### Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

Changes in Oracle Database 12c Release 2 (12.2)  cxl

### 1 Introduction to Oracle Supplied PL/SQL Packages & Types

1.1 Package Overview 1-2

1.1.1 Package Components 1-2

1.1.2 Using Oracle Supplied Packages 1-2

1.1.3 Creating New Packages 1-2

1.1.3.1 Separating the Specification and Body 1-3

1.1.4 Referencing Package Contents 1-5

1.2 Summary of Oracle Supplied PL/SQL Packages and Types 1-5

### 2 Oracle Application Express Packages APEX_APPLICATION Through APEX_ZIP

### 3 CTX_ADM

### 4 CTX_ANL
### DBMS_ADDM

14.2.10 DELETE_PARAMETER_DIRECTIVE Procedure 14-10
14.2.11 DELETE_SEGMENT_DIRECTIVE Procedure 14-10
14.2.12 DELETE_SQL_DIRECTIVE Procedure 14-11
14.2.13 GET_ASH_QUERY Function 14-11
14.2.14 GET_REPORT Function 14-12
14.2.15 INSERT_FINDING_DIRECTIVE Procedure 14-12
14.2.16 INSERT_PARAMETER_DIRECTIVE Procedure 14-13
14.2.17 INSERT_SEGMENT_DIRECTIVE Procedure 14-14
14.2.18 INSERT_SQL_DIRECTIVE Procedure 14-15
14.2.19 REAL_TIME_ADDM_REPORT Function 14-16

15 DBMS_ADVANCED_REWRITE

15.1 DBMS_ADVANCED_REWRITE Security Model 15-1
15.2 Summary of DBMS_ADVANCED_REWRITE Subprograms 15-1
  15.2.1 ALTER_REWRITE_EQUIVALENCE Procedure 15-2
  15.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure 15-3
  15.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures 15-3
  15.2.4 DROP_REWRITE_EQUIVALENCE Procedure 15-5
  15.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure 15-6

16 DBMS_ADVISOR

16.1 DBMS_ADVISOR Deprecated Subprograms 16-2
16.2 DBMS_ADVISOR Security Model 16-2
16.3 Summary of DBMS_ADVISOR Subprograms 16-2
  16.3.1 ADD_SQLWKLD_REF Procedure 16-5
  16.3.2 ADD_SQLWKLD_STATEMENT Procedure 16-6
  16.3.3 ADD_STS_REF Procedure 16-8
  16.3.4 CANCEL_TASK Procedure 16-9
  16.3.5 COPY_SQLWKLD_TO_STS Procedure 16-10
  16.3.6 CREATE_FILE Procedure 16-11
  16.3.7 CREATE_OBJECT Procedure 16-13
  16.3.8 CREATE_SQLWKLD Procedure 16-14
  16.3.9 CREATE_TASK Procedures 16-15
  16.3.10 DELETE_SQLWKLD Procedure 16-17
  16.3.11 DELETE_SQLWKLD_REF Procedure 16-18
  16.3.12 DELETE_SQLWKLD_STATEMENT Procedure 16-19
  16.3.13 DELETE_STS_REF Procedure 16-20
  16.3.14 DELETE_TASK Procedure 16-21
  16.3.15 EXECUTE_TASK Procedure 16-21
16.3.16 GET_REC_ATTRIBUTES Procedure
16.3.17 GET_TASK_REPORT Function
16.3.18 GET_TASK_SCRIPT Function
16.3.19 IMPLEMENT_TASK Procedure
16.3.20 IMPORT_SQLWKLD_SCHEMA Procedure
16.3.21 IMPORT_SQLWKLD_SQLCACHE Procedure
16.3.22 IMPORT_SQLWKLD_STS Procedure
16.3.23 IMPORT_SQLWKLD_SUMADV Procedure
16.3.24 IMPORT_SQLWKLD_USER Procedure
16.3.25 INTERRUPT_TASK Procedure
16.3.26 MARK_RECOMMENDATION Procedure
16.3.27 QUICK_TUNE Procedure
16.3.28 RESET_SQLWKLD Procedure
16.3.29 RESET_TASK Procedure
16.3.30 SET_DEFAULT_SQLWKLD_PARAMETER Procedure
16.3.31 SET_DEFAULT_TASK_PARAMETER Procedure
16.3.32 SET_SQLWKLD_PARAMETER Procedure
16.3.33 SET_TASK_PARAMETER Procedure
16.3.34 TUNE_MVIEW Procedure
16.3.35 UPDATE_OBJECT Procedure
16.3.36 UPDATE_REC_ATTRIBUTES Procedure
16.3.37 UPDATE_SQLWKLD_ATTRIBUTES Procedure
16.3.38 UPDATE_SQLWKLD_STATEMENT Procedure
16.3.39 UPDATE_TASK_ATTRIBUTES Procedure

17 DBMS_ALERT

17.1 DBMS_ALERT Overview
17.2 DBMS_ALERT Security Model
17.3 DBMS_ALERT Constants
17.4 DBMS_ALERT Restrictions
17.5 DBMS_ALERT Exceptions
17.6 DBMS_ALERT Operational Notes
17.7 DBMS_ALERT Examples
17.8 Summary of DBMS_ALERT Subprograms
   17.8.1 REGISTER Procedure
   17.8.2 REMOVE Procedure
   17.8.3 REMOVEALL Procedure
   17.8.4 SET_DEFAULTS Procedure
   17.8.5 SIGNAL Procedure
   17.8.6 WAITANY Procedure
18 **DBMS_APP_CONT**

18.1 DBMS_APP_CONT Overview 18-1
18.2 DBMS_APP_CONT Security Model 18-2
18.3 Summary of DBMS_APP_CONT Subprograms 18-2
  18.3.1 GET_LTXID_OUTCOME Procedure 18-2

19 **DBMS_APPLICATION_INFO**

19.1 DBMS_APPLICATION_INFO Overview 19-1
19.2 DBMS_APPLICATION_INFO Security Model 19-1
19.3 DBMS_APPLICATION_INFO Operational Notes 19-1
19.4 Summary of DBMS_APPLICATION_INFO Subprograms 19-2
  19.4.1 READ_CLIENT_INFO Procedure 19-2
  19.4.2 READ_MODULE Procedure 19-2
  19.4.3 SET_ACTION Procedure 19-3
  19.4.4 SET_CLIENT_INFO Procedure 19-4
  19.4.5 SET_MODULE Procedure 19-5
  19.4.6 SET_SESSION_LONGOPS Procedure 19-5

20 **DBMS_APPLY_ADM**

20.1 DBMS_APPLY_ADM Overview 20-1
20.2 DBMS_APPLY_ADM Security Model 20-2
20.3 DBMS_APPLY_ADM Deprecated Subprograms 20-3
20.4 Summary of DBMS_APPLY_ADM Subprograms 20-3
  20.4.1 ADD_STMT_HANDLER Procedure 20-5
  20.4.2 ALTER_APPLY Procedure 20-7
  20.4.3 COMPARE_OLD_VALUES Procedure 20-12
  20.4.4 CREATE_APPLY Procedure 20-14
  20.4.5 CREATE_OBJECT_DEPENDENCY Procedure 20-21
  20.4.6 DELETE_ALL_ERRORS Procedure 20-22
  20.4.7 DELETE_ERROR Procedure 20-23
  20.4.8 DROP_APPLY Procedure 20-24
  20.4.9 DROP_OBJECT_DEPENDENCY Procedure 20-25
  20.4.10 EXECUTE_ALL_ERRORS Procedure 20-26
  20.4.11 EXECUTE_ERROR Procedure 20-27
  20.4.12 GET_ERROR_MESSAGE Function 20-30
  20.4.13 HANDLE_COLLISIONS 20-31
  20.4.14 REMOVE_STMT_HANDLER 20-32
## 20.4.15 SET_CHANGE_HANDLER Procedure 20-33
## 20.4.16 SET_DML_CONFLICT_HANDLER Procedure 20-36
## 20.4.17 SET_DML_HANDLER Procedure 20-42
## 20.4.18 SET_ENQUEUE_DESTINATION Procedure 20-47
## 20.4.19 SET_EXECUTE Procedure 20-49
## 20.4.20 SET_GLOBAL_INSTANTIATION_SCN Procedure 20-50
## 20.4.21 SET_KEY_COLUMNS Procedures 20-53
## 20.4.22 SET_PARAMETER Procedure 20-56
## 20.4.23 SET_REPERROR_HANDLER Procedure 20-80
## 20.4.24 SET_SCHEMA_INSTANTIATION_SCN Procedure 20-81
## 20.4.25 SET_TABLE_INSTANTIATION_SCN Procedure 20-84
## 20.4.26 SET_UPDATE_CONFLICT_HANDLER Procedure 20-87
## 20.4.27 SET_VALUE_DEPENDENCY Procedure 20-90
## 20.4.28 START_APPLY Procedure 20-92
## 20.4.29 STOP_APPLY Procedure 20-92

### 21 DBMS_AQ

#### 21.1 DBMS_AQ Security Model 21-1
#### 21.2 DBMS_AQ Constants 21-2
#### 21.3 DBMS_AQ Data Types 21-3
#### 21.4 DBMS_AQ Operational Notes 21-5

22.4.12 CREATE_QUEUE_TABLE Procedure 22-20
22.4.13 CREATE_SHARDED_QUEUE Procedure 22-23
22.4.14 CREATE_EXCEPTION_QUEUE Procedure 22-24
22.4.15 DEL_ALIAS_FROM_LDAP Procedure 22-25
22.4.16 DISABLE_DB_ACCESS Procedure 22-25
22.4.17 DISABLE_PROPAGATION_SCHEDULE Procedure 22-26
22.4.18 DROP_AQ_AGENT Procedure 22-26
22.4.19 DROP_QUEUE Procedure 22-27
22.4.20 DROP_QUEUE_TABLE Procedure 22-27
22.4.21 DROP_SHARDED_QUEUE Procedure 22-28
22.4.22 ENABLE_DB_ACCESS Procedure 22-28
22.4.23 ENABLE_JMS_TYPES Procedure 22-29
22.4.24 ENABLE_PROPAGATION_SCHEDULE Procedure 22-30
22.4.25 GET_MAX_STREAMS_POOL Procedure 22-30
22.4.26 GET_MIN_STREAMS_POOL Procedure 22-31
22.4.27 GET_QUEUE_PARAMETER Procedure 22-31
22.4.28 GET_WATERMARK Procedure 22-32
22.4.29 GRANT_QUEUE_PRIVILEGE Procedure 22-32
22.4.30 GRANT_SYSTEM_PRIVILEGE Procedure 22-33
22.4.31 MIGRATE_QUEUE_TABLE Procedure 22-33
22.4.32 PURGE_QUEUE_TABLE Procedure 22-34
22.4.33 QUEUE_SUBSCRIBERS Function 22-35
22.4.34 REMOVE_SUBSCRIBER Procedure 22-36
22.4.35 REVOKE_QUEUE_PRIVILEGE Procedure 22-36
22.4.36 REVOKE_SYSTEM_PRIVILEGE Procedure 22-37
22.4.37 SCHEDULE_PROPAGATION Procedure 22-37
22.4.38 SET_WATERMARK Procedure 22-39
22.4.39 SET_MAX_STREAMS_POOL Procedure 22-39
22.4.40 SET_MIN_STREAMS_POOL Procedure 22-40
22.4.41 SET_QUEUE_PARAMETER Procedure 22-40
22.4.42 START_QUEUE Procedure 22-41
22.4.43 STOP_QUEUE Procedure 22-41
22.4.44 UNSCHEDULE_PROPAGATION Procedure 22-42
22.4.45 UNSET_QUEUE_PARAMETER Procedure 22-43
22.4.46 VERIFY_QUEUE_TYPES Procedure 22-43

23  DBMS_AQELM

23.1 DBMS_AQELM Security Model 23-1
23.2 Summary of DBMS_AQELM Subprograms 23-1
   23.2.1 SET_MAILHOST Procedure 23-1
   23.2.2 SET_MAILPORT Procedure 23-2
   23.2.3 SET_SENDFROM Procedure 23-2

24  DBMS_AQIN

24.1 DBMS_AQIN Security Model 24-1

25  DBMS_ASSERT

25.1 DBMS_ASSERT Operational Notes 25-1
25.2 Summary of DBMS_ASSERT Subprograms 25-1
   25.2.1 ENQUOTE_LITERAL Function 25-2
   25.2.2 ENQUOTE_NAME Function 25-2
   25.2.3 NOOP Functions 25-4
   25.2.4 QUALIFIED_SQL_NAME Function 25-4
   25.2.5 SCHEMA_NAME Function 25-5
   25.2.6 SIMPLE_SQL_NAME Function 25-5
   25.2.7 SQL_OBJECT_NAME Function 25-6

26  DBMS_AUDIT_MGMT

26.1 DBMS_AUDIT_MGMT Overview 26-1
26.2 DBMS_AUDIT_MGMT Deprecated Subprograms 26-2
26.3 DBMS_AUDIT_MGMT Security Model 26-3
26.4 DBMS_AUDIT_MGMT Constants 26-3
26.5 DBMS_AUDIT_MGMT Views 26-4
26.6 DBMS_AUDIT_MGMT Subprogram Groups 26-5
   26.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms 26-5
   26.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms 26-6
26.7 Summary of DBMS_AUDIT_MGMT Subprograms 26-7
   26.7.1 ALTER_PARTITION_INTERVAL Procedure 26-8
   26.7.2 CLEAN_AUDIT_TRAIL Procedure 26-9
   26.7.3 CLEAR_AUDIT_TRAIL_PROPERTY Procedure 26-11
   26.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure 26-12
   26.7.5 CREATE_PURGE_JOB Procedure 26-14
   26.7.6 DEINIT_CLEANUP Procedure 26-15
   26.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure 26-16
   26.7.8 DROP_PURGE_JOB Procedure 26-16
   26.7.9 FLUSH_UNIFIED_AUDIT_TRAIL Procedure 26-17
   26.7.10 GET_AUDIT_COMMIT_DELAY Function 26-18
   26.7.11 GET_AUDIT_TRAIL_PROPERTY_VALUE Function 26-18
   26.7.12 GET_LAST_ARCHIVE_TIMESTAMP Function 26-19
   26.7.13 INIT_CLEANUP Procedure 26-20
   26.7.14 IS_CLEANUP_INITIALIZED Function 26-22
   26.7.15 LOAD_UNIFIED_AUDIT_FILES Procedure 26-23
   26.7.16 SET_AUDIT_TRAIL_LOCATION Procedure 26-24
   26.7.17 SET_AUDIT_TRAIL_PROPERTY Procedure 26-25
   26.7.18 SET_LAST_ARCHIVE_TIMESTAMP Procedure 26-28
   26.7.19 SET_PURGE_JOB_INTERVAL Procedure 26-29
   26.7.20 SET_PURGE_JOB_STATUS Procedure 26-30
   26.7.21 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure 26-31

27 DBMS_AUDIT_UTIL

27.1 DBMS_AUDIT_UTIL Overview 27-1
27.2 DBMS_AUDIT_UTIL Security Model 27-1
27.3 DBMS_AUDIT_UTIL Views 27-2
27.4 Summary of DBMS_AUDIT_UTIL Subprograms 27-2
   27.4.1 DECODE_RLS_INFO_ATRAIL_FGA Function 27-2
   27.4.2 DECODE_RLS_INFO_ATRAIL_STD Function 27-3
   27.4.3 DECODE_RLS_INFO_ATRAIL_UNI Function 27-4
   27.4.4 DECODE_RLS_INFO_ATRAIL_XML Function 27-5
28 DBMS_AUTO_REPORT

28.1 DBMS_AUTO_REPORT Overview 28-1
28.2 DBMS_AUTO_REPORT Security Model 28-1
28.3 Summary of DBMS_AUTO_REPORT Subprograms 28-1
  28.3.1 FINISH_REPORT_CAPTURE Procedure 28-2
  28.3.2 REPORT_REPOSITORY_DETAIL Function 28-2
  28.3.3 REPORT_REPOSITORY_DETAIL_XML Function 28-3
  28.3.4 REPORT_REPOSITORY_LIST_XML Function 28-3
  28.3.5 START_REPORT_CAPTURE Procedure 28-5

29 DBMS_AUTO_SQLTUNE

29.1 DBMS_AUTO_SQLTUNE Overview 29-1
29.2 DBMS_AUTO_SQLTUNE Security Model 29-1
29.3 Summary of DBMS_AUTO_SQLTUNE Subprograms 29-2
  29.3.1 EXECUTE_AUTO_TUNING_TASK Function and Procedure 29-2
  29.3.2 REPORT_AUTO_TUNING_TASK Function 29-3
  29.3.3 SET_AUTO_TUNING_TASK_PARAMETER Procedures 29-4

30 DBMS_AUTO_TASK_ADMIN

30.1 DBMS_AUTO_TASK_ADMIN Deprecated Subprograms 30-1
30.2 DBMS_AUTO_TASK_ADMIN Security Model 30-1
30.3 DBMS_AUTO_TASK_ADMIN Constants 30-2
30.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms 30-2
  30.4.1 DISABLE Procedures 30-3
  30.4.2 ENABLE Procedures 30-3
  30.4.3 GET_CLIENT_ATTRIBUTES Procedure 30-4
  30.4.4 GET_P1_RESOURCES Procedure 30-4
  30.4.5 OVERRIDE_PRIORITY Procedures 30-5
  30.4.6 SET_CLIENT_SERVICE Procedure 30-6
  30.4.7 SET_P1_RESOURCES Procedure 30-6

31 DBMS_AW_STATS

31.1 Using DBMS_AW_STATS 31-1
31.2 Summary of DBMS_AW_STATS Subprograms 31-1
  31.2.1 ANALYZE Procedure 31-2
  31.2.2 CLEAR Procedure 31-4

34 DBMS_COMPRESSION

34.1 DBMS_COMPRESSION Overview 34-1
34.2 DBMS_COMPRESSION Security Model 34-1
34.3 DBMS_COMPRESSION Constants 34-1
34.4 DBMS_COMPRESSION Data Structures 34-3
  34.4.1 COMPREC Record Type 34-3
  34.4.2 COMPRECLIST Table Type 34-4
34.5 Summary of DBMS_COMPRESSION Subprograms 34-4
  34.5.1 GET_COMPRESSION_RATIO Procedure 34-5
  34.5.2 GET_COMPRESSION_TYPE Function 34-6

35 DBMS_CONNECTION_POOL

35.1 Summary of DBMS_CONNECTION_POOL Subprograms 35-1
  35.1.1 ALTER_PARAM Procedure 35-1
  35.1.2 CONFIGURE_POOL Procedure 35-2
  35.1.3 START_POOL Procedure 35-4
  35.1.4 STOP_POOL Procedure 35-5
  35.1.5 RESTORE_DEFAULTS Procedure 35-5

36 DBMS_CQ_NOTIFICATION

36.1 DBMS_CQ_NOTIFICATION Overview 36-1
36.2 DBMS_CQ_NOTIFICATION Security Model 36-2
36.3 DBMS_CQ_NOTIFICATION Constants 36-2
36.4 DBMS_CQ_NOTIFICATION Operational Notes 36-3
36.5 DBMS_CQ_NOTIFICATION Examples 36-4
36.6 DBMS_CQ_NOTIFICATION Data Structures 36-11
  36.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type 36-11
  36.6.2 CQ_NOTIFICATION$_QUERY Object Type 36-12
  36.6.3 CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type 36-12
  36.6.4 CQ_NOTIFICATION$_TABLE Object Type 36-13
  36.6.5 CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type 36-13
  36.6.6 CQ_NOTIFICATION$_ROW Object Type 36-14
  36.6.7 CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type 36-14
  36.6.8 CQ_NOTIFICATION$_REG_INFO Object Type 36-14
36.7 Summary of DBMS_CQ_NOTIFICATION Subprograms 36-18
  36.7.1 CQ_NOTIFICATION_QUERYID Function 36-18
  36.7.2 DEREGISTER Procedure 36-18
  36.7.3 ENABLE_REG Procedure 36-19
  36.7.4 NEW_REG_START Function 36-19
37  DBMS_CREDENTIAL

37.1 DBMS_CREDENTIAL Overview 37-1
37.2 DBMS_CREDENTIAL Security Model 37-1
37.3 DBMS_CREDENTIAL Operational Notes 37-2
37.4 Summary of DBMS_CREDENTIAL Subprograms 37-2
   37.4.1 CREATE_CREDENTIAL Procedure 37-3
   37.4.2 DISABLE_CREDENTIAL Procedure 37-5
   37.4.3 DROP_CREDENTIAL Procedure 37-5
   37.4.4 ENABLE_CREDENTIAL Procedure 37-6
   37.4.5 UPDATE_CREDENTIAL Procedure 37-7

38  DBMS_CRYPTO

38.1 DBMS_CRYPTO Overview 38-1
38.2 DBMS_CRYPTO Security Model 38-2
38.3 DBMS_CRYPTO Datatypes 38-2
38.4 DBMS_CRYPTO Algorithms 38-3
38.5 DBMS_CRYPTO Restrictions 38-4
38.6 DBMS_CRYPTO Exceptions 38-5
38.7 DBMS_CRYPTO Operational Notes 38-5
38.8 DBMS_CRYPTO Examples 38-7
38.9 Summary of DBMS_CRYPTO Subprograms 38-8
   38.9.1 DECRYPT Function 38-9
   38.9.2 DECRYPT Procedures 38-10
   38.9.3 ENCRYPT Function 38-10
   38.9.4 ENCRYPT Procedures 38-11
   38.9.5 HASH Function 38-12
   38.9.6 MAC Function 38-13
   38.9.7 RANDOMBYTES Function 38-14
   38.9.8 RANDOMINTEGER Function 38-15
   38.9.9 RANDOMNUMBER Function 38-15

39  DBMS_CSX_ADMIN

39.1 DBMS_CSX_ADMIN Overview 39-1
39.2 DBMS_CSX_ADMIN Security Model 39-1
39.3 DBMS_CSX_ADMIN Constants 39-1
39.4 Summary of DBMS_CSX_ADMIN Subprograms 39-2
39.4.1 GETTOKENTABLEINFO Procedure & Function 39-2
39.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure 39-3
39.4.3 NAMESPACEIDTABLE Function 39-4
39.4.4 PATHIDTABLE Function 39-4
39.4.5 QNAMEIDTABLE Function 39-4

40 DBMS_CUBE

40.1 Using DBMS_CUBE 40-1
  40.1.1 DBMS_CUBE Security Model 40-2
40.2 Using SQL Aggregation Management 40-2
  40.2.1 Subprograms in SQL Aggregation Management 40-3
  40.2.2 Requirements for the Relational Materialized View 40-3
  40.2.3 Permissions for Managing and Querying Cube Materialized Views 40-4
  40.2.4 Example of SQL Aggregation Management 40-4
40.3 Upgrading 10g Analytic Workspaces 40-8
40.4 Summary of DBMS_CUBE Subprograms 40-13
  40.4.1 BUILD Procedure 40-14
  40.4.2 CREATE_EXPORT_OPTIONS Procedure 40-26
  40.4.3 CREATE_IMPORT_OPTIONS Procedure 40-29
  40.4.4 CREATE_MVIEW Function 40-30
  40.4.5 DERIVE_FROM_MVIEW Function 40-35
  40.4.6 DROP_MVIEW Procedure 40-36
  40.4.7 EXPORT_XML Procedure 40-38
  40.4.8 EXPORT_XML_TO_FILE Procedure 40-40
  40.4.9 IMPORT_XML Procedure 40-42
  40.4.10 INITIALIZE_CUBE_UPGRADE Procedure 40-44
  40.4.11 REFRESH_MVIEW Procedure 40-46
  40.4.12 UPGRADE_AW Procedure 40-48
  40.4.13 VALIDATE_XML Procedure 40-49

41 DBMS_CUBE_ADVISE

41.1 DBMS_CUBE_ADVISE Security Model 41-1
41.2 Summary of DBMS_CUBE_ADVISE Subprograms 41-1
  41.2.1 MV_CUBE_ADVISE Function 41-1
  41.2.2 SET_CNS_EXCEPTION_LOG Procedure 41-4
  41.2.3 TRACE Procedure 41-5
42  DBMS_CUBE_LOG

42.1  Using DBMS_CUBE_LOG  42-1
  42.1.1  DBMS_CUBE_LOG — Logging Types  42-2
  42.1.2  DBMS_CUBE_LOG — Logging Targets  42-2
  42.1.3  DBMS_CUBE_LOG — Verbosity Levels  42-3
  42.1.4  DBMS_CUBE_LOG Security Model  42-3
  42.1.5  DBMS_CUBE_LOG — Creating Cube Logs  42-3
  42.1.6  DBMS_CUBE_LOG — Cube Build Log  42-4
  42.1.7  DBMS_CUBE_LOG — Cube Dimension Compile Log  42-6
  42.1.8  DBMS_CUBE_LOG — Cube Operations Log  42-6
  42.1.9  DBMS_CUBE_LOG — Cube Rejected Records Log  42-7

42.2  Summary of DBMS_CUBE_LOG Subprograms  42-8
  42.2.1  DEFAULT_NAME Function  42-9
  42.2.2  DISABLE Procedure  42-10
  42.2.3  ENABLE Procedure  42-10
  42.2.4  FLUSH Procedure  42-12
  42.2.5  GET_LOG Procedure  42-12
  42.2.6  GET_LOG_SPEC Function  42-14
  42.2.7  GET_PARAMETER Function  42-14
  42.2.8  LEVEL_HIGH Function  42-15
  42.2.9  LEVEL_HIGHEST Function  42-16
  42.2.10  LEVEL_LOW Function  42-16
  42.2.11  LEVEL_LOWEST Function  42-17
  42.2.12  LEVEL_MEDIUM Function  42-17
  42.2.13  SET_LOG_SPEC Procedure  42-18
  42.2.14  SET_PARAMETER Procedure  42-18
  42.2.15  TABLE_CREATE Procedure  42-20
  42.2.16  TARGET_FILE Function  42-21
  42.2.17  TARGET_LOB Function  42-21
  42.2.18  TARGET_TABLE Function  42-22
  42.2.19  TARGET_TRACE Function  42-22
  42.2.20  TYPE_BUILD Function  42-22
  42.2.21  TYPE_DIMENSION_COMPILE Function  42-23
  42.2.22  TYPE_OPERATIONS Function  42-23
  42.2.23  TYPE_REJECTED_RECORDS Function  42-24
  42.2.24  VERSION Function  42-24

43  DBMS_DATA_MINING

43.1  DBMS_DATA_MINING Overview  43-1
43.2  DBMS_DATA_MINING Security Model  43-2
43.6.18 GET_MODEL_COST_MATRIX Function 43-94
43.6.19 GET_MODELDETAILS_AI Function 43-96
43.6.20 GET_MODELDETAILS_EM Function 43-97
43.6.21 GET_MODELDETAILS_EM_COMP Function 43-99
43.6.22 GET_MODELDETAILS_EM_PROJ Function 43-101
43.6.23 GET_MODELDETAILS_GLM Function 43-102
43.6.24 GET_MODELDETAILS_GLOBAL Function 43-105
43.6.25 GET_MODELDETAILS_KM Function 43-107
43.6.26 GET_MODELDETAILS_NB Function 43-109
43.6.27 GET_MODELDETAILS_NMF Function 43-111
43.6.28 GET_MODELDETAILS_OC Function 43-112
43.6.29 GET_MODEL_SETTINGS Function 43-114
43.6.30 GET_MODEL_SIGNATURE Function 43-115
43.6.31 GET_MODELDETAILS_SVD Function 43-116
43.6.32 GET_MODELDETAILS_SVM Function 43-118
43.6.33 GET_MODELDETAILS_XML Function 43-121
43.6.34 GET_MODELTRANSFORMATIONS Function 43-123
43.6.35 GET_TRANSFORM_LIST Procedure 43-125
43.6.36 IMPORT_MODEL Procedure 43-128
43.6.37 RANK APPLY Procedure 43-133
43.6.38 REMOVE_COST_MATRIX Procedure 43-135
43.6.39 RENAME_MODEL Procedure 43-136

44 DBMS_DATA_MINING_TRANSFORM

44.1 DBMS_DATA_MINING_TRANSFORM Overview 44-1
44.2 DBMS_DATA_MINING_TRANSFORM Operational Notes 44-4
  44.2.1 DBMS_DATA_MINING_TRANSFORM — About Transformation Lists 44-6
  44.2.2 DBMS_DATA_MINING_TRANSFORM — About Stacking and Stack Procedures 44-8
  44.2.3 DBMS_DATA_MINING_TRANSFORM — Nested Data Transformations 44-10
44.3 DBMS_DATA_MINING_TRANSFORM Security Model 44-13
44.4 DBMS_DATA_MINING_TRANSFORM Datatypes 44-14
44.5 DBMS_DATA_MINING_TRANSFORM Constants 44-16
44.6 Summary of DBMS_DATA_MINING_TRANSFORM Subprograms 44-17
  44.6.1 CREATE_BIN_CAT Procedure 44-19
  44.6.2 CREATE_BIN_NUM Procedure 44-20
  44.6.3 CREATE_CLIP Procedure 44-22
  44.6.4 CREATE_COL_REM Procedure 44-24
  44.6.5 CREATE_MISS_CAT Procedure 44-25
  44.6.6 CREATE_MISS_NUM Procedure 44-26
44.6.7 CREATE_NORM_LIN Procedure  44-28
44.6.8 DESCRIBE_STACK Procedure  44-29
44.6.9 GET_EXPRESSION Function  44-31
44.6.10 INSERT_AUTOBIN_NUM_EQWIDTH Procedure  44-32
44.6.11 INSERT_BIN_CAT_FREQ Procedure  44-36
44.6.12 INSERT_BIN_NUM_EQWIDTH Procedure  44-40
44.6.13 INSERT_BIN_NUM_QTILE Procedure  44-44
44.6.14 INSERT_BIN_SUPER Procedure  44-46
44.6.15 INSERT_CLIP_TRIM_TAIL Procedure  44-50
44.6.16 INSERT_CLIP_WINSOR_TAIL Procedure  44-53
44.6.17 INSERT_MISS_CAT_MODE Procedure  44-56
44.6.18 INSERT_MISS_NUM_MEAN Procedure  44-58
44.6.19 INSERT_NORM_LIN_MINMAX Procedure  44-60
44.6.20 INSERT_NORM_LIN_SCALE Procedure  44-62
44.6.21 INSERT_NORM_LIN_ZSCORE Procedure  44-64
44.6.22 SET_EXPRESSION Procedure  44-67
44.6.23 SET_TRANSFORM Procedure  44-69
44.6.24 STACK_BIN_CAT Procedure  44-70
44.6.25 STACK_BIN_NUM Procedure  44-72
44.6.26 STACK_CLIP Procedure  44-74
44.6.27 STACK_COL_REM Procedure  44-76
44.6.28 STACK_MISS_CAT Procedure  44-78
44.6.29 STACK_MISS_NUM Procedure  44-80
44.6.30 STACK_NORM_LIN Procedure  44-82
44.6.31 XFORM_BIN_CAT Procedure  44-84
44.6.32 XFORM_BIN_NUM Procedure  44-86
44.6.33 XFORM_CLIP Procedure  44-89
44.6.34 XFORM_COL_REM Procedure  44-90
44.6.35 XFORM_EXPR_NUM Procedure  44-92
44.6.36 XFORM_EXPR_STR Procedure  44-94
44.6.37 XFORM_MISS_CAT Procedure  44-96
44.6.38 XFORM_MISS_NUM Procedure  44-98
44.6.39 XFORM_NORM_LIN Procedure  44-100
44.6.40 XFORM_STACK Procedure  44-102

45  DBMS_DATAPUMP
45.1  DBMS_DATAPUMP Overview  45-1
45.2  DBMS_DATAPUMP Security Model  45-2
45.3  DBMS_DATAPUMP Constants  45-2
45.4  DBMS_DATAPUMP Data Structures  45-3
45.5 Summary of DBMS_DATAPUMP Subprograms

45.5.1 ADD_FILE Procedure
45.5.2 ATTACH Function
45.5.3 DATA_FILTER Procedures
45.5.4 DATA_REMAP Procedure
45.5.5 DETACH Procedure
45.5.6 GET_DUMPFILE_INFO Procedure
45.5.7 GET_STATUS Procedure
45.5.8 LOG_ENTRY Procedure
45.5.9 METADATA_FILTER Procedure
45.5.10 METADATA_REMAP Procedure
45.5.11 METADATA_TRANSFORM Procedure
45.5.12 OPEN Function
45.5.13 SET_PARALLEL Procedure
45.5.14 SET_PARAMETER Procedures
45.5.15 START_JOB Procedure
45.5.16 STOP_JOB Procedure
45.5.17 WAIT_FOR_JOB Procedure

46 DBMS_DB_VERSION

46.1 DBMS_DB_VERSION Overview
46.2 DBMS_DB_VERSION Constants
46.3 DBMS_DB_VERSION Examples

47 DBMS_DBCOMP

47.1 Using DBMS_DBCOMP
47.2 DBMS_DBCOMP Security Model
47.3 Summary of the DBMS_DBCOMP Subprogram
47.3.1 DBCOMP Procedure

118.2 DBMS_PIPE Security Model 118-2
118.3 DBMS_PIPE Constants 118-2
118.4 DBMS_PIPE Operational Notes 118-2
118.5 DBMS_PIPE Exceptions 118-3
118.6 DBMS_PIPE Examples 118-4
118.7 Summary of DBMS_PIPE Subprograms 118-12
  118.7.1 CREATE_PIPE Function 118-13
  118.7.2 NEXT_ITEM_TYPE Function 118-14
  118.7.3 PACK_MESSAGE Procedures 118-15
  118.7.4 PURGE Procedure 118-16
  118.7.5 RECEIVE_MESSAGE Function 118-17
  118.7.6 RESET_BUFFER Procedure 118-18
  118.7.7 REMOVE_PIPE Function 118-19
  118.7.8 SEND_MESSAGE Function 118-20
  118.7.9 UNIQUE_SESSION_NAME Function 118-22
  118.7.10 UNPACK_MESSAGE Procedures 118-22

### DBMS_PLSQL_CODE_COVERAGE

119.1 DBMS_PLSQL_CODE_COVERAGE Overview 119-1
119.2 DBMS_PLSQL_CODE_COVERAGE Security Model 119-1
119.3 Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms 119-2
  119.3.1 CREATE_COVERAGE_TABLES Procedure 119-2
  119.3.2 START_COVERAGE Function 119-2
## DBMS_PREDICTIVE_ANALYTICS

### 120.1 DBMS_PREDICTIVE_ANALYTICS Overview
120-1

### 120.2 DBMS_PREDICTIVE_ANALYTICS Security Model
120-1

### 120.3 Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms
120-2

#### 120.3.1 EXPLAIN Procedure
120-2

#### 120.3.2 PREDICT Procedure
120-4

#### 120.3.3 PROFILE Procedure
120-6

## DBMS_PREPROCESSOR

### 121.1 DBMS_PREPROCESSOR Overview
121-1

### 121.2 DBMS_PREPROCESSOR Operating Notes
121-1

### 121.3 DBMS_PREPROCESSOR Data Structures
121-2

#### 121.3.1 DBMS_PREPROCESSOR SOURCE_LINES_T Table Type
121-2

### 121.4 Summary of DBMS_PREPROCESSOR Subprograms
121-3

#### 121.4.1 GET_POST_PROCESSED_SOURCE Functions
121-3

#### 121.4.2 PRINT_POST_PROCESSED_SOURCE Procedures
121-4

## DBMS_PRIVILEGE_CAPTURE

### 122.1 DBMS_PRIVILEGE_CAPTURE Overview
122-1

### 122.2 DBMS_PRIVILEGE_CAPTURE Security Model
122-1

### 122.3 DBMS_PRIVILEGE_CAPTURE Constants
122-1

### 122.4 DBMS_PRIVILEGE_CAPTURE Examples
122-2

### 122.5 Summary of DBMS_PRIVILEGE_CAPTURE Subprograms
122-3

#### 122.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure
122-3

#### 122.5.2 CREATE_CAPTURE Procedure
122-4

#### 122.5.3 DELETE_RUN Procedure
122-5

#### 122.5.4 DISABLE_CAPTURE Procedure
122-5

#### 122.5.5 DROP_CAPTURE Procedure
122-6

#### 122.5.6 ENABLE_CAPTURE Procedure
122-6

#### 122.5.7 GENERATE_RESULT Procedure
122-7

## DBMS_PROCESS

### 123.1 DBMS_PROCESS Overview
123-1

### 123.2 DBMS_PROCESS Security Model
123-1

### 123.3 Summary of DBMS_PROCESS Subprograms
123-2

#### 123.3.1 CONFIGURE_POOL Procedure
123-2
124  DBMS_PROFILER

124.1 DBMS_PROFILER Overview
124.2 DBMS_PROFILER Security Model
124.3 DBMS_PROFILER Operational Notes
124.4 DBMS_PROFILER Exceptions
124.5 Summary of DBMS_PROFILER Subprograms
   124.5.1 FLUSH_DATA Function and Procedure
   124.5.2 GET_VERSION Procedure
   124.5.3 INTERNAL_VERSION_CHECK Function
   124.5.4 PAUSE_PROFILER Function and Procedure
   124.5.5 RESUME_PROFILER Function and Procedure
   124.5.6 START_PROFILER Functions and Procedures
   124.5.7 STOP_PROFILER Function and Procedure

125  DBMS_PROPAGATION_ADM

125.1 DBMS_PROPAGATION_ADM Overview
125.2 DBMS_PROPAGATION_ADM Security Model
125.3 Summary of DBMS_PROPAGATION_ADM Subprograms
   125.3.1 ALTER_PROPAGATION Procedure
   125.3.2 CREATE_PROPAGATION Procedure
   125.3.3 DROP_PROPAGATION Procedure
   125.3.4 START_PROPAGATION Procedure
   125.3.5 STOP_PROPAGATION Procedure

126  DBMS_QOPATCH

126.1 DBMS_QOPATCH Overview
126.2 DBMS_QOPATCH Security Model
126.3 DBMS_QOPATCH Operational Notes
126.4 DBMS_QOPATCH Exceptions
126.5 Summary of DBMS_QOPATCH Subprograms
   126.5.1 GET_OPATCH_BUGS Function
   126.5.2 GET_OPATCH_COUNT Function
   126.5.3 GET_OPATCH_DATA Function
   126.5.4 GET_OPATCH_FILES Function
   126.5.5 GET_OPATCH_INSTALL_INFO Function
   126.5.6 GET_OPATCH_LIST Function
126.5.7 GET_OPATCH_LSINVENTORY
126.5.8 GET_OPATCH_OLAYS Function
126.5.9 GET_OPATCH_PREQS Function
126.5.10 GET_OPATCH_XSLT
126.5.11 GET_SQLPATCH_STATUS Procedure
126.5.12 IS_PATCH_INSTALLED Function
126.5.13 SET_CURRENT_OPINST Procedure

127 DBMS_RANDOM
127.1 DBMS_RANDOM Deprecated Subprograms
127.2 DBMS_RANDOM Security Model
127.3 DBMS_RANDOM Operational Notes
127.4 Summary of DBMS_RANDOM Subprograms
  127.4.1 INITIALIZE Procedure
  127.4.2 NORMAL Function
  127.4.3 RANDOM Function
  127.4.4 SEED Procedures
  127.4.5 STRING Function
  127.4.6 TERMINATE Procedure
  127.4.7 VALUE Functions

128 DBMS_REDACT
128.1 DBMS_REDACT Overview
128.2 DBMS_REDACT Security Model
128.3 DBMS_REDACT Constants
128.4 DBMS_REDACT Operating Procedures
128.5 Summary of DBMS_REDACT Subprograms
  128.5.1 ADD_POLICY Procedure
  128.5.2 ALTER_POLICY Procedure
  128.5.3 APPLY_POLICY_EXPR_TO_COL Procedure
  128.5.4 CREATE_POLICY_EXPRESSION Procedure
  128.5.5 DISABLE_POLICY Procedure
  128.5.6 DROP_POLICY Procedure
  128.5.7 DROP_POLICY_EXPRESSION Procedure
  128.5.8 ENABLE_POLICY Procedure
  128.5.9 UPDATE_FULL_REDACTION_VALUES Procedure
  128.5.10 UPDATE_POLICY_EXPRESSION Procedure
### DBMS_REDEFINITION

129.1 DBMS_REDEFINITION Overview
129.2 DBMS_REDEFINITION Security Model
129.3 DBMS_REDEFINITION Constants
129.4 DBMS_REDEFINITION Operational Notes
129.5 DBMS_REDEFINITION Rules and Limits
129.6 DBMS_REDEFINITION Examples
129.7 Summary of DBMS_REDEFINITION Subprograms
  129.7.1 ABORT_REDEF_TABLE Procedure
  129.7.2 ABORT_ROLLBACK Procedure
  129.7.3 ABORT_UPDATE Procedure
  129.7.4 CAN_REDEF_TABLE Procedure
  129.7.5 COPY_TABLE_DEPENDENTS Procedure
  129.7.6 EXECUTE_UPDATE Procedure
  129.7.7 FINISH_REDEF_TABLE Procedure
  129.7.8 REDEF_TABLE Procedure
  129.7.9 REGISTER_DEPENDENT_OBJECT Procedure
  129.7.10 ROLLBACK Procedure
  129.7.11 SET_PARAM Procedure
  129.7.12 START_REDEF_TABLE Procedure
  129.7.13 SYNC_INTERIM_TABLE Procedure
  129.7.14 UNREGISTER_DEPENDENT_OBJECT Procedure

### DBMS_REFRESH

130.1 DBMS_REFRESH Overview
130.2 DBMS_REFRESH Security Model
130.3 Summary of DBMS_REFRESH Subprograms
  130.3.1 ADD Procedure
  130.3.2 CHANGE Procedure
  130.3.3 DESTROY Procedure
  130.3.4 MAKE Procedure
  130.3.5 REFRESH Procedure
  130.3.6 SUBTRACT Procedure

### DBMS_REPAIR

131.1 DBMS_REPAIR Overview
131.2 DBMS_REPAIR Security Model
131.3 DBMS_REPAIR Constants
131.4 DBMS_REPAIR Operating Notes
133.4.8 CREATE_CONSUMER_GROUP Procedure 133-11
133.4.9 CREATE_PENDING_AREA Procedure 133-12
133.4.10 CREATE_PLAN Procedure 133-13
133.4.11 CREATE_PLAN_DIRECTIVE Procedure 133-14
133.4.12 CREATE_SIMPLE_PLAN Procedure 133-18
133.4.13 DELETE_CATEGORY Procedure 133-20
133.4.14 DELETE_CDB_PLAN Procedure 133-20
133.4.15 DELETE_CDB_PLAN_DIRECTIVE Procedure 133-20
133.4.16 DELETE_CDB_PROFILE_DIRECTIVE Procedure 133-21
133.4.17 DELETE_CONSUMER_GROUP Procedure 133-21
133.4.18 DELETE_PLAN Procedure 133-22
133.4.19 DELETE_PLAN.Cascade Procedure 133-22
133.4.20 DELETE_PLAN_DIRECTIVE Procedure 133-23
133.4.21 DEQUEUE_PARALLEL_STATEMENT Procedure 133-23
133.4.22 END_SQL_BLOCK Procedure 133-24
133.4.23 SET_CONSUMER_GROUP_MAPPING Procedure 133-24
133.4.24 SET_CONSUMER_GROUP_MAPPING_PRI Procedure 133-25
133.4.25 SET_INITIAL_CONSUMER_GROUP Procedure 133-26
133.4.26 SUBMIT_PENDING_AREA Procedure 133-27
133.4.27 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure 133-27
133.4.28 SWITCH_CONSUMER_GROUP_FOR_USER Procedure 133-28
133.4.29 SWITCH_PLAN Procedure 133-28
133.4.30 UPDATE_CATEGORY Procedure 133-29
133.4.31 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure 133-29
133.4.32 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure 133-30
133.4.33 UPDATE_CDB_PLAN Procedure 133-31
133.4.34 UPDATE_CDB_PLAN_DIRECTIVE Procedure 133-32
133.4.35 UPDATE_CDB_PROFILE_DIRECTIVE Procedure 133-33
133.4.36 UPDATE_CONSUMER_GROUP Procedure 133-34
133.4.37 UPDATE_PLAN Procedure 133-34
133.4.38 UPDATE_PLAN_DIRECTIVE Procedure 133-35
133.4.39 VALIDATE_PENDING_AREA Procedure 133-39

134 DBMS_RESOURCE_MANAGER_PRIVS

134.1 Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms 134-1
134.1.1 GRANT_SWITCH_CONSUMER_GROUP Procedure 134-1
134.1.2 GRANT_SYSTEM_PRIVILEGE Procedure 134-2
134.1.3 REVOKE_SWITCH_CONSUMER_GROUP Procedure 134-3
134.1.4 REVOKE_SYSTEM_PRIVILEGE Procedure 134-4
## 135 DBMS_RESULT_CACHE

135.1 DBMS_RESULT_CACHE Security Model 135-1  
135.2 DBMS_RESULT_CACHE Constants 135-1  
135.3 Summary of DBMS_RESULT_CACHE Subprograms 135-2  
  135.3.1 BLACK_LIST Function 135-2  
  135.3.2 BLACK_LIST_ADD Procedure 135-2  
  135.3.3 BLACK_LIST_CLEAR Procedure 135-3  
  135.3.4 BLACK_LIST_REMOVE Procedure 135-3  
  135.3.5 BYPASS Procedure 135-4  
  135.3.6 FLUSH Function & Procedure 135-5  
  135.3.7 INVALIDATE Functions & Procedures 135-5  
  135.3.8 INVALIDATE_OBJECT Functions & Procedures 135-6  
  135.3.9 MEMORY_REPORT Procedure 135-7  
  135.3.10 STATUS Function 135-7  

## 136 DBMS_RESUMABLE

136.1 DBMS_RESUMABLE Operational Notes 136-1  
136.2 Summary of DBMS_RESUMABLE Subprograms 136-1  
  136.2.1 ABORT Procedure 136-2  
  136.2.2 GET_SESSION_TIMEOUT Function 136-2  
  136.2.3 GET_TIMEOUT Function 136-3  
  136.2.4 SET_SESSION_TIMEOUT Procedure 136-3  
  136.2.5 SET_TIMEOUT Procedure 136-4  
  136.2.6 SPACE_ERROR_INFO Function 136-4  

## 137 DBMS_RLS

137.1 DBMS_RLS Overview 137-1  
137.2 DBMS_RLS Security Model 137-2  
137.3 DBMS_RLS Constants 137-2  
137.4 DBMS_RLS Operational Notes 137-3  
137.5 DBMS_RLS Rules and Limits 137-3  
137.6 Summary of DBMS_RLS Subprograms 137-3  
  137.6.1 ADD_GROUPED_POLICY Procedure 137-4  
  137.6.2 ADD_POLICY Procedure 137-6  
  137.6.3 ADD_POLICY_CONTEXT Procedure 137-10  
  137.6.4 ALTER_POLICY Procedure 137-11  
  137.6.5 ALTER_GROUPED_POLICY Procedure 137-12  
  137.6.6 CREATE_POLICY_GROUP Procedure 137-14  
  137.6.7 DELETE_POLICY_GROUP Procedure 137-14
137.6.8 DISABLE_GROUPED_POLICY Procedure
137.6.9 DROP_GROUPED_POLICY Procedure
137.6.10 DROP_POLICY Procedure
137.6.11 DROP_POLICY_CONTEXT Procedure
137.6.12 ENABLE_GROUPED_POLICY Procedure
137.6.13 ENABLE_POLICY Procedure
137.6.14 REFRESH_GROUPED_POLICY Procedure
137.6.15 REFRESH_POLICY Procedure

138 DBMS_ROLLING
138.1 DBMS_ROLLING Overview
138.2 DBMS_ROLLING Security Model
138.3 Summary of DBMS_ROLLING Subprograms
  138.3.1 INIT_PLAN Procedure
  138.3.2 DESTROY_PLAN Procedure
  138.3.3 BUILD_PLAN Procedure
  138.3.4 SET_PARAMETER Procedure
  138.3.5 START_PLAN Procedure
  138.3.6 SWITCHOVER Procedure
  138.3.7 FINISH_PLAN Procedure
  138.3.8 ROLLBACK_PLAN Procedure

139 DBMS_ROWID
139.1 DBMS_ROWID Security Model
139.2 DBMS_ROWID Types
139.3 DBMS_ROWID Exceptions
139.4 DBMS_ROWID Operational Notes
139.5 DBMS_ROWID Examples
139.6 Summary of DBMS_ROWID Subprograms
  139.6.1 ROWID_BLOCK_NUMBER Function
  139.6.2 ROWID_CREATE Function
  139.6.3 ROWID_INFO Procedure
  139.6.4 ROWID_OBJECT Function
  139.6.5 ROWID_RELATIVE_FNO Function
  139.6.6 ROWID_ROW_NUMBER Function
  139.6.7 ROWID_TO_ABSOLUTE_FNO Function
  139.6.8 ROWID_TO_EXTENDED Function
  139.6.9 ROWID_TO_RESTRICTED Function
  139.6.10 ROWID_TYPE Function
DBMS_RULE

140.1 DBMS_RULE Overview 140-1
140.2 DBMS_RULE Security Model 140-1
140.3 Summary of DBMS_RULE Subprograms 140-1
  140.3.1 CLOSE_ITERATOR Procedure 140-2
  140.3.2 EVALUATE Procedure 140-3
  140.3.3 EVALUATE_EXPRESSION Procedure 140-7
  140.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure 140-7
  140.3.5 EVALUATE_RULE Procedure 140-8
  140.3.6 EVALUATE_RULE_ITERATOR Procedure 140-9
  140.3.7 GET_NEXT_HIT Function 140-10
  140.3.8 GET_NEXT_RESULT Function 140-11
  140.3.9 IS_FAST Procedure 140-11

DBMS_RULE_ADM

141.1 DBMS_RULE_ADM Overview 141-1
141.2 DBMS_RULE_ADM Security Model 141-1
141.3 Summary of DBMS_RULE_ADM Subprograms 141-1
  141.3.1 ADD_RULE Procedure 141-2
  141.3.2 ALTER_EVALUATION_CONTEXT Procedure 141-4
  141.3.3 ALTER_RULE Procedure 141-6
  141.3.4 CREATE_EVALUATION_CONTEXT Procedure 141-8
  141.3.5 CREATE_RULE Procedure 141-10
  141.3.6 CREATE_RULE_SET Procedure 141-11
  141.3.7 DROP_EVALUATION_CONTEXT Procedure 141-12
  141.3.8 DROP_RULE Procedure 141-13
  141.3.9 DROP_RULE_SET Procedure 141-13
  141.3.10 GRANT_OBJECT_PRIVILEGE Procedure 141-14
  141.3.11 GRANT_SYSTEM_PRIVILEGE Procedure 141-16
  141.3.12 REMOVE_RULE Procedure 141-17
  141.3.13 REVOKE_OBJECT_PRIVILEGE Procedure 141-19
  141.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure 141-19

DBMS_SCHEDULER

142.1 DBMS_SCHEDULER Deprecated Subprograms 142-1
142.2 DBMS_SCHEDULER Security Model 142-1
142.3 DBMS_SCHEDULER Rules and Limits 142-1
142.4 DBMS_SCHEDULER Operational Notes

142.5 DBMS_SCHEDULER Data Structures

142.5.1 DBMS_SCHEDULER JOBARG Object Type

142.5.2 JOBARG_ARRAY Table Type

142.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

142.5.4 JOB_DEFINITION_ARRAY Table Type

142.5.5 JOBATTR Object Type

142.5.6 JOBATTR_ARRAY Table Type

142.5.7 SCHEDULER$_STEP_TYPE Object Type

142.5.8 SCHEDULER$_STEP_TYPE_LIST Table Type

142.5.9 SCHEDULER$_EVENT_INFO Object Type

142.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

142.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

142.6 Summary of DBMS_SCHEDULER Subprograms

142.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

142.6.2 ADD_GROUP_MEMBER Procedure

142.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

142.6.4 ADD_TO_INCOMPATIBILITY Procedure

142.6.5 ALTER_CHAIN Procedure

142.6.6 ALTER_RUNNING_CHAIN Procedure

142.6.7 CLOSE_WINDOW Procedure

142.6.8 COPY_JOB Procedure

142.6.9 CREATE_CHAIN Procedure

142.6.10 CREATE_CREDENTIAL Procedure

142.6.11 CREATE_DATABASE_DESTINATION Procedure

142.6.12 CREATE_EVENT_SCHEDULE Procedure

142.6.13 CREATE_FILE_WATCHER Procedure

142.6.14 CREATE_GROUP Procedure

142.6.15 CREATE_INCOMPATIBILITY Procedure

142.6.16 CREATE_JOB Procedure

142.6.17 CREATE_JOB_CLASS Procedure

142.6.18 CREATE_JOBS Procedure

142.6.19 CREATE_PROGRAM Procedure

142.6.20 CREATERESOURCE Procedure

142.6.21 CREATE_SCHEDULE Procedure

142.6.22 CREATE_WINDOW Procedure

142.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

142.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

142.6.25 DEFINE_CHAIN_RULE Procedure

142.6.26 DEFINE_CHAIN_STEP Procedure

142.6.27 DEFINE_METADATA_ARGUMENT Procedure
143  DBMS_SERVER_ALERT

143.1  DBMS_SERVER_ALERT Security Model 143-1
143.2  DBMS_SERVER_ALERT Object Types 143-1
143.3  DBMS_SERVER_ALERT Relational Operators 143-2
143.4  DBMS_SERVER_ALERT Supported Metrics 143-2
143.5  Summary of DBMS_SERVER_ALERT Subprograms 143-7
   143.5.1  EXPAND_MESSAGE Function 143-7
   143.5.2  GET_THRESHOLD Procedure 143-8
   143.5.3  SET_THRESHOLD Procedure 143-9

144  DBMS_SERVICE

144.1  DBMS_SERVICE Overview 144-1
144.2  DBMS_SERVICE Security Model 144-2
144.3  DBMS_SERVICE Constants 144-2
144.4  DBMS_SERVICE Operating Procedures 144-5
144.5  DBMS_SERVICE Exceptions 144-5
144.6  Summary of DBMS_SERVICE Subprograms 144-6
   144.6.1  CREATE_SERVICE Procedure 144-7
   144.6.2  DELETE_SERVICE Procedure 144-10
   144.6.3  DISCONNECT_SESSION Procedure 144-11
   144.6.4  MODIFY_SERVICE Procedure 144-12
   144.6.5  START_SERVICE Procedure 144-15
   144.6.6  STOP_SERVICE Procedure 144-16

145  DBMS_SESSION

145.1  DBMS_SESSION Security Model 145-1
145.2  DBMS_SESSION Operational Notes 145-1
145.3  DBMS_SESSION Data Structures 145-1
   145.3.1  DBMS_SERVICE INTEGER_ARRAY Table Type 145-1
   145.3.2  DBMS_SERVICE LNAME_ARRAY Table Type 145-1
145.4  Summary of DBMS_SESSION Subprograms 145-2
   145.4.1  CLEAR_ALL_CONTEXT Procedure 145-3
145.4.2  CLEAR_CONTEXT Procedure 145-3
145.4.3  CLEAR_IDENTIFIER Procedure 145-4
145.4.4  CLOSE_DATABASE_LINK Procedure 145-4
145.4.5  FREE_UNUSED_USER_MEMORY Procedure 145-4
145.4.6  GET_PACKAGE_MEMORY_UTILIZATION Procedure 145-6
145.4.7  IS_ROLE_ENABLED Function 145-7
145.4.8  IS_SESSION_ALIVE Function 145-8
145.4.9  LIST_CONTEXT Procedures 145-8
145.4.10 MODIFY_PACKAGE_STATE Procedure 145-9
145.4.11 SESSION_TRACE_DISABLE Procedure 145-13
145.4.12 SESSION_TRACE_ENABLE Procedure 145-13
145.4.13 RESET_PACKAGE Procedure 145-14
145.4.14 SET_CONTEXT Procedure 145-15
145.4.15 SET_EDITION_DEFERRED Procedure 145-16
145.4.16 SET_IDENTIFIER Procedure 145-17
145.4.17 SET_NLS Procedure 145-17
145.4.18 SET_ROLE Procedure 145-18
145.4.19 SET_SQL_TRACE Procedure 145-18
145.4.20 SWITCH_CURRENT_CONSUMER_GROUP Procedure 145-18
145.4.21 UNIQUE_SESSION_ID Function 145-20

146 DBMS_SFW_ACL_ADMIN

146.1  DBMS_SFW_ACL_ADMIN Security Model 146-1
146.2  DBMS_SFW_ACL_ADMIN Operational Notes 146-1
146.3  DBMS_SFW_ACL_ADMIN Examples 146-2
146.4  Summary of DBMS_SFW_ACL_ADMIN Subprograms 146-3
  146.4.1  COMMIT_ACL Procedure 146-3
  146.4.2  IP_ADD_ACE Procedure 146-4
  146.4.3  IP_ADD_PDB_ACE Procedure 146-4
  146.4.4  IP_REMOVE_ACE Procedure 146-4
  146.4.5  IP_REMOVE_ACL Procedure 146-5
  146.4.6  IP_REMOVE_PDB_ACE Procedure 146-5
  146.4.7  IP_REMOVE_PDB_ACL Procedure 146-6

147 DBMS_SHARED_POOL

147.1  DBMS_SHARED_POOL Overview 147-1
147.2  DBMS_SHARED_POOL Operational Notes 147-1
147.3  Summary of DBMS_SHARED_POOL Subprograms 147-1
  147.3.1  ABORTED_REQUEST_THRESHOLD Procedure 147-2
149.4.11 TABLESPACE_FIX_BITMAPS Procedure 149-12
149.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure 149-13
149.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure 149-14
149.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure 149-14
149.4.15 TABLESPACE_REBUILD_BITMAPS Procedure 149-15
149.4.16 TABLESPACE_REBUILD_QUOTAS Procedure 149-16
149.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure 149-16
149.4.18 TABLESPACE_VERIFY Procedure 149-17

150 DBMS_SPD

150.1 DBMS_SPD Overview 150-1
150.2 DBMS_SPD Security Model 150-1
150.3 DBMS_SPD Views 150-1
150.4 Summary of DBMS_SPD Subprograms 150-2
  150.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure 150-2
  150.4.2 CREATE_STGTAB_DIRECTIVE Procedure 150-3
  150.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure 150-4
  150.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure 150-5
  150.4.5 GET_PREFS Function 150-5
  150.4.6 PACK_STGTAB_DIRECTIVE Function 150-6
  150.4.7 SET_PREFS Procedure 150-7
  150.4.8 UNPACK_STGTAB_DIRECTIVE Function 150-8

151 DBMS_SPM

151.1 DBMS_SPM Overview 151-1
151.2 DBMS_SPM Security Model 151-2
151.3 DBMS_SPM Constants 151-2
151.4 DBMS_SPM Examples 151-2
151.5 DBMS_SPM Data Structures 151-2
  151.5.1 DBMS_SPM NAMELIST Table Type 151-3
151.6 Summary of DBMS_SPM Subprograms 151-3
  151.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure 151-4
  151.6.2 ALTER_SQL_PLAN_BASELINE Function 151-5
  151.6.3 CANCEL_EVOLVE_TASK Procedure 151-6
  151.6.4 CONFIGURE Procedure 151-6
  151.6.5 CREATE_EVOLVE_TASK Function 151-9
  151.6.6 CREATE_STGTAB_BASELINE Procedure 151-10
  151.6.7 DROP_EVOLVE_TASK Procedure 151-11
  151.6.8 DROP_SQL_PLAN_BASELINE Function 151-11
151.6.9 EVOLVE_SQL_PLAN_BASELINE Function 151-12
151.6.10 EXECUTE_EVOLVE_TASK Function 151-14
151.6.11 IMPLEMENT_EVOLVE_TASK Function 151-14

  220.2.1  DISABLE Procedure  220-2
  220.2.2  GET_ETAG Function  220-2
  220.2.3  GET_LEVEL Function  220-2
  220.2.4  SET_CACHE Procedure  220-2
  220.2.5  SET_EXPIRES Procedure  220-3
  220.2.6  SET_NOT_MODIFIED Procedure  220-3
  220.2.7  SET_SURROGATE_CONTROL Procedure  220-4
### 226 OWA_SEC

#### 226.1 OWA_SEC Operational Notes 226-1

#### 226.2 Summary of OWA_SEC Subprograms 226-1
- **226.2.1** GET_CLIENT_HOSTNAME Function 226-2
- **226.2.2** GET_CLIENT_IP Function 226-2
- **226.2.3** GET_PASSWORD Function 226-2
- **226.2.4** GET_USER_ID Function 226-3
- **226.2.5** SET_AUTHORIZATION Procedure 226-3
- **226.2.6** SET_PROTECTION_REALM Procedure 226-4

### 227 OWA_TEXT

#### 227.1 OWA_OPT_LOCK Types 227-1
- **227.1.1** MULTI_LINE DATA TYPE 227-1
- **227.1.2** ROW_LIST DATA TYPE 227-1
- **227.1.3** VC_ARR DATA TYPE 227-2

#### 227.2 Summary of OWA_TEXT Subprograms 227-2
- **227.2.1** ADD2MULTI Procedure 227-2
- **227.2.2** NEW_ROW_LIST Function and Procedure 227-3
- **227.2.3** PRINT_MULTI Procedure 227-3
- **227.2.4** PRINT_ROW_LIST Procedure 227-4
- **227.2.5** STREAM2MULTI Procedure 227-4

### 228 OWA_UTIL

#### 228.1 OWA_UTIL Overview 228-1

#### 228.2 OWA_UTIL Types 228-1
- **228.2.1** DATETYPE Datatype 228-2
- **228.2.2** IDENT_ARR Datatype 228-2
- **228.2.3** IP_ADDRESS Datatype 228-2

#### 228.3 Summary of OWA_UTIL Subprograms 228-2
- **228.3.1** BIND_VARIABLES Function 228-3
- **228.3.2** CALENDARPRINT Procedures 228-4
228.3.3  CELLSPRINT Procedures  
228-5
228.3.4  CHOOSE_DATE Procedure  
228-7
228.3.5  GET_CGI_ENV Function  
228-8
228.3.6  GET_OWA_SERVICE_PATH Function  
228-8
228.3.7  GETPROCEDURE Function  
228-8
228.3.8  HTTP_HEADER_CLOSE Procedure  
228-9
228.3.9  LISTPRINT Procedure  
228-9
228.3.10  MIME_HEADER Procedure  
228-10
228.3.11  PRINT_CGI_ENV Procedure  
228-11
228.3.12  REDIRECT_URL Procedure  
228-11
228.3.13  SHOWPAGE Procedure  
228-12
228.3.14  SHOWSOURCE Procedure  
228-12
228.3.15  SIGNATURE procedure  
228-13
228.3.16  STATUS_LINE Procedure  
228-13
228.3.17  TABLEPRINT Function  
228-14
228.3.18  TODATE Function  
228-17
228.3.19  WHO_CALLED_ME Procedure  
228-17

Index
Preface

This Preface contains these topics:

- Audience
- Related Documents
- Conventions

Audience

*Oracle Database PL/SQL Packages and Types Reference* is intended for programmers, systems analysts, project managers, and others interested in developing database applications. This manual assumes a working knowledge of application programming and familiarity with SQL to access information in relational database systems. Some sections also assume a knowledge of basic object-oriented programming.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see the following documents:

- *Oracle Database Development Guide*
- *Oracle Database PL/SQL Language Reference*

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

Printed documentation is available for sale in the Oracle Store at http://shop.oracle.com/
To download free release notes, installation documentation, white papers, or other collateral, please visit the Oracle Technology Network (OTN).

http://docs.oracle.com/

Conventions

This section describes the conventions used in the text and code examples of this documentation set. It describes:

- Conventions in Text
- Conventions in Code Examples

Conventions in Text

We use various conventions in text to help you more quickly identify special terms. The following table describes those conventions and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bold</td>
<td>Bold typeface indicates terms that are defined in the text or terms that appear in a glossary, or both.</td>
<td>When you specify this clause, you create an index-organized table.</td>
</tr>
<tr>
<td>Italic</td>
<td>Italic typeface indicates book titles or emphasis.</td>
<td>Oracle Database Concepts</td>
</tr>
<tr>
<td>UPPERCASE monospace (fixed-width) font</td>
<td>Uppercase monospace typeface indicates elements supplied by the system. Such elements include parameters, privileges, datatypes, RMAN keywords, SQL keywords, SQL*Plus or utility commands, packages and methods, as well as system-supplied column names, database objects and structures, usernames, and roles.</td>
<td>Ensure that the recovery catalog and target database do not reside on the same disk.</td>
</tr>
<tr>
<td>lowercase monospace (fixed-width) font</td>
<td>Lowercase monospace typeface indicates executable programs, filenames, directory names, and sample user-supplied elements. Such elements include computer and database names, net service names and connect identifiers, user-supplied database objects and structures, column names, packages and classes, usernames and roles, program units, and parameter values. Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.</td>
<td>You can specify this clause only for a NUMBER column. You can back up the database by using the BACKUP command. Query the TABLE_NAME column in the USER_TABLES data dictionary view. Use the DBMS_STATS.GENERATE_STATS procedure.</td>
</tr>
<tr>
<td>lowercase italic monospace (fixed-width) font</td>
<td>Lowercase italic monospace font represents placeholders or variables.</td>
<td>Enter sqlplus to start SQL*Plus. The password is specified in the orapwd file. Back up the datafiles and control files in the /disk1/oracle/dbs directory. The department_id, department_name, and location_id columns are in the hr.departments table. Set the QUERY_REWRITE_ENABLED initialization parameter to true. The JRepUtil class implements these methods.</td>
</tr>
</tbody>
</table>

Note: Some programmatic elements use a mixture of UPPERCASE and lowercase. Enter these elements as shown.

You can specify the parallel_clause.
Run old_release.SQL where old_release refers to the release you installed prior to upgrading.
Conventions in Code Examples

Code examples illustrate SQL, PL/SQL, SQL*Plus, or other command-line statements. They are displayed in a monospace (fixed-width) font and separated from normal text as shown in this example:

```
SELECT username FROM dba_users WHERE username = 'MIGRATE';
```

The following table describes typographic conventions used in code examples and provides examples of their use.

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ]</td>
<td>Anything enclosed in brackets is optional.</td>
<td>DECIMAL (digits [ , precision ])</td>
</tr>
<tr>
<td>{ }</td>

Note:
Changes in This Release for Oracle Database PL/SQL Packages and Types Reference

This preface contains:

• Changes in Oracle Database 12c Release 2 (12.2)

Changes in Oracle Database 12c Release 2 (12.2)

The following are changes in Oracle Database PL/SQL Packages and Types Reference for Oracle Database 12c Release 2 (12.2).

• New Features
• Deprecated Features
• Desupported Features

New Features

The following features are new in this release:

• Data Guard Database Compare
  
  The new DBMS_DBCOMP package lets you perform block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases.
  
  See DBMS_DBCOMP

• Enhanced Java Debug Wire Protocol
  
  See DBMS_DEBUG_JDWP and DBMS_DEBUG_JDWP_CUSTOM

• Enhanced support for unified auditing, fine-grained auditing, and Transparent Data Encryption (TDE) column encryption for the creation of transparent sensitive data protection policies.
  
  See DBMS_TSDP_PROTECT

• New package to perform Oracle File System operations (make, mount, and unmount)
  
  See DBMS_FS

• New package to manage foreground prespawned processes.
  
  See DBMS_PROCESS

• New package to identify interconnected databases and trace the system change number (SCN) flow across distributed databases.
See **DBMS_TNS**

- **New** `DBMS_HADOOP` package that provides a PL/SQL procedure called `CREATE_EXTDDL_FOR_HIVE()`, that creates an Oracle external table for a given hive table.

See **DBMS_HADOOP**

- **New** `DBMS_HANG_MANAGER` package provides a method of changing some Hang Manager configuration parameters.

See **DBMS_HANG_MANAGER**

- New package to validate data in tables used by analytic views and hierarchies.

See **DBMS_HIERARCHY**

- **New** `DBMS_JSON` package provides an interface for data-guide operations.

See **DBMS_JSON**

- New package to format the output of queries to the `DBA_FGA_AUDIT_TRAIL`, `DBA_AUDIT_TRAIL`, `UNIFIED_AUDIT_TRAIL`, and `V$XML_AUDIT_TRAIL` auditing views.

See **DBMS_AUDIT_UTIL**

- **New** `DBMS_INMEMORYADMIN` package to manage In-Memory FastStart (IM FastStart)

See **DBMS_INMEMORY_ADMIN**

- **New** `DBMS_PDB_ALTER_SHARING`

See **DBMS_PDB_ALTER_SHARING**

- Error Handling Improvements for Oracle GoldenGate Integrated Replication

See **DBMS_APPLY_ADM**

- Materialized Views: Refresh Statistics History

See **DBMS_MVIEW_STATS**

- **Enhancements for** `DBMS_DATA_MINING` package

The following new algorithm settings are added:

- `DBMS_DATA_MINING — Algorithm Settings: ALGO_EXTENSIBLE_LANG`
- `DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis`

New procedures to support partitioned models are added:

- `ADD_PARTITION Procedure`
- `COMPUTE_CONFUSION_MATRIX_PART Procedure`
- `COMPUTE_LIFT_PART Procedure`
- `COMPUTE_ROC_PART Procedure`
- `CREATE_MODEL2 Procedure`
- `DROP_PARTITION Procedure`

- **Enhancements to the** `DBMS_DST` package:

See **FIND_AFFECTED_TABLES Procedure** (new parameter: `parallel`)

- **Enhancements to the** `DBMS_LOB` package:

See
– ISREMOTE Function (new)

– CLOB2FILE Procedure (this procedure is removed from the DBMS_XSLPROCESSOR package and added to the DBMS_LOB package)

The transfer of the DBMS_XSLPROCESSOR subprogram CLOB2FILE to the DBMS_LOB package.

• New DBMS_PLSQL_CODE_COVERAGE package to collect PL/SQL Basic Block Coverage data

  See DBMS_PLSQL_CODE_COVERAGE

• New Oracle Multimedia packages

  See

  – ORD_AUDIO
  – ORD_DOC
  – ORD_IMAGE
  – ORD_VIDEO

• New SDO_NFE package

  See SDO_NFE

• The following enhancements for the DBMS_REDACT package:

  Addition of the DBMS_REDACT_NULLIFY function to create or alter Data Redaction policies that return null values, using DBMS_REDACT.ADD_POLICY or DBMS_REDACT.ALTER_POLICY. Also, the expression parameter for these procedures supports more functions.

  See

  – ADD_POLICY Procedure
  – ALTER_POLICY Procedure

  New procedures to support the management of named policy expressions:

  See

  – CREATE_POLICY_EXPRESSION Procedure
  – APPLY_POLICY_EXPR_TO_COL Procedure
  – UPDATE_POLICY_EXPRESSION Procedure
  – DROP_POLICY_EXPRESSION Procedure

• Enhancements to the DBMS_PRIVILEGE_CAPTURE package, to enable you to create a capture run to define the period of time during which a privilege capture takes place:

  See

  – CAPTURE_DEPENDENCY_PRIVS Procedure (new)
  – ENABLE_CAPTURE Procedure (updated)
  – DELETE_RUN Procedure (new)

• Enhancements to the DBMS_SERVICE package:

  See
– **CREATE_SERVICE Procedure** (new parameters: FAILOVER_RESTORE, DRAIN_TIMEOUT, and STOP_OPTION)
– **MODIFY_SERVICE Procedure** (new parameters: DRAIN_TIMEOUT, FAILOVER_RESTORE, and STOP_OPTION)
– **STOP_SERVICE Procedure** (new parameters: DRAIN_TIMEOUT and STOP_OPTION)
– **DBMS_SERVICE** new constants (FAILOVER_RESTORE_NONE, FAILOVER_RESTORE_BASIC, STOP_OPTION_NONE, STOP_OPTION_IMMEDIATE, and STOP_OPTION_TRANSACTIONAL)

**Enhancements to the DBMS_SPM package:**

See
– **CONFIGURE Procedure** (new)
– **LOAD_PLANS_FROM_AWR Function** (new)
– **SET_EVOLVE_TASK_PARAMETER Procedure** (new parameter FIND_ALTERNATE_PLANS added to the procedure)

**The DBMS_SQL package** has been enhanced to support more bind variable types. The DESC_REC4 RECORD Type and DESC_TAB4 TABLE Type are introduced to support longer identifiers.

See
– **BIND_VARIABLE Procedures**
– **VARIABLE_VALUE Procedures**
– **BIND_VARIABLE_PKG Procedure** (new)
– **VARIABLE_VALUE_PKG Procedure** (new)
– **DBMS_SQL DESC_REC4 Record Type** (new)
– **DBMS_SQL DESC_TAB4 Table Type** (new)

**Enhancements to the DBMS_SQLDIAG package:**

See **CREATE_SQL_PATCH Function**

**Enhancements to the DBMS_SQLPA package:**

See **SET_ANALYSIS_TASK_PARAMETER Procedures** (new parameters: EXECUTE_TRIGGERS, NUM_ROWS_TO_FETCH, and REPLACE_SYSDATE_WITH)

**Enhancements to the DBMS_XDB_CONFIG package**, to enable you to get and set remote HTTP and HTTPS port values, and to enable a global port value.

See
– **GETREMOTEHTTPPORT Function** (new)
– **GETREMOTEHTTPSPORT Function** (new)
– **ISGLOBALPORTENABLED Function** (new)
– **SETGLOBALPORTENABLED Procedure** (new)
– **SETREMOTEHTTPPORT Procedure** (new)
– **SETREMOTEHTTPSPORT Procedure** (new)
– **DBMS_XDB_CONFIG Constants** (new constants: XDB_ENDPOINT_RHTTP and XDB_ENDPOINT_RHTTPS)
• Enhancements to the DBMS_XMLSTORAGE_MANAGE package:
  See
  – REFPARTITIONEXCHANGEIN Procedure (new)
  – REFPARTITIONEXCHANGEOUT Procedure (new)
• The transfer of the DBMS_XSLPROCESSOR subprograms CLOB2FILE and READ2CLOB to the DBMS_LOB package.
  See Summary of DBMS_LOB Subprograms
• DBMS_STATS preference for automatic column group statistics
  See SET_GLOBAL_PREFS Procedure
• Scan rate and In-Memory Column Store (IM column store) statistics
  See SET_TABLE_STATS Procedure
• New DBMS_STATS preference to override preference settings
  See SET_GLOBAL_PREFS Procedure
• DBMS_STATS monitoring statistics no longer need to be saved to disk
  See FLUSH_DATABASE_MONITORING_INFO Procedure
• Active Data Guard support for SQL Tuning Advisor
  See CREATE_TUNING_TASK Functions
• Real-Time Database Operations monitoring enhancements
  See BEGIN_OPERATION Function
• Optimizer Statistics Advisor, which diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and recommendations.
  See DBMS_STATS Operational Notes
• New DBMS_STATS preference APPROXIMATE_NDV_ALGORITHM
  See SET_GLOBAL_PREFS Procedure
• New plsql_mode parameter, which allows you to specify a PL/SQL capture mode with the DBMS_WORKLOAD_CAPTURE package
  See START_CAPTURE Procedure
• New plsql_mode parameter, which allows you to specify a PL/SQL replay mode with the DBMS_WORKLOAD_REPLAY package
  See
  – INITIALIZE_CONsolidated_REPLAY Procedure
  – INITIALIZE_REPLAY Procedure
  – PROCESS_CAPTURE Procedure
• New rac_inst_list parameter for the DBMS_WORKLOAD_REPLAY package, which enables you to specify a list of Oracle Real Application Clusters (Oracle RAC) instances that will be used for replay
  See INITIALIZE_REPLAY Procedure
• New parameters for the DBMS_WORKLOAD_REPLAY package
See

- **rac_mode**: This parameter specifies replay options in an Oracle RAC environment.

- **query_only**: This parameter replays only the read-only queries of a workload capture.

  See **PREPARE_REPLAY Procedure**

- **New procedure for the `DBMS_WORKLOAD_REPLAY` package that enables you to modify the `DBA_WORKLOAD_GROUP_ASSIGNMENTS` view, which provides information about workload captures and their assigned instances**

  See **ASSIGN_GROUP_TO_INSTANCE Procedure**

- **New procedure for the `DBMS_WORKLOAD_REPLAY` package that enables you to specify SQL statements to be skipped or replaced during database replay**

  See **SET_SQL_MAPPING Procedure**

- **New procedures for the `DBMS_AUDIT_MGMT` package**. **TRANSFER_UNIFIED_AUDIT_RECORDS** enables you to transfer unified audit records from the common logging interface (CLI) swap table to an internal unified audit relational table. This internal table, new for this release, is required for better read performance of the unified audit trail. **ALTER_PARTITION_INTERVAL** changes the unified audit internal relational table’s partition interval.

  See the following topics for more information:

  - **TRANSFER_UNIFIED_AUDIT_RECORDS Procedure**
  
  - **ALTER_PARTITION_INTERVAL Procedure**

- **New `load_details` parameter for the `DBMS_WORKLOAD_REPLAY` package that enables you to load the divergence and track commits data for a replay**

  See **GET_REPLAY_INFO Function**

- **Enhancements to `DBMS_AQADM` package**:

  See

  - **ALTER_QUEUE_TABLE Procedure** (updated)
  
  - **ALTER_SHARDED_QUEUE Procedure** (updated)
  
  - **CREATE_EXCEPTION_QUEUE Procedure** (new)
  
  - **CREATE_QUEUE_TABLE Procedure** (updated)
  
  - **CREATE_SHARDED_QUEUE Procedure** (updated)
  
  - **DROP_SHARDED_QUEUE Procedure** (updated)
  
  - **GET_QUEUE_PARAMETER Procedure** (new)
  
  - **SET_QUEUE_PARAMETER Procedure** (new)
  
  - **UNSET_QUEUE_PARAMETER Procedure** (new)

  See **DBMS_AQADM**

- **New procedure for the `DBMS_DBFS_CONTENT` package**

  See

  - **ISPATHLOCKED Procedure**
• **Enhancements to** DBMS_DBFS_CONTENT **package:**  
  See  
  – LOCKPATH Procedure (updated)  
  – UNLOCKPATH Procedure (updated)  

• **New procedure for the** DBMS_DBFS_CONTENT_SPI **package**  
  See  
  – ISPATHLOCKED Procedure  

• **Enhancements to** DBMS_DBFS_CONTENT_SPI **package:**  
  See  
  – LOCKPATH Procedure (updated)  
  – UNLOCKPATH Procedure (updated)  

• **Modification for the** DBMS_RLS.ADD_POLICY **procedure.** If you plan to include the INSERT statement type, then you must ensure that the update_check parameter is set to TRUE.  
  See  
  – ADD_POLICY Procedure

## Deprecated Features

List of deprecated features in Oracle Database 12c Release 2 (12.2) PL/SQL Packages and Types Reference.

The following features are deprecated in Oracle Database 12c Release 2 (12.2), and may be desupported in a future release:

• **Deprecation of the** DBMS_DEBUG **package**  
  Use DBMS_DEBUG_JDWP instead.

• **Deprecation of the** DBMS_JOB **package**  
  Oracle recommends that you migrate to DBMS_SCHEDULER, which provides a richer set of features and capabilities.

• **Deprecation of the following form** DBMS_LOB.LOADFROMFILE **Procedure.**  
  Use DBMS_LOB.LoadClobFromFile or DBMS_LOB.LoadBlobFromFile instead.

• **Deprecation of the** UTL_FILE_DIR **initialization parameter**  
  Use directory objects instead.

• **Deprecation of Oracle Multimedia SQL/MM Still Image Standard Support,** including the Oracle Multimedia SQL/MM Still Image TYPES  
  Oracle recommends that you replace SQL/MM still image with ORDImage for image processing.

• **Deprecation of Oracle Multimedia DICOM support,** including the ORDDicom TYPE, the ORD_DICOM package, and the ORD_DICOM_ADMIN package  
  There is no replacement for DICOM support in Oracle Database.

• **Deprecation of the following from the** DBMSUTILITY **package:**
There are no replacements for these subprograms.

- **Deprecation of the DBMS_XSLPROCESSOR.CLOB2FILE procedure**
  
  Use **DBMS_LOB.CLOB2FILE** instead.

- **Deprecation of the DBMS_XSLPROCESSOR.READ2CLOB function**
  
  Use **DBMS_LOB.LOADCLOBFROMFILE** instead.

- **Deprecation of the following from the DBMS_AUDIT_MGMT package:**
  
  - **DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL procedure**
  
  - **AUDIT_TRAIL_WRITE mode of the AUDIT_TRAIL_PROPERTY parameter of the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY procedure**

  There is no replacement because there is no longer any need to manually write audit records to disk. Starting with this release, audit records are written directly to an internal relational table, bypassing the common logging infrastructure queues.

### Desupported Features

List of desupported features in Oracle Database 12c Release 2 (12.2) PL/SQL Packages and Types Reference.

The following features are desupported in Oracle Database 12c Release 2 (12.2):

- **Desupport of Advanced Replication**

  The Oracle Database Advanced Replication feature is desupported in its entirety. The desupport of this feature includes all functionality associated with this feature: multimaster replication, updateable materialized views, hierarchical materialized views, and deployment templates. Read-only materialized views are still supported with basic replication.

  Oracle recommends that you replace your use of Advanced Replication with Oracle GoldenGate.

- **Desupport of the following subprograms from the DBMS_XDB_ADMIN package:**
  
  - **CREATEREPOSITORYXMLINDEX**
  
  - **XMLINDEXADDPATH**
  
  - **XMLINDEXREMOVEPATH**
  
  - **DROPREPOSITORYXMLINDEX**

  There is no replacement.
Introduction to Oracle Supplied PL/SQL Packages & Types

Oracle supplies many PL/SQL packages with the Oracle server to extend database functionality and provide PL/SQL access to SQL features. You can use the supplied packages when creating your applications or for ideas in creating your own stored procedures.

This manual covers the packages provided with the Oracle database server. Packages supplied with other products, such as Oracle Developer or the Oracle Application Server, are not covered.

Note that not every package or type described in this manual or elsewhere in the Oracle Database Documentation Library is installed by default. In such cases, the documentation states this and explains how to install the object. Run this query as a suitably privileged user:

```sql
SELECT DISTINCT Owner, Object_Type, Object_Name FROM DBA_Objects_AE
WHERE Owner IN ('SYS', 'OUTLN', 'SYSTEM', 'CTXSYS', 'DBSNMP', 'LOGSTDBY_ADMINISTRATOR', 'ORDSYS', 'ORDDPLUGINS', 'OEM_MONITOR', 'MDSYS', 'LBACSYS', 'DMSYS', 'WMSYS', 'OLAPDBA', 'OLAPSVR', 'OLAP_USER', 'OLAPSYS', 'EXFSYS', 'SYSMAN', 'MDDATA', 'SI_INFORMTN_SCHEMA', 'XDB', 'ODM')
AND Object_Type IN ('PACKAGE', 'TYPE')
ORDER BY Owner, Object_Type, Object_Name
```

This lists every Oracle-supplied package and type that is currently installed in the database. Note that it lists a number of objects not mentioned in the Oracle Database Documentation Library. This is deliberate. Some of the Oracle-supplied packages and types are intended to be used only by other Oracle-supplied components. Any package or type that is not described in the Oracle Database Documentation Library is not supported for direct customer use.

This chapter contains the following topics:

- Package Overview
- Summary of Oracle Supplied PL/SQL Packages and Types

See Also:

*Oracle Database Development Guide* for information on how to create your own packages.
1.1 Package Overview

A package is an encapsulated collection of related program objects stored together in the database. Program objects are procedures, functions, variables, constants, cursors, and exceptions.

1.1.1 Package Components

PL/SQL packages have two parts: the specification and the body, although sometimes the body is unnecessary. The specification is the interface to your application; it declares the types, variables, constants, exceptions, cursors, and subprograms available for use. The body fully defines cursors and subprograms, and so implements the specification.

Unlike subprograms, packages cannot be called, parameterized, or nested. However, the formats of a package and a subprogram are similar:

```sql
CREATE PACKAGE name AS  -- specification (visible part)
    -- public type and item declarations
    -- subprogram specifications
END [name];

CREATE PACKAGE BODY name AS  -- body (hidden part)
    -- private type and item declarations
    -- subprogram bodies
BEGIN
    -- initialization statements
END [name];
```

The specification holds public declarations that are visible to your application. The body holds implementation details and private declarations that are hidden from your application. You can debug, enhance, or replace a package body without changing the specification. You can change a package body without recompiling calling programs because the implementation details in the body are hidden from your application.

1.1.2 Using Oracle Supplied Packages

Most Oracle supplied packages are automatically installed when the database is created. Certain packages are not installed automatically. Special installation instructions for these packages are documented in the individual chapters.

To call a PL/SQL function from SQL, you must either own the function or have EXECUTE privileges on the function. To select from a view defined with a PL/SQL function, you must have SELECT privileges on the view. No separate EXECUTE privileges are needed to select from the view. Instructions on special requirements for packages are documented in the individual chapters.

1.1.3 Creating New Packages

To create packages and store them permanently in an Oracle database, use the CREATE PACKAGE and CREATE PACKAGE BODY statements. You can execute these statements interactively from SQL*Plus or Enterprise Manager.

To create a new package, do the following:
1. Create the package specification with the \texttt{CREATE PACKAGE} statement.

   You can declare program objects in the package specification. Such objects are called \textit{public} objects. Public objects can be referenced outside the package, as well as by other objects in the package.

   \begin{quote}
   \textbf{Note:}

   It is often more convenient to add the OR REPLACE clause in the \texttt{CREATE PACKAGE} statement. But note that \texttt{CREATE PACKAGE} warns you if you are about to overwrite an existing package with the same name while \texttt{CREATE OR REPLACE} just overwrites it with no warning.
   \end{quote}

2. Create the package body with the \texttt{CREATE PACKAGE BODY} statement.

   You can declare and define program objects in the package body.

   - You must define public objects declared in the package specification.
   - You can declare and define additional package objects, called \textit{private} objects. Private objects are declared in the package body rather than in the package specification, so they can be referenced only by other objects in the package. They cannot be referenced outside the package.

   \begin{quote}
   \textbf{See Also:}

   - \textit{Oracle Database PL/SQL Language Reference}
   - \textit{Oracle Database Development Guide} for more information on creating new packages
   - \textit{Oracle Database Concepts}
   for more information on storing and executing packages
   \end{quote}

1.1.3.1 Separating the Specification and Body

The specification of a package declares the public types, variables, constants, and subprograms that are visible outside the immediate scope of the package. The body of a package defines the objects declared in the specification, as well as private objects that are not visible to applications outside the package.

Oracle stores the specification and body of a package separately in the database. Other schema objects that call or reference public program objects depend only on the package specification, not on the package body. Using this distinction, you can change the definition of a program object in the package body without causing Oracle to invalidate other schema objects that call or reference the program object. Oracle invalidates dependent schema objects only if you change the declaration of the program object in the package specification.
1.1.3.1.1 Creating a New Package: Example

The following example shows a package specification for a package named \texttt{EMPLOYEE\_MANAGEMENT}. The package contains one stored function and two stored procedures.

CREATE PACKAGE employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                     mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                     deptno NUMBER) RETURN NUMBER;
  PROCEDURE fire_emp (emp_id NUMBER);
  PROCEDURE sal_raise (emp_id NUMBER, sal_incr NUMBER);
END employee_management;

The body for this package defines the function and the procedures:

CREATE PACKAGE BODY employee_management AS
  FUNCTION hire_emp (name VARCHAR2, job VARCHAR2,
                     mgr NUMBER, hiredate DATE, sal NUMBER, comm NUMBER,
                     deptno NUMBER) RETURN NUMBER IS
    new_empno NUMBER(10);
    BEGIN
      SELECT emp_sequence.NEXTVAL INTO new_empno FROM dual;
      INSERT INTO emp VALUES (new_empno, name, job, mgr,
                              hiredate, sal, comm, deptno);
      RETURN (new_empno);
    END hire_emp;
  PROCEDURE fire_emp(emp_id IN NUMBER) AS
    BEGIN
      DELETE FROM emp WHERE empno = emp_id;
      IF SQL\%NOTFOUND THEN
        raise_application_error(-20011, 'Invalid Employee Number: ' || TO\_CHAR(emp_id));
      END IF;
    END fire_emp;
  PROCEDURE sal_raise (emp_id IN NUMBER, sal_incr IN NUMBER) AS
    BEGIN
      -- If employee exists, then update salary with increase.
      UPDATE emp
        SET sal = sal + sal_incr
        WHERE empno = emp_id;
      IF SQL\%NOTFOUND THEN
        raise_application_error(-20011, 'Employee Not Found: ' || TO\_CHAR(emp_id));
      END IF;
    END sal_raise;
END body_employee_management;

The procedure deletes the employee with an employee number that corresponds to the argument \texttt{emp\_id}. If no employee is found, then an exception is raised.

BEGIN
  DELETE FROM emp WHERE empno = emp_id;
  IF SQL\%NOTFOUND THEN
    raise_application_error(-20011, 'Invalid Employee Number: ' || TO\_CHAR(emp_id));
  END IF;
END fire_emp;

The procedure accepts two arguments. \texttt{Emp\_id} is a number that corresponds to an employee number. \texttt{Sal\_incr} is the amount by which to increase the employee’s salary.

BEGIN
  -- If employee exists, then update salary with increase.
  UPDATE emp
    SET sal = sal + sal_incr
    WHERE empno = emp_id;
  IF SQL\%NOTFOUND THEN
    raise_application_error(-20011, 'Employee Not Found: ' || TO\_CHAR(emp_id));
  END IF;
END sal_raise;
1.1.4 Referencing Package Contents

When you want to reference the types, items, and subprograms declared in a package specification, use the dot notation.

For example:

```
package_name.type_name
package_name.item_name
package_name.subprogram_name
```

1.2 Summary of Oracle Supplied PL/SQL Packages and Types

PL/SQL packages are supplied with the Oracle server that extend database functionality and provide PL/SQL access to SQL features.

These packages, listed in the following table, run as the invoking user, rather than the package owner. Unless otherwise noted, the packages are callable through public synonyms of the same name.

```
<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APEX_APPLICATION through APEX_ZIP</td>
<td>For a complete description of all the packages that ship with Oracle Application Express, see the Oracle Application Express API Reference</td>
</tr>
</tbody>
</table>
```

Note:

- The procedures and functions provided in these packages and their external interfaces are reserved by Oracle and are subject to change.
- Modifying Oracle supplied packages can cause internal errors and database security violations. Do not modify supplied packages.
<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTX_ADM</td>
<td>Lets you administer servers and the data dictionary</td>
</tr>
<tr>
<td>CTX_ANL</td>
<td>The CTX_ANL package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.</td>
</tr>
<tr>
<td>CTX_CLS</td>
<td>Lets you generate CTXRULE rules for a set of documents</td>
</tr>
<tr>
<td>CTX_DDL</td>
<td>Lets you create and manage the preferences, section lists and stopgroups required for Text indexes</td>
</tr>
<tr>
<td>CTX_DOC</td>
<td>Lets you request document services</td>
</tr>
<tr>
<td>CTX_ENTITY</td>
<td>The CTX_ENTITY package enables you to search for terms that are unknown to you without specifying a particular search text.</td>
</tr>
<tr>
<td>CTX_OUTPUT</td>
<td>Lets you manage the index log</td>
</tr>
<tr>
<td>CTX_QUERY</td>
<td>Lets you generate query feedback, count hits, and create stored query expressions</td>
</tr>
<tr>
<td>CTX_REPORT</td>
<td>Lets you create various index reports</td>
</tr>
<tr>
<td>CTX_THES</td>
<td>Lets you to manage and browse thesauri</td>
</tr>
<tr>
<td>CTX_ULEXER</td>
<td>For use with the user-lexer</td>
</tr>
<tr>
<td>DBMS_ADM</td>
<td>Facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor</td>
</tr>
<tr>
<td>DBMS_ADVANCED_REWRITE</td>
<td>Contains interfaces for advanced query rewrite users to create, drop, and maintain functional equivalence declarations for query rewrite</td>
</tr>
<tr>
<td>DBMS_ADVISOR</td>
<td>Part of the SQLAccess Advisor, an expert system that identifies and helps resolve performance problems relating to the execution of SQL statements</td>
</tr>
<tr>
<td>DBMS_ALERT</td>
<td>Provides support for the asynchronous notification of database events</td>
</tr>
<tr>
<td>DBMS_APP_CONT</td>
<td>The DBMS_APP_CONT package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.</td>
</tr>
<tr>
<td>DBMS_APPLICATION_INFO</td>
<td>Lets you register an application name with the database for auditing or performance tracking purposes</td>
</tr>
<tr>
<td>DBMS_APPLY_ADM</td>
<td>Provides administrative procedures to start, stop, and configure an apply process</td>
</tr>
<tr>
<td>DBMS_AQ</td>
<td>Lets you add a message (of a predefined object type) onto a queue or to dequeue a message</td>
</tr>
<tr>
<td>DBMS_AQADM</td>
<td>Lets you perform administrative functions on a queue or queue table for messages of a predefined object type</td>
</tr>
<tr>
<td>DBMS_AQEIM</td>
<td>Provides procedures to manage the configuration of Advanced Queuing asynchronous notification by e-mail and HTTP</td>
</tr>
<tr>
<td>DBMS_AQIN</td>
<td>Plays a part in providing secure access to the Oracle JMS interfaces</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_ASSERT</td>
<td>Provides an interface to validate properties of the input value.</td>
</tr>
<tr>
<td>DBMS_AUDIT_UTIL</td>
<td>The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.</td>
</tr>
<tr>
<td>DBMS_AUDIT_MGMT</td>
<td>The DBMS_AUDIT_MGMT package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail.</td>
</tr>
<tr>
<td>DBMS_AUTO_REPORT</td>
<td>The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.</td>
</tr>
<tr>
<td>DBMS_AUTO_SQLTUNE</td>
<td>The DBMS_AUTO_SQLTUNE package is the interface for managing the Automatic SQL Tuning task.</td>
</tr>
<tr>
<td>DBMS_AUTO_TASK_ADMIN</td>
<td>Used by the DBA as well as Enterprise Manager to access the AUTOTASK controls.</td>
</tr>
<tr>
<td>DBMS_AW_STATS</td>
<td>Contains a subprogram that generates and stores optimizer statistics for cubes and dimensions.</td>
</tr>
<tr>
<td>DBMS_CAPTURE_ADM</td>
<td>Describes administrative procedures to start, stop, and configure a capture process; used in Streams.</td>
</tr>
<tr>
<td>DBMS_COMPARISON</td>
<td>Provides interfaces to compare and converge database objects at different databases.</td>
</tr>
<tr>
<td>DBMS_COMPRESSION</td>
<td>Provides an interface to facilitate choosing the correct compression level for an application.</td>
</tr>
<tr>
<td>DBMS_CONNECTION_POOL</td>
<td>Provides an interface to manage the Database Resident Connection Pool.</td>
</tr>
<tr>
<td>DBMS_CQ_NOTIFICATION</td>
<td>Is part of a set of features that clients use to receive notifications when result sets of a query have changed. The package contains interfaces that can be used by mid-tier clients to register objects and specify delivery mechanisms.</td>
</tr>
<tr>
<td>DBMS_CREDENTIAL</td>
<td>The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.</td>
</tr>
<tr>
<td>DBMS_CRYPTO</td>
<td>Lets you encrypt and decrypt stored data, can be used in conjunction with PL/SQL programs running network communications, and supports encryption and hashing algorithms.</td>
</tr>
<tr>
<td>DBMS_CSX_ADMIN</td>
<td>Provides an interface to customize the setup when transporting a tablespace containing binary XML data.</td>
</tr>
<tr>
<td>DBMS_CUBE</td>
<td>Contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
</tr>
<tr>
<td>DBMS_CUBE_ADVISE</td>
<td>Contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite</td>
</tr>
<tr>
<td>DBMS_CUBE_LOG</td>
<td>Contains subprograms for creating and managing logs for cubes and cube dimensions.</td>
</tr>
<tr>
<td>DBMS_DATA_MINING</td>
<td>Implements the Oracle Data Mining interface for creating, evaluating, and managing mining models</td>
</tr>
<tr>
<td>DBMS_DATA_MINING_TRANSFORM</td>
<td>Provides subroutines that can be used to prepare data for Oracle Data Mining</td>
</tr>
<tr>
<td>DBMS_DATAPUMP</td>
<td>Lets you move all, or part of, a database between databases, including both data and metadata</td>
</tr>
<tr>
<td>DBMS_DB_VERSION</td>
<td>The DBMS_DB_VERSION package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.</td>
</tr>
<tr>
<td>DBMS_DBCOMP</td>
<td>The DBMS_DBCOMP package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases.</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT</td>
<td>Provides an interface comprising a file system-like abstraction backed by one or more Store Providers</td>
</tr>
<tr>
<td>DBMS_DBFS_CONTENT_SPI</td>
<td>Provides the Application Programming Interface (API) specification for DBMS_DBFS_CONTENT service providers</td>
</tr>
<tr>
<td>DBMS_DBFS_HS</td>
<td>Provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables</td>
</tr>
<tr>
<td>DBMS_DBFS_SFS</td>
<td>Provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the DBMS_DBFS_CONTENT package</td>
</tr>
<tr>
<td>DBMS_DDL</td>
<td>Provides access to some SQL DDL statements from stored procedures, and provides special administration operations not available as DDLs</td>
</tr>
<tr>
<td>DBMS_DEBUG</td>
<td>Implements server-side debuggers and provides a way to debug server-side PL/SQL program units</td>
</tr>
<tr>
<td>DBMS_DEBUG_JDWP</td>
<td>The DBMS_DEBUG_JDWP provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).</td>
</tr>
<tr>
<td>DBMS_DEBUG_JDWP_CUSTOM</td>
<td>The DBMS_DEBUG_JDWP_CUSTOM package is a PL/SQL package that provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).</td>
</tr>
<tr>
<td>DBMS_DESCRIBE</td>
<td>Describes the arguments of a stored procedure with full name translation and security checking</td>
</tr>
<tr>
<td>DBMS_DG</td>
<td>Allows applications to notify the primary database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_DIMENSION</td>
<td>Enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.</td>
</tr>
<tr>
<td>DBMS_DISTRIBUTED_TRUST_ADMIN</td>
<td>Maintains the Trusted Database List, which is used to determine if a privileged database link from a particular server can be accepted.</td>
</tr>
<tr>
<td>DBMS_DNFS</td>
<td>The DBMS_DNFS package provides an interface to assist in creating a database using files in the backup set.</td>
</tr>
<tr>
<td>DBMS_DST</td>
<td>The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.</td>
</tr>
<tr>
<td>DBMS_EDITIONS_UTILITIES</td>
<td>The DBMS_EDITIONS_UTILITIES package provides helper functions for edition related operations.</td>
</tr>
<tr>
<td>DBMS_EPG</td>
<td>Implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.</td>
</tr>
<tr>
<td>DBMS_ERRLOG</td>
<td>Provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back.</td>
</tr>
<tr>
<td>DBMS_FGA</td>
<td>Provides fine-grained security functions.</td>
</tr>
<tr>
<td>DBMS_FILE_GROUP</td>
<td>One of a set of Streams packages, provides administrative interfaces for managing file groups, file group versions, files and file group repositories.</td>
</tr>
<tr>
<td>DBMS_FILE_TRANSFER</td>
<td>Lets you copy a binary file within a database or to transfer a binary file between databases.</td>
</tr>
<tr>
<td>DBMS_FLASHBACK</td>
<td>Lets you flash back to a version of the database at a specified wall-clock time or a specified system change number (SCN).</td>
</tr>
<tr>
<td>DBMS_FLASHBACK_ARCHIVE</td>
<td>Contains procedures for disassociation and re-association of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA respectively.</td>
</tr>
<tr>
<td>DBMS_FREQUENT_ITEMSET</td>
<td>Enables frequent itemset counting.</td>
</tr>
<tr>
<td>DBMS_FS</td>
<td>The DBMS_FS package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.</td>
</tr>
<tr>
<td>DBMS_GOLDENGATE_AUTH</td>
<td>The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.</td>
</tr>
<tr>
<td>DBMS_HADOOP</td>
<td>The DBMS_HADOOP package provides a PL/SQL procedure called CREATE_EXTDDL_FOR_HIVE(), that creates an Oracle external table for a given hive table.</td>
</tr>
<tr>
<td>DBMS_HANG_MANAGER</td>
<td>The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.</td>
</tr>
<tr>
<td>DBMS_HEAT_MAP</td>
<td>The DBMS_HEAT_MAP package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_HIERARCHY</td>
<td>Contains functions and procedures for validating the data in tables used by analytic views and hierarchies and for creating a log table.</td>
</tr>
<tr>
<td>DBMS_HM</td>
<td>Contains constants and procedure declarations for health check management</td>
</tr>
<tr>
<td>DBMS_HPROF</td>
<td>Provides an interface for profiling the execution of PL/SQL applications</td>
</tr>
<tr>
<td>DBMS_HS_PARALLEL</td>
<td>Enables parallel processing for heterogeneous targets access</td>
</tr>
<tr>
<td>DBMS_HS_PASSTHROUGH</td>
<td>Lets you use Heterogeneous Services to send pass-through SQL statements to non-Oracle systems</td>
</tr>
<tr>
<td>DBMS_ILM</td>
<td>The DBMS_ILM package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.</td>
</tr>
<tr>
<td>DBMS_ILM_ADMIN</td>
<td>The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution.</td>
</tr>
<tr>
<td>DBMS_INMEMORY</td>
<td>The DBMS_INMEMORY package provides an interface for In-Memory Column Store (IM column store) functionality.</td>
</tr>
<tr>
<td>DBMS_INMEMORY_ADMIN</td>
<td>The DBMS_INMEMORY_ADMIN package provides interfaces for managing an In-Memory FastStart (IM FastStart) area and In-Memory Expressions (IM expressions).</td>
</tr>
<tr>
<td>DBMS_IOT</td>
<td>Creates a table into which references to the chained rows for an Index Organized Table can be placed using the ANALYZE command</td>
</tr>
<tr>
<td>DBMS_JAVA</td>
<td>Provides a PL/SQL interface for accessing database functionality from Java</td>
</tr>
<tr>
<td>DBMS_JOB</td>
<td>Schedules and manages jobs in the job queue ( Deprecated)</td>
</tr>
<tr>
<td>DBMS_JSON</td>
<td>Provides an interface for data-guide operations</td>
</tr>
<tr>
<td>DBMS_LDAP</td>
<td>Provides functions and procedures to access data from LDAP servers</td>
</tr>
<tr>
<td>DBMS_LDAP_UTILITY</td>
<td>Provides the Oracle Extension utility functions for LDAP</td>
</tr>
<tr>
<td>DBMS_LIBCACHE</td>
<td>Prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution</td>
</tr>
<tr>
<td>DBMS_LOB</td>
<td>Provides general purpose routines for operations on Oracle Large Object (LOB) datatypes - BLOB, CLOB (read/write), and BFILE (read-only)</td>
</tr>
<tr>
<td>DBMS_LOCK</td>
<td>Lets you request, convert and release locks through Oracle Lock Management services</td>
</tr>
<tr>
<td>DBMS_LOGMNR</td>
<td>Provides functions to initialize and run the log reader</td>
</tr>
<tr>
<td>DBMS_LOGMNR_D</td>
<td>Queries the dictionary tables of the current database, and creates a text based file containing their contents</td>
</tr>
</tbody>
</table>
### Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_LOGSTDBY</td>
<td>Describes procedures for configuring and managing the logical standby database environment.</td>
</tr>
<tr>
<td>DBMS_LOGSTDBY_CONTEXT</td>
<td>You can use the procedures provided in the <a href="#">DBMS_LOGSTDBY_CONTEXT</a> package to set and retrieve various parameters associated with LSBY_APPLY_CONTEXT.</td>
</tr>
<tr>
<td>DBMS_METADATA</td>
<td>Lets callers easily retrieve complete database object definitions (metadata) from the dictionary.</td>
</tr>
<tr>
<td>DBMS_METADATA_DIFF</td>
<td>Contains the interfaces for comparing two metadata documents in SXML format. The result of the comparison is an SXML difference document. This document can be converted to other formats using the <a href="#">DBMS_METADATA</a> submit interface and the <a href="#">CONVERT</a> API.</td>
</tr>
<tr>
<td>DBMS_MGD_ID_UTIL</td>
<td>Provides a set of utility subprograms.</td>
</tr>
<tr>
<td>DBMS_MGWADM</td>
<td>Describes the Messaging Gateway administrative interface; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MGWMSG</td>
<td>Describes object types (used by the canonical message types to convert message bodies) and helper methods, constants, and subprograms for working with the Messaging Gateway message types; used in Advanced Queuing.</td>
</tr>
<tr>
<td>DBMS_MONITOR</td>
<td>Let you use PL/SQL for controlling additional tracing and statistics gathering.</td>
</tr>
<tr>
<td>DBMS_MVIEW</td>
<td>Lets you refresh snapshots that are not part of the same refresh group and purge logs. DBMS_SNAPSHOT is a synonym.</td>
</tr>
<tr>
<td>DBMS_MVIEW_STATS</td>
<td>The DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACL_ADMIN</td>
<td>Provides the interface to administer the network Access Control List (ACL).</td>
</tr>
<tr>
<td>DBMS_NETWORK_ACL.Utility</td>
<td>The DBMS_NETWORK_ACL.UTILITY package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.</td>
</tr>
<tr>
<td>DBMS_ODCI</td>
<td>Returns the CPU cost of a user function based on the elapsed time of the function.</td>
</tr>
<tr>
<td>DBMS_OUTLN</td>
<td>Provides the interface for procedures and functions associated with management of stored outlines. Synonymous with OUTLN_PKG.</td>
</tr>
<tr>
<td>DBMS_OUTPUT</td>
<td>Accumulates information in a buffer so that it can be retrieved later.</td>
</tr>
<tr>
<td>DBMS_PARALLEL_EXECUTE</td>
<td>Enables the user to incrementally update table data in parallel.</td>
</tr>
<tr>
<td>DBMS_PART</td>
<td>The DBMS_PART package provides an interface for maintenance and management operations on partitioned objects.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_PCLXUTIL</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
<tr>
<td>DBMS_PDB</td>
<td>The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface to specify which database objects are application common objects.</td>
</tr>
<tr>
<td>DBMS_PDB_ALTER_SHARING</td>
<td>In an application container with a pre-installed application, the DBMS_PDB_ALTER_SHARING package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.</td>
</tr>
<tr>
<td>DBMS_PERF</td>
<td>The DBMS_PERF package provides an interface to generate active reports for monitoring database performance.</td>
</tr>
<tr>
<td>DBMS_PIPE</td>
<td>Provides a DBMS pipe service which enables messages to be sent between sessions</td>
</tr>
<tr>
<td>DBMS_PLSQL_CODE_COVERAGE</td>
<td>The DBMS_PLSQL_CODE_COVERAGE package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.</td>
</tr>
<tr>
<td>DBMS_PREDICTIVE_ANALYTICS</td>
<td>Provides subroutines that implement automatic data mining operations for predict, explain, and profile analysis.</td>
</tr>
<tr>
<td>DBMS_PREPROCESSOR</td>
<td>Provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.</td>
</tr>
<tr>
<td>DBMS_PRIVILEGE_CAPTURE</td>
<td>The DBMS_PRIVILEGE_CAPTURE package provides an interface to database privilege analysis.</td>
</tr>
<tr>
<td>DBMS_PROCESS</td>
<td>The DBMS_PROCESS package provides an interface to manage the prespawned servers.</td>
</tr>
<tr>
<td>DBMS_PROFILER</td>
<td>Provides a Probe Profiler API to profile existing PL/SQL applications and identify performance bottlenecks.</td>
</tr>
<tr>
<td>DBMS_PROPAGATION_ADM</td>
<td>Provides administrative procedures for configuring propagation from a source queue to a destination queue.</td>
</tr>
<tr>
<td>DBMS_QOPATCH</td>
<td>The DBMS_QOPATCH package provides an interface to view the installed database patches.</td>
</tr>
<tr>
<td>DBMS_RANDOM</td>
<td>Provides a built-in random number generator</td>
</tr>
<tr>
<td>DBMS_REDACT</td>
<td>The DBMS_REDACT package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.</td>
</tr>
<tr>
<td>DBMS_REDEFINITION</td>
<td>Lets you perform an online reorganization of tables</td>
</tr>
<tr>
<td>DBMS_REFRESH</td>
<td>Lets you create groups of snapshots that can be refreshed together to a transactionally consistent point in time. Requires the Distributed Option.</td>
</tr>
<tr>
<td>DBMS_REPAIR</td>
<td>Provides data corruption repair procedures</td>
</tr>
<tr>
<td>DBMS_RESCONFIG</td>
<td>Provides an interface to operate on the Resource Configuration List, and to retrieve listener information for a resource.</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER</td>
<td>Maintains plans, consumer groups, and plan directives; it also provides semantics so that you may group together changes to the plan schema</td>
</tr>
<tr>
<td>DBMS_RESOURCE_MANAGER_PRIVS</td>
<td>Maintains privileges associated with resource consumer groups</td>
</tr>
<tr>
<td>DBMS_RESULT_CACHE</td>
<td>Provides an interface to operate on the Result Cache</td>
</tr>
<tr>
<td>DBMS_RESUMABLE</td>
<td>Lets you suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution</td>
</tr>
<tr>
<td>DBMS_RLS</td>
<td>Provides row level security administrative interface</td>
</tr>
<tr>
<td>DBMS_ROLLING</td>
<td>The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion.</td>
</tr>
<tr>
<td>DBMS_ROWID</td>
<td>Provides procedures to create rowids and to interpret their contents</td>
</tr>
<tr>
<td>DBMS_RULE</td>
<td>Describes the EVALUATE procedure used in Streams</td>
</tr>
<tr>
<td>DBMS_RULE_ADM</td>
<td>Describes the administrative interface for creating and managing rules, rule sets, and rule evaluation contexts; used in Streams</td>
</tr>
<tr>
<td>DBMS_SCHEDULER</td>
<td>Provides a collection of scheduling functions that are callable from any PL/SQL program</td>
</tr>
<tr>
<td>DBMS_SERVER_ALERT</td>
<td>Lets you issue alerts when some threshold has been violated</td>
</tr>
<tr>
<td>DBMS_SERVICE</td>
<td>Lets you create, delete, activate and deactivate services for a single instance</td>
</tr>
<tr>
<td>DBMS_SESSION</td>
<td>Provides access to SQL ALTER SESSION statements, and other session information, from stored procedures</td>
</tr>
<tr>
<td>DBMS_SHARED_POOL</td>
<td>Lets you keep objects in shared memory, so that they will not be aged out with the normal LRU mechanism</td>
</tr>
<tr>
<td>DBMS_SPACE</td>
<td>Provides segment space information not available through standard SQL</td>
</tr>
<tr>
<td>DBMS_SPACE_ADMIN</td>
<td>Provides tablespace and segment space administration not available through the standard SQL</td>
</tr>
<tr>
<td>DBMS_SPD</td>
<td>The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).</td>
</tr>
<tr>
<td>DBMS_SPM</td>
<td>Supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements</td>
</tr>
<tr>
<td>DBMS_SQL</td>
<td>Lets you use dynamic SQL to access the database</td>
</tr>
<tr>
<td>DBMS_SQL_MONITOR</td>
<td>The DBMS_SQL_MONITOR package provides information about Real-time SQL Monitoring and Real-time Database Operation Monitoring.</td>
</tr>
</tbody>
</table>
### Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_SQL_TRANSLATOR</td>
<td>The <code>DBMS_SQL_TRANSLATOR</code> package provides an interface for creating, configuring, and using SQL translation profiles.</td>
</tr>
<tr>
<td>DBMS_SQLDiag</td>
<td>Provides an interface to the SQL Diagnosability functionality.</td>
</tr>
<tr>
<td>DBMS_SQLPA</td>
<td>Provides an interface to implement the SQL Performance Analyzer.</td>
</tr>
<tr>
<td>DBMS_SQLTUNE</td>
<td>Provides the interface to tune SQL statements.</td>
</tr>
<tr>
<td>DBMS_STAT_FUNCS</td>
<td>Provides statistical functions.</td>
</tr>
<tr>
<td>DBMS_STATS</td>
<td>Provides a mechanism for users to view and modify optimizer statistics gathered for database objects.</td>
</tr>
<tr>
<td>DBMS_STORAGE_MAP</td>
<td>Communicates with FMON to invoke mapping operations.</td>
</tr>
<tr>
<td>DBMS_STREAMS</td>
<td>Describes the interface to convert <code>SYS.AnyData</code> objects into LCR objects and an interface to annotate redo entries generated by a session with a binary tag.</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADMIN</td>
<td>Describes administrative procedures for adding and removing simple rules, without transformations, for capture, propagation, and apply at the table, schema, and database level</td>
</tr>
<tr>
<td>DBMS_STREAMS_ADVISOR_ADM</td>
<td>Provides an interface to gather information about an Oracle Streams environment and advise database administrators based on the information gathered</td>
</tr>
<tr>
<td>DBMS_STREAMS_AUTH</td>
<td>Provides interfaces for granting privileges to Streams administrators and revoking privileges from Streams administrators</td>
</tr>
<tr>
<td>DBMS_STREAMS_HANDLER_ADM</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_MESSAGING</td>
<td>Provides interfaces to enqueue messages into and dequeue messages from a <code>SYS.AnyData</code> queue</td>
</tr>
<tr>
<td>DBMS_STREAMS_TABLESPACE_ADM</td>
<td>Provides administrative procedures for copying tablespaces between databases and moving tablespaces from one database to another</td>
</tr>
<tr>
<td>DBMS_SYNC_REFRESH</td>
<td>The <code>DBMS_SYNC_REFRESH</code> package provides an interface to perform a synchronous refresh of materialized views.</td>
</tr>
<tr>
<td>DBMS_TDB</td>
<td>Reports whether a database can be transported between platforms using the RMAN <code>CONVERT DATABASE</code> command. It verifies that databases on the current host platform are of the same endian format as the destination platform, and that the state of the current database does not prevent transport of the database.</td>
</tr>
<tr>
<td>DBMS_TNS</td>
<td>The <code>DBMS_TNS</code> package provides the <code>RESOLVE_TNSNAME</code> function to resolve a TNS name and return the corresponding Oracle Net8 connection string.</td>
</tr>
<tr>
<td>DBMS_TRACE</td>
<td>Provides routines to start and stop PL/SQL tracing.</td>
</tr>
<tr>
<td>DBMS_TRANSACTION</td>
<td>Provides access to SQL transaction statements from stored procedures and monitors transaction activities</td>
</tr>
</tbody>
</table>
### Table 1-1 (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>
<th>Package Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_TRANSFORM</td>
<td>Provides an interface to the message format transformation features of Oracle Advanced Queuing</td>
</tr>
<tr>
<td>DBMS_TSDP_MANAGE</td>
<td>The DBMS_TSDP_MANAGE package provides an interface to import and manage sensitive columns and sensitive column types in the database.</td>
</tr>
<tr>
<td>DBMS_TSDP_PROTECT</td>
<td>The DBMS_TSDP_PROTECT package provides an interface to configure transparent sensitive data protection (TSDP) policies in conjunction with the DBMS_TSDP_MANAGE package. The DBMS_TSDP_PROTECT package is available with the Enterprise Edition only.</td>
</tr>
<tr>
<td>DBMS_TTS</td>
<td>Checks if the transportable set is self-contained</td>
</tr>
<tr>
<td>DBMS_TYPES</td>
<td>Consists of constants, which represent the built-in and user-defined types</td>
</tr>
<tr>
<td>DBMS_UMF</td>
<td>The DBMS_UMF package provides an interface for deploying the Remote Management Framework (RMF) for an Oracle Database. The RMF is used for collecting performance statistics for an Oracle Database.</td>
</tr>
<tr>
<td>DBMS.Utility</td>
<td>Provides various utility routines</td>
</tr>
<tr>
<td>DBMS_WARNING</td>
<td>Provides the interface to query, modify and delete current system or session settings</td>
</tr>
<tr>
<td>DBMS_WM</td>
<td>Describes how to use the programming interface to Oracle Database Workspace Manager to work with long transactions</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_CAPTURE</td>
<td>Configures the Workload Capture system and produce the workload capture data.</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPLAY</td>
<td>Provides an interface to replay and report on a record of a workload on a production or test system</td>
</tr>
<tr>
<td>DBMS_WORKLOAD_REPOSITORY</td>
<td>Lets you manage the Workload Repository, performing operations such as managing snapshots and baselines</td>
</tr>
<tr>
<td>DBMS_XA</td>
<td>Contains the XA/Open interface for applications to call XA interface in PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB</td>
<td>Describes Resource Management and Access Control interface for PL/SQL</td>
</tr>
<tr>
<td>DBMS_XDB_ADMIN</td>
<td>Provides an interface to implement XMLIndex administration operation</td>
</tr>
<tr>
<td>DBMS_XDB_CONFIG</td>
<td>The DBMS_XDB_CONFIG package provides an interface for configuring Oracle XML DB and its repository.</td>
</tr>
<tr>
<td>DBMS_XDB_CONSTANTS</td>
<td>The DBMS_XDB_CONSTANTS package provides an interface to commonly used constants.</td>
</tr>
<tr>
<td>DBMS_XDB_REPOS</td>
<td>The DBMS_XDB_REPOS package provides an interface to operate on the Oracle XML database Repository.</td>
</tr>
<tr>
<td>DBMS_XDBRESOURCE</td>
<td>Provides an interface to operate on the XDB resource's metadata and contents</td>
</tr>
<tr>
<td>DBMS_XDB_VERSION</td>
<td>Describes the versioning interface</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>DBMS_XDBT</td>
<td>Describes how an administrator can create a ConText index on the XML DB hierarchy and configure it for automatic maintenance</td>
</tr>
<tr>
<td>DBMS_XDBZ</td>
<td>Controls the Oracle XML DB repository security, which is based on Access Control Lists (ACLs)</td>
</tr>
<tr>
<td>DBMS_XEVENT</td>
<td>Provides event-related types and supporting subprograms</td>
</tr>
<tr>
<td>DBMS_XMLDOM</td>
<td>Explains access to XMLType objects</td>
</tr>
<tr>
<td>DBMS_XMLGEN</td>
<td>Converts the results of a SQL query to a canonical XML format</td>
</tr>
<tr>
<td>DBMS_XMINDEX</td>
<td>Provides an interface to implement asynchronous indexing and apply node referencing</td>
</tr>
<tr>
<td>DBMS_XMLPARSER</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DBMS_XMQUERY</td>
<td>Provides database-to-XMLType functionality</td>
</tr>
<tr>
<td>DBMS_XMSAVE</td>
<td>Provides XML-to-database-type functionality</td>
</tr>
<tr>
<td>DBMS_XMSCHEMA</td>
<td>Explains procedures to register and delete XML schemas</td>
</tr>
<tr>
<td>DBMS_XMLSTORE</td>
<td>Provides the ability to store XML data in relational tables</td>
</tr>
<tr>
<td>DBMS_XMLTRANSLATIONS</td>
<td>Provides an interface to perform translations so that strings can be searched or displayed in various languages</td>
</tr>
<tr>
<td>DBMS_XPLAN</td>
<td>Describes how to format the output of the <code>EXPLAIN PLAN</code> command</td>
</tr>
<tr>
<td>DBMS_XSLPROCESSOR</td>
<td>Explains access to the contents and structure of XML documents</td>
</tr>
<tr>
<td>DEBUG_EXTPROC</td>
<td>Lets you debug external procedures on platforms with debuggers that attach to a running process</td>
</tr>
<tr>
<td>HFT</td>
<td>Hypertext functions generate HTML tags</td>
</tr>
<tr>
<td>HTP</td>
<td>Hypertext procedures generate HTML tags</td>
</tr>
<tr>
<td>ORD_DICOM</td>
<td>Supports the management and manipulation of Digital Imaging and Communications in Medicine (DICOM) content stored in BLOBs or BFILES rather than in an ORDDicom object type</td>
</tr>
<tr>
<td>ORD_DICOM_ADMIN</td>
<td>Used by Oracle Multimedia Digital Imaging and Communications in Medicine (DICOM) administrators to maintain the Oracle Multimedia DICOM data model repository</td>
</tr>
<tr>
<td>OWA_CACHE</td>
<td>Provides an interface that enables the PL/SQL Gateway cache to improve the performance of PL/SQL Web applications</td>
</tr>
<tr>
<td>OWA_COOKIE</td>
<td>Provides an interface for sending and retrieving HTTP cookies from the client's browser</td>
</tr>
<tr>
<td>OWA_CUSTOM</td>
<td>Provides a Global PLSQL Agent Authorization callback function</td>
</tr>
<tr>
<td>Package Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OWA_IMAGE</td>
<td>Provides an interface to access the coordinates where a user clicked on an image</td>
</tr>
<tr>
<td>OWA_OPT_LOCK</td>
<td>Contains subprograms that impose optimistic locking strategies so as to prevent lost updates</td>
</tr>
<tr>
<td>OWA_PATTERN</td>
<td>Provides an interface to locate text patterns within strings and replace the matched string with another string</td>
</tr>
<tr>
<td>OWA_SEC</td>
<td>Provides an interface for custom authentication</td>
</tr>
<tr>
<td>OWA_TEXT</td>
<td>Contains subprograms used by OWA_PATTERN for manipulating strings. They are externalized so you can use them directly.</td>
</tr>
<tr>
<td>OWA_UTIL</td>
<td>Contains utility subprograms for performing operations such as getting the value of CGI environment variables, printing the data that is returned to the client, and printing the results of a query in an HTML table</td>
</tr>
<tr>
<td>SDO_CS</td>
<td>Provides functions for coordinate system transformation</td>
</tr>
<tr>
<td>SDO_CSW_PROCESS</td>
<td>Contains subprograms for various processing operations related to support for Catalog Services for the Web (CSW)</td>
</tr>
<tr>
<td>SDO_GCDR</td>
<td>Contains the Oracle Spatial geocoding subprograms, which let you geocode unformatted postal addresses</td>
</tr>
<tr>
<td>SDO_GEOM</td>
<td>Provides functions implementing geometric operations on spatial objects</td>
</tr>
<tr>
<td>SDO_GEOR</td>
<td>Contains functions and procedures for the Spatial GeoRaster feature, which lets you store, index, query, analyze, and deliver raster image data and its associated Spatial vector geometry data and metadata</td>
</tr>
<tr>
<td>SDO_GEOR_ADMIN</td>
<td>Contains subprograms for administrative operations related to GeoRaster.</td>
</tr>
<tr>
<td>SDO_GEOR_UTL</td>
<td>Contains utility functions and procedures for the Spatial GeoRaster feature, including those related to using triggers with GeoRaster data</td>
</tr>
<tr>
<td>SDO_LRS</td>
<td>Provides functions for linear referencing system support</td>
</tr>
<tr>
<td>SDO_MIGRATE</td>
<td>Provides functions for migrating spatial data from previous releases</td>
</tr>
<tr>
<td>SDO_NET</td>
<td>Provides functions and procedures for working with data modeled as nodes and links in a network</td>
</tr>
<tr>
<td>SDO_NET_MEM</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_OLS</td>
<td>Contains functions and procedures for performing editing and analysis operations on network data using a network memory object</td>
</tr>
<tr>
<td>SDO_PC_PKG</td>
<td>Contains subprograms to support the use of point clouds in Spatial</td>
</tr>
<tr>
<td>SDO_SAM</td>
<td>Contains functions and procedures for spatial analysis and data mining</td>
</tr>

<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SDO_TIN_PKG</td>
<td>Contains subprograms to support the use of triangulated irregular networks (TINs) in Spatial</td>
</tr>
<tr>
<td>SDO_TOPO</td>
<td>Provides procedures for creating and managing Spatial topologies</td>
</tr>
<tr>
<td>SDO_TOPO_MAP</td>
<td>Contains subprograms for editing Spatial topologies using a cache (TopoMap object)</td>
</tr>
<tr>
<td>SDO_TUNE</td>
<td>Provides functions for selecting parameters that determine the behavior of the spatial indexing scheme used in Oracle Spatial</td>
</tr>
<tr>
<td>SDO_UTIL</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SDO_WFS_LOCK</td>
<td>Contains subprograms for WFS support for registering and unregistering feature tables</td>
</tr>
<tr>
<td>SDO_WFS_PROC</td>
<td>Provides utility functions and procedures for Oracle Spatial</td>
</tr>
<tr>
<td>SEM_APIS</td>
<td>Contains subprograms for working with the Resource Description Framework (RDF) and Web Ontology Language (OWL) in an Oracle database.</td>
</tr>
<tr>
<td>SEM_PERF</td>
<td>Contains subprograms for examining and enhancing the performance of the Resource Description Framework (RDF) and Web Ontology Language (OWL) support in an Oracle database</td>
</tr>
<tr>
<td>SEM_RDFCTX</td>
<td>Contains subprograms for managing extractor policies and semantic indexes created for documents</td>
</tr>
<tr>
<td>SEM_RDFSA</td>
<td>Contains subprograms for providing fine-grained access control to RDF data, using either a virtual private database (VPD) or Oracle Label Security (OLS)</td>
</tr>
<tr>
<td>UTL_COLL</td>
<td>Enables PL/SQL programs to use collection locators to query and update</td>
</tr>
<tr>
<td>UTL_COMPRESS</td>
<td>Provides a set of data compression utilities</td>
</tr>
<tr>
<td>UTL_DBWS</td>
<td>Provides database Web services</td>
</tr>
<tr>
<td>UTL_ENCODE</td>
<td>Provides functions that encode RAW data into a standard encoded format so that the data can be transported between hosts</td>
</tr>
<tr>
<td>UTL_FILE</td>
<td>Enables your PL/SQL programs to read and write operating system text files and provides a restricted version of standard operating system stream file I/O</td>
</tr>
<tr>
<td>UTL_HTTP</td>
<td>Enables HTTP callouts from PL/SQL and SQL to access data on the Internet or to call Oracle Web Server Cartridges</td>
</tr>
<tr>
<td>UTL_I18N</td>
<td>Provides a set of services (Oracle Globalization Service) that help developers build multilingual applications</td>
</tr>
<tr>
<td>UTL_INETADDR</td>
<td>Provides a procedure to support internet addressing</td>
</tr>
<tr>
<td>UTL_IDENT</td>
<td>Specifies which database or client PL/SQL is running</td>
</tr>
<tr>
<td>UTL_LMS</td>
<td>Retrieves and formats error messages in different languages</td>
</tr>

<tbody>
<tr>
<td>UTL_MAIL</td>
<td>A utility for managing email which includes commonly used email features, such as attachments, CC, BCC, and return receipt</td>
</tr>
<tr>
<td>UTL_NLA</td>
<td>Exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs</td>
</tr>
<tr>
<td>UTL_RAW</td>
<td>Provides SQL functions for manipulating RAW datatypes</td>
</tr>
<tr>
<td>UTL_RECOMP</td>
<td>Recompiles invalid PL/SQL modules, invalid views, Java classes, indextypes and operators in a database, either sequentially or in parallels</td>
</tr>
<tr>
<td>UTL_REF</td>
<td>Enables a PL/SQL program to access an object by providing a reference to the object</td>
</tr>
<tr>
<td>UTL_SMTP</td>
<td>Provides PL/SQL functionality to send emails</td>
</tr>
<tr>
<td>UTL_SPADV</td>
<td>Provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment</td>
</tr>
<tr>
<td>UTL_TCP</td>
<td>Provides PL/SQL functionality to support simple TCP/IP-based communications between servers and the outside world</td>
</tr>
<tr>
<td>UTL_URL</td>
<td>Provides escape and unescape mechanisms for URL characters</td>
</tr>
<tr>
<td>WPG_DOCLOAD</td>
<td>Provides an interface to download files, both BLOBs and BFILEs</td>
</tr>
<tr>
<td>ANYDATA TYPE</td>
<td>A self-describing data instance type containing an instance of the type plus a description</td>
</tr>
<tr>
<td>ANYDATASET TYPE</td>
<td>Contains a description of a given type plus a set of data instances of that type</td>
</tr>
<tr>
<td>ANYTYPE TYPE</td>
<td>Contains a type description of any persistent SQL type, named or unnamed, including object types and collection types; or, it can be used to construct new transient type descriptions</td>
</tr>
<tr>
<td>Oracle Database Advanced Queuing Types</td>
<td>Describes the types used in Advanced Queuing</td>
</tr>
<tr>
<td>DBFS Content Interface Types</td>
<td>Describes public types defined to support the DBMS_DBFS_CONTENT interface.</td>
</tr>
<tr>
<td>Database URI Type</td>
<td>Contains URI Support, UriType Super Type, HttpUriType Subtype, DBUriType Subtype, XDBUriType Subtype, UriFactory Package</td>
</tr>
<tr>
<td>Expression Filter Types</td>
<td>Expression Filter feature is supplied with a set of predefined types and public synonyms for these types.</td>
</tr>
<tr>
<td>JMS TYPES</td>
<td>Describes JMS types so that a PL/SQL application can use JMS queues of JMS types</td>
</tr>
<tr>
<td>Oracle Multimedia ORDAudio TYPE</td>
<td>Supports the storage and management of audio data</td>
</tr>
<tr>
<td>Oracle Multimedia ORDDicom Type</td>
<td>Supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data</td>
</tr>
</tbody>
</table>
### Table 1-1  (Cont.) Summary of Oracle Supplied PL/SQL Packages

<table>
<thead>
<tr>

Oracle Application Express Packages
APEX_APPLICATION Through APEX_ZIP

The Oracle Application Express supplies PL/SQL packages for application developers who are building database-centric web applications using Oracle Application Express.

For a complete description of all the packages that ship with Oracle Application Express, see the Oracle Application Express API Reference.
The `CTX_ADM` package lets you administer the Oracle Text data dictionary.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ADM` in the Oracle Text Reference.
The `CTX_ANL` package is used with AUTO_LEXER and provides procedures for adding and dropping a custom dictionary from the lexer.

A custom dictionary might be one that you develop for a special field of study or for your industry. In most cases, the dictionaries supplied for the supported languages with Oracle Text are more than sufficient to handle your requirements.

For a complete description of this package within the context of Oracle Text, see `CTX_ANL` in the Oracle Text Reference.
The `CTX_CLS` package enables generation of CTXRULE rules for a set of documents.

For a complete description of this package within the context of Oracle Text, see `CTX_CLS` in the Oracle Text Reference.
The `CTX_DDL` package lets you create and manage the preferences, section groups, and stoplists required for Text indexes.

Note that you must install this package in order to use it.

For complete description of this package within the context of Oracle Text, see `CTX_DDL` in the Oracle Text Reference.
The `CTX_DOC` package lets you request document services.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_DOC` in the Oracle Text Reference.
8

CTX_ENTITY

The **CTX_ENTITY** package enables you to search for terms that are unknown to you without specifying a particular search text.

It does this by identifying names, places, dates, and other objects when they are mentioned in a document and by tagging each occurrence (called a mention) with its type and subtype. This process enables you to produce a structured view of a document that can later be used for text and data mining and more comprehensive intelligence analysis.

For the complete description of this package within the context of Oracle Text, see **CTX_ENTITY** in the *Oracle Text Reference*. 
This Oracle Text package lets you manage the index log.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_OUTPUT` in the Oracle Text Reference.
This Oracle Text package lets you generate query feedback, count hits, and create stored query expressions.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see \texttt{CTX_QUERY} in the Oracle Text Reference.
This Oracle Text package lets you create various index reports.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_REPORT` in the Oracle Text Reference.
This Oracle Text package lets you to manage and browse thesauri.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see CTX THES in the Oracle Text Reference.
This Oracle Text package is for use with the user-lexer.

Note that you must install this package in order to use it.

For a complete description of this package within the context of Oracle Text, see `CTX_ULEXER` in the Oracle Text Reference.
The DBMS_ADDM package facilitates the use of Advisor functionality regarding the Automatic Database Diagnostic Monitor.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_ADDM Subprograms

### See Also:

- *Oracle Real Application Clusters Administration and Deployment Guide* for more information about "Automatic Workload Repository in Oracle Real Application Clusters Environments"
- *Oracle Database Performance Tuning Guide* for more information about "Automatic Performance Diagnostics"

### 14.1 DBMS_ADDM Security Model

The DBMS_ADDM package runs with the caller's permission, not the definer's, and then applies the security constraints required by the DBMS_ADVISOR package.

### See Also:

The DBMS_ADVISOR package for more information about "Security Model".

### 14.2 Summary of DBMS_ADDM Subprograms

The table in this topic lists and describes the DBMS_ADDM subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE_DB Procedure</td>
<td>Creates an ADDM task for analyzing in database analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_INST Procedure</td>
<td>Creates an ADDM task for analyzing in instance analysis mode and executes it</td>
</tr>
<tr>
<td>ANALYZE_PARTIAL Procedure</td>
<td>Creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it</td>
</tr>
</tbody>
</table>
Table 14-1 (Cont.) DBMS_ADDM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPARE_CAPTURE_REPLAY_FUNCTION</td>
<td>Produces a Compare Period ADDM report comparing the performance of a capture to a replay</td>
</tr>
<tr>
<td>COMPARE_DATABASES_FUNCTION</td>
<td>Produces a Compare Period ADDM report for a database-wide performance comparison</td>
</tr>
<tr>
<td>COMPARE_INSTANCES_FUNCTION</td>
<td>Produces a Compare Period ADDM report for an instance-level performance comparison</td>
</tr>
<tr>
<td>COMPARE_REPLAY_REPLAY_FUNCTION</td>
<td>Produces a Compare Period ADDM report comparing the performance of a replay to another replay</td>
</tr>
<tr>
<td>DELETE Procedure</td>
<td>Deletes an already created ADDM task (of any kind)</td>
</tr>
<tr>
<td>DELETE_FINDING_DIRECTIVE Procedure</td>
<td>Deletes a finding directive</td>
</tr>
<tr>
<td>DELETE_PARAMETER_DIRECTIVE Procedure</td>
<td>Deletes a parameter directive</td>
</tr>
<tr>
<td>DELETE_SEGMENT_DIRECTIVE Procedure</td>
<td>Deletes a segment directive</td>
</tr>
<tr>
<td>DELETE_SQL_DIRECTIVE Procedure</td>
<td>Deletes a SQL directive</td>
</tr>
<tr>
<td>GET_ASH_QUERY Function</td>
<td>Returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding</td>
</tr>
<tr>
<td>GET_REPORT Function</td>
<td>Retrieves the default text report of an executed ADDM task</td>
</tr>
<tr>
<td>INSERT_FINDING_DIRECTIVE Procedure</td>
<td>Creates a directive to limit reporting of a specific finding type.</td>
</tr>
<tr>
<td>INSERT_PARAMETER_DIRECTIVE Procedure</td>
<td>Creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter</td>
</tr>
<tr>
<td>INSERT_SEGMENT_DIRECTIVE Procedure</td>
<td>Creates a directive to prevent ADDM from creating actions to “run Segment Advisor” for specific segments</td>
</tr>
<tr>
<td>INSERT_SQL_DIRECTIVE Procedure</td>
<td>Creates a directive to limit reporting of actions on specific SQL</td>
</tr>
<tr>
<td>REAL_TIME_ADDM_REPORT Function</td>
<td>Produces a real-time report of ADDM activity</td>
</tr>
</tbody>
</table>

14.2.1 ANALYZE_DB Procedure

This procedure creates an ADDM task for analyzing in database analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_DB (  
  task_name IN OUT VARCHAR2,  
  begin_snapshot IN NUMBER,  
  end_snapshot IN NUMBER,  
  db_id IN NUMBER := NULL);  
```
Parameters

Table 14-2 ANALYZE_DB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the task_name parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in database analysis mode and execute it, with its name in variable tname:

```sql
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_database_analysis_mode_task';
  DBMS_ADDM.ANALYZE_DB(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

14.2.2 ANALYZE_INST Procedure

This procedure creates an ADDM task for analyzing in instance analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_INST (  
  task_name IN OUT VARCHAR2,  
  begin_snapshot IN NUMBER,  
  end_snapshot IN NUMBER,  
  instance_number IN NUMBER := NULL,  
  db_id IN NUMBER := NULL);  
```
Parameters

Table 14-3  ANALYZE_INST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>instance_number</td>
<td>Number of the instance to analyze. By default it is the instance currently connected</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Usage Notes

On single instance systems (when not using Oracle RAC) the resulting task is identical to using the `ANALYZE_DB` procedure.

Examples

To create an ADDM task in instance analysis mode and execute it, with its name in variable `tname`:

```sql
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END
```

To see a report:

```sql
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a CLOB, formatted to fit line size of 80.

14.2.3 ANALYZE_PARTIAL Procedure

This procedure creates an ADDM task for analyzing a subset of instances in partial analysis mode and executes it.

Syntax

```sql
DBMS_ADDM.ANALYZE_PARTIAL (   task_name           IN OUT VARCHAR2,
    instance_numbers    IN     VARCHAR2,
    begin_snapshot      IN     NUMBER,
```
end_snapshot IN NUMBER,
db_id IN NUMBER := NULL);

Parameters

Table 14-4 ANALYZE_PARTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be created</td>
</tr>
<tr>
<td>instance_numbers</td>
<td>Comma separated list of instance numbers to analyze</td>
</tr>
<tr>
<td>begin_snapshot</td>
<td>Number of the snapshot that starts the analysis period</td>
</tr>
<tr>
<td>end_snapshot</td>
<td>Number of the snapshot that ends the analysis period</td>
</tr>
<tr>
<td>db_id</td>
<td>Database ID for the database you to analyze. By default, this is the database currently connected</td>
</tr>
</tbody>
</table>

Return Values

The name of the created task is returned in the `task_name` parameter. It may be different from the value that is given as input (only in cases that name is already used by another task).

Examples

To create an ADDM task in partial analysis mode and execute it, with its name in variable `tname`:

```
var tname VARCHAR2(60);
BEGIN
  :tname := 'my_partial_analysis_modetask';
  DBMS_ADDM.ANALYZE_PARTIAL(:tname, '1,2,3', 1, 2);
END
```

To see a report:

```
SET LONG 100000
SET PAGESIZE 50000
SELECT DBMS_ADDM.GET_REPORT(:tname) FROM DUAL;
```

Note that the return type of a report is a `CLOB`, formatted to fit line size of 80.

14.2.4 COMPARE_CAPTURE_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a capture to a replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT {
  replay_id IN NUMBER,
  report_type IN VARCHAR2 := 'HTML'
}
RETURN CLOB;
```
Parameters

Table 14-5  COMPARE_CAPTURE_REPLAY_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.5 COMPARE_DATABASES Function

This function produces a Compare Period ADDM report comparing the performance of a database over two different time periods or the performance of two different databases over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```sql
DBMS_ADDM.COMPARE_DATABASES (  
  base_dbid           IN NUMBER := NULL,  
  base_begin_snap_id  IN NUMBER,  
  base_end_snap_id    IN NUMBER,  
  comp_dbid           IN NUMBER := NULL,  
  comp_begin_snap_id  IN NUMBER,  
  comp_end_snap_id    IN NUMBER,  
  report_type         IN VARCHAR2 := 'HTML')  
RETURN CLOB;
```

Parameters

Table 14-6  COMPARE_DATABASES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database ID (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database ID (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
</tbody>
</table>
Table 14-6  (Cont.) COMPARE_DATABASES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.6 COMPARE_INSTANCES Function

This function produces a Compare Period ADDM report comparing the performance of a single instance over two different time periods or the performance of two different instances over two different time periods.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```sql
DBMS_ADDM.COMPARE_INSTANCES (  
    base_dbid             IN NUMBER := NULL,  
    base_instance_id      IN NUMBER,  
    base_begin_snap_id    IN NUMBER,  
    base_end_snap_id      IN NUMBER,  
    comp_dbid             IN NUMBER := NULL,  
    comp_instance_id      IN NUMBER,  
    comp_begin_snap_id    IN NUMBER,  
    comp_end_snap_id      IN NUMBER,  
    report_type           IN VARCHAR2 := 'HTML')  
RETURN CLOB;
```

Parameters

Table 14-7  COMPARE_INSTANCES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_dbid</td>
<td>Database id (DBID) of the base period. The base period is the baseline period that we compare to in order to determine improvement or regression.</td>
</tr>
<tr>
<td>base_instance_id</td>
<td>Instance number of the database instance to include from the base period</td>
</tr>
<tr>
<td>base_begin_snap_id</td>
<td>Begin AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>base_end_snap_id</td>
<td>End AWR snapshot ID of the base period.</td>
</tr>
<tr>
<td>comp_dbid</td>
<td>Database id (DBID) of the comparison period. The comparison period is the period we compare to the base period.</td>
</tr>
<tr>
<td>comp_instance_id</td>
<td>Instance number of the database instance to include from the comparison period</td>
</tr>
<tr>
<td>comp_begin_snap_id</td>
<td>Begin AWR snapshot ID of the comparison period</td>
</tr>
</tbody>
</table>
Table 14-7  (Cont.) COMPARE_INSTANCES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_end_snap_id</td>
<td>End AWR snapshot ID of the comparison period</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report

14.2.7 COMPARE_REPLAY_REPLAY_REPORT Function

This function produces a Compare Period ADDM report comparing the performance of a replay to another replay.

The AWR data must reside in the same database, but it can originate from different databases. The function generates a report in either XML or HTML(Active Report) format.

Syntax

```sql
DBMS_ADDM.COMPARE_CAPTURE_REPLAY_REPORT (    
  replay_id1    IN NUMBER,    
  replay_id2    IN NUMBER,    
  report_type   IN VARCHAR2 := 'HTML')    
RETURN CLOB;
```

Parameters

Table 14-8  COMPARE_REPLAY_REPLAY_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_id1</td>
<td>Replay ID to use as the base period. The base period is the baseline period to compare in order to determine improvement or regression.</td>
</tr>
<tr>
<td>replay_id2</td>
<td>Replay ID to use as the comparison period. The comparison period is the period to compare to the base period in order to determine improvement or regression.</td>
</tr>
<tr>
<td>report_type</td>
<td>'HTML' (the default) for an HTML active report, 'XML' for an XML report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a compare period ADDM report
14.2.8 DELETE Procedure

This procedure deletes an already created ADDM task (of any kind). For database analysis mode and partial analysis mode this deletes the local tasks associated with the main task.

Syntax

```
DBMS_ADDM.DELETE (
  task_name IN VARCHAR2);
```

Parameters

Table 14-9  DELETE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to be deleted</td>
</tr>
</tbody>
</table>

Examples

```
BEGIN
  DBMS_ADDM.DELETE ('my_partial_analysis_mode_task');
END
```

14.2.9 DELETE_FINDING_DIRECTIVE Procedure

This procedure deletes a finding directive.

Syntax

```
DBMS_ADDM.DELETE_FINDING_DIRECTIVE (
  task_name IN VARCHAR2,
  dir_name IN VARCHAR2);
```

Parameters

Table 14-10  DELETE_FINDING_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
14.2.10 DELETE_PARAMETER_DIRECTIVE Procedure

This procedure deletes a parameter directive. This removes a specific system directive for parameters. Subsequent ADDM tasks are not affected by this directive.

Syntax

```
DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (
    task_name IN VARCHAR2,
    dir_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

Examples

```
BEGIN
    DBMS_ADDM.DELETE_PARAMETER_DIRECTIVE (NULL,'my Parameter directive');
END;
```

14.2.11 DELETE_SEGMENT_DIRECTIVE Procedure

This procedure deletes a segment directive.

Syntax

```
DBMS_ADDM.DELETE_SEGMENT_DIRECTIVE (
    task_name IN VARCHAR2,
    dir_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
### 14.2.12 DELETE_SQL_DIRECTIVE Procedure

This procedure deletes a SQL directive.

**Syntax**

```sql
DBMS_ADDM.DELETE_SQL_DIRECTIVE (
    task_name           IN VARCHAR2,
    dir_name            IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it is a system directive.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>

### 14.2.13 GET_ASH_QUERY Function

The function returns a string containing the SQL text of an ASH query identifying the rows in ASH with impact for the finding.

For most types of findings this identifies the exact rows in ASH corresponding to the finding. For some types of findings the query is an approximation and should not be used for exact identification of the finding's impact or the finding's specific activity.

**Syntax**

```sql
DBMS_ADDM.GET_ASH_QUERY (
    task_name           IN VARCHAR2,
    finding_id          IN NUMBER
) RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>finding</td>
<td>ID of the finding within the task</td>
</tr>
</tbody>
</table>

**Return Values**

A VARCHAR containing an ASH query identifying the rows in ASH with impact for the finding.
14.2.14 GET_REPORT Function

This function retrieves the default text report of an executed ADDM task.

Syntax

```sql
DBMS_ADDM.GET_REPORT (    task_name           IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 14-15  GET_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

Examples

```
Set long 1000000
Set pagesize 50000
SELECT DBMS_ADDM.GET_REPORT('my_partial_analysis_mode_task') FROM DUAL;
```

14.2.15 INSERT_FINDING_DIRECTIVE Procedure

This procedure creates a directive to limit reporting of a specific finding type. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```sql
DBMS_ADDM.INSERT_FINDING_DIRECTIVE (    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    finding_name          IN VARCHAR2,
    min_active_sessions   IN NUMBER := 0,
    min_perc_impact       IN NUMBER := 0);
```

Parameters

Table 14-16  INSERT_FINDING_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>finding_name</td>
<td>Name of an ADDM finding to which this directive applies. All valid findings names appear in the NAME column of view DBA_ADVISOR_FINDING_NAMES.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the finding. If a finding has less than this number, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>
Table 14-16 (Cont.) INSERT_FINDING_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_perc_impact</td>
<td>Minimal number for the &quot;percent impact&quot; of the finding relative to total database time in the analysis period. If the finding's impact is less than this number, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for 'Undersized SGA' findings. The result of GET_REPORT shows only an 'Undersized SGA' finding if the finding is responsible for at least 2 average active sessions during the analysis period, and this constitutes at least 10% of the total database time during that period.

```sql
var tname VARCHAR2(60);
BEGIN
   DBMS_ADDM.INSERT_FINDING_DIRECTIVE(
      NULL,
      'Undersized SGA directive',
      'Undersized SGA',
      2,
      10);
   :tname := 'my_instance_analysis_mode_task';
   DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing 'Undersized SGA' findings regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

14.2.16 INSERT_PARAMETER_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to alter the value of a specific system parameter. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

Syntax

```sql
DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE (
   task_name IN VARCHAR2,
   dir_name  IN VARCHAR2,
   parameter_name IN VARCHAR2);
```

Parameters

Table 14-17 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
</tbody>
</table>
### 14.2.17 INSERT_PARAMETER_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_name</td>
<td>Specifies the parameter to use. Valid parameter names appear in V$PARAMETER.</td>
</tr>
</tbody>
</table>

### Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for all actions that recommend modifying the parameter `'sga_target'`. The result of `GET_REPORT` does not show these actions.

```sql
var tname varchar2(60);
BEGIN
    DBMS_ADDM.INSERT_PARAMETER_DIRECTIVE(
        NULL,
        'my Parameter directive',
        'sga_target'):
    :tname := 'my_instance_analysis_mode_task';
    DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```sql
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

### 14.2.17 INSERT_SEGMENT_DIRECTIVE Procedure

This procedure creates a directive to prevent ADDM from creating actions to "run Segment Advisor" for specific segments. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

#### Syntax

```sql
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    owner_name            IN VARCHAR2,
    object_name           IN VARCHAR2 := NULL,
    sub_object_name       IN VARCHAR2 := NULL);
```

```sql
DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE (
    task_name             IN VARCHAR2,
    dir_name              IN VARCHAR2,
    object_number         IN NUMBER);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies to all subsequently created ADDM Tasks.</td>
</tr>
</tbody>
</table>
**Table 14-18  (Cont.)** INSERT_SEGMENT_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner of the segment/s to be filtered. A wildcard is allowed in the same syntax used for &quot;like&quot; constraints.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the main object to be filtered. Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>sub_object_name</td>
<td>Name of the part of the main object to be filtered. This could be a partition name, or even sub partitions (separated by a &quot;.&quot;). Again, wildcards are allowed. The default value of NULL is equivalent to a value of '%'.</td>
</tr>
<tr>
<td>object_number</td>
<td>Object number of the SEGMENT that this directive is to filter, found in views DBA_OBJECTS or DBA_SEGMENTS</td>
</tr>
</tbody>
</table>

**Examples**

A new ADDM task is created to analyze a local instance. However, it has special treatment for all segments that belong to user SCOTT. The result of GET_REPORT does not show actions for running Segment advisor for segments that belong to SCOTT.

```sql
var tname VARCHAR2(60);
BEGIN
  DBMS_ADDM.INSERT_SEGMENT_DIRECTIVE(NULL, 'my Segment directive', 'SCOTT');
  :tname := 'my_instance_analysis_mode_task';
  DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

**14.2.18 INSERT_SQL_DIRECTIVE Procedure**

This procedure creates a directive to limit reporting of actions on specific SQL. The directive can be created for a specific task (only when the task is in INITIAL status), or for all subsequently created ADDM tasks (such as a system directive).

**Syntax**

```sql
DBMS_ADDM.INSERT_SQL_DIRECTIVE (
  task_name IN VARCHAR2,
  dir_name IN VARCHAR2,
  sql_id IN VARCHAR2,
  min_active_sessions IN NUMBER := 0,
  min_response_time IN NUMBER := 0);
```
Parameters

Table 14-19  INSERT_SQL_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task this directive applies to. If the value is NULL, it applies</td>
</tr>
<tr>
<td>dir_name</td>
<td>Name of the directive. All directives must be given unique names.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifies which SQL statement to filter. A valid value contains exactly</td>
</tr>
<tr>
<td></td>
<td>13 characters from '0' to '9' and 'a' to 'z'.</td>
</tr>
<tr>
<td>min_active_sessions</td>
<td>Minimal number of active sessions for the SQL. If a SQL action has</td>
</tr>
<tr>
<td></td>
<td>less than this number, it is filtered from the ADDM result.</td>
</tr>
<tr>
<td>min_response_time</td>
<td>Minimal value for response time of the SQL (in microseconds). If the</td>
</tr>
<tr>
<td></td>
<td>SQL had lower response time, it is filtered from the ADDM result.</td>
</tr>
</tbody>
</table>

Examples

A new ADDM task is created to analyze a local instance. However, it has special treatment for SQL with id 'abcd123456789'. The result of GET_REPORT shows only actions for that SQL (actions to tune the SQL, or to investigate application using it) if the SQL is responsible for at least 2 average active sessions during the analysis period, and the average response time was at least 1 second.

```
var tname VARCHAR2(60);
BEGIN
   DBMS_ADDM.INSERT_SQL_DIRECTIVE(
      NULL,
      'my SQL directive',
      'abcd123456789',
      2,
      1000000);
   :tname := 'my_instance_analysis_mode_task';
   DBMS_ADDM.ANALYZE_INST(:tname, 1, 2);
END;
```

To see a report containing all actions regardless of the directive:

```
SELECT DBMS_ADVISOR.GET_TASK_REPORT(:tname, 'TEXT', 'ALL') FROM DUAL;
```

14.2.19 REAL_TIME_ADDM_REPORT Function

This function produces a real-time ADDM report for ADDM-related activity for the last five minutes. In an Oracle Real Application Clusters (Oracle RAC) environment, the function assumes that executing SQL over GV$ is possible.

Syntax

```
DBMS_ADDM.REAL_TIME_ADDM_REPORT ()
RETURN CLOB;
```

Return Values

CLOB containing a real-time ADDM report
DBMS_ADVANCED_REWRITE contains interfaces for advanced query rewrite users. Using this package, you can create, drop, and maintain functional equivalence declarations for query rewrite.

See Also:
Oracle Database Data Warehousing Guide for more information about query rewrite

This chapter contains the following topics:

- DBMS_ADVANCED_REWRITE Security Model
- Summary of DBMS_ADVANCED_REWRITE Subprograms

15.1 DBMS_ADVANCED_REWRITE Security Model

Default privileges are not granted to anyone for access to DBMS_ADVANCED_REWRITE Security Model procedures. To gain access to these procedures, you must connect as SYSDBA and explicitly grant execute access to the desired database administrators.

You can control security on this package by granting the EXECUTE privilege to selected database administrators or roles. For example, the user er can be given access to use this package by the following statement, executed as SYSDBA:

GRANT EXECUTE ON DBMS_ADVANCED_REWRITE TO er;

You may want to write a separate cover package on top of this package for restricting the alert names used. Instead of granting the EXECUTE privilege on the DBMS_ADVANCED_REWRITE package directly, you can then grant it to the cover package.

In addition, similar to the privilege required for regular materialized views, the user should be granted the privilege to create an equivalence. For example, the user er can be granted this privilege by executing the following statement as SYSDBA:

GRANT CREATE MATERIALIZED VIEW TO er;

15.2 Summary of DBMS_ADVANCED_REWRITE Subprograms

This table lists the subprograms and briefly describes them.
### Table 15-1  DBMS_ADVANCED_REWRITE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_REWRITE_EQUVALENCE Procedure</td>
<td>Changes the mode of the rewrite equivalence declaration to the mode you specify</td>
</tr>
<tr>
<td>BUILD_SAFE_REWRITE_EQUIVALENCE</td>
<td>Enables the rewrite of top-level materialized views using submaterialized views. Oracle Corporation does not recommend you directly use this procedure</td>
</tr>
<tr>
<td>DECLARE_REWRITE_EQUIVALENCE Procedures</td>
<td>Creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance</td>
</tr>
<tr>
<td>DROP_REWRITE_EQUIVALENCE Procedure</td>
<td>Drops the specified rewrite equivalence declaration</td>
</tr>
<tr>
<td>VALIDATE_REWRITE_EQUIVALENCE PROCE</td>
<td>Validates the specified rewrite equivalence declaration using the same validation method as described with the validate parameter</td>
</tr>
</tbody>
</table>

#### 15.2.1 ALTER_REWRITE_EQUIVALENCE Procedure

This table lists all the package subprograms in alphabetical order.

**Syntax**

```sql
DBMS_ADVANCED_REWRITE.ALTER_REWRITE_EQUIVALENCE (
    name VARCHAR2,
    rewrite_mode VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to alter. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is altered in the current schema. The invoker must have the appropriate alter materialized view privileges to alter an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
Table 15-2 (Cont.) ALTER_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rewrite_mode</td>
<td>The following modes are supported, in increasing order of power:</td>
</tr>
<tr>
<td></td>
<td>disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</td>
</tr>
<tr>
<td></td>
<td>text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</td>
</tr>
<tr>
<td></td>
<td>general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query.</td>
</tr>
<tr>
<td></td>
<td>recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration.</td>
</tr>
<tr>
<td></td>
<td>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>

15.2.2 BUILD_SAFE_REWRITE_EQUIVALENCE Procedure

This procedure enables the rewrite and refresh of top-level materialized views using submaterialized views. It is provided for the exclusive use by scripts generated by the DBMS_ADVISOR.TUNE_MVIEW procedure.

It is required to enable query rewrite and fast refresh when DBMS_ADVISOR.TUNE_MVIEW decomposes a materialized view into a top-level materialized view and one or more submaterialized views.

Oracle does not recommend you directly use the BUILD_SAFE_REWRITE_EQUIVALENCE procedure. You should use either the DBMS_ADVISOR.TUNE_MVIEW or the DBMS_ADVANCED_REWRITE.CREATE_REWRITE_EQUIVALENCE procedure as appropriate.

15.2.3 DECLARE_REWRITE_EQUIVALENCE Procedures

This procedure creates a declaration indicating that source_stmt is functionally equivalent to destination_stmt for as long as the equivalence declaration remains enabled, and that destination_stmt is more favorable in terms of performance.

The scope of the declaration is system wide. The query rewrite engine uses such declarations to perform rewrite transformations in QUERY_REWRITE_INTEGRITY = trusted and stale_tolerated modes.

Because the underlying equivalences between the source and destination statements cannot be enforced by the query rewrite engine, queries can be only rewritten in trusted and stale_tolerated integrity modes.

Syntax

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (name VARCHAR2, source_stmt VARCHAR2, destination_stmt VARCHAR2)
validate BOOLEAN := TRUE,
rewrite_mode VARCHAR2 := 'TEXT_MATCH');

DBMS_ADVANCED_REWRITE.DECLARE_REWRITE_EQUIVALENCE (  
  name VARCHAR2,
  source_stmt CLOB,
  destination_stmt CLOB,
  validate BOOLEAN := TRUE,
  rewrite_mode VARCHAR2 := 'TEXT_MATCH');

Parameters

Table 15-3 DECLARE_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is created in the current schema. The invoker must have the appropriate CREATE MATERIALIZED VIEW privileges to alter an equivalence declaration.</td>
</tr>
<tr>
<td>source_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format. This is the query statement that is the target of optimization.</td>
</tr>
<tr>
<td>destination_stmt</td>
<td>A sub-SELECT expression in either VARCHAR2 or CLOB format.</td>
</tr>
<tr>
<td>validate</td>
<td>A Boolean indicating whether to validate that the specified source_stmt is functionally equivalent to the specified destination_stmt. If validate is specified as TRUE, DECLARE_REWRITE_EQUIVALENCE evaluates the two subSELECTs and compares their results. If the results are not the same, DECLARE_REWRITE_EQUIVALENCE does not create the rewrite equivalence and returns an error condition. If FALSE, DECLARE_REWRITE_EQUIVALENCE does not validate the equivalence.</td>
</tr>
<tr>
<td>rewrite_mode</td>
<td>The following modes are supported, in increasing order of power:</td>
</tr>
<tr>
<td></td>
<td>• disabled: Query rewrite does not use the equivalence declaration. Use this mode to temporarily disable use of the rewrite equivalence declaration.</td>
</tr>
<tr>
<td></td>
<td>• text_match: Query rewrite uses the equivalence declaration only in its text match modes. This mode is useful for simple transformations.</td>
</tr>
<tr>
<td></td>
<td>• general: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. However, query rewrite makes no attempt to rewrite the specified destination_query.</td>
</tr>
<tr>
<td></td>
<td>• recursive: Query rewrite uses the equivalence declaration in all of its transformation modes against the incoming request queries. Moreover, query rewrite further attempts to rewrite the specified destination_query for further performance enhancements whenever it uses the equivalence declaration.</td>
</tr>
<tr>
<td></td>
<td>Oracle recommends you use the least powerful mode that is sufficient to solve your performance problem.</td>
</tr>
</tbody>
</table>
Exceptions

Table 15-4 DECLARE_REWRITE_EQUIVALENCE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-30388</td>
<td>Name of the rewrite equivalence is not specified</td>
</tr>
<tr>
<td>ORA-30391</td>
<td>The specified rewrite equivalence does not exist</td>
</tr>
<tr>
<td>ORA-30392</td>
<td>The checksum analysis for the rewrite equivalence failed</td>
</tr>
<tr>
<td>ORA-30393</td>
<td>A query block in the statement did not write</td>
</tr>
<tr>
<td>ORA-30396</td>
<td>Rewrite equivalence procedures require the COMPATIBLE parameter to be set to 10.1 or greater</td>
</tr>
</tbody>
</table>

Usage Notes

Query rewrite using equivalence declarations occurs simultaneously and in concert with query rewrite using materialized views. The same query rewrite engine is used for both. The query rewrite engine uses the same rewrite rules to rewrite queries using both equivalence declarations and materialized views. Because the rewrite equivalence represents a specific rewrite crafted by a sophisticated user, the query rewrite engine gives priority to rewrite equivalences over materialized views when it is possible to perform a rewrite with either a materialized view or a rewrite equivalence. For this same reason, the cost-based optimizer (specifically, cost-based rewrite) will not choose an unrewritten query plan over a query plan that is rewritten to use a rewrite equivalence even if the cost of the un-rewritten plan appears more favorable. Query rewrite matches properties of the incoming request query against the equivalence declaration’s source_stmt or the materialized view’s defining statement, respectively, and derives an equivalent relational expression in terms of the equivalence declaration’s destination_stmt or the materialized view’s container table, respectively.

15.2.4 DROP_REWRITE_EQUIVALENCE Procedure

This procedure drops the specified rewrite equivalence declaration.

Syntax

```
DBMS_ADVANCED_REWRITE.DROP_REWRITE_EQUIVALENCE (name VARCHAR2);
```

Parameters

Table 15-5 DROP_REWRITE_EQUIVALENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to drop. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name complies with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is dropped in the current schema. The invoker must have the appropriate drop materialized view privilege to drop an equivalence declaration outside their own schema.</td>
</tr>
</tbody>
</table>
15.2.5 VALIDATE_REWRITE_EQUIVALENCE Procedure

This procedure validates the specified rewrite equivalence declaration.

It uses the same validation method as described with the VALIDATE parameter in "VALIDATE_REWRITE_EQUIVALENCE Procedure".

Syntax

```sql
DBMS_ADVANCED_REWRITE.VALIDATE_REWRITE_EQUIVALENCE (
    name VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>A name for the equivalence declaration to validate. The name can be of the form owner.name, where owner complies with the rules for a schema name, and name compiles with the rules for a table name. Alternatively, a simple name that complies with the rules for a table name can be specified. In this case, the rewrite equivalence is validated in the current schema. The invoker must have sufficient privileges to execute both the source_stmt and destination_stmt of the specified equivalence declaration.</td>
</tr>
</tbody>
</table>

DBMS_ADVISOR is part of the server manageability suite of advisors, a set of expert systems that identifies and helps resolve performance problems relating to database server components.

Some advisors have their own packages. For these advisors, Oracle recommends that you use the advisor-specific package rather than DBMS_ADVISOR. Each of the following advisors has its own package, tailored to its specific functionality:

- Automatic Database Diagnostic Monitor (DBMS_ADDM)
- SQL Performance Analyzer (DBMS_SQLPA)
- SQL Repair Advisor (DBMS_SQLDIAG)
- SQL Tuning Advisor (DBMS_SQLTUNE)
- Compression Advisor (DBMS_COMPRESSION.GET_COMPRESSION_RATIO)

SQL Access Advisor and Segment Advisor are the only advisors with common use cases for DBMS_ADVISOR. Undo Advisor and Compression Advisor do not support DBMS_ADVISOR subprograms.

This chapter contains the following topics:

- DBMS_ADVISOR Deprecated Subprograms
- DBMS_ADVISOR Security Model
- Summary of DBMS_ADVISOR Subprograms

See Also:

- Oracle Database Administrator's Guide to learn about Segment Advisor
- Oracle Database 2 Day + Performance Tuning Guide to learn how to use SQL Access Advisor in Enterprise Manager
- Oracle Database SQL Tuning Guide to learn more about SQL Access Advisor
16.1 DBMS_ADVISOR Deprecated Subprograms

The section lists programs that are deprecated with Oracle Database 11g.

Note:
Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated:

- ADD_SQLWKLD_REF Procedure
- CREATE_SQLWKLD Procedure
- DELETE_SQLWKLD Procedure
- DELETE_SQLWKLD_REF Procedure
- DELETE_SQLWKLD_STATEMENT Procedure
- IMPORT_SQLWKLD_SCHEMA Procedure
- IMPORT_SQLWKLD_SQLCACHE Procedure
- IMPORT_SQLWKLD_STS Procedure
- IMPORT_SQLWKLD_SUMADV Procedure
- IMPORT_SQLWKLD_USER Procedure
- RESET_SQLWKLD Procedure
- SET_SQLWKLD_PARAMETER Procedure
- UPDATE_SQLWKLD_ATTRIBUTES Procedure
- UPDATE_SQLWKLD_STATEMENT Procedure

16.2 DBMS_ADVISOR Security Model

The ADVISOR privilege is required to use the DBMS_ADVISOR package.

16.3 Summary of DBMS_ADVISOR Subprograms

This topic lists and describes the subprograms in the DBMS_ADVISOR package.

In the following table, the Used in column lists advisors relevant for each subprogram, but excludes ADDM, SQL Performance Analyzer, SQL Repair Advisor, and SQL Tuning Advisor because these advisors have their own packages.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
<th>Used in</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ADD_SQLWKLD</strong>&lt;br&gt;_REF Procedure</td>
<td>Adds a workload reference to an Advisor task (Caution: Deprecated Subprogram)</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td><strong>ADD_SQLWKLD</strong>&lt;br&gt;_STATEMENT Procedure</td>
<td>Adds a single statement to a workload</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td><strong>ADD_STS_REF</strong> Procedure</td>
<td>Establishes a link between the current SQL Access Advisor task and a SQL tuning set</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td><strong>CANCEL_TASK</strong> Procedure</td>
<td>Cancels a currently executing task operation</td>
<td>Segment Advisor, SQL Access Advisor</td>
</tr>
<tr>
<td><strong>COPY_SQLWKL D_TO_STS</strong> Procedure</td>
<td>Copies the contents of a SQL workload object to a SQL tuning set</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td><strong>CREATE_FILE</strong> Procedure</td>
<td>Creates an external file from a PL/SQL CLOB variable, which is useful for creating scripts and reports</td>
<td>SQL Access Advisor</td>
</tr>
<tr>
<td><strong>CREATE_OBJE C_T Procedure</strong></td>
<td>Creates a new task object</td>
<td>Segment Advisor</td>

16.3.1 ADD_SQLWKLD_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL Workload object.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

The link allows an advisor task to access interesting data for doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL Workload object is made, the workload is protected from removal or modification.

Users should use ADD_STS_REF instead of ADD_SQLWKLD_REF for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

**Syntax**

```sql
DBMS_ADVISOR.ADD_SQLWKLD_REF (  
    task_name              IN VARCHAR2,  
    workload_name          IN VARCHAR2,  
    is_sts                 IN NUMBER :=0);  
```

**Parameters**

Table 16-2  ADD_SQLWKLD_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>
Table 16-2  (Cont.) ADD_SQLWKLD_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be linked. Once an object has been</td>
</tr>
<tr>
<td></td>
<td>linked to a task, it becomes read-only and cannot be deleted. There is</td>
</tr>
<tr>
<td></td>
<td>no limit to the number of links to workload objects. To remove the link</td>
</tr>
<tr>
<td></td>
<td>to the workload object, use the procedure DELETE_REFERENCE.</td>
</tr>
<tr>
<td>is sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>• 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

Examples

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name, 1);
END;
/

16.3.2 ADD_SQLWKLD_STATEMENT Procedure

This procedure adds a single statement to the specified workload.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT (  
  workload_name IN VARCHAR2,  
  module IN VARCHAR2,  
  action IN VARCHAR2,  
  cpu_time IN NUMBER := 0,  
  elapsed_time IN NUMBER := 0,  
  disk_reads IN NUMBER := 0,  
  buffer_gets IN NUMBER := 0,  
  rows_processed IN NUMBER := 0,  
  optimizer_cost IN NUMBER := 0,  
  executions IN NUMBER := 1,  
  priority IN NUMBER := 2,  
  last_execution_date IN DATE := 'SYSDATE',  
  stat_period IN NUMBER := 0,  
  username IN VARCHAR2,  
  sql_text IN CLOB);
Parameters

Table 16-3    ADD_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>module</td>
<td>An optional business application module that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>action</td>
<td>An optional application action that will be associated with the SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>The total CPU time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>The total elapsed time in seconds that is consumed by the SQL statement.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>The total disk-read operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>buffer_gets</td>
<td>The total buffer-get operations that are consumed by the SQL statement.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>The average number of rows processed by the SQL statement.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>The optimizer's calculated cost value.</td>
</tr>
<tr>
<td>executions</td>
<td>The total execution count by the SQL statement. This value should be greater than zero.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>last_execution_date</td>
<td>The date and time at which the SQL statement last executed. If the value is NULL, then the current date and time will be used.</td>
</tr>
<tr>
<td>stat_period</td>
<td>Time interval in seconds from which statement statistics were calculated.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. Because a user name is an Oracle identifier, the username value must be entered exactly as it is stored in the server. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. It will not recognize the user scott as a match for SCOTT.</td>
</tr>
<tr>
<td>sql_text</td>
<td>The complete SQL statement. To increase the quality of a recommendation, the SQL statement should not contain bind variables.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot modify or delete a workload when it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure for directions on setting a task to its initial state.

The ADD_SQLWKLD_STATEMENT procedure accepts several parameters that may be ignored by the caller. The database only uses the disk_reads, buffer_gets, and optimizer_cost parameters to sort workload data when actual analysis occurs. Therefore, actual values are only necessary when the order_list task parameter references a particular statistic.
To determine what statistics to provide when adding a new SQL statement to a workload, examine or set the task parameter `order_list`. The `order_list` parameter accepts any combination of the keys:

- `cpu_time`
- `elapsed_time`
- `buffer_gets`
- `optimizer_cost`
- `disk_reads`
- `executions`
- `priority`

The `optimizer_cost` key, which is a typical setting of `priority`, indicates that SQL Access Advisor sorts the workload data by `priority` and `optimizer_cost`, and processes the highest cost statements first. Any statements that you add to the workload must include appropriate `priority` and `optimizer_cost` values. All other statistics can be defaulted or set to zero.

For the statistical keys referenced by the `order_list` task parameter, the actual parameter values should be reasonably accurate since they will be compared to other statements in the workload. If the caller is unable to estimate values, then choose values that would determine its importance relative to other statements in the workload. For example, if the current statement is considered the most critical query in your business, then an appropriate value would be anything greater than all other values for the same statistic found in the workload.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                       100, 400, 5041, 103, 640445, 680000, 2,
                                       1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold) FROM
                                       sh.sales');
END;
/
```

### 16.3.3 ADD_STS_REF Procedure

This procedure establishes a link between the current SQL Access Advisor task and a SQL tuning set.

The link enables an advisor task to access data for the purpose of doing an analysis. The link also provides a stable view of the data. Once a connection between a SQL Access Advisor task and a SQL tuning set is made, the STS is protected from removal or modification.

Use `ADD_STS_REF` for any STS-based advisor runs. The older method of using `ADD_SQLWKLD_REF` with parameter `IS_STS=1` is only supported for backward compatibility. Furthermore, the `ADD_STS_REF` function accepts a SQL tuning set owner name, whereas `ADD_SQLWKLD_REF` does not.
Syntax

```
DBMS_ADVISOR.ADD_STS_REF(
    task_name IN VARCHAR2 NOT NULL,
    sts_owner IN VARCHAR2,
    workload_name IN VARCHAR2 NOT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be linked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. After a workload has been linked to a task, it becomes read-only and cannot be deleted. There is no limit to the number of links to workloads. To remove the link to the workload, use the procedure DBMS_ADVISOR.DELETE_STS_REF.</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_ADVISOR.ADD_STS_REF ('My Task', 'SCOTT', 'My Workload');
```

16.3.4 CANCEL_TASK Procedure

This procedure causes a currently executing operation to terminate.

This call performs a soft interrupt. It will not break into a low-level database access call like a hard interrupt such as Ctrl-C. The SQL Access Advisor periodically checks for soft interrupts and acts appropriately. As a result, this operation may take a few seconds to respond to a call.

Syntax

```
DBMS_ADVISOR.CANCEL_TASK (
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>
Usage Notes

A cancel command restores the task to its condition prior to the start of the cancelled operation. Therefore, a cancelled task or data object cannot be resumed.

Because all Advisor task procedures are synchronous, to cancel an operation, you must use a separate database session.

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR_SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CANCEL_TASK('My Task');
END;
/

16.3.5 COPY_SQLWKLD_TO_STS Procedure

This procedure copies the contents of a SQL workload object to a SQL tuning set.

Syntax

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

DBMS_ADVISOR.COPY_SQLWKLD_TO_STS (  
    workload_name IN VARCHAR2,
    sts_name IN VARCHAR2,
    import_mode IN VARCHAR2 := 'NEW');

Parameters

Table 16-6 COPY_SQLWKLD_TO_STS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name to copy.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The SQL tuning set name into which the SQL Workload object will be copied.</td>
</tr>
</tbody>
</table>
Table 16-6 (Cont.) COPY_SQLWKLD_TO_STS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import_mode</td>
<td>Specifies the handling of the target SQL tuning set. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND</td>
</tr>
<tr>
<td></td>
<td>Causes SQL Workload data to be appended to the target SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>• NEW</td>
</tr>
<tr>
<td></td>
<td>Indicates the SQL tuning set can only contain the copied contents. If the SQL</td>
</tr>
<tr>
<td></td>
<td>tuning set exists and has data, an error will be reported.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE</td>
</tr>
<tr>
<td></td>
<td>Causes any existing data in the target SQL tuning set to be purged prior to</td>
</tr>
<tr>
<td></td>
<td>the workload copy.</td>
</tr>
<tr>
<td></td>
<td>In all cases, if the specified SQL tuning set does not exist, it will be</td>
</tr>
<tr>
<td></td>
<td>created.</td>
</tr>
</tbody>
</table>

Usage Notes

To use this procedure, the caller must have privileges to create and modify a SQL tuning set.

Examples

BEGIN
  DBMS_ADVISOR.COPY_SQLWKLD_TO_STS('MY_OLD_WORKLOAD', 'MY_NEW_STS', 'NEW');
END;
/

16.3.6 CREATE_FILE Procedure

This procedure creates an external file from a PL/SQL CLOB variable, which is used for creating scripts and reports.

Syntax

```
DBMS_ADVISOR.CREATE_FILE (    
  buffer IN CLOB,    
  location IN VARCHAR2,    
  filename IN VARCHAR2);
```

Parameters

Table 16-7 CREATE_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>A CLOB buffer containing report or script information.</td>
</tr>
<tr>
<td>location</td>
<td>The name of the directory that will contain the output file. You must use</td>
</tr>
<tr>
<td></td>
<td>the alias as defined by the CREATE DIRECTORY statement. The Advisor</td>
</tr>
<tr>
<td></td>
<td>translates the alias into the actual directory location.</td>
</tr>
</tbody>
</table>
Table 16-7  (Cont.) CREATE_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The name of the output file. The file name can only contain the name and an optional file type of the form filename.filetype.</td>
</tr>
</tbody>
</table>

Usage Notes

You must embed all formatting within the CLOB.

The database restricts file access within stored procedures. This means that file locations and names must adhere to the known file permissions in the server.

Examples

CREATE DIRECTORY MY_DIR as '/homedir/user4/gssmith';
GRANT READ,WRITE ON DIRECTORY MY_DIR TO PUBLIC;

DECLARE
    v_task_id NUMBER;
    v_task_name VARCHAR2(30);
    v_workload_name VARCHAR2(30);
BEGIN
    v_task_name := 'My Task';
    v_workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(advisor_name => DBMS_ADVISOR.SQLACCESS_ADVISOR,
                                task_id      => v_task_id,
                                task_name    => v_task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(  workload_name => v_workload_name,
                                 description   => 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(   task_name     => v_task_name,
                                    workload_name => v_workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(  workload_name       => v_workload_name,
                                          module              => 'MONTHLY',
                                          action              => 'ROLLUP',
                                          cpu_time            => 100,
                                          elapsed_time        => 400,
                                          disk_reads          => 5041,
                                          buffer_gets         => 103,
                                          rows_processed      => 640445,
                                          optimizer_cost      => 680000,
                                          executions          => 2,
                                          priority            => 1,
                                          last_execution_date => SYSDATE,
                                          stat_period         => 1,
                                          username            => 'SH',
                                          sql_text            => 'SELECT AVG(amount_sold) FROM sh.sales');
    DBMS_ADVISOR.EXECUTE_TASK(v_task_name);
    DBMS_ADVISOR.CREATE_FILE(  buffer   => DBMS_ADVISOR.GET_TASK_SCRIPT(v_task_name),
                                location => 'MY_DIR',
                                filename => 'script.sql');
16.3.7 CREATE_OBJECT Procedure

This procedure creates a new task object.

Syntax

```sql
DBMS_ADVISOR.CREATE_OBJECT (
    task_name         IN VARCHAR2,
    object_type       IN VARCHAR2,
    attr1             IN VARCHAR2 := NULL,
    attr2             IN VARCHAR2 := NULL,
    attr3             IN VARCHAR2 := NULL,
    attr4             IN CLOB := NULL,
    attr5             IN VARCHAR2 := NULL,
    object_id         OUT NUMBER,
    attr6             IN VARCHAR2 := NULL,
    attr7             IN VARCHAR2 := NULL,
    attr8             IN VARCHAR2 := NULL,
    attr9             IN VARCHAR2 := NULL,
    attr10            IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_type</td>
<td>Specifies the external object type.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr6</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr7</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr8</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr9</td>
<td>Advisor-specific data.</td>
</tr>
<tr>
<td>attr10</td>
<td>Advisor-specific data.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator's Guide for details regarding these parameters and object types.

Return Values

Returns the new object identifier.
Usage Notes

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level. If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition of a table, index, or LOB column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

See Oracle Database Administrator’s Guide for further information regarding the Segment Advisor.

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
                                  'SELECT * FROM SH.SALES',obj_id);
END;
/

16.3.8 CREATE_SQLWKLD Procedure

This procedure creates a new private SQL Workload object for the user.

A SQL Workload object manages a SQL workload on behalf of the SQL Access Advisor. A SQL Workload object must exist prior to performing any other SQL Workload operations, such as importing or updating SQL statements.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.CREATE_SQLWKLD (
    workload_name        IN OUT VARCHAR2,
    description          IN VARCHAR2 := NULL,
    template             IN VARCHAR2 := NULL,
    is_template          IN VARCHAR2 := 'FALSE');
Parameters

Table 16-9  CREATE_SQLWKLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>A name that uniquely identifies the created workload. If not specified, the system will generate a unique name. Names can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>Specifies an optional workload description. Descriptions can be up to 256 characters.</td>
</tr>
<tr>
<td>template</td>
<td>An optional SQL Workload name of an existing workload data object or data object template.</td>
</tr>
<tr>
<td>is_template</td>
<td>An optional value that enables you to set the newly created workload as a template. Valid values are TRUE and FALSE.</td>
</tr>
</tbody>
</table>

Return Values

The SQL Access Advisor returns a unique workload object identifier number that must be used for subsequent activities within the new SQL Workload object.

Usage Notes

By default, workload objects are created using built-in default settings. To create a workload using the parameter settings of an existing workload or workload template, the user may specify an existing workload name.

After a SQL Workload object is present, it can then be referenced by one or more SQL Access Advisor tasks using the ADD_SQLWKLD_REF procedure.

Examples

DECLARE
  workload_name VARCHAR2(30);
BEGIN
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
END;
/

16.3.9 CREATE_TASK Procedures

This procedure creates a new Advisor task in the repository.

Syntax

DBMS_ADVISOR.CREATE_TASK ( 
  advisor_name IN VARCHAR2,
  task_id OUT NUMBER,
  task_name IN OUT VARCHAR2,
  task_desc IN VARCHAR2 := NULL,
  template IN VARCHAR2 := NULL,
  is_template IN VARCHAR2 := 'FALSE',
  how_created IN VARCHAR2 := NULL);
DBMS_ADVISOR.CREATE_TASK (  
    advisor_name          IN VARCHAR2,  
    task_name             IN VARCHAR2,  
    task_desc             IN VARCHAR2 := NULL,  
    template              IN VARCHAR2 := NULL,  
    is_template           IN VARCHAR2 := 'FALSE',  
    how_created           IN VARCHAR2 := NULL);

DBMS_ADVISOR.CREATE_TASK (  
    parent_task_name      IN VARCHAR2,  
    rec_id                IN NUMBER,  
    task_id               OUT NUMBER,  
    task_name             IN OUT VARCHAR2,  
    task_desc             IN VARCHAR2,  
    template              IN VARCHAR2);

Parameters

Table 16-10 CREATE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| advisor_name| Specifies the unique advisor name as defined in the view
                  DBA_ADVISOR_DEFINITIONS.                                   |
| task_id     | A number that uniquely identifies the created task. The number is generated
                  by the procedure and returned to the user.                |
| task_name   | Specifies a new task name. Names must be unique among all tasks for the
                  user.                                                      |
|             | When using the second form of the CREATE_TASK syntax listed above (with
                  OUT), a unique name can be generated. Names can be up to 30 characters
                  long.                                                     |
| task_desc   | Specifies an optional task description. Descriptions can be up to 256
                  characters in length.                                    |
| template    | An optional task name of an existing task or task template. To specify built-
                  in SQL Access Advisor templates, use the template name as described
                  earlier.                                                  |
| is_template | An optional value that allows the user to set the newly created task as
                  template. Valid values are: TRUE and FALSE.             |
| how_created | An optional value that identifies how the source was created.              |

Return Values

Returns a unique task ID number and a unique task name if one is not specified.

Usage Notes

A task must be associated with an advisor, and once the task has been created, it is
permanently associated with the original advisor. By default, tasks are created using
built-in default settings. To create a task using the parameter settings of an existing
task or task template, the user may specify an existing task name.

For the SQL Access Advisor, use the identifier DBMS_ADVISOR.SQLACCESS_ADVISOR as the
advisor_name.

The SQL Access Advisor provides three built-in task templates, using the following
constants:
• **DBMS_ADVISOR.SQLACCESS_OLTP**  
  Parameters are preset to favor an OLTP application environment.

• **DBMS_ADVISOR.SQLACCESS_WAREHOUSE**  
  Parameters are preset to favor a data warehouse application environment.

• **DBMS_ADVISOR.SQLACCESS_GENERAL**  
  Parameters are preset to favor a hybrid application environment where both OLTP and data warehouse operations may occur. For the SQL Access Advisor, this is the default template.

### Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
END;
/
```

### 16.3.10 DELETE_SQLWKLD Procedure

This procedure deletes an existing SQL Workload object from the repository.

**Note:**
This procedure is deprecated starting in Oracle Database 11g.

#### Syntax

```sql
DBMS_ADVISOR.DELETE_SQLWKLD (
    workload_name        IN VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload. The wildcard <code>%</code> is supported as a WORKLOAD_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard <code>%</code> as the WORKLOAD_NAME. If a wildcard is provided, the DELETE_SQLWKLD operation will not delete any workloads marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

#### Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the [RESET_TASK Procedure](#) to set a task to its initial state.
### Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.DELETE_SQLWKLD(workload_name);
END;
/
```

---

#### 16.3.11 DELETE_SQLWKLD_REF Procedure

This procedure removes a link between the current SQL Access task and a SQL Workload data object.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

Use `DELETE_STS_REF` instead of `DELETE_SQLWKLD_REF` for all SQL tuning set-based advisor runs. This function is only provided for backward compatibility.

**Syntax**

```sql
DBMS_ADVISOR.DELETE_SQLWKLD_REF (
    task_name              IN VARCHAR2,
    workload_name          IN VARCHAR2,
    is_sts                 IN NUMBER := 0);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload object to be unlinked. The wildcard % is supported as a <code>workload_name</code>. The rules of use are identical to the LIKE operator. For example, to remove all links to workload objects, use the wildcard % as the <code>workload_name</code>.</td>
</tr>
<tr>
<td>is_sts</td>
<td>Indicates the type of workload source. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 0 - SQL workload object</td>
</tr>
<tr>
<td></td>
<td>• 1 - SQL tuning set</td>
</tr>
</tbody>
</table>

**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
```

---
task_name := 'My Task';
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
DBMS_ADVISOR.DELETE_SQLWKLD_REF(task_name, workload_name);
END;
/

16.3.12 DELETE_SQLWKLD_STATEMENT Procedure

This procedure deletes one or more statements from a workload.

**Note:**
This procedure has been deprecated.

**Syntax**

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (  
    workload_name        IN VARCHAR2,
    sql_id               IN NUMBER);
```

```
DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT (  
    workload_name        IN VARCHAR2,
    search               IN VARCHAR2,
    deleted              OUT NUMBER);
```

**Parameters**

**Table 16-13 DELETE_SQLWKLD_STATEMENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant ADVISOR_ALL.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
<tr>
<td>deleted</td>
<td>Returns the number of statements deleted by the searched deleted operation.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See the **RESET_TASK Procedure** to set a task to its initial state.

**Examples**

```sql
DECLARE
    workload_name VARCHAR2(30);
    deleted NUMBER;
    id NUMBER;
BEGIN
```
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'YEARLY', 'ROLLUP',
100,400,5041,103,640445,680000,2,
1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales');

SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
WHERE workload_name = 'My Workload';

DBMS_ADVISOR.DELETE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

16.3.13 DELETE_STS_REF Procedure

This procedure removes a link between the current SQL Access Advisor task and a
SQL tuning set.

Use DELETE_STS_REF for any STS-based advisor runs. The older method of using
DELETE_SQLWKLD_REF with parameter IS_STS=1 is only supported for backward
compatibility. Furthermore, the DELETE_STS_REF function accepts an STS owner name,
whereas DELETE_SQLWKLD_REF does not.

Syntax

DBMS_ADVISOR.DELETE_STS_REF (
    task_name IN VARCHAR2 NOT NULL,
    sts_owner IN VARCHAR2,
    workload_name IN VARCHAR2 NOT NULL);

Parameters

Table 16-14  DELETE_STS_REF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The SQL Access Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The owner of the SQL tuning set. The value of this parameter may be NULL, in which case the advisor assumes the SQL tuning set to be owned by the currently logged-in user.</td>
</tr>
<tr>
<td>workload_name</td>
<td>The name of the workload to be unlinked. A workload consists of one or more SQL statements, plus statistics and attributes that fully describe each statement. The database stores a workload as a SQL tuning set. The wildcard % is supported as a workload name. The rules of use are identical to the SQL LIKE operator. For example, to remove all links to SQL tuning set objects, use the wildcard % as the STS_NAME.</td>
</tr>
</tbody>
</table>

Examples

DBMS_ADVISOR.DELETE_STS_REF ('My task', 'SCOTT', 'My workload');
16.3.14 DELETE_TASK Procedure

This procedure deletes an existing task from the repository.

Syntax

```
DBMS_ADVISOR.DELETE_TASK (
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be deleted from the repository. The wildcard <code>%</code> is supported as a TASK_NAME. The rules of use are identical to the LIKE operator. For example, to delete all tasks for the current user, use the wildcard <code>%</code> as the TASK_NAME. If a wildcard is provided, the DELETE_TASK operation will not delete any tasks marked as READ_ONLY or TEMPLATE.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.DELETE_TASK(task_name);
END;
/
```

16.3.15 EXECUTE_TASK Procedure

This procedure performs the Advisor analysis or evaluation for the specified task. The procedure is overloaded.

The execution-related arguments are optional and you do not need to set them for advisors that do not allow their tasks to be executed multiple times.

Advisors can execute a task multiple times and use the results for further processing and analysis.

Syntax

```
DBMS_ADVISOR.EXECUTE_TASK (
    task_name IN VARCHAR2);
```

```
DBMS_ADVISOR.EXECUTE_TASK (
    task_name IN VARCHAR2,
    execution_type IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    execution_params IN dbms_advisor.argList := NULL,
```
Parameters

Table 16-16  EXECUTE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>
| execution_type | The type of action to be performed by the function. If NULL, it will default to the value of the DEFAULT_EXECUTION_TYPE parameter. As an example, the SQL Performance Analyzer accepts the following possible values:  
  - EXPLAIN PLAN: Generate an explain plan for a SQL statement. This is similar to an EXPLAIN PLAN command. The resulting plans will be stored in the advisor framework in association with the task.  
  - TEST EXECUTE: Test execute the SQL statement and collect its execute plan and statistics. The resulting plans and statistics are stored in the advisor framework.  
  - ANALYZE PERFORMANCE: Analyze and compare two versions of SQL performance data. The performance data is generated by test executing a SQL statement or generating its explain plan. |
| execution_name | A name to qualify and identify an execution. If not specified, it will be generated by the Advisor and returned by function. |
| execution_params | A list of parameters (name, value) for the specified execution. Note that execution parameters are real task parameters, but they affect only the execution they are specified for. As an example, consider the following: DBMS_ADVISOR.ARGLIST(‘time_limit’, 12, ‘username’, ‘hr’) |
| execution_desc | A 256-length string describing the execution.                                |

Usage Notes

Task execution is a synchronous operation. Control will not be returned to the caller until the operation has completed, or a user-interrupt was detected.

Upon return, you can check the DBA_ADVISOR_LOG table for the execution status.

Examples

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
  workload_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  workload_name := 'My Workload';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/
16.3.16 GET_REC_ATTRIBUTES Procedure

This procedure retrieves a specified attribute of a new object as recommended by Advisor analysis.

Syntax

```sql
DBMS_ADVISOR.GET_REC_ATTRIBUTES (  
    workload_name         IN VARCHAR2,  
    rec_id                IN NUMBER,  
    action_id             IN NUMBER,  
    attribute_name        IN VARCHAR2,  
    value                 OUT VARCHAR2,  
    owner_name            IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute to change.</td>
</tr>
<tr>
<td>value</td>
<td>The buffer to receive the requested attribute value.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Optional owner name of the target task. This permits access to task data not owned by the current user.</td>
</tr>
</tbody>
</table>

Return Values

The requested attribute value is returned in the `value` argument.

Examples

```sql
DECLARE  
    task_id NUMBER;  
    task_name VARCHAR2(30);  
    workload_name VARCHAR2(30);  
    attribute VARCHAR2(100);  
BEGIN  
    task_name := 'My Task';  
    workload_name := 'My Workload';  
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);  
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');  
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);  
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',  
        100,400,5041,103,640445,680000,2,  
        1,SYSDATE,1,'SH',  
        'SELECT AVG(amount_sold)  
         FROM sh.sales WHERE promo_id = 10');  
    DBMS_ADVISOR.EXECUTE_TASK(task_name);  
    DBMS_ADVISOR.GET_REC_ATTRIBUTES(task_name, 1, 1, 'NAME', attribute);  
END;  
/```
16.3.17 GET_TASK_REPORT Function

This function creates and returns a report for the specified task.

Syntax

```sql
DBMS_ADVISOR.GET_TASK_REPORT (  
    task_name      IN VARCHAR2,  
    type           IN VARCHAR2 := 'TEXT',  
    level          IN VARCHAR2 := 'TYPICAL',  
    section        IN VARCHAR2 := 'ALL',  
    owner_name     IN VARCHAR2 := NULL,  
    execution_name IN VARCHAR2 := NULL,  
    object_id      IN NUMBER   := NULL)  
RETURN CLOB;
```

Parameters

Table 16-18  GET_TASK_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task from which the script will be created.</td>
</tr>
<tr>
<td>type</td>
<td>The only valid value is TEXT.</td>
</tr>
<tr>
<td>level</td>
<td>The possible values are BASIC, TYPICAL, and ALL.</td>
</tr>
<tr>
<td>section</td>
<td>Advisor-specific report sections.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the task. If specified, the system will check to see if the current user has read privileges to the task data.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

Return Values

Returns the buffer receiving the script.

16.3.18 GET_TASK_SCRIPT Function

This function creates a SQL*Plus-compatible SQL script and sends the output to a file.

The output script contains all of the accepted recommendations from the specified task.

Syntax

```sql
DBMS_ADVISOR.GET_TASK_SCRIPT (  
    task_name          IN VARCHAR2  
    type               IN VARCHAR2 := 'IMPLEMENTATION',  
    rec_id             IN NUMBER   := NULL,  
    act_id             IN NUMBER   := NULL,  
    owner_name         IN VARCHAR2 := NULL,  
    execution_name     IN VARCHAR2 := NULL,  
    object_id          IN NUMBER   := NULL)  
RETURN CLOB;
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of script to generate. The possible values are IMPLEMENTATION and UNDO.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation identifier number that can be used to extract a subset of the implementation script. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all accepted recommendations would be included. The default is to include all accepted recommendations for the task.</td>
</tr>
<tr>
<td>act_id</td>
<td>Optional action identifier number that can be used to extract a single action as a DDL command. A zero or the value DBMS_ADVISOR.ADVISOR_ALL indicates all actions for the recommendation would be included. The default is to include all actions for a recommendation.</td>
</tr>
<tr>
<td>owner_name</td>
<td>An optional task owner name.</td>
</tr>
<tr>
<td>execution_name</td>
<td>An identifier of a specific execution of the task. It is needed only for advisors that allow their tasks to be executed multiple times.</td>
</tr>
<tr>
<td>object_id</td>
<td>An identifier of an advisor object that can be targeted by the script.</td>
</tr>
</tbody>
</table>

### Return Values

Returns the script as a CLOB buffer.

### Usage Notes

Though the script is ready to execute, Oracle recommends that the user review the script for acceptable locations for new materialized views and indexes.

For a recommendation to appear in a generated script, it must be marked as accepted.

### Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    buf CLOB;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                         FROM sh.sales');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    buf := DBMS_ADVISOR.GET_TASK_SCRIPT(task_name);
```
16.3.19 IMPLEMENT_TASK Procedure

This procedure implements the recommendations of the specified Advisor task.

Syntax

```sql
DBMS_ADVISOR.IMPLEMENT_TASK (
   task_name          IN VARCHAR2,
   rec_id             IN NUMBER := NULL,
   exit_on_error      IN BOOLEAN := NULL);
```

Parameters

Table 16-20 IMPLEMENT_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>An optional recommendation ID.</td>
</tr>
<tr>
<td>exit_on_error</td>
<td>An optional Boolean to exit on the first error.</td>
</tr>
</tbody>
</table>

16.3.20 IMPORT_SQLWKLD_SCHEMA Procedure

This procedure constructs and loads a SQL workload based on schema evidence. The workload is also referred to as a hypothetical workload.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA (
   workload_name         IN VARCHAR2,
   import_mode           IN VARCHAR2 := 'NEW',
   priority              IN NUMBER := 2,
   saved_rows            OUT NUMBER,
   failed_rows           OUT NUMBER);
```

Parameters

Table 16-21 IMPORT_SQLWKLD_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>
Table 16-21  (Cont.) IMPORT_SQLWKLD_SCHEMA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td></td>
<td>The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number or rows that were not saved due to syntax or validation errors</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
</tbody>
</table>

Return Values

This call returns the number of rows saved and failed as output parameters.

Usage Notes

To successfully import a hypothetical workload, the target schemas must contain dimensions.

If the VALID_TABLE_LIST parameter is not set, the search space may become very large and require a significant amount of time to complete. Oracle recommends that you limit your search space to specific set of tables.

If a task contains valid recommendations from a prior run, adding or modifying task will mark the task as invalid, preventing the viewing and reporting of potentially valuable recommendation data.

Examples

DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_SCHEMA(workload_name, 'REPLACE', 1, saved, failed);
END;
/

Chapter 16
Summary of DBMS_ADVISOR Subprograms

16-27
16.3.21 IMPORT_SQLWKLD_SQLCACHE Procedure

This procedure creates a SQL workload from the current contents of the server’s SQL cache.

**Note:**
This procedure is deprecated starting in Oracle Database 11g.

**Syntax**

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE (  
  workload_name      IN VARCHAR2,  
  import_mode        IN VARCHAR2 := 'NEW',  
  priority           IN NUMBER := 2,  
  saved_rows         OUT NUMBER,  
  failed_rows        OUT NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload. The default value is NEW.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows saved as output parameters.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.
Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_SQLCACHE(workload_name, 'REPLACE', 1, saved, failed);
END;
/

16.3.22 IMPORT_SQLWKLD_STS Procedure

This procedure loads a SQL workload from an existing SQL tuning set. A SQL tuning set is typically created from the server workload repository using various time and data filters.

\[ Note: \]

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
    workload_name IN VARCHAR2,  
    sts_name IN VARCHAR2,  
    import_mode IN VARCHAR2 := 'NEW',  
    priority IN NUMBER := 2,  
    saved_rows OUT NUMBER,  
    failed_rows OUT NUMBER);  

DBMS_ADVISOR.IMPORT_SQLWKLD_STS (  
    workload_name IN VARCHAR2,  
    sts_owner IN VARCHAR2,  
    sts_name IN VARCHAR2,  
    import_mode IN VARCHAR2 := 'NEW',  
    priority IN NUMBER := 2,  
    saved_rows OUT NUMBER,  
    failed_rows OUT NUMBER);
### Parameters

**Table 16-23 IMPORT_SQLWKLD_STS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sts_owner</td>
<td>The optional owner of the SQL tuning set.</td>
</tr>
<tr>
<td>sts_name</td>
<td>The name of an existing SQL tuning set workload from which the data will be imported. If the sts_owner value is not provided, the owner will default to the current user.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the application priority for each statement that is saved in the workload object. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW. The default value is 2.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.

**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See **RESET_TASK Procedure** to set a task to its initial state.

**Examples**

```sql
DECLARE
    workload_name VARCHAR2(30);
    saved NUMBER;
    failed NUMBER;
BEGIN
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST', 'SH.%');
    DBMS_ADVISOR.IMPORT_SQLWKLD_STS(workload_name, 'MY_SQLSET', 'REPLACE', 1, saved, failed);
END;
/```
16.3.23 IMPORT_SQLWKLD_SUMADV Procedure

This procedure collects a SQL workload from a Summary Advisor workload.

This procedure is intended to assist Oracle9i Database Summary Advisor users in the migration to SQL Access Advisor.

![Note:]

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.IMPORT_SQLWKLD_SUMADV (  
workload_name IN VARCHAR2,  
import_mode IN VARCHAR2 := 'NEW',  
priority IN NUMBER := 2,  
sumadv_id IN NUMBER,  
saved_rows OUT NUMBER,  
failed_rows OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>priority</td>
<td>Specifies the default application priority for each statement that is saved in the workload object. If a Summary Advisor workload statement contains a priority of zero, the default priority will be applied. If the workload statement contains a valid priority, then the Summary Advisor priority will be converted to a comparable SQL Access Advisor priority. The value must be one of the following: 1-HIGH, 2-MEDIUM, or 3-LOW.</td>
</tr>
<tr>
<td>sumadv_id</td>
<td>Specifies the Summary Advisor workload identifier number.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the repository.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>
Return Values
This call returns the number of rows saved and failed as output parameters.

Usage Notes
A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See \textit{RESET\_TASK Procedure} to set a task to its initial state.

Examples

\begin{verbatim}
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
  sumadv_id NUMBER;
BEGIN
  workload_name := 'My Workload';
  sumadv_id := 394;
  DBMS_ADVISOR.CREATE\_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET\_SQLWKLD\_PARAMETER(workload_name,'VALID\_TABLE\_LIST','SH.%');
  DBMS_ADVISOR.IMPORT\_SQLWKLD\_SUMADV(workload_name, 'REPLACE', 1, sumadv_id,
                                       saved, failed);
END;
/
\end{verbatim}

16.3.24 IMPORT\_SQLWKLD\_USER Procedure

This procedure collects a SQL workload from a specified user table.

\begin{center}
\textbf{Note:}
This procedure is deprecated starting in Oracle Database 11g.
\end{center}

Syntax

\begin{verbatim}
DBMS_ADVISOR.IMPORT\_SQLWKLD\_USER (  
  workload_name       IN VARCHAR2,
  import_mode         IN VARCHAR2 := 'NEW',
  owner_name          IN VARCHAR2,
  table_name          IN VARCHAR2,
  saved_rows          OUT NUMBER,
  failed_rows         OUT NUMBER);
\end{verbatim}

Parameters

\begin{table}[ht]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{Parameter} & \textbf{Description} \\
\hline
workload_name & The workload object name that uniquely identifies an existing workload. \\
\hline
\end{tabular}
\caption{IMPORT\_SQLWKLD\_USER Procedure Parameters}
\end{table}
### Table 16-25  (Cont.) IMPORT_SQLWKLD_USER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>import_mode</td>
<td>Specifies the action to be taken when storing the workload. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• APPEND Indicates that the collected workload will be added to any existing workload in the task.</td>
</tr>
<tr>
<td></td>
<td>• NEW Indicates that the collected workload will be the exclusive workload for the task. If an existing workload is found, an exception will be thrown.</td>
</tr>
<tr>
<td></td>
<td>• REPLACE Indicates the collected workload will be the exclusive workload for the task. If an existing workload is found, it will be deleted prior to saving the new workload.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Specifies the owner name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>table_name</td>
<td>Specifies the name of the table or view from which workload data will be collected.</td>
</tr>
<tr>
<td>saved_rows</td>
<td>Returns the number of rows actually saved in the workload object.</td>
</tr>
<tr>
<td>failed_rows</td>
<td>Returns the number of rows that were not saved due to syntax or validation errors.</td>
</tr>
</tbody>
</table>

**Return Values**

This call returns the number of rows saved and failed as output parameters.

**Usage Notes**

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See [RESET_TASK Procedure](#) to set a task to its initial state.

**Examples**

```sql
DECLARE
  workload_name VARCHAR2(30);
  saved NUMBER;
  failed NUMBER;
BEGIN
  workload_name := 'My Workload';

  DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
  DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name,'VALID_TABLE_LIST','SH.%');
  DBMS_ADVISOR.IMPORT_SQLWKLD_USER(workload_name, 'REPLACE', 'SH', 'USER_WORKLOAD', saved, failed);
END;
/
```

### 16.3.25 INTERRUPT Task Procedure

This procedure stops a currently executing task.

The task will end its operations as it would at a normal exit. The user will be able to access any recommendations that exist to this point.
Syntax

DBMS_ADVISOR.INTERRUPT_TASK (
  task_name IN VARCHAR2);

Parameters

Table 16-26  INTERRUPT_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A single Advisor task name that will be interrupted.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
  DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
  DBMS_ADVISOR.EXECUTE_TASK(task_name);
END;
/

While this session is executing its task, you can interrupt the task from a second session using the following statement:

BEGIN
  DBMS_ADVISOR.INTERRUPT_TASK('My Task');
END;
/

16.3.26 MARK_RECOMMENDATION Procedure

This procedure marks a recommendation for import or implementation.

Syntax

DBMS_ADVISOR.MARK_RECOMMENDATION (
  task_name IN VARCHAR2,
  id IN NUMBER,
  action IN VARCHAR2);

Parameters

Table 16-27  MARK_RECOMMENDATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>id</td>
<td>The recommendation identifier number assigned by the Advisor.</td>
</tr>
</tbody>
</table>
### Table 16-27 (Cont.) MARK_RECOMMENDATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>The recommendation action setting. The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT Marks the recommendation as accepted. With this setting, the recommendation will appear in implementation and undo scripts.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE Marks the recommendation as ignore. With this setting, the recommendation will not appear in an implementation or undo script.</td>
</tr>
<tr>
<td></td>
<td>• REJECT Marks the recommendation as rejected. With this setting, the recommendation will not appear in any implementation or undo scripts.</td>
</tr>
</tbody>
</table>

#### Usage Notes

For a recommendation to be implemented, it must be marked as accepted. By default, all recommendations are considered accepted and will appear in any generated scripts.

#### Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
    rec_id NUMBER;
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
                                         100, 400, 5041, 103, 640445, 680000, 2,
                                         1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
                                             FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    rec_id := 1;
    DBMS_ADVISOR.MARK_RECOMMENDATION(task_name, rec_id, 'REJECT');
END;
/
```

### 16.3.27 QUICK_TUNE Procedure

This procedure performs an analysis and generates recommendations for a single SQL statement.

This provides a shortcut method of all necessary operations to analyze the specified SQL statement. The operation creates a task using the specified task name. The task will be created using a specified Advisor task template. Finally, the task will be executed and the results will be saved in the repository.
Syntax

```sql
DBMS_ADVISOR.QUICK_TUNE (
    advisor_name IN VARCHAR2,
    task_name   IN VARCHAR2,
    attr1       IN CLOB,
    attr2       IN VARCHAR2 := NULL,
    attr3       IN NUMBER := NULL,
    template    IN VARCHAR2 := NULL,
    implement   IN BOOLEAN := FALSE,
    description IN VARCHAR2 := NULL);
```

Parameters

**Table 16-28 QUICK_TUNE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Name of the Advisor that will perform the analysis.</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific attribute in the form of a CLOB variable.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific attribute in the form of a VARCHAR2 variable.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific attribute in the form of a NUMBER.</td>
</tr>
<tr>
<td>template</td>
<td>Name of an existing task or template from which the initial settings need to be copied.</td>
</tr>
<tr>
<td>implement</td>
<td>Flag specifying whether to implement the task.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the task.</td>
</tr>
</tbody>
</table>

Usage Notes

If indicated by the user, the final recommendations can be implemented by the procedure.

The task will be created using either a specified SQL Access task template or the built-in default template of `SQLACCESS_GENERAL`. The workload will only contain the specified statement, and all task parameters will be defaulted.

`attr1` must be the single SQL statement to tune. For the SQL Access Advisor, `attr2` is the user who would execute the single statement. If omitted, the current user will be used.

Examples

```sql
DECLARE
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.QUICK_TUNE(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_name,
                             'SELECT AVG(amount_sold) FROM sh.sales WHERE promo_id=10');
END;
/
16.3.28 RESET_SQLWKLD Procedure

This procedure resets a workload to its initial starting point.

Resetting the workload has the effect of removing all journal and log messages, and recalculating necessary volatility and usage statistics.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```sql
DBMS_ADVISOR.RESET_SQLWKLD (
   workload_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
</tbody>
</table>

Usage Notes

**RESET_SQLWKLD** should be executed after any workload adjustments such as adding or removing SQL statements.

Examples

```sql
DECLARE
   workload_name VARCHAR2(30);
BEGIN
   workload_name := 'My Workload';
   DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
   DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
      100, 400, 5041, 103, 640445, 680000, 2,
      1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
      FROM sh.sales WHERE promo_id = 10');
   DBMS_ADVISOR.RESET_SQLWKLD(workload_name);
END;
/```
16.3.29 RESET_TASK Procedure

This procedure re-initializes the metadata for the specified task. The task status will be set to INITIAL.

Syntax

DBMS_ADVISOR.RESET_TASK (task_name IN VARCHAR2);

Parameters

Table 16-30  RESET_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    DBMS_ADVISOR.RESET_TASK(task_name);
END;
/

16.3.30 SET_DEFAULT_SQLWKLD_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting. When a default value is changed for a parameter, workload objects will inherit the new value when they are created.

Note:

This procedure is deprecated starting in Oracle Database 11g.

Syntax

DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (parameter IN VARCHAR2, value IN VARCHAR2);
DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER (  
  parameter IN VARCHAR2,
  value IN NUMBER);

Parameters

Table 16-31  SET_DEFAULT_SQLWKLD_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the workload object type, but not necessarily unique to all workload object types. Various object types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

BEGIN
  DBMS_ADVISOR.SET_DEFAULT_SQLWKLD_PARAMETER('VALID_TABLE_LIST','SH.%');
END;
/

16.3.31 SET_DEFAULT_TASK_PARAMETER Procedure

This procedure modifies the default value for a user parameter within a task or a template.

A user parameter is a simple variable that stores various attributes that affect various Advisor operations. When a default value is changed for a parameter, tasks will inherit the new value when they are created.

A default task is different from a regular task. The default value is the initial value that will be inserted into a newly created task, while setting a task parameter with SET_TASK_PARAMETER sets the local value only. Thus, SET_DEFAULT_TASK_PARAMETER has no effect on an existing task.

Syntax

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (  
  advisor_name        IN VARCHAR2
  parameter           IN VARCHAR2,
  value               IN VARCHAR2);  
/

DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER (  
  advisor_name        IN VARCHAR2
  parameter           IN VARCHAR2,
  value               IN NUMBER);
Parameters

Table 16-32  SET_DEFAULT_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advisor_name</td>
<td>Specifies the unique advisor name as defined in the view DBA_ADVISOR_DEFINITIONS.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number.</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_ADVISOR.SET_DEFAULT_TASK_PARAMETER(DBMS_ADVISOR.SQLACCESS_ADVISOR,
                                          'VALID_TABLE_LIST', 'SH.%');
END;
/

16.3.32 SET_SQLWKLD_PARAMETER Procedure

This procedure modifies a user parameter within a SQL Workload object or SQL Workload object template.

A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```
DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
  workload_name   IN VARCHAR2,
  parameter       IN VARCHAR2,
  value           IN VARCHAR2);

DBMS_ADVISOR.SET_SQLWKLD_PARAMETER (  
  workload_name   IN VARCHAR2,
  parameter       IN VARCHAR2,
  value           IN NUMBER);
```
Parameters

### Table 16-33  SET_SQLWKLD_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the data parameter to be modified. Parameter names are not case sensitive.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified parameter. The value can be specified as a string or a number. If the value is DBMS_ADVISOR.DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A parameter will only affect operations that modify the workload collection. Therefore, parameters should be set prior to importing or adding new SQL statements to a workload. If a parameter is set after data has been placed in a workload object, it will have no effect on the existing data.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.SET_SQLWKLD_PARAMETER(workload_name, 'VALID_TABLE_LIST','SH.%');
END;
/
```

### 16.3.33 SET_TASK_PARAMETER Procedure

This procedure modifies a user parameter within an Advisor task or a template. A user parameter is a simple variable that stores various attributes that affect workload collection, tuning decisions and reporting.

Syntax

```sql
DBMS_ADVISOR.SET_TASK_PARAMETER (
    task_name    IN VARCHAR2,
    parameter    IN VARCHAR2,
    value        IN VARCHAR2);
```

```sql
DBMS_ADVISOR.SET_TASK_PARAMETER (
    task_name    IN VARCHAR2,
    parameter    IN VARCHAR2,
    value        IN NUMBER);
```
Parameters

Table 16-34  SET_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the task parameter to be modified. Parameter names are not case sensitive. Parameter names are unique to the task type, but not necessarily unique to all task types. Various task types may use the same parameter name for different purposes.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the specified task parameter. The value can be specified as a string or a number. If the value is DEFAULT, the value will be reset to the default value.</td>
</tr>
</tbody>
</table>

Usage Notes

A task cannot be modified unless it is in its initial state. See RESET_TASK Procedure to set a task to its initial state. See your Advisor-specific documentation for further information on using this procedure.

SQL Access Advisor Task Parameters

Table 16-35 lists SQL Access Advisor task parameters.
Table 16-35 SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYSIS_SCOPE</td>
<td>A comma-separated list that specifies the tuning artifacts to consider during analysis. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• ALL Short name for specifying INDEX, MVIEW, TABLE, and PARTITION.</td>
</tr>
<tr>
<td></td>
<td>• EVALUATION Causes a read-only evaluation of the specified workload. No new recommendations will be made. Can only be specified alone.</td>
</tr>
<tr>
<td></td>
<td>• INDEX Allows the SQL Access Advisor to recommend index structure changes.</td>
</tr>
<tr>
<td></td>
<td>• MVIEW Allows the SQL Access Advisor to recommend materialized view and log changes.</td>
</tr>
<tr>
<td></td>
<td>• PARTITION Allows the SQL Access Advisor to recommend partition options. Use this in conjunction with the INDEX, MVIEW, and TABLE options.</td>
</tr>
<tr>
<td></td>
<td>• TABLE Allows the SQL Access Advisor to make base-table recommendations. In this release, the only base-table recommendation is partitioning.</td>
</tr>
<tr>
<td></td>
<td>Using the new keywords, the following combinations are valid:</td>
</tr>
<tr>
<td></td>
<td>• INDEX</td>
</tr>
<tr>
<td></td>
<td>• MVIEW</td>
</tr>
<tr>
<td></td>
<td>• INDEX, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• INDEX, MVIEW, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• INDEX, TABLE, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• MVIEW, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• MVIEW, TABLE, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• INDEX, MVIEW, TABLE, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• TABLE, PARTITION</td>
</tr>
<tr>
<td></td>
<td>• EVALUATION</td>
</tr>
<tr>
<td></td>
<td>The default value is INDEX. The data type is STRINGLIST.</td>
</tr>
<tr>
<td>CREATION_COST</td>
<td>When set to true (default), the SQL Access Advisor will weigh the cost of creation of the access structure (index or materialized view) against the frequency of the query and potential improvement in the query execution time.</td>
</tr>
<tr>
<td></td>
<td>When set to false, the cost of creation is ignored. The data type is STRING.</td>
</tr>
<tr>
<td>DAYS_TO_EXPIRE</td>
<td>Specifies the expiration time in days for the current SQL Access Advisor task. The value is relative to the last modification date. Once the task expires, it will become a candidate for removal by an automatic purge operation.</td>
</tr>
<tr>
<td></td>
<td>Specifies the expiration time in days for the current Access Advisor task. The value is relative to the last modification date. The data type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>Once the task expires, it becomes a candidate for removal by an automatic purge operation.</td>
</tr>
<tr>
<td></td>
<td>The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• an integer in the range of 0 to 2147483647</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNLIMITED</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is 30.</td>
</tr>
<tr>
<td>DEF_EM_TEMPLATE</td>
<td>Contains the default task or template name from which the Enterprise Manager SQL Access Advisor Wizard reads its initial values.</td>
</tr>
<tr>
<td></td>
<td>The default value is SQLACCESS_EMTASK. The data type is STRING.</td>
</tr>
</tbody>
</table>
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEF_INDEX_OWNER</td>
<td>Specifies the default owner for new index recommendations. When a script is created, this value will be used to qualify the index name. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing schema name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td>DEF_INDEX_TABLESPACE</td>
<td>Specifies the default tablespace for new index recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED No tablespace clause will be present in the script for indexes.</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td>DEF_MVIEW_OWNER</td>
<td>Specifies the default owner for new materialized view recommendations. When a script is created, this value will be used to qualify the materialized view name. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing schema name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR UNUSED</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td>DEF_MVIEW_TABLESPACE</td>
<td>Specifies the default tablespace for new materialized view recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR_UNUSED No tablespace clause will be present in the script for materialized view logs.</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td>DEF_MVLOG_TABLESPACE</td>
<td>Specifies the default tablespace for new materialized view log recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR UNUSED No tablespace clause will be present in the script for materialized view logs.</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR UNUSED. The data type is STRING.</td>
</tr>
<tr>
<td>DEF_PARTITION_TABLESPACE</td>
<td>Specifies the default tablespace for new partitioning recommendations. When a script is created, this value will be used to specify a tablespace clause. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• Existing tablespace name. Quoted identifiers are supported.</td>
</tr>
<tr>
<td></td>
<td>• ADVISOR UNUSED No tablespace clause will be present in the script for materialized views.</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR UNUSED. The data type is STRING.</td>
</tr>
</tbody>
</table>
### Table 16-35 (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DML_VOLATILITY</td>
<td>When set to TRUE, the SQL Access Advisor will consider the impact of index maintenance and materialized view refresh in determining the recommendations. It will limit the access structure recommendations involving columns or tables that are frequently updated. For example, if there are too many DML statements on a column, then it may favor a B-tree index over a bitmap index on that column. For this process to be effective, the workload must include DML (insert/update/delete/merge/direct path inserts) statements that represent the update behavior of the application. The data type is STRING. See the related parameter refresh_mode.</td>
</tr>
</tbody>
</table>
| END_TIME           | Specifies an end time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:  
- DD is the numeric date  
- MM is the numeric month  
- YYYY is the numeric year  
- HH is the hour in 24 hour format  
- MI is the minute  
- SS is the second  
The data type is STRING. |
| EVALUATIONONLY     | This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. If set to TRUE, causes SQL Access Advisor to analyze the workload, but only comment on how well the current configuration is supporting it. No tuning recommendations will be generated. Possible values are:  
- FALSE  
- TRUE  
The default value is FALSE. The data type is STRING. |
| EXECUTION_TYPE     | This parameter is maintained for backward compatibility. All values will be translated and placed into the ANALYSIS_SCOPE task parameter. The translated values are:  
- FULL => FULL  
- INDEX_ONLY => INDEX  
- MVIEW ONLY => MVIEW  
- MVIEW_LOG_ONLY => MVIEW_LOG_ONLY  
The type of recommendations that is desired. Possible values:  
- FULL All supported recommendation types will be considered.  
- INDEX_ONLY The SQL Access Advisor will only consider index solutions as recommendations.  
- MVIEW_ONLY The SQL Access Advisor will consider materialized view and materialized view log solutions as recommendations.  
- MVIEW_LOG_ONLY The SQL Access Advisor will only consider materialized view log solutions as recommendations.  
The default value is FULL. The data type is STRINGLIST. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| IMPLEMENT_EXIT_ON_ERROR   | When performing an IMPLEMENT_TASK operation, this parameter will control behavior when an action fails to implement. If set to TRUE, IMPLEMENT_TASK will stop on the first unexpected error. The possible values are:  
  • TRUE  
  • FALSE  
  The default value is TRUE. The data type is STRING. |
| INDEX_NAME_TEMPLATE       | Specifies the method by which new index names are formed.  
  If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. Once formatted, the maximum size of a name is 30 characters. Valid keywords are:  
  • Any literal value up to 22 characters.  
  • TABLE Causes the parent table name to be substituted into the index name. If the name is too long, it will be trimmed to fit.  
  • TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.  
  • SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.  
  The default template is table_IDX$$_task_idsequence. The data type is STRING. |
| INVALID_ACTION_LIST       | Contains a fully qualified list of actions that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.  
  An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness.  
  During a task execution, if a SQL statement's action matches a name in the action list, it will not be processed by the task. An action name is case sensitive. The possible values are:  
  • single action  
  • comma-delimited action list  
  • ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_MODULE_LIST</td>
<td>Contains a fully qualified list of modules that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</td>
</tr>
<tr>
<td></td>
<td>A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness.</td>
</tr>
<tr>
<td></td>
<td>During a task execution, if a SQL statement's module matches a name in the list, it will not be processed by the task. A module name is case sensitive.</td>
</tr>
<tr>
<td></td>
<td>The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• single application</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</td>
</tr>
<tr>
<td>INVALID_SQLSTRING_LIST</td>
<td>Contains a fully qualified list of text strings that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted values are supported.</td>
</tr>
<tr>
<td></td>
<td>A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness.</td>
</tr>
<tr>
<td></td>
<td>During a task execution, if a SQL statement contains a string in the SQL string list, it will not be processed by the task.</td>
</tr>
<tr>
<td></td>
<td>The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• single string</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</td>
</tr>
<tr>
<td>INVALID_USERNAME_LIST</td>
<td>Contains a fully qualified list of user names that are not eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported.</td>
</tr>
<tr>
<td></td>
<td>During a task execution, if a SQL statement's user name matches a name in the user name list, it will not be processed by the task. A user name is not case sensitive unless it is quoted.</td>
</tr>
<tr>
<td></td>
<td>The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• single user name</td>
</tr>
<tr>
<td></td>
<td>The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</td>
</tr>
</tbody>
</table>
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>JOURNALING</td>
<td>Controls the logging of messages to the journal (<a href="#">DBA_ADVISOR_JOURNAL</a> and <a href="#">USER_ADVISOR_JOURNAL</a> views). The higher the setting, the more information is logged to the journal. Possible values are:</td>
</tr>
</tbody>
</table>
|                    | • UNUSED: no journal messages  
• FATAL: explanation of fatal conditions  
• ERROR: explanation of errors  
• WARNING: explanation of warnings  
• INFORMATION: information message  
• INFORMATION2: common information  
• INFORMATION3: common information  
• INFORMATION4: common information  
• INFORMATION5: common information  
• INFORMATION6: common information  |
|                    | Each journal value represents all recorded messages at that level or lower. For example, when choosing WARNING, all messages marked WARNING as well as ERROR and FATAL will be recorded in the repository. INFORMATION6 represents the most thorough message recording and UNUSED is the least. The default value is INFORMATION. The data type is NUMBER. |
| LIMITED_PARTITION_SCHEMES | User can suggest that the Partition Expert cut off the number of partitioning schemes to investigate. This can help with cutting down the run time of the advisor. Possible values are:  |
|                    | • An integer in the range of 1 to 10  
• ADVISOR_UNUSED  |
|                    | The default value is ADVISOR_UNUSED. The data type is NUMBER. |
| MAX_NUMBER_PARTITIONS | Limits the number of partitions the advisor will recommend for any base table, index, or materialized view. Possible values are:  |
|                    | • An integer in the range of 1 to 4294967295  
• ADVISOR_UNLIMITED  
• ADVISOR_UNUSED  |
|                    | The default value is ADVISOR_UNLIMITED. The data type is NUMBER. |
| MODE               | Specifies the mode by which Access Advisor will operate during an analysis. Valid values are:  |
|                    | • LIMITED Indicates the Advisor will attempt to a quick job by limiting the search-space of candidate recommendations, and correspondingly, the results may be of a low quality.  
• COMPREHENSIVE Indicates the Advisor will search a large pool of candidates that may take long to run, but the resulting recommendations will be of the highest quality.  |
|                    | The default value is COMPREHENSIVE. The data type is STRING. |
### Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| MVIEW_NAME_TEMPLATE     | Specifies the method by which new materialized view names are formed. If the TASK_ID is omitted from the template, names generated by two concurrently executing SQL Access Advisor tasks may conflict and cause undesirable effects. So it is recommended that you include the TASK_ID in the template. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:  
  - Any literal value up to 22 characters.  
  - TASK_ID Causes the current task identifier number to be inserted in hexadecimal form.  
  - SEQ Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.  
  The default template is: MV$$_task_idsequence. The data type is STRING. |
| ORDER_LIST              | This parameter has been deprecated. It contains the primary natural order in which the Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, Access Advisor sorts the workload using ORDER_LIST values. A comma must separate multiple order keys. Possible values are:  
  - BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.  
  - CPU_TIME Sets the order using the SQL statement's CPU time value.  
  - DISK_READS Sets the order using the SQL statement's disk-read count value.  
  - ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.  
  - EXECUTIONS Sets the order using the SQL statement's execution frequency value.  
  - OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.  
  - I/O Sets the order using the SQL statement's I/O count value.  
  - PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value.  
  The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| PARTITION_NAME_TEMPLATE    | Specifies the method by which new partition names are formed. The format is any combination of keyword tokens and literals. However, once formatted, the maximum size of a name is 30 characters. Valid tokens are:  
  • Any literal value up to 22 characters.  
  • table - Causes the parent table name to be substituted into the partition name. If the name is too long, it will be trimmed to fit.  
  • task_id - Causes the current task identifier number to be inserted in hexadecimal form.  
  • sequence - Causes a sequence number to be inserted in hexadecimal form. Because this number is used to guarantee uniqueness, it is a required token.  
  The default template is PTN$$_table_task_idsequence. The data type is STRING. |
| PARTITIONING_GOAL          | Specifies the approach used to make partitioning recommendations. One possible value is PERFORMANCE, which is the default. The data type is STRING.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| PARTITIONING TYPES         | Specifies the type of partitioning used. Possible values are RANGE and HASH. The data type is STRING.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| RANKING_MEASURE            | Contains the primary natural order in which the SQL Access Advisor processes workload elements during the analysis operation. To determine absolute natural order, SQL Access Advisor sorts the workload using RANKING_MEASURE values. A comma must separate multiple order keys. Possible values are:  
  • BUFFER_GETS Sets the order using the SQL statement's buffer-get count value.  
  • CPU_TIME Sets the order using the SQL statement's CPU time value.  
  • DISK_READS Sets the order using the SQL statement's disk-read count value.  
  • ELAPSED_TIME Sets the order using the SQL statement's elapsed time value.  
  • EXECUTIONS Sets the order using the SQL statement's elapsed time value.  
  • OPTIMIZER_COST Sets the order using the SQL statement's optimizer cost value.  
  • PRIORITY Sets the order using the user-supplied business priority value. All values are accessed in descending order, where a high value is considered more interesting than a low value.  
  The default value is PRIORITY, OPTIMIZER_COST. The data type is STRINGLIST. |
| RECOMMEND_MV_EXACT_TEXT_MATC | When considering candidate materialized views, exact text match solutions will only be included if this parameter contains TRUE. The possible values are:  
  • TRUE  
  • FALSE  
  The default value is TRUE. The data type is STRING. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **RECOMMENDED_TABLESPACES** | Allows the SQL Access Advisor to recommend optimal tablespaces for any partitioning scheme. If this is not set, the SQL Access Advisor will simply recommend a partitioning method but give no advice on physical storage. Possible values are:  
• TRUE  
• FALSE (the default)  
The data type is STRING. |
| **REFRESH_MODE** | Specifies whether materialized views are refreshed **ON_DEMAND** or **ON_COMMIT**. This will be used to weigh the impact of materialized view refresh when the parameter dml_volatility is set to TRUE. Possible values are:  
• ON_DEMAND  
• ON_COMMIT  
The default value is ON_DEMAND. The data type is STRING. |
| **REPORT_DATE_FORMAT** | This is the default date and time formatting template. The default format is DD/MM/YYYYHH24:MI. The data type is STRING. |
| **SHOW_RETAINS** | Controls the display of **RETAIN** actions within an implementation script and the SQL Access Advisor wizard. The possible values are:  
• TRUE  
• FALSE  
The default value is TRUE. The data type is STRING. |
| **SQL_LIMIT** | Specifies the number of SQL statements to be analyzed. The **SQL_LIMIT** filter is applied after all other filters have been applied. For example, if only statements referencing the table hr.employees are to be accepted, the **SQL_LIMIT** value will be only apply to those statements. When used in conjunction with the parameter **ORDER_LIST**, SQL Access Advisor will process the most interesting SQL statements by ordering the statements according to the specified sort keys. Possible values are:  
• An integer in the range of 1 to 2147483647  
• ADVISOR_UNLIMITED  
• ADVISOR_UNUSED  
The default value is ADVISOR_UNUSED. The data type is NUMBER. |
| **START_TIME** | Specifies a start time for selecting SQL statements. If the statement did not execute on or before the specified time, it will not be processed. Each date must be in the standard Oracle form of MM-DD-YYYY HH24:MI:SS, where:  
• DD is the numeric date  
• MM is the numeric month  
• YYYY is the numeric year  
• HH is the hour in 24 hour format  
• MI is the minute  
• SS is the second  
The data type is STRING. |
Table 16-35  (Cont.) SQL Access Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| STORAGE_CHANGE     | Contains the amount of space adjustment that can be consumed by SQL Access Advisor recommendations. Zero or negative values are only permitted if the workload scope is marked as FULL. When the SQL Access Advisor produces a set of recommendations, the resultant physical structures must be able to fit into the budgeted space. A space budget is computed by adding the STORAGE_CHANGE value to the space quantity currently used by existing access structures. A negative STORAGE_CHANGE value may force SQL Access Advisor to remove existing structures in order to shrink space demand. Possible values:  
  • Any valid integer including negative values, zero and positive values.  
  The default value is ADVISOR_UNLIMITED. The data type is NUMBER. |
| TIME_LIMIT         | Specifies the time in minutes that the SQL Access Advisor can use to perform an analysis operation. If the SQL Access Advisor reaches a specified recommendation quality or all input data has been analyzed, processing will terminate regardless of any remaining time. Possible values:  
  • An integer in the range of 1 to 10,000  
  • ADVISOR_UNLIMITED  
  The default value is 720 (12 hours). The data type is NUMBER.  
  Note that specifying ADVISOR_UNLIMITED has the same effect as setting the parameter to the maximum of 10,000 (about one week). The SQL Access Advisor will never run for more than 10,000 minutes. |
| VALID_ACTION_LIST  | Contains a fully qualified list of actions that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. An action can be any string. If an action is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. An action string is not scanned for correctness. During a task execution, if a SQL statement's action does not match a name in the action list, it will not be processed by the task. An action name is case sensitive.  
  The possible values are:  
  • single action  
  • comma-delimited action list  
  • ADVISOR_UNUSED  
  The default value is ADVISOR_UNUSED. The data type is STRINGLIST. |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALID_MODULE_LIST</td>
<td>Contains a fully qualified list of application modules that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A module can be any string. If a module is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A module string is not scanned for correctness. During a task execution, if a SQL statement's module does not match a name in the module list, it will not be processed by the task. A module name is case sensitive. The possible values are: • single application • comma-delimited module list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</td>
</tr>
<tr>
<td>VALID_SQLSTRING_LIST</td>
<td>Contains a fully qualified list of text strings that are eligible for processing in a SQL workload object. The list elements are comma-delimited, and quoted names are supported. A SQL string can be any string. If a string is not quoted, it will be changed to uppercase lettering and stripped of leading and trailing spaces. A SQL string is not scanned for correctness. During a task execution, if a SQL statement does not contain string in the SQL string list, it will not be processed by the task. The possible values are: • single string • comma-delimited string list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is STRINGLIST.</td>
</tr>
<tr>
<td>VALID_TABLE_LIST</td>
<td>Contains a fully qualified list of tables that are eligible for tuning. The list elements are comma-delimited, and quoted identifiers are supported. Wildcard specifications are supported for tables. The default value is all tables within the user's scope are eligible for tuning. Supported wildcard character is %. A % wildcard matches any set of consecutive characters. When a SQL statement is processed, it will not be accepted unless at least one referenced table is specified in the valid table list. If the list is unused, then all table references within a SQL statement are considered valid. The valid syntax for a table reference is: • schema.table • schema • schema.% (equivalent to schema) • comma-delimited action list • ADVISOR_UNUSED The possible values are: • single table reference • comma-delimited reference list • ADVISOR_UNUSED The default value is ADVISOR_UNUSED. The data type is TABLELIST.</td>
</tr>

</tbody>
</table>

Segment Advisor Parameters

Table 16-36 lists the input task parameters that can be set in the Segment Advisor using the SET_TASK_PARAMETER procedure.

Table 16-36  Segment Advisor Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODE</td>
<td>The data to use for analysis. The default value is COMPREHENSIVE, and the possible values are:</td>
</tr>
<tr>
<td></td>
<td>• LIMITED: Analysis restricted to statistics available in the Automatic Workload Repository</td>
</tr>
<tr>
<td></td>
<td>• COMPREHENSIVE: Analysis based on sampling and Automatic Workload Repository statistics</td>
</tr>
<tr>
<td>TIME_LIST</td>
<td>The time limit for which the Advisor should run. It is specified in seconds, and the default and possible values are UNLIMITED.</td>
</tr>
<tr>
<td>RECOMMEND_ALL</td>
<td>Whether to generate recommendations for all segments. The default value is TRUE. If set to TRUE, it generates recommendations all segments specified by the user. If set to FALSE, it generates recommendations for only those objects that are eligible for shrink.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
  task_id NUMBER;
  task_name VARCHAR2(30);
BEGIN
  task_name := 'My Task';
DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
DBMS_ADVISOR.SET_TASK_PARAMETER(task_name, 'VALID_TABLELIST',
  'SH.%$SCOTT.EMP');
END;
/

Undo Advisor Task Parameters

Table 16-37 lists the input task parameters that can be set in the Undo Advisor using the SET_TASK_PARAMETER procedure.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TARGET_OBJECTS</td>
<td>The undo tablespace of the system. There is no default value, and the possible value is UNDO_TBS.</td>
</tr>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>BEGIN_TIME_SEC</td>
<td>The number of seconds between the beginning time of the period and now. Describes a period of time for the system to perform analysis. BEGIN_TIME_SEC should be greater than END_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
<tr>
<td>END_TIME_SEC</td>
<td>The number of seconds between the ending time of the period and now. END_TIME_SEC should be less than BEGIN_TIME_SEC. There is no default value and the possible values are any positive integer.</td>
</tr>
</tbody>
</table>

Examples

DECLARE
tname  VARCHAR2(30);
oid    NUMBER;
BEGIN
  DBMS_ADVISOR.CREATE_TASK('Undo Advisor', tid, tname, 'Undo Advisor Task');
  DBMS_ADVISOR.CREATE_OBJECT(tname, 'UNDO_TBS', null, null, null, 'null', oid);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'TARGET_OBJECTS', oid);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', 1);
  DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', 2);
  DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/

Automatic Database Diagnostic Monitor (ADDM) Task Parameters

Table 16-38 lists the input task parameters that can be set in ADDM using the SET_TASK_PARAMETER procedure.
### Table 16-38  ADDM Task Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_SNAPSHOT</td>
<td>The starting time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>END_SNAPSHOT</td>
<td>The ending time for the system to perform analysis using the snapshot numbers in the AWR repository. There is no default value, and the possible values are the valid snapshot numbers in the AWR repository.</td>
</tr>
<tr>
<td>DB_ID</td>
<td>The database for START_SNAPSHOT and END_SNAPSHOT. The default value is the current database ID.</td>
</tr>
<tr>
<td>INSTANCE</td>
<td>The instance for START_SNAPSHOT and END_SNAPSHOT. The default value is 0 or UNUSED, and the possible values are all positive integers. By default, all instances are analyzed.</td>
</tr>
<tr>
<td>INSTANCES</td>
<td>If the INSTANCE parameter has been set, INSTANCES is ignored. The default value is UNUSED, and the possible values are comma-separated list of instance numbers (for example, &quot;1, 3, 5&quot;). By default, all instances are analyzed.</td>
</tr>
<tr>
<td>DBIOEXPECTED</td>
<td>The average time to read the database block in microseconds. The default value is 10 milliseconds, and the possible values are system-dependent.</td>
</tr>
</tbody>
</table>

### Examples

The following creates and executes an ADDM task for the current database and an AWR snapshot range between 19 and 26. Note that this example will analyze all instances, whether you have only one or an Oracle RAC database.

```sql
DECLARE
    tid NUMBER;
    tname VARCHAR2(30) := 'ADDM_TEST';
BEGIN
    DBMS_ADVISOR.CREATE_TASK('ADDM', tid, tname, 'my test');
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'START_SNAPSHOT', '19');
    DBMS_ADVISOR.SET_TASK_PARAMETER(tname, 'END_SNAPSHOT', '26');
    DBMS_ADVISOR.EXECUTE_TASK(tname);
END;
/
```

SQL Tuning Advisor Task Parameters

See the DBMS_SQLTUNE package and Oracle Database SQL Tuning Guide for more information.

16.3.34 TUNE_MVIEW Procedure

This procedure shows how to decompose a materialized view into multiple views and to restate the materialized view to be optimized for fast refresh and query rewrite. It also shows how to fix materialized view logs and to enable query rewrite.

Syntax

DBMS_ADVISOR.TUNE_MVIEW (  
    task_name        IN OUT VARCHAR2,  
    mv_create_stmt   IN     
                      [CLOB | VARCHAR2]);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name for querying the results in a catalog view. If not specified, the database generates a task name, and then returns.</td>
</tr>
<tr>
<td>mv_create_stmt</td>
<td>The original materialized view creation statement.</td>
</tr>
</tbody>
</table>

Usage Notes

Executing TUNE_MVIEW generates two sets of output results: one for the implementation, and the other for undoing the implementation. The output is accessible through USER_TUNE_MVIEW and DBA_TUNE_MVIEW views. You can also use DBMS_ADVISOR.GET_TASK_SCRIPT and DBMS_ADVISOR.CREATE_FILE to print the TUNE_MVIEW results into a script file for later execution.

Table 16-40 USER_TUNE_MVIEW and DBA_TUNE_MVIEW Views

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>The name of the materialized view owner.</td>
</tr>
<tr>
<td>TASK_NAME</td>
<td>The name of the task. This name serves as a key to access the set of recommendations.</td>
</tr>
<tr>
<td>SCRIPT_TYPE</td>
<td>Recommendation ID that indicates whether the row is for the IMPLEMENTATION or UNDO script.</td>
</tr>
<tr>
<td>ACTION_ID</td>
<td>Action ID used as the command order number.</td>
</tr>
<tr>
<td>STATEMENT</td>
<td>For TUNE_MVIEW output, this column represents the following statements, and includes statement properties such as REFRESH and REWRITE options:</td>
</tr>
<tr>
<td></td>
<td>• CREATE MATERIALIZED VIEW LOG</td>
</tr>
<tr>
<td></td>
<td>• ALTER MATERIALIZED VIEW LOG FORCE</td>
</tr>
<tr>
<td></td>
<td>• [CREATE</td>
</tr>
</tbody>
</table>
Examples

The following example shows how to use TUNE_MVIEW to optimize a CREATE MATERIALIZED VIEW statement:

```sql
DECLARE
    v_tname VARCHAR2(30);
BEGIN
    v_tname := 'mview_task';
    DBMS_ADVISOR.TUNE_MVIEW(
        task_name => v_tname,
        mv_create_stmt => 'CREATE MATERIALIZED VIEW omv REFRESH WITH ROWID AS SELECT * FROM orders');
END;
```

You can view the results by querying USER_TUNE_MVIEW or DBA_TUNE_MVIEW as the following example (sample output included):

```sql
SET LINESIZE 120
COL TASK_NAME FORMAT a20
COL STATEMENT FORMAT a40
SELECT *
FROM USER_TUNE_MVIEW
WHERE TASK_NAME='mview_task'
AND SCRIPT_TYPE='IMPLEMENTATION';
```

<table>
<thead>
<tr>
<th>TASK_NAME</th>
<th>ACTION_ID</th>
<th>SCRIPT_TYPE</th>
<th>STATEMENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>mview_task</td>
<td>1</td>
<td>IMPLEMENTATION</td>
<td>CREATE MATERIALIZED VIEW LOG ON</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>&quot;OE&quot;.&quot;ORDERS&quot; WITH ROWID</td>
</tr>
<tr>
<td>mview_task</td>
<td>2</td>
<td>IMPLEMENTATION</td>
<td>ALTER MATERIALIZED VIEW LOG FORCE ON</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>&quot;.&quot;ORDERS&quot; ADD ROWID</td>
</tr>
<tr>
<td>mview_task</td>
<td>3</td>
<td>IMPLEMENTATION</td>
<td>CREATE MATERIALIZED VIEW OE.OMV REFRESH</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>FAST WITH ROWID DISABLE QUERY REWRITE</td>
</tr>
</tbody>
</table>

Alternatively, you can save the output results in an external script file as in the following example:

```sql
CREATE DIRECTORY TUNE_RESULTS_DIR AS '/tmp';
GRANT READ, WRITE ON DIRECTORY TUNE_RESULTS_DIR TO PUBLIC;
BEGIN
    DBMS_ADVISOR.CREATE_FILE(
        buffer => DBMS_ADVISOR.GET_TASK_SCRIPT( task_name => 'mview_task'),
        location => 'TUNE_RESULTS_DIR',
        filename => 'mview_create.sql');
END;
```

The preceding statement will save the results in /tmp/mview_create.sql.
16.3.35 UPDATE_OBJECT Procedure

This procedure updates an existing task object.

Task objects are typically used as input data for a particular advisor. Segment advice can be generated at the object, segment, or tablespace level.

Syntax

```
DBMS_ADVISOR.UPDATE_OBJECT (  
    task_name       IN VARCHAR2
    object_id       IN NUMBER,
    attr1           IN VARCHAR2 := NULL,
    attr2           IN VARCHAR2 := NULL,
    attr3           IN VARCHAR2 := NULL,
    attr4           IN CLOB := NULL,
    attr5           IN VARCHAR2 := NULL);
```

Parameters

Table 16-41  UPDATE_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>A valid advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>object_id</td>
<td>The advisor-assigned object identifier.</td>
</tr>
<tr>
<td>attr1</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr2</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr3</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr4</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
<tr>
<td>attr5</td>
<td>Advisor-specific data. If set to NULL, there will be no effect on the target object.</td>
</tr>
</tbody>
</table>

The attribute parameters have different values depending upon the object type. See Oracle Database Administrator's Guide for details regarding these parameters and object types.

Usage Notes

If for the object level, advice is generated on all partitions of the object (if the object is partitioned). The advice is not cascaded to any dependent objects. If for the segment level, advice can be obtained on a single segment, such as the partition or subpartition...
of a table, index, or lob column. If for a tablespace level, target advice for every segment in the tablespace will be generated.

Examples

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    obj_id NUMBER;
BEGIN
    task_name := 'My Task';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_OBJECT (task_name,'SQL',NULL,NULL,NULL,
        'SELECT * FROM SH.SALES',obj_id);
    DBMS_ADVISOR.UPDATE_OBJECT (task_name, obj_id,NULL,NULL,NULL,
        'SELECT count(*) FROM SH.SALES');
END;
/
```

See Also:

*Oracle Database Administrator's Guide* for further information regarding the Segment Advisor

16.3.36 UPDATE_REC_ATTRIBUTES Procedure

This procedure updates the owner, name, and tablespace for a recommendation.

Syntax

```sql
DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES (  
    task_name            IN VARCHAR2  
    rec_id               IN NUMBER,  
    action_id            IN NUMBER,  
    attribute_name       IN VARCHAR2,  
    value                IN VARCHAR2);  
```

Parameters

Table 16-42  UPDATE_REC_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>rec_id</td>
<td>The Advisor-generated identifier number that is assigned to the recommendation.</td>
</tr>
<tr>
<td>action_id</td>
<td>The Advisor-generated action identifier that is assigned to the particular command.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of the attribute to be changed. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>• owner The new owner of the object.</td>
</tr>
<tr>
<td></td>
<td>• name The new name of the object.</td>
</tr>
<tr>
<td></td>
<td>• tablespace The new tablespace for the object.</td>
</tr>
</tbody>
</table>
Table 16-42 (Cont.) UPDATE_REC_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Specifies the new value for the recommendation attribute.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Recommendation attributes cannot be modified unless the task has successfully executed.

**Examples**

```sql
DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
    workload_name VARCHAR2(30);
    attribute VARCHAR2(100);
BEGIN
    task_name := 'My Task';
    workload_name := 'My Workload';
    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_REF(task_name, workload_name);
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100, 400, 5041, 103, 640445, 680000, 2,
        1, SYSDATE, 1, 'SH', 'SELECT AVG(amount_sold)
            FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.EXECUTE_TASK(task_name);
    attribute := 'SH';
    DBMS_ADVISOR.UPDATE_REC_ATTRIBUTES(task_name, 1, 3, 'OWNER', attribute);
END;
/
```

**16.3.37 UPDATE_SQLWKLD_ATTRIBUTES Procedure**

This procedure changes various attributes of a SQL Workload object or template.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

**Syntax**

```sql
DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES (  
    workload_name IN VARCHAR2,  
    new_name IN VARCHAR2 := NULL,  
    description IN VARCHAR2 := NULL,  
    read_only IN VARCHAR2 := NULL,  
    is_template IN VARCHAR2 := NULL,  
    how_created IN VARCHAR2 := NULL) ;
```
Parameters

Table 16-43  UPDATE_SQLWKLD_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new workload object name. If the value is NULL or contains the value ADVISOR_UNUSED, the workload will not be renamed. A task name can be up to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new workload description. If the value is NULL or contains the value ADVISOR_UNUSED, the description will not be changed. Names can be up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Set to TRUE so it cannot be changed.</td>
</tr>
<tr>
<td>is_template</td>
<td>TRUE if workload is to be used as a template.</td>
</tr>
<tr>
<td>how_created</td>
<td>Indicates a source application name that initiated the workload creation. If the value is NULL or contains the value ADVISOR_UNUSED, the source will not be changed.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE
    workload_name VARCHAR2(30);
BEGIN
    workload_name := 'My Workload';

    DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
    DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
        100,400,5041,103,640445,680000,2,
        1,SYSDATE,'SH','SELECT AVG(amount_sold)
        FROM sh.sales WHERE promo_id = 10');
    DBMS_ADVISOR.UPDATE_SQLWKLD_ATTRIBUTES(workload_name,'New workload name');
END;
/
```

16.3.38 UPDATE_SQLWKLD_STATEMENT Procedure

This procedure updates an existing SQL statement in a specified SQL workload.

**Note:**

This procedure is deprecated starting in Oracle Database 11g.

Syntax

```
DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT (
    workload_name IN VARCHAR2,
    sql_id IN NUMBER,
    application IN VARCHAR2 := NULL,
    action IN VARCHAR2 := NULL,
    priority IN NUMBER := NULL,
```
Parameters

Table 16-44  UPDATE_SQLWKLD_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>workload_name</td>
<td>The SQL Workload object name that uniquely identifies an existing workload.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The Advisor-generated identifier number that is assigned to the statement. To specify all workload statements, use the constant DBMS_ADVISOR.ADVISOR_ALL.</td>
</tr>
<tr>
<td>updated</td>
<td>Returns the number of statements changed by a searched update.</td>
</tr>
<tr>
<td>application</td>
<td>Specifies a business application name that will be associated with the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the application action for the statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>priority</td>
<td>The relative priority of the SQL statement. The value must be one of the following: 1 - HIGH, 2 - MEDIUM, or 3 - LOW. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository.</td>
</tr>
<tr>
<td>username</td>
<td>The Oracle user name that executed the SQL statement. If the value is NULL or contains the value ADVISOR_UNUSED, then the column will not be updated in the repository. Because a user name is an Oracle identifier, the username value must be entered exactly like it is stored in the database. For example, if the user SCOTT is the executing user, then you must provide the user identifier SCOTT in all uppercase letters. The database does not recognize the user scott as a match for SCOTT.</td>
</tr>
<tr>
<td>search</td>
<td>Disabled.</td>
</tr>
</tbody>
</table>

Usage Notes

A workload cannot be modified or deleted if it is currently referenced by an active task. A task is considered active if it is not in its initial state. See RESET_TASK Procedure to set a task to its initial state.

Examples

```sql
DECLARE
    workload_name VARCHAR2(30);
    updated NUMBER;
    id NUMBER;
BEGIN
```
workload_name := 'My Workload';

DBMS_ADVISOR.CREATE_SQLWKLD(workload_name, 'My Workload');
DBMS_ADVISOR.ADD_SQLWKLD_STATEMENT(workload_name, 'MONTHLY', 'ROLLUP',
100,400,5041,103,640445,680000,2,
1,SYSDATE,1,'SH','SELECT AVG(amount_sold)
FROM sh.sales WHERE promo_id = 10');

SELECT sql_id INTO id FROM USER_ADVISOR_SQLW_STMTS
WHERE workload_name = 'My Workload';

DBMS_ADVISOR.UPDATE_SQLWKLD_STATEMENT(workload_name, id);
END;
/

16.3.39 UPDATE_TASK_ATTRIBUTES Procedure

This procedure changes various attributes of a task or a task template.

Syntax

DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES ( 
  task_name          IN VARCHAR2
  new_name           IN VARCHAR2 := NULL,
  description        IN VARCHAR2 := NULL,
  read_only          IN VARCHAR2 := NULL,
  is_template        IN VARCHAR2 := NULL,
  how_created        IN VARCHAR2 := NULL);

Parameters

Table 16-45  UPDATE_TASK_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The Advisor task name that uniquely identifies an existing task.</td>
</tr>
<tr>
<td>new_name</td>
<td>The new Advisor task name. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the task will not be renamed. A task name can be up</td>
</tr>
<tr>
<td></td>
<td>to 30 characters long.</td>
</tr>
<tr>
<td>description</td>
<td>A new task description. If the value is NULL or contains the value</td>
</tr>
<tr>
<td></td>
<td>ADVISOR_UNUSED, the description will not be changed. Names can be</td>
</tr>
<tr>
<td></td>
<td>up to 256 characters long.</td>
</tr>
<tr>
<td>read_only</td>
<td>Sets the task to read-only. Possible values are: TRUE and FALSE.</td>
</tr>
<tr>
<td></td>

Examples

DECLARE
    task_id NUMBER;
    task_name VARCHAR2(30);
BEGIN
    task_name := 'My Task';

    DBMS_ADVISOR.CREATE_TASK(DBMS_ADVISOR.SQLACCESS_ADVISOR, task_id, task_name);
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES(task_name, 'New Task Name');
    DBMS_ADVISOR.UPDATE_TASK_ATTRIBUTES('New Task Name', NULL, 'New description');
END;
/
DBMS_ALERT supports asynchronous notification of database events (alerts). By appropriate use of this package and database triggers, an application can notify itself whenever values of interest in the database are changed.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Restrictions
- Exceptions
- Operational Notes
- Examples
- Summary of DBMS_ALERT Subprograms

17.1 DBMS_ALERT Overview

This scenario describes a possible use of the DBMS_ALERT package.

Suppose a graphics tool is displaying a graph of some data from a database table. The graphics tool can, after reading and graphing the data, wait on a database alert (waitone) covering the data just read. The tool automatically wakes up when the data is changed by any other user. All that is required is that a trigger be placed on the database table, which performs a signal (signal) whenever the trigger is fired.

17.2 DBMS_ALERT Security Model

Security on this package can be controlled by granting execute on this package to selected users or roles. You might want to write a cover package on top of this one that restricts the alert names used. execute privilege on this cover package can then be granted rather than on this package.

17.3 DBMS_ALERT Constants

The DBMS_ALERT package uses the constants listed and described in this topic.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAXWAIT</td>
<td>INTEGER</td>
<td>86400000</td>
<td>The maximum time to wait for an alert (1000 days which is essentially forever).</td>
</tr>
</tbody>
</table>
17.4 DBMS_ALERT Restrictions

Because database alerters issue commits, they cannot be used with Oracle Forms. For more information on restrictions on calling stored procedures while Oracle Forms is active, refer to your Oracle Forms documentation.

17.5 DBMS_ALERT Exceptions

DBMS_ALERT raises the application error -20000 on error conditions.

Table 17-2 shows the messages and the procedures that can raise them.

17.6 DBMS_ALERT Operational Notes

This topic lists notes related to general and specific applications. Also, a list of DBMS_ALERT error messages is provided.

• Alerts are transaction-based. This means that the waiting session is not alerted until the transaction signalling the alert commits. There can be any number of concurrent signalers of a given alert, and there can be any number of concurrent waiters on a given alert.

• A waiting application is blocked in the database and cannot do any other work.

• An application can register for multiple events and can then wait for any of them to occur using the WAITANY procedure.

• An application can also supply an optional timeout parameter to the WAITONE or WAITANY procedures. A timeout of 0 returns immediately if there is no pending alert.

• The signalling session can optionally pass a message that is received by the waiting session.

• Alerts can be signalled more often than the corresponding application wait calls. In such cases, the older alerts are discarded. The application always gets the latest alert (based on transaction commit times).

• If the application does not require transaction-based alerts, the DBMS_PIPE package may provide a useful alternative.

See Also:

DBMS_PIPE

• If the transaction is rolled back after the call to SIGNAL, no alert occurs.

• It is possible to receive an alert, read the data, and find that no data has changed. This is because the data changed after the prior alert, but before the data was read for that prior alert.

• Usually, Oracle is event-driven; this means that there are no polling loops. There are two cases where polling loops can occur:
– Shared mode. If your database is running in shared mode, a polling loop is required to check for alerts from another instance. The polling loop defaults to one second and can be set by the SET_DEFAULTS procedure.

– WAITANY procedure. If you use the WAITANY procedure, and if a signalling session does a signal but does not commit within one second of the signal, a polling loop is required so that this uncommitted alert does not camouflage other alerts. The polling loop begins at a one second interval and exponentially backs off to 30-second intervals.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>Procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10001 lock request error, status: N</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10015 error: N waiting for pipe status</td>
<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10016 error: N sending on pipe 'X'</td>
<td>SIGNAL</td>
</tr>
<tr>
<td>ORU-10017 error: N receiving on pipe 'X'</td>

<td>WAITANY</td>
</tr>
<tr>
<td>ORU-10025 lock request error; status N</td>
<td>REGISTER</td>
</tr>
<tr>
<td>ORU-10037 attempting to wait on uncommitted signal from same session</td>
<td>WAITONE</td>
</tr>
</tbody>
</table>

17.7 DBMS_ALERT Examples

In this example, suppose that you want to graph average salaries by department, for all employees. Your application needs to know whenever EMP is changed.

Your application would look similar to this code:

```sql
DBMS_ALERT.REGISTER('emp_table_alert');
<<readagain>>:
/* ... read the emp table and graph it */
DBMS_ALERT.WAITONE('emp_table_alert', :message, :status);
if status = 0 then goto <<readagain>>; else
/* ... error condition */
```

The EMP table would have a trigger similar to this:

```sql
CREATE TRIGGER emptrig AFTER INSERT OR UPDATE OR DELETE ON emp
BEGIN
    DBMS_ALERT.SIGNAL('emp_table_alert', 'message_text');
END;
```

When the application is no longer interested in the alert, it makes this request:

```sql
DBMS_ALERT.REMOVE('emp_table_alert');
```
This reduces the amount of work required by the alert signaller. If a session exits (or dies) while registered alerts exist, the alerts are eventually cleaned up by future users of this package.

The example guarantees that the application always sees the latest data, although it may not see every intermediate value.

17.8 Summary of DBMS_ALERT Subprograms

This table lists the DBMS_ALERT subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGISTER Procedure</td>
<td>Receives messages from an alert</td>
</tr>
<tr>
<td>REMOVE Procedure</td>
<td>Disables notification from an alert</td>
</tr>
<tr>
<td>REMOVEALL Procedure</td>
<td>Removes all alerts for this session from the registration list</td>
</tr>
<tr>
<td>SET_DEFAULTS Procedure</td>
<td>Sets the polling interval</td>
</tr>
<tr>
<td>SIGNAL Procedure</td>
<td>Signals an alert (send message to registered sessions)</td>
</tr>
<tr>
<td>WAITANY Procedure</td>
<td>Waits timeout seconds to receive alert message from an alert registered for session</td>
</tr>
<tr>
<td>WAITONE Procedure</td>
<td>Waits timeout seconds to receive message from named alert</td>
</tr>
</tbody>
</table>

17.8.1 REGISTER Procedure

This procedure lets a session register interest in an alert.

Syntax

```
DBMS_ALERT.REGISTER {
    name IN VARCHAR2,
    cleanup IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert in which this session is interested</td>
</tr>
<tr>
<td>cleanup</td>
<td>Specifies whether to perform cleanup of any extant orphaned pipes used by the DBMS_ALERT package. This cleanup is only performed on the first call to REGISTER for each package instantiation. The default for the parameter is TRUE.</td>
</tr>
</tbody>
</table>
WARNING:
Alert names beginning with 'ORA$' are reserved for use for products provided by Oracle. Names must be 30 bytes or less. The name is case insensitive.

Usage Notes
A session can register interest in an unlimited number of alerts. Alerts should be deregistered when the session no longer has any interest, by calling REMOVE.

17.8.2 REMOVE Procedure
This procedure enables a session that is no longer interested in an alert to remove that alert from its registration list. Removing an alert reduces the amount of work done by signalers of the alert.

Syntax
DBMS_ALERT.REMOVE (name  IN  VARCHAR2);

Parameters
Table 17-5  REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert (case-insensitive) to be removed from registration list.</td>
</tr>
</tbody>
</table>

Usage Notes
Removing alerts is important because it reduces the amount of work done by signalers of the alert. If a session dies without removing the alert, that alert is eventually (but not immediately) cleaned up.

17.8.3 REMOVEALL Procedure
This procedure removes all alerts for this session from the registration list. You should do this when the session is no longer interested in any alerts.

This procedure is called automatically upon first reference to this package during a session. Therefore, no alerts from prior sessions which may have terminated abnormally can affect this session.

This procedure always performs a commit.

Syntax
DBMS_ALERT.REMOVEALL;
17.8.4 SET_DEFAULTS Procedure

In case a polling loop is required, use the `SET_DEFAULTS` procedure to set the polling interval.

**Syntax**

```sql
DBMS_ALERT.SET_DEFAULTS (
    sensitivity  IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensitivity</td>
<td>Polling interval, in seconds, to sleep between polls. The default interval is five seconds.</td>
</tr>
</tbody>
</table>

17.8.5 SIGNAL Procedure

This procedure signals an alert. The effect of the `SIGNAL` call only occurs when the transaction in which it is made commits. If the transaction rolls back, `SIGNAL` has no effect.

All sessions that have registered interest in this alert are notified. If the interested sessions are currently waiting, they are awakened. If the interested sessions are not currently waiting, they are notified the next time they do a wait call.

Multiple sessions can concurrently perform signals on the same alert. Each session, as it signals the alert, blocks all other concurrent sessions until it commits. This has the effect of serializing the transactions.

**Syntax**

```sql
DBMS_ALERT.SIGNAL (    name     IN  VARCHAR2,
                        message  IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to signal.</td>
</tr>
<tr>
<td>message</td>
<td>Message, of 1800 bytes or less, to associate with this alert. This message is passed to the waiting session. The waiting session might be able to avoid reading the database after the alert occurs by using the information in the message.</td>
</tr>
</tbody>
</table>
17.8.6 WAITANY Procedure

Call this procedure to wait for an alert to occur for any of the alerts for which the current session is registered.

Syntax

```sql
DBMS_ALERT.WAITANY (
    name OUT VARCHAR2,
    message OUT VARCHAR2,
    status OUT INTEGER,
    timeout IN NUMBER DEFAULT MAXWAIT);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Returns the name of the alert that occurred.</td>
</tr>
<tr>
<td>message</td>
<td>Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITANY, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>status</td>
<td>Values returned: 0 - alert occurred 1 - timeout occurred</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum time to wait for an alert. If no alert occurs before timeout seconds, this returns a status of 1.</td>
</tr>
</tbody>
</table>

Usage Notes

An implicit COMMIT is issued before this procedure is executed. The same session that waits for the alert may also first signal the alert. In this case remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.

Exceptions

-20000, ORU-10024: there are no alerts registered.

17.8.7 WAITONE Procedure

This procedure waits for a specific alert to occur.

An implicit COMMIT is issued before this procedure is executed. A session that is the first to signal an alert can also wait for the alert in a subsequent transaction. In this case, remember to commit after the signal and before the wait; otherwise, DBMS_LOCK.REQUEST (which is called by DBMS_ALERT) returns status 4.
Syntax

```sql
DBMS_ALERT.WAITONE (
    name      IN   VARCHAR2,
    message   OUT  VARCHAR2,
    status    OUT  INTEGER,
    timeout   IN   NUMBER DEFAULT MAXWAIT);
```

Parameters

**Table 17-9  WAITONE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the alert to wait for. Returns the message associated with the alert. This is the message provided by the SIGNAL call. If multiple signals on this alert occurred before WAITONE, the message corresponds to the most recent SIGNAL call. Messages from prior SIGNAL calls are discarded.</td>
</tr>
<tr>
<td>message</td>
<td>Values returned: 0 - alert occurred 1 - timeout occurred</td>
</tr>
<tr>
<td>status</td>
<td>Maximum time to wait for an alert. If the named alert does not occurs before <code>timeout</code> seconds, this returns a status of 1.</td>
</tr>
<tr>
<td>timeout</td>
<td></td>
</tr>
</tbody>
</table>
The **DBMS_APP_CONT** package provides an interface to determine if the in-flight transaction on a now unavailable session committed or not, and if the last call on that session completed or not.

### See Also:

*Oracle Database Development Guide* for explanations of application continuity and Transaction Guard, and the relationship between these two features:

- "Using Transaction Guard"
- "Ensuring Application Continuity"

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Summary of DBMS_APP_CONT Subprograms**

### 18.1 DBMS_APP_CONT Overview

The DBMS_APP_CONT package can be used to solve this example issue.

#### Problem Description

One of the fundamental problems for recovering applications after an outage is that the commit message that is sent back to the client is not durable. If there is a break between the client and the server, the client sees an error message indicating that the communication failed. This error does not inform the application whether the submission executed any commit operations or if a procedural call, ran to completion executing all expected commits and session state changes or failed part way through or yet worse, is still running disconnected from the client.

**GET_LTXID_OUTCOME**

The purpose of the **GET_LTXID_OUTCOME Procedure** is to determine if the in-flight transaction on a now unavailable session completed or not. It is used when the original session returned an error due to unavailability. Situations that can cause such session unavailability may occur at the session, instance, server, or network, and result from planned or unplanned outages. When such an outage occurs, the application receives a disconnection error. Such an error provides no insight as to whether the transaction committed. It also does not reveal what the application might have been expecting from that commit if it had returned.
18.2 DBMS_APP_CONT Security Model

Applications must have the EXECUTE privilege on the DBMS_APP_CONT package.

To grant this privilege, ask your database administrator to run the following SQL statement:

```
GRANT execute on DBMS_APP_CONT to application user;
```

18.3 Summary of DBMS_APP_CONT Subprograms

The DBMS_APP_CONT package contains the GET_LTXID_OUTCOME Procedure.

### Table 18-1  DBMS_APP_CONT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_LTXID_OUTCOME</td>
<td>Lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.</td>
</tr>
</tbody>
</table>

18.3.1 GET_LTXID_OUTCOME Procedure

This procedure lets customer applications and third party application servers determine the transactional status of the last session when that session becomes unavailable.

**Syntax**

```
DBMS_APP_CONT.GET_LTXID_OUTCOME (  
  client_ltxid          IN    RAW,  
  committed             OUT   BOOLEAN,  
  user_call_completed   OUT   BOOLEAN) 
```

**Parameters**

### Table 18-2  GET_LTXID_OUTCOME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
Table 18-2  (Cont.) GET_LTXID_OUTCOME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>committed</td>
<td>Returns TRUE if the transaction with the named logical LTXID has COMMITTED. Returns FALSE if the logical LTXID has not COMMITTED. When returning FALSE, the procedure blocks the LTXID from further use so that there is no possibility of previous in-flight work committing this LTXID.</td>
</tr>
<tr>
<td>user_call_completed</td>
<td>Whether all information has been returned to the client. Examples of such messages are the number of rows processed when using autocommit or commit on success, parameter and function results when calling PL/SQL, or PL/SQL with more work to do after the COMMIT. Applications that expect to use data returned from the commit in order to function correctly must look at this second parameter.</td>
</tr>
</tbody>
</table>

Exceptions

Table 18-3  GET_LTXID_OUTCOME Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-14950 - SERVER_AHEAD</td>
<td>The server is ahead so the transaction is both an old transaction and one which has already committed. This is an error as the application is passing an older LTXID that is the not the last used for that session. The purpose of GET_LTXID_OUTCOME is to return the current transaction outcome for that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14951 - CLIENT_AHEAD</td>
<td>The client is ahead of the server. This can happen if the server has been flashed backed, recovered using media recovery, or is a standby that has opened earlier with data loss.</td>
</tr>
<tr>
<td>ORA-14906 - SAME_SESSION</td>
<td>Executing GET_LTXID_OUTCOME is not supported on the session owning the LTXID as it blocks further processing on that session after a recoverable outage.</td>
</tr>
<tr>
<td>ORA-14909 - COMMIT_BLOCKED</td>
<td>Your session has been blocked from committing by another user with the same username using GET_LTXID_OUTCOME. GET_LTXID_OUTCOME should only be called on dead sessions. Please check with your application administrator.</td>
</tr>
<tr>
<td>ORA-14952 - ERROR</td>
<td>The outcome cannot be determined. During processing an error happened. The error stack shows the error detail.</td>
</tr>
</tbody>
</table>
Application developers can use the DBMS_APPLICATION_INFO package with Oracle Trace and the SQL trace facility to record names of executing modules or transactions in the database for later use when tracking the performance of various modules and debugging.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_APPLICATION_INFO Subprograms

19.1 DBMS_APPLICATION_INFO Overview

Registering the application allows system administrators and performance tuning specialists to track performance by module. System administrators can also use this information to track resource use by module. When an application registers with the database, its name and actions are recorded in the V$SESSION and V$SQLAREA views.

19.2 DBMS_APPLICATION_INFO Security Model

No further privileges are required. The DBMSAPIN.SQL script is already run as a part of standard database creation.

Note:

The public synonym for DBMS_APPLICATION_INFO is not dropped before creation so that you can redirect the public synonym to point to your own package.

19.3 DBMS_APPLICATION_INFO Operational Notes

Your applications should set the name of the module and name of the action automatically each time a user enters that module. The module name could be the name of a form in an Oracle Forms application, or the name of the code segment in an Oracle Precompilers application. The action name should usually be the name or description of the current transaction within a module.

If you want to gather your own statistics based on module, you can implement a wrapper around this package by writing a version of this package in another schema that first gathers statistics and then calls the SYS version of the package. The public synonym for DBMS_APPLICATION_INFO can then be changed to point to the DBA's version of the package.
19.4 Summary of DBMS_APPLICATION_INFO Subprograms

This table lists and describes the DBMS_APPLICATION_INFO package subprograms.

Table 19-1   DBMS_APPLICATION_INFO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ_CLIENT_INFO Procedure</td>
<td>Reads the value of the client_info field of the current session</td>
</tr>
<tr>
<td>READ_MODULE Procedure</td>
<td>Reads the values of the module and action fields of the current session</td>
</tr>
<tr>
<td>SET_ACTION Procedure</td>
<td>Sets the name of the current action within the current module</td>
</tr>
<tr>
<td>SET_CLIENT_INFO Procedure</td>
<td>Sets the client_info field of the session</td>
</tr>
<tr>
<td>SET_MODULE Procedure</td>
<td>Sets the name of the module that is currently running to a new module</td>
</tr>
<tr>
<td>SET_SESSION_LONGOPS Procedure</td>
<td>Sets a row in the V$SESSION_LONGOPS table</td>
</tr>
</tbody>
</table>

19.4.1 READ_CLIENT_INFO Procedure

This procedure reads the value of the client_info field of the current session.

Syntax

DBMS_APPLICATION_INFO.READ_CLIENT_INFO (client_info OUT VARCHAR2);

Parameters

Table 19-2   READ_CLIENT_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Last client information value supplied to the SET_CLIENT_INFO procedure.</td>
</tr>
</tbody>
</table>

19.4.2 READ_MODULE Procedure

This procedure reads the values of the module and action fields of the current session.

Syntax

DBMS_APPLICATION_INFO.READ_MODULE (module_name OUT VARCHAR2, action_name OUT VARCHAR2);
Parameters

Table 19-3  READ_MODULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Last value that the module name was set to by calling SET_MODULE.</td>
</tr>
<tr>
<td>action_name</td>
<td>Last value that the action name was set to by calling SET_ACTION or SET_MODULE.</td>
</tr>
</tbody>
</table>

Usage Notes

Module and action names for a registered application can be retrieved by querying V$SQLAREA or by calling the READ_MODULE procedure. Client information can be retrieved by querying the V$SESSION view, or by calling the READ_CLIENT_INFO Procedure.

Examples

The following sample query illustrates the use of the MODULE and ACTION column of the V$SQLAREA.

```sql
SELECT sql_text, disk_reads, module, action
FROM v$sqlarea
WHERE module = 'add_employee';
```

```
SQL_TEXT        DISK_READS MODULE ACTION
------------------- ---------- ------------------ ----------------
INSERT INTO emp 1 add_employee insert into emp
(ename, empno, sal, mgr, job, hiredate, comm, deptno)
VALUES
(name, next.emp_seq, manager, title, SYSDATE, commission, department)

1 row selected.
```

19.4.3 SET_ACTION Procedure

This procedure sets the name of the current action within the current module.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_ACTION (    
    action_name IN VARCHAR2);
```

Parameters

Table 19-4  SET_ACTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action_name</td>
<td>The name of the current action within the current module. When the current action terminates, call this procedure with the name of the next action if there is one, or NULL if there is not. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>
Usage Notes

The action name should be descriptive text about the current action being performed. You should probably set the action name before the start of every transaction.

Set the transaction name to NULL after the transaction completes, so that subsequent transactions are logged correctly. If you do not set the transaction name to NULL, subsequent transactions may be logged with the previous transaction's name.

Example

The following is an example of a transaction that uses the registration procedure:

```sql
CREATE OR REPLACE PROCEDURE bal_tran (amt IN NUMBER(7,2)) AS
BEGIN
    -- balance transfer transaction
    DBMS_APPLICATION_INFO.SET_ACTION(
        action_name => 'transfer from chk to sav');
    UPDATE chk SET bal = bal + :amt
    WHERE acct# = :acct;
    UPDATE sav SET bal = bal - :amt
    WHERE acct# = :acct;
    COMMIT;
    DBMS_APPLICATION_INFO.SET_ACTION(null);
END;
```

19.4.4 SET_CLIENT_INFO Procedure

This procedure supplies additional information about the client application.

Syntax

```sql
DBMS_APPLICATION_INFO.SET_CLIENT_INFO (
    client_info IN VARCHAR2);
```

Parameters

Table 19-5   SET_CLIENT_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_info</td>
<td>Supplies any additional information about the client application. This information is stored in the $SESSION view. Information exceeding 64 bytes is truncated.</td>
</tr>
</tbody>
</table>

Note:

CLIENT_INFO is readable and writable by any user. For storing secured application attributes, you can use the application context feature.
19.4.5 SET MODULE Procedure

This procedure sets the name of the current application or module.

Syntax

DBMS_APPLICATION_INFO.SET_MODULE (   module_name IN VARCHAR2,   action_name IN VARCHAR2);

Parameters

Table 19-6  SET MODULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>module_name</td>
<td>Name of module that is currently running. When the current module terminates, call this procedure with the name of the new module if there is one, or NULL if there is not. Names longer than 48 bytes are truncated.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of current action within the current module. If you do not want to specify an action, this value should be NULL. Names longer than 32 bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

Example

CREATE or replace PROCEDURE add_employee(   name VARCHAR2,   salary NUMBER,   manager NUMBER,   title VARCHAR2,   commission NUMBER,   department NUMBER) AS   BEGIN   DBMS_APPLICATION_INFO.SET_MODULE(    module_name => 'add_employee',    action_name => 'insert into emp');   INSERT INTO emp   (ename, empno, sal, mgr, job, hiredate, comm, deptno) VALUES (name, emp_seq.nextval, salary, manager, title, SYSDATE, commission, department);   DBMS_APPLICATION_INFO.SET_MODULE(null, null);   END;

19.4.6 SET_SESSION_LONGOPS Procedure

This procedure sets a row in the V$SESSION_LONGOPS view. This is a view that is used to indicate the on-going progress of a long running operation. Some Oracle functions,
such as parallel execution and Server Managed Recovery, use rows in this view to indicate the status of, for example, a database backup.

Applications may use the `SET_SESSION_LONGOPS` procedure to advertise information on the progress of application specific long running tasks so that the progress can be monitored by way of the `V$SESSION_LONGOPS` view.

**Syntax**

```sql
DBMS_APPLICATION_INFO.SET_SESSION_LONGOPS (
    rindex      IN OUT BINARY_INTEGER,
    slno        IN OUT BINARY_INTEGER,
    op_name     IN     VARCHAR2       DEFAULT NULL,
    target      IN     BINARY_INTEGER DEFAULT 0,
    context     IN     BINARY_INTEGER DEFAULT 0,
   sofar       IN     NUMBER         DEFAULT 0,
    totalwork   IN     NUMBER         DEFAULT 0,
    target_desc IN     VARCHAR2       DEFAULT 'unknown target',
    units       IN     VARCHAR2       DEFAULT NULL)
```

```sql
set_session_longops_nohint constant BINARY_INTEGER := -1;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rindex</td>
<td>A token which represents the <code>v$session_longops</code> row to update. Set this to <code>set_session_longops_nohint</code> to start a new row. Use the returned value from the prior call to reuse a row.</td>
</tr>
<tr>
<td>slno</td>
<td>Saves information across calls to <code>set_session_longops</code>: It is for internal use and should not be modified by the caller.</td>
</tr>
<tr>
<td>op_name</td>
<td>Specifies the name of the long running task. It appears as the <code>OPNAME</code> column of <code>v$session_longops</code>. The maximum length is 64 bytes.</td>
</tr>
<tr>
<td>target</td>
<td>Specifies the object that is being worked on during the long running operation. For example, it could be a table ID that is being sorted. It appears as the <code>TARGET</code> column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>context</td>
<td>Any number the client wants to store. It appears in the <code>CONTEXT</code> column of <code>v$session_longops</code>.</td>
</tr>
<tr>
<td>sofar</td>
<td>Any number the client wants to store. It appears in the <code>SOFAR</code> column of <code>v$session_longops</code>. This is typically the amount of work which has been done so far.</td>
</tr>
<tr>
<td>totalwork</td>
<td>Any number the client wants to store. It appears in the <code>TOTALWORK</code> column of <code>v$session_longops</code>. This is typically an estimate of the total amount of work needed to be done in this long running operation.</td>
</tr>
<tr>
<td>target_desc</td>
<td>Specifies the description of the object being manipulated in this long operation. This provides a caption for the <code>target</code> parameter. This value appears in the <code>TARGET_DESC</code> field of <code>v$session_longops</code>. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>
Table 19-7  (Cont.) SET_SESSION_LONGOPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>Specifies the units in which sofar and totalwork are being represented. It appears as the UNITS field of v$session_longops. The maximum length is 32 bytes.</td>
</tr>
</tbody>
</table>

Example

This example performs a task on 10 objects in a loop. As the example completes each object, Oracle updates V$SESSION_LONGOPS on the procedure’s progress.

DECLARE
  rindex    BINARY_INTEGER;
  slno      BINARY_INTEGER;
  totalwork number;
  sofar     number;
  obj       BINARY_INTEGER;
BEGIN
  rindex := dbms_application_info.set_session_longops_nohint;
  sofar := 0;
  totalwork := 10;
  WHILE sofar < 10 LOOP
    -- update obj based on sofar
    -- perform task on object target
    sofar := sofar + 1;
    dbms_application_info.set_session_longops(rindex, slno,
      "Operation X", obj, 0, sofar, totalwork, "table", "tables");
  END LOOP;
END;
The DBMS_APPLY_ADM package provides subprograms to configure and manage Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This chapter contains the following topics:

• Overview
• Security Model
• Operational Notes
• Summary of DBMS_APPLY_ADM Subprograms

See Also:

• Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and apply processes
• Oracle Database XStream Guide for more information about XStream outbound servers and inbound servers

20.1 DBMS_APPLY_ADM Overview

The DBMS_APPLY_ADM package provides interfaces to start, stop, and configure Oracle Streams apply processes, XStream outbound servers, and XStream inbound servers.

This package includes subprograms for configuring apply handlers, setting enqueue destinations for messages, and specifying execution directives for messages. This package also provides administrative subprograms that set the instantiation SCN for objects at a destination database. This package also includes subprograms for managing apply errors.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

Note:

• For simplicity, this chapter refers to apply processes, XStream outbound servers, and XStream inbound servers as apply components. This chapter identifies a specific type of apply component when necessary.
• Using XStream requires purchasing a license for the Oracle GoldenGate product.
20.2 DBMS_APPLY_ADM Security Model

Security on this package can be controlled by either granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the `DBMS_APPLY_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_APPLY_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

**Note:**

The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting an apply user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator
20.3 DBMS_APPLY_ADM Deprecated Subprograms

The `NONE` value for the `commit_serialization` apply component parameter is deprecated. It is replaced by the `DEPENDENT_TRANSACTIONS` value.

> **Note:**

Oracle recommends that you do not use deprecated apply component parameter values. Support for deprecated features is for backward compatibility only.

> **See Also:**

SET_PARAMETER Procedure

20.4 Summary of DBMS_APPLY_ADM Subprograms

This table topic lists and describes the DBMS_APPLY_ADM subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_STMT_HANDLER Procedure</td>
<td>Adds a statement DML handler for a specified operation on a specified database object to a single apply component or to all apply components in the database</td>
</tr>
<tr>
<td>ALTER_APPLY Procedure</td>
<td>Alters an apply component</td>
</tr>
<tr>
<td>COMPARE_OLD_VALUES Procedure</td>
<td>Specifies whether to compare the old value of one or more columns in a row logical change record (row LCR) with the current value of the corresponding columns at the destination site during apply</td>
</tr>
<tr>
<td>CREATE_APPLY Procedure</td>
<td>Creates an apply component</td>
</tr>
<tr>
<td>CREATE_OBJECT_DEPENDENCY Procedure</td>
<td>Creates an object dependency</td>
</tr>
<tr>
<td>DELETE_ALL_ERRORS Procedure</td>
<td>Deletes all the error transactions for the specified apply component</td>
</tr>
<tr>

<td>Enables or disables basic conflict resolution for an apply process and a table</td>
</tr>
<tr>
<td>REMOVE_STMT_HANDLER</td>
<td>Removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database</td>
</tr>
<tr>
<td>SET_CHANGE_HANDLER Procedure</td>
<td>Sets or unsets a statement DML handler that tracks changes for a specified operation on a specified database object for a single apply component</td>
</tr>
<tr>
<td>SET_DML_CONFLICT_HANDLER Procedure</td>
<td>Adds, modifies, or removes a prebuilt DML conflict handler for INSERT, UPDATE, or DELETE conflicts on the specified object</td>
</tr>
<tr>
<td>SET_DML_HANDLER Procedure</td>
<td>Sets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database</td>
</tr>
<tr>
<td>SET_ENQUEUE_DESTINATION Procedure</td>
<td>Sets the queue where the apply component automatically enqueues a message that satisfies the specified rule</td>
</tr>
<tr>
<td>SET_EXECUTE Procedure</td>
<td>Specifies whether a message that satisfies the specified rule is executed by an apply component</td>
</tr>
<tr>
<td>SET_GLOBAL_INSTANTIATION_Scn Procedure</td>
<td>Records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas</td>
</tr>
<tr>
<td>SET_KEY_COLUMNS Procedures</td>
<td>Records the set of columns to be used as the substitute primary key for local apply purposes and removes existing substitute primary key columns for the specified object if they exist</td>
</tr>
<tr>
<td>SET_PARAMETER Procedure</td>
<td>Sets an apply parameter to the specified value</td>
</tr>
<tr>
<td>SET_REPERROR_HANDLER Procedure</td>
<td>Specifies how a particular error is handled based on its error number</td>
</tr>
<tr>
<td>SET_SCHEMA_INSTANTIATION_Scn Procedure</td>
<td>Records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database</td>
</tr>
<tr>
<td>SET_TABLE_INSTANTIATION_Scn Procedure</td>
<td>Records the specified instantiation SCN for the specified table in the specified source database</td>
</tr>
<tr>
<td>SET_UPDATE_CONFLICT_HANDLER Procedure</td>
<td>Adds, updates, or drops an update conflict handler for the specified object</td>
</tr>
<tr>
<td>SET_VALUE_DEPENDENCY Procedure</td>
<td>Sets or removes a value dependency</td>
</tr>
<tr>
<td>START_APPLY Procedure</td>
<td>Directs the apply component to start applying messages</td>
</tr>
</tbody>
</table>
### Table 20-1 (Cont.) DBMS_APPLY_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOP_APPLY Procedure</td>
<td>Stops the apply component from applying any messages and rolls back any unfinished transactions being applied</td>
</tr>
</tbody>
</table>

**Note:**

All procedures commit unless specified otherwise. However, the GET_ERROR_MESSAGE function does not commit.

---

#### 20.4.1 ADD_STMT_HANDLER Procedure

This procedure adds a statement DML handler for a specified operation on a specified database object. The procedure adds the statement DML handler to a single apply component or to all apply components in the database.

This procedure is overloaded. One version of this procedure contains the `statement` and `comment` parameters, and the other does not. The `statement` parameter enables you to create the statement DML handler and add it to one or more processes in one step. Otherwise, create the statement DML handler using the `DBMS_STREAMS_HANDLER_ADM` package before adding it to one or more processes.

**See Also:**

- `DBMS_STREAMS_HANDLER_ADM`
- *Oracle Streams Concepts and Administration*

**Syntax**

```sql
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    statement       IN  CLOB,
    apply_name      IN  VARCHAR2 DEFAULT NULL,
    comment         IN  VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_APPLY_ADM.ADD_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    apply_name      IN  VARCHAR2 DEFAULT NULL);
```
### Parameters

**Table 20-2  ADD_STMT_HANDLER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>• INSERT</td>
</tr>
<tr>
<td></td>
<td>• UPDATE</td>
</tr>
<tr>
<td></td>
<td>• DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>Note: Statement DML handlers cannot be specified for LOB operations.</td>
<td></td>
</tr>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If the specified statement DML handler exists, then the statement in the statement parameter is added to the existing handler. Ensure that the existing statement DML handler is for the same operation on the same database object as the settings for the operation_name and object_name parameters, respectively. If the existing handler is for a different operation or database object, then an apply error results when the handler is invoked.</td>
</tr>
<tr>
<td></td>
<td>If the specified statement DML handler does not exist and a non-NULL statement parameter is specified, then this procedure creates the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If the specified statement DML handler does not exist and the statement parameter is not specified or is NULL, then this procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>statement</td>
<td>The text of the SQL statement to add to the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure adds the statement DML handler as a general handler to all apply components in the database.</td>
</tr>
<tr>
<td>comment</td>
<td>A comment for the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then no comment is recorded for the statement DML handler.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- The ADD_STMT_HANDLER Procedure and XStream Outbound Servers
- The ADD_STMT_HANDLER Procedure and XStream Inbound Servers
The ADD_STMT_HANDLER Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers. Outbound servers ignore all apply handlers.

The ADD_STMT_HANDLER Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

20.4.2 ALTER_APPLY Procedure
This procedure alters an apply component.

Syntax

```sql
DBMS_APPLY_ADM.ALTER_APPLY(
    apply_name                IN  VARCHAR2,
    rule_set_name             IN  VARCHAR2  DEFAULT NULL,
    remove_rule_set           IN  BOOLEAN   DEFAULT FALSE,
    message_handler           IN  VARCHAR2  DEFAULT NULL,
    remove_message_handler    IN  BOOLEAN   DEFAULT FALSE,
    ddl_handler               IN  VARCHAR2  DEFAULT NULL,
    remove_ddl_handler        IN  BOOLEAN   DEFAULT FALSE,
    apply_user                IN  VARCHAR2  DEFAULT NULL,
    apply_tag                 IN  RAW       DEFAULT NULL,
    remove_apply_tag          IN  BOOLEAN   DEFAULT FALSE,
    precommit_handler         IN  VARCHAR2  DEFAULT NULL,
    remove_precommit_handler  IN  BOOLEAN   DEFAULT FALSE,
    negative_rule_set_name    IN  VARCHAR2  DEFAULT NULL,
    remove_negative_rule_set  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 20-3 ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being altered. You must specify the name of an existing apply component. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then this procedure retains any existing positive rule set for the specified apply component. If you specify NULL and the remove_rule_set parameter is set to TRUE, then this procedure removes any existing positive rule set from the specified apply component.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified apply component. If you remove the positive rule set for an apply component, and the apply component does not have a negative rule set, then the apply component dequeues all messages in its queue. If you remove the positive rule set for an apply component, and a negative rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified apply component. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply component. See “Usage Notes” in the CREATE_APPLY Procedure for more information about a message handler procedure.</td>
</tr>
<tr>
<td>remove_message_handler</td>
<td>If TRUE, then the procedure removes the message handler for the specified apply component. If FALSE, then the procedure retains any message handler for the specified apply component. If the message_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>ddl_handler</td>
<td>A user-defined procedure that processes DDL logical change records (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See “Usage Notes” in the CREATE_APPLY Procedure for more information about a DDL handler procedure.</td>
</tr>
<tr>
<td>remove_ddl_handler</td>
<td>If TRUE, then the procedure removes the DDL handler for the specified apply component. If FALSE, then the procedure retains any DDL handler for the specified apply component. If the ddl_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| apply_user  | The user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations, and runs apply handlers. If NULL, then the apply user is not changed. If a non-NULL value is specified to change the apply user, then the user who invokes the ALTER_APPLY procedure must be granted the DBA role. Only the SYS user can set the apply_user to SYS.
If you change the apply user, then this procedure grants the new apply user dequeue privilege on the queue used by the apply component. It also configures the user as a secure queue user of the queue.
In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:
• The necessary privileges to perform DML and DDL changes on the apply objects
• EXECUTE privilege on the rule sets used by the apply component
• EXECUTE privilege on all rule-based transformation functions used in the rule set
• EXECUTE privilege on all apply handler procedures
These privileges can be granted directly to the apply user, or they can be granted through roles.
In addition, the apply user must be granted the EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.
By default, this parameter is set to the user who created the apply component by running either the CREATE_APPLY procedure in this package or a procedure in the DBMS_STREAMS_ADM package.
**Note:** If the apply user for an apply component is dropped using DROP USER . . . CASCADE, then the apply component is also dropped automatically.
A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.
The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component. If so, then the captured changes include the tag specified by this parameter.
If NULL, the default, then the apply tag for the apply component is not changed.
The following is an example of a tag with a hexadecimal value of 17:
```
HEXTORAW('17')
```
**See Also:** Oracle Streams Replication Administrator's Guide for more information about tags

apply_tag
Table 20-3  (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_apply_tag</td>
<td>If TRUE, then the procedure sets the apply tag for the specified apply component to NULL, and the apply component generates redo entries with NULL tags.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure retains any apply tag for the specified apply component.</td>
</tr>
<tr>
<td></td>
<td>If the apply_tag parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>precommit_handler</td>
<td>A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component.</td>
</tr>
<tr>
<td></td>
<td>An internal commit directive is enqueued in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.</td>
</tr>
<tr>
<td></td>
<td>• When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.</td>
</tr>
<tr>
<td></td>
<td>For a captured row LCR, a commit directive contains the commit SCN of the transaction from the source database. For a user message, the commit SCN is generated by the apply component.</td>
</tr>
<tr>
<td></td>
<td>The precommit handler procedure must conform to the following restrictions:</td>
</tr>
<tr>
<td></td>
<td>• Any work that commits must be an autonomous transaction.</td>
</tr>
<tr>
<td></td>
<td>• Any rollback must be to a named savepoint created in the procedure.</td>
</tr>
<tr>
<td></td>
<td>If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Usage Notes&quot; in the CREATE_APPLY Procedure for more information about a precommit handler procedure.</td>
</tr>
<tr>
<td>remove_precommit_handler</td>
<td>If TRUE, then the procedure removes the precommit handler for the specified apply component.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure retains any precommit handler for the specified apply component.</td>
</tr>
<tr>
<td></td>
<td>If the precommit_handler parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>
Table 20-3  (Cont.) ALTER_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages.</td>
</tr>
<tr>
<td></td>
<td>If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set.</td>
</tr>
<tr>
<td></td>
<td>If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If TRUE, then the procedure removes the negative rule set for the specified apply component. If you remove the negative rule set for an apply component, and the apply component does not have a positive rule set, then the apply component dequeues all messages in its queue.</td>
</tr>
<tr>
<td></td>
<td>If you remove the negative rule set for an apply component, and a positive rule set exists for the apply component, then the apply component dequeues all messages in its queue that are not discarded by the positive rule set.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the procedure retains the negative rule set for the specified apply component. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Automatic Restart of Apply Components
- The ALTER_APPLY Procedure and XStream Outbound Servers
- The ALTER_APPLY Procedure and XStream Inbound Servers

Automatic Restart of Apply Components

An apply component is stopped and restarted automatically when you change the value of one or more of the following ALTER_APPLY procedure parameters:

- message_handler
- ddi_handler
- apply_user
The ALTER_APPLY Procedure and XStream Outbound Servers

The following usage notes apply to this procedure and XStream outbound servers:

- The apply_user parameter can change the connect user for an outbound server.
- You cannot specify an apply handler for an outbound server. An outbound server ignores the settings for the following parameters: message_handler, ddl_handler, and precommit_handler.
  The client application can perform custom processing of the LCRs instead if necessary.
- An outbound server cannot set an apply tag for the changes it processes. An outbound server ignores the setting for the apply_tag parameter.

The ALTER_APPLY Procedure and XStream Inbound Servers

Inbound servers can use apply handlers and process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.

20.4.3 COMPARE_OLD_VALUES Procedure

This procedure specifies whether to compare the old values of one or more columns in a row logical change record (row LCR) with the current values of the corresponding columns at the destination site during apply.

This procedure is relevant only for UPDATE and DELETE operations because only these operations result in old column values in row LCRs. The default is to compare old values for all columns.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

See Also:

Oracle Streams Replication Administrator's Guide for more information about conflict detection and resolution in an Oracle Streams environment

Syntax

```sql
DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name       IN VARCHAR2,
    column_list       IN VARCHAR2,
    operation         IN VARCHAR2 DEFAULT 'UPDATE',
    compare           IN BOOLEAN  DEFAULT TRUE,
    apply_database_link IN VARCHAR2 DEFAULT NULL);

DBMS_APPLY_ADM.COMPARE_OLD_VALUES(
    object_name       IN VARCHAR2,
    column_table      IN DBMS_UTILITY.LNAME_ARRAY,
    operation         IN VARCHAR2 DEFAULT 'UPDATE',

```
Parameters

Table 20-4  COMPARE_OLD_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries. Specify * to include all nonkey columns.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.LNAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td>operation</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>• UPDATE for UPDATE operations</td>
</tr>
<tr>
<td></td>
<td>• DELETE for DELETE operations</td>
</tr>
<tr>
<td></td>
<td>• * for both UPDATE and DELETE operations</td>
</tr>
<tr>
<td>compare</td>
<td>If compare is TRUE, the old values of the specified columns are compared during apply.</td>
</tr>
<tr>
<td></td>
<td>If compare is FALSE, the old values of the specified columns are not compared during apply.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Conflict Detection
- The COMPARE_OLD_VALUES Procedure and XStream Outbound Servers
- The COMPARE_OLD_VALUES Procedure and XStream Inbound Servers

Conflict Detection

By default, an apply component uses the old column values in a row LCR to detect conflicts. You can choose not to compare old column values to avoid conflict detection for specific tables. For example, if you do not want to compare the old values for a set of columns during apply, then, using the COMPARE_OLD_VALUES procedure, specify the set of columns in the column_list or column_table parameter, and set the compare parameter to FALSE.

In addition, when the compare_key_only apply component parameter is set to Y, automatic conflict detection is disabled, and the apply component only uses primary key and unique key columns to identify the table row for a row LCR. When the compare_key_only apply component parameter is set to N, automatic conflict detection is enabled, and the apply component uses all of the old values in a row LCR to identify the table row for a row LCR.
Note:

- An apply component compares old values for non-key columns when they are present in a row LCR and when the apply component parameter `compare_key_only` is set to `N`.
- This procedure raises an error if a key column is specified in `column_list` or `column_table` and the `compare` parameter is set to `FALSE`.

See Also:

- `SET_PARAMETER Procedure` for more information about the `compare_key_only` apply component parameter

The `COMPARE_OLD_VALUES Procedure` and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The `COMPARE_OLD_VALUES Procedure` and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.4 CREATE_APPLY Procedure

This procedure creates an apply component.

Syntax

```
DBMS_APPLY_ADM.CREATE_APPLY(
    queue_name         IN  VARCHAR2,
    apply_name         IN  VARCHAR2,
    rule_set_name      IN  VARCHAR2  DEFAULT NULL,
    message_handler    IN  VARCHAR2  DEFAULT NULL,
    ddl_handler        IN  VARCHAR2  DEFAULT NULL,
    apply_user         IN  VARCHAR2  DEFAULT NULL,
    apply_database_link IN  VARCHAR2  DEFAULT NULL,
    apply_tag          IN  RAW       DEFAULT '00',
    apply_captured     IN  BOOLEAN  DEFAULT FALSE,
    precommit_handler  IN  VARCHAR2  DEFAULT NULL,
    negative_rule_set_name IN  VARCHAR2  DEFAULT NULL,
    source_database    IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 20-5  CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue from which the apply component dequeues messages. You must specify an existing queue in the form <code>[schema_name.]queue_name</code>. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. <strong>Note:</strong> The queue_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component being created. A NULL specification is not allowed. Do not specify an owner. The specified name must not match the name of an existing apply component or messaging client. <strong>Note:</strong> The apply_name setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the apply component. The positive rule set contains the rules that instruct the apply component to apply messages. If you want to use a positive rule set for the apply component, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a positive rule set in the hr schema named job_apply_rules, enter hr.job_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no negative rule set is specified, then the apply component applies either all captured messages or all messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADMIN package or the DBMS_RULE_ADMIN package.</td>
</tr>
<tr>
<td>message_handler</td>
<td>A user-defined procedure that processes non-LCR messages in the queue for the apply component. See &quot;Usage Notes&quot; for more information about a message handler procedure.</td>
</tr>
<tr>
<td>ddl_handler</td>
<td>A user-defined procedure that processes DDL logical change record (DDL LCRs) in the queue for the apply component. All applied DDL LCRs commit automatically. Therefore, if a DDL handler calls the EXECUTE member procedure of a DDL LCR, then a commit is performed automatically. See &quot;Usage Notes&quot; for more information about a DDL handler procedure.</td>
</tr>
</tbody>
</table>
Table 20-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_user</td>
<td>The user who applies all DML and DDL changes that satisfy the apply component rule sets and who runs user-defined apply handlers. If NULL, then the user who runs the CREATE_APPLY procedure is used.</td>
</tr>
<tr>
<td></td>
<td>The apply user is the user in whose security domain an apply component dequeues messages that satisfy its rule sets, applies messages directly to database objects, runs custom rule-based transformations configured for apply component rules, and runs apply handlers configured for the apply component. This user must have the necessary privileges to apply changes. This procedure grants the apply user dequeue privilege on the queue used by the apply component and configures the user as a secure queue user of the queue.</td>
</tr>
<tr>
<td></td>
<td>In addition to the privileges granted by this procedure, you also should grant the following privileges to the apply user:</td>
</tr>
<tr>
<td></td>
<td>• The necessary privileges to perform DML and DDL changes on the apply objects</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on the rule sets used by the apply component</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on all rule-based transformation functions used in the rule set</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE privilege on all apply handler procedures</td>
</tr>
<tr>
<td></td>
<td>These privileges can be granted directly to the apply user, or they can be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>In addition, the apply user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in subprograms run by the apply component. These privileges must be granted directly to the apply user. They cannot be granted through roles.</td>
</tr>
<tr>
<td></td>
<td>You can use the packages DBMS_STREAMS_AUTH and DBMS_XSTREAM_AUTH to grant and revoke administrative privileges in Oracle Streams and XStream configurations, respectively. These packages do not configure the necessary privileges to perform DML or DDL changes on the apply objects.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The database at which the apply component applies messages. This parameter is used by an apply component when applying changes from Oracle to non-Oracle systems, such as Sybase. Set this parameter to NULL to specify that the apply component applies messages at the local database.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The apply_database_link setting cannot be altered after the apply component is created.</td>
</tr>
</tbody>
</table>
Table 20-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_tag</td>
<td>A binary tag that is added to redo entries generated by the specified apply component. The tag is a binary value that can be used to track LCRs.</td>
</tr>
<tr>
<td></td>
<td>The tag is relevant only if a capture process at the database where the apply component is running captures changes made by the apply component.</td>
</tr>
<tr>
<td></td>
<td>If so, then the captured changes include the tag specified by this parameter.</td>
</tr>
<tr>
<td></td>
<td>By default, the tag for an apply component is the hexadecimal equivalent of '00' (double zero).</td>
</tr>
<tr>
<td></td>
<td>The following is an example of a tag with a hexadecimal value of 17:</td>
</tr>
<tr>
<td></td>
<td>HEXTORAW('17')</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the apply component generates redo entries with NULL tags.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Replication Administrator’s Guide for more information about tags</td>
</tr>
<tr>
<td>apply_almost</td>
<td>Either TRUE or FALSE.</td>
</tr>
<tr>
<td></td>
<td>If TRUE, then the apply component applies only the captured LCRs in the queue. Captured LCRs are LCRs that were captured by an Oracle Streams capture process.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the apply component applies only the messages in a persistent queue. These are messages that were not captured by an Oracle Streams capture process, such as persistent LCRs or user messages.</td>
</tr>
<tr>
<td></td>
<td>To apply both captured LCRs and messages in a persistent queue, you must create at least two apply components.</td>
</tr>
<tr>
<td></td>
<td>Note: The apply_almost setting cannot be altered after the apply component is created.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Concepts and Administration for more information about processing messages with an apply component</td>
</tr>
</tbody>
</table>
Table 20-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| precommit_handler | A user-defined procedure that can receive internal commit directives in the queue for the apply component before they are processed by the apply component. Typically, precommit handlers are used for auditing commit information for transactions processed by an apply component. An internal commit directive is enqueued in the following ways:  
  • When a capture process captures row LCRs, the capture process enqueues the commit directive for the transaction that contains the row LCRs.  
  • When a synchronous capture captures row LCRs, the persistent LCRs that were enqueued by the synchronous capture are organized into a message group. The synchronous capture records the transaction identifier in each persistent LCR in a transaction.  
  • When a user or application enqueues messages and then issues a COMMIT statement, the commit directive is enqueued automatically.  
  For a row LCR captured by a capture process or synchronous capture, a commit directive contains the commit SCN of the transaction from the source database. For a message enqueued by a user or application, the commit SCN is generated by the apply component.  
  The precommit handler procedure must conform to the following restrictions:  
  • Any work that commits must be an autonomous transaction.  
  • Any rollback must be to a named savepoint created in the procedure.  
  If a precommit handler raises an exception, then the entire apply transaction is rolled back, and all of the messages in the transaction are moved to the error queue.  
  See "Usage Notes" for more information about a precommit handler procedure. |
Table 20-5  (Cont.) CREATE_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the apply component. The negative rule set contains the rules that instruct the apply component to discard messages. If you want to use a negative rule set for the apply component, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_apply_rules, enter hr.neg_apply_rules. If the schema is not specified, then the current user is the default. If you specify NULL, and no positive rule set is specified, then the apply component applies either all captured LCRs or all of the messages in the persistent queue, depending on the setting of the apply_captured parameter. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify both a positive and a negative rule set for an apply component, then the negative rule set is always evaluated first.</td>
</tr>
</tbody>
</table>

| source_database     | The global name of the source database for the changes that will be applied by the apply component. The source database is the database where the changes originated. If an apply component applies captured messages, then the apply component can apply messages from only one capture process at one source database. If NULL, then the source database name of the first LCR received by the apply component is used for the source database. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically. The rules in the apply component rule sets determine which messages are dequeued by the apply component. If the apply component dequeues an LCR with a source database that is different than the source database for the apply component, then an error is raised. You can determine the source database for an apply component by querying the DBA_APPLY_PROGRESS data dictionary view. |

Usage Notes

The following sections describe usage notes for this procedure:

- **DBA Role Requirement**
- **Handler Procedure Names**
- **Message Handler and DDL Handler Procedure**
- **Precommit Handler Procedure**
- **The CREATE_APPLY Procedure and XStream Outbound Servers**
The CREATE_APPLY Procedure and XStream Inbound Servers

**DBA Role Requirement**

If the user who invokes this procedure is different from the user specified in the `apply_user` parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the `apply_user` parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the `apply_user` to SYS.

**Handler Procedure Names**

For the `message_handler`, `ddl_handler`, and `precommit_handler` parameters, specify an existing procedure in one of the following forms:

- `[schema_name.]procedure_name`
- `[schema_name.]package_name.procedure_name`

If the procedure is in a package, then the `package_name` must be specified. For example, to specify a procedure in the `apply_pkg` package in the `hr` schema named `process_ddls`, enter `hr.apply_pkg.process_ddls`. An error is returned if the specified procedure does not exist.

The user who invokes the CREATE_APPLY procedure must have EXECUTE privilege on a specified handler procedure. Also, if the `schema_name` is not specified, then the user who invokes the CREATE_APPLY procedure is the default.

**Message Handler and DDL Handler Procedure**

The procedure specified in both the `message_handler` parameter and the `ddl_handler` parameter must have the following signature:

```sql
PROCEDURE handler_procedure (  
    parameter_name IN  ANYDATA);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. For the message handler, the parameter passed to the procedure is a ANYDATA encapsulation of a user message. For the DDL handler procedure, the parameter passed to the procedure is a ANYDATA encapsulation of a DDL LCR.

**Precommit Handler Procedure**

The procedure specified in the `precommit_handler` parameter must have the following signature:

```sql
PROCEDURE handler_procedure (  
    parameter_name IN  NUMBER);
```

Here, `handler_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is the commit SCN of a commit directive.

---

**See Also:**

Logical Change Record TYPES for information about DDL LCRs
The CREATE_APPLY Procedure and XStream Outbound Servers

This procedure cannot create an XStream outbound server. To create an XStream outbound server, use the DBMS_XSTREAM_ADM package.

The CREATE_APPLY Procedure and XStream Inbound Servers

The following usage notes apply to this procedure and XStream inbound servers:

- The CREATE_APPLY procedure always creates an apply process. The apply process remains an apply process if it receives messages from a source other than an XStream client application, such as a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives messages from any other source. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

- When creating an inbound server using the CREATE_APPLY procedure, set the apply_captured parameter to TRUE. Inbound servers only process LCRs captured by a capture process.

- Inbound servers can use apply handlers. Inbound servers process only DML and DDL LCRs. Therefore, inbound servers ignore message handlers specified in the message_handler parameter.

20.4.5 CREATE_OBJECT_DEPENDENCY Procedure

This procedure creates an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

An apply component schedules execution of transactions that involve the child object after all transactions with a lower commit system change number (commit SCN) that involve the parent object have been committed. An apply component uses the object identifier of the objects in the logical change records (LCRs) to detect dependencies. The apply component does not use column values in the LCRs to detect dependencies.

Note:

An error is raised if NULL is specified for either of the procedure parameters.

See Also:

- DROP_OBJECT_DEPENDENCY Procedure
- Oracle Streams Concepts and Administration
Syntax

DBMS_APPLY_ADM.CREATE_OBJECT_DEPENDENCY(
    object_name         IN  VARCHAR2,
    parent_object_name  IN  VARCHAR2);

Parameters

Table 20-6  CREATE_OBJECT_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as [schema_name.]object_name. For example, hr.departments. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers
- The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The CREATE_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.6 DELETE_ALL_ERRORS Procedure

This procedure deletes all the error transactions for the specified apply component.

Syntax

DBMS_APPLY_ADM.DELETE_ALL_ERRORS(
    apply_name IN VARCHAR2 DEFAULT NULL);

Parameter

Table 20-7  DELETE_ALL_ERRORS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are deleted.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers
- The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

The DELETE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

The DELETE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.7 DELETE_ERROR Procedure

This procedure deletes the specified error transaction.

Syntax

```
DBMS_APPLY_ADM.DELETE_ERROR(
    local_transaction_id  IN  VARCHAR2);
```

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to delete. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DELETE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure has no effect on XStream outbound servers.

- The DELETE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
20.4.8 DROP_APPLY Procedure

This procedure drops an apply component.

Syntax

```sql
DBMS_APPLY_ADM.DROP_APPLY(
    apply_name      IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 20-9  DROP_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component being dropped. You must specify an existing apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified apply component if these rule sets are not used by any other Oracle Streams or XStream component. These components include capture processes, propagations, apply processes, inbound servers, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified apply component, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The DROP_APPLY Procedure and Rules
- The DROP_APPLY Procedure and XStream Outbound Servers
- The DROP_APPLY Procedure and XStream Inbound Servers

The DROP_APPLY Procedure and Rules

When you use this procedure to drop an apply component, information about rules created for the apply component using the `DBMS_STREAMS_ADM` package is removed from the data dictionary views for rules. Information about such a rule is removed even if the rule is not in either the positive or negative rule set for the apply component. The following are the data dictionary views for rules:

- `ALLSTREAMSGlobalRules`
- `DBA_STREAMSGlobalRules`
- `ALLSTREAMSMensajeRules`
- `DBA_STREAMSMensajeRules`
- `ALLSTREAMSCHEMA_RULES`
- `DBA_STREAMSCHEMA_RULES`
The DROP_APPLY Procedure and XStream Outbound Servers

When the DROP_APPLY procedure is executed on an outbound server, it runs the DROP_OUTBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the outbound server's capture process and queue.

The DROP_APPLY Procedure and XStream Inbound Servers

When the DROP_APPLY procedure is executed on an inbound server, it runs the DROP_INBOUND procedure in the DBMS_XSTREAM_ADM package. Therefore, it might also drop the inbound server's queue.

20.4.9 DROP_OBJECT_DEPENDENCY Procedure

This procedure drops an object dependency. An object dependency is a virtual dependency definition that defines a parent-child relationship between two objects at a destination database.

Note:

- An error is raised if an object dependency does not exist for the specified database objects.
- An error is raised if NULL is specified for either of the procedure parameters.

See Also:

- CREATE_OBJECT_DEPENDENCY Procedure
- Oracle Streams Concepts and Administration

Syntax

DBMS_APPLY_ADM.DROP_OBJECT_DEPENDENCY(
object_name IN VARCHAR2,
parent_object_name IN VARCHAR2);
### Parameters

#### Table 20-10  DROP_OBJECT_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the child database object, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>parent_object_name</td>
<td>The name of the parent database object, specified as [schema_name.]object_name. For example, hr.departments. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The following usage notes apply to this procedure:

**The DROP_OBJECT_DEPENDENCY Procedure and XStream Outbound Servers**

This procedure has no effect on XStream outbound servers.

**The DROP_OBJECT_DEPENDENCY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

### 20.4.10 EXECUTE_ALL_ERRORS Procedure

This procedure re-executes the error transactions in the error queue for the specified apply component.

The transactions are re-executed in commit SCN order. Error re-execution stops if an error is raised.

**See Also:**

*Oracle Streams Concepts and Administration* for more information about the error queue

#### Syntax

```sql
DBMS_APPLY_ADM.EXECUTE_ALL_ERRORS(
    apply_name       IN  VARCHAR2  DEFAULT NULL,
    execute_as_user  IN  BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 20-11 EXECUTE_ALL_ERRORS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply component that raised the errors while processing the transactions. Do not specify an owner. If NULL, then all error transactions for all apply components are re-executed.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If TRUE, then the procedure re-executes the transactions in the security context of the current user. If FALSE, then the procedure re-executes each transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The DBA_APPLY_ERROR data dictionary view lists the original receiver for each error transaction. The user who executes the transactions must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

• The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers
• The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

The EXECUTE_ALL_ERRORS Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ALL_ERRORS Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.11 EXECUTE_ERROR Procedure

This procedure re-executes the specified error transaction in the error queue.

See Also:

Oracle Streams Concepts and Administration for more information about the error queue

Syntax

```
DBMS_APPLY_ADM.EXECUTE_ERROR(
  local_transaction_id  IN  VARCHAR2,
  execute_as_user       IN  BOOLEAN   DEFAULT FALSE,
  user_procedure        IN  VARCHAR2  DEFAULT NULL);
```
**Parameters**

**Table 20-12 EXECUTE_ERROR Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>local_transaction_id</td>
<td>The identification number of the error transaction to execute. If the specified transaction does not exist in the error queue, then an error is raised.</td>
</tr>
<tr>
<td>execute_as_user</td>
<td>If <strong>TRUE</strong>, then the procedure re-executes the transaction in the security context of the current user. If <strong>FALSE</strong>, then the procedure re-executes the transaction in the security context of the original receiver of the transaction. The original receiver is the user who was processing the transaction when the error was raised. The <strong>DBA_APPLY_ERROR</strong> data dictionary view lists the original receiver for each error transaction. The user who executes the transaction must have privileges to perform DML and DDL changes on the apply objects and to run any apply handlers. This user must also have dequeue privileges on the queue used by the apply component.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that modifies the error transaction so that it can be successfully executed. Specify <strong>NULL</strong> to execute the error transaction without running a user procedure. <strong>See Also</strong>: &quot;Usage Notes&quot; for more information about the user procedure</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- **The User Procedure**
- **The EXECUTE_ERROR Procedure and XStream Outbound Servers**
- **The EXECUTE_ERROR Procedure and XStream Inbound Servers**

**The User Procedure**

You must specify the full procedure name for the **user_procedure** parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the **package_name** must be specified. The user who invokes the **EXECUTE_ERROR** procedure must have EXECUTE privilege on the specified procedure. Also, if the **schema_name** is not specified, then the user who invokes the **EXECUTE_ERROR** procedure is the default.

For example, suppose the **procedure_name** has the following properties:

- **strmadmin** is the **schema_name**.
- **fix_errors** is the **package_name**.
- **fix_hr_errors** is the **procedure_name**.

In this case, specify the following:
The procedure you create for error handling must have the following signature:

```sql
PROCEDURE user_procedure (  
in_anydata                    IN      ANYDATA,  
error_record                  IN      DBA_APPLY_ERROR%ROWTYPE,  
error_message_number          IN      NUMBER,  
messaging_default_processing  IN OUT  BOOLEAN,  
out_anydata                   OUT     ANYDATA);
```

The user procedure has the following parameters:

- **in_anydata**: The `ANYDATA` encapsulation of a message that the apply component passes to the procedure. A single transaction can include multiple messages. A message can be a row logical change record (row LCR), a DDL logical change record (DDL LCR), or a user message.

- **error_record**: The row in the `DBA_APPLY_ERROR` data dictionary view that identifies the transaction.

- **error_message_number**: The message number of the `ANYDATA` object in the `in_anydata` parameter, starting at 1.

- **messaging_default_processing**: If `TRUE`, then the apply component continues processing the message in the `in_anydata` parameter, which can include executing DML or DDL statements and invoking apply handlers. If `FALSE`, then the apply component skips processing the message in the `in_anydata` parameter and moves on to the next message in the `in_anydata` parameter.

- **out_anydata**: The `ANYDATA` object processed by the user procedure and used by the apply component if `messaging_default_processing` is `TRUE`.

If an LCR is executed using the `EXECUTE LCR` member procedure in the user procedure, then the LCR is executed directly, and the `messaging_default_processing` parameter should be set to `FALSE`. In this case, the LCR is not passed to any apply handlers.

Processing an error transaction with a user procedure results in one of the following outcomes:

- The user procedure modifies the transaction so that it can be executed successfully.

- The user procedure fails to make the necessary modifications, and an error is raised when transaction execution is attempted. In this case, the transaction is rolled back and remains in the error queue.

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction.

- Do not modify `LONG`, `LONG RAW` or `LOB` column data in an LCR.

- If the `ANYDATA` object in the `in_anydata` parameter is a row LCR, then the `out_anydata` parameter must be row LCR if the `messaging_default_processing` parameter is set to `TRUE`.

- If the `ANYDATA` object in the `in_anydata` parameter is a DDL LCR, then the `out_anydata` parameter must be DDL LCR if the `messaging_default_processing` parameter is set to `TRUE`.
• The user who runs the user procedure must have the SELECT or READ privilege on the DBA_APPLY_ERROR data dictionary view.

Note:

LCRs containing transactional directives, such as COMMIT and ROLLBACK, are not passed to the user procedure.

The EXECUTE_ERROR Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The EXECUTE_ERROR Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.12 GET_ERROR_MESSAGE Function

This function returns the message payload from the error queue for the specified message number and transaction identifier. The message can be a logical change record (LCR) or a non-LCR message.

This function is overloaded. One version of this function contains two OUT parameters. These OUT parameters contain the destination queue into which the message should be enqueued, if one exists, and whether the message should be executed. The destination queue is specified using the SET_ENQUEUE_DESTINATION procedure, and the execution directive is specified using the SET_EXECUTE procedure.

See Also:

• SET_ENQUEUE_DESTINATION Procedure
• SET_EXECUTE Procedure

Syntax

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number IN NUMBER,
    local_transaction_id IN VARCHAR2,
    destination_queue_name OUT VARCHAR2,
    execute OUT BOOLEAN
) RETURN ANYDATA;

DBMS_APPLY_ADM.GET_ERROR_MESSAGE(
    message_number IN NUMBER,
    local_transaction_id IN VARCHAR2
) RETURN ANYDATA;
Parameters

Table 20-13 GET_ERROR_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_number</td>
<td>The identification number of the message. This number identifies the position of the message in the transaction. Query the DBA_APPLY_ERROR data dictionary view to view the message number of each apply error.</td>
</tr>
<tr>
<td>local_transaction_id</td>
<td>Identifier of the error transaction for which to return a message</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>Contains the name of the queue into which the message should be enqueued. If the message should not be enqueued into a queue, then this parameter contains NULL.</td>
</tr>
<tr>
<td>execute</td>
<td>Contains TRUE if the message should be executed</td>
</tr>
<tr>
<td></td>
<td>Contains FALSE if the message should not be executed</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers
- The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

The GET_ERROR_MESSAGE Procedure and XStream Outbound Servers

Outbound servers do not enqueue error transactions into an error queue. This procedure cannot be used with XStream outbound servers.

The GET_ERROR_MESSAGE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.13 HANDLE_COLLISIONS

This procedure enables or disables basic conflict resolution for an apply process and a table.

Syntax

```sql
DBMS_APPLY_ADM.HANDLE_COLLISIONS(
    apply_name  IN  VARCHAR2,
    enable      IN  BOOLEAN,
    object      IN  VARCHAR2,
    source_object IN  VARCHAR2 DEFAULT NULL);
```

Parameters

### 20.4.14 REMOVE_STMT_HANDLER

This procedure removes a statement DML handler for a specified operation on a specified database object from a single apply component or from all apply components in the database.

**See Also:**

- **DBMS_STREAMS_HANDLER_ADM**
- **Oracle Streams Concepts and Administration**

**Syntax**

```sql
DBMS_APPLY_ADM.REMOVE_STMT_HANDLER(
    object_name     IN  VARCHAR2,
    operation_name  IN  VARCHAR2,
    handler_name    IN  VARCHAR2,
    apply_name      IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 20-15  REMOVE_STMT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as:</td>
</tr>
<tr>
<td></td>
<td>• INSERT</td>
</tr>
<tr>
<td></td>
<td>• UPDATE</td>
</tr>
<tr>
<td></td>
<td>• DELETE</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>handler_name</td>
<td>The name of the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the statement DML handler.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure removes the statement DML handler from all apply components in the database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers
- The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

The REMOVE_STMT_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The REMOVE_STMT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.15 SET_CHANGE_HANDLER Procedure

This procedure sets or unsets a change handler that tracks changes for a specified operation on a specified database object for a single apply component.

A change handler is a special type of statement DML handler that tracks table changes and was created by either the DBMS_STREAMS_ADM.MAINTAIN_CHANGE_TABLE procedure or this SET_CHANGE_HANDLER procedure. Information about change handlers is stored in the ALL_APPLY_CHANGE_HANDLERS and DBA_APPLY_CHANGE_HANDLERS views.

This procedure automatically generates the statement that is added to the change handler based on values specified in the procedure parameters. You should only run this procedure when a configuration that tracks database changes exists.
Use the `MAINTAIN_CHANGE_TABLE` Procedure to configure an environment that tracks table changes.

Syntax

```sql
DBMS_APPLY_ADM.SET_CHANGE_HANDLER(
    change_table_name    IN  VARCHAR2,
    source_table_name    IN  VARCHAR2,
    capture_values       IN  VARCHAR2,
    apply_name           IN  VARCHAR2,
    operation_name       IN  VARCHAR2,
    change_handler_name  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>change_table_name</code></td>
<td>The table that records changes to the source table.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as <code>[schema_name.]table_name</code>. For example,</td>
</tr>
<tr>
<td></td>
<td><code>hr.jobs_change_table</code>. If the schema is not specified, then the current</td>
</tr>
<tr>
<td></td>
<td>user is the default. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>source_table_name</code></td>
<td>The table at the source database for which changes are recorded.</td>
</tr>
<tr>
<td></td>
<td>Specify the table as <code>[schema_name.]table_name</code>. For example,</td>
</tr>
<tr>
<td></td>
<td><code>hr.jobs</code>. If the schema is not specified, then the current user is the</td>
</tr>
<tr>
<td></td>
<td>default. If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>capture_values</code></td>
<td>Specify which values to record in the change table when update operations</td>
</tr>
<tr>
<td></td>
<td>are performed on the source table:</td>
</tr>
<tr>
<td></td>
<td>- <code>old</code> - To record the original values for an updated column in the source</td>
</tr>
<tr>
<td></td>
<td>table</td>
</tr>
<tr>
<td></td>
<td>- <code>new</code> - To record the new values for an updated column in the source</td>
</tr>
<tr>
<td></td>
<td>table</td>
</tr>
<tr>
<td></td>
<td>- <code>*</code> - To record both the original and the new values for an updated</td>
</tr>
<tr>
<td></td>
<td>column in the source table</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td><code>apply_name</code></td>
<td>The name of the apply component that applies changes to the change table.</td>
</tr>
<tr>
<td></td>
<td>Do not specify an owner.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Table 20-16  (Cont.) SET_CHANGE_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| operation_name          | The name of the operation, which can be specified as:  
• INSERT  
• UPDATE  
• DELETE  
If NULL, then the procedure raises an error.  
**Note:** Change handlers cannot be specified for LOB operations. |
| change_handler_name     | The name of the change handler.  
If the specified change handler exists, then a statement is added to the existing handler. Ensure that the existing change handler is for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively. If the existing handler is for a different operation or table, then an apply error results when the handler is invoked.  
If NULL and the specified change handler does not exist, then this procedure creates the change handler.  
If NULL and a change handler exists for the same operation on the same table as the settings for the operation_name and source_table_name parameters, respectively, then the existing change handler is removed.  
If NULL and the specified change handler does not exist, then the procedure raises an error.  
**See Also:** "Usage Notes" for more information about this parameter. |

**Usage Notes**

The following usage notes apply to this procedure:

- Checking for an Existing Change Handler
- The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers
- The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers

Checking for an Existing Change Handler

To check for an existing change handler for a specific operation on a specific source table, run the following query:

```sql
SELECT HANDLER_NAME, APPLY_NAME FROM DBA_APPLY_CHANGE_HANDLERS
WHERE operation_name = 'operation'
AND source_table_owner = 'source_table_owner'
AND source_table_name = 'source_table_name'
AND change_table_owner = 'change_table_owner'
AND change_table_name = 'change_table_name';
```

where:

- **operation** is operation specified for the new handler, either INSERT, UPDATE, or DELETE
- **source_table_owner** is the owner of the source table
- **source_table_name** is the name of the source table
• change_table_owner is the owner of the change table
• change_table_owner is the owner of the change table

The SET_CHANGE_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_CHANGE_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.16 SET_DML_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt DML conflict handler for INSERT, UPDATE, or DELETE conflicts on the specified object.

This procedure is overloaded. The column_list and column_table parameters are mutually exclusive.

Syntax

DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name             IN  VARCHAR2,
    conflict_handler_name  IN  VARCHAR2,
    object                 IN  VARCHAR2  DEFAULT NULL,
    operation_name         IN  VARCHAR2  DEFAULT NULL,
    conflict_type          IN  VARCHAR2  DEFAULT NULL,
    method_name            IN  VARCHAR2  DEFAULT NULL,
    column_list            IN  VARCHAR2  DEFAULT NULL,
    resolution_column      IN  VARCHAR2  DEFAULT NULL,
    source_object          IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER(
    apply_name             IN  VARCHAR2,
    conflict_handler_name  IN  VARCHAR2,
    object                 IN  VARCHAR2  DEFAULT NULL,
    operation_name         IN  VARCHAR2  DEFAULT NULL,
    conflict_type          IN  VARCHAR2  DEFAULT NULL,
    method_name            IN  VARCHAR2  DEFAULT NULL,
    column_table           IN  DBMS_UTILITY.LNAME_ARRAY,
    resolution_column      IN  VARCHAR2  DEFAULT NULL,
    source_object          IN  VARCHAR2  DEFAULT NULL);

Parameters

<tr>
<td></td>
<td>If a conflict handler already exists with the same object_name and resolution_column and conflict_type, then the existing handler is replaced.</td>
</tr>
</tbody>
</table>
Table 20-17  (Cont.) SET_DML_CONFLICT_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| column_list  | A comma-separated list of the column names for which the conflict handler is called.  
The same column cannot be in more than one column list (for a given apply_name, object_name, operation_name and conflict_type).  
Specify * for the default column group, which includes all the columns in the table that are not already specified in another column list (for a given apply_name, object_name, operation_name and conflict_type).  
If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list.  
You cannot use a column_list if you use a * in the object_name.  
The only time you can use multiple column groups is when you are specifying a conflict handler for insert or update for ROW_EXISTS.  
**Note:** Prebuilt conflict handlers do not support LOB, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the column_list parameter.  
This parameter must be set to '*' in the following cases:  
* The operation_name is DELETE.  
* The method_name is RECORD.  
* The operation_name is UPDATE and the conflict_type is ROW_MISSING. |
| column_table | An array of column names for which the conflict handler is called.  
This parameter is the same as the column_list parameter, but it uses an array instead of a list for the column names.  
**Note:** The column_list and column_table parameters are mutually exclusive. |
| resolution_column | For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is the one tested to determine whether the current row or the LCR has the smaller value. The resolution column must be one of the columns listed in the column_list or column_table parameter.  
You can specify NULL for other resolution methods. |
| source_object | The schema and object name of the source table, specified as [schema_name.]table_name for the table where the change originated.  
For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default. |

**Usage Notes**

The following usage notes apply to this procedure:

- **Modifying an Existing Conflict Handler**
• Removing an Existing Conflict Handler
• Series of Actions for Conflicts
• Procedure DML Handlers for Conflicts
• A Column Can Be in Only One Column List
• The SET_DML_CONFLICT_HANDLER Procedure and XStream Outbound Servers
• The SET_DML_CONFLICT_HANDLER Procedure and XStream Inbound Servers
• Table 20-18
• Example

Modifying an Existing Conflict Handler

If you want to modify an existing conflict handler, then you specify the object, conflict_type, and resolution_column of an existing conflict handler. You can modify the method_name or the column_list.

Removing an Existing Conflict Handler

If you want to remove an existing conflict handler, then specify NULL for the method_name and specify the object, conflict_type, and resolution_column of the existing conflict handler.

Series of Actions for Conflicts

If an conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate conflict handler to resolve the conflict
2. If no conflict handler is specified or if the conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, object name, and operation name to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

See Also:

"Signature of a DML Handler Procedure or Error Handler Procedure" for information about setting an error handler

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the SET_DML_HANDLER procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.
A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:

ORA-00001: UNIQUE CONSTRAINT (SYS.APPLYS_CONF_HDRL_COLUMNS_UNQ1) VIOLATED

The **SET_DML_CONFLICT_HANDLER** Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The **SET_DML_CONFLICT_HANDLER** Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

</tbody>
</table>

### Example

The following is an example for setting a conflict handler for the `employees` table in the `hr` schema:

```sql
DECLARE
    cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
    DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER('employees', 'hr', 'ROW_EXISTS', 'OVERWRITE');
END;
```

See Also:

**SET_DML_HANDLER** Procedure
cols(1) := 'salary';
cols(2) := 'commission_pct';
DBMS_APPLY_ADM.SET_DML_CONFLICT_HANDLER{
  apply_name => 'appl1',
  conflict_handler_name => 'emp_handler_update',
  object => 'hr.employees',
  operation_name => 'UPDATE',
  conflict_type => 'ROW_EXISTS',
  method_name => 'MAXIMUM',
  resolution_column => 'salary',
  column_table => cols};
END;
/

This example sets a conflict handler named emp_handler_update that is called if a conflict occurs for the salary or commission_pct column in the hr.employees table. If such a conflict occurs, then the salary column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the job_id column, then this conflict handler is not called.

20.4.17 SET_DML_HANDLER Procedure

This procedure sets or unsets a user procedure as a procedure DML handler for a specified operation on a specified database object for a single apply component or for all apply components in the database. The user procedure alters the apply behavior for the specified operation on the specified object.

Syntax

DBMS_APPLY_ADM.SET_DML_HANDLER{
  object_name IN VARCHAR2,
  object_type IN VARCHAR2,
  operation_name IN VARCHAR2,
  error_handler IN BOOLEAN DEFAULT FALSE,
  user_procedure IN VARCHAR2,
  apply_database_link IN VARCHAR2 DEFAULT NULL,
  apply_name IN VARCHAR2 DEFAULT NULL,
  assemble_lob IN BOOLEAN DEFAULT TRUE};

Parameters

Table 20-19  SET_DML_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. The specified object does not need to exist when you run this procedure.</td>
</tr>
<tr>
<td>object_type</td>
<td>The type of the source object. Currently, TABLE is the only possible source object type.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation, which can be specified as: • INSERT • UPDATE • DELETE • LOB_UPDATE • DEFAULT The procedure must be run for each operation individually. Specify DEFAULT to set the procedure as the default procedure DML handler for the database object. In this case, the procedure DML handler is used for any INSERT, UPDATE, DELETE, and LOB_WRITE on the database object, if another procedure DML handler is not specifically set for the operation on the database object.</td>
</tr>
<tr>
<td>error_handler</td>
<td>If TRUE, then the specified user procedure is run when a row logical change record (row LCR) involving the specified operation on the specified object raises an apply error. You can code the user procedure to resolve possible error conditions, notify administrators of the error, log the error, or any combination of these actions. If FALSE, then the handler being set is run for all row LCRs involving the specified operation on the specified object.</td>
</tr>
<tr>
<td>user_procedure</td>
<td>A user-defined procedure that is invoked during apply for the specified operation on the specified object. If the procedure is a procedure DML handler, then it is invoked instead of the default apply performed by Oracle. If the procedure is an error handler, then it is invoked when an apply error is encountered. Specify NULL to unset a procedure DML handler that is set for the specified operation on the specified object.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
<tr>
<td>apply_name</td>
<td>The name of the apply component that uses the procedure DML handler or error handler. If NULL, then the procedure sets the procedure DML handler or error handler as a general handler for all apply components in the database. If the user_procedure parameter is set to NULL to unset a handler, and the handler being unset is set for a specific apply component, then use the apply_name parameter to specify the apply component to unset the handler.</td>
</tr>
<tr>
<td>assemble_lobs</td>
<td>If TRUE, then LOB assembly is used for LOB columns in LCRs processed by the handler. LOB assembly combines multiple LCRs for a LOB column resulting from a single row change into one row LCR before passing the LCR to the handler. Database compatibility must be 10.2.0 or higher to use LOB assembly. If FALSE, then LOB assembly is not used for LOB columns in LCRs processed by the handler.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- Run the SET_DML_HANDLER Procedure at the Destination Database
- Procedure DML Handlers and Error Handlers
- The apply_name Parameter
- Signature of a DML Handler Procedure or Error Handler Procedure
- LOB Assembly
- The SET_DML_HANDLER Procedure and XStream Outbound Servers
- The SET_DML_HANDLER Procedure and XStream Inbound Servers

Run the SET_DML_HANDLER Procedure at the Destination Database

Run this procedure at the destination database. The SET_DML_HANDLER procedure provides a way for users to apply logical change records containing DML changes (row LCRs) using a customized apply.

Procedure DML Handlers and Error Handlers

If the error_handler parameter is set to TRUE, then it specifies that the user procedure is an error handler. An error handler is invoked only when a row LCR raises an apply error. Such an error can result from a data conflict if no conflict handler is specified or if the update conflict handler cannot resolve the conflict. If the error_handler parameter is set to FALSE, then the user procedure is a procedure DML handler, not an error handler, and a procedure DML handler is always run instead of performing the specified operation on the specified object.

This procedure either sets a procedure DML handler or an error handler for a particular operation on an object. It cannot set both a procedure DML handler and an error handler for the same object and operation.

Note:

Currently, setting an error handler for an apply component that is applying changes to a non-Oracle database is not supported.

The apply_name Parameter

If the apply_name parameter is non-NULL, then the procedure DML handler or error handler is set for the specified apply component. In this case, this handler is not invoked for other apply components at the local destination database. If the apply_name parameter is NULL, the default, then the handler is set as a general handler for all apply components at the destination database. When a handler is set for a specific apply component, then this handler takes precedence over any general handlers. For example, consider the following scenario:

- A procedure DML handler named handler_hr is specified for an apply component named apply_hr for UPDATE operations on the hr.employees table.
- A general procedure DML handler named handler_gen also exists for UPDATE operations on the hr.employees table.
In this case, the `apply_hr` apply component uses the `handler_hr` procedure DML handler for `UPDATE` operations on the `hr.employees` table.

At the source database, you must specify an unconditional supplemental log group for the columns needed by a DML or error handler.

**Signature of a DML Handler Procedure or Error Handler Procedure**

You can use the `SET_DML_HANDLER` procedure to set either a procedure DML handler or an error handler for row LCRs that perform a specified operation on a specified object. The signatures of a DML handler procedure and of an error handler procedure are described following this section.

In either case, you must specify the full procedure name for the `user_procedure` parameter in one of the following forms:

- `[schema_name.]package_name.procedure_name`
- `[schema_name.]procedure_name`

If the procedure is in a package, then the `package_name` must be specified. The user who invokes the `SET_DML_HANDLER` procedure must have `EXECUTE` privilege on the specified procedure. Also, if the `schema_name` is not specified, then the user who invokes the `SET_DML_HANDLER` procedure is the default.

For example, suppose the `procedure_name` has the following properties:

- `hr` is the `schema_name`.
- `apply_pkg` is the `package_name`.
- `employees_default` is the `procedure_name`.

In this case, specify the following:

`hr.apply_pkg.employees_default`

The following restrictions apply to the user procedure:

- Do not execute `COMMIT` or `ROLLBACK` statements. Doing so can endanger the consistency of the transaction that contains the LCR.
- If you are manipulating a row using the `EXECUTE` member procedure for the row LCR, then do not attempt to manipulate more than one row in a row operation. You must construct and execute manually any DML statements that manipulate more than one row.
- If the command type is `UPDATE` or `DELETE`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR must include the entire key in the list of old values. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all `non LOB`, `non LONG`, and `non LONG RAW` columns.
- If the command type is `INSERT`, then row operations resubmitted using the `EXECUTE` member procedure for the LCR should include the entire key in the list of new values. Otherwise, duplicate rows are possible. The key is the primary key or the smallest unique index that has at least one `NOT NULL` column, unless a substitute key has been specified by the `SET_KEY_COLUMNS` procedure. If there is no specified key, then the key consists of all of the table columns, except for columns of the following data types: `LOB`, `LONG`, `LONG RAW`, user-defined types (including object
types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

**See Also:**

*Oracle Streams Replication Administrator's Guide* for information about and restrictions regarding procedure DML handlers and LOB, LONG, and LONG RAW data types.

The procedure specified in the `user_procedure` parameter must have the following signature:

```sql
PROCEDURE user_procedure (parameter_name IN ANYDATA);
```

Here, `user_procedure` stands for the name of the procedure and `parameter_name` stands for the name of the parameter passed to the procedure. The parameter passed to the procedure is a `ANYDATA` encapsulation of a row LCR.

**See Also:**

*Logical Change Record TYPEs* for more information about LCRs.

The procedure you create for error handling must have the following signature:

```sql
PROCEDURE user_procedure (message IN ANYDATA, error_stack_depth IN NUMBER, error_numbers IN DBMS_UTILITY.NUMBER_ARRAY, error_messages IN emsg_array);
```

If you want to retry the DML operation within the error handler, then have the error handler procedure run the `EXECUTE` member procedure for the LCR. The last error raised is on top of the error stack. To specify the error message at the top of the error stack, use `error_numbers(1)` and `error_messages(1)`.

**Note:**

- Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.
- The `emsg_array` value must be a user-defined array that is a table of type `VARCHAR2` with at least 76 characters.

Running an error handler results in one of the following outcomes:

- The error handler successfully resolves the error and returns control to the apply component.
• The error handler fails to resolve the error, and the error is raised. The raised error causes the transaction to be rolled back and placed in the error queue.

LOB Assembly

Do not modify `LONG`, `LONG RAW`, or nonassembled LOB column data in an LCR with procedure DML handlers, error handlers, or custom rule-based transformation functions. Procedure DML handlers and error handlers can modify LOB columns in row LCRs that have been constructed by LOB assembly.

The SET_DML_HANDLER Procedure and XStream Outbound Servers

Outbound servers ignore all apply handlers. This procedure has no effect on XStream outbound servers.

The SET_DML_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.18 SET_ENQUEUE_DESTINATION Procedure

This procedure sets the queue where the apply component automatically enqueues a message that satisfies the specified rule.

This procedure modifies the specified rule's action context to specify the queue. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to `TRUE` for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type `SYS.RE$NV_LIST`, which consists of a list of name-value pairs.

A queue destination specified by this procedure always consists of the following name-value pair in an action context:

- The name is `APPLY$_ENQUEUE`.
- The value is an `ANYDATA` instance containing the queue name specified as a `VARCHAR2`.

Syntax

```sql
DBMS_APPLY_ADM.SET_ENQUEUE_DESTINATION(
    rule_name               IN  VARCHAR2,
    destination_queue_name  IN  VARCHAR2);
```

Parameters

**Table 20-20  SET_ENQUEUE_DESTINATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as <code>[schema_name.]</code>rule_name. For example, to specify a rule named <code>hr5</code> in the <code>hr</code> schema, enter <code>hr.hr5</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Table 20-20  (Cont.) SET_ENQUEUE_DESTINATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_queue_name | The name of the queue into which the apply component enqueues the message. Specify the queue in the form [schema_name.]queue_name. Only local queues can be specified.  
For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default.  
If NULL, then an existing name-value pair with the name APPLY$_ENQUEUE is removed. If no name-value pair exists with the name APPLY$_ENQUEUE for the rule, then no action is taken.  
If non-NULL and a name-value pair exists for the rule with the name APPLY$_ENQUEUE, then it is removed, and a new name-value pair with the value specified by this parameter is added. |

Usage Notes

The following usage notes apply to this procedure:

• The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers
• Considerations for the SET_ENQUEUE_DESTINATION Procedure
• The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
• The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers

The SET_ENQUEUE_DESTINATION Procedure and Apply Handlers

If an apply handler, such as a procedure DML handler, DDL handler, or message handler, processes a message that also is enqueued into a destination queue, then the apply handler processes the message before it is enqueued.

Considerations for the SET_ENQUEUE_DESTINATION Procedure

The following are considerations for using this procedure:

• This procedure does not verify that the specified queue exists. If the queue does not exist, then an error is raised when an apply component tries to enqueue a message into it.
• Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
• The apply user of the apply component using the specified rule must have the necessary privileges to enqueue messages into the specified queue. If the queue is a secure queue, then the apply user must be a secure queue user of the queue.
• The specified rule must be in the positive rule set for an apply component. If the rule is in the negative rule set for an apply component, then the apply component does not enqueue the message into the destination queue.
• If the commit SCN for a message is less than or equal to the relevant instantiation SCN for the message, then the message is not enqueued into the destination queue, even if the message satisfies the apply component rule sets.

The SET_ENQUEUE_DESTINATION Procedure and XStream Outbound Servers
This procedure has no effect on XStream outbound servers.

The SET_ENQUEUE_DESTINATION Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

20.4.19 SET_EXECUTE Procedure

This procedure specifies whether a message that satisfies the specified rule is executed by an apply component.

This procedure modifies the specified rule’s action context to specify message execution. A rule action context is optional information associated with a rule that is interpreted by the client of the rules engine after the rule evaluates to TRUE for a message. In this case, the client of the rules engine is an apply component. The information in an action context is an object of type SYS.RE$NV_LIST, which consists of a list of name-value pairs.

A message execution directive specified by this procedure always consists of the following name-value pair in an action context:

• The name is APPLY$_EXECUTE.

• The value is an ANYDATA instance that contains NO as a VARCHAR2. When the value is NO, an apply component does not execute the message and does not send the message to any apply handler.

Syntax

DBMS_APPLY_ADM.SET_EXECUTE(
rule_name  IN  VARCHAR2,
execute    IN  BOOLEAN);

Parameters

Table 20-21  SET_EXECUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. For example, to specify a rule named hr5 in the hr schema, enter hr.hr5 for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>execute</td>
<td>If TRUE, then the procedure removes the name-value pair with the name APPLY$_EXECUTE for the specified rule. Removing the name-value pair means that the apply component executes messages that satisfy the rule. If no name-value pair with name APPLY$_EXECUTE exists for the rule, then no action is taken. If FALSE, then the procedure adds a name-value pair to the rule's action context. The name is APPLY$_EXECUTE and the value is NO. An apply component does not execute a message that satisfies the rule and does not send the message to any apply handler. If a name-value pair exists for the rule with the name APPLY$_EXECUTE, then it is removed, and a new one with the value NO is added. If NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_EXECUTE Procedure
- The SET_EXECUTE Procedure and XStream Outbound Servers
- The SET_EXECUTE Procedure and XStream Inbound Servers

Considerations for the SET_EXECUTE Procedure

The following are considerations for using this procedure:

- If the message is a logical change record (LCR) and the message is not executed, then the change encapsulated in the LCR is not made to the relevant local database object. Also, if the message is not executed, then it is not sent to any apply handler.
- Oracle Streams capture processes, propagations, and messaging clients ignore the action context created by this procedure.
- The specified rule must be in the positive rule set for an apply component for the apply component to follow the execution directive. If the rule is in the negative rule set for an apply component, then the apply component ignores the execution directive for the rule.

The SET_EXECUTE Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_EXECUTE Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

20.4.20 SET_GLOBAL_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified source database and, optionally, for the schemas at the source database and the tables owned by these schemas. This procedure overwrites any existing instantiation SCN for the database, and, if it sets the instantiation SCN for a schema or a table, then it overwrites any existing instantiation SCN for the schema or table.

This procedure gives you precise control over which DDL logical change records (DDL LCRs) from a source database are ignored and which DDL LCRs are applied by an apply component.

Syntax

```sql
DBMS_APPLY_ADM.SET_GLOBAL_INSTANTIATION_SCN(
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT FALSE,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 20-22  SET_GLOBAL_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source database from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the source database, all schemas in the source database, and all tables owned by the schemas in the source database. This procedure selects the schemas and tables from the ALL_USERS and ALL_TABLES data dictionary views, respectively, at the source database under the security context of the current user. If FALSE, then the procedure sets the global instantiation SCN for the source database, but does not set the instantiation SCN for any schemas or tables. <strong>Note:</strong> If recursive is set to TRUE, then a database link from the destination database to the source database is required. This database link must have the same name as the global name of the source database and must be accessible to the current user. Also, a table must be accessible to the current user in either the ALL_TABLES or DBA_TABLES data dictionary view at the source database for this procedure to set the instantiation SCN for the table at the destination database.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, if you want to do the instantiation for a specific container than you must specify both source_database and source_root_name. If you want to do the instantiation for all the containers in the CDB, specify the source_root_name for the database and leave the source_database name as NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- **Instantiation SCNs and DDL LCRs**
- **The recursive Parameter**
- **Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure**
- **The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers**
- **The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers**
The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object from a source database is less than or equal to the instantiation SCN for that source database at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The global instantiation SCN specified by this procedure is used for a DDL LCR only if the DDL LCR does not have `object_owner`, `base_table_owner`, and `base_table_name` specified. For example, the global instantiation SCN set by this procedure is used for DDL LCRs with a `command_type` of `CREATE USER`.

The recursive Parameter

If the `recursive` parameter is set to `TRUE`, then this procedure sets the instantiation SCN for each schema at a source database and for the tables owned by these schemas. This procedure uses the `SET_SCHEMA_INSTANTIATION_SCN` procedure to set the instantiation SCN for each schema, and it uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each schema instantiation SCN is used for DDL LCRs on the schema, and each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the `recursive` parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any schemas or tables.

Considerations for the SET_GLOBAL_INSTANTIATION_SCN Procedure

The following are considerations for using this procedure:

- Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.
- The instantiation SCN is not set for the `SYS` or `SYSTEM` schemas.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.
The `apply_database_link` parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also:

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_GLOBAL_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_GLOBAL_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

### 20.4.21 SET_KEY_COLUMNS Procedures

This procedure records the set of columns to be used as the substitute primary key for apply purposes and removes existing substitute primary key columns for the specified object if they exist.

This procedure is overloaded. The `column_list` and `column_table` parameters are mutually exclusive.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name          IN  VARCHAR2,
    column_list          IN  VARCHAR2,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);

DBMS_APPLY_ADM.SET_KEY_COLUMNS(
    object_name          IN  VARCHAR2,
    column_table         IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

**Table 20-23  SET_KEY_COLUMNS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. If the apply component is applying changes to a non-Oracle database in a heterogeneous environment, then the object name is not verified.</td>
</tr>
</tbody>
</table>
Table 20-23  (Cont.) SET_KEY_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>A comma-delimited list of the columns in the table to use as the substitute primary key, with no spaces between the column names. If the column_list parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>column_table</td>
<td>A PL/SQL associative array of type <code>DBMS_UTILITY.NAME_ARRAY</code> of the columns in the table to use as the substitute primary key. The index for column_table must be 1-based, increasing, dense, and terminated by a NULL. If the column_table parameter is empty or NULL, then the current set of key columns is removed.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Considerations for the SET_KEY_COLUMNS Procedure
- Duplicate Rows and Substitute Primary Key Columns
- The SET_KEY_COLUMNS Procedure and XStream Outbound Servers
- The SET_KEY_COLUMNS Procedure and XStream Inbound Servers
- The SET_KEY_COLUMNS Procedure and CDBs

Considerations for the SET_KEY_COLUMNS Procedure

The following are considerations for using this procedure:

- When not empty, the specified set of columns takes precedence over any primary key for the specified object. Do not specify substitute key columns if the object has primary key columns and you want to use those primary key columns as the key.
- Run this procedure at the destination database. At the source database, you must specify an unconditional supplemental log group for the substitute key columns.
- Unlike true primary keys, columns specified as substitute key column columns can contain NULLS. However, Oracle recommends that each column you specify as a substitute key column be a NOT NULL column. You also should create a single index that includes all of the columns in a substitute key. Following these guidelines improves performance for updates, deletes, and piecewise updates to LOBs because Oracle can locate the relevant row more efficiently.
- Do not permit applications to update the primary key or substitute key columns of a table. This ensures that Oracle can identify rows and preserve the integrity of the data.
- If there is neither a primary key, nor a unique index that has at least one NOT NULL column, nor a substitute key for a table, then the key consists of all of the table columns, except for columns of the following data types: LOB, LONG, LONG RAW, user-
defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including Any types, XML types, spatial types, and media types).

Duplicate Rows and Substitute Primary Key Columns

A table has duplicate rows when all of the column values are identical for two or more rows in the table, excluding LOB, LONG, and LONG RAW columns. You can specify substitute primary key columns for a table at a destination database using the SET_KEY_COLUMNS procedure. When substitute primary key columns are specified for a table with duplicate rows at a destination database, and the allow_duplicate_rows apply component parameter is set to \texttt{Y}, meet the following requirements to keep the table data synchronized at the source and destination databases:

- Ensure that supplemental logging is specified at source database for the columns specified as substitute key columns at the destination database. The substitute key columns must be in an unconditional log group at the source database.
- Ensure that the substitute key columns uniquely identify each row in the table at the destination database.

The rest of this section provides more details about these requirements.

When there is no key for a table and the allow_duplicate_rows apply component parameter is set to \texttt{Y}, a single row LCR with an UPDATE or DELETE command type only is applied to one of the duplicate rows. In this case, if the table at the source database and the table at the destination database have corresponding duplicate rows, then a change that changes all of the duplicate rows at the source database also changes all the duplicate rows at the destination database when the row LCRs resulting from the change are applied.

For example, suppose a table at a source database has two duplicate rows. An update is performed on the duplicate rows, resulting in two row LCRs. At the destination database, one row LCR is applied to one of the duplicate rows. At this point, the rows are no longer duplicate at the destination database because one of the rows has changed. When the second row LCR is applied at the destination database, the rows are duplicate again. Similarly, if a delete is performed on these duplicate rows at the source database, then both rows are deleted at the destination database when the row LCRs resulting from the source change are applied.

When substitute primary key columns are specified for a table, row LCRs are identified with rows in the table during apply using the substitute primary key columns. If substitute primary key columns are specified for a table with duplicate rows at a destination database, and the allow_duplicate_rows apply component parameter is set to \texttt{Y}, then an update performed on duplicate rows at the source database can result in different changes when the row LCRs are applied at the destination database. Specifically, if the update does not change one of the columns specified as a substitute primary key column, then the same duplicate row can be updated multiple times at the destination database, while other duplicate rows might not be updated.

Also, if the substitute key columns do not identify each row in the table at the destination database uniquely, then a row LCR identified with multiple rows can update any one of the rows. In this case, the update in the row LCR might not be applied to the correct row in the table at the destination database.

An apply component ignores substitute primary key columns when it determines whether rows in a table are duplicates. An apply component determines that rows are duplicates only if all of the column values in the rows are identical (excluding LOB, LONG, and LONG RAW columns). Therefore, an apply component always raises an error if a single update or delete changes two or more nonduplicate rows in a table.
For example, consider a table with columns \( c_1, c_2, \) and \( c_3 \) on which the `SET_KEY_COLUMNS` procedure is used to designate column \( c_1 \) as the substitute primary key. If two rows have the same key value for the \( c_1 \) column, but different value for the \( c_2 \) or \( c_3 \) columns, then an apply component does not treat the rows as duplicates. If an update or delete modifies more than one row because the \( c_1 \) values in the rows are the same, then the apply component raises an error regardless of the setting for the `allow_duplicate_rows` apply component parameter.

**See Also:**

`SET_PARAMETER Procedure` for more information about the `allow_duplicate_rows` apply component parameter.

The `SET_KEY_COLUMNS` Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The `SET_KEY_COLUMNS` Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

The `SET_KEY_COLUMNS` Procedure and CDBs

This procedure defines the columns that are used as a substitute primary key. You must perform the `SET_KEY_COLUMNS` procedure in the appropriate PDB.

### 20.4.22 SET_PARAMETER Procedure

This procedure sets an apply parameter to the specified value.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_PARAMETER ( apply_name  IN  VARCHAR2,
  parameter   IN  VARCHAR2,
  value       IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

**Table 20-24**  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set. If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

**Apply Component Parameters**

The following table lists the parameters for an apply component.
### Table 20-25  Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_duplicate_rows</td>
<td>Y or N</td>
<td>N</td>
<td>If Y and more than one row is changed by a single row logical change record (row LCR) with an UPDATE or DELETE command type, then the apply component only updates or deletes one of the rows. If N, then the apply component raises an error when it encounters a single row LCR with an UPDATE or DELETE command type that changes more than one row in a table. <strong>Note:</strong> Regardless of the setting for this parameter, apply components do not allow changes to duplicate rows for tables with LOB, LONG, or LONG RAW columns. <strong>See Also:</strong> “Usage Notes” and “Duplicate Rows and Substitute Primary Key Columns”</td>
</tr>
<tr>
<td>apply_sequence_nextval</td>
<td>Y or N</td>
<td>N</td>
<td>Controls whether the apply component checks and adjusts sequence values. If Y, then the apply component checks and adjusts sequence values. For ascending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or greater than the source sequence values. For descending sequences, setting this parameter to Y ensures that the destination sequence values are equal to or less than the source sequence values. If N, then the apply component does not check or adjust sequence values. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” for information about enabling XStream optimizations. <strong>See Also:</strong> SET_PARAMETER Procedure for information about the capture_sequence_nextval capture process parameter</td>
</tr>
</tbody>
</table>
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>batchsql_mode</td>
<td>DEPENDENT, DEPENDENT_EAGER, or SEQUENTIAL</td>
<td>DEPENDENT</td>
<td>Determines the batching method used to generate batch transactions for reordering. This parameter can be set to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• DEPENDENT - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. An executing batch has no unresolved dependencies.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• DEPENDENT_EAGER - Batch transactions in a dependency-aware manner to minimize cross-batch dependencies and improve parallel processing performance in Oracle GoldenGate BATCHSQL mode. A batch can be executed when there are unresolved dependencies. The apply server waits for dependencies to be resolved before executing an LCR.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• SEQUENTIAL - Batch transactions in a sequential manner. COMMITIALIZATION = FULL runs in this mode regardless of the Oracle GoldenGate BATCHSQL mode.</td>
</tr>
<tr>
<td>cdgranularity</td>
<td>ROW or COLGROUP</td>
<td>COLGROUP for XStream in ROW for Oracle GoldenGate</td>
<td>Specifies the conflict detection granularity. This parameter can be set to one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• ROW - Conflict resolution is applied for all column groups if there is a conflict for any column group.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• COLGROUP - Conflict resolution is applied for column groups that have a conflict. Conflict resolution is not applied for column groups that do not have a conflict.</td>
</tr>
</tbody>
</table>

Note: This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| commit_serialization| DEPENDENT_TRANSACTIONS or FULL| DEPENDENT_TRANSACTIONS | The order in which applied transactions are committed. Apply servers can apply nondependent transactions at the destination database in an order that is different from the commit order at the source database. Dependent transactions are always applied at the destination database in the same order as they were committed at the source database. You control whether the apply servers can apply nondependent transactions in a different order at the destination database using the commit_serialization apply parameter. This parameter has the following settings:  
  - DEPENDENT_TRANSACTIONS - The apply component can commit nondependent transactions in any order. Performance is best if you specify DEPENDENT_TRANSACTIONS.  
  - FULL - The apply component commits applied transactions in the order in which they were committed at the source database.  
Regardless of the specification, applied transactions can execute in parallel subject to data dependencies and constraint dependencies. If you specify DEPENDENT_TRANSACTIONS, then a destination database might commit changes in a different order than the source database. For example, suppose two nondependent transactions are committed at the source database in the following order:  
1. Transaction A  
2. Transaction B  
At the destination database, these transactions might be committed in the opposite order:  
1. Transaction B  
2. Transaction A  
If you specify DEPENDENT_TRANSACTIONS and there are application constraints that are not enforced by the database, then use virtual dependency definitions or add RELY constraints to account for the application constraints. See Oracle Streams Concepts and Administration for information about virtual dependency definitions and Oracle.
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compare_key_only</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then disables automatic conflict detection and only uses primary and unique key columns to identify the table row for a row LCR. If N, then enables automatic conflict detection and uses all of the old values in a row LCR to identify the table row for a row LCR. <strong>Note:</strong> The <code>COMPARE_OLD_VALUES</code> procedure in this package can disable comparison of old values for specified columns during apply. See <code>COMPARE_OLD_VALUES Procedure</code>. <strong>See Also:</strong> &quot;Usage Notes&quot; and Oracle Streams Replication Administrator's Guide for information about automatic conflict detection.</td>
</tr>
<tr>
<td>compute_lcr_dep_on_arrival</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, the dependencies are computed as the LCRs for the transaction are received. If N, the dependencies are computed only after all the LCRs for a transaction are received. If the target table has all of the same constraints as the source table, you can improve the performance by setting this parameter to Y. If the number of LCRs in transaction exceeds the value of the number of the <code>eager_size</code> parameter, then the dependencies for that transaction are calculated on arrival regardless of the setting of <code>compute_lcr_dep_on_arrival</code>. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>disable_on_error</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the apply component is disabled on the first unresolved error, even if the error is not irrecoverable. If N, then the apply component continues regardless of unresolved errors.</td>
</tr>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the apply component is disabled if the apply component terminates because it reached a value specified by the time_limit parameter or transaction_limit parameter. If N, then the apply component is restarted immediately after stopping because it reached a limit. When an apply component is restarted, it gets a new session identifier, and the processes associated with the apply component also get new session identifiers. However, the coordinator process number (APN) remains the same.</td>
</tr>
</tbody>
</table>
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eager_size</td>
<td>A positive integer</td>
<td>9500</td>
<td>The apply component usually waits until it receives a commit record before starting to apply changes of a transaction. If XStream is enabled and more than eager_size LCRs arrive for a given transaction, then apply starts processing the changes. If XStream is not enabled and more than eager_size LCRs arrive for a given transaction, then apply waits until the complete transaction is received before processing the changes. Since it is possible that all existing apply servers are handling complete transactions from the source, additional apply servers are automatically created to handle outstanding eager transactions. The apply parameter max_parallelism limits the maximum number of apply servers that can be used for an apply process. This apply parameter is relevant only if its value is less than the value of the txn_lcr_spill_threshold apply parameter. When the value of txn_lcr_spill_threshold is lower than the value of eager_size, transactions spill to disk before eager apply begins. Note: This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations.</td>
</tr>
<tr>
<td>enable_xstream_table_stats</td>
<td>Y or N</td>
<td>Y</td>
<td>When this parameter is set to Y, statistics about the operations of applied transactions are collected and made available in the V$XSTREAM_TABLE_STATS view. When this parameter is set to N, no statistics are collected. Note: This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludetag</td>
<td>Comma-delimited list of Oracle Streams tags</td>
<td>NULL</td>
<td>Controls whether the capture process for an outbound server captures DML changes that are tagged with one of the specified Oracle Streams tags. Whether the capture process captures these changes depends on the settings for the <code>getapprops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. <strong>See Also:</strong> &quot;Usage Notes&quot; for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</td>
</tr>
<tr>
<td>excludetrans</td>
<td>Comma-delimited list of transaction names</td>
<td>NULL</td>
<td>Controls whether the capture process for an outbound server captures DML changes in the specified transaction names. Whether the capture process captures these changes depends on the settings for the <code>getapprops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. <strong>See Also:</strong> &quot;Usage Notes&quot; for the <code>DBMS_CAPTURE_ADM.SET_PARAMETER</code> procedure for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>excludeuser</td>
<td>Comma-delimited list of user names</td>
<td>NULL</td>
<td>Controls whether the capture process for an outbound server captures DML changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. Specify an exact pattern match for each user name. The pattern match is case sensitive. For example, specify HR for the hr user. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment.</td>
</tr>
<tr>
<td>excludeuserid</td>
<td>Comma-delimited list of user ID values</td>
<td>NULL</td>
<td>Controls whether the capture process for an outbound server captures data manipulation language (DML) changes made by the specified users. Whether the capture process captures these changes depends on the settings for the getapplops and getreplicates parameters. To view the user ID for a user, query the USER_ID column in the ALL_USERS data dictionary view. If NULL, then the capture process ignores this parameter. <strong>Note:</strong> This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. <strong>See Also:</strong> &quot;Usage Notes&quot; for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>getapplops</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process captures DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is not specified in the excludeuserid or excludeuser parameters and the transaction name is not specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process’s rule sets. When N is set for both getapplops and getreplicates, no data is captured. Note: This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. See Also: “Usage Notes” for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter.</td>
</tr>
<tr>
<td>getreplicates</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter. In either case, the capture process captures a DML change only if it satisfies the capture process’s rule sets. When N is set for both getapplops and getreplicates, no data is captured. Note: This parameter is intended for an XStream Out environment in which multiple outbound servers use the same capture process. XStream inbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment. See Also: “Usage Notes” for the DBMS_CAPTURE_ADM.SET_PARAMETER procedure for more information about this parameter.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>----------------</td>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>grouptransops</td>
<td>A positive integer from 1 to 10000</td>
<td>250 for apply processes and XStream inbound servers, 10000 for XStream outbound servers</td>
<td>The minimum number of LCRs that can be grouped into a single transaction. The commit LCR for a transaction is not included in the LCR count for the transaction. This parameter enables an apply component to group LCRs from multiple transactions into a single transaction. The apply component groups only LCRs that are part of committed transactions. If a transaction has more LCRs than the setting for this parameter, then the transaction is applied as a single transaction. The apply component does not split a transaction into separate transactions. This parameter only takes effect if the parallelism parameter setting is 1. The grouptransops parameter is ignored if the parallelism parameter setting is greater than 1. <strong>Note:</strong> This parameter is intended for XStream outbound servers and inbound servers. An Oracle Streams apply process ignores this parameter unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See “<code>ENABLE_GG_XSTREAM_FOR_STREAMS Procedure</code>” for information about enabling XStream optimizations. <strong>See Also:</strong> “Usage Notes”</td>
</tr>
</tbody>
</table>
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handlecollisions</td>
<td>Y or N</td>
<td>N</td>
<td>This parameter controls whether the apply component tries to resolve duplicate-record and missing-record errors when applying changes during data loading. This parameter should be set to N for normal replication activity. It should be set to Y only when data is being loaded (instantiated) and replication is enabled. If Y, then does the equivalent of OVERWRITE for INSERT, UPDATE and DELETE operations that get ROW_EXISTS errors, and ignores UPDATE and DELETE operations that get ROW_MISSING errors. Specifically, the apply component performs the following actions when this parameter is set to Y: • If the operation is an insert and the primary key or unique key exists, then the insert is converted to an update. • If the operation is an update that does not modify the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and the row does not exist, then the change is ignored. • If the operation is an update that modifies the primary key or unique key columns, and a row with the new key values already exists, then delete the row with the old key values and replace the row with the new key values. • If the operation is a delete and the row does not exist, then the change is ignored. If N then it disables the above settings. <strong>Note:</strong> This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment.</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore_transaction</td>
<td>A valid source transaction ID or NULL</td>
<td>NULL</td>
<td>Instructs the apply component to ignore the specified transaction from the source database, effective immediately. Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database. To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_APPLY_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter. If NULL, then the apply component ignores this parameter. <strong>Note:</strong> An apply component ignores this parameter for transactions that were not captured by a capture process. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
<tr>
<td>maximum_scn</td>
<td>A valid SCN or INFINITE</td>
<td>INFINITE</td>
<td>The apply component is disabled before applying a transaction with a commit SCN greater than or equal to the value specified. If INFINITE, then the apply component runs regardless of the SCN value. <strong>Note:</strong> An apply component ignores this parameter for transactions that were not captured by a capture process. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>

**Chapter 20**

Summary of DBMS_APPLY_ADM Subprograms
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_parallelism</td>
<td>A positive integer</td>
<td>50</td>
<td>Limits the maximum number of apply servers that can be used for an apply component. When the apply parallelism parameter is set greater than one, the apply component adds apply servers when necessary to process transactions until it reaches the limit set by this parameter (max_parallelism). Transactions include both unassigned (eager) and assigned transactions. Apply servers that idle for more than 5 minutes are shut down until the configured parallelism is attained. Runtime statistics for servers that have been shut down are aggregated into apply server 0 so that accurate apply statistics for the entire apply process can be maintained. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter to Y for an apply process in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations.</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_sga_size</td>
<td>A positive integer</td>
<td>INFINITE</td>
<td>Controls the amount of system global area (SGA) memory allocated specifically to the apply component, in megabytes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The memory is allocated for the duration of the apply component’s session and is released when the apply component becomes disabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the STREAMS_POOL_SIZE initialization parameter. If NULL, then the apply component uses the original default value. A NULL value has the same effect as resetting the parameter to its default value. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See “ENABLE_GG_XSTREAM_FOR_STREAMS Procedure” for information about enabling XStream optimizations. <strong>See Also:</strong> “Usage Notes”</td>
</tr>
<tr>
<td>message_tracking_frequency</td>
<td>0 or a positive integer</td>
<td>2000000</td>
<td>The frequency at which messages applied by the inbound server are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is inbound_server_name:AUTOTRACK, where inbound_server_name is the name of the inbound server. Only the first 20 bytes of the inbound server name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. <strong>See Oracle Streams Replication Administrator’s Guide</strong> for more information about message tracking.</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>optimize_progress_table</td>
<td>Y or N</td>
<td>Y</td>
<td>This parameter determines if a table or the redo log tracks the apply transactions. The progress table tracks completed apply transactions. If Y, transactions are tracked in the redo log. If N, transactions are tracked in a table. If the database is not in archivelog mode, then the setting of Y is ignored. <strong>Note:</strong> This parameter is intended for XStream. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
<tr>
<td>optimize_self_updates</td>
<td>Y or N</td>
<td>Y</td>
<td>This parameter affects conflict resolution when an update in the source database sets a column to its existing value. When this parameter is set to Y, a conflict between the value in the LCR and the corresponding column in the target database is considered resolved. When this parameter is set to N, the conflict is processed.</td>
</tr>
</tbody>
</table>
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallelism</td>
<td>A positive integer</td>
<td>4</td>
<td>The number of apply servers that can concurrently apply transactions. The reader server and the apply server process names are \textit{ASnn}, where \textit{nn} can include letters and numbers. The total number of \textit{ASnn} processes is the value of the parallelism parameter plus one. For example, if parallelism is set to 4, then an apply component uses a total of five \textit{ASnn} processes. In this case, there is one reader server and four apply servers. Setting the parallelism parameter to a number higher than the number of available operating system user processes can disable the apply component. Make sure the \texttt{PROCESSES} initialization parameter is set appropriately when you set the parallelism parameter. Note: When the value of this parameter is changed from 1 to a higher value for a running apply component, the apply component is stopped and restarted automatically. This can take some time depending on the size of the transactions currently being applied. When the value of this parameter is greater than 1, and the parameter value is decreased or increased, the apply component does not restart. See Also: &quot;Usage Notes&quot;</td>
</tr>
</tbody>
</table>
### Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallelism_interval</td>
<td>0 or a positive integer</td>
<td>0</td>
<td>The parallelism interval is the interval in seconds at which the current workload activity is computed. The apply component calculates the mean throughput every 5 X parallelism_interval seconds. After each calculation, the apply component can increase or decrease the number of apply servers to try to improve throughput. If throughput is improved, then the apply component keeps the new number of apply servers. The parallelism interval is used only if the parallelism parameter is set to a value greater than one and the max_parallelism parameter value is greater than the parallelism parameter value. <strong>Note:</strong> This parameter is intended for an XStream In environment with one or more inbound servers. XStream outbound servers ignore this parameter. Do not set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>

<tr>
<td>suppresstriggers</td>
<td>Y or N</td>
<td>Y</td>
<td>This parameter controls whether triggers fire when a change is made by the apply component. If Y, triggers do not fire for changes made by the apply component. If N, triggers fire for changes made by the apply component. If a trigger's firing property is set to always fire, then the trigger always fires for changes made by the apply component, regardless of the value of the suppresstriggers parameter. A trigger's firing property is set to always fire by running the DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY procedure with the fire_once parameter set to FALSE. <strong>Note:</strong> This parameter is intended for an XStream In environment with one or more inbound servers. Do not set this parameter in an Oracle Streams replication environment.</td>
</tr>
<tr>
<td>time_limit</td>
<td>A positive integer or INFINITE</td>
<td>INFINITE</td>
<td>The apply component stops as soon as possible after the specified number of seconds since it started. If INFINITE, then the apply component continues to run until it is stopped explicitly. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
<tr>

</tr>
<tr>
<td>transaction_limit</td>
<td>A positive integer or INFINITE</td>
<td>INFINITE</td>
<td>The apply component stops after applying the specified number of transactions. If INFINITE, then the apply component continues to run regardless of the number of transactions applied. <strong>See Also:</strong> &quot;Usage Notes&quot;</td>
</tr>
</tbody>
</table>
Table 20-25  (Cont.) Apply Component Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>txn_age_spill_threshold</td>
<td>A positive integer or INFINITE</td>
<td>900</td>
<td>The apply component begins to spill messages from memory to hard disk for a particular transaction when the amount of time that any message in the transaction has been in memory exceeds the specified number. The parameter specifies the age in seconds. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 900, and the reader server of an apply component detects that one message in a transaction has been in memory longer than 900 seconds, then all of the messages in the transaction spill from memory to hard disk. If INFINITE, then the apply component does not spill messages to the hard disk based on the age of the messages. Query the DBA_APPLY_SPILL_TXN data dictionary view for information about transactions spilled by an apply component. See Also: &quot;Usage Notes&quot;</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>txn_lcr_spill_threshold</td>
<td>A positive integer or INFINITE</td>
<td>10000</td>
<td>The apply component begins to spill messages from memory to hard disk for a particular transaction when the number of messages in memory for the transaction exceeds the specified number. The number of messages in first chunk of messages spilled from memory equals the number specified for this parameter, and the number of messages spilled in future chunks is either 100 or the number specified for this parameter, whichever is less. If the reader server of an apply component has the specified number of messages in memory for a particular transaction, then when it detects the next message for this transaction, it spills the messages that are in memory to the hard disk. For example, if this parameter is set to 10000, and a transaction has 10,200 messages, then the reader server handles the transaction in the following way: 1. Reads the first 10,000 messages in the transaction into memory 2. Spills messages 1 - 10,000 to hard disk when it detects message 10,000 3. Reads the next 100 messages in the transaction into memory 4. Spills messages 10,001 - 10,100 to hard disk when it detects message 10,100 5. Reads the next 100 messages in the transaction into memory The apply component applies the first 10,100 messages from the hard disk and the last 100 messages from memory. When the reader server spills messages from memory, the messages are stored in a database table on the hard disk. These messages are not spilled from memory to a queue table. Message spilling occurs at the transaction level. For example, if this parameter is set to 10000, and the reader server of an apply component is assembling two transactions, one with 7,500 messages and another with 8,000 messages, then it does not spill any messages. If INFINITE, then the apply component does not spill messages to the hard disk based on the number of messages in a transaction.</td>
</tr>

Usage Notes

The following usage notes apply to this procedure:

- Delays Are Possible Before New Parameter Settings Take Effect
- Parameters Interpreted as Positive Integers
- Parameters with a System Change Number (SCN) Setting
- The SET_PARAMETER Procedure and Streams
- The SET_PARAMETER Procedure and XStream Outbound Servers
- The SET_PARAMETER Procedure and XStream Inbound Servers

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

The SET_PARAMETER Procedure and Streams

You can use the following parameters in Streams if you enable XStream performance optimizations for Oracle Streams using the procedure DBMS_XSTREAM_ADM.ENABLE GG_XSTREAM FOR STREAMS:

- apply_sequence_nextval
- compute_lcr_dep_on_arrival
- eager_size
- grouptransops
- max_parallelism
• max_sga_size
• optimize_progress_table
• parallelism_interval

The SET_PARAMETER Procedure and XStream Outbound Servers

Outbound servers ignore the settings for the following apply parameters:

• allow_duplicate_rows
• commit_serialization
• compare_key_only
• compute_lcr_dep_on_arrival
• disable_on_error
• eager_size
• enable_xstream_table_stats
• grouptransops
• handlecollisions
• optimize_self_updates
• parallelism
• parallelism_interval
• preserve_encryption
• rtrim_on_implicit_conversion
• suppresstriggers

The commit_serialization parameter is always set to FULL for an outbound server, and the parallelism parameter is always set to 1 for an outbound server.

You can use the other apply parameters with outbound servers.

🔗 Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

The SET_PARAMETER Procedure and XStream Inbound Servers

Inbound servers ignore the settings for the following apply parameters:

• excludetag
• excludetrans
• excludeuser
• excludeuserid
• getapplops
• getreplicates
• ignore_transaction
• maximum scn

You can use all of the other apply component parameters with inbound servers.

The default setting for the compare_key_only parameter for an inbound server is Y.
The default setting for the parallelism parameter for an inbound server is 4.

Note:
Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

20.4.23 SET_REPERROR_HANDLER Procedure

This procedure specifies how a particular error is handled based on its error number.

You can choose between several predefined actions for a given error.

Syntax

```sql
DBMS_APPLY_ADM.SET_REPERROR_HANDLER(
    apply_name     IN  VARCHAR2,
    object         IN  VARCHAR2,
    error_number   IN  NUMBER,
    method         IN  VARCHAR2,
    source_object  IN  VARCHAR2  DEFAULT NULL,
    max_retries    IN  NUMBER    DEFAULT NULL,
    delay_csecs    IN  NUMBER    DEFAULT 6000);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The name of the apply process.</td>
</tr>
<tr>
<td>object</td>
<td>The schema and name of the target table, specified as [schema name.]table name for which an error handler is being added, modified, or removed. The table must exist. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>error_number</td>
<td>The error handling number. If 0, then use the default for all error handling for object.</td>
</tr>
</tbody>
</table>
Table 20-26  (Cont.) SET_REPERROR_HANDLER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>Specifies the action to take when the given error_number occurs.</td>
</tr>
<tr>
<td></td>
<td>If NULL, remove the error handler for error_number.</td>
</tr>
<tr>
<td></td>
<td>The possible actions are:</td>
</tr>
<tr>
<td></td>
<td>• ABEND: Stop the apply process when the error occurs.</td>
</tr>
<tr>
<td></td>
<td>• RECORD: Move the LCR to the error queue when the error is encountered.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE: Silently ignore the error and do not apply the LCR.</td>
</tr>
<tr>
<td></td>
<td>• RETRY: Retry the LCR max_retries times.</td>
</tr>
<tr>
<td></td>
<td>• RETRY_TRANSACTION: Retry the transaction max_retries times. Wait delay_csecs centiseconds before each retry. RECORD_TRANSACTION: Move the entire transaction to the error queue if this error occurs.</td>
</tr>
<tr>
<td>source_object</td>
<td>The schema and object name of the source table, specified as [schema_name.]table_name for the table where the change originated. For example, if the change originated at the employees table owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Maximum number of times to retry for RETRY and RETRY_TRANSACTION actions in method. Must be specified with either the RETRY or RETRY_TRANSACTION.</td>
</tr>
<tr>
<td>delay_csecs</td>
<td>The number of centiseconds between retries for RETRY and RETRY_TRANSACTION action in method.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

• Priority of Error Handlers

Priority of Error Handlers

Any conflict handling specified by SET_UPDATE_CONFLICT_HANDLER or SET_DML_CONFLICT_HANDLER is tried before the actions specified by SET_REPERROR_HANDLER. The PL/SQL procedure specified by SET_DML_HANDLER is called to handle the error if none of the previously mentioned methods resolve it.

20.4.24 SET_SCHEMA_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified schema in the specified source database and, optionally, for the tables owned by the schema at the source database. This procedure overwrites any existing instantiation SCN for the schema, and, if it sets the instantiation SCN for a table, it overwrites any existing instantiation SCN for the table.

This procedure gives you precise control over which DDL logical change records (LCRs) for a schema are ignored and which DDL LCRs are applied by an apply component.
Syntax

```
DBMS_APPLY_ADM.SET_SCHEMA_INSTANTIATION_SCN(
    source_schema_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    recursive             IN  BOOLEAN   DEFAULT FALSE,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 20-27  SET_SCHEMA_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_schema_name</td>
<td>The name of the source schema. For example, hr. When setting an instantiation SCN for schema, always specify the name of the schema at the source database, even if a rule-based transformation or apply handler is configured to change the schema name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source schema from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
<tr>
<td>recursive</td>
<td>If TRUE, then the procedure sets the instantiation SCN for the specified schema and all tables owned by the schema in the source database. This procedure selects the tables owned by the specified schema from the ALL_TABLES data dictionary view at the source database under the security context of the current user. If FALSE, then the procedure sets the instantiation SCN for the specified schema, but does not set the instantiation SCN for any tables.</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs
- Instantiation SCNs and DDL LCRs
- The recursive Parameter
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_SCHEMA_INSTANTIATION_SCN Procedure and CDBs

See Also:

- SET_GLOBAL_INSTANTIATION_SCN Procedure
- SET_TABLE_INSTANTIATION_SCN Procedure
- LCR$_DDL_RECORD Type for more information about DDL LCRs
- Oracle Streams Replication Administrator’s Guide

The SET_SCHEMA_INSTANTIATION_SCN Procedure and LCRs

Any instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

Instantiation SCNs and DDL LCRs

If the commit SCN of a DDL LCR for a database object in a schema from a source database is less than or equal to the instantiation SCN for that database object at a destination database, then the apply component at the destination database disregards the DDL LCR. Otherwise, the apply component applies the DDL LCR.

The schema instantiation SCN specified by this procedure is used on the following types of DDL LCRs:

- DDL LCRs with a command_type of CREATE TABLE
- DDL LCRs with a non-NULL object_owner specified and neither base_table_owner nor base_table_name specified.

For example, the schema instantiation SCN set by this procedure is used for a DDL LCR with a command_type of CREATE TABLE and ALTER USER.

The schema instantiation SCN specified by this procedure is not used for DDL LCRs with a command_type of CREATE USER. A global instantiation SCN is needed for such DDL LCRs.

The recursive Parameter

If the recursive parameter is set to TRUE, then this procedure sets the table instantiation SCN for each table at the source database owned by the schema. This procedure
uses the `SET_TABLE_INSTANTIATION_SCN` procedure to set the instantiation SCN for each table. Each table instantiation SCN is used for DDL LCRs and row LCRs on the table.

If the recursive parameter is set to `FALSE`, then this procedure does not set the instantiation SCN for any tables.

The `SET_SCHEMA_INSTANTIATION_SCN` Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The `apply_database_link` parameter must be set to `NULL` or to the local database for this procedure to set an instantiation SCN for an outbound server.

See Also:

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The `SET_SCHEMA_INSTANTIATION_SCN` Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The `SET_SCHEMA_INSTANTIATION_SCN` Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.

### 20.4.25 SET_TABLE_INSTANTIATION_SCN Procedure

This procedure records the specified instantiation SCN for the specified table in the specified source database. This procedure overwrites any existing instantiation SCN for the particular table.

This procedure gives you precise control over which logical change records (LCRs) for a table are ignored and which LCRs are applied by an apply component.

**Syntax**

```sql
DBMS_APPLY_ADM.SET_TABLE_INSTANTIATION_SCN(
    source_object_name    IN  VARCHAR2,
    source_database_name  IN  VARCHAR2,
    instantiation_scn     IN  NUMBER,
    apply_database_link   IN  VARCHAR2  DEFAULT NULL,
    source_root_name      IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 20-28 SET_TABLE_INSTANTIATION_SCN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_object_name</td>
<td>The name of the source object specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default. When setting an instantiation SCN for a database object, always specify the name of the schema and database object at the source database, even if a rule-based transformation or apply handler is configured to change the schema name or database object name.</td>
</tr>
<tr>
<td>source_database_name</td>
<td>The global name of the source database. For example, DBS1.NET. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
<tr>
<td>instantiation_scn</td>
<td>The instantiation SCN. Specify NULL to remove the instantiation SCN metadata for the source table from the data dictionary.</td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database of a local apply component is a non-Oracle database.</td>
</tr>
</tbody>
</table>

Note: This parameter must be NULL when the procedure is invoked from the root of a CDB.

| source_root_name     | The global name of the source root database. In a non-CDB, this parameter must be NULL. In a CDB, both source_database and source_root_name must be specified to identify a specific container. |

Usage Notes

The following usage notes apply to this procedure:

- Instantiation SCNs and LCRs
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers
- The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

Instantiation SCNs and LCRs

If the commit SCN of an LCR for a table from a source database is less than or equal to the instantiation SCN for that table at some destination database, then the apply component at the destination database disregards the LCR. Otherwise, the apply component applies the LCR.

The table instantiation SCN specified by this procedure is used on the following types of LCRs:

- Row LCRs for the table
• DDL LCRs that have a non-NULL base_table_owner and base_table_name specified, except for DDL LCRs with a command_type of CREATE TABLE

For example, the table instantiation SCN set by this procedure is used for DDL LCRs with a command_type of ALTER TABLE or CREATE TRIGGER.

**Note:**

The instantiation SCN specified by this procedure is used only for LCRs captured by a capture process. It is not used for user-created LCRs.

**See Also:**

• **SET_GLOBAL_INSTANTIATION_SCN Procedure**
• **SET_SCHEMA_INSTANTIATION_SCN Procedure**
• **LCR$_ROW_RECORD Type** for more information about row LCRs
• **LCR$_DDL_RECORD Type** for more information about DDL LCRs
• **Oracle Streams Replication Administrator's Guide**

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Outbound Servers

Instantiation SCNs are not required for database objects processed by an outbound server. If an instantiation SCN is set for a database object, then the outbound server only sends the LCRs for the database object with SCN values that are greater than the instantiation SCN value. If a database object does not have an instantiation SCN set, then the outbound server skips the instantiation SCN check and sends all LCRs for that database object. In both cases, the outbound server only sends LCRs that satisfy its rule sets.

The apply_database_link parameter must be set to NULL or to the local database for this procedure to set an instantiation SCN for an outbound server.

**See Also:**

*Oracle Database XStream Guide* for more information about outbound servers and instantiation SCNs

The SET_TABLE_INSTANTIATION_SCN Procedure and XStream Inbound Servers

Inbound servers ignore instantiation SCNs. This procedure has no effect on XStream inbound servers.

The SET_TABLE_INSTANTIATION_SCN Procedure and CDBs

In a CDB, this procedure must be invoked from the same container as the apply process that uses the instantiation SCN information.
20.4.26 SET_UPDATE_CONFLICT_HANDLER Procedure

This procedure adds, modifies, or removes a prebuilt update conflict handler for the specified object.

Syntax

```sql
DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
    object_name          IN  VARCHAR2,
    method_name          IN  VARCHAR2,
    resolution_column    IN  VARCHAR2,
    column_list          IN  DBMS_UTILITY.NAME_ARRAY,
    apply_database_link  IN  VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The schema and name of the table, specified as [schema_name.]object_name, for which an update conflict handler is being added, modified, or removed. For example, if an update conflict handler is being added for table employees owned by user hr, then specify hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
| method_name        | Type of update conflict handler to create. You can specify one of the prebuilt handlers, which determine whether the column list from the source database is applied for the row or whether the values in the row at the destination database are retained:  
  • MAXIMUM: Applies the column list from the source database if it has the greater value for the resolution column. Otherwise, retains the values at the destination database.  
  • MINIMUM: Applies the column list from the source database if it has the lesser value for the resolution column. Otherwise, retains the values at the destination database.  
  • OVERWRITE: Applies the column list from the source database, overwriting the column values at the destination database.  
  • DISCARD: Retains the column list from the destination database, discarding the column list from the source database.  
If NULL, then the procedure removes any existing update conflict handler with the same object_name, resolution_column, and column_list. If non-NULL, then the procedure replaces any existing update conflict handler with the same object_name and resolution_column. |
### Table 20-29  (Cont.) SET_UPDATE_CONFLICT_HANDLER Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resolution_column</td>
<td>Name of the column used to uniquely identify an update conflict handler. For the MAXIMUM and MINIMUM prebuilt methods, the resolution column is also used to resolve the conflict. The resolution column must be one of the columns listed in the column_list parameter. NULL is not allowed for this parameter. For the OVERWRITE and DISCARD prebuilt methods, you can specify any column in the column list.</td>
</tr>
<tr>
<td>column_list</td>
<td>List of columns for which the conflict handler is called. The same column cannot be in more than one column list. If a conflict occurs for one or more of the columns in the list when an apply component tries to apply a row logical change record (row LCR), then the conflict handler is called to resolve the conflict. The conflict handler is not called if a conflict occurs only for columns that are not in the list. <em>(Note): Prebuilt update conflict handlers do not support LOB, LONG, LONG RAW, user-defined type, and Oracle-supplied type columns. Therefore, you should not include these types of columns in the column_list parameter.</em></td>
</tr>
<tr>
<td>apply_database_link</td>
<td>The name of the database link to a non-Oracle database. This parameter should be set only when the destination database is a non-Oracle database. <em>(Note): Currently, conflict handlers are not supported when applying changes to a non-Oracle database.</em></td>
</tr>
</tbody>
</table>

### Usage Notes

The following usage notes apply to this procedure:

- **Modifying an Existing Update Conflict Handler**
- **Removing an Existing Update Conflict Handler**
- **Series of Actions for Conflicts**
- **Procedure DML Handlers for Conflicts**
- **A Column Can Be in Only One Column List**
- **Update Conflict Handlers and Non-Oracle Databases**
- **The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers**
- **The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers**
Modifying an Existing Update Conflict Handler

If you want to modify an existing update conflict handler, then you specify the table and resolution column of an the existing update conflict handler. You can modify the prebuilt method or the column list.

Removing an Existing Update Conflict Handler

If you want to remove an existing update conflict handler, then specify `NULL` for the prebuilt method and specify the table, column list, and resolution column of the existing update conflict handler.

Series of Actions for Conflicts

If an update conflict occurs, then Oracle completes the following series of actions:

1. Calls the appropriate update conflict handler to resolve the conflict
2. If no update conflict handler is specified or if the update conflict handler cannot resolve the conflict, then calls the appropriate error handler for the apply component, table, and operation to handle the error
3. If no error handler is specified or if the error handler cannot resolve the error, then raises an error and moves the transaction containing the row LCR that caused the error to the error queue

Procedure DML Handlers for Conflicts

If you cannot use a prebuilt update conflict handler to meet your requirements, then you can create a PL/SQL procedure to use as a custom conflict handler. You use the `SET_DML_HANDLER` procedure to designate one or more custom conflict handlers for a particular table. In addition, a custom conflict handler can process LOB columns and use LOB assembly.

A Column Can Be in Only One Column List

When a column is in a column list, and you try to add the same column to another column list, this procedure returns the following error:
ORA-00001: UNIQUE CONSTRAINT (SYS.APPLY$_CONF_HDLR_COLUMNS_UNQ1) VIOLATED

Update Conflict Handlers and Non-Oracle Databases

Setting an update conflict handler for an apply component that is applying to a non-Oracle database is not supported.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.

The SET_UPDATE_CONFLICT_HANDLER Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.

Examples

The following is an example for setting an update conflict handler for the `employees` table in the `hr` schema:

```sql
DECLARE
    cols  DBMS_UTILITY.NAME_ARRAY;
BEGIN
    cols(1) := 'salary';
    cols(2) := 'commission_pct';
    DBMS_APPLY_ADM.SET_UPDATE_CONFLICT_HANDLER(
        object_name           =>  'hr.employees',
        method_name           =>  'MAXIMUM',
        resolution_column     =>  'salary',
        column_list           =>  cols);
END;
/
```

This example sets a conflict handler that is called if a conflict occurs for the `salary` or `commission_pct` column in the `hr.employees` table. If such a conflict occurs, then the `salary` column is evaluated to resolve the conflict. If a conflict occurs only for a column that is not in the column list, such as the `job_id` column, then this conflict handler is not called.

20.4.27 SET_VALUE_DEPENDENCY Procedure

This procedure sets or removes a value dependency. A value dependency is a virtual dependency definition that defines a relationship between the columns of two or more tables.

An apply component uses the name of a value dependencies to detect dependencies between row logical change records (row LCRs) that contain the columns defined in the value dependency. Value dependencies can define virtual foreign key relationships between tables, but, unlike foreign key relationships, value dependencies can involve more than two database objects.

This procedure is overloaded. The `attribute_list` and `attribute_table` parameters are mutually exclusive.
Syntax

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_list  IN VARCHAR2);

DBMS_APPLY_ADM.SET_VALUE_DEPENDENCY(
    dependency_name IN VARCHAR2,
    object_name     IN VARCHAR2,
    attribute_table IN DBMS_UTILITY.NAME_ARRAY);

Parameters

Table 20-30  SET_VALUE_DEPENDENCY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dependency_name</td>
<td>The name of the value dependency. If a dependency with the specified name does not exist, then it is created.</td>
</tr>
<tr>
<td></td>
<td>If a dependency with the specified name exists, then the specified object and attributes are added to the dependency.</td>
</tr>
<tr>
<td></td>
<td>If NULL, an error is raised.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the table, specified as [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>If NULL and the specified dependency exists, then the dependency is removed. If NULL and the specified dependency does not exist, then an error is raised.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then attribute_list and attribute_table also must be NULL.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>A comma-delimited list of column names in the table. There must be no spaces between entries.</td>
</tr>
<tr>
<td>attribute_table</td>
<td>A PL/SQL associative array of type DBMS_UTILITY.NAME_ARRAY that contains names of columns in the table. The first column name should be at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers
- The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers

The SET_VALUE_DEPENDENCY Procedure and XStream Outbound Servers

This procedure has no effect on XStream outbound servers.
The SET_VALUE_DEPENDENCY Procedure and XStream Inbound Servers
This procedure functions the same way for apply processes and inbound servers.

### 20.4.28 START_APPLY Procedure

This procedure directs the apply component to start applying messages.

**Syntax**

```
DBMS_APPLY_ADM.START_APPLY(
    apply_name  IN  VARCHAR2);
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply to this procedure:

- **Apply Component Status**
- **The START_APPLY Procedure and XStream Outbound Servers**
- **The START_APPLY Procedure and XStream Inbound Servers**

**Apply Component Status**

The apply component status is persistently recorded. Hence, if the status is `ENABLED`, then the apply component is started upon database instance startup. An apply component (annn) is an Oracle background process. The enqueue and dequeue state of `DBMS_AQADM.START_QUEUE` and `DBMS_AQADM.STOP_QUEUE` have no effect on the start status of an apply component.

**The START_APPLY Procedure and XStream Outbound Servers**

This procedure functions the same way for apply processes and outbound servers.

**The START_APPLY Procedure and XStream Inbound Servers**

This procedure functions the same way for apply processes and inbound servers.

### 20.4.29 STOP_APPLY Procedure

This procedure stops the apply component from applying messages and rolls back any unfinished transactions being applied.

**Syntax**

```
DBMS_APPLY_ADM.STOP_APPLY(
    apply_name  IN  VARCHAR2,
    force       IN  BOOLEAN   DEFAULT FALSE);
```
Parameters

Table 20-32  STOP_APPLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_name</td>
<td>The apply component name. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the apply component as soon as possible. If FALSE, then the procedure stops the apply component after ensuring that there are no gaps in the set of applied transactions. The behavior of the apply component depends on the setting specified for the force parameter and the setting specified for the commit_serialization apply component parameter. See &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- Apply Component Status
- Queue Subprograms Have No Effect on Apply Component Status
- The STOP_APPLY force Parameter and the commit_serialization Apply Parameter
- The STOP_APPLY Procedure and XStream Outbound Servers
- The STOP_APPLY Procedure and XStream Inbound Servers

Apply Component Status

The apply component status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the apply component is not started upon database instance startup.

Queue Subprograms Have No Effect on Apply Component Status

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the STOP status of an apply component.

The STOP_APPLY force Parameter and the commit_serialization Apply Parameter

The following table describes apply component behavior for each setting of the force parameter in the STOP_APPLY procedure and the commit_serialization apply component parameter. In all cases, the apply component rolls back any unfinished transactions when it stops.

<table>
<thead>
<tr>
<th>force</th>
<th>commit_serialization</th>
<th>Apply Component Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>FULL</td>
<td>The apply component stops immediately and does not apply any unfinished transactions.</td>
</tr>
<tr>
<td>TRUE</td>
<td>DEPENDENT_TRANSACTIONS</td>
<td>When the apply component stops, some transactions that have been applied locally might have committed at the source database at a later point in time than some transactions that have not been applied locally.</td>
</tr>
</tbody>
</table>
The apply component stops after applying the next uncommitted transaction in the commit order, if any such transaction is in progress.

Before stopping, the apply component applies all of the transactions that have a commit time that is earlier than the applied transaction with the most recent commit time.

For example, assume that the `commit_serialization` apply component parameter is set to `DEPENDENT_TRANSACTIONS` and there are three transactions: transaction 1 has the earliest commit time, transaction 2 is committed after transaction 1, and transaction 3 has the latest commit time. Also assume that an apply component has applied transaction 1 and transaction 3 and is in the process of applying transaction 2 when the STOP_APPLY procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transaction 2 is not applied, and the apply component stops (transaction 2 is rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction 2 is applied before the apply component stops.

A different scenario would result if the `commit_serialization` apply component parameter is set to `FULL`. For example, assume that the `commit_serialization` apply component parameter is set to `FULL` and there are three transactions: transaction A has the earliest commit time, transaction B is committed after transaction A, and transaction C has the latest commit time. In this case, the apply component has applied transaction A and is in the process of applying transactions B and C when the STOP_APPLY procedure is run. Given this scenario, if the `force` parameter is set to `TRUE`, then transactions B and C are not applied, and the apply component stops (transactions B and C are rolled back). If, however, the `force` parameter is set to `FALSE`, then transaction B is applied before the apply component stops, and transaction C is rolled back.

See Also:

SET_PARAMETER Procedure for more information about the `commit_serialization` apply component parameter.

The STOP_APPLY Procedure and XStream Outbound Servers

This procedure functions the same way for apply processes and outbound servers.

The STOP_APPLY Procedure and XStream Inbound Servers

This procedure functions the same way for apply processes and inbound servers.
21

DBMS_AQ

The DBMS_AQ package provides an interface to Oracle Streams Advanced Queuing (AQ).

This chapter contains the following topics:

- Security Model
- Constants
- Data Structures
- Operational Notes
- Summary of DBMS_AQ Subprograms

See Also:

- Oracle Database Advanced Queuing User’s Guide
- Oracle Database Advanced Queuing (AQ) Types for information about types to use with DBMS_AQ.

21.1 DBMS_AQ Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQ and DBMS_AQADM.

Queue Security

To enqueue or dequeue, users need EXECUTE rights on DBMS_AQ and either ENQUEUE or DEQUEUE privileges on target queues, or ENQUEUE_ANY/DEQUEUE_ANY system privileges. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas.

As a database user, you do not need any explicit object-level or system-level privileges to enqueue or dequeue to queues in your own schema other than the EXECUTE right on DBMS_AQ.

See Also:

Oracle Database Advanced Queuing User’s Guide for more information on queue privileges and access control.
OCI Applications and Queue Access

For an Oracle Call Interface (OCI) application to access a queue, the session user must be granted either the object privilege of the queue he intends to access or the ENQUEUE ANY QUEUE or DEQUEUE ANY QUEUE system privileges. The EXECUTE right of DBMS_AQ is not checked against the session user's rights.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

See Also:

- DBMS_AQADM
- Oracle Database Advanced Queuing User’s Guide for more information on security required for propagation

21.2 DBMS_AQ Constants

This topic describes the constants used by DBMS_AQ.

The DBMS_AQ package uses the constants shown in the following table.

When using enumerated constants such as BROWSE, LOCKED, or REMOVE, the PL/SQL constants must be specified with the scope of the packages defining it. All types associated with the operational interfaces have to be prepended with DBMS_AQ. For example: DBMS_AQ.BROWSE.

Note:

The sequence_deviation attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if message_grouping parameter of DBMS_AQADM subprograms is set to TRANSACTIONAL. The sequence deviation feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).

### 21.3 DBMS_AQ Data Types

This topic lists and describes DBMS_AQ data types.

#### Table 21-2  DBMS_AQ Data Structures

<table>
<thead>
<tr>
<th>Data Structures</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_NAME</td>
<td>Names database objects</td>
</tr>
<tr>
<td>TYPE_NAME</td>
<td>Defines queue types</td>
</tr>
<tr>
<td>Oracle Database Advanced Queuing</td>
<td>Specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification</td>
</tr>
<tr>
<td>PL/SQL Callback</td>
<td></td>
</tr>
</tbody>
</table>
OBJECT_NAME

The object_name data structure names database objects. It applies to queues, queue tables, agent names, and object types.

Syntax

object_name := VARCHAR2;
object_name := [schema_name.]name;

Usage Notes

Names for objects are specified by an optional schema name and a name. If the schema name is not specified, the current schema is assumed. The name must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters. Schema names, agent names, and object type names can be up to 128 bytes long. Queue names and queue table names can be up to 122 bytes long. Maximum length of agent names and subscriber names can be 128 characters with datablock size greater than 2k. For 2k datablock size, maximum length for subscriber is 128 bytes.

TYPE_NAME

The type_name data structure defines queue types.

Syntax

type_name := VARCHAR2;
type_name := object_type | "RAW";

Attributes

Table 21-3 Type Name Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Maximum number of attributes in the object type is limited to 900. To store payload of type RAW, Oracle Database Advanced Queuing creates a queue table with a LOB column as the payload repository. The theoretical maximum size of the message payload is the maximum amount of data that can be stored in a LOB column. However, the maximum size of the payload is determined by which programmatic environment you use to access Oracle Database Advanced Queuing. For PL/SQL, Java and precompilers the limit is 32K; for the OCI the limit is 4G. Because the PL/SQL enqueue and dequeue interfaces accept RAW buffers as the payload parameters you will be limited to 32K bytes. In OCI, the maximum size of your RAW data will be limited to the maximum amount of contiguous memory (as an OCIRaw is simply an array of bytes) that the OCI Object Cache can allocate. Typically, this will be at least 32K bytes and much larger in many cases. Because LOB columns are used for storing RAW payload, the Oracle Database Advanced Queuing administrator can choose the LOB tablespace and configure the LOB storage by constructing a LOB storage string in the storage_clause parameter during queue table creation time.</td>
</tr>
<tr>
<td>&quot;RAW&quot;</td>
<td></td>
</tr>
</tbody>
</table>
Oracle Database Advanced Queuing PL/SQL Callback

The `plsqlcallback` data structure specifies the user-defined PL/SQL procedure, defined in the database to be invoked on message notification.

Syntax

If a notification message is expected for a RAW payload enqueue, then the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN  RAW,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR,
    payload  IN  RAW,
    payloadl IN  NUMBER);
```

Attributes

Table 21-4  Oracle Database Advanced Queuing PL/SQL Callback Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>context</td>
<td>Specifies the context for the callback function that was passed by <code>dbms_aq.register</code>. See <code>AQ$_REG_INFO</code> Type.</td>
</tr>
<tr>
<td>reginfo</td>
<td>See <code>AQ$_REG_INFO</code> Type.</td>
</tr>
<tr>
<td>descr</td>
<td>See <code>AQ$_DESCRIPTOR</code> Type</td>
</tr>
<tr>
<td>payload</td>
<td>If a notification message is expected for a raw payload enqueue then this contains the raw payload that was enqueued into a non persistent queue. In case of a persistent queue with raw payload this parameter will be null.</td>
</tr>
<tr>
<td>payloadl</td>
<td>Specifies the length of <code>payload</code>. If <code>payload</code> is null, <code>payloadl</code> = 0.</td>
</tr>
</tbody>
</table>

If the notification message is expected for an ADT payload enqueue, the PL/SQL callback must have the following signature:

```plsql
procedure plsqlcallback(
    context  IN  RAW,
    reginfo  IN  SYS.AQ$_REG_INFO,
    descr    IN  SYS.AQ$_DESCRIPTOR,
    payload  IN  VARCHAR2,
    payloadl IN  NUMBER);
```

21.4 DBMS_AQ Operational Notes

This topic lists various DBMS_AQ operational notes.

DBMS_AQ and DBMS_AQADM Java Classes

Java interfaces are available for `DBMS_AQ` and `DBMS_AQADM`. The Java interfaces are provided in the `$ORACLE_HOME/rdbms/jlib/aqapi.jar`. Users are required to have EXECUTE privileges on the `DBMS_AQIN` package to use these interfaces.
21.5 Summary of DBMS_AQ Subprograms

The DBMS_AQ package uses subprograms described in this table.

### Table 21-5   DBMS_AQ Package Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_AGENT Procedure</td>
<td>Creates an entry for an Oracle Database Advanced Queuing agent in the LDAP directory</td>
</tr>
<tr>
<td>DEQUEUE Procedure</td>
<td>Dequeues a message from the specified queue</td>
</tr>
<tr>
<td>DEQUEUE_ARRAY Function</td>
<td>Dequeues an array of messages from the specified queue</td>
</tr>
<tr>
<td>ENQUEUE Procedure</td>
<td>Adds a message to the specified queue</td>
</tr>
<tr>
<td>ENQUEUE_ARRAY Function</td>
<td>Adds an array of messages to the specified queue</td>
</tr>
<tr>
<td>LISTEN Procedures</td>
<td>Listen to one or more queues on behalf of a list of agents</td>
</tr>
<tr>
<td>POST Procedure</td>
<td>Posts to an anonymous subscription which allows all clients who are registered for the subscription to get notifications</td>
</tr>
<tr>
<td>REGISTER Procedure</td>
<td>Registers for message notifications</td>
</tr>
<tr>
<td>UNBIND_AGENT Procedure</td>
<td>Removes an entry for an Oracle Database Advanced Queuing agent from the LDAP directory</td>
</tr>
<tr>
<td>UNREGISTER Procedure</td>
<td>Unregisters a subscription which turns off notification</td>
</tr>
</tbody>
</table>

**Note:**

DBMS_AQ does not have a purity level defined; therefore, you cannot call any procedure in this package from other procedures that have RNDS, WNDS, RNPS or WNPS constraints defined.

### 21.5.1 BIND_AGENT Procedure

This procedure creates an entry for an Oracle Database Advanced Queuing agent in the LDAP server.

**Syntax**

```sql
DBMS_AQ.BIND_AGENT(
    agent       IN SYS.AQ$_AGENT,
    certificate IN VARCHAR2 default NULL);
```

**Parameters**

### Table 21-6   BIND_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be registered in LDAP server.</td>
</tr>
</tbody>
</table>
Table 21-6  (Cont.) BIND_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certificate</td>
<td>Location (LDAP distinguished name) of the &quot;organizationalperson&quot; entry in LDAP whose digital certificate (attribute usercertificate) is to be used for this agent. Example: &quot;cn=OE, cn=ACME, cn=com&quot; is a distinguished name for a OrganizationalPerson OE whose certificate will be used with the specified agent.</td>
</tr>
</tbody>
</table>

Usage Notes

In the LDAP server, digital certificates are stored as an attribute (usercertificate) of the OrganizationalPerson entity. The distinguished name for this OrganizationalPerson must be specified when binding the agent.

21.5.2 DEQUEUE Procedure

This procedure dequeues a message from the specified queue.

Syntax

```sql
DBMS_AQ.DEQUEUE (  
    queue_name          IN      VARCHAR2,  
    dequeue_options     IN      dequeue_options_t,  
    message_properties  OUT     message_properties_t,  
    payload             OUT     "<ADT_1>"  
    msgid               OUT     RAW);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue.</td>
</tr>
<tr>
<td>dequeue_options</td>
<td>See DEQUEUE_OPTIONS_T Type.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. For the definition of type_name refer to TYPE_NAME in DBMS_AQ Data Types.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message.</td>
</tr>
</tbody>
</table>

Usage Notes

The search criteria for messages to be dequeued is determined by the following parameters in dequeue_options:

- consumer_name
- msgid

Msgid uniquely identifies the message to be dequeued. Only messages in the READY state are dequeued unless msgid is specified.
• correlation

Correlation identifiers are application-defined identifiers that are not interpreted by Oracle Database Advanced Queuing.

• deq_condition

Dequeue condition is an expression based on the message properties, the message data properties and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Message properties include priority, corrid and other columns in the queue table.

To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload.

Example: tab.user_data.orderstatus='EXPRESS'

The dequeue order is determined by the values specified at the time the queue table is created unless overridden by the msgid and correlation ID in dequeue_options.

The database-consistent read mechanism is applicable for queue operations. For example, a BROWSE call may not see a message that is enqueued after the beginning of the browsing transaction.

The default navigation parameter during dequeue is NEXT_MESSAGE. This means that subsequent dequeues will retrieve the messages from the queue based on the snapshot obtained in the first dequeue. In particular, a message that is enqueued after the first dequeue command will be processed only after processing all the remaining messages in the queue. This is usually sufficient when all the messages have already been enqueued into the queue, or when the queue does not have a priority-based ordering. However, applications must use the FIRST_MESSAGE navigation option when the first message in the queue needs to be processed by every dequeue command. This usually becomes necessary when a higher priority message arrives in the queue while messages already-enqueued are being processed.

Note:

It may be more efficient to use the FIRST_MESSAGE navigation option when messages are concurrently enqueued. If the FIRST_MESSAGE option is not specified, Oracle Database Advanced Queuing continually generates the snapshot as of the first dequeue command, leading to poor performance. If the FIRST_MESSAGE option is specified, then Oracle Database Advanced Queuing uses a new snapshot for every dequeue command.

Messages enqueued in the same transaction into a queue that has been enabled for message grouping will form a group. If only one message is enqueued in the transaction, then this will effectively form a group of one message. There is no upper limit to the number of messages that can be grouped in a single transaction.

In queues that have not been enabled for message grouping, a dequeue in LOCKED or REMOVE mode locks only a single message. By contrast, a dequeue operation that
seeks to dequeue a message that is part of a group will lock the entire group. This is useful when all the messages in a group need to be processed as an atomic unit.

When all the messages in a group have been dequeued, the dequeue returns an error indicating that all messages in the group have been processed. The application can then use the NEXT_TRANSACTION to start dequeuing messages from the next available group. In the event that no groups are available, the dequeue will time out after the specified WAIT period.

Using Secure Queues

For secure queues, you must specify consumer_name in the dequeue_options parameter. See DEQUEUE_OPTIONS_T Type for more information about consumer_name.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using DBMS_AQADM.CREATE_AQ_AGENT. See CREATE_AQ_AGENT Procedure.
- You must map the Oracle Database Advanced Queuing agent to a database user with dequeue privileges on the secure queue. Use DBMS_AQADM.ENABLE_DB_ACCESS to do this. See ENABLE_DB_ACCESS Procedure.

See Also:

Oracle Streams Concepts and Administration for information about secure queues

21.5.3 DEQUEUE_ARRAY Function

This function dequeues an array of messages and returns them in the form of an array of payloads, an array of message properties and an array of message IDs. This function returns the number of messages successfully dequeued.

Syntax

```
DBMS_AQ.DEQUEUE_ARRAY (
  queue_name                IN   VARCHAR2,
  dequeue_options           IN   dequeue_options_t,
  array_size                IN   pls_integer,
  message_properties_array  OUT  message_properties_array_t,
  payload_array             OUT  *<COLLECTION_1>*,
  msgid_array               OUT  msgid_array_t,
  error_array               OUT  error_array_t)
RETURN pls_integer;
```

Parameters

**Table 21-8  DEQUEUE_ARRAY Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name from which messages are dequeued (same as single-row dequeue).</td>
</tr>
</tbody>
</table>
### Table 21-8  (Cont.) DEQUEUE_ARRAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dequeue_options</td>
<td>The set of options which will be applied to all messages in the array (same as single-row dequeue).</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to dequeue. For buffered messages, array_size should be 1.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. Each payload element has a corresponding set of message properties. See MESSAGE_PROPERTIES_ARRAY_T Type.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of dequeued payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, varray or nested table in its PL/SQL representation. Users can dequeue RAW and ADT payloads.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs of the dequeued messages. See MSGID_ARRAY_T Type.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

### Usage Notes

A nonzero wait time, as specified in `dequeue_options`, is recognized only when there are no messages in the queue. If the queue contains messages that are eligible for dequeue, then the `DEQUEUE_ARRAY` function will dequeue up to `array_size` messages and return immediately.

Dequeque by `message_id` is not supported. See `DEQUEUE Procedure` for more information on the `navigation` parameter. Existing `NAVIGATION` modes are supported. In addition, two new `NAVIGATION` modes are supported for queues enabled for message grouping:

- FIRST_MESSAGE_MULTI_GROUP
- NEXT_MESSAGE_MULTI_GROUP

**See Also:**

ENQUEUE_OPTIONS_T Type

For transaction grouped queues and `ONE_GROUP` navigation, messages are dequeued from a single transaction group only, subject to the `array_size` limit. In `MULTI_GROUP` navigation, messages are dequeued across multiple transaction groups, still subject to the `array_size` limit. ORA-25235 is returned to indicate the end of a transaction group.

`DEQUEUE_ARRAY` is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting `array_size` to one message.
21.5.4 ENQUEUE Procedure

This procedure adds a message to the specified queue.

Syntax

```
DBMS_AQ.ENQUEUE (
  queue_name          IN      VARCHAR2,
  enqueue_options     IN      enqueue_options_t,
  message_properties  IN      message_properties_t,
  payload             IN       "<ADT_1>",
  msgid               OUT     RAW);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the name of the queue to which this message should be enqueued. The queue cannot be an exception queue.</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type.</td>
</tr>
<tr>
<td>message_properties</td>
<td>See MESSAGE_PROPERTIES_T Type.</td>
</tr>
<tr>
<td>payload</td>
<td>Not interpreted by Oracle Database Advanced Queuing. The payload must be specified according to the specification in the associated queue table. NULL is an acceptable parameter. For the definition of type_name refer to TYPE_NAME in DBMS_AQ Data Types.</td>
</tr>
<tr>
<td>msgid</td>
<td>System generated identification of the message. This is a globally unique identifier that can be used to identify the message at dequeue time.</td>
</tr>
</tbody>
</table>

Usage Notes

The `sequence_deviation` parameter in `enqueue_options` can be used to change the order of processing between two messages. The identity of the other message, if any, is specified by the `enqueue_options` parameter `relative_msgid`. The relationship is identified by the `sequence_deviation` parameter.

Specifying `sequence_deviation` for a message introduces some restrictions for the delay and priority values that can be specified for this message. The delay of this message must be less than or equal to the delay of the message before which this message is to be enqueued. The priority of this message must be greater than or equal to the priority of the message before which this message is to be enqueued.

Note:

The `sequence_deviation` attribute has no effect in releases prior to Oracle Streams AQ 10g Release 1 (10.1) if `message_grouping` parameter of `DBMS_AQADM` subprograms is set to TRANSACTIONAL. The `sequence_deviation` feature is deprecated in Oracle Streams AQ 10g Release 2 (10.2).
If a message is enqueued to a multiconsumer queue with no recipient, and if the queue has no subscribers (or rule-based subscribers that match this message), then Oracle error ORA-24033 is raised. This is a warning that the message will be discarded because there are no recipients or subscribers to whom it can be delivered.

Using Secure Queues

For secure queues, you must specify the `sender_id` in the `messages_properties` parameter. See MESSAGE_PROPERTIES_T Type for more information about `sender_id`.

When you use secure queues, the following are required:

- You must have created a valid Oracle Database Advanced Queuing agent using DBMS_AQADM.CREATE_AQ_AGENT. See CREATE_AQ_AGENT Procedure.
- You must map `sender_id` to a database user with enqueue privileges on the secure queue. Use DBMS_AQADM.ENABLE_DB_ACCESS to do this. See ENABLE_DB_ACCESS Procedure.

See Also:

Oracle Streams Concepts and Administration for information about secure queues

21.5.5 ENQUEUE_ARRAY Function

This function enqueues an array of payloads using a corresponding array of message properties. The output will be an array of message IDs of the enqueued messages.

Syntax

```sql
DBMS_AQ.ENQUEUE_ARRAY (
    queue_name               IN   VARCHAR2,
    enqueue_options          IN   enqueue_options_t,
    array_size               IN   pls_integer,
    message_properties_array IN   message_properties_array_t,
    payload_array            IN   "<COLLECTION_1>",
    msgid_array              OUT  msgid_array_t,
    error_array              OUT  error_array_t)
RETURN pls_integer;
```

Parameters

**Table 21-10 ENQUEUE_ARRAY Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The queue name in which messages are enqueued (same as single-row enqueue).</td>
</tr>
<tr>
<td>enqueue_options</td>
<td>See ENQUEUE_OPTIONS_T Type.</td>
</tr>
<tr>
<td>array_size</td>
<td>The number of elements to enqueue. For buffered messages, <code>array_size</code> should be 1.</td>
</tr>
<tr>
<td>message_properties_array</td>
<td></td>
</tr>
<tr>
<td>payload_array</td>
<td></td>
</tr>
<tr>
<td>msgid_array</td>
<td></td>
</tr>
<tr>
<td>error_array</td>
<td></td>
</tr>
</tbody>
</table>
Table 21-10  (Cont.) ENQUEUE_ARRAY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_properties_array</td>
<td>A record containing an array corresponding to each message property. For each property, the user must allocate array_size elements. See MESSAGE_PROPERTIES_ARRAY_T Type.</td>
</tr>
<tr>
<td>payload_array</td>
<td>An array of payload data. &quot;&lt;COLLECTION_1&gt;&quot; can be an associative array, VARRAY, or nested table in its PL/SQL representation. Users can enqueue RAW and ADT payloads.</td>
</tr>
<tr>
<td>msgid_array</td>
<td>An array of message IDs for the enqueued messages. If an error occurs for a particular message, then its corresponding message ID is null. See MSGID_ARRAY_T Type.</td>
</tr>
<tr>
<td>error_array</td>
<td>Currently not implemented</td>
</tr>
</tbody>
</table>

Usage Notes

ENQUEUE_ARRAY is not supported for buffered messages, but you can still use this procedure on individual buffered messages by setting array_size to one message.

21.5.6 LISTEN Procedures

This procedure listens on one or more queues on behalf of a list of agents. The address field of the agent indicates the queue the agent wants to monitor. Only local queues are supported as addresses. Protocol is reserved for future use.

Syntax

```sql
DBMS_AQ.LISTEN (  
agent_list            IN    AQ$_AGENT_LIST_T,  
wait                  IN    BINARY_INTEGER DEFAULT DBMS_AQ.FOREVER,  
agent                 OUT   SYS.AQ$_AGENT);
```

```sql
DBMS_AQ.LISTEN (  
agent_list             IN   AQ$_AGENT_LIST_T,  
wait                   IN   BINARY_INTEGER DEFAULT FOREVER,  
listen_delivery_mode   IN   PLS_INTEGER DEFAULT DBMS_AQ.PERSISTENT,  
agent                  OUT  SYS.AQ$_AGENT,  
message_delivery_mode  OUT  PLS_INTEGER);
```

TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;
TYPE aq$_agent_list_t IS TABLE of aq$_agent INDEXED BY BINARY_INTEGER;

Parameters

Table 21-11  LISTEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_list</td>
<td>List of agents to listen for</td>
</tr>
<tr>
<td>wait</td>
<td>Time out for the listen call in seconds. By default, the call will block forever.</td>
</tr>
</tbody>
</table>
Table 21-11 (Cont.) LISTEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listen_delivery_mode</td>
<td>The caller specifies whether it is interested in persistent, buffered messages or both types of messages, specifying a delivery mode of DBMS_AQ.PERSISTENT or DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT_OR_BUFFERED</td>
</tr>
<tr>
<td>agent</td>
<td>Agent with a message available for consumption</td>
</tr>
<tr>
<td>message_delivery_mode</td>
<td>Returns the message type along with the queue and consumer for which there is a message</td>
</tr>
</tbody>
</table>

Usage Notes

If agent-address is a multiconsumer queue, then agent-name is mandatory. For single-consumer queues, agent-name must not be specified.

This procedure takes a list of agents as an argument. You specify the queue to be monitored in the address field of each agent listed. You also must specify the name of the agent when monitoring multiconsumer queues. For single-consumer queues, an agent name must not be specified. Only local queues are supported as addresses. Protocol is reserved for future use.

This is a blocking call that returns when there is a message ready for consumption for an agent in the list. If there are messages for more than one agent, only the first agent listed is returned. If there are no messages found when the wait time expires, an error is raised.

A successful return from the LISTEN call is only an indication that there is a message for one of the listed agents in one the specified queues. The interested agent must still dequeue the relevant message.

Note:

You cannot call LISTEN on nonpersistent queues.

21.5.7 POST Procedure

This procedure posts to a list of anonymous subscriptions that allows all clients who are registered for the subscriptions to get notifications.

Syntax

```sql
DBMS_AQ.POST (  
  post_list IN SYS.AQ$_POST_INFO_LIST,  
  post_count IN NUMBER);  
```
Table 21-12  POST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>post_list</td>
<td>Specifies the list of anonymous subscriptions to which you want to post. It is a list of AQ$_POST_INFO_LIST Type.</td>
</tr>
<tr>
<td>post_count</td>
<td>Specifies the number of entries in the post_list.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is used to post to anonymous subscriptions which allows all clients who are registered for the subscriptions to get notifications. Several subscriptions can be posted to at one time.

21.5.8 REGISTER Procedure

This procedure registers an e-mail address, user-defined PL/SQL procedure, or HTTP URL for message notification.

Syntax

```sql
DBMS_AQ.REGISTER (  
    reg_list IN SYS.AQ$_REG_INFO_LIST,  
    count IN NUMBER);
```

Parameters

Table 21-13  REGISTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure is used to register for notifications. You can specify an e-mail address to which message notifications are sent, register a procedure to be invoked on a notification, or register an HTTP URL to which the notification is posted. Interest in several subscriptions can be registered at one time.
- The procedure can also be used to register for grouping notifications using five grouping attributes:
  - Class – grouping criterion (currently only TIME criterion is supported)
  - Value – the value of the grouping criterion (currently only time in seconds for criterion TIME)
  - Type – summary or last, also contains count of notifications received in group (for AQ namespace only, not for DBCHANGE namespace)
  - Repeat count – how many times to perform grouping (Default is FOREVER)
– Start time – when to start grouping (Default is current time)

• If you register for e-mail notifications, you should set the host name and port name for the SMTP server that will be used by the database to send e-mail notifications. If required, you should set the send-from e-mail address, which is set by the database as the sent from field. You need a Java-enabled database to use this feature.

• If you register for HTTP notifications, you may want to set the host name and port number for the proxy server and a list of no-proxy domains that will be used by the database to post HTTP notifications.

See Also:
DBMS_AQELM for more information on e-mail and HTTP notifications

21.5.9 UNBIND_AGENT Procedure

This procedure removes the entry for an Oracle Database Advanced Queuing agent from the LDAP server.

Syntax

DBMS_AQ.UNBIND_AGENT(
    agent    IN SYS.AQ$_AGENT);

Parameters

Table 21-14 BIND_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>Agent that is to be removed from the LDAP server</td>
</tr>
</tbody>
</table>

21.5.10 UNREGISTER Procedure

This procedure unregisters a subscription which turns off notifications.

Syntax

DBMS_AQ.UNREGISTER (  
    reg_list     IN  SYS.AQ$_REG_INFO_LIST,  
    reg_count    IN  NUMBER);

Parameters

Table 21-15 UNREGISTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reg_list</td>
<td>Specifies the list of subscriptions to which you want to register for message notifications. It is a list of AQ$_REG_INFO Type.</td>
</tr>
<tr>
<td>reg_count</td>
<td>Specifies the number of entries in the reg_list.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure is used to unregister a subscription which turns off notifications. Several subscriptions can be unregistered from at one time.
The DBMS_AQADM package provides procedures to manage Oracle Database Advanced Queuing (AQ) configuration and administration information.

See Also:

- Oracle Database Advanced Queuing User's Guide
- Oracle Database Advanced Queuing (AQ) Types for information about the TYPES to use with DBMS_AQADM

This chapter contains the following topics:

- Security Model
- Constants
- Subprogram Groups
- Summary of DBMS_AQADM Subprograms

22.1 DBMS_AQADM Security Model

Initially, only SYS and SYSTEM have execution privilege for the procedures in DBMS_AQADM and DBMS_AQ. Users who have been granted EXECUTE rights to DBMS_AQ and DBMS_AQADM are able to create, manage, and use queues in their own schemas. The MANAGE_ANY AQ system privilege is used to create and manage queues in other schemas and can be granted and revoked through DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE respectively.

User Roles

The database administrator has the option of granting the system privileges ENQUEUE_ANY and DEQUEUE_ANY, exercising DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE and DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE directly to a database user, if you want the user to have this level of control.

The application developer gives rights to a queue by granting and revoking privileges at the object level by exercising DBMS_AQADM.GRANT_QUEUE_PRIVILEGE and DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE.
See Also:

- DBMS_AQ.
- Oracle Database Advanced Queuing User’s Guide for more information on queue privileges and access control.

Security Required for Propagation

Propagation jobs are owned by SYS, but the propagation occurs in the security context of the queue table owner. Previously propagation jobs were owned by the user scheduling propagation, and propagation occurred in the security context of the user setting up the propagation schedule. The queue table owner must be granted EXECUTE privileges on the DBMS_AQADM package. Otherwise, the Oracle Database snapshot processes do not propagate and generate trace files with the error identifier SYS.DBMS_AQADM not defined. Private database links owned by the queue table owner can be used for propagation. The username specified in the connection string must have EXECUTE access on the DBMS_AQ and DBMS_AQADM packages on the remote database.

Queue Table Migration

The MIGRATE_QUEUE_TABLE procedure requires that the EXECUTE privilege on DBMS_AQADM be granted to the queue table owner, who is probably an ordinary queue user. If you do not want ordinary queue users to be able to create and drop queues and queue tables, add and delete subscribers, and so forth, then you must revoke the EXECUTE privilege as soon as the migration is done.

22.2 DBMS_AQADM Constants

When using enumerated constants, such as INFINITE, TRANSACTIONAL, or NORMAL_QUEUE, the symbol must be specified with the scope of the packages defining it. All types associated with the administrative interfaces must be prepended with DBMS_AQADM. For example: DBMS_AQADM.NORMAL_QUEUE.
Table 22-1  Enumerated Types in the Administrative Interface

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention</td>
<td>0, 1, 2...INFINITE</td>
</tr>
<tr>
<td>message_grouping</td>
<td>TRANSACTIONAL, NONE</td>
</tr>
<tr>
<td>queue_type</td>
<td>NORMAL_QUEUE, EXCEPTION_QUEUE, NON_PERSISTENT_QUEUE</td>
</tr>
</tbody>
</table>

See Also:
For more information on the Java classes and data structures used in both DBMS_AQ and DBMS_AQADM, see the DBMS_AQ package.

22.3 DBMS_AQADM Subprogram Groups

This section lists and describes the DBMS_AQADM subprogram groups.

This DBMS_AQADM package is made up of the following subprogram groups:

- Queue Table Subprograms
- Privilege Subprograms
- Queue Subprograms
- Subscriber Subprograms
- Propagation Subprograms
- Miscellaneous Subprograms
- Oracle Database Advanced Queuing Agent Subprograms
- Alias Subprograms

22.3.1 DBMS_AQADM Queue Table Subprograms

This section lists and describes the DBMS_AQADM Queue Table subprograms.

Table 22-2  Queue Table Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_QUEUE_TABLE Procedure</td>
<td>Alters the existing properties of a queue table</td>
</tr>
<tr>
<td>CREATE_QUEUE_TABLE Procedure</td>
<td>Creates a queue table for messages of a predefined type</td>
</tr>
<tr>
<td>DROP_QUEUE_TABLE Procedure</td>
<td>Drops an existing queue table</td>
</tr>
<tr>
<td>ENABLE_JMS_TYPES Procedure</td>
<td>A precondition for the enqueue of JMS types and XML types</td>
</tr>
</tbody>
</table>
Table 22-2  (Cont.) Queue Table Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MIGRATE_QUEUE_TABLE</td>
<td>Upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table</td>
</tr>
<tr>
<td>PURGE_QUEUE_TABLE</td>
<td>Purges messages from queue tables</td>
</tr>
</tbody>
</table>

22.3.2 DBMS_AQADM Privilege Subprograms

This sections lists and describes the DBMS_AQADM Privilege subprograms.

Table 22-3  Privilege Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_QUEUE_PRIVILEGE</td>
<td>Grants privileges on a queue to users and roles</td>
</tr>
<tr>
<td>GRANT_SYSTEM_PRIVILEGE</td>
<td>Grants Oracle Database Advanced Queuing system privileges to users and roles</td>
</tr>
<tr>
<td>REVOKE_QUEUE_PRIVILEGE</td>
<td>Revokes privileges on a queue from users and roles</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE</td>
<td>Revokes Oracle Database Advanced Queuing system privileges from users and roles</td>
</tr>
</tbody>
</table>

22.3.3 DBMS_AQADM Queue Subprograms

This sections lists and describes the DBMS_AQADM Queue subprograms.

Table 22-4  Queue Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_QUEUE Procedure</td>
<td>Alters existing properties of a queue</td>
</tr>
<tr>
<td>CREATE_NP_QUEUE Procedure</td>
<td>Creates a nonpersistent RAW queue</td>
</tr>
<tr>
<td>CREATE_QUEUE Procedure</td>
<td>Creates a queue in the specified queue table</td>
</tr>
<tr>
<td>CREATE_SHARDED_QUEUE</td>
<td>Creates a queue and its queue table for a sharded queue together.</td>
</tr>
<tr>
<td>DROP_SHARDED_QUEUE</td>
<td>Drops an existing sharded queue from the database queuing system</td>
</tr>
<tr>
<td>ALTER_SHARDED_QUEUE</td>
<td>Alters an sharded queue in the database queuing system</td>
</tr>
<tr>
<td>CREATE_EXCEPTION_QUEUE</td>
<td>Creates an exception queue for a sharded queue</td>
</tr>
<tr>
<td>DROP_QUEUE Procedure</td>
<td>Drops an existing queue</td>
</tr>
</tbody>
</table>
### 22.3.4 DBMS_AQADM Subscriber Subprograms

This sections lists and describes the DBMS_AQADM Subscriber subprograms.

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_SUBSCRIBER Procedure</td>
<td>Adds a default subscriber to a queue</td>
</tr>
<tr>
<td>ALTER_SUBSCRIBER Procedure</td>
<td>Alters existing properties of a subscriber to a specified queue</td>
</tr>
<tr>
<td>REMOVE_SUBSCRIBER Procedure</td>
<td>Removes a default subscriber from a queue</td>
</tr>
</tbody>
</table>

### 22.3.5 DBMS_AQADM Propagation Subprograms

This section lists and describes the DBMS_AQADM propagation subprograms.

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PROPAGATION_SCHEDULE Procedure</td>
<td>Alters parameters for a propagation schedule</td>
</tr>
<tr>
<td>DISABLE_PROPAGATION_SCHEDULE Procedure</td>
<td>Disables a propagation schedule</td>
</tr>
<tr>
<td>ENABLE_PROPAGATION_SCHEDULE Procedure</td>
<td>Enables a previously disabled propagation schedule</td>
</tr>
<tr>
<td>SCHEDULE_PROPAGATION Procedure</td>
<td>Schedules propagation of messages from a queue to a destination identified by a specific database link</td>
</tr>
<tr>
<td>UNSCHEDULE_PROPAGATION Procedure</td>
<td>Unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link</td>
</tr>
<tr>
<td>VERIFY_QUEUE_TYPES Procedure</td>
<td>Verifies that the source and destination queues have identical types</td>
</tr>
</tbody>
</table>

### 22.3.6 DBMS_AQADM Miscellaneous Subprograms

This section lists and describes the DBMS_AQADM miscellaneous subprograms.
Table 22-7  Miscellaneous Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_WATERMARK Procedure</td>
<td>Retrieves the value of watermark set by the SET_WATERMARK Procedure</td>
</tr>
<tr>
<td>GET_MAX_STREAMS_POOL Procedure</td>
<td>Retrieves the value of Oracle Database Advanced Queuing maximum streams pool limit</td>
</tr>
<tr>
<td>GET_MIN_STREAMS_POOL Procedure</td>
<td>Retrieves the value of Oracle Database Advanced Queuing minimum streams pool limit</td>
</tr>
<tr>
<td>SET_WATERMARK Procedure</td>
<td>Used for Oracle Database Advanced Queuing notification to specify and limit memory use</td>
</tr>
<tr>
<td>SET_MAX_STREAMS_POOL Procedure</td>
<td>Used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use</td>
</tr>
<tr>
<td>SET_MIN_STREAMS_POOL Procedure</td>
<td>Used for Oracle Database Advanced Queuing to specify and limit minimum streams pool memory use</td>
</tr>
<tr>
<td>SET_QUEUE_PARAMETER Procedure</td>
<td>Used to set different parameters for sharded queues at queue or database level.</td>
</tr>
<tr>
<td>GET_QUEUE_PARAMETER Procedure</td>
<td>Used to get different parameters for sharded queues at queue or database level.</td>
</tr>
<tr>
<td>UNSET_QUEUE_PARAMETER Procedure</td>
<td>Used to unset different parameters for sharded queues at queue or database level.</td>
</tr>
</tbody>
</table>

22.3.7 DBMS_AQADM Agent Subprograms

This section lists and describes the DBMS_AQADM agent subprograms.

Table 22-8  Oracle Streams AQ Agent Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_AQ_AGENT Procedure</td>
<td>Alters an agent registered for Oracle Database Advanced Queuing Internet access, and an Oracle Database Advanced Queuing agent that accesses secure queues</td>
</tr>
<tr>
<td>CREATE_AQ_AGENT Procedure</td>
<td>Registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols, and creates an Oracle Database Advanced Queuing agent to access secure queues</td>
</tr>
<tr>
<td>DISABLE_DB_ACCESS Procedure</td>
<td>Revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent</td>
</tr>
<tr>
<td>DROP_AQ_AGENT Procedure</td>
<td>Drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access</td>
</tr>
<tr>
<td>ENABLE_DB_ACCESS Procedure</td>
<td>Grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user</td>
</tr>
</tbody>
</table>

22.3.8 DBMS_AQADM Alias Subprograms

This section lists and describes the DBMS_AQADM alias subprograms.
Table 22-9  Alias Subprograms

<table>
<thead>
<tr>
<th>Subprograms</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_ALIAS_TO_LDAP Procedure</td>
<td>Creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP</td>

<td>VERIFY_QUEUE_TYPES Procedure</td>
<td>Verifies that the source and destination queues have identical types</td>
</tr>
</tbody>
</table>

### 22.4.1 ADD_ALIAS_TO_LDAP Procedure

This procedure creates an alias for a queue, agent, or a JMS ConnectionFactory in LDAP. The alias will be placed directly under the database server's distinguished name in LDAP hierarchy.

**Syntax**

```sql
DBMS_AQADM.ADD_ALIAS_TO_LDAP (
    alias IN VARCHAR2,
    obj_location IN VARCHAR2);
```

**Parameters**

**Table 22-11 ADD_ALIAS_TO_LDAP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Name of the alias. Example: west_shipping.</td>
</tr>
</tbody>
</table>
Table 22-11  (Cont.) ADD_ALIAS_TO_LDAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj_location</td>
<td>The distinguished name of the object (queue, agent or connection factory) to which alias refers.</td>
</tr>
</tbody>
</table>

Usage Notes

This method can be used to create aliases for queues, agents, and JMS ConnectionFactory objects. These object must exist before the alias is created. These aliases can be used for JNDI lookup in JMS and Oracle Database Advanced Queuing Internet access.

22.4.2 ADD_SUBSCRIBER Procedure

This procedure adds a default subscriber to a queue.

Syntax

```
DBMS_AQADM.ADD_SUBSCRIBER (  
  queue_name      IN    VARCHAR2,  
  subscriber      IN    sys.aq$_agent,  
  rule            IN    VARCHAR2 DEFAULT NULL,  
  transformation  IN    VARCHAR2 DEFAULT NULL  
  queue_to_queue  IN    BOOLEAN DEFAULT FALSE,  
  delivery_mode   IN    PLS_INTEGER DEFAULT DBMS_AQADM.PERSISTENT);
```

Parameters

Table 22-12  ADD_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being defined.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. A rule is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the where clause of a SQL query). Currently supported message properties are priority and corrid. To specify rules on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The rule parameter cannot exceed 4000 characters.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
<tr>
<td>queue_to_queue</td>
<td>If TRUE, propagation is from queue-to-queue.</td>
</tr>
</tbody>
</table>
Table 22-12 (Cont.) ADD_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>delivery_mode</td>
<td>The administrator may specify one of DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED, or DBMS_AQADM.PERSISTENT_OR_BUFFERED for the delivery mode of the messages the subscriber is interested in. This parameter will not be modifiable by ALTER_SUBSCRIBER.</td>
</tr>
</tbody>
</table>

Usage Notes

A program can enqueue messages to a specific list of recipients or to the default list of subscribers. This operation only succeeds on queues that allow multiple consumers. This operation takes effect immediately, and the containing transaction is committed. Enqueue requests that are executed after the completion of this call will reflect the new behavior.

Any string within the rule must be quoted:

```sql
rule => 'PRIORITY <= 3 AND CORRID = ''FROM JAPAN''
```

Note that these are all single quotation marks.

22.4.3 ALTER_AQ_AGENT Procedure

This procedure alters an agent registered for Oracle Database Advanced Queuing Internet access. It is also used to alter an Oracle Database Advanced Queuing agent that accesses secure queues.

**See Also:**

*Oracle Streams Concepts and Administration* for information about secure queues

Syntax

```sql
DBMS_AQADM.ALTER_AQ_AGENT (  
  agent_name IN VARCHAR2,  
  certificate_location IN VARCHAR2 DEFAULT NULL,  
  enable_http IN BOOLEAN DEFAULT FALSE,  
  enable_smtp IN BOOLEAN DEFAULT FALSE,  
  enable_anyp IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22-13 ALTER_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>
Table 22-13  (Cont.) ALTER_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>certification_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>

22.4.4 ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters parameters for a propagation schedule.

Syntax

```
DBMS_AQADM.ALTER_PROPAGATION_SCHEDULE (  
    queue_name           IN    VARCHAR2,  
    destination          IN    VARCHAR2 DEFAULT NULL,  
    duration             IN    NUMBER   DEFAULT NULL,  
    next_time            IN    VARCHAR2 DEFAULT NULL,  
    latency              IN    NUMBER   DEFAULT 60,  
    destination_queue    IN    VARCHAR2 DEFAULT NULL);  
```

Parameters

Table 22-14  ALTER_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
</tbody>
</table>
Table 22-14  (Cont.) ALTER_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the</td>
</tr>
<tr>
<td></td>
<td>end of the current window. If this value is NULL, then propagation is stopped</td>
</tr>
<tr>
<td></td>
<td>at the end of the current window. For example, to start the window at the</td>
</tr>
<tr>
<td></td>
<td>same time every day, next_time should be specified as SYSDATE + 1 -</td>
</tr>
<tr>
<td></td>
<td>duration/86400.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be</td>
</tr>
<tr>
<td></td>
<td>propagated after it is enqueued. The default value is 60. Caution: if latency</td>
</tr>
<tr>
<td></td>
<td>is not specified for this call, then latency will over-write any existing</td>
</tr>
<tr>
<td></td>
<td>value with the default value.</td>
</tr>
<tr>
<td></td>
<td>For example, if the latency is 60 seconds and there are no messages to be</td>
</tr>
<tr>
<td></td>
<td>propagated during the propagation window, then messages from that</td>
</tr>
<tr>
<td></td>
<td>queue for the destination are not propagated for at least 60 more seconds.</td>
</tr>
<tr>
<td></td>
<td>It will be at least 60 seconds before the queue will be checked again for</td>
</tr>
<tr>
<td></td>
<td>messages to be propagated for the specified destination. If the latency is</td>
</tr>
<tr>
<td></td>
<td>600, then the queue will not be checked for 10 minutes and if the latency is</td>
</tr>
<tr>
<td></td>
<td>0, then a job queue process will be waiting for messages to be enqueued</td>
</tr>
<tr>
<td></td>
<td>for the destination and as soon as a message is enqueued it will be</td>
</tr>
<tr>
<td></td>
<td>propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the</td>
</tr>
<tr>
<td></td>
<td>form of a dblink.</td>
</tr>
</tbody>
</table>

22.4.5 ALTER_QUEUE Procedure

This procedure alters existing properties of a queue. The parameters `max_retries`, `retention_time`, and `retry_delay` are not supported for nonpersistent queues.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE (  
    queue_name        IN    VARCHAR2,  
    max_retries       IN    NUMBER   DEFAULT NULL,  
    retry_delay       IN    NUMBER   DEFAULT NULL,  
    retention_time    IN    NUMBER   DEFAULT NULL,  
    auto_commit       IN    BOOLEAN  DEFAULT TRUE,  
    comment           IN    VARCHAR2 DEFAULT NULL);  
```

Parameters

Table 22-15  ALTER_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be altered</td>
</tr>
</tbody>
</table>
Table 22-15  (Cont.) ALTER_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with REMOVE mode can be attempted on a message. The maximum value of max_retries is $2^{31}$ - 1.</td>
</tr>
<tr>
<td></td>
<td>A message is moved to an exception queue if RETRY_COUNT is greater than MAX_RETRIES. RETRY_COUNT is incremented when the application</td>
</tr>
<tr>
<td></td>
<td>issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or</td>
</tr>
<tr>
<td></td>
<td>SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td></td>
<td>Note that max_retries is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible</td>
</tr>
<tr>
<td></td>
<td>multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time in seconds before this message is scheduled for processing again after an application rollback. The default is NULL, which means</td>
</tr>
<tr>
<td></td>
<td>that the value will not be altered.</td>
</tr>
<tr>
<td></td>
<td>Note that retry_delay is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible</td>
</tr>
<tr>
<td></td>
<td>multiconsumer queues.</td>
</tr>
<tr>
<td>retention_time</td>
<td>Retention time in seconds for which a message is retained in the queue table after being dequeued. The default is NULL, which means that the</td>
</tr>
<tr>
<td></td>
<td>value will not be altered.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the ALTER_QUEUE operation is carried out. The ALTER_QUEUE operation become</td>
</tr>
<tr>
<td></td>
<td>persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only</td>
</tr>
<tr>
<td></td>
<td>when the caller enters a commit.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog. The default value is NULL, which means that the value</td>
</tr>
<tr>
<td></td>
<td>will not be changed.</td>
</tr>
</tbody>
</table>

22.4.6 ALTER_QUEUE_TABLE Procedure

This procedure alters the existing properties of a queue table.

Syntax

```sql
DBMS_AQADM.ALTER_QUEUE_TABLE ( 
    queue_table          IN   VARCHAR2,  
    comment              IN   VARCHAR2       DEFAULT NULL,  
    primary_instance     IN   BINARY_INTEGER DEFAULT NULL,  
    secondary_instance   IN   BINARY_INTEGER DEFAULT NULL,  
    replication_mode     IN   BINARY_INTEGER DEFAULT NULL) ;
```
Parameters

Table 22-16 ALTER_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created.</td>
</tr>
<tr>
<td>comment</td>
<td>Modifies the user-specified description of the queue table. This user comment is added to the queue catalog. The default value is NULL which means that the value will not be changed.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>This is the primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table will be done in this instance. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is NULL, which means that the current value will not be changed.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode. DBMS_AQADM.NONE if queue is being altered to not be replicated. The default value is NULL.</td>
</tr>
</tbody>
</table>

22.4.7 ALTER_SHARDED_QUEUE Procedure

This procedure provides user the ability to alter a sharded queue.

See Also:

Oracle® Database Advanced Queuing User’s Guide for information about sharded queues

Syntax

```sql
PROCEDURE ALTER_SHARDED_QUEUE(
    queue_name             IN VARCHAR2,
    max_retries            IN NUMBER         DEFAULT NULL,
    comment                IN VARCHAR2       DEFAULT NULL,
    queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,
    replication_mode       IN BINARY_INTEGER DEFAULT NULL);
```

Parameters

Table 22-17 ALTER_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This parameter specifies the name of the sharded queue. A maximum of 128 characters are allowed.</td>
</tr>
<tr>
<td>max_retries</td>
<td>The maximum number of retries allowed.</td>
</tr>
<tr>
<td>comment</td>
<td>The comment of the queue.</td>
</tr>
</tbody>
</table>
Table 22-17    (Cont.) ALTER_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_properties</td>
<td>Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being altered to be in the Replication Mode or else DBMS_AQADM.NONE. Default is NULL.</td>
</tr>
</tbody>
</table>

22.4.8 ALTER_SUBSCRIBER Procedure

This procedure alters existing properties of a subscriber to a specified queue. Only the rule can be altered.

Syntax

```sql
DBMS_AQADM.ALTER_SUBSCRIBER (
    queue_name     IN    VARCHAR2,
    subscriber     IN    sys.aq$_agent,
    rule           IN    VARCHAR2,
    transformation IN    VARCHAR2);
```

Parameters

Table 22-18    ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent on whose behalf the subscription is being altered. See “AQ__AGENT Type”.</td>
</tr>
<tr>
<td>rule</td>
<td>A conditional expression based on the message properties, the message data properties and PL/SQL functions. The rule parameter cannot exceed 4000 characters. To eliminate the rule, set the rule parameter to NULL.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied when this subscriber dequeues the message. The source type of the transformation must match the type of the queue. If the subscriber is remote, then the transformation is applied before propagation to the remote queue.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure alters both the rule and the transformation for the subscriber. If you want to retain the existing value for either of them, you must specify its old value. The current values for rule and transformation for a subscriber can be obtained from the schema.AQ$queue_table_R and schema.AQ$queue_table_S views.
22.4.9 CREATE_AQ_AGENT Procedure

This procedure registers an agent for Oracle Database Advanced Queuing Internet access using HTTP/SMTP protocols. It is also used to create an Oracle Database Advanced Queuing agent to access secure queues.

See Also:

Oracle Streams Concepts and Administration for information about secure queues

Syntax

DBMS_AQADM.CREATE_AQ_AGENT (  
  agent_name                IN VARCHAR2,  
  certificate_location      IN VARCHAR2 DEFAULT NULL,  
  enable_http               IN BOOLEAN DEFAULT FALSE,  
  enable_smtp               IN BOOLEAN DEFAULT FALSE,  
  enable_anyp               IN BOOLEAN DEFAULT FALSE )

Parameters

Table 22-19  CREATE_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>certification_location</td>
<td>Agent's certificate location in LDAP (default is NULL). If the agent is allowed to access Oracle Database Advanced Queuing through SMTP, then its certificate must be registered in LDAP. For access through HTTP, the certificate location is not required.</td>
</tr>
<tr>
<td>enable_http</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through HTTP. FALSE means the agent cannot access Oracle Database Advanced Queuing through HTTP.</td>
</tr>
<tr>
<td>enable_smtp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through SMTP (e-mail). FALSE means the agent cannot access Oracle Database Advanced Queuing through SMTP.</td>
</tr>
<tr>
<td>enable_anyp</td>
<td>TRUE means the agent can access Oracle Database Advanced Queuing through any protocol (HTTP or SMTP).</td>
</tr>
</tbody>
</table>

Usage Notes

The SYS.AQ$INTERNET_USERS view has a list of all Oracle Database Advanced Queuing Internet agents.
22.4.10 CREATE_NP_QUEUE Procedure

This procedure creates a nonpersistent RAW queue.

Note:
Nonpersistent queues are deprecated as of Release 10gR2. Oracle recommends using buffered messaging.

Syntax

```sql
DBMS_AQADM.CREATE_NP_QUEUE (
  queue_name              IN        VARCHAR2,
  multiple_consumers      IN        BOOLEAN  DEFAULT FALSE,
  comment                 IN        VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the nonpersistent queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message. Note that this parameter is distinguished at the queue level, because a nonpersistent queue does not inherit this characteristic from any user-created queue table.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
</tbody>
</table>

Usage Notes

The queue may be either single-consumer or multiconsumer queue. All queue names must be unique within a schema. The queues are created in a 8.1-compatible or higher system-created queue table (AQ$_MEM_SC or AQ$_MEM_MC) in the same schema as that specified by the queue name.

If the queue name does not specify a schema name, the queue is created in the login user's schema. After a queue is created with CREATE_NP_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

You cannot dequeue from a nonpersistent queue. The only way to retrieve a message from a nonpersistent queue is by using the OCI notification mechanism. You cannot invoke the LISTEN call on a nonpersistent queue.
22.4.11 CREATE_QUEUE Procedure

This procedure creates a queue in the specified queue table.

Syntax

```sql
DBMS_AQADM.CREATE_QUEUE (  
  queue_name    IN       VARCHAR2,  
  queue_table   IN       VARCHAR2,  
  queue_type    IN       BINARY_INTEGER DEFAULT NORMAL_QUEUE,  
  max_retries   IN       NUMBER         DEFAULT NULL,  
  retry_delay   IN       NUMBER         DEFAULT 0,  
  retention_time IN       NUMBER         DEFAULT 0,  
  dependency_tracking IN       BOOLEAN        DEFAULT FALSE,  
  comment       IN       VARCHAR2       DEFAULT NULL,  
  auto_commit   IN       BOOLEAN        DEFAULT TRUE);
```

Parameters

Table 22-21  CREATE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be created. The name must be unique within a schema and must follow object name guidelines in Oracle Database SQL Language Reference with regard to reserved characters.</td>
</tr>
<tr>
<td>queue_table</td>
<td>Name of the queue table that will contain the queue.</td>
</tr>
<tr>
<td>queue_type</td>
<td>Specifies whether the queue being created is an exception queue or a normal queue. NORMAL_QUEUE means the queue is a normal queue. This is the default. EXCEPTION_QUEUE means it is an exception queue. Only the dequeue operation is allowed on the exception queue.</td>
</tr>
<tr>
<td>max_retries</td>
<td>Limits the number of times a dequeue with the REMOVE mode can be attempted on a message. The maximum value of <code>max_retries</code> is $2^{31} - 1$. A message is moved to an exception queue if <code>RETRY_COUNT</code> is greater than <code>MAX_RETRIES</code>. <code>RETRY_COUNT</code> is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then <code>RETRY_COUNT</code> is not incremented. Note that <code>max_retries</code> is supported for all single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
<tr>
<td>retry_delay</td>
<td>Delay time, in seconds, before this message is scheduled for processing again after an application rollback. The default is 0, which means the message can be retried as soon as possible. This parameter has no effect if <code>max_retries</code> is set to 0. Note that <code>retry_delay</code> is supported for single consumer queues and 8.1-compatible or higher multiconsumer queues but not for 8.0-compatible multiconsumer queues.</td>
</tr>
</tbody>
</table>
Table 22-21  (Cont.) CREATE_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention_time</td>
<td>Number of seconds for which a message is retained in the queue table after being dequeued from the queue. INFINITE means the message is retained forever. NUMBER is the number of seconds for which to retain the messages. The default is 0, no retention.</td>
</tr>
<tr>
<td>dependency_tracking</td>
<td>Reserved for future use. FALSE is the default. TRUE is not permitted in this release.</td>
</tr>
<tr>
<td>comment</td>
<td>User-specified description of the queue. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE operation is carried out. The CREATE_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

All queue names must be unique within a schema. After a queue is created with CREATE_QUEUE, it can be enabled by calling START_QUEUE. By default, the queue is created with both enqueue and dequeue disabled.

22.4.12 CREATE_QUEUE_TABLE Procedure

This procedure creates a queue table for messages of a predefined type.

Syntax

```sql
DBMS_AQADM.CREATE_QUEUE_TABLE (  
  queue_table          IN      VARCHAR2,  
  queue_payload_type   IN      VARCHAR2,  
  storage_clause       IN      VARCHAR2 DEFAULT NULL,  
  sort_list            IN      VARCHAR2 DEFAULT NULL,  
  multiple_consumers   IN      BOOLEAN DEFAULT FALSE,  
  message_grouping     IN      BINARY_INTEGER DEFAULT NONE,  
  comment              IN      VARCHAR2 DEFAULT NULL,  
  auto_commit          IN      BOOLEAN DEFAULT TRUE,  
  primary_instance     IN      BINARY_INTEGER DEFAULT 0,  
  secondary_instance   IN      BINARY_INTEGER DEFAULT 0,  
  compatible           IN      VARCHAR2 DEFAULT NULL,  
  secure               IN      BOOLEAN DEFAULT FALSE,  
  replication_mode     IN      BINARY_INTEGER DEFAULT NONE)
```

Parameters

Table 22-22 CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be created</td>
</tr>
</tbody>
</table>
### Table 22-22  (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_payload_type</td>
<td>Type of the user data stored. See Type Name in <a href="#">DBMS_AQ Data Types</a> for valid values for this parameter.</td>
</tr>
<tr>
<td>storage_clause</td>
<td>Storage parameter. The storage parameter is included in the CREATE TABLE statement when the queue table is created. The storage_clause argument can take any text that can be used in a standard CREATE TABLE storage clause argument. The storage parameter can be made up of any combinations of the following parameters: PCTFREE, PCTUSED, INITRANS, MAXTRANS, TABLESPACE, LOB, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See <a href="#">Oracle Database SQL Language Reference</a> for the usage of these parameters.</td>
</tr>
<tr>
<td>sort_list</td>
<td>The columns to be used as the sort key in ascending order. This parameter has the following format: 'sort_column_1,sort_column_2'. The allowed column names are priority, enq_time, and commit_time. If both columns are specified, then sort_column_1 defines the most significant order. After a queue table is created with a specific ordering mechanism, all queues in the queue table inherit the same defaults. The order of a queue table cannot be altered after the queue table has been created. If no sort list is specified, then all the queues in this queue table are sorted by the enqueue time in ascending order. This order is equivalent to FIFO order. Even with the default ordering defined, a deqequier is allowed to choose a message to dequeue by specifying its msgid or correlation.msgid, correlation, and sequence_deviation value take precedence over the default dequeueing order, if they are specified. When commit_time is specified for the sort_list parameter the resulting queue table uses commit-time ordering. See “Commit-Time Queues” in Oracle Streams Concepts and Administration for more information about commit-time ordering. See also “Priority and Ordering of Messages” in Oracle Database Advanced Queuing User’s Guide for information about message ordering in Oracle Database Advanced Queuing.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues created in the table can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>message_grouping</td>
<td>Message grouping behavior for queues created in the table. NONE means each message is treated individually. TRANSACTIONAL means messages enqueued as part of one transaction are considered part of the same group and can be dequeued as a group of related messages.</td>
</tr>
</tbody>
</table>
### Table 22-22 (Cont.) CREATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>User-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the CREATE_QUEUE_TABLE operation is carried out. The CREATE_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Note: This parameter has been deprecated.</td>
</tr>
<tr>
<td>primary_instance</td>
<td>The primary owner of the queue table. Queue monitor scheduling and propagation for the queues in the queue table are done in this instance. The default value for primary instance is 0, which means queue monitor scheduling and propagation will be done in any available instance.</td>
</tr>
<tr>
<td>secondary_instance</td>
<td>The queue table fails over to the secondary instance if the primary instance is not available. The default value is 0, which means that the queue table will fail over to any available instance.</td>
</tr>
<tr>
<td>compatible</td>
<td>The lowest database version with which the queue is compatible. Currently the possible values are either 8.0, 8.1, or 10.0. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.</td>
</tr>
<tr>
<td>secure</td>
<td>This parameter must be set to TRUE if you want to use the queue table for secure queues. Secure queues are queues for which AQ agents must be associated explicitly with one or more database users who can perform queue operations, such as enqueue and dequeue. The owner of a secure queue can perform all queue operations on the queue, but other users cannot perform queue operations on a secure queue, unless they are configured as secure queue users.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.</td>
</tr>
</tbody>
</table>

### Usage Notes

The sort keys for dequeue ordering, if any, must be defined at table creation time. The following objects are created at this time:

- `aq$q_queue_table_name_e`, a default exception queue associated with the queue table
- `aq$q_queue_table_name`, a read-only view, which is used by Oracle Database Advanced Queuing applications for querying queue data
- `aq$q_queue_table_name_t`, an index (or an index organized table (IOT) in the case of multiple consumer queues) for the queue monitor operations
- `aq$q_queue_table_name_i`, an index (or an index organized table in the case of multiple consumer queues) for dequeue operations
For 8.1-compatible or higher queue tables, the following index-organized tables are created:

- `aq$queue_table_name_s`, a table for storing information about the subscribers
- `aq$queue_table_name_r`, a table for storing information about rules on subscriptions
- `aq$queue_table_name_h`, an index-organized table for storing the dequeue history data

CLOB, BLOB, and BFILE are valid attributes for Oracle Database Advanced Queuing object type payloads. However, only CLOB and BLOB can be propagated using Oracle Database Advanced Queuing propagation in Oracle8i release 8.1.5 or later. See the Oracle Database Advanced Queuing User's Guide for more information.

The default value of the compatible parameter depends on the database compatibility mode in the `init.ora`. If the database is in 10.1-compatible mode, the default value is 10.0. If the database is in 8.1-compatible or 9.2-compatible mode, the default value is 8.1. If the database is in 8.0 compatible mode, the default value is 8.0.

You can specify and modify the `primary_instance` and `secondary_instance` only in 8.1-compatible or higher mode. You cannot specify a secondary instance unless there is a primary instance.

### 22.4.13 CREATE_SHARDED_QUEUE Procedure

The `CREATE_SHARDED_QUEUE` API creates a queue and its queue table as appropriate for a sharded queue. This API cannot be used to create unsharded queues. Sharded queues must be created using this single integrated API that will automatically set AQ properties as needed.

Sharded queues may be either a single consumer or a multi-consumer queue.

#### Syntax

```sql
PROCEDURE CREATE_SHARDED_QUEUE (  
queue_name             IN VARCHAR2,  
storage_clause         IN VARCHAR2       DEFAULT NULL,  
multiple_consumers     IN BOOLEAN        DEFAULT FALSE,  
max_retries            IN NUMBER         DEFAULT NULL,  
comment                IN VARCHAR2       DEFAULT NULL,  
queue_payload_type     IN VARCHAR2       DEFAULT JMS_TYPE,  
queue_properties       IN QUEUE_PROPS_T  DEFAULT NULL,  
replication_mode       IN BINARY_INTEGER DEFAULT NONE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>This required parameter specifies the name of the new queue. Maximum of 128 characters allowed.</td>
</tr>
</tbody>
</table>
### 22.4.14 CREATE_EXCEPTION_QUEUE Procedure

The **CREATE_EXCEPTION_QUEUE** API creates an exception queue for a sharded queue.

**Syntax**

```sql
PROCEDURE CREATE_EXCEPTION_QUEUE(
    sharded_queue_name     IN VARCHAR2,
    exception_queue_name   IN VARCHAR2 DEFAULT NULL
);```

#### Table 22-23  (Cont.) CREATE_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>storage_clause</td>
<td>The storage parameter is included in the CREATE TABLE statement when the queue table is created. The <strong>storage_clause</strong> argument can take any text that can be used in a standard CREATE TABLE statement. The storage parameter can be made up of any combinations of the following parameters: <strong>PCTFREE</strong>, <strong>PCTUSED</strong>, <strong>INITRANS</strong>, <strong>MAXTRANS</strong>, <strong>TABLESPACE</strong>, <strong>LOB</strong>, and a table storage clause. If a tablespace is not specified here, then the queue table and all its related objects are created in the default user tablespace. If a tablespace is specified here, then the queue table and all its related objects are created in the tablespace specified in the storage clause. See Oracle Database SQL Language Reference for the usage of these parameters.</td>
</tr>
<tr>
<td>multiple_consumers</td>
<td>FALSE means queues can only have one consumer for each message. This is the default. TRUE means queues created in the table can have multiple consumers for each message.</td>
</tr>
<tr>
<td>max_retries</td>
<td>This optional parameter limits the number of times that a dequeue can be attempted on a message after a failure. The maximum value of max_retries is (2^{31} - 1). After the retry limit has been exceeded, the message will be purged from the queue. RETRY_COUNT is incremented when the application issues a rollback after executing the dequeue. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td>comment</td>
<td>This optional parameter is a user-specified description of the queue table. This user comment is added to the queue catalog.</td>
</tr>
<tr>
<td>queue_payload_type</td>
<td>Payload can be RAW, DBMS_AQADM.JMS_TYPE, or an object type. Default is DBMS_AQADM.JMS_TYPE.</td>
</tr>
<tr>
<td>queue_properties</td>
<td>Properties such as Normal or Exception Queue, Retry delay, retention time, sort list and cache hint. Refer to QUEUE_PROPS_T Type for more information about queue_properties.</td>
</tr>
<tr>
<td>replication_mode</td>
<td>Reserved for future use. DBMS_AQADM.REPLICATION_MODE if Queue is being created in the Replication Mode or else DBMS_AQADM.NONE. Default is DBMS_AQADM.NONE.</td>
</tr>
</tbody>
</table>
### 22.4.15 DEL_ALIAS_FROM_LDAP Procedure

This procedure drops an alias for a queue, agent, or JMS ConnectionFactory in LDAP.

#### Syntax

```sql
DBMS_AQADM.DEL_ALIAS_FROM_LDAP(
    alias IN VARCHAR2);
```

#### Parameters

**Table 22-25   DEL_ALIAS_FROM_LDAP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>The alias to be removed.</td>
</tr>
</tbody>
</table>

### 22.4.16 DISABLE_DB_ACCESS Procedure

This procedure revokes the privileges of a specific database user from an Oracle Database Advanced Queuing Internet agent.

#### Syntax

```sql
DBMS_AQADM.DISABLE_DB_ACCESS (
    agent_name                IN VARCHAR2,
    db_username               IN VARCHAR2)
```

#### Parameters

**Table 22-26   DISABLE_DB_ACCESS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be revoked from the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously granted those privileges using the `ENABLE_DB_ACCESS Procedure`. 

---

### Table 22-24 CREATE_EXCEPTION_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sharded_queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>exception_queue_name</td>
<td>The name of the exception queue.</td>
</tr>
</tbody>
</table>
22.4.17 DISABLE_PROPAGATION_SCHEDULE Procedure

This procedure disables a propagation schedule.

Syntax

DBMS_AQADM.DISABLE_PROPAGATION_SCHEDULE (
    queue_name    IN   VARCHAR2,
    destination   IN   VARCHAR2 DEFAULT NULL,
    destination_queue IN VARCHAR2 DEFAULT NULL);

Parameters

Table 22-27  DISABLE_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>

22.4.18 DROP_AQ_AGENT Procedure

This procedure drops an agent that was previously registered for Oracle Database Advanced Queuing Internet access.

Syntax

DBMS_AQADM.DROP_AQ_AGENT (
    agent_name    IN VARCHAR2)

Parameters

Table 22-28  DROP_AQ_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent</td>
</tr>
</tbody>
</table>
22.4.19 DROP_QUEUE Procedure

This procedure drops an existing queue.

Syntax

```
DBMS_AQADM.DROP_QUEUE (  
    queue_name        IN    VARCHAR2,  
    auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue that is to be dropped.</td>
</tr>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE operation is carried out. The DROP_QUEUE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

DROP_QUEUE is not allowed unless STOP_QUEUE has been called to disable the queue for both enqueuing and dequeuing. All the queue data is deleted as part of the drop operation.

22.4.20 DROP_QUEUE_TABLE Procedure

This procedure drops an existing queue table.

Syntax

```
DBMS_AQADM.DROP_QUEUE_TABLE (  
    queue_table       IN    VARCHAR2,  
    force             IN    BOOLEAN DEFAULT FALSE,  
    auto_commit       IN    BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Name of a queue table to be dropped.</td>
</tr>
<tr>
<td>force</td>
<td>FALSE means the operation does not succeed if there are any queues in the table. This is the default. TRUE means all queues in the table are stopped and dropped automatically.</td>
</tr>
</tbody>
</table>
Table 22-30  (Cont.) DROP_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_commit</td>
<td>TRUE causes the current transaction, if any, to commit before the DROP_QUEUE_TABLE operation is carried out. The DROP_QUEUE_TABLE operation becomes persistent when the call returns. This is the default. FALSE means the operation is part of the current transaction and becomes persistent only when the caller enters a commit. Caution: This parameter has been deprecated.</td>
</tr>
</tbody>
</table>

Usage Notes

All the queues in a queue table must be stopped and dropped before the queue table can be dropped. You must do this explicitly unless the force option is used, in which case this is done automatically.

22.4.21 DROP_SHARDED_QUEUE Procedure

This procedure drops an existing sharded queue from the database queuing system.

You must stop the queue before calling DROP_SHARDED_QUEUE. User must stop the queue explicitly if force is set to FALSE before calling DROP_SHARDED_QUEUE. If force is set to TRUE then queue will be stopped internally and then dropped.

Syntax

```
DBMS_AQADM.DROP_SHARDED_QUEUE(
    queue_name IN VARCHAR2,
    force      IN BOOLEAN DEFAULT FALSE )
```

Parameters

Table 22-31  DROP_SHARDED_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>This required parameter specifies the name of the sharded queue.</td>
</tr>
<tr>
<td>force</td>
<td>The sharded queue is dropped even if the queue is not stopped.</td>
</tr>
</tbody>
</table>

22.4.22 ENABLE_DB_ACCESS Procedure

This procedure grants an Oracle Database Advanced Queuing Internet agent the privileges of a specific database user.

Syntax

```
DBMS_AQADM.ENABLE_DB_ACCESS ( 
    agent_name      IN VARCHAR2,
    db_username     IN VARCHAR2)
```
### Parameters

**Table 22-32  ENABLE_DB_ACCESS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Specifies the username of the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
<tr>
<td>db_username</td>
<td>Specifies the database user whose privileges are to be granted to the Oracle Database Advanced Queuing Internet agent.</td>
</tr>
</tbody>
</table>

#### Usage Notes

The Oracle Database Advanced Queuing Internet agent should have been previously created using the `CREATE_AQ_AGENT` Procedure.

For secure queues, the sender and receiver agent of the message must be mapped to the database user performing the enqueue or dequeue operation.

> **See Also:**

*Oracle Streams Concepts and Administration* for information about secure queues

The `SYS.AQ$INTERNET_USERS` view has a list of all Oracle Database Advanced Queuing Internet agents and the names of the database users whose privileges are granted to them.

### 22.4.23 ENABLE_JMS_TYPES Procedure

Enqueue of JMS types and XML types does not work with Oracle Streams `Sys.Anydata` queues unless you call this procedure after `DBMS_STREAMS_ADM.SET_UP_QUEUE`. Enabling an Oracle Streams queue for these types may affect import/export of the queue table.

#### Syntax

```sql
DBMS_AQADM.ENABLE_JMS_TYPES (
    queue_table  IN  VARCHAR2);
```

**Parameters**

**Table 22-33  ENABLE_JMS_TYPES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be enabled for JMS and XML types.</td>
</tr>
</tbody>
</table>
22.4.24 ENABLE_PROPAGATION_SCHEDULE Procedure

This procedure enables a previously disabled propagation schedule.

Syntax

```sql
DBMS_AQADM.ENABLE_PROPAGATION_SCHEDULE (  
    queue_name         IN   VARCHAR2,  
    destination        IN   VARCHAR2 DEFAULT NULL,  
    destination_queue  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>queue_name</code></td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td><code>destination</code></td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is <code>NULL</code>, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td><code>destination_queue</code></td>
<td>Name of the target queue to which messages are to be propagated in the form of a <code>dblink</code></td>
</tr>
</tbody>
</table>

22.4.25 GET_MAX_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing maximum streams pool memory limit.

Syntax

```sql
DBMS_AQADM.GET_MAX_STREAMS_POOL (  
    value     OUT      NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
22.4.26 GET_MIN_STREAMS_POOL Procedure

This procedure retrieves the value of Oracle Database Advanced Queuing minimum streams pool memory limit.

Syntax

```sql
DBMS_AQADM.GET_MIN_STREAMS_POOL (    value OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>

22.4.27 GET_QUEUE_PARAMETER Procedure

This procedure allows user to get different parameters for sharded queues at queue or database level.

For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

See Also:

*Oracle® Database Advanced Queuing User's Guide* for information about sharded queues

Syntax

```sql
PROCEDURE GET_QUEUE_PARAMETER (    queue_name IN VARCHAR2,    param_name IN VARCHAR2,    param_value OUT NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>param_name</td>
<td>The name of the parameter.</td>
</tr>
<tr>
<td>param_value</td>
<td>The value of the parameter.</td>
</tr>
</tbody>
</table>
22.4.28 GET_WATERMARK Procedure

This procedure retrieves the value of watermark set by SET_WATERMARK.

Syntax

```
DBMS_AQADM.GET_WATERMARK (  
    wmvalue     IN      NUMBER);
```

Parameters

Table 22-38   GET_WATERMARK Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>

22.4.29 GRANT_QUEUE_PRIVILEGE Procedure

This procedure grants privileges on a queue to users and roles. The privileges are ENQUEUE or DEQUEUE. Initially, only the queue table owner can use this procedure to grant privileges on the queues.

Syntax

```
DBMS_AQADM.GRANT_QUEUE_PRIVILEGE (  
    privilege        IN    VARCHAR2,  
    queue_name       IN    VARCHAR2,  
    grantee          IN    VARCHAR2,  
    grant_option     IN    BOOLEAN := FALSE);
```

Parameters

Table 22-39   GRANT_QUEUE_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to grant. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>grant_option</td>
<td>Specifies if the access privilege is granted with the GRANT option or not. If the privilege is granted with the GRANT option, then the grantee is allowed to use this procedure to grant the access privilege to other users or roles, regardless of the ownership of the queue table. The default is FALSE.</td>
</tr>
</tbody>
</table>
22.4.30 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants Oracle Database Advanced Queuing system privileges to users and roles.

The privileges are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. Initially, only SYS and SYSTEM can use this procedure successfully.

Syntax

DBMS_AQADM.GRANT_SYSTEM_PRIVILEGE (
  privilege IN VARCHAR2,
  grantee IN VARCHAR2,
  admin_option IN BOOLEAN := FALSE);

Parameters

Table 22-40  GRANT_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to grant. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. ENQUEUE_ANY means users granted this privilege are allowed to enqueue messages to any queues in the database. DEQUEUE_ANY means users granted this privilege are allowed to dequeue messages from any queues in the database. MANAGE_ANY means users granted this privilege are allowed to run DBMS_AQADM calls on any schemas in the database.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
<tr>
<td>admin_option</td>
<td>Specifies if the system privilege is granted with the ADMIN option or not.</td>
</tr>
<tr>
<td></td>
<td>If the privilege is granted with the ADMIN option, then the grantee is allowed to use this procedure to grant the system privilege to other users or roles. The default is FALSE.</td>
</tr>
</tbody>
</table>

22.4.31 MIGRATE_QUEUE_TABLE Procedure

This procedure upgrades an 8.0-compatible queue table to an 8.1-compatible or higher queue table, or downgrades an 8.1-compatible or higher queue table to an 8.0-compatible queue table.

Syntax

DBMS_AQADM.MIGRATE_QUEUE_TABLE (
  queue_table IN VARCHAR2,
  compatible IN VARCHAR2);

Parameters

Table 22-41  MIGRATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies name of the queue table to be migrated.</td>
</tr>
</tbody>
</table>
### Table 22-41  (Cont.) MIGRATE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>compatible</td>
<td>Set this to 8.1 to upgrade an 8.0-compatible queue table, or set this to 8.0 to downgrade an 8.1-compatible queue table.</td>
</tr>
</tbody>
</table>

#### 22.4.32 PURGE_QUEUE_TABLE Procedure

This procedure purges messages from queue tables. You can perform various purge operations on both single-consumer and multiconsumer queue tables for persistent and buffered messages.

**Syntax**

```sql
DBMS_AQADM.PURGE_QUEUE_TABLE(
    queue_table        IN   VARCHAR2,
    purge_condition    IN   VARCHAR2,
    purge_options      IN   aq$_purge_options_t);
```

where type `aq$_purge_options_t` is described in *Oracle Database Advanced Queuing (AQ) Types*.

**Parameters**

**Table 22-42  PURGE_QUEUE_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_table</td>
<td>Specifies the name of the queue table to be purged.</td>
</tr>
<tr>
<td>purge_condition</td>
<td>Specifies the purge condition to use when purging the queue table. The purge condition must be in the format of a SQL <code>WHERE</code> clause, and it is case-sensitive. The condition is based on the columns of <code>aq$queue_table_name</code> view. When specifying the <code>purge_condition</code>, qualify the column names in <code>aq$queue_table_name</code> view with <code>qtview</code>. To purge all queues in a queue table, set <code>purge_condition</code> to either <code>NULL</code> (a bare null word, no quotes) or <code>' '</code> (two single quotes).</td>
</tr>
</tbody>
</table>

| purge_options  | |

Table 22-42  (Cont.) PURGE_QUEUE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| purge_options | Type aq$_purge_options_t contains a block parameter and a delivery_mode parameter.  
• If block is TRUE, then an exclusive lock on all the queues in the queue table is held while purging the queue table. This will cause concurrent enqueuers and dequeuers to block while the queue table is purged. The purge call always succeeds if block is TRUE. The default for block is FALSE. This will not block enqueuers and dequeuers, but it can cause the purge to fail with an error during high concurrency times.  
• delivery_mode is used to specify whether DBMS_AQADM.PERSISTENT, DBMS_AQADM.BUFFERED or DBMS_AQADM.PERSISTENT_OR_BUFFERED types of messages are to be purged. You cannot implement arbitrary purge conditions if buffered messages have to be purged. |

Usage Notes

• You can purge selected messages from the queue table by specifying a purge_condition. Table 22-42 describes these parameters. Messages can be enqueued to and dequeued from the queue table while the queue table is being purged.

• A trace file is generated in the udump destination when you run this procedure. It details what the procedure is doing.

• This procedure commits batches of messages in autonomous transactions. Several such autonomous transactions may get executed as a part of one purge_queue_table call depending on the number of messages in the queue table.

22.4.33 QUEUE_SUBSCRIBERS Function

This function returns the subscribers to an 8.0-compatible multiconsumer queue in the PL/SQL index by table collection type DBMS_AQADM.AQ$_subscriber_list_t.

Each element of the collection is of type sys.aq$_agent. This function is provided for 8.1-compatible queues by the AQ$queue_table_name_S view.

Syntax

```sql
DBMS_AQADM.QUEUE_SUBSCRIBERS (
    queue_name IN VARCHAR2);
RETURN aq$_subscriber_list_t IS
```
Parameters

Table 22-43 QUEUE_SUBSCRIBERS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Specifies the queue whose subscribers are to be printed.</td>
</tr>
</tbody>
</table>

22.4.34 REMOVE_SUBSCRIBER Procedure

This procedure removes a default subscriber from a queue. This operation takes effect immediately, and the containing transaction is committed. All references to the subscriber in existing messages are removed as part of the operation.

Syntax

```sql
DBMS_AQADM.REMOVE_SUBSCRIBER (
    queue_name         IN         VARCHAR2,
    subscriber         IN         sys.aq$_agent);
```

Parameters

Table 22-44 REMOVE_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>subscriber</td>
<td>Agent who is being removed. See AQ$_AGENT Type.</td>
</tr>
</tbody>
</table>

22.4.35 REVOKE_QUEUE_PRIVILEGE Procedure

This procedure revokes privileges on a queue from users and roles. The privileges are ENQUEUE or DEQUEUE.

Syntax

```sql
DBMS_AQADM.REVOKE_QUEUE_PRIVILEGE (
    privilege         IN      VARCHAR2,
    queue_name        IN      VARCHAR2,
    grantee           IN      VARCHAR2);
```

Parameters

Table 22-45 REVOKE_QUEUE_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing queue privilege to revoke. The options are ENQUEUE, DEQUEUE, and ALL. ALL means both ENQUEUE and DEQUEUE.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Name of the queue.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role. If the privilege has been propagated by the grantee through the GRANT option, then the propagated privilege is also revoked.</td>
</tr>
</tbody>
</table>
Usage Notes

To revoke a privilege, the revoker must be the original grantor of the privilege. The privileges propagated through the GRANT option are revoked if the grantor’s privileges are revoked.

22.4.36 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes Oracle Database Advanced Queuing system privileges from users and roles. The privileges are ENQUEUE_ANY, DEQUEUE_ANY and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.

Syntax

DBMS_AQADM.REVOKE_SYSTEM_PRIVILEGE (privilege IN VARCHAR2, grantee IN VARCHAR2);

Parameters

Table 22-46  REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The Oracle Database Advanced Queuing system privilege to revoke. The options are ENQUEUE_ANY, DEQUEUE_ANY, and MANAGE_ANY. The ADMIN option for a system privilege cannot be selectively revoked.</td>
</tr>
<tr>
<td>grantee</td>
<td>Grantee(s). The grantee(s) can be a user, a role, or the PUBLIC role.</td>
</tr>
</tbody>
</table>

22.4.37 SCHEDULE_PROPAGATION Procedure

This procedure schedules propagation of messages from a queue to a destination identified by a specific database link.

Syntax

DBMS_AQADM.SCHEDULE_PROPAGATION (queue_name IN VARCHAR2, destination IN VARCHAR2 DEFAULT NULL, start_time IN DATE DEFAULT SYSDATE, duration IN NUMBER DEFAULT NULL, next_time IN VARCHAR2 DEFAULT NULL, latency IN NUMBER DEFAULT 60, destination_queue IN VARCHAR2 DEFAULT NULL);
## Parameters

Table 22-47  SCHEDULE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 390 bytes, and if the name is not fully qualified, then the default domain name is used. The pattern <code>schema.queue@dblink</code> is used.</td>
</tr>
<tr>
<td>start_time</td>
<td>Initial start time for the propagation window for messages from the source queue to the destination.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of the propagation window in seconds. A NULL value means the propagation window is forever or until the propagation is unscheduled.</td>
</tr>
<tr>
<td>next_time</td>
<td>Date function to compute the start of the next propagation window from the end of the current window. If this value is NULL, then propagation is stopped at the end of the current window. For example, to start the window at the same time every day, <code>next_time</code> should be specified as <code>SYSDATE + 1 - duration/86400</code>.</td>
</tr>
<tr>
<td>latency</td>
<td>Maximum wait, in seconds, in the propagation window for a message to be propagated after it is enqueued. For example, if the latency is 60 seconds and there are no messages to be propagated during the propagation window, then messages from that queue for the destination are not propagated for at least 60 more seconds. It is at least 60 seconds before the queue is checked again for messages to be propagated for the specified destination. If the latency is 600, then the queue is not checked for 10 minutes, and if the latency is 0, then a job queue process will be waiting for messages to be enqueued for the destination. As soon as a message is enqueued, it is propagated.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink.</td>
</tr>
</tbody>
</table>
Usage Notes

Messages may also be propagated to other queues in the same database by specifying a NULL destination. If a message has multiple recipients at the same destination in either the same or different queues, the message is propagated to all of them at the same time.

Oracle extensions for JMS such as JMS propagation and remote subscribers are not currently supported for sharded queues. Propagation between sharded and non-sharded queues is not supported.

Related Topics

- Oracle Database Advanced Queuing User's Guide

22.4.38 SET_WATERMARK Procedure

This procedure is used for Oracle Database Advanced Queuing notification to specify and limit memory use.

Syntax

```sql
DBMS_AQADM.SET_WATERMARK (    wmvalue IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wmvalue</td>
<td>Watermark value in megabytes.</td>
</tr>
</tbody>
</table>

22.4.39 SET_MAX_STREAMS_POOL Procedure

This procedure is used for Oracle Database Advanced Queuing to specify and limit maximum streams pool memory use.

Syntax

```sql
DBMS_AQADM.SET_MAX_STREAMS_POOL (    value IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>
22.4.40 SET_MIN_STREAMS_POOL Procedure

This procedure is used for Oracle Database AQ to specify and limit minimum streams pool memory use.

Syntax

DBMS_AQADM.SET_MIN_STREAMS_POOL (value IN NUMBER);

Parameters

Table 22-50 SET_MIN_STREAMS_POOL Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value in megabytes.</td>
</tr>
</tbody>
</table>

22.4.41 SET_QUEUE_PARAMETER Procedure

This procedure allows user to set different parameters for sharded queues at queue or database level. For database level the queue_name should be NULL. Note that queue overrides database level parameter values.

See Also:

Oracle® Database Advanced Queuing User’s Guide for information about sharded queues

Syntax

PROCEDURE SET_QUEUE_PARAMETER(
    queue_name          IN VARCHAR2,
    param_name          IN VARCHAR2,
    param_value         IN NUMBER);

Parameters

Table 22-51 SET_QUEUE_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>param_name</td>
<td>The name of the parameter.</td>
</tr>
<tr>
<td>param_value</td>
<td>The value of the parameter.</td>
</tr>
</tbody>
</table>
22.4.42 START_QUEUE Procedure

This procedure enables the specified queue for enqueuing or dequeuing.

Syntax

```
DBMS_AQADM.START_QUEUE (
    queue_name IN VARCHAR2,
    enqueue    IN BOOLEAN DEFAULT TRUE,
    dequeue    IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be enabled</td>
</tr>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be enabled on this queue. TRUE means enable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be enabled on this queue. TRUE means enable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
</tbody>
</table>

Usage Notes

After creating a queue, the administrator must use START_QUEUE to enable the queue. The default is to enable it for both ENQUEUE and DEQUEUE. Only dequeue operations are allowed on an exception queue. This operation takes effect when the call completes and does not have any transactional characteristics.

22.4.43 STOP_QUEUE Procedure

This procedure disables enqueuing or dequeuing on the specified queue.

Syntax

```
DBMS_AQADM.STOP_QUEUE (
    queue_name IN VARCHAR2,
    enqueue    IN BOOLEAN DEFAULT TRUE,
    dequeue    IN BOOLEAN DEFAULT TRUE,
    wait       IN BOOLEAN DEFAULT TRUE,
    free_memory IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue to be disabled</td>
</tr>
</tbody>
</table>
Table 22-53  (Cont.) STOP_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enqueue</td>
<td>Specifies whether ENQUEUE should be disabled on this queue. TRUE means disable ENQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>dequeue</td>
<td>Specifies whether DEQUEUE should be disabled on this queue. TRUE means disable DEQUEUE. This is the default. FALSE means do not alter the current setting.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies whether to wait for the completion of outstanding transactions. TRUE means wait if there are any outstanding transactions. In this state no new transactions are allowed to enqueue to or dequeue from this queue. FALSE means return immediately either with a success or an error.</td>
</tr>
<tr>
<td>free_memory</td>
<td>Specifies whether the queue should be stopped.</td>
</tr>
</tbody>
</table>

Usage Notes

By default, this call disables both ENQUEUE and DEQUEUE. A queue cannot be stopped if there are outstanding transactions against the queue. This operation takes effect when the call completes and does not have any transactional characteristics.

22.4.44 UNSCHEDULE_PROPAGATION Procedure

This procedure unschedules previously scheduled propagation of messages from a queue to a destination identified by a specific database link.

Syntax

```sql
DBMS_AQADM.UNSCHEDULE_PROPAGATION (     queue_name         IN  VARCHAR2,     destination        IN  VARCHAR2 DEFAULT NULL     destination_queue  IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 22-54  UNSCHEDULE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the administrative user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>Name of the target queue to which messages are to be propagated in the form of a dblink</td>
</tr>
</tbody>
</table>
22.4.45 UNSET_QUEUE_PARAMETER Procedure

This procedure allows user to unset different parameters for sharded queues at queue or database level.

For database level the `queue_name` should be `NULL`. Note that queue overrides database level parameter values.

See Also:

Oracle® Database Advanced Queuing User's Guide for information about sharded queues

Syntax

```sql
PROCEDURE UNSET_QUEUE_PARAMETER(
    queue_name          IN VARCHAR2,
    param_name          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the sharded queue.</td>
</tr>
<tr>
<td>param_name</td>
<td>The name of the parameter.</td>
</tr>
</tbody>
</table>

22.4.46 VERIFY_QUEUE_TYPES Procedure

This procedure verifies that the source and destination queues have identical types.

The result of the verification is stored in the table `sys.aq$message_types`, overwriting all previous output of this command.

Syntax

```sql
DBMS_AQADM.VERIFY_QUEUE_TYPES (
    src_queue_name    IN VARCHAR2,
    dest_queue_name   IN VARCHAR2,
    destination       IN VARCHAR2 DEFAULT NULL,
    rc                 OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_queue_name</td>
<td>Name of the source queue whose messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
</tbody>
</table>
Table 22-56  (Cont.) VERIFY_QUEUE_TYPES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_queue_name</td>
<td>Name of the destination queue where messages are to be propagated, including the schema name. If the schema name is not specified, then it defaults to the schema name of the user.</td>
</tr>
<tr>
<td>destination</td>
<td>Destination database link. Messages in the source queue for recipients at this destination are propagated. If it is NULL, then the destination is the local database and messages are propagated to other queues in the local database. The length of this field is currently limited to 128 bytes, and if the name is not fully qualified, then the default domain name is used.</td>
</tr>
<tr>
<td>rc</td>
<td>Return code for the result of the procedure. If there is no error, and if the source and destination queue types match, then the result is 1. If they do not match, then the result is 0. If an Oracle error is encountered, then it is returned in rc.</td>
</tr>
</tbody>
</table>

**Note:**

- SYS.AQ$_MESSAGE_TYPES can have multiple entries for the same source queue, destination queue, and database link, but with different transformations.
- VERIFY_QUEUE_TYPES check happens once per AQ propagation schedule and not for every propagated message send.
- In case the payload of the queue is modified then the existing propagation schedule between source and destination queue needs to be dropped and recreated.
DBMS_AQELM

The package provides subprograms to manage the configuration of Oracle Streams Advanced Queuing (AQ) asynchronous notification by e-mail and HTTP.

See Also:
Oracle Database Advanced Queuing User's Guide for detailed information about DBMS_AQELM

This chapter contains the following topics:
- Security Model
- Summary of DBMS_AQELM Subprograms

23.1 DBMS_AQELM Security Model

You need the administrator role AQ_ADMINISTRATOR_ROLE to run all procedures in DBMS_AQELM.

23.2 Summary of DBMS_AQELM Subprograms

This section lists and briefly describes the DBMS_AQELM subprograms.

Table 23-1 DBMS_AQELM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_MAILHOST Procedure</td>
<td>Sets the host name for the SMTP server that the database will uses send out e-mail notifications</td>
</tr>
<tr>
<td>SET_MAILPORT Procedure</td>
<td>Sets the port number for the SMTP server</td>
</tr>
<tr>
<td>SET_SENDFROM Procedure</td>
<td>Sets the sent-from e-mail address</td>
</tr>
</tbody>
</table>

23.2.1 SET_MAILHOST Procedure

This procedure sets the host name for the SMTP server. The database uses this SMTP server host name to send out e-mail notifications.

Syntax

```
DBMS_AQELM.SET_MAILHOST (
   mailhost  IN  VARCHAR2);
```
Parameters

Table 23-2 SET_MAILHOST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailhost</td>
<td>SMTP server host name.</td>
</tr>
</tbody>
</table>

Usage Notes
As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on the DBMS_AQELM package needs to set the host name before registering for e-mail notifications.

23.2.2 SET_MAILPORT Procedure

This procedure sets the port number for the SMTP server.

Syntax

DBMS_AQELM.SET_MAILPORT (
    mailport  IN NUMBER);

Parameters

Table 23-3 SET_MAILPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mailport</td>
<td>SMTP server port number.</td>
</tr>
</tbody>
</table>

Usage Notes
As part of the configuration for e-mail notifications, a user with AQ_ADMINISTRATOR_ROLE or with EXECUTE permissions on DBMS_AQELM package needs to set the port number before registering for e-mail notifications. The database uses this SMTP server port number to send out e-mail notifications. If not set, the SMTP mailport defaults to 25.

23.2.3 SET_SENDFROM Procedure

This procedure sets the sent-from e-mail address. This e-mail address is used in the sent-from field in all the e-mail notifications sent out by the database to the registered e-mail addresses.

Syntax

DBMS_AQELM.SET_SENDFROM (
    sendfrom IN VARCHAR2);
Parameters

Table 23-4  SET_SENDFROM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sendfrom</td>
<td>The sent-from e-mail address.</td>
</tr>
</tbody>
</table>

Usage Notes

As part of the configuration for e-mail notifications, a user with `AQ_ADMINISTRATOR_ROLE` or with `EXECUTE` permissions on the `DBMS_AQELM` package should set the sent-from address before registering for e-mail notifications.
24

DBMS_AQIN

The DBMS_AQIN package plays a part in providing secure access to the Oracle JMS interfaces.

See Also:

Oracle Database Advanced Queuing User's Guide for detailed information about DBMS_AQIN

This chapter contains the following topic:

• Security Model

24.1 DBMS_AQIN Security Model

While you should not call any subprograms in the DBMS_AQIN package directly, you must have the EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces.

Use the following syntax to accomplish this with regard to the DBMS_AQIN package:

GRANT EXECUTE ON DBMS_AQIN to user;

You must have EXECUTE privilege on the DBMS_AQIN and DBMS_AQJMS packages to use the Oracle JMS interfaces. You can also acquire these rights through the AQ_USER_ROLE or the AQ_ADMINISTRATOR_ROLE.

See Also:

Oracle Database Advanced Queuing User's Guide for more information on accessing standard and Oracle JMS applications.
The DBMS_ASSERT package provides an interface to validate properties of the input value.

**See Also:**

*Oracle Database PL/SQL Language Reference* for more information about "Avoiding SQL Injection in PL/SQL"

This chapter contains the following topics:

- Operational Notes
- Summary of DBMS_ASSERT Subprograms

### 25.1 DBMS_ASSERT Operational Notes

If the condition which determines the property asserted in a function is not met then a value error is raised. Otherwise the input value is returned through the return value. Most functions return the value unchanged, however, several functions modify the value.

### 25.2 Summary of DBMS_ASSERT Subprograms

This section describes the subprograms of the DBMS_ASSERT package.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENQUOTE_LITERAL Function</td>
<td>Enquotes a string literal</td>
</tr>
<tr>
<td>ENQUOTE_NAME Function</td>
<td>Ensures that a string is enclosed by quotation marks, then checks that the result is a valid SQL identifier.</td>
</tr>
<tr>
<td>NOOP Functions</td>
<td>Returns the value without any checking</td>
</tr>
<tr>
<td>QUALIFIED_SQL_NAME Function</td>
<td>Verifies that the input string is a qualified SQL name</td>
</tr>
<tr>
<td>SCHEMA_NAME Function</td>
<td>Verifies that the input string is an existing schema name</td>
</tr>
<tr>
<td>SIMPLE_SQL_NAME Function</td>
<td>Verifies that the input string is a simple SQL name</td>
</tr>
<tr>
<td>SQL_OBJECT_NAME Function</td>
<td>Verifies that the input parameter string is a qualified SQL identifier of an existing SQL object</td>
</tr>
</tbody>
</table>
25.2.1 ENQUOTE_LITERAL Function

This function adds leading and trailing single quotes to a string literal.

Syntax

DBMS_ASSERT.ENQUOTE_LITERAL (str VARCHAR2)
RETURN VARCHAR2;

Parameters

Table 25-2  ENQUOTE_LITERAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
</tbody>
</table>

Usage Notes

- Verify that all single quotes except leading and trailing characters are paired with adjacent single quotes.
- No additional quotes are added if the name was already in quotes.

25.2.2 ENQUOTE_NAME Function

This function encloses the provided string in double quotes (quotation marks). No additional quotes are added if the string was already in quotes (quotation marks). The quoted string is then checked to see if it is a valid (quoted) simple SQL name.

For more information on Database object names and qualifiers, see Oracle Database SQL Language Reference.

Syntax

DBMS_ASSERT.ENQUOTE_NAME (str VARCHAR2,
capitalize BOOLEAN DEFAULT TRUE)
RETURN VARCHAR2;

Parameters

Table 25-3  ENQUOTE_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>String to enquote</td>
</tr>
<tr>
<td>capitalize</td>
<td>If TRUE or defaulted, alphabetic characters of str which was not in quotes are translated to upper case</td>
</tr>
</tbody>
</table>

Usage Notes

- No additional quotes are added if the name was already in quotes.
- Verify that all other double quotes in the string are adjacent pairs of double quotes.
Examples

-- This procedure creates a single column table in the createOneColumnTable's schema.  
create or replace procedure createOneColumnTable(proposedTableName varchar2) is
BEGIN
  IF (proposedTableName is NULL) THEN
    raise value_error;
  END IF;
-- The use of ENQUOTE_NAME ensures that the table will be created in the
-- definer's schema and not in some other schema even if the definer has
-- privileges to create tables in other schemas.
EXECUTE IMMEDIATE 'create table ' ||
DBMS_ASSERT.ENQUOTE_NAME(proposedTableName) || ' (c1 number)';
EXCEPTION
  WHEN others THEN
    dbms_output.put_line('Table creation failed due to: ' || SQLERRM);
END;
/

-- Examples of ENQUOTE_NAME showing input/output relationships
BEGIN
  -- 'eMp' becomes "EMP" since it is unquoted
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('eMp'));
END;
/

BEGIN
  -- For quoted strings, the case is preserved
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME("EmP"));
END;
/

-- Invalid identifier example
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('SCOTT."EMP"'));
END;
/

-- CHR(0) examples
-- The following examples illustrates that CHR(0), the NULL character, cannot appear
-- in the string; such a string poses a SQL injection risk.
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('BAD' || CHR(0) || 'IDENTIFIER'));
END;
/

BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT' || CHR(0) || 'EMP"'));
END;
/

-- Oracle allows a period (.) to be a part of a quoted string
BEGIN
  dbms_output.put_line(DBMS_ASSERT.ENQUOTE_NAME('"SCOTT.EMP"'));
END;
/
The single quotation mark ('), as opposed to a double quotation mark, can appear in the string.

Note: In Oracle, a single quotation mark is specified in a literal using two single quotes. The first quotation mark escapes the second quotation mark in the same way that backslash (\) in POSIX is an escape character.

```sql
BEGIN
    dbms_output.put_line(dbms_assert.enquote_name('"O''LEARY"'));
END;
/
```

### 25.2.3 NOOP Functions

This function returns the value without any checking.

**Syntax**

```sql
DBMS_ASSERT.NOOP (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

**Parameters**

**Table 25-4**  
**NOOP Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

### 25.2.4 QUALIFIED_SQL_NAME Function

This function verifies that the input string is a qualified SQL name.

**Syntax**

```sql
DBMS_ASSERT.QUALIFIED_SQL_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

**Parameters**

**Table 25-5**  
**QUALIFIED_SQL_NAME Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA44004: string is not a qualified SQL name
Usage Notes

A qualified SQL name `<qualified name>` can be expressed by the following grammar:

- `<local qualified name>` ::= `<simple name>` {'.' `<simple name>`}
- `<database link name>` ::= `<local qualified name>` ['`@`' `<connection string>`]
- `<connection string>` ::= `<simple name>`
- `<qualified name>` ::= `<local qualified name>` ['`@`' `<database link name>`]

25.2.5 SCHEMA_NAME Function

This function verifies that the input string is an existing schema name.

Syntax

```sql
DBMS_ASSERT.SCHEMA_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44001: Invalid schema name

Usage Notes

By definition, a schema name need not be just a simple SQL name. For example, "FIRST LAST" is a valid schema name. As a consequence, care must be taken to quote the output of schema name before concatenating it with SQL text.

25.2.6 SIMPLE_SQL_NAME Function

This function verifies that the input string is a simple SQL name.

Syntax

```sql
DBMS_ASSERT.SIMPLE_SQL_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>
Exceptions

ORA44003: string is not a simple SQL name

Usage Notes

• The input value must meet the following conditions:
  – The name must begin with an alphabetic character. It may contain
    alphanumeric characters as well as the characters _, $, and # in the second
    and subsequent character positions.
  – Quoted SQL names are also allowed.
  – Quoted names must be enclosed in double quotes.
  – Quoted names allow any characters between the quotes.
  – Quotes inside the name are represented by two quote characters in a row, for
    example, "a name with "" inside" is a valid quoted name.
  – The input parameter may have any number of leading and/or trailing white
    space characters.
• The length of the name is not checked.

25.2.7 SQL_OBJECT_NAME Function

This function verifies that the input parameter string is a qualified SQL identifier of an
existing SQL object.

Syntax

DBMS_ASSERT.SQL_OBJECT_NAME (str VARCHAR2 CHARACTER SET ANY_CS)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

Parameters

Table 25-8 SQL_OBJECT_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Input value</td>
</tr>
</tbody>
</table>

Exceptions

ORA44002: Invalid object name

Usage Notes

The use of synonyms requires that the base object exists.
The **DBMS_AUDIT_MGMT** package provides subprograms to manage audit trail records. These subprograms enable audit administrators to manage the audit trail. In a mixed-mode environment, these audit trails comprise the database, operating system (OS), and XML audit trails. In a unified auditing environment, this comprises the unified audit trail.

This chapter contains the following topics:

- DBMS_AUDIT_MGMT Overview
- DBMS_AUDIT_MGMT Deprecated Subprograms

### 26.1 DBMS_AUDIT_MGMT Overview

Database auditing helps meet your database security and compliance requirements. In a mixed mode environment, audit records are written to database tables, operating system (OS) files, or XML files depending on the AUDIT_TRAIL initialization parameter setting. If you have upgraded to unified auditing, then the audit records are written to the unified audit trail.

In a mixed mode environment, when **AUDIT_TRAIL** is set to **DB**, database records are written to the **AUD$** table. In a unified auditing environment, audit records are written to a read-only table in the **AUDSYS** schema. The contents of this table are available from the **UNIFIED_AUDIT_TRAIL** data dictionary view. When **AUDIT_TRAIL** is set to **OS**, audit records are written to operating system files. When **AUDIT_TRAIL** is set to **XML**, audit records are written to operating system files in XML format.

With Unified Auditing facility, all audit records are written to the unified audit trail in a uniform format and are made available through the **UNIFIED_AUDIT_TRAIL** views.
It is important to manage your audit records properly in order to ensure efficient performance and disk space management. The DBMS_AUDIT_MGMT subprograms enable you to efficiently manage your audit trail records.

If you have not yet migrated to unified auditing, the DBMS_AUDIT_MGMT package provides a subprogram that allows you to move the database audit trail tables out of the SYSTEM tablespace. This improves overall database performance by reducing the load on the SYSTEM tablespace. It also enables you to dedicate an optimized tablespace for audit records.

For a mixed mode environment, the DBMS_AUDIT_MGMT subprograms also enable you to manage your operating system and XML audit files. You can define properties like the maximum size and age of an audit file. This enables you to keep the file sizes of OS and XML audit files in check.

The DBMS_AUDIT_MGMT subprograms enable you to perform cleanup operations on all audit trail types. Audit trails can be cleaned based on the last archive timestamp value. The last archive timestamp represents the timestamp of the most recent audit record that was securely archived.

The DBMS_AUDIT_MGMT package provides a subprogram that enables audit administrators to set the last archive timestamp for archived audit records. This subprogram can also be used by external archival systems to set the last archive timestamp.

The DBMS_AUDIT_MGMT subprograms also enable you to configure jobs that periodically delete audit trail records. The frequency with which these jobs should run can be controlled by the audit administrator.

See Also:
Oracle Database Security Guide for a detailed description of unified auditing

26.2 DBMS_AUDIT_MGMT Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following have been deprecated from the DBMS_AUDIT_MGMT package starting in Oracle Database 12c release 12.2:

- DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL procedure
- AUDIT_TRAIL_WRITE mode of the AUDIT_TRAIL_PROPERTY parameter of the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY procedure

These are no longer necessary because audit records now bypass the common logging infrastructure queues and are directly written to a new internal relational table.
26.3 DBMS_AUDIT_MGMT Security Model

All DBMS_AUDIT_MGMT subprograms require the user to have EXECUTE privilege over the DBMS_AUDIT_MGMT package. The SYSDBA and AUDIT_ADMIN roles have EXECUTE privileges on the package by default.

Oracle strongly recommends that only audit administrators should have the EXECUTE privilege on the DBMS_AUDIT_MGMT package and be granted the AUDIT_ADMIN role.

Executions of the DBMS_AUDIT_MGMT subprograms are always audited.

26.4 DBMS_AUDIT_MGMT Constants

The DBMS_AUDIT_MGMT package defines several constants that can be used for specifying parameter values.

These constants shown in the following tables:

- Table 26-1
- Table 26-2
- Table 26-3

Audit trails can be classified based on whether audit records are written to database tables, operating system files, or XML files. The following table lists the audit trail type constants.

Table 26-1   DBMS_AUDIT_MGMT Constants - Audit Trail Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_ALL</td>
<td>PLS_INTEGER</td>
<td>All audit trail types. This includes the standard database audit trail (SYS.AUD$, SYS.FGA_LOG$ and unified audit trail tables), operating system (OS) audit trail, and XML audit trail.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_AUD_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database audit records in the SYS.AUD$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_DB_STD</td>
<td>PLS_INTEGER</td>
<td>Both standard audit (SYS.AUD$) and FGA audit(SYS.FGA_LOG$) records</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FGA_STD</td>
<td>PLS_INTEGER</td>
<td>Standard database fine-grained auditing (FGA) records in the SYS.FGA_LOG$ table</td>
</tr>
<tr>
<td>AUDIT_TRAIL_FILES</td>
<td>PLS_INTEGER</td>
<td>Both operating system (OS) and XML audit trails</td>
</tr>
<tr>
<td>AUDIT_TRAIL.OS</td>
<td>PLS_INTEGER</td>
<td>Operating system audit trail. This refers to the audit records stored in operating system files.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_UNIFIED</td>
<td>PLS_INTEGER</td>
<td>Unified audit trail. In unified auditing, all audit records are written to the unified audit trail and are made available through the unified audit trail views, such as UNIFIED_AUDIT_TRAIL.</td>
</tr>
<tr>
<td>AUDIT_TRAIL_XML</td>
<td>PLS_INTEGER</td>
<td>XML audit trail. This refers to the audit records stored in XML files.</td>
</tr>
</tbody>
</table>
Audit trail properties determine the audit configuration settings. The following table lists the constants related to audit trail properties.

**Table 26-2  DBMS_AUDIT_MGMT Constants - Audit Trail Properties**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUDIT_TRAIL_WRITE_MODE</td>
<td>PLS_INTEGER</td>
<td>Note: This procedure has been deprecated starting in Oracle Database 12c release 12.2. A value of AUDIT_TRAIL_IMMEDIATE_WRITE indicates that the audit record must be immediately persisted and not to be queued. By contrast, AUDIT_TRAIL_QUEUED_WRITE indicates that the audit record can be queued and persisting can be done according the database’s flushing strategy. See Also Oracle Database Security Guide</td>
</tr>
<tr>
<td>CLEAN_UP_INTERVAL</td>
<td>PLS_INTEGER</td>
<td>Interval, in hours, after which the cleanup procedure is called to clear audit records in the specified audit trail</td>
</tr>
<tr>
<td>DB_DELETE_BATCH_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the batch size to be used for deleting audit records in database audit tables. The audit records are deleted in batches of size equal to DB_DELETE_BATCH_SIZE.</td>
</tr>
<tr>
<td>FILE_DELETE_BATCH_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the batch size to be used for deleting audit files in the audit directory. The audit files are deleted in batches of size equal to FILE_DELETE_BATCH_SIZE.</td>
</tr>
<tr>
<td>OS_FILE_MAX_AGE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum number of days for which an operating system (OS) or XML audit file can be kept open before a new audit file gets created</td>
</tr>
<tr>
<td>OS_FILE_MAX_SIZE</td>
<td>PLS_INTEGER</td>
<td>Specifies the maximum size, in kilobytes (KB), to which an operating system (OS) or XML audit file can grow before a new file is opened</td>
</tr>
</tbody>
</table>

The audit trail purge job cleans the audit trail. The following table lists the constants related to purge job status values.

**Table 26-3  DBMS_AUDIT_MGMT Constants - Purge Job Status**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_JOB_DISABLE</td>
<td>PLS_INTEGER</td>
<td>Disables a purge job</td>
</tr>
<tr>
<td>PURGE_JOB_ENABLE</td>
<td>PLS_INTEGER</td>
<td>Enables a purge job</td>
</tr>
</tbody>
</table>

### 26.5 DBMS_AUDIT_MGMT Views

DBMS_AUDIT_MGMT views are used to display DBMS_AUDIT_MGMT configuration and cleanup events.

These views listed in the following table.
### Table 26-4  Views used by DBMS_AUDIT_MGMT

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA_AUDIT_MGMT_CLEAN_EVENTS</td>
<td>Displays the cleanup event history</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CLEANUP_JOBS</td>
<td>Displays the currently configured audit trail purge jobs</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_CONFIG_PARAMS</td>
<td>Displays the currently configured audit trail properties</td>
</tr>
<tr>
<td>DBA_AUDIT_MGMT_LAST_ARCH_TS</td>
<td>Displays the last archive timestamps set for the audit trails</td>
</tr>
</tbody>
</table>

### 26.6 DBMS_AUDIT_MGMT Subprogram Groups

The DBMS_AUDIT_MGMT package subprograms can be grouped into two categories: Audit Trail Management Subprograms and Audit Trail Cleanup Subprograms.

- Audit Trail Management Subprograms
- Audit Trail Cleanup Subprograms

#### 26.6.1 DBMS_AUDIT_MGMT Audit Trail Management Subprograms

Audit trail management subprograms enable you to manage audit trail properties.

### Table 26-5  Audit Trail Management Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARTITION_INTERVAL Procedure</td>
<td>Changes the unified audit internal relational table’s partition interval</td>
</tr>
<tr>
<td>CLEAR_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td>FLUSH_UNIFIED_AUDIT_TRAIL Procedure</td>
<td>Writes the unified audit trail records in the SGA queue to disk (deprecated starting with Oracle Database 12c release 12.2)</td>
</tr>
<tr>
<td>GET_AUDIT_TRAIL_PROPERTY_VALUE Function</td>
<td>Returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure</td>
</tr>
<tr>
<td>GET_LAST_ARCHIVE_TIMESTAMP Function</td>
<td>Returns the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure in that database instance</td>
</tr>
<tr>
<td>LOAD_UNIFIED_AUDIT_FILES Procedure</td>
<td>Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace</td>
</tr>
<tr>
<td>SET_AUDIT_TRAIL_LOCATION Procedure</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
</tbody>
</table>
Table 26-5  (Cont.) Audit Trail Management Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_AUDIT_TRAIL_PROPERTY Procedure</td>
<td>Sets an audit trail property for the audit trail type that you specify</td>
</tr>
<tr>
<td>SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Sets a timestamp indicating when the audit records or files were last archived</td>
</tr>
<tr>
<td>TRANSFER_UNIFIED_AUDIT_RECORDS Procedure</td>
<td>Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD$UNIFIED relational table</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.

26.6.2 DBMS_AUDIT_MGMT Audit Trail Cleanup Subprograms

Audit trail cleanup subprograms help you perform cleanup related operations on the audit trail records.

Table 26-6  Audit Trail Cleanup Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_AUDIT_TRAIL Procedure</td>
<td>Deletes audit trail records or files that have been archived</td>
</tr>
<tr>
<td>CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure</td>
<td>Clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure</td>
</tr>
<tr>
<td>CREATE_PURGE_JOB Procedure</td>
<td>Creates a purge job for periodically deleting the audit trail records or files</td>
</tr>
<tr>
<td>DEINIT_CLEANUP Procedure</td>
<td>Undoes the setup and initialization performed by the INIT_CLEANUP Procedure</td>
</tr>
<tr>
<td>DROP_OLD_UNIFIED_AUDIT_TABLES Procedure</td>
<td>Drops old unified audit tables following the cloning of a pluggable database (PDB)</td>
</tr>
<tr>
<td>DROP_PURGE_JOB Procedure</td>
<td>Drops the purge job created using the CREATE_PURGE_JOB Procedure</td>
</tr>
<tr>
<td>INIT_CLEANUP Procedure</td>
<td>Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records or files</td>
</tr>
<tr>
<td>IS_CLEANUP_INITIALIZED Function</td>
<td>Checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type</td>
</tr>
<tr>
<td>SET_PURGE_JOB_INTERVAL Procedure</td>
<td>Sets the interval at which the CLEAN_AUDIT_TRAIL Procedure is called for the purge job that you specify</td>
</tr>
<tr>
<td>SET_PURGE_JOB_STATUS Procedure</td>
<td>Enables or disables the purge job that you specify</td>
</tr>
</tbody>
</table>

The Summary of DBMS_AUDIT_MGMT Subprograms contains a complete listing of all subprograms in the package.
26.7 Summary of DBMS_AUDIT_MGMT Subprograms

This table lists and describes the subprograms of the **DBMS_AUDIT_MGMT** package.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ALTER_PARTITION_INTERVAL</strong> Procedure</td>
<td>Changes the unified audit internal relational table’s partition interval</td>
</tr>
<tr>
<td><strong>CLEAN_AUDIT_TRAIL</strong> Procedure</td>
<td>Deletes audit trail records that have been archived</td>
</tr>
<tr>
<td><strong>CLEAR_AUDIT_TRAIL_PROPERTY</strong> Procedure</td>
<td>Clears the value for the audit trail property that you specify</td>
</tr>
<tr>
<td><strong>CLEAR_LAST_ARCHIVE_TIMESTAMP</strong> Procedure</td>
<td>Clears the timestamp set by the <strong>SET_LAST_ARCHIVE_TIMESTAMP</strong> Procedure</td>
</tr>
<tr>
<td><strong>CREATE_PURGE_JOB</strong> Procedure</td>
<td>Creates a purge job for periodically deleting the audit trail records</td>
</tr>
<tr>
<td><strong>DEINIT_CLEANUP</strong> Procedure</td>
<td>Undoes the setup and initialization performed by the <strong>INIT_CLEANUP</strong> Procedure</td>
</tr>
<tr>
<td><strong>DROP_OLD_UNIFIED_AUDIT_TABLES</strong> Procedure</td>
<td>Drops old unified audit tables following the cloning of a pluggable database (PDB)</td>
</tr>
<tr>
<td><strong>DROP_PURGE_JOB</strong> Procedure</td>
<td>Drops the purge job created using the <strong>CREATE_PURGE_JOB</strong> Procedure</td>
</tr>
<tr>
<td><strong>FLUSH_UNIFIED_AUDIT_TRAIL</strong> Procedure</td>
<td>Writes the unified audit trail records in the SGA queue to disk</td>
</tr>
<tr>
<td><strong>GET_AUDIT_COMMIT_DELAY</strong> Function</td>
<td>Returns the audit commit delay time as the number of seconds. This is the maximum time that it takes to COMMIT an audit record to the database audit trail.</td>
</tr>
<tr>
<td><strong>GET_AUDIT_TRAILPROPERTY_VALUE</strong> Function</td>
<td>Returns the property value set by the <strong>SET_AUDIT_TRAIL_PROPERTY</strong> Procedure</td>
</tr>
<tr>
<td><strong>GET_LAST_ARCHIVE_TIMESTAMP</strong> Function</td>
<td>Returns the timestamp set by the <strong>SET_LAST_ARCHIVE_TIMESTAMP</strong> Procedure in that database instance</td>
</tr>
<tr>
<td><strong>INIT_CLEANUP</strong> Procedure</td>
<td>Sets up the audit management infrastructure and sets a default cleanup interval for audit trail records</td>
</tr>
<tr>
<td><strong>IS_CLEANUP_INITIALIZED</strong> Function</td>
<td>Checks to see if the <strong>INIT_CLEANUP</strong> Procedure has been run for an audit trail type</td>
</tr>
<tr>
<td><strong>LOAD_UNIFIED_AUDIT_FILES</strong> Procedure</td>
<td>Loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace</td>
</tr>
<tr>
<td><strong>SET_AUDIT_TRAIL_LOCATION</strong> Procedure</td>
<td>Moves the audit trail tables from their current tablespace to a user-specified tablespace</td>
</tr>
<tr>
<td><strong>SET_AUDIT_TRAIL_PROPERTY</strong> Procedure</td>
<td>Sets the audit trail properties for the audit trail type that you specify</td>
</tr>
<tr>
<td><strong>SET_LAST_ARCHIVE_TIMESTAMP</strong> Procedure</td>
<td>Sets a timestamp indicating when the audit records were last archived</td>
</tr>
<tr>
<td><strong>SET_PURGE_JOB_INTERVAL</strong> Procedure</td>
<td>Sets the interval at which the <strong>CLEAN_AUDIT_TRAIL</strong> Procedure is called for the purge job that you specify</td>
</tr>
</tbody>
</table>
Table 26-7  (Cont.) DBMS_AUDIT_MGMT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_PURGE_JOB_STATUS Procedure</td>
<td>Enables or disables the purge job that you specify</td>
</tr>
<tr>
<td>TRANSFER_UNIFIED_AUDIT_RECO RDS Procedure</td>
<td>Transfers audit records from the common logging infrastructure (CLI) swap table to the AUDSYS.AUD$UNIFIED relational table</td>
</tr>
</tbody>
</table>

26.7.1 ALTER_PARTITION_INTERVAL Procedure

This procedure changes the unified audit internal relational table’s partition interval.

Syntax

\[
\text{DBMS_AUDIT_MGMT.\text{ALTER_PARTITION_INTERVAL}(}
\begin{array}{ll}
\text{interval\_number} & \text{IN BINARY\_INTEGER,} \\
\text{interval\_frequency} & \text{IN VARCHAR2})
\end{array}
\]

Parameters

Table 26-8  ALTER_PARTITION_INTERVAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval_number</td>
<td>Sets how often the database creates partitions for the unified audit internal relational table. For example, to specify that the partition is created every two days, you must enter 2.</td>
</tr>
<tr>
<td>interval_frequency</td>
<td>Sets the frequency for the value that was set in the interval_number setting. For example, for a partition to be created every two days, with interval_number set to 2, you must set interval_frequency to DAY.</td>
</tr>
<tr>
<td>Supported values are YEAR, MONTH, and DAY.</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

- The interval frequency that you choose depends on the rate of audit records that are generated in your database. The default setting is for one month. If you have a high audit record rate and are using the default, then too many audit records may be generated in the same partition. In this case, you should change the interval frequency to a more frequent interval, such as one month or one day. If the audit record rate generation is not so high, then you may want to keep it at the default of one month.

Example

The following example sets the partition interval to occur every two months.

\[
\begin{array}{l}
\text{BEGIN} \\
\text{DBMS_AUDIT_MGMT.\text{ALTER_PARTITION_INTERVAL}(}
\begin{array}{ll}
\text{interval\_number} & \Rightarrow 2, \\
\text{interval\_frequency} & \Rightarrow \text{\texttt{MONTH}}
\end{array}
\end{array}
\end{array}
\]
\[
\text{END}
\]
26.7.2 CLEAN_AUDIT_TRAIL Procedure

This procedure deletes audit trail records.

The CLEAN_AUDIT_TRAIL procedure is usually called after the SET_LAST_ARCHIVE_TIMESTAMP Procedure has been used to set the last archived timestamp for the audit records.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
    audit_trail_type         IN PLS_INTEGER,
    use_last_arch_timestamp  IN BOOLEAN DEFAULT TRUE,
    container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
    database_id              IN NUMBER DEFAULT NULL,
    container_guid           IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 26-9  CLEAN_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the cleanup operation needs to be performed. Audit trail types are listed in Table 26-1.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted.</td>
</tr>
<tr>
<td></td>
<td>A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted.</td>
</tr>
<tr>
<td></td>
<td>A value of FALSE indicates that all audit records should be deleted.</td>
</tr>
<tr>
<td></td>
<td>The default value is TRUE. Oracle recommends using this value, as this helps guard against inadvertent deletion of records.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this purges the audit trail in all the PDBs, otherwise it only purges from the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This parameter has been deprecated but is currently retained for backward compatibility.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- When cleaning up operating system (OS) or XML audit files, only files in the current audit directory, specified by the \texttt{AUDIT\_FILE\_DEST} parameter, are cleaned up.
- For Windows platforms, no cleanup is performed when the \texttt{audit_trail_type} parameter is set to \texttt{DBMS_AUDIT_MGMT.AUDIT\_TRAIL\_OS}. This is because operating system (OS) audit records on Windows are written to the Windows Event Viewer.
- For Unix platforms, no cleanup is performed for cases where the operating system (OS) audit records are written to the syslog. When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS`, it removes only the `*.aud` files under the directory specified by the `AUDIT_FILE_DEST` initialization parameter.

  ![See Also:]

  "AUDIT_SYSLOG_LEVEL" in the Oracle Database Reference

- When the `audit_trail_type` parameter is set to `DBMS_AUDIT_MGMT.AUDIT_TRAIL_XML`, this procedure only removes XML audit files (`*.xml`) from the current audit directory.

  Oracle database maintains a book-keeping file (`adx_$ORACLE_SID.txt`) for the XML audit files. This file is not removed by the cleanup procedure.

- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `TRUE`:

  - If you set the `database_id` value for the cleanup operation, then this value is used with the last archive timestamp while `CLEAN_AUDIT_TRAIL` runs. However, for the unified audit records that are present during the cleanup of spillover operating system audit files, the `database_id` value is ignored. Cleanup for operating system audit files is based on the last archive timestamp only. If you want to have the `database_id` value used for the cleanup operation of unified audit trail records that are present in the spillover operating system audit files, then load the contents of these files into database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.

  - If you do not set the `database_id` value for the cleanup operation, then `CLEAN_AUDIT_TRAIL` uses the database ID of the current database container. This ID is used along with the last archive timestamp value while cleaning up the unified audit records that are present in the database tables. However, for unified audit records that are present in the spillover operating system audit records, this database ID is not used and cleanup of these records is based on the last archive timestamp value only. If you want to include the database ID value in the cleanup of unified audit records that are present in the spillover operating system audit files, then load the contents of these files by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`.

- If the cleanup of the unified audit trail is performed when the `use_last_arch_timestamp` parameter is set to `FALSE`:

  - If you set the `database_id` value for the cleanup operation, then this value is used while `CLEAN_AUDIT_TRAIL` cleans up the unified audit trail records that are present in database tables. However, the `database_id` value is not used for the cleanup of unified audit trail records that are present in spillover operating system files. If you want the `database_id` value to be used in the `CLEAN_AUDIT_TRAIL` operation of unified audit records that are present in spillover operating system audit files, then load the contents of these files to the database tables by using the `DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES` procedure before you run `DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL`. 
If you do not set the `database_id` value when you invoke the `CLEAN_AUDIT_TRAIL` procedure, then Oracle Database purges all unified audit records irrespective of `database_id` values and irrespective of the location (that is, database tables or spillover operating system audit files) where the unified audit records reside.

Examples

The following example calls the `CLEAN_AUDIT_TRAIL` procedure to clean up the operating system (OS) audit trail records that were updated before the last archive timestamp.

```sql
BEGIN
    DBMS_AUDIT_MGMT.CLEAN_AUDIT_TRAIL(
        audit_trail_type         =>  DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
        use_last_arch_timestamp  =>  TRUE);
END;
```

26.7.3 CLEAR_AUDIT_TRAIL_PROPERTY Procedure

This procedure clears the value for the specified audit trail property.

Audit trail properties are set using the `SET_AUDIT_TRAIL_PROPERTY Procedure`.

The `CLEAR_AUDIT_TRAIL_PROPERTY` procedure can optionally reset the property value to its default value through the `use_default_values` parameter.

Syntax

```sql
DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    audit_trail_type        IN PLS_INTEGER,
    audit_trail_property    IN PLS_INTEGER,
    use_default_values      IN BOOLEAN DEFAULT FALSE) ;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_type</code></td>
<td>The audit trail type for which the property needs to be cleared. Audit trail types are listed in Table 26-1</td>
</tr>
<tr>
<td><code>audit_trail_property</code></td>
<td>The audit trail property whose value needs to be cleared. You cannot clear the value for the <code>CLEANUP_INTERVAL</code> property. Audit trail properties are listed in Table 26-2</td>
</tr>
<tr>
<td><code>use_default_values</code></td>
<td>Specifies whether the default value of the <code>audit_trail_property</code> should be used in place of the cleared value. A value of <code>TRUE</code> causes the default value of the parameter to be used. A value of <code>FALSE</code> causes the <code>audit_trail_property</code> to have no value. The default value for this parameter is <code>FALSE</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply:

- You can use this procedure to clear the value for an audit trail property that you do not wish to use. For example, if you do not want a restriction on the operating system audit records.
system audit file size, then you can use this procedure to reset the
OS_FILE_MAX_SIZE property.

You can also use this procedure to reset an audit trail property to its default value. You need to set use_default_values to TRUE when invoking the procedure.

- The DB_DELETE_BATCH_SIZE property needs to be individually cleared for the
  AUDIT_TRAIL_AUD_STD and AUDIT_TRAIL_FGA_STD audit trail types. You cannot clear
  this property collectively using the AUDIT_TRAIL_DB_STD and AUDIT_TRAIL_ALL audit
  trail types.

- If you clear the value of the DB_DELETE_BATCH_SIZE property with use_default_value
  set to FALSE, the default value of DB_DELETE_BATCH_SIZE is still assumed. This is
  because audit records are always deleted in batches.

- The FILE_DELETE_BATCH_SIZE property needs to be individually cleared for the
  AUDIT_TRAIL_OS and AUDIT_TRAIL_XML audit trail types. You cannot clear this property
  collectively using the AUDIT_TRAIL_FILES and AUDIT_TRAIL_ALL audit trail types.

- If you clear the value of the FILE_DELETE_BATCH_SIZE property with
  use_default_value set to FALSE, the default value of FILE_DELETE_BATCH_SIZE is still
  assumed. This is because audit files are always deleted in batches.

- You cannot clear the value for the CLEANUP_INTERVAL property.

- You cannot clear the value for the AUDIT_TRAIL_WRITE_MODE property.

Examples

The following example calls the CLEAR_AUDIT_TRAIL_PROPERTY procedure to clear the
value for the audit trail property, OS_FILE_MAX_SIZE. The procedure uses a value of
FALSE for the USE_DEFAULT_VALUES parameter. This means that there will be no maximum
size threshold for operating system (OS) audit files.

BEGIN
  DBMS_AUDIT_MGMT.CLEAR_AUDIT_TRAIL_PROPERTY(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    use_default_values => FALSE);
END;

26.7.4 CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure clears the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP
Procedure.

Syntax

DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP(
  audit_trail_type IN PLS_INTEGER,
  rac_instance_number IN PLS_INTEGER DEFAULT NULL,
  container IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,
  database_id IN NUMBER DEFAULT NULL,
  container_guid IN VARCHAR2 DEFAULT NULL);
Parameters

Table 26-11  CLEAR_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the timestamp needs to be cleared. Audit trail types are listed in Table 26-1.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for single instance databases. You can find the instance number by issuing the SHOW PARAMETER INSTANCE_NUMBER command in SQL*Plus.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this clears the last archive timestamp from all the PDBs, otherwise it clears from only the connected PDB.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
</tbody>
</table>

Note: This parameter has been deprecated but is currently retained for backward compatibility.

Usage Notes

The following usage notes apply:

- The timestamp for only one audit_trail_type can be cleared at a time.
- The following are invalid audit_trail_type values for this procedure and cannot be used:
  - AUDIT_TRAIL_ALL
  - AUDIT_TRAIL_DB_STD
  - AUDIT_TRAIL_FILES

Examples

The following example calls the CLEAR_LAST_ARCHIVE_TIMESTAMP procedure to clear the timestamp value for the operating system (OS) audit trail type.

```
BEGIN
    DBMS_AUDIT_MGMT.CLEAR_LAST_ARCHIVE_TIMESTAMP (audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
                                                 rac_instance_number => 1);
END;
```

Related Topics

- SET_LAST_ARCHIVE_TIMESTAMP Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.
26.7.5 CREATE_PURGE_JOB Procedure

This procedure creates a purge job for periodically deleting the audit trail records.

This procedure carries out the cleanup operation at intervals specified by the user. It calls the CLEAN_AUDIT_TRAIL Procedure to perform the cleanup operation.

The SET_PURGE_JOB_INTERVAL Procedure is used to modify the frequency of the purge job.

The SET_PURGE_JOB_STATUS Procedure is used to enable or disable the purge job.

The DROP_PURGE_JOB Procedure is used to drop a purge job created with the CREATE_PURGE_JOB procedure.

Syntax

```sql
DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_purge_interval  IN PLS_INTEGER,
    audit_trail_purge_name      IN VARCHAR2,
    use_last_arch_timestamp     IN BOOLEAN DEFAULT TRUE,
    container                   IN PLS_INTEGER DEFAULT CONTAINER_CURRENT) ;
```

Parameters

Table 26-12  CREATE_PURGE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the purge job needs to be created. Audit trail types are listed in Table 26-1.</td>
</tr>
<tr>
<td>audit_trail_purge_interval</td>
<td>The interval, in hours, at which the clean up procedure is called. A lower value means that the cleanup is performed more often.</td>
</tr>
<tr>
<td>audit_trail_purge_name</td>
<td>A name to identify the purge job.</td>
</tr>
<tr>
<td>use_last_arch_timestamp</td>
<td>Specifies whether the last archived timestamp should be used for deciding on the records that should be deleted. A value of TRUE indicates that only audit records created before the last archive timestamp should be deleted. A value of FALSE indicates that all audit records should be deleted. The default value is TRUE.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, it creates one job in the Root PDB and the invocation of this job will invoke cleanup in all the PDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to schedule the CLEAN_AUDIT_TRAIL Procedure for your audit trail records.
Examples

The following example calls the `CREATE_PURGE_JOB` procedure to create a cleanup job called `CLEANUP`, for all audit trail types. It sets the `audit_trail_purge_interval` parameter to 100. This means that the cleanup job is invoked every 100 hours. It also sets the `use_last_arch_timestamp` parameter value to `TRUE`. This means that all audit records older than the last archive timestamp are deleted.

```sql
BEGIN
  DBMS_AUDIT_MGMT.CREATE_PURGE_JOB(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    audit_trail_purge_interval => 100 /* hours */,
    audit_trail_purge_name => 'CLEANUP',
    use_last_arch_timestamp => TRUE);
END;
```

26.7.6 DEINIT_CLEANUP Procedure

This procedure undoes the setup and initialization performed by the `INIT_CLEANUP` Procedure. The `DEINIT_CLEANUP` procedure clears the value of the `default_cleanup_interval` parameter. However, when used for audit tables, it does not move the audit trail tables back to their original tablespace.

Syntax

```sql
DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
  audit_trail_type  IN PLS_INTEGER,
  container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

Parameters

Table 26-13  DEINIT_CLEANUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the procedure needs to be called. Audit trail types are listed in Table 26-1</td>
</tr>
<tr>
<td>container</td>
<td>Values: <code>CONTAINER_CURRENT</code> for the connected pluggable database (PDB) or <code>CONTAINER_ALL</code> for all pluggable databases (PDBs). When <code>CONTAINER</code> is set to <code>CONTAINER_ALL</code>, this de-initializes the audit trail from cleanup in all the pluggable databases, otherwise it de-initializes the audit trail from cleanup in the connected PDB only.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot invoke this procedure for `AUDIT_TRAIL_UNIFIED`. Doing so will raise `ORA-46250 : Invalid value for argument 'AUDIT_TRAIL_TYPE'`

Examples

The following example clears the `default_cleanup_interval` parameter setting for the standard database audit trail:

```sql
BEGIN
  DBMS_AUDIT_MGMT.DEINIT_CLEANUP(
```
Related Topics

- **INIT_CLEANUP Procedure**
  This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

### 26.7.7 DROP_OLD_UNIFIED_AUDIT_TABLES Procedure

This procedure drops old unified audit tables following the cloning of a pluggable database (PDB).

**Syntax**

```
DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES(
    container_guid    IN VARCHAR2) ;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>Container GUID of the old unified audit tables</td>
</tr>
</tbody>
</table>

**Usage Notes**

When a pluggable database gets cloned, the unified audit tables get newly created in the new pluggable database. To drop the old unified audit tables, use the `DROP_OLD_UNIFIED_AUDIT_TABLES` by specifying the old GUID of the PDB from which the clone was created. You can query the historical GUIDs from the `DBA_PDB_HISTORY` view for the given PDB.

**Examples**

```
BEGIN
    DBMS_AUDIT_MGMT.DROP_OLD_UNIFIED_AUDIT_TABLES (        
        container_guid => 'E4721865A9321CB5E043EFA9E80A2D77');
END;
```

### 26.7.8 DROP_PURGE_JOB Procedure

This procedure drops the purge job created using the `CREATE_PURGE_JOB` Procedure. The name of the purge job is passed as an argument.

**Syntax**

```
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
    audit_trail_purge_name   IN VARCHAR2) ;
```
Parameters

Table 26-15  DROP_PURGE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job which is being deleted. This is the purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the DROP_PURGE_JOB procedure to drop the purge job called CLEANUP.

BEGIN
DBMS_AUDIT_MGMT.DROP_PURGE_JOB(
  AUDIT_TRAIL_PURGE_NAME => 'CLEANUP');
END;

Related Topics

• CREATE_PURGE_JOB Procedure
  This procedure creates a purge job for periodically deleting the audit trail records.

26.7.9 FLUSH_UNIFIED_AUDIT_TRAIL Procedure

This deprecated procedure writes the unified audit trail records in the SGA queue to disk.

Note:

This procedure has been deprecated starting in Oracle Database 12c release 12.2.

Syntax

DBMS_AUDIT_MGMT.FLUSH_UNIFIED_AUDIT_TRAIL (  
flush_type IN BINARY_INTEGER DEFAULT FLUSH_CURRENT_INSTANCE,  
container IN BINARY_INTEGER DEFAULT CONTAINER_CURRENT);

Parameters

Table 26-16  FLUSH_UNIFIED_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flush_type</td>
<td>Takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>• FLUSH_CURRENT_INSTANCE - Flushes the audit records from SGA queues in that particular RAC instance</td>
</tr>
<tr>
<td></td>
<td>• FLUSH_ALL_INSTANCES - Flushes the audit records from SGA queues in all the RAC instances</td>
</tr>
</tbody>
</table>
Table 26-16 (Cont.) FLUSH_UNIFIED_AUDIT_TRAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>The containers where the SGA queues should be flushed. It takes one of the following two arguments:</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_CURRENT - Flushes the audit records from SGA queues in that particular PDB</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_ALL - Flushes the audit records from SGA queues in all the active PDBs.</td>
</tr>
</tbody>
</table>

26.7.10 GET_AUDIT_COMMIT_DELAY Function

This function returns the audit commit delay time as the number of seconds. Audit commit delay time is the maximum time that it takes to COMMIT an audit record to the database audit trail. If it takes more time to COMMIT an audit record than defined by the audit commit delay time, then a copy of the audit record is written to the operating system (OS) audit trail.

The audit commit delay time value is useful when determining the last archive timestamp for database audit records.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_COMMIT_DELAY
    RETURN NUMBER;
```

26.7.11 GET_AUDIT_TRAIL_PROPERTY_VALUE Function

This procedure returns the property value set by the SET_AUDIT_TRAIL_PROPERTY Procedure.

Syntax

```
DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
    audit_trail_type IN PLS_INTEGER,
    audit_trail_property IN PLS_INTEGER)
    RETURN NUMBER;
```

Parameters

Table 26-17 GET_AUDIT_TRAIL_PROPERTY_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 26-1.</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being queried. Audit trail properties are listed in Table 26-2.</td>
</tr>
</tbody>
</table>

Return Values

If the property value is cached in SGA memory, this function will return the value set by the SET_AUDIT_TRAIL_PROPERTY Procedure. Else it will return NULL.
The `GET_AUDIT_TRAIL_PROPERTY_VALUE` function may return an `ORA-46250` error if the audit trail property value has been set to `DBMS_AUDIT_MGMT.CLEAN_UP_INTERVAL`. To find the cleanup interval of the purge job, query `SYS.DAM_CLEANUP_JOBS$`.

**Examples**

The following example prints the property value of `OS_FILE_MAX_AGE` set by the `SET_AUDIT_TRAIL_PROPERTY` Procedure.

```sql
SET_AUDIT_TRAIL_PROPERTY.
SET SERVEROUTPUT ON
DECLARE
  OS_MAX_AGE_VAL NUMBER;
BEGIN
  OS_MAX_AGE_VAL := DBMS_AUDIT_MGMT.GET_AUDIT_TRAIL_PROPERTY_VALUE(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE);
  IF OS_MAX_AGE_VAL is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Maximum Age configured for OS Audit files is: ' ||
      OS_MAX_AGE_VAL);
  END IF;
END;
```

**Related Topics**

- **SET_AUDIT_TRAIL_PROPERTY Procedure**
  This procedure sets an audit trail property for the audit trail type that is specified.

### 26.7.12 GET_LAST_ARCHIVE_TIMESTAMP Function

This procedure returns the timestamp set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure in that database instance.

**Syntax**

```
DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
  audit_trail_type IN PLS_INTEGER)
RETURN TIMESTAMP;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>audit_trail_type</code></td>
<td>The audit trail type for the timestamp to be retrieved. Audit trail types are listed in Table 26-1.</td>
</tr>
</tbody>
</table>

**Return Values**

In a database that is opened for `READ WRITE`, since there will no timestamp stored in SGA memory, this function will return `NULL`. But in a database that is opened for `READ ONLY`, if a timestamp is set by the `SET_LAST_ARCHIVE_TIMESTAMP` Procedure, the timestamp will be returned. Else it will return `NULL`. 
Usage Notes
This function will return NULL on a database that is opened READ WRITE. Use DBA_AUDIT_MGMT_LAST_ARCH_TS view to check the timestamp set in such a case.

Examples
The following example prints the timestamp set by the SET_LAST_ARCHIVE_TIMESTAMP Procedure on a READ ONLY database.

SET SERVEROUTPUT ON
DECLARE
LAT_TS TIMESTAMP;
BEGIN
LAT_TS := DBMS_AUDIT_MGMT.GET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS);
IF LAT_TS is not NULL THEN
    DBMS_OUTPUT.PUT_LINE('The Last Archive Timestamp is: ' || to_char(LAT_TS));
END IF;
END;

Related Topics
• SET_LAST_ARCHIVE_TIMESTAMP Procedure
  This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

26.7.13 INIT_CLEANUP Procedure
This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

If the audit trail tables are in the SYSTEM tablespace, then the procedure moves them to the SYSAUX tablespace. If you are using unified auditing, you do not need to run this procedure because the unified audit trail tables are in the SYSAUX tablespace by default. If you are not using unified auditing, refer to Oracle Database Upgrade Guide for documentation which references an environment without unified auditing.

Moving the audit trail tables out of the SYSTEM tablespace enhances overall database performance. The INIT_CLEANUP procedure moves the audit trail tables to the SYSAUX tablespace. If the SET_AUDIT_TRAIL_LOCATION Procedure has already moved the audit tables elsewhere, then no tables are moved.

The SET_AUDIT_TRAIL_LOCATION Procedure enables you to specify an alternate target tablespace for the database audit tables.

The INIT_CLEANUP procedure is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. No preliminary set up is required for these audit trail types.

See Also:
Table 26-1 for a list of all audit trail types
This procedure also sets a default cleanup interval for the audit trail records.

**Syntax**

```
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type          IN PLS_INTEGER,
    default_cleanup_interval  IN PLS_INTEGER,
    container                 IN PLS_INTEGER DEFAULT CONTAINER_CURRENT);
```

**Parameters**

Table 26-19 INIT_CLEANUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| audit_trail_type         | The audit trail type for which the clean up operation needs to be initialized.  
                          | Audit trail types are listed in Table 26-1 except AUDIT_TRAIL_UNIFIED        |
| default_cleanup_interval | The default time interval, in hours, after which the cleanup procedure should be called. The minimum value is 1 and the maximum is 999. |
| container                | Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When CONTAINER is set to CONTAINER_ALL, this initializes the audit trails for clean up in all the pluggable databases, otherwise this initializes the audit trail in the connected PDB only. |

**Usage Notes**

The following usage notes apply:

- This procedure may involve data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.
- You should ensure that the SYSAUX tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the SYSAUX tablespace for frequent write operations.
- You can change the default_cleanup_interval later using the SET_AUDIT_TRAIL_PROPERTY Procedure.
- If you do not wish to move the audit trail tables to the SYSAUX tablespace, then you should use the DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION procedure to move the audit trail tables to another tablespace before calling the INIT_CLEANUP procedure.
- Invoking this procedure with AUDIT_TRAIL_UNIFIED results in ORA-46250. It requires no initializations for cleanup since it is cleanup-ready by default.

> See Also:

"SET_AUDIT_TRAIL_LOCATION Procedure"
Examples

The following example calls the INIT_CLEANUP procedure to set a default_cleanup_interval of 12 hours for all audit trail types:

```
BEGIN
DBMS_AUDIT_MGMT.INIT_CLEANUP(
    audit_trail_type   => DBMS_AUDIT_MGMT.AUDIT_TRAIL_ALL,
    default_cleanup_interval   => 12 /* hours */);
END;
```

See Also:

Table 26-1 for a list of all audit trail types

---

26.7.14 IS_CLEANUP_INITIALIZED Function

This function checks to see if the INIT_CLEANUP Procedure has been run for an audit trail type.

The IS_CLEANUP_INITIALIZED function returns TRUE if the procedure has already been run for the audit trail type. It returns FALSE if the procedure has not been run for the audit trail type.

This function is currently not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The function always returns TRUE for these audit trail types. No preliminary set up is required for these audit trail types.

See Also:

Table 26-1 for a list of all audit trail types

Syntax

```
DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(
    audit_trail_type  IN PLS_INTEGER
    container         IN PLS_INTEGER DEFAULT CONTAINER_CURRENT)
RETURN BOOLEAN;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the function needs to be called.</td>
</tr>
<tr>
<td></td>
<td>Note that this does not apply to AUDIT_TRAIL_UNIFIED.</td>
</tr>
<tr>
<td></td>
<td>Audit trail types are listed in Table 26-1</td>
</tr>
</tbody>
</table>
Table 26-20 (Cont.) IS_CLEANUP_INITIALIZED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
<tr>
<td></td>
<td>• When CONTAINER is set to CONTAINER_ALL, this function returns the initialization status of all the pluggable databases. The function returns FALSE even if one of the PDBs is not initialized.</td>
</tr>
<tr>
<td></td>
<td>• When CONTAINER is set to CONTAINER_CURRENT, this returns the initialization status of the connected PDB.</td>
</tr>
</tbody>
</table>

Examples

The following example checks to see if the standard database audit trail type has been initialized for cleanup operation. If the audit trail type has not been initialized, then it calls the INIT_CLEANUP Procedure to initialize the audit trail type.

```sql
BEGIN
  IF NOT DBMS_AUDIT_MGMT.IS_CLEANUP_INITIALIZED(DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD) THEN
    DBMS_AUDIT_MGMT.INIT_CLEANUP(
      audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,
      default_cleanup_interval => 12 /* hours */);
  END IF;
END;
```

Related Topics

• INIT_CLEANUP Procedure
  This procedure sets up the audit management infrastructure and a default cleanup interval for the audit trail records.

26.7.15 LOAD_UNIFIED_AUDIT_FILES Procedure

This procedure loads the data from the spillover OS audit files in a unified audit trail into the designated unified audit trail tablespace.

```sql
DBMS_AUDIT_MGMT.LOAD_UNIFIED_AUDIT_FILES {
  container IN BINARY_INTEGER);
```

See Also:

Oracle Database Security Guide for information about moving the OS audit trail records into the unified audit trail
Parameters

Table 26-21  LOAD_UNIFIED_AUDIT_FILES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs).</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_CURRENT - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in only current PDB</td>
</tr>
<tr>
<td></td>
<td>• CONTAINER_ALL - loads the unified audit files from $ORACLE_BASE/audit/$ORACLE_SID OS directory to the tables in the respective PDBs, but for all the active PDBs</td>
</tr>
</tbody>
</table>

26.7.16 SET_AUDIT_TRAIL_LOCATION Procedure

This procedure moves the audit trail tables from their current tablespace to a user-specified tablespace.

The SET_AUDIT_TRAIL_LOCATION procedure is not relevant for the AUDIT_TRAIL_OS, AUDIT_TRAIL_XML, and AUDIT_TRAIL_FILES audit trail types. The AUDIT_FILE_DEST initialization parameter is the only way you can specify the destination directory for these audit trail types.

See Also:

- Table 26-1 for a list of all audit trail types
- AUDIT_FILE_DEST in the Oracle Database Reference

Syntax

```
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type        IN PLS_INTEGER,
    audit_trail_location_value  IN VARCHAR2) ;
```

Parameters

Table 26-22  SET_AUDIT_TRAIL_LOCATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the audit trail location needs to be set.</td>
</tr>
<tr>
<td>Audit trail types are listed in Table 26-1</td>
<td></td>
</tr>
<tr>
<td>audit_trail_location_value</td>
<td>Target location or tablespace for the audit trail records</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply:

- This procedure involves data movement across tablespaces. This can be a resource intensive operation especially if your database audit trail tables are already populated. Oracle recommends that you invoke the procedure during non-peak hours.

- You should ensure that the target tablespace, into which the audit trail tables are being moved, has sufficient space to accommodate the audit trail tables. You should also optimize the target tablespace for frequent write operations.

- This procedure is valid for the following `audit_trail_type` values only:
  - `AUDIT_TRAIL_AUD_STD`
  - `AUDIT_TRAIL_FGA_STD`
  - `AUDIT_TRAIL_DB_STD`

- You optionally can specify an encrypted tablespace for the audit trail location.

- When `AUDIT_TRAIL_TYPE` is `AUDIT_TRAIL_UNIFIED`, this procedure sets the tablespace for newer audit records in the unified audit trail but does not move the older audit records. Thus, it is not resource intensive for unified audit trail.

- The `UNIFIED_AUDIT_TRAIL` data dictionary view is built on top of an internal relational table. This table is an interval partitioned table (irrespective of database editions) with a default interval of 1 month. This setting means that when you execute the `DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION` procedure, only newly created partitions of the internal table are created in the new tablespace that is set as part of this procedure. Existing partitions of this table remain in the earlier tablespace (`SYSAUX` is the default tablespace for this internal table). If you want to change this table’s partition interval, then use the `DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL` procedure.

Examples

The following example moves the database audit trail tables, `AUD$` and `FGA_LOG$`, from the current tablespace to a user-created tablespace called `RECORDS`:

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_LOCATION(
    audit_trail_type            => DBMS_AUDIT_MGMT.AUDIT_TRAIL_DB_STD,
    audit_trail_location_value  => 'RECORDS');
END;
```

26.7.17 SET_AUDIT_TRAIL_PROPERTY Procedure

This procedure sets an audit trail property for the audit trail type that is specified.

The procedure sets the properties `OS_FILE_MAX_SIZE`, `OS_FILE_MAX_AGE`, and `FILE_DELETE_BATCH_SIZE` for operating system (OS) and XML audit trail types. The `OS_FILE_MAX_SIZE` and `OS_FILE_MAX_AGE` properties determine the maximum size and age of an audit trail file before a new audit trail file gets created. The `FILE_DELETE_BATCH_SIZE` property specifies the number of audit trail files that are deleted in one batch.
The procedure sets the properties `DB_DELETE_BATCH_SIZE` and `CLEANUP_INTERVAL` for the database audit trail type. `DB_DELETE_BATCH_SIZE` specifies the batch size in which records get deleted from audit trail tables. This ensures that if a cleanup operation gets interrupted midway, the process does not need to start afresh the next time it is invoked. This is because all batches before the last processed batch are already committed.

The `CLEANUP_INTERVAL` specifies the frequency, in hours, with which the cleanup procedure is called.

**Syntax**

```sql
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(
    audit_trail_type            IN PLS_INTEGER,
    audit_trail_property        IN PLS_INTEGER,
    audit_trail_property_value  IN PLS_INTEGER) ;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail type for which the property needs to be set. Audit trail types are listed in Table 26-1</td>
</tr>
<tr>
<td>audit_trail_property</td>
<td>The audit trail property that is being set. Audit trail properties are listed in Table 26-2</td>
</tr>
<tr>
<td>audit_trail_property_value</td>
<td>The value of the property specified using <code>audit_trail_property</code>. The following are valid values for audit trail properties:</td>
</tr>
<tr>
<td></td>
<td>• <code>OS_FILE_MAX_SIZE</code> can have a minimum value of 1 and a maximum value of 2000000. The default value is 10000. <code>OS_FILE_MAX_SIZE</code> is measured in kilobytes (KB).</td>
</tr>
<tr>
<td></td>
<td>• <code>OS_FILE_MAX_AGE</code> can have a minimum value of 1 and a maximum value of 497. The default value is 5. <code>OS_FILE_MAX_AGE</code> is measured in days.</td>
</tr>
<tr>
<td></td>
<td>• <code>DB_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 10000. <code>DB_DELETE_BATCH_SIZE</code> is measured as the number of audit records that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>• <code>FILE_DELETE_BATCH_SIZE</code> can have a minimum value of 100 and a maximum value of 1000000. The default value is 1000. <code>FILE_DELETE_BATCH_SIZE</code> is measured as the number of audit files that are deleted in one batch.</td>
</tr>
<tr>
<td></td>
<td>• <code>CLEANUP_INTERVAL</code> can have a minimum value of 1 and a maximum value of 999. The default value is set using the <code>INIT_CLEANUP</code> Procedure. <code>CLEANUP_INTERVAL</code> is measured in hours.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:
The audit trail properties for which you do not explicitly set values use their default values.

If you have set both the **OS_FILE_MAX_SIZE** and **OS_FILE_MAX_AGE** properties for an operating system (OS) or XML audit trail type, then a new audit trail file gets created depending on which of these two limits is reached first.

For example, let us take a scenario where **OS_FILE_MAX_SIZE** is 10000 and **OS_FILE_MAX_AGE** is 5. If the operating system audit file is already more than 5 days old and has a size of 9000 KB, then a new audit file is opened. This is because one of the limits has been reached.

The **DB_DELETE_BATCH_SIZE** property needs to be individually set for the **AUDIT_TRAIL_AUD_STD** and **AUDIT_TRAIL_FGA_STD** audit trail types. You cannot set this property collectively using the **AUDIT_TRAIL_DB_STD** and **AUDIT_TRAIL_ALL** audit trail types.

The **DB_DELETE_BATCH_SIZE** property enables you to control the number of audit records that are deleted in one batch. Setting a large value for this parameter requires increased allocation for the undo log space.

The **FILE_DELETE_BATCH_SIZE** property needs to be individually set for the **AUDIT_TRAIL_OS** and **AUDIT_TRAIL_XML** audit trail types. You cannot set this property collectively using the **AUDIT_TRAIL_FILES** and **AUDIT_TRAIL_ALL** audit trail types.

The **FILE_DELETE_BATCH_SIZE** property enables you to control the number of audit files that are deleted in one batch. Setting a very large value may engage the GEN0 background process for a long time.

In Oracle Database Standard Edition, you can only associate the tablespace for unified auditing once. You should perform this association before you generate any audit records for the unified audit trail. The default tablespace is **SYSAUX**. After you have associated the tablespace, you cannot modify it on the Standard Edition because the partitioning feature is not supported in the Standard Edition.

**Examples**

The following example calls the **SET_AUDIT_TRAIL_PROPERTY** procedure to set the **OS_FILE_MAX_SIZE** property for the operating system (OS) audit trail. It sets this property value to 102400. This means that a new audit file gets created every time the current audit file size reaches 100 MB.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY{
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_SIZE,
    audit_trail_property_value => 102400 /* 100MB*/ );
END;
```

The following example calls the **SET_AUDIT_TRAIL_PROPERTY** procedure to set the **OS_FILE_MAX_AGE** property for the operating system (OS) audit trail. It sets this property value to 5. This means that a new audit file gets created every sixth day.

```sql
BEGIN
DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY{
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    audit_trail_property => DBMS_AUDIT_MGMT.OS_FILE_MAX_AGE,
    audit_trail_property_value => 5 /* days */);
END;
```
The following example calls the \texttt{SET_AUDIT_TRAIL_PROPERTY} procedure to set the \texttt{DB_DELETE_BATCH_SIZE} property for the \texttt{AUDIT_TRAIL_AUD_STD} audit trail. It sets this property value to 100000. This means that during a cleanup operation, audit records are deleted from the \texttt{SYS.AUD$} table in batches of size 100000.

\begin{verbatim}
BEGIN
  DBMS_AUDIT_MGMT.SET_AUDIT_TRAIL_PROPERTY(  
    audit_trail_type              => DBMS_AUDIT_MGMT.AUDIT_TRAIL_AUD_STD,  
    audit_trail_property          => DBMS_AUDIT_MGMT.DB_DELETE_BATCH_SIZE,  
    audit_trail_property_value    => 100000 /* delete batch size */);
END;
\end{verbatim}

26.7.18 SET_LAST_ARCHIVE_TIMESTAMP Procedure

This procedure sets a timestamp indicating when the audit records were last archived. The audit administrator provides the timestamp to be attached to the audit records.

The \texttt{CLEAN_AUDIT_TRAIL} Procedure uses this timestamp to decide on the audit records to be deleted.

Syntax

\begin{verbatim}
DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(  
  audit_trail_type         IN PLS_INTEGER,  
  last_archive_time        IN TIMESTAMP,  
  rac_instance_number      IN PLS_INTEGER DEFAULT NULL,  
  container                IN PLS_INTEGER DEFAULT CONTAINER_CURRENT,  
  database_id              IN NUMBER DEFAULT NULL,  
  container_guid           IN VARCHAR2 DEFAULT NULL);
\end{verbatim}

Parameters

Table 26-24  SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_type</td>
<td>The audit trail for which the timestamp needs to be set. Audit trail types are listed in Table 26-1.</td>
</tr>
<tr>
<td>last_archive_time</td>
<td>The \texttt{TIMESTAMP} value based on which the audit records or files should be deleted. This indicates the last time when the audit records or files were archived.</td>
</tr>
<tr>
<td>rac_instance_number</td>
<td>The instance number for the Oracle Real Application Clusters (Oracle RAC) instance. The default value is NULL. The rac_instance_number is not relevant for the database audit trail type, as the database audit trail tables are shared by all Oracle RAC instances. Set rac_instance_number to 1 for a single-instance database.</td>
</tr>
<tr>
<td>container</td>
<td>Values: CONTAINER_CURRENT for the connected pluggable database (PDB) or CONTAINER_ALL for all pluggable databases (PDBs). When container is set to CONTAINER_ALL, this sets the value for last archive timestamp in all the pluggable databases, otherwise it sets the value in the connected PDB only.</td>
</tr>
<tr>
<td>database_id</td>
<td>Database ID (DBID) of the audit records to cleanup</td>
</tr>
</tbody>
</table>
Table 26-24  (Cont.) SET_LAST_ARCHIVE_TIMESTAMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>Container GUID of the audit records to cleanup</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This parameter has been deprecated but is currently retained for backward compatibility.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:

- **The last_archive_time** must be specified in Coordinated Universal Time (UTC) when the audit trail types are AUDIT_TRAIL_AUD_STD, AUDIT_TRAIL_FGA_STD, or AUDIT_TRAIL_UNIFIED. This is because the database audit trails store the timestamps in UTC. UTC is also known as Greenwich Mean Time (GMT).

- **The last_archive_time** must be specified as the local time zone time when the audit trail types are AUDIT_TRAIL_OS or AUDIT_TRAIL_XML. The time zone must be the time zone of the machine where the OS or XML audit files were created. This is because the operating system audit files are cleaned based on the audit file's Last Modification Timestamp property. The Last Modification Timestamp property value is stored in the local time zone of the machine.

- When using an Oracle Real Application Clusters (Oracle RAC) database, Oracle recommends that you use the Network Time Protocol (NTP) to synchronize individual Oracle RAC nodes.

**Examples**

The following example calls the `SET_LAST_ARCHIVE_TIMESTAMP` procedure to set the last archive timestamp for the operating system (OS) audit trail type on Oracle RAC instance 1. It uses the `TO_TIMESTAMP` function to convert a character string into a timestamp value.

A subsequent call to the `CLEAN_AUDIT_TRAIL` Procedure, with `use_last_arch_timestamp` set to `TRUE`, will delete all those OS audit files from the current `AUDIT_FILE_DEST` directory that were modified before `10-Sep-2012 14:10:10.0`.

```sql
BEGIN
  DBMS_AUDIT_MGMT.SET_LAST_ARCHIVE_TIMESTAMP(
    audit_trail_type => DBMS_AUDIT_MGMT.AUDIT_TRAIL_OS,
    last_archive_time => TO_TIMESTAMP('12-SEP-0714:10:10.0','DD-MON-RRHH24:MI:SS.FF'),
    rac_instance_number => 1);
END;
```

**26.7.19 SET_PURGE_JOB_INTERVAL Procedure**

This procedure sets the interval at which the `CLEAN_AUDIT_TRAIL` Procedure is called for the purge job specified.

The purge job must have already been created using the `CREATE_PURGE_JOB` Procedure.
Syntax

DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
    audit_trail_purge_name IN VARCHAR2,
    audit_trail_interval_value IN PLS_INTEGER);

Parameters

Table 26-25  SET_PURGE_JOB_INTERVAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the interval is being set. This is the</td>
</tr>
<tr>
<td></td>
<td>purge job name that you specified with the CREATE_PURGE_JOB Procedure.</td>
</tr>
<tr>
<td>audit_trail_interval_value</td>
<td>The interval, in hours, at which the clean up procedure should be called.</td>
</tr>
<tr>
<td></td>
<td>This value modifies the audit_trail_purge_interval parameter set using the</td>
</tr>
<tr>
<td></td>
<td>CREATE_PURGE_JOB Procedure</td>
</tr>
</tbody>
</table>

Usage Notes

Use this procedure to modify the audit_trail_purge_interval parameter set using the CREATE_PURGE_JOB Procedure.

Examples

The following example calls the SET_PURGE_JOB_INTERVAL procedure to change the frequency at which the purge job called CLEANUP is invoked. The new interval is set to 24 hours.

BEGIN
    DBMS_AUDIT_MGMT.SET_PURGE_JOB_INTERVAL(
        AUDIT_TRAIL_PURGE_NAME => 'CLEANUP',
        AUDIT_TRAIL_INTERVAL_VALUE => 24);
END;

Related Topics

- CLEAN_AUDIT_TRAIL Procedure
  This procedure deletes audit trail records.

26.7.20 SET_PURGE_JOB_STATUS Procedure

This procedure enables or disables the specified purge job.

The purge job must have already been created using the CREATE_PURGE_JOB Procedure.

Syntax

DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
    audit_trail_purge_name IN VARCHAR2,
    audit_trail_status_value IN PLS_INTEGER);
Parameters

Table 26-26  SET_PURGE_JOB_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_trail_purge_name</td>
<td>The name of the purge job for which the status is being set. This is the purge job name that you specified with the <strong>CREATE_PURGE_JOB</strong> Procedure.</td>
</tr>
<tr>
<td>audit_trail_status_value</td>
<td>One of the values specified in Table 26-3. The value <strong>PURGE_JOB_ENABLE</strong> enables the specified purge job. The value <strong>PURGE_JOB_DISABLE</strong> disables the specified purge job.</td>
</tr>
</tbody>
</table>

Examples

The following example calls the **SET_PURGE_JOB_STATUS** procedure to enable the **CLEANUP** purge job.

```
BEGIN
  DBMS_AUDIT_MGMT.SET_PURGE_JOB_STATUS(
    audit_trail_purge_name      => 'CLEANUP',
    audit_trail_status_value    => DBMS_AUDIT_MGMT.PURGE_JOB_ENABLE);
END;
```

26.7.21 TRANSFER_UNIFIED_AUDIT_RECORDS Procedure

This procedure transfers unified audit records that were in a pre-upgraded Oracle database to an internal relational table that is designed to improve read performance.

In the pre-upgraded Oracle database, these records resided in the common logging infrastructure (CLI) SGA back-end tables.

Syntax

```
DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS (
  container_guid       IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 26-27  TRANSFER_UNIFIED_AUDIT_RECORDS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container_guid</td>
<td>The GUID of the container of the associated CLI back-end table. This back-end table contains the audit records from the pre-upgraded Oracle database. If you omit this setting, then the GUID of the current container is used.</td>
</tr>
</tbody>
</table>

Usage Notes

- **It is not mandatory to run** `DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS` **after an upgrade**, but for better read performance of the unified audit trail, Oracle highly recommends that you run this procedure.
• The DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS is designed to be a one-time operation, to be performed after you upgrade from Oracle Database 12c release 12.1.

• You can find the GUIDs for containers by querying the PDB_GUID column of the DBA_PDB_HISTORY data dictionary view.

• In a multitenant environment, you must run the DBMS_AUDIT_MGMT.TRANSFER_UNIFIED_AUDIT_RECORDS procedure only in the container to which the transfer operation applies, whether it is the root or an individual PDB. You cannot run this procedure in the root, for example, to transfer audit records in a PDB.

• If you have a high rate of audit record generation and your database supports partitioning, then you may want to use the DBMS_AUDIT_MGMT.ALTER_PARTITION_INTERVAL procedure to alter the partition interval setting for the internal relational table. See ALTER_PARTITION_INTERVAL Procedure for more information.
27

DBMS_AUDIT_UTIL

The DBMS_AUDIT_UTIL package provides functions that enable you to format the output of queries to the DBA_FGA_AUDIT_TRAIL, DBA_AUDIT_TRAIL, UNIFIED_AUDIT_TRAIL, and V$XML_AUDIT_TRAIL views.

This chapter contains the following topics:

- DBMS_AUDIT_UTIL Overview
- DBMS_AUDIT_UTIL Security Model
- DBMS_AUDIT_UTIL Views
- Summary of DBMS_AUDIT_UTIL Subprograms

27.1 DBMS_AUDIT_UTIL Overview

The functions in the DBMS_AUDIT_UTIL package enable you to format the output of queries to the RLS_INFO column of several audit trail views so that the output appear in separate rows.

These functions use a cursor to find and format each row of the corresponding view. To use the functions in this package, include the function in a query to one of the following views:

- DBA_FGA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_FGA function
- DBA_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_STD function
- UNIFIED_AUDIT_TRAIL data dictionary view, for the DECODE_RLS_INFO_ATRAIL_UNI function
- V$XML_AUDIT_TRAIL dynamic view, for the DECODE_RLS_INFO_ATRAIL_XML function

27.2 DBMS_AUDIT_UTIL Security Model

All DBMS_AUDIT_UTIL subprograms require the user to have EXECUTE privilege on the DBMS_AUDIT_UTIL package.

The SYSDBA administrative privilege and AUDIT_ADMIN and AUDIT_VIEWER roles have the EXECUTE privilege on the DBMS_AUDIT_UTIL package by default. An auditor can view audit data after being granted the AUDIT_VIEWER role.

Oracle strongly recommends that only audit administrators have the EXECUTE privilege on the DBMS_AUDIT_UTIL package and be granted the AUDIT_VIEWER role.
27.3 DBMS_AUDIT_UTIL Views

The views in this section display the audit information used by the DBMS_AUDIT_UTIL package function.

Table 27-1 displays the DBMS_AUDIT_UTIL views.

Table 27-1   Views Used by DBMS_AUDIT_UTIL

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA_FGA_AUDIT_TRAIL</td>
<td>Displays fine-grained audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA function</td>
</tr>
<tr>
<td>DBA_AUDIT_TRAIL</td>
<td>Displays standard audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD function</td>
</tr>
<tr>
<td>UNIFIED_AUDIT_TRAIL</td>
<td>Displays unified audit trail information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML function</td>
</tr>
<tr>
<td>V$XML_AUDIT_TRAIL</td>
<td>Displays XML audit record information; used with the DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI function</td>
</tr>
</tbody>
</table>

27.4 Summary of DBMS_AUDIT_UTIL Subprograms

This table lists the DBMS_AUDIT_UTIL subprograms and their descriptions.

Table 27-2   DBMS_AUDIT_UTIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_FGA Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_STD Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the DBA_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_UNI Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the UNIFIED_AUDIT_TRAIL data dictionary view</td>
</tr>
<tr>
<td>DECODE_RLS_INFO_ATRAIL_XML Function</td>
<td>Reformats the output for queries to the RLS_INFO column of the V$XML_AUDIT_TRAIL dynamic view</td>
</tr>
</tbody>
</table>

27.4.1 DECODE_RLS_INFO_ATRAIL_FGA Function

This function reformats the output for queries to the RLS_INFO column of the DBA_FGA_AUDIT_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple fine-
grained audit policies in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

See Also:

Oracle Database Security Guide regarding fine-grained auditing

Syntax

DECODE_RLS_INFO_ATRAIL_FGA(
    IN_CURSOR REF CURSOR IN
) RETURN PIPELINED ROW;

Parameters

Except for the IN_CURSOR parameter, the parameters for the DECODE_RLS_INFO_ATRAIL_FGA function are the same as the columns in the DBA_FGA_AUDIT_TRAIL data dictionary view. See Oracle Database Reference for more information about this view.

Usage Notes

• To use this function, include it in a query to the DBA_FGA_AUDIT_TRAIL data dictionary view, using a cursor similar to the example shown in the following section.

• See Oracle Database Reference for more information about the DBA_FGA_AUDIT_TRAIL data dictionary view.

Example

SELECT DB_USER, OBJECT_NAME, SQL_TEXT,
    RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_FGA
(CURSOR (SELECT * FROM DBA_FGA_AUDIT_TRAIL)));

Return Values

A piped row with decoded values of DBA_FGA_AUDIT_TRAIL.RLS_INFO column.

27.4.2 DECODE_RLS_INFO_ATRAIL_STD Function

This function reformats the output for queries to the RLS_INFO column of the DBA_AUDIT_TRAIL data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple standard audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

See Also:

Oracle Database Security Guide regarding auditing
Syntax

```sql
DECODE_RLS_INFO_ATRAIL_STD(
    IN_CURSOR REF CURSOR IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_STD` function are the same as the columns in the `DBA_AUDIT_TRAIL` data dictionary view. See Oracle Database Reference for more information about this view.

Usage Notes

- To use this function, include it in a query to the `DBA_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See Oracle Database Reference for more information about the `DBA_AUDIT_TRAIL` data dictionary view.

Example

```sql
SELECT USERNAME, USERHOST, ACTION, OBJ_NAME, OBJ_PRIVILEGE
     RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_STD
           (CURSOR (SELECT * FROM DBA_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `DBA_AUDIT_TRAIL.RLS_INFO` column

27.4.3 DECODE_RLS_INFO_ATRAIL_UNI Function

This function reformats the output for queries to the `RLS_INFO` column of the `UNIFIED_AUDIT_TRAIL` data dictionary view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple audit records from unified audit policies. It returns the output in separate rows.

See Also:

Oracle Database Security Guide regarding unified auditing

Syntax

```sql
DECODE_RLS_INFO_ATRAIL_UNI(
    IN_CURSOR REF CURSOR IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_UNI` function are the same as the columns in the `UNIFIED_AUDIT_TRAIL` data dictionary view. See Oracle Database Reference for more information about this view.
Usage Notes

- To use this function, include it in a query to the `UNIFIED_AUDIT_TRAIL` data dictionary view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `UNIFIED_AUDIT_TRAIL` data dictionary view.

Example

```
SELECT DBUSERNAME, ACTION_NAME, OBJECT_NAME, SQL_TEXT,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_UNI
            (CURSOR (SELECT * FROM UNIFIED_AUDIT_TRAIL)));
```

Return Values

A piped row with decoded values of `UNIFIED_AUDIT_TRAIL.RLS_INFO` column

### 27.4.4 DECODE_RLS_INFO_ATRAIL_XML Function

This function reformats the output for queries to the `RLS_INFO` column of the `V$XML_AUDIT_TRAIL` dynamic view so that the output is easily readable. It is used for the concatenated Oracle Virtual Private Database predicates for multiple XML audit records in an environment that has not been enabled for unified auditing. It returns the output in separate rows.

See Also:

*Oracle Database Security Guide* regarding auditing

Syntax

```
DECODE_RLS_INFO_ATRAIL_XML(
    IN_CURSOR                  REF CURSOR               IN)
RETURN PIPELINED ROW;
```

Parameters

Except for the `IN_CURSOR` parameter, the parameters for the `DECODE_RLS_INFO_ATRAIL_XML` function are the same as the columns in the `V$XML_AUDIT_TRAIL` data dictionary view. See *Oracle Database Reference* for more information about this view.

Usage Notes

- To use this function, include it in a query to the `V$XML_AUDIT_TRAIL` dynamic view, using a cursor similar to the example shown in the following section.
- See *Oracle Database Reference* for more information about the `V$XML_AUDIT_TRAIL` dynamic view.

Example

```
SELECT OBJECT_NAME, SQL_TEXT,
       RLS_PREDICATE, RLS_POLICY_TYPE, RLS_POLICY_OWNER, RLS_POLICY_NAME
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML
            (CURSOR (SELECT * FROM V$XML_AUDIT_TRAIL)));
```
FROM TABLE (DBMS_AUDIT_UTIL.DECODE_RLS_INFO_ATRAIL_XML
(CURSOR (SELECT * FROM V$XML_AUDIT_TRAIL)));

Return Values

A piped row with decoded values of V$XML_AUDIT_TRAIL.RLS_INFO column
28

DBMS_AUTO_REPORT

The DBMS_AUTO_REPORT package provides an interface to view SQL Monitoring and Real-time Automatic Database Diagnostic Monitor (ADDM) data that has been captured into Automatic Workload Repository (AWR). It also provides subprograms to control the behavior of how these data are captured to AWR.

See Also:

Oracle Database SQL Tuning Guide for more information about reporting database operations

This chapter contains the following topics:

• Overview
• Security Model
• Summary of DBMS_AUTO_REPORT Subprograms

28.1 DBMS_AUTO_REPORT Overview

This package provides an interface to view SQL Monitoring and Real-time ADDM data that has been captured into AWR. It also provides subprograms to control the behavior of how these data are captured to AWR. Captured data are stored in AWR and exposed via 2 views: DBA_HIST_REPORTS and DBA_HIST_REPORTS_DETAILS.

28.2 DBMS_AUTO_REPORT Security Model

This package is available to PUBLIC and performs its own security checking.

28.3 Summary of DBMS_AUTO_REPORT Subprograms

This table describes the parameters of the DBMS_AUTO_REPORT package subprograms.

Table 28-1  DBMS_AUTO_REPORT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FINISH_REPORT_CAPTURE Procedure</td>
<td>Ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE Procedure.</td>
</tr>
<tr>
<td>REPORT_REPOSITORY_DETAIL Function</td>
<td>Obtains the stored report for a given report ID</td>
</tr>
<tr>
<td>REPORT_REPOSITORY_DETAIL_XML Function</td>
<td>Obtains the stored XML report for a given report ID</td>
</tr>
</tbody>
</table>
Table 28-1  (Cont.) DBMS_AUTO_REPORT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPORT_REPOSITORY_LIST_XML Function</td>
<td>Obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR</td>
</tr>
<tr>
<td>START_REPORT_CAPTURE Procedure</td>
<td>Captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.</td>
</tr>
</tbody>
</table>

28.3.1 FINISH_REPORT_CAPTURE Procedure

This procedure ends the complete capture of SQL monitor data that was started with the START_REPORT_CAPTURE procedure.

This subprogram runs a last capture cycle immediately to capture any new data and then ends the per-minute complete capture.

After calling this subprogram, capture of data continues every minute except that it is not captured for all active SQLs but only for those deemed important, namely the top 5 SQLs (by elapsed time, or elapsed time*DOP in case of PQ) whose monitoring has completed.

Syntax

DBMS_AUTO_REPORT.FINISH_REPORT_CAPTURE;

Related Topics

- START_REPORT_CAPTURE Procedure
  This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

28.3.2 REPORT_REPOSITORY_DETAIL Function

This procedure obtains the stored report for a given report ID in the specified format such as XML or HTML.

Syntax

DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL (rid IN NUMBER DEFAULT NULL, type IN VARCHAR2 DEFAULT 'XML', base_path IN VARCHAR2 DEFAULT NULL) RETURNS CLOB

Parameters

Table 28-2  REPORT_REPOSITORY_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
</tbody>
</table>
Table 28-2  (Cont.) REPORT_REPOSITORY_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Desired format of the report. Values can be 'XML', 'TEXT', 'HTML', 'EM' or 'ACTIVE'. The last two options generate a report in the same format called active HTML. Default value is 'XML'.</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>

Return Values

The persisted report for the given record ID

28.3.3 REPORT_REPOSITORY_DETAIL_XML Function

This procedure obtains the stored XML report for a given report ID.

Syntax

```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_DETAIL_XML (    
    rid              IN NUMBER    DEFAULT NULL,    
    base_path        IN VARCHAR2  DEFAULT NULL)    
RETURNS XMLTYPE
```

Parameters

Table 28-3  REPORT_REPOSITORY_DETAIL_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>ID of the stored report which returned by the function</td>
</tr>
<tr>
<td>base_path</td>
<td>Unused/Non-operative</td>
</tr>
</tbody>
</table>

Return Values

The persisted XML report for the given record ID

28.3.4 REPORT_REPOSITORY_LIST_XML Function

This procedure obtains an XML report of the list of SQL Monitor and Real-time ADDM data captured in AWR.

The input parameters can be used to select and restrict which captured data will be included in the list report. All parameters are optional.

Syntax

```sql
DBMS_AUTO_REPORT.REPORT_REPOSITORY_LIST_XML (    
    active_since              IN DATE     DEFAULT NULL,    
    active_upto               IN DATE     DEFAULT NULL,    
    snapshot_id               IN NUMBER   DEFAULT NULL,    
    dbid                      IN NUMBER   DEFAULT NULL,    
    inst_id                   IN NUMBER   DEFAULT NULL,    
    con_dbid                  IN NUMBER   DEFAULT NULL,    
    session_id                IN NUMBER   DEFAULT NULL)
```
Parameters

Table 28-4  REPORT_REPOSITORY_LIST_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>active_since</td>
<td>Start of a time range used to select data. When a time range is specified, only those data are included in the list that were active during the time range. When no value is specified the time range is chosen as the last 24 hours ending at the current system time.</td>
</tr>
<tr>
<td>active_upto</td>
<td>Same as active_since except that it is the end of the time range</td>
</tr>
<tr>
<td>snapshot_id</td>
<td>If a value is specified, only those data captured during the specified snapshot ID are included in the list report. If no value is specified, no filtering is performed on snapshot ID.</td>
</tr>
<tr>
<td>dbid</td>

28.3.5 START_REPORT_CAPTURE Procedure

This procedure captures SQL monitor data of any newly monitored SQLs every minute since the last run of the capture cycle, and stores it in AWR.

Every capture cycle attempts to capture data for SQLs that are not currently executing or queued. This is a complete capture since data of all newly monitored SQLs is captured. It continues to run every minute until it is explicitly ended with the FINISH_REPORT_CAPTURE Procedure. In the case of a RAC system, the capture will start on each node of the cluster.

Syntax

```
DBMS_AUTO_REPORT.START_REPORT_CAPTURE;
```
The `DBMS_AUTO_SQLTUNE` package is the interface for managing the Automatic SQL Tuning task. Unlike `DBMS_SQLTUNE`, the `DBMS_AUTO_SQLTUNE` package requires the `DBA` role.

The chapter contains the following topics:

- `DBMS_AUTO_SQLTUNE` Overview
- `DBMS_AUTO_SQLTUNE` Security Model
- Summary of `DBMS_AUTO_SQLTUNE` Subprograms

### 29.1 DBMS_AUTO_SQLTUNE Overview

The `DBMS_AUTO_SQLTUNE` package is the interface to SQL Tuning Advisor (`DBMS_SQLTUNE`) when run within the Autotask framework.

The database creates the automated system task `SYS_AUTO_SQL_TUNING_TASK` as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs the SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task. The automated task tests any SQL profiles it finds by executing both the old and new query plans. Automatic SQL Tuning differs from manual SQL tuning in one important way. If automatic implementation of SQL profiles is enabled (the default is disabled), then the database implements any SQL profiles that promise a great performance benefit. The implementation occurs at tuning time so that the database can immediately benefit from the new plan. You can enable or disable automatic implementation by using the `SET_AUTO_TUNING_TASK_PARAMETER` API to set the `ACCEPT_SQL_PROFILES` parameter.

In each maintenance window, the automated tuning task stores its results as a new execution. Each execution result has the same task name but a different execution name. Query the `DBA_ADVISOR_EXECUTIONS` view for information about task executions. Use the `REPORT_AUTO_TUNING_TASK` Function to view reports that span multiple executions.

### 29.2 DBMS_AUTO_SQLTUNE Security Model

This package is available to users with the `DBA` role. For other users, you must grant the `EXECUTE` privilege on the package explicitly. Note that the `EXECUTE_AUTO_TUNING_TASK` procedure is an exception: only `SYS` can invoke it.

Users can call APIs in this package to control how the automatic tuning task behaves when it runs, such as enabling automatic SQL profile creation and configuring the total and per-SQL time limits under which the task runs. Because these settings affect the overall performance of the database, it may not be appropriate for all users with the `ADVISOR` privilege to have access to this package.
29.3 Summary of DBMS_AUTO_SQLTUNE Subprograms

The DBMS_AUTO_SQLTUNE package contains EXECUTE, REPORT, and SET subprograms.

Table 29-1 DBMS_AUTO_SQLTUNE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXECUTE_AUTO_TUNING_TASK Function and Procedure</td>
<td>Executes the Automatic SQL Tuning task immediately (SYS only)</td>
</tr>
<tr>
<td>REPORT_AUTO_TUNING_TASK Function</td>
<td>Displays a text report of the automatic tuning task's history</td>
</tr>
<tr>
<td>SET_AUTO_TUNING_TASK_PARAMETER Procedures</td>
<td>Changes a task parameter value for the daily automatic runs</td>
</tr>
</tbody>
</table>

29.3.1 EXECUTE_AUTO_TUNING_TASK Function and Procedure

This function and procedure executes the Automatic SQL Tuning task (SYS_AUTO_SQL_TUNING_TASK).

Both the function and the procedure run in the context of a new task execution. The difference is that the function returns the name of the new execution.

Syntax

```sql
DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK(
    execution_name    IN VARCHAR2               := NULL,
    execution_params  IN DBMS_ADVISOR.argList   := NULL,
    execution_desc    IN VARCHAR2               := NULL)
RETURN VARCHAR2;
```

Parameters

Table 29-2 EXECUTE_AUTO_TUNING_TASK Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution parameters have effect only on the execution for which they are specified. They override the values for the parameters stored in the task (set through the SET_AUTO_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>
Usage Notes

Only SYS can invoke this subprogram. A tuning task can be executed multiple times without having to reset it.

Examples

EXEC DBMS_AUTO_SQLTUNE.EXECUTE_AUTO_TUNING_TASK('SYS_AUTO_SQL_TUNING_TASK');

29.3.2 REPORT_AUTO_TUNING_TASK Function

This procedure displays the results of an Automatic SQL Tuning task.

Syntax

```sql
DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec      IN   VARCHAR2   := NULL,
    end_exec        IN   VARCHAR2   := NULL,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := ALL,
    object_id       IN   NUMBER     := NULL,
    result_limit    IN   NUMBER     := NULL)
RETURN CLOB;
```

Parameters

Table 29-3 REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Name of the beginning task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>end_exec</td>
<td>Name of the ending task execution to use. If NULL, the report is generated for the most recent task execution.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
</tbody>
</table>
| level        | Level of detail in the report:
|              | • BASIC: simple version of the report. Just show info about the actions taken by the advisor.                                              |
|              | • TYPICAL: show information about every statement analyzed, including requests not implemented.                                           |
|              | • ALL: highly detailed report level, also provides annotations about statements skipped over.                                               |
| section      | Section of the report to include:
|              | • SUMMARY: summary information                                                                                                              |
|              | • FINDINGS: tuning findings                                                                                                                  |
|              | • PLAN: explain plans                                                                                                                        |
|              | • INFORMATION: general information                                                                                                            |
|              | • ERROR: statements with errors                                                                                                               |
|              | • ALL: all sections                                                                                                                         |
| object_id    | Advisor framework object id that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution. |
Table 29-3  (Cont.) REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.

Examples

```sql
-- Get the whole report for the most recent execution
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK
FROM   DUAL;

-- Show the summary for a range of executions
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:begin_exec, :end_exec, 'TEXT',
                                   'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Show the findings for the statement of interest
SELECT DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK(:exec, :exec, 'TEXT',
                                   'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;
```

29.3.3 SET_AUTO_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type VARCHAR2 or
NUMBER for SYS_AUTO_SQL_TUNING_TASK.

Syntax

```sql
DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);

DBMS_AUTO_SQLTUNE.SET_AUTO_TUNING_TASK_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```
### Parameters

**Table 29-4  SET_AUTO_TUNING_TASK_PARAMETER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible tuning parameters that can be set by this procedure using the parameter in the form VARCHAR2:</td>
</tr>
<tr>
<td></td>
<td>• MODE: tuning scope (comprehensive, limited)</td>
</tr>
<tr>
<td></td>
<td>• USERNAME: username under which the statement is parsed</td>
</tr>
<tr>
<td></td>
<td>• DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>• EXECUTION_DAYS_TO_EXPIRE: number of days until the task's executions is deleted (without deleting the task)</td>
</tr>
<tr>
<td></td>
<td>• DEFAULT_EXECUTION_TYPE: the task defaults to this type of execution when none is specified by the EXECUTE_AUTO_TUNING_TASK Function and Procedure.</td>
</tr>
<tr>
<td></td>
<td>• TIME_LIMIT: global time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>• LOCAL_TIME_LIMIT: per-statement time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>• TEST_EXECUTE: FULL/AUTO/OFF.</td>
</tr>
<tr>
<td></td>
<td>• FULL - test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
</tr>
<tr>
<td></td>
<td>• AUTO - test-execute for an automatically-chosen time proportional to the tuning time</td>
</tr>
<tr>
<td></td>
<td>• OFF - do not test-execute</td>
</tr>
<tr>
<td></td>
<td>• BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_FILTER: object filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE1: first ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE2: second possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE3: third possible ranking measure for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</td>
</tr>
<tr>
<td></td>
<td>• SQL_LIMIT: maximum number of SQL statements to tune</td>
</tr>
<tr>
<td></td>
<td>• SQL_PERCENTAGE: percentage filter of SQL tuning set statements</td>
</tr>
<tr>
<td></td>
<td>The following parameters are supported for the automatic tuning task only:</td>
</tr>
<tr>
<td></td>
<td>• ACCEPT_SQL_PROFILES: TRUE/FALSE: whether the task should accept SQL profiles automatically</td>
</tr>
<tr>
<td></td>
<td>• MAX_AUTO_SQL_PROFILES: maximum number of automatic SQL profiles allowed on the system, in sum</td>
</tr>
<tr>
<td></td>
<td>• MAX_SQL_PROFILES_PER_EXEC: maximum number of SQL profiles that can be automatically implemented per execution of the task.</td>
</tr>
<tr>
<td></td>
<td>The following parameters are supported for the automatic tuning task only:</td>
</tr>
<tr>
<td></td>
<td>気に作る</td>
</tr>
</tbody>
</table>
The DBMS_AUTO_TASK_ADMIN package provides an interface to AUTOTASK functionality. It is used by the DBA as well as Enterprise Manager to access the AUTOTASK controls. Enterprise Manager also uses the AUTOTASK Advisor.

See Also:

Oracle Database Administrator's Guide for more information about "Configuring Automated Maintenance Task"

This chapter contains the following sections:

• Deprecated Subprograms
• Security Model
• Constants
• Summary of DBMS_AUTO_TASK_ADMIN Subprograms

30.1 DBMS_AUTO_TASK_ADMIN Deprecated Subprograms

The DBMS_AUTO_TASK_ADMIN OVERRIDE_PRIORITY subprogram has been deprecated.

Note:

Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

• OVERRIDE_PRIORITY Procedures

30.2 DBMS_AUTO_TASK_ADMIN Security Model

DBMS_AUTO_TASK_ADMIN is a definer's rights package, and EXECUTE is automatically granted to DBA, IMP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE.
30.3 DBMS_AUTO_TASK_ADMIN Constants

The DBMS_AUTO_TASK_ADMIN package defines several constants that can be used for specifying parameter values.

These constants shown in the following table:

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY_MEDIUM</td>
<td>VARCHAR2</td>
<td>'MEDIUM'</td>
<td>Task with this priority should be executed as time permits</td>
</tr>
<tr>
<td>PRIORITY_HIGH</td>
<td>VARCHAR2</td>
<td>'HIGH'</td>
<td>Task with this priority should be executed within the current Maintenance Window</td>
</tr>
<tr>
<td>PRIORITY_URGENT</td>
<td>VARCHAR2</td>
<td>'URGENT'</td>
<td>Task with this priority is to be executed at the earliest opportunity</td>
</tr>
</tbody>
</table>

30.4 Summary of DBMS_AUTO_TASK_ADMIN Subprograms

This table lists the DBMS_AUTO_TASK_ADMIN subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedures</td>
<td>Prevents AUTOTASK from executing any requests from a specified client or operation.</td>
</tr>
<tr>
<td>ENABLE Procedures</td>
<td>Allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control</td>
</tr>
<tr>
<td>GET_CLIENT_ATTRIBUTES Procedure</td>
<td>Returns values of select client attributes</td>
</tr>
<tr>
<td>GET_P1_RESOURCES Procedure</td>
<td>Returns percent of resources allocated to each AUTOTASK High Priority Consumer Groups</td>
</tr>
<tr>
<td>OVERRIDE_PRIORITY Procedures</td>
<td>Manually overrides task priority.</td>
</tr>
<tr>
<td>SET_CLIENT_SERVICE Procedure</td>
<td>Associates an AUTOTASK Client with a specified Service</td>
</tr>
<tr>
<td>SET_P1_RESOURCES Procedure</td>
<td>Sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients</td>
</tr>
</tbody>
</table>
30.4.1 DISABLE Procedures

This procedure prevents AUTOTASK from executing any requests from a specified client or operation.

Syntax

Disables all AUTOTASK functionality.

```
DBMS_AUTO_TASK_ADMIN.DISABLE;
```

Disables all tasks for the client or operation.

```
DBMS_AUTO_TASK_ADMIN.DISABLE (

  client_name       IN VARCHAR2,
  operation         IN VARCHAR2,
  window_name       IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be disabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If operation and window_name are both NULL, the client is disabled.
- If operation is not NULL, window_name is ignored and the operation is disabled
- If operation is NULL and window_name is not NULL, the client is disabled in the specified window.

30.4.2 ENABLE Procedures

This procedure allows a previously disabled client, operation, target type, or individual target to be enabled under AUTOTASK control.

Specifying the DEFERRED option postpones the effect of the call until the start of the next maintenance window. If IMMEDIATE option is specified the effect of this call is immediate – as long as there is a currently open maintenance window.

Syntax

Re-enabling AUTOTASK. This version enables the specified client. Note that any explicitly disabled tasks or operations must be re-enabled individually.

```
DBMS_AUTO_TASK_ADMIN.ENABLE;
```

Re-enabling a client or operation. Note that any explicitly disabled tasks or operations must be re-enabled individually.
DBMS_AUTO_TASK_ADMIN.ENABLE (  
  client_name IN VARCHAR2, 
  operation IN VARCHAR2, 
  window_name IN VARCHAR2);

Parameters

Table 30-4 ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>window_name</td>
<td>Optional name of the window in which client is to be enabled</td>
</tr>
</tbody>
</table>

Usage Notes

- If operation and window_name are both NULL, the client is enabled.
- If operation is not NULL, window_name is ignored and the specified operation is enabled.
- If operation is NULL and window_name is not NULL, the client is enabled in the specified window.

30.4.3 GET_CLIENT_ATTRIBUTES Procedure

This procedure returns values of select client attributes.

Syntax

DBMS_AUTO_TASK_ADMIN.GET_CLIENT_ATTRIBUTES(  
  client_name IN VARCHAR2,  
  service_name OUT VARCHAR2,  
  window_group OUT VARCHAR2);

Parameters

Table 30-5 GET_CLIENT_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
<tr>
<td>window_group</td>
<td>Name of the window group in which the client is active</td>
</tr>
</tbody>
</table>

30.4.4 GET_P1_RESOURCES Procedure

This procedure returns percent of resources allocated to each AUTOTASK High Priority Consumer Group.

Syntax

DBMS_AUTO_TASK_ADMIN.GET_P1_RESOURCES(  
  stats_group_pct OUT NUMBER,  
  stats_group_pct OUT NUMBER,
Parameters

Table 30-6  GET_P1_RESOURCES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seq_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values will add up to 100%.

30.4.5 OVERRIDE_PRIORITY Procedures

This deprecated procedure is used to manually override task priority.

Note:

This subprogram is deprecated and becomes nonoperative with Oracle Database 12c.

This can be done at the client, operation or individual task level. This priority assignment is honored during the next maintenance window in which the named client is active. Specifically, setting the priority to URGENT causes a high priority job to be generated at the start of the maintenance window. Setting priority to CLEAR removes the override.

Syntax

Override Priority for a Client.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (    client_name IN VARCHAR2,    priority IN VARCHAR2);  

Override Priority for an Operation.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (    client_name IN VARCHAR2,    operation IN VARCHAR2,    priority IN VARCHAR2);  

Override Priority for a Task.

DBMS_AUTO_TASK_ADMIN.OVERRIDE_PRIORITY (    client_name IN VARCHAR2,    operation IN VARCHAR2,    priority IN VARCHAR2);
task_target_type IN VARCHAR2,
task_target_name IN VARCHAR2,
priority IN VARCHAR2);

Parameters

Table 30-7 OVERRIDE_PRIORITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>priority</td>
<td>URGENT, HIGH, MEDIUM or LOW</td>
</tr>
<tr>
<td>operation</td>
<td>Name of the operation as specified in DBA_AUTOTASK_OPERATION View</td>
</tr>
<tr>
<td>task_target_type</td>
<td>Type of target to be affected, as found in V$AUTOTASK_TARGET_TYPE View</td>
</tr>
<tr>
<td>task_target_name</td>
<td>Name of the specific target to be affected</td>
</tr>
</tbody>
</table>

30.4.6 SET_CLIENT_SERVICE Procedure

This procedure associates an AUTOTASK Client with a specified Service.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_CLIENT_SERVICE(
    client_name        IN    VARCHAR2,
    service_name       IN    VARCHAR2);
```

Parameters

Table 30-8 SET_CLIENT SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_name</td>
<td>Name of the client, as found in DBA_AUTOTASK_CLIENT View</td>
</tr>
<tr>
<td>service_name</td>
<td>Service name for client, may be NULL</td>
</tr>
</tbody>
</table>

Usage Notes

All work performed on behalf of the Client takes place only on instances where the service is enabled.

30.4.7 SET_P1_RESOURCES Procedure

This procedure sets percentage-based resource allocation for each High Priority Consumer Group used by AUTOTASK Clients.

Syntax

```
DBMS_AUTO_TASK_ADMIN.SET_P1_RESOURCES(
    stats_group_pct  OUT   NUMBER,
    seg_group_pct    OUT   NUMBER,
    tune_group_pct   OUT   NUMBER,
    health_group_pct OUT   NUMBER);
```
Parameters

Table 30-9  SET_P1/Resources Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_group_pct</td>
<td>%resources for Statistics Gathering</td>
</tr>
<tr>
<td>seq_group_pct</td>
<td>%resources for Space Management</td>
</tr>
<tr>
<td>tune_group_pct</td>
<td>%resources for SQL Tuning</td>
</tr>
<tr>
<td>health_group_pct</td>
<td>%resources for Health Checks</td>
</tr>
</tbody>
</table>

Usage Notes

Values must be integers in the range 0 to 100, and must add up to 100 (percent), otherwise, an exception is raised.
DBMS_AW_STATS contains subprograms for managing optimizer statistics for cubes and dimensions. Generating the statistics does not have a significant performance cost.

### See Also:

*Oracle OLAP User's Guide* regarding use of the OLAP option to support business intelligence and analytical applications

This chapter contains the following topics:

- Using DBMS_AW_STATS
- Summary of DBMS_AW_STATS Subprograms

#### 31.1 Using DBMS_AW_STATS

Cubes and dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Optimizer statistics are used to create execution plans for queries that join two cube views or join a cube view to a table or a view of a table. They are also used for query rewrite to cube materialized views. You need to generate the statistics only for these types of queries.

Queries against a single cube do not use optimizer statistics. These queries are automatically optimized within the analytic workspace.

#### 31.2 Summary of DBMS_AW_STATS Subprograms

DBMS_AW_STATS uses the ANALYZE and CLEAR procedures.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE Procedure</td>
<td>Generates optimizer statistics on cubes and cube dimensions.</td>
</tr>
<tr>
<td>CLEAR Procedure</td>
<td>Clears optimizer statistics from cubes and cube dimensions.</td>
</tr>
</tbody>
</table>
31.2.1 ANALYZE Procedure

This procedure generates optimizer statistics on a cube or a cube dimension.

These statistics are used to generate some execution plans, as described in "Using DBMS_AW_STATS".

For a cube, the statistics are for all of the measures and calculated measures associated with the cube. These statistics include:

- The average length of data values
- The length of the largest data value
- The minimum value
- The number of distinct values
- The number of null values

For a dimension, the statistics are for the dimension and its attributes, levels, and hierarchies. These statistics include:

- The average length of a value
- The length of the largest value
- The minimum value
- The maximum value

Syntax

DBMS_AW_STATS.ANALYZE
    (inname       IN VARCHAR2);

Parameters

Table 31-2 ANALYZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension. For a cube, the format of a qualified name is owner.cube_name. For a dimension, the format is owner.dimension_name.</td>
</tr>
</tbody>
</table>

Usage Notes

Always analyze the dimensions first, then the cube.

After analyzing a dimension, analyze all cubes that use that dimension.

Example

This sample script generates optimizer statistics on UNITS_CUBE and its dimensions.

BEGIN
    DBMS_AW_STATS.ANALYZE('time');
    DBMS_AW_STATS.ANALYZE('customer');
    DBMS_AW_STATS.ANALYZE('product');
    DBMS_AW_STATS.ANALYZE('channel');
DBMS_AW_STATS.ANALYZE('units_cube');
END;
/

The following statements create and display an execution plan for a `SELECT` statement that joins columns from `UNITS_CUBE_VIEW`, `CUSTOMER_PRIMARY_VIEW`, and the `ACCOUNTS` table:

```sql
EXPLAIN PLAN FOR SELECT
cu.long_description customer,
a.city city,
a.zip_pc zip,
cu.level_name "LEVEL",
round(f.sales) sales
/* From dimension views and cube view */
FROM time_calendar_view t,
product_primary_view p,
customer_view cu,
channel_view ch,
units_cube_view f,
account a
/* Create level filters instead of GROUP BY */
WHERE t.long_description = '2004'
    AND p.level_name = 'TOTAL'
    AND cu.customer_account_id like 'COMP%'
    AND ch.level_name = 'TOTAL'
/* Join dimension views to cube view */
    AND t.dim_key = f.TIME
    AND p.dim_key = f.product
    AND cu.dim_key = f.customer
    AND ch.dim_key = f.channel
    AND a.account_id = cu.customer_account_id
ORDER BY zip;
```

```sql
SQL> SELECT plan_table_output FROM TABLE(dbms_xplan.display());
PLAN_TABLE_OUTPUT
-------------------------------------------------------------------------------------------------------------------------------------
Plan hash value: 3890178023
-------------------------------------------------------------------------------------------------------------------------------------

8 - filter(SYS_OP_ATG(VALUE(KOKBF$),16,17,2)='2004' AND SYS_OP_ATG(VALUE(KOKBF$),39,40,2) LIKE 'COMP%' AND
```
SYS_OP_ATG(VALUE(KOKBF$),47,48,2)='TOTAL' AND
SYS_OP_ATG(VALUE(KOKBF$),25,26,2)='TOTAL')
9 - filter("A"."ACCOUNT_ID" LIKE 'COMP%')

Note
-----
- dynamic statistics used for this statement

30 rows selected.

31.2.2 CLEAR Procedure

This procedure clears the statistics generated by the ANALYZE procedure.

Syntax

DBMS_AW_STATS.CLEAR (inname IN VARCHAR2;

Parameters

Table 31-3  CLEAR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inname</td>
<td>The qualified name of a cube or a dimension. For a cube, the format of a qualified name is owner.cube_name. For a dimension, the format is owner.dimension_name.</td>
</tr>
</tbody>
</table>

Examples

The following scripts clears the statistics from UNITS_CUBE and its dimensions.

BEGIN
   DBMS_AW_STATS.clear('units_cube');
   DBMS_AW_STATS.clear('time');
   DBMS_AW_STATS.clear('customer');
   DBMS_AW_STATS.clear('product');
   DBMS_AW_STATS.clear('channel');
END;
/
The DBMS_CAPTURE_ADM package, one of a set of Oracle Streams packages, provides subprograms for starting, stopping, and configuring a capture process. The source of the captured changes is the redo logs, and the repository for the captured changes is a queue.

See Also:

Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and capture processes

This chapter contains the following topics:

• Overview
• Security Model
• Summary of DBMS_CAPTURE_ADM Subprograms

32.1 DBMS_CAPTURE_ADM Overview

This package provides interfaces to start, stop, and configure a capture process or a synchronous capture. This package includes subprograms for preparing database objects for instantiation.

Capture processes can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:

Oracle Database Concepts for more information about CDBs and PDBs

32.2 DBMS_CAPTURE_ADM Security Model

The DBMS_CAPTURE_ADM security can be controlled in one of two ways.

• Granting EXECUTE on this package to selected users or roles.
• Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.
When the `DBMS_CAPTURE_ADM` package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

When the `DBMS_CAPTURE_ADM` package is used to manage an XStream configuration, it requires that the user is granted the privileges of an XStream administrator.

**Note:**

- The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as setting a capture user. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.
- Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**See Also:**

- *Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
- *Oracle Database XStream Guide* for information about configuring an XStream administrator

### 32.3 Summary of DBMS_CAPTURE_ADM Subprograms

This table lists the `DBMS_CAPTURE_ADM` subprograms and briefly describes them.

<table>

</tbody>
</table>

Note: All subprograms commit unless specified otherwise.

32.3.1 ABORT_GLOBAL_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_GLOBAL_INSTANTIATION, PREPARE_SCHEMA_INSTANTIATION, and PREPARE_TABLE_INSTANTIATION procedures.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the database, schema, and table instantiations
- Removes any supplemental logging enabled by the `PREPARE_GLOBAL_INSTANTIATION`, `PREPARE_SCHEMA_INSTANTIATION`, and `PREPARE_TABLE_INSTANTIATION` procedures.

**Syntax**

```
DBMS_CAPTURE_ADM.ABORT_GLOBAL_INSTANTIATION(
    container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameter**

**Table 32-2  ABORT_GLOBAL_INSTANTIATION Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name.</td>
</tr>
<tr>
<td></td>
<td>If CURRENT is specified, then this procedure removes supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for the current container.</td>
</tr>
<tr>
<td></td>
<td>If ALL is specified, then this procedure removes supplemental logging for</td>
</tr>
<tr>
<td></td>
<td>all of the containers in the current CDB.</td>
</tr>
<tr>
<td></td>
<td>If pdb_name is specified, then this procedure removes supplemental logging</td>
</tr>
<tr>
<td></td>
<td>for the specified PDB.</td>
</tr>
<tr>
<td></td>
<td>ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

### 32.3.2 ABORT_SCHEMA_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_SCHEMA_INSTANTIATION` procedure. It also reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure on tables in the specified schema. Specifically, this procedure performs the following actions:

- Removes data dictionary information related to schema instantiations and table instantiations of tables in the schema
- Removes any supplemental logging enabled by the `PREPARE_SCHEMA_INSTANTIATION` procedure
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure for tables in the specified schema

**Syntax**

```
DBMS_CAPTURE_ADM.ABORT_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2,
    container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameter**

**Table 32-3  ABORT_SCHEMA_INSTANTIATION Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema for which to abort the effects of preparing instantiation</td>
</tr>
</tbody>
</table>
### Table 32-3 (Cont.) ABORT_SCHEMA_INSTANTIATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| container | Either CURRENT, ALL, or pdb_name.  
If CURRENT is specified, then this procedure removes supplemental logging for the current container.  
If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB.  
If pdb_name is specified, then this procedure removes supplemental logging for the specified PDB.  
ALL and pdb_name are valid only when you invoke the procedure from the root. |

### 32.3.3 ABORT_SYNC_INSTANTIATION Procedure

This procedure reverses the effects of running the PREPARE_SYNC_INSTANTIATION procedure. Specifically, this procedure removes data dictionary information related to the table instantiation.

This procedure is overloaded. The table_names parameter is VARCHAR2 datatype in one version and DBMS_UTILITY.UNCL_ARRAY datatype in the other version.

#### Syntax

```sql
DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN VARCHAR2);

DBMS_CAPTURE_ADM.ABORT_SYNC_INSTANTIATION(
    table_names IN DBMS_UTILITY.UNCL_ARRAY);
```

#### Parameters

### Table 32-4 ABORT_SYNC_INSTANTIATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| table_names | When the table_names parameter is VARCHAR2 datatype, a comma-delimited list of the tables for which to abort the effects of preparing instantiation. There must be no spaces between entries.  
When the table_names parameter is DBMS_UTILITY.UNCL_ARRAY datatype, specify a PL/SQL associative array of this type that contains the names of the tables for which to abort the effects of preparing instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.  
In either version of the procedure, specify the name of each table in the form [schema_name.]table_name. For example, hr.employees. If the schema is not specified, then the current user is the default. |
32.3.4 ABORT_TABLE_INSTANTIATION Procedure

This procedure reverses the effects of running the `PREPARE_TABLE_INSTANTIATION` procedure.

Specifically, this procedure performs the following actions:

- Removes data dictionary information related to the table instantiation
- Removes any supplemental logging enabled by the `PREPARE_TABLE_INSTANTIATION` procedure

**Syntax**

```sql
DBMS_CAPTURE_ADM.ABORT_TABLE_INSTANTIATION(
    table_name  IN  VARCHAR2,
    container   IN  VARCHAR2  DEFAULT 'CURRENT');
```

**Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table for which to abort the effects of preparing instantiation, specified as <code>[schema_name].object_name</code>. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure removes supplemental logging for the current container. If ALL is specified, then this procedure removes supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure removes supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

32.3.5 ALTER_CAPTURE Procedure

This procedure alters a capture process.

**Syntax**

```sql
DBMS_CAPTURE_ADM.ALTER_CAPTURE(
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2   DEFAULT NULL,
    remove_rule_set            IN  BOOLEAN    DEFAULT FALSE,
```

**See Also:**

*Oracle Streams Concepts and Administration* for more information about altering a capture process.
Parameters

Table 32-6  ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being altered. You must specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes.</td>
</tr>
<tr>
<td></td>
<td>To change the positive rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set. <strong>See Also: Oracle Streams Concepts and Administration</strong> for more information about the changes that can be captured by a capture process</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified capture process. If you remove a positive rule set for a capture process, and the capture process does not have a negative rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you remove a positive rule set for a capture process, and the capture process has a negative rule set, then the capture process captures all supported changes that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified capture process. If the rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.</td>
</tr>
</tbody>
</table>
### Table 32-6 (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_scn</td>
<td>A valid SCN for the database from which the capture process starts capturing changes. The SCN value must be greater than or equal to the first SCN for the capture process. Also, the capture process must be stopped before resetting its start SCN. An error is returned if an invalid SCN is specified or if the capture process is enabled.</td>
</tr>
<tr>
<td>use_database_link</td>
<td>If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. If you want a capture process that is not using a database link currently to begin using a database link, then specify TRUE. In this case, a database link with the same name as the global name of the source database must exist at the downstream database. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. If you want a capture process that is using a database link currently to stop using a database link, then specify FALSE. In this case, you must prepare source database objects for instantiation manually when you add or change capture process rules that pertain to these objects. If NULL, then the current value of this parameter for the capture process is not changed.</td>
</tr>
</tbody>
</table>
| first_scn          | The lowest SCN in the redo log from which a capture process can capture changes. If you specify a new first SCN for the capture process, then the specified first SCN must meet the following requirements:  
  - It must be greater than the current first SCN for the capture process.  
  - It must be less than or equal to the current applied SCN for the capture process. However, this requirement does not apply if the current applied SCN for the capture process is zero.  
  - It must be less than or equal to the required checkpoint SCN for the capture process. An error is returned if the specified SCN does not meet the first three requirements. See "Usage Notes" for information about determining an SCN value that meets all of these conditions. When the first SCN is modified, the capture process purges information from its LogMiner data dictionary that is required to restart it at an earlier SCN. See BUILD Procedure for more information about a LogMiner data dictionary. If the specified first SCN is higher than the current start SCN for the capture process, then the start SCN is set automatically to the new value of the first SCN. |
Table 32-6  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes.</td>
</tr>
<tr>
<td></td>
<td>To change the negative rule set for the capture process, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_capture_rules, enter hr.neg_capture_rules. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.</td>
</tr>
<tr>
<td></td>
<td>If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set.</td>
</tr>
<tr>
<td></td>
<td>If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If TRUE, then the procedure removes the negative rule set for the specified capture process. If you remove a negative rule set for a capture process, and the capture process does not have a positive rule set, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas.</td>
</tr>
<tr>
<td></td>
<td>If you remove a negative rule set for a capture process, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set.</td>
</tr>
</tbody>
</table>
|                            | If FALSE, then the procedure retains the negative rule set for the specified capture process. If the negative_rule_set_name parameter is non-NULL, then ensure that this parameter is set to FALSE.
Table 32-6  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue. In addition, ensure that the capture user has the following privileges: • EXECUTE privilege on the rule sets used by the capture process • EXECUTE privilege on all rule-based transformation functions used in the rule set These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles. The capture process is stopped and restarted automatically when you change the value of this parameter. <strong>Note:</strong> If the capture user for a capture process is dropped using DROP USER . . . CASCADE, then the capture process is also dropped automatically.</td>
</tr>
<tr>
<td>checkpoint_retention_time</td>
<td>Either the number of days that a capture process retains checkpoints before purging them automatically, or DBMS_CAPTURE_ADM.INFINITE if checkpoints should not be purged automatically. If NULL, then the checkpoint retention time is not changed. If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, .25 specifies 6 hours. When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the first_scn of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file. <strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about checkpoint retention time</td>
</tr>
</tbody>
</table>
Table 32-6  (Cont.) ALTER_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time</td>
<td>A valid time from which the capture process starts capturing changes. The capture process must be stopped before resetting its start time. An error is returned if an invalid time is specified or if the capture process is enabled. The start_scn and start_time parameters are mutually exclusive.</td>
</tr>
</tbody>
</table>

Usage Notes

If you want to alter the first SCN for a capture process, then the value specified must meet the conditions in the description for the first_scn parameter.

Examples

The following query determines the current first SCN, applied SCN, and required checkpoint SCN for each capture process in a database:

```
SELECT CAPTURE_NAME, FIRST_SCN, APPLIED_SCN, REQUIRED_CHECKPOINT_SCN
FROM DBA_CAPTURE;
```

32.3.6 ALTER_SYNC_CAPTURE Procedure

This procedure alters a synchronous capture.

See Also:

Oracle Streams Concepts and Administration for more information about altering a capture process

Syntax

```
DBMS_CAPTURE_ADM.ALTER_SYNC_CAPTURE(
    capture_name   IN  VARCHAR2,
    rule_set_name  IN  VARCHAR2  DEFAULT NULL,
    capture_user   IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 32-7  ALTER_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the synchronous capture being altered. You must specify an existing synchronous capture name. Do not specify an owner.</td>
</tr>
</tbody>
</table>
### Table 32-7  (Cont.) ALTER_SYNC_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the synchronous capture. The positive rule set contains the rules that instruct the synchronous capture to capture changes.</td>
</tr>
<tr>
<td></td>
<td>To change the rule set for the synchronous capture, specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the strmadmin schema named sync_cap_rules, enter strmadmin.sync_cap_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You must specify a rule set that was created using the DBMS_STREAMS_ADM package. If NULL, then the rule set is not changed. <strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about the changes that can be captured by a synchronous capture</td>
</tr>
</tbody>
</table>
| capture_user   | The user in whose security domain a synchronous capture captures changes that satisfy its rule set and runs custom rule-based transformations configured for synchronous capture rules. If NULL, then the capture user is not changed. To change the capture user, the user who invokes the ALTER_SYNC_CAPTURE procedure must be granted the DBA role. Only the SYS user can set the capture_user to SYS. If you change the capture user, then this procedure grants the new capture user enqueue privilege on the queue used by the synchronous capture and configures the user as a secure queue user of the queue. In addition, ensure that capture user has the following privileges:  
|                | • EXECUTE privilege on the rule sets used by the synchronous capture  
|                | • EXECUTE privilege on all rule-based transformation functions used in the rule set  
|                | These privileges can be granted directly to the capture user, or they can be granted through roles. In addition, the capture user must be granted EXECUTE privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. They cannot be granted through roles. |

---

#### Usage Notes

If the capture user for a synchronous capture is dropped using DROP USER . . . CASCADE, then the synchronous capture is also dropped automatically.

### 32.3.7 BUILD Procedure

This procedure extracts the data dictionary of the current database to the redo log and automatically specifies database supplemental logging by running the SQL statement

```
ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

This procedure is overloaded. One version of this procedure contains the OUT parameter first_scn, and the other does not.
Syntax

DBMS_CAPTURE_ADM.BUILD(
    first_scn OUT NUMBER);

DBMS_CAPTURE_ADM.BUILD;

Parameters

Table 32-8  BUILD Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_scn</td>
<td>Contains the lowest SCN value corresponding to the data dictionary extracted to the redo log that can be specified as a first SCN for a capture process</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- You can run this procedure multiple times at a source database.
- If you plan to capture changes originating at a source database with a capture process, then this procedure must be executed at the source database at least once. When the capture process is started, either at a local source database or at a downstream database, the capture process uses the extracted information in the redo log to create a LogMiner data dictionary.
- A LogMiner data dictionary is a separate data dictionary used by a capture process to determine the details of a change that it is capturing. The LogMiner data dictionary is necessary because the primary data dictionary of the source database might not be synchronized with the redo data being scanned by a capture process.
- After executing this procedure, you can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine the lowest SCN value for the database that can be specified as a first SCN for a capture process. The first SCN for a capture process is the lowest SCN in the redo log from which the capture process can capture changes. You can specify the first SCN for a capture process when you run the CREATE_CAPTURE or ALTER_CAPTURE procedure in the DBMS_CAPTURE_ADM package.
- In a CDB, the BUILD procedure must be executed from the root.
32.3.8 CREATE_CAPTURE Procedure

This procedure creates a capture process.

See Also:

- *Oracle Streams Replication Administrator's Guide* for more information about creating a capture process
- *DBMS_RULE_ADM* for more information about rules and rule sets

Syntax

```sql
DBMS_CAPTURE_ADM.CREATE_CAPTURE(
    queue_name                 IN  VARCHAR2,
    capture_name               IN  VARCHAR2,
    rule_set_name              IN  VARCHAR2 DEFAULT NULL,
    start_scn                  IN  NUMBER DEFAULT NULL,
    source_database            IN  VARCHAR2 DEFAULT NULL,
    use_database_link          IN  BOOLEAN DEFAULT FALSE,
    first_scn                  IN  NUMBER DEFAULT NULL,
    logfile_assignment         IN  VARCHAR2 DEFAULT 'implicit',
    negative_rule_set_name     IN  VARCHAR2 DEFAULT NULL,
    capture_user               IN  VARCHAR2 DEFAULT NULL,
    checkpoint_retention_time  IN  NUMBER DEFAULT 60,
    start_time                 IN  TIMESTAMP DEFAULT NULL,
    source_root_name           IN  VARCHAR2 DEFAULT NULL,
    capture_class              IN  VARCHAR2 DEFAULT 'Streams');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the queue into which the capture process enqueues changes. You must specify an existing queue in the form [schema_name.]queue_name. For example, to specify a queue in the hr schema named streams_queue, enter hr.streams_queue. If the schema is not specified, then the current user is the default. <strong>Note:</strong> The queue_name setting cannot be altered after the capture process is created.</td>
</tr>
<tr>
<td>capture_name</td>
<td>The name of the capture process being created. A NULL specification is not allowed. Do not specify an owner. <strong>Note:</strong> The capture_name setting cannot be altered after the capture process is created.</td>
</tr>
</tbody>
</table>
Table 32-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the capture process. The positive rule set contains the rules that instruct the capture process to capture changes. If you want to use a positive rule set for the capture process, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named job_capture_rules, enter hr.job_capture_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the SYS and SYSTEM schemas. If you specify NULL, and a negative rule set exists for the capture process, then the capture process captures all changes that are not discarded by the negative rule set.</td>
</tr>
<tr>
<td>start_scn</td>
<td>A valid SCN for the database from which the capture process starts capturing changes. An error is returned if an invalid SCN is specified. The start_scn and start_time parameters are mutually exclusive. See Also: &quot;Usage Notes&quot; for more information setting the start_scn parameter</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes to be captured originated. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM automatically. If NULL, or if the specified name is the same as the global name of the current database, then local capture is assumed and only the default values for use_database_link and first_scn can be specified.</td>
</tr>
</tbody>
</table>
Table 32-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| use_database_link | If TRUE, then the capture process at a downstream database uses a database link to the source database for administrative purposes relating to the capture process. A database link with the same name as the global name of the source database must exist at the downstream database. The capture process uses the database link to prepare database objects for instantiation at the source database and run the DBMS_CAPTURE_ADM.BUILD procedure at the source database, if necessary. During the creation of a downstream capture process, if the first_scn parameter is set to NULL, then the use_database_link parameter must be set to TRUE. Otherwise, an error is returned. If FALSE, then either the capture process is running on the source database, or the capture process at a downstream database does not use a database link to the source database. In this case, you must perform the following administrative tasks manually:  
  • Run the DBMS_CAPTURE_ADM.BUILD procedure at the source database to extract the data dictionary at the source database to the redo log when a capture process is created.  
  • Obtain the first SCN for the downstream capture process if the first SCN is not specified during capture process creation. The first SCN is needed to create and maintain a capture process.  
  • Prepare source database objects for instantiation. |
| first_scn         | The lowest SCN in the redo log from which a capture process can capture changes. A non-NULL value for this parameter is valid only if the DBMS_CAPTURE_ADM.BUILD procedure has been run at least once at the source database. You can query the FIRST_CHANGE# column of the V$ARCHIVED_LOG dynamic performance view where the DICTIONARY_BEGIN column is YES to determine whether the DBMS_CAPTURE_ADM.BUILD procedure has been run on a source database. Any of the values returned by such a query can be used as a first_scn value if the redo log containing that SCN value is still available. See Also: "Usage Notes" for more information setting the first_scn parameter. |
### Table 32-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logfile_assignment</td>
<td>If <code>implicit</code>, which is the default, then the capture process at a downstream database scans all redo log files added by redo transport services or manually from the source database to the downstream database. If <code>explicit</code>, then a redo log file is scanned by a capture process at a downstream database only if the capture process name is specified in the <code>FOR logminer_session_name</code> clause. If <code>explicit</code>, then the redo log file must be added manually to the downstream database, and redo transport services cannot be used to add redo log files to the capture process being created. If you specify <code>explicit</code> for this parameter for a local capture process, then the local capture process cannot use the online redo log to find changes. In this case, the capture process must use the archived redo log. <strong>See Also:</strong> &quot;Usage Notes&quot; for information about adding redo log files manually</td>
</tr>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the capture process. The negative rule set contains the rules that instruct the capture process to discard changes. If you want to use a negative rule set for the capture process, then you must specify an existing rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to specify a negative rule set in the <code>hr</code> schema named <code>neg_capture_rules</code>, enter <code>hr.neg_capture_rules</code>. If the schema is not specified, then the current user is the default. If you specify <code>NULL</code>, and no positive rule set is specified, then the capture process captures all supported changes to all objects in the database, excluding database objects in the <code>SYS</code> and <code>SYSTEM</code> schemas. If you specify <code>NULL</code>, and a positive rule set exists for the capture process, then the capture process captures all changes that are not discarded by the positive rule set. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the <code>DBMS_STREAMS_ADM</code> package or the <code>DBMS_RULE_ADM</code> package. If you specify both a positive and a negative rule set for a capture process, then the negative rule set is always evaluated first.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>capture_user</td>
<td>The user in whose security domain a capture process captures changes that satisfy its rule sets and runs custom rule-based transformations configured for capture process rules. If <code>NULL</code>, then the user who runs the <code>CREATE_CAPTURE</code> procedure is used.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> If the capture user for a capture process is dropped using <code>DROP USER ... CASCADE</code>, then the capture process is also dropped automatically.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>checkpoint_retention_time</td>
<td>Either specify the number of days that a capture process retains checkpoints before purging them automatically, or specify <code>DBMS_CAPTURE_ADM.INFINITE</code> if checkpoints should not be purged automatically.</td>
</tr>
<tr>
<td></td>
<td>If a number is specified, then a capture process purges a checkpoint the specified number of days after the checkpoint was taken. Partial days can be specified using decimal values. For example, <code>.25</code> specifies 6 hours.</td>
</tr>
<tr>
<td></td>
<td>When a checkpoint is purged, LogMiner data dictionary information for the archived redo log file that corresponds to the checkpoint is purged, and the <code>first_scn</code> of the capture process is reset to the SCN value corresponding to the first change in the next archived redo log file.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> <em>Oracle Streams Concepts and Administration</em> for more information about checkpoint retention time</td>
</tr>
<tr>
<td>start_time</td>
<td>A valid time from which the capture process starts capturing changes.</td>
</tr>
<tr>
<td></td>
<td>An error is returned if an invalid time is specified.</td>
</tr>
<tr>
<td></td>
<td>The <code>start_scn</code> and <code>start_time</code> parameters are mutually exclusive.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; for more information setting the <code>start_time</code> parameter</td>
</tr>
<tr>
<td>source_root_name</td>
<td>The global name of the root in the source CDB.</td>
</tr>
<tr>
<td></td>
<td>If you specify <code>NULL</code>, or if the specified name is the same as the global name of the current root, then local capture is assumed.</td>
</tr>
<tr>
<td></td>
<td>If not <code>NULL</code>, then remote capture is assumed and a condition is added to the generated rules to filter the LCRs based on the root in the source CDB.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> In a downstream capture configuration, if the capture database is CDB and the source database is a non-CDB, then specify the same value for <code>source_root_name</code> and <code>source_database</code>. The <code>source_root_name</code> parameter does not need to be specified for local capture for either a CDB or a non-CDB.</td>
</tr>
</tbody>
</table>
Table 32-9  (Cont.) CREATE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_class</td>
<td>The valid values are 'Streams', 'XStream' or 'GoldenGate'. If NULL is specified, then 'Streams' is assumed. Note: The capture_class parameter cannot be set to 'Streams' or NULL when the capture database is a CDB.</td>
</tr>
</tbody>
</table>

Usage Notes
Consider the following usage notes when you run this procedure:

- **DBA Role Requirement**
- **Capture User Requirements**
- **First SCN and Start SCN Settings**
- **Explicit Log File Assignment**

**DBA Role Requirement**
If the user who invokes this procedure is different from the user specified in the capture_user parameter, then the invoking user must be granted the DBA role. If the user who invokes this procedure is the same as the user specified in the capture_user parameter, then the DBA role is not required for the invoking user. Only the SYS user can set the capture_user to SYS.

**Capture User Requirements**
The capture_user parameter specifies the user who captures changes that satisfy the capture process rule sets. This user must have the necessary privileges to capture changes. This procedure grants the capture user enqueue privilege on the queue used by the capture process and configures the user as a secure queue user of the queue.

In addition, ensure that the capture user has the following privileges:

- **EXECUTE** privilege on the rule sets used by the capture process
- **EXECUTE** privilege on all rule-based transformation functions used in the positive rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the capture process. These privileges must be granted directly to the capture user. They cannot be granted through roles.
Note:

- A capture user does not require privileges on a database object to capture changes to the database object. The capture process can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a capture process.
- Creation of the first capture process in a database might take some time because the data dictionary is duplicated during this creation.

First SCN and Start SCN Settings

When you create a capture process using this procedure, you can specify the first SCN and start SCN for the capture process. A capture process scans the redo data from the first SCN or an existing capture process checkpoint forward, even if the start SCN is higher than the first SCN or the checkpoint SCN. In this case, the capture process does not capture any changes in the redo data before the start SCN. Oracle recommends that, at capture process creation time, the difference between the first SCN and start SCN be as small as possible to keep the amount of redo scanned by the capture process to a minimum.

Note:

When you specify the `start_time` parameter instead of the `start_scn` parameter, the `start_time` corresponds with a specific SCN. In this case, the information in this section also applies to the SCN that corresponds with the specified `start_time`.

In some cases, the behavior of the capture process is different depending on the settings of these SCN values and on whether the capture process is local or downstream.

The following table describes capture process behavior for SCN value settings:
<table>
<thead>
<tr>
<th>first_scn Setting</th>
<th>start_scn Setting</th>
<th>Capture Process Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-NULL</td>
<td>NULL</td>
<td>Local or Downstream</td>
<td>The new capture process is created at the local database with a new LogMiner session starting from the value specified for the <code>first_scn</code> parameter. The start SCN is set to the specified first SCN value automatically, and the new capture process does not capture changes that were made before this SCN. The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised when the capture process is started. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
<tr>
<td>Non-NULL</td>
<td>Non-NULL</td>
<td>Local or Downstream</td>
<td>If the specified value for the <code>start_scn</code> parameter is greater than or equal to the specified value for the <code>first_scn</code> parameter, then the new capture process is created at the local database with a new LogMiner session starting from the specified first SCN. In this case, the new capture process does not capture changes that were made before the specified start SCN. If the specified value for the <code>start_scn</code> parameter is less than the specified value for the <code>first_scn</code> parameter, then an error is raised. The <code>BUILD</code> procedure in the <code>DBMS_CAPTURE_ADM</code> package is not run automatically. This procedure must have been run at least once before on the source database, and the specified first SCN must correspond to the SCN value of a previous build that is still available in the redo log. When the new capture process is started for the first time, it creates a new LogMiner data dictionary using the data dictionary information in the redo log. If the <code>BUILD</code> procedure has not been run at least once on the source database, then an error is raised. Capture process behavior is the same for a local capture process and a downstream capture process created with these SCN settings, except that a local capture process is created at the source database and a downstream capture process is created at the downstream database.</td>
</tr>
</tbody>
</table>
The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:

- There is no existing capture process for the local source database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.
- There are existing capture processes, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the database.

In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation. The new capture process uses the resulting build of the source data dictionary in the redo log to create a LogMiner data dictionary the first time it is started, and the first SCN corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing. An in-flight transaction is one that is active during capture process creation or a data dictionary build.

However, if there is at least one existing local capture process for the local source database that has taken a checkpoint, then the new capture process shares an existing LogMiner data dictionary with one or more of the existing capture processes. In this case, a capture process with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.

If there is no existing capture process for the local source database (or if no existing capture processes have taken a checkpoint yet), and the specified start SCN is less than the current SCN for the database, then an error is raised.

<table>
<thead>
<tr>
<th>first_scn Setting</th>

</tr>
<tr>
<td>-------------------</td>
<td>-------------------</td>
<td>----------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| NULL              | Non-NULL          | Downstream           | When the `CREATE_CAPTURE` procedure creates a downstream capture process, the `use_database_link` parameter must be set to `TRUE` when the `first scn` parameter is set to `NULL`. Otherwise, an error is raised. The database link is used to obtain the current SCN of the source database. The new capture process creates a new LogMiner data dictionary if either one of the following conditions is true:  
  • There is no existing capture process that captures changes to the source database at the downstream database, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.  
  • There are existing capture processes that capture changes to the source database at the downstream database, but none of the capture processes have taken a checkpoint yet, and the specified value for the `start_scn` parameter is greater than or equal to the current SCN for the source database.  
   In either of these cases, the `BUILD` procedure in the `DBMS_CAPTURE_ADM` package is run during capture process creation.  
   The first time you start the new capture process, it uses the resulting build of the source data dictionary in the redo log files copied to the downstream database to create a LogMiner data dictionary. Here, the first SCN for the new capture process corresponds to the SCN of the data dictionary build. If there are any in-flight transactions, then the `BUILD` procedure waits until these transactions commit before completing.  
   However, if at least one existing capture process has taken a checkpoint and captures changes to the source database at the downstream database, then the new capture process shares an existing LogMiner data dictionary with one or more of these existing capture processes. In this case, one of these existing capture processes with a first SCN that is lower than or equal to the specified start SCN must have been started successfully at least once. Also, if there are any in-flight transactions, then the capture process is created after these transactions commit.  
   If there is no existing capture process that captures changes to the source database at the downstream database (or no existing capture process has taken a checkpoint), and the specified `start_scn` parameter value is less than the current SCN for the source database, then an error is raised.  
| NULL              | NULL              | Local or Downstream  | The behavior is the same as setting the `first_scn` parameter to `NULL` and setting the `start_scn` parameter to the current SCN of the source database. |

**Note:**

When you create a capture process using the `DBMS_STREAMS_ADM` package, both the first SCN and the start SCN are set to `NULL` during capture process creation.
Explicit Log File Assignment

If you specify `explicit` for the `logfile_assignment` parameter, then you add a redo log file manually to a downstream database using the following statement:

```sql
ALTER DATABASE REGISTER LOGICAL LOGFILE
  file_name FOR capture_process;
```

Here, `file_name` is the name of the redo log file being added and `capture_process` is the name of the capture process that will use the redo log file at the downstream database. The `capture_process` is equivalent to the `logminer_session_name` and must be specified. The redo log file must be present at the site running the downstream database. You must transfer this file manually to the site running the downstream database using the `DBMS_FILE_TRANSFER` package, FTP, or some other transfer method.

32.3.9 CREATE_SYNC_CAPTURE Procedure

This procedure creates a synchronous capture.

```sql
DBMS_CAPTURE_ADM.CREATE_SYNC_CAPTURE(
  queue_name     IN  VARCHAR2,
  capture_name   IN  VARCHAR2,
  rule_set_name  IN  VARCHAR2,
  capture_user   IN  VARCHAR2  DEFAULT NUL);
```

See Also:

</tr>
<tr>
<td>See Also:</td>
<td>&quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

When the CREATE_SYNC_CAPTURE procedure creates a synchronous capture, the procedure must obtain an exclusive lock on each table for which it will capture changes. The rules in the specified rule set for the synchronous capture determine these tables. If there are outstanding transactions on a table for which the synchronous capture will capture changes, then the procedure waits until it can obtain a lock.
The `capture_user` parameter specifies the user who captures changes that satisfy the synchronous capture rule set. This user must have the necessary privileges to capture changes.

In addition, ensure that the capture user has the following privileges:

- **ENQUEUE** privilege on the queue specified in the `queue_name` parameter
- **EXECUTE** privilege on the rule set used by the synchronous capture
- **EXECUTE** privilege on all rule-based transformation functions used in the rule set

These privileges can be granted directly to the capture user, or they can be granted through roles.

In addition, the capture user must be granted **EXECUTE** privilege on all packages, including Oracle-supplied packages, that are invoked in rule-based transformations run by the synchronous capture. These privileges must be granted directly to the capture user. These privileges cannot be granted through roles.

**Note:**

A capture user does not require privileges on a database object to capture changes to the database object. The synchronous capture can pass these changes to a rule-based transformation function. Therefore, ensure that you consider security implications when you configure a synchronous capture.

### 32.3.10 DROP_CAPTURE Procedure

This procedure drops a capture process.

**Syntax**

```
DBMS_CAPTURE_ADM.DROP_CAPTURE(
    capture_name           IN  VARCHAR2,
    drop_unused_rule_sets  IN  BOOLEAN  DEFAULT FALSE);
```

**Parameters**

**Table 32-11**  DROP_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process being dropped. Specify an existing capture process name. Do not specify an owner.</td>
</tr>
<tr>
<td>drop_unused_rule_sets</td>
<td>If <strong>TRUE</strong>, then the procedure drops any rule sets, positive and negative, used by the specified capture process if these rule sets are not used by any other Oracle Streams client. Oracle Streams clients include capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If <strong>FALSE</strong>, then the procedure does not drop the rule sets used by the specified capture process, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>
Usage Notes

The following usage notes apply to this procedure:

- The Capture Process Must Be Stopped Before It Is Dropped
- The DROP_CAPTURE Procedure and Rules-related Information

The Capture Process Must Be Stopped Before It Is Dropped

A capture process must be stopped before it can be dropped.

See Also:

STOP_CAPTURE Procedure

The DROP_CAPTURE Procedure and Rules-related Information

When you use this procedure to drop a capture process, rules-related information for the capture process created by the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the capture process.

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES
- ALL_STREAMS_RULES
- DBA_STREAMS_RULES

See Also:

Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views
32.3.11 INCLUDE_EXTRA_ATTRIBUTE Procedure

This procedure includes or excludes an extra attribute in logical change records (LCRs) captured by the specified capture process or synchronous capture.

Syntax

```
DBMS_CAPTURE_ADM.INCLUDE_EXTRA_ATTRIBUTE(
    capture_name    IN  VARCHAR2,
    attribute_name  IN  VARCHAR2,
    include         IN  BOOLEAN   DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process or synchronous capture. Specify an existing capture process name or synchronous capture name. Do not specify an owner.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The name of the attribute to be included in or excluded from LCRs captured by the capture process or synchronous capture. The following names are valid settings:</td>
</tr>
<tr>
<td></td>
<td>• row_id The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, or in row LCRs for index-organized tables. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• serial# The serial number of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• session# The identifier of the session that performed the change captured in the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• thread# The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• tx_name The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• username The name of the user who performed the change captured in the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td>include</td>
<td>If TRUE, then the specified attribute is included in LCRs captured by the capture process or synchronous capture. If FALSE, then the specified attribute is excluded from LCRs captured by the capture process or synchronous capture.</td>
</tr>
</tbody>
</table>

Usage Notes

Some information is not captured by a capture process or synchronous capture unless you use this procedure to specify that the information should be captured. If you want
to exclude an extra attribute that is being captured by a capture process or synchronous capture, then specify the attribute and specify FALSE for the include parameter.

32.3.12 PREPARE_GLOBAL_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all the tables in the database at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the database for instantiation when a capture process will be used to capture changes to the tables in the database.

This procedure records the lowest SCN of each object in the database for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the database for instantiation.

See Also:

- Oracle Streams Replication Administrator's Guide for more information about instantiation
- Oracle Streams Replication Administrator's Guide for more information about supplemental logging

Syntax

```
DBMS_CAPTURE_ADM.PREPARE_GLOBAL_INSTANTIATION
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```
Parameter

Table 32-13 PREPARE_GLOBAL_INSTANTIATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL. If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the database. This procedure does not remove existing supplemental logging specifications for these tables. If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the database and for any table added to the database in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns. If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the database and for any table added to the database in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
<tr>
<td>container</td>
<td>Either CURRENT, ALL, or pdb_name. If CURRENT is specified, then this procedure adds supplemental logging for the current container. If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB. If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB. ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

Usage Notes

Run this procedure at the source database.

If you use a capture process to capture all of the changes to a database, then use this procedure to prepare the tables in the database for instantiation after the capture process has been configured.

32.3.13 PREPARE_SCHEMA_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating all tables in the schema at another database and can enable supplemental logging for key columns or all columns in these tables.

This procedure prepares the tables in the schema for instantiation when a capture process will be used to capture changes to the tables in the schema.

This procedure records the lowest SCN of each object in the schema for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object. Running this procedure prepares all current and future objects in the schema for instantiation.
Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_SCHEMA_INSTANTIATION(
    schema_name  IN  VARCHAR2,
    supplemental_logging IN  VARCHAR2  DEFAULT 'KEYS',
    container    IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema. For example, hr.</td>
</tr>
</tbody>
</table>
| supplemental_logging | Either NONE, KEYS, or ALL.  
If NONE is specified, then this procedure does not enable supplemental logging for any columns in the tables in the schema. This procedure does not remove existing supplemental logging specifications for these tables.  
If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the tables in the schema and for any table added to this schema in the future. Primary key columns are logged unconditionally. Unique key, bitmap index, and foreign key columns are logged conditionally. Specifying KEYS does not enable supplemental logging of bitmap join index columns.  
If ALL is specified, then this procedure enables supplemental logging for all columns in the tables in the schema and for any table added to this schema in the future. The columns are logged unconditionally. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types. |
| container        | Either CURRENT, ALL, or pdb_name.  
If CURRENT is specified, then this procedure adds supplemental logging for the current container.  
If ALL is specified, then this procedure adds supplemental logging for all of the containers in the current CDB.  
If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB  
ALL and pdb_name are valid only when you invoke the procedure from the root. |
Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a schema, then use this procedure to prepare the tables in the schema for instantiation after the capture process has been configured.

32.3.14 PREPARE_SYNC_INSTANTIATION Function

This function performs the synchronization necessary for instantiating one or more tables at another database. This function returns the prepare system change number (SCN) for the table or tables being prepared for instantiation.

This function prepares one or more tables for instantiation when a synchronous capture will be used to capture changes to the tables.

This function records the lowest SCN of each table for instantiation (prepare SCN). SCNs after the lowest SCN for an object can be used for instantiating the object.

This function is overloaded. The \texttt{table_names} parameter is \texttt{VARCHAR2} datatype in one version and \texttt{DBMS\_UTILITY\_UNCL\_ARRAY} datatype in the other version.

\textbf{See Also:}

\textit{Oracle Streams Replication Administrator's Guide} for more information about instantiation

\section*{Syntax}

\begin{verbatim}
DBMS\_CAPTURE\_ADM\_PREPARE\_SYNC\_INstantiation(
    table_names  IN  VARCHAR2)
RETURN NUMBER;

DBMS\_CAPTURE\_ADM\_PREPARE\_SYNC\_INstantiation(
    table_names  IN  DBMS\_UTILITY\_UNCL\_ARRAY)
RETURN NUMBER;
\end{verbatim}

\section*{Parameters}

\textbf{Table 32-15  PREPARE_SYNC_INSTANTIATION Function Parameter}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_names</td>
<td>When the \texttt{table_names} parameter is \texttt{VARCHAR2} datatype, a comma-delimited list of the tables to prepare for instantiation. There must be no spaces between entries.</td>
</tr>
<tr>
<td></td>
<td>When the \texttt{table_names} parameter is \texttt{DBMS_UTILITY_UNCL_ARRAY} datatype, specify a PL/SQL associative array of this type that contains the names of the tables to prepare for instantiation. The first table name is at position 1, the second at position 2, and so on. The table does not need to be NULL terminated.</td>
</tr>
<tr>
<td></td>
<td>In either version of the function, specify the name of each table in the form \texttt{[schema_name.]table_name}. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
32.3.15 PREPARE_TABLE_INSTANTIATION Procedure

This procedure performs the synchronization necessary for instantiating the table at another database and can enable supplemental logging for key columns or all columns in the table.

This procedure prepares the table for instantiation when a capture process will be used to capture changes to the table.

This procedure records the lowest SCN of the table for instantiation. SCNs after the lowest SCN for an object can be used for instantiating the object.

See Also:

- Oracle Streams Replication Administrator's Guide for more information about instantiation
- Oracle Streams Replication Administrator's Guide for more information about supplemental logging

Syntax

```sql
DBMS_CAPTURE_ADM.PREPARE_TABLE_INSTANTIATION(
    table_name            IN  VARCHAR2,
    supplemental_logging  IN  VARCHAR2  DEFAULT 'KEYS',
    container             IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

Table 32-16  PREPARE_TABLE_INSTANTIATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Table 32-16  (Cont.) PREPARE_TABLE_INSTANTIATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>supplemental_logging</td>
<td>Either NONE, KEYS, or ALL.</td>
</tr>
<tr>
<td></td>
<td>If NONE is specified, then this procedure does not enable supplemental logging for any columns in the table. This procedure does not remove existing supplemental logging specifications for the table.</td>
</tr>
<tr>
<td></td>
<td>If KEYS is specified, then this procedure enables supplemental logging for primary key, unique key, bitmap index, and foreign key columns in the table. The procedure places the key columns for the table in three separate log groups: the primary key columns in an unconditional log group, the unique key columns and bitmap index columns in a conditional log group, and the foreign key columns in a conditional log group. Specifying KEYS does not enable supplemental logging of bitmap join index columns.</td>
</tr>
<tr>
<td></td>
<td>If ALL is specified, then this procedure enables supplemental logging for all columns in the table. The procedure places all of the columns for the table in an unconditional log group. Supplemental logging is not enabled for columns of the following types: LOB, LONG, LONG RAW, user-defined types, and Oracle-supplied types.</td>
</tr>
<tr>
<td>container</td>

<tr>
<td></td>
<td>If pdb_name is specified, then this procedure adds supplemental logging for the specified PDB.</td>
</tr>
<tr>
<td></td>
<td>ALL and pdb_name are valid only when you invoke the procedure from the root.</td>
</tr>
</tbody>
</table>

Usage Notes

Run this procedure at the source database. If you use a capture process to capture all of the changes to a table, then use this procedure to prepare the table for instantiation after the capture process has been configured.

32.3.16 SET_PARAMETER Procedure

This procedure sets a capture process parameter to the specified value.

Syntax

```sql
DBMS_CAPTURE_ADM.SET_PARAMETER(
    capture_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 32-17  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter you are setting.</td>
</tr>
<tr>
<td>value</td>
<td>The value to which the parameter is set.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the parameter is set to its default value.</td>
</tr>
</tbody>
</table>

Capture Process Parameters

The following table lists the parameters for the capture process.

Table 32-18  Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>annotatedddlsize</td>
<td>0 or a positive integer up to 4294967296 (4 GB)</td>
<td>0</td>
<td>The maximum length of the DDL text, in bytes, up to which the DDL can be chosen for annotation, if applicable for the DDL. Any DDL text whose size is greater than the specified size is not annotated. The default, 0, indicates that no DDL text processed by this capture process is annotated. Annotating DDL can simplify filtering and transformation of the DDL within Oracle GoldenGate. <strong>Note:</strong> This parameter is intended for Oracle GoldenGate. Do not use this parameter in an Oracle Streams replication environment or in an XStream environment.</td>
</tr>
</tbody>
</table>
Table 32-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_idkey_objects</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures ID key logical change records (LCRs). If N, then the capture process does not capture ID key LCRs.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Capture processes do not fully support capturing changes to some data types from the redo log. ID key LCRs enable an XStream configuration to capture these changes and process them with an XStream client application.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note</strong>: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>See Also</strong>: &quot;Usage Notes&quot; for more information about this parameter and Oracle Database XStream Guide for more information about ID key LCRs</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Possible Values</td>
<td>Default</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------</td>
<td>---------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>capture_sequence_nextval</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process captures sequence LCRs for all of the sequences in the database, except for sequences in Oracle-supplied, administrative schemas such as SYS and SYSTEM. The capture process’s rule sets can filter sequence LCRs in the same way that they filter row LCRs and DDL LCRs. If N, then the capture process does not capture sequence LCRs. An apply process or XStream inbound server can use sequence LCRs to ensure that the sequence values at a destination database use the appropriate values. For increasing sequences, the sequence values at the destination are equal to or greater than the sequence values at the source database. For decreasing sequences, the sequence values at the destination are less than or equal to the sequence values at the source database. <strong>Note:</strong> This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter and &quot;SET_PARAMETER Procedure&quot; for information about the apply_sequence_nextval apply process parameter.</td>
</tr>
<tr>
<td>disable_on_limit</td>
<td>Y or N</td>
<td>N</td>
<td>If Y, then the capture process is disabled because it reached a value specified by the time_limit parameter or message_limit parameter. If N, then the capture process is restarted immediately after stopping because it reached a limit. When a capture process is restarted, it starts to capture changes at the point where it last stopped. A restarted capture process gets a new session identifier, and the processes associated with the capture process also get new session identifiers. However, the capture process number (CPN0) remains the same.</td>
</tr>
</tbody>
</table>
Table 32-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>downstream_real_time_mine</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process is a real-time downstream capture process. After setting this parameter to Y, switch the redo log file at the source database using the SQL statement <code>ALTER SYSTEM ARCHIVE LOG CURRENT</code> to begin real-time downstream capture. If this parameter is set to Y, then redo data from the source database must be sent to the standby redo log at the downstream database. See Oracle Streams Replication Administrator's Guide for information about creating a real-time downstream capture process. If N, then the capture process is an archived-log downstream capture process. An error is raised if an attempt is made to set this parameter for a local capture process.</td>
</tr>
<tr>
<td>excludetag</td>
<td>Comma-delimited list of Oracle Streams tags</td>
<td>NULL</td>
<td>Controls whether the capture process captures DML changes that are tagged with one of the specified Oracle Streams tags. Whether the capture process captures these changes depends on the settings for the <code>getapplops</code> and <code>getreplicates</code> parameters. If NULL, then the capture process ignores this parameter. Note: This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. See Also: &quot;Usage Notes&quot; for more information about this parameter</td>

Table 32-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
</table>
| getreplicates      | Y or N          | N       | If Y, then the capture process captures DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter.  
If N, then the capture process ignores DML changes if the original user is specified in the excludeuserid or excludeuser parameters and the transaction name is specified in the excludetrans parameter.  
In either case, the capture process captures a DML change only if it satisfies the capture process's rule sets.  
**Note:** This parameter is intended for XStream. Do not use this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAMADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.  
**See Also:** "Usage Notes" for more information about this parameter |
| ignore_transaction | A valid transaction ID or NULL | NULL | Instructs the capture process to ignore the specified transaction from the source database, effective immediately.  
The capture process eliminates all subsequent LCRs for the transaction. If the specified transaction is committed successfully at the source database, the destination database will receive a ROLLBACK statement instead, and any LCRs from the transaction that were enqueued before the ignore transaction request are rolled backed at the destination database.  
If NULL, then the capture process ignores this parameter.  
Use caution when setting this parameter because ignoring a transaction might lead to data divergence between the source database and destination database.  
To ignore multiple transactions, specify each transaction in a separate call to the SET_PARAMETER procedure. The DBA_CAPTURE_PARAMETERS view displays a comma-delimited list of all transactions to be ignored. To clear the list of ignored transactions, run the SET_PARAMETER procedure and specify NULL for the ignore_transaction parameter. |
### Table 32-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore_unsupported_table</td>
<td>A fully qualified table name, *, or -</td>
<td>*</td>
<td>Controls the behavior of the capture process when it tries to capture changes to a specified table or to an unsupported table.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>A capture process tries to capture changes to an unsupported table when its rule sets instruct it to do so. If you do not want the capture process to try to capture changes to unsupported tables, then ensure that the capture process’s rule sets exclude unsupported tables. When a table name is specified, the capture process does not capture changes to the specified table. The table name must be entered in the form table_owner. table_name. For example, hr.employees. To specify multiple tables, specify each table in a separate call to the SET_PARAMETER procedure. When * is specified and the capture process tries to capture a change to an unsupported table, the capture process ignores the change and continues to run. The change to the unsupported table is not captured, and the capture process records the unsupported table in the alert log. When - is specified and the capture process tries to capture a change to an unsupported table, the capture process aborts.</td>
</tr>
<tr>
<td>include_objects</td>
<td>A list of tables or schema names separated by commas</td>
<td>none</td>
<td>Directs capture to include changes from the specified tables or schemas. An LCR that is selected by include_objects is passed to the outbound server regardless of any further filtering that is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>

</thead>
<tbody>
<tr>
<td><code>max_sga_size</code></td>
<td>A positive integer</td>
<td>INFINITE</td>
<td>Controls the amount of system global area (SGA) memory allocated specifically to the capture process, in megabytes. The capture process attempts to allocate memory up to this limit. A capture process uses Oracle LogMiner to scan for changes in the redo log. The memory is allocated for the duration of the capture process session and is released when the capture process becomes disabled. <strong>Note:</strong> The sum of system global area (SGA) memory allocated for all components on a database must be less than the value set for the <code>STREAMS_POOL_SIZE</code> initialization parameter. If <code>NULL</code>, then the capture component uses the original default value. A <code>NULL</code> value has the same effect as resetting the parameter to its default value. <strong>Note:</strong> This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the <code>DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS</code> procedure. See &quot;ENABLE_GG_XSTREAM_FOR_STREAMS Procedure&quot; for information about enabling XStream optimizations. <strong>See Also:</strong> &quot;Usage Notes&quot; for more information about this parameter</td>
</tr>
</tbody>
</table>
### Table 32-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>merge_threshold</td>
<td>A negative integer, 0, a positive integer, or INFINITE</td>
<td>60</td>
<td>The amount of time, in seconds, between the message creation time of the original capture process and the message creation time of the cloned capture process. Specifically, if the difference, in seconds, between the CAPTURE_MESSAGE_CREATE_TIME of the cloned capture process and the original capture process is less than or equal to the value specified for this parameter, then automatic merge begins by running the MERGE_STREAMS procedure. If the difference is greater than the value specified by this parameter, then automatic merge does not begin, and the value is recorded in the LAG column of the DBA_STREAMS_SPLIT_MERGE view. The CAPTURE_MESSAGE_CREATE_TIME is recorded in the V$STREAMS_CAPTURE view. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes and the split_threshold parameter is set to a value other than INFINITE. If a negative value is specified, then automatic merge is disabled. If 0 (zero) is specified, then there must be no lag between the original capture process and the cloned capture process to begin the merge. If INFINITE is specified, then automatic merging starts immediately. See Also: Oracle Streams Replication Administrator’s Guide</td>
</tr>
<tr>
<td>message_limit</td>
<td>A positive integer or INFINITE</td>
<td>INFINITE</td>
<td>The capture process stops after capturing the specified number of messages. If INFINITE, then the capture process continues to run regardless of the number of messages captured.</td>
</tr>
</tbody>
</table>
### Table 32-18 (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message_tracking_frequency</td>
<td>0 or a positive integer</td>
<td>2000000</td>
<td>The frequency at which messages captured by the capture process are tracked automatically. For example, if this parameter is set to the default value of 2000000, then every two-millionth message is tracked automatically. The tracking label used for automatic message tracking is capture_process_name:AUTOTRACK, where capture_process_name is the name of the capture process. Only the first 20 bytes of the capture process name are used; the rest is truncated if it exceeds 20 bytes. If 0 (zero), then no messages are tracked automatically. See Oracle Streams Replication Administrator's Guide for more information about message tracking.</td>
</tr>
<tr>
<td>parallelism</td>
<td>A positive integer</td>
<td>1</td>
<td>The number of preparer servers that can concurrently mine the redo log for the capture process. A capture process consists of one reader server, one or more preparer servers, and one builder server. The preparer servers concurrently format changes found in the redo log into logical change records (LCRs). Each reader server, preparer server, and builder server is a process, and the number of preparer servers equals the number specified for the parallelism capture process parameter. So, if parallelism is set to 5, then a capture process uses a total of seven processes: one reader server, five preparer servers, and one builder server. Setting the parallelism parameter to a number higher than the number of available parallel execution servers might disable the capture process. Ensure that the PROCESSES initialization parameter is set appropriately when you set the parallelism capture process parameter. <strong>Note:</strong> When you change the value of this parameter, the capture process is stopped and restarted automatically. <strong>See Also:</strong> Oracle Streams Concepts and Administration for more information about capture process components.</td>
</tr>
</tbody>
</table>
### Table 32-18  (Cont.) Capture Process Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Possible Values</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>skip_autofiltered_table_ddl</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process does not capture data definition language (DDL) changes to tables that are automatically filtered by the capture process. If N, then the capture process can capture DDL changes to tables that are automatically filtered by the capture process if the DDL changes satisfy the capture process rule sets. The AUTO_FILTERED column in the DBA_STREAMS_UNSUPPORTED data dictionary view shows which tables are automatically filtered by capture processes.</td>
</tr>
<tr>
<td>split_threshold</td>
<td>0, a positive integer, or INFINITE</td>
<td>1800</td>
<td>The amount of time, in seconds, that a stream is broken before the stream is automatically split from other streams that flow from the capture process. When a stream is split, the capture process, queue, and propagation are cloned. In this case, a stream is a flow of logical change records (LCRs) that flows from a capture process to an apply. A stream is broken when LCRs captured by the capture process cannot reach the apply process. For example, a stream is broken when the relevant propagation or apply process is disabled. This parameter is relevant only when changes captured by the capture process are applied by two or more apply processes. If 0 (zero), then automatic splitting starts immediately. If INFINITE, then automatic splitting is disabled. The stream is not split regardless of the amount of time that it is broken. This parameters is designed to be used with the merge_threshold parameter. You can monitor an automatic split and merge operation by querying the DBA_STREAMS_SPLIT_MERGE view. See Also: Oracle Streams Replication Administrator’s Guide</td>
</tr>
<tr>
<td>startup_seconds</td>
<td>0, a positive integer, or INFINITE</td>
<td>0</td>
<td>The maximum number of seconds to wait for another instantiation of the same capture process to finish. If the other instantiation of the same capture process does not finish within this time, then the capture process does not start. This parameter is useful only if you are starting the capture process manually. If INFINITE, then the capture process does not start until another instantiation of the same capture process finishes.</td>
</tr>
</tbody>
</table>

<td>N if XStream</td>
<td></td>
</tr>
<tr>
<td>write_alert_log</td>
<td>Y or N</td>
<td>Y</td>
<td>If Y, then the capture process writes a message to the alert log on exit. If N, then the capture process does not write a message to the alert log on exit. The message specifies the reason the capture process stopped.</td>
</tr>
<tr>
<td>xout_client_exists</td>
<td>Y or N</td>
<td>Y if the capture process sends LCRs to XStream outbound servers</td>
<td>Y indicates that the capture process sends LCRs to one or more XStream outbound servers. N indicates that the capture process sends LCRs to one or more Oracle Streams apply processes. A single capture process cannot send LCRs to both outbound servers and apply processes. In an XStream configuration where an outbound server runs on a different database than its capture process, set this parameter to Y to enable the capture process to send LCRs to the outbound server. Note: Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.</td>
</tr>
</tbody>
</table>

### Usage Notes

The following usage notes apply to the SET_PARAMETER procedure:

- **Note:** This parameter is intended for XStream. Do not use or attempt to set this parameter in an Oracle Streams replication environment unless XStream optimizations are enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure. See "ENABLE_GG_XSTREAM_FOR_STREAMS Procedure" for information about enabling XStream optimizations.

See Also: "Usage Notes" for more information about this parameter.

- **Note:** Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.
Delays Are Possible Before New Parameter Settings Take Effect

Parameters Interpreted as Positive Integers

Parameters with a System Change Number (SCN) Setting

Parameters that Require XStream Optimizations

XStream or Oracle GoldenGate Integrated Capture Configurations

Delays Are Possible Before New Parameter Settings Take Effect

When you alter a parameter value, a short amount of time might pass before the new value for the parameter takes effect.

Parameters Interpreted as Positive Integers

For all parameters that are interpreted as positive integers, the maximum possible value is 4,294,967,295. Where applicable, specify INFINITE for larger values.

Parameters with a System Change Number (SCN) Setting

For parameters that require an SCN setting, any valid SCN value can be specified.

Parameters that Require XStream Optimizations

A capture process uses the following parameters only when the capture process is sending logical change records (LCRs) to an XStream outbound server or when XStream optimizations are enabled for Oracle Streams components:

- capture_idkey_objects
- capture_sequence_nextval
- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_agr_size
- use_rac_services

The DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure enables XStream optimizations for Oracle Streams. When XStream optimizations are not enabled by the DBMS_XSTREAM_ADM.ENABLE_GG_XSTREAM_FOR_STREAMS procedure, a capture process raises an error if one of these parameters is set to any value other than its default value.

When XStream optimizations are enabled for Oracle Streams and the capture_idkey_objects parameter is set to Y, a capture process can capture ID key LCRs. ID key LCRs do not contain all of the columns for a row change. Instead, they contain the rowid of the changed row, a group of key columns to identify the row in the table, and the data for the scalar columns of the table that are supported by capture processes. An apply process can apply these changes using the information available the ID key LCRs.
To determine the database objects for which a capture process will capture ID key LCRs, run the following query on the source database:

```sql
SELECT OWNER, OBJECT_NAME
FROM DBA_XSTREAM_OUT_SUPPORT_MODE
WHERE SUPPORT_MODE='ID KEY';
```

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**See Also:**

- *Oracle Database XStream Guide* for more information about ID key LCRs
- *Oracle Streams Concepts and Administration* for information about the data types supported by capture processes

**XStream or Oracle GoldenGate Integrated Capture Configurations**

In an XStream or Oracle GoldenGate integrated capture configuration, the following parameters control which changes are captured by a capture process:

- capture_idkey_objects
- capture_sequence_nextval
- excludetag
- excludetrans
- excludeuser
- excludeuserid
- getapplops
- getreplicates
- include_objects
- inline_lob_optimization
- max_sga_size
- use_rac_services

You can set these parameters to avoid change cycling. Change cycling sends a change back to the database where it originated. Typically, change cycling should be avoided in a replication environment so that the same change is not made to a database more than once.

In an XStream or Oracle GoldenGate integrated capture configuration that performs bi-directional replication, a GoldenGate Replicat process runs on the source database for a capture process. Therefore, the changes made by the GoldenGate Replicat are recorded in the redo log.
If an integrated configuration performs bi-directional replication, then, to avoid change
cycling, the capture process should not capture the changes made by the Oracle
GoldenGate Replicat process. To accomplish this goal, use the default settings for the
getapplops and getreplicates parameters and exclude changes made by the user
running the Replicat process. To exclude these changes, specify this user in the
excludeuserid or excludeuser parameter. Typically, the user running the Oracle
GoldenGate Replicat process is the XStream administrator.

In some configurations, the goal might be to capture or exclude changes made by
applications or by the Replicat process. For example, an intermediate database in a
replication environment might capture all of the changes made to the database,
including both application changes and Replicat process changes, and send these
changes to a different destination database.

Table 32-19 describes the capture process behavior when at least one of the exclude
parameters is non-NULL.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>N</td>
<td>Y</td>
<td>The capture process does not capture any DML changes.</td>
</tr>
<tr>
<td>N</td>
<td>N</td>
<td>The capture process does not capture any DML changes.</td>
</tr>
</tbody>
</table>

See the documentation for the Oracle GoldenGate product for more information:

http://docs.oracle.com/cd/E15881_01/index.htm

Note:
A capture process evaluates a change using these parameters before it evaluates a change using its rule sets. Therefore, a capture process can discard a change before the change is evaluated against the capture process's rule sets. Also, regardless of the settings for these parameters, a capture process captures a change only if the change satisfies the capture process's rule sets.

Oracle Database XStream Guide

32.3.17 START_CAPTURE Procedure

This procedure starts the capture process, which mines redo logs and enqueues the mined redo information into the associated queue.

The start status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup.

The capture process is a background Oracle process and is prefixed by c.

The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the start status of a capture process.

See Also:
DBMS_STREAMS_ADM

Syntax

DBMS_CAPTURE_ADM.START_CAPTURE(
    capture_name IN VARCHAR2);
Parameters

Table 32-21  START_CAPTURE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. Do not specify an owner. The capture process uses LogMiner to capture changes in the redo information. A NULL setting is not allowed.</td>
</tr>
</tbody>
</table>

Usage Notes

The capture process status is persistently recorded. Hence, if the status is ENABLED, then the capture process is started upon database instance startup. A capture process \((cnnn)\) is an Oracle background process.

32.3.18 STOP_CAPTURE Procedure

This procedure stops the capture process from mining redo logs.

Syntax

```sql
DBMS_CAPTURE_ADM.STOP_CAPTURE(
    capture_name  IN  VARCHAR2,
    force         IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 32-22  STOP_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>capture_name</td>
<td>The name of the capture process. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then it aborts. If FALSE, then the procedure stops the capture process as soon as possible. If the capture process cannot stop normally, then an ORA-26672 error is returned, and the capture process might continue to run.</td>
</tr>
</tbody>
</table>

Usage Notes

The following usage notes apply to this procedure:

- The capture process status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the capture process is not started upon database instance startup.
- A capture process is an Oracle background process with a name in the form CP\(nn\), where \(nn\) can include letters and numbers.
- The enqueue and dequeue state of DBMS_AQADM.START_QUEUE and DBMS_AQADM.STOP_QUEUE have no effect on the stop status of a capture process.
The **DBMS_COMPARISON** package provides interfaces to compare and converge database objects at different databases.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Views**
- **Operational Notes**
- **Data Structures**
- **Summary of DBMS_COMPARISON Subprograms**

**See Also:**

- Oracle Streams Replication Administrator's Guide for information about using the basic features of this package

### 33.1 DBMS_COMPARISON Overview

The **DBMS_COMPARISON** package is an Oracle-supplied package that you can use to compare database objects at two databases. This package also enables you to converge the database objects so that they are consistent at different databases. Typically, this package is used in environments that share a database object at multiple databases. When copies of the same database object exist at multiple databases, the database object is a **shared database object**. Several data dictionary views contain information about comparisons made with the **DBMS_COMPARISON** package.

Shared database objects might be maintained by data replication. For example, materialized views or Oracle Streams components might replicate the database objects and maintain them at multiple databases. A custom application might also maintain shared database objects. When a database object is shared, it can diverge at the databases that share it. You can use this package to identify differences in the shared database objects. After identifying the differences, you can optionally use this package to synchronize the shared database objects.

To compare a database object that is shared at two different databases, complete the following general steps:

1. Run the **CREATE_COMPARISON Procedure** in this package to create a comparison. The comparison identifies the database objects to compare and specifies parameters for the comparison.
2. Run the **COMPARE Function** in this package to compare the database object at the two databases and identify differences. This function returns **TRUE** when no differences are found and **FALSE** when differences are found. This function also populates data dictionary views with comparison results. Separate comparison results are generated for each execution of the **COMPARE** function.

3. If you want to examine the comparison results, query the following data dictionary views:
   - `DBA_COMPARISON_SCAN`
   - `USER_COMPARISON_SCAN`
   - `DBA_COMPARISON_SCAN_VALUES`
   - `USER_COMPARISON_SCAN_VALUES`
   - `DBA_COMPARISON_ROW_DIF`
   - `USER_COMPARISON_ROW_DIF`

4. If there are differences, and you want to synchronize the database objects at the two databases, then run the **CONVERGE** procedure in this package.

After you create a comparison with the **CREATE_COMPARISON** procedure in the DBMS_COMPARISON package, you can run the comparison at any time using the **COMPARE** function. Each time you run the **COMPARE** function, it records comparison results in the appropriate data dictionary views. Comparison results might be modified when subprograms in this package are invoked and the scans in the comparison results are specified. For example, comparison results might be modified when you run the **RECHECK** function.

The comparison results for a single execution of the **COMPARE** function can include one or more **scans**. A scan checks for differences in some or all of the rows in a shared database object at a single point in time. You can compare database objects multiple times, and a unique scan ID identifies each scan in the comparison results.

A **bucket** is a range of rows in a database object that is being compared. Buckets improve performance by splitting the database object into ranges and comparing the ranges independently. Every comparison divides the rows being compared into an appropriate number of buckets, and each bucket is compared by a scan.

Each time the **COMPARE** function splits a bucket into smaller buckets, it performs new scans of the smaller buckets. The scan that analyzes a larger bucket is the **parent scan** of each scan that analyzes the smaller buckets into which the larger bucket was split. The **root scan** in the comparison results is the highest level parent scan. The root scan does not have a parent.

You can recheck a scan using the **RECHECK** function, and you can converge a scan using the **CONVERGE** procedure. When you want to recheck or converge all of the rows comparison results, specify the root scan ID for the comparison results in the appropriate subprogram. When you want to recheck or converge a portion of the rows in comparison results, specify the scan ID of the scan that contains the differences.
33.2 DBMS_COMPARISON Security Model

Security on this package can be controlled in one of two ways.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

Each subprogram in the DBMS_COMPARISON package has a `comparison_name` parameter. The current user must be the owner of the specified comparison to run a subprogram in the DBMS_COMPARISON package.

To run the `COMPARE` function, `RECHECK` function, or `CONVERGE` procedure, the following users must have the `SELECT` or `READ` privilege on each copy of the shared database object:

- The comparison owner at the local database
- When a database link is used, the user at the remote database to which the comparison owner connects through a database link

The `CONVERGE` procedure also requires additional privileges for one of these users at the database where it makes changes to the shared database object. The user must have `INSERT`, `UPDATE`, and `DELETE` privileges on the shared database object at this database.

In addition, when the `CONVERGE` procedure is run with either the `local_converge_tag` or `remote_converge_tag` parameter set to a non-NULL value, then the following additional requirements must be met:

- If the local table "wins," then the user at the remote database to which the invoker of the `CONVERGE` procedure connects through a database link must be granted either `EXECUTE_CATALOG_ROLE` or `EXECUTE` privilege on the DBMS_STREAMS_ADM package.
- If the remote table "wins," then the invoker of the `CONVERGE` procedure at the local database must be granted either `EXECUTE_CATALOG_ROLE` or `EXECUTE` privilege on the DBMS_STREAMS_ADM package.

Note:

The database administrator (DBA) can assume control over some of the DBMS_COMPARISON functions and procedures owned by other users. This control applies to `DROP_COMPARISON` and `PURGE_COMPARISON`. This DBA override can be particularly useful in cleanup operations when comparisons created by another user need to be dropped.
33.3 DBMS_COMPARISON Constants

The DBMS_COMPARISON package defines several enumerated constants to use specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_COMPARISON.CMP_SCAN_MODE_FULL.

Table 33-1 lists the parameters and enumerated constants.

Table 33-1  DBMS_COMPARISON Parameters with Enumerated Constants

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_mode</td>
<td>• CMP_COMPARE_MODE_OBJECT</td>

33.4 DBMS_COMPARISON Views

The DBMS_COMPARISON package uses several views.

These views are listed below:

- DBA_COMPARISON
- USER_COMPARISON
- DBA_COMPARISON_COLUMNS
- USER_COMPARISON_COLUMNS
- DBA_COMPARISON_SCAN
- USER_COMPARISON_SCAN
- DBA_COMPARISON_SCAN_VALUES
- USER_COMPARISON_SCAN_VALUES
- DBA_COMPARISON_ROW_DIF
- USER_COMPARISON_ROW_DIF

See Also:
Oracle Database Reference

33.5 DBMS_COMPARISON Operational Notes

The DBMS_COMPARISON package has certain requirements and operational notes.

These include the following:
Oracle Database Release Requirements for the DBMS_COMPARISON Package

Meet the following Oracle Database release requirements when running the subprograms in the DBMS_COMPARISON package:

• The local database that runs the subprograms in the DBMS_COMPARISON package must be an Oracle Database 11g Release 1 (11.1) database.
• The remote database must be an Oracle Database 10g Release 1 (10.1) or later database. Oracle databases before this release and non-Oracle databases are not supported.

Database Character Set Requirements for the DBMS_COMPARISON Package

The database character sets must be the same for the databases that contain the database objects being compared.

See Also:
Oracle Database Globalization Support Guide for information about database character sets

Database Object Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare the following types of database objects:

• Tables
• Single-table views
• Materialized views
• Synonyms for tables, single-table views, and materialized views

Database objects of different types can be compared and converged at different databases. For example, a table at one database and a materialized view at another database can be compared and converged with this package.

To run the subprograms in the DBMS_COMPARISON package, the specified database objects must have the same shape at each database. Specifically, the database objects must have the same number of columns at each database, and the datatypes of corresponding columns must match.

If a database object being compared contains columns that do not exist in the other database object, then you can compare the database objects by excluding the extra columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the columns that exist in both database objects.
Index Column Requirements for the DBMS_COMPARISON Package

This section discusses number, timestamp, and interval columns. These include the following datatypes:

- **Number columns** are of the following datatypes: `NUMBER`, `FLOAT`, `BINARY_FLOAT`, and `BINARY_DOUBLE`.
- **Timestamp columns** are of the following datatypes: `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, and `TIMESTAMP WITH LOCAL TIME ZONE`.
- **Interval columns** are of the following datatypes: `INTERVAL YEAR TO MONTH` and `INTERVAL DAY TO SECOND`.

For all scan modes to be supported by the `DBMS_COMPARISON` package, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, or `DATE` datatype column
- A composite index that only includes number, timestamp, interval, or `DATE` datatype columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

For the scan modes `CMP_SCAN_MODE_FULL` and `CMP_SCAN_MODE_CUSTOM` to be supported, the database objects must have one of the following types of indexes:

- A single-column index on a number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` datatype column
- A composite index that only includes number, timestamp, interval, `DATE`, `VARCHAR2`, or `CHAR` columns. Each column in the composite index must either have a `NOT NULL` constraint or be part of the primary key.

If the database objects do not have one of these types of indexes, then the `DBMS_COMPARISON` package does not support the database objects. For example, if the database objects only have a single index on an `NVARCHAR2` column, then the `DBMS_COMPARISON` package does not support them. Or, if the database objects have only one index, and it is a composite index that includes a `NUMBER` column and an `NCHAR` column, then the `DBMS_COMPARISON` package does not support them.

You can specify an index when you create a comparison using the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure. If you specify an index, then make sure the columns in the index meet the requirements of the scan mode used for the comparison.

The index columns in a comparison must uniquely identify every row involved in a comparison. The following constraints satisfy this requirement:

- A primary key constraint
- A unique constraint on one or more `NON-NULL` columns

If these constraints are not present on a table, then use the `index_schema_name` and `index_name` parameters in the `CREATE_COMPARISON` procedure to specify an index whose columns satisfy this requirement.
When a single index value identifies both a local row and a remote row, the two rows must be copies of the same row in the replicated tables. In addition, each pair of copies of the same row must always have the same index value.

The DBMS_COMPARISON package can use an index only if all of the columns in the index are included in the column_list parameter when the comparison is created with the CREATE_COMPARISON procedure.

After a comparison is created, you can determine the index column or columns for it by running the following query:

```sql
SELECT COLUMN_NAME, COLUMN_POSITION FROM DBA_COMPARISON_COLUMNS
WHERE COMPARISON_NAME = 'COMPARE_CUSTOM' AND
INDEX_COLUMN    = 'Y';
```

If there are multiple index columns, then the index column with 1 for the COLUMN_POSITION is the lead index column in the composite index.

### See Also:
- "Constants" for information about scan modes
- CREATE_COMPARISON Procedure for information about specifying an index for a comparison

### Datatype Requirements for the DBMS_COMPARISON Package

The DBMS_COMPARISON package can compare data in columns of the following datatypes:

- VARCHAR2
- NVARCHAR2
- NUMBER
- FLOAT
- DATE
- BINARY_FLOAT
- BINARY_DOUBLE
- TIMESTAMP
- TIMESTAMP WITH TIME ZONE
- TIMESTAMP WITH LOCAL TIME ZONE
- INTERVAL YEAR TO MONTH
- INTERVAL DAY TO SECOND
- RAW
- CHAR
- NCHAR

If a column with datatype TIMESTAMP WITH LOCAL TIME ZONE is compared, then the two databases must use the same time zone. Also, if a column with datatype NVARCHAR2 or NCHAR is compared, then the two databases must use the same national character set.
The DBMS_COMPARISON package cannot compare data in columns of the following datatypes:

- LONG
- LONG RAW
- ROWID
- UROWID
- CLOB
- NCLOB
- BLOB
- BFILE
- User-defined types (including object types, REFS, varrays, and nested tables)
- Oracle-supplied types (including any types, XML types, spatial types, and media types)

You can compare database objects that contain unsupported columns by excluding the unsupported columns during comparison creation. Use the column_list parameter in the CREATE_COMPARISON procedure to list only the supported columns in a shared database object.

See Also:

- CREATE_COMPARISON Procedure
- Oracle Database SQL Language Reference for more information about datatypes
- Oracle Database Globalization Support Guide for information about national character sets

Only Converge Rows That Are Not Being Updated

You should only converge rows that are not being updated on either database. For example, if the shared database object is updated by replication components, then only converge rows for which replication changes have been applied and make sure no new changes are in the process of being replicated for these rows. If you compare replicated database objects, then it is typically best to compare them during a time of little or no replication activity to identify persistent differences.

Note:

If a scan identifies that a row is different in the shared database object at two databases, and the row is modified after the scan, then it can result in unexpected data in the row after the CONVERGE procedure is run.
33.6 DBMS_COMPARISON Data Structures

The DBMS_COMPARISON package defines a RECORD type.

Contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note:

The COMPARE function only returns a value for the scan_id field.

33.6.1 COMPARISON_TYPE Record Type

This record type contains information returned by the COMPARE function or CONVERGE procedure in the DBMS_COMPARISON package.

Note:

The COMPARE function only returns a value for the scan_id field.

Syntax

TYPE COMPARISON_TYPE IS RECORD(
    scan_id           NUMBER,
    loc_rows_merged   NUMBER,
    rmt_rows_merged   NUMBER,
    loc_rows_deleted  NUMBER,
    rmt_rows_deleted  NUMBER);

Table 33-2   COMPARISON_TYPE Attributes

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

33.7.1 COMPARE Function

This function performs the specified comparison.

Each time a comparison is performed, it results in at least one new scan, and each scan has a unique scan ID. You can define and name a comparison using the CREATE_COMPARISON procedure.

See Also:

- “Overview”
- CREATE_COMPARISON Procedure

Syntax

```sql
DBMS_COMPARISON.COMPARE(
    comparison_name  IN VARCHAR2,
    scan_info        OUT COMPARISON_TYPE,
    min_value        IN VARCHAR2   DEFAULT NULL,
    max_value        IN VARCHAR2   DEFAULT NULL,
    perform_row_dif  IN VARCHAR2 DEFAULT NULL,
    RETURN BOOLEAN;
)
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
</tbody>
</table>

<tbody>
<tr>
<td><strong>scan_info</strong></td>
<td>Information about the compare operation returned in the COMPARISON_TYPE datatype.</td>
</tr>
<tr>
<td><strong>min_value</strong></td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the minimum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See the index column requirements under DBMS_COMPARISON Operational Notes.</td>
</tr>
<tr>
<td><strong>max_value</strong></td>
<td>When the scan mode for the comparison is set to CMP_SCAN_MODE_CUSTOM, specify the maximum index column value for the range of rows that are being compared. To determine the index column for a comparison, query the DBA_COMPARISON_COLUMNS data dictionary view. For a composite index, specify a value for the column with column_position equal to 1 in the DBA_COMPARISON_COLUMNS view. See the index column requirements under DBMS_COMPARISON Operational Notes.</td>
</tr>
<tr>
<td><strong>perform_row_dif</strong></td>
<td>If TRUE, then compares each row individually in the database object being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See DBMS_COMPARISON Overview for information about buckets.</td>
</tr>
</tbody>
</table>

### Return Values

This function returns **TRUE** when no differences are found in the database objects being compared. This function returns **FALSE** when differences are found in the database objects being compared.
33.7.2 CONVERGE Procedure

This procedure executes data manipulation language (DML) changes to synchronize the portion of the database objects that was compared in the specified scan.

Syntax

```sql
DBMS_COMPARISON.CONVERGE(
    comparison_name      IN   VARCHAR2,
    scan_id              IN   NUMBER,
    scan_info            OUT  COMPARISON_TYPE,
    converge_options     IN   VARCHAR2  DEFAULT CMP_CONVERGE_LOCAL_WINS,
    perform_commit       IN   BOOLEAN   DEFAULT TRUE,
    local_converge_tag   IN   RAW       DEFAULT NULL,
    remote_converge_tag  IN   RAW       DEFAULT NULL);
```

Parameters

Table 33-5  CONVERGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The identifier for the scan that contains the differences between the database objects being converged. See &quot;Overview&quot; for more information about specifying a scan ID in this parameter.</td>
</tr>
<tr>
<td>scan_info</td>
<td>Information about the converge operation returned in the COMPARISON_TYPE datatype. See COMPARISON_TYPE Record Type.</td>
</tr>
<tr>
<td>converge_options</td>
<td>Either the CMP_CONVERGE_LOCAL_WINS constant or the CMP_CONVERGE_REMOTE_WINS constant. See &quot;Constants&quot; for information about these constants.</td>
</tr>
<tr>
<td>perform_commit</td>
<td>If TRUE, then performs a COMMIT periodically while making the DML changes. The CONVERGE procedure might perform more than one COMMIT when this parameter is set to TRUE. If FALSE, then does not perform a COMMIT after making DML changes.</td>
</tr>
<tr>
<td>local_converge_tag</td>
<td>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being converged. If non-NULL, then this parameter setting takes precedence over the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison. If NULL, then this parameter is ignored, and the local_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used. See Security Model for information about security requirement related to this parameter, and see the Oracle Streams Replication Administrator's Guide for more information about tags.</td>
</tr>
</tbody>
</table>
Table 33-5  (Cont.) CONVERGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| remote_converge_tag| The Oracle Streams tag to set in the session on the remote database before performing any changes to converge the data in the database objects being converged.  
If non-NULL, then this parameter setting takes precedence over the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison.  
If NULL, then this parameter is ignored, and the remote_converge_tag parameter in the CREATE_COMPARISON procedure that created the comparison is used.  
See Security Model for information about security requirement related to this parameter, and see the Oracle Streams Replication Administrator’s Guide for more information about tags. |

Usage Notes

If one of the database objects being converged is a read-only materialized view, then the converge_options parameter must be set to ensure that the read-only materialized view “wins” in the converge operation. The CONVERGE procedure raises an error if it tries to make changes to a read-only materialized view.

33.7.3 CREATE_COMPARISON Procedure

This procedure creates a comparison.

Syntax

```
DBMS_COMPARISON.CREATE_COMPARISON(
    comparison_name      IN  VARCHAR2,
    schema_name          IN  VARCHAR2,
    object_name          IN  VARCHAR2,
    dblink_name          IN  VARCHAR2,
    index_schema_name    IN  VARCHAR2  DEFAULT NULL,
    index_name           IN  VARCHAR2  DEFAULT NULL,
    remote_schema_name   IN  VARCHAR2  DEFAULT NULL,
    remote_object_name   IN  VARCHAR2  DEFAULT NULL,
    comparison_mode      IN  VARCHAR2  DEFAULT CMP_COMPARE_MODE_OBJECT,
    column_list          IN  VARCHAR2  DEFAULT '*',
    scan_mode            IN  VARCHAR2  DEFAULT CMP_SCAN_MODE_FULL,
    scan_percent         IN  NUMBER    DEFAULT NULL,
    null_value           IN  VARCHAR2  DEFAULT CMP_NULL_VALUE_DEF,
    local_converge_tag   IN  RAW       DEFAULT NULL,
    remote_converge_tag  IN  RAW       DEFAULT NULL,
    max_num_buckets      IN  NUMBER    DEFAULT CMP_MAX_NUM_BUCKETS,
    min_rows_in_bucket   IN  NUMBER    DEFAULT CMP_MIN_ROWS_IN_BUCKET);
```

Parameters

<tr>
<td>object_name</td>
<td>The name of the local database object to compare.</td>
</tr>
<tr>
<td>dblink_name</td>
<td>Database link to the remote database. The specified database object in the remote database is compared with the database object in the local database. If NULL, then the comparison is configured to compare two database objects in the local database. In this case, parameters that specify the remote database object apply to the second database object in the comparison and to operations on the second database object. For example, specify the second database object in this procedure by using the remote_schema_name and remote_object_name parameters.</td>
</tr>
<tr>
<td>index_schema_name</td>
<td>The name of the schema that contains the index. If NULL, then the schema specified in the schema_name parameter is used.</td>
</tr>
<tr>
<td>index_name</td>
<td>The name of the index. If NULL, then the system determines the index columns for the comparison automatically.</td>
</tr>
<tr>
<td></td>
<td>If the index_schema_name parameter is non-NULL, then the index_name parameter must also be non-NULL. Otherwise, an error is raised.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> &quot;Usage Notes&quot; for more information about specifying an index.</td>
</tr>
<tr>
<td>remote_schema_name</td>
<td>The name of the schema that contains the database object at the remote database. Specify a non-NULL value if the schema names are different at the two databases. If NULL, then the schema specified in the schema_name parameter is used.</td>
</tr>
<tr>
<td>remote_object_name</td>
<td>The name of the database object at the remote database. Specify a non-NULL value if the database object names are different at the two databases. If NULL, then the database object specified in the object_name parameter is used.</td>
</tr>
<tr>
<td>comparison_mode</td>
<td>Specify the default value CMP_COMPARE_MODE_OBJECT. Additional modes might be added in future releases.</td>
</tr>
<tr>
<td>column_list</td>
<td>Specify '*' to include all of the columns in the database objects being compared. To compare a subset of columns in the database objects, specify a comma-delimited list of the columns to check. Any columns that are not in the list are ignored during a comparison and convergence. See &quot;Usage Notes&quot; for information about columns that are required in the column_list parameter.</td>
</tr>
</tbody>
</table>
## Table 33-6  (Cont.) CREATE_COMPARISON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>scan_mode</code></td>
<td>Either <code>CMP_SCAN_MODE_FULL</code>, <code>CMP_SCAN_MODE_RANDOM</code>, <code>CMP_SCAN_MODE_CYCLIC</code>, or <code>CMP_SCAN_MODE_CUSTOM</code>. If you specify <code>CMP_SCAN_MODE_CUSTOM</code>, then make sure you specify an index using the <code>index_schema_name</code> and <code>index_name</code> parameters. Specifying an index ensures that you can specify the correct <code>min_value</code> and <code>max_value</code> for the lead index column when you run the <code>COMPARE</code> or <code>RECHECK</code> function. See &quot;Constants&quot; for information about these constants.</td>
</tr>
<tr>
<td><code>scan_percent</code></td>
<td>The percentage of the database object to scan for comparison when the <code>scan_mode</code> parameter is set to either <code>CMP_SCAN_MODE_RANDOM</code> or <code>CMP_SCAN_MODE_CYCLIC</code>. For these <code>scan_mode</code> settings, a non-NULL value that is greater than 0 (zero) and less than 100 is required. If NULL and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_FULL</code>, then the entire database object is scanned for comparison. If NULL and the <code>scan_mode</code> parameter is set to <code>CMP_SCAN_MODE_CUSTOM</code>, then the portion of the database object scanned for comparison is specified when the <code>COMPARE</code> function is run. If non-NULL and the <code>scan_mode</code> parameter is set to either <code>CMP_SCAN_MODE_FULL</code> or <code>CMP_SCAN_MODE_CUSTOM</code>, then the <code>scan_percent</code> parameter is ignored. <strong>Note:</strong> When the <code>scan_percent</code> parameter is non-NULL, and the lead index column for the comparison does not distribute the rows in the database object evenly, the portion of the database object that is compared might be smaller or larger than the specified <code>scan_percent</code> value. See DBMS_COMPARISON Operational Notes for more information about the DBMS_COMPARISON package index requirements for the lead index column.</td>
</tr>
<tr>
<td><code>null_value</code></td>
<td>The value to substitute for each NULL in the database objects being compared. Specify a value or use the <code>CMP_NULL_VALUE_DEF</code> constant. If a column being compared can contain NULLs, then the value specified for this parameter must be different than any non-NULL value in the column. Otherwise, if the value specified for this parameter can appear in the column, some row differences might not be found. See &quot;Constants&quot; for information about this constant.</td>
</tr>
<tr>
<td><code>local_converge_tag</code></td>
<td>The Oracle Streams tag to set in the session on the local database before performing any changes to converge the data in the database objects being compared. If the <code>local_converge_tag</code> parameter is non-NULL in the <code>CONVERGE</code> procedure when comparison results for this comparison are converged, then the setting in the <code>CONVERGE</code> procedure takes precedence. See CONVERGE Procedure for more information. See the Oracle Streams Replication Administrator's Guide for more information about tags.</td>
</tr>
</tbody>
</table>

<td>Specify the minimum number of rows in each bucket. Specify a value or use the CMP_MIN_ROWS_IN_BUCKET constant. See &quot;Constants&quot; for information about this constant. See &quot;Overview&quot; for information about buckets.</td>
</tr>
</tbody>
</table>

Usage Notes

This section contains usage notes for the CREATE_COMPARISON procedure.

Usage Notes for the index_schema_name and index_name Parameters

When you specify an index for a comparison with the index_schema_name and index_name parameters, the specified index determines the comparison's index columns and their ordering. The order of the columns in the index determines the index column ordering for the comparison. Therefore, the column in column position 1 in the index is the lead column for the comparison.

The index columns and their ordering affect the details of each SQL statement generated and executed for a comparison. For each SQL statement, the optimizer decides whether to use indexes. If the optimizer decides to use indexes, then the optimizer decides which particular indexes to use. An index specified in column_list parameter might or might not be used.

The columns in the specified index must meet the requirements described in DBMS_COMPARISON Operational Notes. If the index columns do not meet these requirements, then an error is raised.
If you do not specify an index when you create a comparison, then the `CREATE_COMPARISON` procedure selects either the primary key, if it exists, or an existing unique index. The procedure never selects a non-unique index. However, if you specify an index, then the `CREATE_COMPARISON` procedure does not check its uniqueness. Therefore, if you specify a non-unique index, and duplicate index keys exist, then the results might be incorrect when the `CONVERGE` procedure synchronizes data.

Usage Notes for the `column_list` Parameter

When the `column_list` parameter is set to a value other than '*', the following columns are required in the `column_list` parameter:

- Any columns that are required to meet the index column requirements for the `DBMS_COMPARISON` package. If the `index_name` parameter is non-NULL, then the columns in the specified index must be in the column list. If the `index_name` parameter is NULL, then see `DBMS_COMPARISON Operational Notes` for information about the `DBMS_COMPARISON` index requirements.

- If you plan to use the `CONVERGE` procedure to make changes to a database object based on the comparison, then any columns in this database object that have a `NOT NULL` constraint but no default value must be included in the column list. If these columns are not included, then the `CONVERGE` procedure returns an error. See `CONVERGE Procedure`.

### 33.7.4 DROP_COMPARISON Procedure

This procedure drops a comparison.

**Syntax**

```
DBMS_COMPARISON.DROP_COMPARISON(
    comparison_name  IN  VARCHAR2);
```

**Parameters**

**Table 33-7  DROP_COMPARISON Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
</tbody>
</table>
33.7.5 PURGE_COMPARISON Procedure

This procedure purges the comparison results, or a subset of the comparison results, for a comparison.

**Note:**

At least one of the following parameters must be set to `NULL`: `scan_id` or `purge_time`. If both the `scan_id` and `purge_time` parameters are `NULL`, then this procedure purges all comparison results for the comparison.

**Syntax**

```sql
DBMS_COMPARISON.PURGE_COMPARISON(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER     DEFAULT NULL,
    purge_time       IN  TIMESTAMP  DEFAULT NULL);
```

**Parameters**

**Table 33-8  PURGE_COMPARISON Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan for which results are purged. The scan ID must</td>
</tr>
<tr>
<td></td>
<td>identify a root scan. If the scan ID does not identify a root scan, then</td>
</tr>
<tr>
<td></td>
<td>an error is raised. When a root scan ID is specified, it is purged, and all</td>

<tr>
<td></td>
<td>for the comparison.</td>
</tr>
</tbody>
</table>

33.7.6 RECHECK Function

This function rechecks the differences in a specified scan for a comparison.

This function performs one of the following actions:

- If the specified scan completed successfully the last time it ran, then this function checks the previously identified differences in the scan.
- If the specified scan completed partially, then this function continues to check the database object from the point where the previous scan ended.
Note:

This function does not compare the shared database object for differences that were not recorded in the specified comparison scan. To check for those differences, run the COMPARE function.

See Also:

- Oracle Streams Replication Administrator's Guide
- COMPARE Function

Syntax

```sql
DBMS_COMPARISON.RECHECK(
    comparison_name  IN  VARCHAR2,
    scan_id          IN  NUMBER,
    perform_row_dif  IN  BOOLEAN  DEFAULT FALSE)
RETURN BOOLEAN;
```

Parameters

Table 33-9  RECHECK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comparison_name</td>
<td>The name of the comparison.</td>
</tr>
<tr>
<td>scan_id</td>
<td>The scan ID of the scan to recheck.</td>
</tr>
<tr>
<td>perform_row_dif</td>
<td>If TRUE, then compares each row individually in the database objects being compared after reaching the smallest possible bucket for the comparison. If FALSE, then compares buckets for differences but does not compare each row individually when differences are found in the smallest possible bucket. See “Overview” for information about buckets.</td>
</tr>
</tbody>
</table>

Return Values

This function returns TRUE when no differences are found in the database objects being compared. This function returns FALSE when differences are found in the database objects being compared.
The DBMS_COMPRESSION package provides an interface to facilitate choosing the correct compression level for an application.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Data Structures
- Summary of DBMS_COMPRESSION Subprograms

See Also:

- Oracle Database Reference

### 34.1 DBMS_COMPRESSION Overview

The DBMS_COMPRESSION package gathers compression-related information within a database environment. This includes tools for estimating compressibility of a table for both partitioned and non-partitioned tables, and gathering row-level compression information on previously compressed tables. This gives the user with adequate information to make compression-related decision.

### 34.2 DBMS_COMPRESSION Security Model

The DBMS_COMPRESSION package is defined with AUTHID CURRENT USER, so it executes with the privileges of the current user.

### 34.3 DBMS_COMPRESSION Constants

The DBMS_COMPRESSION package uses constants that can be used for specifying parameter values.

These constants are shown in the following table:
<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMP_NOCOMPRESS</td>
<td>NUMBER</td>
<td>1</td>
<td>No compression</td>
</tr>
<tr>
<td>COMP_advanced</td>
<td>NUMBER</td>
<td>2</td>
<td>Advanced row compression</td>
</tr>
<tr>
<td>COMP_QUERY_HIGH</td>
<td>NUMBER</td>
<td>4</td>
<td>High for query warehouse compression (Hybrid Columnar Compression)</td>
</tr>
<tr>
<td>COMP_QUERY_LOW</td>
<td>NUMBER</td>
<td>8</td>
<td>Low for query warehouse compression (Hybrid Columnar Compression)</td>
</tr>
<tr>
<td>COMP_ARCHIVE_HIGH</td>
<td>NUMBER</td>
<td>16</td>
<td>High archive compression (Hybrid Columnar Compression)</td>
</tr>
<tr>
<td>COMP_ARCHIVE_LOW</td>
<td>NUMBER</td>

</tbody>
</table>

Note:
Hybrid columnar compression is a feature of certain Oracle storage systems. See Oracle Database Concepts for more information.

34.4 DBMS_COMPRESSION Data Structures

The DBMS_COMPRESSION package defines a RECORD type and a TABLE type.

RECORD TYPES

COMPREC Record Type

TABLE TYPES

COMPRECLIST Table Type

34.4.1 COMPREC Record Type

The COMPREC record type is a record for calculating an individual index compression ratio on a table.

Syntax

```
TYPE COMPREC IS RECORD(
  ownname  varchar2(255),
  objname  varchar2(255),
  blkcnt_cmp  PLS_INTEGER,
  blkcnt_uncmp  PLS_INTEGER,
  row_cmp  PLS_INTEGER,
  row_uncmp  PLS_INTEGER,
);
```
cmp_ratio NUMBER,  
objtype PLS_INTEGER);

Fields

Table 34-2  COMPREC Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the object owner</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by the compressed sample of the object</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by the uncompressed sample of the object</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the object</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the object</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object</td>
</tr>
</tbody>
</table>

34.4.2 COMPRECLIST Table Type

COMPRECLIST is a table type of the COMPREC Record Type.

Syntax

TYPE compreclist IS TABLE OF comprec;

Related Topics

• COMPREC Record Type
  The COMPREC record type is a record for calculating an individual index compression ratio on a table.

34.5 Summary of DBMS_COMPRESSION Subprograms

The DBMS_COMPRESSION package uses the GET_COMPRESSION_RATIO Procedure and GET_COMPRESSION_TYPE Function subprograms.

Table 34-3  DBMS_COMPRESSION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_COMPRESSION_RATIO Procedure</td>
<td>Analyzes the compression ratio of a table, and gives information about compressibility of a table</td>
</tr>
<tr>
<td>GET_COMPRESSION_TYPE Function</td>
<td>Returns the compression type for a specified row</td>
</tr>
</tbody>
</table>
34.5.1 GET_COMPRESSION_RATIO Procedure

This procedure analyzes the compression ratio of a table or an index, and gives information about compressibility of the object. Various parameters can be provided by the user to selectively analyze different compression types.

Syntax

Get compression ratio for an object (table or index, default is table):

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname        IN     VARCHAR2,  
  ownname               IN     VARCHAR2,  
  objname               IN     VARCHAR2,  
  subobjname            IN     VARCHAR2,  
  comptype              IN     NUMBER,  
  blkcnt_cmp            OUT    PLS_INTEGER,  
  blkcnt_uncmp          OUT    PLS_INTEGER,  
  row_cmp               OUT    PLS_INTEGER,  
  row_uncmp             OUT    PLS_INTEGER,  
  cmp_ratio             OUT    NUMBER,  
  comptype_str          OUT    VARCHAR2,  
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_MINROWS,  
  objtype               IN     PLS_INTEGER DEFAULT OBJTYPE_TABLE);
```

Get compression ratio for LOBs:

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname        IN     VARCHAR2,  
  tabowner              IN     VARCHAR2,  
  tabname               IN     VARCHAR2,  
  lobname               IN     VARCHAR2,  
  partname              IN     VARCHAR2,  
  comptype              IN     NUMBER,  
  blkcnt_cmp            OUT    PLS_INTEGER,  
  blkcnt_uncmp          OUT    PLS_INTEGER,  
  lobcnt                OUT    PLS_INTEGER,  
  cmp_ratio             OUT    NUMBER,  
  comptype_str          OUT    VARCHAR2,  
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_LOB_MAXROWS);
```

Get compression ratio for all indexes on a table. The compression ratios are returned as a collection.

```sql
DBMS_COMPRESSION.GET_COMPRESSION_RATIO (  
  scratchtbsname        IN     VARCHAR2,  
  ownname               IN     VARCHAR2,  
  tabname               IN     VARCHAR2,  
  comptype              IN     NUMBER,  
  index_cr              OUT    DBMS_COMPRESSION.COMPRECLIST,  
  comptype_str          OUT    VARCHAR2,  
  subset_numrows        IN     NUMBER DEFAULT COMP_RATIO_INDEX_MINROWS);
```
Parameters

Table 34-4    GET_COMPRESSION_RATIO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scratchtbsname</td>
<td>Temporary scratch tablespace that can be used for analysis</td>
</tr>
<tr>
<td>ownname/ tabowner</td>
<td>Schema of the table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to analyze</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the partition or sub-partition of the object</td>
</tr>
<tr>
<td>compctype</td>
<td>Compression types for which analysis should be performed</td>
</tr>
<tr>
<td></td>
<td>When the object is an index, only the following compression types are valid:</td>
</tr>
<tr>
<td></td>
<td>COMP_INDEX_ADVANCED_HIGH (value 1024) and COMP_INDEX_ADVANCED_LOW (value 2048).</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The following compression types cannot be specified in this parameter for any type of object: COMP_BLOCK (value 64) and COMP_BASIC (value 4096).</td>
</tr>
<tr>
<td>blkcnt_cmp</td>
<td>Number of blocks used by compressed sample of the table</td>
</tr>
<tr>
<td>blkcnt_uncmp</td>
<td>Number of blocks used by uncompressed sample of the table</td>
</tr>
<tr>
<td>row_cmp</td>
<td>Number of rows in a block in compressed sample of the table</td>
</tr>
<tr>
<td>row_uncmp</td>
<td>Number of rows in a block in uncompressed sample of the table</td>
</tr>
<tr>
<td>cmp_ratio</td>
<td>Compression ratio, blkcnt_uncmp divided by blkcnt_cmp</td>
</tr>
<tr>
<td>compctype_str</td>
<td>String describing the compression type</td>
</tr>
<tr>
<td>subset_numrows</td>
<td>Number of rows sampled to estimate compression ratio</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object, either OBJTYPE_TABLE or OBJTYPE_INDEX</td>
</tr>
<tr>
<td>lobname</td>
<td>Name of the LOB column</td>
</tr>
<tr>
<td>partname</td>
<td>In case of partitioned tables, the related partition name</td>
</tr>
<tr>
<td>lobcnt</td>
<td>Number of lobs actually sampled to estimate compression ratio</td>
</tr>
<tr>
<td>index_cr</td>
<td>List of indexes and their estimated compression ratios</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure creates different tables in the scratch tablespace and runs analysis on these objects. It does not modify anything in the user-specified tables.

34.5.2 GET_COMPRESSION_TYPE Function

This function returns the compression type for a specified row. If the row is chained, the function returns the compression type of the head piece only, and does not examine the intermediate or the tail piece since head pieces can be differently compressed.

Syntax

```sql
DBMS_COMPRESSION.GET_COMPRESSION_TYPE (    
    ownname IN VARCHAR2, 
    tabname IN VARCHAR2, 
    row_id IN ROWID, 
)```
subobjname IN VARCHAR2 DEFAULT NULL))
RETURN NUMBER;

Parameters

Table 34-5  GET_COMPRESSION_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>rowid</td>
<td>Rowid of the row</td>
</tr>
<tr>
<td>subobjname</td>
<td>Name of the table partition or subpartition</td>
</tr>
</tbody>
</table>

Return Values

Flag to indicate the compression type (see Table 34-1).
The `DBMS_CONNECTION_POOL` package provides an interface to manage Database Resident Connection Pool.

See Also:

*Oracle Database Concepts* for more information on "Database Resident Connection Pooling"

This chapter contains the following topic:

- Summary of DBMS_CONNECTION_POOL Subprograms

### 35.1 Summary of DBMS_CONNECTION_POOL Subprograms

This table lists the `DBMS_CONNECTION_POOL` subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PARAM Procedure</td>
<td>Alters a specific configuration parameter as a standalone unit and does not affect other parameters</td>
</tr>
<tr>
<td>CONFIGURE_POOL Procedure</td>
<td>Configures the pool with advanced options</td>
</tr>
<tr>
<td>START_POOL Procedure</td>
<td>Starts the pool for operations. It is only after this call that the pool could be used by connection clients for creating sessions</td>
</tr>
<tr>
<td>STOP_POOL Procedure</td>
<td>Stops the pool and makes it unavailable for the registered connection clients</td>
</tr>
<tr>
<td>RESTORE_DEFAULTS Procedure</td>
<td>Restores the pool to default settings</td>
</tr>
</tbody>
</table>

### 35.1.1 ALTER_PARAM Procedure

This procedure alters a specific configuration parameter as a standalone unit and does not affect other parameters.

**Syntax**

```sql
DBMS_CONNECTION_POOL.ALTER_PARAM (pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
```

---

35-1
param_name    IN  VARCHAR2,
param_value   IN  VARCHAR2);

Parameters

Table 35-2    ALTER_PARAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
</tr>
<tr>
<td>param_name</td>
</tr>
<tr>
<td>param_value</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>Any parameter name from CONFIGURE_POOL</td>
</tr>
<tr>
<td>Parameter value for param_name.</td>
</tr>
</tbody>
</table>

See Also:

For the list and description of all the database resident connection pooling parameters that can be configured using this procedure, see the Oracle Database Administrator's Guide.

Exceptions

Table 35-3    ALTER_PARAM Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56504</td>
<td>Invalid connection pool configuration parameter name</td>
</tr>
<tr>
<td>ORA-56505</td>
<td>Invalid connection pool configuration parameter value</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_CONNECTION_POOL.ALTER_PARAM(
    'SYS_DEFAULT_CONNECTION_POOL', 'MAX_LIFETIME_SESSION', '120');
```

35.1.2 CONFIGURE_POOL Procedure

This procedure configures the pool with advanced options.

Syntax

```
DBMS_CONNECTION_POOL.CONFIGURE_POOL (  
    pool_name                IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL',
    minsize                  IN NUMBER   DEFAULT 4,
    maxsize                  IN NUMBER   DEFAULT 40,
    incrsize                 IN NUMBER   DEFAULT 2,
    session_cached_cursors   IN NUMBER   DEFAULT 20,
    inactivity_timeout       IN NUMBER   DEFAULT 300,
    max_think_time           IN NUMBER   DEFAULT 120,
    max_use_session          IN NUMBER   DEFAULT 500000,
    max_lifetime_session     IN NUMBER   DEFAULT 86400,
    max_txn_think_time       IN NUMBER);
```
Parameters

Table 35-4  CONFIGURE_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be configured. Currently only the default pool name is supported.</td>
</tr>
<tr>
<td>minsize</td>
<td>Minimum number of pooled servers in the pool</td>
</tr>
<tr>
<td>maxsize</td>
<td>Maximum allowed pooled servers in the pool</td>
</tr>
<tr>
<td>incrsize</td>
<td>Pool would increment by this number of pooled server when pooled server are unavailable at application request time</td>
</tr>
<tr>
<td>session_cached_cursors</td>
<td>Turn on SESSION_CACHED_CURSORS for all connections in the pool. This is an existing init.ora parameter</td>
</tr>
<tr>
<td>inactivity_timeout</td>
<td>TTL (Time to live) for an idle session in the pool. This parameter helps to shrink the pool when it is not used to its maximum capacity. If a connection remains in the pool idle for this time, it is killed.</td>
</tr>
<tr>
<td>max_think_time</td>
<td>The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with no open transactions in it. After obtaining a pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_THINK_TIME, the pooled server is freed and the client connection is terminated.</td>
</tr>
<tr>
<td>max_use_session</td>
<td>Maximum number of times a connection can be taken and released to the pool</td>
</tr>
<tr>
<td>max_lifetime_session</td>
<td>TTL (Time to live) for a pooled session</td>
</tr>
<tr>
<td>max_txn_think_time</td>
<td>The maximum time of inactivity, in seconds, for a client after it obtains a pooled server from the pool with an open transaction. After obtaining the pooled server from the pool, if the client application does not issue a database call for the time specified by MAX_TXN_THINK_TIME, then the pooled server is freed, and the client connection is terminated. The default value of this parameter is the value of the MAX_THINK_TIME parameter. Applications can set the value of the MAX_TXN_THINK_TIME parameter to a value higher than the MAX_THINK_TIME value to allow more time for the connections with open transactions.</td>
</tr>
</tbody>
</table>

Exceptions

Table 35-5  CONFIGURE_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

- All expressions of time are in seconds
- All of the parameters should be set based on statistical request patterns.
• minsize should be set keeping in mind that it puts a lower bound on server resource consumption. This is to prevent the timeout from dragging the pool too low, because of a brief period of inactivity.
• maxsize should be set keeping in mind that it puts an upper bound on concurrency and response-times and also server resource consumption.
• session_cached.Cursors is typically set to the number of most frequently used statements. It occupies cursor resource on the server.
• In doubt, do not set the increment and inactivity_timeout. The pool will have reasonable defaults.
• max_use_session and max_lifetime_session allow for software rejuvenation or defensive approaches to potential bugs, leaks, accumulations, and like problems, by getting brand new sessions once in a while.
• The connection pool reserves 5% of the pooled servers for authentication, and at least one pooled server is always reserved for authentication. When setting the maxsize parameter, ensure that there are enough pooled servers for both authentication and connections.

35.1.3 START_POOL Procedure

This procedure starts the pool for operations. It is only after this call that the pool could be used by connection classes for creating sessions.

Syntax

DBMS_CONNECTION_POOL.START_POOL (pool_name IN VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');

Parameters

Table 35-6 START_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be started. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

Table 35-7 START_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56501</td>
<td>Connection pool startup failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
35.1.4 STOP_POOL Procedure

This procedure stops the pool and makes it unavailable for the registered connection classes.

Syntax

```sql
DBMS_CONNECTION_POOL.STOP_POOL (
    pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 35-8  STOP_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be stopped. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>

Exceptions

Table 35-9  STOP_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56506</td>
<td>Connection pool shutdown failed</td>
</tr>
</tbody>
</table>

Usage Notes

This stops the pool and takes it offline. This does not destroy the persistent data (such as, the pool name and configuration parameters) associated with the pool.

35.1.5 RESTORE_DEFAULTS Procedure

This procedure restores the pool to default settings.

Syntax

```sql
DBMS_CONNECTION_POOL.RESTORE_DEFAULTS (
    pool_name   IN   VARCHAR2 DEFAULT 'SYS_DEFAULT_CONNECTION_POOL');
```

Parameters

Table 35-10  RESTORE_DEFAULTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Pool to be restored. Currently only the default pool name is supported.</td>
</tr>
</tbody>
</table>
Exceptions

Table 35-11    RESTORE_DEFAULTS Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-56500</td>
<td>Connection pool not found</td>
</tr>
<tr>
<td>ORA-56507</td>
<td>Connection pool alter configuration failed</td>
</tr>
</tbody>
</table>

Usage Notes

If the instance is restarted (shutdown followed by startup), the pool is automatically started.
36

DBMS_CQ_NOTIFICATION

The DBMS_CQ_NOTIFICATION package is part of the database change notification feature that provides the functionality to create registration on queries designated by a client application and so to receive notifications in response to DML or DDL changes on the objects associated with the queries. The notifications are published by the database when the DML or DDL transaction commits.

See Also:
Oracle Database Development Guide regarding implementing database change notification.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Examples
- Data Structures
- Summary of DBMS_CQ_NOTIFICATION Subprograms

36.1 DBMS_CQ_NOTIFICATION Overview

The DBMS_CQ_NOTIFICATION package provides PL/SQL based registration interfaces. A client can use this interface to create registrations on queries based on objects of interest and specify a PL/SQL callback handler to receive notifications. In case of object level registration, when a transaction changes any of the objects associated with the registered queries and COMMITs, the PL/SQL callback, specified during registration for those objects, is invoked. The application can define client-specific processing inside the implementation of its PL/SQL callback handler.

The interface lets you define a registration block (using a mechanism similar to a BEGIN-END block). The recipient of notifications namely the name of the PL/SQL callback handler and a few other registration properties like time-outs can be specified during the BEGIN phase. Any queries executed subsequently (inside the registration block) are considered “interesting queries” and objects referenced by those queries during query execution are registered. The registration is completed by ENDing the registration block. The registration block lets you create new registrations or add objects to existing registrations.

When a registration is created through the PL/SQL interface, a unique registration ID is assigned to the registration by the RDBMS. The client application can use the
registration ID to keep track of registrations created by it. When a notification is published by the RDBMS, the registration ID will be part of the notification.

**Typical Applications**

This functionality is useful for example to applications that cache query result sets on mostly read-only objects in the mid-tier to avoid network round trips to the database. Such an application can create a registration on the queries it is interested in caching. On changes to objects referenced inside those queries, the database publishes a notification when the underlying transaction commits. In response to the notification, the mid-tier application can refresh its cache by re-executing the query/queries.

### 36.2 DBMS_CQ_NOTIFICATION Security Model

The `DBMS_CQ_NOTIFICATION` package requires that the user have the `CHANGE NOTIFICATION` system privilege in order to receive notifications, and be granted `EXECUTE` privilege on the `DBMS_CQ_NOTIFICATION` package.

In addition the user is required to have `SELECT` or `READ` privileges on all objects to be registered. Note that if the `SELECT` or `READ` privilege on an object was granted at the time of registration creation but lost subsequently (due to a revoke), then the registration will be purged and a notification to that effect will be published.

### 36.3 DBMS_CQ_NOTIFICATION Constants

`DBMS_CQ_NOTIFICATION` constants are used as flag parameters either during registration or when received during the notification.

The `DBMS_CQ_NOTIFICATION` package has sets of constants:

- `EVENT_STARTUP`, `EVENT_SHUTDOWN`, `EVENT_SHUTDOWN_ANY`, `EVENT_DEREG` describe the type of the notification published by the database.
- `INSERTOP`, `DELETEOP`, `UPDATEOP`, `ALTEROP`, `DROPOP` and `UNKNOWNOP` describe the type of operation on a table (during a notification published by the database).
- `QOS_RELIABLE`, `QOS_DEREG_NFY`, `QOS_ROWIDs` describe registration Quality of Service properties that the client requires. These are specified during registration.

The constants are shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL_OPERATIONS</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Interested in being notified on all operations, specified as a parameter during registration</td>
</tr>
<tr>
<td>ALL_ROWS</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>All rows within the table may have been potentially modified</td>
</tr>
<tr>
<td>EVENT_STARTUP</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Instance startup notification</td>
</tr>
<tr>
<td>EVENT_SHUTDOWN</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Instance shutdown notification</td>
</tr>
<tr>
<td>EVENT_SHUTDOWN_ANY</td>
<td>BINARY_INTEGER</td>
<td>3</td>
<td>Any instance shutdown when running Oracle Real Application Clusters (Oracle RAC)</td>
</tr>
</tbody>
</table>

<td>Last notification in the group</td>
</tr>
<tr>
<td>NTFN_GROUPING_FOREVER</td>
<td>BINARY_INTEGER</td>
<td>-1</td>
<td>Repeat notifications forever</td>
</tr>
</tbody>
</table>

36.4 DBMS_CQ_NOTIFICATION Operational Notes

The following are DBMS_CQ_NOTIFICATION operational notes.

Object Level Registration

- The notifications are published by the database when a transaction changes the registered objects and commits.
- All objects referenced in the queries executed inside the registration block starting from the previous NEW_REG_START or ENABLE_REG to REG_END are considered interesting objects and added to the registration.

Query Result Change Registration

- The notifications are published by the database when a transaction changes the result set of the registered query and commits.
Troubleshooting

If you have created a registration and seem to not receive notifications when the underlying tables are changed, please check the following.

- Is the `job_queue_processes` parameter set to a nonzero value? This parameter needs to be configured to a nonzero value in order to receive PL/SQL notifications through the handler.

- Are the registrations being created as a non-SYS user?

- If you are attempting DML changes on the registered object, are you COMMITting the transaction? Please note that the notifications are transactional and will be generated when the transaction COMMITs.

- It maybe possible that there are run-time errors during the execution of the PL/SQL callback due to implementation errors. If so, they would be logged to the trace file of the JOBQ process that attempts to execute the procedure. The trace file would be usually named `<ORACLE_SID>_j*.<PID>.trc`.

For example, if the ORACLE_SID is 'dbs1' and the process is 12483, the trace file might be named 'dbs1_j000_12483.trc.'

Suppose a registration is created with 'chnf_callback' as the notification handler and with `registration_id` 100. Let us suppose the user forgets to define the `chnf_callback` procedure. Then the JOBQ trace file might contain a message of the following form.

```
Runtime error during execution of PL/SQL cbk chnf_callback for reg CHNF100
  Error in PLSQL notification of msgid:
  Queue :
  Consumer Name :
  PLSQL function :chnf_callback
  Exception Occured, Error msg:
  ORA-00604: error occurred at recursive SQL level 2
  ORA-06550: line 1, column 7:
  ORA-00201: identifier 'CHNF_CALLBACK' must be declared
  ORA-06550: line 1, column 7:
  PL/SQL: Statement ignored
```

36.5 DBMS_CQ_NOTIFICATION Examples

Suppose that a mid-tier application has a lot of queries on the HR.EMPLOYEES table. If the EMPLOYEES table is infrequently updated, it can obtain better performance by caching rows from the table because that would avoid a round-trip to the backend database server and server side execution latency. Let us assume that the application has
implemented a mid-tier HTTP listener that listens for notifications and updates the mid-tier cache in response to a notification.

Object Change Registration Example

The DBMS_CQ_NOTIFICATION package can be utilized in this scenario to send notifications about changes to the table by means of the following steps:

1. Implement a mid-tier listener component of the cache management system (for example, using HTTP) that listens to notification messages sent from the database and refreshes the mid-tier cache in response to the notification.

2. Create a server side stored procedure to process notifications

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;

Rem Enable job queue processes to receive notifications.
ALTER SYSTEM SET "job_queue_processes"=2;

CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid number, event_type number);

Rem create a table to record changes to registered tables
CREATE TABLE nftablechanges(regid number, table_name varchar2(100),
table_operation number);

Rem create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(regid number, table_name varchar2(100),
row_id varchar2(30));

Rem Create a PL/SQL callback handler to process notifications.
CREATE OR REPLACE PROCEDURE chnf_callback(ntfnds IN SYS.CHNF$_DESC) IS
regid           NUMBER;
tbname          VARCHAR2(60);
event_type      NUMBER;
umtables       NUMBER;
operation_type  NUMBER;
umrows         NUMBER;
row_id          VARCHAR2(20);
BEGIN
regid      := ntfnds.registration_id;
numtables  := ntfnds.numtables;
event_type := ntfnds.event_type;

INSERT INTO nfevents VALUES(regid, event_type);
IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_OBJCHANGE) THEN
FOR i IN 1..numtables LOOP
   tbname          := ntfnds.table_desc_array(i).table_name;
operation_type  := ntfnds.table_desc_array(i).Opflags;
   INSERT INTO nftablechanges VALUES(regid, tbname, operation_type);
/* Send the table name and operation_type to client side listener using
UTL_HTTP */
/* If interested in the rowids, obtain them as follows */
   IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0) THEN
      numrows := ntfnds.table_desc_array(i).numrows;
   ELSE

Chapter 36
DBMS_CQ_NOTIFICATION Examples

36-5
numrows :=0; /* ROWID INFO NOT AVAILABLE */
END IF;

/* The body of the loop is not executed when numrows is ZERO */
FOR j IN 1..numrows LOOP
  Row_id := ntfnds.table_desc_array(i).row_desc_array(j).row_id;
  INSERT INTO nfrowchanges VALUES(regid, tbname, Row_id);
  /* optionally Send out row_ids to client side listener using UTL_HTTP; */
END LOOP;

END LOOP;

END LOOP;
END IF;
COMMIT;
END;
/

In Step 2 we can send as much information about the invalidation as the mid-tier application needs based on the information obtained from the notification descriptor.

Notes
a. In the above example, a registration was created on the EMPLOYEES table with 'chnf_callback' as the PL/SQL handler for notifications. During registration, the client specified reliable notifications (QOS_RELIABLE) and rowid notifications (QOS_ROWIDS)

b. The handler accesses the table descriptor array from the notification descriptor only if the notification type is of EVENT_OBJCHANGE. In all other cases (e.g EVENT_DEREG, EVENT_SHUTDOWN), the table descriptor array should not be accessed.

c. The handler accesses the row descriptor array from the table notification descriptor only if the ALL_ROWS bit is not set in the table operation flag. If the ALL_ROWS bit is set in the table operation flag, then it means that all rows within the table may have been potentially modified. In addition to operations like TRUNCATE that affect all rows in the tables, this bit may also be set if individual rowids have been rolled up into a FULL table invalidation.

This can occur if too many rows were modified on a given table in a single transaction (more than 80) or the total shared memory consumption due to rowids on the RDBMS is determined too large (exceeds 1% of the dynamic shared pool size). In this case, the recipient must conservatively assume that the entire table has been invalidated and the callback/application must be able to handle this condition.

Also note that the implementation of the user defined callback is up to the developer. In the above example, the callback was used to record event details into database tables. The application can additionally send the notification details to a mid-tier HTTP listener of its cache management system (as in the example) using UTL_HTTP. The listener could then refresh its cache by querying from the back-end database.

3. Create a registrations on the tables that we wish to be notified about. We pass in the previously defined procedure name (chnf_callback) as the name of the server side PL/SQL procedure to be executed when a notification is generated.

Rem Create a REGISTRATION on the EMPLOYEES TABLE
DECLARE
  REGDS SYS.CHNF$_REG_INFO;
  REGDS...
BEGIN
qosflags := DBMS_CQ_NOTIFICATION.QOS_RELIABLE +
DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
REGDS := SYS.CHNF$_REG_INFO ('chnf_callback', qosflags, 0,0,0);
regid := DBMS_CQ_NOTIFICATION.NEW_REG_START (REGDS);
SELECT manager_id INTO mgr_id FROM EMPLOYEES WHERE employee_id = 200;
DBMS_CQ_NOTIFICATION.REG_END;
END;/

Once the registration is created in Step 3 above, the server side PL/SQL procedure defined in Step 2 is executed in response to any COMMITted changes to the HR.EMPLOYEES table. As an example, let us assume that the following update is performed on the employees table.

UPDATE employees SET salary=salary*1.05 WHERE employee_id=203;COMMIT;

Once the notification is processed, you will find rows which might look like the following in the nfevents, nftablechanges and nfrowchanges tables.

SQL> SELECT * FROM nfevents;
REGID EVENT_TYPE
---------------------------
20045 6

SQL> SELECT * FROM nftablechanges;
REGID TABLE_NAME TABLE_OPERATION
-------------------------------------------
20045 HR.EMPLOYEES 4

SQL> select * from nfrowchanges;
REGID TABLE_NAME ROW_ID
------------------------------------------------------
20045 HR.EMPLOYEES AAAKB/AABAAAJ8zAAF

Query Result Change Registration Example

1. Creating a Callback

CONNECT system;
Enter password: password
GRANT CHANGE NOTIFICATION TO hr;
GRANT EXECUTE ON DBMS_CQ_NOTIFICATION TO hr;
CONNECT hr;
Enter password: password
Rem Create a table to record notification events
CREATE TABLE nfevents(regid NUMBER, event_type NUMBER);

Rem Create a table to record notification queries
CREATE TABLE nfqueries (qid NUMBER, qop NUMBER);
Rem Create a table to record changes to registered tables
CREATE TABLE nftablechanges(
    qid                NUMBER,
    table_name         VARCHAR2(100),
    table_operation    NUMBER);

Rem Create a table to record rowids of changed rows.
CREATE TABLE nfrowchanges(
    qid                NUMBER,
    table_name         VARCHAR2(100),
    row_id             VARCHAR2(2000));

CREATE OR REPLACE PROCEDURE chnf_callback
    (ntfnds IN CQ_NOTIFICATION$.DESCRIPTOR)
IS
    regid           NUMBER;
    tbname          VARCHAR2(60);
    event_type      NUMBER;
    numtables       NUMBER;
    operation_type  NUMBER;
    numrows         NUMBER;
    row_id          VARCHAR2(2000);
    numqueries      NUMBER;
    qid NUMBER;
    qop NUMBER;
BEGIN
    regid := ntfnds.registration_id;
    event_type := ntfnds.event_type;
    INSERT INTO nfevents VALUES(regid, event_type);
    numqueries := 0;
    IF (event_type = DBMS_CQ_NOTIFICATION.EVENT_QUERYCHANGE) THEN
        numqueries := ntfnds.query_desc_array.count;
        FOR i IN 1..numqueries LOOP
            qid := ntfnds.query_desc_array(i).queryid;
            qop := ntfnds.query_desc_array(i).queryop;
            INSERT INTO nfqueries VALUES(qid, qop);
            numtables := 0;
            numtables := ntfnds.query_desc_array(i).table_desc_array.count;
            FOR j IN 1..numtables LOOP
                tbname := ntfnds.query_desc_array(i).table_desc_array(j).table_name;
                operation_type := ntfnds.query_desc_array(i).table_desc_array(j).Opflags;
                INSERT INTO nftablechanges VALUES(qid, tbname, operation_type);
                IF (bitand(operation_type, DBMS_CQ_NOTIFICATION.ALL_ROWS) = 0)
                    numrows := ntfnds.query_desc_array(i).table_desc_array(j).numrows;
                ELSE
                    numrows := 0; /* ROWID INFO NOT AVAILABLE */
                END IF;
                FOR k IN 1..numrows LOOP
                    Row_id :=
                        ntfnds.query_desc_array(i).table_desc_array(j).row_desc_array(k).row_id;
                    INSERT INTO nfrowchanges VALUES(qid, tbname, Row_id);
                END LOOP; /* loop over rows */
            END LOOP; /* loop over tables */
        END LOOP; /* loop over queries */
    END IF;
END;
2. Creates a query registration

DECLARE
    reginfo    cq_notification$_reg_info;
    mgr_id     NUMBER;
    dept_id    NUMBER;
    v_cursor   SYS_REFCURSOR;
    regid      NUMBER;
    qosflags   NUMBER;
BEGIN
    /* Register two queries for result-set-change notifications: */
    /* 1. Construct registration information. */
    'chnf_callback' is name of notification handler.
    QOS_QUERY specifies result-set-change notifications. */
    qosflags := DBMS_CQ_NOTIFICATION.QOS_QUERY +
                DBMS_CQ_NOTIFICATION.QOS_ROWIDS;
    reginfo := cq_notification$_reg_info('chnf_callback', qosflags,0, 0, 0);
    /* 2. Create registration */
    regid := DBMS_CQ_NOTIFICATION.NEW_REG_START(reginfo);
    OPEN v_cursor FOR
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, manager_id
        FROM HR.employees
        WHERE employee_id = 7902;
    CLOSE v_cursor;
    OPEN v_cursor for
        SELECT DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID, department_id
        FROM HR.departments
        WHERE department_name = 'IT';
    CLOSE v_cursor;

    DBMS_CQ_NOTIFICATION.REG_END;
END;
/

3. After creating the query registrations, the output from USER_CQ_NOTIFICATION_QUERIES would appear as follows.

```
    SQL> SELECT queryid, regid, to_char(querytext)
              FROM user_cq_notification_queries;

    QUERYID      REGID
              --------  -------
   TO_CHAR(QUERYTEXT)
    --------------------------------------------------------
        22         41
    SELECT HR.DEPARTMENTS.DEPARTMENT_ID  FROM HR.DEPARTMENTS  WHERE HR.DEPARTMENTS.
                  DEPARTMENT_NAME  = 'IT'
```
SELECT HR.EMPLOYEES.MANAGER_ID FROM HR.EMPLOYEES WHERE HR.EMPLOYEES.EMPLOYEE_ ID = 7902

Now, let us perform an UPDATE that changes the result of the query with queryid 22 by renaming the department with name 'IT' to FINANCE.

SQL> update departments set department_name = 'FINANCE' where department_name = 'IT';
1 row updated.
SQL> commit;
Commit complete.

Now we can query the notifications that we recorded in the callback.

SQL> select * from nfevents;

REGID EVENT_TYPE
---------- ----------
   61       7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nfqueries;

QID QOP
---------- ----------
   42       7

Event type 7 corresponds to EVENT_QUERYCHANGE

SQL> select * from nftablechanges;

REGID TABLE_NAME--------------------------------------------------------------------------------
---------- ---------------------------------------------------------------
   42 HR.DEPARTMENTS---------------------------------------------------

TABLE_OPERATION 4 corresponds to UPDATEOP

SQL> select * from nfrowchanges;

REGID TABLE_NAME--------------------------------------------------------------------------------
---------- ---------------------------------------------------------------
   61 ROW_ID---------------------------------------------------------------
36.6 DBMS_CQ_NOTIFICATION Data Structures

The DBMS_CQ_NOTIFICATION package defines several object types.

OBJECT Types

- CQ_NOTIFICATION$_DESCRIPTOR Object Type
- CQ_NOTIFICATION$_QUERY Object Type
- CQ_NOTIFICATION$_QUERY_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_TABLE Object Type
- CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_ROW Object Type
- CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type
- CQ_NOTIFICATION$_REG_INFO Object Type

36.6.1 CQ_NOTIFICATION$_DESCRIPTOR Object Type

This is the top level change notification descriptor type. It is a synonym for the SYS.CHNF$_DESC type.

Syntax

```plaintext
TYPE SYS.CHNF$_DESC IS OBJECT(
    registration_id    NUMBER,
    transaction_id     RAW(8),
    dbname             VARCHAR2(30),
    event_type         NUMBER,
    numtables          NUMBER,
    table_desc_array   CQ_NOTIFICATION$_TABLE_ARRAY,
    query_desc_array   CQ_NOTIFICATION$_QUERY_ARRAY);
```

Attributes

Table 36-2  CQ_NOTIFICATION$_DESCRIPTOR Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_id</td>
<td>Registration ID returned during registration</td>
</tr>
<tr>
<td>transaction_id</td>
<td>Transaction ID. transaction_id of the transaction that made the change. Will be NULL unless the event_type is EVENT_OBJCHANGE or EVENT_QUERYCHANGE.</td>
</tr>
<tr>
<td>dbname</td>
<td>Name of database</td>
</tr>
<tr>
<td>event_type</td>
<td>Database event associated with the notification. Can be one of EVENT_OBJCHANGE (change to a registered object), EVENT_STARTUP, or EVENT_QUERYCHANGE, EVENT_SHUTDOWN or EVENT_DEREG (registration has been removed due to a timeout or other reason)</td>
</tr>
</tbody>
</table>
### Table 36-2 (Cont.) CQ_NOTIFICATION$ DESCRIPTOR Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numtables</td>
<td>Number of modified tables. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table descriptors. Will be NULL unless the event_type is EVENT_OBJCHANGE.</td>
</tr>
<tr>
<td>query_desc_array</td>
<td>Array of queries changed. This will be NULL unless event_type is EVENT_QUERYCHANGE</td>
</tr>
</tbody>
</table>

### 36.6.2 CQ_NOTIFICATION$ QUERY Object Type

The object type describes the changes to a query result caused by an event such as a transaction commit.

An array of CQ_NOTIFICATION$ QUERY descriptors is embedded inside the top level notification descriptor (CQ_NOTIFICATION$ DESCRIPTOR) for events of type EVENT_QUERYCHANGE. The array corresponds to the SET of queryids which were invalidated as a result of the event.

This is a synonym for the base type SYS.CHNF$ QDESC.

**Syntax**

```sql
TYPE SYS.CHNF$ QDESC IS OBJECT {
    queryid            NUMBER,
    queryop            NUMBER,
    table_desc_array   CQ_NOTIFICATION$ TABLE_ARRAY;
};
```

**Attributes**

### Table 36-3 TYPE SYS.CQ_NOTIFICATION$ QUERY Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queryid</td>
<td>QueryId of the changed query</td>
</tr>
<tr>
<td>queryop</td>
<td>Operation describing change to the query</td>
</tr>
<tr>
<td>table_desc_array</td>
<td>Array of table changes which contributed to the query Result Set change</td>
</tr>
</tbody>
</table>
36.6.4 CQ_NOTIFICATION$_TABLE Object Type

This descriptor type describes a change to a table and is embedded inside the top level change notification descriptor type for EVENT_OBJCHANGE event types. For query result set changes (event type will be set to EVENT_QUERYCHANGE), the array of table descriptors is embedded inside each query change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_TDESC.

Syntax

```sql
TYPE SYS.CHNF$_TDESC IS OBJECT (
  opflags            NUMBER,
  table_name         VARCHAR2(2*M_IDEN+1),
  numrows            NUMBER,
  row_desc_array     CQ_NOTIFICATION$_ROW_ARRAY)
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Table level operation flags. This is a flag field (bit-vector) that describes the operations that occurred on the table. It can be an OR of the following bit fields - INSERTOP, UPDATEOP, DELETEOP, DROPOP, ALTEROP, ALL_ROWS. If the ALL_ROWS (0x1) bit is set it means that either the entire table is modified (for example, DELETE * FROM t) or row level granularity of information is not requested or not available in the notification and the receiver has to conservatively assume that the entire table has been invalidated.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of modified table</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of modified rows within the table. numrows will be NULL and hence should not be accessed if the ALL_ROWS bit is set in the table change descriptor.</td>
</tr>
<tr>
<td>row_desc_array</td>
<td>Array of row descriptors. This field will be NULL if the ALL_ROWS bit is set in opflags.</td>
</tr>
</tbody>
</table>

36.6.5 CQ_NOTIFICATION$_TABLE_ARRAY Object (Array) Type

This type corresponds to an array of CQ_NOTIFICATION$_TABLE objects. It is a synonym for the SYS.CHNF$_TDESC_ARRAY type.

Syntax

```sql
TYPE CQ_NOTIFICATION$_TABLE_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_TABLE;
```
36.6.6 CQ_NOTIFICATION$_ROW Object Type

An array of CQ_NOTIFICATION$_ROW is embedded inside a CQ_NOTIFICATION$_TABLE (table change descriptor), if the QOS_ROWIDS option was chosen at registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

Note that this is a synonym for the type previously named SYS.CHNF$_RDESC.

Syntax

```sql
TYPE SYS.CHNF$_RDESC IS OBJECT (
   opflags            NUMBER,
   row_id             VARCAHR2 (2000));
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opflags</td>
<td>Row level operation flags. The flag field (bit vector) describes the operations in the row (could be INSERTOP, UPDATEOP or DELETEOP).</td>
</tr>
<tr>
<td>row_id</td>
<td>The rowid of the modified row</td>
</tr>
</tbody>
</table>

36.6.7 CQ_NOTIFICATION$_ROW_ARRAY Object (Array) Type

This object type corresponds to an array of CQ_NOTIFICATION$_ROW objects. It is embedded inside the CQ_NOTIFICATION$_TABLE if QOS_ROWIDS was specified during registration and the ALL_ROWS bit is not set in the opflags field of the table change descriptor.

This type is a synonym for the SYS.CHNF$_RDESC_ARRAY type.

Syntax

```sql
TYPE CQ_NOTIFICATION$_ROW_ARRAY IS VARRAY (1073741824) OF CQ_NOTIFICATION$_ROW;
```

36.6.8 CQ_NOTIFICATION$_REG_INFO Object Type

The object type describes the attributes associated with creating a new registration. It is a synonym for the type previously named SYS.CHNF$_REG_INFO.

Syntax

```sql
TYPE SYS.CHNF$_REG_INFO IS OBJECT (
   callback                        VARCHAR2(20),
   qosflags                        NUMBER,
   timeout                         NUMBER,
   operations_filter               NUMBER,
   transaction_lag                 NUMBER,
   ntfn_grouping_class             NUMBER,
   ntfn_grouping_value             NUMBER,
   ntfn_grouping_type              NUMBER,
```
ntfn_grouping_start_time      TIMESTAMP WITH TIME ZONE,
ntfn_grouping_repeat_count    NUMBER);

Attributes

Table 36-6  TYPE CQ_NOTIFICATIONS_REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>callback</td>
<td>Name of the server side PL/SQL procedure to be executed on a notification. Prototype is &lt;call_backname&gt;(ntfnds IN SYS.chnf$_desc)</td>
</tr>
</tbody>
</table>
| qosflags  | Quality of service flags. Can be set to an OR of the following values:  
  - QOS_RELIABLE (0x1): Notifications are reliable (persistent) and survive instance death. This means that on an instance death in an Oracle RAC cluster, surviving instances will be able to deliver any queued invalidations. Similarly, pending invalidations can be delivered on instance restart, in a single instance configuration. The disadvantage is that there is a CPU cost/latency involved in inserting the invalidation message to a persistent store. If this parameter is false, then server side CPU and latency are minimized, because invalidations are buffered into an in memory queue but the client could lose invalidation messages on an instance shutdown.  
  - QOS_DEREG_NFY (0x2): The registration will be expunged on the first notification  
  - QOS_ROWIDS (0x4): The notification needs to include information about the rowids that were modified  
  - QOS_QUERY (0x8): specifies query result change notification as opposed to object change notification  
  - QOS_BEST_EFFORT (0x10) or QOS_BEST_EFFORT (0x16): can register simplified versions of queries and minimizes evaluation with some false positives. |
| timeout   | If set to a nonzero value, specifies the time in seconds after which the registration is automatically expunged by the database. If zero / NULL, the registration lives until explicitly deregistered. Note that the timeout option can be combined with the purge on notification (QOS_DEREG_NFY) option as well. |
### Table 36-6 (Cont.) TYPE CQ_NOTIFICATION$ REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>operations_filter</td>
<td>if nonzero, specifies a filter to be selectively notified on certain operations. These flags can be used to filter based on specific operation types:</td>
</tr>
<tr>
<td></td>
<td>• 0: Notify on all operations ([DBMS_CQ_NOTIFICATION.ALL_OPERATIONS])</td>
</tr>
<tr>
<td></td>
<td>• 0x2: Notify on every INSERT ([DBMS_CQ_NOTIFICATION.INSERTOP])</td>
</tr>
<tr>
<td></td>
<td>• 0x4: Notify on every UPDATE ([DBMS_CQ_NOTIFICATION.UPDATEOP])</td>
</tr>
<tr>
<td></td>
<td>• 0x8: Notify on every DELETE ([DBMS_CQ_NOTIFICATION.DELETEOP])</td>
</tr>
<tr>
<td></td>
<td>A combination of operations can be specified by using a bitwise OR.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change registrations. To implement notification flow control in 11g, the applications can use the &quot;GROUPING notification&quot; option.</td>
</tr>
<tr>
<td>transaction_lag</td>
<td>Lag between consecutive notifications in units of transactions. Can be used to specify the number of transactions/database changes, by which the client is willing to lag behind the database. If 0, it means that the client needs to receive an invalidation message as soon as it is generated.</td>
</tr>
<tr>
<td></td>
<td>Caution: This parameter will be honored for object level registrations but ignored for query result change notification registrations.</td>
</tr>
<tr>
<td>ntfn_grouping_class</td>
<td>When grouping notifications, the class based on which the group is derived. Currently, the only allowed value is [DBMS_CQ_NOTIFICATION.NTFN_GROUPING_CLASS_TIME] by which notifications are grouped by time.</td>
</tr>
<tr>
<td>ntfn_grouping_value</td>
<td>The grouping value. This describes the time interval that defines the group in seconds. For example, if this were set to 900, it would mean that notifications that were generated in each 15 minute interval would be grouped together.</td>
</tr>
<tr>
<td>ntfn_grouping_type</td>
<td>The type of grouping desired. It can be one of two allowed values</td>
</tr>
<tr>
<td></td>
<td>• [DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_SUMMARY] - all notifications in the group are summarized into a single notification</td>
</tr>
<tr>
<td></td>
<td>• [DBMS_CQ_NOTIFICATION.NTFN_GROUPING_TYPE_LAST] - only the last notification in the group is published and the earlier ones discarded</td>
</tr>
<tr>
<td>ntfn_grouping_start_time</td>
<td>When to start generating notifications. If specified as NULL, it defaults to the current system generated time.</td>
</tr>
</tbody>
</table>
Table 36-6 (Cont.) TYPE CQ_NOTIFICATION$_REG_INFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntfn_grouping_repeat_count</td>
<td>How many times the notification should be repeated. Set this to DBMS_CQ_NOTIFICATION.NTFN_GROUPING_FOREVER to receive notifications for the life time of the registration. Set to a nonzero value if only a certain number of notifications are desired for the life time of the registration.</td>
</tr>
</tbody>
</table>

Usage Notes

- The type declaration incorporates three other alternative constructors. In the first case all other parameters default to their default values.

```plsql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    qosflags                        NUMBER,
    timeout                         NUMBER);
```

The second option applies to the type constructor defined in a previous release, and which is retained for backward compatibility:

```plsql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    qosflags                        NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    transaction_lag                 NUMBER);
```

The third definition contains all the members of the type except `transaction_lag` which is being deprecated:

```plsql
TYPE CQ_NOTIFICATION$_REG_INFO IS OBJECT (
    callback                        VARCHAR2(20),
    qosflags                        NUMBER,
    timeout                         NUMBER,
    operations_filter               NUMBER,
    ntfn_grouping_class             NUMBER,
    ntfn_grouping_value             NUMBER,
    ntfn_grouping_type              NUMBER,
    ntfn_grouping_start_time        TIMESTAMP WITH TIME ZONE,
    ntfn_grouping_repeat_count      NUMBER);
```

- In response to a database change, the server side PL/SQL procedure specified by "callback" is executed. The PL/SQL procedure name has to be specified in the format `schema_name.procedure_name`. The procedure must have the following signature:

```plsql
PROCEDURE <procedure_name>(ntfnds IN SYS.CHNF$_desc)
```

CHNF$_DESC describes the change notification descriptor.

- The init.ora parameter `job_queue_processes` must be set to a nonzero value to receive PL/SQL notifications, because the specified procedure is executed inside a job queue process when a notification is generated.
36.7 Summary of DBMS_CQ_NOTIFICATION Subprograms

This table lists the DBMS_CQ_NOTIFICATION subprograms and briefly describes them.

**Table 36-7 DBMS_CQ_NOTIFICATION Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CQ_NOTIFICATION_QUERYID Function</td>
<td>Returns the queryid of the most recent query that was attempted to be registered in a registration block</td>
</tr>
<tr>
<td>DEREGISTER Procedure</td>
<td>De-subscribes the client with the supplied registration identifier (ID)</td>
</tr>
<tr>
<td>ENABLE_REG Procedure</td>
<td>Begins a registration block using an existing registration identifier (ID)</td>
</tr>
<tr>
<td>NEW_REG_START Function</td>
<td>Begins a new registration block</td>
</tr>
<tr>
<td>REG_END Procedure</td>
<td>Ends the registration boundary</td>
</tr>
<tr>
<td>SET_ROWID_THRESHOLD Procedure</td>
<td>Configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction</td>
</tr>
</tbody>
</table>

36.7.1 CQ_NOTIFICATION_QUERYID Function

This function returns the queryid of the most recent query that was attempted to be registered in a registration block.

**Syntax**

```sql
DBMS_CQ_NOTIFICATION.CQ_NOTIFICATION_QUERYID
RETURN NUMBER;
```

**Return Values**

Returns the queryid of the most recently registered query.

36.7.2 DEREGISTER Procedure

This procedure describes the client with the specified registration identifier (ID).

**Syntax**

```sql
DBMS_CQ_NOTIFICATION.DEREGISTER (regid IN NUMBER);
```

**Parameters**

**Table 36-8 DEREGISTER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>
Usage Notes

Only the user that created the registration (or the SYS user) will be able to desubscribe the registration.

36.7.3 ENABLE_REG Procedure

This procedure adds objects to an existing registration identifier (ID).

It is similar to the interface for creating a new registration, except that it takes an existing regid to which to add objects. Subsequent execution of queries causes the objects referenced in the queries to be added to the specified regid, and the registration is completed on invoking the REG_END Procedure.

Syntax

DBMS_CQ_NOTIFICATION.ENABLE_REG (regid IN NUMBER);

Parameters

Table 36-9 ENABLE_REG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regid</td>
<td>Client registration ID</td>
</tr>
</tbody>
</table>

Usage Notes

Only the user that created the registration will be able to add further objects to the registration.

36.7.4 NEW_REG_START Function

This procedure begins a new registration block.

Any objects referenced by queries executed within the registration block are considered interesting objects and added to the registration. The registration block ends upon calling the REG_END procedure.

Syntax

DBMS_CQ_NOTIFICATION.NEW_REG_START (regds IN sys.chnf$$_reg_info) RETURN NUMBER;

Parameters

Table 36-10 NEW_REG_START Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sys.chnf$$_reg_info</td>
<td>Registration descriptor describing the notification handler and other properties of the registration</td>
</tr>
</tbody>
</table>
Return Values

The procedure returns a registration-id which is a unique integer assigned by the database to this registration. The registration-id will be echoed back in every notification received for this registration.

Usage Notes

- The only operations permitted inside a registration block are queries (the ones the user wishes to register). DML and DDL operations are not permitted.
- The registration block is a session property and implicitly terminates upon exiting the session. While the registration block is a session property, the registration itself is a persistent database entity. Once created, the registration survives until explicitly deregistered by the client application or timed-out or removed by the database for some other reason (such as loss of privileges).
- The user must have the CHANGE NOTIFICATION system privilege and SELECT or READ privileges on any objects to be registered.
- The SYS user will not be permitted to create new registrations.
- Nesting of registration block is not permitted.

36.7.5 REG_END Procedure

This procedure marks the end of the registration block. No newly executed queries are tracked.

Syntax

```sql
DBMS_CQ_NOTIFICATION.REG_END;
```

36.7.6 SET_ROWID_THRESHOLD Procedure

This procedure configures the maximum number of rows of a table published in a change notification if the rows of the table are modified in a transaction.

Syntax

```sql
DBMS_CQ_NOTIFICATION.SET_ROWID_THRESHOLD (  
  tbnname IN VARCHAR2,  
  threshold IN NUMBER);
```

Parameters

Table 36-11  SET_ROWID_THRESHOLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tbnname</td>
<td>Table name qualified by the schema name in the form schemaname.tablename</td>
</tr>
<tr>
<td>threshold</td>
<td>Maximum number of modified rows of the table to be published in the change notification</td>
</tr>
</tbody>
</table>
Usage Notes

- The table needs to be registered for change notification either at object change granularity or at query result set granularity.
- The threshold set by means of this subprogram applies to that instance only and does not persist across instance startup/shutdown.
DBMS_CREDENTIAL

The DBMS_CREDENTIAL package provides an interface for authenticating and impersonating EXTPROC callout functions, as well as external jobs, remote jobs and file watchers from the SCHEDULER.

See Also:

- Oracle Database Administrator's Guide regarding Specifying Job Credentials

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_CREDENTIAL Subprograms

37.1 DBMS_CREDENTIAL Overview

Credentials are database objects that hold a username/password pair for authenticating and impersonating EXTPROC callout functions, as well as remote jobs, external jobs and file watchers from the SCHEDULER.

They are created using the CREATE_CREDENTIAL Procedure. The procedure also allows you to specify the Windows domain for remote external jobs executed against a Windows server.

37.2 DBMS_CREDENTIAL Security Model

Every Oracle credential has a unique credential name and you can associate a credential through its unique credential name with EXTPROC by means of a PL/SQL alias library.

In order to associate a credential with a PL/SQL alias library and external procedure, you must have the CREATE AND/OR REPLACE LIBRARY privilege or CREATE AND/OR REPLACE FUNCTION / PROCEDURE privilege and read permission of the DLL or shared object that the alias library to be associated with so that you can create and/or replace function or procedure to make use of the alias library.
Once authenticated, EXTPROC must act on behalf of the client based on client's identity defined in the supplied user credential. If not authenticated, EXTPROC must return an error message.

In order to create or alter a credential, you must have the CREATE CREDENTIAL privilege. If you are attempting to create or alter a credential in a schema other than your own, you must have the CREATE ANY CREDENTIAL privilege.

### 37.3 DBMS_CREDENTIAL Operational Notes

As the existing CREATE OR REPLACE LIBRARY statement and CREATE OR REPLACE FUNCTION/PROCEDURE do not support a CREDENTIAL clause, this model requires syntax and semantic changes in CREATE OR REPLACE LIBRARY and CREATE OR REPLACE FUNCTION/PROCEDURE statement.

For example:

```sql
CREATE OR REPLACE LIBRARY test
  AS 'ORACLE_HOME/bin/test.so' CREDENTIAL ricky_cred;
CREATE OR REPLACE FUNCTION ftest1
  (x VARCHAR2, y BINARY_INTEGER)
RETURN BINARY_INTEGER
AS LANGUAGE C
LIBRARY test
NAME "negative"
PARAMETERS(x STRING, y INT);
```

The credential name defined in the CREDENTIAL clause is a name of a database object. Therefore, do not enclose the credential name with single or double quotes.

An example of a credential being used on an external job:

```sql
BEGIN
  DBMS_SCHEDULER.CREATE_JOB(
    job_name            => 'example_job',
    job_type            => 'EXECUTABLE',
    job_action          => '/bin/ls',
    credential_name     => 'ricky_cred');
END;
/
```

### 37.4 Summary of DBMS_CREDENTIAL Subprograms

This table lists the DBMS_CREDENTIAL subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_CREDENTIAL</td>
<td>Creates a stored username/password pair in a database object called an Oracle credential</td>
</tr>
<tr>
<td>DISABLE_CREDENTIAL</td>
<td>Disables an Oracle credential</td>
</tr>
<tr>
<td>DROP_CREDENTIAL</td>
<td>Drops an Oracle credential</td>
</tr>
</tbody>
</table>
Table 37-1  (Cont.) DBMS_CREDENTIAL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENABLE_CREDENTIAL Procedure</td>
<td>Enables an Oracle credential</td>
</tr>
<tr>
<td>UPDATE_CREDENTIAL Procedure</td>
<td>Updates an existing Oracle credential</td>
</tr>
</tbody>
</table>

37.4.1 CREATE_CREDENTIAL Procedure

This procedure creates a stored username/password pair in a database object called an Oracle credential.

Syntax

```sql
DBMS_CREDENTIAL.CREATE_CREDENTIAL (  
    credential_name   IN  VARCHAR2,  
    username          IN  VARCHAR2,  
    password          IN  VARCHAR2,  
    database_role     IN  VARCHAR2 DEFAULT NULL,  
    windows_domain    IN  VARCHAR2 DEFAULT NULL,  
    comments          IN  VARCHAR2 DEFAULT NULL,  
    enabled           IN  BOOLEAN DEFAULT TRUE);
```

Parameters

Table 37-2  CREATE_CREDENTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>username</td>
<td>User name to login to the operating system or remote database to run a job if this credential is chosen. This cannot be set to NULL.</td>
</tr>
<tr>
<td>password</td>
<td>Password to login to the remote operating system to run a job if this credential is chosen. It is case sensitive.</td>
</tr>
<tr>
<td>database_role</td>
<td>Whether a database job using this credential should attempt to log in with administrative privileges. Values: SYSDBA, SYSDG, SYSADMIN or SYSBACKUP.</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. The domain will be converted to uppercase automatically.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that can be used to describe the credential to the user. The Scheduler does not use this field.</td>
</tr>
<tr>
<td>enabled</td>
<td>Determines whether the credential is enabled or not</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be created by any user with the CREATE CREDENTIAL or CREATE ANY CREDENTIAL system privilege. To create a credential...
in a schema other than your own, you must have the `CREATE CREDENTIAL` or `CREATE ANY CREDENTIAL` privilege.

- The user name is case sensitive. It cannot contain double quotes or spaces.
- Attempting to create a credential with an existing credential name returns an error. To alter an existing credential, users must drop the existing credential first using the `DROP_CREDENTIAL` Procedure.
- Attempting to drop an existing credential, which is already referenced by alias libraries, returns an error. To drop an existing credential without any checking, users must set the `force` parameter of `DROP_CREDENTIAL` Procedure to `TRUE`.
- You may also alter a credential, by means of the `UPDATE_CREDENTIAL` Procedure.

Examples

Create a Basic Credential

```
CONN scott
Enter password: password

BEGIN
   -- Basic credential.
   DBMS_CREDENTIAL.CREATE_CREDENTIAL(
      credential_name => 'TIM_HALL_CREDENTIAL',
      username         => 'tim_hall',
      password         => 'password');
END
```

Create a Windows Credential

```
CONN scott
Enter password: password

BEGIN
   -- Credential including Windows domain
   DBMS_CREDENTIAL.CREATE_CREDENTIAL(
      credential_name   => 'TIM_HALL_WIN_CREDENTIAL',
      username          => 'tim_hall',
      password          => 'password',
      windows_domain    => 'localdomain');
END
```

Display Information about Credentials

Information about credentials is displayed using the `[DBA|ALL|USER] _CREDENTIALS` views.

```
COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name, username, windows_domain
FROM user_credentials
ORDER BY credential_name;
```

<table>
<thead>
<tr>
<th>CREDENTIAL_NAME</th>
<th>USERNAME</th>
<th>WINDOWS_DOMAIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIM_HALL_CREDENTIAL</td>
<td>tim_hall</td>
<td></td>
</tr>
</tbody>
</table>
37.4.2 DISABLE_CREDENTIAL Procedure

This procedure disables an Oracle credential.

Syntax

DBMS_CREDENTIAL.DISABLE_CREDENTIAL (credential_name IN VARCHAR2, force IN BOOLEAN DEFAULT FALSE);

Parameters

Table 37-3 DISABLE_CREDENTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
<tr>
<td>force</td>
<td>If FALSE, the credential is not disabled provided it has no dependency on any existing scheduler job or PL/SQL library. An error is returned if the dependency is observed. If TRUE, the credential is disabled whether or not there is any scheduler job or PL/SQL library referencing it.</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE_CREDENTIAL or CREATE_ANY_CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE_ANY_CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled lets an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user of external jobs, database jobs, file transfers, external procedures, and file watching. To enable an existing disabled credential, you need to use the ENABLE_CREDENTIAL Procedure.
- A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

37.4.3 DROP_CREDENTIAL Procedure

This procedure drops an Oracle credential.

Syntax

DBMS_CREDENTIAL.DROP_CREDENTIAL (credential_name IN VARCHAR2, force IN BOOLEAN DEFAULT FALSE);
Parameters

Table 37-4 DROP_CREDENTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the credential must not be referenced by any EXTPROC alias library or an error is raised. If set to TRUE, the credential is dropped whether or not there are extproc alias libraries referencing it. EXTPROC alias libraries that reference the dropped credential become invalid.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner of a credential or a user with the CREATE ANY CREDENTIAL system privilege may drop the credential.

Examples

EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_CREDENTIAL', FALSE);
EXEC DBMS_CREDENTIAL.DROP_CREDENTIAL('TIM_HALL_WIN_CREDENTIAL', FALSE);

37.4.4 ENABLE_CREDENTIAL Procedure

This procedure enables an Oracle credential.

Syntax

DBMS_CREDENTIAL.ENABLE_CREDENTIAL ( credential_name IN VARCHAR2);

Parameters

Table 37-5 ENABLE_CREDENTIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to NULL. It is converted to upper case unless enclosed in double quotes.</td>
</tr>
</tbody>
</table>

Usage Notes

- Credentials reside in a particular schema and can be disabled by any user with the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL system privilege. To disable a credential in a schema other than your own, you must have the CREATE CREDENTIAL OR CREATE ANY CREDENTIAL privilege.
- A credential for an OS user can be viewed as an entry point into an operating system as a particular user. Allowing a credential to be disabled would allow an administrator (or credential owner) to quickly, easily and reversibly disallow all logins from the database to the OS as a particular user (external jobs, file transfers, external procedures, file watching). To disable an existing credential, you need to use the DISABLE_CREDENTIAL Procedure.
A library can become invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

### 37.4.5 UPDATE_CREDENTIAL Procedure

This procedure updates an existing Oracle credential.

**Syntax**

```sql
DBMS_CREDENTIAL.UPDATE_CREDENTIAL (  
    credential_name IN VARCHAR2,  
    attribute IN VARCHAR2,  
    value IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>Name of the credential. It can optionally be prefixed with a schema. This cannot be set to <code>NULL</code>. It is converted to upper case unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>attribute</td>
<td>Name of attribute to update: <code>USERNAME</code>, <code>PASSWORD</code>, <code>WINDOWS_DOMAIN</code>, <code>DATABASE_ROLE</code> or <code>COMMENTS</code></td>
</tr>
<tr>
<td>value</td>
<td>New value for the selected attribute</td>
</tr>
</tbody>
</table>

**Usage Notes**

- **Credentials** reside in a particular schema and can be created by any user with the `CREATE CREDENTIAL` or `CREATE ANY CREDENTIAL` system privilege. To create a credential in a schema other than your own, you must have the `CREATE ANY CREDENTIAL` privilege.
- The user name is case sensitive. It cannot contain double quotes or spaces.
- `EXTPROC` alias libraries that reference the updated credential will become invalid. A library becomes invalid if the properties of the credential – windows domain, username, password, its enable/disable bit – are changed.

**Examples**

**Update a Basic Credential**

```
CONN scott
Enter password: password

BEGIN
  -- Basic credential.
  DBMS_CREDENTIAL.UPDATE_CREDENTIAL (  
    credential_name => 'TIM_HALL_CREDENTIAL',  
    attribute => 'password',  
    value => 'password2');

  DBMS_CREDENTIAL.UPDATE_CREDENTIAL (  
    credential_name => 'TIM_HALL_CREDENTIAL',  
    attribute => 'username',
```
value => 'tim_hall');

END;

Update a Windows Credential

CONN scott
Enter password: password

-- Credential including Windows domain
BEGIN
   DBMS_CREDENTIAL.UPDATE_CREDENTIAL(
      credential_name => 'TIM_HALL_WIN_CREDENTIAL',
      username        => 'tim_hall',
      password        => 'password',
      windows_domain  => 'localdomain');
END

Display Information about Credentials

Information about credentials is displayed using the [DBA|ALL|USER] _CREDENTIALS views.

COLUMN credential_name FORMAT A25
COLUMN username FORMAT A20
COLUMN windows_domain FORMAT A20
SELECT credential_name,
       username,
       windows_domain
FROM   all_credentials
ORDER BY credential_name;

<table>
<thead>
<tr>
<th>credential_name</th>
<th>username</th>
<th>windows_domain</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIM_HALL_CREDENTIAL</td>
<td>tim_hall</td>
<td></td>
</tr>

SQL>
DBMS_CRYPTO provides an interface to encrypt and decrypt stored data, and can be used in conjunction with PL/SQL programs running network communications. It provides support for several industry-standard encryption and hashing algorithms, including the Advanced Encryption Standard (AES) encryption algorithm. AES has been approved by the National Institute of Standards and Technology (NIST) to replace the Data Encryption Standard (DES).

See Also:
Oracle Database Security Guide for further information about using this package and about encrypting data in general.

This chapter contains the following topics:

- Overview
- Security Model
- Datatypes
- Algorithms
- Restrictions
- Exceptions
- Operational Notes
- Summary of DBMS_CRYPTO Subprograms

38.1 DBMS_CRYPTO Overview

DBMS_CRYPTO contains basic cryptographic functions and procedures. To use this package correctly and securely, a general level of security expertise is assumed.

The DBMS_CRYPTO package enables encryption and decryption for common Oracle datatypes, including RAW and large objects (LOBs), such as images and sound. Specifically, it supports BLOBs and CLOBs. In addition, it provides Globalization Support for encrypting data across different database character sets.

The following cryptographic algorithms are supported:

- Data Encryption Standard (DES), Triple DES (3DES, 2-key and 3-key)
- Advanced Encryption Standard (AES)
- MD5, MD4, SHA-1, and SHA-2 cryptographic hashes
- MD5, SHA-1, and SHA-2 Message Authentication Code (MAC)
Block cipher modifiers are also provided with `DBMS_CRYPTO`. You can choose from several padding options, including PKCS (Public Key Cryptographic Standard) #5, and from four block cipher chaining modes, including Cipher Block Chaining (CBC).

*Table 38-1* summarizes the `DBMS_CRYPTO` package features.

---

**Table 38-1   DBMS_CRYPTO Features**

<table>
<thead>
<tr>
<th>Package Feature</th>
<th>DBMS_CRYPTO</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cryptographic algorithms</td>
<td>DES, 3DES, AES, RC4, 3DES_2KEY</td>
</tr>
<tr>
<td>Padding forms</td>
<td>PKCS5, zeroes</td>
</tr>
<tr>
<td>Block cipher chaining modes</td>
<td>CBC, CFB, ECB, OFB</td>
</tr>
<tr>
<td>Cryptographic hash algorithms</td>
<td>MD5, SHA-1, SHA-2 (SHA-256, SHA-384, SHA-512), MD4</td>
</tr>
<tr>
<td>Keyed hash (MAC) algorithms</td>
<td>HMAC_MD5, HMAC_SH1, HMAC_SH256, HMAC_SH384, HMAC_SH512</td>
</tr>
<tr>
<td>Cryptographic pseudo-random number generator</td>
<td>RAW, NUMBER, BINARY_INTEGER</td>
</tr>
<tr>
<td>Database types</td>
<td>RAW, CLOB, BLOB</td>
</tr>
</tbody>
</table>

The `DBMS_CRYPTO` package replaces `DBMS_OBFUSCATION_TOOLKIT`, providing greater ease of use and support for a range of algorithms to accommodate new and existing systems. Specifically, 3DES_2KEY and MD4 are provided for backward compatibility. It is not recommended that you use these algorithms because they do not provide the same level of security as provided by 3DES, AES, MD5, SHA-1, or SHA-2.

### 38.2 DBMS_CRYPTO Security Model

Oracle Database installs this package in the `SYS` schema. You can then grant package access to existing users and roles as needed.

### 38.3 DBMS_CRYPTO Datatypes

Parameters for the `DBMS_CRYPTO` subprograms use these datatypes.

**Table 38-2   DBMS_CRYPTO Datatypes**

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>Provides padding which complies with the PKCS #5: Password-Based Cryptography Standard</td>
</tr>
<tr>
<td>PAD_NONE</td>
<td>Provides option to specify no padding. Caller must ensure that blocksize is correct, else the package returns an error.</td>
</tr>
<tr>
<td>PAD_ZERO</td>
<td>Provides padding consisting of zeroes</td>
</tr>
</tbody>
</table>

38.5 DBMS_CRYPTO Restrictions

The VARCHAR2 datatype is not directly supported by DBMS_CRYPTO. Before you can perform cryptographic operations on data of the type VARCHAR2, you must convert it to the uniform database character set AL32UTF8, and then convert it to the RAW datatype.
After performing these conversions, you can then encrypt it with the `DBMS_CRYPTO` package.

See Also:

`DBMS_CRYPTO Operational Notes` for information about the conversion rules for converting datatypes.

### 38.6 DBMS_CRYPTO Exceptions

The following table lists exceptions that have been defined for `DBMS_CRYPTO`.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CipherSuiteInvalid</td>
<td>28827</td>
<td>The specified cipher suite is not defined.</td>
</tr>
<tr>
<td>CipherSuiteNull</td>
<td>28829</td>
<td>No value has been specified for the cipher suite to be used.</td>
</tr>
<tr>
<td>KeyNull</td>
<td>28239</td>
<td>The encryption key has not been specified or contains a NULL value.</td>
</tr>
<tr>
<td>KeyBadSize</td>
<td>28234</td>
<td>DES keys: Specified key size is too short. DES keys must be at least 8 bytes (64 bits). AES keys: Specified key size is not supported. AES keys must be 128, 192, or 256 bits in length.</td>
</tr>
<tr>
<td>DoubleEncryption</td>
<td>28233</td>
<td>Source data was previously encrypted.</td>
</tr>
</tbody>
</table>

### 38.7 DBMS_CRYPTO Operational Notes

This section describes several DBMS_CRYPTO operational notes.

- When to Use Encrypt and Decrypt Procedures or Functions
- When to Use Hash or Message Authentication Code (MAC) Functions
- About Generating and Storing Encryption Keys
- Conversion Rules

#### When to Use Encrypt and Decrypt Procedures or Functions

This package includes both `ENCRYPT` and `DECRYPT` procedures and functions. The procedures are used to encrypt or decrypt `LOB` datatypes (overloaded for `CLOB` and `BLOB` datatypes). In contrast, the `ENCRYPT` and `DECRYPT` functions are used to encrypt and decrypt `RAW` datatypes. Data of type `VARCHAR2` must be converted to `RAW` before you can use `DBMS_CRYPTO` functions to encrypt it.

#### When to Use Hash or Message Authentication Code (MAC) Functions

This package includes two different types of one-way hash functions: the `HASH` function and the `MAC` function. Hash functions operate on an arbitrary-length input message, and return a fixed-length hash value. One-way hash functions work in one direction...
only. It is easy to compute a hash value from an input message, but it is extremely
difficult to generate an input message that hashes to a particular value. Note that hash
values should be at least 128 bits in length to be considered secure.

You can use hash values to verify whether data has been altered. For example, before
storing data, the user runs `DBMS_CRYPTOHASH` against the stored data to create a hash
value. On returning the stored data, the user can again run the hash function against
it, using the same algorithm. If the second hash value is identical to the first one, then
the data has not been altered. Hash values are similar to “file fingerprints” and are
used to ensure data integrity.

The `HASH` function included with `DBMS_CRYPTO`, is a one-way hash function that you can
use to generate a hash value from either `RAW` or `LOB` data. The `MAC` function is also a
one-way hash function, but with the addition of a secret key. It works the same way as
the `DBMS_CRYPTOHASH` function, except only someone with the key can verify the hash
value.

MACs can be used to authenticate files between users. They can also be used by a
single user to determine if her files have been altered, perhaps by a virus. A user could
compute the MAC of his files and store that value in a table. If the user did not use a
MAC function, then the virus could compute the new hash value after infection and
replace the table entry. A virus cannot do that with a MAC because the virus does not
know the key.

About Generating and Storing Encryption Keys

The `DBMS_CRYPTO` package can generate random material for encryption keys, but it
does not provide a mechanism for maintaining them. Application developers must take
care to ensure that the encryption keys used with this package are securely generated
and stored. Also note that the encryption and decryption operations performed by
`DBMS_CRYPTO` occur on the server, not on the client. Consequently, if the key is sent over
the connection between the client and the server, the connection must be protected by
using network encryption. Otherwise, the key is vulnerable to capture over the wire.

Although `DBMS_CRYPTO` cannot generate keys on its own, it does provide tools you can
use to aid in key generation. For example, you can use the `RANDOMBYTES` function to
generate random material for keys.

When generating encryption keys for DES, it is important to remember that some
numbers are considered weak and semiweak keys. Keys are considered weak or
semiweak when the pattern of the algorithm combines with the pattern of the initial key
value to produce ciphertext that is more susceptible to cryptanalysis. To avoid this,
filter out the known weak DES keys. Lists of the known weak and semiweak DES keys
are available on several public Internet sites.

See Also:

- *Oracle Database Security Guide* for information about configuring
  network encryption and SSL
- `RANDOMBYTES` Function
Conversion Rules

- To convert VARCHAR2 to RAW, use the UTL_I18N.STRING_TO_RAW function to perform the following steps:
  1. Convert VARCHAR2 in the current database character set to VARCHAR2 in the AL32UTF8 database character.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to RAW.

  Syntax example:
  
  ```plsql
  UTL_I18N.STRING_TO_RAW (string, 'AL32UTF8');
  ```

- To convert RAW to VARCHAR2, use the UTL_I18N.RAW_TO_CHAR function to perform the following steps:
  1. Convert RAW to VARCHAR2 in the AL32UTF8 database character set.
  2. Convert VARCHAR2 in the AL32UTF8 database character set to VARCHAR2 in the database character set you wish to use.

  Syntax example:
  
  ```plsql
  UTL_I18N.RAW_TO_CHAR (data, 'AL32UTF8');
  ```

  See Also:

  UTL_I18N for information about using the UTL_I18N PL/SQL package.

- If you want to store encrypted data of the RAW datatype in a VARCHAR2 database column, then use RAWTOHEX or UTL_ENCODE.BASE64_ENCODE to make it suitable for VARCHAR2 storage. These functions expand data size by 2 and 4/3, respectively.

38.8 DBMS_CRYPTO Examples

This listing shows PL/SQL block encrypting and decrypting pre-defined 'input_string' using 256-bit AES algorithm with Cipher Block Chaining and PKCS#5 compliant padding.

```
DECLARE
  input_string       VARCHAR2 (200) := 'Secret Message';
  output_string      VARCHAR2 (200);
  encrypted_raw      RAW (2000);             -- stores encrypted binary text
  decrypted_raw      RAW (2000);             -- stores decrypted binary text
  num_key_bytes      NUMBER := 256/8;        -- key length 256 bits (32 bytes)
  key_bytes_raw      RAW (32);               -- stores 256-bit encryption key
  encryption_type    PLS_INTEGER :=
    DBMS_CRYPTO.ENCRYPT_AES256
    + DBMS_CRYPTO.CHAIN_CBC
    + DBMS_CRYPTO.PAD_PKCS5;
  iv_raw             RAW (16);
BEGIN
  DBMS_OUTPUT.PUT_LINE ( 'Original string: ' || input_string);
  key_bytes_raw := DBMS_CRYPTO.RANDOMBYTES (num_key_bytes);
```

38-7
iv_raw := DBMS_CRYPTO.RANDOMBYTES (16);
encrypted_raw := DBMS_CRYPTO.ENCRYPT
    (  
        src => UTL_I18N.STRING_TO_RAW (input_string, 'AL32UTF8'),
        typ => encryption_type,
        key => key_bytes_raw,
        iv  => iv_raw
    );

    -- The encrypted value "encrypted_raw" can be used here

decrypted_raw := DBMS_CRYPTO.DECRYPT
    (  
        src => encrypted_raw,
        typ => encryption_type,
        key => key_bytes_raw,
        iv  => iv_raw
    );

    output_string := UTL_I18N.RAW_TO_CHAR (decrypted_raw, 'AL32UTF8');

    DBMS_OUTPUT.PUT_LINE ('Decrypted string: ' || output_string);
END;

38.9 Summary of DBMS_CRYPTO Subprograms

This table lists the DBMS_CRYPTO subprograms in alphabetical order and briefly describes them.

Table 38-10  DBMS_CRYPTO Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DECRYPT Function</td>
<td>Decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector)</td>
</tr>
<tr>
<td>DECRYPT Procedures</td>
<td>Decrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Function</td>
<td>Encrypts RAW data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>ENCRYPT Procedures</td>
<td>Encrypts LOB data using a stream or block cipher with a user supplied key and optional IV</td>
</tr>
<tr>
<td>HASH Function</td>
<td>Applies one of the supported cryptographic hash algorithms (MD4, MD5, SHA-1, or SHA-2) to data</td>
</tr>
<tr>
<td>MAC Function</td>
<td>Applies Message Authentication Code algorithms (MD5, SHA-1, or SHA-2) to data to provide keyed message protection</td>
</tr>
<tr>
<td>RANDOMBYTES Function</td>
<td>Returns a RAW value containing a cryptographically secure pseudorandom sequence of bytes, and can be used to generate random material for encryption keys</td>
</tr>
<tr>
<td>RANDOMINTEGER Function</td>
<td>Returns a random BINARY_INTEGER</td>
</tr>
<tr>
<td>RANDOMNUMBER Function</td>
<td>Returns a random 128-bit integer of the NUMBER datatype</td>
</tr>
</tbody>
</table>
38.9.1 DECRYPT Function

This function decrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```
DBMS_CRYPTO.DECRYPT(
  src IN RAW,
  typ IN PLS_INTEGER,
  key IN RAW,
  iv  IN RAW DEFAULT NULL)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be decrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- To retrieve original plaintext data, DECRYPT must be called with the same cipher, modifiers, key, and IV that was used to encrypt the data originally.

See Also:

- "Usage Notes" for the ENCRYPT function for additional information about the ciphers and modifiers available with this package.
- If VARCHAR2 data is converted to RAW before encryption, then it must be converted back to the appropriate database character set by using the UTL_I18N package.

See Also:

- DBMS_CRYPTO Operational Notes for a discussion of the VARCHAR2 to RAW conversion rules
38.9.2 DECRYPT Procedures

These procedures decrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

```sql
DBMS_CRYPTO.DECRYPT(
    dst IN OUT NOCOPY CLOB         CHARACTER SET ANY_CS,
    src IN            BLOB,
    typ IN            PLS_INTEGER,
    key IN            RAW,
    iv  IN            RAW          DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_REFERENCES(decrypt,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 38-12  DECRYPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dst</td>
<td>LOB locator of output data. The value in the output LOB &lt;dst&gt; will be overwritten.</td>
</tr>
<tr>
<td>src</td>
<td>LOB locator of input data.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for decryption.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is all zeroes.</td>
</tr>
</tbody>
</table>

38.9.3 ENCRYPT Function

This function encrypts RAW data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
    src IN RAW,
    typ IN PLS_INTEGER,
    key IN RAW,
    iv  IN RAW          DEFAULT NULL)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_REFERENCES(encrypt,WNDS,RNDS,WNPS,RNPS);
```
Parameters

Table 38-13  ENCRYPT Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>RAW data to be encrypted.</td>
</tr>
<tr>
<td>typ</td>
<td>Stream or block cipher type and modifiers to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Encryption key to be used for encrypting data.</td>
</tr>
<tr>
<td>iv</td>
<td>Optional initialization vector for block ciphers. Default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

- Block ciphers may be modified with chaining and padding type modifiers. The chaining and padding type modifiers are added to the block cipher to produce a cipher suite. Cipher Block Chaining (CBC) is the most commonly used chaining type, and PKCS #5 is the recommended padding type. See Table 38-7 and Table 38-8 for block cipher chaining and padding modifier constants that have been defined for this package.

- To improve readability, you can define your own package-level constants to represent the cipher suites you use for encryption and decryption. For example, the following example defines a cipher suite that uses DES, cipher block chaining mode, and no padding:

  ```sql
  DES_CBC_NONE CONSTANT PLS_INTEGER := DBMS_CRYPTO.ENCRYPT_DES + DBMS_CRYPTO.CHAIN_CBC + DBMS_CRYPTO.PAD_NONE;
  ```

  See Table 38-6 for the block cipher suites already defined as constants for this package.

- To encrypt VARCHAR2 data, it should first be converted to the AL32UTF8 character set.

See Also:
The discussion of conversion rules under DBMS_CRYPTO Operational Notes

- Stream ciphers, such as RC4, are not recommended for stored data encryption.

38.9.4 ENCRYPT Procedures

These procedures encrypt LOB data using a stream or block cipher with a user supplied key and optional IV (initialization vector).

Syntax

```sql
DBMS_CRYPTO.ENCRYPT(
    dst IN OUT NOCOPY BLOB,
    src IN BLOB,
    typ IN PLS_INTEGER,
)
```
38.9.5 HASH Function

A one-way hash function takes a variable-length input string, the data, and converts it to a fixed-length (generally smaller) output string called a hash value. The hash value serves as a unique identifier (like a fingerprint) of the input data. You can use the hash value to verify whether data has been changed or not.

Note that a one-way hash function is a hash function that works in one direction. It is easy to compute a hash value from the input data, but it is hard to generate data that hashes to a particular value. Consequently, one-way hash functions work well to ensure data integrity. Refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notes for more information about using one-way hash functions.

This function applies to data one of the supported cryptographic hash algorithms listed in Table 38-3.

Syntax

```
DBMS_CRYPTO.Hash (  
   src IN RAW,  
   typ IN PLS_INTEGER)  
RETURN RAW;
```
DBMS_CRYPTO.Hash (    src IN BLOB,    typ IN PLS_INTEGER) RETURN RAW;

DBMS_CRYPTO.Hash (    src IN CLOB CHARACTER SET ANY_CS,    typ IN PLS_INTEGER) RETURN RAW;

Pragmas
pragma restrict_references(hash,WNDS,RNDS,WNPS,RNPS);

Parameters

Table 38-15  HASH Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>The source data to be hashed.</td>
</tr>
<tr>
<td>typ</td>
<td>The hash algorithm to be used.</td>
</tr>
</tbody>
</table>

Usage Note

Oracle recommends that you use the SHA-1 (Secure Hash Algorithm) or SHA-2 because it is more resistant to brute-force attacks than MD4 or MD5. If you must use a Message Digest algorithm, then MD5 provides greater security than MD4.

38.9.6 MAC Function

This function applies Message Authentication Code (MAC) algorithms to data to provide keyed message protection.

A MAC is a key-dependent one-way hash function. MACs have the same properties as the one-way hash function described in HASH Function, but they also include a key. Only someone with the identical key can verify the hash. Also refer to “When to Use Hash or Message Authentication Code (MAC) Functions” in DBMS_CRYPTO Operational Notes for more information about using MACs.

See Table 38-4 for a list of MAC algorithms that have been defined for this package.

Syntax

DBMS_CRYPTO.MAC (    src IN RAW,    typ IN PLS_INTEGER,    key IN RAW) RETURN RAW;

DBMS_CRYPTO.MAC (    src IN BLOB,    typ IN PLS_INTEGER    key IN RAW) RETURN RAW;

DBMS_CRYPTO.MAC (    src IN CLOB CHARACTER SET ANY_CS,
typ IN PLS_INTEGER
key IN RAW)
RETURN RAW;

Pragmas
pragma restrict_references(mac,WNDS,RNDS,WNPS,RNPS);

Parameters

Table 38-16    MAC Function Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src</td>
<td>Source data to which MAC algorithms are to be applied.</td>
</tr>
<tr>
<td>typ</td>
<td>MAC algorithm to be used.</td>
</tr>
<tr>
<td>key</td>
<td>Key to be used for MAC algorithm.</td>
</tr>
</tbody>
</table>

38.9.7 RANDOMBYTES Function

This function returns a RAW value containing a cryptographically secure pseudo-random sequence of bytes, which can be used to generate random material for encryption keys.

The RANDOMBYTES function is based on the RSA X9.31 PRNG (Pseudo-Random Number Generator).

Syntax

DBMS_CRYPTO.RANDOMBYTES (
    number_bytes IN POSITIVE)
RETURN RAW;

Pragmas
pragma restrict_references(randombytes,WNDS,RNDS,WNPS,RNPS);

Parameters

Table 38-17    RANDOMBYTES Function Parameter

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_bytes</td>
<td>The number of pseudo-random bytes to be generated.</td>
</tr>
</tbody>
</table>

Usage Note

The number_bytes value should not exceed the maximum length of a RAW variable.
38.9.8 RANDOMINTEGER Function

This function returns an integer in the complete range available for the Oracle BINARY_INTEGER datatype.

Syntax

```sql
DBMS_CRYPTO.RANDOMINTEGER
RETURN BINARY_INTEGER;
```

Pragmas

```sql
pragma restrict_references(randominteger,WNDS,RNDS,WNPS,RNPS);
```

38.9.9 RANDOMNUMBER Function

This function returns an integer in the Oracle NUMBER datatype in the range of [0..2**128-1].

Syntax

```sql
DBMS_CRYPTO.RANDOMNUMBER
RETURN NUMBER;
```

Pragmas

```sql
pragma restrict_references(randomnumber,WNDS,RNDS,WNPS,RNPS);
```
The `DBMS_CSX_ADMIN` package provides an interface to customize the setup when transporting a tablespace containing binary XML data.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of `DBMS_CSX_ADMIN`

### 39.1 DBMS_CSX_ADMIN Overview

This package can be used by DBAs to customize the setup when transporting a tablespace containing binary XML data. The use of the package is not required in order for a transportable tablespace job to run.

By default, all binary XML tables will use the default token table set, which will be replicated during transport on the target database. To avoid the cost of transporting a potentially large token table set, the DBA may opt for registering a new set of token tables for a given tablespace. The package provides routines for token table set registration and lookup.

### 39.2 DBMS_CSX_ADMIN Security Model

Owned by `XDB`, the `DBMS_CSX_ADMIN` package must be created by `SYS` or `XDB`. The `EXECUTE` privilege is granted to `SYS` or `XDB` or `DBA`. Subprograms in this package are executed using the privileges of the current user.

### 39.3 DBMS_CSX_ADMIN Constants

The `DBMS_CSX_ADMIN` package uses several constants.

These are described in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>0</td>
<td>Default token table</td>
</tr>
<tr>
<td>TAB_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Token table set associated with tables, not tablespaces</td>
</tr>
<tr>
<td>TBS_LEVEL</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Token table set associated with a tablespace</td>
</tr>
</tbody>
</table>
### 39.4 Summary of DBMS_CSX_ADMIN Subprograms

This table lists and describes the DBMS_CSX_ADMIN Package subprograms.

#### Table 39-2   DBMS_CSX_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETTOKENTABLEINFO Procedure &amp; Function</td>
<td>Returns the GUID of the token table set where token mappings for this table can be found.</td>
</tr>
<tr>
<td>GETTOKENTABLEINFOBYTABLESPACE Procedure</td>
<td>Returns the GUID and the token table names for this table.</td>
</tr>
<tr>
<td>NAMESPACEIDTABLE Function</td>
<td>Returns default namespace-ID token table.</td>
</tr>
<tr>
<td>PATHIDTABLE Function</td>
<td>Returns the default path-ID token table.</td>
</tr>
<tr>
<td>QNAMEIDTABLE Function</td>
<td>Returns the default qname-ID token table.</td>
</tr>
</tbody>
</table>

#### 39.4.1 GETTOKENTABLEINFO Procedure & Function

This procedure is overloaded. The specific forms of functionality are described along with the syntax declarations.

Given the table name and the owner, the first overload of the procedure returns the globally unique identifier (GUID) of the token table set where token mappings for this table can be found. The procedure returns also the names of the token tables, and whether the token table set is the default one.

Given the object number of a table, the second overload of the procedure returns the GUID of the token table set used by the table, and whether this is the default token table set.

**Syntax**

```sql
DBMS_CSX_ADMIN.GETTOKENTABLEINFO ( 
    ownername IN VARCHAR2, 
    tablename IN VARCHAR2, 
    guid OUT RAW, 
    qnametable OUT VARCHAR2, 
    nmspctable OUT VARCHAR2, 
) 
```
level OUT NUMBER,
tabno OUT NUMBER);

DBMS_CSX_ADMIN.GETTOKENTABLEINFO  (
  tabno IN NUMBER,
guid OUT RAW);
RETURN BOOLEAN;

Parameters

Table 39-3 GETTOKENTABLEINFO Procedure & Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set used by the given table</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table in the new set</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table in the new set</td>
</tr>
<tr>
<td>level</td>
<td>DEFAULT_LEVEL if default token table set, TBS_LEVEL if same token table set is used by all tables in the same tablespace as the given table, TAB_LEVEL otherwise</td>
</tr>
<tr>
<td>tabno</td>
<td>Table object number</td>
</tr>
</tbody>
</table>

39.4.2 GETTOKENTABLEINFOBYTABLESPACE Procedure

Given a tablespace number, this procedure returns the GUID and the token table names for this tablespace.

Syntax

DBMS_CSX_ADMIN.GETTOKENTABLEINFOBYTABLESPACE  (
  tname IN VARCHAR2,
tablespaceino IN NUMBER,
guid OUT RAW,
qnametable OUT VARCHAR2,
nmspctable OUT VARCHAR2,
isdefault OUT BOOLEAN,
containTokTab OUT BOOLEAN);

Parameters

Table 39-4 GETTOKENTABLEINFOBYTABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tname</td>
<td>Tablespace name</td>
</tr>
<tr>
<td>tablespaceino</td>
<td>Tablespace number</td>
</tr>
<tr>
<td>guid</td>
<td>GUID of the token table set associated with this tablespace (if any)</td>
</tr>
<tr>
<td>qnametable</td>
<td>Name of the qname-ID table</td>
</tr>
<tr>
<td>nmspctable</td>
<td>Name of the namespace-ID table</td>
</tr>
</tbody>
</table>
Table 39-4 (Cont.) GETTOKENABLEINFOBYTABLESPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isdefault</td>
<td>TRUE if the token table is the default one</td>
</tr>
<tr>
<td>containTokTab</td>
<td>TRUE if the tablespace contains its own token table set</td>
</tr>
</tbody>
</table>

39.4.3 NAMESPACEIDTABLE Function

This procedure returns default namespace-ID token table.

**Syntax**

```sql
DBMS_CSX_ADMIN.NAMESPACEIDTABLE
RETURN VARCHAR2;
```

39.4.4 PATHIDTABLE Function

This procedure returns the default path-ID token table. This is used for granting permissions on the default path-ID token table for a user before executing `EXPLAIN PLAN` for a query on an XML table with an XML index.

**Syntax**

```sql
DBMS_CSX_ADMIN.PATHIDTABLE
RETURN VARCHAR2;
```

39.4.5 QNAMEIDTABLE Function

This procedure returns the default qname-ID token table.

**Syntax**

```sql
DBMS_CSX_ADMIN.QNAMEIDTABLE
RETURN VARCHAR2;
```
DBMS_CUBE contains subprograms that create OLAP cubes and dimensions, and that load and process the data for querying.

See Also:
OLAP Technology in the Oracle Database in Oracle OLAP User's Guide regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:

• Using DBMS_CUBE
• Using SQL Aggregation Management
• Upgrading 10g Analytic Workspaces
• Summary of DBMS_CUBE Subprograms

40.1 Using DBMS_CUBE

Cubes and cube dimensions are first class data objects that support multidimensional analytics. They are stored in a container called an analytic workspace. Multidimensional objects and analytics are available with the OLAP option to Oracle Database.

Cubes can be enabled as cube materialized views for automatic refresh of the cubes and dimensions, and for query rewrite. Several DBMS_CUBE subprograms support the creation and maintenance of cube materialized views as a replacement for relational materialized views. These subprograms are discussed in "Using SQL Aggregation Management".

The metadata for cubes and dimensions is defined in XML documents, called templates, which you can derive from relational materialized views using the CREATE_CUBE or DERIVE_FROM_MVIEW functions. Using a graphical tool named Analytic Workspace Manager, you can enhance the cube with analytic content or create the metadata for new cubes and cube dimensions from scratch.

Several other DBMS_CUBE subprograms provide a SQL alternative to Analytic Workspace Manager for creating an analytic workspace from an XML template and for refreshing the data stored in cubes and dimensions. The IMPORT_XML procedure creates an analytic workspace with its cubes and cube dimensions from an XML template. The BUILD procedure loads data into the cubes and dimensions from their data sources and performs whatever processing steps are needed to prepare the data for querying.
40.1.1 DBMS_CUBE Security Model

Certain roles and system privileges are required to use the DBMS_CUBE package.

To create dimensional objects in the user's own schema:
- OLAP_USER role
- CREATE SESSION privilege

To create dimensional objects in different schemas:
- OLAP_DBA role
- CREATE SESSION privilege

To create cube materialized views in the user's own schema:
- CREATE MATERIALIZED VIEW privilege
- CREATE DIMENSION privilege
- ADVISOR privilege

To create cube materialized views in different schemas:
- CREATE ANY MATERIALIZED VIEW privilege
- CREATE ANY DIMENSION privilege
- ADVISOR privilege

If the source tables are in a different schema, then the owner of the dimensional objects needs SELECT object privileges on those tables.

40.2 Using SQL Aggregation Management

SQL Aggregation Management is a group of PL/SQL subprograms in DBMS_CUBE that supports the rapid deployment of cube materialized views from existing relational materialized views.

Cube materialized views are cubes that have been enhanced to use the automatic refresh and query rewrite features of Oracle Database. A single cube materialized view can replace many of the relational materialized views of summaries on a fact table, providing uniform response time to all summary data.

Cube materialized views bring the fast update and fast query capabilities of the OLAP option to applications that query summaries of detail relational tables. The summary data is generated and stored in a cube, and query rewrite automatically redirects queries to the cube materialized views. Applications experience excellent querying performance.

In the process of creating the cube materialized views, DBMS_CUBE also creates a fully functional analytic workspace including a cube and the cube dimensions. The cube stores the data for a cube materialized view instead of the table that stores the data for a relational materialized view. A cube can also support a wide range of analytic functions that enhance the database with information-rich content.
Cube materialized views are registered in the data dictionary along with all other materialized views. A CB$ prefix identifies a cube materialized view.

The DBMS_CUBE subprograms also support life-cycle management of cube materialized views.

See Also:
Adding Materialized View Capability to a Cube in Oracle OLAP User's Guide for more information about cube materialized views and enhanced OLAP analytics.

### 40.2.1 Subprograms in SQL Aggregation Management

SQL Aggregation Management includes four subprograms.

- CREATE_MVIEW Function
- DERIVE_FROM_MVIEW Function
- DROP_MVIEW Procedure
- REFRESH_MVIEW Procedure

### 40.2.2 Requirements for the Relational Materialized View

SQL Aggregation Management uses an existing relational materialized view to derive all the information needed to generate a cube materialized view. The relational materialized view determines the detail level of data that is stored in the cube materialized view. The related relational dimension objects determine the scope of the aggregates, from the lowest level specified in the GROUP BY clause of the materialized view subquery, to the highest level of the dimension hierarchy.

The relational materialized view must conform to these requirements:

- **Explicit GROUP BY clause for one or more columns.**
- **No expressions in the select list or GROUP BY clause.**
- **At least one of these numeric aggregation methods:** SUM, MIN, MAX, or AVG.
- No outer joins.
- Summary keys with at least one simple column associated with a relational dimension.

- **or**

  Summary keys with at least one simple column and no hierarchies or levels.

- Numeric datatype of any type for the fact columns. All facts are converted to NUMBER.
- **Eligible for rewrite. REWRITE_CAPABILITY should be GENERAL; it cannot be NONE. Refer to the ALL_MVIEWS entry in the Oracle Database Reference.**
- **Cannot use the DISTINCT or UNIQUE keywords with an aggregate function in the defining query. For example, AVG(DISTINCT units) causes an error in STRICT mode and is ignored in LOOSE mode.**
You can choose between two modes when rendering the cube materialized view, **LOOSE** and **STRICT**. In **STRICT** mode, any deviation from the requirements raises an exception and prevents the materialized view from being created. In **LOOSE** mode (the default), some deviations are allowed, but they affect the content of the materialized view. These elements in the relational materialized view generate warning messages:

- Complex expressions in the defining query are ignored and do not appear in the cube materialized view.
- The **AVG** function is changed to **SUM** and **COUNT**.
- The **COUNT** function without a **SUM**, **MIN**, **MAX**, or **AVG** function is ignored.
- The **STDDEV** and **VARIANCE** functions are ignored.

You can also choose how conditions in the **WHERE** clause are filtered. When filtering is turned off, the conditions are ignored. When turned on, valid conditions are rendered in the cube materialized view, but asymmetric conditions among dimension levels raise an exception.

### 40.2.3 Permissions for Managing and Querying Cube Materialized Views

Certain permissions are required to manage and query cube materialized views.

To create cube materialized views, you must have these privileges:

- **CREATE [ANY] MATERIALIZED VIEW** privilege
- **CREATE [ANY] DIMENSION** privilege
- **ADVISOR** privilege

To access cube materialized views from another schema using query rewrite, you must have these privileges:

- **GLOBAL QUERY REWRITE** privilege
- **SELECT or READ** privilege on the relational source tables
- **SELECT or READ** privilege on the analytic workspace (AW$ name) that supports the cube materialized view
- **SELECT or READ** privilege on the cube
- **SELECT or READ** privilege on the dimensions of the cube

Note that you need **SELECT or READ** privileges on the database objects that support the cube materialized views, but not on the cube materialized views.

### 40.2.4 Example of SQL Aggregation Management

Six examples of SQL Aggregate Management are given. All these examples use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: **CAL_MONTH_SALES_MV** and **FWEK_PSCAT_SALES_MV**.

- About Relational Materialized View **CAL_MONTH_SALES_MV**
- Creating the Cube Materialized View
- Disabling the Relational Materialized Views
• Creating Execution Plans for Cube Materialized Views
• Maintaining Cube Materialized Views
• New Database Objects

About Relational Materialized View CAL_MONTH_SALES_MV

This example uses CAL_MONTH_SALES_MV as the basis for creating a cube materialized view. The following query was used to create CAL_MONTH_SALES_MV. CAL_MONTH_SALES_MV summarizes the daily sales data stored in the SALES table by month.

\[
\begin{align*}
\text{SELECT} & \quad \text{query FROM user_mviews} \\
& \quad \text{WHERE mview_name='CAL_MONTH_SALES_MV';}
\end{align*}
\]

DBMS_CUBE uses relational dimensions to derive levels and hierarchies for the cube materialized view. The SH schema has relational dimensions for most dimension tables in the schema, as shown by the following query.

\[
\begin{align*}
\text{SELECT} & \quad \text{dimension_name FROM user_dimensions;} \\
\end{align*}
\]

Creating the Cube Materialized View

This PL/SQL script uses the CREATE_MVIEW function to create a cube materialized view from CAL_MONTH_SALES_MV. CREATE_MVIEW sets the optional BUILD parameter to refresh the cube materialized view immediately.

\[
\begin{align*}
\text{SET serverout ON format wrapped} \\
\text{DECLARE} \\
\quad \text{salesaw varchar2(30);} \\
\text{BEGIN} \\
\quad \text{salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV', 'build=immediate');} \\
\text{END;}
\end{align*}
\]

These messages confirm that the script created and refreshed CB$CAL_MONTH_SALES successfully:

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212 08:42:58.03.
Created cube organized materialized view "CB$CAL_MONTH_SALES" for rewrite at 20130212 08:42:58.004.
The following query lists the materialized views in the SH schema:

```sql
SELECT mview_name FROM user_mviews;
```

<table>
<thead>
<tr>
<th>MVIEW_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>CB$CAL_MONTH_SALES</td>
</tr>
<tr>
<td>CB$TIMES_DIM_D1_CAL_ROLLUP</td>
</tr>
<tr>
<td>CAL_MONTH_SALES_MV</td>
</tr>
<tr>
<td>FWEEK_PSCAT_SALES_MV</td>
</tr>
</tbody>
</table>

Two new materialized views are registered in the data dictionary:

- CB$CAL_MONTH_SALES: Cube materialized view
- CB$TIMES_DIM_D1_CAL_ROLLUP: Cube dimension materialized view for the TIME_DIM Calendar Rollup hierarchy

Cube dimension materialized views support refresh of the cube materialized view. You do not directly administer dimension materialized views.

### Disabling the Relational Materialized Views

After creating a cube materialized view, disable query rewrite on all relational materialized views for the facts now supported by the cube materialized view. You can drop them when you are sure that you created the cube materialized view with the optimal parameters.

```sql
ALTER MATERIALIZED VIEW cal_month_sales_mv DISABLE QUERY REWRITE;
```

Materialized view altered.

You can also use the `DISABLEQRW` parameter in the `CREATE_MVIEW` function, which disables query rewrite on the source materialized view as described in Table 40-7.

### Creating Execution Plans for Cube Materialized Views

You can create execution plans for cube materialized views the same as for relational materialized views. The following command generates an execution plan for a query against the SALES table, which contains data at the day level. The answer set requires data summarized by quarter. Query rewrite would not use the original relational materialized view for this query, because its data is summarized by month. However, query rewrite can use the new cube materialized view for summary data for months, quarters, years, and all years.

```sql
EXPLAIN PLAN FOR SELECT
t.calendar_quarter_desc,
    sum(s.amount_sold) AS dollars
FROM     sales s,
    times t
WHERE    s.time_id = t.time_id
AND      t.calendar_quarter_desc LIKE '2001%'
GROUP BY t.calendar_quarter_desc
ORDER BY t.calendar_quarter_desc;
```

The query returns these results:

<table>
<thead>
<tr>
<th>CALENDAR_QUARTER_DESC</th>
<th>DOLLARS</th>
</tr>
</thead>
<tbody>
<tr>
<td>2001-01</td>
<td>6547097.44</td>
</tr>
<tr>
<td>2001-02</td>
<td>6922468.39</td>
</tr>
</tbody>
</table>
The execution plan shows that query rewrite returned the summary data from the cube materialized view, `CB$CAL_MONTH_SALES`, instead of recalculating it from the `SALES` table.

```
SELECT plan_table_output FROM TABLE(dbms_xplan.display());
```

<table>
<thead>
<tr>
<th>Id</th>
<th>Operation</th>
<th>Name</th>
<th>Rows</th>
<th>Bytes</th>
<th>Cost (%CPU)</th>
<th>Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>SELECT STATEMENT</td>
<td></td>
<td>1</td>
<td>30</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>1</td>
<td>SORT GROUP BY</td>
<td></td>
<td>1</td>
<td>30</td>
<td>3 (34)</td>
<td>00:00:01</td>
</tr>
<tr>
<td>*2</td>
<td>MAT_VIEW REWRITE CUBE ACCESS</td>
<td>CB$CAL_MONTH_SALES</td>
<td>1</td>
<td>30</td>
<td>2 (0)</td>
<td>00:00:01</td>
</tr>
</tbody>
</table>

Predicate Information (identified by operation id):

```
2 - filter("CB$CAL_MONTH_SALES"."D1_CALENDAR_QUARTER_DESC" LIKE '2001%' AND "CB$CAL_MONTH_SALES"."SYS_GID"=63)
```

15 rows selected.

**Maintaining Cube Materialized Views**

You can create a cube materialized view that refreshes automatically. However, you can force a refresh at any time using the `REFRESH_MVIEW` Procedure:

```
BEGIN
    dbms_cube.refresh_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Completed refresh of cube mview "SH"."CB$CAL_MONTH_SALES" at 20130212 14:30:59.534.

If you want to drop a cube materialized view, use the `DROP_MVIEW` Procedure so that all supporting database objects (analytic workspace, cube, cube dimensions, and so forth) are also dropped:

```
BEGIN
    dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
END;
/
```

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130212 13:38:47.878.

**New Database Objects**

The `CREATE_MVIEW` function creates several first class database objects in addition to the cube materialized views. You can explore these objects through the data dictionary by querying views such as `ALL_CUBES` and `ALL_CUBE_DIMENSIONS`.

This example created the following supporting objects:

- **Analytic workspace** `CAL_MONTH_SALES_AW` (`AW$CAL_MONTH_SALES_AW` table)
- **Cube** `CAL_MONTH_SALES`
40.3 Upgrading 10g Analytic Workspaces

You can upgrade an OLAP 10g analytic workspace to OLAP 12c by saving the OLAP 10g objects as an XML template and importing the XML into a different schema. The original analytic workspace remains accessible and unchanged by the upgrade process.

Oracle OLAP metadata is the same in OLAP 11g and OLAP 12c so you do not need to upgrade an OLAP 11g analytic workspace to OLAP 12c. This topic describes upgrading an Oracle OLAP 10g analytic workspace to OLAP 12c.

Tip:

Oracle recommends using Analytic Workspace Manager for performing upgrades. See Upgrading Metadata From Oracle OLAP 10g in Oracle OLAP User's Guide.

These subprograms in DBMS_CUBE support the upgrade process:

- CREATE_EXPORT_OPTIONS Procedure
- CREATE_IMPORT_OPTIONS Procedure
- EXPORT_XML Procedure
- EXPORT_XML_TO_FILE Procedure
- IMPORT_XML Procedure
- INITIALIZE_CUBE_UPGRADE Procedure
- UPGRADE_AW Procedure

Prerequisites:

- The OLAP 10g analytic workspace can use OLAP standard form metadata.
- Customizations to the OLAP 10g analytic workspace may not be exported to the XML template. You must re-create them in OLAP 12c.
- The original relational source data must be available to load into the new analytic workspace. If the data is in a different schema or the table names are different, then you must remap the dimensional objects to the new relational sources after the upgrade.
- You can create the OLAP 12c analytic workspace in the same schema as the OLAP 10g analytic workspace. However, if you prefer to create it in a different schema, then create a new user with the following privileges:
  - SELECT or READ privileges on the OLAP 10g analytic workspace (GRANT SELECT ON schema.AW$analytic_workspace).
– **SELECT or READ** privileges on all database tables and views that contain the source data for the OLAP 10g analytic workspace.

– Appropriate privileges for an OLAP administrator.

– Same default tablespace as the Oracle 10g user.

See the *Oracle OLAP User's Guide*.

### Correcting Naming Conflicts

The namespaces are different in OLAP 10g than those in OLAP 12c. For a successful upgrade, you must identify any 10g object names that are used multiple times under the 12c naming rules and provide unique names for them.

The following namespaces control the uniqueness of OLAP object names in Oracle 12c:

- **Schema**: The names of cubes, dimensions, and measure folders must be unique within a schema. They cannot conflict with the names of tables, views, indexes, relational dimensions, or any other first class objects. However, these OLAP 12c object names do not need to be distinct from 10g object names, because they are in different namespaces.

- **Cube**: The names of measures must be unique within a cube.

- **Dimension**: The names of hierarchies, levels, and attributes must be unique within a dimension. For example, a dimension cannot have a hierarchy named Customers and a level named Customers.

You can use an initialization table and a rename table to rename objects in the upgraded 12c analytic workspace.

### Initialization Table

The `INITIALIZE_CUBE_UPGRADE` procedure identifies ambiguous names under the OLAP 12c naming rules. For example, a 10g dimension might have a hierarchy and a level with the same name. Because hierarchies and levels are in the same 12c namespace, the name is not unique in 12c; to a 12c client, the hierarchy and the level cannot be differentiated by name.

`INITIALIZE_CUBE_UPGRADE` creates and populates a table named `CUBE_UPGRADE_INFO` with unique names for these levels, hierarchies, and attributes. By using the unique names provided in the table, a 12c client can browse the OLAP 12c metadata. You cannot attach an OLAP 12c client to the analytic workspace or perform an upgrade without a `CUBE_UPGRADE_INFO` table, if the 10g metadata contains ambiguous names.

You can edit `CUBE_UPGRADE_INFO` to change the default unique names to names of your choosing. You can also add rows to change the names of any other objects. When using an 12c client, you see the new object names. When using an 10g client, you see the original names. However, the `INITIALIZE_CUBE_UPGRADE` procedure overwrites this table, so you may prefer to enter customizations in a rename table.

During an upgrade from OLAP 10g, the unique object names in `CUBE_UPGRADE_INFO` are used as the names of 12c objects in the new analytic workspace. However, `INITIALIZE_CUBE_UPGRADE` does not automatically provide unique names for cubes, dimensions, and measure folders. To complete an upgrade, you must assure that these objects have unique names within the 12c namespace. You can provide these objects with new names in the `CUBE_UPGRADE_INFO` table or in a rename table.
OLAP 12c clients automatically use `CUBE_UPGRADE_INFO` when it exists in the same schema as the OLAP 10g analytic workspace.

See Also:

"INITIALIZE_CUBE_UPGRADE Procedure"

Rename Table

You can create a rename table that contains new object names for an OLAP 12c analytic workspace. You can then use the rename table in the `CREATE_IMPORT_OPTIONS` and `UPGRADE_AW` procedures.

When upgrading within the same schema, you must provide a unique name for the 12c analytic workspace. The `UPGRADE_AW` procedure provides a parameter for this purpose; otherwise, you must provide the new name in the rename table. The duplication of cube names does not create ambiguity because the 12c cubes are created in a different namespace than the 10g cubes.

The names provided in a rename table are used only during an upgrade and overwrite any names entered in the `CUBE_UPGRADE_INFO` table.

To create a rename table:

1. Open SQL*Plus or another SQL client, and connect to Oracle Database as the owner of the 10g analytic workspace.

2. Issue a command like the following:

   ```sql
   CREATE TABLE table_name ( 
     source_id    VARCHAR2(300),
     new_name     VARCHAR2(30),
     object_type  VARCHAR2(30));
   ```

3. Populate the rename table with the appropriate values, as follows.

   `table_name` is the name of the rename table.

   `source_id` is the identifier for an object described in the XML document supplied to `IMPORT_XML`. The identifier must have this format:

   `schema_name.object_name[.subobject_name]`

   `new_name` is the object name given during the import to the object specified by `source_id`.

   `object_type` is the object type as described in the XML, such as `StandardDimension` or `DerivedMeasure`.

   For example, these SQL statements populate the table with new names for the analytic workspace, a cube, and four dimensions:

   ```sql
   INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW', 'GLOBAL12', 'AW');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.UNITS_CUBE', 'UNIT_SALES_CUBE', 'Cube');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CUSTOMER', 'CUSTOMERS', 'StandardDimension');
   INSERT INTO my_object_map VALUES('GLOBAL_AW.CHANNEL', 'CHANNELS', 'Explorer');
   ```
Simple Upgrade

A simple upgrade creates an OLAP 12c analytic workspace from an OLAP 10g analytic workspace.

To perform a simple upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner for the OLAP 12c analytic workspace.
2. To rename any objects in the 12c analytic workspace, create a rename table as described in the Rename Table section. (Optional)
3. Perform the upgrade, as described in "UPGRADE_AW Procedure".
4. Use the DBMS_CUBE.BUILD procedure to load data into the cube.

Example 40-1 Performing a Simple Upgrade to the GLOBAL Analytic Workspace

This example creates an OLAP 12c analytic workspace named GLOBAL12 from an OLAP 10g analytic workspace named GLOBAL10. GLOBAL10 contains no naming conflicts between cubes, dimensions, measure folders, or tables in the schema, so a rename table is not needed in this example.

```
BEGIN
    -- Upgrade the analytic workspace
    dbms_cube.upgrade_aw(sourceaw =>'GLOBAL10', destaw => 'GLOBAL12');

    -- Load and aggregate the data
    dbms_cube.build(script => 'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

Custom Upgrade

A custom upgrade enables you to set the export and import options.

To perform a custom upgrade of an Oracle OLAP 10g analytic workspace:

1. Open SQL*Plus or a similar SQL command-line interface and connect to Oracle Database 12c as the schema owner of the OLAP 12c analytic workspace.
2. Generate an initialization table, as described in the Initialization Table section. Review the new, default object names and modify them as desired.
3. Create a rename table, as described in the Rename Table section. If you are upgrading in the same schema, you must use a rename table to provide a unique
name for the 12c analytic workspace. Otherwise, a rename table is needed only if names are duplicated among the cubes, dimensions, and measure folders of the analytic workspace, or between those names and the existing cubes, dimensions, measure folders, or tables of the destination schema.

4. Create a SQL script that does the following:
   a. Create an XML document for the export options, as described in "CREATE_EXPORT_OPTIONS Procedure". The SUPPRESS_NAMESPACE option must be set to TRUE for the upgrade to occur.
   b. Create an XML document for the import options, as described in "CREATE_IMPORT_OPTIONS Procedure".
   c. Create an XML template in OLAP 12c format, as described in "EXPORT_XML Procedure".
   d. Create an OLAP 12c analytic workspace from the XML template, as described in "IMPORT_XML Procedure".

5. Load and aggregate the data in the new analytic workspace, as described in "BUILD Procedure".

Example 40-2 Performing a Custom Upgrade to the GLOBAL Analytic Workspace

This example upgrades the GLOBAL10 analytic workspace from OLAP 10g metadata to OLAP 12c metadata in the GLOBAL_AW schema.

The rename table provides the new name of the analytic workspace. These commands define the rename table.

```sql
CREATE TABLE my_object_map(
    source_id    VARCHAR2(300),
    new_name     VARCHAR2(30),
    object_type  VARCHAR2(30));

INSERT INTO my_object_map VALUES('GLOBAL_AW.GLOBAL10.AW',  'GLOBAL12', 'AW');
COMMIT;
```

Following is the script for performing the upgrade.

```sql
set serverout on

DECLARE
    importClob    clob;
    exportClob    clob;
    exportOptClob clob;
    importOptClob clob;
BEGIN
    -- Create table of reconciled names
    dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob,
        suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob,
        rename_table =>
```
'MY_OBJECT_MAP'});

-- Create CLOBs for the metadata
dbms_lob.createtemporary(importClob, TRUE);
dbms_lob.createtemporary(exportClob, TRUE);

-- Export metadata from a 10g analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob,
out_xml=>importClob);

-- Load and aggregate the data
dbms_cube.build('UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/

40.4 Summary of DBMS_CUBE Subprograms

This table lists and describes the DBMS_CUBE procedure subprograms.

Table 40-1  DBMS_CUBE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD Procedure</td>
<td>Loads data into one or more cubes and dimensions, and prepares the data for querying.</td>
</tr>
<tr>
<td>CREATE_EXPORT_OPTIONS</td>
<td>Creates an input XML document of processing options for the EXPORT_XML procedure.</td>
</tr>
<tr>
<td>CREATE_IMPORT_OPTIONS</td>
<td>Creates an input XML document of processing options for the IMPORT_XML procedure.</td>
</tr>
<tr>
<td>CREATE_MVIEW Function</td>
<td>Creates a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>DERIVE_FROM_MVIEW Function</td>
<td>Creates an XML template for a cube materialized view from the definition of a relational materialized view.</td>
</tr>
<tr>
<td>DROP_MVIEW Procedure</td>
<td>Drops a cube materialized view.</td>
</tr>
<tr>
<td>EXPORT_XML Procedure</td>
<td>Exports the XML of an analytic workspace to a CLOB.</td>
</tr>
<tr>
<td>EXPORT_XML_TO_FILE Procedure</td>
<td>Exports the XML of an analytic workspace to a file.</td>
</tr>
<tr>
<td>IMPORT_XML Procedure</td>
<td>Creates, modifies, or drops an analytic workspace by using an XML template.</td>
</tr>
<tr>
<td>INITIALIZE_CUBE_UPGRADE</td>
<td>Processes Oracle OLAP 10g objects with naming conflicts to enable Oracle 12c clients to access them.</td>
</tr>
<tr>
<td>REFRESH_MVIEW Procedure</td>
<td>Refreshes a cube materialized view.</td>
</tr>
<tr>
<td>UPGRADE_AW Procedure</td>
<td>Upgrades an analytic workspace from Oracle OLAP 10g to 12c.</td>
</tr>
<tr>
<td>VALIDATE_XML Procedure</td>
<td>Checks the XML to assure that it is valid, without committing the results to the database.</td>
</tr>
</tbody>
</table>
40.4.1 BUILD Procedure

This procedure loads data into one or more cubes and dimensions, and generates aggregate values in the cubes. The results are automatically committed to the database.

Syntax

```sql
DBMS_CUBE.BUILD (  
  script                IN  VARCHAR2,  
  method                IN  VARCHAR2        DEFAULT NULL,  
  refresh_after_errors  IN  BOOLEAN         DEFAULT FALSE,  
  parallelism           IN  BINARY_INTEGER  DEFAULT 0,  
  atomic_refresh        IN  BOOLEAN         DEFAULT FALSE,  
  automatic_order       IN  BOOLEAN         DEFAULT TRUE,  
  add_dimensions        IN  BOOLEAN         DEFAULT TRUE,  
  scheduler_job         IN  VARCHAR2        DEFAULT NULL,  
  master_build_id       IN  BINARY_INTEGER  DEFAULT 0,  
  nested                IN  BOOLEAN         DEFAULT FALSE);  
  job_class             IN  VARCHAR2        DEFAULT 'DEFAULT_JOB_CLASS'
)```

Parameters

**Table 40-2  BUILD Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>script</code></td>
<td>A list of cubes and dimensions and their build options (see “SCRIPT Parameter”).</td>
</tr>
<tr>
<td><code>method</code></td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated. You can specify a method for each cube and dimension in sequential order, or a single method to apply to all cubes and dimensions. If you list more objects than methods, then the last method applies to the additional objects.</td>
</tr>
<tr>
<td></td>
<td>• C: Complete refresh clears all dimension values before loading. (Default)</td>
</tr>
<tr>
<td></td>
<td>• F: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</td>
</tr>
<tr>
<td></td>
<td>• ?: Fast refresh if possible, and otherwise a complete refresh.</td>
</tr>
<tr>
<td></td>
<td>• P: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td></td>
<td>• S: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</td>
</tr>
<tr>
<td></td>
<td>See the “Usage Notes” for additional details.</td>
</tr>
<tr>
<td><code>refresh_after_errors</code></td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</td>
</tr>
<tr>
<td></td>
<td>FALSE to roll back all objects in the build.</td>
</tr>
<tr>
<td><code>parallelism</code></td>
<td>Number of parallel processes to allocate to this job (see Usage Notes).</td>
</tr>
</tbody>
</table>
Table 40-2  (Cont.) BUILD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atomic_refresh</td>
<td>TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state. FALSE enables users to access intermediate results during an build.</td>
</tr>
<tr>
<td>automatic_order</td>
<td>TRUE enables optimization of the build order. Dimensions are loaded before cubes. FALSE builds objects in the order you list them in the script.</td>
</tr>
<tr>
<td>add_dimensions</td>
<td>TRUE automatically includes all the dimensions of the cubes in the build, whether or not you list them in the script. If a cube materialized view with a particular dimension is fresh, then that dimension is not reloaded. You can list a cube once in the script. FALSE includes only dimensions specifically listed in the script.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>master_build_id</td>
<td>A unique name for the build.</td>
</tr>
<tr>
<td>nested</td>
<td>TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.</td>
</tr>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
</tbody>
</table>

SCRIPT Parameter

The SCRIPT parameter identifies the objects to include in the build, and specifies the type of processing to perform on each one. The parameter has this syntax:

```
[VALIDATE | NO COMMIT] objects [ USING ( commands ) ][,...]
```

**Where:**

- VALIDATE checks all steps of the build and sends the planned steps to CUBE_BUILD_LOG without executing the steps. You can view all generated SQL in the OUTPUT column of the log table.
- NO COMMIT builds the objects in the current attach mode (or Read Only when the analytic workspace is not attached) but does not commit the changes. This option supports what-if analysis, since it enables you to change data values temporarily. See "SCRIPT Parameter: USING Clause: SET command”.
- objects is the qualified name of one or more cubes or dimensions, separated by commas, in the form [aw_name.]object, such as UNITS_CUBE or GLOBAL.UNITS_CUBE.
SCRIPT Parameter: USING Clause

The USING clause specifies the processing options. It consists of one or more commands separated by commas.

Note:
A cube with a rewrite materialized view cannot have a USING clause, except for the ANALYZE command. It uses the default build options.

The commands can be any of the following.

- AGGREGATE USING [MEASURE]
  Generates aggregate values using the syntax described in "SCRIPT Parameter: USING Clause: AGGREGATE command".

- ANALYZE
  Runs DBMS_AW_STATS.ANALYZE, which generates and stores optimizer statistics for cubes and dimensions.

- CLEAR [VALUES | LEAVES | AGGREGATES] [SERIAL | PARALLEL]
  Prepares the cube for a data refresh. It can also be used on dimensions, but CLEAR removes all dimension keys, and thus deletes all data values for cubes that use the dimension.

  These optional arguments control the refresh method. If you omit the argument, then the behavior of CLEAR depends on the refresh method. The ‘C’ (complete) refresh method runs CLEAR VALUES, and all other refresh methods run CLEAR LEAVES.

  - VALUES: Clears all data in the cube. All facts must be reloaded and all aggregates must be recomputed. This option supports the COMPLETE refresh method. (Default for the C and F methods)

  - LEAVES: Clears the detail data and retains the aggregates. All facts must be reloaded, and the aggregates for any new or changed facts must be computed. This option supports the FAST refresh method. (Default for the ? method)

  - AGGREGATES: Retains the detail data and clears the aggregates. All aggregates must be recomputed.

  These optional arguments control the load method, and can be combined with any of the refresh options:

  - PARALLEL: Each partition is cleared separately. (Default)

  - SERIAL: All partitions are cleared together.

  If you omit the CLEAR command, DBMS_CUBE loads new and updated facts, but does not delete any old detail data. This is equivalent to a LOAD NO SYNC for dimensions.

- COMPILe [SORT | NO SORT | SORT ONLY]
  Creates the supporting structures for the dimension. (Dimensions only)

  These options control the use of a sort order attribute:
- **SORT**: The user-defined sort order attribute populates the sort column in the embedded-total (ET) view. (Default)
- **NO SORT**: Any sort order attribute is ignored. This option is for very large dimensions where sorting could consume too many resources.
- **SORT ONLY**: The compile step only runs the sort.

- **EXECUTE PL/SQL string**
  
  Executes a PL/SQL command or script in the database.

- **EXECUTE OLAP DML string [PARALLEL | SERIAL]**
  
  Executes an OLAP DML command or program in the analytic workspace. The options control execution of the command or program:
  - **PARALLEL**: Execute the command or program once for each partition. This option can be used to provide a performance boost to complex DML operations, such as forecasts and models.
  - **SERIAL**: Execute the command or program once for the entire cube. (Default)

- **[INSERT | MERGE] INTO [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] VALUES (dim_key, parent, level_name)**
  
  Adds a dimension member to one or more hierarchies. **INSERT** throws an error if the member already exists, while **MERGE** does not. See "Dimension Maintenance Example".

  - **dimension.hierarchy**: The name of a hierarchy the new member belongs to. Enclose each part of the name in double quotes, for example, "PRODUCT"."PRIMARY".
  - **dim_key**: The **DIM_KEY** value of the dimension member.
  - **parent**: The parent of the dimension key.
  - **level_name**: The level of the dimension key.

- **UPDATE [ALL HIERARCHIES | HIERARCHIES (dimension.hierarchy)] SET PARENT = parent, LEVEL=level_name WHERE MEMBER = dim_key**
  
  Alters the level or parent of an existing dimension member. See **INSERT** for a description of the options. Also see "Dimension Maintenance Example".

- **DELETE FROM DIMENSION WHERE MEMBER=dim_key**
  
  Deletes a dimension member. See "Dimension Maintenance Example".

  - **dim_key**: The **DIM_KEY** value of the dimension member to be deleted.

- **SET dimension.attribute[qdr] = CAST('attribute_value' AS VARCHAR2))**
  
  Sets the value of an attribute for a dimension member. See "Dimension Maintenance Example".

  - **dimension.attribute**: The name of the attribute. Enclose each part of the name in double quotes, for example, "PRODUCT"."LONG_DESCRIPTION".
  - **qdr**: The dimension member being given an attribute value in the form of a qualified data reference, such as "PRODUCT"='OPT MOUSE'.
  - **attribute_value**: The value of the attribute, such as 'Optical Mouse'.

- **FOR dimension_clause measure_clause BUILD {commands}**
Restricts the build to particular measures and dimension values, using the following arguments. See “FOR Clause Example”.

- **dimension_clause**:
  
  \[ \text{dimension \ ALL | NONE | WHERE condition | LEVELS (level [, level...])} \]

  *dimension* is the name of a dimension of the cube.

  ALL sets the dimension status to all members before executing the list of commands.

  NONE loads values for no dimension members.

  WHERE loads values for those dimension members that match the condition.

  LEVELS loads values for dimension members in the named levels.

  level is a level of the named dimension.

- **measure_clause**:
  
  \[ \text{MEASURES (measure [, measure...])} \]

  *measure* is the name of a measure in the cube.

- **commands**: Any of the other USING commands.

  - LOAD \{SYNCH | NO SYNCH | RETAIN\} \{PRUNE | PARALLEL | SERIAL\} \{WHERE condition\}

  Loads data into the dimension or cube.

  - WHERE limits the load to those values in the mapped relational table that match condition.

  - condition is a valid predicate based on the columns of the mapped table. See the “Examples”.

These optional arguments apply only to dimensions:

- **SYNCH** matches the dimension keys to the relational data source. (Default)

- **NO SYNCH** loads new dimension keys but does not delete old keys.

  If the parent of a dimension key has changed in the relational data source, this option allows the load to change the parent/child relation in the analytic workspace.

- **RETAIN** loads new dimension keys but does not delete old keys.

  This option does not allow the parent of a dimension key to change. If the parent has changed, the load rejects the record. The rejection generates an error in the rejected records log, if the log is enabled.

These optional arguments apply only to cubes:

- **PRUNE**: Runs a full table scan on the fact table to determine which partitions to load. For example, if a cube is partitioned by month and the fact table has values only for the last two months, then jobs are only started to load the partitions for the last two months.

- **PARALLEL**: Each partition is loaded separately. (Default)

- **SERIAL**: All partitions are loaded in one SELECT statement.

- **MODEL model_name \{PARALLEL | SERIAL\}**

  Executes a model previously created for the cube. It accepts these arguments:
- **PARALLEL**: The model runs separately on each partition.
- **SERIAL**: The model runs on all cubes at the same time. (Default)

- **SET**
  
  Supports write-back to the cube using the syntax described in "**SCRIPT Parameter: USING Clause: SET command**". (Cubes only)

- **SOLVE [PARALLEL | SERIAL]**

  Aggregates the cube using the rules defined for the cube, including the aggregation operator and the precompute specifications. (Cubes only)

  It accepts these arguments:
  
  - **PARALLEL**: Each partition is solved separately. (Default)
  - **SERIAL**: All partitions are solved at the same time.

**SCRIPT Parameter: USING Clause: AGGREGATE command**

The **AGGREGATE** command in a script specifies the aggregation rules for one or more measures.

**Note:**

The **AGGREGATE** command is available only for uncompressed cubes.

**AGGREGATE** has the following syntax:

```
{ AGGREGATE USING MEASURE
  WHEN measure1 THEN operator1
  WHEN measure2 THEN operator2...
  ELSE default_operator
 |
  [AGGREGATE USING] operator_clause }
processing_options
OVER { ALL | dimension | dimension HIERARCHIES (hierarchy)}
```

**USING MEASURE Clause**

This clause enables you to specify different aggregation operators for different measures in the cube.

**Operator Clause**

The **operator_clause** has this syntax:

```
operator(WEIGHTBY expression | SCALEBY expression)
```

**WEIGHTBY** multiplies each data value by an expression before aggregation.

**SCALEBY** adds the value of an expression to each data value before aggregation.
### Table 40-3 Aggregation Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of data values that were added together.</td>
</tr>
<tr>
<td>FIRST</td>
<td>WEIGHTBY</td>
<td>The first real data value.</td>
</tr>
<tr>
<td>HIER_AVG</td>
<td>WEIGHTBY</td>
<td>Adds data values, then divides the sum by the number of the children in the dimension hierarchy. Unlike AVERAGE, which counts only non-NA children, HAVERAGE counts all of the logical children of a parent, regardless of whether each child does or does not have a value.</td>
</tr>
<tr>
<td>HIER_FIRST</td>
<td>WEIGHTBY</td>
<td>The first data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>HIER_LAST</td>
<td>WEIGHTBY</td>
<td>The last data value in the hierarchy, even when that value is NA.</td>
</tr>
<tr>
<td>LAST</td>
<td>WEIGHTBY</td>
<td>The last real data value.</td>
</tr>
<tr>
<td>MAX</td>
<td>WEIGHTBY</td>
<td>The largest data value among the children of each parent.</td>
</tr>
<tr>
<td>MIN</td>
<td>WEIGHTBY</td>
<td>The smallest data value among the children of each parent.</td>
</tr>
<tr>
<td>NO AGGREGATION</td>
<td>No option</td>
<td>Do not aggregate the values of the dimension or dimensions. Leave all aggregated values as NA.</td>
</tr>
<tr>
<td>SUM</td>
<td>SCALEBY, WEIGHTBY</td>
<td>Adds data values. (Default)</td>
</tr>
</tbody>
</table>

### Processing Options

You can specify these processing options for aggregation:

- **(ALLOW | DISALLOW) OVERFLOW**
  - Specifies whether to allow decimal overflow, which occurs when the result of a calculation is very large and can no longer be represented by the exponent portion of the numerical representation.
    - **ALLOW**: A calculation that generates overflow executes without error and produces null results. (Default)
    - **DISALLOW**: A calculation involving overflow stops executing and generates an error message.

- **(ALLOW | DISALLOW) DIVISION BY ZERO**
  - Specifies whether to allow division by zero.
    - **ALLOW**: A calculation involving division by zero executes without error but returns a null value. (Default)
    - **DISALLOW**: A calculation involving division by zero stops executing and generates an error message.

- **(CONSIDER | IGNORE) NULLS**
  - Specifies whether nulls are included in the calculations.
— **CONSIDER:** Nulls are included in the calculations. A calculation that includes a null value returns a null value.

— **IGNORE:** Only actual data values are used in calculations. Nulls are treated as if they do not exist. (Default)

- **MAINTAIN COUNT**

  Stores an up-to-date count of the number of dimension members for use in calculating averages. Omit this option to count the members on the fly.

**SCRIPT Parameter: USING Clause: SET command**

The `SET` command in a script assigns values to one or more cells in a stored measure. It has this syntax:

```
SET target = expression
```

Where:

- `target` is a a measure or a qualified data reference.
- `expression` returns values of the appropriate datatype for `target`.

**Qualified Data References**

Qualified data references (QDRs) limit a dimensional object to a single member in one or more dimensions for the duration of a query.

A QDR has the following syntax:

```
expression [ { dimension = member }[ , { dimension = member } ...] ]
```

Where:

- `expression` is a dimensional expression, typically the name of a measure.
- `dimension` is a primary dimension of expression.
- `member` is a value of dimension.

The outside square brackets shown in bold are literal syntax elements; they do not indicate an optional argument. The inside square brackets shown in regular text delimit an optional argument and are not syntax elements.

This example returns Sales values for calendar year 2007:

```
global.sales[global.time = 'CY2007'
]
```

The next example returns Sales values only for the United States in calendar year 2007:

```
sales[customer = 'US', time = 'CY2007'
]
```

See the Examples for qualified data references in SET commands.

**Usage Notes**

**Build Methods**

The `C, S, and ?` methods always succeed and can be used on any cube.
The F and P methods require that the cube have a materialized view that was created as a fast or a rewrite materialized view.

**Parallelism**

Partitioned cubes can be loaded and aggregated in parallel processes. For example, a cube with five partitions can use up to five processes. Dimensions are always loaded serially.

The number of parallel processes actually allocated by a build is controlled by the smallest of these factors:

- Number of cubes in the build and the number of partitions in each cube.
- Setting of the `PARALLELISM` argument of the `BUILD` procedure.
- Setting of the `JOB_QUEUE_PROCESSES` database initialization parameter.

Suppose `UNITS_CUBE` has 12 partitions, `PARALLELISM` is set to 10, and `JOB_QUEUE_PROCESSES` is set to 4. OLAP uses four processes, which appear as slave processes in the build log.

The SQL engine may allocate additional processes when the `PARALLEL_DEGREE_POLICY` database initialization parameter is set to AUTO or LIMITED. For example, if OLAP allocates four processes, the SQL engine might determine that two of those processes should be done by four processes instead, for a total of six processes.

**Build Logs**

OLAP generates three logs that provide diagnostic information about builds:

- Cube build log
- Rejected records log
- Cube dimension compile log

Analytic Workspace Manager creates these logs automatically as tables in the same schema as the analytic workspace. If you do not use Analytic Workspace Manager, you can create and manage the logs in PL/SQL using the `DBMS_CUBE_LOG` package.

You can also create the cube log file by running `$ORACLE_HOME/olap/admin/utlolaplog.sql`. This script creates three additional views:

- `CUBE_BUILD_LATEST`: Returns rows only from the last build.
- `CUBE_BUILD_REPORT`: Returns one row for each command with elapsed times.
- `CUBE_BUILD_REPORT_LATEST`: Returns a report like `CUBE_BUILD_REPORT` only from the last build.

This report shows a successfully completed build of the objects in the `GLOBAL` analytic workspace, which has four dimensions and two cubes.

```sql
SELECT command, status, build_object, build_object_type type
FROM cube_build_report_latest;
```

<table>
<thead>
<tr>
<th>COMMAND</th>
<th>STATUS</th>
<th>BUILD_OBJECT</th>
<th>TYPE</th>

<td>COMPLETED</td>
<td>CHANNEL</td>
<td>DIMENSION</td>
</tr>
</tbody>
</table>
31 rows selected.

Examples

This example uses the default parameters to build UNITS_CUBE.

EXECUTE DBMS_CUBE.BUILD('GLOBAL.UNITS_CUBE');

The next example builds UNITS_CUBE and explicitly builds two of its dimensions, TIME and CHANNEL. The dimensions use the complete (C) method, and the cube uses the fast solve (S) method.

BEGIN
  DBMS_CUBE.BUILD(
    script=>'GLOBAL."TIME", GLOBAL.CHANNEL, GLOBAL.UNITS_CUBE',
    method=>'CCS',
    parallelism=>2);
END;
/

The following example loads only the selection of data identified by the WHERE clause:

BEGIN
  DBMS_CUBE.BUILD(q'!
    GLOBAL."TIME", GLOBAL.CHANNEL,
    GLOBAL.CUSTOMER, GLOBAL.PRODUCT,
    GLOBAL.UNITS_CUBE USING (LOAD NO SYNCH
      WHERE UNITS_FACT.MONTH_ID LIKE '2006%' AND UNITS_FACT.SALES > 5000)'),
END;
/
FOR Clause Example

In this example, the Time dimension is partitioned by calendar year, and DBMS_CUBE builds only the partition identified by CY2006. The HIER_ANCESTOR is an analytic function in the OLAP expression syntax.

BEGIN
    dbms_cube.build(q'
    UNITS_CUBE USING
    {
      FOR "TIME"
        WHERE HIER_ANCESTOR(WITHIN "TIME".CALENDAR LEVEL "TIME".CALENDAR_YEAR) = 'CY2006'
        BUILD (LOAD, SOLVE)
    }!
    ,
    parallelism=>1);
END;
/

The next example uses a FOR clause to limit the build to the SALES measure in 2006. All objects are built using the complete (C) method.

BEGIN
    DBMS_CUBE.BUILD(
        script => '
          GLOBAL."TIME",
          GLOBAL.CHANNEL,
          GLOBAL.CUSTOMER,
          GLOBAL.PRODUCT,
          GLOBAL.UNITS_CUBE USING
          {
            FOR MEASURES(GLOBAL.UNITS_CUBE.SALES)
              BUILD(LOAD NO SYNCH WHERE GLOBAL.UNITS_FACT.MONTH_ID LIKE ''2006%'')
          },
        method => 'C',
        parallelism => 2);
END;
/

Write-Back Examples

The following examples show various use of the SET command in a USING clause.

This example sets Sales Target to Sales increased by 5%:

DBMS_CUBE.BUILD('UNITS_CUBE USING(
    SET UNITS_CUBE.SALES_TARGET = UNITS_CUBE.SALES * 1.05, SOLVE)');

This example sets the price of the Deluxe Mouse in May 2007 to $29.99:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE''] = 29.99, SOLVE)');

The next example contains two SET commands, but does not reaggregate the cube:

DBMS_CUBE.BUILD('PRICE_CUBE USING(
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2006.12'', "PRODUCT"=''DLX MOUSE''] = 29.49,
    SET PRICE_CUBE.UNIT_PRICE["TIME"=''2007.05'', "PRODUCT"=''DLX MOUSE''] = 29.99]');
### Dimension Maintenance Example

This script shows dimension maintenance. It adds a new dimension member named `OPT MOUSE` to all hierarchies, alters its position in the Primary hierarchy, assigns it a long description, then deletes it from the dimension.

```sql
BEGIN
    dbms_output.put_line('Add optical mouse');
    dbms_cube.build(q'
        "PRODUCT" using (MERGE INTO ALL HIERARCHIES
            VALUES ('ITEM_OPT MOUSE', 'CLASS_SFT', "PRODUCT")."FAMILY")
    !');

    dbms_output.put_line('Alter optical mouse');
    dbms_cube.build(q'
        "PRODUCT" using (UPDATE HIERARCHIES ("PRODUCT")."PRIMARY")
            SET PARENT = 'FAMILY_ACC', LEVEL = "PRODUCT")."ITEM"
            WHERE MEMBER = 'ITEM_OPT MOUSE')
    !');

    dbms_output.put_line('Provide attributes to optical mouse');
    dbms_cube.build(q'
        "PRODUCT" USING (SET "PRODUCT")."LONG_DESCRIPTION" ["PRODUCT" = 'ITEM_OPT MOUSE']
            = CAST('Optical Mouse' AS VARCHAR2))
    !');

    dbms_output.put_line('Delete optical mouse');
    dbms_cube.build(q'
        "PRODUCT" USING (DELETE FROM DIMENSION WHERE MEMBER='ITEM_OPT MOUSE')
    !');

END;
/
```

### OLAP DML Example

This example uses the OLAP DML to add comments to the cube build log:

```sql
BEGIN
    DBMS_CUBE.BUILD (q'
        global.units_cube USING (EXECUTE OLAP DML 'SHOW STATLEN(units_cube_prt_list)' PARALLEL,
            EXECUTE OLAP DML 'SHOW LIMIT(units_cube_prt_list KEEP ALL)' PARALLEL,
            EXECUTE OLAP DML 'SHOW STATLEN(time)' parallel,
            EXECUTE OLAP DML 'SHOW LIMIT(time KEEP time_levelrel "CALENDAR_YEAR")' parallel)),
        parallelism=>2,
        add_dimensions=>false);
END;
/
```

This query shows the comments in the cube build log:

```sql
SELECT partition, slave_number, TO_CHAR(output) output
    FROM cube_build_log
    WHERE command = 'OLAP DML'
    AND status = 'COMPLETED'
    ORDER BY slave_number, time;
```

<table>
<thead>
<tr>
<th>PARTITION</th>
<th>SLAVE_NUMBER</th>
<th>OUTPUT</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
40.4.2 CREATE_EXPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the EXPORT_XML Procedure and the EXPORT_XML_TO_FILE Procedure.

Syntax

```sql
DBMS_CUBE.CREATE_EXPORT_OPTIONS (  
  out_options_xml        IN/OUT  CLOB,  
  target_version         IN      VARCHAR2  DEFAULT NULL,  
  suppress_owner         IN      BOOLEAN   DEFAULT FALSE,  
  suppress_namespace     IN      BOOLEAN   DEFAULT FALSE,  
  preserve_table_owners  IN      BOOLEAN   DEFAULT FALSE,  
  metadata_changes       IN      CLOB      DEFAULT NULL);
```

Parameters

Table 40-4  CREATE_EXPORT_OPTIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed into the options_xml parameter of the EXPORT_XML Procedure.</td>
</tr>
</tbody>
</table>
### Table 40-4  (Cont.) CREATE_EXPORT_OPTIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_version</td>
<td>Specifies the version of Oracle Database in which the XML document generated by EXPORT_XML or EXPORT_XML_TO_FILE will be imported. You can specify two to five digits, such as 12.1 or 12.1.0.1.0. This parameter defaults to the current database version, and so can typically be omitted.</td>
</tr>
<tr>
<td>suppress_owner</td>
<td>Controls the use of the Owner attribute in XML elements and the owner qualifier in object names. Enter True to drop the owner from the XML, or enter False to retain it. Enter True if you plan to import the exported metadata into a different schema.</td>
</tr>
<tr>
<td>suppress_namespace</td>
<td>Controls the use of Namespace attributes in XML elements and the namespace qualifier in object names. Enter True to drop the namespace from the XML, or enter False to retain it (default). Enter True when upgrading to Oracle OLAP 12c metadata. Namespaces allow objects created in Oracle 10g to coexist with objects created in Oracle 12c. You cannot set or change namespaces.</td>
</tr>
<tr>
<td>preserve_table_owners</td>
<td>Controls the use of the owner in qualifying table names in the mapping elements, such as GLOBAL.UNITS_HISTORY_FACT instead of UNITS_HISTORY_FACT. Enter True to retain the table owner, or enter False to default to the current schema for table mappings. If you plan to import the exported metadata to a different schema, you must set this option to True to load data from tables and views in the original schema, unless the destination schema has its own copies of the tables and views.</td>
</tr>
<tr>
<td>metadata_changes</td>
<td>Contains an 12c XML description of an object that overwrites the exported object description. The XML document must contain all parent XML elements of the modified element with the attributes needed to uniquely identify them. Use the Name attribute if it exists. See the Examples.</td>
</tr>
</tbody>
</table>

### Examples

The following example generates an XML document of export options:

```sql
DECLARE
    optionsClob  CLOB;
BEGIN
    dbms_lob.createtemporary(optionsClob, false, dbms_lob.CALL);
    dbms_cube.create_export_options(out_options_xml=>optionsClob,
        suppress_namespace=>TRUE);
    dbms_output.put_line(optionsClob);
END;
/
```

The `DBMS_OUTPUT.PUT_LINE` procedure displays this XML document (formatted for readability):

```xml
<?xml version="1.0"?>
<Export TargetVersion="12.1.0.1">
    <ExportOptions>
        <Option Name="SuppressOwner" Value="FALSE"/>
        <Option Name="SuppressNamespace" Value="TRUE"/>
    </ExportOptions>
</Export>
```
The next example generates an XML document with a metadata change to the mapping of the American long description attribute of the CHANNEL dimension.

DECLARE
    importClob         clob;
    exportClob         clob;
    overClob           clob;
    exportOptClob      clob;
    importOptClob      clob;
BEGIN
    dbms_lob.createtemporary(overClob, TRUE);
    dbms_lob.open(overClob, DBMS_LOB.LOB_READWRITE);
    dbms_lob.writeappend(overClob,58, '<Metadata Version="1.3"
MinimumDatabaseVersion="12.1.0.1">');
    dbms_lob.writeappend(overClob,34, '<StandardDimension Name="CHANNEL">');
    dbms_lob.writeappend(overClob,75, '<Description Type="Description"
Language="AMERICAN" Value="Sales Channel"/>');
    dbms_lob.writeappend(overClob,20, '</StandardDimension>');
    dbms_lob.writeappend(overClob,11, '</Metadata>');
    dbms_lob.close(overClob);

    -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
    dbms_cube.initialize_cube_upgrade;

    -- Create a CLOB containing the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob,
suppress_namespace=>TRUE, metadata_changes=>overClob);

    -- Create a CLOB containing the import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob, rename_table =>'MY_OBJECT_MAP');

    -- Create CLOBs for the metadata
    dbms_lob.createtemporary(importClob, TRUE);
    dbms_lob.createtemporary(exportClob, TRUE);

    -- Export metadata from a 10g analytic workspace to a CLOB
    dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

    -- Import metadata from the CLOB
    dbms_cube.import_xml(in_xml => exportClob, options_xml=>importOptClob,
out_xml=>importClob);

    -- Load and aggregate the data
    dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');
END;
/

The following is the content of exportClob (formatting added for readability). The XML document changes the description of Channel to Sales Channel.
40.4.3 CREATE_IMPORT_OPTIONS Procedure

This procedure creates an input XML document that describes processing options for the IMPORT_XML Procedure.

Syntax

```
DBMS_CUBE.CREATE_IMPORT_OPTIONS (
    out_options_xml  IN/OUT  CLOB,
    validate_only    IN      BOOLEAN   DEFAULT FALSE,
    rename_table     IN      VARCHAR2  DEFAULT NULL);
```

Parameters

Table 40-5 CREATE_IMPORT_OPTIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_options_xml</td>
<td>Contains the generated XML document, which can be passed to the <code>options_xml</code> parameter of the IMPORT_XML Procedure.</td>
</tr>
<tr>
<td>validate_only</td>
<td>TRUE causes the IMPORT.Xml procedure to validate the metadata described in the input file or the <code>in_xml</code> parameter, without committing the changes to the metadata.</td>
</tr>
<tr>
<td>rename_table</td>
<td>The name of a table identifying new names for the imported objects, in the form <code>{schema_name}.{table_name}</code>. The IMPORT_XML procedure creates objects using the names specified in the table instead of the ones specified in the XML document. See the Usage Notes for the format of the rename table.</td>
</tr>
</tbody>
</table>

Usage Notes

See the information about using a rename table in DBMS_CUBE - Upgrading 10g Analytic Workspaces.

Examples

This example specifies validation only and a rename table. For an example of the import CLOB being used in an import, see "IMPORT_XML Procedure".

```
DECLARE
    importClob  clob;
```
BEGIN
    dbms_lob.createtemporary(importClob, TRUE);

    dbms_cube.create_import_options(out_options_xml => importClob, rename_table => 'MY_OBJECT_MAP', validate_only => TRUE);

    dbms_output.put_line(importClob);
END;
/

It generates the following XML document:

```xml
<?xml version="1.0"?>
<Import>
    <ImportOptions>
        <Option Name="ValidateOnly" Value="TRUE"/>
        <Option Name="RenameTable" Value="MY_OBJECT_MAP"/>
    </ImportOptions>
</Import>
```

  This procedure creates, modifies, or drops an analytic workspace by using an XML template.

### 40.4.4 CREATE_MVIEW Function

This function creates a cube materialized view from the definition of a relational materialized view.

**Syntax**

```
DBMS_CUBE.CREATE_MVIEW (  
    mvowner        IN  VARCHAR2,  
    mvname         IN  VARCHAR2,  
    sam_parameters IN  CLOB  DEFAULT NULL)  
RETURN VARCHAR2;
```

**Parameters**

**Table 40-6  CREATE_MVIEW Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot;. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Parameters in the form <code>'parameter1=value1, parameter2=value2,...'</code>. See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>
SQL Aggregation Management Parameters

The `CREATE_MVIEW` and `DERIVE_FROM_MVIEW` functions use the SQL aggregation management (SAM) parameters described in Table 40-7. Some parameters support the development of cubes with advanced analytics. Other parameters support the development of Java applications. The default settings are appropriate for cube materialized views that are direct replacements for relational materialized views.

Table 40-7  SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDTOPS</td>
<td>Adds a top level and a level member to every dimension hierarchy in the cube. If the associated relational dimension has no hierarchy, then a dimension hierarchy is created. TRUE: Creates levels named <code>ALL_dimension</code> with level members <code>ALL_dimension</code>. (Default) FALSE: Creates only the hierarchies and levels identified by the relational dimensions.</td>
</tr>
<tr>
<td>ADDUNIQUEKEYPREFIX</td>
<td>Controls the creation of dimension keys. TRUE: Creates cube dimension keys by concatenating the level name with the relational dimension key. This practice assures that the dimension keys are unique across all levels, such as <code>CITY_NEW_YORK</code> and <code>STATE_NEW_YORK</code>. (Default) FALSE: Uses the relational dimension keys as cube dimension keys.</td>
</tr>
<tr>
<td>ATRMAPTYPE</td>
<td>Specifies whether attributes are mapped by hierarchy levels, dimension levels, or both. HIER_LEVEL: Maps attributes to the levels of a particular dimension hierarchy. (Default) DIM_LEVEL: Maps attributes to the levels of the dimension regardless of hierarchy. BOTH: Maps attributes to both dimension and hierarchy levels. AUTO: Maps attributes to the levels of the dimension for a star schema and to the levels of a particular dimension hierarchy for a snowflake schema.</td>
</tr>
<tr>
<td>AWNAME</td>
<td>Provides the name of the analytic workspace that owns the cube. Choose a simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_AWn</code>.</td>
</tr>
<tr>
<td>BUILD</td>
<td>Specifies whether a data refresh will immediately follow creation of the cube materialized view. IMMEDIATE: Refreshes immediately. DEFERRED: Does not perform a data refresh. (Default) Note: Only the <code>CREATE_MVIEW</code> function uses this parameter.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CUBEMVOPTION</td>
<td>Controls validation and creation of a cube materialized view. Regardless of this setting, the function creates an analytic workspace containing a cube and its related cube dimensions.</td>
</tr>
<tr>
<td></td>
<td><strong>COMPLETE_REFRESH</strong>: Creates a complete refresh cube materialized view (full update).</td>
</tr>
<tr>
<td></td>
<td><strong>FAST_REFRESH</strong>: Creates a fast refresh materialized view (incremental update).</td>
</tr>
<tr>
<td></td>
<td><strong>REWRITE_READY</strong>: Runs validation checks for a rewrite cube materialized view, but does not create it.</td>
</tr>
<tr>
<td></td>
<td><strong>REWRITE</strong>: Creates a rewrite cube materialized view.</td>
</tr>
<tr>
<td></td>
<td><strong>REWRITE_WITH_ATTRIBUTES</strong>: Creates a rewrite cube materialized view that includes columns with dimension attributes, resulting in faster query response times. (Default)</td>
</tr>
<tr>
<td>Note:</td>
<td>The following settings do not create a cube materialized view. Use Analytic Workspace Manager to drop an analytic workspace that does not have a cube materialized view. You can use the DROP_MVIEW procedure to delete an analytic workspace only when it supports a cube materialized view.</td>
</tr>
<tr>
<td></td>
<td><strong>NONE</strong>: Does not create a cube materialized view.</td>
</tr>
<tr>
<td></td>
<td><strong>COMPLETE_REFRESH_READY</strong>: Runs validation checks for a complete refresh cube materialized view, but does not create it.</td>
</tr>
<tr>
<td></td>
<td><strong>FAST_REFRESH_READY</strong>: Runs validation checks for fast refresh, but does not create the cube materialized view.</td>
</tr>
<tr>
<td>CUBENAME</td>
<td>Provides the name of the cube derived from the relational materialized view. Choose simple database object name of 1 to 30 bytes. The default name is <code>fact_tablename_Cn</code>.</td>
</tr>
<tr>
<td>DIMJAVABINDVARS</td>
<td>Supports access by Java programs to the XML document.</td>
</tr>
<tr>
<td></td>
<td><strong>TRUE</strong>: Generates an XML template that uses Java bind variable notation for the names of dimensions. No XML validation is performed. You cannot use the IMPORT_XML procedure to create a cube using this template.</td>
</tr>
<tr>
<td></td>
<td><strong>FALSE</strong>: Generates an XML template that does not support Java bind variables. (Default)</td>
</tr>
<tr>
<td>DISABLEQRW</td>
<td>Controls disabling of query rewrite on the source relational materialized view.</td>
</tr>
<tr>
<td></td>
<td><strong>TRUE</strong>: Issues an <code>ALTER MATERIALIZED VIEW mview_name DISABLE QUERY REWRITE</code> command.</td>
</tr>
<tr>
<td></td>
<td><strong>FALSE</strong>: No action.</td>
</tr>
<tr>
<td>Note:</td>
<td>Only the CREATE_MVIEW function with BUILD=IMMEDIATE uses this parameter.</td>
</tr>
<tr>
<td>EXPORTXML</td>
<td>Exports the XML that defines the dimensional objects to a file, which you specify as <code>dir/filename</code>. Both the directory and the file name are case sensitive.</td>
</tr>
<tr>
<td></td>
<td><code>dir</code>: Name of a database directory.</td>
</tr>
<tr>
<td></td>
<td><code>filename</code>: The name of the file, typically given an XML filename extension.</td>
</tr>
</tbody>
</table>
**Table 40-7  (Cont.) SQL Aggregation Management Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILTERPARTITIONANCESTORSLEVELS</td>
<td>Controls the generation of aggregate values above the partitioning level of a partitioned cube.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Removes levels above the partitioning level from the cube. Requests for summary values above the partitioning level are solved by SQL.</td>
</tr>
<tr>
<td>FALSE:</td>
<td>All levels are retained in the cube. Requests for summary values are solved by OLAP. (Default)</td>
</tr>
<tr>
<td>LOGDEST</td>
<td>Directs and stores log messages. By default, the messages are not available.</td>
</tr>
<tr>
<td>SERVEROUT:</td>
<td>Sends messages to server output (typically the screen), which is suitable when working interactively such as in SQL*Plus or SQL Developer.</td>
</tr>
<tr>
<td>TRACEFILE:</td>
<td>Sends messages to the session trace file.</td>
</tr>
<tr>
<td>PARTITIONOPTION</td>
<td>Controls partitioning of the cube.</td>
</tr>
<tr>
<td>NONE:</td>
<td>Prevents partitioning.</td>
</tr>
<tr>
<td>DEFAULT:</td>
<td>Allows the Sparsity Advisor to determine whether partitioning is needed and how to partition the cube. (Default)</td>
</tr>
<tr>
<td>FORCE:</td>
<td>Partitions the cube even when the Sparsity Advisor recommends against it. The Sparsity Advisor identifies the best dimension, hierarchy, and level to use for partitioning.</td>
</tr>
<tr>
<td>dimension.hierarchy.level:</td>
<td>Partitions the cube using the specified dimension, hierarchy, and level.</td>
</tr>
<tr>
<td>POPULATELINEAGE</td>
<td>Controls the appearance of attributes in a cube materialized view.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Includes all dimension attributes in the cube materialized view. (Default)</td>
</tr>
<tr>
<td>FALSE:</td>
<td>Omits all dimension attributes from the cube materialized view.</td>
</tr>
<tr>
<td>PRECOMPUTE</td>
<td>Identifies a percentage of the data that is aggregated and stored. The remaining values are calculated as required by queries during the session.</td>
</tr>
<tr>
<td>precompute_percentage:[precompute_top_percentage]</td>
<td>Specify the top percentage for partitioned cubes. The default value is 35:0, which specifies precomputing 35% of the bottom partition and 0% of the top partition. If the cube is not partitioned, then the second number is ignored.</td>
</tr>
<tr>
<td>REMAPCOMPOSITEKEYS</td>
<td>Controls how multicolumn keys are rendered in the cube.</td>
</tr>
<tr>
<td>TRUE:</td>
<td>Creates a unique key attribute whose values are concatenated string expressions with an underscore between the column values. For example, the value BOSTON_MA_USA might be an expression produced from a multicolumn key composed of CITY, STATE, and COUNTRY columns. In addition, an attribute is created for each individual column to store the relational keys. (Default)</td>
</tr>
<tr>
<td>FALSE:</td>
<td>Creates a unique key attribute for each column.</td>
</tr>
</tbody>
</table>
Table 40-7  (Cont.) SQL Aggregation Management Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RENDERINGMODE</td>
<td>Controls whether a loss in fidelity between the relational materialized view and the cube materialized view results in a warning message or an exception. See &quot;Requirements for the Relational Materialized View&quot;.</td>
</tr>
<tr>
<td></td>
<td>LOOSE: Losses are noted in the optional logs generated by the CREATE_MVIEW Function and the DERIVE_FROM_MVIEW Function. No exceptions are raised. (Default)</td>
</tr>
<tr>
<td></td>
<td>STRICT: Any loss in fidelity raises an exception so that no XML template is created.</td>
</tr>
<tr>
<td>SEEFILTERS</td>
<td>Controls whether conditions in the WHERE clause of the relational materialized view's defining query are retained or ignored.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Renders valid conditions in the XML template. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: Ignores all conditions.</td>
</tr>
<tr>
<td>UNIQUENAMES</td>
<td>Controls whether top level dimensional objects have unique names. Cross namespace conflicts may occur because dimensional objects have different namespaces than relational objects.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Modifies all relational names when they are rendered in the cube. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: Duplicates relational names in the cube unless a naming conflict is detected. In that case, a unique name is created.</td>
</tr>
<tr>
<td>UNKNOWNKEYASDIM</td>
<td>Controls handling of simple columns with no levels or hierarchies in the GROUP BY clause of the relational materialized view's defining query.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Renders a simple column without a relational dimension as a cube dimension with no levels or hierarchies.</td>
</tr>
<tr>
<td></td>
<td>FALSE: Raises an exception when no relational dimension is found for the column. (Default)</td>
</tr>
<tr>
<td>VALIDATEXML</td>
<td>Controls whether the generated XML document is validated.</td>
</tr>
<tr>
<td></td>
<td>TRUE: Validates the template using the VALIDATE_XML procedure. (Default)</td>
</tr>
<tr>
<td></td>
<td>FALSE: No validation is done.</td>
</tr>
</tbody>
</table>

Returns

The name of the cube materialized view created by the function.

Usage Notes

See "Using SQL Aggregation Management"

Examples

All examples for the SQL Aggregate Management subprograms use the sample Sales History schema, which is installed in Oracle Database with two relational materialized views: CAL_MONTH_SALES_MV and FWEEK_PSCAT_SALES_MV.

The following script creates a cube materialized view using CAL_MONTH_SALES_MV as the relational materialized view. It uses all default options.
SET serverout ON format wrapped

DECLARE
  salesaw  varchar2(30);
BEGIN
  salesaw := dbms_cube.create_mview('SH', 'CAL_MONTH_SALES_MV');
END;
/

The next example sets several parameters for creating a cube materialized view from FWEEK_PSCAT_SALES_MV. These parameters change the cube materialized view in the following ways:

- **ADDTOPS**: Adds a top level consisting of a single value to the hierarchies. All of the dimensions in Sales History have a top level already.
- **PRECOMPUTE**: Changes the percentage of materialized aggregates from 35:0 to 40:10.
- **EXPORTXML**: Creates a text file for the XML document.
- **BUILD**: Performs a data refresh.

DECLARE
  salescubemv   varchar2(30);
  sam_param     clob := 'ADDTOPS=FALSE,
                       PRECOMPUTE=40:10,
                       EXPORTXML=WORK_DIR/sales.xml,
                       BUILD=IMMEDIATE';
BEGIN
  salescubemv := dbms_cube.create_mview('SH', 'FWEEK_PSCAT_SALES_MV',
                                         sam_param);
END;
/

### 40.4.5 DERIVE_FROM_MVIEW Function

This function generates an XML template that defines a cube with materialized view capabilities, using the information derived from an existing relational materialized view.

**Syntax**

```
DBMS_CUBE.DERIVE_FROM_MVIEW (  
    mvowner IN VARCHAR2,
    mvname IN VARCHAR2,
    sam_parameters IN CLOB DEFAULT NULL)  
RETURN CLOB;
```

**Parameters**

**Table 40-8  DERIVE_FROM_MVIEW Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the relational materialized view.</td>
</tr>
</tbody>
</table>
Table 40-8  (Cont.) DERIVE_FROM_MVIEW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvname</td>
<td>Name of the relational materialized view. For restrictions, see &quot;Requirements for the Relational Materialized View&quot;. A single cube materialized view can replace many of the relational materialized views for a table. Choose the materialized view that has the lowest levels of the dimension hierarchies that you want represented in the cube materialized view.</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>Optional list of parameters in the form 'parameter1=value1, parameter2=value2,...'. See &quot;SQL Aggregation Management Parameters&quot;.</td>
</tr>
</tbody>
</table>

Returns

An XML template that defines an analytic workspace containing a cube enabled as a materialized view.

Usage Notes

To create a cube materialized view from an XML template, use the IMPORT_XML procedure. Then use the REFRESH_MVIEW procedure to refresh the cube materialized view with data.

See "Using SQL Aggregation Management".

Examples

The following example generates an XML template named sales_cube.xml from the CAL_MONTH_SALES_MV relational materialized view in the SH schema.

```sql
DECLARE
    salescubexml clob := null;
    sam_param    clob := 'exportXML=WORK_DIR/sales_cube.xml';
BEGIN
    salescubexml := dbms_cube.derive_from_mview('SH', 'CAL_MONTH_SALES_MV', 
        sam_param);
END;
/
```

40.4.6 DROP_MVIEW Procedure

This procedure drops a cube materialized view and all associated objects from the database. These objects include the dimension materialized views, cubes, cube dimensions, levels, hierarchies, and the analytic workspace.

Syntax

```sql
DBMS_CUBE.DROP_MVIEW (
    mvowner    IN VARCHAR2,
    mvname     IN VARCHAR2,
    sam_parameters IN CLOB DEFAULT NULL);
```
## Parameters

### Table 40-9  DROP_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view</td>
</tr>
<tr>
<td>sam_parameters</td>
<td>EXPORTXML: Exports the XML that drops the dimensional objects to a file, which you specify as dir/filename. Both the directory and the file name are case sensitive. dir: Name of a database directory. filename: The name of the file, typically given an XML filename extension.</td>
</tr>
</tbody>
</table>

## Usage Notes

Use this procedure to drop a cube materialized view that you created using the CREATE_MVIEW and DERIVE_FROM_MVIEW functions. If you make modifications to the cubes or dimensions, then DROP_MVIEW may not be able to drop the cube materialized view.

Some of the CUBEMVOPTION parameters used by the CREATE_MVIEW and DERIVE_FROM_MVIEW functions do not create a materialized view. Use Analytic Workspace Manager to drop the analytic workspace, cubes, and cube dimensions.

If you use the EXPORTXML parameter, then you can use the XML document to drop the cube materialized view, after you re-create it. Use the IMPORT_XML procedure.

See "Using SQL Aggregation Management".

## Examples

The current schema has four materialized views. CB$CAL_MONTH_SALES is a cube materialized view for the SALES table. CB$TIMES_DIM_D1_CAL_ROLLUP is a cube dimension materialized view for the TIMES_DIM dimension on the TIMES dimension table. The others are relational materialized views.

```sql
SELECT mview_name FROM user_mviews;
```

```sql
MVIEW_NAME
------------------------
CB$CAL_MONTH_SALES
CB$TIMES_DIM_D1_CAL_ROLLUP
CAL_MONTH_SALES_MV
FWEK_PSCAT_SALES_MV
```

The following command drops both CB$CAL_MONTH_SALES and CB$TIMES_DIM_D1_CAL_ROLLUP.

```sql
EXECUTE dbms_cube.drop_mview('SH', 'CB$CAL_MONTH_SALES');
```

Dropped cube organized materialized view "SH"."CAL_MONTH_SALES" including container analytic workspace "SH"."CAL_MONTH_SALES_AW" at 20130213 16:31:40.056.
This query against the data dictionary confirms that the materialized views have been dropped.

```sql
SELECT mview_name FROM user_mviews;
```

<table>
<thead>
<tr>
<th>MVIEW_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAL_MONTH_SALES_MV</td>
</tr>
<tr>
<td>FWEEK_PSCAT_SALES_MV</td>
</tr>
</tbody>
</table>

### 40.4.7 EXPORT_XML Procedure

This procedure writes OLAP metadata to a CLOB.

#### Syntax

```sql
DBMS_CUBE.EXPORT_XML
  (object_ids            IN      VARCHAR2,
   out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
  (object_ids            IN      VARCHAR2,
   options_xml           IN      CLOB,
   out_xml               IN/OUT  CLOB;

DBMS_CUBE.EXPORT_XML
  (object_ids            IN      VARCHAR2,
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   out_xml               IN/OUT  CLOB;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory that contains options_filename.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file containing an XML document of export options.</td>
</tr>
<tr>
<td>options_xml</td>
<td>A CLOB variable that contains an XML document of export options. Use the CREATE_EXPORT_OPTIONS Procedure to generate this document.</td>
</tr>
</tbody>
</table>

**Note:** When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when exporting a cube, you must also export the dimensions of the cube.
Table 40-10  (Cont.) EXPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_xml</td>
<td>A CLOB variable that will store the XML document of OLAP metadata for the objects listed in object_ids.</td>
</tr>
</tbody>
</table>

Export Options

The default settings for the export options are appropriate in many cases, so you can omit the options_xml parameter or the options_dirname and options_filename parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings. This example changes all of the parameters from False to True; set them appropriately for your schema.

```xml
<?xml version="1.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the `CREATE_EXPORT_OPTIONS` Procedure.

Usage Notes

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

For an example of using EXPORT_XML in an upgrade to the same schema, see "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

The following PL/SQL script copies an OLAP 12c analytic workspace named GLOBAL12 from the GLOBAL_AW schema to the GLOBAL schema. No upgrade is performed.

To upgrade into a different schema, change the example as follows:

- **Call the INITIALIZE_CUBE_UPGRADE procedure.**
- **Call the CREATE_EXPORT_OPTIONS procedure with the additional parameter setting SUPPRESS_NAMESPACE=>TRUE.**

The PL/SQL client must be connected to the database as GLOBAL. The GLOBAL user must have SELECT permissions on GLOBAL_AW.AW$GLOBAL and on all relational data sources.

```plsql
BEGIN
  -- Create a CLOB for the export options
  dbms_lob.createtemporary(optionsClob, TRUE);
  dbms_cube.create_export_options(out_options_xml=>optionsClob,
                                  suppress_owner=>TRUE,
                                  preserve_table_owners=>TRUE);

  -- Create a CLOB for the XML template
  dbms_lob.createtemporary(exportClob, TRUE);
END;
```
-- Export metadata from an analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW.GLOBAL12.AW',
options_xml=>optionsClob, out_xml=>exportClob);

-- Import metadata from the CLOB
dbms_cube.import_xml(in_xml=>exportClob);

-- Load and aggregate the data
dbms_cube.build(script=>'GLOBAL.UNITS_CUBE, GLOBAL.PRICE_AND_COST_CUBE');

END;
/

40.4.8 EXPORT_XML_TO_FILE Procedure

This procedure exports OLAP metadata to a file. This file can be imported into a new
or existing analytic workspace using the IMPORT_XML procedure. In this way, you can
create a copy of the analytic workspace in another schema or database.

This procedure can also be used as part of the process for upgrading OLAP standard
form metadata contained in an Oracle OLAP 10g analytic workspace to OLAP 12c
format.

Syntax

DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids    IN      VARCHAR2,
   output_dirname IN      VARCHAR2,
   output_filename IN      VARCHAR2;

DBMS_CUBE.EXPORT_XML_TO_FILE
  (object_ids    IN      VARCHAR2,
   options_dirname IN      VARCHAR2,
   options_filename IN      VARCHAR2,
   output_dirname IN      VARCHAR2,
   output_filename IN      VARCHAR2;

Parameters

Table 40-11  EXPORT_XML_TO_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_ids</td>
<td>Any of these identifiers.</td>
</tr>
<tr>
<td></td>
<td>• The name of a schema, such as GLOBAL.</td>
</tr>
<tr>
<td></td>
<td>• The fully qualified name of an analytic workspace in the form owner.aw_name.AW, such as GLOBAL.GLOBAL12.AW.</td>
</tr>
<tr>
<td></td>
<td>• Cube</td>
</tr>
<tr>
<td></td>
<td>• Dimension</td>
</tr>
<tr>
<td></td>
<td>• Named build process</td>
</tr>
<tr>
<td></td>
<td>• Measure folder</td>
</tr>
<tr>
<td></td>
<td>You can specify multiple objects by separating the names with commas.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> When exporting an individual object, be sure to export any objects required to reconstruct it. For example, when you export a cube, you must also export the dimensions of the cube.</td>
</tr>
</tbody>
</table>
**Table 40-11 (Cont.) EXPORT_XML_TO_FILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory that contains options_filename. See &quot;Export Options&quot;.</td>
</tr>
<tr>
<td>options_filename</td>
<td>The name of a file containing an XML document of export options. See &quot;Export Options&quot;.</td>
</tr>
<tr>
<td>output_dirname</td>
<td>The case-sensitive name of a database directory where output_filename is created.</td>
</tr>
<tr>
<td>output_filename</td>
<td>The name of the template file created by the procedure.</td>
</tr>
</tbody>
</table>

**Export Options**

The default settings for the export options are appropriate in most cases, and you can omit the options_dirname and options_filename parameters. However, when upgrading Oracle OLAP 10g metadata to OLAP 12c, you must specify an XML document that changes the default settings, like the following:

```xml
<?xml version="2.0"?>
<Export>
  <ExportOptions>
    <Option Name="SuppressNamespace" Value="True"/>
    <Option Name="SuppressOwner" Value="True"/>
    <Option Name="PreserveTableOwners" Value="True"/>
  </ExportOptions>
</Export>
```

You can create this XML document manually or by using the CREATE_EXPORT_OPTIONS Procedure.

**Usage Notes**

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

**Examples**

The following example generates an XML file named global.xml in OLAP 12c format using the default export settings. The metadata is derived from all analytic workspaces and CWM metadata in the GLOBAL_AW schema. The output file is generated in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW', 'WORK_DIR', 'global.xml');
```

The next example also generates an XML file named global.xml in OLAP 12c format using the export options set in options.xml. The metadata is derived from the GLOBAL analytic workspace in the GLOBAL_AW schema. Both the options file and the output file are in the WORK_DIR database directory.

```
execute dbms_cube.export_xml_to_file('GLOBAL_AW.GLOBAL.AW', 'WORK_DIR', 'options.xml', 'WORK_DIR', 'global.xml');
```
40.4.9 IMPORT_XML Procedure

This procedure creates, modifies, or drops an analytic workspace by using an XML template.

**Syntax**

```sql
DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2);

DBMS_CUBE.IMPORT_XML
  (dirname               IN      VARCHAR2,
   filename              IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (input_dirname         IN      VARCHAR2,
   input_filename        IN      VARCHAR2,
   options_dirname       IN      VARCHAR2,
   options_filename      IN      VARCHAR2,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB);

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   out_xml               IN/OUT  CLOB );

DBMS_CUBE.IMPORT_XML
  (in_xml                IN      CLOB,
   options_xml           IN      CLOB,
   out_xml               IN/OUT  CLOB );
```

**Parameters**

Table 40-12  IMPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>in_xml</td>
<td>A CLOB containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_dirname</td>
<td>The case-sensitive name of a database directory containing the XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>input_filename</td>
<td>A file containing an XML document describing an analytic workspace.</td>
</tr>
<tr>
<td>options_dirname</td>
<td>The case-sensitive name of a database directory containing a file of import options.</td>
</tr>
<tr>
<td>options_filename</td>
<td>A file of import options.</td>
</tr>
</tbody>
</table>
Table 40-12  (Cont.) IMPORT_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options_xml</td>
<td>An XML document describing the import options. Use the CREATE_IMPORT_OPTIONS Procedure to generate this document.</td>
</tr>
<tr>
<td>out_xml</td>
<td>An XML document that either describes the analytic workspace or, for validation only, describes any errors. It may contain changes that DBMS_CUBE made to the imported XML, such as setting default values or making minor corrections to the XML.</td>
</tr>
</tbody>
</table>

Usage Notes

The XML can define, modify, or drop an entire analytic workspace, or one or more cubes or dimensions. When defining just cubes or dimensions, you must do so within an existing analytic workspace.

You can also use IMPORT_XML to drop an analytic workspace by using the XML document generated by the DROP_MVIEW procedure with the EXPORTXML parameter.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Example

This example loads an XML template from a file named GLOBAL.XML and located in a database directory named XML_DIR.

EXECUTE dbms_cube.import_xml('XML_DIR', 'GLOBAL.XML');

The next example exports an OLAP 10g template and uses IMPORT_XML to validate it before an upgrade to 12c.

DECLARE
    exportOptClob clob;
    importOptClob clob;
    importClob clob;
    exportClob clob;

BEGIN

    -- Create a CLOB for the export options
    dbms_lob.createtemporary(exportOptClob, TRUE);
    dbms_cube.create_export_options(out_options_xml=>exportOptClob,
            suppress_namespace=>TRUE, preserve_table_owners=>TRUE);

    -- Create a CLOB for the XML template
    dbms_lob.createtemporary(exportClob, TRUE);

    -- Create a CLOB for import options
    dbms_lob.createtemporary(importOptClob, TRUE);
    dbms_cube.create_import_options(out_options_xml=>importOptClob,
            validate_only=>TRUE);

    -- Create a CLOB for the change log
    dbms_lob.createtemporary(importClob, TRUE);

    -- Enable Oracle Database 12c Release 1 (12.1) clients to access 10g metadata
dbms_cube.initialize_cube_upgrade;

-- Export metadata from an analytic workspace to a CLOB
dbms_cube.export_xml(object_ids=>'GLOBAL_AW', options_xml=>exportOptClob,
out_xml=>exportClob);

/* Import metadata from the CLOB. No objects are committed to the database
because the validate_only parameter of CREATE_IMPORT_OPTIONS is set to
TRUE.
*/

dbms_cube.import_xml(in_xml=>exportClob, options_xml=>importOptClob,
out_xml=>importClob);

-- Output the metadata changes
dbms_output.put_line('This is the validation log:');
dbms_output.put_line(importClob);

END;
/

The contents of importClob show that the XML is valid. Otherwise, error messages
appear in the <RootCommitResult> element.

This is the validation log:
<?xml version="1.0" encoding="UTF-16"?>
<RootCommitResult>

</RootCommitResult>

For an example of IMPORT_XML within the context of an upgrade from 10g to 12c
metadata, see the Custom Upgrade section of "DBMS_CUBE - Upgrading 10g
Analytic Workspaces".

40.4.10 INITIALIZE_CUBE_UPGRADE Procedure

This procedure processes analytic workspaces created in Oracle OLAP 10g so they
can be used by Oracle OLAP 12c clients. It processes all analytic workspaces in the
current schema. Run this procedure once for each schema in which there are 10g
analytic workspaces.

Without this processing step, 12c clients cannot connect to a database containing a
10g analytic workspace with subobjects of a dimension or cube having the same
name. Additionally, some DBMS_CUBE procedures and functions, such as EXPORT_XML and
EXPORT_XML_TO_FILE, do not work on the 10g metadata.

After processing, OLAP 12c clients can connect and use the alternate names provided
by INITIALIZE_CUBE_UPGRADE for the conflicting subobjects. OLAP 10g clients continue to
use the original names.

INITIALIZE_CUBE_UPGRADE does not upgrade any OLAP 10g objects to OLAP 12c format.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

DBMS_CUBE.INITIALIZE_CUBE_UPGRADE;
Usage Notes

This procedure creates and populates a table named `CUBE_UPGRADE_INFO`. If it already exists, the table is truncated and repopulated.

While the 10g namespace allowed subobjects with the same name in the same dimension or cube, the 12c namespace does not. When `INITIALIZE_CUBE_UPGRADE` detects a name conflict among subobjects such as levels, hierarchies, and dimension attributes, it creates a row in `CUBE_UPGRADE_INFO` providing a new, unique name for each one. Rows may also be created for objects that do not require renaming; these rows are distinguished by a value of 0 or null in the `CONFLICT` column. Top-level objects, such as dimensions and cubes, are not listed.

You can edit the table using SQL `INSERT` and `UPDATE` if you want to customize the names of OLAP 10g objects on OLAP 12c clients.

The `UPGRADE_AW`, `EXPORT_XML` and `EXPORT_XML_TO_FILE` procedures use the names specified in the `NEW_NAME` column of the table to identify objects in CWM or OLAP standard form (AWXML) analytic workspaces, rather than the original names.

The following table describes the columns of `CUBE_UPGRADE_INFO`.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Owner of the analytic workspace.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Name of the analytic workspace.</td>
</tr>
<tr>
<td>AWXML_ID</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>Full logical name of the object requiring modification, in the form simple_name.[subtype_name].object_type. For example, TIME.DIMENSION and PRODUCT.COLOR.ATTRIBUTE.</td>
</tr>
<tr>
<td>NEW_NAME</td>
<td>VARCHAR2</td>
<td>NOT NULL</td>
<td>The name the object will have in Oracle 12c after the upgrade.</td>
</tr>
<tr>
<td>OBJECT_CLASS</td>
<td>VARCHAR2</td>
<td>--</td>
<td>DerivedMeasure for calculated measures, or empty for all other object types.</td>
</tr>
<tr>
<td>CONFLICT</td>
<td>NUMBER</td>
<td>--</td>
<td>Indicates the reason that the row was added to CUBE_UPGRADE_INFO:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 0: The object does not have a naming conflict but appears in the table for other reasons.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• 1: Two objects have the same name and would create a conflict in the OLAP 12c namespace. The object type (such as level or hierarchy) will be added to the names.</td>
</tr>
</tbody>
</table>

Examples

The following command creates and populates the `CUBE_UPGRADE_INFO` table:

```sql
EXECUTE dbms_cube.initialize_cube_upgrade;
```

The table shows that the OLAP 10g analytic workspace has a hierarchy and a level named MARKET_SEGMENT, which will be renamed. The table also contains rows for calculated measures, but these objects do not require renaming: The value of `CONFLICT` is 0.

```sql
SELECT awxml_id, new_name, conflict FROM cube_upgrade_info;
```
40.4.11 REFRESH_MVIEW Procedure

This procedure refreshes the data in a cube materialized view.

Syntax

```sql
DBMS_CUBE.REFRESH_MVIEW ( 
  mvowner  IN  VARCHAR2, 
  mvname   IN  VARCHAR2, 
  method   IN  VARCHAR2  DEFAULT NULL, 
  refresh_after_errors IN  BOOLEAN  DEFAULT FALSE, 
  parallelism IN  BINARY_INTEGER DEFAULT 0, 
  atomic_refresh IN  BOOLEAN  DEFAULT FALSE, 
  scheduler_job IN  VARCHAR2  DEFAULT NULL, 
  sam_parameters IN  CLOB  DEFAULT NULL, 
  nested    IN  BOOLEAN  DEFAULT FALSE );
```

Parameters

Table 40-13  REFRESH_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mvowner</td>
<td>Owner of the cube materialized view.</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube materialized view.</td>
</tr>
</tbody>
</table>
### Table 40-13 (Cont.) REFRESH_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>method</strong></td>
<td>A full or a fast (partial) refresh. In a fast refresh, only changed rows are inserted in the cube and the affected areas of the cube are re-aggregated.</td>
</tr>
<tr>
<td></td>
<td>You can specify a method for each cube in sequential order, or a single method to apply to all cubes. If you list more cubes than methods, then the last method applies to the additional cubes.</td>
</tr>
<tr>
<td></td>
<td>• <strong>C</strong>: Complete refresh clears all dimension values before loading. (Default)</td>
</tr>
<tr>
<td></td>
<td>• <strong>F</strong>: Fast refresh of a cube materialized view, which performs an incremental refresh and re-aggregation of only changed rows in the source table.</td>
</tr>
<tr>
<td></td>
<td>• <strong>?</strong>: Fast refresh if possible, and otherwise a complete refresh.</td>
</tr>
<tr>
<td></td>
<td>• <strong>P</strong>: Recomputes rows in a cube materialized view that are affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td></td>
<td>• <strong>S</strong>: Fast solve of a compressed cube. A fast solve reloads all the detail data and re-aggregates only the changed values.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>TRUE to roll back just the cube or dimension with errors, and then continue building the other objects.</td>
</tr>
<tr>
<td>parallelism</td>
<td>Number of parallel processes to allocate to this job.</td>
</tr>
<tr>
<td>atomic_refresh</td>
<td>TRUE prevents users from accessing intermediate results during a build. It freezes the current state of an analytic workspace at the beginning of the build to provide current sessions with consistent data. This option thaws the analytic workspace at the end of the build to give new sessions access to the refreshed data. If an error occurs during the build, then all objects are rolled back to the frozen state.</td>
</tr>
<tr>
<td>scheduler_job</td>
<td>Any text identifier for the job, which will appear in the log table. The string does not need to be unique.</td>
</tr>
<tr>
<td>nested</td>
<td>TRUE performs nested refresh operations for the specified set of cube materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. All objects must reside in a single analytic workspace.</td>
</tr>
</tbody>
</table>

**Usage Notes**

REFRESH_MVIEW changes `mvname` to the name of the cube, then passes the cube name and all parameters to the BUILD procedure. Thus, you can use the BUILD procedure to
refresh a cube materialized view. See the "BUILD Procedure" for additional information about the parameters.

Examples

The following example uses the default settings to refresh a cube materialized view named CB$FWEEK_PSCAT_SALES.

SET serverout ON format wrapped
EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES');

The next example changes the refresh method to use fast refresh if possible, continue refreshing after an error, and use two parallel processes.

EXECUTE dbms_cube.refresh_mview('SH', 'CB$FWEEK_PSCAT_SALES', '?', TRUE, 2);

After successfully refreshing the cube materialized view, REFRESH_MVIEW returns a message like the following:

Completed refresh of cube mview "SH".CB$FWEEK_PSCAT_SALES" at 20130212 15:04:46.370.

40.4.12 UPGRADE_AW Procedure

This procedure creates an Oracle OLAP 12c analytic workspace from a copy of the metadata contained in an OLAP 10g analytic workspace. The original OLAP 10g analytic workspace is not affected and can exist at the same time and in the same schema as the OLAP 12c analytic workspace.

UPGRADE_AW automatically runs INITIALIZE_CUBE_UPGRADE if the CUBE_UPGRADE_INFO table does not exist. If it does exist, then UPGRADE_AW does not overwrite it, thus preserving any changes you made to the table.

See "DBMS_CUBE - Upgrading 10g Analytic Workspaces".

Syntax

DBMS_CUBE.UPGRADE_AW
(sourceaw                      IN  VARCHAR2,
 destaw                       IN  VARCHAR2,
 upgoptions                   IN  CLOB DEFAULT NULL);

Parameters

Table 40-14  UPGRADE_AW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceaw</td>
<td>The name of a 10g analytic workspace.</td>
</tr>
<tr>
<td>destaw</td>
<td>A new name for the generated 12c analytic workspace. It cannot be the same as sourceaw.</td>
</tr>
</tbody>
</table>
Table 40-14  (Cont.) UPGRADE_AW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgoptions</td>
<td>One or more of these upgrade options, as a string in the form 'OPTION=VALUE'. Separate multiple options with commas.</td>
</tr>
<tr>
<td>• PRESERVE_TABLE_OWNERS:</td>
<td>YES preserves the original source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the original schema. (Default)</td>
</tr>
<tr>
<td></td>
<td>NO removes the schema owner from the source table mappings. Use this option when creating an OLAP 12c analytic workspace in a different schema from the 10g analytic workspace, and you want the new objects mapped to tables in the destination schema.</td>
</tr>
<tr>
<td>• RENAME_TABLE:</td>
<td>The name of a table that specifies new names for objects as they are created in OLAP 12c format. These changes are in addition to those specified by the INITIALIZE_CUBE_UPGRADE procedure. See &quot;CREATE_IMPORT_OPTIONS Procedure&quot; for information about creating a rename table.</td>
</tr>
<tr>
<td>• TARGET_VERSION:</td>
<td>The version of the upgrade, specified by a 2- to 5-part number, such as 11.2 or 11.2.0.2.0. If you enter an unsupported version number, then the closest version below it is used.</td>
</tr>
</tbody>
</table>

Examples

This example upgrades an OLAP 10g analytic workspace named GLOBAL10 to an OLAP 12c analytic workspace named GLOBAL12, using a rename table named MY_OBJECT_MAP:

```
BEGIN
    -- Upgrade the analytic workspace
    dbms_cube.upgrade_aw(sourceaw => 'GLOBAL10', destaw => 'GLOBAL12', upgoptions => 'RENAME_TABLE=MY_OBJECT_MAP');

    -- Load and aggregate the data
    dbms_cube.build(script=>'UNITS_CUBE, PRICE_AND_COST_CUBE');

END;
/
```

40.4.13 VALIDATE_XML Procedure

This procedure checks the XML to assure that it is valid without committing the results to the database. It does not create an analytic workspace.

Syntax

```
DBMS_CUBE.VALIDATE_XML
    (dirname               IN  VARCHAR2,
     filename              IN  VARCHAR2 );
```
DBMS_CUBE.VALIDATE_XML
  (in_xml        IN  CLOB );

Parameters

Table 40-15  VALIDATE_XML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dirname</td>
<td>The case-sensitive name of a database directory.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of a file containing an XML template.</td>
</tr>
<tr>
<td>IN_XML</td>
<td>The name of a CLOB containing an XML template.</td>
</tr>
</tbody>
</table>

Usage Notes

You should always load a template into the same version and release of Oracle Database as the one used to generate the template. The XML may not be valid if it was generated by a different release of the software.

Example

This example reports a problem in the schema:

```sql
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
BEGIN dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML'); END;
```

* ERROR at line 1:
ORA-37162: OLAP error
'GLOBAL.PRICE_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.PRICE_CUBE" contains multiple BuildSpecifications with the same name.
'GLOBAL.UNITS_CUBE.$AW_ORGANIZATION': XOQ-01950: The AWCubeOrganization for cube "GLOBAL.UNITS_CUBE" contains multiple BuildSpecifications with the same name.
XOQ-01400: invalid metadata objects
ORA-06512: at "SYS.DBMS_CUBE", line 411
ORA-06512: at "SYS.DBMS_CUBE", line 441
ORA-06512: at "SYS.DBMS_CUBE", line 501
ORA-06512: at "SYS.DBMS_CUBE", line 520
ORA-06512: at line 1

After the problems are corrected, the procedure reports no errors:

```sql
EXECUTE dbms_cube.validate_xml('UPGRADE_DIR', 'MYGLOBAL.XML');
```

PL/SQL procedure successfully completed.

This example loads an XML template into a temporary CLOB, then validates it. The script is named GLOBAL.XML, and it is located in a database directory named XML_DIR.

```
DEFINE xml_file = 'GLOBAL.XML';
SET ECHO ON;
SET SERVEROUT ON;

DECLARE
  xml_file   BFILE := bfilename('XML_DIR', '&xml_file');
```

in_xml   CLOB;
out_xml  CLOB := NULL;
dest_offset  INTEGER := 1;
src_offset  INTEGER := 1;
lang_context  INTEGER := 0;
warning    INTEGER;
BEGIN
  -- Setup the clob from a file
  DBMS_LOB.CREATETEMPORARY(in_xml, TRUE);
  DBMS_LOB.OPEN(in_xml, DBMS_LOB.LOB_READWRITE);
  DBMS_LOB.OPEN(xml_file, DBMS_LOB.FILE_READONLY);
  DBMS_LOB.LOADCLOBFROMFILE(in_xml, xml_file, DBMS_LOB.LOBMAXSIZE,
                              dest_offset, src_offset, 0, lang_context, warning);

  -- Validate the xml
  DBMS_CUBE.VALIDATE_XML(in_xml);
END;
/

DBMS_CUBE_ADVISE

DBMS_CUBE_ADVISE contains subprograms for evaluating cube materialized views to support log-based fast refresh and query rewrite.

This chapter contains the following topics:

- DBMS_CUBE_ADVISE Security Model
- Summary of DBMS_CUBE_ADVISE Subprograms

See Also:
Oracle OLAP User's Guide for information about cube materialized views

41.1 DBMS_CUBE_ADVISE Security Model

The MV_CUBE_ADVICE function requires the ADVISOR privilege.

41.2 Summary of DBMS_CUBE_ADVISE Subprograms

This table lists and describes the DBMS_CUBE_ADVISE subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MV_CUBE_ADVICE Function</td>
<td>Evaluates the metadata of a cube materialized view and generates recommendations for constraints, SQL dimension objects, and materialized view logs to support a broad range of query rewrite and fast refresh opportunities.</td>
</tr>
<tr>
<td>SET_CNS_EXCEPTION_LOG Procedure</td>
<td>Identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.</td>
</tr>
<tr>
<td>TRACE Procedure</td>
<td>Displays or suppresses diagnostic messages for MV_CUBE_ADVICE.</td>
</tr>
</tbody>
</table>

41.2.1 MV_CUBE_ADVICE Function

This table function evaluates the metadata for a specified cube materialized view. It generates recommendations and returns them as a SQL result set. These SQL statements can be used to create constraints, SQL dimension objects, and
materialized view logs that allow the broadest range of query rewrite transformations and log-based fast refresh of the cube materialized view.

**Syntax**

```
DBMS_CUBE_ADVISE.MV_CUBE_ADVICE (
    owner        IN  VARCHAR2  DEFAULT USER,  
    mvname       IN  VARCHAR2,  
    reqtype      IN  VARCHAR2  DEFAULT '0',  
    validate     IN  NUMBER    DEFAULT 0)
RETURN COAD_ADVICE_T  PIPELINED;
```

**Parameters**

**Table 41-2  MV_CUBE_ADVICE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the cube materialized view</td>
</tr>
<tr>
<td>mvname</td>
<td>Name of the cube, such as UNITS_CUBE, or the cube materialized view, such as CB$UNITS_CUBE</td>
</tr>
</tbody>
</table>
| reqtype   | Type of advice to generate:  
            • 0: All applicable advice types  
            • 1: Column NOT NULL constraints  
            • 2: Primary key constraints  
            • 3: Foreign key constraints  
            • 4: Relational dimension objects  
            • 5: Cube materialized view logs with primary key |
| validate  | Validation option:  
            • 0: Validate the constraints  
            • 1: Do not validate the constraints |

**Returns**

A table of type COAD_ADVICE_T, consisting of a set of rows of type COAD_ADVICE_REC. Table 41-3 describes the columns.

**Table 41-3  MV_CUBE_ADVICE Return Values**

<table>
<thead>
<tr>
<th>Column</th>

<td></td>
<td>• 6: Create relational dimensions on the master dimension tables</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 7: Create a materialized view log</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• 8: Compile the materialized view</td>
</tr>
<tr>
<td>DISPOSITION</td>
<td>CLOB</td>
<td>Pre-existing conditions that conflict with the recommendations and should be resolved before SQLTEXT can be executed.</td>
</tr>
<tr>
<td>SQLTEXT</td>
<td>CLOB</td>
<td>SQL statement that implements the recommendation.</td>
</tr>
<tr>
<td>DROPTEXT</td>
<td>CLOB</td>
<td>SQL statement that reverses SQLTEXT. Pre-existing conditions may prevent these statements from restoring the schema to its previous state.</td>
</tr>
</tbody>
</table>

Usage Notes

This function is available in Analytic Workspace Manager as the Materialized View Advisor, which will generate a SQL script with the recommendations.

You can query the returned rows the same as any other table, as shown in the example.

MV_CUBE_ADVICE generates unique object names each time it is called. You should execute the function once, capture the results, and work with those SQL statements.

Take care when dropping database objects. If a table already has a materialized view log, it will have the same name used in the SQL DROP MATERIALIZED VIEW LOG statement in the DROPTEXT column. You should avoid inadvertently dropping materialized view logs, especially when they may be used for remote data replication.

Examples

The following query displays the SQL statements recommended by MV_CUBE_ADVICE. UNITS_FACT is the master table for UNITS_CUBE, and MV_CUBE_ADVICE generates an ALTER TABLE command to add primary key constraints.

It also generates an ALTER MATERIALIZED VIEW command to compile the CB$UNITS_CUBE cube materialized view.

```
SQL> SELECT apiobject, sqlobject, sqltext
            FROM TABLE(dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'));
```
41.2.2 SET_CNS_EXCEPTION_LOG Procedure

This procedure identifies the name of an exception log used in validated constraints generated by MV_CUBE_ADVICE.

Syntax

DBMS_CUBE_ADVISE.SET_CNS_EXCEPTION_LOG (
    exceptlogtab     IN   VARCHAR2  DEFAULT user.EXCEPTIONS);

Parameters

Table 41-4  SET_CNS_EXCEPTION_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exceptlogtab</td>
<td>The name of an existing exception log.</td>
</tr>
</tbody>
</table>

Usage Notes

To create an exception log, use the utlexcpt.sql or the utlexpt1.sql script before executing SET_CNS_EXCEPTION_LOG.

The validate parameter of MV_CUBE_ADVICE must be set to 1.

Examples

The utlexcpt.sql script creates a table named EXCEPTIONS, and the SET_CNS_EXCEPTION_LOG procedure identifies it as the exception log for MV_CUBE_ADVICE. The ALTER TABLE statement now includes the clause VALIDATE EXCEPTIONS INTO "GLOBAL"."EXCEPTIONS".

SQL> @utlexcpt
Table created.

SQL> EXECUTE dbms_cube_advise.set_cns_exception_log;
PL/SQL procedure successfully completed.

SQL> SELECT apiobject, sqlobject, advicetype type, sqltext
FROM TABLE(
    dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE', '2', 1));

<table>
<thead>
<tr>
<th>APIOBJECT</th>
<th>SQLOBJECT</th>
<th>TYPE</th>
<th>SQLTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_CUBE</td>
<td>UNITS_FACT</td>
<td>2</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add constraint &quot;COAD_PK000219&quot; PRIMARY KEY (&quot;CHANNEL_ID&quot;, &quot;ITEM_ID&quot;, &quot;SHIP_TO_ID&quot;, &quot;MONTH_ID&quot;) norely enable validate exceptions into &quot;GLOBAL&quot;.&quot;EXCEPTIONS&quot;</td>
</tr>
</tbody>
</table>
41.2.3 TRACE Procedure

This procedure turns on and off diagnostic messages to server output for the MV_CUBE_ADVICE function.

Syntax

DBMS_CUBE_ADVISE.TRACE (  
    diaglevel  IN  BINARY_INTEGER DEFAULT 0);  

Parameters

Table 41-5  TRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>diaglevel</td>
<td>0 to turn tracing off, or 1 to turn tracing on.</td>
</tr>
</tbody>
</table>

Examples

The following example directs the diagnostic messages to server output. The SQL*Plus SERVEROUTPUT setting displays the messages.

```
SQL> SET SERVEROUT ON FORMAT WRAPPED
SQL> EXECUTE dbms_cube_advise.trace(1);
PL/SQL procedure successfully completed.

PL/SQL procedure successfully completed.

SQL> SELECT sqlobject, sqltext, droptext  
FROM TABLE(  
    dbms_cube_advise.mv_cube_advice('GLOBAL', 'CB$UNITS_CUBE'))  
WHERE apiobject='UNITS_CUBE';
```

```
<table>
<thead>
<tr>
<th>SQLOBJECT</th>
<th>SQLTEXT</th>
<th>DROPTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNITS_FACT</td>
<td>alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; add co alter table &quot;GLOBAL&quot;.&quot;UNITS_FACT&quot; drop c nstraint &quot;COAD_PK000222&quot; PRIMARY KEY (&quot;C onstraint &quot;COAD_PK000222&quot; cascade HANNEL_ID&quot;, &quot;ITEM_ID&quot;, &quot;SHIP_TO_ID&quot;, &quot;MO NTH_ID&quot;) rely disable novalidate</td>
<td></td>
</tr>
<tr>
<td>CB$UNITS_CUBE</td>
<td>alter materialized view &quot;GLOBAL&quot;.&quot;CB$UNIT TS_CUBE&quot; compile</td>
<td>TS_CUBE&quot; compile</td>

Summary of DBMS_CUBE_ADVISE Subprograms

41-5
Chapter 41
Summary of DBMS_CUBE_ADVISE Subprograms

SQL> EXECUTE dbms_cube_advise.trace(0);
DBMS_COAD_DIAG: Changing diaglevel from [1] to [0]

PL/SQL procedure successfully completed.
DBMS_CUBE_LOG contains subprograms for creating and managing logs for cubes and cube dimensions.

See Also:
OLAP Technology in the Oracle Database in Oracle OLAP User’s Guide regarding use of the OLAP option to support business intelligence and analytical applications.

This chapter contains the following topics:
• Using DBMS_CUBE_LOG
• Summary of DBMS_CUBE_LOG Subprograms

42.1 Using DBMS_CUBE_LOG

DBMS_CUBE_LOG manages several logs that enable you to track the progress of long running processes, then use the results to profile performance characteristics.

They provide information to help you diagnose and remedy problems that may occur during development and maintenance of a cube, such as hierarchies that are improperly structured in the relational source tables, records that fail to load, or data refreshes that take too long to complete. They also help diagnose performance problems in querying cubes.

Analytic Workspace Manager creates the logs automatically using the default names and types. It also disables the logs when Analytic Workspace Manager is closed. To use the same logs outside of Analytic Workspace Manager, you must first enable them. Alternatively, you can create and manage different logs for use outside of Analytic Workspace Manager.

This section contains the following topics:
• Logging Types
• Logging Targets
• Verbosity Levels
• Security Model
• Creating Cube Logs
• Cube Build Log
• Cube Dimension Compile Log
• Cube Operations Log
42.1.1 DBMS_CUBE_LOG — Logging Types

Several logs are available, each one dedicated to storing messages of a particular type. You may use all of them or only those that you find particularly valuable. The logs and their contents are described later in this topic.

• Cube Build Log
• Cube Dimension Compile Log
• Cube Operations Log
• Cube Rejected Records Log

DBMS_CUBE_LOG provides functions that return the binary integer for each log type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

• TYPE_BUILD Function
• TYPE_DIMENSION_COMPILE Function
• TYPE_OPERATIONS Function
• TYPE_REJECTED_RECORDS Function

42.1.2 DBMS_CUBE_LOG — Logging Targets

The TABLE_CREATE procedure creates database tables for storing the logs. Using the ENABLE procedure, you can create additional targets with changes in the destination or logging level. For example, you might target the Cube Operations log to both a table and a disk file.

These are the available targets:

• Disk file
• LOB
• Database table
• Trace file

See ENABLE Procedure for more information about creating multiple targets.

DBMS_CUBE_LOG provides functions that return the binary integer for each target type. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

• TARGET_FILE Function
• TARGET_LOB Function
• TARGET_TABLE Function
• TARGET_TRACE Function
42.1.3 DBMS_CUBE_LOG — Verbosity Levels

You can decide how much information is recorded in a log. You may want fewer details when leaving a job to run overnight than when you are monitoring the success of a new build. You can choose from these verbosity levels. Each level adds to the preceding level.

- **LOWEST**: Logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records. This is the basic logging level.
- **LOW**: Logs messages from the OLAP engine, such as start and finish records for SQL Import, Aggregate, and Update.
- **MEDIUM**: Logs messages at the level used by Analytic Workspace Manager.
- **HIGH**: Logs messages that provide tuning information, such as composite lengths, partitioning details, object sizes, and aggregation work lists. This level is intended for use by Oracle Field Services.
- **HIGHEST**: Logs debugging messages and other information typically sent to a trace file. This level is intended for use by Oracle Support Services.

DBMS_CUBE_LOG provides functions that return the binary integer for each verbosity level. You can produce more readable code by using these functions instead of integers for the argument values of other DBMS_CUBE_LOG procedures and functions. Refer to these descriptions:

- **LEVEL_LOWEST Function**
- **LEVEL_LOW Function**
- **LEVEL_MEDIUM Function**
- **LEVEL_HIGH Function**
- **LEVEL_HIGHEST Function**

42.1.4 DBMS_CUBE_LOG Security Model

The **TABLE_CREATE** procedure requires the **CREATE TABLE** privilege.

42.1.5 DBMS_CUBE_LOG — Creating Cube Logs

To store logging information in a database table, you must create that table using the **TABLE_CREATE** procedure. Cube Build logs are always stored in tables. The **ENABLE** procedure creates the other target types for the other logs.

**To create a Cube Build log:**

- Execute the **TABLE_CREATE** procedure.

The following command creates a Cube Build log with the default name of **CUBE_BUILD_LOG**:

EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_build);
To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a database table target:

1. Execute the `TABLE_CREATE` procedure to create the table.
2. Execute the `ENABLE` procedure to begin logging.

These commands create and enable a Cube Operations table with the default name of `CUBE_OPERATIONS_LOG` and the default verbosity level:

```sql
EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_operations);
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations);
```

To create a Cube Dimension Compile log, Cube Operations log, or Cube Rejected Records log with a trace file, disk file, or LOB target:

- Execute the `ENABLE` procedure.

This command enables the Cube Rejected Records log, sets verbosity to the lowest level, and directs the output to a disk file named `rejects.log` in the `WORK_DIR` database directory:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_rejected_records, -
    dbms_cube_log.target_file, dbms_cube_log.level_lowest, -
    'WORK_DIR/rejects.log');
```

### 42.1.6 DBMS_CUBE_LOG — Cube Build Log

The Cube Build log provides information about what happened during a build. Use this log to determine whether the build produced the results you were expecting, and if not, why not.

The contents of the Cube Build log are refreshed continuously during a build. You can query the log at any time to evaluate the progress of the build and to estimate the time to completion.

The default name of the Cube Build log is `CUBE_BUILD_LOG`. The following table describes its contents.

#### Note:
To manage a Cube Build log, use only the `TABLE_CREATE` and `VERSION` procedures.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_ID</td>
<td>NUMBER</td>
<td>--</td>
<td>A unique sequence number for the build. The same number is used for slave processes in a parallel build.</td>
</tr>
<tr>
<td>SLAVE_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>A counter for slave processes in a parallel build: 0 is the master process, 1 is the first slave, 2 is the second slave, and so forth.</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The current status of the command: STARTED, COMPLETED, FAILED, or WORKING.</td>
</tr>
<tr>
<td>Column</td>
<td>Datatype</td>
<td>NULL</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------</td>
<td>------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COMMAND</td>
<td>VARCHAR2(25)</td>
<td>--</td>
<td>The name of the command being executed, such as BUILD, LOAD, and SOLVE.</td>
</tr>
<tr>
<td>BUILD_OBJECT</td>
<td>VARCHAR2(500)</td>
<td>--</td>
<td>The name of the cube or cube dimension being processed.</td>
</tr>
<tr>
<td>BUILD_OBJECT_TYPE</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The type of object: CUBE, DIMENSION, or BUILD.</td>
</tr>
<tr>
<td>OUTPUT</td>
<td>CLOB</td>
<td>--</td>
<td>Information structured like an XML document about the command, or NULL when there is no additional information, such as for a STARTED row.</td>
</tr>
<tr>
<td>AW</td>
<td>VARCHAR2(30)</td>
<td>--</td>
<td>The name of the analytic workspace that contains the objects of the build.</td>
</tr>
<tr>
<td>OWNER</td>
<td>VARCHAR2(30)</td>
<td></td>
<td>The owner of the analytic workspace and all the objects of the build.</td>
</tr>
<tr>
<td>PARTITION</td>
<td>VARCHAR2(10)</td>
<td>--</td>
<td>The name of the partition being processed, or NULL when the current operation does not correspond to a partition.</td>
</tr>
<tr>
<td>SCHEDULER_JOB</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>A user-specified string to identify the build.</td>
</tr>
<tr>
<td>TIME</td>
<td>TIMESTAMP(6)</td>
<td>--</td>
<td>The time the row is added to the table.</td>
</tr>
<tr>
<td>BUILD_SCRIPT</td>
<td>CLOB</td>
<td>--</td>
<td>The cube build script. Populated only in rows where COMMAND is BUILD.</td>
</tr>
<tr>
<td>BUILD_TYPE</td>
<td>VARCHAR2(22)</td>
<td>--</td>
<td>The origin of the build: DBMS_CUBE, DBMS_MVIEW, JAVA, or SLAVE.</td>
</tr>
<tr>
<td>COMMAND_DEPTH</td>
<td>NUMBER(2)</td>
<td>--</td>
<td>The nesting depth of the command. For example, COMPARE HIERARCHIES is a component step of COMPARE, so if COMPARE has a depth of 1, then COMPARE HIERARCHIES has a depth of 2.</td>
</tr>
<tr>
<td>BUILD_SUB_OBJECT</td>
<td>VARCHAR2(30)</td>
<td>--</td>
<td>The name of a subobject being processed, such as a measure that does not inherit the aggregation rules of the cube.</td>
</tr>
<tr>
<td>REFRESH_METHOD</td>
<td>VARCHAR2(1)</td>
<td>--</td>
<td>The refresh method, such as C or F, that is associated with the current command. The refresh method is important only for the CLEAR step.</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>COMMAND_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>The sequence number of the command in the current process, which can be used to distinguish the same command on different objects. For example, a LOAD on PRODUCT and a LOAD on TIME.</td>
</tr>
<tr>
<td>IN_BRANCH</td>
<td>NUMBER(1)</td>
<td>--</td>
<td>Not currently used.</td>
</tr>
<tr>
<td>Column</td>
<td>Datatype</td>
<td>NULL</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>--------------</td>
<td>------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COMMAND_STATUS_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Identifies the sequence number of all rows for a particular command. For example, a particular command might be represented by four rows: The first row has a status of \textit{STARTED} and the last row has a status of \textit{COMPLETED}. This column is used for sorting.</td>
</tr>
</tbody>
</table>

### 42.1.7 DBMS_CUBE_LOG — Cube Dimension Compile Log

When solving a cube, OLAP checks the dimension hierarchies to make sure they are valid. Errors that occur during this validation are written to the Cube Dimension Compile log.

The checks include:

- **Circularity:** Hierarchies are defined by parent-child relations among dimension members. Circularity occurs when a dimension member is specified as its own ancestor or descendant.
- **Hierarchy type:** Hierarchies can be level based or value based. You can define a cube so that only level-based hierarchies are valid, such as a cube materialized view.
- **Level options:** Level-based hierarchies can be regular, ragged, or skip level. You can define a dimension so that only regular hierarchies are valid, such as a Time dimension.

The default name of the Cube Dimension Compile log is \texttt{CUBE\_DIMENSION\_COMPILE}. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT NULL</td>
<td>Number of the error being reported</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2(2000)</td>
<td>--</td>
<td>Error message associated with the error</td>
</tr>
<tr>
<td>DIMENSION</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Name of the dimension being compiled</td>
</tr>
<tr>
<td>DIMENSION_MEMBER</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Faulty dimension member</td>
</tr>
<tr>
<td>MEMBER_ANCESTOR</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Parent of DIMENSION_MEMBER</td>
</tr>
<tr>
<td>HIERARCHY1</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>First hierarchy involved in the error</td>
</tr>
<tr>
<td>HIERARCHY2</td>
<td>VARCHAR2(100)</td>
<td>--</td>
<td>Second hierarchy involved in the error</td>
</tr>
<tr>
<td>ERROR_CONTEXT</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about the error</td>
</tr>
</tbody>
</table>

### 42.1.8 DBMS_CUBE_LOG — Cube Operations Log

The Cube Operations log contains messages and debugging information for all OLAP engine events. You can track current operations at a very detailed level. Using the \texttt{SQL\_ID} column, you can join the Cube Operations log to dynamic performance views.
such as V$SQL, V$SESSION, and V$SESSION_LONGOPS to see cube operations in the context of other database operations such as I/O Wait and CPU.

The default name of the Cube Operations log is CUBE_OPERATIONS_LOG. The following table describes its contents.

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INST_ID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Instance identifier</td>
</tr>
<tr>
<td>SID</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session identifier</td>
</tr>
<tr>
<td>SERIAL#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>Session serial number</td>
</tr>
<tr>
<td>USER#</td>
<td>NUMBER</td>
<td>NOT NULL</td>
<td>User identifier</td>
</tr>
<tr>
<td>SQL_ID</td>
<td>VARCHAR2(13)</td>
<td>--</td>
<td>Executing SQL statement identifier</td>
</tr>
<tr>
<td>JOB</td>
<td>NUMBER</td>
<td>--</td>
<td>Job identifier</td>
</tr>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>PARENT_ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Parent operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>TIME</td>
<td>TIMESTAMP(6) WITH TIME ZONE</td>
<td>NOT NULL</td>
<td>Time the record was added to the Cube Operations log</td>
</tr>
<tr>
<td>LOG_LEVEL</td>
<td>NUMBER(4)</td>
<td>NOT NULL</td>
<td>Verbosity level of the record, as specified by the DBMS_CUBE_LOG.ENABLE procedure.</td>
</tr>
<tr>
<td>DEPTH</td>
<td>NUMBER(4)</td>
<td>--</td>
<td>Nesting depth of the record. For example, a level of 0 indicates that the operation and suboperation are not nested within other operations and suboperations.</td>
</tr>
<tr>
<td>OPERATION</td>
<td>VARCHAR2(15)</td>
<td>NOT NULL</td>
<td>Current operation, such as AGGREGATE, ROWSOURCE, or SQLIMPORT.</td>
</tr>
<tr>
<td>SUBOPERATION</td>
<td>VARCHAR2(20)</td>
<td>--</td>
<td>Current suboperation, such as Loading or Import</td>
</tr>
<tr>
<td>STATUS</td>
<td>VARCHAR2(10)</td>
<td>NOT NULL</td>
<td>Current status of the operation, such as START, TRACE, COMPLETED, or Failed.</td>
</tr>
<tr>
<td>NAME</td>
<td>VARCHAR2(20)</td>
<td>NOT NULL</td>
<td>Name of the record, such as ROWS LOADED, AVE_ROW_LEN, and PAGEPOOLSIZE</td>
</tr>
<tr>
<td>VALUE</td>
<td>VARCHAR2(4000)</td>
<td>--</td>
<td>Value of NAME</td>
</tr>
<tr>
<td>DETAILS</td>
<td>CLOB</td>
<td>--</td>
<td>Additional information about NAME.</td>
</tr>
</tbody>
</table>

42.1.9 DBMS_CUBE_LOG — Cube Rejected Records Log

The Cube Rejected Records log contains a summary of the loader job and any records that were rejected because they did not meet the expected format.

A single row in the source table may have errors in more than one field. Each field generates an error in the log, resulting in multiple rows with the same rowid in the SOURCE_ROW column.

The default name of the Cube Rejected Records log is CUBE_REJECTED_RECORDS. The following table describes its contents.
### Column Datatype NULL Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID</td>
<td>NUMBER</td>
<td>--</td>
<td>Current operation identifier</td>
</tr>
<tr>
<td>SEQ_NUMBER</td>
<td>NUMBER</td>
<td>--</td>
<td>Sequence number in the Cube Build log</td>
</tr>
<tr>
<td>ERROR#</td>
<td>NUMBER(8)</td>
<td>NOT NULL</td>
<td>Number of the error triggered by the record</td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2</td>
<td>--</td>
<td>Error message associated with the error</td>
</tr>
<tr>
<td>RECORD#</td>
<td>NUMBER(38)</td>
<td>--</td>
<td>Input record number</td>
</tr>
<tr>
<td>SOURCE_ROW</td>
<td>ROWID</td>
<td>--</td>
<td>Rowid of the row in the source table; null when the source is a view or a query</td>
</tr>
</tbody>
</table>

### 42.2 Summary of DBMS_CUBE_LOG Subprograms

This table lists and describes the DBMS_CUBE_LOG subprograms.

#### Table 42-1  DBMS_CUBE_LOG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEFAULT_NAME Function</td>
<td>Returns the default table names of the various log types.</td>
</tr>
<tr>
<td>DISABLE Procedure</td>
<td>Turns logging off for the duration of a session.</td>
</tr>
<tr>
<td>ENABLE Procedure</td>
<td>Turns on logging for the duration of a session, redirects logging to additional output types, and changes the verbosity level in the logs.</td>
</tr>
<tr>
<td>FLUSH Procedure</td>
<td>Forces all buffered messages to be written to the logs.</td>
</tr>
<tr>
<td>GET_LOG Procedure</td>
<td>Returns the current settings for the level and location of a particular log.</td>
</tr>
<tr>
<td>GET_LOG_SPEC Function</td>
<td>Retrieves a description of all active logs.</td>
</tr>
<tr>
<td>GET_PARAMETER Function</td>
<td>Returns the current values of the options that control various aspects of logging.</td>
</tr>
<tr>
<td>LEVEL_HIGH Function</td>
<td>Returns the integer value of the high verbosity level.</td>
</tr>
<tr>
<td>LEVEL_HIGHEST Function</td>
<td>Returns the integer value of the highest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOW Function</td>
<td>Returns the integer value of the low verbosity level.</td>
</tr>
<tr>
<td>LEVEL_LOWEST Function</td>
<td>Returns the integer value of the lowest verbosity level.</td>
</tr>
<tr>
<td>LEVEL_MEDIUM Function</td>
<td>Returns the integer value of the medium verbosity level.</td>
</tr>
<tr>
<td>SET_LOG_SPEC Procedure</td>
<td>Sets all logging to the values specified in the input string.</td>
</tr>
<tr>
<td>SET_PARAMETER Procedure</td>
<td>Sets options that control various aspects of logging.</td>
</tr>
<tr>
<td>TABLE_CREATE Procedure</td>
<td>Creates the table targets for the OLAP logs.</td>
</tr>
<tr>
<td>TARGET_FILE Function</td>
<td>Returns the integer value of a disk file target.</td>
</tr>
<tr>
<td>TARGET_LOB Function</td>
<td>Returns the integer value of a LOB target.</td>
</tr>
<tr>
<td>TARGET_TABLE Function</td>
<td>Returns the integer value of a database table target</td>
</tr>
<tr>
<td>TARGET_TRACE Function</td>
<td>Returns the integer value of a trace file target.</td>
</tr>
<tr>
<td>TYPE_BUILD Function</td>
<td>Returns the integer value of the Cube Build log.</td>
</tr>
</tbody>
</table>
Table 42-1  (Cont.) DBMS_CUBE_LOG Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_DIMENSION_COMPILE Function</td>
<td>Returns the integer value of the Cube Dimension Compile log.</td>
</tr>
<tr>
<td>TYPE_OPERATIONS Function</td>
<td>Returns the integer value of the Cube Operations log.</td>
</tr>
<tr>
<td>TYPE_REJECTED_RECORDS Function</td>
<td>Returns the integer value of the Cube Rejected Records log.</td>
</tr>
<tr>
<td>VERSION Function</td>
<td>Returns the version number of a specific log table or the current version number of a specific log type.</td>
</tr>
</tbody>
</table>

42.2.1 DEFAULT_NAME Function

This function returns the default table names of the various log types.

Syntax

```
DBMS_CUBE_LOG.DEFAULT_NAME (LOG_TYPE IN BINARY_INTEGER DEFAULT TYPE_OPERATIONS) RETURN VARCHAR2;
```

Parameters

Table 42-2  DEFAULT_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
</tbody>
</table>

Returns

The default table name of the specified log type.

Examples

This example returns the default name of the Cube Operations log:

```
SELECT dbms_cube_log.default_name FROM dual;
```

```
DEFAULT_NAME
---------------------
CUBE_OPERATIONS_LOG
```

The next example returns the default name of the Cube Rejected Records log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) - "Default Name" FROM dual;
```
42.2.2 DISABLE Procedure

This procedure turns logging off for the duration of a session, unless logging is explicitly turned on again with the ENABLE procedure.

Syntax

```
DBMS_CUBE_LOG.DISABLE (
    LOG_TYPE       IN   BINARY_INTEGER  DEFAULT,
    LOG_TARGET     IN   BINARY_INTEGER  DEFAULT);
```

Parameters

Table 42-3 DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You cannot disable the Cube Build log with this procedure.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to</td>
</tr>
<tr>
<td></td>
<td>a table unless you previously specified a different target using the ENABLE</td>
</tr>
<tr>
<td></td>
<td>procedure.</td>
</tr>
<tr>
<td></td>
<td>• 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>• 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>• 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot;</td>
</tr>
</tbody>
</table>

Example

This command disables the dimension compilation error log table:

```
EXECUTE dbms_cube_log.disable(dbms_cube_log.type_dimension_compile);
```

42.2.3 ENABLE Procedure

This procedure turns on logging for the duration of a session or until it is turned off using the DISABLE procedure.

The ENABLE procedure also allows you to direct logging to additional output types and to change the amount of detail in the logs. You can enable a log type to each of the log targets. For example, you can enable the Cube Operations log to the trace file, a table, and a file at different verbosity levels, but you cannot enable the Cube Operations log to two files at the same time.

This procedure also checks the format of the logs and updates them if necessary.
Syntax

DBMS_CUBE_LOG.ENABLE (  
   LOG_TYPE IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_TARGET IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_LEVEL IN  BINARY_INTEGER  DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
   LOG_TYPE IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_TARGET IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_LEVEL IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_LOCATION IN  VARCHAR2        DEFAULT NULL);  

DBMS_CUBE_LOG.ENABLE (  
   LOG_TYPE IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_TARGET IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_LEVEL IN  BINARY_INTEGER  DEFAULT NULL,  
   LOG_LOCATION IN/OUT CLOB );

Parameters

Table 42-4   ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: You cannot disable the Cube Build log with this procedure.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are</td>
</tr>
<tr>
<td></td>
<td>sent to a table unless you previously specified a different target</td>
</tr>
<tr>
<td></td>
<td>using the ENABLE procedure.</td>
</tr>
<tr>
<td></td>
<td>• 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>• 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>• 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot;</td>
</tr>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of</td>
</tr>
<tr>
<td></td>
<td>messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>• 1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>• 2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>• 3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>• 4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>• 5: LEVEL_HIGHEST</td>
</tr>
<tr>
<td></td>
<td>See &quot;Verbosity Levels&quot;</td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as owner.table_name when</td>
</tr>
<tr>
<td></td>
<td>log_target is a table.</td>
</tr>
</tbody>
</table>

Examples

The following command enables all cube logs:

EXECUTE dbms_cube_log.enable;
The following PL/SQL procedure sets the log level to `LEVEL_LOWEST`:

```plsql
BEGIN
    dbms_cube_log.disable(dbms_cube_log.type_rejected_records);
    dbms_cube_log.enable(dbms_cube_log.type_rejected_records,
                        dbms_cube_log.target_table, dbms_cube_log.level_lowest);
END;
/
```

42.2.4 FLUSH Procedure

This procedure forces all buffered messages to be written to the logs.

The buffers are flushed automatically throughout a session, but manually flushing them before viewing the logs assures that you can view all of the messages.

Syntax

```
DBMS_CUBE_LOG.FLUSH ( );
```

Example

The following example flushes the buffers for all of the logs:

```
EXECUTE dbms_cube_log.flush;
```

42.2.5 GET_LOG Procedure

This procedure returns the current settings for the level and location of a particular log.

Syntax

```
DBMS_CUBE_LOG.GET_LOG ( 
    LOG_TYPE IN   BINARY_INTEGER  DEFAULT TYPE_OPERATIONS, 
    LOG_TARGET IN   BINARY_INTEGER  DEFAULT TARGET_TABLE, 
    LOG_LEVEL OUT  BINARY_INTEGER, 
    LOG_LOCATION OUT VARCHAR2 );
```

Parameters

Table 42-5 GET_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;</td>
</tr>
</tbody>
</table>

### Table 42-5 (Cont.) GET_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_target</td>
<td>One of the following destinations for the logging records. The logs are sent to a table unless you previously specified a different target using the <code>ENABLE</code> procedure.</td>
</tr>
<tr>
<td></td>
<td>• 1: TARGET_TABLE</td>
</tr>
<tr>
<td></td>
<td>• 2: TARGET_TRACE</td>
</tr>
<tr>
<td></td>
<td>• 3: TARGET_FILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TARGET_LOB</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Targets&quot;</td>
</tr>
<tr>
<td>log_level</td>
<td>One of the following log verbosity levels. Each level adds new types of messages to the previous level.</td>
</tr>
<tr>
<td></td>
<td>• 1: LEVEL_LOWEST</td>
</tr>
<tr>
<td></td>
<td>• 2: LEVEL_LOW</td>
</tr>
<tr>
<td></td>
<td>• 3: LEVEL_MEDIUM</td>
</tr>
<tr>
<td></td>
<td>• 4: LEVEL_HIGH</td>
</tr>
<tr>
<td></td>
<td>• 5: LEVEL_HIGHEST</td>
</tr>
<tr>
<td></td>
<td>See &quot;Verbosity Levels&quot;</td>
</tr>
<tr>
<td>log_location</td>
<td>The full identity of the log, such as <code>owner.table_name</code> when <code>log_target</code> is a table.</td>
</tr>
</tbody>
</table>

### Usage Notes

If `log_type` is not active, then `log_level` and `log_location` are null. Use `DBMS_CUBE_LOG.ENABLE` to activate a log.

### Examples

This PL/SQL procedure provides information about the Cube Rejected Records log:

```plsql
SET serverout ON format wrapped
DECLARE
    myloglevel  binary_integer;
    mylogtarget varchar2(128);
BEGIN
    dbms_cube_log.get_log(dbms_cube_log.type_rejected_records, dbms_cube_log.target_table, myloglevel, mylogtarget);
    dbms_output.put_line('Log Level: ' || myloglevel);
    dbms_output.put_line('Log Target: ' || mylogtarget);
END;
/
```

The procedure generates results like the following:

Log Level: 5

Log Target: GLOBAL.CUBE_REJECTED_RECORDS
42.2.6 GET_LOG_SPEC Function

This function retrieves a description of all active Cube Operations logs, Cube Rejected Records logs, and Cube Dimension Compile logs.

Syntax

```sql
DBMS_CUBE_LOG.GET_LOG_SPEC ( )
RETURN VARCHAR2;
```

Returns

The type and target of all active logs.

Usage Notes

You can use the output from this function as the input to `SET_LOG_SPEC`.

Examples

The following example shows that the Cube Operations log, Cube Rejected Records log, and Cube Dimension Compile log are active. The Cube Operations log is stored in the session trace file and the other logs are stored in tables.

```sql
SELECT dbms_cube_log.get_log_spec FROM dual;
```

```
GET_LOG_SPEC
-----------------------------------------------
OPERATIONS(TABLE, TRACE) REJECTED_RECORDS(TABLE[DEBUG])
```

42.2.7 GET_PARAMETER Function

This function returns the current values of the options that control various aspects of logging. To set these options, use the `SET_PARAMETER` function.

Syntax

```sql
DBMS_CUBE_LOG.GET_PARAMETER (
    LOG_TYPE       IN   BINARY_INTEGER,
    LOG_PARAMETER  IN   BINARY_INTEGER
) RETURN BINARY_INTEGER;
```

Parameters

Table 42-6  GET_PARAMETER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;</td>
</tr>
</tbody>
</table>
Table 42-6  (Cont.) GET_PARAMETER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_parameter</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>• 1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>• 2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>• 3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>• 4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>• 5: ALLOW_ERRORS</td>
</tr>
<tr>
<td></td>
<td>See &quot;SET_PARAMETER Procedure&quot;</td>
</tr>
</tbody>
</table>

Returns

The value of the specified log_parameter.

Examples

This example shows the current maximum number of errors in the Cube Rejected Records log before logging stops. This parameter was previously set with the SET_PARAMETER procedure.

```sql
SELECT dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1) -
   "Maximum Records" FROM dual;
```

Maximum Records
---------------
    100

42.2.8 LEVEL_HIGH Function

This function returns the integer value of the high verbosity level.

Syntax

```sql
DBMS_CUBE_LOG.LEVEL_HIGH ()
RETURN BINARY_INTEGER;
```

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to high:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
   dbms_cube_log.target_table, dbms_cube_log.level_high);
```
42.2.9 LEVEL_HIGHEST Function

This function returns the integer value of the highest verbosity level.

Syntax

```sql
DBMS_CUBE_LOG.LEVEL_HIGHEST ()
RETURN BINARY_INTEGER;
```

Returns

5

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to highest:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
  dbms_cube_log.target_table, dbms_cube_log.level_highest);
```

42.2.10 LEVEL_LOW Function

This function returns the integer value of the low verbosity level.

Syntax

```sql
DBMS_CUBE_LOG.LEVEL_LOW ()
RETURN BINARY_INTEGER;
```

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Verbosity Levels".

Example

This command sets the verbosity level of the cube operations table to low:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
  dbms_cube_log.target_table, dbms_cube_log.level_low);
```
42.2.11 LEVEL_LOWEST Function

This function returns the integer value of the lowest verbosity level. This level logs the status of each command used to build the cube dimensions and cubes, the use of slave processes, and summary records.

**Syntax**

```sql
DBMS_CUBE_LOG.LEVEL_LOWEST ()
RETURN BINARY_INTEGER;
```

**Returns**

1

**Usage Notes**

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels".

**Example**

This command sets the verbosity level of the cube operations table to lowest:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_lowest);
```

42.2.12 LEVEL_MEDIUM Function

This function returns the integer value of the medium verbosity level.

**Syntax**

```sql
DBMS_CUBE_LOG.LEVEL_MEDIUM ()
RETURN BINARY_INTEGER;
```

**Returns**

3

**Usage Notes**

Use this function instead of its binary integer equivalent for the `LOG_LEVEL` parameter in `DBMS_CUBE_LOG` subprograms. See "Verbosity Levels".

**Example**

This command sets the verbosity level of the cube operations table to medium:

```sql
EXECUTE dbms_cube_log.enable(dbms_cube_log.type_operations, -
    dbms_cube_log.target_table, dbms_cube_log.level_medium);
```
42.2.13 SET_LOG_SPEC Procedure

This procedure sets all logging to the values specified in the input string.

Syntax

DBMS_CUBE_LOG.SET_LOG_SPEC(
   LOG_SPEC IN VARCHAR2);

Parameters

Table 42-7  SET_LOG_SPEC Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_spec</td>
<td>A string consisting of type(target) pairs. Type can be:</td>
</tr>
<tr>
<td></td>
<td>• OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>Target can be:</td>
</tr>
<tr>
<td></td>
<td>• TABLE</td>
</tr>
<tr>
<td></td>
<td>• TRACE</td>
</tr>
<tr>
<td></td>
<td>• FILE</td>
</tr>
<tr>
<td></td>
<td>• LOB</td>
</tr>
</tbody>
</table>

Usage Notes

The GET_LOG_SPEC function returns a properly formatted string for SET_LOG_SPEC.

Examples

This PL/SQL procedure disables all logs, verifies that they are disabled, then activates the Cube Operations log and the Cube Rejected Records log.

BEGIN
   dbms_cube_log.disable;
   dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);

   dbms_cube_log.set_log_spec('OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)');
   dbms_output.put_line('Cube Logs: ' || dbms_cube_log.get_log_spec);
END;
/

The output from the procedure verifies that the DISABLE function de-activated all logs, and the SET_LOG_SPEC function activated two logs:

Cube Logs:

Cube Logs: OPERATIONS(TRACE) REJECTED_RECORDS(TABLE)

42.2.14 SET_PARAMETER Procedure

This procedure sets options that control various aspects of logging.

To obtain the current value of these options, use the GET_PARAMETER function.
Syntax

```plsql
DBMS_CUBE_LOG.SET_PARAMETER (
    LOG_TYPE       IN   BINARY_INTEGER,
    LOG_PARAMETER  IN   BINARY_INTEGER,
    VALUE          IN   BINARY_INTEGER );
```

Parameters

### Table 42-8  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>log_type</code></td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><code>log_parameter</code></th>
<th>One of the following parameters:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• 1: MAX_ERRORS</td>
</tr>
<tr>
<td></td>
<td>Maximum number of records before signalling an end to logging, such as the number of rejected records in the Cube Rejected Records log or the number of compilation errors in the dimension compilation error log.</td>
</tr>
<tr>
<td></td>
<td>• 2: FLUSH_INTERVAL</td>
</tr>
<tr>
<td></td>
<td>The number of seconds to buffer the records before writing them to a log. When this parameter is 0, the records are written directly to the logs without buffering.</td>
</tr>
<tr>
<td></td>
<td>• 3: LOG_FULL_RECORD</td>
</tr>
<tr>
<td></td>
<td>Controls logging of rejected records. Set this parameter to one of the following constants:</td>
</tr>
<tr>
<td></td>
<td>0: FULL_RECORD_AUTO: Log the full record when no row ID is available.</td>
</tr>
<tr>
<td></td>
<td>1: FULL_RECORD_ALWAYS: Always log the full record.</td>
</tr>
<tr>
<td></td>
<td>2: FULL_RECORD_NEVER: Never log the full record.</td>
</tr>
<tr>
<td></td>
<td>• 4: LOG_EVERY_N</td>
</tr>
<tr>
<td></td>
<td>Enters a progress message every n rows during data maintenance.</td>
</tr>
<tr>
<td></td>
<td>• 5: ALLOW_ERRORS: Displays logging errors, which are initially turned off to allow processing to proceed.</td>
</tr>
</tbody>
</table>

| `value`        | The new value of `log_parameter`. |

Examples

This PL/SQL procedure sets the two parameters, then uses the `GET_PARAMETER` function to show the settings:

```plsql
BEGIN
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 1, 150);
    dbms_cube_log.set_parameter(dbms_cube_log.type_rejected_records, 2, 5);
    dbms_output.put_line('Max rejected records: ' ||
                            dbms_cube_log.get_parameter(dbms_cube_log.type_rejected_records, 1));
END;
```
The procedure displays this information:

Max rejected records: 150
Buffer time: 5 seconds

42.2.15 TABLE_CREATE Procedure

This procedure creates the table targets for the OLAP logs. You must have the `CREATE TABLE` privilege to use this procedure.

`TABLE_CREATE` also upgrades existing log tables to the current version while preserving the data.

Syntax

```sql
DBMS_CUBE_LOG.TABLE_CREATE (
    LOG_TYPE IN BINARY_INTEGER DEFAULT,
    TBLNAME IN VARCHAR2 DEFAULT );
```

Parameters

Table 42-9  TABLE_CREATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_type</td>
<td>One of the following log types:</td>
</tr>
<tr>
<td></td>
<td>• 1: TYPE_OPERATIONS</td>
</tr>
<tr>
<td></td>
<td>• 2: TYPE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• 3: TYPE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• 4: TYPE_BUILD</td>
</tr>
<tr>
<td></td>
<td>See &quot;Logging Types&quot;.</td>
</tr>
<tr>
<td>tblname</td>
<td>A table name for the log. These are the default names:</td>
</tr>
<tr>
<td></td>
<td>• CUBE_OPERATIONS_LOG</td>
</tr>
<tr>
<td></td>
<td>• CUBE_REJECTED_RECORDS</td>
</tr>
<tr>
<td></td>
<td>• CUBE_DIMENSION_COMPILE</td>
</tr>
<tr>
<td></td>
<td>• CUBE_BUILD_LOG</td>
</tr>
</tbody>
</table>

Examples

This example creates a Cube Operations log table named `CUBE_OPERATIONS_LOG`:

EXECUTE dbms_cube_log.table_create;

This example creates a Cube Rejected Records log table named `CUBE_REJECTED_RECORDS`:

EXECUTE dbms_cube_log.table_create(dbms_cube_log.type_rejected_records);

The next example creates a Cube Build log table named `MY_BUILD_LOG`:
EXECUTE dbms_cube_log.table_create -
(dbms_cube_log.type_build, 'MY_BUILD_LOG');

42.2.16 TARGET_FILE Function

This function returns the integer value of a file target in DBMS_CUBE_LOG subprograms.

Syntax

DBMS_CUBE_LOG.TARGET_FILE ()
RETURN BINARY_INTEGER;

Returns

3

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log file:

EXECUTE dbms_cube_log.disable -
(dbms_cube_log.type_operations, dbms_cube_log.target_file);

42.2.17 TARGET_LOB Function

This function returns the integer value of a LOB target.

Syntax

DBMS_CUBE_LOG.TARGET_LOB ()
RETURN BINARY_INTEGER;

Returns

4

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_LEVEL parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log LOB:

EXECUTE dbms_cube_log.disable -
(dbms_cube_log.type_operations, dbms_cube_log.target_lob);
42.2.18 TARGET_TABLE Function

This function returns the integer value of a table target.

Syntax

DBMS_CUBE_LOG.TARGET_TABLE ()
RETURN BINARY_INTEGER;

Returns

1

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log table:
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_table);

42.2.19 TARGET_TRACE Function

This function returns the integer value of a trace file target.

Syntax

DBMS_CUBE_LOG.TARGET_TRACE ()
RETURN BINARY_INTEGER;

Returns

2

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TARGET parameter in DBMS_CUBE_LOG subprograms. See "Logging Targets".

Example

This command disables the Cube Operations log trace file:
EXECUTE dbms_cube_log.disable -
    (dbms_cube_log.type_operations, dbms_cube_log.target_trace);

42.2.20 TYPE_BUILD Function

This function returns the integer value of the Cube Build log.

Syntax

DBMS_CUBE_LOG.TYPE_BUILD ()
RETURN BINARY_INTEGER;
42.2.21 TYPE_DIMENSION_COMPILE Function

This function returns the integer value of the Cube Dimension Compile log.

Syntax

```
DBMS_CUBE_LOG.TYPE_DIMENSION_COMPILE ()
    RETURN BINARY_INTEGER;
```

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Dimension Compile log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_dimension_compile) "Log Name" -
    FROM dual;
```

Log Name
----------
CUBE_DIMENSION_COMPILE

42.2.22 TYPE_OPERATIONS Function

This function returns the integer value of the Cube Operations log.

Syntax

```
DBMS_CUBE_LOG.TYPE_OPERATIONS ()
    RETURN BINARY_INTEGER;
```

Usage Notes

Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example

This query returns the default name of a Cube Operations log:

```
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" -
    FROM dual;
```

Log Name
----------
CUBE_OPERATIONS
Returns
1

Usage Notes
Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example
This query returns the default name of a Cube Dimension Compile log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_operations) "Log Name" FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------------------------</td>
</tr>
<tr>
<td>CUBE_OPERATIONS_LOG</td>
</tr>
</tbody>
</table>

### 42.2.23 TYPE_REJECTED_RECORDS Function

This function returns the integer value of the cube Cube Rejected Records log.

**Syntax**

```sql
DBMS_CUBE_LOG.TYPE_REJECTED_RECORDS ()
    RETURN BINARY_INTEGER;
```

Returns
2

Usage Notes
Use this function instead of its binary integer equivalent for the LOG_TYPE parameter in DBMS_CUBE_LOG subprograms. See "Logging Types".

Example
This query returns the default name of a Cube Rejected Records log:

```sql
SELECT dbms_cube_log.default_name(dbms_cube_log.type_rejected_records) "Log Name" FROM dual;
```

<table>
<thead>
<tr>
<th>Log Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>-------------------------------</td>
</tr>
<tr>
<td>CUBE_REJECTED_RECORDS</td>
</tr>
</tbody>
</table>

### 42.2.24 VERSION Function

This function returns the version number of a specific log table or the current version number of a specific log type.

**Syntax**

```sql
DBMS_CUBE_LOG.VERSION (LOG_TYPE IN BINARY_INTEGER DEFAULT 1,
```

Returns

A version number

Examples

This example returns the current version of the Cube Operations log:

```sql
SELECT dbms_cube_log.version FROM dual;
```

```
VERSION
---------
  2
```

This example returns the version number of an existing Cube Rejected Records log named CUBE_REJECTED_RECORDS.

```sql
SELECT dbms_cube_log.version(dbms_cube_log.type_rejected_records, -
  'CUBE_REJECTED_RECORDS') version FROM dual;
```

```
VERSION
---------
  2
```
The `DBMS_DATA_MINING` package is the application programming interface for creating, evaluating, and querying data mining models.

This chapter contains the following topics:

- Overview
- Security Model
- Mining Functions
- Model Settings
- Datatypes
- Summary of `DBMS_DATA_MINING` Subprograms

See Also:

- Oracle Data Mining Concepts
- Oracle Data Mining User’s Guide
- `DBMS_DATA_MINING_TRANSFORM`
- `DBMS_PREDICTIVE_ANALYTICS`

### 43.1 DBMS_DATA_MINING Overview

Oracle Data Mining supports both supervised and unsupervised data mining. Supervised data mining predicts a target value based on historical data. Unsupervised data mining discovers natural groupings and does not use a target. You can use Oracle Data Mining to mine structured data and unstructured text.

Supervised data mining functions include:

- Classification
- Regression
- Feature Selection (Attribute Importance)

Unsupervised data mining functions include:

- Clustering
- Association
- Feature Extraction
- Anomaly Detection
The steps you use to build and apply a mining model depend on the data mining function and the algorithm being used. The algorithms supported by Oracle Data Mining are listed in Table 43-1.

**Table 43-1  Oracle Data Mining Algorithms**

<table>

</table>

Oracle Data Mining supports more than one algorithm for the classification, regression, clustering, and feature extraction mining functions. Each of these mining functions has a default algorithm, as shown in Table 43-2.

## 43.2 DBMS_DATA_MINING Security Model

The **DBMS_DATA_MINING** package is owned by user **SYS** and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The **DBMS_DATA_MINING** package exposes APIs that are leveraged by the Oracle Data Mining component of the Advanced Analytics Option. Users who wish to create mining models in their own schema require the **CREATE MINING MODEL** system privilege. Users who wish to create mining models in other schemas require the **CREATE ANY MINING MODEL** system privilege.
Users have full control over managing models that exist within their own schema. Additional system privileges necessary for managing data mining models in other schemas include `ALTER ANY MINING MODEL`, `DROP ANY MINING MODEL`, `SELECT ANY MINING MODEL`, `COMMENT ANY MINING MODEL`, and `AUDIT ANY`.

Individual object privileges on mining models, `ALTER MINING MODEL` and `SELECT MINING MODEL`, can be used to selectively grant privileges on a model to a different user.

See Also:

*Oracle Data Mining User's Guide* for more information about the security features of Oracle Data Mining

### 43.3 DBMS_DATA_MINING — Mining Functions

A data mining function refers to the methods for solving a given class of data mining problems.

The mining function must be specified when a model is created. (See `CREATE_MODEL` Procedure.)

#### Table 43-3 Mining Functions

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSOCIATION</td>
<td>Association is a descriptive mining function. An association model identifies relationships and the probability of their occurrence within a data set. Association models use the Apriori algorithm.</td>
</tr>
<tr>
<td>ATTRIBUTE_IMPORTANCE</td>
<td>Attribute importance is a predictive mining function, also known as feature selection. An attribute importance model identifies the relative importance of an attribute in predicting a given outcome. Attribute importance models use Minimum Description Length.</td>
</tr>
<tr>
<td>CLASSIFICATION</td>
<td>Classification is a predictive mining function. A classification model uses historical data to predict a categorical target. Classification models can use: Naive Bayes, Decision Tree, Logistic Regression, or Support Vector Machine. The default is Naive Bayes. The classification function can also be used for anomaly detection. In this case, the SVM algorithm with a null target is used (One-Class SVM).</td>
</tr>
<tr>
<td>CLUSTERING</td>
<td>Clustering is a descriptive mining function. A clustering model identifies natural groupings within a data set. Clustering models can use k-Means, O-Cluster, or Expectation Maximization. The default is k-Means.</td>
</tr>
</tbody>
</table>
Table 43-3  (Cont.) Mining Functions

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_EXTRACTION</td>
<td>Feature Extraction is a descriptive mining function. A feature extraction model creates an optimized data set on which to base a model. Feature extraction models can use Explicit Semantic Analysis, Non-Negative Matrix Factorization, Singular Value Decomposition, or Principal Component Analysis. Non-Negative Matrix Factorization is the default.</td>
</tr>
<tr>
<td>REGRESSION</td>
<td>Regression is a predictive mining function. A regression model uses historical data to predict a numerical target. Regression models can use Support Vector Machine or Linear Regression. The default is Support Vector Machine.</td>
</tr>
</tbody>
</table>

See Also:

*Oracle Data Mining Concepts* for more information about mining functions

43.4 DBMS_DATA_MINING — Model Settings

Oracle Data Mining uses settings to specify the algorithm and other characteristics of a model. Some settings are general, some are specific to a mining function, and some are specific to an algorithm.

All settings have default values. If you want to override one or more of the settings for a model, you must create a settings table. The settings table must have the column names and datatypes shown in the following table.

Table 43-4  Required Columns in the Model Settings Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>SETTING_NAME</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SETTING_VALUE</td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

The information you provide in the settings table is used by the model at build time. The name of the settings table is an optional argument to the `CREATE_MODEL Procedure`.

You can find the settings used by a model by querying the data dictionary view `ALL_MINING_MODEL_SETTINGS`. This view lists the model settings used by the mining models to which you have access. All the setting values are included in the view, whether default or user-specified.
43.4.1 DBMS_DATA_MINING — Algorithm Names

The ALGO_NAME setting specifies the model algorithm. The values for the ALGO_NAME setting are listed in the following table.

<table>
<thead>
<tr>
<th>ALGO_NAME Value</th>
<th>Description</th>
<th>Mining Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALGO_AI_MDL</td>
<td>Minimum Description Length</td>
<td>Attribute Importance</td>
</tr>
<tr>
<td>ALGO_APRIORI_ASSOCIATION_RULES</td>
<td>Apriori</td>
<td>Association Rules</td>
</tr>
<tr>

<td>Singular Value Decomposition</td>
<td>Feature Extraction</td>
</tr>
<tr>
<td>ALGO_SUPPORT VECTOR MACHINES</td>
<td>Support Vector Machine</td>
<td>Classification and Regression</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Mining Concepts for information about algorithms

43.4.2 DBMS_DATA_MINING — Automatic Data Preparation

Oracle Data Mining supports fully Automatic Data Preparation (ADP), user-directed general data preparation, and user-specified embedded data preparation. The PREP_*
settings enable the user to request fully automated or user-directed general data preparation. By default, fully Automatic Data Preparation (PREP_AUTO_ON) is enabled.

When you enable Automatic Data Preparation, the model uses heuristics to transform the build data according to the requirements of the algorithm. Instead of fully Automatic Data Preparation, the user can request that the data be shifted and/or scaled with the PREP_SCALE* and PREP_SHIFT* settings. The transformation instructions are stored with the model and reused whenever the model is applied. Refer to Model Detail Views, Oracle Data Mining User’s Guide.

You can choose to supplement Automatic Data Preparations by specifying additional transformations in the xform_list parameter when you build the model. (See "CREATE_MODEL Procedure").

If you do not use Automatic Data Preparation and do not specify transformations in the xform_list parameter to CREATE_MODEL, you must implement your own transformations separately in the build, test, and scoring data. You must take special care to implement the exact same transformations in each data set.

If you do not use Automatic Data Preparation, but you do specify transformations in the xform_list parameter to CREATE_MODEL, Oracle Data Mining embeds the transformation definitions in the model and prepares the test and scoring data to match the build data.

The values for the PREP_* setting are described in the following table.

### Table 43-6  PREP_* Setting

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| PREP_AUTO    | • PREP_AUTO_ON  
|               | • PREP_AUTO_OFF | This setting enables fully automated data preparation. The default is PREP_AUTO_ON. |
| PREP_SCALE_2DNUM | • PREP_SCALE_STDDEV  
|               | • PREP_SCALE_RANGE | This setting enables scaling data preparation for two-dimensional numeric columns. PREP_AUTO must be OFF for this setting to take effect. The following are the possible values: |
|               |               | • PREP_SCALE_STDDEV: A request to divide the column values by the standard deviation of the column and is often provided together with PREP_SHIFT_MEAN to yield z-score normalization. |
|               |               | • PREP_SCALE_RANGE: A request to divide the column values by the range of values and is often provided together with PREP_SHIFT_MIN to yield a range of [0,1]. |
| PREP_SCALE_NNUM | PREP_SCALE_MAXABS | This setting enables scaling data preparation for nested numeric columns. PREP_AUTO must be OFF for this setting to take effect. If specified, then the valid value for this setting is PREP_SCALE_MAXABS, which yields data in the range of [-1,1]. |
### Table 43-6  (Cont.) PREP_* Setting

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PREP_SHIFT_2DNUM</td>
<td>• PREP_SHIFT_MEAN</td>
<td>This setting enables centering data preparation for two-dimensional numeric columns. PREP_AUTO must be OFF for this setting to take effect. The following are the possible values:</td>
</tr>
<tr>
<td></td>
<td>• PREP_SHIFT_MIN</td>
<td>• PREP_SHIFT_MEAN: Results in subtracting the average of the column from each value.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PREP_SHIFT_MIN: Results in subtracting the minimum of the column from each value.</td>
</tr>
</tbody>
</table>

*Oracle Data Mining User's Guide* for information about data transformations

### 43.4.3 DBMS_DATA_MINING — Mining Function Settings

The settings described in this table apply to a mining function.

#### Table 43-7  Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASSO_MAX_RULE_LENGTH</td>
<td>TO_CHAR( 2&lt;= numeric_expr &lt;=20)</td>
<td>Maximum rule length for Association Rules. Default is 4.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_CONFIDENCE</td>
<td>TO_CHAR( 0&lt;= numeric_expr &lt;=1)</td>
<td>Minimum confidence for Association Rules. Default is 0.1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_SUPPORT</td>
<td>TO_CHAR( 0&lt;= numeric_expr &lt;=1)</td>
<td>Minimum support for Association Rules. Default is 0.1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_SUPPORT_INT</td>
<td>TO_CHAR( 0&lt;= numeric_expr &lt;=1)</td>
<td>Minimum absolute support that each rule must satisfy. The value must be an integer. Default is 1.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_MIN_REV_CONFIDENCE</td>
<td>TO_CHAR( 0&lt;= numeric_expr &lt;=1)</td>
<td>Sets the Minimum Reverse Confidence that each rule should satisfy. The Reverse Confidence of a rule is defined as the number of transactions in which the rule occurs divided by the number of transactions in which the consequent occurs. The value is real number between 0 and 1. The default is 0.</td>
</tr>
<tr>
<td>Mining Function</td>
<td>Setting Name</td>
<td>Setting Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------------</td>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules applied for each association rule: it specifies the list of items that at least one of them must appear in each reported association rule, either as antecedent or as consequent. It is a comma separated string containing the list of including items. If not set, the default behavior is, the filtering is not applied.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules applied for each association rule: it specifies the list of items that none of them can appear in each reported Association Rules. It is a comma separated string containing the list of excluding items. No rule can contain any item in the list. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_ANT_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules for the antecedent: it specifies the list of items that at least one of them must appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of including items. The antecedent part of each rule must contain at least one item in the list. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_ANT_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules for the antecedent: it specifies the list of items that none of them can appear in the antecedent part of each reported association rule. It is a comma separated string containing the list of excluding items. No rule can contain any item in the list in its antecedent part. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_CONS_IN_RULES</td>
<td>NULL</td>
<td>Sets Including Rules for the consequent: it specifies the list of items that at least one of them must appear in the consequent part of each reported association rule. It is a comma separated string containing the list of including items. The consequent of each rule must be an item in the list. The default is NULL.</td>
</tr>
<tr>
<td>Association</td>
<td>ASSO_CONS_EX_RULES</td>
<td>NULL</td>
<td>Sets Excluding Rules for the consequent: it specifies the list of items that none of them can appear in the consequent part of each reported association rule. It is a comma separated string containing the list of excluding items. No rule can have any item in the list as its consequent. The excluding rule can be used to reduce the data that must be stored, but the user may be required to build extra model for executing different including or Excluding Rules. The default is NULL.</td>
</tr>
</tbody>
</table>
### Table 43-7 (Cont.) Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Association</td>
<td>ASSO_AGGREGATES</td>
<td>NULL</td>
<td>Specifies the columns to be aggregated. It is a comma separated string containing the names of the columns for aggregation. Number of columns in the list must be &lt;= 10. You can set ASSO_AGGREGATES if ODMS_ITEM_ID_COLUMN_NAME is set indicating transactional input data. See DBMS_DATA_MINING - Global Settings. The data table must have valid column names such as ITEM_ID and CASE_ID which are derived from ODMS_ITEM_ID_COLUMN_NAME and case_id_column_name respectively. ITEM_VALUE is not a mandatory value. The default is NULL. For each item, the user may supply several columns to aggregate. It requires more memory to buffer the extra data. Also, the performance impact can be seen because of the larger input data set and more operation.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_COST_TABLE_NAME</td>
<td>table_name</td>
<td>(Decision Tree only) Name of a table that stores a cost matrix to be used by the algorithm in building the model. The cost matrix specifies the costs associated with misclassifications. Only Decision Tree models can use a cost matrix at build time. All classification algorithms can use a cost matrix at apply time. The cost matrix table is user-created. See &quot;ADD_COST_MATRIX Procedure&quot; for the column requirements. See Oracle Data Mining Concepts for information about costs.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_PRIORS_TABLE_NAME</td>
<td>table_name</td>
<td>(Naive Bayes) Name of a table that stores prior probabilities to offset differences in distribution between the build data and the scoring data. The priors table is user-created. See Oracle Data Mining User's Guide for the column requirements. See Oracle Data Mining Concepts for additional information about priors.</td>
</tr>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_TABLE_NAME</td>
<td>table_name</td>
<td>(GLM and SVM only) Name of a table that stores weighting information for individual target values in SVM classification and GLM logistic regression models. The weights are used by the algorithm to bias the model in favor of higher weighted classes. The class weights table is user-created. See Oracle Data Mining User's Guide for the column requirements. See Oracle Data Mining Concepts for additional information about class weights.</td>
</tr>
</tbody>
</table>
### Table 43-7  (Cont.) Mining Function Settings

<table>
<thead>
<tr>
<th>Mining Function</th>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Classification</td>
<td>CLAS_WEIGHTS_BALANCED</td>
<td>ON/ OFF</td>
<td>This setting indicates that the algorithm must create a model that balances the target distribution. This setting is most relevant in the presence of rare targets, as balancing the distribution may enable better average accuracy (average of per-class accuracy) instead of overall accuracy (which favors the dominant class). The default value is OFF.</td>
</tr>
<tr>
<td>Clustering</td>
<td>CLUS_NUM_CLUSTERS</td>
<td>TO_CHAR( numeric_expr &gt;=1)</td>
<td>Maximum number of leaf clusters generated by a clustering algorithm. The algorithm may return fewer clusters, depending on the data. Enhanced k-Means usually produces the exact number of clusters specified by CLUS_NUM_CLUSTERS, unless there are fewer distinct data points. Expectation Maximization (EM) may return fewer clusters than the number specified by CLUS_NUM_CLUSTERS depending on the data. The number of clusters returned by EM cannot be greater than the number of components, which is governed by algorithm-specific settings. (See Expectation Maximization Settings for Learning table) Depending on these settings, there may be fewer clusters than components. If component clustering is disabled, the number of clusters equals the number of components. For EM, the default value of CLUS_NUM_CLUSTERS is system-determined. For k-Means and O-Cluster, the default is 10.</td>
</tr>
<tr>
<td>Feature Extraction</td>
<td>FEAT_NUM_FEATURES</td>
<td>TO_CHAR( numeric_expr &gt;=1)</td>
<td>Number of features to be extracted by a feature extraction model. The default is estimated from the data by the algorithm. If the matrix rank is smaller than this number, fewer features will be returned.</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Data Mining Concepts* for information about mining functions

### 43.4.4 DBMS_DATA_MINING — Global Settings

The configuration settings in this table are applicable to any type of model, but are currently only implemented for specific algorithms.
### Table 43-8  Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| ODMS_ITEM_ID_COLUMN_NAME           | column_name       | (Association Rules only) Name of a column that contains the items in a transaction. When this setting is specified, the algorithm expects the data to be presented in native transactional format, consisting of two columns:  
  • Case ID, either categorical or numeric  
  • Item ID, either categorical or numeric  
  A typical example of transactional data is market basket data, wherein a case represents a basket that may contain many items. Each item is stored in a separate row, and many rows may be needed to represent a case. The case ID values do not uniquely identify each row. Transactional data is also called multi-record case data.  
  Association Rules is normally used with transactional data, but it can also be applied to single-record case data (similar to other algorithms).  
  For more information about single-record and multi-record case data, see Oracle Data Mining User’s Guide. |
| ODMS_ITEM_VALUE_COLUMN_NAME        | column_name       | (Association Rules only) Name of a column that contains a value associated with each item in a transaction. This setting is only used when a value has been specified for ODMS_ITEM_ID_COLUMN_NAME indicating that the data is presented in native transactional format.  
  If ASSO_AGGREGATES is used, then the build data must include the following three columns and the columns specified in the AGGREGATES setting:  
  • Case ID, either categorical or numeric  
  • Item ID, either categorical or numeric, specified by ODMS_ITEM_ID_COLUMN_NAME  
  • Item value, either categorical or numeric, specified by ODMS_ITEM_VALUE_COLUMN_NAME  
  If ASSO_AGGREGATES, Case ID, and Item ID column are present, then the Item Value column may or may not appear.  
  The Item Value column may specify information such as the number of items (for example, three apples) or the type of the item (for example, macintosh apples).  
  For details on ASSO_AGGREGATES, see DBMS_DATA_MINING - Mining Function Settings. |
### Table 43-8  (Cont.) Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODMS_MISSING_VALUE_TREATMENT</td>
<td>ODMS_MISSING_VALUE_MEAN_MODE</td>
<td>Indicates how to treat missing values in the training data. This setting does not affect the scoring data. The default value is ODMS_MISSING_VALUE_AUTO.</td>
</tr>
<tr>
<td></td>
<td>ODMS_MISSING_VALUE_DELETE_ROW</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ODMS_MISSING_VALUE_AUTO</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Indicates how to treat missing values in the training data. This setting does not affect the scoring data.</strong> The default value is ODMS_MISSING_VALUE_AUTO.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>ODMS_MISSING_VALUE_MEAN_MODE replaces missing values with the mean (numeric attributes) or the mode (categorical attributes) both at build time and apply time where appropriate. ODMS_MISSING_VALUE_AUTO performs different strategies for different algorithms.</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>When ODMS_MISSING_VALUE_TREATMENT is set to ODMS_MISSING_VALUE_DELETE_ROW, the rows in the training data that contain missing values are deleted. However, if you want to replicate this missing value treatment in the scoring data, then you must perform the transformation explicitly.</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>The value ODMS_MISSING_VALUE_DELETE_ROW is applicable to all algorithms.</strong></td>
</tr>
<tr>
<td>ODMS_ROW_WEIGHT_COLUMN_NAME</td>
<td>column_name</td>
<td>(GLM only) Name of a column in the training data that contains a weighting factor for the rows. The column datatype must be NUMBER. Row weights can be used as a compact representation of repeated rows, as in the design of experiments where a specific configuration is repeated several times. Row weights can also be used to emphasize certain rows during model construction. For example, to bias the model towards rows that are more recent and away from potentially obsolete data.</td>
</tr>
<tr>
<td>ODMS_TEXT_POLICY_NAME</td>
<td>The name of an Oracle Text POLICY created using CTX_DDL.CREATE_POLICY.</td>
<td>Affects how individual tokens are extracted from unstructured text. For details about CTX_DDL.CREATE_POLICY, see Oracle Text Reference.</td>
</tr>
<tr>
<td>ODMS_TEXT_MAX_FEATURES</td>
<td>1 &lt;= value</td>
<td>Maximum number of distinct features, across all text attributes, to use from a document set passed to CREATE_MODEL. The default is 3000. ESA has the default value of 300000.</td>
</tr>
<tr>
<td>ODMS_TEXT_MIN_DOCUMENTS</td>
<td>Non-negative value</td>
<td>This is a text processing setting the controls how in how many documents a token needs to appear to be used as a feature. The default is 1. ESA has default of 3.</td>
</tr>
<tr>
<td>ODMS_PARTITION_COLUMNS</td>
<td>Comma separated list of mining attributes</td>
<td>This setting indicates a request to build a partitioned model. The setting value is a comma-separated list of the mining attributes to be used to determine the in-list partition key values. These mining attributes are taken from the input columns, unless an XFORM_LIST parameter is passed to CREATE_MODEL. If XFORM_LIST parameter is passed to CREATE_MODEL, then the mining attributes are taken from the attributes produced by these transformations.</td>
</tr>
<tr>
<td>ODMS_MAX_PARTITIONS</td>
<td>1 &lt;= 1000000</td>
<td>New setting that indicates the maximum number of partitions allowed for the model. Default is 1000.</td>
</tr>
</tbody>
</table>
Table 43-8 (Cont.) Global Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

43.4.5 DBMS_DATA_MINING — Algorithm Settings: ALGO_EXTENSIBLE_LANG

The settings listed in the following table configure the behavior of the mining model with an Extensible algorithm. The mining model is built in R language.

The `RALG_.*_FUNCTION` specifies the R script that is used to build, score, and view R model and must be registered in ORACLR Script repository. The R scripts are registered through Oracle Enterprise R product with special privilege. When `ALGO_EXTENSIBLE_LANG` is set to R in the `MINING_MODEL_SETTING` table, the mining model is built in the R language. After the R model is built, the names of the R scripts are recorded in `MINING_MODEL_SETTING` table in the `SYS` schema. The scripts must exist in the repository for the R model to function. The amount of R memory used to build, score, and view the R model through these R scripts can be controlled by Oracle Enterprise R.
All algorithm-independent DBMS_DATA_MINING subprograms can operate on the R model for mining functions such as Association, Attribute Importance, Classification, Clustering, Feature Extraction, and Regression.

The supported DBMS_DATA_MINING subprograms include, but are not limited, to the following:

- ADD_COST_MATRIX Procedure
- COMPUTE_CONFUSION_MATRIX Procedure
- COMPUTE_LIFT Procedure
- COMPUTE_ROC Procedure
- CREATE_MODEL Procedure
- DROP_MODEL Procedure
- EXPORT_MODEL Procedure
- GET_MODEL_COST_MATRIX Function
- IMPORT_MODEL Procedure
- REMOVE_COST_MATRIX Procedure
- RENAME_MODEL Procedure

43.4.6 DBMS_DATA_MINING — Algorithm Settings: Decision Tree

These settings configure the behavior of the Decision Tree algorithm.

Table 43-10 Decision Tree Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TREE_IMPURITY_METRIC</td>
<td>TREE_IMPURITY_ENTROPY</td>
<td>Tree impurity metric for Decision Tree. Tree algorithms seek the best test question for splitting data at each node. The best splitter and split value are those that result in the largest increase in target value homogeneity (purity) for the entities in the node. Purity is measured in accordance with a metric. Decision trees can use either gini (TREE_IMPURITY_GINI) or entropy (TREE_IMPURITY_ENTROPY) as the purity metric. By default, the algorithm uses TREE_IMPURITY_GINI.</td>
</tr>
<tr>
<td>TREE_TERM_MAX_DEPTH</td>
<td>TO_CHAR( 2&lt;= numeric_expr &lt;=20)</td>
<td>Criteria for splits: maximum tree depth (the maximum number of nodes between the root and any leaf node, including the leaf node). Default is 7.</td>
</tr>
<tr>
<td>TREE_TERM_MINPCT_NODE</td>
<td>TO_CHAR( 0&lt;= numeric_expr &lt;=10)</td>
<td>No child shall have fewer records than this number, which is expressed as a percentage of the training rows. Default is 0.05, indicating 0.05%.</td>
</tr>
</tbody>
</table>
Table 43-10  (Cont.) Decision Tree Settings

<table>

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_ATTRIBUTE_FILTER</td>
<td>EMCS_ATTR_FILTER_ENABLE, EMCS_ATTR_FILTER_DISABLE</td>
<td>Whether or not to include uncorrelated attributes in the model. When EMCS_ATTRIBUTE_FILTER is enabled, uncorrelated attributes are not included.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> This setting applies only to attributes that are not nested.</td>
</tr>
<tr>
<td>EMCS_MAX_NUM_ATTR_2D</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Maximum number of correlated attributes to include in the model. Note: This setting applies only to attributes that are not nested (2D). Default is 50.</td>
</tr>
<tr>
<td>EMCS_NUM_DISTRIBUTION</td>
<td>EMCS_NUM_DISTR_BERNOULLI, EMCS_NUM_DISTR_GAUSSIAN, EMCS_NUM_DISTR_SYSTEM</td>
<td>The distribution for modeling numeric attributes. Applies to the input table or view as a whole and does not allow per-attribute specifications. The options include Bernoulli, Gaussian, or system-determined distribution. When the distribution is system-determined, individual attributes may use different distributions (either Bernoulli or Gaussian), depending on the data. Default is EMCS_NUM_DISTR_SYSTEM.</td>
</tr>
<tr>
<td>EMCS_NUM_EQUIWIDTH_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Number of equi-width bins that will be used for gathering cluster statistics for numeric columns. Default is 11.</td>
</tr>
<tr>
<td>EMCS_NUM_PROJECTIONS</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Specifies the number of projections that will be used for each nested column. If a column has fewer distinct attributes than the specified number of projections, the data will not be projected. The setting applies to all nested columns. Default is 50.</td>
</tr>
<tr>
<td>EMCS_NUM_QUANTILE_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Specifies the number of quantile bins that will be used for modeling numeric columns with multivalued Bernoulli distributions. Default is system-determined.</td>
</tr>
<tr>
<td>EMCS_NUM_TOPN_BINS</td>
<td>TO_CHAR(1 &lt; numeric_expr &lt;= 255)</td>
<td>Specifies the number of top-N bins that will be used for modeling categorical columns with multivalued Bernoulli distributions. Default is system-determined.</td>
</tr>
</tbody>

<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CONVERGENCE_CRITERION</td>
<td>EMCS_CONV_CRIT_HELDASIDE</td>
<td>The convergence criterion for EM. The convergence criterion may be based on a held-aside data set, or it may be Bayesian Information Criterion. Default is system determined.</td>
</tr>
<tr>
<td>EMCS_CONV_CRIT_BIC</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EMCS_LOGLIKE_IMPROVEMENT</td>
<td>TO_CHAR( 0 &lt; numeric_expr &lt; 1)</td>
<td>When the convergence criterion is based on a held-aside data set (EMCS_CONVERGENCE_CRITERION = EMCS_CONV_CRIT_HELDASIDE), this setting specifies the percentage improvement in the value of the log likelihood function that is required for adding a new component to the model. Default value is 0.001.</td>
</tr>
<tr>
<td>EMCS_NUM_COMPONENTS</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Maximum number of components in the model. If model search is enabled, the algorithm automatically determines the number of components based on improvements in the likelihood function or based on regularization, up to the specified maximum. The number of components must be greater than or equal to the number of clusters. Default is 20.</td>
</tr>
<tr>
<td>EMCS_NUM_ITERATIONS</td>
<td>TO_CHAR(numeric_expr &gt;=1)</td>
<td>Specifies the maximum number of iterations in the EM algorithm. Default is 100.</td>
</tr>
<tr>
<td>EMCS_MODEL_SEARCH</td>
<td>EMCS_MODEL_SEARCH_ENABLE</td>
<td>This setting enables model search in EM where different model sizes are explored and a best size is selected. The default is EMCS_MODEL_SEARCH_DISABLE.</td>
</tr>
<tr>
<td></td>
<td>EMCS_MODEL_SEARCH_DISABLE</td>
<td></td>
</tr>
<tr>
<td>EMCS_REMOVE_COMPONENTS</td>
<td>EMCS_REMOVE_COMPS_ENABLE (default)</td>
<td>This setting allows the EM algorithm to remove a small component from the solution. The default is EMCS_REMOVE_COMPS_ENABLE.</td>
</tr>
<tr>
<td></td>
<td>EMCS_REMOVE_COMPS_DISABLE</td>
<td></td>
</tr>
<tr>
<td>EMCS_RANDOM_SEED</td>
<td>Non-negative integer</td>
<td>This setting controls the seed of the random generator used in EM. The default is 0.</td>
</tr>
</tbody>
</table>

### Table 43-13  Expectation Maximization Settings for Component Clustering

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMCS_CLUSTER_COMPONENTS</td>
<td>EMCS_CLUSTER_COMP_ENABLE EMCS_CLUSTER_COMP_DISABLE</td>
<td>Enables or disables the grouping of EM components into high-level clusters. When disabled, the components themselves are treated as clusters. When component clustering is enabled, model scoring through the SQL CLUSTER function will produce assignments to the higher level clusters. When clustering is disabled, the CLUSTER function will produce assignments to the original components. Default is EMCS_CLUSTER_COMP_ENABLE.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Table 43-13  (Cont.) Expectation Maximization Settings for Component Clustering

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>EMCS_CLUSTER_THRESH</strong></td>
<td>TO_CHAR(numeric_expr &gt;= 1)</td>
<td>Dissimilarity threshold that controls the clustering of EM components. When the dissimilarity measure is less than the threshold, the components are combined into a single cluster. A lower threshold may produce more clusters that are more compact. A higher threshold may produce fewer clusters that are more spread out. Default is 2.</td>
</tr>
<tr>
<td><strong>EMCS_LINKAGE_FUNCTION</strong></td>
<td>[EMCS_LINKAGE_SINGLE, EMCS_LINKAGE_AVERAGE, EMCS_LINKAGE_COMPLETE]</td>
<td>Allows the specification of a linkage function for the agglomerative clustering step. EMCS_LINKAGE_SINGLE uses the nearest distance within the branch. The clusters tend to be larger and have arbitrary shapes. EMCS_LINKAGE_AVERAGE uses the average distance within the branch. There is less chaining effect and the clusters are more compact. EMCS_LINKAGE_COMPLETE uses the maximum distance within the branch. The clusters are smaller and require strong component overlap. Default is EMCS_LINKAGE_SINGLE.</td>
</tr>
</tbody>
</table>

</thead>
<tbody>
<tr>
<td><strong>EMCS_CLUSTER_STATISTICS</strong></td>
<td>[EMCS_CLUS_STATS_ENABLE, EMCS_CLUS_STATS_DISABLE]</td>
<td>Enables or disables the gathering of descriptive statistics for clusters (centroids, histograms, and rules). When statistics are disabled, model size is reduced, and GET_MODEL_DETAILS_EM only returns taxonomy (hierarchy) and cluster counts. Default is EMCS_CLUS_STATS_ENABLE.</td>
</tr>
<tr>
<td><strong>EMCS_MIN_PCT_ATTR_SUPPORT</strong></td>
<td>TO_CHAR(0 &lt; numeric_expr &lt; 1)</td>
<td>Minimum support required for including an attribute in the cluster rule. The support is the percentage of the data rows assigned to a cluster that must have non-null values for the attribute. Default is 0.1.</td>
</tr>
</tbody>
</table>

### 43.4.8 DBMS_DATA_MINING — Algorithm Settings: Explicit Semantic Analysis

Explicit Semantic Analysis (ESA) is a useful technique for extracting meaningful and interpretable features.

The settings listed in the following table configure the ESA values.
### Table 43-15  Explicit Semantic Analysis Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESAS_VALUE_THRESHOLD</td>
<td>Non-negative number</td>
<td>This setting thresholds a small value for attribute weights in the transformed build data. The default is $1e^{-8}$.</td>
</tr>
<tr>
<td>ESAS_MIN_ITEMS</td>
<td>Text input 100 Non-text input is 0</td>
<td>This setting determines the minimum number of non-zero entries that need to be present in an input row. The default is 100 for text input and 0 for non-text input.</td>
</tr>
<tr>
<td>ESAS_TOPN_FEATURES</td>
<td>A positive integer</td>
<td>This setting controls the maximum number of features per attribute. The default is 1000.</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Data Mining Concepts* for information about Explicit Semantic Analysis.

### 43.4.9 DBMS_DATA_MINING — Algorithm Settings: Generalized Linear Models

The settings listed in the following table configure the behavior of Generalized Linear Models.

### Table 43-16  DBMS_DATA_MINING GLM Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLMS_CONF_LEVEL</td>
<td>TO_CHAR(0&lt; numeric_expr &lt;1)</td>
<td>The confidence level for coefficient confidence intervals. The default confidence level is 0.95.</td>
</tr>
<tr>
<td>GLMS_FTR_GEN_METHOD</td>
<td>GLMS_FTR_GEN_QUADRATIC GLMS_FTR_GEN_CUBIC</td>
<td>Whether feature generation is quadratic or cubic. When feature generation is enabled, the algorithm automatically chooses the most appropriate feature generation method based on the data.</td>
</tr>
<tr>
<td>GLMS_FTR_GENERATION</td>
<td>GLMS_FTR_GENERATION_ENABLE GLMS_FTR_GENERATION_DISABLE</td>
<td>Whether or not feature generation is enabled for GLM. By default, feature generation is not enabled. <strong>Note:</strong> Feature generation can only be enabled when feature selection is also enabled.</td>
</tr>
<tr>
<td>GLMS_FTR_SEL_CRIT</td>
<td>GLMS_FTR_SEL_AIC GLMS_FTR_SEL_SBIC GLMS_FTR_SEL_RIC GLMS_FTR_SEL_ALPHA_INV</td>
<td>Feature selection penalty criterion for adding a feature to the model. When feature selection is enabled, the algorithm automatically chooses the penalty criterion based on the data.</td>
</tr>
</tbody>
</table>
Table 43-16  (Cont.) DBMS_DATA_MINING GLM Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLMS_FTR_SELECTION</td>
<td>GLMS_FTR_SELECTION_ENABLE</td>
<td>Whether or not feature selection is enabled for GLM. By default, feature selection is not enabled.</td>
</tr>
<tr>
<td>GLMS_FTR_SELECTION_DISABLE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>GLMS_MAX_FEATURES</td>
<td>TO_CHAR(0 &lt; numeric_expr &lt;= 2000)</td>
<td>When feature selection is enabled, this setting specifies the maximum number of features that can be selected for the final model. By default, the algorithm limits the number of features to ensure sufficient memory.</td>
</tr>
<tr>
<td>GLMS_PRUNE_MODEL</td>
<td>GLMS_PRUNE_MODEL_ENABLE</td>
<td>Prune enable or disable for features in the final model. Pruning is based on T-Test statistics for linear regression, or Wald Test statistics for logistic regression. Features are pruned in a loop until all features are statistically significant with respect to the full data. When feature selection is enabled, the algorithm automatically performs pruning based on the data.</td>
</tr>
<tr>
<td></td>
<td>GLMS_PRUNE_MODEL_DISABLE</td>
<td></td>
</tr>
<tr>
<td>GLMS_REFERENCE_CLASS_NAME</td>
<td>target_value</td>
<td>The target value used as the reference class in a binary logistic regression model. Probabilities are produced for the other class. By default, the algorithm chooses the value with the highest prevalence (the most cases) for the reference class.</td>
</tr>
<tr>
<td>GLMS_RIDGE_REGRESSION</td>
<td>GLMS_RIDGE_REG_ENABLE</td>
<td>Enable or disable Ridge Regression. Ridge applies to both regression and Classification mining functions. When ridge is enabled, prediction bounds are not produced by the PREDICTION_BOUNDS SQL function.</td>
</tr>
<tr>
<td></td>
<td>GLMS_RIDGE_REG_DISABLE</td>
<td></td>
</tr>
<tr>
<td>GLMS_RIDGE_VALUE</td>
<td>TO_CHAR (numeric_expr &gt; 0)</td>
<td>The value of the ridge parameter. This setting is only used when the algorithm is configured to use Ridge Regression. If Ridge Regression is enabled internally by the algorithm, then the ridge parameter is determined by the algorithm.</td>
</tr>
<tr>
<td>GLMS_ROW_DIAGNOSTICS</td>
<td>GLMS_ROW_DIAG_ENABLE</td>
<td>Enable or disable row diagnostics.</td>
</tr>
<tr>
<td></td>
<td>GLMS_ROW_DIAG_DISABLE</td>
<td>(default).</td>
</tr>
<tr>
<td>GLMS_CONV_TOLERANCE</td>
<td>The range is (0, 1) non-inclusive.</td>
<td>Convergence Tolerance setting of the GLM algorithm The default value is system-determined.</td>
</tr>
<tr>
<td>GLMS_NUM_ITERATIONS</td>
<td>Positive integer</td>
<td>Maximum number of iterations for the GLM algorithm. The default value is system-determined.</td>
</tr>
</tbody>
</table>
Table 43-16  (Cont.) DBMS_DATA_MINING GLM Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLMS_BATCH_ROWS</td>
<td>0 or Positive integer</td>
<td>Number of rows in a batch used by the SGD solver. The value of this parameter sets the size of the batch for the SGD solver. An input of 0 triggers a data driven batch size estimate. The default is 2000.</td>
</tr>
<tr>
<td>GLMS_SOLVER</td>
<td>GLMS_SOLVER_SGD (StochasticGradient Descent) GLMS_SOLVER_CHOL (Cholesky) GLMS_SOLVER_QR</td>
<td>This setting allows the user to choose the GLM solver. The solver cannot be selected if GLMS_FTR_SELECTION setting is enabled. The default value is system determined.</td>
</tr>
<tr>
<td>GLMS_SPARSE_SOLVER</td>
<td>GLMS_SPARSE_SOLVER_ENABLE GLMS_SPARSE_SOLVER_DISABLE (default)</td>
<td>This setting allows the user to use sparse solver if it is available. The default value is GLMS_SPARSE_SOLVER_DISABLE.</td>
</tr>
</tbody>
</table>

Oracle Data Mining Concepts for information about GLM.

43.4.10 DBMS_DATA_MINING — Algorithm Settings: k-Means

The settings listed in the following table configure the behavior of the k-Means algorithm.

Table 43-17  k-Means Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KMNS_CONV_TOLERANCE</td>
<td>TO_CHAR(0&lt;numeric_expr&lt;1)</td>
<td>Minimum Convergence Tolerance for k-Means. The algorithm iterates until the minimum Convergence Tolerance is satisfied or until the maximum number of iterations, specified in KMNS_ITERATIONS, is reached. Decreasing the Convergence Tolerance produces a more accurate solution but may result in longer run times. The default Convergence Tolerance is 0.001.</td>
</tr>
<tr>
<td>KMNS_DISTANCE</td>
<td>KMNS_COSINE KMNS_EUCLIDEAN</td>
<td>Distance function for k-Means. The default distance function is KMNS_EUCLIDEAN.</td>
</tr>
<tr>
<td>Setting Name</td>
<td>Setting Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>KMNS_ITERATIONS</td>
<td>TO_CHAR(positive_numeric_expr)</td>
<td>Maximum number of iterations for k-Means. The algorithm iterates until either the maximum number of iterations is reached or the minimum Convergence Tolerance, specified in KMNS_CONV_TOLERANCE, is satisfied. The default number of iterations is 20.</td>
</tr>
<tr>
<td>KMNS_MIN_PCT_ATTR_SUPP</td>
<td>TO_CHAR(0&lt;=numeric_expr&lt;=1)</td>
<td>Minimum percentage of attribute values that must be non-null in order for the attribute to be included in the rule description for the cluster. If the data is sparse or includes many missing values, a minimum support that is too high can cause very short rules or even empty rules. The default minimum support is 0.1.</td>
</tr>
<tr>
<td>KMNS_NUM_BINS</td>
<td>TO_CHAR(numeric_expr&gt;0)</td>
<td>Number of bins in the attribute histogram produced by k-Means. The bin boundaries for each attribute are computed globally on the entire training data set. The binning method is equi-width. All attributes have the same number of bins with the exception of attributes with a single value that have only one bin. The default number of histogram bins is 11.</td>
</tr>
<tr>
<td>KMNS_SPLIT_CRITERION</td>
<td>KMNS_SIZE KMNS_VARIANCE</td>
<td>Split criterion for k-Means. The split criterion controls the initialization of new k-Means clusters. The algorithm builds a binary tree and adds one new cluster at a time. When the split criterion is based on size, the new cluster is placed in the area where the largest current cluster is located. When the split criterion is based on the variance, the new cluster is placed in the area of the most spread-out cluster. The default split criterion is the KMNS_VARIANCE.</td>
</tr>
<tr>
<td>KMNS_RANDOM_SEED</td>
<td>Non-negative integer</td>
<td>This setting controls the seed of the random generator used during the k-Means initialization. It must be a non-negative integer value. The default is 0.</td>
</tr>
<tr>
<td>KMNSDETAILS</td>
<td>KMNSDETAILS_NONE KMNSDETAILS_HIERARCHY KMNSDETAILS_ALL</td>
<td>This setting determines the level of cluster detail that are computed during the build. KMNSDETAILS_NONE: No cluster details are computed. Only the scoring information is persisted. KMNSDETAILS_HIERARCHY: Cluster hierarchy and cluster record counts are computed. This is the default value. KMNSDETAILS_ALL: Cluster hierarchy, record counts, descriptive statistics (means, variances, modes, histograms, and rules) are computed.</td>
</tr>
</tbody>
</table>

### 43.4.14 DBMS_DATA_MINING — Algorithm Constants and Settings: Singular Value Decomposition

The following constant affects the behavior of the Singular Value Decomposition algorithm.

### Table 43-21  Singular Value Decomposition Constant

<table>
<thead>
<tr>
<th>Constant Name</th>
<th>Constant Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVDS_MAX_NUM_FEATURES</td>
<td>2500</td>
<td>The maximum number of features supported by SVD.</td>
</tr>
</tbody>
</table>

The following settings configure the behavior of the Singular Value Decomposition algorithm.
### Table 43-22  Singular Value Decomposition Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVDS_U_MATRIX_OUTPUT</td>
<td>SVDS_U_MATRIX_ENABLE</td>
<td>Indicates whether or not to persist the U Matrix produced by SVD.</td>
</tr>
<tr>
<td></td>
<td>SVDS_U_MATRIX_DISABLE</td>
<td>The U matrix in SVD has as many rows as the number of rows in the build data. To avoid creating a large model, the U matrix is persisted only when SVDS_U_MATRIX_OUTPUT is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When SVDS_U_MATRIX_OUTPUT is enabled, the build data must include a case ID. If no case ID is present and the U matrix is requested, then an exception is raised.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default is SVDS_U_MATRIX_DISABLE.</td>
</tr>
<tr>
<td>SVDS_SCORING_MODE</td>
<td>SVDS_SCORING_SVD</td>
<td>Whether to use SVD or PCA scoring for the model.</td>
</tr>
<tr>
<td></td>
<td>SVDS_SCORING_PCA</td>
<td>When the build data is scored with SVD, the projections will be the same as the U matrix. When the build data is scored with PCA, the projections will be the product of the U and S matrices.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default is SVDS_SCORING_SVD.</td>
</tr>
<tr>
<td>SVDS_SOLVER</td>
<td>svds_solver_tssvd</td>
<td>This setting indicates the solver to be used for computing SVD of the data. In the case of PCA, the solver setting indicates the type of SVD solver used to compute the PCA for the data. When this setting is not specified the solver type selection is data driven. If the number of attributes is greater than 3240, then the default wide solver is used. Otherwise, the default narrow solver is selected.</td>
</tr>
<tr>
<td></td>
<td>svds_solver_tseigen</td>
<td>The following are the group of solvers:</td>
</tr>
<tr>
<td></td>
<td>svds_solver_ssvd</td>
<td>• Narrow data solvers: for matrices with up to 11500 attributes (TSEIGEN) or up to 8100 attributes (TSSVD).</td>
</tr>
<tr>
<td></td>
<td>svds_solver_steigen</td>
<td>• Wide data solvers: for matrices up to 1 million attributes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For narrow data solvers:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Tall-Skinny SVD uses QR computation TSVD (svds_solver_tssvd)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Tall-Skinny SVD uses eigenvalue computation, TSEIGEN (svds_solver_tseigen), is the default solver for narrow data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For wide data solvers:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Stochastic SVD uses QR computation SSVD (svds_solver_ssvd), is the default solver for wide data solvers.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Stochastic SVD uses eigenvalue computations, STEIGEN (svds_solver_steigen).</td>
</tr>
<tr>
<td>SVDS_TOLERANCE</td>
<td>Range [0, 1]</td>
<td>This setting is used to prune features. Define the minimum value the eigenvalue of a feature as a share of the first eigenvalue to not to prune. Default value is data driven.</td>
</tr>
<tr>
<td>SVDS_RANDOM_SEED</td>
<td>Range [0 - 4,294,967,296]</td>
<td>The random seed value is used for initializing the sampling matrix used by the Stochastic SVD solver. The default is 0. The SVD Solver must be set to SSVD or STEIGEN.</td>
</tr>
<tr>
<td>SVDS_OVER_SAMPLING</td>
<td>Range [1, 5000]</td>
<td>This setting is configures the number of columns in the sampling matrix used by the Stochastic SVD solver. The number of columns in this matrix is equal to the requested number of features plus the oversampling setting. The SVD Solver must be set to SSVD or STEIGEN.</td>
</tr>
</tbody>
</table>
Table 43-22  (Cont.) Singular Value Decomposition Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVDS POWER ITERATION S</td>
<td>S</td>
<td>The power iteration setting improves the accuracy of the SSVD solver. The default is 2. The SVD Solver must be set to SSVD or STEIGEN.</td>
</tr>
</tbody>
</table>

43.4.15 DBMS_DATA_MINING — Algorithm Settings: Support Vector Machine

The settings listed in the following table configure the behavior of the Support Vector Machine algorithm.

Table 43-23  SVM Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVMS COMPLEXITY_FACTOR</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Regularization setting that balances the complexity of the model against model robustness to achieve good generalization on new data. SVM uses a data-driven approach to finding the complexity factor. Value of complexity factor for SVM algorithm (both Classification and Regression). Default value estimated from the data by the algorithm.</td>
</tr>
<tr>
<td>SVMS_CONV_TOLERANCE</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Convergence tolerance for SVM algorithm. Default is 0.0001.</td>
</tr>
<tr>
<td>SVMS_EPSILON</td>
<td>TO_CHAR(numeric_expr &gt;0)</td>
<td>Regularization setting for regression, similar to complexity factor. Epsilon specifies the allowable residuals, or noise, in the data. Value of epsilon factor for SVM regression. Default is 0.1.</td>
</tr>
<tr>
<td>SVMS KERNEL_FUNCTION</td>
<td>svm_gaussian, svms_linear</td>
<td>Kernel for Support Vector Machine. Linear or Gaussian. The algorithm automatically uses the kernel function that is most appropriate to the data. SVM uses the linear kernel when there are many attributes (more than 100) in the training data, otherwise it uses the Gaussian kernel. The number of attributes does not correspond to the number of columns in the training data. SVM explodes categorical attributes to binary, numeric attributes. In addition, Oracle Data Mining interprets each row in a nested column as a separate attribute. The default value is SVMS_LINEAR.</td>
</tr>
</tbody>
</table>
Table 43-23  (Cont.) SVM Settings

<table>
<thead>
<tr>
<th>Setting Name</th>
<th>Setting Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVMS_OUTLIER_RATE</td>
<td>TO_CHAR(0&lt;numeric_expr&lt;1)</td>
<td>The desired rate of outliers in the training data. Valid for One-Class SVM models only (Anomaly Detection). Default is 0.01.</td>
</tr>
<tr>
<td>SVMS_STD_DEV</td>
<td>TO_CHAR(numeric_expr&gt;0)</td>
<td>Controls the spread of the Gaussian kernel function. SVM uses a data-driven approach to find a standard deviation value that is on the same scale as distances between typical cases. Value of standard deviation for SVM algorithm. This is applicable only for Gaussian kernel. Default value estimated from the data by the algorithm.</td>
</tr>
<tr>
<td>SVMS_NUM_ITERATIONS</td>
<td>Positive integer</td>
<td>This setting sets an upper limit on the number of SVM iterations. The default is system determined because it depends on the SVM solver.</td>
</tr>
<tr>
<td>SVMS_NUM_PIVOTS</td>
<td>Range [1; 10000]</td>
<td>This setting sets an upper limit on the number of pivots used in the Incomplete Cholesky decomposition. It can be set only for non-linear kernels. The default value is 200.</td>
</tr>
<tr>
<td>SVMS_BATCH_ROWS</td>
<td>Positive integer</td>
<td>This setting applies to SVM models with linear kernel. This setting sets the size of the batch for the SGD solver. An input of 0 triggers a data driven batch size estimate. The default is 20000.</td>
</tr>
<tr>
<td>SVMS_REGULARIZER</td>
<td>SVMS_REGULARIZER_L1, SVMS_REGULARIZER_L2</td>
<td>This setting controls the type of regularization that the SGD SVM solver uses. The setting can be used only for linear SVM models. The default is system determined because it depends on the potential model size.</td>
</tr>
<tr>
<td>SVMS_SOLVER</td>
<td>SVMS_SOLVER_SGD (Sub-Gradient Descend), SVMS_SOLVER_IPM (Interior Point Method)</td>
<td>This setting allows the user to choose the SVM solver. The SGD solver cannot be selected if the kernel is non-linear. The default value is system determined.</td>
</tr>
</tbody>
</table>

43.5 DBMS_DATA_MINING Datatypes

The DBMS_DATA_MINING package defines object datatypes for storing information about model attributes. Most of these types are returned by the table functions GET_n, where n identifies the type of information to return. These functions take a model name as input and return the requested information as a collection of rows.

For a list of the GET functions, see "Summary of DBMS_DATA_MINING Subprograms".

The DBMS_DATA_MINING package also defines object datatypes for mining transactional data. These types are called DM_NESTED_n, where n identifies the Oracle datatype of the
nested attributes. For more information about mining nested data, see *Oracle Data Mining User's Guide*.

All the table functions use pipelining, which causes each row of output to be materialized as it is read from model storage, without waiting for the generation of the complete table object. For more information on pipelined, parallel table functions, consult the *Oracle Database PL/SQL Language Reference*.

The Data Mining object datatypes are described in the following table:

Table 43-24 DBMS_DATA_MINING Summary of Datatypes

<table>
<thead>
<tr>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_CENTROID</td>
<td>The centroid of a cluster.</td>
</tr>
<tr>
<td>DM_CENTROIDS</td>
<td>A collection of DM_CENTROID. A member of DM_CLUSTER.</td>
</tr>
<tr>
<td>DM_CHILD</td>
<td>A child node of a cluster.</td>
</tr>
<tr>
<td>DM_CHILDREN</td>
<td>A collection of DM_CHILD. A member of DM_CLUSTER.</td>
</tr>
<tr>
<td>DM_CLUSTER</td>
<td>A cluster. A cluster includes DM_PREDICATES, DM_CHILDREN, DM_CENTROIDS, and DM_HISTOGRAMS. It also includes a DM_RULE. See also, Table 43-26.</td>
</tr>
<tr>
<td>DM_CONDITIONAL</td>
<td>The conditional probability of an attribute in a Naive Bayes model.</td>
</tr>
<tr>
<td>DM_CONDITIONALS</td>
<td>A collection of DM_CONDITIONAL. Returned by GET_MODEL_DETAILS_NB Function.</td>
</tr>
<tr>
<td>DM_COST_ELEMENT</td>
<td>The actual and predicted values in a cost matrix.</td>
</tr>
<tr>
<td>DM_COST_MATRIX</td>
<td>A collection of DM_COST_ELEMENT. Returned by GET_MODEL_COST_MATRIX Function.</td>
</tr>
<tr>
<td>DM_EM_COMPONENT</td>
<td>A component of an Expectation Maximization model.</td>
</tr>
<tr>
<td>DM_EM_PROJECTION</td>
<td>A projection of an Expectation Maximization model.</td>
</tr>
<tr>
<td>DM_GLM_COEFF</td>
<td>The coefficient and associated statistics of an attribute in a Generalized Linear Model.</td>
</tr>
<tr>
<td>DM_GLM_COEFF_SET</td>
<td>A collection of DM_GLM_COEFF. Returned by GET_MODEL_DETAILS_GLM Function.</td>
</tr>
<tr>
<td>DM_HISTOGRAM_BIN</td>
<td>A histogram associated with a cluster.</td>
</tr>
<tr>
<td>DM_HISTOGRAMS</td>
<td>A collection of DM_HISTOGRAM_BIN. A member of DM_CLUSTER. See also, Table 43-26.</td>
</tr>
<tr>
<td>DM_ITEM</td>
<td>An item in an association rule.</td>
</tr>
<tr>
<td>DM_ITEMS</td>
<td>A collection of DM_ITEM.</td>
</tr>
</tbody>
</table>
### Table 43-24 (Cont.) DBMS_DATA_MINING Summary of Datatypes

<td>A measure used to quantify whether a set of observed occurrences are dispersed compared to a standard statistical model.</td>
</tr>
</tbody>
</table>
**Table 43-26  (Cont.) DM_CLUSTER Fields**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>split_predicate</td>
<td>The <code>split_predicate</code> column of <code>DM_CLUSTER</code> returns a nested table of type <code>DM_PREDICATES</code>. Each row, of type <code>DM_PREDICATE</code>, has the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), conditional_operator CHAR(2) /<em>, &lt;=</em>/, attribute_num_value NUMBER,</td>
</tr>
<tr>
<td></td>
<td>attribute_str_value VARCHAR2(4000), attribute_support NUMBER, attribute_confidence NUMBER)</td>
</tr>
<tr>
<td></td>
<td>Note: The Expectation Maximization algorithm uses all the fields except <code>dispersion</code> and <code>split_predicate</code>.</td>
</tr>
<tr>
<td>child</td>
<td>The <code>child</code> column of <code>DM_CLUSTER</code> returns a nested table of type <code>DM_CHILDREN</code>. The rows, of type <code>DM_CHILD</code>, have a single column of type <code>NUMBER</code>, which contains the identifiers of each child.</td>
</tr>
<tr>
<td>centroid</td>
<td>The <code>centroid</code> column of <code>DM_CLUSTER</code> returns a nested table of type <code>DM_CENTROIDS</code>. The rows, of type <code>DM_CENTROID</code>, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), mean NUMBER, mode_value VARCHAR2(4000), variance NUMBER)</td>
</tr>
<tr>
<td>histogram</td>
<td>The <code>histogram</code> column of <code>DM_CLUSTER</code> returns a nested table of type <code>DM_HISTOGRAMS</code>. The rows, of type <code>DM_HISTOGRAM_BIN</code>, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), bin_id NUMBER, lower_bound NUMBER, upper_bound NUMBER, label VARCHAR2(4000), count NUMBER)</td>
</tr>
<tr>
<td>rule</td>
<td>The <code>rule</code> column of <code>DM_CLUSTER</code> returns a single row of type <code>DM_RULE</code>. The columns are:</td>
</tr>
<tr>
<td></td>
<td>(rule_id INTEGER, antecedent DM_PREDICATES, consequent DM_PREDICATES, rule_support NUMBER, rule_confidence NUMBER, rule_lift NUMBER, antecedent_support NUMBER, consequent_support NUMBER, number_of_items INTEGER)</td>
</tr>
</tbody>
</table>
Usage Notes

- The table function pipes out rows of type `DM_CLUSTER`. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".
- For descriptions of predicates (`DM_PREDICATE`) and rules (`DM_RULE`), see `GET_ASSOCIATION_RULES Function`.

43.6 Summary of DBMS_DATA_MINING Subprograms

This table summarizes the subprograms included in the `DBMS_DATA_MINING` package.

The `GET_*` interfaces are replaced by model views. Oracle recommends that users leverage the views instead. For more information, refer to Oracle Data Mining User’s Guide.

Table 43-27  DBMS_DATA_MINING Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COST_MATRIX Procedure</td>
<td>Adds a cost matrix to a classification model</td>

43.6.1 ADD_COST_MATRIX Procedure

The ADD_COST_MATRIX procedure associates a cost matrix table with a Classification model. The cost matrix biases the model by assigning costs or benefits to specific model outcomes.

The cost matrix is stored with the model and taken into account when the model is scored.

You can also specify a cost matrix inline when you invoke a Data Mining SQL function for scoring. To view the scoring matrix for a model, query the DM$VC prefixed model view. Refer to Model Detail View for Classification Algorithm.

To obtain the default scoring matrix for a model, query the DM$VC prefixed model view. To remove the default scoring matrix from a model, use the REMOVE_COST_MATRIX procedure. See "GET_MODEL_COST_MATRIX Function" and "REMOVE_COST_MATRIX Procedure".

See Also:

- "Biasing a Classification Model" in Oracle Data Mining Concepts for more information about costs
- Oracle Database SQL Language Reference for syntax of inline cost matrix
- Oracle Data Mining User's Guide

Syntax

```sql
DBMS_DATA_MINING.ADD_COST_MATRIX (    model_name                IN VARCHAR2,    cost_matrix_table_name IN VARCHAR2,    cost_matrix_schema_name IN VARCHAR2 DEFAULT NULL,    partition_name            IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table (described in Table 43-29).</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table. If no schema is specified, then the current schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition in a partitioned model</td>
</tr>
</tbody>
</table>

Usage Notes

1. If the model is not in your schema, then ADD_COST_MATRIX requires the ALTER ANY MINING MODEL system privilege or the ALTER object privilege for the mining model.
2. The cost matrix table must have the columns shown in Table 43-29.

**Table 43-29  Required Columns in a Cost Matrix Table**

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTUAL_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
<tr>
<td>PREDICTED_TARGET_VALUE</td>
<td>Valid target data type</td>
</tr>
<tr>
<td>COST</td>
<td>NUMBER, FLOAT, BINARY_DOUBLE, or BINARY_FLOAT</td>
</tr>
</tbody>
</table>

See Also: Oracle Data Mining User's Guide for valid target datatypes

3. The types of the actual and predicted target values must be the same as the type of the model target. For example, if the target of the model is BINARY_DOUBLE, then the actual and predicted values must be BINARY_DOUBLE. If the actual and predicted values are CHAR or VARCHAR, then ADD_COST_MATRIX treats them as VARCHAR2 internally.

If the types do not match, or if the actual or predicted value is not a valid target value, then the ADD_COST_MATRIX procedure raises an error.

**Note:**

If a reverse transformation is associated with the target, then the actual and predicted values must be consistent with the target after the reverse transformation has been applied.

See “Reverse Transformations and Model Transparency” under the “About Transformation Lists” section in DBMS_DATA_MINING_TRANSFORM Operational Notes for more information.

4. Since a benefit can be viewed as a negative cost, you can specify a benefit for a given outcome by providing a negative number in the costs column of the cost matrix table.

5. All Classification algorithms can use a cost matrix for scoring. The Decision Tree algorithm can also use a cost matrix at build time. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the CLAS_COST_TABLE_NAME setting in the settings table for the model. See Table 43-7.

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, use the REMOVE_COST_MATRIX procedure to remove the cost matrix and the ADD_COST_MATRIX procedure to add a new one.

6. Scoring on a partitioned model is partition-specific. Scoring cost matrices can be added to or removed from an individual partition in a partitioned model. If PARTITION_NAME is NOT NULL, then the model must be a partitioned model. The COST_MATRIX is added to that partition of the partitioned model.
If the `PARTITION_NAME` is NULL, but the model is a partitioned model, then the `COST_MATRIX` table is added to every partition in the model.

**Example**

This example creates a cost matrix table called `COSTS_NB` and adds it to a Naive Bayes model called `NB_SH_CLAS_SAMPLE`. The model has a binary target: 1 means that the customer responds to a promotion; 0 means that the customer does not respond. The cost matrix assigns a cost of .25 to misclassifications of customers who do not respond and a cost of .75 to misclassifications of customers who do respond. This means that it is three times more costly to misclassify responders than it is to misclassify non-responders.

```sql
CREATE TABLE costs_nb (  
    actual_target_value           NUMBER,  
    predicted_target_value        NUMBER,  
    cost                          NUMBER);
INSERT INTO costs_nb values (0, 0, 0);  
INSERT INTO costs_nb values (0, 1, .25);  
INSERT INTO costs_nb values (1, 0, .75);  
INSERT INTO costs_nb values (1, 1, 0);  
COMMIT;
EXEC dbms_data_mining.add_cost_matrix('nb_sh_clas_sample', 'costs_nb');
```

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age  
FROM mining_data_apply_v  
WHERE PREDICTION(nb_sh_clas_sample COST MODEL  
    USING cust_marital_status, education, household_size) = 1  
GROUP BY cust_gender  
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>C</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>72</td>
<td>39</td>
</tr>
<tr>
<td>M</td>
<td>555</td>
<td>44</td>
</tr>
</tbody>
</table>

### 43.6.2 ADD_PARTITION Procedure

The `ADD_PARTITION` procedure supports a single or multiple partition addition to an existing partitioned model.

The `ADD_PARTITION` procedure derives build settings and user-defined expressions from the existing model. The target column must exist in the input data query when adding partitions to a supervised model.

**Syntax**

```sql
DBMS_DATA_MINING.ADD_PARTITION (  
    model_name                IN VARCHAR2,  
    data_query                IN CLOB,  
    add_options               IN VARCHAR2 DEFAULT ERROR);
```
Parameters

Table 43-30  ADD_PARTITION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>data_query</td>
<td>An arbitrary SQL statement that provides data to the model build. The user must have privilege to evaluate this query.</td>
</tr>
<tr>
<td>add_options</td>
<td>Allows users to control the conditional behavior of ADD for cases where rows in the input dataset conflict with existing partitions in the model. The following are the possible values:</td>
</tr>
<tr>
<td></td>
<td>• REPLACE: Replaces the existing partition for which the conflicting keys are found.</td>
</tr>
<tr>
<td></td>
<td>• ERROR: Terminates the ADD operation without adding any partitions.</td>
</tr>
<tr>
<td></td>
<td>• IGNORE: Eliminates the rows having the conflicting keys.</td>
</tr>
</tbody>
</table>

Note:
For better performance, Oracle recommends using DROP_PARTITION followed by the ADD_PARTITION instead of using the REPLACE option.

43.6.3 ALTER_REVERSE_EXPRESSION Procedure

This procedure replaces a reverse transformation expression with an expression that you specify. If the attribute does not have a reverse expression, the procedure creates one from the specified expression.

You can also use this procedure to customize the output of clustering, feature extraction, and anomaly detection models.

Syntax

```sql
DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION (  
    model_name             VARCHAR2,  
    expression             CLOB,  
    attribute_name         VARCHAR2 DEFAULT NULL,  
    attribute_subname      VARCHAR2 DEFAULT NULL);
```

Parameters

Table 43-31  ALTER_REVERSE_EXPRESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>expression</td>
<td>An expression to replace the reverse transformation associated with the attribute.</td>
</tr>
</tbody>
</table>
Table 43-31  (Cont.) ALTER_REVERSE_EXPRESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>Name of the attribute. Specify NULL if you wish to apply expression to a cluster, feature, or One-Class SVM prediction.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

1. For purposes of model transparency, Oracle Data Mining provides reverse transformations for transformations that are embedded in a model. Reverse transformations are applied to the attributes returned in model details (GET_MODEL_DETAILS_* functions) and to the scored target of predictive models.

See Also:

“About Transformation Lists” under DBMS_DATA_MINING_TRANSFORM Operational Notes

2. If you alter the reverse transformation for the target of a model that has a cost matrix, you must specify a transformation expression that has the same type as the actual and predicted values in the cost matrix. Also, the reverse transformation that you specify must result in values that are present in the cost matrix.

See Also:

“ADD_COST_MATRIX Procedure” and Oracle Data Mining Concepts for information about cost matrixes.

3. To prevent reverse transformation of an attribute, you can specify NULL for expression.

4. The reverse transformation expression can contain a reference to a PL/SQL function that returns a valid Oracle datatype. For example, you could define a function like the following for a categorical attribute named blood_pressure that has values 'Low', 'Medium' and 'High'.

```sql
CREATE OR REPLACE FUNCTION numx(c char) RETURN NUMBER IS
BEGINCASE c WHEN ''Low'' THEN RETURN 1;
WHEN ''Medium'' THEN RETURN 2;
WHEN ''High'' THEN RETURN 3;
ELSE RETURN null;
END CASE;
END numx;
```

Then you could invoke ALTER_REVERSE_EXPRESSION for blood_pressure as follows.

```sql
EXEC dbms_data_mining.alter_reverse_expression(
    '<model_name>', 'NUMX(blood_pressure)', 'blood_pressure');
```
5. You can use `ALTER_REVERSE_EXPRESSION` to label clusters produced by clustering models and features produced by feature extraction.

You can use `ALTER_REVERSE_EXPRESSION` to replace the zeros and ones returned by anomaly-detection models. By default, anomaly-detection models label anomalous records with 0 and all other records with 1.

See Also:

Oracle Data Mining Concepts for information about anomaly detection

Examples

1. In this example, the target (`affinity_card`) of the model `CLASS_MODEL` is manipulated internally as `yes` or `no` instead of 1 or 0 but returned as 1s and 0s when scored. The `ALTER_REVERSE_EXPRESSION` procedure causes the target values to be returned as `TRUE` or `FALSE`.

The data sets `MINING_DATA_BUILD` and `MINING_DATA_TEST` are included with the Oracle Data Mining sample programs. See Oracle Data Mining User's Guide for information about the sample programs.

```sql
DECLARE
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
    'affinity_card', NULL,
    'decode(affinity_card, 1, ''yes'', ''no'')',
    'decode(affinity_card, ''yes'', 1, 0)');
  dbms_data_mining.CREATE_MODEL(
    model_name => 'CLASS_MODEL',
    mining_function => dbms_data_mining.classification,
    data_table_name => 'mining_data_build',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    settings_table_name => NULL,
    data_schema_name => 'dmuser',
    settings_schema_name => NULL,
    xform_list => v_xlst );
END;
/
SELECT cust_income_level, occupation,
  PREDICTION(CLASS_MODEL USING *) predict_response
FROM mining_data_test WHERE age = 60 AND cust_gender IN 'M'
ORDER BY cust_income_level;
```

<table>

</tbody>
</table>

43.6.4 APPLY Procedure

The apply procedure applies a mining model to the data of interest, and generates the results in a table. The apply procedure is also referred to as scoring.

For predictive mining functions, the apply procedure generates predictions in a target column. For descriptive mining functions such as Clustering, the apply process assigns each case to a cluster with a probability.
In Oracle Data Mining, the APPLY procedure is not applicable to Association models and Attribute Importance models.

**Note:**

Scoring can also be performed directly in SQL using the Data Mining functions. See

- “Data Mining Functions” in *Oracle Database SQL Language Reference*
- “Scoring and Deployment” in *Oracle Data Mining User's Guide*

### Syntax

```sql
DBMS_DATA_MINING.APPLY (
    model_name           IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    case_id_column_name  IN VARCHAR2,
    result_table_name    IN VARCHAR2,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 43-32  APPLY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of table or view containing the data to be scored</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table in which to store apply results</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema containing the data to be scored</td>
</tr>
</tbody>
</table>

### Usage Notes

1. The data provided for APPLY must undergo the same preprocessing as the data used to create and test the model. When you use Automatic Data Preparation, the preprocessing required by the algorithm is handled for you by the model: both at build time and apply time. (See "Automatic Data Preparation".)

2. APPLY creates a table in the user's schema to hold the results. The columns are algorithm-specific.

   The columns in the results table are listed in Table 43-33 through Table 43-37. The case ID column name in the results table will match the case ID column name provided by you. The type of the incoming case ID column is also preserved in APPLY output.
Note:

Make sure that the case ID column does not have the same name as one of the columns that will be created by APPLY. For example, when applying a Classification model, the case ID in the scoring data must not be PREDICTION or PROBABILITY (See Table 43-33).

3. The datatype for the PREDICTION, CLUSTER_ID, and FEATURE_ID output columns is influenced by any reverse expression that is embedded in the model by the user. If the user does not provide a reverse expression that alters the scored value type, then the types will conform to the descriptions in the following tables. See "ALTER_REVERSE_EXPRESSION Procedure".

4. If the model is partitioned, the result_table_name can contain results from different partitions depending on the data from the input data table. An additional column called PARTITION_NAME is added to the result table indicating the partition name that is associated with each row.

For a non-partitioned model, the behavior does not change.

Classification

The results table for Classification has the columns described in Table 43-33. If the target of the model is categorical, the PREDICTION column will have a VARCHAR2 datatype. If the target has a binary type, the PREDICTION column will have the binary type of the target.

Table 43-33  APPLY Results Table for Classification

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Anomaly Detection

The results table for Anomaly Detection has the columns described in Table 43-34.

Table 43-34  APPLY Results Table for Anomaly Detection

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Regression

The results table for Regression has the columns described in APPLY Procedure.
Table 43-35  APPLY Results Table for Regression

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>Type of the target</td>
</tr>
</tbody>
</table>

Clustering

Clustering is an unsupervised mining function, and hence there are no targets. The results of an APPLY procedure will contain simply the cluster identifier corresponding to a case, and the associated probability. The results table has the columns described in Table 43-36.

Table 43-36  APPLY Results Table for Clustering

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>CLUSTER_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Feature Extraction

Feature Extraction is also an unsupervised mining function, and hence there are no targets. The results of an APPLY procedure will contain simply the feature identifier corresponding to a case, and the associated match quality. The results table has the columns described in Table 43-37.

Table 43-37  APPLY Results Table for Feature Extraction

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>Type of the case ID</td>
</tr>
<tr>
<td>FEATURE_ID</td>
<td>NUMBER</td>
</tr>
<tr>
<td>MATCH_QUALITY</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

Examples

This example applies the GLM Regression model GLMR_SH_REGR_SAMPLE to the data in the MINING_DATA_APPLY_V view. The APPLY results are output of the table REGRESSION_APPLY_RESULT.

```
SQL> BEGIN
    DBMS_DATA_MINING.APPLY (
        model_name     => 'glmr_sh_regr_sample',
        data_table_name => 'mining_data_apply_v',
        case_id_column_name => 'cust_id',
        result_table_name   => 'regression_apply_result');
    END;
/

SQL> SELECT * FROM regression_apply_result WHERE cust_id > 101485;
```

</table>

### 43.6.5 COMPUTE_CONFUSION_MATRIX Procedure

This procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

A confusion matrix is a test metric for classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

**COMPUTE_CONFUSION_MATRIX** accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

### See Also:

- [Oracle Data Mining Concepts](#) for more details about confusion matrixes and other test metrics for classification

Syntax

```
DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (  
    accuracy                     OUT NUMBER,  
    apply_result_table_name      IN  VARCHAR2,  
    target_table_name            IN  VARCHAR2,  
    case_id_column_name          IN  VARCHAR2,  
    target_column_name           IN  VARCHAR2,  
    confusion_matrix_table_name  IN  VARCHAR2,  
    score_column_name            IN  VARCHAR2 DEFAULT 'PREDICTION',  
    score_criterion_column_name  IN  VARCHAR2 DEFAULT 'PROBABILITY',  
    cost_matrix_table_name       IN  VARCHAR2 DEFAULT NULL,  
    apply_result_schema_name     IN  VARCHAR2 DEFAULT NULL,  
    target_schema_name           IN  VARCHAR2 DEFAULT NULL,  
    cost_matrix_schema_name      IN  VARCHAR2 DEFAULT NULL,  
    score_criterion_type         IN  VARCHAR2 DEFAULT 'PROBABILITY');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accuracy</td>
<td>Output parameter containing the overall percentage accuracy of the predictions.</td>
</tr>
<tr>
<td>apply_result_table_name</td>
<td>Table containing the predictions.</td>
</tr>
<tr>
<td>target_table_name</td>
<td>Table containing the known target values from the test data.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case ID column in the apply results table. Must match the case identifier in the targets table.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Target column in the targets table. Contains the known target values from the test data.</td>
</tr>
<tr>
<td>confusion_matrix_table_name</td>
<td>Table containing the confusion matrix. The table will be created by the procedure in the user's schema. The columns in the confusion matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Column containing the predictions in the apply results table.</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Column containing the scoring criterion in the apply results table.</td>
</tr>
</tbody>
</table>

By default, scoring is based on probability; the class with the highest probability is predicted for each case. If scoring is based on cost, the class with the lowest cost is predicted.

The `score_criterion_type` parameter indicates whether probabilities or costs will be used for scoring.

The default column name is 'PROBABILITY', which is the default name created by the `APPLY` procedure (See "APPLY Procedure").

See the Usage Notes for additional information.
Table 43-38  (Cont.) COMPUTE_CONFUSION_MATRIX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cost_matrix_table_name</td>
<td>(Optional) Table that defines the costs associated with misclassifications. If a cost matrix table is provided and the <code>score_criterion_type</code> parameter is set to 'COSTS', the costs in this table will be used as the scoring criteria. The columns in a cost matrix table are described in the Usage Notes.</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Schema of the apply results table. If null, the user's schema is assumed.</td>
</tr>
<tr>
<td>target_schema_name</td>
<td>Schema of the table containing the known targets. If null, the user's schema is assumed.</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table, if one is provided. If null, the user's schema is assumed.</td>
</tr>
<tr>
<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the <code>score_criterion_column_name</code> parameter. The default value of <code>score_criterion_type</code> is 'PROBABILITY'. To use costs as the scoring criterion, specify 'COST'. If <code>score_criterion_type</code> is set to 'COST' but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to `COMPUTE_CONFUSION_MATRIX` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.

- Instead of passing a cost matrix to `COMPUTE_CONFUSION_MATRIX`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.

- The predictions that you pass to `COMPUTE_CONFUSION_MATRIX` are in a table or view specified in `apply_result_table_name`.

  ```sql
  CREATE TABLE apply_result_table_name AS (  
      case_id_column_name VARCHAR2,  
      score_column_name VARCHAR2,  
      score_criterion_column_name VARCHAR2);  
  ```

- A cost matrix must have the columns described in Table 43-39.
### Table 43-39  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

**See Also:**

### Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

**Compute a Confusion Matrix Based on Probabilities**

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
SELECT cust_id,
       PREDICTION(nb_sh_clas_sample USING *) prediction,
       PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
FROM mining_data_test_v;
```
Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```sql
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (accuracy => v_accuracy,
                                             apply_result_table_name => 'nb_apply_results',
                                             target_table_name => 'mining_data_test_v',
                                             case_id_column_name => 'cust_id',
                                             target_column_name => 'affinity_card',
                                             confusion_matrix_table_name => 'nb_confusion_matrix',
                                             score_column_name => 'PREDICTION',
                                             score_criterion_column_name => 'PROBABILITY',
                                             cost_matrix_table_name => null,
                                             apply_result_schema_name => null,
                                             target_schema_name => null,
                                             cost_matrix_schema_name => null,
                                             score_criterion_type => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847
```

```sql
SQL> SELECT * from nb_confusion_matrix;
ACTUAL_TARGET_VALUE    PREDICTED_TARGET_VALUE      VALUE
---------------------- ---------------------- ----------
1                      0         60
0                      0        891
1                      1        286
0                      1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table

The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```sql
SQL> SELECT * from nb_cost_matrix;
ACTUAL_TARGET_VALUE    PREDICTED_TARGET_VALUE       COST
---------------------- ---------------------- ----------
0                      0          0
0                      1        .75
1                      0        .25
1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```sql
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name => 'nb_sh_clas_sample',
    data_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name => 'nb_apply_results');
END;
```
This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by APPLY.

```sql
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY',
    cost_matrix_table_name => 'nb_cost_matrix',
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```sql
SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE VALUE
------------------- ---------------------- ----------
1                   0         91
0                   0        942
1                   1        255
0                   1        212
```

**Compute a Confusion Matrix Based on Embedded Costs**

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```sql
BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample',
                                  'nb_cost_matrix');
END;
/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```sql
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.
DECLARE
  v_accuracy NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX (
    accuracy => v_accuracy,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    confusion_matrix_table_name => 'nb_confusion_matrix',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'COST',
    cost_matrix_table_name => null,
    apply_result_schema_name => null,
    target_schema_name => null,
    cost_matrix_schema_name => null,
    score_criterion_type => 'COST');
END;
/

The results are:

**** MODEL ACCURACY ****: .798

SQL> SELECT * FROM nb_confusion_matrix;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE VALUE
------------------- ---------------------- ----------
1                      0         91
0                      0        942
1                      1        255
0                      1        212

43.6.6 COMPUTE_CONFUSION_MATRIX_PART Procedure

The COMPUTE_CONFUSION_MATRIX_PART procedure computes a confusion matrix, stores it in a table in the user's schema, and returns the model accuracy.

COMPUTE_CONFUSION_MATRIX_PART provides support to computation of evaluation metrics per-partition for partitioned models. For non-partitioned models, refer to COMPUTE_CONFUSION_MATRIX Procedure.

A confusion matrix is a test metric for Classification models. It compares the predictions generated by the model with the actual target values in a set of test data. The confusion matrix lists the number of times each class was correctly predicted and the number of times it was predicted to be one of the other classes.

COMPUTE_CONFUSION_MATRIX_PART accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
Target column containing the known target values

(Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See Also:

*Oracle Data Mining Concepts* for more details about confusion matrixes and other test metrics for classification

"COMPUTE_LIFT_PART Procedure"

"COMPUTE_ROC_PART Procedure"

Syntax

```sql
DBMS_DATA_MINING.compute_confusion_matrix_part(
    accuracy                    OUT DM_NESTED_NUMERICALS,
    apply_result_table_name     IN  VARCHAR2,
    target_table_name           IN  VARCHAR2,
    case_id_column_name         IN  VARCHAR2,
    target_column_name          IN  VARCHAR2,
    confusion_matrix_table_name IN  VARCHAR2,
    score_column_name           IN  VARCHAR2 DEFAULT 'PREDICTION',
    score_criterion_column_name IN  VARCHAR2 DEFAULT 'PROBABILITY',
    score_partition_column_name IN  VARCHAR2 DEFAULT 'PARTITION_NAME',
    cost_matrix_table_name      IN  VARCHAR2 DEFAULT NULL,
    apply_result_schema_name    IN  VARCHAR2 DEFAULT NULL,
    target_schema_name          IN  VARCHAR2 DEFAULT NULL,
    cost_matrix_schema_name     IN  VARCHAR2 DEFAULT NULL,
    score_criterion_type        IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

<tr>
<td>cost_matrix_schema_name</td>
<td>Schema of the cost matrix table, if one is provided. If null, then the user's schema is assumed.</td>
</tr>
<tr>
<td>score_criterion_type</td>
<td>Whether to use probabilities or costs as the scoring criterion. Probabilities or costs are passed in the column identified in the score_criterion_column_name parameter. The default value of score_criterion_type is PROBABILITY. To use costs as the scoring criterion, specify COST. If score_criterion_type is set to COST but no cost matrix is provided and if there is a scoring cost matrix associated with the model, then the associated costs are used for scoring. See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to `COMPUTE_CONFUSION_MATRIX_PART` may be generated using SQL `PREDICTION` functions, the `DBMS_DATA_MINING.APPLY` procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the confusion matrix.
- Instead of passing a cost matrix to `COMPUTE_CONFUSION_MATRIX_PART`, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL `PREDICTION_COST` function to populate the score criterion column.
- The predictions that you pass to `COMPUTE_CONFUSION_MATRIX_PART` are in a table or view specified in `apply_result_table_name`.

```sql
CREATE TABLE apply_result_table_name AS (
    case_id_column_name VARCHAR2,
    score_column_name VARCHAR2,
    score_criterion_column_name VARCHAR2);
```

- A cost matrix must have the columns described in Table 43-39.

Table 43-42 Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the test data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>BINARY_DOUBLE</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Data Mining User’s Guide* for valid target datatypes

*Oracle Data Mining Concepts* for more information about cost matrices

- The confusion matrix created by `COMPUTE_CONFUSION_MATRIX_PART` has the columns described in Table 43-40.

</tbody>
</table>
Examples

These examples use the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.

Compute a Confusion Matrix Based on Probabilities

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id,
PREDICTION(nb_sh_clas_sample USING *) prediction,
PREDICTION_PROBABILITY(nb_sh_clas_sample USING *) probability
FROM mining_data_test_v;
```

Using probabilities as the scoring criterion, you can compute the confusion matrix as follows.

```
DECLARE
    v_accuracy NUMBER;
BEGIN
    DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
        accuracy                     => v_accuracy,
        apply_result_table_name      => 'nb_apply_results',
target_table_name            => 'mining_data_test_v',
case_id_column_name          => 'cust_id',
target_column_name           => 'affinity_card',
confusion_matrix_table_name  => 'nb_confusion_matrix',
score_column_name            => 'PREDICTION',
score_criterion_column_name  => 'PROBABILITY'
score_partition_column_name  => 'PARTITION_NAME',
cost_matrix_table_name       =>  null,
apply_result_schema_name     =>  null,
target_schema_name           =>  null,
cost_matrix_schema_name      =>  null,
score_criterion_type         => 'PROBABILITY');
    DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The confusion matrix and model accuracy are shown as follows.

```
**** MODEL ACCURACY ****: .7847

SELECT * FROM NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
-------------------- ---------------------- ----------
1                      0         60
0                      0        891
1                      1        286
0                      1        263
```

Compute a Confusion Matrix Based on a Cost Matrix Table
The confusion matrix in the previous example shows a high rate of false positives. For 263 cases, the model predicted 1 when the actual value was 0. You could use a cost matrix to minimize this type of error.

The cost matrix table `nb_cost_matrix` specifies that a false positive is 3 times more costly than a false negative.

```
SELECT * from NB_COST_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE       COST
------------------- ---------------------- ----------
0                      0          0
0                      1        .75
1                      0        .25
1                      1          0
```

This statement shows how to generate the predictions using `APPLY`.

```
BEGIN
  DBMS_DATA_MINING.APPLY(
    model_name          => 'nb_sh_clas_sample',
    data_table_name     => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    result_table_name   => 'nb_apply_results');
END;
/
```

This statement computes the confusion matrix using the cost matrix table. The score criterion column is named 'PROBABILITY', which is the name generated by `APPLY`.

```
DECLARE
  v_accuracy    NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (           
    accuracy                     => v_accuracy,
    apply_result_table_name      => 'nb_apply_results',
    target_table_name            => 'mining_data_test_v',
    case_id_column_name          => 'cust_id',
    target_column_name           => 'affinity_card',
    confusion_matrix_table_name  => 'nb_confusion_matrix',
    score_column_name            => 'PREDICTION',
    score_criterion_column_name  => 'PROBABILITY',
    score_partition_column_name  => 'PARTITION_NAME'
    cost_matrix_table_name       => 'nb_cost_matrix',
    apply_result_schema_name     => null,
    target_schema_name           => null,
    cost_matrix_schema_name      => null,
    score_criterion_type         => 'COST');
  DBMS_OUTPUT.PUT_LINE('**** MODEL ACCURACY ****: ' || ROUND(v_accuracy,4));
END;
/
```

The resulting confusion matrix shows a decrease in false positives (212 instead of 263).

```
**** MODEL ACCURACY ****: .798
```

```
SELECT * from NB_CONFUSION_MATRIX;
ACTUAL_TARGET_VALUE PREDICTED_TARGET_VALUE      VALUE
------------------- ---------------------- ----------
1                      0         91
0                      0        942
```
Compute a Confusion Matrix Based on Embedded Costs

You can use the ADD_COST_MATRIX procedure to embed a cost matrix in a model. The embedded costs can be used instead of probabilities for scoring. This statement adds the previously-defined cost matrix to the model.

```
BEGIN
  DBMS_DATA_MINING.ADD_COST_MATRIX ('nb_sh_clas_sample', 'nb_cost_matrix');
END;/
```

The following statement applies the model to the test data using the embedded costs and stores the results in a table.

```
CREATE TABLE nb_apply_results AS
  SELECT cust_id,
         PREDICTION(nb_sh_clas_sample COST MODEL USING *) prediction,
         PREDICTION_COST(nb_sh_clas_sample COST MODEL USING *) cost
  FROM mining_data_test_v;
```

You can compute the confusion matrix using the embedded costs.

```
DECLARE
  v_accuracy         NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_CONFUSION_MATRIX_PART (
    accuracy    => v_accuracy,
    apply_result_table_name      => 'nb_apply_results',
    target_table_name            => 'mining_data_test_v',
    case_id_column_name          => 'cust_id',
    target_column_name           => 'affinity_card',
    confusion_matrix_table_name  => 'nb_confusion_matrix',
    score_column_name            => 'PREDICTION',
    score_criterion_column_name  => 'COST',
    score_partition_column_name  => 'PARTITION_NAME',
    cost_matrix_table_name       => null,
    apply_result_schema_name     => null,
    target_schema_name           => null,
    cost_matrix_schema_name      => null,
    score_criterion_type         => 'COST');
END;
/
```

The results are:

```
**** MODEL ACCURACY ****: .798
```

```
SELECT * FROM NB_CONFUSION_MATRIX;
```

43.6.7 COMPUTE_LIFT Procedure

This procedure computes lift and stores the results in a table in the user's schema.

Lift is a test metric for binary classification models. To compute lift, one of the target values must be designated as the positive class. COMPUTE_LIFT compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.

Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

COMPUTE_LIFT calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, COMPUTE_LIFT accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

See the Usage Notes and the Examples.</td>
</tr>
</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_LIFT may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the lift.

- Instead of passing a cost matrix to COMPUTE_LIFT, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.

- The predictions that you pass to COMPUTE_LIFT are in a table or view specified in apply_results_table_name.

    CREATE TABLE apply_result_table_name AS (  
          case_id_column_name VARCHAR2,  
          score_column_name VARCHAR2,  
          score_criterion_column_name VARCHAR2);  

- A cost matrix must have the columns described in Table 43-45.
Table 43-45  Columns in a Cost Matrix

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
</tr>
</thead>
<tbody>
<tr>
<td>actual_target_value</td>
<td>Type of the target column in the build data</td>
</tr>
<tr>
<td>predicted_target_value</td>
<td>Type of the predicted target in the test data. The type of the predicted target must be the same as the type of the actual target unless the predicted target has an associated reverse transformation.</td>
</tr>
<tr>
<td>cost</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

*Oracle Data Mining Concepts* for details about the information in the lift table

- When a cost matrix is passed to `COMPUTE_LIFT`, the cost threshold is returned in the `probability_threshold` column of the lift table.

Examples

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.
The example illustrates lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```sql
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute lift as follows.

```sql
BEGIN
    DBMS_DATA_MINING.COMPUTE_LIFT (apply_result_table_name            => 'nb_apply_results',
                                    target_table_name                  => 'mining_data_test_v',
                                    case_id_column_name                => 'cust_id',
                                    target_column_name                 => 'affinity_card',
                                    lift_table_name                        => 'nb_lift',
                                    positive_target_value              => to_char(1),
                                    score_column_name                  => 'PREDICTION',
                                    score_criterion_column_name    => 'PROBABILITY',
                                    num_quantiles                          => 10,
                                    cost_matrix_table_name             => null,
                                    apply_result_schema_name           => null,
                                    target_schema_name                 => null,
                                    cost_matrix_schema_name            => null,
                                    score_criterion_type               => 'PROBABILITY');
END;
/
```

This query displays some of the statistics from the resulting lift table.

```sql
SQL>SELECT quantile_number, probability_threshold, gain_cumulative, quantile_total_count
    FROM nb_lift;
```

43.6.8 COMPUTE_LIFT_PART Procedure

The `COMPUTE_LIFT_PART` procedure computes Lift and stores the results in a table in the user's schema. This procedure provides support to the computation of evaluation metrics per-partition for partitioned models.

Lift is a test metric for binary Classification models. To compute Lift, one of the target values must be designated as the positive class. `COMPUTE_LIFT_PART` compares the predictions generated by the model with the actual target values in a set of test data. Lift measures the degree to which the model's predictions of the positive class are an improvement over random chance.
Lift is computed on scoring results that have been ranked by probability (or cost) and divided into quantiles. Each quantile includes the scores for the same number of cases.

`COMPUTE_LIFT_PART` calculates quantile-based and cumulative statistics. The number of quantiles and the positive class are user-specified. Additionally, `COMPUTE_LIFT_PART` accepts three input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing either probabilities or costs associated with the predictions
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values
- (Optional) A cost matrix table with predefined columns. See the Usage Notes for the column requirements.

Usage Notes

- The predictive information you pass to COMPUTE_LIFT_PART may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other mechanism. As long as you pass the appropriate data, the procedure can compute the Lift.

- Instead of passing a cost matrix to COMPUTE_LIFT_PART, you can use a scoring cost matrix associated with the model. A scoring cost matrix can be embedded in the model or it can be defined dynamically when the model is applied. To use a scoring cost matrix, invoke the SQL PREDICTION_COST function to populate the score criterion column.

- The predictions that you pass to COMPUTE_LIFT_PART are in a table or view specified in apply_results_table_name.

```sql
CREATE TABLE apply_result_table_name AS (
  case_id_column_name VARCHAR2,
  score_column_name VARCHAR2,
  score_criterion_column_name VARCHAR2);
```

- A cost matrix must have the columns described in Table 43-45.

*Oracle Data Mining Concepts* for details about the information in the Lift table

* When a cost matrix is passed to `COMPUTE_LIFT_PART`, the cost threshold is returned in the `probability_threshold` column of the Lift table.

**Examples**

This example uses the Naive Bayes model `nb_sh_clas_sample`, which is created by one of the Oracle Data Mining sample programs.
The example illustrates Lift based on probabilities. For examples that show computation based on costs, see "COMPUTE_CONFUSION_MATRIX Procedure".

For a partitioned model example, see "COMPUTE_CONFUSION_MATRIX_PART Procedure".

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

```
CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
    FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
```

Using probabilities as the scoring criterion, you can compute Lift as follows.

```
BEGIN

43.6.9 COMPUTE_ROC Procedure

This procedure computes the receiver operating characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. COMPUTE_ROC compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an X-Y axis. The false positive rate is placed on the X axis. The true positive rate is placed on the Y axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

COMPUTE_ROC accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities
- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

</tbody>
</table>

Usage Notes

- The predictive information you pass to COMPUTE_ROC may be generated using SQL PREDICTION functions, the DBMS_DATA_MINING.APPLY procedure, or some other
mechanism. As long as you pass the appropriate data, the procedure can compute the receiver operating characteristic.

- The predictions that you pass to `COMPUTE_ROC` are in a table or view specified in `apply_results_table_name`.

```sql
CREATE TABLE apply_result_table_name AS (
  case_id_column_name VARCHAR2,
  score_column_name VARCHAR2,
  score_criterion_column_name VARCHAR2);
```

- The table created by `COMPUTE_ROC` has the columns shown in Table 43-51.

**See Also:**

*Oracle Data Mining Concepts* for details about the output of `COMPUTE_ROC`.

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```sql
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

- There are two approaches to identifying the most desirable probability threshold. Which approach you use depends on whether or not you know the relative cost of positive versus negative class prediction errors.

If the costs are known, you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query like this.

```sql
WITH cost AS (
  SELECT probability_threshold, 20 * false_negatives + false_positives cost
  FROM ROC_table
```
GROUP BY probability_threshold),
    minCost AS (  
    SELECT min(cost) minCost  
        FROM cost)  
    SELECT max(probability_threshold)probability_threshold  
        FROM cost, minCost  
    WHERE cost = minCost;

If relative costs are not well known, you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.

SELECT * FROM ROC_table
    ORDER BY probability_threshold;

Examples

This example uses the Naive Bayes model nb_sh_clas_sample, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

CREATE TABLE nb_apply_results AS
    SELECT cust_id, t.prediction, t.probability
        FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;

Using the predictions and the target values from the test data, you can compute ROC as follows.

DECLARE  
    v_area_under_curve NUMBER;
BEGIN  
    DBMS_DATA_MINING.COMPUTE_ROC  
        roc_area_under_curve        => v_area_under_curve,  
        apply_result_table_name     => 'nb_apply_results',  
        target_table_name           => 'mining_data_test_v',  
        case_id_column_name         => 'cust_id',  
        target_column_name          => 'mining_data_test_v',  
        roc_table_name              => 'nb_roc',  
        positive_target_value       => '1',  
        score_column_name           => 'PREDICTION',  
        score_criterion_column_name => 'PROBABILITY');  
    DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||  
        ROUND(v_area_under_curve,4));
END;  
/

The resulting AUC and a selection of columns from the ROC table are shown as follows.

**** AREA UNDER ROC CURVE ****: .8212

SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
        FROM nb_roc;

<table>
<thead>
<tr>
<th>PROBABILITY</th>
<th>TRUE_POSITIVE_FRACTION</th>

</tr>
</thead>
<tbody>
<tr>
<td>0.00000</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>0.50018</td>
<td>0.826589595</td>
<td>0.227902946</td>
</tr>
</tbody>
</table>
43.6.10 COMPUTE_ROC_PART Procedure

The **COMPUTE_ROC_PART** procedure computes Receiver Operating Characteristic (ROC), stores the results in a table in the user's schema, and returns a measure of the model accuracy. This procedure provides support to computation of evaluation metrics per-partition for partitioned models.

ROC is a test metric for binary classification models. To compute ROC, one of the target values must be designated as the positive class. **COMPUTE_ROC_PART** compares the predictions generated by the model with the actual target values in a set of test data.

ROC measures the impact of changes in the probability threshold. The probability threshold is the decision point used by the model for predictions. In binary classification, the default probability threshold is 0.5. The value predicted for each case is the one with a probability greater than 50%.

ROC can be plotted as a curve on an x-y axis. The false positive rate is placed on the x-axis. The true positive rate is placed on the y-axis. A false positive is a positive prediction for a case that is negative in the test data. A true positive is a positive prediction for a case that is positive in the test data.

**COMPUTE_ROC_PART** accepts two input streams:

- The predictions generated on the test data. The information is passed in three columns:
  - Case ID column
  - Prediction column
  - Scoring criterion column containing probabilities

- The known target values in the test data. The information is passed in two columns:
  - Case ID column
  - Target column containing the known target values

See Also:

Oracle Data Mining Concepts for details about the output of
COMPUTE_ROC_PART

- ROC is typically used to determine the most desirable probability threshold. This can be done by examining the true positive fraction and the false positive fraction. The true positive fraction is the percentage of all positive cases in the test data that were correctly predicted as positive. The false positive fraction is the percentage of all negative cases in the test data that were incorrectly predicted as positive.

Given a probability threshold, the following statement returns the positive predictions in an apply result table ordered by probability.

```
SELECT case_id_column_name
FROM apply_result_table_name
WHERE probability > probability_threshold
ORDER BY probability DESC;
```

- There are two approaches to identify the most desirable probability threshold. The approach you use depends on whether you know the relative cost of positive versus negative class prediction errors.

If the costs are known, then you can apply the relative costs to the ROC table to compute the minimum cost probability threshold. Suppose the relative cost ratio is: Positive Class Error Cost / Negative Class Error Cost = 20. Then execute a query as follows:

```
WITH cost AS (  
  SELECT probability_threshold, 20 * false_negatives + false_positives cost  
  FROM ROC_table  
  GROUP BY probability_threshold),  
minCost AS (  
  SELECT min(cost) minCost  
  FROM cost)  
SELECT max(probability_threshold)probability_threshold  
FROM cost, minCost  
WHERE cost = minCost;
```

If relative costs are not well known, then you can simply scan the values in the ROC table (in sorted order) and make a determination about which of the displayed trade-offs (misclassified positives versus misclassified negatives) is most desirable.
SELECT * FROM ROC_table
ORDER BY probability_threshold;

Examples

This example uses the Naive Bayes model \texttt{nb\_sh\_clas\_sample}, which is created by one of the Oracle Data Mining sample programs.

The following statement applies the model to the test data and stores the predictions and probabilities in a table.

\begin{verbatim}
CREATE TABLE nb_apply_results AS
SELECT cust_id, t.prediction, t.probability
FROM mining_data_test_v, TABLE(PREDICTION_SET(nb_sh_clas_sample USING *)) t;
\end{verbatim}

Using the predictions and the target values from the test data, you can compute ROC as follows.

\begin{verbatim}
DECLARE
  v_area_under_curve NUMBER;
BEGIN
  DBMS_DATA_MINING.COMPUTE_ROC_PART (
    roc_area_under_curve => v_area_under_curve,
    apply_result_table_name => 'nb_apply_results',
    target_table_name => 'mining_data_test_v',
    case_id_column_name => 'cust_id',
    target_column_name => 'affinity_card',
    roc_table_name => 'nb_roc',
    positive_target_value => '1',
    score_column_name => 'PREDICTION',
    score_criterion_column_name => 'PROBABILITY');
  DBMS_OUTPUT.PUT_LINE('**** AREA UNDER ROC CURVE ****: ' ||
    ROUND(v_area_under_curve,4));
END;
/ 
\end{verbatim}

The resulting AUC and a selection of columns from the ROC table are shown as follows.

\begin{verbatim}
**** AREA UNDER ROC CURVE ****: .8212

SELECT PROBABILITY, TRUE_POSITIVE_FRACTION, FALSE_POSITIVE_FRACTION
FROM NB_ROC;
\end{verbatim}

\begin{tabular}{|c|c|c|}
\hline

\end{tabular}
43.6.11 CREATE_MODEL Procedure

This procedure creates a mining model with a given mining function.

Syntax

```
DBMS_DATA_MINING.CREATE_MODEL (
    model_name            IN VARCHAR2,
    mining_function       IN VARCHAR2,
    data_table_name       IN VARCHAR2,
    case_id_column_name   IN VARCHAR2,
    target_column_name    IN VARCHAR2 DEFAULT NULL,
    settings_table_name   IN VARCHAR2 DEFAULT NULL,
    data_schema_name      IN VARCHAR2 DEFAULT NULL,
    settings_schema_name  IN VARCHAR2 DEFAULT NULL,
    xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

Parameters

Table 43-54  CREATE_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used. See the Usage Notes for model naming restrictions.</td>
</tr>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in Table 43-3.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Table or view containing the build data</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>settings_table_name</td>
<td>Table containing build settings for the model. NULL if there is no settings table (only default settings are used).</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema hosting the build data. If NULL, then the user's schema is assumed.</td>
</tr>
<tr>
<td>settings_schema_name</td>
<td>Schema hosting the settings table. If NULL then the user's schema is assumed.</td>
</tr>
</tbody>
</table>
Table 43-54  (Cont.) CREATE_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformations to be used in addition to or instead of automatic transformations, depending on the value of the PREP_AUTO setting. (See &quot;Automatic Data Preparation&quot;).</td>
</tr>
</tbody>
</table>

The datatype of xform_list is TRANSFORM_LIST, which consists of records of type TRANSFORM_REC. Each TRANSFORM_REC specifies the transformation information for a single attribute.

```
TYPE TRANSFORM_REC IS RECORD (  
  attribute_name       VARCHAR2(4000),  
  attribute_subname    VARCHAR2(4000),  
  expression           EXPRESSION_REC,  
  reverse_expression   EXPRESSION_REC,  
  attribute_spec       VARCHAR2(4000));
```

The expression field stores a SQL expression for transforming the attribute. The reverse_expression field stores a SQL expression for reversing the transformation in model details and, if the attribute is a target, in the results of scoring. The SQL expressions are manipulated by routines in the DBMS_DATA_MINING_TRANSFORM package:

- SET_EXPRESSION Procedure
- GET_EXPRESSION Function
- SET_TRANSFORM Procedure

The attribute_spec field identifies individualized treatment for the attribute. See the Usage Notes for details.

See Table 44-1 for details about the TRANSFORM_REC type.

Usage Notes

1. You can use the attribute_spec field of the xform_list argument to identify an attribute as unstructured text or to disable Automatic Data Preparation for the attribute. The attribute_spec can have the following values:

   - TEXT: Indicates that the attribute contains unstructured text. The TEXT value may optionally be followed by POLICY_NAME, TOKEN_TYPE, MAX_FEATURES, and MIN_DOCUMENTS parameters.

   TOKEN_TYPE has the following possible values: NORMAL, STEM, THEME, SYNONYM, BIGRAM, STEM_BIGRAM. SYNONYM may be optionally followed by a thesaurus name in square brackets.

   MAX_FEATURES specifies the maximum number of tokens extracted from the text.

   MIN_DOCUMENTS specifies the minimal number of documents in which every selected token shall occur. (For information about creating a text policy, see CTX_DDL.CREATE_POLICY in Oracle Text Reference).

Oracle Data Mining can process columns of VARCHAR2/CHAR, CLOB, BLOB, and BFILE as text. If the column is VARCHAR2 or CHAR and you do not specify TEXT, Oracle Data Mining will process the column as categorical data. If the column is CLOB, then Oracle Data Mining will process it as text by default (You do not need to specify it as TEXT. However, you do need to provide an Oracle Text
Policy in the settings). If the column is BLOB or BFILE, you must specify it as TEXT, otherwise CREATE_MODEL will return an error.

If you specify TEXT for a nested column or for an attribute in a nested column, CREATE_MODEL will return an error.

- NOPREP: Disables ADP for the attribute. When ADP is OFF, the NOPREP value is ignored.

You can specify NOPREP for a nested column, but not for an attribute in a nested column. If you specify NOPREP for an attribute in a nested column when ADP is on, CREATE_MODEL will return an error.

2. You can obtain information about a model by querying the Data Dictionary views.

```
ALL/USER/DBA_MINING_MODELS
ALL/USER/DBA_MINING_MODEL_ATTRIBUTES
ALL/USER/DBA_MINING_MODEL_SETTINGS
ALL/USER/DBA_MINING_MODEL_VIEWS
ALL/USER/DBA_MINING_MODEL_PARTITIONS
ALL/USER/DBA_MINING_MODEL_XFORMS
```

You can obtain information about model attributes by querying the model details through model views. Refer to Oracle Data Mining User's Guide.

3. The naming rules for models are more restrictive than the naming rules for most database schema objects. A model name must satisfy the following additional requirements:

- It must be 123 or fewer characters long.
- It must be a nonquoted identifier. Oracle requires that nonquoted identifiers contain only alphanumeric characters, the underscore (_), dollar sign ($), and pound sign (#); the initial character must be alphabetic. Oracle strongly discourages the use of the dollar sign and pound sign in nonquoted literals.

Naming requirements for schema objects are fully documented in Oracle Database SQL Language Reference.

4. To build a partitioned model, you must provide additional settings.

The setting for partitioning columns are as follows:

```
INSERT INTO settings_table VALUES ('ODMS_PARTITION_COLUMNS', 'GENDER, AGE');
```

To set user-defined partition number for a model, the setting is as follows:

```
INSERT INTO settings_table VALUES ('ODMS_MAX_PARTITIONS', '10');
```

The default value for maximum number of partitions is 1000.

5. By passing an xform_list to CREATE_MODEL, you can specify a list of transformations to be performed on the input data. If the PREP_AUTO setting is ON, the transformations are used in addition to the automatic transformations. If the PREP_AUTO setting is OFF, the specified transformations are the only ones implemented by the model. In both cases, transformation definitions are embedded in the model and executed automatically whenever the model is applied. See "Automatic Data Preparation". Other transforms that can be specified with xform_list include FORCE_IN. Refer to Oracle Data Mining User's Guide.
Examples

The first example builds a Classification model using the Support Vector Machine algorithm.

```
-- Create the settings table
CREATE TABLE svm_model_settings (
    setting_name VARCHAR2(30),
    setting_value VARCHAR2(30));

-- Populate the settings table
-- Specify SVM. By default, Naive Bayes is used for classification.
-- Specify ADP. By default, ADP is not used.
BEGIN
    INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
        (dbms_data_mining.algo_name, dbms_data_mining.algo_support_vector_machines);
    INSERT INTO svm_model_settings (setting_name, setting_value) VALUES
        (dbms_data_mining.prep_auto, dbms_data_mining.prep_auto_on);
    COMMIT;
END;
/

-- Create the model using the specified settings
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
        model_name          => 'svm_model',
        mining_function     => dbms_data_mining.classification,
        data_table_name     => 'mining_data_build_v',
        case_id_column_name => 'cust_id',
        target_column_name  => 'affinity_card',
        settings_table_name => 'svm_model_settings');
END;
/
```

You can display the model settings with the following query:

```
SELECT * FROM user_mining_model_settings
WHERE model_name IN 'SVM_MODEL';
```

```
MODEL_NAME     SETTING_NAME            SETTING_VALUE                  SETTING
-------------  ----------------------  -----------------------------  -------
SVM_MODEL      ALGO_NAME               ALGO_SUPPORT_VECTOR_MACHINES  INPUT
SVM_MODEL      SVMS_STD_DEV            3.004524                      DEFAULT
SVM_MODEL      PREP_AUTO               ON                            INPUT
SVM_MODEL      SVMS_COMPLEXITY_FACTOR  1.887389                      DEFAULT
SVM_MODEL      SVMS_KERNEL_FUNCTION    SVMS_LINEAR                      DEFAULT
SVM_MODEL      SVMS_CONV_TOLERANCE     .001                          DEFAULT
```

The following is an example of querying a model view instead of the older GEL_MODEL_DETAILS_SVM routine.

```
SELECT target_value, attribute_name, attribute_value, coefficient
FROM DM$VLVLSVM.MODEL;
```

The second example creates an Anomaly Detection model. Anomaly Detection uses SVM Classification without a target. This example uses the same settings table created for the SVM Classification model in the first example.

```
BEGIN
    DBMS_DATA_MINING.CREATE_MODEL(
```
This query shows that the models created in these examples are the only ones in your schema.

```sql
SELECT model_name, mining_function, algorithm FROM user_mining_models;
```

<table>
<thead>
<tr>
<th>MODEL_NAME</th>
<th>MINING_FUNCTION</th>
<th>ALGORITHM</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVM_MODEL</td>
<td>CLASSIFICATION</td>
<td>SUPPORT_VECTOR_MACHINES</td>
</tr>
<tr>
<td>ANOMALY_DETECT_MODEL</td>
<td>CLASSIFICATION</td>
<td>SUPPORT_VECTOR_MACHINES</td>
</tr>
</tbody>
</table>

This query shows that only the SVM Classification model has a target.

```sql
SELECT model_name, attribute_name, attribute_type, target
FROM user_mining_model_attributes
WHERE target = 'YES';
```

<table>
<thead>
<tr>
<th>MODEL_NAME</th>
<th>ATTRIBUTE_NAME</th>
<th>ATTRIBUTE_TYPE</th>
<th>TARGET</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVM_MODEL</td>
<td>AFFINITY_CARD</td>
<td>CATEGORICAL</td>
<td>YES</td>
</tr>
</tbody>
</table>

### 43.6.12 CREATE_MODEL2 Procedure

The `CREATE_MODEL2` procedure is an alternate procedure to the `CREATE_MODEL` procedure, which enables creating a model without extra persistence stages. In the `CREATE_MODEL` procedure, the input is a table or a view and if such an object is not already present, the user must create it. By using the `CREATE_MODEL2` procedure, the user does not need to create such transient database objects.

**Syntax**

```sql
DBMS_DATA_MINING.CREATE_MODEL2 (  
    model_name            IN VARCHAR2,
    mining_function       IN VARCHAR2,
    data_query            IN CLOB,
    set_list              IN SETTING_LIST,
    case_id_column_name   IN VARCHAR2 DEFAULT NULL,
    target_column_name    IN VARCHAR2 DEFAULT NULL,
    xform_list            IN TRANSFORM_LIST DEFAULT NULL);
```

**Parameters**

**Table 43-55  CREATE_MODEL2 Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.model_name]. If you do not specify a schema, then the current schema is used. See the Usage Notes, CREATE_MODEL Procedure for model naming restrictions.</td>
</tr>
</tbody>
</table>
Table 43-55  (Cont.) CREATE_MODEL2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mining_function</td>
<td>The mining function. Values are listed in DBMS_DATA_MINING — Mining Function Settings.</td>
</tr>
<tr>
<td>data_query</td>
<td>A query which provides training data for building the model.</td>
</tr>
<tr>
<td>set_list</td>
<td>Specifies the setting of SETTING_LIST. SETTING_LIST is a table of CLOB index by VARCHAR2(30); Where the index is the setting name and the CLOB is the setting value for that name.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Case identifier column in the build data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>For supervised models, the target column in the build data. NULL for unsupervised models.</td>
</tr>
<tr>
<td>xform_list</td>
<td>Refer to CREATE_MODEL Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

Refer to CREATE_MODEL Procedure for Usage Notes.

Examples

The following example uses the Support Vector Machine algorithm.

declare
  v_setlst DBMS_DATA_MINING.SETTING_LIST;
BEGIN
  v_setlst(dbms_data_mining.algo_name) :=
    dbms_data_mining.algo_support_vector_machines;
  v_setlst(dbms_data_mining.prep_auto) := dbms_data_mining.prep_auto_on;
  DBMS_DATA_MINING.CREATE_MODEL2(
    model_name         => 'svm_model',
    mining_function    => dbms_data_mining.classification,
    data_query         => 'select * from mining_data_build_v',
    data_table_name    => 'mining_data_build_v',
    case_id_column_name=> 'cust_id',
    target_column_name => 'affinity_card',
    set_list           => v_setlst,
    case_id_column_name=> 'cust_id',
    target_column_name => 'affinity_card');
END;
/

43.6.13 DROP_PARTITION Procedure

The DROP_PARTITION procedure drops a single partition that is specified in the parameter partition_name.

Syntax

DBMS_DATA_MINING.DROP_PARTITION (
  model_name IN VARCHAR2,
  partition_name IN VARCHAR2);
Parameters

Table 43-56   DROP_PARTITION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do</td>
</tr>
<tr>
<td></td>
<td>not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition that must be dropped.</td>
</tr>
</tbody>
</table>

43.6.14 DROP_MODEL Procedure

This procedure deletes the specified mining model.

Syntax

```
DBMS_DATA_MINING.DROP_MODEL (model_name IN VARCHAR2,
                           force      IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 43-57   DROP_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the mining model in the form [schema_name.]model_name. If you do</td>
</tr>
<tr>
<td></td>
<td>not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>force</td>
<td>Forces the mining model to be dropped even if it is invalid. A mining</td>
</tr>
<tr>
<td></td>
<td>model may be invalid if a serious system error interrupted the model build</td>
</tr>
<tr>
<td></td>
<td>process.</td>
</tr>
</tbody>
</table>

Usage Note

To drop a mining model, you must be the owner or you must have the DROP ANY MINING
MODEL privilege. See Oracle Data Mining User’s Guide for information about privileges
for data mining.

Example

You can use the following command to delete a valid mining model named
nb_sh_clas_sample that exists in your schema.

```
BEGIN
   DBMS_DATA_MINING.DROP_MODEL(model_name => 'nb_sh_clas_sample');
END;
/
```

43.6.15 EXPORT_MODEL Procedure

This procedure exports the specified data mining models to a dump file set.

To import the models from the dump file set, use the IMPORT_MODEL Procedure.
EXPORT_MODEL and IMPORT_MODEL use Oracle Data Pump technology.
When Oracle Data Pump is used to export/import an entire schema or database, the mining models in the schema or database are included. However, `EXPORT_MODEL` and `IMPORT_MODEL` are the only utilities that support the export/import of individual models.

**See Also:**

- *Oracle Database Utilities* for information about Oracle Data Pump
- *Oracle Data Mining User's Guide* for more information about exporting and importing mining models

**Syntax**

```sql
DBMS_DATA_MINING.EXPORT_MODEL (  
  filename          IN VARCHAR2,  
  directory         IN VARCHAR2,  
  model_filter      IN VARCHAR2 DEFAULT NULL,  
  filesize          IN VARCHAR2 DEFAULT NULL,  
  operation         IN VARCHAR2 DEFAULT NULL,  
  remote_link       IN VARCHAR2 DEFAULT NULL,  
  jobname           IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Name of the dump file set to which the models should be exported. The name must be unique within the schema. The dump file set can contain one or more files. The number of files in a dump file set is determined by the size of the models being exported (both metadata and data) and a specified or estimated maximum file size. You can specify the file size in the <code>filesize</code> parameter, or you can use the <code>operation</code> parameter to cause Oracle Data Pump to estimate the file size. If the size of the models to export is greater than the maximum file size, one or more additional files are created. When the export operation completes successfully, the name of the dump file set is automatically expanded to <code>filename01.dmp</code>, even if there is only one file in the dump set. If there are additional files, they are named sequentially as <code>filename02.dmp</code>, <code>filename03.dmp</code>, and so forth.</td>
</tr>
<tr>
<td><code>directory</code></td>
<td>Name of a pre-defined directory object that specifies where the dump file set should be created. The exporting user must have read/write privileges on the directory object and on the file system directory that it identifies. See <em>Oracle Database SQL Language Reference</em> for information about directory objects.</td>
</tr>
<tr>
<td><code>model_filter</code></td>
<td>Optional parameter that specifies which model or models to export. If you do not specify a value for <code>model_filter</code>, all models in the schema are exported. You can also specify NULL (the default) or ‘ALL’ to export all models. You can export individual models by name and groups of models based on mining function or algorithm. For instance, you could export all regression models or all Naive Bayes models. Examples are provided in Table 43-59.</td>
</tr>
</tbody>
</table>
Table 43-58  (Cont.) EXPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filesize</td>
<td>Optional parameter that specifies the maximum size of a file in the dump file set. The size may be specified in bytes, kilobytes (K), megabytes (M), or gigabytes (G). The default size is 50 MB. If the size of the models to export is larger than <code>filesize</code>, one or more additional files are created within the dump set. See the description of the <code>filename</code> parameter for more information.</td>
</tr>
</tbody>
</table>
| operation | Optional parameter that specifies whether or not to estimate the size of the files in the dump set. By default the size is not estimated and the value of the `filesize` parameter determines the size of the files. You can specify either of the following values for `operation`:
  - 'EXPORT' — Export all or the specified models. (Default)
  - 'ESTIMATE' — Estimate the size of the exporting models. |
| remote_link | Optional parameter that specifies the name of a database link to a remote system. The default value is `NULL`. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for `remote_link`, you can export the models in the remote database. The `EXP_FULL_DATABASE` role is required for exporting the remote models. The `EXP_FULL_DATABASE` privilege, the `CREATE DATABASE LINK` privilege, and other privileges may also be required. |
| jobname | Optional parameter that specifies the name of the export job. By default, the name has the form `username_exp_nnnn`, where `nnnn` is a number. For example, a job name in the `SCOTT` schema might be `SCOTT_exp_134`. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the export job, named `jobname.log`, is created in the same directory as the dump file set. |

Usage Notes

The `model_filter` parameter specifies which models to export. You can list the models by name, or you can specify all models that have the same mining function or algorithm. You can query the `USER_MINING_MODELS` view to list the models in your schema.

```
SQL> describe user_mining_models
Name                        Null?    Type
---------------------------------------- -------- ----------------------------
MODEL_NAME                   NOT NULL VARCHAR2(30)
MINING_FUNCTION            VARCHAR2(30)
ALGORITHM                   VARCHAR2(30)
CREATION_DATE              NOT NULL DATE
BUILD_DURATION             NUMBER
MODEL_SIZE                  NUMBER
COMMENTS                    VARCHAR2 (4000)
```

Examples of model filters are provided in Table 43-59.
Table 43-59  Sample Values for the Model Filter Parameter

<table>
<thead>
<tr>
<th>Sample Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'mymodel'</td>
<td>Export the model named mymodel</td>
</tr>
<tr>
<td>'name= ''mymodel'''</td>
<td>Export the model named mymodel</td>
</tr>
<tr>
<td>'name IN (''mymodel2'',''mymodel3'')'</td>
<td>Export the models named mymodel2 and mymodel3</td>
</tr>
<tr>
<td>'ALGORITHM_NAME = ''NAIVE_BAYES'''</td>
<td>Export all Naive Bayes models. See Table 43-5 for a list of algorithm names.</td>
</tr>
<tr>
<td>'FUNCTION_NAME =''CLASSIFICATION''</td>
<td>Export all classification models. See Table 43-3 for a list of mining functions.</td>
</tr>
</tbody>
</table>

Examples

1. The following statement exports all the models in the DMUSER3 schema to a dump file set called models_out in the directory $ORACLE_HOME/rdbms/log. This directory is mapped to a directory object called DATA_PUMP_DIR. The DMUSER3 user has read/write access to the directory and to the directory object.

   SQL>execute dbms_data_mining.export_model ('models_out', 'DATA_PUMP_DIR');

   You can exit SQL*Plus and list the resulting dump file and log file.

   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp

2. The following example uses the same directory object and is executed by the same user. This example exports the models called NMF_SH_SAMPLE and SVMR_SH_REGR_SAMPLE to a different dump file set in the same directory.

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL ( 'models2_out', 'DATA_PUMP_DIR',
                                              'name in (''NMF_SH_SAMPLE'', ''SVMR_SH_REGR_SAMPLE'')');

   SQL>EXIT
   >cd $ORACLE_HOME/rdbms/log
   >ls
   >DMUSER3_exp_1027.log  models_out01.dmp
   >DMUSER3_exp_924.log  models2_out01.dmp

3. The following examples show how to export models with specific algorithm and mining function names.

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('algo.dmp','DM_DUMP',
                                             'ALGORITHM_NAME IN (''O_CLUSTER'',''GENERALIZED_LINEAR_MODEL'','
                                                          ''SUPPORT_VECTOR_MACHINES''',''NAIVE_BAYES'')');

   SQL>EXECUTE DBMS_DATA_MINING.EXPORT_MODEL('func.dmp','DM_DUMP',
                                             'FUNCTION_NAME IN (CLASSIFICATION,CLUSTERING,FEATURE_EXTRACTION)');
43.6.16 GET_ASSOCIATION_RULES Function

The **GET_ASSOCIATION_RULES** function returns the rules produced by an Association model.

You can specify filtering criteria to **GET_ASSOCIATION_RULES** to return a subset of the rules. Filtering criteria can improve the performance of the table function. If the number of rules is large, then the greatest performance improvement will result from specifying the `topn` parameter.

**Syntax**

```
DBMS_DATA_MINING.get_association_rules(
    model_name       IN VARCHAR2,
    topn             IN NUMBER DEFAULT NULL,
    rule_id          IN INTEGER DEFAULT NULL,
    min_confidence   IN NUMBER DEFAULT NULL,
    min_support      IN NUMBER DEFAULT NULL,
    max_rule_length  IN INTEGER DEFAULT NULL,
    min_rule_length  IN INTEGER DEFAULT NULL,
    sort_order       IN ORA_MINING_VARCHAR2_NT DEFAULT NULL,
    antecedent_items IN DM_ITEMS DEFAULT NULL,
    consequent_items IN DM_ITEMS DEFAULT NULL,
    min_lift         IN NUMBER DEFAULT NULL,
    partition_name   IN VARCHAR2 DEFAULT NULL)
RETURN DM_Rules PIPELINED;
```

**Parameters**

**Table 43-60  GET_ASSOCIATION_RULES Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>model_name</code></td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, then your own schema is used. This is the only required parameter of <strong>GET_ASSOCIATION_RULES</strong>. All other parameters specify optional filters on the rules to return.</td>
</tr>
<tr>
<td><code>topn</code></td>
<td>Returns the n top rules ordered by confidence and then support, both descending. If you specify a sort order, then the top n rules are derived after the sort is performed. If <code>topn</code> is specified and no maximum or minimum rule length is specified, then the only columns allowed in the sort order are <code>RULE_CONFIDENCE</code> and <code>RULE_SUPPORT</code>. If <code>topn</code> is specified and a maximum or minimum rule length is specified, then <code>RULE_CONFIDENCE</code>, <code>RULE_SUPPORT</code>, and <code>NUMBER_OF_ITEMS</code> are allowed in the sort order.</td>
</tr>
<tr>
<td><code>rule_id</code></td>
<td>Identifier of the rule to return. If you specify a value for <code>rule_id</code>, do not specify values for the other filtering parameters.</td>
</tr>
<tr>
<td><code>min_confidence</code></td>
<td>Returns the rules with confidence greater than or equal to this number.</td>
</tr>
<tr>
<td><code>min_support</code></td>
<td>Returns the rules with support greater than or equal to this number.</td>
</tr>
</tbody>
</table>
Table 43-60  (Cont.) GET_ASSOCIATION_RULES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_rule_length</td>
<td>Returns the rules with a length less than or equal to this number. Rule length refers to the number of items in the rule (See NUMBER_OF_ITEMS in Table 43-61). For example, in the rule A=&gt;B (if A, then B), the number of items is 2. If max_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.</td>
</tr>
<tr>
<td>min_rule_length</td>
<td>Returns the rules with a length greater than or equal to this number. See max_rule_length for a description of rule length. If min_rule_length is specified, then the NUMBER_OF_ITEMS column is permitted in the sort order.</td>
</tr>
<tr>
<td>sort_order</td>
<td>Sorts the rules by the values in one or more of the returned columns. Specify one or more column names, each followed by ASC for ascending order or DESC for descending order. (See Table 43-61 for the column names.) For example, to sort the result set in descending order first by the NUMBER_OF_ITEMS column, then by the RULE_CONFIDENCE column, you must specify: ORA_MINING_VARCHAR2_NT ('NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC') If you specify topn, the results will vary depending on the sort order. By default, the results are sorted by Confidence in descending order, then by Support in descending order.</td>
</tr>
<tr>
<td>antecedent_items</td>
<td>Returns the rules with these items in the antecedent.</td>
</tr>
<tr>
<td>consequent_items</td>
<td>Returns the rules with this item in the consequent.</td>
</tr>
<tr>
<td>min_lift</td>
<td>Returns the rules with lift greater than or equal to this number.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

The object type returned by GET_ASSOCIATION_RULES is described in Table 43-61. For descriptions of each field, see the Usage Notes.

Table 43-61  GET_ASSOCIATION RULES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_RULES</td>
<td>A set of rows of type DM_RULE. The rows have the following columns:</td>

</tbody>
</table>
Table 43-61   (Cont.) GET_ASSOCIATION RULES Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_PREDICATES</td>
<td>The antecedent and consequent columns each return nested tables of type DM_PREDICATES. The rows, of type DM_PREDICATE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>(attribute_name        VARCHAR2(4000),</td>
<td></td>
</tr>
<tr>
<td>attribute_subname       VARCHAR2(4000),</td>
<td></td>
</tr>
<tr>
<td>conditional_operator    CHAR(2)/*=,&lt;&gt;,&lt;,&gt;,&lt;,&gt;=,&gt;/,</td>
<td></td>
</tr>
<tr>
<td>attribute_num_value     NUMBER,</td>
<td></td>
</tr>
<tr>
<td>attribute_str_value     VARCHAR2(4000),</td>
<td></td>
</tr>
<tr>
<td>attribute_support       NUMBER,</td>
<td></td>
</tr>
<tr>
<td>attribute_confidence    NUMBER)</td>
<td></td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_RULES. For information on Data Mining data types and piped output from table functions, see "Datatypes".

2. ORA_MINING_VARCHAR2_NT is defined as a table of VARCHAR2(4000).

3. The columns returned by GET_ASSOCIATION_RULES are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_RULES</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_id</td>
<td>Unique identifier of the rule</td>
</tr>
<tr>
<td>antecedent</td>
<td>The independent condition in the rule. When this condition exists, the dependent condition in the consequent also exists.</td>
</tr>
<tr>
<td></td>
<td>The condition is a combination of attribute values called a predicate (DM_PREDICATE). The predicate specifies a condition for each attribute. The condition may specify equality (=), inequality (&lt;&gt;), greater than (&gt;), less than (&lt;), greater than or equal to (&gt;=), or less than or equal to (&lt;=) a given value.</td>
</tr>
<tr>
<td></td>
<td>Support and Confidence for each attribute condition in the antecedent is returned in the predicate. Support is the number of transactions that satisfy the antecedent. Confidence is the likelihood that a transaction will satisfy the antecedent.</td>
</tr>
<tr>
<td></td>
<td>Note: The occurrence of the attribute as a DM_PREDICATE indicates the presence of the item in the transaction. The actual value for attribute_num_value or attribute_str_value is meaningless.</td>
</tr>
<tr>
<td></td>
<td>For example, the following predicate indicates that 'Mouse Pad' is present in the transaction even though the attribute value is NULL.</td>
</tr>
<tr>
<td></td>
<td>DM_PREDICATE('PROD_NAME',</td>
</tr>
<tr>
<td></td>
<td>'Mouse Pad', '=' , NULL, NULL, NULL,</td>
</tr>
<tr>
<td></td>
<td>NULL))</td>
</tr>
<tr>
<td>consequent</td>
<td>The dependent condition in the rule. This condition exists when the antecedent exists.</td>
</tr>
<tr>
<td></td>
<td>The consequent, like the antecedent, is a predicate (DM_PREDICATE).</td>
</tr>
<tr>
<td></td>
<td>Support and confidence for each attribute condition in the consequent is returned in the predicate. Support is the number of transactions that satisfy the consequent. Confidence is the likelihood that a transaction will satisfy the consequent.</td>
</tr>
<tr>
<td>Column in DM_RULES</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>rule_support</td>
<td>The number of transactions that satisfy the rule.</td>
</tr>
<tr>
<td>rule_confidence</td>
<td>The likelihood of a transaction satisfying the rule.</td>
</tr>
<tr>
<td>rule_lift</td>
<td>The degree of improvement in the prediction over random chance when the rule is satisfied.</td>
</tr>
<tr>
<td>antecedent_support</td>
<td>The ratio of the number of transactions that satisfy the antecedent to the total number of transactions.</td>
</tr>
<tr>
<td>consequent_support</td>
<td>The ratio of the number of transactions that satisfy the consequent to the total number of transactions.</td>
</tr>
<tr>
<td>number_of_items</td>
<td>The total number of attributes referenced in the antecedent and consequent of the rule.</td>
</tr>
</tbody>
</table>

Examples

The following example demonstrates an Association model build followed by several invocations of the GET_ASSOCIATION_RULES table function:

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS
SELECT *
FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_%';
BEGIN
-- update the value of the minimum confidence
UPDATE market_settings
SET setting_value = TO_CHAR(0.081)
WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;
-- build an AR model
DBMS_DATA_MINING.CREATE_MODEL(
    model_name => 'market_model',
    function => DBMS_DATA_MINING.ASSOCIATION,
    data_table_name => 'market_build',
    case_id_column_name => 'item_id',
    target_column_name => NULL,
    settings_table_name => 'market_settings');
END;
/
-- View the (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model'));
```

In the previous example, you view all rules. To view just the top 20 rules, use the following statement.

```sql
-- View the top 20 (unformatted) rules
SELECT rule_id, antecedent, consequent, rule_support,
    rule_confidence
FROM TABLE(DBMS_DATA_MINING.GET_ASSOCIATION_RULES('market_model', 20));
```

The following query uses the Association model AR_SH_SAMPLE, which is created from one of the Oracle Data Mining sample programs:

```sql
SELECT * FROM TABLE (DBMS_DATA_MINING.GET_ASSOCIATION_RULES ( 'AR_SH_SAMPLE', 10, NULL, 0.5, 0.01, 2, 1,
```
ORA_MINING_VARCHAR2_NT ( 'NUMBER_OF_ITEMS DESC', 'RULE_CONFIDENCE DESC', 'RULE_SUPPORT DESC'),
DM_ITEMS(DM_ITEM('CUSTPRODS', 'Mouse Pad', 1, NULL),
DM_ITEM('CUSTPRODS', 'Standard Mouse', 1, NULL),
DM_ITEMS(DM_ITEM('CUSTPRODS', 'Extension Cable', 1, NULL)));

The query returns three rules, shown as follows:

13 DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Mouse Pad', ' = ', 1, NULL, NULL, NULL),
    DM_PREDICATE('CUSTPRODS', 'Standard Mouse', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
.15532  .84393  2.7075  .18404  .3117  2

11 DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Standard Mouse', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
.18085  .56291  1.8059  .32128  .3117  1

9 DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Mouse Pad', ' = ', 1, NULL, NULL, NULL))
DM_PREDICATES(
    DM_PREDICATE('CUSTPRODS', 'Extension Cable', ' = ', 1, NULL, NULL, NULL))
.17766  .55116  1.7682  .32234  .3117  1

Oracle Data Mining User’s Guide for Model Detail Views.

43.6.17 GET_FREQUENT_ITEMSETS Function

The GET_FREQUENT_ITEMSETS function returns a set of rows that represent the frequent itemsets from an Association model.

For a detailed description of frequent itemsets, consult Oracle Data Mining Concepts.

Syntax

DBMS_DATA_MINING.get_frequent_itemsets(
    model_name IN VARCHAR2,
    topn IN NUMBER DEFAULT NULL,
    max_itemset_length IN NUMBER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_ItemSets PIPELINED;
Parameters

Table 43-62  GET_FREQUENT_ITEMSETS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>topn</td>
<td>When not NULL, return the top n rows ordered by support in descending order</td>
</tr>
<tr>
<td>max_itemset_length</td>
<td>Maximum length of an item set.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Note:

The partition_name columns applies only when the model is partitioned.

Return Values

Table 43-63  GET_FREQUENT_ITEMSETS Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_ITEMSETS</td>
<td>A set of rows of type DM_ITEMSET. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(partition_name VARCHAR2(128), itemsets_id NUMBER, items DM_ITEMS, support NUMBER, number_of_items NUMBER)</td>
</tr>
</tbody>
</table>

Note:

The partition_name columns applies only when the model is partitioned.

The items column returns a nested table of type DM_ITEMS. The rows have type DM_ITEM:

<table>
<thead>
<tr>
<th>attribute_name</th>
<th>VARCHAR2(4000),</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_subname</td>
<td>VARCHAR2(4000),</td>
</tr>
<tr>
<td>attribute_num_value</td>
<td>NUMBER,</td>
</tr>
<tr>
<td>attribute_str_value</td>
<td>VARCHAR2(4000))</td>
</tr>
</tbody>
</table>

Usage Notes

This table function pipes out rows of type DM_ITEMSETS. For information on Data Mining datatypes and piped output from table functions, see “Datatypes”.
Examples

The following example demonstrates an Association model build followed by an invocation of `GET_FREQUENT_ITEMSETS` table function from Oracle SQL.

```sql
-- prepare a settings table to override default settings
CREATE TABLE market_settings AS

   SELECT *

   FROM TABLE(DBMS_DATA_MINING.GET_DEFAULT_SETTINGS)
WHERE setting_name LIKE 'ASSO_';
BEGIN
   -- update the value of the minimum confidence
   UPDATE market_settings
   SET setting_value = TO_CHAR(0.081)
   WHERE setting_name = DBMS_DATA_MINING.asso_min_confidence;

   /* build a AR model */
   DBMS_DATA_MINING.CREATE_MODEL(
      model_name           => 'market_model',
      function             => DBMS_DATA_MINING.ASSOCIATION,
      data_table_name      => 'market_build',
      case_id_column_name  => 'item_id',
      target_column_name   => NULL,
      settings_table_name  => 'market_settings');
END;
/

-- View the (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model'));
```

In the example above, you view all itemsets. To view just the top 20 itemsets, use the following statement:

```sql
-- View the top 20 (unformatted) Itemsets from SQL*Plus
SELECT itemset_id, items, support, number_of_items
FROM TABLE(DBMS_DATA_MINING.GET_FREQUENT_ITEMSETS('market_model', 20));
```

Oracle Data Mining User's Guide

43.6.18 GET_MODEL_COST_MATRIX Function

The `GET_*` interfaces are replaced by model views, and Oracle recommends that users leverage the views instead. The `GET_MODEL_COST_MATRIX` function is replaced by the `DM$VC` prefixed view, Scoring Cost Matrix. The cost matrix used when building a Decision Tree is made available by the `DM$VM` prefixed view, Decision Tree Build Cost Matrix.

Refer to Model Detail View for Classification Algorithm.

The `GET_MODEL_COST_MATRIX` function returns the rows of a cost matrix associated with the specified model.
By default, this function returns the scoring cost matrix that was added to the model with the \texttt{ADD\_COST\_MATRIX} procedure. If you wish to obtain the cost matrix used to create a model, specify \texttt{cost\_matrix\_type\_create} as the \texttt{matrix\_type}. See Table 43-64.

See also \texttt{ADD\_COST\_MATRIX} Procedure.

Syntax

\begin{verbatim}
DBMS\_DATA\_MINING\_GET\_MODEL\_COST\_MATRIX (  
    model_name                IN VARCHAR2,  
    matrix_type               IN VARCHAR2 DEFAULT cost_matrix_type_score)  
RETURN DM\_COST\_MATRIX PIPELINED;
\end{verbatim}

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>The type of cost matrix. costs_matrix_type_score — cost matrix used for scoring. (Default.) costs_matrix_type_create — cost matrix used to create the model (Decision Tree only).</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_COST_MATRIX</td>
<td>A set of rows of type DM_COST_ELEMENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>actual VARCHAR2(4000), NUMBER, predicted VARCHAR2(4000), cost NUMBER</td>
</tr>
</tbody>
</table>

Usage Notes

Only Decision Tree models can be built with a cost matrix. If you want to build a Decision Tree model with a cost matrix, specify the cost matrix table name in the \texttt{CLAS\_COST\_TABLE\_NAME} setting in the settings table for the model. See Table 43-7.

The cost matrix used to create a Decision Tree model becomes the default scoring matrix for the model. If you want to specify different costs for scoring, you can use the \texttt{REMOVE\_COST\_MATRIX} procedure to remove the cost matrix and the \texttt{ADD\_COST\_MATRIX} procedure to add a new one.

The \texttt{GET\_MODEL\_COST\_MATRIX} may return either the build or scoring cost matrix defined for a model or model partition.

If you do not specify a partitioned model name, then an error is displayed.
Example

This example returns the scoring cost matrix associated with the Naive Bayes model NB_SH_CLAS_SAMPLE.

column actual format a10
column predicted format a10

```
SELECT *
FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample'))
ORDER BY predicted, actual;
```

<table>
<thead>
<tr>
<th>ACTUAL</th>
<th>PREDICTED</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>.00</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>.75</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>.25</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>.00</td>
</tr>
</tbody>
</table>

43.6.19 GET_MODELDETAILS_AI Function

The `GET_MODELDETAILS_AI` function returns a set of rows that provide the details of an Attribute Importance model.

Syntax

```
DBMS_DATA_MINING.get_model_details_ai(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN dm_ranked_attributes pipelined;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form <code>[schema_name.]model_name</code>. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_RANKED_ATTRIBUTES</td>
<td>A set of rows of type <code>DM_RANKED_ATTRIBUTE</code>. The rows have the following columns:</td>
</tr>
</tbody>
</table>

\[
\begin{align*}
\text{attribute_name} & : \text{VARCHAR2(4000)}, \\
\text{attribute_subname} & : \text{VARCHAR2(4000)}, \\
\text{importance_value} & : \text{NUMBER}, \\
\text{rank} & : \text{NUMBER(38)}
\end{align*}
\]
Examples

The following example returns model details for the Attribute Importance model AI_SH_sample, which was created by the sample program dmaidemo.sql. For information about the sample programs, see Oracle Data Mining User's Guide.

```sql
SELECT attribute_name, importance_value, rank
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_AI('AI_SH_sample'))
ORDER BY RANK;
```

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>IMPORTANCE_VALUE</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOUSEHOLD_SIZE</td>
<td>.151685183</td>
<td>1</td>
</tr>
<tr>
<td>CUST_MARITAL_STATUS</td>
<td>.145294546</td>
<td>2</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td>.07838928</td>
<td>3</td>
</tr>
<tr>
<td>AGE</td>
<td>.075027496</td>
<td>4</td>
</tr>
<tr>
<td>Y_BOX_GAMES</td>
<td>.063039952</td>
<td>5</td>
</tr>
<tr>
<td>EDUCATION</td>
<td>.059605314</td>
<td>6</td>
</tr>
<tr>
<td>HOME_THEATER_PACKAGE</td>
<td>.056458722</td>
<td>7</td>
</tr>
<tr>

</tr>
<tr>
<td>CUST_INCOME_LEVEL</td>
<td>-.03951311</td>
<td>16</td>
</tr>
</tbody>
</table>

43.6.20 GET_MODELDETAILS_EM Function

The GET_MODELDETAILS_EM function returns a set of rows that provide statistics about the clusters produced by an Expectation Maximization model.

By default, the EM algorithm groups components into high-level clusters, and GET_MODELDETAILS_EM returns only the high-level clusters with their hierarchies. Alternatively, you can configure EM model to disable the grouping of components into high-level clusters. In this case, GET_MODELDETAILS_EM returns the components themselves as clusters with their hierarchies. See Table 43-11.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_em(
    model_name VARCHAR2,
    cluster_id NUMBER DEFAULT NULL,
    attribute VARCHAR2 DEFAULT NULL,
    centroid NUMBER DEFAULT 1,
    histogram NUMBER DEFAULT 1,
    rules NUMBER DEFAULT 2,
    attribute_subname VARCHAR2 DEFAULT NULL,
    topn_attributes NUMBER DEFAULT NULL,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN dm_clusters PIPELINED;
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise, the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 1: Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 0: Details about centroids are not returned</td>
</tr>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 1: Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 0: Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 2: Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 1: Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>• 0: No information about rules is returned</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of a nested attribute. The full name of a nested attribute has the form:</td>
</tr>
<tr>
<td></td>
<td>attribute_name.attribute_subname</td>
</tr>
<tr>
<td></td>
<td>where attribute_name is the name of the column and attribute_subname is the name of the nested attribute in that column. If the attribute is not nested, then attribute_subname is null.</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the n attributes with the highest confidence values in the rules are returned. If the number of attributes included in the rules is less than topn, then, up to n additional attributes in alphabetical order are returned. If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

### Usage Notes

1. For information on Data Mining datatypes and Return Values for Clustering Algorithms piped output from table functions, see "Datatypes".

2. GET_MODELDETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.
3. When cluster statistics are disabled (EMCS_CLUSTER_STATISTICS is set to EMCS_CLUS_STATS_DISABLE), GET_MODEL_DETAILS_EM does not return centroids, histograms, or rules. Only taxonomy (hierarchy) and cluster counts are returned.

4. When the partition_name is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

43.6.21 GET_MODEL_DETAILS_EM_COMP Function

The GET_MODEL_DETAILS_EM_COMP table function returns a set of rows that provide details about the parameters of an Expectation Maximization model.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_em_comp(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_EM_COMPONENT_SET PIPELINED;
```

Parameters

Table 43-69  GET_MODEL_DETAILS_EM_COMP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model to retrieve details for.</td>
</tr>
</tbody>
</table>

Return Values

Table 43-70  GET_MODEL_DETAILS_EM_COMP Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_EM_COMPONENT_SET</td>
<td>A set of rows of type DM_EM_COMPONENT. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(info_type VARCHAR2(30), component_id NUMBER, cluster_id NUMBER, attribute_name VARCHAR2(4000), covariate_name VARCHAR2(4000), attribute_value VARCHAR2(4000), value NUMBER )</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_EM_COMPONENT. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

The columns in each row returned by GET_MODEL_DETAILS_EM_COMP are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_EM_COMPONENT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_type</td>
<td>The type of information in the row. The following information types are supported:</td>
</tr>
<tr>
<td></td>
<td>• cluster</td>
</tr>
<tr>
<td></td>
<td>• prior</td>
</tr>
<tr>
<td></td>
<td>• mean</td>
</tr>
<tr>
<td></td>
<td>• covariance</td>
</tr>
<tr>
<td></td>
<td>• frequency</td>
</tr>
<tr>
<td>component_id</td>
<td>Unique identifier of a component</td>
</tr>
<tr>
<td>cluster_id</td>
<td>Unique identifier of the high-level leaf cluster for each component</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of an original attribute or a derived feature ID. The derived feature ID is used in models built on data with nested columns. The derived feature definitions can be obtained from the GET_MODEL_DETAILS_EM_PROJ Function.</td>
</tr>
<tr>
<td>covariate_name</td>
<td>Name of an original attribute or a derived feature ID used in variance/covariance definition</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Categorical value or bin interval for binned numerical attributes</td>
</tr>
<tr>
<td>value</td>
<td>Encodes different information depending on the value of info_type, as follows:</td>
</tr>
<tr>
<td></td>
<td>• cluster — The value field is NULL</td>
</tr>
<tr>
<td></td>
<td>• prior — The value field returns the component prior</td>
</tr>
<tr>
<td></td>
<td>• mean — The value field returns the mean of the attribute specified in attribute_name</td>
</tr>
<tr>
<td></td>
<td>• covariance — The value field returns the covariance of the attributes specified in attribute_name and covariate_name. Using the same attribute in attribute_name and covariate_name, returns the variance.</td>
</tr>
<tr>
<td></td>
<td>• frequency— The value field returns the multivalued Bernoulli frequency parameter for the attribute/value combination specified by attribute_name and attribute_value</td>
</tr>
</tbody>
</table>

See Usage Note 2 for details.

2. The following table shows which fields are used for each info_type. The blank cells represent NULLs.

<table>
<thead>
<tr>
<th>info_type</th>
<th>component_id</th>
<th>cluster_id</th>
<th>attribute_name</th>
<th>covariate_name</th>
<th>attribute_value</th>
<th>value</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>prior</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>mean</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>covariance</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>frequency</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

3. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes
returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

4. When the value is **NULL** for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

### 43.6.22 GET_MODEL_DETAILS_EM_PROJ Function

The **GET_MODEL_DETAILS_EM_PROJ** function returns a set of rows that provide statistics about the projections produced by an Expectation Maximization model.

**Syntax**

```sql
DBMS_DATA_MINING.get_model_details_em_proj(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_EM_PROJECTION_SET PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| DM_EM_PROJECTION_SET      | A set of rows of type **DM_EM_PROJECTION**. The rows have the following columns:
|                           | (feature_name VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER ) |

**Usage Notes**

1. This table function pipes out rows of type **DM_EM_PROJECTION**. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

The columns in each row returned by **GET_MODEL_DETAILS_EM_PROJ** are described as follows:
<table>
<thead>
<tr>
<th>Column in DM_EM_PROJECTION</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature_name</td>
<td>Name of a derived feature. The feature maps to the attribute_name returned by the GET_MODEL_DETAILS_EM Function.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of a column in the build data</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Subname in a nested column</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Categorical value</td>
</tr>
<tr>
<td>coefficient</td>
<td>Projection coefficient. The representation is sparse; only the non-zero coefficients are returned.</td>
</tr>
</tbody>
</table>

2. GET_MODEL_DETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information.

3. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

43.6.23 GET_MODEL_DETAILS_GLM Function

The GET_MODEL_DETAILS_GLM function returns the coefficient statistics for a Generalized Linear Model.

The same set of statistics is returned for both linear and Logistic Regression, but statistics that do not apply to the mining function are returned as NULL. For more details, see the Usage Notes.

Syntax

```
DBMS_DATA_MINING.get_model_details_glm(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL) RETURN DM_GLM_Coeff_Set PIPELINED;
```

Parameters

Table 43-73 GET_MODEL_DETAILS_GLM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

<td></td>
<td>exp_lower_coeff_limit      BINARY_DOUBLE,</td>
</tr>
<tr>
<td></td>
<td>exp_upper_coeff_limit      BINARY_DOUBLE)</td>
</tr>
</tbody>
</table>

GET_MODELDETAILS_GLM returns a row of statistics for each attribute and one extra row for the intercept, which is identified by a null value in the attribute name. Each row has the DM_GLM_COEFF datatype. The statistics are described in Table 43-75.

Table 43-75  DM_GLM_COEFF Datatype Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>class</td>
<td>The non-reference target class for Logistic Regression. The model is built to predict the probability of this class.</td>
</tr>
<tr>
<td></td>
<td>The other class (the reference class) is specified in the model setting GLMS_REFERENCE_CLASS_NAME. See Table 43-16.</td>
</tr>
<tr>
<td></td>
<td>For Linear Regression, class is null.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The attribute name when there is no subname, or first part of the attribute name when there is a subname. The value of attribute_name is also the name of the column in the case table that is the source for this attribute.</td>
</tr>
<tr>
<td></td>
<td>For the intercept, attribute_name is null. Intercepts are equivalent to the bias term in SVM models.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>The name of an attribute in a nested table. The full name of a nested attribute has the form:</td>
</tr>
<tr>
<td></td>
<td>attribute_name.attribute_subname</td>
</tr>
<tr>
<td></td>
<td>where attribute_name is the name of the nested column in the case table that is the source for this attribute.</td>
</tr>
<tr>
<td></td>
<td>If the attribute is not nested, then attribute_subname is null. If the attribute is an intercept, then both the attribute_name and the attribute_subname are null.</td>
</tr>
</tbody>
</table>
### Table 43-75(Cont.) DM_GLM_COEFF Datatype Description

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_value</td>
<td>The value of the attribute (categorical attribute only). For numeric attributes, attribute_value is null.</td>
</tr>
<tr>
<td>feature_expression</td>
<td>The feature name constructed by the algorithm when feature generation is enabled and higher-order features are found. If feature selection is not enabled, then the feature name is simply the fully-qualified attribute name (attribute_name.attribute_subname if the attribute is in a nested column). For categorical attributes, the algorithm constructs a feature name that has the following form: fully-qualified_attribute_name.attribute_value. For numeric attributes, the algorithm constructs a name for the higher-order feature by taking the product of the resulting values: (attrib1)<em>(attrib2)</em>...... where attrib1 and attrib2 are fully-qualified attribute names.</td>
</tr>
<tr>
<td>coefficient</td>
<td>The linear coefficient estimate.</td>
</tr>
<tr>
<td>std_error</td>
<td>Standard error of the coefficient estimate.</td>
</tr>
<tr>
<td>test_statistic</td>
<td>For Linear Regression, the t-value of the coefficient estimate. For Logistic Regression, the Wald chi-square value of the coefficient estimate.</td>
</tr>
<tr>
<td>p-value</td>
<td>Probability of the test_statistic. Used to analyze the significance of specific attributes in the model.</td>
</tr>
<tr>
<td>VIF</td>
<td>Variance Inflation Factor. The value is zero for the intercept. For Logistic Regression, VIF is null. VIF is not computed if the solver is Cholesky.</td>
</tr>
<tr>
<td>std_coefficient</td>
<td>Standardized estimate of the coefficient.</td>
</tr>
<tr>
<td>lower_coeff_limit</td>
<td>Lower confidence bound of the coefficient.</td>
</tr>
<tr>
<td>upper_coeff_limit</td>
<td>Upper confidence bound of the coefficient.</td>
</tr>
<tr>
<td>exp_coefficient</td>
<td>Exponentiated coefficient for Logistic Regression. For Linear Regression, exp_coefficient is null.</td>
</tr>
<tr>
<td>exp_lower_coeff_limit</td>
<td>Exponentiated coefficient for lower confidence bound of the coefficient for Logistic Regression. For Linear Regression, exp_lower_coeff_limit is null.</td>
</tr>
<tr>
<td>exp_upper_coeff_limit</td>
<td>Exponentiated coefficient for upper confidence bound of the coefficient for Logistic Regression. For Linear Regression, exp_lower_coeff_limit is null.</td>
</tr>
</tbody>
</table>

### Usage Notes

Not all statistics are necessarily returned for each coefficient. Statistics will be null if:

- They do not apply to the mining function. For example, exp_coefficient does not apply to Linear Regression.
- They cannot be computed from a theoretical standpoint. For information on ridge regression, see Table 43-16.
- They cannot be computed because of limitations in system resources.
Their values would be infinity.

When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns some of the model details for the GLM Regression model GLMR_SH_Regr_sample, which was created by the sample program dmglrdem.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

```

43.6.24 GET_MODEL_DETAILS_GLOBAL Function

The GET_MODEL_DETAILS_GLOBAL function returns statistics about the model as a whole.

Global details are available for Generalized Linear Models, Association Rules, Singular Value Decomposition, and Expectation Maximization. There are new Global model views which show global information for all algorithms. Oracle recommends that users leverage the views instead. Refer to Model Details View Global.

Syntax

```
DBMS_DATA_MINING.get_model_details_global(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_model_global_details PIPELINED;
```
Parameters

Table 43-76  GET_MODEL_DETAILS_GLOBAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name].model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>

</table>
43.6.25 GET_MODEL_DETAILS_KM Function

The GET_MODEL_DETAILS_KM function returns a set of rows that provide the details of a \( k \)-Means clustering model.

You can provide input to GET_MODEL_DETAILS_KM to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then GET_MODEL_DETAILS_KM returns all the information about the model.

Syntax

\[
\text{DBMS\_DATA\_MINING}.\text{get\_model\_details\_km}(\text{model\_name VARCHAR2, cluster\_id NUMBER DEFAULT NULL, attribute VARCHAR2 DEFAULT NULL, centroid NUMBER DEFAULT 1, histogram NUMBER DEFAULT 1, rules NUMBER DEFAULT 2, attribute\_subname VARCHAR2 DEFAULT NULL, topn\_attributes NUMBER DEFAULT NULL, partition\_name VARCHAR2 DEFAULT NULL)}\]

RETURN dm_clusters PIPELINED;

Parameters

Table 43-78  GET_MODEL_DETAILS_KM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema.name.]model.name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 1: Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 0: Details about centroids are not returned</td>
</tr>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 1: Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 0: Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 2: Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 1: Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>( \cdot ) 0: No information about rules is returned</td>
</tr>
</tbody>
</table>
### Table 43-78  (Cont.) GET_MODEL_DETAILS_KM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_subname</td>
<td>The name of a nested attribute. The full name of a nested attribute has the form:</td>
</tr>
<tr>
<td></td>
<td>[attribute_name.attribute_subname]</td>
</tr>
<tr>
<td></td>
<td>where attribute_name is the name of the column and attribute_subname is the name of the nested attribute in that column.</td>
</tr>
<tr>
<td></td>
<td>If the attribute is not nested, attribute_subname is null.</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the ( n ) attributes with the highest confidence values in the rules are returned.</td>
</tr>
<tr>
<td></td>
<td>If the number of attributes included in the rules is less than ( topn ), then up to ( n ) additional attributes in alphabetical order are returned.</td>
</tr>
<tr>
<td></td>
<td>If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

### Usage Notes

1. The table function pipes out rows of type DM_CLUSTERS. For information on Data Mining datatypes and Return Value for Clustering Algorithms piped output from table functions, see "Datatypes".

2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

### Examples

The following example returns model details for the \( k \)-Means clustering model KM_SH_Clus_sample, which was created by the sample program dmkmdemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.

```sql
SELECT T.id clu_id,
       T.record_count rec_cnt,
       T.parent parent,
       T.tree_level tree_level,
       T.dispersion dispersion
FROM (SELECT *
       FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_KM(    
           'KM_SH_Clus_sample'))
       ORDER BY id)
WHERE ROWNUM < 6;
```

<tr>
<td>5</td>
<td>486</td>
<td>3</td>
<td>3</td>
<td>5.42901522</td>
</tr>
</tbody>
</table>
43.6.26 GET_MODEL_DETAILS_NB Function

The GET_MODEL_DETAILS_NB function returns a set of rows that provide the details of a Naive Bayes model.

Syntax

```sql
DBMS_DATA_MINING.get_model_details_nb(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_NB_Details PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_NB_DETAILS</td>
<td>A set of rows of type DM_NB_DETAIL. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>{target_attribute_name VARCHAR2(30), target_attribute_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>target_attribute_num_value NUMBER, prior_probability NUMBER, conditionals</td>
</tr>
<tr>
<td></td>
<td>DM_CONDITIONALS)</td>
</tr>
<tr>
<td></td>
<td>The conditionals column of DM_NB_DETAIL returns a nested table of type</td>
</tr>
<tr>
<td></td>
<td>DM_CONDITIONALS. The rows, of type DM_CONDITIONAL, have the following</td>
</tr>
<tr>
<td></td>
<td>columns:</td>
</tr>
<tr>
<td></td>
<td>{attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_str_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_num_value NUMBER, conditional_probability NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

- The table function pipes out rows of type DM_NB_DETAILS. For information on Data Mining datatypes and piped output from table functions, see “Datatypes”.
- When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.
Examples

The following query is from the sample program `dmnbdemo.sql`. It returns model details about the model `NB_SH_Clas_sample`. For information about the sample programs, see `Oracle Data Mining User's Guide`.

The query creates labels from the bin boundary tables that were used to bin the training data. It replaces the attribute values with the labels. For numeric bins, the labels are `[lower_boundary,upper_boundary];` for categorical bins, the label matches the value it represents. (This method of categorical label representation will only work for cases where one value corresponds to one bin.) The target was not binned.

```sql
WITH
  bin_label_view AS (SELECT col, bin, (DECODE(bin,'1','[','(') || lv || ',' || val || ')') label
                     FROM (SELECT col, bin,
                            LAST_VALUE(val) OVER (PARTITION BY col ORDER BY val)
                            Rows BETWEEN UNBOUNDED PRECEDING AND 1 PRECEDING) lv, val
                     FROM nb_sh_sample_num)
  UNION ALL
  SELECT col, bin, val label
  FROM nb_sh_sample_cat),
model_details AS (SELECT T.target_attribute_name tname,
                    NVL(TO_CHAR(T.target_attribute_num_value,T.target_attribute_str_value)) tval,
                    C.attribute_name pname,
                    NVL(L.label, NVL(C.attribute_str_value, C.attribute_num_value)) pval,
                    T.prior_probability priorp,
                    C.conditional_probability condp
                    FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NB('NB_SH_Clas_sample')) T,
                    TABLE(T.conditionals) C,
                    bin_label_view L
                    WHERE C.attribute_name = L.col (+) AND
                          (NVL(C.attribute_str_value,C.attribute_num_value) = L.bin(+))
                    ORDER BY 1,2,3,4,5,6 )
  SELECT tname, tval, pname, pval, priorp, condp
  FROM model_details
  WHERE ROWNUM < 11;
```

</tr>
<tr>
<td></td>
<td>(feature_id NUMBER, mapped_feature_id VARCHAR2(4000), attribute_set DM_NMF_ATTRIBUTE_SET)</td>
</tr>
<tr>
<td></td>
<td>The attribute_set column of DM_NMF_FEATURE returns a nested table of type DM_NMF_ATTRIBUTE_SET. The rows, of type DM_NMF_ATTRIBUTE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000), attribute_value VARCHAR2(4000), coefficient NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

- The table function pipes out rows of type DM_NMF_FEATURE_SET. For information on Data Mining datatypes and piped output from table functions, see “Datatypes”.
- When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the feature extraction model NMF_SH_Sample, which was created by the sample program dmmndemo.sql. For information about the sample programs, see Oracle Data Mining User’s Guide.
SELECT * FROM {
SELECT F.feature_id,
    A.attribute_name,
    A.attribute_value,
    A.coefficient
FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('NMF_SH_Sample')) F,
    TABLE(F.attribute_set) A
ORDER BY feature_id,attribute_name,attribute_value
} WHERE ROWNUM < 11;

---

### 43.6.28 GET_MODEL_DETAILS_OC Function

The `GET_MODEL_DETAILS_OC` function returns a set of rows that provide the details of an O-Cluster clustering model. The rows are an enumeration of the Clustering patterns generated during the creation of the model.

You can provide input to `GET_MODEL_DETAILS_OC` to request specific information about the model, thus improving the performance of the query. If you do not specify filtering parameters, then `GET_MODEL_DETAILS_OC` returns all the information about the model.

**Syntax**

```sql
DBMS_DATA_MINING.get_model_details_oc(
    model_name VARCHAR2,
    cluster_id NUMBER DEFAULT NULL,
    attribute VARCHAR2 DEFAULT NULL,
    centroid NUMBER DEFAULT 1,
    histogram NUMBER DEFAULT 1,
    rules NUMBER DEFAULT 2,
    topn_attributes NUMBER DEFAULT NULL,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN dm_clusters PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>cluster_id</td>
<td>The ID of a cluster in the model. When a valid cluster ID is specified, only the details of this cluster are returned. Otherwise the details for all clusters are returned.</td>
</tr>
</tbody>
</table>
Table 43-83  (Cont.) GET_MODELDETAILS_OC Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of an attribute. When a valid attribute name is specified, only the details of this attribute are returned. Otherwise, the details for all attributes are returned.</td>
</tr>
<tr>
<td>centroid</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 1: Details about centroids are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 0: Details about centroids are not returned</td>
</tr>
<tr>
<td>histogram</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 1: Details about histograms are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 0: Details about histograms are not returned</td>
</tr>
<tr>
<td>rules</td>
<td>This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• 2: Details about rules are returned (default)</td>
</tr>
<tr>
<td></td>
<td>• 1: Rule summaries are returned</td>
</tr>
<tr>
<td></td>
<td>• 0: No information about rules is returned</td>
</tr>
<tr>
<td>topn_attributes</td>
<td>Restricts the number of attributes returned in the centroid, histogram, and rules objects. Only the ( n ) attributes with the highest confidence values in the rules are returned.</td>
</tr>
<tr>
<td></td>
<td>If the number of attributes included in the rules is less than ( topn ), then up to ( n ) additional attributes in alphabetical order are returned.</td>
</tr>
<tr>
<td></td>
<td>If both the attribute and topn_attributes parameters are specified, then topn_attributes is ignored.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Usage Notes

1. For information about Data Mining datatypes and Return Values for Clustering Algorithms piped output from table functions, see "Datatypes".

2. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.

Examples

The following example returns model details for the clustering model OC_SH_Clus_sample, which was created by the sample program dmocdemo.sql. For information about the sample programs, see Oracle Data Mining User's Guide.

For each cluster in this example, the split predicate indicates the attribute and the condition used to assign records to the cluster's children during model build. It provides an important piece of information on how the population within a cluster can be divided up into two smaller clusters.

```
SELECT clu_id, attribute_name, op, s_value
  FROM (SELECT a.id clu_id, sp.attribute_name, sp.conditional_operator op,
            sp.attribute_str_value s_value
       FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_OC(
             'OC_SH_Clus_sample')) a,
    TABLE(a.split_predicate) sp
       ORDER BY a.id, op, s_value)
WHERE ROWNUM < 11;
```
43.6.29 GET_MODEL_SETTINGS Function

The GET_MODEL_SETTINGS function returns the settings used to build the given model.

Syntax

```sql
FUNCTION get_model_settings(model_name IN VARCHAR2)
    RETURN DM_Model_Settings PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SETTINGS</td>
<td>A set of rows of type DM_MODEL_SETTINGS. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>DM_MODEL_SETTINGS TABLE OF SYS.DM_MODEL_SETTING</td>
</tr>
<tr>
<td></td>
<td>Name</td>
</tr>
<tr>
<td></td>
<td>----------------------</td>
</tr>
<tr>
<td></td>
<td>SETTING_NAME</td>
</tr>
<tr>
<td></td>
<td>SETTING_VALUE</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_MODEL_SETTINGS. For information on Data Mining datatypes and piped output from table functions, see "DBMS_DATA_MINING Datatypes".

2. The setting names/values include both those specified by the user and any defaults assigned by the build process.
Examples

The following example returns model settings for an example Naive Bayes model.

<table>
<thead>
<tr>
<th>SETTING_NAME</th>
<th>SETTING_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALGO_NAME</td>
<td>ALGO_NAIVE_BAYES</td>
</tr>
<tr>
<td>PREP_AUTO</td>
<td>ON</td>
</tr>
<tr>
<td>ODM_MAX_PARTITIONS</td>
<td>1000</td>
</tr>
<tr>
<td>NABS_SINGLETON_THRESHOLD</td>
<td>0</td>
</tr>
<tr>
<td>CLAS_WEIGHTS_BALANCED</td>
<td>OFF</td>
</tr>
<tr>
<td>NABS_PAIRWISE_THRESHOLD</td>
<td>0</td>
</tr>
<tr>
<td>ODM_PARTITION_COLUMNS</td>
<td>GENDER,Y_BOX_GAMES</td>
</tr>
<tr>
<td>ODM_MISSING_VALUE_TREATMENT</td>
<td>ODM_MISSING_VALUE_AUTO</td>
</tr>
<tr>
<td>ODM_SAMPLING</td>
<td>ODM_SAMPLING_DISABLE</td>
</tr>
</tbody>
</table>

9 rows selected.

43.6.30 GET_MODEL_SIGNATURE Function

The GET_MODEL_SIGNATURE function returns the list of columns from the build input table that were used by the build process to train the model.

Syntax

FUNCTION get_model_signature (model_name IN VARCHAR2) RETURN DM_Model_Signature PIPELINED;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_MODEL_SIGNATURE</td>
<td>A set of rows of type DM_MODEL_SIGNATURE. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>DM_MODEL_SIGNATURE TABLE OF SYS.DM_MODEL_SIGNATURE_ATTRIBUTE</td>
</tr>
<tr>
<td></td>
<td>Name                      Type</td>
</tr>
<tr>
<td></td>
<td>ATTRIBUTE_NAME            VARCHAR2 (130)</td>
</tr>
<tr>
<td></td>
<td>ATTRIBUTE_TYPE            VARCHAR2 (106)</td>
</tr>
</tbody>
</table>
Usage Notes

1. This table function pipes out rows of type DM_MODEL_SIGNATURE. For information on Data Mining datatypes and piped output from table functions, see "DBMS_DATA_MINING Datatypes".

2. The signature names or types include only those attributes used by the build process.

Examples

The following example returns model settings for an example Naive Bayes model.

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>ATTRIBUTE_TYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGE</td>
<td>NUMBER</td>
</tr>
<tr>
<td>ANNUAL_INCOME</td>
<td>NUMBER</td>
</tr>
<tr>
<td>AVERAGE__ITEMS_PURCHASED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>BOOKKEEPING_APPLICATION</td>
<td>NUMBER</td>
</tr>
<tr>
<td>BULK_PACK_DISKETTES</td>
<td>NUMBER</td>
</tr>
<tr>
<td>BULK_PURCH_AVE_AMT</td>
<td>NUMBER</td>
</tr>
<tr>
<td>DISABLE_COOKIES</td>
<td>NUMBER</td>
</tr>
<tr>
<td>EDUCATION</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>FLAT_PANEL_MONITOR</td>
<td>NUMBER</td>
</tr>
<tr>
<td>GENDER</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>HOME_THEATER_PACKAGE</td>
<td>NUMBER</td>
</tr>
<tr>
<td>HOUSEHOLD_SIZE</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>MAILING_LIST</td>
<td>NUMBER</td>
</tr>
<tr>
<td>MARITAL_STATUS</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>NO_DIFFERENT_KIND_ITEMS</td>
<td>NUMBER</td>
</tr>
<tr>
<td>OCCUPATION</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>OS_DOC_SET_KANJI</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PETS</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PRINTER_SUPPLIES</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROMO_RESPOND</td>
<td>NUMBER</td>
</tr>
<tr>
<td>SHIPPING_ADDRESS_COUNTRY</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>SR_CITIZEN</td>
<td>NUMBER</td>
</tr>
<tr>
<td>TOP_REASON_FOR_SHOPPING</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>WKS_SINCE_LAST_PURCH</td>
<td>NUMBER</td>
</tr>
<tr>
<td>WORKCLASS</td>
<td>VARCHAR2</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td>NUMBER</td>
</tr>
<tr>
<td>Y_BOX_GAMES</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

27 rows selected.

43.6.31 GET_MODEL_DETAILS_SVD Function

The GET_MODEL_DETAILS_SVD function returns a set of rows that provide the details of a Singular Value Decomposition model. Oracle recommends to use model details view settings.

Refer to Model Details View for Singular Value Decomposition.

Syntax

```
DBMS_DATA_MINING.get_model_details_svd(
    model_name IN VARCHAR2,
    matrix_type IN VARCHAR2 DEFAULT NULL,
```
partition_name VARCHAR2 DEFAULT NULL)
RETURN DM_SVD_MATRIX_Set PIPELINED;

Parameters

Table 43-88 GET_MODELDETAILS_SVD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>matrix_type</td>
<td>Specifies which of the three SVD matrix types to return. Values are: U, S, V, and NULL. When matrix_type is null (default), all matrices are</td>
</tr>
<tr>
<td></td>
<td>returned.</td>
</tr>
<tr>
<td></td>
<td>The U matrix is only computed when the SVDS_UMATRIX_OUTPUT setting is enabled. It is not computed by default. If the model does not contain U</td>
</tr>
<tr>
<td></td>
<td>matrices and you set matrix_type to U, an empty set of rows is returned. See Table 43-22.</td>
</tr>
<tr>
<td>partition_name</td>
<td>A partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

Table 43-89 GET_MODELDETAILS_SVD Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVD_MATRIX_SET</td>
<td>A set of rows of type DM_SVD_MATRIX. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(matrix_type CHAR(1), feature_id NUMBER, mapped_feature_id VARCHAR2(4000), attribute_name VARCHAR2(4000), attribute_subname VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>case_id VARCHAR2(4000), value NUMBER, variance NUMBER, pct_cum_variance NUMBER)</td>
</tr>
</tbody>
</table>

Usage Notes

1. This table function pipes out rows of type DM_SVD_MATRIX. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".

The columns in each row returned by GET_MODELDETAILS_SVD are described as follows:

<table>
<thead>
<tr>
<th>Column in DM_SVD_MATRIX_SET</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>matrix_type</td>
<td>The type of matrix. Possible values are S, V, and U. This field is never null.</td>
</tr>
<tr>
<td>feature_id</td>
<td>The feature that the matrix entry refers to.</td>
</tr>
<tr>
<td>mapped_feature_id</td>
<td>A descriptive name for the feature.</td>
</tr>
<tr>
<td>Column in DM_SVD_MATRIX_SET</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Column name in the V matrix component bases. This field is null for the S and U matrices.</td>
</tr>
<tr>
<td>attribute_subname</td>
<td>Subname in the V matrix component bases. This is relevant only in the case of a nested column. This field is null for the S and U matrices.</td>
</tr>
<tr>
<td>case_id</td>
<td>Unique identifier of the row in the build data described by the U matrix projection. This field is null for the S and V matrices.</td>
</tr>
<tr>
<td>value</td>
<td>The matrix entry value.</td>
</tr>
<tr>
<td>variance</td>
<td>The variance explained by a component. It is non-null only for S matrix entries. This column is non-null only for S matrix entries and for SVD models with setting dbms_data_mining.svds_scoring_mode set to dbms_data_mining.svds_scoring_pca and the build data is centered, either manually or because the setting dbms_data_mining.prep_auto is set to dbms_data_mining.prep_auto_on.</td>
</tr>
<tr>
<td>pct_cum_variance</td>
<td>The percent cumulative variance explained by the components thus far. The components are ranked by the explained variance in descending order. This column is non-null only for S matrix entries and for SVD models with setting dbms_data_mining.svds_scoring_mode set to dbms_data_mining.svds_scoring_pca and the build data is centered, either manually or because the setting dbms_data_mining.prep_auto is set to dbms_data_mining.prep_auto_on.</td>
</tr>
</tbody>
</table>

2. The output of GET_MODEL_DETAILS is in sparse format. Zero values are not returned. Only the diagonal elements of the S matrix, the non-zero coefficients in the V matrix bases, and the non-zero U matrix projections are returned.

There is one exception: If the data row does not produce non-zero U Matrix projections, the case ID for that row is returned with NULL for the feature_id and value. This is done to avoid losing any records from the original data.

3. GET_MODELDETAILS functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

4. When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the preferred partition name.

43.6.32 GET_MODELDETAILS_SVM Function

The GET_MODELDETAILS_SVM function returns a set of rows that provide the details of a linear Support Vector Machine (SVM) model. If invoked for nonlinear SVM, it returns ORA-40215.

In linear SVM models, only nonzero coefficients are stored. This reduces storage and speeds up model loading. As a result, if an attribute is missing in the coefficient list returned by GET_MODELDETAILS_SVM, then the coefficient of this attribute should be interpreted as zero.
Syntax

```
DBMS_DATA_MINING.get_model_details_svm(
    model_name   VARCHAR2,
    reverse_coef NUMBER DEFAULT 0,
    partition_name VARCHAR2 DEFAULT NULL)
RETURN DM_SVM_Linear_Coeff_Set PIPELINED;
```

Parameters

Table 43-90  GET_MODEL_DETAILS_SVM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>reverse_coef</td>
<td>Whether or not GET_MODEL_DETAILS_SVM should transform the attribute coefficients using the original attribute transformations.</td>
</tr>
<tr>
<td></td>
<td>When reverse_coef is set to 0 (default), GET_MODEL_DETAILS_SVM returns the coefficients directly from the model without applying transformations.</td>
</tr>
<tr>
<td></td>
<td>When reverse_coef is set to 1, GET_MODEL_DETAILS_SVM transforms the coefficients and bias by applying the normalization shifts and scales that</td>
</tr>
<tr>
<td></td>
<td>were generated using automatic data preparation.</td>
</tr>
<tr>
<td></td>
<td>See Usage Note 4.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

Table 43-91  GET_MODEL_DETAILS_SVM Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_SVM_LINEAR_COEFF_SET</td>
<td>A set of rows of type DM_SVM_LINEAR_COEFF. The rows have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(class         VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_set  DM_SVM_ATTRIBUTE_SET)</td>
</tr>
<tr>
<td></td>
<td>The attribute_set column returns a nested table of type DM_SVM_ATTRIBUTE_SET. The rows, of type DM_SVM_ATTRIBUTE, have the following columns:</td>
</tr>
<tr>
<td></td>
<td>(attribute_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_subname VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>attribute_value VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>coefficient    NUMBER)</td>
</tr>
</tbody>
</table>

See Usage Notes.

Usage Notes

1. This table function pipes out rows of type DM_SVM_LINEAR_COEFF. For information on Data Mining datatypes and piped output from table functions, see "Datatypes".
2. The class column of DM_SVM_LINEAR_COEFF contains Classification target values. For SVM Regression models, class is null. For each Classification target value, a set
of coefficients is returned. For Binary Classification, one-class Classification, and Regression models, only a single set of coefficients is returned.

3. **The attribute_value column in DM_SVM_ATTRIBUTE_SET is used for categorical attributes.**

4. **GET_MODELDETAILS** functions preserve model transparency by automatically reversing the transformations applied during the build process. Thus the attributes returned in the model details are the original attributes (or a close approximation of the original attributes) used to build the model.

   The coefficients are related to the transformed, not the original, attributes. When returned directly with the model details, the coefficients may not provide meaningful information. If you want **GET_MODELDETAILS** to transform the coefficients such that they relate to the original attributes, set the `reverse_coef` parameter to 1.

5. **When the value is NULL for a partitioned model, an exception is thrown. When the value is not null, it must contain the desired partition name.**

**Examples**

The following example returns model details for the SVM Classification model `SVMC_SH_Clas_sample`, which was created by the sample program `dmsvcdem.sql`. For information about the sample programs, see *Oracle Data Mining User's Guide*.

```sql
WITH mod_dtls AS (
    SELECT *
    FROM TABLE(DBMS_DATA_MINING.GET_MODELDETAILS_SVM('SVMC_SH_Clas_sample'))
),
model_details AS (
    SELECT D.class, A.attribute_name, A.attribute_value, A.coefficient
    FROM mod_dtls D,
    TABLE(D.attribute_set) A
    ORDER BY D.class, ABS(A.coefficient) DESC
)
SELECT class, attribute_name aname, attribute_value aval, coefficient coeff
FROM model_details
WHERE ROWNUM < 11;
```

<table>
<thead>
<tr>
<th>CLASS</th>
<th>ANAME</th>
<th>AVAL</th>
<th>COEFF</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><em>(null)</em></td>
<td><em>(null)</em></td>
<td><em>(null)</em></td>
</tr>
<tr>
<td>1</td>
<td>BOOKKEEPING_APPLICATION</td>
<td><em>(null)</em></td>
<td>-2.85</td>
</tr>
<tr>
<td>1</td>
<td>OCCUPATION</td>
<td>Other</td>
<td>-0.94</td>
</tr>
<tr>
<td>1</td>
<td>HOUSEHOLD_SIZE</td>
<td>4-5</td>
<td>0.88</td>
</tr>
<tr>
<td>1</td>
<td>CUST_MARITAL_STATUS</td>
<td>Married</td>
<td>0.82</td>
</tr>
<tr>
<td>1</td>
<td>YRS_RESIDENCE</td>
<td><em>(null)</em></td>
<td>0.76</td>
</tr>
<tr>
<td>1</td>
<td>HOUSEHOLD_SIZE</td>
<td>6-8</td>
<td>-0.74</td>
</tr>
<tr>
<td>1</td>
<td>OCCUPATION</td>
<td>Exec.</td>
<td>0.71</td>
</tr>
<tr>
<td>1</td>
<td>EDUCATION</td>
<td>11th</td>
<td>-0.71</td>
</tr>
<tr>
<td>1</td>
<td>EDUCATION</td>
<td>Masters</td>
<td>0.63</td>
</tr>
</tbody>
</table>
43.6.33 GET_MODELDETAILS_XML Function

This function returns an XML object that provides the details of a Decision Tree model.

Syntax

```
DBMS_DATA_MINING.get_model_details_xml(
    model_name IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL)
RETURN XMLType;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XMLTYPE</td>
<td>The XML definition for the Decision Tree model. See &quot;XMLTYPE&quot; for details.</td>
</tr>
</tbody>
</table>

The XML definition conforms to the Data Mining Group Predictive Model Markup Language (PMML) version 2.1 specification. The specification is available at [http://www.dmg.org](http://www.dmg.org).

If a nested attribute is used as a splitter, the attribute will appear in the XML document as field="<column_name>.<subname>", as opposed to the non-nested attributes which appear in the document as field="<column_name>".

Note:

The column names are surrounded by single quotes and a period separates the column_name from the subname.

The rest of the document style remains unchanged.

Usage Notes

Special characters that cannot be displayed by Oracle XML are converted to ‘#’.
Examples

The following statements in SQL*Plus return the details of the Decision Tree model dt_sh_clas_sample. This model is created by the program dmdtdemo.sql, one of the sample data mining programs provided with Oracle Database Examples.

Note: The "&quot" characters you will see in the XML output are a result of SQL*Plus behavior. To display the XML in proper format, cut and past it into a file and open the file in a browser.

```
column dt_details format a320
SELECT
  dbms_data_mining.get_model_details_xml('dt_sh_clas_sample')
AS DT_DETAILS
FROM dual;
```

```
<PMML version="2.1">

    </costMatrix>
  </TreeModel>
</PMML>
```
43.6.34 GET_MODEL_TRANSFORMATIONS Function

This function returns the transformation expressions embedded in the specified model.

All GET_* interfaces are replaced by model views, and Oracle recommends that users reference the model views to retrieve the relevant information. The GET_MODEL_TRANSFORMATIONS function is replaced by the following:

- USER(/DBA/ALL)_MINING_MODEL_XFORMS: provides the user-embedded transformations
- DM$VX prefixed model view: provides text feature extraction information
- D$VN prefixed model view: provides normalization and missing value information
- DM$VB: provides binning information

See Also:

- “About Transformation Lists” in DBMS_DATA_MINING_TRANSFORM

Model Details View for Binning
Normalization and Missing Value Handling
Data Preparation for Text Features

Syntax

```sql
DBMS_DATA_MINING.get_model_transformations(
    model_name IN VARCHAR2,
```
partition_name IN VARCHAR2 DEFAULT NULL)
RETURN DM_Transforms PIPELINED;

Parameters

Table 43-94  GET_MODEL_TRANSFORMATIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Indicates the name of the model in the form [schema_name.]model_name. If you do not specify a schema, then your own schema is used.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Specifies a partition in a partitioned model</td>
</tr>
</tbody>
</table>

Return Values

Table 43-95  GET_MODEL_TRANSFORMATIONS Function Return Value

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DM_TRANSFORMS</td>
<td>The transformation expressions embedded in model_name.</td>
</tr>
<tr>
<td></td>
<td>The DM_TRANSFORMS type is a table of DM_TRANSFORM objects. Each DM_TRANSFORM has these fields:</td>
</tr>
<tr>
<td></td>
<td>attribute_name       VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>attribute_subname    VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td>expression           CLOB</td>
</tr>
<tr>
<td></td>
<td>reverse_expression   CLOB</td>
</tr>
</tbody>
</table>

Usage Notes

When Automatic Data Preparation (ADP) is enabled, both automatic and user-defined transformations may be associated with an attribute. In this case, the user-defined transformations are evaluated before the automatic transformations.

When invoked for a partitioned model, the partition_name parameter must be specified.

Examples

In this example, several columns in the SH.CUSTOMERS table are used to create a Naive Bayes model. A transformation expression is specified for one of the columns. The model does not use ADP.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_year_of_birth, cust_income_level, cust_credit_limit
    FROM sh.customers;

describe mining_data
Name                          Null?    Type

43.6.35 GET_TRANSFORM_LIST Procedure

This procedure converts transformation expressions specified as DM_TRANSFORMS to a transformation list (TRANSFORM_LIST) that can be used in creating a model. DM_TRANSFORMS is returned by the GET_MODEL_TRANSFORMATIONS function.

You can also use routines in the DBMS_DATA_MINING_TRANSFORM package to construct a transformation list.

See Also:

<td>reverse_expression CLOB</td>
</tr>
</tbody>
</table>

Examples

In this example, a model mod1 is trained using several columns in the SH.CUSTOMERS table. The model uses ADP, which automatically bins one of the columns.

A second model mod2 is trained on the same data without ADP, but it uses a transformation list that was obtained from mod1. As a result, both mod1 and mod2 have the same embedded transformation expression.

CREATE OR REPLACE VIEW mining_data AS

### 43.6.36 IMPORT_MODEL Procedure

This procedure imports one or more data mining models. The procedure is overloaded. You can call it to import mining models from a dump file set, or you can call it to import a single mining model from a PMML document.

#### Import from a dump file set

You can import mining models from a dump file set that was created by the `EXPORT_MODEL Procedure`. `IMPORT_MODEL` and `EXPORT_MODEL` use Oracle Data Pump technology to export to and import from a dump file set.

When Oracle Data Pump is used directly to export/import an entire schema or database, the mining models in the schema or database are included. `EXPORT_MODEL` and `IMPORT_MODEL` export/import mining models only.

#### Import from PMML

You can import a mining model represented in Predictive Model Markup Language (PMML). The model must be of type `RegressionModel`, either linear regression or binary logistic regression.

PMML is an XML-based standard specified by the Data Mining Group ([http://www.dmg.org](http://www.dmg.org)). Applications that are PMML-compliant can deploy PMML-compliant models that were created by any vendor. Oracle Data Mining supports the core features of PMML 3.1 for regression models.
See Also:

*Oracle Data Mining User's Guide* for more information about exporting and importing mining models

*Oracle Database Utilities* for information about Oracle Data Pump

[http://www.dmg.org/faq.html](http://www.dmg.org/faq.html) for more information about PMML

Syntax

Imports a mining model from a dump file set:

```sql
DBMS_DATA_MINING.IMPORT_MODEL (
    filename          IN  VARCHAR2,
    directory         IN  VARCHAR2,
    model_filter      IN  VARCHAR2 DEFAULT NULL,
    operation         IN  VARCHAR2 DEFAULT NULL,
    remote_link       IN  VARCHAR2 DEFAULT NULL,
    jobname           IN  VARCHAR2 DEFAULT NULL,
    schema_remap      IN  VARCHAR2 DEFAULT NULL,
    tablespace_remap  IN  VARCHAR2 DEFAULT NULL);
```

Imports a mining model from a PMML document:

```sql
DBMS_DATA_MINING.IMPORT_MODEL (
    model_name        IN  VARCHAR2,
    pmmldoc           IN  XMLTYPE
    strict_check      IN  BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 43-97  IMPORT_MODEL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Name of the dump file set from which the models should be imported. The dump file set must have been created by the <code>EXPORT_MODEL</code> procedure or the <code>expdp</code> export utility of Oracle Data Pump. The dump file set can contain one or more files. (Refer to &quot;EXPORT_MODEL Procedure&quot; for details.) If the dump file set contains multiple files, you can specify <code>'filename%U'</code> instead of listing them. For example, if your dump file set contains 3 files, <code>archive01.dmp</code>, <code>archive02.dmp</code>, and <code>archive03.dmp</code>, you can import them by specifying <code>'archive%U'</code>.</td>
</tr>
<tr>
<td><code>directory</code></td>
<td>Name of a pre-defined directory object that specifies where the dump file set is located. Both the exporting and the importing user must have read/write access to the directory object and to the file system directory that it identifies. Note: The target database must have also have read/write access to the file system directory.</td>
</tr>
</tbody>
</table>
Table 43-97  (Cont.) IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| model_filter| Optional parameter that specifies one or more models to import. If you do not specify a value for model_filter, all models in the dump file set are imported. You can also specify NULL (the default) or 'ALL' to import all models. The value of model_filter can be one or more model names. The following are valid filters.  
'mymodel1'  
'name IN ('mymodel2','mymodel3')'  
The first causes IMPORT_MODEL to import a single model named mymodel1. The second causes IMPORT_MODEL to import two models, mymodel2 and mymodel3. |
| operation    | Optional parameter that specifies whether to import the models or the SQL statements that create the models. By default, the models are imported. You can specify either of the following values for operation:  
• 'IMPORT' — Import the models (Default)  
• 'SQL_FILE' — Write the SQL DDL for creating the models to a text file. The text file is named job_name.sql and is located in the dump set directory. |
| remote_link  | Optional parameter that specifies the name of a database link to a remote system. The default value is NULL. A database link is a schema object in a local database that enables access to objects in a remote database. When you specify a value for remote_link, you can import models into the local database from the remote database. The import is fileless; no dump file is involved. The IMP_FULL_DATABASE role is required for importing the remote models. The EXP_FULL_DATABASE privilege, the CREATE DATABASE LINK privilege, and other privileges may also be required. (See Example 2.) |
| jobname      | Optional parameter that specifies the name of the import job. By default, the name has the form username_imp_nnnn, where nnnn is a number. For example, a job name in the SCOTT schema might be SCOTT_imp_134. If you specify a job name, it must be unique within the schema. The maximum length of the job name is 30 characters. A log file for the import job, named jobname.log, is created in the same directory as the dump file set. |
| schema_remap | Optional parameter for importing into a different schema. By default, models are exported and imported within the same schema. If the dump file set belongs to a different schema, you must specify a schema mapping in the form export_user:import_user. For example, you would specify 'SCOTT:MARY' to import a model exported by SCOTT into the MARY schema. Note: In some cases, you may need to have the IMP_FULL_DATABASE privilege or the SYS role to import a model from a different schema. |
Table 43-97  (Cont.) IMPORT_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_remap</td>
<td>Optional parameter for importing into a different tablespace. By default, models are exported and imported within the same tablescape. If the dump file set belongs to a different tablespace, you must specify a tablespace mapping in the form <code>export_tablespace:import_tablespace</code>. For example, you would specify <code>TBLSPC01:TBLSPC02</code> to import a model that was exported from <code>TBLSPC01</code> into <code>TBLSPC02</code>. Note: In some cases, you may need to have the <code>IMP_FULL_DATABASE</code> privilege or the <code>SYS</code> role to import a model from a different tablespace.</td>
</tr>
<tr>
<td>model_name</td>
<td>Name for the new model that will be created in the database as a result of an import from PMML. The name must be unique within the user's schema.</td>
</tr>
<tr>
<td>pmmldoc</td>
<td>The PMML document representing the model to be imported. The PMML document has an <code>XMLTYPE</code> object type. See &quot;XMLTYPE&quot; for details.</td>
</tr>
<tr>
<td>strict_check</td>
<td>Whether or not an error occurs when the PMML document contains sections that are not part of core PMML (for example, Output or Targets). Oracle Data Mining supports only core PMML; any non-core features may affect the scoring representation. If the PMML does not strictly conform to core PMML and <code>strict_check</code> is set to <code>TRUE</code>, then <code>IMPORT_MODEL</code> returns an error. If <code>strict_check</code> is <code>FALSE</code> (the default), then the error is suppressed. The model may be imported and scored.</td>
</tr>
</tbody>
</table>

Examples

1. This example shows a model being exported and imported within the schema `dmuser2`. Then the same model is imported into the `dmuser3` schema. The `dmuser3` user has the `IMP_FULL_DATABASE` privilege. The `dmuser2` user has been assigned the `USER2` tablespace; `dmuser3` has been assigned the `USER3` tablespace.

   SQL> connect dmuser2
   Enter password: dmuser2_password
   Connected.
   SQL> select model_name from user_mining_models;

   MODEL_NAME
   ------------------------
   NMF_SH_SAMPLE
   SVMO_SH_CLAS_SAMPLE
   SVMR_SH_REGR_SAMPLE

   -- export the model called NMF_SH_SAMPLE to a dump file in same schema
   SQL> EXECUTE DBMS_DATA_MINING.EXPORT_MODEL (
          filename => 'NMF_SH_SAMPLE_out',
          directory => 'DATA_PUMP_DIR',
          model_filter => 'name = ''NMF_SH_SAMPLE''' );

   -- import the model back into the same schema
   SQL> EXECUTE DBMS_DATA_MINING.IMPORT_MODEL (
          filename => 'NMF_SH_SAMPLE_out01.dmp',
          directory => 'DATA_PUMP_DIR',
          model_filter => 'name = ''NMF_SH_SAMPLE''' );

   -- connect as different user
   -- import same model into that schema
SQL> connect dmuser3
Enter password: dmuser3_password
Connected.
SQL> EXECUTE DBMS_DATA_MINING.IMPORT_MODEL (  
    filename => 'NMF_SH_SAMPLE_out01.dmp',  
    directory => 'DATA_PUMP_DIR',  
    model_filter => 'name = ''NMF_SH_SAMPLE''',  
    operation => 'IMPORT',  
    remote_link => NULL,  
    jobname => 'nmf_imp_job',  
    schema_remap => 'dmuser2:dmuser3',  
    tablespace_remap => 'USER2:USER3');

The following example shows user MARY importing all models from a dump file, model_exp_001.dmp, which was created by user SCOTT. User MARY has been assigned a tablespace named USER2; user SCOTT was assigned the tablespace USERS when the models were exported into the dump file model_exp_001.dmp. The dump file is located in the file system directory mapped to a directory object called DM_DUMP. If user MARY does not have IMP_FULL_DATABASE privileges, IMPORT_MODEL will raise an error.

-- import all models
DECLARE
    file_name  VARCHAR2(40);
BEGIN
    file_name := 'model_exp_001.dmp';
    DBMS_DATA_MINING.IMPORT_MODEL(  
        filename => 'file_name',  
        directory => 'DM_DUMP',  
        schema_remap => 'SCOTT:MARY',  
        tablespace_remap => 'USERS:USER2');
    DBMS_OUTPUT.PUT_LINE(  
        'DBMS_DATA_MINING.IMPORT_MODEL of all models from SCOTT done!');
END;
/

2. This example shows how the user xuser could import the model dmuser.r1mod from a remote database. The SQL*Net connection alias for the remote database is R1DB. The user xuser is assigned the SYSAUX tablespace; the user dmuser is assigned the TBS_1 tablespace.

CONNECT / AS SYSDBA;
GRANT CREATE DATABASE LINK TO xuser;
GRANT imp_full_database TO xuser;
CONNECT xuser/xuserpassword
CREATE DATABASE LINK dmuser_link
    CONNECT TO dmuser IDENTIFIED BY dmuserpassword USING 'R1DB';
EXEC dbms_data_mining.import_model (  
    NULL,  
    'DMUSER_DIR',  
    'R1MOD',  
    remote_link => 'DMUSER_LINK',  
    schema_remap => 'DMUSER:XUSER',  
    tablespace_remap => 'TBS_1:SYSAUX');
SELECT name FROM dm_user_models;

NAME
------------------------------------------
R1MOD
3. This example shows how a PMML document called `SamplePMML1.xml` could be imported from a location referenced by directory object `PMMLDIR` into the schema of the current user. The imported model will be called `PMMLMODEL1`.

```sql
BEGIN
    dbms_data_mining.import_model ('PMMLMODEL1',
        XMLType (bfilename ('PMMLDIR', 'SamplePMML1.xml'),
            nls_charset_id ('AL32UTF8')));
END;
```

**43.6.37 RANK_APPLY Procedure**

This procedure ranks the results of an APPLY operation based on a top-N specification for predictive and descriptive model results.

For classification models, you can provide a cost matrix as input, and obtain the ranked results with costs applied to the predictions.

**Syntax**

```sql
DBMS_DATA_MINING.RANK_APPLY (
    apply_result_table_name        IN VARCHAR2,
    case_id_column_name            IN VARCHAR2,
    score_column_name              IN VARCHAR2,
    score_criterion_column_name    IN VARCHAR2,
    ranked_apply_table_name        IN VARCHAR2,
    top_N                          IN NUMBER (38) DEFAULT 1,
    cost_matrix_table_name         IN VARCHAR2    DEFAULT NULL,
    apply_result_schema_name       IN VARCHAR2    DEFAULT NULL,
    cost_matrix_schema_name        IN VARCHAR2    DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apply_result_table_name</td>
<td>Name of the table or view containing the results of an APPLY operation on the test data set (see Usage Notes)</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the case identifier column. This must be the same as the one used for generating APPLY results.</td>
</tr>
<tr>
<td>score_column_name</td>
<td>Name of the prediction column in the apply results table</td>
</tr>
<tr>
<td>score_criterion_column_name</td>
<td>Name of the probability column in the apply results table</td>
</tr>
<tr>
<td>ranked_apply_result_table_name</td>
<td>Name of the table containing the ranked apply results</td>
</tr>
<tr>
<td>top_N</td>
<td>Top N predictions to be considered from the APPLY results for precision recall computation</td>
</tr>
<tr>
<td>cost_matrix_table_name</td>
<td>Name of the cost matrix table</td>
</tr>
<tr>
<td>apply_result_schema_name</td>
<td>Name of the schema hosting the APPLY results table</td>
</tr>
<tr>
<td>cost_matrix_schema_name</td>
<td>Name of the schema hosting the cost matrix table</td>
</tr>
</tbody>
</table>
Usage Notes

You can use `RANK_APPLY` to generate ranked apply results, based on a top-N filter and also with application of cost for predictions, if the model was built with costs.

The behavior of `RANK_APPLY` is similar to that of `APPLY` with respect to other DDL-like operations such as `CREATE_MODEL`, `DROP_MODEL`, and `RENAME_MODEL`. The procedure does not depend on the model; the only input of relevance is the apply results generated in a fixed schema table from `APPLY`.

The main intended use of `RANK_APPLY` is for the generation of the final `APPLY` results against the scoring data in a production setting. You can apply the model against test data using `APPLY`, compute various test metrics against various cost matrix tables, and use the candidate cost matrix for `RANK_APPLY`.

The schema for the apply results from each of the supported algorithms is listed in subsequent sections. The `case_id` column will be the same case identifier column as that of the apply results.

Classification Models — NB and SVM

For numerical targets, the ranked results table will have the definition as shown:

```sql
(case_id VARCHAR2/NUMBER,
prediction NUMBER,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

For categorical targets, the ranked results table will have the following definition:

```sql
(case_id VARCHAR2/NUMBER,
prediction VARCHAR2,
probability NUMBER,
cost NUMBER,
rank INTEGER)
```

Clustering Using `k`-Means or O-Cluster

Clustering is an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the cluster identifier corresponding to a case, and the associated probability. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the cluster ids ranked by top-N.

```sql
(case_id VARCHAR2/NUMBER,
cluster_id NUMBER,
probability NUMBER,
rank INTEGER)
```

Feature Extraction using NMF

Feature extraction is also an unsupervised mining function, and hence there are no targets. The results of an `APPLY` operation contains simply the feature identifier corresponding to a case, and the associated match quality. Cost matrix is not considered here. The ranked results table will have the definition as shown, and contains the feature ids ranked by top-N.

```sql
(case_id VARCHAR2/NUMBER,
feature_id NUMBER,
```
match_quality NUMBER,
rank INTEGER)

Examples

BEGIN
/* build a model with name census_model.
  * (See example under CREATE_MODEL)
  */

/* if training data was pre-processed in any manner,
  * perform the same pre-processing steps on apply
  * data also.
  * (See examples in the section on DBMS_DATA_MINING_TRANSFORM)
  */

/* apply the model to data to be scored */
DBMS_DATA_MINING.RANK_APPLY(
  apply_result_table_name       => 'census_apply_result',
  case_id_column_name           => 'person_id',
  score_column_name             => 'prediction',
  score_criterion_column_name   => 'probability',
  ranked_apply_result_tab_name  => 'census_ranked_apply_result',
  top_N                         => 3,
  cost_matrix_table_name        => 'census_cost_matrix');
END;
/

-- View Ranked Apply Results
SELECT *
FROM census_ranked_apply_result;

43.6.38 REMOVE_COST_MATRIX Procedure

The REMOVE_COST_MATRIX procedure removes the default scoring matrix from a classification model.

See Also:
- “ADD_COST_MATRIX Procedure”
- “REMOVE_COST_MATRIX Procedure”

Syntax

DBMS_DATA_MINING.REMOVE_COST_MATRIX (
  model_name IN VARCHAR2);

Parameters

Table 43-99  Remove_Cost_Matrix Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Name of the model in the form [schema_name.]model_name. If you do not specify a schema, your own schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

If the model is not in your schema, then REMOVE_COST_MATRIX requires the ALTER ANY MINING_MODEL system privilege or the ALTER object privilege for the mining model.

Example

The Naive Bayes model NB_SH_CLAS_SAMPLE has an associated cost matrix that can be used for scoring the model.

```sql
SQL> SELECT * FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample')) ORDER BY predicted, actual;
ACTUAL     PREDICTED     COST
---------- ---------- ----------
   0         0          0
   1         0          .75
   0         1          .25
   1         1          0
```

You can remove the cost matrix with REMOVE_COST_MATRIX.

```sql
SQL> EXECUTE dbms_data_mining.remove_cost_matrix('nb_sh_clas_sample');
SQL> SELECT * FROM TABLE(dbms_data_mining.get_model_cost_matrix('nb_sh_clas_sample')) ORDER BY predicted, actual;
no rows selected
```

43.6.39 RENAME_MODEL Procedure

This procedure changes the name of the mining model indicated by \textit{model\_name} to the name that you specify as \textit{new\_model\_name}.

If a model with \textit{new\_model\_name} already exists, then the procedure optionally renames \textit{new\_model\_name} to \textit{versioned\_model\_name} before renaming \textit{model\_name} to \textit{new\_model\_name}.

The model name is in the form [\textit{schema\_name}.]\textit{model\_name}. If you do not specify a schema, your own schema is used. For mining model naming restrictions, see the Usage Notes for “CREATE_MODEL Procedure”.

Syntax

```sql
DBMS\_DATA\_MINING.RENAME\_MODEL (  
  model\_name            IN VARCHAR2,  
  new\_model\_name        IN VARCHAR2,  
  versioned\_model\_name  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>model_name</td>
<td>Model to be renamed.</td>
</tr>
</tbody>
</table>
Table 43-100  (Cont.) RENAME_MODEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_model_name</td>
<td>New name for the model model_name.</td>
</tr>
<tr>
<td>versioned_model_name</td>
<td>New name for the model new_model_name if it already exists.</td>
</tr>
</tbody>
</table>

Usage Notes

If you attempt to rename a model while it is being applied, then the model will be renamed but the apply operation will return indeterminate results.

Examples

1. This example changes the name of model census_model to census_model_2012.

```
BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name => 'census_model',
    new_model_name => 'census_model_2012');
END;
/
```

2. In this example, there are two classification models in the user’s schema: clas_mod, the working model, and clas_mod_tst, a test model. The RENAME_MODEL procedure preserves clas_mod as clas_mod_old and makes the test model the new working model.

```
SELECT model_name FROM user_mining_models;
MODEL_NAME
-------------------------------------------------------------------
CLAS_MOD
CLAS_MOD_TST

BEGIN
  DBMS_DATA_MINING.RENAME_MODEL(
    model_name            => 'clas_mod_tst',
    new_model_name        => 'clas_mod',
    versioned_model_name  => 'clas_mod_old');
END;
/

SELECT model_name FROM user_mining_models;
MODEL_NAME
-------------------------------------------------------------------
CLAS_MOD
CLAS_MOD_OLD
```
DBMS_DATA_MINING_TRANSFORM implements a set of transformations that are commonly used in data mining.

This chapter contains the following topics:

- Overview
- Operational Notes
- Security Model
- Datatypes
- Constants
- Summary of DBMS_DATA_MINING_TRANSFORM Subprograms

See Also:

- DBMS_DATA_MINING
- Oracle Data Mining User's Guide

44.1 DBMS_DATA_MINING_TRANSFORM Overview

A transformation is a SQL expression that modifies the data in one or more columns. Data must typically undergo certain transformations before it can be used to build a mining model. Many data mining algorithms have specific transformation requirements.

Data that will be scored must be transformed in the same way as the data that was used to create (train) the model.

External or Embedded Transformations

DBMS_DATA_MINING_TRANSFORM offers two approaches to implementing transformations. For a given model, you can either:

- Create a list of transformation expressions and pass it to the CREATE_MODEL Procedure
- Create a view that implements the transformations and pass the name of the view to the CREATE_MODEL Procedure

If you create a transformation list and pass it to CREATE_MODEL, the transformation expressions are embedded in the model and automatically implemented whenever the model is applied.
If you create a view, the transformation expressions are external to the model. You will need to re-create the transformations whenever you apply the model.

Note:

Embedded transformations significantly enhance the model's usability while simplifying the process of model management.

Automatic Transformations

Oracle Data Mining supports an Automatic Data Preparation (ADP) mode. When ADP is enabled, most algorithm-specific transformations are automatically embedded. Any additional transformations must be explicitly provided in an embedded transformation list or in a view.

If ADP is enabled and you create a model with a transformation list, both sets of transformations are embedded. The model will execute the user-specified transformations from the transformation list before executing the automatic transformations specified by ADP.

Within a transformation list, you can selectively disable ADP for individual attributes.

See Also:

"Automatic Data Preparation" in DBMS_DATA_MINING
Oracle Data Mining User’s Guide for a more information about ADP
"DBMS_DATA_MINING_TRANSFORM-About Transformation Lists"

Transformations in DBMS_DATA_MINING_TRANSFORM

The transformations supported by DBMS_DATA_MINING_TRANSFORM are summarized in this section.

Binning

Binning refers to the mapping of continuous or discrete values to discrete values of reduced cardinality.

- Supervised Binning (Categorical and Numerical)
  Binning is based on intrinsic relationships in the data as determined by a decision tree model.
  See "INSERT_BIN_SUPER Procedure".
- Top-N Frequency Categorical Binning
  Binning is based on the number of cases in each category.
  See "INSERT_BIN_CAT_FREQ Procedure"
- Equi-Width Numerical Binning
  Binning is based on equal-range partitions.
Quantile Numerical Binning

Binning is based on quantiles computed using the SQL `NTILE` function. See “INSERT_BIN_NUM_QTILE Procedure”.

Linear Normalization

Normalization is the process of scaling continuous values down to a specific range, often between zero and one. Normalization transforms each numerical value by subtracting a number (the **shift**) and dividing the result by another number (the **scale**).

\[ x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \]

- **Min-Max Normalization**
  
  Normalization is based on the minimum and maximum with the following shift and scale:
  
  \[
  \text{shift} = \min \\
  \text{scale} = \max - \min
  \]

  See “INSERT_NORM_LIN_MINMAX Procedure”.

- **Scale Normalization**
  
  Normalization is based on the minimum and maximum with the following shift and scale:
  
  \[
  \text{shift} = 0 \\
  \text{scale} = \max \{ \abs{\max}, \abs{\min} \}
  \]

  See “INSERT_NORM_LIN_SCALE Procedure”.

- **Z-Score Normalization**
  
  Normalization is based on the mean and standard deviation with the following shift and scale:
  
  \[
  \text{shift} = \text{mean} \\
  \text{scale} = \text{standard\_deviation}
  \]

  See “INSERT_NORM_LIN_ZSCORE Procedure”.

Outlier Treatment

An outlier is a numerical value that is located far from the rest of the data. Outliers can artificially skew the results of data mining.

- **Winsorizing**
  
  Outliers are replaced with the nearest value that is not an outlier.

  See “INSERT_CLIP_WINSOR_TAIL Procedure”

- **Trimming**
  
  Outliers are set to **NULL**.

  See “INSERT_CLIP_TRIM_TAIL Procedure”.

Missing Value Treatment
Missing data may indicate sparsity or it may indicate that some values are missing at random. DBMS_DATA_MINING_TRANSFORM supports the following transformations for minimizing the effects of missing values:

- Missing numerical values are replaced with the mean.
  See "INSERT_MISS_NUM_MEAN Procedure".
- Missing categorical values are replaced with the mode.
  See "INSERT_MISS_CAT_MODE Procedure".

Note:
Oracle Data Mining also has default mechanisms for handling missing data. See Oracle Data Mining User's Guide for details.

### 44.2 DBMS_DATA_MINING_TRANSFORM Operational Notes

The DBMS_DATA_MINING_TRANSFORM package offers a flexible framework for specifying data transformations. If you choose to embed transformations in the model (the preferred method), you create a transformation list object and pass it to the CREATE_MODEL Procedure. If you choose to transform the data without embedding, you create a view.

When specified in a transformation list, the transformation expressions are executed by the model. When specified in a view, the transformation expressions are executed by the view.

**Transformation Definitions**

Transformation definitions are used to generate the SQL expressions that transform the data. For example, the transformation definitions for normalizing a numeric column are the shift and scale values for that data.

With the DBMS_DATA_MINING_TRANSFORM package, you can call procedures to compute the transformation definitions, or you can compute them yourself, or you can do both.

**Transformation Definition Tables**

DBMS_DATA_MINING_TRANSFORM provides INSERT procedures that compute transformation definitions and insert them in transformation definition tables. You can modify the values in the transformation definition tables or populate them yourself.

XFORM routines use populated definition tables to transform data in external views. STACK routines use populated definition tables to build transformation lists.

To specify transformations based on definition tables, follow these steps:

1. Use CREATE routines to create transformation definition tables.

   The tables have columns to hold the transformation definitions for a given type of transformation. For example, the CREATE_BIN_NUM Procedure creates a
definition table that has a column for storing data values and another column for storing the associated bin identifiers.

2. Use **INSERT** routines to compute and insert transformation definitions in the tables.

   Each **INSERT** routine uses a specific technique for computing the transformation definitions. For example, the **INSERT_BIN_NUM_EQWIDTH Procedure** computes bin boundaries by identifying the minimum and maximum values then setting the bin boundaries at equal intervals.

3. Use **STACK** or **XFORM** routines to generate transformation expressions based on the information in the definition tables:
   - Use **STACK** routines to add the transformation expressions to a transformation list. Pass the transformation list to the **CREATE_MODEL Procedure**. The transformation expressions will be assembled into one long SQL query and embedded in the model.
   - Use **XFORM** routines to execute the transformation expressions within a view. The transformations will be external to the model and will need to be re-created whenever the model is applied to new data.

**Transformations Without Definition Tables**

**STACK** routines are not the only method for adding transformation expressions to a transformation list. You can also build a transformation list without using definition tables.

To specify transformations without using definition tables, follow these steps:

1. Write a SQL expression for transforming an attribute.
2. Write a SQL expression for reversing the transformation. (See "Reverse Transformations and Model Transparency" in "DBMS_DATA_MINING_TRANSFORM-About Transformation Lists".)
3. Determine whether or not to disable ADP for the attribute. By default ADP is enabled for the attribute if it is specified for the model. (See "Disabling Automatic Data Preparation" in "DBMS_DATA_MINING_TRANSFORM - About Transformation Lists".)
4. Specify the SQL expressions and ADP instructions in a call to the **SET_TRANSFORM Procedure**, which adds the information to a transformation list.
5. Repeat steps 1 through 4 for each attribute that you wish to transform.
6. Pass the transformation list to the **CREATE_MODEL Procedure**. The transformation expressions will be assembled into one long SQL query and embedded in the model.

---

**Note:**

SQL expressions that you specify with **SET_TRANSFORM** must fit within a **VARCHAR2**. To specify a longer expression, you can use the **SET_EXPRESSION Procedure**. With **SET_EXPRESSION**, you can build an expression by appending rows to a **VARCHAR2** array.
About Stacking

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Related Topics

- **CREATE_MODEL Procedure**
  This procedure creates a mining model with a given mining function.

- **DBMS_DATA_MINING_TRANSFORM — About Transformation Lists**
  The elements of a transformation list are transformation records. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

- **DBMS_DATA_MINING_TRANSFORM — About Stacking and Stack Procedures**
  Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

- **DBMS_DATA_MINING_TRANSFORM — Nested Data Transformations**
  The CREATE routines create transformation definition tables that include two columns, col and att, for identifying attributes. The column col holds the name of a column in the data table. If the data column is not nested, then att is null, and the name of the attribute is col. If the data column is nested, then att holds the name of the nested attribute, and the name of the attribute is col.att.

### 44.2.1 DBMS_DATA_MINING_TRANSFORM — About Transformation Lists

The elements of a transformation list are transformation records. Each transformation record provides all the information needed by the model for managing the transformation of a single attribute.

Each transformation record includes the following fields:

- **attribute_name** — Name of the column of data to be transformed
- **attribute_subname** — Name of the nested attribute if attribute_name is a nested column, otherwise NULL
- **expression** — SQL expression for transforming the attribute
- **reverse_expression** — SQL expression for reversing the transformation
- **attribute_spec** — Identifies special treatment for the attribute during the model build. See Table 44-33 for details.
Reverse Transformations and Model Transparency

An algorithm manipulates transformed attributes to train and score a model. The transformed attributes, however, may not be meaningful to an end user. For example, if attribute \(x\) has been transformed into bins 1 — 4, the bin names 1, 2, 3, and 4 are manipulated by the algorithm, but a user is probably not interested in the model details about bins 1 — 4 or in predicting the numbers 1 — 4.

To return original attribute values in model details and predictions, you can provide a reverse expression in the transformation record for the attribute. For example, if you specify the transformation expression \('\log(10, y)\'\) for attribute \(y\), you could specify the reverse transformation expression \('\text{power}(10, y)\'\).

Reverse transformations enable model transparency. They make internal processing transparent to the user.

**Note:**

STACK procedures automatically reverse normalization transformations, but they do not provide a mechanism for reversing binning, clipping, or missing value transformations.

You can use the DBMS_DATA_MINING.ALTER_REVERSE_EXPRESSION procedure to specify or update reverse transformations expressions for an existing model.

Disabling Automatic Data Preparation

ADP is controlled by a model-specific setting (PREP_AUTO). The PREP_AUTO setting affects all model attributes unless you disable it for individual attributes.

If ADP is enabled and you set attribute_spec to NOPREP, only the transformations that you specify for that attribute will be evaluated. If ADP is enabled and you do not set
attribute_spec to NOPREP, the automatic transformations will be evaluated after the transformations that you specify for the attribute.

If ADP is not enabled for the model, the attribute_spec field of the transformation record is ignored.

See Also:
"Automatic Data Preparation" for information about the PREP_AUTO setting

Adding Transformation Records to a Transformation List

A transformation list is a stack of transformation records. When a new transformation record is added, it is appended to the top of the stack. (See "About Stacking" for details.)

When you use SET_TRANSFORM to add a transformation record to a transformation list, you can specify values for all the fields in the transformation record.

When you use STACK procedures to add transformation records to a transformation list, only the transformation expression field is populated. For normalization transformations, the reverse transformation expression field is also populated.

You can use both STACK procedures and SET_TRANSFORM to build one transformation list. Each STACK procedure call adds transformation records for all the attributes in a specified transformation definition table. Each SET_TRANSFORM call adds a transformation record for a single attribute.

44.2.2 DBMS_DATA_MINING_TRANSFORM — About Stacking and Stack Procedures

Transformation lists are built by stacking transformation records. Transformation lists are evaluated from bottom to top. Each transformation expression depends on the result of the transformation expression below it in the stack.

Stack Procedures

STACK procedures create transformation records from the information in transformation definition tables. For example, STACK_BIN_NUM builds a transformation record for each attribute specified in a definition table for numeric binning. STACK procedures stack the transformation records as follows:

- If an attribute is specified in the definition table but not in the transformation list, the STACK procedure creates a transformation record, computes the reverse transformation (if possible), inserts the transformation and reverse transformation in the transformation record, and appends the transformation record to the top of the transformation list.
- If an attribute is specified in the transformation list but not in the definition table, the STACK procedure takes no action.
- If an attribute is specified in the definition table and in the transformation list, the STACK procedure stacks the transformation expression from the definition table on
top of the transformation expression in the transformation record and updates the reverse transformation. See Table 44-1 and Example 44-4.

**Example 44-1  Stacking a Clipping Transformation**

This example shows how STACK_CLIP Procedure would add transformation records to a transformation list. Note that the clipping transformations are not reversed in COL1 and COL2 after stacking (as described in "Reverse Transformations and Model Transparency" in "DBMS_DATA_MINING_TRANSFORM-About Transformation Lists").

Refer to:

- **CREATE_CLIP Procedure** — Creates the definition table
- **INSERT_CLIP_TRIM_TAIL Procedure** — Inserts definitions in the table
- **INSERT_CLIP_WINSOR_TAIL Procedure** — Inserts definitions in the table
- **Table 44-1** — Describes the structure of the transformation list (TRANSFORM_LIST object)

Assume a clipping definition table populated as follows.

<table>
<thead>
<tr>
<th>col</th>
<th>att</th>
<th>lcut</th>
<th>lval</th>
<th>rcut</th>
<th>rval</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL1</td>
<td>null</td>
<td>-1.5</td>
<td>-1.5</td>
<td>4.5</td>
<td>4.5</td>
</tr>
<tr>
<td>COL2</td>
<td>null</td>
<td>0</td>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

Assume the following transformation list before stacking.

```
-------------------------
transformation record #1:
-------------------------
attribute_name       = COL1
attribute_subname    = null
expression           = log(10, COL1)
reverse_expression   = power(10, COL1)
-------------------------
transformation record #2:
-------------------------
attribute_name       = COL3
attribute_subname    = null
expression           = ln(COL3)
reverse_expression   = exp(COL3)
```

After stacking, the transformation list is as follows.

```
-------------------------
transformation record #1:
-------------------------
attribute_name       = COL1
attribute_subname    = null
expression           = CASE WHEN log(10, COL1) < -1.5 THEN -1.5
                        WHEN log(10, COL1) > 4.5 THEN 4.5
                        ELSE log(10, COL1)
                        END;
reverse_expression   = power(10, COL1)
-------------------------
transformation record #2:
```
44.2.3 DBMS_DATA_MINING_TRANSFORM — Nested Data Transformations

The CREATE routines create transformation definition tables that include two columns, col and att, for identifying attributes. The column col holds the name of a column in the data table. If the data column is not nested, then att is null, and the name of the attribute is col. If the data column is nested, then att holds the name of the nested attribute, and the name of the attribute is col.att.

The INSERT and XFORM routines ignore the att column in the definition tables. Neither the INSERT nor the XFORM routines support nested data.

Only the STACK procedures and SET_TRANSFORM support nested data. Nested data transformations are always embedded in the model.

feature 322331-1 Native doubles in DMFs

Nested columns in Oracle Data Mining can have the following types:

DM_NESTED_NUMERICALS
DM_NESTED_CATEGORICALS
DM_NESTED_BINARY_DOUBLES
DM_NESTED_BINARY_FLOATS

See Also:

"Constants"

Oracle Data Mining User's Guide for details about nested attributes in Oracle Data Mining

Specifying Nested Attributes in a Transformation Record

A transformation record (TRANSFORM_REC) includes two fields, attribute_name and attribute_subname, for identifying the attribute. The field attribute_name holds the name of a column in the data table. If the data column is not nested, then attribute_subname is null, and the name of the attribute is attribute_name. If the data column is nested, then attribute_subname holds the name of the nested attribute, and the name of the attribute is attribute_name.attribute_subname.
Transforming Individual Nested Attributes

You can specify different transformations for different attributes in a nested column, and you can specify a default transformation for all the remaining attributes in the column. To specify a default nested transformation, specify null in the attribute_name field and the name of the nested column in the attribute_subname field as shown in Example 44-2. Note that the keyword VALUE is used to represent the value of a nested attribute in a transformation expression.

**Example 44-2  Transforming a Nested Column**

The following statement transforms two of the nested attributes in COL_N1. Attribute ATTR1 is transformed with normalization; Attribute ATTR2 is set to null, which causes attribute removal transformation (ATTR2 is not used in training the model). All the remaining attributes in COL_N1 are divided by 10.

```sql
DECLARE
    stk dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, 'COL_N1', 'ATTR1', '(VALUE - (-1.5))/20', 'VALUE * 20 + (-1.5)');
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, 'COL_N1', 'ATTR2', NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM(
        stk, NULL, 'COL_N1', 'VALUE/10', 'VALUE * 10');
END;
/
```

The following SQL is generated from this statement.

```sql
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
    "ATTRIBUTE_NAME",
    DECODE("ATTRIBUTE_NAME",
        'ATTR1', ('VALUE' - (-1.5))/20, 'VALUE'/10))
FROM TABLE("COL_N1")
WHERE "ATTRIBUTE_NAME" IS NOT IN ('ATTR2'))
AS DM_NESTED_NUMERICALS)
```

If transformations are not specified for COL_N1.ATTR1 and COL_N1.ATTR2, then the default transformation is used for all the attributes in COL_N1, and the resulting SQL does not include a DECODE.

```sql
CAST(MULTISET(SELECT DM_NESTED_NUMERICAL(
    "ATTRIBUTE_NAME",
    "VALUE"/10)
FROM TABLE("COL_N1"))
AS DM_NESTED_NUMERICALS)
```

Since DECODE is limited to 256 arguments, multiple DECODE functions are nested to support an arbitrary number of individual nested attribute specifications.

Adding a Nested Column

You can specify a transformation that adds a nested column to the data, as shown in Example 44-3.
Example 44-3  Adding a Nested Column to a Transformation List

DECLARE
    v_xlst dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst,
                                              'YOB_CREDLIM', NULL,
                                              'dm_nested_numericals(
                                                  dm_nested_numerical(
                                                      'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
                                                  dm_nested_numerical(
                                                      'CUST_CREDIT_LIMIT', cust_credit_limit))',
                                              NULL);
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'CUST_YEAR_OF_BIRTH', NULL, NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM(v_xlst, 'CUST_CREDIT_LIMIT', NULL, NULL, NULL);
    dbms_data_mining_transform.XFORM_STACK(
                                              v_xlst, 'mining_data', 'mining_data_v');
END;
/

set long 2000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_V';

TEXT
---------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_POSTAL_CODE",dm_nested_numericals(
                                                  dm_nested_numerical(
                                                      'CUST_YEAR_OF_BIRTH', cust_year_of_birth),
                                                  dm_nested_numerical(
                                                      'CUST_CREDIT_LIMIT', cust_credit_limit)) "YOB_CREDLIM" FROM mining_data

                                                                 'CUST_YEAR_OF_BIRTH', 1962),
                                                                 DM_NESTED_NUMERICAL('CUST_CREDIT_LIMIT', 15000))

Stacking Nested Transformations

Example 44-4 shows how the STACK_NORM_LIN Procedure would add transformation records for nested column COL_N to a transformation list.

Refer to:
- CREATE_NORM_LIN Procedure — Creates the definition table
- INSERT_NORM_LIN_MINMAX Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_SCALE Procedure — Inserts definitions in the table
- INSERT_NORM_LIN_ZSCORE Procedure — Inserts definitions in the table
- Table 44-1 — Describes the structure of the transformation list

Example 44-4  Stacking a Nested Normalization Transformation

Assume a linear normalization definition table populated as follows.
Assume the following transformation list before stacking.

transformation record #1:

- attribute_name = COL_N
- attribute_subname = ATT1
- expression = log(10, VALUE)
- reverse_expression = power(10, VALUE)

transformation record #2:

- attribute_name = null
- attribute_subname = COL_N
- expression = ln(VALUE)
- reverse_expression = exp(VALUE)

After stacking, the transformation list is as follows.

transformation record #1:

- attribute_name = COL_N
- attribute_subname = ATT1
- expression = (log(10, VALUE) - 0)/10
- reverse_expression = power(10, VALUE*10 + 0)

transformation record #2:

- attribute_name = NULL
- attribute_subname = COL_N
- expression = (ln(VALUE) - 0)/10
- reverse_expression = exp(VALUE*10 + 0)

transformation record #3:

- attribute_name = COL_N
- attribute_subname = ATT2
- expression = (ln(VALUE) - 0)/20
- reverse_expression = exp(VALUE*20 + 0)

44.3 DBMS_DATA_MINING_TRANSFORM Security Model

The DBMS_DATA_MINING_TRANSFORM package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers' rights (run with the privileges of the current user).

The DBMS_DATA_MINING_TRANSFORM.INSERT_* procedures have a data_table_name parameter that enables the user to provide the input data for transformation purposes. The value of data_table_name can be the name of a physical table or a view. The data_table_name parameter can also accept an inline query.
**Note:**

Because an inline query can be used to specify the data for transformation, Oracle strongly recommends that the calling routine perform any necessary SQL injection checks on the input string.

**See Also:**

"Operational Notes" for a description of the `DBMS_DATA_MINING_TRANSFORM.INSERT_*` procedures

---

**44.4 DBMS_DATA_MINING_TRANSFORM Datatypes**

`DBMS_DATA_MINING_TRANSFORM` defines the datatypes described in the following table:

### Table 44-1 Datatypes in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_LIST</td>
<td>VARRAY(1000) OF varchar2(32)</td>
<td><code>COLUMN_LIST</code> stores quoted and non-quoted identifiers for column names.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>COLUMN_LIST</code> is the datatype of the <code>exclude_list</code> parameter in the INSERT procedures. See &quot;INSERT_AUTOBIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See Oracle Database PL/SQL Language Reference for information about populating <code>VARRAY</code> structures.</td>
</tr>
</tbody>
</table>
### Table 44-1  (Cont.) Datatypes in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCRIBE_LIST</td>
<td>DBMS_SQL.DESC_TAB2</td>
<td>DESCRIBE_LIST describes the columns of the data table after the transformation list has been applied. A DESCRIBE_LIST is returned by the DESCRIBE_STACK Procedure. The DESC_TAB2 and DESC_REC2 types are defined in the DBMS_SQL package. See &quot;DESC_REC2 Record Type&quot;. The col_type field of DESC_REC2 identifies the datatype of the column. The datatype is expressed as a numeric constant that represents a built-in datatype. For example, a 1 indicates a variable length character string. The codes for Oracle built-in datatypes are listed in Oracle Database SQL Language Reference. The codes for the Oracle Data Mining nested types are described in &quot;Constants&quot;. The col_name field of DESC_REC2 identifies the column name. It may be populated with a column name, an alias, or an expression. If the column name is a SELECT expression, it may be very long. If the expression is longer than 30 bytes, it cannot be used in a view unless it is given an alias.</td>
</tr>
<tr>
<td></td>
<td>TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER</td>
<td></td>
</tr>
<tr>
<td></td>
<td>TYPE desc_rec2 IS RECORD (</td>
<td></td>
</tr>
<tr>
<td></td>

<td></td>
</tr>
<tr>
<td></td>
<td>col_charsetform BINARY_INTEGER := 0,</td>
<td></td>
</tr>
<tr>
<td></td>
<td>col_null_ok BOOLEAN := TRUE);</td>
<td></td>
</tr>
</tbody>
</table>
Table 44-1  (Cont.) Datatypes in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>List Type</th>
<th>List Elements</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSFORM_LIST</td>
<td>TABLE OF transform_rec</td>
<td>TRANSFORM_LIST is a list of transformations that can be embedded in a model. A TRANSFORM_LIST is accepted as an argument by the CREATE_MODEL Procedure. Each element in a TRANSFORM_LIST is a TRANSFORM_REC that specifies how to transform a single attribute. The attribute_name is a column name. The attribute_subname is the nested attribute name if the column is nested, otherwise attribute_subname is null. The expression field holds a SQL expression for transforming the attribute. See &quot;About Transformation Lists&quot; for an explanation of reverse expressions. The attribute_spec field can be used to cause the attribute to be handled in a specific way during the model build. See Table 44-33 for details. The expressions in a TRANSFORM_REC have type EXPRESSION_REC. The lstmt field stores a VARCHAR2A, which is a table of VARCHAR2(32767). The VARCHAR2A datatype allows transformation expressions to be very long, as they can be broken up across multiple rows of VARCHAR2. The VARCHAR2A type is defined in the DBMS_SQL package. See &quot;VARCHAR2A Table Type&quot;. The ub (upper bound) and lb (lower bound) fields indicate how many rows there are in the VARCHAR2A table. If ub &lt; lb (default) the EXPRESSION_REC is empty; if lb=ub=1 there is one row; if lb=1 and ub=2 there are 2 rows, and so on.</td>
</tr>
<tr>
<td>TYPE transform_rec IS RECORD (</td>
<td>attribute_name VARCHAR2(30),</td>
<td>attribute_subname VARCHAR2(4000),</td>
</tr>
<tr>
<td>expression EXPRESSION_REC,</td>
<td>reverse_expression EXPRESSION_REC,</td>
<td>attribute_spec VARCHAR2(4000));</td>
</tr>
<tr>
<td>TYPE expression_rec IS RECORD (</td>
<td>lstmt DBMS_SQL.VARCHAR2A,</td>
<td>lb BINARY_INTEGER DEFAULT 1,</td>
</tr>
<tr>
<td>ub BINARY_INTEGER DEFAULT 0);</td>
<td>TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;</td>
<td></td>
</tr>
</tbody>
</table>

44.5 DBMS_DATA_MINING_TRANSFORM Constants

DBMS_DATA_MINING_TRANSFORM defines the constants described in the following table.

Table 44-2  Constants in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEST_NUM_COL_TYPE</td>
<td>100001</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_NUMERICALS. Nested numerical attributes are defined as follows: attribute_name VARCHAR2(4000) value NUMBER</td>
</tr>
<tr>
<td>NEST_CAT_COL_TYPE</td>
<td>100002</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_CATEGORICALS. Nested categorical attributes are defined as follows: attribute_name VARCHAR2(4000) value VARCHAR2(4000)</td>
</tr>
</tbody>
</table>
Table 44-2  (Cont.) Constants in DBMS_DATA_MINING_TRANSFORM

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEST_BD_COL_TYPE</td>
<td>100003</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_DOUBLES. Nested binary double attributes are defined as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute_name VARCHAR2(4000)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>value BINARY_DOUBLE</td>
</tr>
<tr>
<td>NEST_BF_COL_TYPE</td>
<td>100004</td>
<td>Indicates that an attribute in the transformation list comes from a row in a column of DM_NESTED_BINARY_FLOATS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute_name VARCHAR2(4000)</td>
</tr>
<tr>

44.6.1 CREATE_BIN_CAT Procedure

This procedure creates a transformation definition table for categorical binning.

The columns are described in the following table.

Table 44-4 Columns in a Transformation Definition Table for Categorical Binning

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the attribute name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT (  
    bin_table_name   IN VARCHAR2,  
    bin_schema_name IN VARCHAR2 DEFAULT NULL );
```
Parameters

**Table 44-5  CREATE_BIN_CAT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - **INSERT_BIN_CAT_FREQ** Procedure — frequency-based binning
   - **INSERT_BIN_SUPER** Procedure — supervised binning

See Also:

- "Binning" in *DBMS_DATA_MINING_TRANSFORM Overview*
- "Operational Notes"

Examples

The following statement creates a table called bin_cat_xtbl in the current schema. The table has columns that can be populated with bin assignments for categorical attributes.

```sql
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_CAT('bin_cat_xtbl');
END;
/
```

DESCRIBE bin_cat_xtbl

<table>
<thead>
<tr>
<th>Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>COL</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>ATT</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>VAL</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
<tr>
<td>BIN</td>
<td></td>
<td>VARCHAR2(4000)</td>
</tr>
</tbody>
</table>

44.6.2 CREATE_BIN_NUM Procedure

This procedure creates a transformation definition table for numerical binning.

The columns are described in the following table.
Table 44-6  Columns in a Transformation Definition Table for Numerical Binning

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>column name is also the attribute name. For information about attribute</td>
</tr>
<tr>
<td></td>
<td></td>
<td>names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column. If col is nested, the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Values of the attribute</td>
</tr>
<tr>
<td>bin</td>
<td>VARCHAR2(4000)</td>
<td>Bin assignments for the values</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM (
    bin_table_name    IN VARCHAR2,
    bin_schema_name   IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 44-7  CREATE_BIN_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is</td>
</tr>
<tr>
<td></td>
<td>used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See “Nested Data Transformations” for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_AUTOBIN_NUM_EQWIDTH Procedure — automatic equi-width binning
   - INSERT_BIN_NUM_EQWIDTH Procedure — user-specified equi-width binning
   - INSERT_BIN_NUM_QTILE Procedure — quantile binning
   - INSERT_BIN_SUPER Procedure — supervised binning
Examples

The following statement creates a table called `bin_num_xtbl` in the current schema. The table has columns that can be populated with bin assignments for numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_BIN_NUM('bin_num_xtbl');
END;
/
```

```
DESCRIBE bin_num_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                NUMBER
BIN                                                VARCHAR2(4000)
```

44.6.3 CREATE_CLIP Procedure

This procedure creates a transformation definition table for clipping or winsorizing to minimize the effect of outliers.

The columns are described in the following table.

Table 44-8 Columns in a Transformation Definition Table for Clipping or Winsorizing

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the column is not nested, the column name is also the attribute name.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If <code>col</code> is nested, the attribute name is <code>col.att</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>lcut</td>
<td>NUMBER</td>
<td>The lowest typical value for the attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If the attribute values were plotted on an xy axis, <code>lcut</code> would be the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>left-most boundary of the range of values considered typical for this</td>
</tr>
<tr>
<td></td>
<td></td>
<td>attribute.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Any values to the left of <code>lcut</code> are outliers.</td>
</tr>
<tr>
<td>lval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the left of <code>lcut</code>.</td>
</tr>
</tbody>
</table>
### Table 44-8  (Cont.) Columns in a Transformation Definition Table for Clipping or Winsorizing

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rcut</td>
<td>NUMBER</td>
<td>The highest typical value for the attribute. If the attribute values were plotted on an $xy$ axis, $rcut$ would be the right-most boundary of the range of values considered typical for this attribute. Any values to the right of $rcut$ are outliers.</td>
</tr>
<tr>
<td>rval</td>
<td>NUMBER</td>
<td>Value assigned to an outlier to the right of $rcut$</td>
</tr>
</tbody>
</table>

#### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP (  
    clip_table_name    IN VARCHAR2,  
    clip_schema_name   IN VARCHAR2 DEFAULT NULL );
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>clip_schema_name</td>
<td>Schema of $clip_table_name$. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

#### Usage Notes

1. See *Oracle Data Mining User’s Guide* for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
   - INSERT_CLIP_TRIM_TAIL Procedure — replaces outliers with nulls
   - INSERT_CLIP_WINSOR_TAIL Procedure — replaces outliers with an average value

#### See Also:

- “Outlier Treatment” in DBMS_DATA_MINING_TRANSFORM Overview
- "Operational Notes"

#### Examples

The following statement creates a table called $clip_xtbl$ in the current schema. The table has columns that can be populated with clipping instructions for numerical attributes.
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_CLIP('clip_xtbl');
END;
/

DESCRIBE clip_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
LCUT                                               NUMBER
LVAL                                               NUMBER
RCUT                                               NUMBER
RVAL                                               NUMBER

44.6.4 CREATE_COL_REM Procedure

This procedure creates a transformation definition table for removing columns from the data table.

The columns are described in the following table.

Table 44-10  Columns in a Transformation Definition Table for Column Removal

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is nested (DM_NESTED_NUMERICALS or DM_NESTED_CATEGORICALS). If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
</tbody>
</table>

Syntax

DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM (rem_table_name VARCHAR2, rem_schema_name VARCHAR2 DEFAULT NULL);

Parameters

Table 44-11  CREATE_COL_REM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rem_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See "Nested Data Transformations" for information about transformation definition tables and nested data.

2. See "Operational Notes".
Examples

The following statement creates a table called `rem_att_xtbl` in the current schema. The table has columns that can be populated with the names of attributes to exclude from the data to be mined.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('rem_att_xtbl');
END;
/
```

```
DESCRIBE rem_att_xtbl
Name                                      Null?    Type
----------------------------------------- -------- -----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
```

44.6.5 CREATE_MISS_CAT Procedure

This procedure creates a transformation definition table for replacing categorical missing values.

The columns are described in the following table.

Table 44-12  Columns in a Transformation Definition Table for Categorical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of categorical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User's Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_CATEGORICALS</code>. If <code>col</code> is nested, the attribute name is <code>col.att</code>. If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>val</td>
<td>VARCHAR2(4000)</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT (
    miss_table_name       IN VARCHAR2,
    miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 44-13  CREATE_MISS_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of <code>miss_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.

2. See "Nested Data Transformations" for information about transformation definition tables and nested data.

3. You can use the `INSERT_MISS_CAT_MODE Procedure` to populate the transformation definition table.

See Also:

"Missing Value Treatment" in DBMS_DATA_MINING_TRANSFORM Overview
"Operational Notes"

Examples

The following statement creates a table called `miss_cat_xtbl` in the current schema. The table has columns that can be populated with values for missing data in categorical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_CAT('miss_cat_xtbl');
END;
/
```

```
DESCRIBE miss_cat_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
VAL                                                VARCHAR2(4000)
```

44.6.6 CREATE_MISS_NUM Procedure

This procedure creates a transformation definition table for replacing numerical missing values.

The columns are described in Table 44-14.

Table 44-14 Columns in a Transformation Definition Table for Numerical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see <em>Oracle Data Mining User's Guide</em>.</td>
</tr>
</tbody>
</table>
Table 44-14  (Cont.) Columns in a Transformation Definition Table for Numerical Missing Value Treatment

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if <code>col</code> is a nested column of <code>DM_NESTED_NUMERICALS</code>. If <code>col</code> is nested, the attribute name is <code>col.att</code>. If <code>col</code> is not nested, <code>att</code> is null.</td>
</tr>
<tr>
<td>val</td>
<td>NUMBER</td>
<td>Replacement for missing values in the attribute</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM (  
    miss_table_name       IN VARCHAR2,  
    miss_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 44-15  CREATE_MISS_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of <code>miss_table_name</code>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the `INSERT_MISS_NUM_MEAN Procedure` to populate the transformation definition table.

See Also:

- "Missing Value Treatment" in DBMS_DATA_MINING_TRANSFORM Overview
- "Operational Notes"

Example

The following statement creates a table called `miss_num_xtbl` in the current schema. The table has columns that can be populated with values for missing data in numerical attributes.

```sql
BEGIN  
    DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('miss_num_xtbl');
END;
/
44.6.7 CREATE_NORM_LIN Procedure

This procedure creates a transformation definition table for linear normalization.

The columns are described in Table 44-16.

Table 44-16   Columns in a Transformation Definition Table for Linear Normalization

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col</td>
<td>VARCHAR2(30)</td>
<td>Name of a column of numerical data. If the column is not nested, the column name is also the attribute name. For information about attribute names, see Oracle Data Mining User’s Guide.</td>
</tr>
<tr>
<td>att</td>
<td>VARCHAR2(4000)</td>
<td>The attribute subname if col is a nested column of DM_NESTED_NUMERICALS. If col is nested, the attribute name is col.att. If col is not nested, att is null.</td>
</tr>
<tr>
<td>shift</td>
<td>NUMBER</td>
<td>A constant to subtract from the attribute values</td>
</tr>
<tr>
<td>scale</td>
<td>NUMBER</td>
<td>A constant by which to divide the shifted values</td>
</tr>
</tbody>
</table>

Syntax

```
DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN ( 
   norm_table_name       IN VARCHAR2, 
   norm_schema_name      IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 44-17   CREATE_NORM_LIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table to be created</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of norm_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.
2. See "Nested Data Transformations" for information about transformation definition tables and nested data.
3. You can use the following procedures to populate the transformation definition table:
INSERT_NORM_LIN_MINMAX Procedure — Uses linear min-max normalization

INSERT_NORM_LIN_SCALE Procedure — Uses linear scale normalization

INSERT_NORM_LIN_ZSCORE Procedure — Uses linear zscore normalization

See Also:

"Linear Normalization" in DBMS_DATA_MINING_TRANSFORM
Overview

"Operational Notes"

Examples

The following statement creates a table called norm_xtbl in the current schema. The table has columns that can be populated with shift and scale values for normalizing numerical attributes.

```
BEGIN
    DBMS_DATA_MINING_TRANSFORM.CREATE_NORM_LIN('norm_xtbl');
END;
/
```

```
DESCRIBE norm_xtbl
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
COL                                                VARCHAR2(30)
ATT                                                VARCHAR2(4000)
SHIFT                                              NUMBER
SCALE                                              NUMBER
```

44.6.8 DESCRIBE_STACK Procedure

This procedure describes the columns of the data table after a list of transformations has been applied.

Only the columns that are specified in the transformation list are transformed. The remaining columns in the data table are included in the output without changes.

To create a view of the data table after the transformations have been applied, use the XFORM_STACK Procedure.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.DESCRIBE_STACK (  
xform_list IN TRANSFORM_LIST,  
data_table_name IN VARCHAR2,  
describe_list OUT DESCRIBE_LIST,  
data_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 44-18  DESCRIBE_STACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A list of transformations. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>describe_list</td>
<td>Descriptions of the columns in the data table after the transformations specified in xform_list have been applied. See Table 44-1 for a description of the DESCRIBE_LIST object type.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes" for information about transformation lists and embedded transformations.

Examples

This example shows the column name and datatype, the column name length, and the column maximum length for the view dmuser.cust_info after the transformation list has been applied. All the transformations are user-specified. The results of DESCRIBE_STACK do not include one of the columns in the original table, because the SET_TRANSFORM procedure sets that column to NULL.

```
CREATE OR REPLACE VIEW cust_info AS
    SELECT a.cust_id, c.country_id, c.cust_year_of_birth,
    CAST(COLLECT(DM_Nested_Numerical(
       b.prod_name, 1))
    AS DM_Nested_Numericals) custprods
    FROM sh.sales a, sh.products b, sh.customers c
    WHERE a.prod_id = b.prod_id AND
    a.cust_id=c.cust_id AND
    a.cust_id between 100001 AND 105000
    GROUP BY a.cust_id, country_id, cust_year_of_birth;
```

```
describe cust_info
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
CUST_ID                                   NOT NULL NUMBER
COUNTRY_ID                                NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                        NOT NULL NUMBER(4)
CUSTPRODS                                          SYS.DM_NESTED_NUMERICALS
```

```
DECLARE
cust_stack   dbms_data_mining_transform.TRANSFORM_LIST;
cust_cols    dbms_data_mining_transform.DESCRIBE_LIST;
BEGIN
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
       'country_id', NULL, 'country_id/10', 'country_id*10');
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
       'cust_year_of_birth', NULL, NULL, NULL);
    dbms_data_mining_transform.SET_TRANSFORM (cust_stack,
       'custprods', 'Mouse Pad', 'value*100', 'value/100');
```
**44.6.9 GET_EXPRESSION Function**

This function returns a row from a VARCHAR2 array that stores a transformation expression. The array is built by calls to the SET_EXPRESSION Procedure.

The array can be used for specifying SQL expressions that are too long to be used with the SET_TRANSFORM Procedure.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.GET_EXPRESSION (
    expression           IN EXPRESSION_REC,
    chunk_num            IN PLS_INTEGER DEFAULT NULL);
RETURN VARCHAR2;
```
Parameters

Table 44-19  GET_EXPRESSION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 44-1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Usage Notes

1. Chunk numbering starts with one. For chunks outside of the range, the return value is null. When a chunk number is null the whole expression is returned as a string. If the expression is too big, a VALUE_ERROR is raised.

2. See "About Transformation Lists".

3. See "Operational Notes".

Examples

See the example for the SET_EXPRESSION Procedure.

Related Topics

• SET_EXPRESSION Procedure
  This procedure appends a row to a VARCHAR2 array that stores a SQL expression.

• SET_TRANSFORM Procedure
  This procedure appends the transformation instructions for an attribute to a transformation list.

44.6.10 INSERT_AUTOBIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_AUTOBIN_NUM_EQWIDTH computes the number of bins separately for each column. If you want to use equi-width binning with the same number of bins for each column, use the INSERT_BIN_NUM_EQWIDTH Procedure.

INSERT_AUTOBIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_AUTOBIN_NUM_EQWIDTH (bin_table_name IN VARCHAR2,
data_table_name IN VARCHAR2,
```
Parameters

Table 44-20  INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>CREATE_BIN_NUM creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_AUTOBIN_NUM_EQWIDTH.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Minimum number of bins. If bin_num is 0 or NULL, it is ignored. The default value of bin_num is 3.</td>
</tr>
<tr>
<td>max_bin_num</td>
<td>Maximum number of bins. If max_bin_num is 0 or NULL, it is ignored. The default value of max_bin_num is 100.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned.</td>
</tr>
<tr>
<td></td>
<td>The format of exclude_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')</td>
</tr>
<tr>
<td>round_num</td>
<td>Specifies how to round the number in the VAL column of the transformation definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of round_num is 6.</td>
</tr>
<tr>
<td>sample_size</td>
<td>Size of the data sample. If sample_size is less than the total number of non-NULL values in the column, then sample_size is used instead of the SQL COUNT function in computing the number of bins. If sample_size is 0 or NULL, it is ignored. See the Usage Notes. The default value of sample_size is 50,000.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
### Table 44-20 (Cont.) INSERT_AUTOBIN_NUM_EQWIDTH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>rem_table_name</td>
<td>Name of a transformation definition table for column removal. The table must have the columns described in &quot;CREATE_COL_REM Procedure&quot;. INSERT_AUTOBIN_NUM_EQWIDTH ignores columns with all nulls or only one unique value. If you specify a value for rem_table_name, these columns are removed from the mining data. If you do not specify a value for rem_table_name, these unbinned columns remain in the data.</td>
</tr>
<tr>
<td>rem_schema_name</td>
<td>Schema of rem_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

#### Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.

2. **INSERT_AUTOBIN_NUM_EQWIDTH** computes the number of bins for a column based on the number of non-null values (COUNT), the maximum (MAX), the minimum (MIN), the standard deviation (STDDEV), and the constant C=3.49/0.9:

   \[
   N = \text{floor} ( \text{power} (\text{COUNT}, 1/3) \times (\text{max-min}) / (c\times\text{dev}))
   \]

   If the sample_size parameter is specified, it is used instead of COUNT.

   See *Oracle Database SQL Language Reference* for information about the COUNT, MAX, MIN, STDDEV, FLOOR, and POWER functions.

3. **INSERT_AUTOBIN_NUM_EQWIDTH** uses absolute values to compute the number of bins. The sign of the parameters bin_num, max_bin_num, and sample_size has no effect on the result.

4. In computing the number of bins, **INSERT_AUTOBIN_NUM_EQWIDTH** evaluates the following criteria in the following order:
   a. The minimum number of bins (bin_num)
   b. The maximum number of bins (max_bin_num)
   c. The maximum number of bins for integer columns, calculated as the number of distinct values in the range max-min+1.

5. The round_num parameter controls the rounding of column values in the transformation definition table, as follows:

   **For a value of 308.162:**
   - when round_num = 1    result is 300
   - when round_num = 2    result is 310
   - when round_num = 3    result is 308
   - when round_num = 0    result is 308.162
   - when round_num = -1   result is 308.16
   - when round_num = -2   result is 308.2

#### Examples

In this example, **INSERT_AUTOBIN_NUM_EQWIDTH** computes the bin boundaries for the cust_year_of_birth column in sh.customers and inserts the transformations in a transformation definition table. The **STACK_BIN_NUM Procedure** creates a
transformation list from the contents of the definition table. The `CREATE_MODEL` Procedure embeds the transformation list in a new model called `nb_model`.

The transformation and reverse transformation expressions embedded in `nb_model` are returned by the `GET_MODEL_TRANSFORMATIONS` Function.

```sql
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_postal_code
    FROM sh.customers;

DESCRIBE mining_data
Name                          Null?    Type
----------------------------- -------- ----------------------------
CUST_ID                       NOT NULL NUMBER
CUST_YEAR_OF_BIRTH            NOT NULL NUMBER(4)
CUST_POSTAL_CODE              NOT NULL VARCHAR2(10)

BEGIN
  dbms_data_mining_transform.CREATE_BIN_NUM(
    bin_table_name   => 'bin_tbl');
  dbms_data_mining_transform.INSERT_AUTOBIN_NUM_EQWIDTH (
    bin_table_name   => 'bin_tbl',
    data_table_name  => 'mining_data',
    bin_num          => 3,
    max_bin_num      => 5,
    exclude_list     => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/

44.6.11 INSERT_BIN_CAT_FREQ Procedure

This procedure performs categorical binning and inserts the transformation definitions
in a transformation definition table. The procedure computes the bin boundaries based
on frequency.

INSERT_BIN_CAT_FREQ bins all the CHAR and VARCHAR2 columns in the data source unless
you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_CAT_FREQ (  
    bin_table_name       IN VARCHAR2,
    data_table_name      IN VARCHAR2,
    bin_num              IN PLS_INTEGER DEFAULT 9,
    exclude_list         IN COLUMN_LIST DEFAULT NULL,
    default_num          IN PLS_INTEGER DEFAULT 2,
    bin_support          IN NUMBER DEFAULT NULL,
    bin_schema_name      IN VARCHAR2 DEFAULT NULL,
    data_schema_name     IN VARCHAR2 DEFAULT NULL);
Parameters

Table 44-21  INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| bin_table_name    | Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The following columns are required:  
                      | COL VARCHAR2(30)  
                      | VAL VARCHAR2(4000)  
                      | BIN VARCHAR2(4000)  
                      | CREATE_BIN_CAT creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_BIN_CAT_FREQ. |
| data_table_name   | Name of the table containing the data to be transformed                                                                                                                                                     |
| bin_num           | The number of bins to fill using frequency-based binning. The total number of bins will be bin_num+1. The additional bin is the default bin. Classes that are not assigned to a frequency-based bin will be assigned to the default bin.  
                      | The default binning order is from highest to lowest: the most frequently occurring class is assigned to the first bin, the second most frequently occurring class is assigned to the second bin, and so on. You can reverse the binning order by specifying a negative number for bin_num.  
                      | The negative sign causes the binning order to be from lowest to highest.  
                      | If the total number of distinct values (classes) in the column is less than bin_num, then a separate bin will be created for each value and the default bin will be empty.  
                      | If you specify NULL or 0 for bin_num, no binning is performed.  
                      | The default value of bin_num is 9. |
| exclude_list      | List of categorical columns to be excluded from the binning process. If you do not specify exclude_list, all categorical columns in the data source are binned.  
                      | The format of exclude_list is:  
                      | dbms_data_mining_transform.COLUMN_LIST('col1','col2',  
                      | ...'coln') |
| default_num       | The number of class occurrences (rows of the same class) required for assignment to the default bin  
                      | By default, default_num is the minimum number of occurrences required for assignment to the default bin. For example, if default_num is 3 and a given class occurs only once, it will not be assigned to the default bin. You can change the occurrence requirement from minimum to maximum by specifying a negative number for default_num. For example, if default_num is -3 and a given class occurs only once, it will be assigned to the default bin, but a class that occurs four or more times will not be included.  
                      | If you specify NULL or 0 for default_bin, there are no requirements for assignment to the default bin.  
                      | The default value of default_num is 2. |
Table 44-21 (Cont.) INSERT_BIN_CAT_FREQ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_support</td>
<td>The number of class occurrences (rows of the same class) required for assignment to a frequency-based bin. <em>bin_support</em> is expressed as a fraction of the total number of rows. By default, <em>bin_support</em> is the minimum percentage required for assignment to a frequency-based bin. For example, if there are twenty rows of data and you specify .2 for <em>bin_support</em>, then there must be four or more occurrences of a class (.2*20) in order for it to be assigned to a frequency-based bin. You can change <em>bin_support</em> from a minimum percentage to a maximum percentage by specifying a negative number for <em>bin_support</em>. For example, if there are twenty rows of data and you specify -.2 for <em>bin_support</em>, then there must be four or less occurrences of a class in order for it to be assigned to a frequency-based bin. Classes that occur less than a positive <em>bin_support</em> or more than a negative <em>bin_support</em> will be assigned to the default bin. If you specify NULL or 0 for <em>bin_support</em>, then there is no support requirement for frequency-based binning. The default value of <em>bin_support</em> is NULL.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of <em>bin_table_name</em>. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of <em>data_table_name</em>. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See *Oracle Data Mining User's Guide* for details about categorical data.
2. If values occur with the same frequency, INSERT_BIN_CAT_FREQ assigns them in descending order when binning is from most to least frequent, or in ascending order when binning is from least to most frequent.

Examples

1. In this example, INSERT_BIN_CAT_FREQ computes the bin boundaries for the *cust_postal_code* and *cust_city* columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_CAT Procedure creates a transformation list from the contents of the definition table, and the CREATE_MODEL Procedure embeds the transformation list in a new model called nb_model.

   The transformation and reverse transformation expressions embedded in nb_model are returned by the GET_MODEL_TRANSFORMATIONS Function.

   ```sql
   CREATE OR REPLACE VIEW mining_data AS
   SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_city
   FROM sh.customers;
   DESCRIBE mining_data
   Name                      Null?     Type
   ------------------------- -------- -----------------------------
   CUST_ID                   NOT NULL NUMBER
   CUST_YEAR_OF_BIRTH        NOT NULL NUMBER(4)
   CUST_POSTAL_CODE          NOT NULL VARCHAR2(10)
   ```
CUST_CITY                  NOT NULL VARCHAR2(30)

BEGIN
  dbms_data_mining_transform.CREATE_BIN_CAT(
    bin_table_name   => 'bin_tbl_1');
  dbms_data_mining_transform.INSERT_BIN_CAT_FREQ (  
    bin_table_name   => 'bin_tbl_1',
    data_table_name  => 'mining_data',
    bin_num          => 4);
END;
/

column col format a18
column val format a15
column bin format a10

SELECT col, val, bin
FROM bin_tbl_1
ORDER BY col ASC, bin ASC;

DECLARE
  city_xform   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.STACK_BIN_CAT (  
    bin_table_name           => 'bin_tbl_1',
    xform_list               => city_xform);
  dbms_data_mining.CREATE_MODEL(
    model_name              => 'nb_model',
    mining_function         => dbms_data_mining.classification,
    data_table_name         => 'mining_data',
    case_id_column_name     => 'cust_id',
    target_column_name      => 'cust_city',
    settings_table_name     => null,
    data_schema_name        => null,
    settings_schema_name    => null,
    xform_list              => city_xform);
END;

</table>

44.6.12 INSERT_BIN_NUM_EQWIDTH Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure identifies the minimum and maximum values and computes the bin boundaries at equal intervals.

INSERT_BIN_NUM_EQWIDTH computes a specified number of bins \( n \) and assigns \( (\text{max-min})/n \) values to each bin. The number of bins is the same for each column. If you want to use equi-width binning, but you want the number of bins to be calculated on a per-column basis, use the INSERT_AUTOBIN_NUM_EQWIDTH Procedure.
INSERT_BIN_NUM_EQWIDTH bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_EQWIDTH (  
    bin_table_name        IN VARCHAR2,  
    data_table_name       IN VARCHAR2,  
    bin_num               IN PLS_INTEGER DEFAULT 10,  
    exclude_list          IN COLUMN_LIST DEFAULT NULL,  
    round_num             IN PLS_INTEGER DEFAULT 6,  
    bin_schema_name       IN VARCHAR2 DEFAULT NULL,  
    data_schema_name      IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 44-22 INSERT_BIN_NUM_EQWIDTH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL</td>
</tr>
<tr>
<td></td>
<td>VAL</td>
</tr>
<tr>
<td></td>
<td>BIN</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned. The format of exclude_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</td>
</tr>
<tr>
<td>round_num</td>
<td>Specifies how to round the number in the VAL column of the transformation definition table. When round_num is positive, it specifies the most significant digits to retain. When round_num is negative, it specifies the least significant digits to remove. In both cases, the result is rounded to the specified number of digits. See the Usage Notes for an example. The default value of round_num is 6.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical data.

2. The `round_num` parameter controls the rounding of column values in the transformation definition table, as follows:

   For a value of 308.162:
   - when `round_num = 1` result is 300
   - when `round_num = 2` result is 310
   - when `round_num = 3` result is 308
   - when `round_num = 0` result is 308.162
   - when `round_num = -1` result is 308.16
   - when `round_num = -2` result is 308.2

3. `INSERT_BIN_NUM_EQWIDTH` ignores columns with all NULL values or only one unique value.

Examples

In this example, `INSERT_BIN_NUM_EQWIDTH` computes the bin boundaries for the `affinity_card` column in `mining_data_build` and inserts the transformations in a transformation definition table. The `STACK_BIN_NUM Procedure` creates a transformation list from the contents of the definition table. The `CREATE_MODEL Procedure` embeds the transformation list in a new model called `glm_model`.

The transformation and reverse transformation expressions embedded in `glm_model` are returned by the `GET_MODEL_TRANSFORMATIONS Function`.

```sql
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, cust_income_level, cust_gender, affinity_card
    FROM mining_data_build;

DESCRIBE mining_data
Name Null? Type
------------------------ -------- -----------------
CUST_ID NOT NULL NUMBER
CUST_INCOME_LEVEL VARCHAR2(30)
CUST_GENDER VARCHAR2(1)
AFFINITY_CARD NUMBER(10)

BEGIN
    dbms_data_mining_transform.CREATE_BIN_NUM(
        bin_table_name  =>'bin_tbl');
    dbms_data_mining_transform.INSERT_BIN_NUM_EQWIDTH (
        bin_table_name  =>'bin_tbl',
        data_table_name =>'mining_data',
        bin_num          => 4,
        exclude_list     => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/

set numwidth 10
column val off
column col format a20
column bin format a10
SELECT col, val, bin FROM bin_tbl
ORDER BY val ASC;

COL VAL BIN
CREATE TABLE glmsettings(
    setting_name  VARCHAR2(30),
    setting_value VARCHAR2(30));

BEGIN
    INSERT INTO glmsettings (setting_name, setting_value)
    VALUES (dbms_data_mining.algo_name,
            dbms_data_mining.algo_generalized_linear_model);
    COMMIT;
END;
/

DECLARE
    xforms dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_BIN_NUM (
        bin_table_name => 'bin_tbl',
        xform_list => xforms,
        literal_flag => TRUE);
    dbms_data_mining.CREATE_MODEL(
        model_name => 'glm_model',
        mining_function => dbms_data_mining.regression,
        data_table_name => 'mining_data',
        case_id_column_name => 'cust_id',
        target_column_name => 'affinity_card',
        settings_table_name => 'glmsettings',
        data_schema_name => null,
        settings_schema_name => null,
        xform_list => xforms);
END;
/

SELECT attribute_name
FROM TABLE(dbms_data_mining.GET_MODEL_TRANSFORMATIONS('glm_model'));

ATTRIBUTE_NAME

SELECT expression
FROM TABLE(dbms_data_mining.GET_MODEL_TRANSFORMATIONS('glm_model'));

EXPRESSION
--------------------------------------------------------
CASE WHEN "AFFINITY_CARD"<0 THEN NULL WHEN "AFFINITY_CARD"<=.25 THEN 1 WHEN "AFFINITY_CARD"<=.5 THEN 2 WHEN "AFFINITY_CARD"<=.75 THEN 3 WHEN "AFFINITY_CARD"<=1 THEN 4 END

SELECT reverse_expression
FROM TABLE(dbms_data_mining.GET_MODEL_TRANSFORMATIONS('glm_model'));

REVERSE_EXPRESSION
--------------------------------------------------------
44.6.13 INSERT_BIN_NUM_QTILE Procedure

This procedure performs numerical binning and inserts the transformation definitions in a transformation definition table. The procedure calls the SQL NTILE function to order the data and divide it equally into the specified number of bins (quantiles).

INSERT_BIN_NUM_QTILE bins all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_NUM_QTILE (    bin_table_name    IN VARCHAR2,  data_table_name    IN VARCHAR2,  bin_num            IN PLS_INTEGER DEFAULT 10,  exclude_list        IN COLUMN_LIST DEFAULT NULL,  bin_schema_name    IN VARCHAR2 DEFAULT NULL,  data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The following columns are required:</td>
</tr>
<tr>
<td></td>
<td>COL VARCHAR2(30)</td>
</tr>
<tr>
<td></td>
<td>VAL NUMBER</td>
</tr>
<tr>
<td></td>
<td>BIN VARCHAR2(4000)</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>bin_num</td>
<td>Number of bins. No binning occurs if bin_num is 0 or NULL. The default number of bins is 10.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from the binning process. If you do not specify exclude_list, all numerical columns in the data source are binned. The format of exclude_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2', 'coln')</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.

2. After dividing the data into quantiles, the NTILE function distributes any remainder values one for each quantile, starting with the first. See Oracle Database SQL Language Reference for details.

3. Columns with all NULL values are ignored by INSERT_BIN_NUM_QTILE.

Examples

In this example, INSERT_BIN_NUM_QTILE computes the bin boundaries for the cust_year_of_birth and cust_credit_limit columns in sh.customers and inserts the transformations in a transformation definition table. The STACK_BIN_NUM Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in STACK_VIEW. The view is for display purposes only; it cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
FROM sh.customers;

BEGIN
dbms_data_mining_transform.CREATE_BIN_NUM(
    bin_table_name => 'bin_tbl');

44.6.14 INSERT_BIN_SUPER Procedure

This procedure performs numerical and categorical binning and inserts the transformation definitions in transformation definition tables. The procedure computes bin boundaries based on intrinsic relationships between predictors and a target.

INSERT_BIN_SUPER uses an intelligent binning technique known as supervised binning. It builds a single-predictor decision tree and derives the bin boundaries from splits within the tree.

INSERT_BIN_SUPER bins all the VARCHAR2, CHAR, NUMBER, and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_BIN_SUPER (  
  num_table_name        IN VARCHAR2,
  cat_table_name        IN VARCHAR2,
  data_table_name       IN VARCHAR2,
  target_column_name    IN VARCHAR2,
  max_bin_num           IN PLS_INTEGER  DEFAULT 1000,
  exclude_list          IN COLUMN_LIST  DEFAULT NULL,
  num_schema_name       IN VARCHAR2  DEFAULT NULL,
  cat_schema_name       IN VARCHAR2  DEFAULT NULL,
  data_schema_name      IN VARCHAR2  DEFAULT NULL,
  rem_table_name        IN VARCHAR2  DEFAULT NULL,
  rem_schema_name       IN VARCHAR2  DEFAULT NULL);
## Parameters

</tbody>
</table>
Usage Notes

1. See Oracle Data Mining User’s Guide for details about numerical and categorical data.

2. Columns that have no significant splits are not binned. You can remove the unbinned columns from the mining data by specifying a column removal definition table. If you do not specify a column removal definition table, the unbinned columns remain in the mining data.

3. See Oracle Data Mining Concepts to learn more about decision trees in Oracle Data Mining.

Examples

In this example, INSERT_BIN_SUPER computes the bin boundaries for predictors of cust_credit_limit and inserts the transformations in transformation definition tables. One predictor is numerical, the other is categorical. (INSERT_BIN_SUPER determines that the cust_postal_code column is not a significant predictor.) STACK procedures create transformation lists from the contents of the definition tables.

The SQL expressions that compute the transformations are shown in the views MINING_DATA_STACK_NUM and MINING_DATA_STACK_CAT. The views are for display purposes only; they cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_marital_status,
cust_postal_code, cust_credit_limit
FROM sh.customers;

BEGIN
    dbms_data_mining_transform.CREATE_BIN_NUM(
        bin_table_name => 'bin_num_tbl');

44.6.15 INSERT_CLIP_TRIM_TAIL Procedure

This procedure replaces numeric outliers with nulls and inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_TRIM_TAIL computes the boundaries of the data based on a specified percentage. It removes the values that fall outside the boundaries (tail values) from the data. If you wish to replace the tail values instead of removing them, use the INSERT_CLIP_WINSOR_TAIL Procedure.

INSERT_CLIP_TRIM_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_TRIM_TAIL (clip_table_name IN VARCHAR2, data_table_name IN VARCHAR2, tail_frac IN NUMBER DEFAULT 0.025, exclude_list IN COLUMN_LIST DEFAULT NULL, clip_schema_name IN VARCHAR2 DEFAULT NULL, data_schema_name IN VARCHAR2 DEFAULT NULL);
Parameters

</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.

2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_TRIM_TAIL and INSERT_CLIP_WINSOR_TAIL. Both procedures compute the boundaries as follows:
   - Count the number of non-null values, n, and sort them in ascending order
   - Calculate the number of outliers, t, as n*tail_frac
   - Define the lower boundary lcut as the value at position 1+floor(t)
   - Define the upper boundary rcut as the value at position n-floor(t)
   (The SQL FLOOR function returns the largest integer less than or equal to t.)
   - All values that are <= lcut or => rcut are designated as outliers.
**Examples**

In this example, `INSERT_CLIP_TRIM_TAIL` trims 10% of the data in two columns (5% from the high end and 5% from the low end) and inserts the transformations in a transformation definition table. The `STACK_CLIP` Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the trimming is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_year_of_birth, cust_credit_limit, cust_city
  FROM sh.customers;

44.6.16 INSERT_CLIP_WINSOR_TAIL Procedure

This procedure replaces numeric outliers with the upper or lower boundary values. It inserts the transformation definitions in a transformation definition table.

INSERT_CLIP_WINSOR_TAIL computes the boundaries of the data based on a specified percentage. It replaces the values that fall outside the boundaries (tail values) with the related boundary value. If you wish to set tail values to null, use the INSERT_CLIP_TRIM_TAIL Procedure.

INSERT_CLIP_WINSOR_TAIL clips all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_CLIP_WINSOR_TAIL (clip_table_name    IN VARCHAR2,
data_table_name    IN VARCHAR2,
tail_frac          IN NUMBER DEFAULT 0.025,
exclude_list       IN COLUMN_LIST DEFAULT NULL,
clip_schema_name   IN VARCHAR2 DEFAULT NULL,
data_schema_name   IN VARCHAR2 DEFAULT NULL);

Parameters

Table 44-26 INSERT_CLIP_WINSOR_TAIL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clip_table_name</td>
<td>Name of the transformation definition table for numerical clipping. You can use the CREATE_CLIP Procedure to create the definition table. The following columns are required:</td>

</tr>
</tbody>
</table>

Usage Notes

1. See Oracle Data Mining User's Guide for details about numerical data.
2. The DBMS_DATA_MINING_TRANSFORM package provides two clipping procedures: INSERT_CLIP_WINSOR_TAIL and INSERT_CLIP_TRIM_TAIL. Both procedures compute the boundaries as follows:
   - Count the number of non-null values, \( n \), and sort them in ascending order
   - Calculate the number of outliers, \( t \), as \( n \times \text{tail}\_\text{frac} \)
   - Define the lower boundary \( lcut \) as the value at position \( 1+\text{floor}(t) \)
   - Define the upper boundary \( rcut \) as the value at position \( n-\text{floor}(t) \)
     (The SQL FLOOR function returns the largest integer less than or equal to \( t \).)
   - All values that are \( \leq lcut \) or \( \geq rcut \) are designated as outliers.
   - INSERT_CLIP_WINSOR_TAIL assigns \( lcut \) to the low outliers and \( rcut \) to the high outliers.
   - INSERT_CLIP_TRIM_TAIL replaces the outliers with nulls, effectively removing them from the data.

Examples

In this example, INSERT_CLIP_WINSOR_TAIL winsorizes 10% of the data in two columns (5% from the high end, and 5% from the low end) and inserts the transformations in a transformation definition table. The STACK_CLIP Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

44.6.18 INSERT_MISS_NUM_MEAN Procedure

This procedure replaces missing numerical values with the average (the mean) and inserts the transformation definitions in a transformation definition table.

**INSERT_MISS_NUM_MEAN** replaces missing values in all **NUMBER** and **FLOAT** columns in the data source unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (  
    miss_table_name    IN VARCHAR2,  
    data_table_name    IN VARCHAR2,  
    exclude_list       IN COLUMN_LIST DEFAULT NULL,  
    round_num          IN PLS_INTEGER DEFAULT 6,  
    miss_schema_name   IN VARCHAR2 DEFAULT NULL,  
    data_schema_name   IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value treatment. You can use the <strong>CREATE_MISS_NUM</strong> Procedure to create the definition table. The following columns are required by <strong>INSERT_MISS_NUM_MEAN</strong>: COL VARCHAR2(30) VAL NUMBER</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to be excluded from missing value treatment. If you do not specify exclude_list, all numerical columns are transformed. The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')</td>
</tr>
<tr>
<td>round_num</td>
<td>The number of significant digits to use for the mean. The default number is 6.</td>
</tr>
</tbody>
</table>
### Table 44-28  (Cont.) INSERT_MISS_NUM_MEAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

#### Usage Notes

1. See *Oracle Data Mining User's Guide* for details about numerical data.

2. If you wish to replace numerical missing values with a value other than the mean, you can edit the transformation definition table.

---

#### See Also:

*Oracle Data Mining User’s Guide* for information about default missing value treatment in Oracle Data Mining

---

#### Example

In this example, `INSERT_MISS_NUM_MEAN` computes missing value treatment for `cust_year_of_birth` and inserts the transformation in a transformation definition table. The `STACK_MISS_NUM Procedure` creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view `MINING_DATA_STACK`. The view is for display purposes only; it cannot be used to embed the transformations in a model.

```sql
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_city
FROM sh.customers;

DESCRIBE mining_data
Name                                  Null?    Type
------------------------------------ -------- -------------------
CUST_ID                              NOT NULL NUMBER
CUST_YEAR_OF_BIRTH                   NOT NULL NUMBER(4)
CUST_CITY                            NOT NULL VARCHAR2(30)

BEGIN
    dbms_data_mining_transform.create_miss_num(
        miss_table_name   => 'missn_tbl');
    dbms_data_mining_transform.insert_miss_num_mean(
        miss_table_name   => 'missn_tbl',
        data_table_name   => 'mining_data',
        exclude_list      => DBMS_DATA_MINING_TRANSFORM.COLUMN_LIST('cust_id'));
END;
/
```

set numwidth 4
column val off
SELECT col, val
FROM missn_tbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1957</td>
</tr>
</tbody>
</table>

SELECT avg(cust_year_of_birth) FROM mining_data;

DECLARE
    xforms    dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_MISS_NUM (
        miss_table_name    => 'missn_tbl',
        xform_list        => xforms);
    dbms_data_mining_transform.XFORM_STACK (
        xform_list         => xforms,
        data_table_name    => 'mining_data',
        xform_view_name    => 'mining_data_stack');
END;
/

set long 3000
SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT

--------------------------------------------------------------------------------
SELECT "CUST_ID",NVL("CUST_YEAR_OF_BIRTH",1957.4) "CUST_YEAR_OF_BIRTH","CUST_CITY" FROM mining_data

44.6.19 INSERT_NORM_LIN_MINMAX Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_MINMAX computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[
\begin{align*}
\text{shift} &= \min \\
\text{scale} &= \max - \min
\end{align*}
\]

Normalization is computed as:

\[
\text{x_new} = (x_{old} - \text{shift})/\text{scale}
\]

INSERT_NORM_LIN_MINMAX rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_MINMAX normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_MINMAX (
    norm_table_name IN VARCHAR2,
    data_table_name IN VARCHAR2,
Parameters

Table 44-29  INSERT_NORM_LIN_MINMAX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| norm_table_name    | Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The following columns are required:  
                  | COL VARCHAR2(30)  
                  | SHIFT NUMBER  
                  | SCALE NUMBER  
                  | CREATE_NORM_LIN creates an additional column, ATT, which may be used for specifying nested attributes. This column is not used by INSERT_NORM_LIN_MINMAX. |
| data_table_name    | Name of the table containing the data to be transformed                                                                                       |
| exclude_list       | List of numerical columns to be excluded from normalization. If you do not specify exclude_list, all numerical columns are transformed.  
                  | The format of exclude_list is:  
                  | dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')                                                                              |
| round_num          | The number of significant digits to use for the minimum and maximum. The default number is 6.                                                   |
| norm_schema_name   | Schema of norm_table_name. If no schema is specified, the current schema is used.                                                             |
| data_schema_name   | Schema of data_table_name. If no schema is specified, the current schema is used.                                                             |

Usage Notes

See Oracle Data Mining User's Guide for details about numerical data.

Examples

In this example, INSERT_NORM_LIN_MINMAX normalizes the cust_year_of_birth column and inserts the transformation in a transformation definition table. The STACK_NORM_LIN Procedure creates a transformation list from the contents of the definition table.

The SQL expression that computes the transformation is shown in the view MINING_DATA_STACK. The view is for display purposes only; it cannot be used to embed the transformations in a model.

CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, cust_gender, cust_year_of_birth  
FROM sh.customers;

describe mining_data
<table>
<thead>
<tr>

<tr>
<td>--------------------------------------</td>
<td>-------</td>
<td>------</td>
</tr>
</tbody>
</table>
44.6.20 INSERT_NORM_LIN_SCALE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

INSERT_NORM_LIN_SCALE computes the minimum and maximum values from the data and sets the value of shift and scale as follows:

\[
\begin{align*}
\text{shift} & = 0 \\
\text{scale} & = \max(\text{abs(max)}, \text{abs(min)})
\end{align*}
\]

Normalization is computed as:

\[
x_{\text{new}} = \frac{x_{\text{old}}}{\text{scale}}
\]

INSERT_NORM_LIN_SCALE rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.
INSERT_NORM_LIN_SCALE normalizes all the NUMBER and FLOAT columns in the data source unless you specify a list of columns to ignore.

Syntax

DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_SCALE (
    norm_table_name IN VARCHAR2,
    data_table_name IN VARCHAR2,
    exclude_list IN COLUMN_LIST DEFAULT NULL,
    round_num IN PLS_INTEGER DEFAULT 6,
    norm_schema_name IN VARCHAR2 DEFAULT NULL,
    data_schema_name IN VARCHAR2 DEFAULT NULL);

* FROM mining_data

44.6.21 INSERT_NORM_LIN_ZSCORE Procedure

This procedure performs linear normalization and inserts the transformation definitions in a transformation definition table.

`INSERT_NORM_LIN_ZSCORE` computes the mean and the standard deviation from the data and sets the value of `shift` and `scale` as follows:
Normalization is computed as:

\[ x_{\text{new}} = \frac{x_{\text{old}} - \text{shift}}{\text{scale}} \]

INSERT_NORM_LIN_ZSCORE rounds the value of scale to a specified number of significant digits before storing it in the transformation definition table.

INSERT_NORM_LIN_ZSCORE normalizes all the NUMBER and FLOAT columns in the data unless you specify a list of columns to ignore.

**Syntax**

```sql
DBMS_DATA_MINING_TRANSFORM.INSERT_NORM_LIN_ZSCORE (
    norm_table_name     IN VARCHAR2,
    data_table_name     IN VARCHAR2,
    exclude_list        IN COLUMN_LIST DEFAULT NULL,
    round_num           IN PLS_INTEGER DEFAULT 6,
    norm_schema_name    IN VARCHAR2 DEFAULT NULL,
    data_schema_name    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

BEGIN
dbms_data_mining_transform.STACK_NORM_LIN (norm_table_name => 'norm_tbl',
xform_list => xforms);
dbms_data_mining_transform.XFORM_STACK(
xform_list => xforms,
data_table_name => 'mining_data',

xform_view_name => 'mining_data_stack');
END;
/

set long 3000
SQL> SELECT text FROM user_views WHERE view_name IN 'MINING_DATA_STACK';

TEXT
--------------------------------------------------------------------------------
SELECT "CUST_ID","CUST_GENDER",("CUST_YEAR_OF_BIRTH"-1960)/15 "CUST_YEAR_OF_BIRTH" FROM mining_data
44.6.22 SET_EXPRESSION Procedure

This procedure appends a row to a VARCHAR2 array that stores a SQL expression. The array can be used for specifying a transformation expression that is too long to be used with the SET_TRANSFORM Procedure.

The GET_EXPRESSION Function returns a row in the array.

When you use SET_EXPRESSION to build a transformation expression, you must build a corresponding reverse transformation expression, create a transformation record, and add the transformation record to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_EXPRESSION (
    expression    IN OUT NOCOPY EXPRESSION_REC,
    chunk                       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression record (EXPRESSION_REC) that specifies a transformation expression or a reverse transformation expression for an attribute. Each expression record includes a VARCHAR2 array and index fields for specifying upper and lower boundaries within the array. There are two EXPRESSION_REC fields within a transformation record (TRANSFORM_REC): one for the transformation expression; the other for the reverse transformation expression. See Table 44-1 for a description of the EXPRESSION_REC type.</td>
</tr>
<tr>
<td>chunk</td>
<td>A VARCHAR2 chunk (row) to be appended to expression.</td>
</tr>
</tbody>
</table>

Notes

1. You can pass NULL in the chunk argument to SET_EXPRESSION to clear the previous chunk. The default value of chunk is NULL.
2. See "About Transformation Lists".
3. See "Operational Notes".

Examples

In this example, two calls to SET_EXPRESSION construct a transformation expression and two calls construct the reverse transformation.
Note:

This example is for illustration purposes only. It shows how `SET_EXPRESSION` appends the text provided in `chunk` to the text that already exists in `expression`. The `SET_EXPRESSION` procedure is meant for constructing very long transformation expressions that cannot be specified in a `VARCHAR2` argument to `SET_TRANSFORM`.

Similarly while transformation lists are intended for embedding in a model, the transformation list `v_xlst` is shown in an external view for illustration purposes.

CREATE OR REPLACE VIEW mining_data AS

SELECT cust_id, cust_year_of_birth, cust_postal_code, cust_credit_limit
FROM sh.customers;

DECLARE
  v_expr dbms_data_mining_transform.EXPRESSION_REC;
  v_rexp dbms_data_mining_transform.EXPRESSION_REC;
  v_xrec dbms_data_mining_transform.TRANSFORM_REC;
  v_xlst dbms_data_mining_transform.TRANSFORM_LIST :=
    dbms_data_mining_transform.TRANSFORM_LIST(NULL);
BEGIN
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK => '("CUST_YEAR_OF_BIRTH"-1910)');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_expr,
    CHUNK => '/77');
  dbms_data_mining_transform.SET_EXPRESSION(
    EXPRESSION => v_rexp,
    CHUNK => '"CUST_YEAR_OF_BIRTH"*77');
  dbms_data_mining_transform.SET_EXPRESSION(

44.6.23 SET_TRANSFORM Procedure

This procedure appends the transformation instructions for an attribute to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.SET_TRANSFORM (
    xform_list               IN OUT NOCOPY TRANSFORM_LIST,
    attribute_name           VARCHAR2,
    attribute_subname        VARCHAR2,
    expression               VARCHAR2,
    reverse_expression       VARCHAR2,
    attribute_spec           VARCHAR2 DEFAULT NULL);
```

Parameters

Table 44-33  SET_TRANSFORM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>

</tr>
<tr>
<td>attribute_subname</td>
<td>Name of the nested attribute if attribute_name is a nested column, otherwise NULL.</td>
</tr>
<tr>
<td>expression</td>
<td>A SQL expression that specifies the transformation of the attribute.</td>
</tr>
<tr>
<td>reverse_expression</td>
<td>A SQL expression that reverses the transformation for readability in model details and in the target of a supervised model (if the attribute is a target)</td>
</tr>
</tbody>
</table>
Table 44-33  (Cont.) SET_TRANSFORM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| attribute_spec| One or more keywords that identify special treatment for the attribute during model build. Values are:  
|               | • NOPREP — When ADP is on, prevents automatic transformation of the attribute. If ADP is not on, this value has no effect.  
|               | • TEXT — Causes the attribute to be treated as unstructured text data  
|               | • FORCE_IN — Forces the inclusion of the attribute in the model build. Applies only to GLM models with feature selection enabled (ftr_selection_enable = yes). Feature selection is disabled by default.  
|               | If the model is not using GLM with feature selection, this value has no effect.  
|               | See “Specifying Transformation Instructions for an Attribute” in Oracle Data Mining User’s Guide for more information about attribute_spec. |

Usage Notes

1. See the following relevant sections in "Operational Notes":  
   • About Transformation Lists  
   • Nested Data Transformations

2. As shown in the following example, you can eliminate an attribute by specifying a null transformation expression and reverse expression. You can also use the STACK interface to remove a column (CREATE_COL_REM Procedure and STACK_COL_REM Procedure).

44.6.24 STACK_BIN_CAT Procedure

This procedure adds categorical binning transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_CAT (  
  bin_table_name IN VARCHAR2,  
  xform_list     IN OUT NOCOPY TRANSFORM_LIST,  
  literal_flag   IN BOOLEAN DEFAULT FALSE,  
  bin_schema_name IN VARCHAR2 DEFAULT NULL);  
```
Parameters

Table 44-34  STACK_BIN_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 44-4.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

Examples

This example shows how a binning transformation for the categorical column cust_postal_code could be added to a stack called mining_data_stack.

```
CREATE or REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 AND 100100;
```

Note:

This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
44.6.25 STACK_BIN_NUM Procedure

This procedure adds numerical binning transformations to a transformation list.

Syntax

```plaintext
DBMS_DATA_MINING_TRANSFORM.STACK_BIN_NUM (  
  bin_table_name IN VARCHAR2,  
  xform_list IN OUT NOCOPY TRANSFORM_LIST,  
  literal_flag IN BOOLEAN DEFAULT FALSE,  
  bin_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 44-35  STACK_BIN_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for numerical binning. You can use the CREATE_BIN_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_BIN_NUM. To populate the table, you can use one of the INSERT procedures for numerical binning or you can write your own SQL. See Table 44-6.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is TRUE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to FALSE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

Examples

This example shows how a binning transformation for the numerical column cust_credit_limit could be added to a stack called mining_data_stack.

```
CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_postal_code, cust_credit_limit
FROM sh.customers
WHERE cust_id BETWEEN 100050 and 100100;
```

Note:

This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
BEGIN
    dbms_data_mining_transform.create_bin_num ('bin_num_tbl');
    dbms_data_mining_transform.insert_bin_num_qtile (bin_table_name => 'bin_num_tbl', data_table_name => 'mining_data', bin_num => 5, exclude_list => dbms_data_mining_transform.COLUMN_LIST('cust_id'));
END;
/
DECLARE
    MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.STACK_BIN_CAT (bin_table_name => 'bin_num_tbl', xform_list => mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (xform_list => mining_data_stack, data_table_name => 'mining_data', xform_view_name => 'mining_data_stack_view');
END;
/
-- Before transformation
SELECT cust_id, cust_postal_code, ROUND(cust_credit_limit) FROM mining_data

</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

Examples

This example shows how the column cust_credit_limit could be removed in a transformation list called mining_data_stack.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
    FROM sh.customers;
BEGIN
    dbms_data_mining_transform.create_col_rem ('rem_tbl');
END;
/
```

```
INSERT INTO rem_tbl VALUES (upper('cust_postal_code'), null);
```

Note:

This example invokes the XFORM_STACK Procedure to show how the data is transformed by the stack. XFORM_STACK simply generates an external view of the transformed data. The actual purpose of the STACK procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to CREATE_MODEL in the xform_list parameter. See INSERT_BIN_NUM_EQWIDTH Procedure for an example.
MINING_DATA_STACK dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.stack_col_rem (
    rem_table_name     => 'rem_tbl',
    xform_list         => mining_data_stack);
  dbms_data_mining_transform.XFORM_STACK (
    xform_list         => mining_data_stack,
    data_table_name    => 'mining_data',
    xform_view_name    => 'mining_data_stack_view');
END;
/

SELECT * FROM mining_data
  WHERE cust_id BETWEEN 100050 AND 100051
  ORDER BY cust_id;

100051   52790      9000               

44.6.28 STACK_MISS_CAT Procedure

This procedure adds categorical missing value transformations to a transformation list.

Syntax

DBMS_DATA_MINING_TRANSFORM.STACK_MISS_CAT {
  miss_table_name IN VARCHAR2,
  xform_list      IN OUT NOCOPY TRANSFORM_LIST,
  miss_schema_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 44-38 STACK_MISS_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL.</td>
</tr>
<tr>
<td></td>
<td>See Table 44-12.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>

<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>
Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

Examples

This example shows how the missing values in the column `cust_marital_status` could be replaced with the mode in a transformation list called `mining_data_stack`.

Note:

This example invokes the `XFORM_STACK Procedure` to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See `INSERT_BIN_NUM_EQWIDTH Procedure` for an example.

```
CREATE OR REPLACE VIEW mining_data AS
    SELECT cust_id, country_id, cust_marital_status
    FROM sh.customers
    WHERE cust_id BETWEEN 1 AND 10;
BEGIN
    dbms_data_mining_transform.create_miss_cat ('miss_cat_tbl');
    dbms_data_mining_transform.insert_miss_cat_mode ('miss_cat_tbl', 'mining_data');
END;
/

DECLARE
    MINING_DATA_STACK   dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
    dbms_data_mining_transform.stack_miss_cat (   miss_table_name   => 'miss_cat_tbl',
                                               xform_list        => mining_data_stack);
    dbms_data_mining_transform.XFORM_STACK (   xform_list        => mining_data_stack,   data_table_name   => 'mining_data',   xform_view_name   => 'mining_data_stack_view');
END;
/

SELECT * FROM mining_data
ORDER BY cust_id;
```

</tr>
<tr>
<td>5</td>
<td>52789</td>
<td></td>
</tr>
</tbody>
</table>
44.6.29 STACK_MISS_NUM Procedure

This procedure adds numeric missing value transformations to a transformation list.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.STACK_MISS_NUM (  
  miss_table_name     IN       VARCHAR2,  
  xform_list          IN OUT   NOCOPY TRANSFORM_LIST,  
  miss_schema_name    IN       VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value</td>
</tr>
<tr>
<td></td>
<td>treatment. You can use the CREATE_MISS_NUM Procedure to create</td>
</tr>
<tr>
<td></td>
<td>the definition table. The table must be populated with transformation</td>
</tr>
<tr>
<td></td>
<td>definitions before you call STACK_MISS_NUM. To populate the table, you</td>
</tr>
<tr>
<td></td>
<td>can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL.</td>

10               200

44.6.30 STACK_NORM_LIN Procedure

This procedure adds linear normalization transformations to a transformation list.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.STACK_NORM_LIN (
    norm_table_name     IN       VARCHAR2,
    xform_list          IN OUT   NOCOPY TRANSFORM_LIST,
    norm_schema_name    IN       VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 44-40  STACK_NORM_LIN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call STACK_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 44-16.</td>
</tr>
<tr>
<td>xform_list</td>
<td>A transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of norm_table_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"
Examples

This example shows how the column `cust_credit_limit` could be normalized in a transformation list called `mining_data_stack`.

Note:

This example invokes the `XFORM_STACK` Procedure to show how the data is transformed by the stack. `XFORM_STACK` simply generates an external view of the transformed data. The actual purpose of the `STACK` procedures is to assemble a list of transformations for embedding in a model. The transformations are passed to `CREATE_MODEL` in the `xform_list` parameter. See `INSERT_BIN_NUM_EQWIDTH` Procedure for an example.

```sql
CREATE OR REPLACE VIEW mining_data AS
  SELECT cust_id, country_id, cust_postal_code, cust_credit_limit
  FROM sh.customers;

### 44.6.31 XFORM_BIN_CAT Procedure

This procedure creates a view that implements the categorical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

#### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_CAT (
  bin_table_name       IN VARCHAR2,
  data_table_name      IN VARCHAR2,
  xform_view_name      IN VARCHAR2,
  literal_flag         IN BOOLEAN DEFAULT FALSE,
  bin_schema_name      IN VARCHAR2 DEFAULT NULL,
  data_schema_name     IN VARCHAR2 DEFAULT NULL,
  xform_schema_name    IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin_table_name</td>
<td>Name of the transformation definition table for categorical binning. You can use the CREATE_BIN_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_BIN_CAT. To populate the table, you can use one of the INSERT procedures for categorical binning or you can write your own SQL. See Table 44-4.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed.</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in bin_table_name.</td>
</tr>
</tbody>
</table>
Table 44-41  (Cont.) XFORM_BIN_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>literal_flag</td>
<td>Indicates whether the values in the bin column in the transformation definition table are valid SQL literals. When literal_flag is FALSE (the default), the bin identifiers will be transformed to SQL literals by surrounding them with single quotes. Set literal_flag to TRUE if the bin identifiers are numbers that should have a numeric datatype, as is the case for an O-Cluster model. See &quot;INSERT_BIN_NUM_EQWIDTH Procedure&quot; for an example.</td>
</tr>
<tr>
<td>bin_schema_name</td>
<td>Schema of bin_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes
See "Operational Notes".

Examples
This example creates a view that bins the cust_postal_code column. The data source consists of three columns from sh.customer.

```sql
describe mining_data
Name                                   Null?    Type
-------------------------------------- -------- ------------------------
CUST_ID                                NOT NULL NUMBER
CUST_POSTAL_CODE                       NOT NULL VARCHAR2(10)
CUST_CREDIT_LIMIT                               NUMBER

SELECT * FROM mining_data WHERE cust_id between 104066 and 104069;

    CUST_ID  CUST_POSTAL_CODE
---------- -------------------
      104066    9776
      104067    9726
      104068    9875
      104069    9577

BEGIN
    dbms_data_mining_transform.create_bin_cat(
        bin_table_name  => 'bin_cat_tbl');
    dbms_data_mining_transform.insert_bin_cat_freq(
        bin_table_name  => 'bin_cat_tbl',
        data_table_name => 'mining_data',
        bin_num          => 10);
```
44.6.32 XFORM_BIN_NUM Procedure

This procedure creates a view that implements the numerical binning transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_BIN_NUM (  
    bin_table_name  IN VARCHAR2,  
    data_table_name IN VARCHAR2,  
    xform_view_name IN VARCHAR2,  
    literal_flag    IN BOOLEAN DEFAULT FALSE,  
    bin_schema_name IN VARCHAR2 DEFAULT NULL,  
    data_schema_name IN VARCHAR2 DEFAULT NULL,  
    xform_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

44.6.33 XFORM_CLIP Procedure

This procedure creates a view that implements the clipping transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

DBMS_DATA_MINING_TRANSFORM.XFORM_CLIP (clip_table_name IN VARCHAR2,
data_table_name IN VARCHAR2,
xform_view_name IN VARCHAR2,
clip_schema_name IN VARCHAR2 DEFAULT NULL,
data_schema_name IN VARCHAR2, DEFAULT NULL,
xform_schema_name IN VARCHAR2, DEFAULT NULL);

Parameters

<td>Schema of (\text{rem_table_name} ). If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of (\text{data_table_name} ). If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of (\text{xform_view_name} ). If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes".

Examples

This example creates a view that includes all but one column from the table \text{customers} \) in the current schema.

describe customers
Name                                      Null?    Type
----------------------------------------- -------- ----------------------------
CUST_ID                                   NOT NULL NUMBER
CUST_MARITAL_STATUS                                VARCHAR2(20)
OCCUPATION                                         VARCHAR2(21)
AGE                                                NUMBER
YRS_RESIDENCE                                      NUMBER

BEGIN
DBMS_DATA_MINING_TRANSFORM.CREATE_COL_REM ('colrem_xtbl');
END;
/
INSERT INTO colrem_xtbl VALUES('CUST_MARITAL_STATUS', null);
NOTE: This currently doesn't work. See bug 9310319

BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_COL_REM {
  rem_table_name => 'colrem_xtbl',
  data_table_name => 'customers',
}
44.6.35 XFORM_EXPR_NUM Procedure

This procedure creates a view that implements the specified numeric transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM (    
    expr_pattern       IN       VARCHAR2,    
    data_table_name    IN       VARCHAR2,    
    xform_view_name    IN       VARCHAR2,    
    exclude_list       IN       COLUMN_LIST DEFAULT NULL,    
    include_list       IN       COLUMN_LIST DEFAULT NULL,    
    col_pattern        IN       VARCHAR2 DEFAULT ':col',    
    data_schema_name   IN       VARCHAR2 DEFAULT NULL,    
    xform_schema_name  IN       VARCHAR2 DEFAULT NULL);
```

Parameters

Table 44-45  XFORM_EXPR_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A numeric transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in <code>data_table_name</code> with the transformations specified in <code>expr_pattern</code> and <code>col_pattern</code>.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of numerical columns to exclude. If NULL, no numerical columns are excluded. The format of <code>exclude_list</code> is:</td>
</tr>
<tr>
<td></td>
<td><code>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</code></td>
</tr>
<tr>
<td>include_list</td>
<td>List of numeric columns to include. If NULL, all numeric columns are included. The format of <code>include_list</code> is:</td>
</tr>
<tr>
<td></td>
<td><code>dbms_data_mining_transform.COLUMN_LIST('col1','col2', ...'coln')</code></td>
</tr>
</tbody>
</table>
Table 44-45  (Cont.) XFORM_EXPR_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>col_pattern</td>
<td>The value within expr_pattern that will be replaced with a column name. The value of col_pattern is case-sensitive. The default value of col_pattern is ':col'</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_NUM procedure constructs numeric transformation expressions from the specified expression pattern (expr_pattern) by replacing every occurrence of the specified column pattern (col_pattern) with an actual column name.

XFORM_EXPR_NUM uses the SQL REPLACE function to construct the transformation expressions.

REPLACE (expr_pattern, col_pattern, '"column_name"') || '"column_name"'

If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

See:

Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_NUM and XFORM_EXPR_STR procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See “Operational Notes”

Examples

This example creates a view that transforms the datatype of numeric columns.

describe customers
Name                                      Null?   Type
--------------------------------------------------------------------------
CUST_ID                                   NOT NULL NUMBER
CUST_MARITAL_STATUS                       VARCHAR2(20)
OCCUPATION                                VARCHAR2(21)
AGE                                       NUMBER
YRS_RESIDENCE                              NUMBER

BEGIN
DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_NUM(
    expr_pattern => 'to_char(:col)',
    ...)
END
data_table_name => 'customers',
xform_view_name => 'cust_nonum_view',
exclude_list => dbms_data_mining_transform.COLUMN_LIST( 'cust_id'),
include_list => null,
col_pattern => ':col');
END;
/

describe cust_nonum_view
Name Null? Type
----------------------------------- -------- ------------------------
CUST_ID NOT NULL NUMBER
CUST_MARITAL_STATUS VARCHAR2(20)
OCCUPATION VARCHAR2(21)
AGE VARCHAR2(40)
YRS_RESIDENCE VARCHAR2(40)

44.6.36 XFORM_EXPR_STR Procedure

This procedure creates a view that implements the specified categorical transformations. Only the columns that you specify are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

DBMS_DATA_MINING_TRANSFORM.XFORM_EXPR_STR {
    expr_pattern IN VARCHAR2,
data_table_name IN VARCHAR2,
xform_view_name IN VARCHAR2,
exclude_list IN COLUMN_LIST DEFAULT NULL,
include_list IN COLUMN_LIST DEFAULT NULL,
col_pattern IN VARCHAR2 DEFAULT ':col',
data_schema_name IN VARCHAR2 DEFAULT NULL,
xform_schema_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 44-46  XFORM_EXPR_STR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expr_pattern</td>
<td>A character transformation expression</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in expr_pattern and col_pattern.</td>
</tr>
<tr>
<td>exclude_list</td>
<td>List of categorical columns to exclude. If NULL, no categorical columns are excluded. The format of exclude_list is: dbms_data_mining_transform.COLUMN_LIST('col1','col2',...'coln')</td>
</tr>
</tbody>
</table>
Table 44-46 (Cont.) XFORM_EXPR_STR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_list</td>
<td>List of character columns to include. If NULL, all character columns are included. The format of include_list is:</td>
</tr>
<tr>
<td></td>
<td>dbms_data_mining_transform.COLUMN_LIST('col1','col2', '...','coln')</td>
</tr>
<tr>
<td>col_pattern</td>
<td>The value within expr_pattern that will be replaced with a column name. The value of col_pattern is case-sensitive.</td>
</tr>
<tr>
<td></td>
<td>The default value of col_pattern is ':col'</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

1. The XFORM_EXPR_STR procedure constructs character transformation expressions from the specified expression pattern (expr_pattern) by replacing every occurrence of the specified column pattern (col_pattern) with an actual column name.

   XFORM_EXPR_STR uses the SQL REPLACE function to construct the transformation expressions.

   ```sql
   REPLACE (expr_pattern, col_pattern, '"column_name"') || '"column_name"
   ```

   If there is a column match, then the replacement is made in the transformation expression; if there is not a match, then the column is used without transformation.

   See: Oracle Database SQL Language Reference for information about the REPLACE function

2. Because of the include and exclude list parameters, the XFORM_EXPR_STR and XFORM_EXPR_NUM procedures allow you to easily specify individual columns for transformation within large data sets. The other XFORM_* procedures support an exclude list only. In these procedures, you must enumerate every column that you do not want to transform.

3. See "Operational Notes"

Examples

This example creates a view that transforms character columns to upper case.

```sql
describe customers
Name                                Null?    Type
----------------------------------- -------- ------------------------
```
44.6.37 XFORM_MISS_CAT Procedure

This procedure creates a view that implements the categorical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_CAT (  
  miss_table_name IN VARCHAR2,  
  data_table_name IN VARCHAR2,  
  xform_view_name IN VARCHAR2,  
  miss_schema_name IN VARCHAR2 DEFAULT NULL,  
);  
```
Parameters

Table 44-47  XFORM_MISS_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for categorical missing value treatment. You can use the CREATE_MISS_CAT Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_CAT. To populate the table, you can use the INSERT_MISS_CAT_MODE Procedure or you can write your own SQL. See Table 44-12.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes".

Examples

This example creates a view that replaces missing categorical values with the mode.

SELECT * FROM geog;

REG_ID  REGION
-------  ------------------------------
  1  NE
  2  SW
  3  SE
  4  SW
  5
  6  NE
  7  NW
  8  NW
  9
 10
 11  SE
 12  SE
 13  NW
 14  SE
 15  SE

SELECT STATS_MODE(region) FROM geog;
44.6.38 XFORM_MISS_NUM Procedure

This procedure creates a view that implements the numerical missing value treatment transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name IN VARCHAR2,
    data_table_name IN VARCHAR2,
    xform_view_name IN VARCHAR2,
);```
miss_schema_name      IN VARCHAR2 DEFAULT NULL,
data_schema_name      IN VARCHAR2 DEFAULT NULL,
xform_schema_name     IN VARCHAR2 DEFAULT NULL;

Parameters

Table 44-48    XFORM_MISS_NUM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>miss_table_name</td>
<td>Name of the transformation definition table for numerical missing value treatment. You can use the CREATE_MISS_NUM Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_MISS_NUM. To populate the table, you can use the INSERT_MISS_NUM_MEAN Procedure or you can write your own SQL. See Table 44-14.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>miss_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes".

Examples

This example creates a view that replaces missing numerical values with the mean.

```sql
SELECT * FROM items;

+------+-----+
<table>
<thead>
<tr>
<th>ITEM_ID</th>
<th>QTY</th>
</tr>
</thead>
<tbody>
<tr>
<td>aa</td>
<td>200</td>
</tr>
<tr>
<td>bb</td>
<td>200</td>
</tr>
<tr>
<td>cc</td>
<td>250</td>
</tr>
<tr>
<td>dd</td>
<td></td>
</tr>
<tr>
<td>ee</td>
<td></td>
</tr>
<tr>
<td>ff</td>
<td>100</td>
</tr>
<tr>
<td>gg</td>
<td>250</td>
</tr>
<tr>
<td>hh</td>
<td>200</td>
</tr>
<tr>
<td>ii</td>
<td></td>
</tr>
<tr>
<td>jj</td>
<td>200</td>
</tr>
</tbody>
</table>

SELECT AVG(qty) FROM items;

+-------+
<table>
<thead>
<tr>
<th>AVG(QTY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
</tr>
</tbody>
</table>
```
BEGIN
  DBMS_DATA_MINING_TRANSFORM.CREATE_MISS_NUM('missnum_xtbl');
  DBMS_DATA_MINING_TRANSFORM.INSERT_MISS_NUM_MEAN (
    miss_table_name => 'missnum_xtbl',
    data_table_name => 'items');
END;
/

SELECT col, val FROM missnum_xtbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>VAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QTY</td>
<td>200</td>
</tr>
</tbody>
</table>

BEGIN
  DBMS_DATA_MINING_TRANSFORM.XFORM_MISS_NUM (
    miss_table_name => 'missnum_xtbl',
    data_table_name => 'items',
    xform_view_name => 'items_view');
END;
/

SELECT * FROM items_view;

<table>
<thead>
<tr>
<th>ITEM_ID</th>
<th>QTY</th>
</tr>
</thead>
<tbody>
<tr>
<td>aa</td>
<td>200</td>
</tr>
<tr>
<td>bb</td>
<td>200</td>
</tr>
<tr>
<td>cc</td>
<td>250</td>
</tr>
<tr>
<td>dd</td>
<td>200</td>
</tr>
<tr>
<td>ee</td>
<td>200</td>
</tr>
<tr>
<td>ff</td>
<td>100</td>
</tr>
<tr>
<td>gg</td>
<td>250</td>
</tr>
<tr>
<td>hh</td>
<td>200</td>
</tr>
<tr>
<td>ii</td>
<td>200</td>
</tr>
<tr>
<td>jj</td>
<td>200</td>
</tr>
</tbody>
</table>

### 44.6.39 XFORM_NORM_LIN Procedure

This procedure creates a view that implements the linear normalization transformations specified in a definition table. Only the columns that are specified in the definition table are transformed; the remaining columns from the data table are present in the view, but they are not changed.

#### Syntax

```sql
DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
  norm_table_name IN VARCHAR2,
  data_table_name IN VARCHAR2,
  xform_view_name IN VARCHAR2,
  norm_schema_name IN VARCHAR2 DEFAULT NULL,
  data_schema_name IN VARCHAR2 DEFAULT NULL,
  xform_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 44-49  XFORM_NORM_LIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>norm_table_name</td>
<td>Name of the transformation definition table for linear normalization. You can use the CREATE_NORM_LIN Procedure to create the definition table. The table must be populated with transformation definitions before you call XFORM_NORM_LIN. To populate the table, you can use one of the INSERT procedures for normalization or you can write your own SQL. See Table 44-12.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view presents columns in data_table_name with the transformations specified in miss_table_name.</td>
</tr>
<tr>
<td>norm_schema_name</td>
<td>Schema of miss_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

Usage Notes

See "Operational Notes".

Examples

This example creates a view that normalizes the cust_year_of_birth and cust_credit_limit columns. The data source consists of three columns from sh.customer.

CREATE OR REPLACE VIEW mining_data AS
SELECT cust_id, cust_year_of_birth, cust_credit_limit
FROM sh.customers;

describe mining_data
Name Null? Type
-------------- --------- --------------------------
CUST_ID NOT NULL NUMBER
CUST_YEAR_OF_BIRTH NOT NULL NUMBER(4)
CUST_CREDIT_LIMIT NUMBER

SELECT * FROM mining_data WHERE cust_id > 104495
ORDER BY cust_year_of_birth;

CUST_ID  CUST_YEAR_OF_BIRTH  CUST_CREDIT_LIMIT
--------  ------------------  ------------------
104496    1947               3000
104498    1954               10000
104500    1962               15000
104499    1970               3000
104497    1976               3000
BEGIN
    dbms_data_mining_transform.CREATE_NORM_LIN(
        norm_table_name => 'normx_tbl');
    dbms_data_mining_transform.INSERT_NORM_LIN_MINMAX(
        norm_table_name => 'normx_tbl',
        data_table_name => 'mining_data',
        exclude_list => dbms_data_mining_transform.COLUMN_LIST('cust_id'),
        round_num => 3);
END;
/

SELECT col, shift, scale FROM normx_tbl;

<table>
<thead>
<tr>
<th>COL</th>
<th>SHIFT</th>
<th>SCALE</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1910</td>
<td>77</td>
</tr>
<tr>
<td>CUST_CREDIT_LIMIT</td>
<td>1500</td>
<td>13500</td>
</tr>
</tbody>
</table>

BEGIN
    DBMS_DATA_MINING_TRANSFORM.XFORM_NORM_LIN (
        norm_table_name => 'normx_tbl',
        data_table_name => 'mining_data',
        xform_view_name => 'norm_view');
END;
/

SELECT * FROM norm_view WHERE cust_id > 104495
    ORDER BY cust_year_of_birth;

<table>
<thead>
<tr>
<th>CUST_ID</th>
<th>CUST_YEAR_OF_BIRTH</th>
<th>CUST_CREDIT_LIMIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>104496</td>
<td>.4805195</td>
<td>.1111111</td>
</tr>
<tr>
<td>104498</td>
<td>.5714286</td>
<td>.6296296</td>
</tr>
<tr>

<td>.6753247</td>
<td>1</td>
</tr>
<tr>
<td>104499</td>
<td>.7792208</td>
<td>.1111111</td>
</tr>
<tr>
<td>104497</td>
<td>.8571429</td>
<td>.1111111</td>
</tr>
</tbody>
</table>

set long 2000
SQL> SELECT text FROM user_views WHERE view_name IN 'NORM_VIEW';

TEXT

---------------------------------------------------------------------------
SELECT "CUST_ID",("CUST_YEAR_OF_BIRTH"-1910)/77 "CUST_YEAR_OF_BIRTH",("CUST
_CREDIT_LIMIT"-1500)/13500 "CUST_CREDIT_LIMIT" FROM mining_data

44.6.40 XFORM_STACK Procedure

This procedure creates a view that implements the transformations specified by the stack. Only the columns and nested attributes that are specified in the stack are transformed. Any remaining columns and nested attributes from the data table appear in the view without changes.

To create a list of objects that describe the transformed columns, use the DESCRIBE_STACK Procedure.
See Also:

"Overview"

*Oracle Data Mining User's Guide* for more information about data mining attributes

## Syntax

```
DBMS_DATA_MINING_TRANSFORM.XFORM_STACK (   
    xform_list         IN     TRANSFORM_list,  
    data_table_name    IN     VARCHAR2,  
    xform_view_name    IN     VARCHAR2,  
    data_schema_name   IN     VARCHAR2 DEFAULT NULL,  
    xform_schema_name  IN     VARCHAR2 DEFAULT NULL);
```

### Parameters

#### Table 44-50  XFORM_STACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xform_list</td>
<td>The transformation list. See Table 44-1 for a description of the TRANSFORM_LIST object type.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be transformed</td>
</tr>
<tr>
<td>xform_view_name</td>
<td>Name of the view to be created. The view applies the transformations in xform_list to data_table_name.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Schema of data_table_name. If no schema is specified, the current schema is used.</td>
</tr>
<tr>
<td>xform_schema_name</td>
<td>Schema of xform_view_name. If no schema is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

### Usage Notes

See "Operational Notes". The following sections are especially relevant:

- "About Transformation Lists"
- "About Stacking"
- "Nested Data Transformations"

### Examples

This example applies a transformation list to the view `dmuser.cust_info` and shows how the data is transformed. The `CREATE` statement for `cust_info` is shown in "DESCRIBE_STACK Procedure".

```
BEGIN  
  dbms_data_mining_transform.CREATE_BIN_NUM ('birth_yr_bins');  
  dbms_data_mining_transform.INSERT_BIN_NUM_QTILE ( 
    bin_table_name   => 'birth_yr_bins',  
    data_table_name  => 'cust_info',  
    bin_num          => 6,  
    exclude_list     => dbms_data_mining_transform.column_list(
```
'cust_id','country_id'));

END;
/
SELECT * FROM birth_yr_bins;

<table>
<thead>
<tr>
<th>COL</th>
<th>ATT</th>
<th>VAL</th>
<th>BIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1922</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1951 1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1959 2</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1966 3</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1973 4</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1979 5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>CUST_YEAR_OF_BIRTH</td>
<td>1986 6</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

DECLARE cust_stack dbms_data_mining_transform.TRANSFORM_LIST;
BEGIN
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack, 'country_id', NULL, 'country_id/10', 'country_id*10');
  dbms_data_mining_transform.STACK_BIN_NUM ('birth_yr_bins', cust_stack);
  dbms_data_mining_transform.SET_TRANSFORM (cust_stack, 'custprods', 'Mouse Pad', 'value*100', 'value/100');
  dbms_data_mining_transform.XFORM_STACK (xform_list => cust_stack, data_table_name => 'cust_info', xform_view_name => 'cust_xform_view');

The **DBMS_DATAPUMP** package is used to move all, or part of, a database between databases, including both data and metadata.

### See Also:

*Oracle Database Utilities* for more information on the concepts behind the **DBMS_DATAPUMP** API, how it works, and how it is implemented in the Data Pump Export and Import utilities

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Data Structures**
- **Summary of DBMS_DATAPUMP Subprograms**

### 45.1 DBMS_DATAPUMP Overview

**DBMS_DATAPUMP** provides the following support and functionality.

- The source and target databases can have different hardware, operating systems, character sets, time zones, and versions.
- All object types and datatypes existing in Oracle Database 11g and higher are supported.
- Data and metadata can be transferred between databases without using any intermediary files.
- A subset of a database can be moved based upon object type and names of objects.
- Schema names, data file names, tablespace names, and data can be transformed at import time.
- Previously aborted export and import jobs can be restarted without duplicating or omitting any data or metadata from the original job.
- The resources applied to an export or import job can be modified.
- Data in an Oracle proprietary format can be unloaded and loaded.
45.2 DBMS_DATAPUMP Security Model

Security for the DBMS_DATAPUMP package is implemented through roles.

The DATAPUMP_EXP_FULL_DATABASE and DATAPUMP_IMP_FULL_DATABASE roles allow privileged users to take full advantage of the API. The Data Pump API will use these roles to determine whether privileged application roles should be assigned to the processes comprising the job.

- **DATAPUMP_EXP_FULL_DATABASE**
  The DATAPUMP_EXP_FULL_DATABASE role affects only Export operations. It allows users running these operations to do the following:
  - Perform the operation outside of the scope of their schema
  - Monitor jobs that were initiated by another user
  - Export objects (for example, TABLESPACE definitions) that unprivileged users cannot reference

Although the SYS schema does not have the DATAPUMP_EXP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_EXP_FULL_DATABASE role will also grant access to the SYS schema.

- **DATAPUMP_IMP_FULL_DATABASE**
  The DATAPUMP_IMP_FULL_DATABASE role affects only Import and SQL_FILE operations. It allows users running these operations to do the following:
  - Perform the operation outside of the scope of their schema
  - Monitor jobs that were initiated by another user
  - Import objects (for example, DIRECTORY definitions) that unprivileged users cannot create

Although the SYS schema does not have the DATAPUMP_IMP_FULL_DATABASE role assigned to it, all security checks performed by Data Pump that require the DATAPUMP_IMP_FULL_DATABASE role will also grant access to the SYS schema.

45.3 DBMS_DATAPUMP Constants

There are several public constants defined for use with the DBMS_DATAPUMP.GET_STATUS procedure. All such constants are defined as part of the DBMS_DATAPUMP package. Any references to these constants must be prefixed by DBMS_DATAPUMP, and followed by the symbols in the following lists:

**Mask Bit Definitions**

The following mask bit definitions are used for controlling the return of data through the DBMS_DATAPUMP.GET_STATUS procedure.

- **KU$_STATUS_WIP** CONSTANT BINARY_INTEGER := 1;
- **KU$_STATUS_JOB_DESC** CONSTANT BINARY_INTEGER := 2;
- **KU$_STATUS_JOB_STATUS** CONSTANT BINARY_INTEGER := 4;
- **KU$_STATUS_JOB_ERROR** CONSTANT BINARY_INTEGER := 8;
Dump File Type Definitions

The following definitions are used for identifying types of dump files returned through the DBMS_DATAPUMP.GET_STATUS procedure.

- KU$_DUMPFILE_TYPE_DISK CONSTANT BINARY_INTEGER := 0;
- KU$_DUMPFILE_TYPE_TEMPLATE CONSTANT BINARY_INTEGER := 3;

45.4 DBMS_DATAPUMP Data Structures

The DBMS_DATAPUMP package defines object types. The types described in this section are defined in the SYS schema for use by the GET_STATUS function. The way in which these types are defined and used may be different than what you are accustomed to. Be sure to read this section carefully.

The collection of types defined for use with the GET_STATUS procedure are version-specific and include version information in the names of the types. Once introduced, these types will always be provided and supported in future versions of Oracle Database and will not change. However, in future releases of Oracle Database, new versions of these types might be created that provide new or different information. The new versions of these types will have different version information embedded in the type names.

For example, in Oracle Database 12c, Release 1 (12.1), there is a sys.ku$Status1210 type, and in the next Oracle Database release, there could be a sys.ku$Status1310 type defined. Both types could be used with the GET_STATUS procedure.

Public synonyms have been defined for each of the types used with the GET_STATUS procedure. This makes it easier to use the types and means that you do not have to be concerned with changes to the actual type names or schemas where they reside. Oracle recommends that you use these synonyms whenever possible.

For each of the types, there is a version-specific synonym and a generic synonym. For example, the version-specific synonym ku$Status1210 is defined for the sys.ku$Status1210 type.

The generic synonym always describes the latest version of that type. For example, in Oracle Database 12c, Release 1 (12.1), the generic synonym ku$Status is defined as ku$Status1210. In a future release, there might be a ku$Status1310 synonym for sys.ku$Status1310. Because the ku$Status generic synonym always points to the latest definition, it would then point to ku$Status1310 rather than to ku$Status1210.

The choice of whether to use version-specific synonyms or generic synonyms makes a significant difference in how you work. Using version-specific names protects your code from changes in future releases of Oracle Database because those types will continue to exist and be supported. However, access to new information will require code changes to use new synonym names for each of the types. Using the generic names implies that you always want the latest definition of the types and are prepared to deal with changes in different releases of Oracle Database.

When the version of Oracle Database that you are using changes, any C code that accesses types through generic synonym names will need to be recompiled.
Data Structures — Object Types

The `DBMS_DATAPUMP` package defines the following kinds of `OBJECT` types:

- Worker Status Types
- Log Entry and Error Types
- Job Status Types
- Job Description Types
- Status Types

Worker Status Types

The worker status types describe what each worker process in a job is doing. The schema, object name, and object type of an object being processed will be provided. For workers processing user data, the partition name for a partitioned table (if any), the number of bytes processed in the partition, and the number of rows processed in the partition are also returned. Workers processing metadata provide status on the last object that was processed. No status for idle threads is returned.

The `percent_done` refers to the amount completed for the current data item being processed. It is not updated for metadata objects.

The worker status types are defined as follows:

```sql
CREATE TYPE sys.ku$WorkerStatus1010 AS OBJECT
{
    worker_number NUMBER, -- Worker process identifier
    process_name VARCHAR2(30), -- Worker process name
    state VARCHAR2(30), -- Worker process state
    schema VARCHAR2(30), -- Schema name
    name VARCHAR2(4000), -- Object name
    object_type VARCHAR2(200), -- Object type

Log Entry and Error Types

These types provide informational and error text to attached clients and the log stream. The ku$LogLine.errorNumber type is set to NULL for informational messages but is specified for error messages. Each log entry may contain several lines of text messages.

The log entry and error types are defined as follows:
CREATE TYPE sys.ku$_LogLine1010 AS OBJECT (  
    logLineNumber NUMBER,  
    errorNumber NUMBER,  
    LogText VARCHAR2(2000)  
)

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine1010 FOR sys.ku$_LogLine1010;

CREATE OR REPLACE PUBLIC SYNONYM ku$_LogLine FOR ku$_LogLine1010;  
CREATE TYPE sys.ku$_LogEntry1010 AS TABLE OF sys.ku$_LogLine1010  
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1010 FOR sys.ku$_LogEntry1010;  
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry1020 FOR sys.ku$_LogEntry1010;  
CREATE OR REPLACE PUBLIC SYNONYM ku$_LogEntry FOR ku$_LogEntry1010;

Job Status Types

The job status type returns status about a job. Usually, the status concerns a running job but it could also be about a stopped job when a client attaches. It is typically requested at attach time, when the client explicitly requests status from interactive mode and every N seconds when the client has requested status periodically.

The job status types are defined as follows (percent_done applies to data only):

CREATE TYPE sys.ku$_JobStatus1010 IS OBJECT  
{  
    job_name VARCHAR2(30),  -- Name of the job  
    operation VARCHAR2(30),  -- Current operation  
    job_mode VARCHAR2(30),  -- Current mode  
    bytes_processed NUMBER,  -- Bytes so far  
    total_bytes NUMBER,  -- Total bytes for job  
    percent_done NUMBER,  -- Percent done  
    degree NUMBER,  -- Of job parallelism  
    error_count NUMBER,  -- #errors so far  
    state VARCHAR2(30),  -- Current job state  
    phase NUMBER,  -- Job phase  
    restart_count NUMBER,  -- #Job restarts  
    worker_status_list ku$_WorkerStatusList1010,  -- For (non-idle)  
    -- job worker processes  
    files ku$_DumpFileSet1010  -- Dump file info  
}

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobStatus1010 FOR sys.ku$_JobStatus1010;  
CREATE TYPE sys.ku$_JobStatus1020 IS OBJECT  
{  
    job_name VARCHAR2(30),  -- Name of the job  
    operation VARCHAR2(30),  -- Current operation

Job Description Types

The job description type holds all the environmental information about the job such as parameter settings and dump file set members. There are a couple of subordinate types required as well.

The job description types are defined as follows:

CREATE TYPE sys.ku$_JobDesc1010 IS OBJECT
{
    job_name        VARCHAR2(30),           -- The job name
    guid            RAW(16),                -- The job GUID
    operation       VARCHAR2(30),           -- Current operation
    job_mode        VARCHAR2(30),           -- Current mode
    remote_link     VARCHAR2(4000),         -- DB link, if any
    owner           VARCHAR2(30),           -- Job owner
    instance        VARCHAR2(16),           -- The instance name
    db_version      VARCHAR2(30),           -- Version of objects
    creator_privs   VARCHAR2(30),           -- Privs of job
    start_time      DATE,                   -- This job start time
    max_degree      NUMBER,                 -- Max. parallelism
    log_file        VARCHAR2(4000),         -- Log file name
    sql_file        VARCHAR2(4000),         -- SQL file name

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc1220 FOR sys.ku$_JobDesc1220;

CREATE OR REPLACE PUBLIC SYNONYM ku$_JobDesc FOR ku$_JobDesc1220;

Status Types

The status type is an aggregate of some the previous types defined and is the return value for the GET_STATUS call. The mask attribute indicates which types of information are being returned to the caller. It is created by a client's shadow process from information it retrieves off the status queue or directly from the master table.

For errors, the ku$_LogEntry that is returned has already had its log lines ordered for proper output. That is, the original ku$_LogEntry objects have been ordered from outermost context to innermost.

The status types are defined as follows:

CREATE TYPE sys.ku$_Status1010 IS OBJECT
{
  mask            NUMBER,           -- Status types present
  wip             ku$_LogEntry1010, -- Work in progress
  job_description ku$_JobDesc1010, -- Complete job description
  job_status      ku$_JobStatus1010, -- Detailed job status
  error           ku$_LogEntry1010 -- Multi-level context errors
}

CREATE OR REPLACE PUBLIC SYNONYM ku$_Status1010 FOR sys.ku$_Status1010;

CREATE TYPE sys.ku$_Status1020 IS OBJECT

45.5 Summary of DBMS_DATAPUMP Subprograms

This table lists the DBMS_DATAPUMP subprograms in alphabetical order and briefly describes them.

Table 45-1  DBMS_DATAPUMP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_FILE Procedure</td>
<td>Adds dump files to the dump file set for an Export, Import, or SQL_FILE operation. In addition to dump files, other types of files can also be added by using the FILETYPE parameter provided with this procedure.</td>
</tr>
<tr>
<td>ATTACH Function</td>
<td>Used to gain access to a Data Pump job that is in the Defining, Executing, Idling, or Stopped state</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DATA_FILTER Procedures</td>
<td>Specifies restrictions on the rows that are to be retrieved</td>
</tr>
<tr>
<td>DATA_REMAP Procedure</td>
<td>Specifies transformations to be applied to column data as it is exported from, or imported into, a database.</td>
</tr>
<tr>
<td>DETACH Procedure</td>
<td>Specifies that the user has no further interest in using the handle</td>
</tr>
<tr>
<td>GET_DUMPFILE_INFO Procedure</td>
<td>Retrieves information about a specified dump file</td>
</tr>
<tr>
<td>GET_STATUS Procedure</td>
<td>Monitors the status of a job or waits for the completion of a job or for more details on API errors</td>
</tr>
<tr>
<td>LOG_ENTRY Procedure</td>
<td>Inserts a message into the log file</td>
</tr>
<tr>
<td>METADATA_FILTER Procedure</td>
<td>Provides filters that allow you to restrict the items that are included in a job</td>
</tr>
<tr>
<td>METADATA_REMAP Procedure</td>
<td>Specifies a remapping to be applied to objects as they are processed in the specified job</td>
</tr>
<tr>
<td>METADATA_TRANSFORM Procedure</td>
<td>Specifies transformations to be applied to objects as they are processed in the specified job</td>
</tr>
<tr>
<td>OPEN Function</td>
<td>Declares a new job using the Data Pump API, the handle returned being used as a parameter for calls to all other procedures (but not to the ATTACH function)</td>
</tr>
<tr>
<td>SET_PARALLEL Procedure</td>
<td>Adjusts the degree of parallelism within a job</td>
</tr>
<tr>
<td>SET_PARAMETER Procedures</td>
<td>Specifies job-processing options</td>
</tr>
<tr>
<td>START_JOB Procedure</td>
<td>Begins or resumes execution of a job</td>
</tr>
<tr>
<td>STOP_JOB Procedure</td>
<td>Terminates a job, but optionally, preserves the state of the job</td>
</tr>
<tr>
<td>WAIT_FOR_JOB Procedure</td>
<td>Runs a job until it either completes normally or stops for some other reason</td>
</tr>
</tbody>
</table>

45.5.1 ADD_FILE Procedure

This procedure adds files to the dump file set for an Export, Import, or SQL_FILE operation or specifies the log file or the output file for a SQL_FILE operation.

Syntax

```sql
DBMS_DATAPUMP.ADD_FILE (  handle     IN NUMBER,  filename   IN VARCHAR2,  directory  IN VARCHAR2,  filesize   IN VARCHAR2 DEFAULT NULL,  filetype   IN NUMBER DEFAULT DBMS_DATAPUMP.KU$_FILE_TYPE_DUMP_FILE,  reusefile  IN NUMBER DEFAULT NULL);
```
Parameters

Table 45-2  ADD_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>filename</td>
<td>The name of the file being added. filename must be a simple filename without any directory path information. For dump files, the filename can include a substitution variable. See the following table for a description of available substitution variables.</td>
</tr>
<tr>
<td>directory</td>
<td>The name of a directory object within the database that is used to locate filename. A directory must be specified.</td>
</tr>
<tr>
<td>filesize</td>
<td>The size of the dump file that is being added. It may be specified as the number of bytes, number of kilobytes (if followed by K), number of megabytes (if followed by M), number of gigabytes (if followed by G) or number of terabytes (if followed by T). An Export operation will write no more than the specified number of bytes to the file. Once the file is full, it will be closed. If there is insufficient space on the device to write the specified number of bytes to the file, the Export operation will fail, but it can be restarted. If not specified, filesize will default to an unlimited size. For Import and SQL_FILE operations, filesize is ignored. The minimum value for filesize is ten times the default Data Pump block size, which is 4 kilobytes. A filesize can only be specified for dump files.</td>
</tr>
</tbody>
</table>
| filetype  | The type of the file to be added. The legal values are as follows and must be preceded by DBMS_DATAPUMP.:
  - KU$_FILE_TYPE_DUMP_FILE (dump file for a job)
  - KU$_FILE_TYPE_LOG_FILE (log file for a job)
  - KU$_FILE_TYPE_SQL_FILE (output for SQL_FILE job) |
| reusefile | If 0, a preexisting file will cause an error. If 1, a preexisting file will be overwritten. If NULL, the default action for the file type will be applied (that is, dump files will not be overwritten). This parameter should only be non-NULL for dump files. The reusefile parameter is restricted to export jobs. |

Substitution Variables

Table 45-3  Substitution Variables Available for the Filename Parameter on DBMS_DATAPUMP.ADD_FILE

<table>
<thead>
<tr>
<th>Substitution Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%U</td>
<td>The %U is expanded in the resulting file names into a two-character, fixed-width, incrementing integer starting at 01. For example, the dump filename of export%U would cause export01, export02, export03, and so on, to be created depending on how many files are needed to perform the export. For filenames containing the % character, the % must be represented as %% to avoid ambiguity.</td>
</tr>
<tr>
<td>%d, %D</td>
<td>Specifies the current day of the month from the Gregorian calendar in format DD. Note: This substitution variable cannot be used in an import file name.</td>
</tr>
<tr>
<td>%m, %M</td>
<td>Specifies the month in the Gregorian calendar in format MM. Note: This substitution variable cannot be used in an import file name.</td>
</tr>
</tbody>
</table>
Table 45-3   (Cont.) Substitution Variables Available for the Filename Parameter on DBMS_DATAPUMP.ADD_FILE

<table>
<thead>
<tr>
<th>Substitution Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%t, %T</td>
<td>Specifies the year, month, and day in the Gregorian calendar in this format: YYYYMMDD. Note: This substitution variable cannot be used in an import file name.</td>
</tr>
<tr>
<td>%l, %L</td>
<td>Specifies a system-generated unique file name. The file names can contain a substitution variable (%L), which implies that multiple files may be generated. The substitution variable is expanded in the resulting file names into a 2-digit, fixed-width, incrementing integer starting at 01 and ending at 99 which is the same as (%U). In addition, the substitution variable is expanded in the resulting file names into a 3-digit to 10-digit, variable-width, incrementing integers starting at 100 and ending at 2147483646. The width field is determined by the number of digits in the integer. For example if the current integer was 1, exp%Uaa%U.dmp would resolve to exp01aa01.dmp exp02aa02.dmp and so forth up until 99. Then, the next file name would have 3 digits substituted: exp100aa100.dmp exp101aa101.dmp and so forth up until 999 where the next file would have 4 digits substituted. The substitution will continue up to the largest number substitution allowed, which is 2147483646.</td>
</tr>
<tr>
<td>%y, %Y</td>
<td>Specifies the year in this format: YYYY. Note: This substitution variable cannot be used in an import file name.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE**. The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL**. An invalid value was supplied for an input parameter.
- **INVALID_STATE**. The job is completing, or the job is past the defining state for an import or SQL_FILE job or is past the defining state for LOG and SQL files.
- **INVALID_OPERATION**. A dump file was specified for a Network Import or ESTIMATE_ONLY export operation.
- **SUCCESS_WITH_INFO**. The procedure succeeded, but further information is available through the **GET_STATUS** procedure.
- **NO_SUCH_JOB**. The specified job does not exist.

Usage Notes

- Adds files to a Data Pump job. Three types of files may be added to jobs: Dump files to contain the data that is being moved, log files to record the messages associated with an operation, and SQL files to record the output of a SQL_FILE operation. Log and SQL files will overwrite previously existing files. Dump files will never overwrite previously existing files. Instead, an error will be generated.
• Import and SQL_FILE operations require that all dump files be specified during the
definition phase of the job. For Export operations, dump files can be added at any
time. For example, if the user ascertains that the file space is running low during
an Export, additional dump files may be added through this API. If the specified
dump file already exists for an Export operation and reusefile is not set to 1, an
error will be returned.

• For Export operations, the parallelism setting should be less than or equal to the
number of dump files in the dump file set. If there are not enough dump files, the
job will not be able to maximize parallelism to the degree specified by the
SET_PARALLEL procedure.

• For Import operations, the parallelism setting should also be less than or equal to
the number of dump files in the dump file set. If there are not enough dump files,
the performance will not be optimal as multiple threads of execution try to access
the same dump file.

• If the substitution variable (%U) is included in a filename, multiple dump files may be
specified through a single call to ADD_FILE. For Export operations, the new dump
files will be created as they are needed. Enough dump files will be created to allow
all of the processes specified by the current SET_PARALLEL value to be active. If one
of the dump files fills, it will be closed and a new dump file (with a new generated
name) will be created to take its place. If multiple ADD_FILES with substitution
variables have been specified for dump files in a job, they will be used to generate
dump files in a round robin fashion. For example, if expa%U, expb%U and expc%U were
all specified for a job having a parallelism of 6, the initial dump files created would
look like: expa01, expb01, expc01, expa02, expb02, and expc02.

• If presented with dump file specifications, expa%U, expb%U and expc%U, an Import or
SQL_FILE operation will begin by attempting to open the dump files, expa01,
expb01, and expc01. If the dump file containing the master table is not found in this
set, the operation will expand its search for dump files by incrementing the
substitution variable and looking up the new filenames (for example, expa02,
expb02, and expc02). The DataPump API will keep expanding the search until it
locates the dump file containing the master table. If the DataPump API determines
that the dump file does not exist or is not part of the current dump set at any
iteration, the DataPump API will stop incrementing the substitution variable for the
dump file specification that was in error. Once the master table is found, the
master table will be used to ascertain when all of dump files in the dump file set
have been located.

### 45.5.2 ATTACH Function

This function gains access to a previously-created job.

**Syntax**

```sql
DBMS_DATAPUMP.ATTACH(
    job_name    IN VARCHAR2 DEFAULT NULL,
    job_owner    IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```
Parameters

Table 45-4  ATTACH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job. The default is the job name owned by the user who is specified in the job_owner parameter (assuming that user has only one job in the Defining, Executing, or Idling states).</td>
</tr>
<tr>
<td>job_owner</td>
<td>The user who originally started the job. If NULL, the value defaults to the owner of the current session. To specify a job owner other than yourself, you must have either the DATAPUMP_EXP_FULL_DATABASE role (for export operations) or the DATAPUMP_IMP_FULL_DATABASE role (for import and SQL_FILE operations). Being a privileged user allows you to monitor another user's job, but you cannot restart another user's job.</td>
</tr>
</tbody>
</table>

Return Values

An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB.

Exceptions

- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- OBJECT_NOT_FOUND. The specified job no longer exists or the user specified a job owned by another schema, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- If the job was in the Stopped state, the job is placed into the Idling state. Once the ATTACH succeeds, you can monitor the progress of the job or control the job. The stream of KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR messages returned through the GET_STATUS procedure will be returned to the newly attached job starting at the approximate time of the client's attachment. There will be no repeating of status and error messages that were processed before the client attached to a job.
- If you want to perform a second attach to a job, you must do so from a different session.
- If the ATTACH fails, use a null handle in a subsequent call to GET_STATUS for more information about the failure.

45.5.3 DATA_FILTER Procedures

This procedure specifies restrictions on the rows that are to be retrieved.

Syntax

```sql
DBMS_DATAPUMP.DATA_FILTER (
    handle      IN NUMBER,
)```
Parameters

Table 45-5  DATA_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle that is returned from the OPEN function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table on which the data filter is applied. If no table name</td>
</tr>
<tr>
<td></td>
<td>is supplied, the filter applies to all tables in the job.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the table on which the filter is applied.</td>
</tr>
<tr>
<td></td>
<td>If no schema name is specified, the filter applies to all schemas in the job.</td>
</tr>
<tr>
<td></td>
<td>If you supply a schema name you must also supply a table name.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_ARGVAL. There can be several reasons for this message:
  - A bad filter name is specified
  - The mode is TRANSPORTABLE, which does not support data filters
  - The specified table does not exist
  - The filter has already been set for the specified values of schema_name and table_name
- INVALID_STATE. The user called DATA_FILTER when the job was not in the Defining state.
- INCONSISTENT_ARGS. The value parameter is missing or its datatype does not match the filter name. Or a schema name was supplied, but not a table name.
- PRIVILEGE_ERROR. A schema name was supplied, but the user did not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
• **NO_SUCH_JOB.** The specified job does not exist.

**Usage Notes**

• Each data filter can only appear once in each table (for example, you cannot supply multiple `SUBQUERY` filters to a table) or once in each job. If different filters using the same name are applied to both a particular table and to the whole job, the filter parameter supplied for the specific table will take precedence.

With the exception of the `INCLUDE_ROWS` filter, data filters are not supported on tables having nested tables or domain indexes defined upon them. Data filters are not supported in jobs performed in Transportable Tablespace mode.

The available data filters are described in Table 45-6.

**Table 45-6  Data Filters**

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_ROWS</td>
<td>NUMBER</td>
<td>EXPORT, IMPORT</td>
<td>If nonzero, this filter specifies that user data for the specified table should be included in the job. The default is 1.</td>
</tr>
<tr>
<td>PARTITION_EXPR</td>
<td>TEXT</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, these filters specify which partitions are unloaded from the database. For Import jobs, they specify which table partitions are loaded into the database. Partition names are included in the job if their names satisfy the specified expression (for <code>PARTITION_EXPR</code>) or are included in the list (for <code>PARTITION_LIST</code>). Whereas the expression version of the filter offers more flexibility, the list version provides for full validation of the partition names. Double quotation marks around partition names are required only if the partition names contain special characters. <code>PARTITION_EXPR</code> is not supported on jobs across a network link. Default=All partitions are processed.</td>
</tr>
<tr>
<td>PARTITION_LIST</td>
<td>TEXT</td>
<td>EXPORT, IMPORT</td>
<td>For Export jobs, specifies a percentage for sampling the data blocks to be moved. This filter allows subsets of large tables to be extracted for testing purposes.</td>
</tr>
</tbody>
</table>

**Note:**

In this description, the information about partitions also applies to subpartitions.
Table 45-6  (Cont.) Data Filters

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Operations that Support Filter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SUBQUERY</td>
<td>TEXT</td>
<td>EXPORT, IMPORT</td>
<td>Specifies a subquery that is added to the end of the SELECT statement for the table. If you specify a WHERE clause in the subquery, you can restrict the rows that are selected. Specifying an ORDER BY clause orders the rows dumped in the export which improves performance when migrating from heap-organized tables to index-organized tables.</td>
</tr>
</tbody>
</table>

45.5.4 DATA_REMAP Procedure

This procedure specifies transformations to be applied to column data as it is exported from, or imported into, a database.

Syntax

```sql
DBMS_DATAPUMP.DATA_REMAP(
    handle          IN NUMBER,
    name            IN VARCHAR2,
    table_name      IN VARCHAR2,
    column          IN VARCHAR2,
    remap_function  IN VARCHAR2,
    schema          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 45-7  DATA_REMAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the current job. The current session must have previously attached to the handle through a call to an OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the remap</td>
</tr>
<tr>
<td>table_name</td>
<td>The table containing the column to be remapped</td>
</tr>
<tr>
<td>column</td>
<td>The name of the column to be remapped</td>
</tr>
<tr>
<td>remap_function</td>
<td>The meaning of remap_function is dependent upon the value of name. See Table 45-8 for a list of possible names.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema containing the column to be remapped. If NULL, the remapping applies to all schemas moved in the job that contain the specified table.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_ARGVAL. The mode is transportable (which does not support data modifications) or it has specified that no data to be included in the job. An invalid remap name was supplied.
• **INVALID_OPERATION.** Data remaps are only supported for Export and Import operations.

• **INVALID_STATE.** The `DATA_REMAP` procedure was called after the job started (that is, it was not in the defining state).

• **NO_SUCH_JOB.** The job handle is no longer valid.

**Usage Notes**

• The `DATA_REMAP` procedure is only supported for Export and Import operations. It allows you to manipulate user data being exported or imported. The name of the remap determines the remap operation to be performed.

• For export operations, you might wish to define a data remap to obscure sensitive data such as credit card numbers from a dump file, but leave the remainder of the data so that it can be read. To accomplish this, the remapping should convert each unique source number into a distinct generated number. So that the mapping is consistent across the dump file set, the same function should be called for every column that contains the credit card number.

• For import operations, you might wish to define a data remap to reset the primary key when data is being merged into an existing table that contains colliding primary keys. A single remapping function should be provided for all columns defining or referencing the primary key to ensure that remapping is consistent.

**Note:**

If the called function uses package state variables, then to ensure that remapping is performed consistently across all tables, the job should be run with a `SET_PARALLEL` value of 1 and no restart operations should be performed.

The Data Remap functions are listed in Table 45-8.

**Table 45-8   Names of Data Remap Functions**

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning of remap_function</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COLUMN_FUNCTION</td>
<td>String having the format:</td>
<td>The name parameter references a PL/SQL package function which is called to modify the data for the specified column. The function accepts a single parameter, which has the same datatype as the remapped column, and returns a value having the same datatype as the remapped column. Note that the default for the schema is the schema of the user performing the export.</td>
</tr>
<tr>
<td></td>
<td>[schema.]package.function</td>
<td></td>
</tr>
</tbody>
</table>
45.5.5 DETACH Procedure

This procedure specifies that the user has no further interest in using the handle.

Syntax

```sql
DBMS_DATAPUMP.DETACH(
    handle  IN NUMBER);
```

Parameters

Table 45-9  DETACH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the job. The current session must have previously attached to the handle through a call to either an OPEN or ATTACH function.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Through this call, you specify that you have no further interest in using the handle. Resources associated with a completed job cannot be reclaimed until all users are detached from the job. An implicit detach from a handle is performed when the user’s session is exited or aborted. An implicit detach from a handle is also performed upon the expiration of the timeout associated with a STOP_JOB that was applied to the job referenced by the handle. All previously allocated DBMS_DATAPUMP handles are released when an instance is restarted.

45.5.6 GET_DUMPFILE_INFO Procedure

This procedure retrieves information about a specified dump file.

Syntax

```sql
DBMS_DATAPUMP.GET_DUMPFILE_INFO(
    filename    IN VARCHAR2,
    directory   IN VARCHAR2,
    info_table  OUT ku$_dumpfile_info,
    filetype    OUT NUMBER);
```
Parameters

Table 45-10  GET_DUMPFILE_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>A simple filename with no directory path information</td>
</tr>
<tr>
<td>directory</td>
<td>A directory object that specifies where the file can be found</td>
</tr>
<tr>
<td>info_table</td>
<td>A PL/SQL table for storing information about the dump file</td>
</tr>
<tr>
<td>filetype</td>
<td>The type of file (Data Pump dump file, original Export dump file, external tables dump file, or unknown)</td>
</tr>
</tbody>
</table>

Exceptions

The GET_DUMPFILE_INFO procedure is a utility routine that operates outside the context of any Data Pump job. Exceptions are handled differently for this procedure than for procedures associated in some way with a Data Pump job. A full exception stack should be available directly, without the need to call the GET_STATUS procedure to retrieve the detailed information. The exception for this procedure is as follows:

• NO_DUMPFILE_INFO. Unable to retrieve dump file information as specified.

Usage Notes

You can use the GET_DUMPFILE_INFO procedure to request information about a specific file. If the file is not recognized as any type of dump file, then a filetype of 0 (zero) is returned and the dump file info_table remains empty.

A filetype value of 1 indicates a Data Pump dump file. A filetype value of 2 indicates an original Export dump file. A filetype value of 3 indicates an external tables dump file. In all cases, the dump file info_table will be populated with information retrieved from the dump file header. Rows of this table consist of item code and value pairs, where the item code indicates the type of information and the value column is a VARCHAR2 containing the actual data (converted to a string in some cases). The table is defined as follows:

```
CREATE TYPE sys.ku$_dumpfile_item IS OBJECT (    item_code NUMBER, -- Identifies header item
    value VARCHAR2(2048) -- Text string value)/
GRANT EXECUTE ON sys.ku$_dumpfile_item TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_item FOR sys.ku$_dumpfile_item;

CREATE TYPE sys.ku$_dumpfile_info AS TABLE OF sys.ku$_dumpfile_item/
GRANT EXECUTE ON sys.ku$_dumpfile_info TO PUBLIC;
CREATE OR REPLACE PUBLIC SYNONYM ku$_dumpfile_info FOR sys.ku$_dumpfile_info;
```

The item codes, which can easily be extended to provide more information as needed, are currently defined as shown in Table 45-11 (prepended with the package name, DBMS_DATAPUMP). Assume the following with regard to these item codes:

• Unless otherwise stated, all item codes may be returned only for Oracle Data Pump and external tables dump files (filetypes 1 and 3).
• Unless otherwise stated, all item codes have been available since Oracle Database 10g Release 2 (10.2).

Table 45-11  Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KUS_DFHDR_FILE_VERSION</td>
<td>The internal file version of the dump file.</td>
</tr>
<tr>
<td>KUS_DFHDR_MASTER_PRESENT</td>
<td>If the Data Pump master table is present in the dump file, then the value for this item code is 1; otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KUS_DFHDR_GUID</td>
<td>A unique identifier assigned to the Data Pump export job or the external tables unload job that produced the dump file. For a multifile dump set, each file in the set has the same value for this item code.</td>
</tr>
<tr>
<td>KUS_DFHDR_FILE_NUMBER</td>
<td>A numeric identifier assigned to the dump file. Each dump file in a multifile dump set has its own identifier, unique only within the dump set.</td>
</tr>
<tr>
<td>KUS_DFHDR_CHARSET_ID</td>
<td>A numeric code that represents the character set in use at the source system when the dump file was created. Returned for all filetypes.</td>
</tr>
<tr>
<td>KUS_DFHDR_CREATION_DATE</td>
<td>The date and time that the dump file was created.</td>
</tr>
<tr>
<td>KUS_DFHDR_FLAGS</td>
<td>Internal flag values.</td>
</tr>
<tr>
<td>KUS_DFHDR_JOB_NAME</td>
<td>The name assigned to the export job that created the dump file. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KUS_DFHDR_PLATFORM</td>
<td>The operating system name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KUS_DFHDR_INSTANCE</td>
<td>The instance name of the source system on which the dump file was created.</td>
</tr>
<tr>
<td>KUS_DFHDR_LANGUAGE</td>
<td>The language name that corresponds to the character set of the source system where the export dump file was created.</td>
</tr>
<tr>
<td>KUS_DFHDR_BLOCKSIZE</td>
<td>The blocksize, in bytes, of the dump file.</td>
</tr>
<tr>
<td>KUS_DFHDR_DIRPATH</td>
<td>If direct path mode was used when the dump file was created, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 2.</td>
</tr>
<tr>
<td>KUS_DFHDR_METADATA_COMPRESSED</td>
<td>If the system metadata is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1.</td>
</tr>
<tr>
<td>KUS_DFHDR_DB_VERSION</td>
<td>The database job version used to create the dump file. Returned for all filetypes.</td>
</tr>
<tr>
<td>KUS_DFHDR_MASTER_PIECE_COUNT</td>
<td>The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates the number of dump files that contain pieces of the master table. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KUS_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
</tbody>
</table>
### Table 45-11  (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KU$_DFHDR_MASTER_PIECE_NUMBER</td>
<td>The Data Pump master table may be split into multiple pieces and written to multiple dump files in the set, one piece per file. The value returned for this item code indicates which master table piece is contained in the dump file. The value for this item code is only meaningful if the Data Pump master table is present in the dump file, as indicated by the item code KU$_DFHDR_MASTER_PRESENT. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_DATA_COMPRESSED</td>
<td>If the table data is stored in the dump file in compressed format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_METADATA_ENCRYPTED</td>
<td>If the system metadata is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_DATA_ENCRYPTED</td>
<td>If the table data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_COLUMNS_ENCRYPTED</td>
<td>If encrypted column data is stored in the dump file in encrypted format, then the value for this item code is 1, otherwise the value is 0. Returned only for filetype 1. Only available since Oracle Database 11g Release 1 (11.1).</td>
</tr>
<tr>
<td>KU$_DFHDR_ENCRYPTION_MODE</td>
<td>The encryption mode indicates whether a user-provided password or the Oracle Encryption Wallet was used to encrypt data written to the dump file. The possible values returned for this item code are:</td>
</tr>
</tbody>
</table>
|                                             | • KU$_DFHDR_ENCMODE_NONE  
No data was written to the dump file in encrypted format. |
|                                             | • KU$_DFHDR_ENCMODE_PASSWORD  
Data was written to the dump file in encrypted format using a provided password. |
|                                             | • KU$_DFHDR_ENCMODE_DUAL  
Data was written to the dump file in encrypted format using both a provided password as well as an Oracle Encryption Wallet. |
|                                             | • KU$_DFHDR_ENCMODE_TRANS  
Data was written to the dump file in encrypted format transparently using an Oracle Encryption Wallet. Only available since Oracle Database 11g Release 1 (11.1). |
Table 45-11  (Cont.) Item Codes For the DBMS_DATAPUMP.GET_DUMPFILE_INFO Procedure

<table>
<thead>
<tr>
<th>Item Code</th>
<th>Description</th>
</tr>
</thead>
</table>
| KU$_DFHDR_COMPRESSION_ALG         | The compression algorithm used when writing system metadata and/or table data to the dump file in compressed format. The possible values returned for this item code are:  
  • KU$_DFHDR_CMPALG_NONE  
    No data was written to the dump file in compressed format.  
  • KU$_DFHDR_CMPALG_BASIC  
    Data was written to the dump file in compressed format using an internal algorithm. This is the default algorithm used since Oracle Database 10g Release 2 (10.2).  
  • KU$_DFHDR_CMPALG_LOW  
    Data was written to the dump file in compressed format using the LOW algorithm.  
  • KU$_DFHDR_CMPALG_MEDIUM  
    Data was written to the dump file in compressed format using the MEDIUM algorithm.  
  • KU$_DFHDR_CMPALG_HIGH  
    Data was written to the dump file in compressed format using the HIGH algorithm.  
    Only available since Oracle Database 12c Release 1 (12.1).                                                                                                                                                                                                                     |

45.5.7 GET_STATUS Procedure

This procedure monitors the status of a job or waits for the completion of a job.

Syntax

DBMS_DATAPUMP.GET_STATUS(
  handle    IN NUMBER,
  mask      IN BINARY_INTEGER,
  timeout   IN NUMBER DEFAULT NULL,
  job_state OUT VARCHAR2,
  status    OUT ku$_Status);

Parameters

Table 45-12  GET_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. A null handle can be used to retrieve error information after OPEN and ATTACH failures.</td>
</tr>
</tbody>
</table>
| mask      | A bit mask that indicates which of four types of information to return:  
  • KU$_STATUS_WIP  
  • KU$_STATUS_JOB_DESC  
  • KU$_STATUS_JOB_STATUS  
  • KU$_STATUS_JOB_ERROR  
    Each status has a numerical value. You can request multiple types of information by adding together different combinations of values.                                                                                                                                                                                                                     |
Table 45-12  (Cont.) GET_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Maximum number of seconds to wait before returning to the user. A value of 0 requests an immediate return. A value of -1 requests an infinite wait. If KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and becomes available during the timeout period, then the procedure returns before the timeout period is over.</td>
</tr>
<tr>
<td>job_state</td>
<td>Current state of the job. If only the job state is needed, it is much more efficient to use this parameter than to retrieve the full ku$_Status structure.</td>
</tr>
<tr>
<td>status</td>
<td>A ku$_Status is returned. The ku$_Status mask indicates what kind of information is included. This could be none if only KU$_STATUS_WIP or KU$_STATUS_JOB_ERROR information is requested and the timeout period expires.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALIDHANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_VALUE. The mask or timeout contains an illegal value.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The GET_STATUS procedure is used to monitor the progress of an ongoing job and to receive error notification. You can request various type of information using the mask parameter. The KU$_STATUS_JOB_DESC and KU$_STATUS_JOB_STATUS values are classified as synchronous information because the information resides in the master table. The KU$_STATUS_WIP and KU$_STATUS_JOB_ERROR values are classified as asynchronous because the messages that embody these types of information can be generated at any time by various layers in the Data Pump architecture.

- If synchronous information only is requested, the interface will ignore the timeout parameter and simply return the requested information.
- If asynchronous information is requested, the interface will wait a maximum of timeout seconds before returning to the client. If a message of the requested asynchronous information type is received, the call will complete prior to timeout seconds. If synchronous information was also requested, it will be returned whenever the procedure returns.
- If the job_state returned by GET_STATUS does not indicate a terminating job, it is possible that the job could still terminate before the next call to GET_STATUS. This would result in an INVALIDHANDLE exception. Alternatively, the job could terminate during the call to GET_STATUS, which would result in a NO_SUCH_JOB exception. Callers should be prepared to handle these cases.

Error Handling

There are two types of error scenarios that need to be handled using the GET_STATUS procedure:
• Errors resulting from other procedure calls: For example, the `SET_PARAMETER` procedure may produce an `INCONSISTENT_ARGS` exception. The client should immediately call `GET_STATUS` with `mask=8` (errors) and `timeout=0`. The returned `ku$_Status.error` will contain a `ku$_LogEntry` that describes the inconsistency in more detail.

• Errors resulting from events asynchronous to the client(s): An example might be Table already exists when trying to create a table. The `ku$_Status.error` will contain a `ku$_LogEntry` with all error lines (from all processing layers that added context about the error) properly ordered.

After a job has begun, a client's main processing loop will typically consist of a call to `GET_STATUS` with an infinite timeout (-1) "listening" for `KU$_STATUS_WIP` and `KU$_STATUS_JOB_ERROR` messages. If status was requested, then `JOB_STATUS` information will also be in the request.

When the `ku$_Status` is interpreted, the following guidelines should be used:

• `ku$_Status.ku$_JobStatus.percent_done` refers only to the amount of data that has been processed in a job. Metadata is not considered in the calculation. It is determined using the following formulas:
  - **EXPORT or network IMPORT**—\( \frac{\text{bytes_processed}}{\text{estimated_bytes}} \) * 100
  - **IMPORT**—\( \frac{\text{bytes_processed}}{\text{total_expected_bytes}} \) * 100
  - **SQL_FILE** or estimate-only EXPORT—0.00 if not done or 100.00 if done

The effects of the `QUERY` and `PARTITION_EXPR` data filters are not considered in computing `percent_done`.

It is expected that the status returned will be transformed by the caller into more user-friendly status. For example, when percent done is not zero, an estimate of completion time could be produced using the following formula:

\[ \left( \frac{\text{SYSDATE} - \text{start time}}{\text{ku$_Status.ku$_JobStatus.percent_done}} \right) \times 100 \]

• The caller should not use `ku$_Status.ku$_JobStatus.percent_done` for determining whether the job has completed. Instead, the caller should only rely on the state of the job as found in `job_state`.

### 45.5.8 LOG_ENTRY Procedure

This procedure inserts a message into the log file.

**Syntax**

```sql
DBMS_DATAPUMP.LOG_ENTRY(
    handle         IN NUMBER,
    message        IN VARCHAR2
    log_file_only  IN NUMBER DEFAULT 0);```

---

**Chapter 45**

Summary of DBMS_DATAPUMP Subprograms

---

**ORACLE**
Parameters

Table 45-13  LOG_ENTRY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>message</td>
<td>A text line to be added to the log file.</td>
</tr>
<tr>
<td>log_file_only</td>
<td>Specified text should be written only to the log file. It should not be returned in GET_STATUS work-in-progress (KU$_STATUS_WIP) messages.</td>
</tr>
</tbody>
</table>

Exceptions

• INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
• SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
• NO_SUCH_JOB. The specified job does not exist.

Usage Notes

The message is added to the log file. If log_file_only is zero (the default), the message is also broadcast as a KU$_STATUS_WIP message through the GET_STATUS procedure to all users attached to the job.

The LOG_ENTRY procedure allows applications to tailor the log stream to match the abstractions provided by the application. For example, the command-line interface supports INCLUDE and EXCLUDE parameters defined by the user. Identifying these values as calls to the underlying METADATA_FILTER procedure would be confusing to users. Instead, the command-line interface can enter text into the log describing the settings for the INCLUDE and EXCLUDE parameters.

Lines entered in the log stream from LOG_ENTRY are prefixed by the string, ”;; “

45.5.9 METADATA_FILTER Procedure

This procedure provides filters that allow you to restrict the items that are included in a job.

Syntax

DBMS_DATAPUMP.METADATA_FILTER(
    handle IN NUMBER,
    name  IN VARCHAR2,
    value IN VARCHAR2,
    object_path IN VARCHAR2 DEFAULT NULL);

DBMS_DATAPUMP.METADATA_FILTER(
    handle IN NUMBER,
    name  IN VARCHAR2,
    value IN CLOB,
    object_path IN VARCHAR2 DEFAULT NULL);
**Parameters**

**Table 45-14** METADATA_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from the OPEN function</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter. See Table 45-15 for descriptions of the available filters.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter</td>
</tr>
<tr>
<td>object_path</td>
<td>The object path to which the filter applies. If the default is used, the filter applies to all applicable objects. Lists of the object paths supported for each mode are contained in the catalog views for DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS. (Note that the TABLE_EXPORT_OBJECTS view is applicable to both Table and Tablespace mode because their object paths are the same.) For an import operation, object paths reference the mode used to create the dump file rather than the mode being used for the import.</td>
</tr>
</tbody>
</table>

Table 45-15 describes the name, the object type, and the meaning of the filters available with the METADATA_FILTER procedure. The datatype for all the filters is a text expression. All operations support all filters.

**Table 45-15** Filters Provided by METADATA_FILTER Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_EXPR</td>
<td>Named objects</td>
<td>Defines which object names are included in the job. You use the object type parameter to limit the filter to a particular object type. For Table mode, identifies which tables are to be processed.</td>
</tr>
<tr>
<td>NAME_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SCHEMA_EXPR</td>
<td>Schema objects</td>
<td>Restricts the job to objects whose owning schema name is satisfied by the expression. For Table mode, only a single SCHEMA_EXPR filter is supported. If specified, it must only specify a single schema (for example, 'IN (''SCOTT'')'). For Schema mode, identifies which users are to be processed.</td>
</tr>
<tr>
<td>SCHEMA_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TABLESPACE_EXPR</td>
<td>TABLE, CLUSTER, INDEX, ROLLBACK_SEGMENT</td>
<td>Restricts the job to objects stored in a tablespace whose name is satisfied by the expression. For Tablespace mode, identifies which tablespaces are to be processed. If a partition of an object is stored in the tablespace, the entire object is added to the job. For Transportable mode, identifies which tablespaces are to be processed. If a table has a single partition in the tablespace set, all partitions must be in the tablespace set. An index is not included within the tablespace set unless all of its partitions are in the tablespace set. A domain index is not included in the tablespace set unless all of its secondary objects are included in the tablespace set.</td>
</tr>
</tbody>
</table>
Table 45-15 (Cont.) Filters Provided by METADATA_FILTER Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCLUDE_PATH_EXPR</td>
<td>All</td>
<td>Defines which object paths are included in, or excluded from, the job. You use these filters to select only certain object types from the database or dump file set. Objects of paths satisfying the condition are included (INCLUDE_PATH_<em>) or excluded (EXCLUDE_PATH_</em>) from the operation. The object_path parameter is not supported for these filters.</td>
</tr>
<tr>
<td>INCLUDE_PATH_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCLUDE_PATH_EXPR</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCLUDE_PATH_LIST</td>
<td></td>
<td></td>
</tr>
<tr>
<td>EXCLUDE_TABLE</td>
<td>TABLE_EXPORT</td>
<td>Specifies that no tables are to be exported.</td>
</tr>
<tr>
<td>VIEWS_AS_TABLES</td>
<td>TABLE_EXPORT</td>
<td>A comma-separated list of views to be exported as tables: [schema_name.]view_name[:table_name] The filter can be called multiple times with multiple values and all values get added to a list. All views on the list are exported as tables.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This exception can indicate any of the following conditions:
  - An object_path was specified for an INCLUDE_PATH_EXPR or EXCLUDE_PATH_EXPR filter.
  - The specified object_path is not supported for the current mode.
  - The SCHEMA_EXPR filter specified multiple schemas for a Table mode job.
- INVALID_STATE. The user called the METADATA_FILTER procedure after the job left the defining state.
- INCONSISTENT_ARGS. The filter value is of the wrong datatype or is missing.
- SUCCESS_WITH_INFO. The procedure succeeded but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- Metadata filters identify a set of objects to be included or excluded from a Data Pump operation. Except for EXCLUDE_PATH_EXPR and INCLUDE_PATH_EXPR, dependent objects of an identified object will be processed along with the identified object. For example, if an index is identified for inclusion by a filter, grants upon that index will also be included by the filter. Likewise, if a table is excluded by a filter, then indexes, constraints, grants and triggers upon the table will also be excluded by the filter.
- Two versions of each filter are supported: SQL expression and List. The SQL expression version of the filters offer maximum flexibility for identifying objects (for example the use of LIKE to support use of wild cards). The names of the expression filters are as follows:
The list version of the filters allow maximum validation of the filter. An error will be reported if one of the elements in the filter is not found within the source database (for Export and network-based jobs) or is not found within the dump file (for file-based Import and SQLFILE jobs). The names of the list filters are as follows:

- NAME_LIST
- SCHEMA_LIST
- TABLESPACE_LIST
- INCLUDE_PATH_LIST
- EXCLUDE_PATH_LIST

• Filters allow a user to restrict the items that are included in a job. For example, a user could request a full export, but without Package Specifications or Package Bodies.

• If multiple filters are specified for a object type, they are implicitly 'ANDed' together (that is, objects participating in the job must pass all of the filters applied to their object types).

• The same filter name can be specified multiple times within a job. For example, specifying NAME_EXPR as '!=''EMP'' and NAME_EXPR as '!=''DEPT'' on a Table mode export would produce a file set containing all of the tables except for EMP and DEPT.

45.5.10 METADATA_REMAP Procedure

This procedure specifies a remapping to be applied to objects as they are processed in the specified job.

Syntax

```sql
DBMS_DATAPUMP.METADATA_REMAP (  
    handle IN NUMBER,  
    name IN VARCHAR2,  
    old_value IN VARCHAR2,  
    value IN VARCHAR2,  
    object_type IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
</tbody>
</table>
Table 45-16  (Cont.) METADATA_REMAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the remap. See Table 45-17 for descriptions of the available remaps.</td>
</tr>
<tr>
<td>old_value</td>
<td>Specifies which value in the dump file set should be reset to value</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the remap. This signifies the new value that old_value should be translated into.</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the remap applies. The list of object types supported for each mode are contained in the DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, TABLE_EXPORT_OBJECTS, and TABLESPACE_EXPORT_OBJECTS catalog views. By default, the remap applies to all applicable objects within the job. The object_type parameter allows a caller to specify different parameters for different object types within a job. Remaps that explicitly specify an object type override remaps that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 45-17 describes the remaps provided by the METADATA_REMAP procedure.

Table 45-17  Remaps Provided by the METADATA_REMAP Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_SCHEMA</td>
<td>TEXT</td>
<td>Schema objects</td>
<td>Any schema object in the job that matches the object_type parameter and was located in the old_value schema will be moved to the value schema. Privileged users can perform unrestricted schema remaps. Nonprivileged users can perform schema remaps only if their schema is the target schema of the remap. For example, SCOTT can remap his BLAKE's objects to SCOTT, but SCOTT cannot remap SCOTT's objects to BLAKE.</td>
</tr>
<tr>
<td>REMAP_TABLESPACE</td>
<td>TEXT</td>
<td>TABLE, INDEX, ROLLBACK_SEGMENT, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, TABLE_SPACE</td>
<td>Any storage segment in the job that matches the object_type parameter and was located in the old_value tablespace will be relocated to the value tablespace.</td>
</tr>
</tbody>
</table>
Table 45-17  (Cont.) Remaps Provided by the METADATA_REMAP Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REMAP_DATAFILE</td>
<td>TEXT</td>
<td>LIBRARY,</td>
<td>If old_value and value are both full file specifications, then any data file reference in the job that matches the object_type parameter and that referenced the old_value data file will be redefined to use the value data file. If old_value and value are both directory paths, then any data file reference whose object path matches old_value will have its path substituted with value.</td>
</tr>
<tr>
<td>REMAP_TABLE</td>
<td>TEXT</td>
<td>TABLE</td>
<td>Any reference to a table in the job that matches the old_value table name will be replaced with the value table name. The old_value parameter may refer to a partition such as employees.low. This allows names for tables constructed the by PARTITION_OPTIONS=DEPARTITION parameter to be specified by the user.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The job's mode does not include the specified object_type.
  - The remap has already been specified for the specified old_value and object_type.
- **INVALID_OPERATION.** Remaps are only supported for SQL_FILE and Import operations. The job's operation was Export, which does not support the use of metadata remaps.
- **INVALID_STATE.** The user called METADATA_REMAP after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no value supplied or it was of the wrong datatype for the remap.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.
Usage Notes

- The `METADATA_REMAP` procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined remappings to the definition of objects as part of the transfer. If you need remaps that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any remappings that you need.

- Transforms for the DataPump API are a subset of the remaps implemented by the `DBMS_METADATA.SET_TRANSFORM_PARAMETER` API. Multiple remaps can be defined for a single job. However, each remap defined must be unique according to its parameters. That is, two remaps cannot specify conflicting or redundant remaps.

### 45.5.11 METADATA_TRANSFORM Procedure

This procedure specifies transformations to be applied to objects as they are processed in the specified job.

**Syntax**

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN VARCHAR2,
  object_type IN VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_DATAPUMP.METADATA_TRANSFORM (
  handle      IN NUMBER,
  name        IN VARCHAR2,
  value       IN NUMBER,
  object_type IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle for the current job. The current session must have previously attached to the handle through a call to the <code>OPEN</code> function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transformation. See Table 45-19 for descriptions of the available transforms.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the parameter for the transform</td>
</tr>
<tr>
<td>object_type</td>
<td>Designates the object type to which the transform applies. The list of object types supported for each mode are contained in the <code>DATABASE_EXPORT_OBJECTS</code>, <code>SCHEMA_EXPORT_OBJECTS</code>, <code>TABLE_EXPORT_OBJECTS</code>, and <code>TABLESPACE_EXPORT_OBJECTS</code> catalog views. By default, the transform applies to all applicable objects within the job. The <code>object_type</code> parameter allows a caller to specify different transform parameters for different object types within a job. Transforms that explicitly specify an object type override transforms that apply to all object types.</td>
</tr>
</tbody>
</table>

Table 45-19 describes the transforms provided by the `METADATA_TRANSFORM` procedure.
### Table 45-19  Transforms Provided by the METADATA_TRANFORM Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE_ARCHIVE_LOGGING</td>
<td>NUMBER</td>
<td>TABLE, INDEX</td>
<td>Specifies whether to disable archive logging for specified object types during import. A value of zero (FALSE) is the default. It specifies that archive logging will take place. This is the default behavior if this transform parameter is not specified. A non-zero (TRUE) value disables archive logging for the specified object types before data is loaded during import. If no object type is specified, then archive logging is disabled for both TABLE and INDEX object types. All other object types processed during data pump import are logged. <strong>Note:</strong> If the database is in FORCE LOGGING mode, then the DISABLE_ARCHIVE_LOGGING transform does not disable logging when indexes and tables are created.</td>
</tr>
<tr>
<td>INMEMORY</td>
<td>NUMBER</td>
<td>TABLE, TABLESPACE, MATERIALIZED VIEWS</td>
<td>The INMEMORY transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. If a non-zero value (TRUE) is specified on import, then Data Pump generates an IM clause that preserves the IM setting those objects had at export time. This is the default. If a value of zero (FALSE) is specified on import, then Data Pump does not include an IM clause for any objects. <strong>Note:</strong> The INMEMORY transform is available only in Oracle Database 12c Release 1 (12.1.0.2) or higher.</td>
</tr>
<tr>
<td>INMEMORY_CLAUSE</td>
<td>TEXT</td>
<td>TABLE, TABLESPACE, MATERIALIZED VIEWS</td>
<td>The INMEMORY_CLAUSE transform is related to the In-Memory Column Store (IM column store), an optional area in the SGA that stores whole tables, table partitions, and individual columns in a compressed columnar format. When you specify this transform, Data Pump uses the contents of the string as the IM clause for all objects being imported that have an IM clause in their DDL. This transform is useful when you want to override the IM clause for an object in the dump file. <strong>Note:</strong> The INMEMORY_CLAUSE transform is available only in Oracle Database 12c Release (12.1.0.2) or higher.</td>
</tr>
</tbody>
</table>
Table 45-19  (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

Table 45-19 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_COMPRESSION_CLAUSE</td>
<td>TEXT</td>
<td>TABLE</td>
<td>Specifies a table compression clause (for example, COMPRESS BASIC) to use when the table is created. Specify NONE to omit the table compression clause. The table will have the default compression for the tablespace. Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- **INVALID_OPERATION.** Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- **INVALID_STATE.** The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- **INCONSISTENT_ARGS.** There was no value supplied or it was of the wrong datatype for the transform.
- **PRIVILEGE_ERROR.** A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique according its
parameters. That is, two transforms cannot specify conflicting or redundant transformations.

45.5.12 OPEN Function

This function is used to declare a new job using the Data Pump API.

The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```sql
DBMS_DATAPUMP.OPEN (
  operation    IN VARCHAR2,
  job_mode         IN VARCHAR2,
  remote_link  IN VARCHAR2 DEFAULT NULL,
  job_name     IN VARCHAR2 DEFAULT NULL,
  version      IN VARCHAR2 DEFAULT 'COMPATIBLE')
RETURN NUMBER;
```

Parameters

Table 45-20 OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The type of operation to be performed. Table 45-21 contains descriptions of valid operation types.</td>
</tr>
<tr>
<td>job_mode</td>
<td>The scope of the operation to be performed. Table 45-22 contains descriptions of valid modes. Specifying NULL generates an error.</td>
</tr>
<tr>
<td>remote_link</td>
<td>If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job. The name is limited to 128 characters; it will be truncated if more than 128 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: SYS_&lt;OPERATION&gt;<em>&lt;MODE&gt;</em>%N. The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, &quot;SYS_IMPORT_FULL_03&quot;). The name supplied for the job will also be used to name the master table and other resources associated with the job.</td>
</tr>
<tr>
<td>version</td>
<td>In VARCHAR2 DEFAULT 'COMPATIBLE'</td>
</tr>
</tbody>
</table>

Chapter 45 Summary of DBMS_DATAPUMP Subprograms

45-39
Table 45-20  (Cont.) OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</td>
</tr>
<tr>
<td></td>
<td>• COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</td>
</tr>
<tr>
<td></td>
<td>• LATEST - the version of the metadata corresponds to the database version.</td>
</tr>
<tr>
<td></td>
<td>• A specific database version, for example, ‘11.0.0’. Specify a value of 12 to allow all existing database features, components, and options to be exported from Oracle Database 11g release 2 (11.2.0.3) or later into an Oracle Database 12 c Release 1 (12.1) (either a multitenant container database (CDB) or a non-CDB).</td>
</tr>
</tbody>
</table>

Table 45-21 describes the valid operation types for the OPEN function.

Table 45-21  Valid Operation Types for the OPEN Function

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT</td>
<td>Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.</td>
</tr>
<tr>
<td>IMPORT</td>
<td>Restores data and metadata from a dump file set or across a database link.</td>
</tr>
<tr>
<td>SQL_FILE</td>
<td>Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.</td>
</tr>
</tbody>
</table>

Table 45-22 describes the valid modes for the OPEN function.

Table 45-22  Valid Modes for the OPEN Function

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL</td>
<td>Operates on the full database or full dump file set except for Oracle Database internal schemas. (Some tables from Oracle Database internal schemas may be registered to be exported and imported in full operations in order to provide consistent metadata during import.) The TRANSPORTABLE parameter can be set to ALWAYS during a full database export in order to move data via transportable tablespaces rather than in the Data Pump dump file.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. In SCHEMA mode, you cannot specify Oracle-internal schemas (for example, SYS, XDB, ORDSYS, MDSYS,CTXSYS, ORDPLUGINS, or LBACSYS).</td>
</tr>
</tbody>
</table>
Table 45-22  (Cont.) Valid Modes for the OPEN Function

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE</td>
<td>Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.</td>
</tr>
<tr>
<td>TABLESPACE</td>
<td>Operates on a set of selected table spaces. No defaulting is performed. Tables that have storage in the specified table spaces are processed in the same manner as in Table mode.</td>
</tr>
<tr>
<td>TRANSPORTABLE</td>
<td>Operates on metadata for tables (and their dependent objects) within a set of selected table spaces to perform a transportable table space export/import.</td>
</tr>
</tbody>
</table>

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA_TRANSFORM, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default table space. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH function.
- If the call to the OPEN function fails, call the GET_STATUS procedure with a null handle to retrieve additional information about the failure.
45.5.13 SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
    handle    IN NUMBER,
    degree    IN NUMBER);
```

Parameters

**Table 45-23  SET_PARALLEL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>degree</td>
<td>The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_OPERATION.** The SET_PARALLEL procedure is only valid for export and import operations.
- **INVALID_ARGVAL.** An invalid value was supplied for an input parameter.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
• To parallelize an Export job to a degree of $n$, the user should supply $n$ files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

• SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

45.5.14 SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

```sql
DBMS_DATAPUMP.SET_PARAMETER(
    handle       IN NUMBER,
    name         IN VARCHAR2,
    value        IN VARCHAR2);
```

```sql
DBMS_DATAPUMP.SET_PARAMETER (   handle      IN NUMBER,
    name        IN VARCHAR2,
    value       IN NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the parameter. Table 45-25 describes the valid parameter names.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the specified parameter</td>
</tr>
</tbody>
</table>

Table 45-25 describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 45-25  Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_COMMAND</td>
<td>TEXT</td>
<td>All</td>
<td>An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.</td>
</tr>
</tbody>
</table>
### Table 45-25  (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPRESSION</td>
<td>TEXT</td>
<td>Export</td>
<td>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The DATA_ONLY option compresses only user data in the dump file set. The METADATA_ONLY option compresses only metadata in the dump file set. The ALL option compresses both user data and metadata. The NONE option stores the dump file set in an uncompressed format. The METADATA_ONLY and NONE options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. Default=METADATA_ONLY</td>
</tr>
</tbody>
</table>
| COMPRESSION_ALGORTHM | TEXT     | Export               | Indicates the compression algorithm is to be used when compressing dump file data. The choices are as follows:  
  - **BASIC**---Offers a good combination of compression ratios and speed; the algorithm used is the same as in previous versions of Oracle Data Pump.  
  - **LOW**---Least impact on backup throughput and suited for environments where CPU resources are the limiting factor.  
  - **MEDIUM**---Recommended for most environments. This option, like the **BASIC** option, provides a good combination of compression ratios and speed, but it uses a different algorithm than **BASIC**.  
  - **HIGH**--Best suited for exports over slower networks where the limiting factor is network speed.  
To use this feature, the **COMPATIBLE** initialization parameter must be set to at least 12.0.0. This feature requires that the Oracle Advanced Compression option be enabled. |
| DATA_ACCESS_METHOD | TEXT     | Export and Import    | Allows you to specify an alternative method to unload data if the default method does not work for some reason. The choices are AUTOMATIC, DIRECT_PATH, or EXTERNAL_TABLE. Oracle recommends that you use the default option (AUTOMATIC) whenever possible because it allows Data Pump to automatically select the most efficient method. |
Table 45-25  (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA_OPTIONS</td>
<td>Number</td>
<td>Export and Import</td>
<td>A bitmask to supply special options for processing the job. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KUS_DATAOPT_SKIP_CONST_ERR</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KUS_DATAOPT_XMLTYPE_CLOB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KUS_DATAOPT_DISABL_APPEND_HINT</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>KUS_DATAOPT_GRP_PART_TAB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KUS_DATAOPT_TRUST_EXIST_TB_PAR</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Export supports the value KUS_DATAOPT_XMLTYPE_CLOB. This option stores compressed XMLType columns in the dump file in CLOB format rather than as XML documents.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Import supports the value KUS_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Import also supports the value KUS_DATAOPT_DISABL_APPEND_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data Pump Export supports the value KUS_DATAOPT_GRP_PART_TAB. This option tells Data Pump to unload all table data in one operation rather than unload each table partition as a separate operation. As a result, the definition of the table will not matter at import time because Import will see one partition of data that will be loaded into the entire table.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Data Pump Import supports the value KUS_DATAOPT_TRUST_EXIST_TB_PAR. This option tells Data Pump to load partition data in parallel into existing tables.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Use of the DATA_OPTIONS parameter requires that the version on the OPEN function be set to 11.1 or later.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default=0</td>
<td></td>
</tr>
</tbody>
</table>
