– `processStartDate`
		You can use different ways to set the date and time. Examples are as follows:
		`"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *-- starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		To display the time in UTC format, use the Linux `date` command. For example:
		`$ date --utc "+%F %T"` `2021-03-15 20:31:37`
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/Template Parameter	Required?	Description
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

CLI Example

```
okv managed-object certificate register --type X_509 --private-key-uuid
95092BD2-B546-4F9A-BF0B-D8ECDC548546 --algorithm RSA --mask "ENCRYPT" --object
/Users/dopark/test/my.crt --name cert_0701 --activation-date now
--deactivation-date "2030-10-10 10:10:10
```

JSON Example

1. Generate JSON input for the `okv managed-object certificate register` command.

   ```
   okv managed-object certificate register --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "certificate",
       "action" : "register",
       "options" : {
         "object" : "#VALUE",
         "algorithm" : "#RSA",
         "length" : "#1024,2048,4096(RSA)",
         "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
   "#UNWRAP_KEY", "#EXPORT",
                     "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
   "#TRANSLATE_ENCRYPT",
                     "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
         "subType" : "#USER_CERT|TRUSTPOINT",
         "privateKeyUUID" : "#VALUE",
         "wallet" : "#VALUE",
         "attributes" : {
           "name" : {
             "value" : "#VALUE",
             "type" : "#text|uri"
           },
   ```

```
        "contactInfo" : "#VALUE",
        "activationDate" : "#VALUE",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `reg_cert.json`) and then edit it to register the specified certificate.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate",
    "action" : "register",
    "options" : {
      "object" : "./cert.pem",
      "algorithm" : "RSA",
      "length" : "2048",
      "mask" : [ "ENCRYPT"],
      "type" : "X_509",
      "subType" : "USER_CERT",
      "privateKeyUUID" : "D497994E-74CD-4F60-BF7C-52F254142705",
      "wallet" : "hr_wallet",
      "attributes" : {
        "name" : {
          "value" : "FINDB-PROD-CERT",
          "type" : "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object certificate register` command using the generated JSON file.

```
okv managed-object certificate register --from-json reg_cert.json
```

Output similar to the following appears:

```
{
 "result" : "Success",
  "value" : {
  "uuid" : "EEED2C4F-33D7-4F9A-BF02-52DD2225A43A"
  }
}
```

Example Using Text as Output Format

```
okv managed-object certificate register --output_format text --object
certificate_file_path --type certificate_type --sub-type certificate_sub_type --
algorithm cryptographic_algorithm --length key_length --mask
```

cryptographic_usage_mask --private-key-uuid *private_key_uuid* --wallet *wallet_name*

Output

Output similar to the following appears:

```
"EEED2C4F-33D7-4F9A-BF02-52DD2225A43A"
```

  You specify the date or timestamp, and duration using the supported formats.

5.10 okv managed-object certificate-request get Command

The `okv managed-object certificate-request get` command retrieves a certificate request.

Required Authorization

The endpoint must have read permission on the certificate request object.

Syntax

```
okv managed-object certificate-request get --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate-request",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--uuid / uuid	Required	Universally unique ID (UUID) of the certificate request.
		To find the unique identifier for the certificate request, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the **Unique Identifier** column.

Parameter/Template Parameter	Required?	Description
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text` **✎ Note:** Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object certificate-request get` command.

```
okv managed-object certificate-request get  --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate-request",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `get_cert_req.json`) and then edit it to specify the UUID of the certificate request.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate-request",
    "action" : "get",
    "options" : {
      "uuid" : "BC0E9004-82E0-4FFA-BFF2-29A67DDD5C64"
    }
  }
}
```

3. Run the `okv managed-object certificate-request get` command using the generated JSON file.

```
okv managed-object certificate-request get  --from-json get_cert_req.json
```

Output similar to the following appears:

```
{
    "result" : "Success",
    "value" : {
     "object" : "-----BEGIN NEW CERTIFICATE REQUEST-----
\nMIIC5TCCAc0CAQAwdDELMAkGA1UEBhMCdXMxEzARBgNVBAgTCkNhbGlmb3JuaWEx << output
truncated >> \nDtWoeZfNYHcWPFmHK8aiLCgzeFG62xRdyg==\n-----END NEW CERTIFICATE
REQUEST-----"
      }
    }
```

Example Using Text as Output Format

```
okv managed-object certificate-request get --output_format text --uuid
BC0E9004-82E0-4FFA-BFF2-29A67DDD5C64
```

Output

Output similar to the following appears:

```
"-----BEGIN NEW CERTIFICATE REQUEST-----
\nMIIC5TCCAc0CAQAwdDELMAkGA1UEBhMCdXMxEzARBgNVBAgTCkNhbGlmb3JuaWEx << output truncated
>> \nDtWoeZfNYHcWPFmHK8aiLCgzeFG62xRdyg==\n-----END NEW CERTIFICATE REQUEST-----"
```

5.11 okv managed-object certificate-request register Command

The `okv managed-object certificate-request register` command registers a certificate request object with Oracle Key Vault.

Required Authorization

None

Syntax

```
okv managed-object certificate-request register --output_format <text|json>
object certificate_requeset_file_path --type certificate_requeset_type --
private-key-uuid private_key_uuid --wallet wallet_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate-request",
    "action" : "register",
    "options" : {
      "type" : "#CRMF,PKCS10,PEM,PGP",
      "object" : "#VALUE",
      "privateKeyUUID" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#VALUE",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--object / object	Required	File path to the certificate request object.
--type / type	Optional	Type of certificate request. Choose from the following values: • CRMF • PKCS10 • PGP The default value is: • PEM
--privateKeyUUID / privateKeyUUID	Required	Universally unique ID (UUID) of the private key associated with the certificate request to be registered. To find the unique identifier for the key, run the `okv manage-access wallet list-objects` command or the `okv admin endpoint list-objects` command.
--wallet / wallet	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description

`/attributes`	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		
		Attributes that you can enter are as follows:
		• `name` includes the following:
		 – `value` is the name value.
		 – `type` is either `text` or `uri`. The default value is `text`.
		• `contactInfo`
		• The following date and time attributes:
		 – `activationDate`
		 – `deactivationDate`
		 – `protectStopDate`
		 – `processStartDate`
		You can use different ways to set the date and time. Examples are as follows:
		
		`"activationDate" : "now"` *--starts immediately*
		`"activationDate" : "now+PT10M"` *--starts 10 minutes from now*
		`"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time*
		`"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		
		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`
		
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/Template Parameter	Required?	Description
`--name`		Specifies the name of a security object. The allowed values are : • `value` • `type` The default value is: • `text` `-Support complex data format,` `name attribute in command line` `--name '{"value" :` `"KEY1", "type" : "uri"}'or` `--name '{"value" :` `"KEY1", "type" : "text}'` `-Support simplified data format,` `name attribute in command line.` `when type is "text" as a default:` `--name KEY1`

`--custom-attribute/` `customAttribute`		Specifies custom defined attribute on security object.
		
		 `2017-04-29 18:14:51"}'` `--custom-attribute` `'[ { "name": "x-OKV Certificate` `Expiration Date",` `"value" : "2017-04-29` `18:14:51"}, { "name": "x-local-` `name", "value" : "HR"} ] '`
		
		 `Support simplified data format, name` `attribute(single instance), in` `command line --name KEY1`
		
		 `Support simplified data format,` `custom attribute(multi instance),in` `commandline` `--custom-attribute "x-local-` `name:HR"` `--custom-attribute ' [  "x-` `local-name:HR","x-local-id:100" ]'`

`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.

Parameter/Template Parameter	Required?	Description
`--activation-date`		Specifies when to activate a security object. It has the following format. `"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *-- starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

CLI Example

```
okv managed-object certificate-request register --name "FINDB-PROD-CERTREQ" --custom-attribute "x-local-name:HR" --activation-date "2020-12-31 09:00:00" --deactivation-date "2024-12-31 09:00:00"
```

JSON Example

1. Generate JSON input for the `okv managed-object certificate-request register` command.

   ```
   okv managed-object certificate-request register --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "certificate-request",
       "action" : "register",
       "options" : {
   ```

```
      "type" : "#CRMF,PKCS10,PEM,PGP",
      "object" : "#VALUE",
      "privateKeyUUID" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#VALUE",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `reg_cert_req.json`) and then edit it to specify the appropriate certificate request values.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "certificate-request",
    "action" : "register",
    "options" : {
      "type" : "PEM",
      "object" : "./cert_req.pem",
      "privateKeyUUID" : "D497994E-74CD-4F60-BF7C-52F254142705",
      "wallet" : "hr_wallet",
      "attributes" : {
        "name" : {
          "value" : "FINDB-PROD-CERTREQ",
          "type" : "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object certificate-request register` command using the generated JSON file.

```
okv managed-object certificate-request register --from-json reg_cert_req.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
   "value" : {
    "uuid" : "BC0E9004-82E0-4FFA-BFF2-29A67DDD5C64"
   }
    }
```

Example Using Text as Output Format

```
okv managed-object  certificate-request register --output_format text --object "./
cert_req.pem" --type "PEM" --private-key-uuid
      "D497994E-74CD-4F60-BF7C-52F254142705" --wallet hr_wallet  --activation-date now
--name hr_csr --custom-attribute "x-local-name:HR"
```

Output

Output similar to the following appears:

```
"BC0E9004-82E0-4FFA-BFF2-29A67DDD5C64"
```

  You specify the date or timestamp, and duration using the supported formats.

5.12 okv managed-object custom-attribute add Command

The `okv managed-object custom-attribute add` command adds a custom attribute to a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object custom-attribute add --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "add",
    "options" : {
      "uuid" : "#VALUE",
      "customAttribute" : {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid`/`uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`/ customAttribute`	Required	Custom attribute name. Include the prefix `x-` in the attribute name. Do not use the prefix of `x-OKV` with custom attribute names. The custom attributes that start with the `x-OKV` prefix are reserved for use by Oracle Key Vault only. You must use the JSON syntax to specify the attribute. You cannot specify attributes at the command line. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		You must specify these values for the custom attribute:
		• `name` is the name of the value that you want to add.
		• `value` is the value of the attribute.
		• `type` is either `text` or `number`.
		See Key Management Interoperability Protocol Specification Version 1.1 for details about JSON attributes.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object custom-attribute add` command.

```
okv managed-object custom-attribute add --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "add",
    "options" : {
      "uuid" : "#VALUE",
      "customAttribute" : {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `add_cust_attr.json`) and then edit it to include the custom attribute to the security object.

```
{
  "service": {
    "category": "managed-object",
    "resource": "custom-attribute",
    "action": "add",
    "options": {
      "uuid": "3C695846-BB8D-4FD2-BFC4-E646ACB60404",
      "customAttribute": {
        "name": "x-ApplicationTag",
        "value": "HR-Production",
        "type": "TEXT"
      }
    }
  }
}
```

3. Run the `okv managed-object custom-attribute add` command using the generated JSON file.

```
okv managed-object custom-attribute add --from-json add_cust_attr.json
```

Output similar to the following appears:

```
{
 "result" : "Success"
}
```

5.13 okv managed-object custom-attribute delete Command

The `okv managed-object custom-attribute delete` command deletes a custom attribute of a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object custom-attribute delete --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "delete",
    "options" : {
      "uuid" : "#VALUE",
      "customAttribute" : {
        "name" : "#VALUE",
        "index" : "#VALUE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

Parameter/Template Parameter	Required?	Description
`/ customAttribute`	Required	Custom attribute name and its index. Do not use the prefix of `x-OKV` with custom attribute names. The custom attributes that start with the `x-OKV` prefix are reserved for use by Oracle Key Vault only. You must use the JSON syntax to specify the attribute. You cannot specify attributes at the command line. To find the existing attributes for a managed object, run the `okv managed-object attribute get-all` command.
		You must specify these values for the attribute:
		• `name` is the name of the value.
		• `index` is the index of the value.

> **Note:**
>
> Do not use the prefix of `x-OKV` with custom attribute names. The custom attributes that start with the `x-OKV` prefix are reserved for use by Oracle Key Vault only.

See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

JSON Example

1. Generate JSON input for the `okv managed-object custom-attribute delete` command.

   ```
   okv managed-object custom-attribute delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "custom-attribute",
       "action" : "delete",
       "options" : {
         "uuid" : "#VALUE",
         "customAttribute" : {
           "name" : "#VALUE",
           "index" : "#VALUE"
         }
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `del_cust_attr.json`) and then edit it so that you can delete the custom attribute.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "delete",
    "options" : {
      "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "customAttribute" : {
        "name" : "x-ApplicationTag",
        "index" : "1"
      }
    }
  }
}
```

3. Run the `okv managed-object custom-attribute delete` command using the generated JSON file.

```
okv managed-object custom-attribute delete --from-json del_cust_attr.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

5.14 okv managed-object custom-attribute modify Command

The `okv managed-object custom-attribute modify` command modifies a custom attribute of a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

Uses JSON syntax only: `okv managed-object custom-attribute modify --generate-json-input`

You must use the JSON syntax for this command to specify the attributes. However, you can use the `--uuid` parameter at the command line with this command. This is useful for cases where you want to apply the same attribute values to multiple objects. You can re-use the same JSON file and specify different UUIDs at the command line.

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "modify",
    "options" : {
      "uuid" : "#VALUE",
      "customAttribute" : {
        "name" : "#VALUE",
        "newValue" : "#VALUE",
```

```
            "index" : "#VALUE"
         }
      }
   }
}
```

Parameters

Template Parameter	Required?	Description
`--uuid`/ `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`/ customAttribute`	Required	Custom attribute name, value, and index. You must use the JSON syntax to specify the attribute. You cannot specify attributes at the command line. To find the existing attributes for the managed object, run the `okv managed-object attribute get-all` command.
		You cannot specify attributes at the command line. You must use the JSON syntax to modify a custom attribute.
		You must specify these values for the attribute:
		• `name` is the name of the attribute that you want to modify.
		• `newValue` is the new value for the attribute.
		• `index` is the index of the attribute that you want to modify.
		✎ Note: Do not use the prefix of `x-OKV` with custom attribute names. The custom attributes that start with the `x-OKV` prefix are reserved for use by Oracle Key Vault only.
		See Key Management Interoperability Protocol Specification Version 1.1 for details about JSON attributes.

JSON Example

1. Generate JSON input for the `okv managed-object custom-attribute modify` command.

   ```
   okv managed-object custom-attribute modify --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "modify",
    "options" : {
      "uuid" : "#VALUE",
      "customAttribute" : {
        "name" : "#VALUE",
        "newValue" : "#VALUE",
        "index" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `modify_cust_attr.json`) and then edit it to modify the custom attribute.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "custom-attribute",
    "action" : "modify",
    "options" : {
      "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "customAttribute" : {
        "name" : "x-ApplicationTag",
        "newValue" : "Global-HR-Production",
        "index" : "1"
      }
    }
  }
}
```

3. Run the `okv managed-object custom-attribute modify` command using the generated JSON file.

```
okv managed-object custom-attribute modify --from-json modify_cust_attr.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

5.15 okv managed-object key create Command

The `okv managed-object key create` command creates a symmetric key.

Required Authorization

None

Syntax

```
okv managed-object key create --extractable --output_format <text|json> --
algorithm  cryptographic_algorithm --length  key_length --mask
crypographic_usage_mask --wallet wallet_name --name name_value --custom-attrbute
custom_attribute_value --activation-date activation_date --deactivation-date
deactivation_date
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "create",
    "options": {
      "algorithm": "#3DES|AES",
      "length": "#112,168(3DES)|128,192,256(AES)",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT",
                 "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
"#TRANSLATE_ENCRYPT",
                 "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],       "wallet": "#VALUE",
      "attributes": {
          "extractable" : "#TRUE|FALSE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--algorithm / algorithm	Optional	Cryptographic algorithm. Choose from the following values: • AES • 3DES The default value is: • AES
--length / length	Optional	Key length for the algorithm. Choose from the following values: • For AES: 128, 192, 256 • For 3DES: 112, 168 The default value is: • 256

Parameter/Template Parameter	Required?	Description
`--mask`/`mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `ENCRYPT` • `DECRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `SIGN` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VERIFY` • `VALIDATE_CRYPTOGRAM` • `WRAP_KEY` • The default values are: • `ENCRYPT` • `DECRYPT` • `UNWRAP_KEY` • `WRAP_KEY`
`--wallet`/`wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`/attributes`	Optional	Sets the `extractable` attribute. • `TRUE` Allows the object to be extracted from Oracle Key Vault. • `FALSE` Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault. If you do not set the `extractable` attribute, then this value is inherited from the endpoint's configuration. In the command line, you can only specify the `extractable` attribute setting that is stricter than the endpoint's effective setting. For example, you cannot set the `extractable` attribute to `TRUE` if it is set to `FALSE` in the endpoint. However, you can always set the extractable attribute value to `FALSE` in the command line.

Parameter/Template Parameter	Required?	Description
`--name`		Specifies the name of a security object. The allowed values are : • `value` • `type` The default value is: • `text` `-Support complex data format, name attribute in command line --name '{"value" : "KEY1", "type" : "uri"}'or --name '{"value" : "KEY1", "type" : "text}'` `-Support simplified data format, name attribute in command line. when type is "text" as a default: --name KEY1`

`--custom-attribute / -- custom-attribute`		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}' --custom-attribute '[ { "name": "x-OKV Certificate Expiration Date", "value" : "2017-04-29 18:14:51"}, { "name": "x-local-name", "value" : "HR"} ] '`
		
		`Support simplified data format, name attribute(single instance), in command line --name KEY1`
		
		`Support simplified data format, custom attribute(multi instance),in commandline --custom-attribute "x-local-name:HR" --custom-attribute ' [  "x-local-name:HR","x-local-id:100" ]'`

`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.

Parameter/Template Parameter	Required?	Description
`--activation-date`		Specifies when to activate a security object. It has the following format.
		`"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *--starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.

> **✎ Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

Example without using JSON

```
okv managed-object key create --length 128 --algorithm AES --
mask"ENCRYPT" --name  dw_0706
```

JSON Example

1. Generate JSON input for the `okv managed-object key create` command.

   ```
   okv managed-object key create --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "key",
       "action": "create",
       "options": {
         "algorithm": "#3DES|AES",
         "length": "#112,168(3DES)|128,192,256(AES)",
         "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
   ```

```
"#UNWRAP_KEY", "#EXPORT",
                    "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
"#TRANSLATE_ENCRYPT",
                    "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],      "wallet": "#VALUE",
      "attributes": {
          "extractable" : "#TRUE|FALSE"
        }
      }
    }
  }
```

2. Save the generated input to a file (for example, `create_key.json`) and then edit it to create the key.

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "create",
    "options": {
      "algorithm": "AES",
      "length": "256",
      "mask": [
        "ENCRYPT",
        "DECRYPT"
      ],
      "wallet": "hr_wallet",
      "attributes": {
          "extractable" : "FALSE"
      }
    }
  }
}
```

3. Run the `okv managed-object key create` command using the generated JSON file.

```
okv managed-object key create --from-json create_key.json
```

Output similar to the following appears:

```
{
  "result": "Success",
   "value": {
    "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
  }
}
```

Example Using Text as Output Format

```
okv managed-object key create --extractable false --output_format text --algorithm
cryptographic_algorithm --length key_length --mask crypographic_usage_mask --wallet
wallet_name
```

Output

Output similar to the following appears:

```
"2359E04F-DA61-4F7C-BF9F-913D3369A93A"
```

5.16 okv managed-object key get Command

The `okv managed-object key get` command retrieves a symmetric key.

Required Authorization

The endpoint must have read permission on the key object.

Syntax

```
okv managed-object key get --output_format <text|json> --uuid UUID
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "get",
    "options": {
      "uuid": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the key.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object key get` command.

```
okv managed-object key get --generate-json-input
```

The generated input appears as follows:

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "get",
    "options": {
      "uuid": "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `get_key.json`) and then edit it to get the specified key.

```
{
  "service": {
    "category": "managed-object",
    "resource": "key",
    "action": "get",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
    }
  }
}
```

3. Run the `okv managed-object key get` command using the generated JSON file.

```
okv managed-object key get --from-json get_key.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "object": "E7A641D77DDAF074C62E7A2C2355F2B8D9CD49486E6AF7F38A22CBDEC91630D0"
  }
}
```

If the symmetric key is not extractable, then the following message appears:

```
{
 "result" : "Failure",
 "message" : "Operation Result Status: Operation Failed, Result Reason:
Unavailable"
}
```

Example Using Text as Output Format

```
okv managed-object certificate-request get --output_format text --uuid 2359E04F-
DA61-4F7C-BF9F-913D3369A93A
```

Output

Output similar to the following appears:

```
"E7A641D77DDAF074C62E7A2C2355F2B8D9CD49486E6AF7F38A22CBDEC91630D0"
```

5.17 okv managed-object key register Command

The `okv managed-object key register` command registers a symmetric key.

Required Authorization

None

Syntax

```
okv managed-object key register --extractablefalse --output_format <text|json> --
algorithm cryptographic_algorithm --length key_length --mask
cryptographic_usage_mask --object key_file_path --wallet wallet_name --name
name_value --custom-attrbute custom_attribute_value --activation-date
activation_date --deactivation-date deactivation_date
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "key",
    "action" : "register",
    "options" : {
      "length" : "#112,168(3DES)|128,192,256(AES)",
      "object" : "#VALUE",
      "algorithm" : "#3DES|AES",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT",
                    "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
                    "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],        "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
         "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE",
        "extractable" : "#TRUE|FALSE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--algorithm`/ `algorithm`	Optional	Cryptographic algorithm. Choose from the following values: • `AES` • `3DES` The default value is: • `AES`
`--length`/ `length`	Optional	Key length for the algorithm. Choose from the following values: • For `AES`: `128, 192, 256` • For `3DES`: `112, 168` The default value is: • `256`
`--mask`/ `mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `ENCRYPT` • `DECRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `WRAP_KEY` The default values are: • `ENCRYPT` • `DECRYPT` • `WRAP_KEY` • `UNWRAP_KEY`
`--object`/ `object`	Required	File path to the symmetric key object.
`--wallet`/ `wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description
/attributes	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		Attributes that you can enter are as follows:

- `name` includes the following:
  - `value` is the name value.
  - `type` is either `text` or `uri`.
- `contactInfo`
- The following date and time attributes:
  - `activationDate`
  - `deactivationDate`
  - `protectStopDate`
  - `processStartDate`
- `extractable` can be set as follows:
  - `TRUE` Allows the object to be extracted from Oracle Key Vault.
  - `FALSE` Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault.

If you do not set the `extractable` attribute, then this value is inherited from the endpoint's configuration. In the command line, you can only specify the `extractable` attribute setting that is stricter than the endpoint's effective setting. For example, you cannot set the `extractable` attribute to `TRUE` if it is set to `FALSE` in the endpoint. However, you can always set the extractable attribute value to `FALSE` in the command line.

You can use different ways to set the date and time. Examples are as follows:

```
"activationDate" : "now" --starts
immediately
"activationDate" : "now+PT10M" --starts
10 minutes from now
"activationDate" : "2021-12-20
10:30:00" --starts at this date and time
"activationDate" : "2021-12-20
10:30:00+PT10M" --starts 10 minutes
after this date and time
```

Parameter/Template Parameter	Required?	Description

		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`
		
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

`--name`		Specifies the name of a security object. The allowed values are :
		• `value`
		• `type`
		The default value is:
		• `text`
		
		`-Support complex data format, name`
		`attribute in command line`
		`        --name '{"value" : "KEY1",`
		`"type" : "uri"}'or`
		`        --name '{"value" : "KEY1",`
		`"type" : "text}'`
		`-Support simplified data format,`
		`name attribute in command line. when`
		`type is "text" as a default:`
		`        --name KEY1`

`--custom-attribute//`
`customAttribute`
		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}'`
		`      --custom-attribute '[ { "name":`
		`"x-OKV Certificate Expiration Date",`
		`      "value" : "2017-04-29`
		`18:14:51"}, { "name": "x-local-name",`
		`"value" : "HR"} ] '`
		
		`Support simplified data format, name`
		`    attribute(single instance), in`
		`command line --name KEY1`
		
		`Support simplified data format, custom`
		`attribute(multi instance),in commandline`
		`    --custom-attribute "x-local-`
		`name:HR"`
		`    --custom-attribute ' [  "x-local-`
		`name:HR","x-local-id:100" ]'`

Parameter/Template Parameter	Required?	Description
`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.
`--activation-date`		Specifies when to activate a security object. It has the following format.
		`"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` `--starts 10 minutes from now` `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

Example without using JSON

```
     okv managed-object key register
     --length 128 --object/Users/dopark/test/my.key --algorithm AES
     --mask "ENCRYPT" --name dw_0701--activation-date now --
deactivation-date "2030-10-10 10:10:10"
     okv managed-object key register --name
     '{"value" : "dw_key_2"}'--activation-date --deactivation-date
     okv managed-object key register --name
     '{"value" : "dw_key_2", "type" :"uri"}' --activation-date --
deactivation-date
     okv managed-object key register --name
     '{"value" : "dw_key_2", "type" :"text"}' --activation-date --
deactivation-date
     okv managed-object key register --name
     '{"value" : "dw_key_2", "type" :"uri"}' --custom-attribute
'[ { "name": "x-OKV
```

```
                  Private Key UID", "value" :"CA8075A4-C13F-4FD0-BF58-FDB984CC879A"},
{ "name":
        "x-NAME2", "value" :"11111"} ] ' --activation-date
        --deactivation-date
```

JSON Example

1. Generate JSON input for the `okv managed-object key register` command.

   ```
   okv managed-object key register --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "key",
       "action" : "register",
       "options" : {
         "length" : "#112,168(3DES)|128,192,256(AES)",
         "object" : "#VALUE",
         "algorithm" : "#3DES|AES",
         "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
   "#UNWRAP_KEY", "#EXPORT",
                       "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
   "#TRANSLATE_ENCRYPT",
                       "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
         "wallet" : "#VALUE",
         "attributes" : {
           "name" : {
             "value" : "#VALUE",
             "type" : "#text|uri"
           },
           "contactInfo" : "#VALUE",
           "activationDate" : "#YYYY-MM-DD HH:mm:ss",
           "deactivationDate" : "#VALUE",
           "processStartDate" : "#VALUE",
           "protectStopDate" : "#VALUE",
           "extractable" : "#TRUE|FALSE"
         }
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `reg_key.json`) and then edit it to register the key.

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "key",
       "action": "register",
       "options": {
         "length": "256",
         "object": "./object.txt",
         "algorithm": "AES",
         "mask": [
           "ENCRYPT",
           "DECRYPT"
         ],
         "wallet": "hr_wallet",
   ```

```
      "attributes": {
        "name": {
          "value": "FINDB-PROD-MKEY",
          "type": "text"
        },
        "contactInfo" : "pfitch@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00",
        "extractable" : "FALSE"
      }
    }
  }
}
```

3. Run the `okv managed-object key register` command using the generated JSON file.

```
okv managed-object key register --from-json reg_key.json
```

Output similar to the following appears:

```
{
 "result": "Success",
  "value": {
   "uuid": "39BE0215-5D7B-4F38-BF5F-FC87C82AA004"
  }
}
```

Example Using Text as Output Format

```
okv managed-object key register --output_format text --algorithm
cryptographic_algorithm --length key_length --mask cryptographic_usage_mask --
object key_file_path --wallet wallet_name
```

Output

Output similar to the following appears:

```
"39BE0215-5D7B-4F38-BF5F-FC87C82AA004"
```

Related Topics

• How to Set the Date and Time in RESTful Services Utility Commands
  You specify the date or timestamp, and duration using the supported formats.

5.18 okv managed-object object activate Command

The `okv managed-object object activate` command activates a security object.

See Oasis Key Management Interoperability Protocol Specification Version 1.1 Oasis Standard for various states that a security object can be in.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

```
okv managed-object object activate --uuid UUID
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "activate",
    "options": {
      "uuid": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object managed-object activate` command.

   ```
   okv managed-object object activate --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
   ```

```
        "resource": "object",
        "action": "activate",
        "options": {
            "uuid": "#VALUE"
        }
      }
    }
```

2. Save the generated input to a file (for example, `activate_object.json`) and then edit it to activate the security object.

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "activate",
    "options": {
        "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
    }
  }
}
```

3. Run the `okv managed-object managed-object activate` command using the generated JSON file.

```
okv managed-object object activate --from-json activate_object.json
```

Output similar to the following appears:

```
{
 "result": "Success"
}
```

Example Using Output Format Text

```
okv managed-object object activate --output_format text --uuid UUID
```

Output

Output similar to the following appears:

- exit code 0 - Indicates Success
- exit code 1- Indicates Failure

5.19 okv managed-object object destroy Command

The `okv managed-object object destroy` command requests the server to destroy the key data for a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

```
okv managed-object object destroy --uuid UUID
```

JSON Input File Template

```
{
  "service": {
```

```
      "category": "managed-object",
      "resource": "object",
      "action": "destroy",
      "options": {
        "uuid": "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid`/`uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object object destroy` command.

   ```
   okv managed-object object destroy --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "object",
       "action": "destroy",
       "options": {
         "uuid": "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `destroy_obj.json`) and then edit it so that you can destroy the security object data.

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "destroy",
    "options": {
      "uuid": "B36F3AD1-0AC7-4FEB-BF32-79E6F727ECB2"
      }
    }
  }
```

3. Run the `okv managed-object object destroy` command using the generated JSON file.

```
okv managed-object object destroy --from-json destroy_obj.json
```

Output similar to the following appears:

```
{
 "result": "Success"
}
```

Example Using Output Format Text

```
okv managed-object object destroy --output_format text --uuid UUID
```

Output

Output similar to the following appears:

- exit code 0 - Indicates Success
- exit code 1- Indicates Failure

5.20 okv managed-object object locate Command

The `okv managed-object object locate` command locates a security object.

Required Authorization

The endpoint must have read permission on the objects.

Syntax

```
okv managed-object object locate --output_format text|json --output_format text
--max max_value --object-group-member object_group_member_type --state
state_value --name name_value --custom-attribute custom_attributes_value
```

JSON Input File Template

```
okv managed-object object locate --generate-json-input
{
  "service" : {
    "category" : "managed-object",
    "resource" : "object",
    "action" : "locate",
    "options" : {
      "max" : "#VALUE",
```

```
      "objectGroupMember" : "#FRESH|DEFAULT",
      "attributes" : {
        "name" : {
          "value" : "#VALUE"
        },
        "state" : "#PREACTIVE|ACTIVE|DEACTIVATED|COMPROMISED|DESTROYED|
DESTROYED_COMPROMISED",
        "objectType" : "#VALUE",
        "fresh" : "#YES|NO",
        "objectGroup" : "#VALUE",
        "contactInfo" : "#VALUE",
        "cryptographicAlgorithm" : "#VALUE",
        "cryptographicLength" : "#VALUE",
        "cryptoUsageMask" : "#VALUE",
        "certificateLength" : "#VALUE",
        "certificateType" : "#VALUE",
        "x509CertificateSubject" : "#VALUE",
        "x509CertificateIssuer" : "#VALUE",
        "digitalSigningAlgorithm" : "#VALUE",
        "digest" : {
          "digestValue" : "#VALUE",
          "algorithm" : "#VALUE",
          "keyFormatType" : "#VALUE"
        },
        "link" : {
          "linkType" : "#VALUE",
          "linkValue" : "#VALUE"
        },
        "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#YYYY-MM-DD HH:mm:ss",
        "initialDate" : "#YYYY-MM-DD HH:mm:ss",
        "lastChangeDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseOccurrenceDate" : "#YYYY-MM-DD HH:mm:ss",
        "destroyDate" : "#YYYY-MM-DD HH:mm:ss",
        "archiveDate" : "#YYYY-MM-DD HH:mm:ss",
        "extractable" : "#TRUE|FALSE",
        "neverExtractable" : "#TRUE|FALSE"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      } ]
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--max / max	Optional	Maximum number of objects that this command should return

Parameter/Template Parameter	Required?	Description
`--object-group-member` / `objectGroupMember`	Optional	Enter one of the following group values: • `DEFAULT` • `FRESH`
`--state` / `state`	Optional	Enter one of the following states: • `PREACTIVE` • `ACTIVE` • `DEACTIVATED` • `COMPROMISED` • `DESTROYED` • `DESTROYED_COMPROMISED`
`--name` / `name`	Optional	Name of the object to locate.

Parameter/Template Parameter	Required?	Description
`attributes`	Required	Attributes names and their values of the object to locate. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.

Attributes that you can enter are as follows:

- `name` includes `value`.
- `state` is the state of the object.
- `objectType`, type of the object.
- `fresh` indicates whether the object is fresh or not. Enter either `YES` or `NO`.
- `objectGroup` is the object group or wallet name.
- `contactInfo` is the contact information for the object.
- `cryptographicAlgorithm` is the cryptographic algorithm of the object.
- `cryptographicLength` is the cryptographic length of the object.
- `cryptoUsageMask` is the usage mask of the object.
- `certificateType` is the type of the certificate object.
- `x509CertificateSubject` is the subject of the X.509 certificate.
- `x509CertificateIssuer` is the issuer of the X.509 certificate.
- `digitalSigningAlgorithm` is the digital signature algorithm of the object.
- `digest` is digest of the object, which includes:
  - `digestValue` is the value of the digest.
  - `algorithm` is the hashing algorithm.
  - `keyFormatType` is the format of the object.
- `link` is the link attribute of the object, and it includes:
  - `linkType` is the type of the link.
  - `linkValue` is the linked object UUID.
- The following date and time attributes:
  - `activationDate`
  - `deactivationDate`
  - `protectStopDate`
  - `processStartDate`
  - `activationDate`
  - `deactivationDate`
  - `processStartDate`
  - `protectStopDate`
  - `initialDate`
  - `lastChangeDate`
  - `compromiseDate`
  - `compromiseOccurrenceDate`

Parameter/Template Parameter	Required?	Description
		– `destroyDate` – `archiveDate` • `extractable` can be set as follows: – `TRUE` Allows the object to be extracted from Oracle Key Vault. – `FALSE` Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault. • `neverExtractable` tracks whether the extraction of the security object has always been restricted during its existence in the Oracle Key Vault server. Settings are as follows: – `TRUE` means that the security object was never extractable from Oracle Key Vault during the object's existence. – `FALSE` means the security object was extractable from Oracle Key Vault at least once during the object's existence. You can use different ways to set the date and time. Examples are as follows: `"activationDate" : "2021-12-20 10:30:00" --starts at this date and time` To display the time in UTC format, use the Linux `date` command. For example: `$ date --utc "+%F %T"` `2021-03-15 20:31:37`

Parameter/Template Parameter	Required?	Description

`--cutstom-attribute`/`customAttribute`	Optional	List of custom attributes of the object to locate. Custom attributes that you can enter are as follows:
		• `name` is the name of the custom attribute.
		• `value` is the value of the custom attribute.
		• `type` is either `text` or `number`.
		
		`-Support simplified data format, name`
		    `attribute(single instance),`
		`in command line --name KEY1`
		`-Support simplified data format,`
		`custom attribute(multi instance),in`
		`commandline`
		    `--custom-attribute "x-local-`
		`name:HR"`
		    `--custom-attribute ' [ "x-`
		`local-name:HR","x-local-id:100" ]'`
		
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

`--name`		Specifies the name of a security object. The allowed values are :
		• `value`
		• `type`
		The default value is:
		• `text`
		
		`-Support complex data format, name`
		`attribute in command line`
		    `--name '{"value" : "KEY1",`
		`"type" : "uri"}'or`
		    `--name '{"value" : "KEY1",`
		`"type" : "text}'`
		`-Support simplified data format,`
		`name attribute in command line.`
		`when type is "text" as a default:`
		    `--name KEY1`

`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

ORACLE®

> **✎ Note:**
>
> Use the CLI command syntax to specify the output_format option. By default,
> the output format is JSON. However, the output_format option with a value
> as 'text' displays the output in text format. Use of text output format removes
> the need to parse JSON output. The option is useful when the output of a
> command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object object locate` command.

```
okv managed-object object locate --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "object",
    "action" : "locate",
    "options" : {
      "max" : "#VALUE",
      "objectGroupMember" : "#FRESH|DEFAULT",
      "attributes" : {
        "name" : {
          "value" : "#VALUE"
        },
        "state" : "#PREACTIVE|ACTIVE|DEACTIVATED|COMPROMISED|DESTROYED|
DESTROYED_COMPROMISED",
        "objectType" : "#VALUE",
        "fresh" : "#YES|NO",
        "objectGroup" : "#VALUE",
        "contactInfo" : "#VALUE",
        "cryptographicAlgorithm" : "#VALUE",
        "cryptographicLength" : "#VALUE",
        "cryptoUsageMask" : "#VALUE",
        "certificateLength" : "#VALUE",
        "certificateType" : "#VALUE",
        "x509CertificateSubject" : "#VALUE",
        "x509CertificateIssuer" : "#VALUE",
        "digitalSigningAlgorithm" : "#VALUE",
        "digest" : {
          "digestValue" : "#VALUE",
          "algorithm" : "#VALUE",
          "keyFormatType" : "#VALUE"
        },
        "link" : {
          "linkType" : "#VALUE",
          "linkValue" : "#VALUE"
        },
        "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#YYYY-MM-DD HH:mm:ss",
        "initialDate" : "#YYYY-MM-DD HH:mm:ss",
        "lastChangeDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseDate" : "#YYYY-MM-DD HH:mm:ss",
        "compromiseOccurrenceDate" : "#YYYY-MM-DD HH:mm:ss",
```

```
      "destroyDate" : "#YYYY-MM-DD HH:mm:ss",
      "archiveDate" : "#YYYY-MM-DD HH:mm:ss",
      "extractable" : "#TRUE|FALSE",
      "neverExtractable" : "#TRUE|FALSE"
    },
    "customAttributes" : [ {
      "name" : "#VALUE",
      "value" : "#VALUE",
      "type" : "#TEXT|NUMBER"
    } ]
  }
 }
}
```

2. Save the generated input to a file (for example, `locate_obj.json`) and then edit it to locate the security object.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "object",
    "action" : "locate",
    "options" : {
      "max" : "10",
      "objectGroupMember" : "FRESH",
      "attributes" : {
        "state": "ACTIVE",
         "name": {
            "value": "key8"
         },
         "fresh" : "Yes",
         "activationDate": "2021-04-10 07:16:00",
          "link" : {
            "linkType" : "Replaced Object Link",
            "linkValue" : "6B13B7B3-BE61-4FF6-BFB0-4108231392F8"
           },
          "extractable" : "FALSE",
          "neverExtractable" : "TRUE"
      },
     "customAttributes" : [{
        "name": "x-test_1",
        "value": "test_1",
        "type": "TEXT"
       },
       {
        "name": "x-number",
        "value": "1",
        "type": "NUMBER"
       }]
    }
  }
}
```

3. Run the `okv managed-object object locate` command using the generated JSON file.

```
okv managed-object object locate --from-json locate_obj.json
```

Output similar to the following appears:

```
{
    "result" : "Success",
    "value" : {
```

```
                "uuids" : [ "6C51CC04-BFA5-4FBD-BFB4-12DCCECAA355" ]
            }
        }
```

Example Using Output Format Text

```
okv managed-object object locate --output_format text|json --output_format text
--max max_value --object-group-member object_group_member_type --state
state_value --name name_value --custom-attribute custom_attributes_value
```

Output

Output similar to the following appears:

```
"6C51CC04-BFA5-4FBD-BFB4-12DCCECAA355"
```

  You specify the date or timestamp, and duration using the supported formats.

5.21 okv managed-object object query Command

The `okv managed-object object query` command identifies supported operations and objects.

Required Authorization

None

Syntax

```
okv managed-object object query
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "query"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv managed-object object query` command.

   ```
   okv managed-object object query --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "object",
   ```

```
      "action": "query"
    }
  }
```

2. Save the generated input to a file (for example, `query_obj.json`).

3. Run the `okv managed-object object query` command using the generated JSON file.

```
okv managed-object object query --from-json query_obj.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "objects": [
      "Symmetric Key",
      "Template",
      "Secret Data",
      "Opaque Object",
      "Certificate"
    ],
    "operations": [
      "Create",
      "Register",
      "Re-key",
      "Locate",
      "Check",
      "Get",
      "Get Attributes",
      "Get Attribute List",
      "Add Attribute",
      "Modify Attribute",
      "Delete Attribute",
      "Activate",
      "Revoke",
      "Destroy",
      "Query",
      "Discover Versions"
    ]
  }
}
```

5.22 okv managed-object object revoke Command

The `okv managed-object object revoke` command revokes a security object.

Required Authorization

The endpoint must have read-modify permission on the object.

Syntax

```
okv managed-object object revoke --code code --reason reason --compromise-occurrence-
date date --uuid UUID
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
```

```
    "resource": "object",
    "action": "revoke",
    "options": {
      "code": "#UNSPECIFIED|KEY_COMPROMISE|CA_COMPROMISE|AFFILIATION_CHANGED|
SUPERSEDED|CESSATION_OF_OPERATION|PRIVILEGE_WITHDRAWN",
      "reason": "#VALUE",
      "compromiseOccurrenceDate": "#VALUE",
      "uuid": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--code` / `code`	Optional	Enter one of the following values: • `AFFILIATION_CHANGED` • `CA_COMPROMISE` • `CESSATION_OF_OPERATION` • `PRIVILEGE_WITHDRAWN` • `SUPERSEDED` • `UNSPECIFIED` • `KEY_COMPROMISE` The default value is: • `KEY_COMPROMISE`
`--reason` / `reason`	Required	Description of the reason for the revocation
`--compromise-occurrence-date` / `compromiseOccurrenceDate`	Optional	Date the compromise took place. This setting is used only if `KEY_COMPROMISE` is selected for the `--code` / `code` parameter.
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object. To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **✎ Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object object revoke` command.

```
okv managed-object object revoke --generate-json-input
```

The generated input appears as follows:

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "revoke",
    "options": {
      "code": "#UNSPECIFIED|KEY_COMPROMISE|CA_COMPROMISE|AFFILIATION_CHANGED|
SUPERSEDED|CESSATION_OF_OPERATION|PRIVILEGE_WITHDRAWN",
      "reason": "#VALUE",
      "compromiseOccurrenceDate": "#VALUE",
      "uuid": "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `revoke_obj.json`) and then edit it so that you can revoke the security object privileges.

```
{
  "service": {
    "category": "managed-object",
    "resource": "object",
    "action": "revoke",
    "options": {
      "code": "KEY_COMPROMISE",
      "reason": "security incidence",
      "compromiseOccurrenceDate": "2020-11-20 10:34:29",
      "uuid": "E4CA6A16-B3CD-4F98-BF25-4A0EF482B8B8"
    }
  }
}
```

3. Run the `okv managed-object object revoke` command using the generated JSON file.

```
okv managed-object object revoke --from-json revoke_obj.json
```

Output similar to the following appears:

```
{
 "result": "Success"
}
```

Example Using Output Format Text

```
okv managed-object object revoke --output_format text --code code --reason
reason --compromise-occurrence-date date --uuid UUID
```

Output

Output similar to the following appears:

- exit code 0 - Indicates Success
- exit code 1- Indicates Failure

5.23 okv managed-object opaque get Command

The `okv managed-object opaque get` command retrieves an object that contains opaque data.

Required Authorization

The endpoint must have read permission on the object.

Syntax

```
okv managed-object opaque get --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "opaque",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

Parameter/Template Parameter	Required?	Description
--output_format	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • text

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object opaque get` command.

```
okv managed-object opaque get --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "opaque",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `get_opaque_object.json`) and then edit it to retrieve the data from the opaque object.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "opaque",
    "action" : "get",
    "options" : {
      "uuid" : "2359E04F-DA61-4F7C-BF9F-913D3369A93A"
    }
  }
}
```

3. Run the `okv managed-object opaque get` command using the generated JSON file.

```
okv managed-object opaque get --from-json get_opaque_object.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
   "object" :
"2D2D2D2D2D424547494E2050524956415445204B45592D2D2D2D2D0A4D494945765149424144

2D2D2D2D0A"
  }
 }
```

Example Using Output Format Text

```
okv managed-object opaque get --output_format text --uuid 2359E04F-DA61-4F7C-
BF9F-913D3369A93A
```

Output

Output similar to the following appears:

```
2D2D2D2D2D424547494E2050524956415445204B45592D2D2D2D2D0A4D49945765149424144414E4

```

5.24 okv managed-object opaque register Command

The `okv managed-object opaque register` command registers an opaque security object.

Objects containing opaque data are not necessarily interpreted by the server.

Required Authorization

None

Syntax

```
okv managed-object opaque register --object object_name --wallet wallet_name --
name name_value --custom-attrbute custom_attribute_value --activation-date
activation_date --deactivation-date deactivation_date
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "opaque",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
```

```
      "name" : {
        "value" : "#VALUE",
        "type" : "#text|uri"
      },
      "contactInfo" : "#VALUE",
      "activationDate" : "#YYYY-MM-DD HH:mm:ss",
      "deactivationDate" : "#VALUE",
      "processStartDate" : "#VALUE",
      "protectStopDate" : "#VALUE"
    }
  }
}
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--object` / `object`	Required	File path to the object.
`--wallet` / `wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description
attributes	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.

You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.

Attributes that you can enter are as follows:

- `name` includes the following:
  - `value` is the name value.
  - `type` is either `text` or `uri`. The default value is `text`.
- `contactInfo`
- The following date and time attributes:
  - `activationDate`
  - `deactivationDate`
  - `protectStopDate`
  - `processStartDate`

You can use different ways to set the date and time. Examples are as follows:

```
"activationDate" : "now" --starts
immediately
"activationDate" : "now+PT10M" --
starts 10 minutes from now
"activationDate" : "2021-12-20
10:30:00" --starts at this date and
time
"activationDate" : "2021-12-20
10:30:00+PT10M" --starts 10 minutes
after this date and time
```

To display the time in UTC format, use the Linux `date` command. For example:

```
$ date --utc "+%F %T"
2021-03-15 20:31:37
```

See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/Template Parameter	Required?	Description

`--name`		Specifies the name of a security object. The allowed values are :
		
		 • `value`
		 • `KEY1`
		 • `type`
		 • `uri`
		
		 The default value is:
		
		 • `text`
		
		 ```-Support complex data format,```
		 ```name attribute in command line```
		 ``` --name '{"value" :```
		 ```"KEY1", "type" : "uri"}'or```
		 ``` --name '{"value" :```
		 ```"KEY1", "type" : "text}'```
		 ```-Support simplified data format,```
		 ```name attribute in command line.```
		 ```when type is "text" as a default:```
		 ``` --name KEY1```

`--custom-attribute`		Specifies custom defined attribute on security object.
		
		 ```Support simplified data format,```
		 ```custom attribute(multi instance),in```
		 ```commandline```
		 ``` --custom-attribute "x-local-```
		 ```name:HR"```
		 ``` --custom-attribute ' ["x-```
		 ```local-name:HR","x-local-id:100"]'```
		
		 ```Support simplified data format, name```
		 ``` attribute(single instance), in```
		 ```command line --name KEY1```
		
		 Specifies custom defined attribute on security object.
		
		 ```2017-04-29 18:14:51"}'```
		 ``` --custom-attribute```
		 ```'[{ "name": "x-OKV Certificate```
		 ```Expiration Date",```
		 ``` "value" : "2017-04-29```
		 ```18:14:51"}, { "name": "x-local-```
		 ```name", "value" : "HR"}] '```

`--deactivation-date`		Specifies when to deactivate a security object.

Parameter/Template Parameter	Required?	Description
`--activation-date`		Specifies when to activate a security object. It has the following format. `"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *--starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object opaque register` command.

```
okv managed-object opaque register --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "opaque",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
```

```
            "contactInfo" : "#VALUE",
            "activationDate" : "#YYYY-MM-DD HH:mm:ss",
            "deactivationDate" : "#VALUE",
            "processStartDate" : "#VALUE",
            "protectStopDate" : "#VALUE"
          }
        }
      }
    }
```

2. Save the generated input to a file (for example, `reg_opaque.json`) and then edit it to register the opaque key.

```
{
  "service": {
    "category": "managed-object",
    "resource": "opaque",
    "action": "register",
    "options": {
      "object": "./key.pem",
      "wallet": "hr_wallet",
      "attributes": {
        "name": {
          "value": "Opaque-Key-102",
          "type": "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object opaque register` command using the generated JSON file.

```
okv managed-object opaque register --from-json reg_opaque.json
```

Output similar to the following appears:

```
{
 "result" : "Success",
  "value" : {
   "uuid" : "B44A99FD-F892-4F3E-BF7D-487B68159CC3"
  }
}
```

Example Using Output Format Text

```
okv managed-object opaque register --output_format text --object object_name --wallet
wallet_name
```

Output

Output similar to the following appears:

```
"B44A99FD-F892-4F3E-BF7D-487B68159CC3"
```

Related Topics

- How to Set the Date and Time in RESTful Services Utility Commands
  You specify the date or timestamp, and duration using the supported formats.

- okv managed-object opaque get Command
  The `okv managed-object opaque get` command retrieves an object that contains opaque data.

5.25 okv managed-object private-key get Command

The `okv managed-object private-key get` command retrieves a private key.

Required Authorization

The endpoint must have read permission on the private key.

Syntax

```
okv managed-object private-key get  --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "private-key",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the private key.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.

Parameter/Template Parameter	Required?	Description
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.

> ✏️ **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

The default value is:
- `text`

JSON Example

1. Generate JSON input for the `okv managed-object private-key get` command.

   ```
   okv managed-object private-key get  --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "private-key",
       "action" : "get",
       "options" : {
   ```

```
            "uuid" : "#VALUE"
        }
     }
}
```

2. Save the generated input to a file (for example, `get_private_key.json`) and then edit it to specify the UUID of the private key.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "private-key",
    "action" : "get",
    "options" : {
        "uuid" : "2F9E2A31-D15A-4F5B-BFA0-761892021DBE"
    }
  }
}
```

3. Run the `okv managed-object private-key get` command using the generated JSON file.

```
okv managed-object private-key get  --from-json get_private_key.json
```

Output similar to the following appears:

```
{
    "result" : "Success",
    "value" : {
        "object" : "-----BEGIN PRIVATE KEY-----
\nMIIEvgIBADANBgkqhkiG9w0BAQEFAASCBKgwggSkAg << output truncated >> /
onTXJKf8A1kZwPW/Qa6IpPOGCfOJDtyM9F5X9REaJQr+1\nXw1sBm1Tjh4z/
m6rsKK6A4YP\n-----END PRIVATE KEY-----"
                }
}
```

Example Using Output Format Text

```
okv managed-object private-key get --output_format text --uuid 2F9E2A31-
D15A-4F5B-BFA0-761892021DBE
```

Output

Output similar to the following appears:

```
"-----BEGIN PRIVATE KEY-----\nMIIEvgIBADANBgkqhkiG9w0BAQEFAASCBKgwggSkAg <<
output truncated >> /onTXJKf8A1kZwPW/Qa6IpPOGCfOJDtyM9F5X9REaJQr+1\nXw1sBm1Tjh4z/
m6rsKK6A4YP\n-----END PRIVATE KEY-----"
```

5.26 okv managed-object private-key register Command

The `okv managed-object private-key register` command registers a private key. You can use this command to also register an SSH private key.

Required Authorization

None

Syntax

```
okv managed-object private-key register [--activation-date <activation date>] [--
algorithm <algorithm>] [--custom-attribute <custom attribute>] [--deactivation-date
<deactivation date>] [--extractable <extractable>] --length <length> [--mask <mask>]
[--name <name>] --object <object> [--ssh-user <ssh-user>] [--wallet <wallet>]
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "private-key",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "algorithm" : "#RSA",
      "length" : "#1024,2048,4096(RSA)",
      "sshUser" : "#VALUE",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT", "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
                 "#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT",
"#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "extractable" : "#TRUE|FALSE"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      } ]
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--object` / `object`	Required	File path to the private key object.
`--algorithm` / `algorithm`	Optional	Cryptographic algorithm. The default value is: `RSA`.
`--length` / `length`	Required	Key length for the algorithm. Choose from the following values: • `1024` • `2048` • `4096`

Parameter/Template Parameter	Required?	Description
--mask / mask	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • ENCRYPT • DERIVE_KEY • EXPORT • GENERATE_CRYPTOGRAM • SIGN • TRANSLATE_DECRYPT • TRANSLATE_ENCRYPT • TRANSLATE_UNWRAP • TRANSLATE_WRAP • VALIDATE_CRYPTOGRAM • WRAP_KEY • VERIFY • The default values are: • DECRYPT • UNWRAP_KEY
--wallet / wallet	Optional	Wallet name. To find the names of existing wallets to which you have access, run the okv manage-access wallet list command.

Parameter/Template Parameter	Required?	Description

`/attributes`	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		
		Attributes that you can enter are as follows:
		
		• `name` includes the following:
		  – `value` is the name value.
		  – `type` is either `text` or `uri`. the default value is`text`.
		• `contactInfo`
		• The following date and time attributes:
		  – `activationDate`
		  – `deactivationDate`
		  – `protectStopDate`
		  – `processStartDate`
		• `extractable` can be set as follows:
		
		  – `TRUE` Allows the object to be extracted from Oracle Key Vault.
		  – `FALSE` Prevents the key material within the object from being extracted from Oracle Key Vault. However, the metadata of the object (including object attributes, state, and so on) can still be retrieved from Oracle Key Vault.
		
		If you do not set the `extractable` attribute, then this value is inherited from the endpoint's configuration. In the command line, you can only specify the `extractable` attribute setting that is stricter than the endpoint's effective setting. For example, you cannot set the `extractable` attribute to `TRUE` if it is set to `FALSE` in the endpoint. However, you can always set the extractable attribute value to `FALSE` in the command line.
		
		You can use different ways to set the date and time. Examples are as follows:
		
		`"activationDate" : "now"` *--starts immediately*
		`"activationDate" : "now+PT10M"` *--starts 10 minutes from now*
		`"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time*
		`"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*

Parameter/Template Parameter	Required?	Description

		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`
		
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

`--name`		Specifies the name of a security object. The allowed values are :
		• value
		• type
		The default value is:
		• text
		
		`-Support complex data format, name attribute in command line`
		`        --name '{"value" : "KEY1", "type" : "uri"}'or`
		`        --name '{"value" : "KEY1", "type" : "text}'`
		`-Support simplified data format, name attribute in command line.`
		`when type is "text" as a default:`
		`        --name KEY1`

`--custom-attribute//`
`customAttribute`
		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}'`
		`      --custom-attribute '[ { "name": "x-OKV Certificate Expiration Date",`
		`        "value" : "2017-04-29 18:14:51"}, { "name": "x-local-name", "value" : "HR"} ] '`
		
		`Support simplified data format, name attribute(single instance), in command line --name KEY1`
		
		`Support simplified data format, custom attribute(multi instance),in commandline`
		`      --custom-attribute "x-local-name:HR"`
		`      --custom-attribute ' [  "x-local-name:HR","x-local-id:100" ]'`

Parameter/Template Parameter	Required?	Description
`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.
`--activation-date`		Specifies when to activate a security object. It has the following format. `"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` `--starts 10 minutes from now` `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`
`--ssh-user`/`sshUser`	Optional	SSH user name. The SSH user is intended to track the actual consumer of the SSH keys, a human, an application, or a machine.

> **✎ Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

Example without using JSON

```
okv managed-object private-key register --algorithm RSA --length 2048
      --mask"ENCRYPT" --object /Users/dopark/test/id_rsa
      --name private_0701--activation-date now --deactivation-date
"2030-10-10 10:10:10"
```

JSON Example

1. Generate JSON input for the `okv managed-object private-key register` command.

   ```
   okv managed-object private-key register --generate-json-input
   ```

   The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "private-key",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "algorithm" : "#RSA",
      "length" : "#1024,2048,4096(RSA)",
      "sshUser" : "#VALUE",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT", "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
                 "#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
"#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "extractable" : "#TRUE|FALSE"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER"
      } ]
    }
  }
}
```

2. Save the generated input to a file (for example, `reg_private_key.json`) and then edit it to specify the appropriate private key settings.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "private-key",
    "action" : "register",
    "options" : {
      "object" : "./priv_key.pem",
      "algorithm" : "RSA",
      "length" : "2048",
      "mask" : [ "ENCRYPT", "DECRYPT" ],
      "wallet" : "hr_wallet",
      "attributes" : {
        "name" : {
          "value" : "CERT-APPID-103",
          "type" : "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
```

```
      }
    }
  }
```

3. Run the `okv managed-object private-key register` command using the generated JSON file.

```
okv managed-object private-key register --from-json reg_private_key.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
   "value" : {
     "uuid" : "2F9E2A31-D15A-4F5B-BFA0-761892021DBE"
   }
}
```

Example Using Output Format Text

```
okv managed-object private-key register --object privkey.pem --algorithm RSA --length
2048 --activation-date now
```

Output

Output similar to the following appears:

```
"2F9E2A31-D15A-4F5B-BFA0-761892021DBE"
```

5.27 okv managed-object public-key get Command

The `okv managed-object public-key get` command retrieves a public key.

Required Authorization

The endpoint must have read permission on the public key.

Syntax

```
okv managed-object public-key get  --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "public-key",
    "action" : "get",
    "options" : {
      "uuid" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the public key.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object public-key get` command.

   ```
   okv managed-object public-key get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "public-key",
       "action" : "get",
       "options" : {
         "uuid" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_public_key.json`) and then edit it to specify the UUID of the public key.

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "public-key",
       "action" : "get",
   ```

```
    "options" : {
      "uuid" : "11652909-D019-4F3B-BFB9-791723095005"
    }
  }
}
```

3. Run the `okv managed-object public-key get` command using the generated JSON file.

```
okv managed-object public-key get  --from-json get_public_key.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "object" : "-----BEGIN PUBLIC KEY-----
\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAtK4YrT6A/

kX9C66H0WRMxgfaOn/uRNbikFOFK6IPOGcT+0S\n/QIDAQAB\n-----END PUBLIC KEY-----"
  }
}
```

Example Using Output Format Text

```
okv managed-object public-key get --output_format text --uuid 11652909-D019-4F3B-
BFB9-791723095005
```

Output

Output similar to the following appears:

```
"-----BEGIN PUBLIC KEY-----\nMIIBIjANBgkqhkiG9w0BAQEFAAOCAQ8AMIIBCgKCAQEAtK4YrT6A/

```

5.28 okv managed-object public-key register Command

The `okv managed-object public-key register` command registers a public key. You can use this command to also register an SSH public key.

Required Authorization

None

Syntax

```
okv managed-object public-key register [--activation-date <activation date>] [--
algorithm <algorithm>] [--custom-attribute <custom attribute>]
      [--deactivation-date <deactivation date>] --length <length> [--mask <mask>] [--
name <name>] --object <object> [--private-key-uuid
      <private-key-uuid>] [--ssh-user <ssh-user>] [--wallet <wallet>]
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "public-key",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "algorithm" : "#RSA",
      "length" : "#1024,2048,4096(RSA)",
      "sshUser" : "#VALUE",
       "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT","#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT",
"#TRANSLATE_WRAP","#TRANSLATE_UNWRAP" ],
      "privateKeyUUID" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
       "contactInfo" : "#VALUE",
       "activationDate" : "#VALUE",
       "deactivationDate" : "#VALUE",
       "processStartDate" : "#VALUE",
       "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--object / object	Required	File path to the public key object.
--algorithm / algorithm	Optional	Cryptographic algorithm. The default value is: • RSA
--length / length	Required	Key length for the algorithm. Choose from the following values: • 1024 • 2048 • 4096

Parameter/Template Parameter	Required?	Description
`--mask`/`mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `ENCRYPT` • `DECRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `SIGN` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `VERIFY` • `WRAP_KEY` • The default values are: • `WRAP_KEY` • `ENCRYPT` • `VERIFY`
`--privateKeyUUID`/ `privateKeyUUID`	Optional	Universally unique ID (UUID) of the private key associated with the public key being registered. To find the unique identifier for the key, run the `okv manage-access wallet list-objects` command or the `okv admin endpoint list-objects` command.
`--wallet`/`wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.

Parameter/Template Parameter	Required?	Description

/attributes	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		
		Attributes that you can enter are as follows:
		• `name` includes the following:
		  – `value` is the name value.
		  – `type` is either `text` or `uri`.
		• `contactInfo`
		• The following date and time attributes:
		  – `activationDate`
		  – `deactivationDate`
		  – `protectStopDate`
		  – `processStartDate`
		
		You can use different ways to set the date and time. Examples are as follows:
		
		`"activationDate" : "now"` *--starts immediately*
		`"activationDate" : "now+PT10M"` *--starts 10 minutes from now*
		`"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time*
		`"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		
		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`
		
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/Template Parameter	Required?	Description
`--name`		Specifies the name of a security object. The allowed values are : • `value` • `type` The default value is: • `text` `-Support complex data format, name attribute in command line --name '{"value" : "KEY1", "type" : "uri"}'or --name '{"value" : "KEY1", "type" : "text}' -Support simplified data format, name attribute in command line. when type is "text" as a default: --name KEY1`

`--custom- attribute// customAttribute`		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}' --custom-attribute '[ { "name": "x-OKV Certificate Expiration Date", "value" : "2017-04-29 18:14:51"}, { "name": "x-local- name", "value" : "HR"} ] '`
		
		`Support simplified data format, name attribute(single instance), in command line --name KEY1`
		
		`Support simplified data format, custom attribute(multi instance),in commandline --custom-attribute "x-local- name:HR" --custom-attribute ' [ "x- local-name:HR","x-local-id:100" ]'`

`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.

Parameter/Template Parameter	Required?	Description
`--activation-date`		Specifies when to activate a security object. It has the following format. `"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *-- starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`
`--ssh-user`/`sshUser`	Optional	SSH user name. The SSH user is intended to track the actual consumer of the SSH keys, a human, an application, or a machine.

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object public-key register` command.

```
okv managed-object public-key register --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "public-key",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "algorithm" : "#RSA",
```

```
      "length" : "#1024,2048,4096(RSA)",
      "sshUser" : "#VALUE",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT","#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT",
"#TRANSLATE_WRAP","#TRANSLATE_UNWRAP" ],
      "privateKeyUUID" : "#VALUE",
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#VALUE",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `reg_public_key.json`) and then edit it to specify the appropriate public key settings.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "public-key",
    "action" : "register",
    "options" : {
      "object" : "./key.pub",
      "algorithm" : "RSA",
      "length" : "2048",
      "mask" : [ "ENCRYPT", "DECRYPT" ],
      "privateKeyUUID" : "2F9E2A31-D15A-4F5B-BFA0-761892021DBE ",
      "wallet" : "hr_wallet",
      "attributes" : {
        "name" : {
          "value" : " FINDB-PROD-PUBKEY ",
          "type" : "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object public-key register` command using the generated JSON file.

```
okv managed-object public-key register --from-json reg_public_key.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
```

```
     "value" : {
      "uuid" : "11652909-D019-4F3B-BFB9-791723095005"
     }
    }
```

Example without using JSON

```
okv managed-object public-key register   --object
id_rsa.pub  --algorithm RSA ---length 2048 -mask "ENCRYPT"
--private-key-uuid  95092BD2-B546-4F9A-BF0B-D8ECDC548546 --name
hr_public_key
--activation-date now --deactivation-date "2030-10-10 10:10:10
```

Example Using Output Format Text

```
okv managed-object public-key register --output_format text --object
public_key_file_path --algorithm cryptographic_algorithm --length key_length --
mask cryptographic_usage_mask --private-key-uuid private_key_uuid --wallet
wallet_nameokv managed-object public-key get --output_format text --uuid UUID
```

Output

Output similar to the following appears:

```
"11652909-D019-4F3B-BFB9-791723095005 "
```

5.29 okv managed-object secret get Command

The `okv managed-object secret get` command retrieves the secret data from a security object of type secret.

Required Authorization

The endpoint must have read permission on the secret object.

Syntax

```
okv managed-object secret get --output_format OUTPUT_FORMAT --uuid UUID
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "secret",
    "action": "get",
    "options": {
      "uuid": "#VALUE"
    }
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the security object.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object secret get` command.

   ```
   okv managed-object secret get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "secret",
       "action": "get",
       "options": {
         "uuid": "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `secret_get.json`) and then edit it to locate the secret object.

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "secret",
       "action": "get",
       "options": {
         "uuid": "D69D2F32-2DBB-4FF3-BF52-95487526E6EC"
       }
   ```

```
    }
  }
```

3. Run the `okv managed-object secret get` command using the generated JSON file.

```
okv managed-object secret get --from-json secret_get.json
```

Output similar to the following appears:

```
{
    "result": "Success",
    "value": {
      "object": "ki3j&8slo73y2ls"
     }
   }
```

Example Using Output Format Text

```
okv managed-object secret get --output_format text --uuid D69D2F32-2DBB-4FF3-
BF52-95487526E6EC
```

Output

Output similar to the following appears:

```
"ki3j&8slo73y2ls"
```

5.30 okv managed-object secret register Command

The `okv managed-object secret register` command registers secret data such as passwords or random seeds.

Required Authorization

None

Syntax

```
okv managed-object secret register --output_format text|json --object
object_name type PASSWORD|SEED wallet wallet_name --mask
cryptogrpahic_usage_mask --name name_value --custom-attrbute
custom_attribute_value --activation-date activation_date --deactivation-date
deactivation_date
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "secret",
    "action" : "register",
    "options" : {
      "object" : "#VALUE",
      "type" : "#PASSWORD|SEED",
      "mask" : [ "#SIGN", "#VERIFY", "#ENCRYPT", "#DECRYPT", "#WRAP_KEY",
"#UNWRAP_KEY", "#EXPORT", "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT",
"#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
      "wallet" : "#VALUE",
```

```
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "processStartDate" : "#NOW|YYYY-MM-DD HH:mm:ss",
        "protectStopDate" : "#NOW|YYYY-MM-DD HH:mm:ss"
      },
      "customAttributes" : [ {
        "name" : "#VALUE",
        "value" : "#VALUE",
        "type" : "#TEXT|NUMBER|DATE_TIME|BOOLEAN|INTERVAL|ENUMERATION|BIG_INTEGER|
LONG_INTEGER|BYTE_STRING"
      } ]
    }
  }
}
```

Parameters

Parameter/Template	Required?	Description
`--object` / `object`	Required	Path of the object file containing secret data.
`--type` / `type`	Optional	Enter one of the following values: • `SEED` • `PASSWORD` The default value is: • `PASSWORD`
`--wallet` / `wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--mask` / `mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. The default value is : `DERIVE_KEY` Choose from the following values: • `ENCRYPT` • `DECRYPT` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `SIGN` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `VERIFY` • `WRAP_KEY`

Parameter/Template	Required?	Description
/attributes	Optional	Attribute names and their values. Enclose this value in double quotation marks if the value contains spaces, slashes, or colons. To find the existing attributes for the managed object, run the `okv managed-object attribute list` command.
		You cannot specify attributes at the command line. If you want to use attributes, then you must use the JSON syntax.
		Attributes that you can enter are as follows:
		• `name` includes the following:
		– `value` is the name value.
		– `type` is either `text` or `uri`. The default value is`text`.
		• `contactInfo`
		• The following date and time attributes:
		– `activationDate`
		– `deactivationDate`
		– `protectStopDate`
		– `processStartDate`
		You can use different ways to set the date and time. Examples are as follows:
		`"activationDate" : "now" `--*starts immediately* `"activationDate" : "now+PT10M" `--*starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00" `--*starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M" `--*starts 10 minutes after this date and time*
		To display the time in UTC format, use the Linux `date` command. For example:
		`$ date --utc "+%F %T"` `2021-03-15 20:31:37`
		See Key Management Interoperability Protocol Specification Version 1.1 for details about these attributes.

Parameter/Template	Required?	Description

`--name`		Specifies the name of a security object. The allowed values are :
		• `value`
		• `type`
		The default value is:
		• `text`
		
		`-Support complex data format, name attribute in command line`
		`        --name '{"value" : "KEY1", "type" : "uri"}'or`
		`        --name '{"value" : "KEY1", "type" : "text}'`
		`-Support simplified data format, name attribute in command line. when type is "text" as a default:`
		`        --name KEY1`

`--custom-attribute`/ / `customAttribute`		Specifies custom defined attribute on security object.
		
		`2017-04-29 18:14:51"}'`
		`        --custom-attribute '[ { "name": "x-OKV Certificate Expiration Date",`
		`        "value" : "2017-04-29 18:14:51"}, { "name": "x-local-name", "value" : "HR"} ] '`
		
		`Support simplified data format, name attribute(single instance), in command line --name KEY1`
		
		`Support simplified data format, custom attribute(multi instance),in commandline`
		`        --custom-attribute "x-local-name:HR"`
		`        --custom-attribute ' [  "x-local-name:HR","x-local-id:100" ]'`

`--deactivation-date`		Specifies when to deactivate a security object. It has the same format as `activation-date`.

Parameter/Template	Required?	Description
`--activation-date`		Specifies when to activate a security object. It will have the following format. `"activationDate" : "now"` *--starts immediately* `"activationDate" : "now+PT10M"` *--starts 10 minutes from now* `"activationDate" : "2021-12-20 10:30:00"` *--starts at this date and time* `"activationDate" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message. The default value is: • `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

Example without using JSON

```
okv managed-object secret register --type PASSWORD --mask "DERIVE_KEY"
--name secret_0701 --object /Users/dopark/test/my.secret --activation-
date now
--deactivation-date "2030-10-10 10:10:10
```

JSON Example

1. Generate JSON input for the `okv managed-object secret register` command.

   ```
   okv managed-object secret register --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "managed-object",
       "resource" : "secret",
       "action" : "register",
       "options" : {
         "object" : "#VALUE",
   ```

```
      "type" : "#PASSWORD|SEED",
      "mask" : [ "#SIGN", "#VERIFY",
      "#ENCRYPT", "#DECRYPT", "#WRAP_KEY", "#UNWRAP_KEY", "#EXPORT",
"#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
      "#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT", "#TRANSLATE_DECRYPT",
"#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
      "wallet" : "#VALUE",
      "attributes" : {
        "name" : {
          "value" : "#VALUE",
          "type" : "#text|uri"
        },
        "contactInfo" : "#VALUE",
        "activationDate" : "#YYYY-MM-DD HH:mm:ss",
        "deactivationDate" : "#VALUE",
        "processStartDate" : "#VALUE",
        "protectStopDate" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `reg_secret.json`) and then edit it to register the secret object.

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "secret",
    "action" : "register",
    "options" : {
      "object" : "./hr_db_connect_password.txt",
      "type" : "PASSWORD",
      "mask" : [ "DERIVE_KEY" ],
      "wallet" : "hr_wallet",
      "attributes" : {
        "name" : {
          "value" : "HR-DB-CONNECT-PASSWORD",
          "type" : "text"
        },
        "contactInfo" : "psmith@example.com"
        "activationDate" : "2020-12-31 09:00:00",
        "deactivationDate" : "2024-12-31 09:00:00",
        "processStartDate" : "2020-12-31 09:00:00",
        "protectStopDate" : "2024-12-31 09:00:00"
      }
    }
  }
}
```

3. Run the `okv managed-object secret register` command using the generated JSON file.

```
okv managed-object secret register --from-json reg_secret.json
```

Output similar to the following appears:

```
{
    "result": "Success",
    "value": {
     "uuid": "0F54D31A-ABA0-4F15-BF67-1B7513DD8634"
```

```
                     }
              }
```

Example Using Output Format Text

```
okv managed-object secret register --output_format text --object object_name
type PASSWORD|SEED wallet wallet_name --mask cryptogrpahic_usage_mask
```

Output

Output similar to the following appears:

```
"0F54D31A-ABA0-4F15-BF67-1B7513DD8634"
```

    You specify the date or timestamp, and duration using the supported formats.

5.31 okv managed-object wallet add-member Command

The `okv managed-object wallet add-member` command adds a security object to a wallet as its member.

This command authenticates with the endpoint's client certificate.

Required Authorization

The endpoint must have read-modify permission on the object and manage-wallet access (`MW`) on the wallet.

Syntax

```
okv managed-object wallet add-member -output_format text|json --uuid UUID --
wallet wallet_name
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "wallet",
    "action": "add-member",
    "options": {
      "uuid": "#VALUE",
      "wallet": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid`/`uuid`	Required	Universally unique ID (UUID) of the managed object that is being added to the wallet.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--wallet`/`wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object wallet add-member` command.

```
okv managed-object wallet add-member --generate-json-input
```

The generated input appears as follows:

```
{
  "service": {
    "category": "managed-object",
    "resource": "wallet",
    "action": "add-member",
    "options": {
      "uuid": "#VALUE",
      "wallet": "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `add_wallet_member.json`) and then edit it to add the security object to the wallet.

```
{
  "service": {
    "category": "managed-object",
```

```
        "resource": "wallet",
        "action": "add-member",
        "options": {
          "uuid": "D69D2F32-2DBB-4FF3-BF52-95487526E6EC",
          "wallet": "hr_wallet"
        }
      }
    }
```

3. Run the `okv managed-object wallet add-member` command using the generated JSON file.

```
okv managed-object wallet add-member --from-json add_wallet_member.json
```

Output similar to the following appears:

```
{
 "result": "Success"
}
```

Example Using Output Format Text

```
okv managed-object wallet add-member --output_format text --uuid UUID --wallet
wallet_name
```

Output

Output similar to the following appears:

- exit code 0 - Indicates Success
- exit code 1- Indicates Failure

5.32 okv managed-object wallet delete-member Command

The `okv managed-object wallet delete-member` command deletes the membership of the managed-object from a wallet.

This command authenticates with the endpoint's client certificate.

Required Authorization

The endpoint must have read-modify permission on the object and manage-wallet access (`MW`) on the wallet.

Syntax

```
okv managed-object wallet delete-member -output_format text|json--uuid UUID --
wallet wallet_name
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "wallet",
    "action": "delete-member",
    "options": {
      "uuid": "#VALUE",
      "wallet": "#VALUE"
    }
```

```
  }
}
```

Parameters

Parameter/ Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the managed object in the wallet.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--wallet` / `wallet`	Required	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`-- output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is:
		• `text`

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object wallet delete-member` command.

   ```
   okv managed-object wallet delete-member --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "wallet",
       "action": "delete-member",
       "options": {
         "uuid": "#VALUE",
         "wallet": "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `delete_wallet_member.json`) and then edit it to delete the security object from the wallet.

```
{
  "service": {
    "category": "managed-object",
    "resource": "wallet",
    "action": "delete-member",
    "options": {
      "uuid": "D69D2F32-2DBB-4FF3-BF52-95487526E6EC",
      "wallet": "hr_wallet"
    }
  }
}
```

3. Run the `okv managed-object wallet delete-member` command using the generated JSON file.

```
okv managed-object wallet delete-member --from-json delete_wallet_member.json
```

Output similar to the following appears:

```
{
 "result": "Success"
}
```

Example Using Output Format Text

```
okv managed-object wallet delete-member --output_format text --uuid UUID --
wallet wallet_name
```

Output

Output similar to the following appears:

- exit code 0 - Indicates Success
- exit code 1- Indicates Failure

5.33 okv managed-object wallet list Command

The `okv managed-object wallet list` command lists wallets that have their access granted to the endpoint used to connect to Oracle Key Vault.

This command authenticates with the endpoint's client certificate.

Required Authorization

None, but this command returns only those wallets to which the current endpoint is granted access.

Syntax

```
okv managed-object wallet list
```

JSON Input File Template

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "wallet",
    "action" : "list"
  }
}
```

Parameters

None

Parameter/Template Parameter	Required?	Description
`--output_format`	Optional	Specifies output format of the command. The command completes with an exit code 0, when command is executed successfully, and exit code 1, when the command fails and generates a relevant error message.
		The default value is `text`.

> **Note:**
>
> Use the CLI command syntax to specify the output_format option. By default, the output format is JSON. However, the output_format option with a value as 'text' displays the output in text format. Use of text output format removes the need to parse JSON output. The option is useful when the output of a command serves as input for another command.

JSON Example

1. Generate JSON input for the `okv managed-object wallet list` command.

```
okv managed-object wallet list --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "managed-object",
    "resource" : "wallet",
    "action" : "list"
  }
}
```

2. Save the generated input to a file (for example, `wallet_list.json`).

3. Run the `okv managed-object wallet list` command using the generated JSON file.

```
okv managed-object wallet list --from-json wallet_list.json
```

Output similar to the following appears:

```
{
  "result": "Success",
  "value": {
    "wallets": [
      "HR_WALLET",
      "SALES_WALLET"
              ]
          }
```

```
        }
    )
```

Example Using Output Format Text

```
okv managed-object wallet list -output_format text
```

Output

Output similar to the following appears:

```
"HR_WALLET","SALES_WALLET
```

5.34 okv managed-object key-pair create command

The `okv managed-object key-pair create` command creates a pair of public and private keys. You can use this command to also create an SSH key pair.

Required Authorization

Must be an endpoint

Syntax

```
okv managed-object key-pair create
        --activation-date <activation date>] [--algorithm <algorithm>]
[--deactivation-date <deactivation date>]
        [--length <length>] [--private-key-custom-attribute <private
key custom attribute>] [--private-key-extractable <private-key-
extractable>]
        [--private-key-mask <private key mask>] [--private-key-name
<private-key-name>] [--public-key-custom-attribute <public key custom
attribute>]
        [--public-key-mask <public key mask>] [--public-key-name
<public-key-name>] [--ssh-user <ssh-user>] [--wallet <wallet>]
```

JSON Input File Template

```
{
  "service": {
    "category": "managed-object",
    "resource": "key-pair",
    "action": "create ",
    "options": {
      "algorithm": "#RSA",
      "length": "#2048|3072|4096",
      "sshUser" : "#VALUE",
      "wallet" : "#VALUE",
       "privateKey" : {
            "mask" : ["#SIGN", "#DECRYPT", "#WRAP_KEY", "#UNWRAP_KEY", "#EXPORT",
                      "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
                      "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],
            "attributes" : {
                    "name" : {
                            "value" : "#VALUE",
```

```
                        "type" : "#text|uri"
                    },
                    "extractable" : "#TRUE|FALSE"
            },
            "customAttributes" : [ {
                    "name" : "#VALUE",
                    "value" : "#VALUE",
                    "type" : "#TEXT|NUMBER"
            } ]
        },

        "publicKey" : {
            "mask" : ["#VERIFY", "#ENCRYPT", "#WRAP_KEY", "#UNWRAP_KEY", "#EXPORT",
                    "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM", "#VALIDATE_CRYPTOGRAM",
"#TRANSLATE_ENCRYPT",
                    "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP", "#TRANSLATE_UNWRAP" ],
            "attributes" : {
                    "name" : {
                        "value" : "#VALUE",
                        "type" : "#text|uri"
                    }
            },
            "customAttributes" : [ {
                    "name" : "#VALUE",
                    "value" : "#VALUE",
                    "type" : "#TEXT|NUMBER"
            } ]
        },
        "attributes" : {
                "contactInfo" : "#VALUE",
                "activationDate" : "#VALUE",
                "deactivationDate" : "#VALUE"
        }

    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--algorithm` / `algorithm`	Optional	Cryptographic algorithm. Choose from the following values: • `RSA` The default value is: • `RSA`
`--length` / `length`	Optional	Key length for the algorithm. Choose from the following values: • For `RSA`: `2048`, `3072`, `4096` The default value is: • `2048`

Parameter/Template Parameter	Required?	Description
`--private-key-mask` / `privateKey → mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `DECRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `SIGN` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `WRAP_KEY` • The default values are: • `DECRYPT` • `UNWRAP_KEY` • `SIGN`
`--public-key-mask` / `publicKey → mask`	Optional	Cryptographic usage mask, enclosed in double quotation marks. Choose from the following values: • `ENCRYPT` • `DERIVE_KEY` • `EXPORT` • `GENERATE_CRYPTOGRAM` • `TRANSLATE_DECRYPT` • `TRANSLATE_ENCRYPT` • `TRANSLATE_UNWRAP` • `TRANSLATE_WRAP` • `UNWRAP_KEY` • `VALIDATE_CRYPTOGRAM` • `WRAP_KEY` • The default values are: • `ENCRYPT` • `WRAP_KEY` • `VERIFY`
`--wallet` / `wallet`	Optional	Wallet name. To find the names of existing wallets to which you have access, run the `okv manage-access wallet list` command.
`--deactivation-date` / `attributes → deactivationDate`	Optional	Specifies when to deactivate a security object. It has the same format as activation-date.

Parameter/Template Parameter	Required?	Description

`--activation-date/`
`attributes →`
`activationDate`
	Optional	Specifies when to activate a security object. It has the following format.
		
		`"activationDate" : "now" --starts immediately`
		`"activationDate" : "now+PT10M" --starts 10 minutes from now`
		`"activationDate" : "2021-12-20 10:30:00" --starts at this date and time`
		`"activationDate" : "2021-12-20 10:30:00+PT10M" --starts 10 minutes after this date and time`

`--private-key-name/`
`privateKey → attributes`
`→ name`
		Specifies the name of a security object. The allowed values are :
		
		• `value`
		• `type`
		The default value is:
		• `text`
		
		`    -Support complex data format,`
		`    name attribute in command line`
		`          --name '{"value" :`
		`    "PRIVATE_KEY1", "type" :`
		`    "uri"}'or`
		`          --name '{"value" : "`
		`    PRIVATE_KEY1", "type" : "text}'`
		`    -Support simplified data`
		`    format, name attribute in`
		`    command line, when type is`
		`    "text" as a default:`
		`    --name PRIVATE_KEY1`

Parameter/Template Parameter	Required?	Description

`--private-key-custom-attribute/ privateKey → customAttributes`		Specifies custom defined attribute on security object.
		
		`--custom-attribute '[ { "name": "x-OKV Certificate Expiration Date", "value" : "2017-04-29 18:14:51"}, { "name": "x-local-name", "value" : "HR"} ] '`
		
		Support simplified data format, name attribute(single instance), in command line --name KEY1
		
		Support simplified data format, custom attribute(multi instance),in command line
		`--custom-attribute "x-local-name:HR"`
		`--custom-attribute ' [  "x-local-name:HR","x-local-id:100" ]'`

`--public-key-name/ publicKey → attributes→ name`		Specifies the name of a security object. The allowed values are :
		• value
		• type
		The default value of the type is:
		• text
		
		-Support complex data format, name attribute in command line
		`--name '{"value" : "PUBLIC_KEY1", "type" : "uri"}'or`
		`--name '{"value" : " PUBLIC_KEY1", "type" : "text}'`
		-Support simplified data format, name attribute in command line, when type is "text" as a default:
		`--name PUBLIC_KEY1`

Parameter/Template Parameter	Required?	Description

`--public-key-custom-attribute/ publicKey → customAttributes`		Specifies when to activate a security object. It has the following format.
		
		`Specifies custom defined attribute`
		`on security object.`
		`2017-04-29 18:14:51"}'`
		`        --custom-attribute`
		`'[ { "name": "x-OKV Certificate`
		`Expiration Date",`
		`        "value" : "2017-04-29`
		`18:14:51"}, { "name": "x-local-`
		`name", "value" : "HR"} ] '`
		`Support simplified data format, name`
		`    attribute(single instance),`
		`in command line --name KEY1`
		`Support simplified data format,`
		`custom attribute(multi instance),in`
		`command line`
		`    --custom-attribute "x-local-`
		`name:HR"`
		`    --custom-attribute ' [  "x-`
		`local-name:HR","x-local-id:100" ]'`

`--output_format`	Optional	Specifies the output format of the command. The allowed values are "text" or "json". When the specified output format is "text", the command completes with an exit code 0 upon successful execution, and returns the universally unique IDs (UUIDs) of the private and public keys. The first line of output is the UUID of the private key and the second line is the UUID for the public key. It completes with an exit code of 1 on failure and generates a relevant error message. When the specified output format is "json", the command returns a JSON structure indicating the result of the operation. If the operation is successful, the JSON structure includes the universally unique IDs (UUIDs) of the private and public keys, and completes with an exit code of 0. If the operation fails, the JSON structure includes a relevant error message, and completes with an exit code of 1.
`--ssh-user`/`sshUser`	Optional	SSH user name. The SSH user is intended to track the actual consumer of the SSH keys, a human, an application, or a machine.

> **✎ Note:**
>
> Use the CLI command syntax to specify the `output_format` option. By
> default, the output format is JSON. However, the `output_format` option with
> a value as 'text' displays the output in text format. Use of text output format
> removes the need to parse JSON output. The option is useful when the
> output of a command serves as input for another command.

Example without using JSON

```
okv managed-object key-pair create --length 4096 --algorithm RSA --
private-key-mask "SIGN" --public-key-mask "VERIFY" --private-key-name
2023_ PRIVATE_KEY_FOR_SIGNING --public-key-name
2023_PUBLIC_KEY_FOR_VERIFY
```

JSON Example

1. Generate JSON input for the `okv managed-object key-pair create` command.

   ```
   okv managed-object key create --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "managed-object",
       "resource": "key-pair",
       "action": "create ",
       "options": {
         "algorithm": "#RSA",
         "length": "#2048|3072|4096",
         "sshUser" : "#VALUE",
         "wallet" : "#VALUE",
         "privateKey" : {
                 "mask" : ["#SIGN", "#DECRYPT", "#WRAP_KEY", "#UNWRAP_KEY",

   "#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
                           "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
   "#TRANSLATE_UNWRAP" ],
                 "attributes" : {
                       "name" : {
                               "value" : "#VALUE",
                               "type" : "#text|uri"
                       },
                       "extractable" : "#TRUE|FALSE"
                 },
                 "customAttributes" : [ {
                         "name" : "#VALUE",
                         "value" : "#VALUE",
                         "type" : "#TEXT|NUMBER"
                 } ]
         },
         "publicKey" : {
                 "mask" : ["#VERIFY", "#ENCRYPT", "#WRAP_KEY", "#UNWRAP_KEY",
   "#EXPORT",
                           "#DERIVE_KEY", "#GENERATE_CRYPTOGRAM",
   ```

```
"#VALIDATE_CRYPTOGRAM", "#TRANSLATE_ENCRYPT",
                      "#TRANSLATE_DECRYPT", "#TRANSLATE_WRAP",
"#TRANSLATE_UNWRAP" ],
             "attributes" : {
                     "name" : {
                             "value" : "#VALUE",
                             "type" : "#text|uri"
                     }
             },
             "customAttributes" : [ {
                     "name" : "#VALUE",
                     "value" : "#VALUE",
                     "type" : "#TEXT|NUMBER"
             } ]
        },
        "attributes" : {
                "contactInfo" : "#VALUE",
                "activationDate" : "#VALUE",
                "deactivationDate" : "#VALUE"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `create_key_pair.json`) and then edit it to create the key pair.

```
{
 "service": {
   "category": "managed-object",
   "resource": "key-pair",
   "action": "create",
   "options": {
     "algorithm": "RSA",
     "length": "3072",
     "privateKey": {
       "mask": ["SIGN", "DECRYPT"],
       "attributes": {
        "extractable" : "FALSE"
       },
     },
     "publicKey": {
       "mask": ["VERIFY", "ENCRYPT"]
     },
     "wallet": "hr_wallet"
   }
 }
}
```

3. Run the `okv managed-object key-pair create` command using the generated JSON file.

```
okv managed-object key-pair create --from-json create_key_pair.json
```

Output similar to the following appears:

```
{
  "result": "Success",
   "value": {
     "privateKeyUUID": "2BFDEBD7-5AE5-4F31-BFF7-6E8B2D20A170",
     "publicKeyUUID": "6B87CF6A-A10E-4F10-BF06-D92CB0241E8A",
```

```
      }
    }
```

Usage Notes

(Optional) Provide detailed information about using the API or subprogram here.

Example Using Text as Output Format

```
okv managed-object key-pair create --output_format text --length 4096 --
algorithm RSA --private-key-mask "SIGN" --public-key-mask "VERIFY" -private-key-
name 2023_PRIVATE_KEY_FOR_SIGNING -public-key-name 2023_PUBLIC_KEY_FOR_VERIFY
```

Output

Output similar to the following appears:

```
2BFDEBD7-5AE5-4F31-BFF7-6E8B2D20A170
6B87CF6A-A10E-4F10-BF06-D92CB0241E8A
```

6
Cryptographic Commands

You can use the cryptographic commands to encrypt and decrypt the provided data using the Oracle Key Vault managed security objects.

- okv crypto data decrypt Command
  The `okv crypto data decrypt` command performs a decrypt operation on the given ciphertext data using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the decrypted data.

- okv crypto data encrypt Command
  The `okv crypto data encrypt` command performs an encrypt operation on the given plaintext data using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the encrypted data.

- okv crypto data sign Command
  The `okv crypto data sign` command performs a sign operation on the given message file using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the signature data.

- okv crypto data sign-verify Command
  The `okv crypto data sign-verify` command performs a signature verification operation on the given signature data and message file using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns whether or not the signature is valid.

6.1 okv crypto data decrypt Command

The `okv crypto data decrypt` command performs a decrypt operation on the given ciphertext data using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the decrypted data.

Required Authorization

The endpoint must have read permission on the key used for the decryption.

Syntax

```
okv crypto data decrypt --uuid UUID --data file_path
--block-cipher-mode block_cipher_mode --padding padding --iv file_path
--authenticated-encryption-additional-data file_path
--authenticated-encryption-tag file_path --data-format data_format
--decrypted-data output_file_path
```

JSON Input File Template

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "decrypt",
    "options": {
```

```
        "uuid": "#VALUE",
        "data" : "#VALUE",
        "blockCipherMode" : "#CBC|ECB|CFB|OFB|GCM",
        "padding" : "#NONE|ZEROS|PKCS5",
        "iv" : "#VALUE",
        "authenticatedEncryptionAdditionalData" : "#VALUE",
        "authenticatedEncryptionTag" : "#VALUE"
        "dataFormat": "#HEX|BASE64",
        "decryptedData": "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the key to use for the decryption.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--data` / `data`	Required	File path to the ciphertext data that needs to be decrypted
`--block-cipher-mode` / `blockCipherMode`	Optional	Block Cipher Mode. Values are as follows: • `CBC` for cipher block chaining • `CFB` for cipher feedback • `ECB` for electronic codebook • `GCM` for Galois/counter • `OFB` for output feedback If you omit this setting, then Oracle Key Vault uses the cryptographic parameters that are associated with the key.
`--padding` / `padding`	Optional	Padding. Values are as follows: • `NONE` • `ZEROS` • `PKCS5` If you omit this setting, then Oracle Key Vault uses the cryptographic parameters that are associated with the key.
`--iv` / `iv`	Optional	File path of the initialization vector (IV) to use for the decrypt operation. You must use the same initialization vector that was used during encryption.
`--authenticated-encryption-additional-data` / `authenticatedEncryptionAdditionalData`	Optional	File path of authenticated encryption additional data to use for the decrypt operation. You must specify the same authenticated encryption additional data that was used during encryption.

Parameter/Template Parameter	Required?	Description
`--authenticated-encryption-tag`/`authenticatedEncryptionTag`	Optional	File path of the authenticated encryption tag to use for the decrypt operation. You must specify the same authenticated encryption tag that was generated during encryption.
`--data-format`/`dataFormat`	Optional	Data format. Format of the data in input and output files. If not specified, data is read and written as binary data. Values are as follows: • `HEX` • `BASE64`
`--decrypted-data`/`decryptedData`	Required	File path where the decrypted data is written. If the provided output file does not exist, then an error results. If the file is present, then it is overwritten with the decrypted data.

JSON Example

1. Generate JSON input for the `okv crypto data decrypt` command.

```
okv crypto data decrypt --generate-json-input
```

The generated input appears as follows:

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "decrypt",
    "options": {
      "uuid": "#VALUE",
      "data" : "#VALUE",
      "blockCipherMode" : "#CBC|ECB|CFB|OFB|GCM",
      "padding" : "#NONE|ZEROS|PKCS5",
      "iv" : "#VALUE",
      "authenticatedEncryptionAdditionalData" : "#VALUE",
      "authenticatedEncryptionTag" : "#VALUE"
      "dataFormat": "#HEX|BASE64",
      "decryptedData": "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `key_decrypt.json`) and then edit it to include the decryption settings that you want. For example:

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "decrypt",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "data" : "/okv/opt/data",
      "blockCipherMode" : "GCM",
      "padding" : "ZEROS",
      "iv" : "/okv/opt/iv",
      "authenticatedEncryptionAdditionalData" : "/okv/opt/keys/
```

```
authenticatedEncryptionAdditionalData",
      "authenticatedEncryptionTag" : "/okv/opt/keys/
authenticatedEncryptionTag",
      "dataFormat": "HEX",
      "decryptedData": "/okv/opt/keys/decrypted_data"
    }
  }
}
```

3. Run the `okv crypto data decrypt` command using the generated JSON file.

```
okv crypto data decrypt --from-json key_decrypt.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "decryptedData" : "/okv/opt/keys/decrypted_data"
  }
}
```

6.2 okv crypto data encrypt Command

The `okv crypto data encrypt` command performs an encrypt operation on the given plaintext data using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the encrypted data.

Required Authorization

The endpoint must have read permission on the key used for the encryption.

Syntax

```
okv crypto data encrypt --uuid UUID --data file_path
--block-cipher-mode block_cipher_mode --padding padding
--random-iv random_iv --iv file_path
--authenticated-encryption-additional-data file_path --data-format data_format
--encrypted-data output_file_path --iv-out output_file_path
--authenticated-encryption-tag output_file_path
```

JSON Input File Template

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "encrypt",
    "options": {
      "uuid": "#VALUE",
      "data" : "#VALUE",
      "blockCipherMode" : "#CBC|ECB|CFB|OFB|GCM",
      "padding" : "#NONE|ZEROS|PKCS5",
      "randomIV" : "#TRUE|FALSE",
      "iv" : "#VALUE",
      "authenticatedEncryptionAdditionalData" : "#VALUE",
      "dataFormat": "#HEX|BASE64",
      "encryptedData": "#VALUE",
      "ivOut": "#VALUE",
      "authenticatedEncryptionTag" : "#VALUE"
    }
```

```
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid` / `uuid`	Required	Universally unique ID (UUID) of the key to use for the encryption. To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--data` / `data`	Required	File path to the plaintext data that needs to be encrypted
`--block-cipher-mode` / `blockCipherMode`	Optional	Block Cipher Mode. Values are as follows: • `CBC` for cipher block chaining • `CFB` for cipher feedback • `ECB` for electronic codebook • `GCM` for Galois/counter • `OFB` for output feedback If you omit this setting, then Oracle Key Vault uses the cryptographic parameters that are associated with the key.
`--padding` / `padding`	Optional	Padding. Values are as follows: • `NONE` • `ZEROS` • `PKCS5` If you omit this setting, then Oracle Key Vault uses the cryptographic parameters that are associated with the key.
`--random-iv` / `randomIV`	Optional	Indicates whether the Oracle Key Vault server should use random initialization vector (IV). Values are as follows: • `TRUE` • `FALSE` (default) Oracle Key Vault uses the `randomIV` value only when the IV is not provided in the input for this command. If you omit the IV and if `randomIV` is set to `TRUE` in the input, then Oracle Key Vault uses a random IV for the encrypt operation.
`--iv` / `iv`	Optional	File path of the IV to use for the encrypt operation. If you include the IV file path in the `okv crypto data encrypt` command, and when you run `okv crypto data decrypt`, use this IV file path.
`--authenticated-encryption-additional-data` / `authenticatedEncryptionAdditionalData`	Optional	File path of authenticated encryption additional data to use for the encrypt operation. If you include the authenticated encryption additional data file path in the `okv crypto data encrypt` command, and when you run `okv crypto data decrypt`, use this authenticated encryption file path.

Parameter/Template Parameter	Required?	Description
`--data-format` / `dataFormat`	Optional	Data format. Format of the data in input and output files. If not specified, data is read and written as binary data. Values are as follows: • `HEX` • `BASE64`
`--encrypted-data` / `encryptedData`	Required	File path where the encrypted data is written. If the provided output file does not exist, then an error results. If the file is present, then it is overwritten with the encrypted data.
`--iv-out` / `ivOut`	Optional	File path where the response IV is written. If the provided output file does not exist, then an error results. If the file is present, then it is overwritten with the response IV. The IV is returned in `ivOut` only when `iv` is not provided and `randomIV` is set to true in the input. If `iv` is provided in the input, then Oracle Key Vault ignores the `ivOut` parameter. If you include the response IV file path in the `okv crypto data encrypt` command, and when you run `okv crypto data decrypt`, use this response IV file path.
`--authenticated-encryption-tag` / `authenticatedEncryptionTag`	Optional	File path where the response authenticated encryption tag is written. If the provided output file does not exist, then an error results. If the file is present, then it is overwritten with the response authenticated encryption tag. The authenticated encryption tag that is returned should be used for decrypting the cipher text. If you include the response authenticated encryption tag file path in the `okv crypto data encrypt` command, and when you run `okv crypto data decrypt`, use this response authenticated encryption tag file path.

JSON Example

1. Generate JSON input for the `okv crypto data encrypt` command.

   ```
   okv crypto data encrypt --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "crypto",
       "resource": "data",
       "action": "encrypt",
       "options": {
         "uuid": "#VALUE",
         "data" : "#VALUE",
         "blockCipherMode" : "#CBC|ECB|CFB|OFB|GCM",
         "padding" : "#NONE|ZEROS|PKCS5",
         "randomIV" : "#TRUE|FALSE",
         "iv" : "#VALUE",
         "authenticatedEncryptionAdditionalData" : "#VALUE",
   ```

```
        "dataFormat": "#HEX|BASE64",
        "encryptedData": "#VALUE",
        "ivOut": "#VALUE",
        "authenticatedEncryptionTag" : "#VALUE"
      }
    }
}
```

2. Save the generated input to a file (for example, `key_encrypt.json`) and then edit it to include the encryption settings that you want. ***Keep a record of the values that you use during encryption along with the generated ivOut and authenticatedEncryptionTag, if any. You must provide the same values when decrypting the ciphertext.*** For example:

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "encrypt",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "data" : "/okv/opt/data",
      "blockCipherMode" : "GCM",
      "padding" : "ZEROS",
      "iv" : "/okv/opt/iv",
      "authenticatedEncryptionAdditionalData" : "/okv/opt/keys/
authenticatedEncryptionAdditionalData",
      "dataFormat": "HEX",
      "encryptedData": "/okv/opt/keys/encrypted_data",
      "authenticatedEncryptionTag" : "/okv/opt/keys/authenticatedEncryptionTag"
    }
  }
}
```

3. Run the `okv crypto data encrypt` command using the generated JSON file.

```
okv crypto data encrypt --from-json key_encrypt.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "encryptedData" : "/okv/opt/keys/encrypted_data"
    "authenticatedEncryptionTag" : "/okv/opt/keys/authenticatedEncryptionTag"
  }
}
```

6.3 okv crypto data sign Command

The `okv crypto data sign` command performs a sign operation on the given message file using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns the signature data.

Required Authorization

The endpoint must have read permission on the private key used for signing.

Syntax

```
okv crypto data sign --uuid <UUID> --message-file <filePath> --message <message>
--message-type <messageType> --digital-signature-algorithm
<digitalSignatureAlgoritm> --signature-data <output file path> --output_format
TEXT
```

JSON Input File Template

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "sign",
    "options": {
      "uuid": "#VALUE",
      "message" : "#VALUE",
      "messageFile" : "#VALUE",
      "messageType" : "#RAW|DIGEST",
      "digitalSignatureAlgorithm" : #RSASSA_PKCS1_v1_5_SHA256|
RSASSA_PKCS1_v1_5_SHA384|RSASSA_PKCS1_v1_5_SHA512|RSASSA_PSS_SHA256|
RSASSA_PSS_SHA384|RSASSA_PSS_SHA512",
      "signatureData": "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--uuid/uuid	Required	Unique Identifier of the key to be used for the signature operation.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
--message/message	Optional	The data that needs to be signed.
		• If message type is DIGEST, it should be HEX.
		• If message type is RAW, it can be any type.
		• Either --message/message or --message-file/messageFile options are required.
--message-file/ messageFile	Optional	Denotes the file path to the data that needs to be signed. Specified by the message-file or messageFile argument. Either --message/ message or --message-file/messageFile options is required
--message-type/ messageType	Optional	Denotes the type of data specified by the message or message-file/messageFile argument - RAW or DIGEST. The Default value is RAW

Parameter/Template Parameter	Required?	Description
`--digital-signature-algorithm`/ `digitalSignatureAlgorithm`	Optional	Digital Signature Algorithm
		Supported algorithms are
		• * `RSASSA_PKCS1_v1_5_SHA256`
		• * `RSASSA_PKCS1_v1_5_SHA384`
		• * `RSASSA_PKCS1_v1_5_SHA512`
		• * `RSASSA_PSS_SHA256`
		• * `RSASSA_PSS_SHA384`
		• * `RSASSA_PSS_SHA512`
		Default: `RSASSA_PKCS1_v1_5_SHA256`
`--signature-data`// `signatureData`	Optional	Path to the file where the received signed data should be written to.
		If this option is provided, the output will be:
		``` { "result" : "Success" } ```
		If this option is not provided, the output will be:
		``` { "result" : "Success", "value" : { "signatureData" : "3258D33DFB12F97....86419A35F32BA903A DDEB3" } } ```

JSON Example

1. Generate JSON input for the `okv crypto data sign` command.

   ```
   okv crypto data sign --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service": {
       "category": "crypto",
       "resource": "data",
       "action": "sign",
       "options": {
         "uuid": "#VALUE",
         "message" : "#VALUE",
         "messageFile" : "#VALUE",
         "messageType" : "#RAW|DIGEST",
         "digitalSignatureAlgorithm" : "#RSASSA_PKCS1_v1_5_SHA256|
   RSASSA_PKCS1_v1_5_SHA384|RSASSA_PKCS1_v1_5_SHA512",
         "signatureData": "#VALUE"
       }
   ```

```
       }
     }
```

2. Save the generated input to a file (for example, `key_sign.json`) and then edit it to include the sign settings that you want. For example:

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "sign",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "message" : "Example message to sign",
      "messageType" : "RAW",
      "digitalSignatureAlgorithm" : "RSASSA_PKCS1_v1_5_SHA256"
    }
  }
}
```

3. Run the `okv crypto data sign` command using the generated JSON file.

```
okv crypto data sign --from-json key_sign.json
```

If "--signature-data/signatureData" is provided, the output will be:

```
{
  "result" : "Success",
  "value" : {
    "signatureData" :
"12634F979551C19ADAEB69733853ADB41405FF108E479393AF8B82140186F7244A41F7E36BA1
129E67453B36297BB91115C4B10B02101AA8068E251B74B7374E975E1E9C1EEACDCB73BAACF4E
05359563A8806B49AA9263ECF61A0D4A0769F1CA5C3CEC0B0B8B4F4F470C5E78F01549C04A491
CE346916ECC55E5AA6E2EEA42A3909A38A8090C341FAFEE7C1547D7BC4509CDC65728729011F4
301DFB105CF2A0F6B1799D4B9B29667789E6EA1A4319D14E7B92BBC2E68F3DB20CA8B8270FC20
C272F638202F3D68248B7AF12750C2A22DF159886AC2456DBAA4CC94A90A064D771106619C103
DCCC66C0815FA9FF3349A03E0E3D9696984E6A826EAA507C32F"
  }
}
```

6.4 okv crypto data sign-verify Command

The `okv crypto data sign-verify` command performs a signature verification operation on the given signature data and message file using the Oracle Key Vault managed security object that is within the Oracle Key Vault server, and returns whether or not the signature is valid.

Required Authorization

The endpoint must have read permission on the public key used for signature verification.

Syntax

```
okv crypto data sign-verify --uuid <UUID> --message-file <filePath> --message
<message> --signature-data <filePath> --digital-signature-algorithm
<digitalSignAlgoritm> --text_output TEXT
```

JSON Input File Template

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "sign-verify",
    "options": {
      "uuid": "#VALUE",
      "message" : "#VALUE",
      "messageFile" : "#VALUE",
      "messageType" : "#RAW|DIGEST",
      "signatureData" : "#VALUE",
      "digitalSignatureAlgorithm" : "#RSASSA_PKCS1_v1_5_SHA256|
RSASSA_PKCS1_v1_5_SHA384|RSASSA_PKCS1_v1_5_SHA512|RSASSA_PSS_SHA256|RSASSA_PSS_SHA384|
RSASSA_PSS_SHA512"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--uuid`/`uuid`	Required	Universally unique ID (UUID) of the key to use for the signature verify.
		To find the unique identifier for the object, in the Oracle Key Vault management console, click the **Keys & Wallets** tab, and then click **Keys & Secrets** in the left navigation window. In the Keys & Secrets table, check the Unique Identifier column.
`--message`/`message`	Optional	The data that is passed to the signing operation (for the algorithms requiring the original data to verify a signature). Either `--message/message` or `--message-file/messageFile` options is required
`--message-file`/`--messageFile`	Optional	Specifies the file path to the data that is passed to the signing operation (for the algorithms requiring the original data to verify a signature). Denotes the file path to the data that needs to be signed. Specified by the `message-file` or `messageFile` argument.
`--message-type`/`messageType`	Optional	Denotes the type of data specified by the `message` or `message-file/messageFile` argument - `RAW` or `DIGEST`.
`--signature-data`/`signatureData`	Required	Denotes the file path to the signature that needs to be verified.
`--digital-signature-algorithm`/`digitalSignatureAlgorithm`	Optional	Digital Signature of the algorithm.
`--output_format`	Optional	Provides the output format.

JSON Example

1. Generate JSON input for the `okv crypto data sign-verify` command.

```
okv crypto data sign-verify --generate-json-input
```

The generated input appears as follows:

```
{
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "sign-verify",
    "options": {
      "uuid": "#VALUE",
      "message" : "#VALUE",
      "messageFile" : "#VALUE",
      "messageType" : "#RAW|DIGEST",
      "signatureData" : "#VALUE",
      "digitalSignatureAlgorithm" : "#RSASSA_PKCS1_v1_5_SHA256|
RSASSA_PKCS1_v1_5_SHA384|RSASSA_PKCS1_v1_5_SHA512"
    }
  }
}
```

2. Save the generated input to a file (for example, `key_sign-verify.json`) and then edit it to include the decryption settings that you want. For example:

```
{
  {
  "service": {
    "category": "crypto",
    "resource": "data",
    "action": "sign-verify",
    "options": {
      "uuid": "2359E04F-DA61-4F7C-BF9F-913D3369A93A",
      "message" : "Example message to sign",
      "messageType" : "RAW",
      "signatureData": "/tmp/signature_data",
      "digitalSignatureAlgorithm" : "RSASSA_PKCS1_v1_5_SHA256"
    }
  }
}
```

3. Run the `okv crypto data sign-verify` command using the generated JSON file.

```
okv crypto data sign-verify --from-json key_sign-verify.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "validityIndicator" : "VALID"
  }
}
```

Example

The following example shows how to use openssl to verify signature generated by `okvutil sign` command.

1. openssl does not support verification of signatures in HEX format. As the signature generated by okvutil sign command is in HEX format therefore the signature can be converted into binary format using xxd or some other utility.

```
xxd -r -p /tmp/signature_data >
    /tmp/signature_data.bin
```

2. Verify signature of a message stored in file message.txt, using signature in binary format stored in /tmp/signature_data.bin and public key stored in file key.pub.

```
openssl dgst -sha256 -verify key.pub -signature /tmp/signature_data.bin
message.txt
Verified OK
```

7
Monitoring Commands

You can use the monitoring commands to check the Oracle Key Vault configuration, health, and deployment modes.

- okv cluster info get Command
  The `okv cluster info get` command retrieves status information about a cluster or a cluster node.

- okv cluster status get Command
  The `okv cluster status get` command retrieves dynamic information about the cluster or the specified cluster node.

- okv primary-standby info get Command
  The `okv primary-standby info get` command displays static information about the Oracle Key Vault primary-standby configuration.

- okv primary-standby status get Command
  The `okv primary-standby status get` command retrieves dynamic information about the Oracle Key Vault primary-standby configuration.

- okv server info get Command
  The `okv server info get` command retrieves static information about an Oracle Key Vault server.

- okv server status get Command
  The `okv server status get` command retrieves status information about an Oracle Key Vault server.

- okv metrics server get Command
  The `okv metrics server get` command retrieves System Metrics information of an Oracle Key Vault server.

- okv metrics application get Command
  The `okv metrics application get` command retrieves the Oracle Key Vault server application metrics information.

7.1 okv cluster info get Command

The `okv cluster info get` command retrieves status information about a cluster or a cluster node.

`okv cluster info get` retrieves the following information:

- Cluster name
- Cluster version
- **Maximum Disable Node Duration** setting
- List of cluster subgroups
- Information of cluster nodes including their configuration mode, status, subgroup, version information, and so on.

Required Authorization

System Administrator role. A regular Oracle Key Vault user can also run the command to check the Oracle Key Vault version.

> **Note:**
>
> For regular Oracle Key Vault user the command displays the version number only.

Syntax

```
okv cluster info get --node node_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "cluster",
    "resource" : "info",
    "action" : "get",
    "options" : {
      "node" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--node / node	Optional	Name of the node within the current cluster. If you omit this setting, then information for the entire cluster is retrieved.

JSON Example

1. Generate JSON input for the `okv cluster info get` command.

   ```
   okv cluster info get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "cluster",
       "resource" : "info",
       "action" : "get",
       "options" : {
         "node" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_cluster_info.json`).

Depending on the kind of information that you want to find, do one of the following:

- **Get cluster information for a specific node:** Edit the file to specify the `node` value. For example:

```
{
  "service" : {
    "category" : "cluster",
    "resource" : "info",
    "action" : "get",
    "options" : {
      "node" : "node_1"
    }
  }
}
```

- **Get cluster information for all nodes in the cluster:** Edit the file to remove the node entry.

```
{
  "service" : {
    "category" : "cluster",
    "resource" : "info",
    "action" : "get"
  }
}
```

3. Run the `okv cluster info get` command using the generated JSON file.

```
okv cluster info get --from-json get_cluster_info.json
```

Depending on how you handled the file in Step 2, output similar to the following appears.

- **Get cluster information for a specific node:**

```
{
  "result" : "Success",
  "value" : {
    "clusterSubgroup" : "subgrp1",
    "disableDate" : "",
    "ipAddress" : "192.0.2.114",
    "joinDate" : "2021-06-16 06:57:45",
    "mode" : "Read-Write",
    "nodeID" : "1",
    "nodeName" : "node1",
    "readWritePeer" : "node2",
    "status" : "ACTIVE",
    "version" : "21.2.0.0.0"
  }
}
```

- **Get cluster information for all nodes in the cluster:**

```
{
  "result" : "Success",
  "value" : {
    "clusterName" : "cluster1",
    "clusterSubgroups" : [ "subgrp1", "subgrp2" ],
    "clusterVersion" : "21.2.0.0.0",
    "maximumDisableNodeDuration" : "24 hrs",
    "nodes" : [ {
      "nodeName" : "node1",
      "nodeID" : "1",
      "ipAddress" : "192.0.2.114",
```

```
                            "mode" : "Read-Write",
                            "status" : "ACTIVE",
                            "readWritePeer" : "node2",
                            "clusterSubgroup" : "subgrp1",
                            "joinDate" : "2021-06-16 06:57:45",
                            "disableDate" : "",
                            "version" : "21.2.0.0.0"
                        }, {
                            "nodeName" : "node2",
                            "nodeID" : "2",
                            "ipAddress" : "192.0.2.115",
                            "mode" : "Read-Write",
                            "status" : "ACTIVE",
                            "readWritePeer" : "node1",
                            "clusterSubgroup" : "subgrp2",
                            "joinDate" : "2021-06-16 07:05:34",
                            "disableDate" : "",
                            "version" : "21.2.0.0.0"
                        } ]
                    }
                }
```

7.2 okv cluster status get Command

The `okv cluster status get` command retrieves dynamic information about the cluster or the specified cluster node.

`okv cluster status get` retrieves the following information:

- Nodes that are read-write pairs
- Nodes that are read-only pairs
- The number and type of unresolved name conflicts
- Alerts that are related to the cluster

Required Authorization

System Administrator role

Syntax

```
okv cluster status get --node node_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "cluster",
    "resource" : "status",
    "action" : "get",
    "options" : {
      "node" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--node` / `node`	Optional	Name of the node within the current cluster. If you omit this setting, then information for the entire cluster is retrieved.

JSON Example

1. Generate JSON input for the `okv cluster status get` command.

   ```
   okv cluster status get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "cluster",
       "resource" : "status",
       "action" : "get",
       "options" : {
         "node" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `get_cluster_status.json`).
   Depending on the kind of information that you want to find, do one of the following:

   • **Get cluster status for a specific node:** Edit the file to specify the `node` value. For example:

   ```
   {
     "service" : {
       "category" : "cluster",
       "resource" : "status",
       "action" : "get",
       "options" : {
         "node" : "node_1"
       }
     }
   }
   ```

   • **Get the status of the cluster:** Edit the file to remove the node entry.

   ```
   {
     "service" : {
       "category" : "cluster",
       "resource" : "status",
       "action" : "get"
     }
   }
   ```

3. Run the `okv cluster status get` command using the generated JSON file.

   ```
   okv cluster status get --from-json get_cluster_status.json
   ```

   Depending on how you handled the file in Step 2, output similar to the following appears.

   • **Get cluster status for a specific node:**

```
{
  "result" : "Success",
  "value" : {
    "mode" : "Read-Write",
    "nameResolutionTime" : "Could not determine",
    "nodeID" : 1,
    "nodeName" : "node1",
    "status" : "ACTIVE"
  }
}
```

- **Get the status of the cluster:**

```
{
  "result" : "Success",
  "value" : {
    "alertsCount" : "1",
    "clusterServiceStatus" : "Up",
    "nodes" : [ {
      "nodeID" : "1",
      "nodeName" : "node1",
      "mode" : "Read-Write",
      "status" : "ACTIVE",
      "nameResolutionTime" : "Could not determine"
    }, {
      "nodeID" : "2",
      "nodeName" : "node2",
      "mode" : "Read-Write",
      "status" : "ACTIVE",
      "nameResolutionTime" : "119.98 sec(s)"
    } ],
    "unresolvedConflicts" : {
      "endpointNameConflicts" : "0",
      "endpointGroupNameConflicts" : "0",
      "userNameConflicts" : "0",
      "userGroupNameConflicts" : "0",
      "walletNameConflicts" : "0",
      "kmipObjectNameConflicts" : "0"
    }
  }
}
```

7.3 okv primary-standby info get Command

The okv primary-standby info get command displays static information about the Oracle Key Vault primary-standby configuration.

okv primary-standby info retrieves the following information:

- The primary-standby status

- The primary server IP address

- The standby server IP address

- The fast-start failover threshold value

Required Authorization

System Administrator role

Syntax

```
okv primary-standby info get
```

JSON Input File Template

```
{
  "service" : {
    "category" : "primary-standby",
    "resource" : "info",
    "action" : "get"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv primary-standby info get` command.

   ```
   okv primary-standby info get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "primary-standby",
       "resource" : "info",
       "action" : "get"
     }
   }
   ```

2. Save the output to a file (for example, `primary_standby_info.json`).

3. Run the `okv primary-standby info get` command using the generated JSON file.

   ```
   okv primary-standby info get --from-json primary_standby_info.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "fsfo" : "60",
       "primaryIPAddress" : "192.0.2.114",
       "primaryStandbyStatus" : "Primary",
       "standbyIPAddress" : "192.0.2.115"
     }
   }
   ```

7.4 okv primary-standby status get Command

The `okv primary-standby status get` command retrieves dynamic information about the Oracle Key Vault primary-standby configuration.

`okv primary-standby status get` get retrieves the following information:

- The switchover status

- The failover status
- Whether the primary is in read-only restricted mode

Required Authorization

System Administrator role

Syntax

```
okv primary-standby status get
```

JSON Input File Template

```
  "service" : {
    "category" : "primary-standby",
    "resource" : "status",
    "action" : "get"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv primary-standby status get` command.

   ```
   okv primary-standby status get --generate-json-input
   ```

   The generated input appears as follows:

   ```
     "service" : {
       "category" : "primary-standby",
       "resource" : "status",
       "action" : "get"
     }
   }
   ```

2. Save the generated input to a file (for example, `primary_standby_status.json`).

3. Run the `okv primary-standby status get` command using the generated JSON file.

   ```
   okv primary-standby status get --from-json primary_standby_status.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "failoverStatus" : "SYNCHRONIZED",
       "rormMode" : "No",
       "switchoverStatus" : "TO STANDBY"
     }
   }
   ```

7.5 okv server info get Command

The `okv server info get` command retrieves static information about an Oracle Key Vault server.

`okv server info get` displays the following:

- The current version of the Oracle Key Vault server
- The Oracle Key Vault server certification expiration date
- The deployment type of the Oracle Key Vault server, such as standalone, cluster, or primary-standby

Required Authorization

System Administrator role

Syntax

```
okv server info get
```

JSON Input File Template

```
{
  "service" : {
    "category" : "server",
    "resource" : "info",
    "action" : "get"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv server info get` command.

   ```
   okv server info get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "server",
       "resource" : "info",
       "action" : "get"
     }
   }
   ```

2. Save the generated input to a file (for example, `server_info_get.json`). You do not need to edit the file because it has no parameters to modify.

3. Run the `okv server info get` command using the generated JSON file.

   ```
   okv server info get --from-json server_info_get.json
   ```

   Output similar to the following appears:

```
        {
          "result" : "Success",
          "value" : {
            "caCertificateExpirationDate" : "2025-12-07 00:49:13",
            "cpuCores" : "16",
            "deploymentType" : "Standalone",
            "diskInGB" : "293",
            "fraInGB" : "20",
            "memoryInKB" : "7847752",
            "serverAlternateName" : "<userConfiguredAlternateHostnameForNode>",
            "serverCertificateExpirationDate" : "2023-12-14 18:06:52",
            "serverTime" : "2022-12-09 18:33:47",
            "version" : "21.6.0.0.0"
          }
        }
```

All dates are shown in UTC.

7.6 okv server status get Command

The `okv server status get` command retrieves status information about an Oracle Key Vault server.

`okv server status get` displays the following:

- The amount of time (uptime) that the Oracle Key Vault has been running

- How much current free space is left on the Oracle Key Vault server

- The status of any backup jobs that have been started for Oracle Key Vault

- Number of alerts that have been raised concerning the Oracle Key Vault system

- Current CPU usage percentage and number of CPU cores installed on the Oracle Key Vault server

- Current disk space usage percentage and amount in GB and total disk space in GB on the Oracle Key Vault server

- Current Fast Recovery Area (FRA) space usage percentage, amount in GB, and total space in GB for FRA on the Oracle Key Vault server

- Current memory usage percentage, amount in KB, and total memory amount in KB installed on the Oracle Key Vault server

- Status of services running on the Oracle Key Vault server

Required Authorization

System Administrator role

Syntax

```
okv server status get
```

JSON Input File Template

```
{
 "service" : {
  "category" : "server",
  "resource" : "status",
  "action" : "get"
```

```
    }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv server status get` command.

   ```
   okv server status get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
      "category" : "server",
      "resource" : "status",
      "action" : "get"
      }
   }
   ```

2. Save the generated input to a file (for example, `server_status.json`).

3. Run the `okv server status get` command using the generated JSON file.

   ```
   okv server status get --from-json server_status.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "alertsRaised" : "1",
       "backupStatus" : "25 day(s) since successful backup",
       "cpu" : {
         "usagePercentage" : "2",
         "cpuCores" : "16"
       },
       "disk" : {
         "usagePercentage" : "14",
         "usedInGB" : "42",
         "totalInGB" : "293"
       },
       "fra" : {
         "usagePercentage" : "20",
         "usedInGB" : "4",
         "totalInGB" : "20"
       },
       "freeSpacePercentage" : "86",
       "memory" : {
         "usagePercentage" : "98",
         "usedInKB" : "7655964",
         "totalInKB" : "7847768"
       },
       "services" : {
         "RESTfulService" : "Up",
         "emailService" : "Up",
         "KMIPService" : "Up",
         "storageDB" : "Up",
         "auditVaultAgentMonitor" : "Not enabled"
       },
   ```

```
        "uptime" : "11:59 HH:MM"
      }
   }
```

7.7 okv metrics server get Command

The `okv metrics server get` command retrieves System Metrics information of an Oracle Key Vault server.

Installed resources on an Oracle Key Vault server shown under reserved resources, including:

- Number of CPU Cores
- Total amount of memory installed in KB

> **Note:**
>
> There can be multiple entries for reserved resources in case there's a change in resources installed or an Oracle Key Vault server reboot.

Server metrics details of Oracle Key Vault server are divided into four categories with each containing metrics related to the category:

- CPU Usage
    - CPU Utilization Percentage
    - CPU load averages from last one, five and fifteen minutes
- Memory Usage
    - Amount of free memory available to start new processes in KB
- Disk I/O
    - Number of disk read and write operations
- Network I/O
    - Amount of network data sent and received in KB
    - Rate of network data sent and received in KB/s
    - Number of incoming TCP connections

Required Authorization

System Administrator role

Syntax

```
okv metrics server get --start-time start_time --end-time end_time --include
include --interval interval --statistic statistic
```

JSON Input File Template

```
{
  "service" : {
    "category" : "metrics",
    "resource" : "server",
```

```
      "action" : "get",
      "options" : {
        "startTime" : "#YYYY-MM-DD hh:mm:ss",
        "endTime" : "#NOW|YYYY-MM-DD hh:mm:ss",
        "interval" : "#VALUE",
        "statistic" : "#MEAN|MAX|MIN|COUNT",
        "include" : [ "ALL" ],
        "limit" : "#VALUE"
      }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--start-time	Required	Specifies the start time for which results should be returned. It should be entered as timestamp in "YYYY-MM-DD HH:mm:ss" format.
		Example: Timestamp : YYYY-MM-DD HH:mm:ss
--end-time	Required	The end time for which results should be returned.
		Example: Timestamp : YYYY-MM-DD HH:mm:ss or NOW.
--interval	Required	Specifies the time window used to convert given set of raw data points. Enter this value using the ISO 8601 standard. For example, enter PT10M to specify an interval size of 10 Minutes.
		Note: The timestamp of the aggregated data point corresponds to the start of the time window during which raw data points are assessed. For example, for a 10 minutes interval, the timestamp "09:00" corresponds to the 10 minutes time window from 09:00 to 09:10.
		Example: ISO 8601 Duration
--statistic	Required	Specifies the aggregation function applied to the given set of raw data points in an interval. Supported functions are MEAN, MIN, MAX, and COUNT.
		Example: MEAN, MIN, MAX, or COUNT.

Parameter/Template Parameter	Required?	Description
--include	Required	Specifies the list of system resources that requires data. The supported resources are CPU, Memory, Disk, and network.
		Example: Specify "CPU" to include CPU, "CPU, MEMORY" to include CPU and Memory, "DISK" to include Disk, "NETWORK" to include Network, "ALL" to include all resources.
--limit	Optional	The maximum number of data should be returned.

JSON Example

1. Generate JSON input for the `okv metrics server get` command.

```
okv metrics server get --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "metrics",
    "resource" : "server",
    "action" : "get",
    "options" : {
      "startTime" : "#YYYY-MM-DD hh:mm:ss",
      "endTime" : "#NOW|YYYY-MM-DD hh:mm:ss",
      "interval" : "#VALUE",
      "statistic" : "#MEAN|MAX|MIN|COUNT",
      "include" : [ "ALL" ],
      "limit" : "#VALUE"
    }
  }
}
```

2. Save the generated output to a file (for example, `metric_server_get.json`).

```
{
  "service" : {
    "category" : "metrics",
    "resource" : "server",
    "action" : "get",
    "options" : {
      "startTime" : "2023-04-20 20:05:00",
      "endTime" : "NOW",
      "interval" : "PT10M",
      "statistic" : "MEAN",
      "include" : [ "ALL" ],
      "limit" : "3"
    }
  }
}
```

3. Run the `okv metrics server get` command using the generated JSON file.

```
okv metrics server get --from-json metric_server_get.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "availableResources" : [ {
      "sampleTime" : "2023-04-20 00:15:37",
      "cpuCores" : "1",
      "totalMemoryInKB" : "16096332"
    } ],
    "metrics" : [ {
      "sampleTime" : "2023-04-20 20:05:03",
      "cpuUtilizationPercentage" : "4",
      "loadAverage1Minute" : "0.07",
      "loadAverage5Minutes" : "0.07",
      "loadAverage15Minutes" : "0.08",
      "freeMemoryInKB" : "2758802",
      "diskReads" : "106",
      "diskWrites" : "424",
      "networkDataReceivedInKB" : "1131.74",
      "networkDataSentInKB" : "6.23",
      "networkDataReceivedRateInKBps" : "113.17",
      "networkDataSentRateInKBps" : "0.62",
      "incomingTCPConnections" : "23"
    }, {
      "sampleTime" : "2023-04-20 20:15:04",
      "cpuUtilizationPercentage" : "34",
      "loadAverage1Minute" : "1.41",
      "loadAverage5Minutes" : "1.15",
      "loadAverage15Minutes" : "0.64",
      "freeMemoryInKB" : "2476931",
      "diskReads" : "1155",
      "diskWrites" : "1276",
      "networkDataReceivedInKB" : "1228.44",
      "networkDataSentInKB" : "2909.42",
      "networkDataReceivedRateInKBps" : "122.84",
      "networkDataSentRateInKBps" : "290.94",
      "incomingTCPConnections" : "20"
    }, {
      "sampleTime" : "2023-04-20 20:25:05",
      "cpuUtilizationPercentage" : "7",
      "loadAverage1Minute" : "0.16",
      "loadAverage5Minutes" : "0.35",
      "loadAverage15Minutes" : "0.46",
      "freeMemoryInKB" : "2233553",
      "diskReads" : "339",
      "diskWrites" : "530",
      "networkDataReceivedInKB" : "184.05",
      "networkDataSentInKB" : "559.61",
      "networkDataReceivedRateInKBps" : "18.41",
      "networkDataSentRateInKBps" : "55.96",
      "incomingTCPConnections" : "7"
    } ]
  }
}
```

ORACLE

7.8 okv metrics application get Command

The `okv metrics application get` command retrieves the Oracle Key Vault server application metrics information.

Application metrics details of Oracle Key Vault server:

- Number of KMIP Connections
- Number of RESTFul KMIP Connections

Required Authorization

System Administrator role

Syntax

```
 okv metrics application get --start-time start_time --end-time end_time --
include include --interval interval --statistic statistic
```

JSON Input File Template

```
{
 "service" : {
  "category" : "metrics",
  "resource" : "application",
  "action" : "get",
  "options" : {
   "startTime" : "#YYYY-MM-DD hh:mm:ss",
   "endTime" : "#NOW|YYYY-MM-DD hh:mm:ss",
   "interval" : "#VALUE",
   "statistic" : "#MEAN|MAX|MIN|COUNT",
   "include" : [ "ALL" ],
   "limit" : "#VALUE"
   }
  }
 }
```

Parameters

Parameter/Template Parameter	Required?	Description
`--start-time`	Required	Specifies the start time for which results should be returned. It should be entered as timestamp in "YYYY-MM-DD HH:mm:ss" format.
		Example: Timestamp : YYYY-MM-DD HH:mm:ss
`--end-time`	Required	The end time for which results should be returned.
		Example: Timestamp : YYYY-MM-DD HH:mm:ss or NOW.

Parameter/Template Parameter	Required?	Description
`--interval`	Required	Specifies the time window used to convert given set of raw data points. Enter this value using the ISO 8601 standard. For example, enter PT10M to specify an interval size of 10 Minutes.
		✎ **Note:** The timestamp of the aggregated data point corresponds to the start of the time window during which raw data points are assessed. For example, for a 10 minutes interval, the timestamp "09:00" corresponds to the 10 minutes time window from 09:00 to 09:10.
		Example: ISO 8601 Duration
`--statistic`	Required	Specifies the aggregation function applied to the given set of raw data points in an interval. Supported functions are MEAN, MIN, MAX and COUNT. Example: MEAN, MIN, MAX, or COUNT.
`--include`	Required	Specifies the list of system resources that requires data. The supported resources are KMIP. Example: Specify "KMIP" to include KMIP and "ALL" to include all resources.
`--limit`	Optional	The maximum number of data should be returned.

JSON Example

1. Generate JSON input for the `okv metrics application get` command.

```
okv metrics application get --generate-json-input
```

The generated input appears as follows:

```
{
 "service" : {
  "category" : "metrics",
  "resource" : "application",
  "action" : "get",
  "options" : {
   "startTime" : "#YYYY-MM-DD hh:mm:ss",
   "endTime" : "#NOW|YYYY-MM-DD hh:mm:ss",
   "interval" : "#VALUE",
   "statistic" : "#MEAN|MAX|MIN|COUNT",
```

```
     "include" : [ "ALL" ],
     "limit" : "#VALUE"
    }
   }
 }
```

2. Save the generated output to a file (for example, `metric_application_get.json`).

```
{
  "service" : {
    "category" : "metrics",
    "resource" : "application",
    "action" : "get",
    "options" : {
      "startTime" : "2023-04-20 20:05:00",
      "endTime" : "NOW",
      "interval" : "PT10M",
      "statistic" : "COUNT",
      "include" : [ "ALL" ],
      "limit" : "3"
    }
  }
}
```

3. Run the `okv metrics application get` command using the generated JSON file.

```
okv metrics application get --from-json metric_application_get.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "metrics" : [ {
      "sampleTime" : "2023-04-20 20:05:03",
      "kmipConnections" : "15",
      "RESTfulKmipConnections" : "5"
    }, {
      "sampleTime" : "2023-04-20 20:15:04",
      "kmipConnections" : "10",
      "RESTfulKmipConnections" : "7"
    }, {
      "sampleTime" : "2023-04-20 20:25:05",
      "kmipConnections" : "3",
      "RESTfulKmipConnections" : "1"
    } ]
  }
}
```

8
Cluster Monitoring Commands

You can use the Cluster Management monitoring commands to check the Oracle Key Vault configuration, health, and deployment modes.

- [okv cluster service start Command](#)
  The `okv cluster service start` command starts the cluster service of a node.
- [okv cluster service stop Command](#)
  The `okv cluster service stop` command stops the cluster service of a node.
- [okv cluster service monitor Command](#)
  The `okv cluster service monitor` command monitors the cluster service of a node.
- [okv cluster link enable Command](#)
  The `okv cluster link enable` command enables the replication link between the current node and the given node in a cluster.
- [okv cluster link disable Command](#)
  The `okv cluster link disable` command disables a cluster node.
- [okv cluster link monitor Command](#)
  The `okv cluster link monitor` command monitors the replication link.

8.1 okv cluster service start Command

The `okv cluster service start` command starts the cluster service of a node.

Required Authorization

System Administrator role

Syntax

```
okv cluster service start
```

JSON Input File Template

```
{
 "service" : {
  "category":"cluster,
  "resource":"service",
  "action":"start,
  "options":{
  "nodeName":"#VALUE"
   }
   }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node.

JSON Examples

1. Generate JSON input for the okv cluster service start command.

    ```
    okv cluster service start --generate-json-input
    ```

    The generated input appears as follows:

    ```
    {
      "service" : {
        "category" : "cluster",
        "resource" : "service",
        "action" : "start",
        "options" : {
          "nodeName" : "#VALUE"
        }
      }
    }
    ```

2. Save the generated input to a file, for example, service_start.json.

3. Run the okv cluster service start command using the generated JSON file.
    For example:

    ```
    okv  cluster service start --from-json service_start.json
    ```

    Output similar to the following appears:

8.2 okv cluster service stop Command

The okv cluster service stop command stops the cluster service of a node.

Required Authorization

System Administrator role

Syntax

```
okv cluster service stop
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "service",
  "action" : "stop,
```

```
 "options" : {
  "nodeName" : "#VALUE"
  }
 }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node

CLI Command

```
okv cluster service stop --node <argument>
```

JSON Examples

1. Generate JSON input for the `okv cluster service stop` command.

   ```
   okv cluster service stop --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "service",
     "action" : "stop,
     "options" : {
      "nodeName" : "#VALUE"
      }
    }
   }
   ```

2. Save the generated input to a file, for example, `service_stop.json`.

3. Run the `okv cluster service stop` command using the generated JSON file. For example:

   ```
   okv cluster service stop --from-json service_stop.json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success"
   }
   ```

8.3 okv cluster service monitor Command

The `okv cluster service monitor` command monitors the cluster service of a node.

Required Authorization

System Administrator role

Syntax

```
okv cluster service monitor --generate-json-input
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "service",
  "action" : "monitor,
  "options" : {
   "nodeName" : "#VALUE"
   }
  }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node.

JSON Examples

1. Generate JSON input for the `okv cluster service monitor` command.

   ```
   okv cluster service monitor
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "service",
     "action" : "monitor,
     "options" : {
      "nodeName" : "#VALUE"
      }
     }
   }
   ```

2. Save the generated input to a file, for example, `service_monitor.json`.

3. Run the `okv cluster service monitor` command using the generated JSON file. For example:

```
okv cluster service monitor --from-json service_monitor.json
```

Output similar to the following appears:

```
{
 "result" : "Success",
 "value" : {
  "clusterServiceStatus":"Up",
  "mode":"Read-Write",
  "nodeID":"2",
  "nodeName":"node2"
  }
 }
}
```

8.4 okv cluster link enable Command

The `okv cluster link enable` command enables the replication link between the current node and the given node in a cluster.

Required Authorization

System Administrator role

`okv cluster link enable` command displays the following:

• The command result, whether it is Success or failure.

Syntax

```
okv cluster link enable --generate-json-input
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster target node to enable.
--target-node	Optional	Name of the node to initiate disabling of a node

JSON Examples

1. Generate JSON input for the `okv cluster link enable` command.

```
okv cluster link enable
```

The generated input appears as follows:

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "link",
```

```
    "action" : "enable,
    "options" : {
     "nodeName" : "#VALUE",
     "targetNode" : "#VALUE"
     }
    }
  }
```

2. Save the generated input to a file, for example, `link_enable.json`.

3. Run the `okv cluster link enable` command using the generated JSON file. For example:

```
okv cluster link enable --from-json link_enable.json
```

   Output similar to the following appears:

```
{
 "result" : "Success"
}
```

8.5 okv cluster link disable Command

The `okv cluster link disable` command disables a cluster node.

Required Authorization

System Administrator role

`okv cluster link disable` command displays the following:

• The command result, whether it is Success or failure.

Syntax

```
okv cluster link disable
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "link",
  "action" : "enable,
  "options" : {
   "nodeName" : "#VALUE",
   "targetNode" : "#VALUE"
  }
 }
}
```

Parameters

Parameter	Required	Description
`--node-name`	Required	Name of the cluster node.
`--target-node`	Optional	Name of the node to initiate disabling of a node.

JSON Examples

1. Generate JSON input for the `okv cluster link disable` command.

   ```
   okv cluster link disable --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "link",
     "action" : "enable,
     "options" : {
      "nodeName" : "#VALUE",
      "targetNode" : "#VALUE"
     }
    }
   }
   ```

2. Save the generated input to a file, for example, `link_disable.json`.

3. Run the `okv cluster link disable` command using the generated JSON file. For example:

   ```
   okv cluster link disable --from-json link_disable.json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success"
   }
   ```

8.6 okv cluster link monitor Command

The `okv cluster link monitor` command monitors the replication link.

Required Authorization

System Administrator role

Syntax

```
okv cluster link monitor
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "link",
  "action" : "monitor,
  "options" : {
   "nodeName" : "#VALUE"
  }
 }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node.

JSON Examples

1. Generate JSON input for the okv cluster link monitor command.

   ```
   okv cluster link monitor --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "link",
     "action" : "monitor,
     "options" : {
      "nodeName" : "#VALUE"
     }
    }
   }
   ```

2. Save the generated input to a file, for example, link_monitor.json.

3. Run the okv cluster link monitor command using the generated JSON file. For example:

   ```
   okv cluster link monitor --from-json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success",
    "value" : {
     "linkStatus":[ {
      "nodeID":"1",
      "nodeName":"okv080027ef30b1",
      "heartbeatLagInSeconds":"82.95",
      "linkState":"Up",
   ```

```
          "replicationLagInSeconds":"6"
          },
          {
           "nodeID":"2",
           "nodeName":"node2",
           "heartbeatLagInSeconds":"40.55",
           "linkState":"Up",
           "replicationLagInSeconds":"5"
           } ],
           "nodeID":"3",
           "nodeName":"node3"
           }
         }
       }
```

9

Cluster Management Commands

You can use the Cluster Management commands to create a cluster, to manage a node in the cluster and to monitor the status of the node in the cluster.

- okv cluster node create Command
  The `okv cluster node create` command creates the first node of the cluster.

- okv cluster node status Command
  The `okv cluster node status` command provides the information for the cluster node pairing process or the status of a cluster node.

- okv cluster node add Command
  The `okv cluster node add` command adds a node to the cluster.

- okv cluster node abort-pairing
  The `okv cluster node abort-pairing` command aborts the node pairing process in the cluster.

- okv cluster node delete Command
  The `okv cluster node delete` command deletes a cluster node.

- okv cluster node enable Command
  The `okv cluster node enable` command enables a cluster node.

- okv cluster node disable Command
  The `okv cluster node disable` command disables a cluster node.

- okv cluster node cancel-disable Command
  The `okv cluster node cancel-disable` command cancels disabling of a cluster node.

- okv cluster node update Command
  The `okv cluster node update` command modifies the cluster subgroup of a cluster node.

9.1 okv cluster node create Command

The `okv cluster node create` command creates the first node of the cluster.

Purpose

The `okv cluster node create` command is the first node under cluster. Following information is required:

- cluster name
- cluster node name
- subgroup name in a cluster

Syntax

```
okv cluster node create --generate-json-input
```

JSON Input File Template

```
{
  "service" : {
   "category" : "cluster,
   "resource" : "node",
   "action" : "create",
   "options" : {
     "nodeName" : "#VALUE",
     "clusterName" : "#VALUE",
     "clusterSubgroup" : "#VALUE"
     }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
--cluster-name	Required	Name of the cluster.
--cluster-subgroup	Required	Name of the cluster subgroup.
--node-name	Required	Name of the cluster node.

CLI Command

```
okv cluster node create --cluster-name --cluster-subgroup --node-name
```

CLI Example

```
okv cluster node create --cluster-name "NorthAmerica" --cluster-
subgroup "NewYork" --node-name "node1"
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "requestId" : "1630"
  }
}
```

Usage Notes

Once you submit the add or create command to view the status, perform the following steps:

1. You can get `requestID`. Using this `requestID`, you can check the request status, using the command:

   ```
   okv cluster node status --pairing-request-id
   ```

2. Following this, you can check the current node status using the command:

```
okv cluster node status
```

JSON Examples

1. Generate JSON input for the `okv cluster node create` command.

```
okv cluster node create --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
   "category" : "cluster,
   "resource" : "node",
   "action" : "create",
   "options" : {
     "nodeName" : "node1",
      "clusterName" : "NorthAmerica",
      "clusterSubgroup" : "NewYork"
     }
   }
}
```

2. Save the generated input to a file, for example, `okv cluster node create --from-json node-create.json`.
   Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "requestId" : "1926"
  }
}
```

Related Topics

- okv cluster node status Command
  The `okv cluster node status` command provides the information for the cluster node pairing process or the status of a cluster node.

9.2 okv cluster node status Command

The `okv cluster node status` command provides the information for the cluster node pairing process or the status of a cluster node.

Required Authorization

System Administrator role

Syntax

```
okv cluster node status
```

JSON Input File Template

```
{
  "service" : {
   "category" : "cluster,
   "resource" : "node",
   "action" : "status",
   "options" : {
     "node-name" : "#VALUE",
     "pairingRequestId" : "#VALUE",
     "pairingSteps" : "#TRUE|FALSE",
     "candidateNodeIpAddress" : "#VALUE",
     "candidateNodeUser : "#VALUE",
     "candidateNodePassword : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required	Description
--candidate-node-ip-address	Optional	IP address of the candidate node.
--candidate-node-password	Optional	Password of the user from the candidate node.
--candidate-node-user	Optional	Name of a user from the candidate node.
--node-name	Optional	Name of the cluster node.
--pairing-request-id	Optional	Request ID for a long running command.
--pairing-steps	Optional	Display detailed pairing steps - TRUE or FALSE.

CLI Command

```
1. okv cluster node status
2. $ okv cluster node status --node-name
3. $ okv cluster uster node status --pairing-request-id
4. $ okv cluster node status --pairing-steps TRUE
5. $ okv cluster node status --pairing-steps --candidate-node-ip-
address --candidate-node-user --candidate-node-password
```

> **✏ Note:**
>
> You need to follow the multiple mode in the provided sequence:
>
> 1. We can use `okv cluster node status` command for candidate node or controller node that belongs to manage cluster commands. It will check the status of controller node.
>
> 2. We can use `okv cluster node status --pairing-request-id` for commands that returns requestId. It will check the status of the given node.
>
> 3. We can use `okv cluster node status --pairing-steps` to check pairing step in controller node for an "add" command. It will check the status of the job by a request ID. The request ID is available from "create", "add", and "abort-paring) command. It will check the status of pairing steps in controller node.
>
> 4. We can use `okv cluster node status --pairing-steps --candidate-node-ip-address --candidate-node-user --candidate-node-password` to check pairing steps in candidate node for an "add" command. It will check the status of pairing steps in controller node.

Usage Notes

Once you submit the add or create command to view the status, perform the following steps:

1. You can get `requestID`. Using this `requestID`, you can check the request status, using the command:

   ```
   okv cluster node status --pairing-request-id
   ```

2. Following this, you can check the node current status using the command:

   ```
   okv cluster node status
   ```

JSON Examples

1. Generate JSON input for the `okv cluster node status` command.

   ```
   okv cluster node status --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
      "category" : "cluster,
      "resource" : "node",
      "action" : "status",
      "options" : {
        "node-name" : "#VALUE",
        "pairingRequestId" : "#VALUE",
        "pairingSteps" : "#TRUE|FALSE",
        "candidateNodeIpAddress" : "#VALUE",
        "candidateNodeUser : "#VALUE",
        "candidateNodePassword : "#VALUE"
       }
   ```

```
      }
    }
```

2. Save the generated input to a file, for example, node_status.json.

3. Run the okv cluster node status command using the generated JSON file. For example:
Output similar to the following appears:

```
okv cluster node status:

{
  "result" : "Success",
  "value" : {
   "status" : "CONFIGURED"
}

okv cluster node status --node-name node1

{
  "result" : "Success",
  "value" : {
   "status" : "ENABLING"
   }
  }
okv cluster node status --pairing-request-id 18374:
 {
   "result" : "Failure",
   "message" : "Server is already a node or is already configured as node."
 }
 {
   "result" : "Success"
 }
okv cluster node status  --pairing-steps TRUE
 {
  "result" : "Success",
  "value" : {
    "stages" : [ {
      "step1" : "Open transport channel with the candidate node",
      "status" : "COMPLETED"
             }, {
      "step2" : "Verify the candidate node details",
      "status" : "COMPLETED"
    }, {
      "step3" : "Enable data replication to the candidate node",
      "status" : "COMPLETED"
    }, {
      "step4" : "Generate the controller node details",
      "status" : "COMPLETED"
    }, {
      "step5" : "Generate backup of the controller node for cloning",
      "status" : "COMPLETED"
    }, {
      "step6" : "Send clone bundle to the candidate node",
      "status" : "COMPLETED"
    }, {
      "step8" : "Enable data replication to other cluster nodes",
      "status" : ""
    }, {
      "step9" : "The candidate node successfully joins the cluster",
      "status" : ""
```

```
      } ]
    }
  }
  okv cluster node status --pairing-steps TRUE --candidate-node-ip-
  address100.70.126.53 --candidate-node-user okvadmin --candidate-node-password
  Welcome_1
  {
    "result" : "Success",
    "value" : {
      "stages" : [ {
        "step1" : "Generate the candidate node details",
        "status" : "COMPLETED"
      }, {
        "step2" : "Open transport channel with the controller node",
        "status" : "COMPLETED"
      }, {
        "step3" : "Send node details to the controller node",
        "status" : "COMPLETED"
      }, {
        "step4" : "Receive clone bundle from the controller node",
        "status" : "COMPLETED"
      }, {
        "step5" : "Restore backup on the candidate node",
        "status" : "COMPLETED"
      }, {
        "step6" : "Update credentials of the candidate node",
        "status" : "COMPLETED"
      }, {
        "step7" : "Tune the database on the candidate node",
        "status" : "COMPLETED"
      }, {
        "step8" : "Setup network configuration on the candidate node",
        "status" : "COMPLETED"
      }
    }
  }
```

9.3 okv cluster node add Command

The `okv cluster node add` command adds a node to the cluster.

Syntax

```
okv cluster node add
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "add",
  "options" : {
    "recoveryPassphrase" : "#VALUE",
    "candidateNodeIpAddress" : "#VALUE",
    "mode" : "#VALUE",
    "nodeId" : "#VALUE",
    "nodeName" : "#VALUE",
    "clusterSubgroup" : "#VALUE",
    "hsmCredential : "#VALUE",
```

```
    "candidateNodeUser : "#VALUE",
    "candidateNodePassword : "#VALUE"
     }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--candidate-node-ip-address`	Required	IP address of the candidate node.
`--candidate-node-password`	Required	Password of the user from the candidate node.
		Note: The user is not required to provide the password in command line or JSON. The user will be prompted for password during runtime.
`--candidate-node-user`	Required	Name of a user from the candidate node.
`--cluster-subgroup`	Required	Name of the cluster subgroup.
`--mode`	Required	Pairing mode - READ-ONLY or READ-WRITE.
`--node-id`	Required	ID of the cluster node. The id can be between 1 to 16 and the ID should be unique and not the duplicated ID with other node.
`--node-name`	Required	Name of the cluster node.
`--recovery-passphrase`	Required	Recovery pass phrase of the cluster.
		Note: The user is not required to provide the password in command line or JSON. The user will be prompted for password during runtime.
`--hsm-credential`	Optional	HSM credential.

CLI Command

```
okv cluster node add --options <argument>
```

JSON Example

1. Generate JSON input for the `okv cluster node add` command.

   ```
   okv cluster node add --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "node",
     "action" : "add",
     "options" : {
       "recoveryPassphrase" : "#VALUE",
       "candidateNodeIpAddress" : "#VALUE",
       "mode" : "#VALUE",
       "nodeId" : "#VALUE",
       "nodeName" : "#VALUE",
       "clusterSubgroup" : "#VALUE",
       "hsmCredential : "#VALUE",
       "candidateNodeUser : "#VALUE",
       "candidateNodePassword : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file, for example, `node-add.json`.

3. Run the `okv cluster node add` command using the generated JSON file. For example:

   ```
   okv cluster node add--from-json-node-add.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
      "value" : {
       "requestId" : "78219"
       }
    }
   ```

> **Note:**
>
> See, section okv cluster node status Command for requestId output.

Related Topics

- okv cluster node delete Command
  The `okv cluster node delete` command deletes a cluster node.

- okv cluster node status Command

    The `okv cluster node status` command provides the information for the cluster node pairing process or the status of a cluster node.

9.4 okv cluster node abort-pairing

The `okv cluster node abort-pairing` command aborts the node pairing process in the cluster.

Required Authorization

System Administrator role

Syntax

```
okv cluster node abort-pairing --generate-json-input
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "abort-pairing",
  "options" : {
    "candidateNodeIpAddress" : "#VALUE",
    "candidateNodeUser : "#VALUE",
    "candidateNodePassword : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required	Description
`--candidate-node-ip-address`	Optional	IP address of the candidate node.
`--candidate-node-password`	Optional	Password of the user from the candidate node. If `--candidate-node-password` is not provided, the process wait for the input.
`--candidate-node-user`	Optional	Name of a user from the candidate node.

> **Note:**
>
> If you do not provide information in the `--candidate-node-ip-address`, the command gets aborted in the controller node. If you want to abort the `--candidate-node-ip-address`, you have to provide information for all three parameters.

CLI Command

```
okv cluster node abort-pairing --options <argument>
```

Usage Notes

Once you submit the add or create command to view the status, perform the following steps:

1. You can get `requestID`. Using this `requestID`, you can check the request status, using the command:

   ```
   okv cluster node status --pairing-request-id
   ```

2. Following this, you can check the node current status using the command:

   ```
   okv cluster node status
   ```

JSON Examples

1. Generate JSON input for the `okv cluster node abort-pairing` command.

   ```
   okv cluster node abort-pairing.
   ```

   The generated input is as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "node",
     "action" : "abort-pairing",
     "options" : {
       "candidateNodeIpAddress" : "#VALUE",
       "candidateNodeUser : "#VALUE",
       "candidateNodePassword : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file, for example, `abort_pairing.json`.

3. Run the `okv cluster node delete` command using the generated JSON file. For example:

   ```
   okv cluster node abort-pairing --from-json abort_pairing.json
   ```

Output similar to the following appears:

```
{
 "result" : "Success",
 "value" : {
  "requestId" : "78223"
  }
}
```

> **Note:**
>
> See, section okv cluster node status Command for requestId output.

Related Topics

- okv cluster node status Command
  The `okv cluster node status` command provides the information for the cluster node pairing process or the status of a cluster node.

9.5 okv cluster node delete Command

The `okv cluster node delete` command deletes a cluster node.

Required Authorization

System Administrator role

`okv cluster node delete` command displays the following:

- The command result, whether it is Success or failure.

Syntax

```
okv cluster node delete
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "delete",
  "options" : {
   "nodeName" : "#VALUE",
   "force" : "#TRUE|FALSE",
   "originNodeName" : "#VALUE"
   }
  }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node.
--origin-node-name	Required	Name of an origin node to initiate deletion of a node.
--force	Optional	Use force option to delete a node - TRUE or FALSE.

CLI Command

```
okv cluster node delete --options <argument>
```

JSON Examples

1. Generate JSON input for the `okv cluster node delete` command.

   ```
   okv cluster node delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "node",
     "action" : "delete",
     "options" : {
      "nodeName" : "#VALUE",
      "force" : "#TRUE|FALSE",
      "originNodeName" : "#VALUE"
      }
     }
    }
   ```

2. Save the generated input to a file, for example, `node_delete.json`.

3. Run the `okv cluster node delete` command using the generated JSON file. For example:

   ```
   okv cluster node delete --from-json node_delete.json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success"
   }
   ```

   > **Note:**
   >
   > See, section okv cluster node status Command for requestId output.

9.6 okv cluster node enable Command

The `okv cluster node enable` command enables a cluster node.

Required Authorization

System Administrator role

`okv cluster node enable` command displays the following:

- The command result, whether it is Success or failure.

Syntax

```
okv cluster node enable
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "enable",
  "options" : {
   "nodeName" : "#VALUE"
   }
   }
}
```

Parameters

Parameter	Required	Description
--node-name	Required	Name of the cluster node.

JSON Example

1. Generate JSON input for the `okv cluster node enable` command.

   ```
   okv cluster node enable --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "node",
     "action" : "enable",
     "options" : {
      "nodeName" : "#VALUE"
      }
     }
   }
   ```

2. Save the generated input to a file, for example, `node_enable.json`.

3. Run the `okv cluster node enable` command using the generated JSON file. For example:

```
okv cluster node enable --from-json node_enable.json
```

Output similar to the following appears:

```
{
 "result" : "Success"
}
```

9.7 okv cluster node disable Command

The `okv cluster node disable` command disables a cluster node.

Required Authorization

System Administrator role

Syntax

```
okv cluster node disable
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "disable",
  "options" : {
   "nodeName" : "#VALUE",
   "originNodeName" : "#VALUE"
   }
  }
}
```

Parameters

Parameter	Required?	Description
`--node-name`	Required	Name of the cluster node.
`--origin-node-name`	Optional	Name of an origin node to initiate disabling of a node.

JSON Examples

1. Generate JSON input for the `okv cluster node disable` command.

```
okv cluster node disable --generate-json-input
```

The generated input appears as follows:

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "disable",
  "options" : {
   "nodeName" : "#VALUE",
   "originNodeName" : "#VALUE"
   }
  }
}
```

2. Save the generated input to a file, for example, `node_disable.json`.

3. Run the `okv cluster node disable` command using the generated JSON file. For example:

```
okv cluster node disable --from-json node_disable.json
```

Output similar to the following appears:

```
{
 "result" :"Success"
}
```

9.8 okv cluster node cancel-disable Command

The `okv cluster node cancel-disable` command cancels disabling of a cluster node.

Required Authorization

System Administrator role

`okv cluster node cancel-disable` command displays the following:

• The command result, whether it is Success or failure.

Syntax

```
okv cluster node cancel-disable
```

JSON Input File Template

```
{
 "service" : {
 "category" : "cluster,
 "resource" : "node",
 "action" : "cancel-disable",
 "options" : {
  "nodeName" : "#VALUE"
  }
```

```
 }
}
```

Parameters

Parameter	Required?	Description
`--node-name`	Required	Name of the cluster node.

JSON Examples

1. Generate JSON input for the `okv cluster node cancel-disable` command.

   ```
   okv cluster node cancel-disable --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
    "category" : "cluster,
    "resource" : "node",
    "action" : "cancel-disable",
    "options" : {
     "nodeName" : "#VALUE"
     }
    }
   }
   ```

2. Save the generated input to a file, for example, `cancel_disable.json`.

3. Run the `okv cluster node cancel-disable` command using the generated JSON file.
   For example:

   ```
   okv cluster node cancel-disable --from-json cancel_disable.json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success"
   }
   ```

9.9 okv cluster node update Command

The `okv cluster node update` command modifies the cluster subgroup of a cluster node.

Required Authorization

System Administrator role

Syntax

```
okv cluster node update --generate-json-input
```

JSON Input File Template

```
{
 "service" : {
  "category" : "cluster,
  "resource" : "node",
  "action" : "update",
  "options" : {
   "nodeName" : "#VALUE",
   "clusterSubgroup" : "#VALUE"
  }
 }
}
```

Parameters

Parameter	Required	Description
--cluster-subgroup	Required	Name of the cluster subgroup.
--node-name	Required	Name of the cluster node.

JSON Examples

1. Generate JSON input for the `okv cluster node update` command.

   ```
   okv cluster node update
   ```

   The generated input appears as follows:

   ```
   {
    "service" : {
     "category" : "cluster,
     "resource" : "node",
     "action" : "update",
     "options" : {
      "nodeName" : "#VALUE",
      "clusterSubgroup" : "#VALUE"
     }
    }
   }
   ```

2. Save the generated input to a file, for example, `node_update.json`.

3. Run the `okv cluster node delete` command using the generated JSON file. For example:

   ```
   okv cluster node update --from-json node_update.json
   ```

   Output similar to the following appears:

   ```
   {
    "result" : "Success"
   }
   ```

10

Backup, Schedule, and Restore Commands

You can use the backup, schedule, and restore commands to automate Oracle Key Vault appliance backups.

- **okv backup destination create Command**
  The `okv backup destination create` command creates a remote backup destination for the Oracle Key Vault server.

- **okv backup destination delete Command**
  The `okv backup destination delete` command deletes a remote backup destination.

- **okv backup destination delete-backup Command**
  The `okv backup destination delete-backup` command enables you to manually delete a local Oracle Key Vault backup.

- **okv backup destination get Command**
  The `okv backup destination get` command gets information about a specific backup destination.

- **okv backup destination list Command**
  The `okv backup destination list` command displays a list of the current Oracle Key Vault server backup destinations.

- **okv backup destination list-backups Command**
  The `okv backup destination list-backups` command lists the backups that are available for restore operations on a destination.

- **okv backup destination-policy create Command**
  The `okv backup destination-policy create` command creates a backup destination policy.

- **okv backup destination-policy delete Command**
  The `okv backup destination-policy delete` command deletes a backup destination policy.

- **okv backup destination-policy get Command**
  The `okv backup destination-policy get` command retrieves detailed information about a backup destination policy.

- **okv backup destination-policy list Command**
  The `okv backup destination-policy list` command lists existing backup destination policies and their settings.

- **okv backup destination-policy list-purged-backups Command**
  The `okv backup destination-policy list-purged-backups` command lists the backups purged by a backup destination policy.

- **okv backup destination-policy update Command**
  The `okv backup destination-policy update` command updates a backup destination policy.

- okv backup destination resume-policy Command

  The `okv backup destination resume-policy` command resumes the operation of the backup destination policy that is associated with a specified backup destination.

- okv backup destination suspend-policy Command

  The `okv backup destination suspend-policy` command suspends the operation of the backup destination policy that is associated with a specified backup destination.

- okv backup destination update Command

  The `okv backup destination update` command updates the settings of a remote backup destination.

- okv backup destination get-public-key Command

  The `okv backup destination get-public-key` command retrieves the SSH public key of the Oracle Key Vault internal user used for performing backups.

- okv backup destination reset-host-key Command

  The `okv backup destination reset-host-key` command resets a destination host's public key in the `known_hosts` file for the `oracle` user.

- okv backup history list Command

  The `okv backup history list` command lists the details of a backup history, such as runtime errors, whether the backup completed, and start and end times.

- okv backup schedule create Command

  The `okv backup schedule create` command creates a backup schedule job.

- okv backup schedule get Command

  The `okv backup schedule get` command retrieves detailed information about a scheduled Oracle Key Vault server backup.

- okv backup schedule list Command

  The `okv backup schedule list` command displays a listing of the currently scheduled Oracle Key Vault server backups.

- okv backup schedule pause Command

  The `okv backup schedule pause` command pauses a scheduled Oracle Key Vault server backup.

- okv backup schedule resume Command

  The `okv backup schedule resume` command resumes a paused Oracle Key Vault backup job.

- okv backup schedule delete Command

  The `okv backup schedule delete` command deletes scheduled backup job.

- okv backup schedule update Command

  The `okv backup schedule update` command updates a currently scheduled backup.

- okv backup restore start Command

  The `okv backup restore start` command starts the restore process of an Oracle Key Vault backup.

- okv backup restore status Command

  The `okv backup restore status` command checks the status of the Oracle Key Vault backup restore operation.

10.1 okv backup destination create Command

The `okv backup destination create` command creates a remote backup destination for the Oracle Key Vault server.

Required Authorization

System Administrator role

Syntax

```
okv backup destination create
--name destination_name
--transfer-method scp|sftp
--host-name host_name
--port port
--path destination_path
--user-name user_name
--authentiation-method password|key-based
--destination-policy policy_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "create",
    "options" : {
      "name" : "#VALUE",
      "transferMethod" : "#scp|sftp",
      "hostName" : "#VALUE",
      "port" : "#VALUE",
      "path" : "#VALUE",
      "userName" : "#VALUE",
      "authenticationMethod" : "#password|key-based",
      "destinationPolicy" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup destination. For a listing of existing names, run the `okv backup destination list` command.
`--transfer-method` / `transferMethod`	Optional	Enter one of the following values: • `scp` The default value is: • `sftp`

Parameter/Template Parameter	Required?	Description
`--host-name` / `hostName`	Required	Host name or IP address of the remote server for the backup. If you enter the host name, then ensure that DNS is configured to translate the host name to its corresponding IP address. Do not include spaces, single quotation marks, or double quotation marks in a host name that is in a remote backup destination.
`--port` / `port`	Optional	Port number of the destination backup computer. The default is 22.
`--path` / `path`	Required	Path to an existing directory on the external server where the backup file will be copied. You cannot modify this directory location after the backup destination is created. This path must not be the destination for backups from another Oracle Key Vault server. Do not include spaces, single quotation marks, or double quotation marks destination path that is in a remote backup destination.
`--user-name` / `userName`	Required	User name of the user account on the remote server. Ensure that this user has the write permissions on the directory specified in the path parameter for the `scp` connection. Do not include spaces, single quotation marks, or double quotation marks in a user name that is in a remote backup destination.
`--authentication-method` / `authenticationMethod`	Optional	Enter one of the following values: • `password`: The password of the user account specified in the `--user-name` / `userName` parameter. The default Value is: • `key-based`: Use `okv backup destination get-public-key` to obtain the public key of the Oracle Key Vault internal user. Copy the public key from the command output and paste it in the appropriate configuration file, such as `authorized_keys`, on the destination server. Check that the permissions of the configuration file are set to allow access only to the backup account owner and no other group or user. Be aware that certain events may trigger a change of the public key, which means that Oracle Key Vault cannot use the backup destination until the new public key is re-copied from Oracle Key Vault to the appropriate configuration file. These events include but are not limited to certificate rotation, changing the IP address, and conversion to a cluster node.
`--destination-policy` / `destinationPolicy`	Optional	Specifies the name of the backup destination policy. To find existing backup destination policies, run the `okv backup destination-policy list` command.

JSON Example

1. Generate JSON input for the `okv backup destination create` command.

```
okv backup destination create --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "create",
    "options" : {
      "name" : "#VALUE",
      "transferMethod" : "#scp|sftp",
      "hostName" : "#VALUE",
      "port" : "#VALUE",
      "path" : "#VALUE",
      "userName" : "#VALUE",
      "authenticationMethod" : "#password|key-based",
      "destinationPolicy" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `bkup_srvr_dest_create.json`) and then edit it to create the backup server destination.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "create",
    "options" : {
      "name" : "prod_okv_backup_dest",
      "transferMethod" : "scp",
      "hostName" : "192.0.2.34",
      "port" : "22",
      "path" : "/opt/okv/backups",
      "userName" : "psmith",
      "authenticationMethod" : "password",
      "destinationPolicy" : "global_dest_pol"
    }
  }
}
```

3. Run the `okv backup destination create` command using the generated JSON file.

```
okv backup destination create --from-json bkup_srvr_dest_create.json
```

If you specified `password` for the user authentication method, then you will be prompted for the password. After entering the correct password, output similar to the following appears:

```
Destination User Password: password
{
  "result" : "Success"
}
```

10.2 okv backup destination delete Command

The `okv backup destination delete` command deletes a remote backup destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination delete --name destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "delete",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template	Required?	Description
`--name` / `name`	Required	Name of the remote backup destination. To find existing backup names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination delete` command.

   ```
   okv backup destination delete --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "delete",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_srvr_dest_del.json`) and then edit it to delete the backup server destination.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
   ```

```
      "action" : "delete",
      "options" : {
        "name" : "prod_okv_backup_dest"
      }
    }
  }
```

3. Run the `okv backup destination delete` command using the generated JSON file.

   ```
   okv backup destination delete --from-json bkup_srvr_dest_del.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

10.3 okv backup destination delete-backup Command

The `okv backup destination delete-backup` command enables you to manually delete a local Oracle Key Vault backup.

Required Authorization

System Administrator role

Syntax

```
okv backup destination delete-backup --destination backup_destination --backup-file
backup_file_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
     "action" : "delete-backup",
    "options" : {
      "backupFile" : "#VALUE",
      "destination" : "#VALUE"
     }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination`/ `destination`	Required	Specifies the name of the backup destination. Enter `LOCAL`.
		The `okv backup destination delete-backup` command deletes an Oracle Key Vault backup by its backup file name. This is only supported for `LOCAL` destination.

Parameter/Template Parameter	Required?	Description
`--backup-file` / `backupFile`	Required	Specifies the name of the backup file. To find existing backup file names, run the `okv backup destination list-backups` command.

JSON Example

1. Generate JSON input for the `okv backup destination delete-backup` command.

   ```
   okv backup destination delete-backup --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
         "category" : "backup",
         "resource" : "destination",
          "action" : "delete-backup",
         "options" : {
            "backupFile" : "#VALUE",
            "destination" : "#VALUE"
           }
       }
   }
   ```

2. Save the generated input to a file (for example, `backup_local_del.json`) and then edit it to specify the backup file name and backup destination name (that is, `local`).

   ```
   {
     "service" : {
         "category" : "backup",
         "resource" : "destination",
          "action" : "delete-backup",
         "options" : {
            "backupFile" : "okvbackup_onetime_onetime_20210118175804",
            "destination" : "local"
           }
       }
   }
   ```

3. Run the `okv backup destination delete-backup` command using the generated JSON file.

   ```
   okv backup destination delete-backup --from-json backup_local_del.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

10.4 okv backup destination get Command

The `okv backup destination get` command gets information about a specific backup destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination get --name backup_destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "get",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup destinination. For a listing of existing names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination get` command.

    ```
    okv backup destination get --generate-json-input
    ```

    The generated input appears as follows:

    ```
    {
      "service" : {
        "category" : "backup",
        "resource" : "destination",
        "action" : "get",
        "options" : {
          "name" : "#VALUE"
        }
      }
    }
    ```

2. Save the generated input to a file (for example, `bkup_srvr_dest_get.json`) and then edit it to retrieve the backup server destination.

    ```
    {
      "service" : {
    ```

```
        "category" : "backup",
        "resource" : "destination",
        "action" : "get",
        "options" : {
          "name" : "prod_okv_backup_dest"
        }
      }
    }
```

3. Run the `okv backup destination get` command using the generated JSON file.

```
okv backup destination get --from-json bkup_srvr_dest_get.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "authenticationMethod" : "Password",
    "hostName" : "192.0.2.34",
    "name" : "PROD_OKV_BACKUP_DEST",
    "path" : "/opt/okv/backups",
    "policyName" : "GLOBAL_DEST_POL",
    "policyState" : "Active",
    "port" : "22",
    "transferMethod" : "scp",
    "userName" : "psmith"
  }
}
```

10.5 okv backup destination list Command

The `okv backup destination list` command displays a list of the current Oracle Key
Vault server backup destinations.

Required Authorization

System Administrator role

Syntax

```
okv backup destination list
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "list"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv backup destination list` command.

```
okv backup destination list --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "list"
  }
}
```

2. Save the generated input to a file (for example, `bkup_srvr_dest_list.json`).

3. Run the `okv backup destination list` command using the generated JSON file.

```
okv backup destination list --from-json bkup_srvr_dest_list.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "destinations" : [
    {
      "authenticationMethod" : " ",
      "hostName" : "localhost",
      "name" : "LOCAL",
      "path" : "-",
      "transferMethod" : "-",
      "userName" : "-"
    },
    {
      "authenticationMethod" : "Password",
      "hostName" : "192.0.2.34",
      "name" : "PROD_OKV_BACKUP_DEST",
      "path" : "/opt/okv/backups",
      "port" : "22",
      "transferMethod" : "scp",
      "userName" : "psmith"
    }
  ]
}
```

10.6 okv backup destination list-backups Command

The `okv backup destination list-backups` command lists the backups that are available for restore operations on a destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination list-backups --name destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
```

```
      "resource" : "destination",
      "action" : "list-backups",
      "options" : {
        "name" : "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup destination.
		To find existing backup destination names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination list-backups` command.

   ```
   okv backup destination list-backups --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "list-backups",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `dest_list_backups.json`) and then edit it to list the backup server destinations.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "list-backups",
       "options" : {
         "name" : "prod_okv_backup_dest"
       }
     }
   }
   ```

3. Run the `okv backup destination list-backups` command using the generated JSON file.

   ```
   okv backup destination list-backups --from-json dest_list_backups.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "backups" : [
       {
         "file" : "okvbackup_periodic_incr_20211030162206",
   ```

```
      "time" : "2021-10-30 16:22:06",
      "type" : "Periodic"
    }, {
      "file" : "okvbackup_periodic_full_20211029162206",
      "time" : "2021-10-29 16:22:06",
      "type" : "Periodic"
    }, {
      "file" : "okvbackup_onetime_onetime_20211028012206",
      "time" : "2021-10-28 01:22:06",
      "type" : "One-Time"
    }
  ]
}
```

10.7 okv backup destination-policy create Command

The `okv backup destination-policy create` command creates a backup destination policy.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy create --destination-policy policy_name --recent-backups-
to-preserve number_of_recent_backups_to_preserve --purge-backup-after
number_of_days_after_which_backup_purged
```

JSON Input File Template

```
{
  "service" : {
     "category" : "backup",
     "resource" : "destination-policy",
     "action" : "create",
     "options" : {
      "destinationPolicy" : "#VALUE",
      "recentBackupsToPreserve" : "#VALUE",
      "purgeBackupAfter" :  "#VALUE"
     }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination-policy`/ `destinationPolicy`	Required	Specifies the name of the backup destination policy to create. To find existing backup destination policies, run the `okv backup destination-policy list` command.
`--recent-backups-to-preserve`/ `recentBackupsToPreserv e`	Optional	The number of the most recent backups to preserve. Enter a value from 1 through 999. For example, to preserve the most recent 15 backups, specify 15 for this value. The default setting is 10.

Parameter/Template Parameter	Required?	Description
`--purge-backup-after` / `purgeBackupAfter`	Optional	Specifies the number of days after which a backup is eligible to be purged. Enter a value from `1` through `999`. For example, a value of 45 will purge any backups older than 45 days. However, note that backups older than this number of days may be available because a backup is purged when it is older than the number of days specified in the `--purge-backup-after` / `purgeBackupAfter` parameter and there are more backups remaining than the number of backups specified in the `--recent-backups-to-preserve` / `recentBackupsToPreserve` parameter. The default setting is `30`.
		Enter this value using the ISO 8601 standard. For example, enter `P25D` to specify 25 days.

JSON Example

1. Generate JSON input for the `okv backup destination-policy create` command.

   ```
   okv backup destination-policy create --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination-policy",
        "action" : "create",
       "options" : {
         "destinationPolicy" : "#VALUE",
         "recentBackupsToPreserve" : "#VALUE",
         "purgeBackupAfter" :   "#VALUE"
        }
     }
   }
   ```

2. Save the generated input to a file (for example, `backup_dest_policy_create.json`) and then edit it to create the backup destination policy.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination-policy",
        "action" : "create",
       "options" : {
         "destinationPolicy" : "global_dest_pol",
         "recentBackupsToPreserve" : "15",
         "purgeBackupAfter" : "P45D"
        }
     }
   }
   ```

3. Run the `okv backup destination-policy create` command using the generated JSON file.

```
okv backup destination-policy create --from-json backup_dest_policy_create.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.8 okv backup destination-policy delete Command

The `okv backup destination-policy delete` command deletes a backup destination policy.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy delete --destination_policy policy_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "delete",
    "options" : {
      "destinationPolicy" : "#VALUE"
     }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination-policy`/ `destinationPolicy`	Required	Specifies the name of the backup destination policy to delete.
		To find existing backup destination policies, run the `okv backup destination-policy list` command.

JSON Example

1. Generate JSON input for the `okv backup destination-policy delete` command.

    ```
    okv backup destination-policy delete --generate-json-input
    ```

    The generated input appears as follows:

    ```
    {
      "service" : {
        "category" : "backup",
        "resource" : "destination-policy",
        "action" : "delete",
        "options" : {
          "destinationPolicy" : "#VALUE"
    ```

```
      }
    }
  }
```

2. Save the generated input to a file (for example,
   `backup_dest_policy_delete.json`) and then edit it to specify the backup
   destination policy to delete.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "delete",
    "options" : {
      "destinationPolicy" : "global_dest_pol"
    }
  }
}
```

3. Run the `okv backup destination-policy delete` command using the generated
   JSON file.

```
okv backup destination-policy delete --from-json
backup_dest_policy_delete.json
```

   Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.9 okv backup destination-policy get Command

The `okv backup destination-policy get` command retrieves detailed information
about a backup destination policy.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy get --destination-policy policy_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "get",
    "options" : {
      "destinationPolicy" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination-policy/ destinationPolicy`	Required	Specifies the name of the backup destination policy to retrieve.
		To find existing backup destination policies, run the `okv backup destination-policy list` command.

JSON Example

1. Generate JSON input for the `okv backup destination-policy get` command.

   ```
   okv backup destination-policy get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
        "category" : "backup",
        "resource" : "destination-policy",
        "action" : "get",
        "options" : {
          "destinationPolicy" : "#VALUE"
         }
      }
   }
   ```

2. Save the generated input to a file (for example, `backup_dest_policy_get.json`) and then edit it to retrieve the backup destination policy.

   ```
   {
     "service" : {
        "category" : "backup",
        "resource" : "destination-policy",
        "action" : "get",
        "options" : {
          "destinationPolicy" : "global_dest_pol"
         }
      }
   }
   ```

3. Run the `okv backup destination-policy get` command using the generated JSON file.

   ```
   okv backup destination-policy get --from-json backup_dest_policy_get.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "destinationPolicy" : "GLOBAL_DEST_POL",
       "purgeBackupAfter" : "P45D",
       "recentBackupsToPreserve" : "15"
     }
   }
   ```

10.10 okv backup destination-policy list Command

The `okv backup destination-policy list` command lists existing backup destination policies and their settings.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy list
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
     "action" : "list"
  }
}
```

Parameters

No parameters

JSON Example

1. Generate JSON input for the `okv backup destination-policy list` command.

   ```
   okv backup destination-policy list --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination-policy",
        "action" : "list"
     }
   }
   ```

2. Save the generated input to a file (for example, `backup_dest_policy_list.json`).

3. Run the `okv backup destination-policy list` command using the generated JSON file.

   ```
   okv backup destination-policy list --from-json backup_dest_policy_list.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "destinationPolicies" : [
         {
           "destinationPolicy" : "GLOBAL_DEST_POL",
           "recentBackupsToPreserve" : "15",
           "purgeBackupAfter" : "P45D"
   ```

```
        }, {
          "destinationPolicy" : "RAC_DEST_POL",
          "recentBackupsToPreserve" : "5",
          "purgeBackupAfter" : "P60D"
        }
      ],
      "fetchedDestinationPolicyCount" : "2"
    }
  }
```

10.11 okv backup destination-policy list-purged-backups Command

The `okv backup destination-policy list-purged-backups` command lists the backups purged by a backup destination policy.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy list-purged-backups --destination-policy policy_name --destination destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "list-purged-backups",
    "options" : {
      "destinationPolicy" : "#VALUE",
      "destination" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination-policy`/ `destinationPolicy`	Required	Specifies the name of the backup destination policy that you want to list purged backups for.
		To find existing backup destination policies, run the `okv backup destination-policy list` command.
`--destination`/ `destination`	Optional	Name of the remote backup destination. To find existing backup destination names, run the `okv backup destination list` command. If you omit this setting, then it lists backups purged by a specified backup destination policy on all of the backup destinations.

JSON Example

1. Generate JSON input for the `okv backup destination-policy list-purged-backups` command.

```
okv backup destination-policy list-purged-backups --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "list-purged-backups",
    "options" : {
      "destinationPolicy" : "#VALUE",
      "destination" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `backup_dest_policy_list_purged.json`) and then edit it to include the backup destination policy name and backup destination name.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination-policy",
    "action" : "list-purged-backups",
    "options" : {
      "destinationPolicy" : "global_dest_pol",
      "destination" : "prod_okv_backup_dest"
    }
  }
}
```

3. Run the `okv backup destination-policy list-purged-backups` command using the generated JSON file.

```
okv backup destination-policy list-purged-backups --from-json
backup_dest_policy_list_purged.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "fetchedPurgedBackupCount" : "2",
    "purgedBackups" : [
      {
        "backupFile" : "okvbackup_periodic_incr_20211030162206",
        "status" : "Purged",
        "purgeTime" : "2021-12-14 19:15:06",
        "destination" : "PROD_OKV_BACKUP_DEST",
        "hostName" : "192.0.2.34",
        "port" : "22",
        "userName" : "psmith",
        "path" : "/opt/okv/backups"
      }, {
        "backupFile" : "okvbackup_onetime_onetime_20211028012206",
```

```
            "status" : "Unknown",
            "purgeTime" : "2021-12-12 17:38:06",
            "destination" : "PROD_OKV_BACKUP_DEST",
            "hostName" : "192.0.2.34",
            "port" : "22",
            "userName" : "psmith",
            "path" : "/opt/okv/backups"
          }
        ]
      }
   }
```

10.12 okv backup destination-policy update Command

The `okv backup destination-policy update` command updates a backup destination policy.

Required Authorization

System Administrator role

Syntax

```
okv backup destination-policy update --destination-policy policy_name --recent-backups-
to-preserve number_of_recent_backups_to_preserve --purge-backup-after
number_of_days_after_which_backup_purged
```

JSON Input File Template

```
{
  "service" : {
     "category" : "backup",
     "resource" : "destination-policy",
     "action" : "update",
     "options" : {
       "destinationPolicy" : "#VALUE",
       "recentBackupsToPreserve" : "#VALUE",
       "purgeBackupAfter" :  "#VALUE"
     }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination-policy`/ `destinationPolicy`	Required	Specifies the name of the backup destination policy to update. To find existing backup destination policies, run the `okv backup destination-policy list` command.
`--recent-backups-to-preserve`/ `recentBackupsToPreserve`	Optional	The number of the most recent backups to preserve. Enter a value from `1` through `999`. For example, to preserve the most recent 15 backups, specify `15` for this value. The default setting is `10`.

Parameter/Template Parameter	Required?	Description
`--purge-backup-after` / `purgeBackupAfter`	Optional	Specifies the number of days after which a backup is eligible to be purged. Enter a value from `1` through `999`. For example, a value of 45 will purge any backups older than 45 days. However, note that backups older than this number of days may be available because a backup is purged when it is older than the number of days specified in the `--purge-backup-after` / `purgeBackupAfter` parameter and there are more backups remaining than the number of backups specified in the `--recent-backups-to-preserve` / `recentBackupsToPreserve` parameter. The default setting is `30`. Enter this value using the ISO 8601 standard. For example, enter `P25D` to specify 25 days.

JSON Example

1. Generate JSON input for the `okv backup destination-policy update` command.

   ```
   okv backup destination-policy update --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination-policy",
       "action" : "update",
       "options" : {
         "destinationPolicy" : "#VALUE",
         "recentBackupsToPreserve" : "#VALUE",
         "purgeBackupAfter" :   "#VALUE"
        }
     }
   }
   ```

2. Save the generated input to a file (for example, `backup_dest_policy_update.json`) and then edit it to update the backup destination policy.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination-policy",
       "action" : "update",
       "options" : {
         "destinationPolicy" : "global_dest_pol",
         "recentBackupsToPreserve" : "20",
         "purgeBackupAfter" : "P60D"
        }
     }
   }
   ```

3. Run the `okv backup destination-policy update` command using the generated JSON file.

```
okv backup destination-policy update --from-json backup_dest_policy_update.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.13 okv backup destination resume-policy Command

The `okv backup destination resume-policy` command resumes the operation of the backup destination policy that is associated with a specified backup destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination resume-policy --destination destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "resume-policy",
    "options" : {
       "destination" : "#VALUE"
     }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination` / `destination`	Required	Specifies the name of the backup destination. For a listing of existing destination names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination resume-policy` command.

   ```
   okv backup destination resume-policy --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "resume-policy",
       "options" : {
         "destination" : "#VALUE"
        }
   ```

```
    }
  }
```

2. Save the generated input to a file (for example, `backup_dest_pol_resume.json`) and then edit it to specify the backup destination policy to resume.

```
{
  "service" : {
     "category" : "backup",
     "resource" : "destination",
     "action" : "resume-policy",
     "options" : {
       "destination" : "prod_okv_backup_dest"
      }
    }
}
```

3. Run the `okv backup destination resume-policy` command using the generated JSON file.

```
okv backup destination resume-policy --from-json backup_dest_pol_resume.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.14 okv backup destination suspend-policy Command

The `okv backup destination suspend-policy` command suspends the operation of the backup destination policy that is associated with a specified backup destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination suspend-policy --destination destination_name
```

JSON Input File Template

```
{
  "service" : {
     "category" : "backup",
     "resource" : "destination",
     "action" : "suspend-policy",
     "options" : {
       "destination" : "#VALUE"
      }
    }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--destination`/`destination`	Required	Name of the backup destination. For a listing of existing backup destination names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination suspend-policy` command.

   ```
   okv backup destination suspend-policy --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
        "category" : "backup",
        "resource" : "destination",
        "action" : "suspend-policy",
        "options" : {
          "destination" : "#VALUE"
         }
      }
   }
   ```

2. Save the generated input to a file (for example, `backup_dest_pol_suspend.json`) and then edit it to specify the backup destination policy to suspend.

   ```
   {
     "service" : {
        "category" : "backup",
        "resource" : "destination",
        "action" : "suspend-policy",
        "options" : {
          "destination" : "prod_okv_backup_dest"
         }
      }
   }
   ```

3. Run the `okv backup destination suspend-policy` command using the generated JSON file.

   ```
   okv backup destination suspend-policy --from-json backup_dest_pol_suspend.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

10.15 okv backup destination update Command

The `okv backup destination update` command updates the settings of a remote backup destination.

Required Authorization

System Administrator role

Syntax

```
okv backup destination update
--name destination_name
--port port
--user-name user_name
--authentication-method authentication_method
--destination-policy destination_policy_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "update",
    "options" : {
      "name" : "#VALUE",
      "port" : "#VALUE",
      "userName" : "#VALUE",
      "authenticationMethod" : "#password|key-based",
      "destinationPolicy" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup destination. For a listing of existing backup destination names, run the `okv backup destination list` command.
`--port` / `port`	Optional	Port number of the destination backup computer. The default is 22.
`--user-name` / `userName`	Optional	User name of the user account on the remote server. Ensure that this user has the write permissions on the directory specified in the path parameter for the `scp` connection. Do not include spaces, single quotation marks, or double quotation marks in a user name that is in a remote backup destination.

Parameter/Template Parameter	Required?	Description
`--authentication-method`/ `authenticationMethod`	Optional	Enter one of the following values: • `password`: The password of the user account specified in the `--user-name`/ `userName`parameter. The default value is: • `key-based`: Use `okv backup destination get-public-key` to obtain the public key of the Oracle Key Vault internal user. Copy the public key from the command output and paste it in the appropriate configuration file, such as `authorized_keys`, on the destination server. Check that the permissions of the configuration file are set to allow access only to the backup account owner and no other group or user. Be aware that certain events may trigger a change of the public key, which means that Oracle Key Vault cannot use the backup destination until the new public key is re-copied from Oracle Key Vault to the appropriate configuration file. These events include but are not limited to certificate rotation, changing the IP address, and conversion to a cluster node.
`--destination-policy`/ `destinationPolicy`	Optional	Specifies the backup destination policy. To find existing backup destination policies, run the `okv backup destination-policy list` command.

Example

1. Generate JSON input for the `okv backup destination update` command.

   ```
   okv backup destination update --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "update",
       "options" : {
         "name" : "#VALUE",
         "port" : "#VALUE",
         "userName" : "#VALUE",
         "authenticationMethod" : "#password|key-based",
         "destinationPolicy" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `update_bkup_srvr_dest.json`) and then edit it to update the backup server destination.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "update",
    "options" : {
      "name" : "prod_okv_backup_dest",
      "port" : "22",
      "userName" : "psmith",
      "authenticationMethod" : "password",
      "destinationPolicy" : "rac_dest_pol"
    }
  }
}
```

3. Run the `okv backup destination update` command using the generated JSON file.

```
okv backup destination update --from-json update_bkup_srvr_dest.json
```

If you specified `password` for the user authentication method, then you will be prompted for the password. After entering the correct password, output similar to the following appears

```
Destination User Password: password
{
  "result" : "Success"
}
```

10.16 okv backup destination get-public-key Command

The `okv backup destination get-public-key` command retrieves the SSH public key of the Oracle Key Vault internal user used for performing backups.

Copy the public key from the output of this command and paste it in the appropriate configuration file, such as `authorized_keys` of the backup destination user account, on the backup destination server. Check that the permissions of the configuration file are set to allow access only to the backup user account and to no other group or user. Be aware that certain events may trigger a change of the public key, which means that Oracle Key Vault cannot use the backup destination until the new public key is re-copied from Oracle Key Vault to the appropriate configuration file. These events include but are not limited to certificate rotation, changing the IP address, and conversion to a cluster node.

Required Authorization

System Administrator role

Syntax

```
okv backup destination get-public-key
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "destination",
    "action" : "get-public-key"
```

```
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv backup destination get-public-key`

   ```
   okv backup destination get-public-key --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "get-public-key"
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_dest_get_public_key.json`).

3. Run the `okv backup destination get-public-key` command using the generated JSON file.

   ```
   okv backup destination get-public-key --from-json bkup_dest_get_public_key.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success",
     "value" : {
       "object" : "ssh-rsa
   AAAAB3NzaC1yc2EAAAADAQABAAABAQDRLparTgrf5F2IExZ1IMZecobMw2ptj5WWlr6l2ww9GHZ5YgMiTNB
   CiAjr68KgLgJ9eRkOSSz7tsnYzcw8th45abB344LzMBLREqtqbV4U0PYHMmt1ovhd+djhsYnJbXptfiSAfe
   2f+1/XPlIYcZNo3m5imffgaIsrn9WlIYxOnP7rrZW3mQkPRLADElTAMWl7zDj71mZrenNBInTd70CBX/
   L7C4NABikPu1E7TxpASQRW9y/n5zdGR4TVww06nAEseCfwfzV1ToNK7CFwFWv/OdIARVVSqwCkCDrwP/
   pNYr7WjzXR939xBfuXaWNZpoDkN1Yxb5sk1NEYRT+cs/SD\n"
     }
   }
   ```

10.17 okv backup destination reset-host-key Command

The `okv backup destination reset-host-key` command resets a destination host's public key in the `known_hosts` file for the `oracle` user.

Required Authorization

System Administrator role

Syntax

```
okv backup destination reset-host-key --name destination_name
```

JSON Input File Template

```
{
  "service" : {
```

```
      "category" : "backup",
      "resource" : "destination",
      "action" : "reset-host-key",
      "options" : {
        "name" : "#VALUE"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup destination. To find existing backup destination names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup destination reset-host-key` command.

   ```
   okv backup destination reset-host-key --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "reset-host-key",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `reset_host_key.json`) and then edit it to reset the host key for the destination server.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "destination",
       "action" : "reset-host-key",
       "options" : {
         "name" : "prod_okv_backup_dest"
       }
     }
   }
   ```

3. Run the `okv backup destination reset-host-key` command using the generated JSON file.

   ```
   okv backup destination reset-host-key --from-json reset_host_key.json
   ```

   Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.18 okv backup history list Command

The `okv backup history list` command lists the details of a backup history, such as runtime errors, whether the backup completed, and start and end times.

Required Authorization

System Administrator role

Syntax

```
okv backup history list --max number_of_backup_records
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "history",
    "action" : "list",
    "options" : {
      "max" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--max` / `max`	Required	The maximum number of the most recent complete backup information records that should be returned

JSON Example

1. Generate JSON input for the `okv backup history list` command.

   ```
   okv backup history list --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "history",
       "action" : "list",
       "options" : {
         "max" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_history_list.json`) and then edit it to generate the backup history list.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "history",
    "action" : "list",
    "options" : {
      "max" : "10"
    }
  }
}
```

3. Run the `okv backup history list` command using the generated JSON file.

```
okv backup history list --from-json bkup_history_list.json
```

Output similar to the following appears:

```
{
  "result" : Success",
  "backups": [
    {
      "backupTime": "2020-11-30 03:59:36",
      "destination": "PROD_OKV_BACKUP_DEST",
      "interval": "0:1:0",
      "lastFullBackupTime": "2020-11-30 01:27:31",
      "name": "OKV_BACKUP_HOURLY",
      "runError": " ",
      "runIndex": "2",
      "scheduleTime": "2020-11-30 01:09:56",
      "startTime": "2020-11-30 03:42:09",
      "status": "DONE",
      "type": "PERIODIC"
    },
    {
      "backupTime": "2020-11-30 02:13:36",
      "destination": "LOCAL",
      "interval": "0:0:0",
      "lastFullBackupTime": "2020-11-30 02:13:36",
      "name": "LOCAL_BACKUP",
      "runError": " ",
      "runIndex": "1",
      "scheduleTime": "2020-11-30 01:40:28",
      "startTime": "2020-11-30 02:00:02",
      "status": "DONE",
      "type": "ONE-TIME"
    },
    {
      "backupTime": "2020-11-30 01:27:31",
      "destination": "PROD_OKV_BACKUP_DEST",
      "interval": "0:1:0",
      "lastFullBackupTime": "2020-11-30 01:27:31",
      "name": "OKV_BACKUP_HOURLY",
      "runError": " ",
      "runIndex": "1",
      "scheduleTime": "2020-11-30 01:09:56",
      "startTime": "2020-11-30 01:10:00",

```

ORACLE®

10.19 okv backup schedule create Command

The `okv backup schedule create` command creates a backup schedule job.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule create
--name backup_schedule_name
--start-time start_time
--destination LOCAL|VALUE
--type ONE-TIME|PERIODIC
--interval timing
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "create",
    "options" : {
      "name" : "#VALUE",
      "startTime" : "#VALUE",
      "type" : "#ONE-TIME|PERIODIC",
      "destination" : "#LOCAL|VALUE",
      "interval" : {
        "days" : "#0-99",
        "hours" : "#0-23",
        "mins" : "#0-59"
      }
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name for the backup schedule job.
		To find existing scheduled backups, run the `okv backup schedule list` command.

Parameter/Template Parameter	Required?	Description

`--start-time` / `startTime`	Required	Time to begin the scheduled backup.
		
		You can use different ways to set the date and time. Examples are as follows:
		
		`"startTime" : "now"` *--starts immediately*
		`"startTime" : "now+PT10M"` *--starts 10 minutes from now*
		`"startTime" : "2021-12-20 10:30:00"` *-- starts at this date and time*
		`"startTime" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		
		To display the time in UTC format, use the Linux `date` command. For example:
		
		`$ date --utc "+%F %T"`
		`2021-03-15 20:31:37`

`--destination` / `destination`	Required	Type or name of backup destination. Enter one of the following values: • `LOCAL` • For a remote destination, enter its name. To find existing names, run the `okv backup destination list` command.
`--type` / `type`	Optional	Enter one of the following values: • `PERIODIC` The default value is: • `ONE-TIME`
`--interval` / `interval`	Required for periodic backups	Enter the days, hours, and minutes in between the backups, using the following format: *days*:*hours*:*minutes*

JSON Example

1. Generate JSON input for the `okv backup schedule create` command.

   ```
   okv backup schedule create --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "schedule",
       "action" : "create",
       "options" : {
         "name" : "#VALUE",
         "startTime" : "#VALUE",
         "type" : "#ONE-TIME|PERIODIC",
         "destination" : "#LOCAL|VALUE",
   ```

```
      "interval" : {
        "days" : "#0-99",
        "hours" : "#0-23",
        "mins" : "#0-59"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `bkup_sched_create.json`) and then edit it to create the backup schedule.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "create",
    "options" : {
      "name" : "okv_backup_hourly",
      "startTime" : "2020-11-30 01:10:00",
      "type" : "PERIODIC",
      "destination" : "prod_okv_backup_dest",
      "interval" : {
        "days" : "0",
        "hours" : "1",
        "mins" : "0"
      }
    }
  }
}
```

3. Run the `okv backup schedule create` command using the generated JSON file.

```
okv backup schedule create --from-json bkup_sched_create.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

  You specify the date or timestamp, and duration using the supported formats.

10.20 okv backup schedule get Command

The `okv backup schedule get` command retrieves detailed information about a scheduled Oracle Key Vault server backup.

The `okv backup schedule get` command returns the following values:

• Type (for example, `periodically @ 1 days 0 hrs 0 mins`)

• Destination (for example, `local` or `remote-dest`)

• State (`ACTIVE`, `ONGOING`, `PAUSED`, `DONE`)

• Last run error

• Schedule time

- Start time
- Last backup time
- Last full backup time
- Run count (for periodic backups)

Required Authorization

System Administrator role

Syntax

```
okv backup schedule get --name backup_schedule_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "get",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup schedule job.
		To find existing scheduled backups, run the `okv backup schedule list` command.

JSON Example

1. Generate JSON input for the `okv backup schedule get` command.

   ```
   okv backup schedule get --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "schedule",
       "action" : "get",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_sched_get.json`) and then edit it to get the backup schedule.

   ```
   {
     "service" : {
   ```

```
      "category" : "backup",
      "resource" : "schedule",
      "action" : "get",
      "options" : {
        "name" : "okv_backup_hourly"
      }
    }
  }
```

3. Run the `okv backup schedule get` command using the generated JSON file.

    ```
    okv backup schedule get --from-json bkup_sched_get.json
    ```

    Output similar to the following appears:

    ```
    {
      "result" : "Success",
      "value" : {
        "destination" : "PROD_OKV_BACKUP_DEST",
        "interval" : "0:1:0",
        "name" : "OKV_BACKUP_HOURLY",
        "runIndex" : "0",
        "scheduleTime" : "2021-01-16 18:37:15",
        "startTime" : "2021-03-31 18:36:00",
        "status" : "ACTIVE",
        "type" : "PERIODIC"
      }
    }
    ```

10.21 okv backup schedule list Command

The `okv backup schedule list` command displays a listing of the currently scheduled Oracle Key Vault server backups.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule list
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "list"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv backup schedule list` command.

    ```
    okv backup schedule list --generate-json-input
    ```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "list"
  }
}
```

2. Save the generated input to a file (for example, `bkup_sched_list.json`).

3. Run the `okv backup schedule list` command using the generated JSON file.

```
okv backup schedule list --from-json bkup_sched_list.json.json
```

Output similar to the following appears:

```
{
  "result" : "Success",
  "value" : {
    "schedules" : [
      "OKV_BACKUP_HOURLY",
      "LOCAL_BACKUP"
    ]
  }
}
```

10.22 okv backup schedule pause Command

The `okv backup schedule pause` command pauses a scheduled Oracle Key Vault server backup.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule pause --name backup_schedule_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "pause",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup schedule job.
		To find existing scheduled backups, run the `okv backup schedule list` command. If you need more details about the backup that you want to pause, then run `okv backup schedule get`.

JSON Example

1. Generate JSON input for the `okv backup schedule pause` command.

   ```
   okv backup schedule pause --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "schedule",
       "action" : "pause",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup-sched-pause.json`) and then edit it so that you can pause the backup schedule.

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "schedule",
       "action" : "pause",
       "options" : {
         "name" : "okv_backup_hourly"
       }
     }
   }
   ```

3. Run the `okv backup schedule pause` command using the generated JSON file.

   ```
   okv backup schedule pause --from-json bkup-sched-pause.json
   ```

   Output similar to the following appears:

   ```
   {
     "result" : "Success"
   }
   ```

10.23 okv backup schedule resume Command

The `okv backup schedule resume` command resumes a paused Oracle Key Vault backup job.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule resume --name backup_schedule_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "resume",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup schedule job.
		To find existing scheduled backups, run the `okv backup schedule list` command. If you need more details about the backup that you want to resume, then run `okv backup schedule get`.

JSON Example

1. Generate JSON input for the `okv backup schedule resume` command.

   ```
   okv backup schedule resume --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "schedule",
       "action" : "resume",
       "options" : {
         "name" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_sched_resume.json`) and then edit it to resume the paused backup schedule.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "resume",
    "options" : {
      "name" : "okv_backup_hourly"
    }
  }
}
```

3. Run the `okv backup schedule resume` command using the generated JSON file.

```
okv backup schedule resume --from-json bkup_sched_resume.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.24 okv backup schedule delete Command

The `okv backup schedule delete` command deletes scheduled backup job.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule delete --name backup_schedule_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "delete",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup schedule job.
		To find existing scheduled backups, run the `okv backup schedule list` command. If you need more details about the backup that you want to delete, then run `okv backup schedule get`.

JSON Example

1. Generate JSON input for the `okv backup schedule delete` command.

```
okv backup schedule delete --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "delete",
    "options" : {
      "name" : "#VALUE"
    }
  }
}
```

2. Save the generated input to a file (for example, `bkup_sched_del.json`) and then edit it to delete the backup schedule.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "delete",
    "options" : {
      "name" : "okv_backup_hourly"
    }
  }
}
```

3. Run the `okv backup schedule delete` command using the generated JSON file.

```
okv backup schedule delete --from-json bkup_sched_del.json
```

Output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.25 okv backup schedule update Command

The `okv backup schedule update` command updates a currently scheduled backup.

Required Authorization

System Administrator role

Syntax

```
okv backup schedule update --name backup_schedule_name --start-time start_time --interval timing
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
```

```
      "resource" : "schedule",
      "action" : "update",
      "options" : {
        "name" : "#VALUE",
        "startTime" : "#VALUE",
        "interval" : {
           "days" : "#0-99",
           "hours" : "#0-23",
           "mins" : "#0-59"
        }
      }
   }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name of the backup schedule job.
		To find the names of existing scheduled backups, run the `okv backup schedule list` command. To find the details of the backup that you want to update, run `okv backup schedule get`.
`--start-time` / `startTime`	Optional	Time to begin the scheduled backup.
		You can use different ways to set the date and time. Examples are as follows:
		`"startTime" : "now"` *--starts immediately* `"startTime" : "now+PT10M"` *--starts 10 minutes from now* `"startTime" : "2021-12-20 10:30:00"` *--starts at this date and time* `"startTime" : "2021-12-20 10:30:00+PT10M"` *--starts 10 minutes after this date and time*
		To display the time in UTC format, use the Linux `date` command. For example:
		`$ date --utc "+%F %T"` `2021-03-15 20:31:37`
`--interval` / `interval`	Required for periodic backups	Enter the days, hours, and minutes in between the backups, using the following format: *days*:*hours*:*minutes*

JSON Example

1. Generate JSON input for the `okv backup schedule update` command.

    ```
    okv backup schedule update --generate-json-input
    ```

    The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "update",
    "options" : {
      "name" : "#VALUE",
      "startTime" : "#VALUE",
      "interval" : {
        "days" : "#0-99",
        "hours" : "#0-23",
        "mins" : "#0-59"
      }
    }
  }
}
```

2. Save the generated input to a file (for example, `bkup_sched_update.json`) and then edit it to update the backup schedule.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "schedule",
    "action" : "update",
    "options" : {
      "name" : "okv_backup_hourly",
      "startTime" : "2020-12-20 18:00:00",
      "interval" : {
        "days" : "0",
        "hours" : "12",
        "mins" : "0"
      }
    }
  }
}
```

3. Run the `okv backup schedule update` command using the generated JSON file.

    ```
    okv backup schedule update --from-json bkup_sched_update.json
    ```

    Output similar to the following appears:

    ```
    {
      "result" : "Success"
    }
    ```

Related Topics

*   How to Set the Date and Time in RESTful Services Utility Commands
    You specify the date or timestamp, and duration using the supported formats.

10.26 okv backup restore start Command

The `okv backup restore start` command starts the restore process of an Oracle Key Vault backup.

This command will require the use of the Oracle Key Vault recovery passphrase.

Required Authorization

System Administrator role

After you begin the restore operation, you can check its status by running the `okv backup restore status` command.

Syntax

```
okv backup restore start --name backup_file_name --destination destination_name
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "restore",
    "action" : "start",
    "options" : {
      "name" : "#VALUE",
      "destination" : "#VALUE"
    }
  }
}
```

Parameters

Parameter/Template Parameter	Required?	Description
`--name` / `name`	Required	Name for the backup file.
		To find existing scheduled backups, run the `okv backup schedule list` command.
`--destination` / `destination`	Required	Name of the backup destination.
		For a listing of existing names, run the `okv backup destination list` command.

JSON Example

1. Generate JSON input for the `okv backup restore start` command.

   ```
   okv backup restore start --generate-json-input
   ```

   The generated input appears as follows:

   ```
   {
     "service" : {
       "category" : "backup",
       "resource" : "restore",
       "action" : "start",
       "options" : {
         "name" : "#VALUE",
         "destination" : "#VALUE"
       }
     }
   }
   ```

2. Save the generated input to a file (for example, `bkup_restore_start.json`) and then edit it to start the restore of a backup. In the following example, the `passphrase` is not specified so that the user will be prompted interactively for it.

```
{
  "service" : {
    "category" : "backup",
    "resource" : "restore",
    "action" : "start",
    "options" : {
      "name" : "okvbackup_onetime_onetime_20210118175804",
      "destination" : "prod_okv_backup_dest"
    }
  }
}
```

3. Run the `okv backup restore start` command using the generated JSON file.

```
okv backup restore start --from-json bkup_restore_start.json
```

You will be prompted to enter the recovery passphrase, which must be the one that was effective at the time of the backup that is being restored. After you enter this passphrase, output similar to the following appears:

```
{
  "result" : "Success"
}
```

10.27 okv backup restore status Command

The `okv backup restore status` command checks the status of the Oracle Key Vault backup restore operation.

Required Authorization

System Administrator role

Syntax

```
okv backup restore status
```

JSON Input File Template

```
{
  "service" : {
    "category" : "backup",
    "resource" : "restore",
    "action" : "status"
  }
}
```

Parameters

None

JSON Example

1. Generate JSON input for the `okv backup restore status` command.

```
okv backup restore status --generate-json-input
```

The generated input appears as follows:

```
{
  "service" : {
    "category" : "backup",
    "resource" : "restore",
    "action" : "status"
  }
}
```

2. Save the generated input to a file (for example, bkup_restore_status.json).

3. Run the okv backup restore status command using the generated JSON file.

```
okv backup restore status --from-json bkup_restore_status.json
```

If restore is ongoing, then output similar to the following appears:

```
{
  "result" : "Success",
  "value" :
    {
      "destination" : "LOCAL",
      "status" : "ONGOING",
      "time" : "2020-12-18 11:49:30"
    }
}
```

If restore is complete, then output similar to the following appears:

```
{
  "result" : "Success",
  "value" :
    {
      "destination" : "LOCAL",
      "status" : "DONE",
      "time" : "2020-12-18 11:52:02"
    }
}
```

Logging and Error Reporting

Logging and error reporting can help with troubleshooting issues that may arise.

- Configuring Logging
  You can configure a variety of ways to handle logging, including specifying a range of different logging levels.

- Error Reporting
  The RESTful Service utility has robust error reporting to debug in order to run RESTful service commands quickly and successfully.

11.1 Configuring Logging

You can configure a variety of ways to handle logging, including specifying a range of different logging levels.

- About Configuring Logging
  Using RESTful service logging configuration, you generate diagnostic logging information to help with troubleshooting issues that may arise.

- Log Property File Parameters
  The log property file has parameters to control aspects such as handlers, log levels, output file names, and so on.

- Example: Logging File
  Oracle Key Vault RESTful services logging files are based on the `java.util.logging` Java logging utility.

11.1.1 About Configuring Logging

Using RESTful service logging configuration, you generate diagnostic logging information to help with troubleshooting issues that may arise.

Oracle Key Vault RESTful service logging is based on the customized Java logging utility, `java.util.logging`.

The RESTful service logging configuration is specified in a log property file. In the log property file, you can accomplish the following:

- Specify whether log messages are sent to the console, to a file or to both

- Specify the file names where log messages are written

- Specify the level of detail in the log messages.

- Specify the log formatter to use. You can choose XML or regular text format. Each log entry shows class, object, and method, along with the time when the log entry is generated.

To specify the log property file in the Oracle Key Vault RESTful services configuration file (`okvrestcli.ini`), you use the `log_property` parameter.

11.1.2 Log Property File Parameters

The log property file has parameters to control aspects such as handlers, log levels, output file names, and so on.

Table 11-1 describes the Oracle Key Vault RESTful logging property file parameters.

Table 11-1   Log Property File Parameters

Logging Property	Description
`handlers`	A comma-delimited list of handler classes to output log messages. Available handlers are `java.util.logging.FileHandler` and `java.util.logging.ConsoleHandler`.
	The `FileHandler` can either write to a specified file, or it can write to a rotating set of files.
	Handlers can have both `ConsoleHandler` and `FileHandler` separated by a comma (`,`).
`.level`	Sets the log level for all `FileHandler` instances. Levels are as follows:
	• `ALL` indicates that all messages should be logged.
	• `FINE` is a message level providing tracing information.
	• `FINER` indicates a fairly detailed tracing message.
	• `FINEST` indicates a highly detailed tracing message.
	• `INFO` is a message level for informational messages.
	• `OFF` is a special level that can be used to turn off logging.
	• `SEVERE` indicates a serious failure.
	• `WARNING` indicates a potential problem.
`java.util.logging.FileHandler.level`	See the description of `.level` for descriptions of these levels that you can use in `java.util.logging.FileHandler.level`

Table 11-1   (Cont.) Log Property File Parameters

Logging Property	Description
`java.util.logging.FileHandler.pattern`	Specifies a pattern for generating the output file name. A pattern consists of a string that includes the following special components that will be replaced at runtime: • `/` is the local path name separator. • `%t` is the system temporary directory. • `%h` is the value of the `user.home` system property. • `%g` is the generation number to distinguish rotated logs. If no `%g` field has been specified and the file count is greater than one, then the generation number will be added to the end of the generated file name, after a dot. • `%u` is a unique number to resolve conflicts between simultaneous Java processes. • `%%` translates to a single percent sign `%`.
`java.util.logging.FileHandler.limit`	The maximum size of the file, in bytes. If this is 0, then there is no limit. The default is 200000. Logs larger than the specified limit roll over to the next log file.
`java.util.logging.FileHandler.count`	The number of log files to use in the log file rotation. The default is 5.
`java.util.logging.FileHandler.formatter`	Specifies the name of a `Formatter` class to use. To generate the log entries in the XML format, use `java.util.logging.XMLFormatter`. To generate the log entries in the plain text, use `com.oracle.okv.rest.log.OkvFormatter`.
`java.util.logging.ConsoleHandler.level`	Sets the default log level for all `ConsoleHandler` instances. See the description of the `java.util.logging.FileHandler.level` for descriptions of these levels.
`java.util.logging.ConsoleHandler.formatter`	Specifies the name of a `Formatter` class to use. To generate the log entries in the XML format, use `java.util.logging.XMLFormatter`. To generate the log entries in the plain text, use `com.oracle.okv.rest.log.OkvFormatter`.

11.1.3 Example: Logging File

Oracle Key Vault RESTful services logging files are based on the `java.util.logging` Java logging utility.

Example 11-1 shows a logging file that uses the `INFO` logging level.

Example 11-1   Logging File

```
handlers= java.util.logging.FileHandler
.level=INFO

# default file output is in log directory.
java.util.logging.FileHandler.pattern = /usr/local/okv/okvrestcli.log
java.util.logging.FileHandler.limit = 200000
java.util.logging.FileHandler.count = 4
java.util.logging.FileHandler.level = INFO
java.util.logging.FileHandler.formatter =
com.oracle.okv.rest.log.OkvFormatter
```

11.2 Error Reporting

The RESTful Service utility has robust error reporting to debug in order to run RESTful service commands quickly and successfully.

- About Error Reporting
  Depending upon the logging configuration, Oracle Key Vault may write additional information about the failure to the log file.

- Command Line Error Reporting
  Error reporting captures both faulty actions, such as incorrect passwords, and successful command executions.

11.2.1 About Error Reporting

Depending upon the logging configuration, Oracle Key Vault may write additional information about the failure to the log file.

The specific error will be reported, with suggestions for corrective actions. Error reporting is common to all REST commands.

The first thing to do when investigating a command failure is to look into the log file. If you have not created a custom log file in a location of your choice, then you can look at the default log file, `okvrestcli.log` in the `conf` directory

To see all the messages from the Oracle Key Vault server during command execution, you can set the appropriate logging level, log file name, and the log file location in the configuration file.

The RESTful service utility reports errors such as the failure to locate a file or an environment variable like `JAVA_HOME`, incorrect command syntax, and incorrect passwords.

11.2.2 Command Line Error Reporting

Error reporting captures both faulty actions, such as incorrect passwords, and successful command executions.

Example: Error: Incorrect Password

```
okv admin endpoint update --user psmith --endpoint hr_db_ep --description 'HR DB
Endpoint'
Password: password
{
  "result" : "Failure",
  "message" : "Invalid username or password. Try again after 5 seconds."
}
```

Example: Successful Service Command Execution

```
okv admin endpoint update --user psmith -endpoint hr_db_ep --description 'HR DB
Endpoint'
Password: password
{
  "result" : "Success"
}
```

Example: Log File Entry

In addition to the helpful error and usage messages, an entry for the action is logged in the log file with the date.

A

Oracle Key Vault RESTful Services Utility Commands Change History

The Oracle Key Vault RESTful services utility commands changed dramatically starting in release 21.

- Oracle Key Vault Pre-Release 21.1 Commands Comparison
  The Oracle Key Vault pre-release 21.1 commands and enable you to work with endoints, endpoint groups, wallets, keys, and security objects.
- Commands New with Oracle Key Vault Release 21.1
  The commands that are new with Oracle Key Vault release 21.1 enable you to work with monitoring operations, and backup and restore operations.

A.1 Oracle Key Vault Pre-Release 21.1 Commands Comparison

The Oracle Key Vault pre-release 21.1 commands and enable you to work with endoints, endpoint groups, wallets, keys, and security objects.

Table A-1 describes how the Oracle Key Vault commands changed in release 21.1.

Table A-1   Changes to Oracle Key Vault RESTful Commands

Pre-Release 21 Command	Release 21 Command Equivalent
`activate`	`okv managed-object object activate`
`add_attr`	`okv managed-object attribute add`
`add_custom_attr`	`okv managed-object custom-attribute add`
`add_epg_member`	`okv manage-access endpoint-group add-endpoint`
`add_member`	`okv managed-object wallet add-member`
`add_wallet_access_ep`	An option in `okv manage-access wallet add-access`
`add_wallet_access_epg`	An option in `okv manage-access wallet add-access`
`check_object_status`	Covered by the following commands: • `okv admin endpoint check-status` • `okv manage-access endpoint-group check-status` • `okv manage-access wallet check-status`
`create_endpoint`	`okv admin endpoint create`
`create_endpoint_group`	`okv manage-access endpoint-group create`
`create_key`	`okv managed-object key create`

Table A-1   (Cont.) Changes to Oracle Key Vault RESTful Commands

Pre-Release 21 Command	Release 21 Command Equivalent
`create_unique_endpoint`	As an option in `okv admin endpoint create`
`create_unique_endpoint_group`	As an option in `okv manage-access endpoint-group create`
`create_unique_wallet`	As an option in `okv manage-access wallet create`
`create_wallet`	`okv manage-access wallet create`
`del_attr`	`okv managed-object attribute delete`
`del_custom_attr`	`okv managed-object custom-attribute delete`
`del_member`	`okv managed-object wallet delete-member`
`delete_endpoint`	`okv admin endpoint delete`
`delete_endpoint_group`	`okv manage-access endpoint-group delete`
`delete_wallet`	`okv manage-access wallet delete`
`destroy`	`okv managed-object object destroy`
`download`	`okv admin endpoint download`
`drop_epg_member`	`okv manage-access endpoint-group remove-endpoint`
`drop_wallet_access_ep`	An option in `okv manage-access wallet remove-access`
`drop_wallet_access_epg`	An option in `okv manage-access wallet remove-access`
`get_attr`	`okv managed-object attribute get`
`get_cert`	`okv managed-object certificate get`
`get_default_wallet`	`okv manage-access wallet get-default`
`get_enrollment_token`	`okv admin endpoint get-enrollment-token`
`get_key`	`okv managed-object key get`
`get_opaque`	`okv managed-object opaque get`
`get_secret`	`okv managed-object secret get`
`get_system_info`	Covered by the following commands: • `okv cluster info get` • `okv primary-standby info get` • `okv server info get`
`get_wallets`	`okv manage-access wallet list-endpoint-wallets`
`list_attr`	`okv managed-object attribute list`
`list_wallet`	`okv managed-object wallet list`
`locate`	`okv managed-object object locate`
`mod_attr`	`okv managed-object attribute modify`

Table A-1   (Cont.) Changes to Oracle Key Vault RESTful Commands

Pre-Release 21 Command	Release 21 Command Equivalent
`mod_custom_attr`	`okv managed-object custom-attribute modify`
`modify_endpoint_desc`	An option in `okv admin endpoint update`
`modify_endpoint_email`	An option in `okv admin endpoint update`
`modify_endpoint_group_desc`	An option in `okv manage-access endpoint-group update`
`modify_endpoint_group_name`	An option in `okv manage-access endpoint-group update`
`modify_endpoint_name`	An option in `okv admin endpoint update`
`modify_endpoint_platform`	An option in `okv admin endpoint update`
`modify_endpoint_type`	An option in `okv admin endpoint update`
`modify_wallet_access_ep`	An option in `okv manage-access wallet update-access`
`modify_wallet_access_epg`	An option in `okv manage-access wallet update-access`
`modify_wallet_desc`	An option in `okv manage-access wallet update`
`modify_wallet_name`	An option in `okv manage-access wallet update`
`provision`	`okv admin endpoint provision`
`query`	`okv managed-object object query`
`re_enroll`	`okv admin endpoint re-enroll`
`re_enroll_all`	`okv admin endpoint re-enroll-all`
`reg_cert`	`okv managed-object certificate register`
`reg_key`	`okv managed-object key register`
`reg_opaque`	`okv managed-object opaque register`
`reg_secret`	`okv managed-object secret register`
`revoke`	`okv managed-object object revoke`
`set_default_wallet`	`okv manage-access wallet set-default`

A.2 Commands New with Oracle Key Vault Release 21.1

The commands that are new with Oracle Key Vault release 21.1 enable you to work with monitoring operations, and backup and restore operations.

Commands that cover RESTful services functionality that was not available in releases earlier than Oracle Key Vault release 21.1 are as follows:

- `okv admin client-wallet add`

- `okv admin client-wallet delete`

- okv admin client-wallet list
- okv admin client-wallet update
- okv backup destination create
- okv backup destination delete
- okv backup destination get
- okv backup destination get-public-key
- okv backup destination list
- okv backup destination list-backups
- okv backup destination reset-host-key
- okv backup destination update
- okv backup history list
- okv backup restore start
- okv backup restore status
- okv backup schedule create
- okv backup schedule delete
- okv backup schedule get
- okv backup schedule list
- okv backup schedule pause
- okv backup schedule resume
- okv backup schedule update
- okv cluster status get
- okv managed-object attribute get-all
- okv primary-standby status get
- okv server status get
