Table 262-8    UTL_HTTP Subprograms—Simple HTTP Fetches in a Single Call

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REQUEST Function</td>
<td>Returns up to the first 2000 bytes of the data retrieved from the given URL. This function can be used directly in SQL queries.</td>
</tr>
<tr>
<td>REQUEST_PIECES Function</td>
<td>Returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL</td>
</tr>
</tbody>
</table>

262.8.2 UTL_HTTP Session Settings Subprograms

This table lists and briefly describes the UTL_HTTP Session Settings Subprograms.

Table 262-9    UTL_HTTP Subprograms—Session Settings

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_BODY_CHARSET Procedure</td>
<td>Retrieves the default character set of the body of all future HTTP requests</td>
</tr>
<tr>
<td>GET_COOKIE_SUPPORT Procedure</td>
<td>Retrieves the current cookie support settings</td>
</tr>
<tr>
<td>GET_DETAILED_EXCP_SUPPORT Procedure</td>
<td>Checks if the UTL_HTTP package will raise a detailed exception or not</td>
</tr>
<tr>
<td>GET_FOLLOW_REDIRECT Procedure</td>
<td>Retrieves the follow-redirect setting in the current session</td>
</tr>
<tr>
<td>GET_PERSISTENT_CONN_SUPPORT Procedure</td>
<td>Checks if the persistent connection support is enabled and gets the maximum number of persistent connections in the current session</td>
</tr>
<tr>
<td>GET_PROXY Procedure</td>
<td>Retrieves the current proxy settings</td>
</tr>
</tbody>
</table>
Table 262-9  (Cont.) UTL_HTTP Subprograms—Session Settings

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_RESPONSE_ERROR_CHECK Procedure</td>
<td>Checks if the response error check is set or not</td>
</tr>
<tr>
<td>GET_TRANSFER_TIMEOUT Procedure</td>
<td>Retrieves the current network transfer timeout value</td>
</tr>
<tr>
<td>SET_TRANSFER_TIMEOUT Procedure</td>
<td>Sets the default character set of the body of all future HTTP requests when the media type is text and the character set is not specified in the Content-Type header</td>
</tr>
<tr>
<td>SET_COOKIE_SUPPORT Procedures</td>
<td>Sets whether or not future HTTP requests will support HTTP cookies; sets the maximum number of cookies maintained in the current database user session</td>
</tr>
<tr>
<td>SET_DETAILED_EXCP_SUPPORT Procedure</td>
<td>Sets the UTL_HTTP package to raise a detailed exception</td>
</tr>
<tr>
<td>SET_FOLLOW_REDIRECT Procedures</td>
<td>Sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP responses to future requests in the GET_RESPONSE function</td>
</tr>
<tr>
<td>SET_PERSISTENT_CONN_SUPPORT Procedure</td>
<td>Sets whether or not future HTTP requests will support the HTTP 1.1 persistent connection; sets the maximum number of persistent connections maintained in the current database user session</td>
</tr>
<tr>
<td>SET_PROXY Procedure</td>
<td>Sets the proxy to be used for requests of HTTP or other protocols</td>
</tr>
<tr>
<td>SET_RESPONSE_ERROR_CHECK Procedure</td>
<td>Sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges</td>
</tr>
<tr>
<td>SET_TRANSFER_TIMEOUT Procedure</td>
<td>Sets the timeout value for UTL_HTTP to read the HTTP response from the Web server or proxy server</td>
</tr>
<tr>
<td>SET_WALLET Procedure</td>
<td>Sets the Oracle Wallet used for all HTTP requests over Secured Socket Layer (SSL), that is, HTTPS</td>
</tr>
</tbody>
</table>

262.8.3 UTL_HTTP HTTP Requests Subprograms

This table lists and briefly describes the UTL_HTTP HTTP Requests.

Table 262-10  UTL_HTTP Subprograms—HTTP Requests

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

</tbody>
</table>
262.9.1 ADD_COOKIES Procedure

This procedure adds the cookies either to a request context or to the UTL_HTTP package's session state.

See Also:
HTTP Cookies and HTTP Cookies Subprograms

Syntax

```sql
UTL_HTTP.ADD_COOKIES (  
  cookies          IN  cookie_table,  
  request_context  IN  request_context_key DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies to be added</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to add the cookies. If NULL, the cookies will be added to the UTL_HTTP package's session state instead.</td>
</tr>
</tbody>
</table>

Usage Notes

The cookies that the package currently maintains are not cleared before new cookies are added.

262.9.2 BEGIN_REQUEST Function

This function begins a new HTTP request. UTL_HTTP establishes the network connection to the target Web server or the proxy server and sends the HTTP request line. The PL/SQL program continues the request by calling some other interface to complete the request.

The URL may contain the username and password needed to authenticate the request to the server. The format is:

```
scheme://[user[:password]@[host[:port]/[...]
```

See Also:
HTTP Requests and HTTP Requests Subprograms

Syntax

```sql
UTL_HTTP.BEGIN_REQUEST (  
  url               IN  VARCHAR2,
```
Parameters

Table 262-18  BEGIN_REQUEST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL of the HTTP request</td>
</tr>
<tr>
<td>method</td>
<td>The method performed on the resource identified by the URL</td>
</tr>
<tr>
<td>http_version</td>
<td>The HTTP protocol version that sends the request. The format of the protocol version is HTTP/major-version.minor-version, where major-version and minor-version are positive numbers. If this parameter is set to NULL, UTL_HTTP uses the latest HTTP protocol version that it supports to send the request. The latest version that the package supports is 1.1 and it can be upgraded to a later version. The default is NULL.</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context that holds the private wallet and the cookie table to use in this HTTP request. If this parameter is NULL, the wallet and cookie table shared in the current database session will be used instead.</td>
</tr>
<tr>
<td>https_host</td>
<td>The host name to be matched against the common name (CN) of the remote server’s certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.</td>
</tr>
</tbody>
</table>

Usage Notes

- The URL passed as an argument to this function is not examined for illegal characters, such as spaces, according to URL specification RFC 2396. You should escape those characters with the UTL_URL package to return illegal and reserved characters. URLs should consist of US-ASCII characters only. See UTL_URL for a list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

- BEGIN_REQUEST can send a URL whose length is up to 32767 bytes. However, different Web servers impose different limits on the length of the URL they can accept. This limit is often about 4000 bytes. If this limit is exceeded, the outcome will depend on the Web server. For example, a Web server might simply drop the HTTP connection without returning a response of any kind. If this happens, a subsequent invocation of the GET_RESPONSE Function will raise the PROTOCOL_ERROR exception.

A URL will be long when its QUERY_STRING (that is, the information that follows the question mark (?)) is long. In general, it is better to send this parameterization in the body of the request using the POST method.

```sql
req := UTL_HTTP.BEGIN_REQUEST (url=>the_url, method=>'POST');
UTL_HTTP.SET_HEADER (r => req,        
    name => 'Content-Type',        
    value => 'application/x-www-form-urlencoded');
UTL_HTTP.SET_HEADER (r => req,  
```
name => 'Content-Length',
value => '<length of data posted in bytes>');
UTL_HTTP.WRITE_TEXT (r => req,
data => 'p1 = value1&p2=value2...');
resp := UTL_HTTP.GET_RESPONSE (r => req);
...

The programmer must determine whether a particular Web server may, or may not, accept data provided in this way.

- An Oracle wallet must be set before accessing Web servers over HTTPS. See the `SET_WALLET Procedure` procedure on how to set up an Oracle wallet. To use SSL client authentication, the client certificate should be stored in the wallet and the caller must have the `use-client-certificates` privilege on the wallet. See "Managing Fine-grained Access to External Network Services" in the *Oracle Database Security Guide* to grant the privilege.

- To connect to the remote Web server directly, or indirectly through a HTTP proxy, the `UTL_HTTP` must have the `connect` ACL privilege to the remote Web server host or the proxy host respectively.

### 262.9.3 CLEAR_COOKIES Procedure

This procedure clears all the cookies maintained either in a request context or in the `UTL_HTTP` package’s session state.

**See Also:**

[HTTP Cookies and HTTP Cookies Subprograms](#)

**Syntax**

```
UTL_HTTP.CLEAR_COOKIES (
    request_context IN request_context_key DEFAULT NULL);
```

**Parameters**

**Table 262-19  CLEAR_COOKIES Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to clear the cookies. If NULL, the cookies maintained in the <code>UTL_HTTP</code> package’s session state will be cleared instead.</td>
</tr>
</tbody>
</table>
262.9.4 CLOSE_PERSISTENT_CONN Procedure

This procedure closes an HTTP persistent connection maintained by the UTL_HTTP package in the current database session.

See Also:
HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

UTL_HTTP.CLOSE_PERSISTENT_CONN (  
    conn  IN connection);  

Parameters

Table 262-20 Close_Persistent_Conn Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conn</td>
<td>The HTTP persistent connection to close</td>
</tr>
</tbody>
</table>

262.9.5 CLOSE_PERSISTENT_CONNS Procedure

This procedure closes a group of HTTP persistent connections maintained by the UTL_HTTP package in the current database session. This procedure uses a pattern-match approach to decide which persistent connections to close.

To close a group of HTTP persistent connection that share a common property (for example, all connections to a particular host, or all SSL connections), set the particular parameters and leave the rest of the parameters NULL. If a particular parameter is set to NULL when this procedure is called, that parameter will not be used to decide which connections to close.

For example, the following call to the procedure closes all persistent connections to foobar:

UTL_HTTP.CLOSE_PERSISTENT_CONNS(host => 'foobar');

And the following call to the procedure closes all persistent connections through the foobar at TCP/IP port 80:

UTL_HTTP.CLOSE_PERSISTENT_CONNS(proxy_host => 'foobar',  
                                proxy_port => 80);  

And the following call to the procedure closes all persistent connections:

UTL_HTTP.CLOSE_PERSISTENT_CONNS;
See Also:
HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```
UTL_HTTP.CLOSE_PERSISTENT_CONNS {
    host        IN VARCHAR2 DEFAULT NULL,
    port        IN PLS_INTEGER DEFAULT NULL,
    proxy_host  IN VARCHAR2 DEFAULT NULL,
    proxy_port  IN PLS_INTEGER DEFAULT NULL,
    ssl         IN BOOLEAN DEFAULT NULL);
```

Parameters

Table 262-21  CLOSE_PERSISTENT_CONNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>port</td>
<td>The port number for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_host</td>
<td>The proxy host for which persistent connections are to be closed</td>
</tr>
<tr>
<td>proxy_port</td>
<td>The proxy port for which persistent connections are to be closed</td>
</tr>
<tr>
<td>ssl</td>
<td>Close persistent SSL connection</td>
</tr>
</tbody>
</table>

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

Note that the use of a NULL value in a parameter when this procedure is called means that the caller does not care about its value when the package decides which persistent connection to close. If you want a NULL value in a parameter to match only a NULL value of the parameter of a persistent connection (which is when you want to close a specific persistent connection), you should use the CLOSE_PERSISTENT_CONN procedure that closes a specific persistent connection.

262.9.6 CREATE_REQUEST_CONTEXT Function

This function creates a request context. A request context is a context that holds a wallet and a cookie for private use in making a HTTP request. This allows the HTTP
request to use a wallet and a cookie table that will not be shared with other applications making HTTP requests in the same database session.

See Also:
Request Context and HTTP Request Contexts Subprograms

Syntax

UTL_HTTP.CREATE_REQUEST_CONTEXT (  
  wallet_path          IN VARCHAR2 DEFAULT NULL,  
  wallet_password      IN VARCHAR2 DEFAULT NULL,  
  enable_cookies       IN BOOLEAN  DEFAULT TRUE,  
  max_cookies          IN PLS_INTEGER DEFAULT 300,  
  max_cookies_per_site IN PLS_INTEGER DEFAULT 20)  
RETURN request_context_key;

Parameters

Table 262-22  CREATE_REQUEST_CONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet. The format is file:directory-path</td>
</tr>
<tr>
<td>wallet_password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to NULL. See the Oracle Database Enterprise User Security Administrator's Guide for detailed information about wallets.</td>
</tr>
<tr>
<td>enable_cookies</td>
<td>Sets whether HTTP requests using this request context should support HTTP cookies or not: TRUE to enable the support, FALSE to disable it.</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies that will be maintained in this request context</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies per each Web site that will be maintained in this request context</td>
</tr>
</tbody>
</table>

Return Values

The request context created.

Examples

DECLARE  
  request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;  
  req              utl_http.req;  
BEGIN  
  request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(  
    wallet_path => 'file:/oracle/wallets/test_wallets',  
    wallet_password => NULL,  
    enable_cookies => TRUE,  
    max_cookies => 300,  
    max_cookies_per_site => 20);  
  req := UTL_HTTP.BEGIN_REQUEST(

262.9.7 DESTROY_REQUEST_CONTEXT Procedure

This procedure destroys a request context in UTL_HTTP. A request context cannot be destroyed when it is in use by a HTTP request or response.

Syntax

```sql
UTL_HTTP.DESTROY_REQUEST_CONTEXT (request_context_key);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to destroy</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    request_context  UTL_HTTP.REQUEST_CONTEXT_KEY;
BEGIN
    request_context := UTL_HTTP.CREATE_REQUEST_CONTEXT(...);
    --
    UTL_HTTP.DESTROY_REQUEST_CONTEXT(request_context);
END;
```

262.9.8 END_REQUEST Procedure

This procedure ends the HTTP request. To terminate the HTTP request without completing the request and waiting for the response, the program can call this procedure. Otherwise, the program should go through the normal sequence of beginning a request, getting the response, and closing the response. The network connection will always be closed and will not be reused.

See Also:

- HTTP Requests and HTTP Requests Subprograms
Syntax

UTL_HTTP.END_REQUEST (  
  r IN OUT NOCOPY req);

Parameters

Table 262-24 END_REQUEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>

262.9.9 END_RESPONSE Procedure

This procedure ends the HTTP response. It completes the HTTP request and response. Unless HTTP 1.1 persistent connection is used in this request, the network connection is also closed.

See Also:

HTTP Responses and HTTP Responses Subprograms

Syntax

UTL_HTTP.END_RESPONSE (  
  r IN OUT NOCOPY resp);

Parameters

Table 262-25 END_RESPONSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>

262.9.10 GET_AUTHENTICATION Procedure

This procedure retrieves the HTTP authentication information needed for the request to be accepted by the Web server as indicated in the HTTP response header.

See Also:

HTTP Responses and HTTP Responses Subprograms

Syntax

UTL_HTTP.GET_AUTHENTICATION (  
  r IN OUT NOCOPY resp,
Parameters

Table 262-26  GET_AUTHENTICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>scheme</td>
<td>The scheme for the required HTTP authentication</td>
</tr>
<tr>
<td>realm</td>
<td>The realm for the required HTTP authentication</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Returns the HTTP authentication information required for the access to the HTTP proxy server instead of the Web server? Default is FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

When a Web client is unaware that a document is protected, at least two HTTP requests are required for the document to be retrieved. In the first HTTP request, the Web client makes the request without supplying required authentication information; so the request is denied. The Web client can determine the authentication information required for the request to be authorized by calling GET_AUTHENTICATION. The Web client makes the second request and supplies the required authentication information with SET_AUTHORIZATION. If the authentication information can be verified by the Web server, the request will succeed and the requested document is returned. Before making the request, if the Web client knows that authentication information is required, it can supply the required authentication information in the first request, thus saving an extra request.

262.9.11 GET_BODY_CHARSET Procedure

This procedure retrieves the default character set of the body of all future HTTP requests.

See Also:

Session Settings and Session Settings Subprograms

Syntax

UTL_HTTP.GET_BODY_CHARSET (  
    charset  OUT NOCOPY VARCHAR2);  

Parameters

Table 262-27  GET_BODY_CHARSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>The default character set of the body of all future HTTP requests</td>
</tr>
</tbody>
</table>
262.9.12 GET_COOKIE_COUNT Function

This function returns the number of cookies maintained either in a request context or in the UTL_HTTP package's session state.

See Also:
HTTP Cookies and HTTP Cookies Subprograms

Syntax

UTL_HTTP.GET_COOKIE_COUNT (
    request_context  IN  request_context_key DEFAULT NULL)
RETURN PLS_INTEGER;

Parameters

Table 262-28  GET_COOKIE_COUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>request_context</td>
<td>Request context to return the cookie count for. If NULL, the cookie count maintained in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>

262.9.13 GET_COOKIE_SUPPORT Procedure

This procedure retrieves the current cookie support settings.

See Also:
Session Settings and Session Settings Subprograms

Syntax

UTL_HTTP.GET_COOKIE_SUPPORT (   enable                OUT BOOLEAN,   max_cookies           OUT PLS_INTEGER,   max_cookies_per_site  OUT PLS_INTEGER);

Parameters

Table 262-29  GET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Indicates whether future HTTP requests should support HTTP cookies (TRUE) or not (FALSE)</td>
</tr>
</tbody>
</table>
### Table 262-29  (Cont.) GET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_cookies</td>
<td>Indicates the maximum total number of cookies maintained in the current session</td>
</tr>
<tr>
<td>max_cookies_per_site</td>
<td>Indicates the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>

#### 262.9.14 GET_COOKIES Function

This function returns all the cookies maintained either in a request context or in the UTL_HTTP package's session state.

- **See Also:**
  - HTTP Cookies and HTTP Cookies Subprograms

**Syntax**

```sql
UTL_HTTP.GET_COOKIES (  
    cookies          IN  OUT NOCOPY cookie_table,  
    request_context  IN             request_context_key DEFAULT NULL);
```

**Parameters**

#### Table 262-30  GET_COOKIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cookies</td>
<td>The cookies returned</td>
</tr>
<tr>
<td>request_context</td>
<td>Request context to return the cookies for. If NULL, the cookies maintained in the UTL_HTTP package's session state will be returned instead.</td>
</tr>
</tbody>
</table>

#### 262.9.15 GET_DETAILS_EXCP_SUPPORT Procedure

This procedure checks if the UTL_HTTP package will raise a detailed exception or not.

- **See Also:**
  - Session Settings and Session Settings Subprograms

**Syntax**

```sql
UTL_HTTP.GET_DETAILS_EXCP_SUPPORT (  
    enable  OUT BOOLEAN);
```
Parameters

Table 262-31  GET_DETAILED_EXCP_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if UTL_HTTP raises a detailed exception; otherwise FALSE</td>
</tr>
</tbody>
</table>

262.9.16 GET_DETAILED_SQLCODE Function

This function retrieves the detailed SQLCODE of the last exception raised.

See Also:
- Error Conditions and Error Conditions Subprograms

Syntax

UTL_HTTP.GET_DETAILED_SQLCODE
RETURN PLS_INTEGER;

262.9.17 GET_DETAILED_SQLERRM Function

This function retrieves the detailed SQLERRM of the last exception raised.

See Also:
- Error Conditions and Error Conditions Subprograms

Syntax

UTL_HTTP.GET_DETAILED_SQLERRM
RETURN VARCHAR2;

262.9.18 GET_FOLLOW_REDIRECT Procedure

This procedure retrieves the follow-redirect setting in the current session

See Also:
- Session Settings and Session Settings Subprograms

Syntax

UTL_HTTP.GET_FOLLOW_REDIRECT (
  max_redirects  OUT PLS_INTEGER);
Parameters

Table 262-32  GET_FOLLOW_REDIRECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirections for all future HTTP requests</td>
</tr>
</tbody>
</table>

262.9.19 GET_HEADER Procedure

This procedure returns the \textit{n}th HTTP response header name and value returned in the response.

See Also:

- HTTP Responses and HTTP Responses Subprograms

Syntax

```plaintext
UTL_HTTP.GET_HEADER (r      IN OUT NOCOPY resp,
                      n      IN PLS_INTEGER,
                      name   OUT NOCOPY VARCHAR2,
                      value  OUT NOCOPY VARCHAR2);
```

Parameters

Table 262-33  GET_HEADER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>n</td>
<td>The \textit{n}th header to return</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.
262.9.20 GET_HEADER_BY_NAME Procedure

This procedure returns the HTTP response header value returned in the response given the name of the header.

See Also:
HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_HEADER_BY_NAME(
    r IN OUT NOCOPY resp,
    name IN VARCHAR2,
    value OUT NOCOPY VARCHAR2,
    n IN PLS_INTEGER DEFAULT 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP response header for which the value is to return</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP response header</td>
</tr>
<tr>
<td>n</td>
<td>The n\textsuperscript{th} occurrence of an HTTP response header by the specified name to return. The default is 1.</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

262.9.21 GET_HEADER_COUNT Function

This function returns the number of HTTP response headers returned in the response.

See Also:
HTTP Responses and HTTP Responses Subprograms
Syntax

UTL_HTTP.GET_HEADER_COUNT (  
    r IN OUT NOCOPY resp)  
RETURN PLS_INTEGER;

Parameters

Table 262-35  GET_HEADER_COUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>

Usage Notes

If the response body returned by the remote Web server is encoded in chunked transfer encoding format, the trailer headers that are returned at the end of the response body will be added to the response, and the response header count will be updated. You can retrieve the additional headers after the end of the response body is reached and before you end the response.

262.9.22 GET_PERSISTENT_CONN_COUNT Function

This function returns the number of network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:

HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

UTL_HTTP.GET_PERSISTENT_CONN_COUNT  
RETURN PLS_INTEGER;

Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.
262.9.23 GET_PERSISTENT_CONN_SUPPORT Procedure

This procedure checks if the persistent connection support is enabled, and gets the maximum number of persistent connections in the current session.

See Also:
Session Settings and Session Settings Subprograms

Syntax

```sql
UTL_HTTP.GET_PERSISTENT_CONN_SUPPORT (enable OUT BOOLEAN, max_conns OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if persistent connection support is enabled; otherwise FALSE</td>
</tr>
<tr>
<td>max_conns</td>
<td>the maximum number of persistent connections maintained in the current session</td>
</tr>
</tbody>
</table>

262.9.24 GET_PERSISTENT_CONNS Procedure

This procedure returns all the network connections currently kept persistent by the UTL_HTTP package to the Web servers.

See Also:
HTTP Persistent Connections and HTTP Persistent Connections Subprograms

Syntax

```sql
UTL_HTTP.get_persistent_conns (connections IN OUT NOCOPY connection_table);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connections</td>
<td>The network connections kept persistent</td>
</tr>
</tbody>
</table>
Usage Notes

Connections to the same Web server at different TCP/IP ports are counted individually. The host names of the Web servers are identified as specified in the URL of the original HTTP requests. Therefore, fully qualified host names with domain names will be counted differently from the host names without domain names.

262.9.25 GET_PROXY Procedure

This procedure retrieves the current proxy settings.

See Also:

Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_PROXY (  
    proxy             OUT NOCOPY VARCHAR2,  
    no_proxy_domains  OUT NOCOPY VARCHAR2);  
```

Parameters

Table 262-38  GET_PROXY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) currently used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy is used for all requests</td>
</tr>
</tbody>
</table>

262.9.26 GET_RESPONSE Function

This function reads the HTTP response.

When the function returns, the status line and the HTTP response headers have been read and processed. The status code, reason phrase, and the HTTP protocol version are stored in the response record. This function completes the HTTP headers section.

See Also:

HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.GET_RESPONSE (  
    r                       IN OUT NOCOPY req,  
```
Parameters

Table 262-39  GET_RESPONSE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>return_info_response</td>
<td>Return 100 informational response or not.</td>
</tr>
<tr>
<td></td>
<td>• TRUE means GET_RESPONSE should return 100 informational response when it is received from the HTTP server. The request will not be ended if a 100 response is returned.</td>
</tr>
<tr>
<td></td>
<td>• FALSE means the API should ignore any 100 informational response received from the HTTP server and should return the following non-100 response instead. The default is FALSE.</td>
</tr>
</tbody>
</table>

Exceptions

- When detailed-exception is disabled:
  ORA-29273 REQUEST_FAILED - the request fails to execute. Use the GET_DETAILED_EXCP_SUPPORT Procedure and the GET_DETAILED_SQLERRM Function to get the detailed error message.

- When detailed-exception is enabled:
  ORA-29261 BAD_ARGUMENT - some arguments passed are not valid

- When response error check is enabled:
  ORA-29268 HTTP_CLIENT_ERROR - the response code is in 400 range
  ORA-29269 HTTP_SERVER_ERROR - the response code is in 500 range

Usage Notes

- The request will be ended when this functions returns regardless of whether an exception is raised or not. There is no need to invoke the END_REQUEST Procedure.
- If URL redirection occurs, the URL and method fields in the req record will be updated to the last redirected URL and the method used to access the URL.

Examples

In certain situations (initiated by the HTTP client or not), the HTTP server may return a 1xx informational response. The user who does not expect such a response may indicate to GET_RESPONSE to ignore the response and proceed to receive the regular response. In the case when the user expects such a response, the user can indicate to GET_RESPONSE to return the response.

For example, when a user is issuing a HTTP POST request with a large request body, the user may want to check with the HTTP server to ensure that the server will accept the request before sending the data. To do so, the user will send the additional EXPECT: 100-CONTINUE request header, and check for 100 CONTINUE response from the server before proceeding to send the request body. Then, the user will get the regular HTTP response.
The following code example illustrates this:

```
DECLARE
  data VARCHAR2(1024) := '...';
  req utl_http.req;
  resp utl_http.resp;
BEGIN
  req := utl_http.begin_request('http://www.acme.com/receiver', 'POST');
  utl_http.set_header(req, 'Content-Length', length(data));
  -- Ask HTTP server to return "100 Continue" response
  utl_http.set_header(req, 'Expect', '100-continue');
  resp := utl_http.get_response(req, TRUE);
  -- Check for and dispose "100 Continue" response
  IF (resp.status_code <> 100) THEN
    utl_http.end_response(resp);
    raise_application_error(20000, 'Request rejected');
  END IF;
  utl_http.end_response(resp);
  -- Now, send the request body
  utl_http.write_text(req, data);
  -- Get the regular response
  resp := utl_http.get_response(req);
  utl_http.read_text(resp, data);
  utl_http.end_response(resp);
END;
```

### 262.9.27 GET_RESPONSE_ERROR_CHECK Procedure

This procedure checks if the response error check is set or not.

**See Also:**

- Session Settings and Session Settings Subprograms

**Syntax**

```
UTL_HTTP.GET_RESPONSE_ERROR_CHECK (enable OUT BOOLEAN);
```

**Parameters**

**Table 262-40** GET_RESPONSE_ERROR_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE if the response error check is set; otherwise FALSE</td>
</tr>
</tbody>
</table>
262.9.28 GET_TRANSFER_TIMEOUT Procedure

This procedure retrieves the default timeout value for all future HTTP requests.

See Also:
Session Settings and Session Settings Subprograms

Syntax

```
UTL_HTTP.GET_TRANSFER_TIMEOUT (    
   timeout  OUT PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds</td>
</tr>
</tbody>
</table>

262.9.29 READ_LINE Procedure

This procedure reads the HTTP response body in text form until the end of line is reached and returns the output in the caller-supplied buffer.

The end of line is as defined in the function `read_line` of UTL_TCP. The `end_of_body` exception will be raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:
HTTP Responses and HTTP Responses Subprograms

Syntax

```
UTL_HTTP.READ_LINE (    
   r           IN OUT NOCOPY resp,    
   data        OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,    
   remove_crlf IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
</tbody>
</table>
Table 262-42 (Cont.) READ_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>Removes the newline characters if set to TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_line waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_line stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the read_raw procedure, or set the character set of the response body explicitly using the set_body_charset procedure and read the response body as text again.

262.9.30 READ_RAW Procedure

This procedure reads the HTTP response body in binary form and returns the output in the caller-supplied buffer.

The end_of_body exception is raised if the end of the HTTP response body is reached.

See Also:

HTTP Responses and HTTP Responses Subprograms

Syntax

```sql
UTL_HTTP.READ_RAW(
    r     IN OUT NOCOPY resp,
    data  OUT NOCOPY RAW,
    len   IN PLS_INTEGER DEFAULT NULL);
```
Parameters

Table 262-43  READ_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in binary form</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if not much data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_raw waits for each data packet to be ready to read until timeout occurs. If it occurs, read_raw stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

262.9.31 READ_TEXT Procedure

This procedure reads the HTTP response body in text form and returns the output in the caller-supplied buffer.

The end_of_body exception is raised if the end of the HTTP response body is reached. Text data is automatically converted from the response body character set to the database character set.

See Also:

HTTP Responses and HTTP Responses Subprograms

Syntax

UTL_HTTP.READ_TEXT(
    r IN OUT NOCOPY resp,
    data OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
    len IN PLS_INTEGER DEFAULT NULL);
Parameters

Table 262-44  READ_TEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response</td>
</tr>
<tr>
<td>data</td>
<td>The HTTP response body in text form</td>
</tr>
<tr>
<td>len</td>
<td>The maximum number of characters of data to read. If len is NULL, this procedure will read as much input as possible to fill the buffer allocated in data. The actual amount of data returned may be less than that specified if little data is available before the end of the HTTP response body is reached or the transfer_timeout amount of time has elapsed. The default is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

The UTL_HTTP package supports HTTP 1.1 chunked transfer-encoding. When the response body is returned in chunked transfer-encoding format as indicated in the response header, the package automatically decodes the chunks and returns the response body in de-chunked format.

If transfer timeout is set in the request of this response, read_text waits for each data packet to be ready to read until timeout occurs. If it occurs, this procedure stops reading and returns all the data read successfully. If no data is read successfully, the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of the response body, read_text stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the read_raw procedure. If a partial multibyte character is seen in the middle of the response body because the remaining bytes of the character have not arrived and read timeout occurs, the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

When the Content-Type response header specifies the character set of the response body and the character set is unknown or unsupported by Oracle, the "ORA-01482: unsupported character set" exception is raised if you try to read the response body as text. You can either read the response body as binary using the READ_RAW procedure, or set the character set of the response body explicitly using the SET_BODY_CHARSET procedure and read the response body as text again.

262.9.32 REQUEST Function

This function returns up to the first 2000 bytes of data retrieved from the given URL.

This function can be used directly in SQL queries. The URL may contain the username and password needed to authenticate the request to the server. The format is

scheme://[user[:password]@]host[:port]/[...]
You can define a username/password for the proxy to be specified in the proxy string. The format is

```
[http://][user[:password]@]host[:port]/
```

**See Also:**
- Simple HTTP Fetches
- Simple HTTP Fetches in a Single Call Subprograms

### Syntax

```
UTL_HTTP.REQUEST (
    url              IN VARCHAR2,
    proxy            IN VARCHAR2 DEFAULT NULL,
    wallet_path      IN VARCHAR2 DEFAULT NULL,
    wallet_password  IN VARCHAR2 DEFAULT NULL,
    https_host       IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;
```

### Pragmas

```
pragma restrict_references (request, wnds, rnds, wnps, rnps);
```

### Parameters

**Table 262-45 REQUEST Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request. The format of wallet_path on a PC is, for example, file:C:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for a description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet</td>
</tr>
<tr>
<td>https_host</td>
<td>The host name to be matched against the common name (CN) of the remote server's certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.</td>
</tr>
</tbody>
</table>
Return Values

The return type is a string of length 2000 or less, which contains up to the first 2000 bytes of the HTML result returned from the HTTP request to the argument URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function is not examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<html>
  <head>
    <title>Error Message</title>
  </head>
  <body>
    <h1>Fatal Error 500</h1>
  </body>
</html>
```

Examples

```sql
SQL> SELECT UTL_HTTP.REQUEST('http://www.my-company.com/') FROM DUAL;
UTL_HTTP.REQUEST('HTTP://WWW.MY-COMPANY.COM/')
<html>
  <head>
    <title>My Company Home Page</title>
  </head>
  <!--changed Jan. 16, 19
1 row selected.
If you are behind a firewall, include the proxy parameter. For example, from within the Oracle firewall, where there might be a proxy server named www-proxy.us.my-company.com:
SQLPLUS> SELECT
```
262.9.33 REQUEST_PIECES Function

This function returns a PL/SQL table of 2000-byte pieces of the data retrieved from the given URL.

You can define a username/password for the proxy to be specified in the proxy string. The format is

[http://][user[:password]@[host[:port]]/]

See Also:
Simple HTTP Fetches and Simple HTTP Fetches in a Single Call Subprograms

Syntax

```sql
TYPE html_pieces IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

UTL_HTTP.REQUEST_PIECES (  
    url IN VARCHAR2,  
    max_pieces IN NATURAL DEFAULT 32767,  
    proxy IN VARCHAR2 DEFAULT NULL,  
    wallet_path IN VARCHAR2 DEFAULT NULL,  
    wallet_password IN VARCHAR2 DEFAULT NULL,  
    https_host IN VARCHAR2 DEFAULT NULL)  
RETURN html_pieces;
```

Pragmas

```
PRAGMA RESTRICT_REFERENCES (request_pieces, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 262-46  REQUEST_PIECES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>Uniform resource locator</td>
</tr>
<tr>
<td>max_pieces</td>
<td>(Optional) The maximum number of pieces (each 2000 characters in length, except for the last, which may be shorter), that REQUEST_PIECES should return. If provided, then that argument should be a positive integer.</td>
</tr>
<tr>
<td>proxy</td>
<td>(Optional) Specifies a proxy server to use when making the HTTP request. See SET_PROXY for the full format of the proxy setting.</td>
</tr>
</tbody>
</table>
Table 262-46  (Cont.) REQUEST_PIECES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>(Optional) Specifies a client-side wallet. The client-side wallet contains the list of trusted certificate authorities required for HTTPS request.</td>
</tr>
<tr>
<td></td>
<td>The format of wallet_path on a PC is, for example, file:c:\WINNT\Profiles\username\WALLETS, and in Unix is, for example, file:/home/username/wallets. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server. See SET_WALLET for the description on how to set up an Oracle wallet. Non-HTTPS requests do not require an Oracle wallet.</td>
</tr>
<tr>
<td>wallet_password</td>
<td>(Optional) Specifies the password required to open the wallet</td>
</tr>
<tr>
<td>https_host</td>
<td>The host name to be matched against the common name (CN) of the remote server's certificate for an HTTPS request. It can also be a domain name like *.example.com. If NULL, the host name in the given URL will be used.</td>
</tr>
</tbody>
</table>

Return Values

REQUEST_PIECES returns a PL/SQL table of type UTL_HTTP.HTML_PIECES. Each element of that PL/SQL table is a string of maximum length 2000. The elements of the PL/SQL table returned by REQUEST_PIECES are successive pieces of the data obtained from the HTTP request to that URL.

Exceptions

INIT_FAILED
REQUEST_FAILED

Usage Notes

The URL passed as an argument to this function will not be examined for illegal characters, for example, spaces, according to URL specification RFC 2396. The caller should escape those characters with the UTL_URL package. See the comments of the package for the list of legal characters in URLs. Note that URLs should consist of US-ASCII characters only. The use of non-US-ASCII characters in a URL is generally unsafe.

Each entry of the PL/SQL table (the "pieces") returned by this function may not be filled to their fullest capacity. The function may start filling the data in the next piece before the previous "piece" is totally full.

Please see the documentation of the function SET_WALLET on the use of an Oracle wallet, which is required for accessing HTTPS Web servers.

Unless response error check is turned on, this function does not raise an exception when a 4xx or 5xx response is received from the Web server. Instead, it returns the formatted error message from the Web server:

```html
<HTML>
<HEAD>
<TITLE>Error Message</TITLE>
</HEAD>
```
<H1>Fatal Error 500</H1>

<B>Reason:</B> Can't locate remote host: home.nothing.comm.

 Examples

SET SERVEROUTPUT ON

DECLARE
    x   UTL_HTTP.HTML_PIECES;
    len PLS_INTEGER;
BEGIN
    x := UTL_HTTP.REQUEST_PIECES('http://www.oracle.com/', 100);
    DBMS_OUTPUT.PUT_LINE(x.count || ' pieces were retrieved.');
    DBMS_OUTPUT.PUT_LINE('with total length ');
    IF x.count < 1 THEN
        DBMS_OUTPUT.PUT_LINE('0');
    ELSE
        len := 0;
        FOR i in 1..x.count LOOP
            len := len + length(x(i));
        END LOOP;
        DBMS_OUTPUT.PUT_LINE(len);
    END IF;
END;
/
  -- Output
Statement processed.
4 pieces were retrieved.
with total length 7687

262.9.34 SET_AUTHENTICATION Procedure

This procedure sets HTTP authentication information in the HTTP request header. The Web server needs this information to authorize the request.

See Also:
HTTP Requests and HTTP Requests Subprograms

Syntax

UTL_HTTP.SET_AUTHENTICATION(
    r         IN OUT NOCOPY req,
    username  IN VARCHAR2,
    password  IN VARCHAR2,
    scheme    IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN DEFAULT FALSE);
Parameters

Table 262-47  SET_AUTHENTICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>HTTP request</td>
</tr>
<tr>
<td>username</td>
<td>Username for the HTTP authentication</td>
</tr>
<tr>
<td>password</td>
<td>Password for the HTTP authentication</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

The supported authentication schemes are HTTP basic and Amazon S3 authentication.

262.9.35 SET_AUTHENTICATION_FROM_WALLET Procedure

This procedure sets the HTTP authentication information in the HTTP request header needed for the request to be authorized by the Web server using the username and password credential stored in the Oracle wallet.

See Also:

External Password Store on Oracle, and HTTP Requests Subprograms

Syntax

UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(
    r         IN OUT NOCOPY req,
    alias     IN VARCHAR2,
    scheme    IN VARCHAR2 DEFAULT 'Basic',
    for_proxy IN BOOLEAN  DEFAULT FALSE);

Parameters

Table 262-48  SET_AUTHENTICATION_FROM_WALLET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>alias</td>
<td>Alias to identify and retrieve the username and password credential stored in the Oracle wallet</td>
</tr>
<tr>
<td>scheme</td>
<td>HTTP authentication scheme. Either Basic for the HTTP basic or AWS for Amazon S3 authentication scheme. Default is basic.</td>
</tr>
</tbody>
</table>
Table 262-48  (Cont.) SET_AUTHENTICATION_FROM_WALLET Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>for_proxy</td>
<td>Identifies if the HTTP authentication information is for access to the HTTP proxy server instead of the Web server. Default is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the password credentials in a wallet, the UTL_HTTP user must have the `use-passwords` privilege on the wallet.
- The supported authentication schemes are HTTP basic and Amazon S3 authentication schemes.

Examples

Creating a wallet and entering username and password in the wallet

```sql
> mkstore -wrl /oracle/wallets/test_wallet -create
Enter password: ******
Enter password again: ******
```

```sql
> mkstore –wrl /oracle/wallets/test_wallet –createCredential hr-access jsmith
Your secret/Password is missing in the command line
Enter your secret/Password: ****
Re-enter your secret/Password: ****
Enter wallet password: ******
```

Granting the `use-passwords` privilege on the wallet to a user by the database administrator

```sql
BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal => 'SCOTT',
    is_grant => TRUE,
    privilege => 'use-passwords');
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_acl(
    acl => 'wallet-acl.xml',
    wallet_path => 'file: /oracle/wallets/test_wallet');
END;
```

Using username and password from the wallet

```sql
DECLARE
  req UTL_HTTP.req;
BEGIN
  UTL_HTTP.SET_WALLET(path => 'file:/oracle/wallets/test_wallet');
  req := UTL_HTTP.BEGIN_REQUEST(...);
  UTL_HTTP.SET_AUTHENTICATION_FROM_WALLET(req, 'hr-access');
  ...
END;
```
262.9.36 SET_BODY_CHARSET Procedures

This procedure is overloaded. The description of different functionality is located alongside the syntax declarations.

See Also:

- HTTP Responses and HTTP Responses Subprograms
- Session Settings and Session Settings Subprograms

Syntax

Sets the default character set of the body of all future HTTP requests when the media type is `text` and the character set is not specified in the `Content-Type` header. Following the HTTP protocol standard specification, if the media type of a request or a response is `text`, but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to `ISO-8859-1`. A response created for a request inherits the default body character set of the request instead of the body character set of the current session. The default body character set is `ISO-8859-1` in a database user session. The default body character set setting affects only future requests and has no effect on existing requests. After a request is created, the body character set can be changed by using the other `SET_BODY_CHARSET` procedure that operates on a request:

```
UTL_HTTP.SET_BODY_CHARSET (  
  charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the request body when the media type is `text` but the character set is not specified in the `Content-Type` header. According to the HTTP protocol standard specification, if the media type of a request or a response is “text” but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to “ISO-8859-1”. Use this procedure to change the default body character set a request inherits from the session default setting:

```
UTL_HTTP.SET_BODY_CHARSET(  
  r        IN OUT NOCOPY req,  
  charset  IN VARCHAR2 DEFAULT NULL);
```

Sets the character set of the response body when the media type is “text” but the character set is not specified in the `Content-Type` header. For each the HTTP protocol standard specification, if the media type of a request or a response is “text” but the character set information is missing in the `Content-Type` header, the character set of the request or response body should default to “ISO-8859-1”. Use this procedure to change the default body character set a response inherits from the request:

```
UTL_HTTP.SET_BODY_CHARSET(  
  r        IN OUT NOCOPY resp,  
  charset  IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 262-49  SET_BODY_CHARSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP response.</td>
</tr>
<tr>
<td>charset</td>
<td>The default character set of the response body. The character set can be in Oracle or Internet Assigned Numbers Authority (IANA) naming convention. If charset is NULL, the database character set is assumed.</td>
</tr>
</tbody>
</table>

262.9.37 SET_COOKIE_SUPPORT Procedures

This overloaded procedure handles cookie support. The description of different functionality is located alongside the syntax declarations.

See Also:
- HTTP Requests and HTTP Requests Subprograms
- Session Settings and Session Settings Subprograms

Syntax

Enables or disables support for the HTTP cookies in the request. Use this procedure to change the cookie support setting a request inherits from the session default setting:

```sql
UTL_HTTP.SET_COOKIE_SUPPORT(
    r       IN OUT NOCOPY REQ,
    enable  IN BOOLEAN DEFAULT TRUE);
```

Sets whether or not future HTTP requests will support HTTP cookies, and the maximum number of cookies maintained in the current database user session:

```sql
UTL_HTTP.SET_COOKIE_SUPPORT (  
    enable   IN BOOLEAN,  
    max_cookies IN PLS_INTEGER DEFAULT 300,  
    max_cookies_per_site IN PLS_INTEGER DEFAULT 20);  
```

Parameters

Table 262-50  SET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>enable</td>
<td>Set enable to TRUE to enable HTTP cookie support; FALSE to disable</td>
</tr>
<tr>
<td>max_cookies</td>
<td>Sets the maximum total number of cookies maintained in the current session</td>
</tr>
</tbody>
</table>
Table 262-50  (Cont.) SET_COOKIE_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_cookies_per_site</td>
<td>Sets the maximum number of cookies maintained in the current session for each Web site</td>
</tr>
</tbody>
</table>

Usage Notes

If cookie support is enabled for an HTTP request, all cookies saved in the current session and applicable to the request are returned to the Web server in the request in accordance with HTTP cookie specification standards. Cookies set in the response to the request are saved in the current session for return to the Web server in the subsequent requests if cookie support is enabled for those requests. If the cookie support is disabled for an HTTP request, no cookies are returned to the Web server in the request and the cookies set in the response to the request are not saved in the current session, although the `Set-Cookie` HTTP headers can still be retrieved from the response.

Cookie support is enabled by default for all HTTP requests in a database user session. The default setting of the cookie support (enabled versus disabled) affects only the future requests and has no effect on the existing ones. After your request is created, the cookie support setting may be changed by using the other `SET_COOKIE_SUPPORT` procedure that operates on a request.

The default maximum number of cookies saved in the current session is 20 for each site and 300 total.

If you lower the maximum total number of cookies or the maximum number of cookies for each Web site, the oldest cookies will be purged first to reduce the number of cookies to the lowered maximum. HTTP cookies saved in the current session last for the duration of the database session only; there is no persistent storage for the cookies. Cookies saved in the current session are not cleared if you disable cookie support.

See "Examples" for how to use `GET_COOKIE` and `ADD_COOKIE` to retrieve, save, and restore cookies.

262.9.38 SET_DETAILED_EXCP_SUPPORT Procedure

This procedure sets the `UTL_HTTP` package to raise a detailed exception.

By default, `UTL_HTTP` raises the `request_failed` exception when an HTTP request fails. Use `GET_DETAILED_SQLCODE` and `GET_DETAILED_SQLERRM` for more detailed information about the error.

See Also:

Session Settings and Session Settings Subprograms
Syntax

UTL_HTTP.SET_DETAILED_EXCP_SUPPORT {
    enable IN BOOLEAN DEFAULT FALSE);

Parameters

Table 262-51  SET_DETAILED_EXCP_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Asks UTL_HTTP to raise a detailed exception directly if set to TRUE; otherwise FALSE</td>
</tr>
</tbody>
</table>

262.9.39 SET_FOLLOW_REDIRECT Procedures

This procedure sets the maximum number of times UTL_HTTP follows the HTTP redirect instruction in the HTTP response to this request, or future requests, in the GET_RESPONSE function.

See Also:
- HTTP Requests and HTTP Requests Subprograms
- Session Settings and Session Settings Subprograms

Syntax

Use this procedure to set the maximum number of redirections:

UTL_HTTP.SET_FOLLOW_REDIRECT {
    max_redirects IN PLS_INTEGER DEFAULT 3);

Use this procedure to change the maximum number of redirections a request inherits from the session default setting:

UTL_HTTP.SET_FOLLOW_REDIRECT(
    r              IN OUT NOCOPY req,
    max_redirects  IN PLS_INTEGER DEFAULT 3);

Parameters

Table 262-52  SET_FOLLOW_REDIRECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>max_redirects</td>
<td>The maximum number of redirects. Set to zero to disable redirects.</td>
</tr>
</tbody>
</table>
Usage Notes

If `max_redirections` is set to a positive number, the `GET_RESPONSE` function will automatically follow the redirected URL for the HTTP response status code 301, 302, and 307 for the HTTP HEAD and GET methods, and 303 for all HTTP methods, and retry the HTTP request (the request method will be changed to HTTP GET for the status code 303) at the new location. It follows the redirection until the final, non-redirect location is reached, or an error occurs, or the maximum number of redirections has been reached (to prevent an infinite loop). The URL and method fields in the `REQ` record will be updated to the last redirected URL and the method used to access the URL. Set the maximum number of redirects to zero to disable automatic redirection.

While it is set not to follow redirect automatically in the current session, it is possible to specify individual HTTP requests to follow redirect instructions the function `FOLLOW_REDIRECT` and vice versa.

The default maximum number of redirections in a database user session is 3. The default value affects only future requests and has no effect on existing requests.

The `SET_FOLLOW_REDIRECT` procedure must be called before `GET_RESPONSE` for any redirection to take effect.

262.9.40 SET_HEADER Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

See Also:

HTTP Requests and HTTP Requests Subprograms

Syntax

```sql
UTL_HTTP.SET_HEADER (
    r IN OUT NOCOPY req,
    name IN VARCHAR2,
    value IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>name</td>
<td>The name of the HTTP request header</td>
</tr>
<tr>
<td>value</td>
<td>The value of the HTTP request header</td>
</tr>
</tbody>
</table>
Usage Notes

Multiple HTTP headers with the same name are allowed in the HTTP protocol standard. Therefore, setting a header does not replace a prior header with the same name.

If the request is made using HTTP 1.1, UTL_HTTP sets the Host header automatically for you.

When you set the Content-Type header with this procedure, UTL_HTTP looks for the character set information in the header value. If the character set information is present, it is set as the character set of the request body. It can be overridden later by using the SET_BODY_CHARSET procedure.

When you set the Transfer-Encoding header with the value chunked, UTL_HTTP automatically encodes the request body written by the WRITE_TEXT, WRITE_LINE and WRITE_RAW procedures. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format.

262.9.41 SET_PERSISTENT_CONN_SUPPORT Procedure

This overloaded procedure provides persistent connection support. Descriptions of the different functionality are given in the syntax declarations.

See Also:
HTTP Requests and HTTP Requests Subprograms

Syntax

Sets whether future HTTP requests should support the HTTP 1.1 persistent connection or not, and the maximum numbers of persistent connections to be maintained in the current database user session.

UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    enable IN BOOLEAN DEFAULT FALSE,
    max_conns IN PLS_INTEGER DEFAULT 0);

Enables or disables support for the HTTP 1.1 persistent-connection in the request.

UTL_HTTP.SET_PERSISTENT_CONN_SUPPORT(
    r IN OUT NOCOPY req,
    enable IN BOOLEAN DEFAULT FALSE);

Parameters

Table 262-54 SET_PERSISTENT_CONN_SUPPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to keep the network connection persistent. FALSE otherwise.</td>
</tr>
<tr>
<td>maximum_conns</td>
<td>Maximum number of connections</td>
</tr>
</tbody>
</table>
Table 262-54    (Cont.) SET_PERSISTENTCONN_SUPPORT Procedure

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
</tbody>
</table>

Usage Notes

If the persistent-connection support is enabled for an HTTP request, the package will keep the network connections to a Web server or the proxy server open in the package after the request is completed properly for a subsequent request to the same server to reuse for each HTTP 1.1 protocol specification. With the persistent connection support, subsequent HTTP requests may be completed faster because the network connection latency is avoided. If the persistent-connection support is disabled for a request, the package will always send the HTTP header "Connection: close" automatically in the HTTP request and close the network connection when the request is completed. This setting has no effect on HTTP requests that follows HTTP 1.0 protocol, for which the network connections will always be closed after the requests are completed.

When a request is being made, the package attempts to reuse an existing persistent connection to the target Web server (or proxy server) if one is available. If none is available, a new network connection will be initiated. The persistent-connection support setting for a request affects only whether the network connection should be closed after a request completes.

Use this procedure to change the persistent-connection support setting a request inherits from the session default setting.

Users should note that while the use of persistent connections in UTL_HTTP may reduce the time it takes to fetch multiple Web pages from the same server, it consumes precious system resources (network connections) in the database server. Also, excessive use of persistent connections may reduce the scalability of the database server when too many network connections are kept open in the database server. Network connections should be kept open only if they will be used immediately by subsequent requests and should be closed immediately when they are no longer needed. Set the default persistent connection support as disabled in the session, and enable persistent connection in individual HTTP requests as shown in "Examples".

The default value of the maximum number of persistent connections in a database session is zero. To truly enable persistent connections, you must also set the maximum number of persistent connections to a positive value or no connections will be kept persistent.

Note that if you want to use persistent connections, you must call the overload that takes the maximum_conns parameter prior to calling the BEGIN_REQUEST Function, otherwise persistent connections will not be enabled for the current request even if the other form of SET_PERSISTENT_CONN_SUPPORT is called.

Examples

Using SET_PERSISTENT_CONN_SUPPORT in http requests at the session level, showing the active persistent connection after each request

```sql
DECLARE
    pieces utl_http.html_pieces;
```
conns  utl_http.connection_table;
BEGIN

-- Turns on persistent connection support for the request_pieces call.
  utl_http.set_persistent_conn_support(true, 1);

FOR i IN 1..10 LOOP

  pieces := utl_http.request_pieces('http://www.example.com/');

  -- Shows the active persistent connection
  utl_http.get_persistent_conns(conns);
  FOR j IN 1..conns.count LOOP
    dbms_output.put_line('Persistent connection '||j||': '||conns(j).host||'':'||conns(j).port);
  END LOOP;
END LOOP;

-- Turns off persistent connection support. Set active max persistent connection
to 0 to close all active connections.
  utl_http.set_persistent_conn_support(false, 0);
END;
/

Using SET_PERSISTENT_CONN_SUPPORT in HTTP requests showing how to use
persistent connection individually in each request to fetch multiple URLs at the same
host

DECLARE
  -- Table to store the URLs

/

262.9.42 SET_PROXY Procedure

This procedure sets the proxy to be used for requests of the HTTP or other protocols, excluding those for hosts that belong to the domain specified in no_proxy_domains.

no_proxy_domains is a comma-, semi-colon-, or space-separated list of domains or hosts for which HTTP requests should be sent directly to the destination HTTP server instead of going through a proxy server.

See Also:
Session Settings and Session Settings Subprograms

Syntax

UTL_HTTP.SET_PROXY (proxy IN VARCHAR2,
no_proxy_domains IN VARCHAR2);
Parameters

Table 262-55  SET_PROXY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy</td>
<td>The proxy (host and an optional port number) to be used by the UTL_HTTP package</td>
</tr>
<tr>
<td>no_proxy_domains</td>
<td>The list of hosts and domains for which no proxy should be used for all requests</td>
</tr>
</tbody>
</table>

Usage Notes

The proxy may include an optional TCP/IP port number at which the proxy server listens. The syntax is [http://]host[:port][/], for example, www-proxy.my-company.com:80. If the port is not specified for the proxy, port 80 is assumed.

Optionally, a port number can be specified for each domain or host. If the port number is specified, the no-proxy restriction is only applied to the request at the port of the particular domain or host, for example, corp.my-company.com, eng.my-company.com:80. When no_proxy_domains is NULL and the proxy is set, all requests go through the proxy. When the proxy is not set, UTL_HTTP sends requests to the target Web servers directly.

You can define a username/password for the proxy to be specified in the proxy string. The format is

[http://][user[:password]@]host[:port][/]

If proxy settings are set when the database server instance is started, the proxy settings in the environment variables http_proxy and no_proxy are assumed. Proxy settings set by this procedure override the initial settings.

262.9.43 SET_RESPONSE_ERROR_CHECK Procedure

This procedure sets whether or not GET_RESPONSE raises an exception when the Web server returns a status code that indicates an error—a status code in the 4xx or 5xx ranges.

For example, when the requested URL is not found in the destination Web server, a 404 (document not found) response status code is returned.

See Also:

Session Settings and Session Settings Subprograms

Syntax

UTL_HTTP.SET_RESPONSE_ERROR_CHECK (
    enable  IN BOOLEAN DEFAULT FALSE);
Parameters

Table 262-56  SET_RESPONSE_ERROR_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>TRUE to check for response errors; otherwise FALSE</td>
</tr>
</tbody>
</table>

Usage Notes

If the status code indicates an error—a 4xx or 5xx code—and this procedure is enabled, GET_RESPONSE will raise the HTTP_CLIENT_ERROR or HTTP_SERVER_ERROR exception. If SET_RESPONSE_ERROR_CHECK is set to FALSE, GET_RESPONSE will not raise an exception when the status code indicates an error.

Response error check is turned off by default.

The GET_RESPONSE function can raise other exceptions when SET_RESPONSE_ERROR_CHECK is set to FALSE.

262.9.44 SET_TRANSFER_TIMEOUT Procedure

This procedure sets the default time out value for all future HTTP requests that the UTL_HTTP package should attempt while reading the HTTP response from the Web server or proxy server.

This time out value may be used to avoid the PL/SQL programs from being blocked by busy Web servers or heavy network traffic while retrieving Web pages from the Web servers.

> See Also:

Session Settings and Session Settings Subprograms

Syntax

```plsql
UTL_HTTP.SET_TRANSFER_TIMEOUT (  
    timeout IN PLS_INTEGER DEFAULT 60);  
```

Parameters

Table 262-57  SET_TRANSFER_TIMEOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The network transfer timeout value in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

The default value of the time out is 60 seconds.
262.9.45 SET_WALLET Procedure

This procedure sets the Oracle wallet used for all HTTP requests over Secured Socket Layer (SSL), namely HTTPS.

When the UTL_HTTP package communicates with an HTTP server over SSL, the HTTP server presents its digital certificate, which is signed by a certificate authority, to the UTL_HTTP package for identification purpose. The Oracle wallet contains the list of certificate authorities that are trusted by the user of the UTL_HTTP package. An Oracle wallet is required to make an HTTPS request.

### Syntax

```
UTL_HTTP.SET_WALLET (  
  path       IN VARCHAR2,  
  password   IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>The directory path that contains the Oracle wallet. The format is <code>file:directory-path</code>. The format of <code>wallet_path</code> on a PC is, for example, <code>file:c:\WINNT\Profiles\username\WALLETS</code>, and in Unix is, for example, <code>file:/home/username/wallets</code>. When the UTL_HTTP package is executed in the Oracle database server, the wallet is accessed from the database server. Therefore, the wallet path must be accessible from the database server.</td>
</tr>
<tr>
<td>password</td>
<td>The password needed to open the wallet. If the wallet is auto-login enabled, the password may be omitted and should be set to <code>NULL</code>. See Oracle Database Advanced Security Guide for information about using Oracle Wallet Manager and the ORAPKI utility to create an auto-login wallet.</td>
</tr>
</tbody>
</table>

### Usage Notes

To set up an Oracle wallet, use the Oracle Wallet Manager to create a wallet. In order for the HTTPS request to succeed, the certificate authority that signs the certificate of the remote HTTPS Web server must be a trust point set in the wallet.

When a wallet is created, it is populated with a set of well-known certificate authorities as trust points. If the certificate authority that signs the certificate of the remote HTTPS Web server is not among the trust points, or the certificate authority has new root
certificates, you should obtain the root certificate of that certificate authority and install it as a trust point in the wallet using Oracle Wallet Manager.

See Also:
Oracle Database Advanced Security Guide for more information on Wallet Manager

262.9.46 WRITE_LINE Procedure

This procedure writes a text line in the HTTP request body and ends the line with newline characters (CRLF as defined in UTL_TCP).

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

See Also:
HTTP Requests and HTTP Requests Subprograms

Syntax

UTL_HTTP.WRITE_LINE(
    r     IN OUT NOCOPY req,
    data  IN VARCHAR2 CHARACTER SET ANY_CS);

Parameters

Table 262-59   WRITE_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text line to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the Content-Length header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. The UTL_HTTP package performs chunked transfer-encoding on the request body transparently when the Transfer-Encoding: chunked header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the SET_HEADER procedure for details.
If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

### 262.9.47 WRITE_RAW Procedure

This procedure writes some binary data in the HTTP request body. As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed.

See Also:

HTTP Requests and HTTP Requests Subprograms

Syntax

```sql
UTL_HTTP.WRITE_RAW(
      r IN OUT NOCOPY REQ,
      data IN RAW);
```

Parameters

Table 262-60  WRITE_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The binary data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

Usage Notes

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding:chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.
262.9.48 WRITE_TEXT Procedure

This procedure writes some text data in the HTTP request body.

As soon as some data is sent as the HTTP request body, the HTTP request headers section is completed. Text data is automatically converted from the database character set to the request body character set.

**See Also:**
HTTP Requests and HTTP Requests Subprograms

**Syntax**

```
UTL_HTTP.WRITE_TEXT(
    r     IN OUT NOCOPY REQ,
    data  IN            VARCHAR2 CHARACTER SET ANY_CS);
```

**Parameters**

**Table 262-61 WRITE_TEXT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>The HTTP request</td>
</tr>
<tr>
<td>data</td>
<td>The text data to send in the HTTP request body</td>
</tr>
</tbody>
</table>

**Usage Notes**

An HTTP client must always let the remote Web server know the length of the request body it is sending. If the amount of data is known beforehand, you can set the `Content-Length` header in the request, where the length of the content is measured in bytes instead of characters. If the length of the request body is not known beforehand, you can send the request body using the HTTP 1.1 chunked transfer-encoding format. The request body is sent in chunks, where the length of each chunk is sent before the chunk is sent. `UTL_HTTP` performs chunked transfer-encoding on the request body transparently when the `Transfer-Encoding: chunked` header is set. Note that some HTTP-1.1-based Web servers or CGI programs do not support or accept the request body encoding in the HTTP 1.1 chunked transfer-encoding format. See the `SET_HEADER` procedure for details.

If you send the `Content-Length` header, you should note that the length specified in the header should be the byte-length of the textual request body after it is converted from the database character set to the request body character set. When either one of the two character sets is a multibyte character set, the precise byte-length of the request body in the request body character set cannot be known beforehand. In this case, you can perform the character set conversion explicitly, determine the byte-length of the results, send the `Content-Length` header, and the results using the `WRITE_RAW` procedure to avoid the automatic character set conversion. Or, if the remote Web server or CGI programs allow, you can send the request body using the HTTP 1.1 chunked transfer-encoding format, where `UTL_HTTP` handles the length of the chunks transparently.

**UTL_I18N**

**UTL_I18N** is a set of services that provides additional globalization functionality for applications written in PL/SQL.

---

**See Also:**

*Oracle Database Globalization Support Guide*

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of UTL_I18N Subprograms

### 263.1 UTL_I18N Overview

**UTL_I18N** services provide additional globalization functionality for applications written in PL/SQL.

The **UTL_I18N** PL/SQL package consists of the following categories of services:

- String conversion functions for various datatypes.
- Functions that convert a text string to character references and vice versa.
- Functions that map between Oracle, Java, and ISO languages and territories.
- Functions that map between Oracle, Internet Assigned Numbers Authority (IANA), and e-mail safe character sets.
- A function that returns the Oracle character set name from an Oracle language name.
- A function that returns the maximum number of bytes for a character of an Oracle character set.
- A function that performs script transliteration.
- Functions that return the ISO currency code, local time zones, and local languages supported for a given territory.
- Functions that return the most appropriate linguistic sort, a listing of all the applicable linguistic sorts, and the local territories supported for a given language.
- Functions that map between the Oracle full and short language names.
- A function that returns the language translation of a given language and territory name.
• A function that returns a listing of the most commonly used time zones.

### 263.2 UTL_I18N Security Model

The functions of the `UTL_I18N` package neither read database contents nor modify them. The functions operate on their arguments only and/or they retrieve static internationalization information from NLS Data files. The execution privilege for the package is granted to `PUBLIC` by default.

### 263.3 UTL_I18N Constants

`UTL_I18N` defines constants to use when specifying parameter values. These constants are shown in the following table.

**Table 263-1  UTL_I18N Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GENERIC_CONTEXT</td>

</tr>
<tr>
<td>RAW_TO_NCHAR Functions</td>
<td>Converts RAW data that is not encoded in the national character set into an NVARCHAR2 string</td>
</tr>
<tr>
<td>STRING_TO_RAW Function</td>
<td>Converts a VARCHAR2 or NVARCHAR2 string to another character set. The result is returned as a RAW datatype.</td>
</tr>
<tr>
<td>TRANSLITERATE Function</td>
<td>Transliterates between Japanese hiragana and katakana.</td>
</tr>
<tr>
<td>UNESCAPE_REFERENCE Function</td>
<td>Converts an input string that contains character references to a text string.</td>
</tr>
</tbody>
</table>

#### 263.4.1 ESCAPE_REFERENCE Function

This function converts a text string to its character reference counterparts for characters that fall outside the character set used by the current document.

Character references are mainly used in HTML and XML documents to represent characters independently of the encoding of the document. Character references may appear in two forms, numeric character references and character entity references. Numeric character references specify the Unicode code point value of a character, while character entity references use symbolic names to refer to the same character. For example, `&#x5B;` is the numeric character reference for the small letter “a” with a ring above, whereas `&aring;` is the character entity reference for the same character. Character entity references are also used to escape special characters, as an example, `&lt;` represents the `<` (less than) sign. This is to avoid possible confusion with the beginning of a tag in Markup languages.
Syntax

UTL_I18N.ESCAPE_REFERENCE(
    str            IN VARCHAR2 CHARACTER SET ANY_CS,
    page_cs_name   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

Parameters

Table 263-3  ESCAPE_REFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
<tr>
<td>page_cs_name</td>
<td>Specifies the character set of the document. If page_cs_name is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set or a NULL string, then the function returns a NULL string.

Examples

UTL_I18N.ESCAPE_REFERENCE('hello < '||chr(229),'us7ascii')

This returns 'hello < å'.

263.4.2 GET_COMMON_TIME_ZONES Function

This function returns a listing of the most commonly used time zones. This list contains a subset of the time zones that are supported in the database.

Syntax

UTL_I18N.GET_COMMON_TIME_ZONES
RETURN STRING_ARRAY;

Examples

Returns the list of the most commonly used time zones.

DECLARE
    retval UTL_I18N.STRING_ARRAY;
BEGIN
    retval := UTL_I18N.GET_COMMON_TIME_ZONES;
END;
/
263.4.3 GET_DEFAULT_CHARSET Function

This function returns the default Oracle character set name or the default e-mail safe character set name from an Oracle language name.

See Also:
"MAP_CHARSET Function" for an explanation of an e-mail safe character set

Syntax

```sql
UTL_I18N.GET_DEFAULT_CHARSET(
    language  IN VARCHAR2,
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    iswindows IN BOOLEAN DEFAULT FALSE)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: Returns the default character set for general cases</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: Returns the default e-mail safe character set name</td>
</tr>
<tr>
<td>iswindows</td>
<td>If context is set as MAIL_CONTEXT, then iswindows should be set to TRUE</td>
</tr>
<tr>
<td></td>
<td>if the platform is Windows and FALSE if the platform is not Windows. The</td>
</tr>
<tr>
<td></td>
<td>default is FALSE.</td>
</tr>
<tr>
<td></td>
<td>iswindows has no effect if context is set as GENERIC_CONTEXT.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name or an invalid flag, then the function returns a NULL string.

Examples

```
GENERIC_CONTEXT, iswindows=FALSE

UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.GENERIC_CONTEXT, FALSE)
```

This returns 'WE8ISO8859P1'.

```
MAIL_CONTEXT, iswindows=TRUE

UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, TRUE)
```

This returns 'WE8MSWIN1252'.

```
MAIL_CONTEXT, iswindows=FALSE
```
UTL_I18N.GET_DEFAULT_CHARSET('French', UTL_I18N.MAIL_CONTEXT, FALSE)

This returns 'WE8ISO8859P1'.

263.4.4 GET_DEFAULT_ISO_CURRENCY Function

This function returns the default ISO 4217 currency code for the specified territory.

**Syntax**

```sql
UTL_I18N.GET_DEFAULT_ISO_CURRENCY (
    territory    IN VARCHAR2 CHARACTER SET ANY_CS
) RETURN VARCHAR2;
```

**Parameters**

**Table 263-5  GET_DEFAULT_ISO_CURRENCY Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the user specifies an invalid territory name, then the function returns a NULL string.

**Examples**

Displays the default ISO currency code for China.

```sql
DECLARE
    retval VARCHAR2(50);
BEGIN
    retval := UTL_I18N.GET_DEFAULT_ISO_CURRENCY('CHINA');
    DBMS_OUTPUT.PUT_LINE(retval); 
END;
/
```

263.4.5 GET_DEFAULT_LINGUISTIC_SORT Function

This function returns the most commonly used Oracle linguistic sort for the specified language.

**Syntax**

```sql
UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (
    language  IN VARCHAR2 CHARACTER SET ANY_CS
) RETURN VARCHAR2;
```

**Parameters**

**Table 263-6  GET_DEFAULT_LINGUISTIC_SORT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>
Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the name of the most appropriate linguistic sort name for the language used in the current SQL session.

```
DECLARE
   retval VARCHAR2(50);
BEGIN
   SELECT value INTO retval FROM nls_session_parameters
   WHERE parameter = 'NLS_LANGUAGE';
   retval := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT(retval);
   DBMS_OUTPUT.PUT_LINE(retval);
END;
/
```

263.4.6 GET_LOCAL_LANGUAGES Function

This function returns the local language names for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_LANGUAGES (territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Returns the list of local languages used in Belgium.

```
DECLARE
   retval UTL_I18N.STRING_ARRAY;
   cnt INTEGER;
BEGIN
   retval := UTL_I18N.GET_LOCAL_LANGUAGES('BELGIUM');
   DBMS_OUTPUT.PUT('Count = ');
   DBMS_OUTPUT.PUT_LINE(retval.LAST);
   cnt := retval.FIRST;
   WHILE cnt IS NOT NULL LOOP
      DBMS_OUTPUT.PUT_LINE(retval(cnt));
      cnt := retval.NEXT(cnt);
   END LOOP;
END;
```
263.4.7 GET_LOCAL_LINGUISTIC_SORTS Function

This function returns a list of the Oracle linguistic sort names that are appropriate for the specified language. A BINARY sort is included for all languages.

Syntax

```
UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS (
    language  IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN STRING_ARRAY;
```

Parameters

```
Table 263-8 GET_LOCAL_LINGUISTIC_SORTS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>
```

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Displays the local linguistic sort names for JAPANESE.

```
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    retval := UTL_I18N.GET_LOCAL_LINGUISTIC_SORTS('Japanese');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.COUNT);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
```

...
263.4.8 GET_LOCAL_TERRITORIES Function

This function returns the local territory names for the specified language.

Syntax

```
UTL_I18N.GET_LOCAL_TERRITORIES (
    language  IN VARCHAR2 CHARACTER SET ANY_CS
) RETURN STRING_ARRAY;
```

Parameters

Table 263-9  GET_LOCAL_TERRITORIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid Oracle language. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the list of Oracle territories that use German as one of their local languages.

```
DECLARE
    retval  UTL_I18N.STRING_ARRAY;
    cnt     INTEGER;
BEGIN
    retval  := UTL_I18N.GET_LOCAL_TERRITORIES('GERMAN');
    DBMS_OUTPUT.PUT('Count = ');
    DBMS_OUTPUT.PUT_LINE(retval.LAST);
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt));
    END LOOP;
END;
/...
Count = 4
GERMANY
AUSTRIA
LUXEMBOURG
SWITZERLAND
```

263.4.9 GET_LOCAL_TIME_ZONES Function

This function returns the local time zone IDs for the specified territory.

Syntax

```
UTL_I18N.GET_LOCAL_TIME_ZONES (
    territory     IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL
) RETURN STRING_ARRAY;
```
Parameters

Table 263-10  GET_LOCAL_TIME_ZONES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>territory</td>
<td>Specifies a valid Oracle territory. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid territory name, then the function returns a NULL string.

Examples

Creates a function that returns the list of time zones locally used in the territory AZERBAIJAN followed by the general common time zones. This is useful for when the user's territory is known and the application still allows the user to choose other time zones as a user's preference.

```sql
CREATE OR REPLACE FUNCTION get_time_zones
    (territory IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN utl_i18n.string_array
IS
    retval  utl_i18n.string_array;
    retval2 utl_i18n.string_array;
    stpos   INTEGER;
BEGIN
    retval  := utl_i18n.get_local_time_zones(
        territory);
    retval2 := utl_i18n.get_common_time_zones;
    stpos := retval.LAST + 1;
    retval(stpos) := '-----'; -- a separator
    FOR i IN retval2.FIRST..retval2.LAST LOOP
        stpos := stpos + 1;
        retval(stpos) := retval2(i);
    END LOOP;
    RETURN retval;
END;
/

Returns the list of local time zones for AZERBAIJAN followed by the common time zones with a separator string of five dashes (-----).

```sql
DECLARE
    retval UTL_I18N.STRING_ARRAY;
    cnt INTEGER;
BEGIN
    DBMS_OUTPUT.ENABLE(100000);
    retval UTL_I18N.GET_TIME_ZONES('AZERBAIJAN');
    cnt := retval.FIRST;
    WHILE cnt IS NOT NULL LOOP
        DBMS_OUTPUT.PUT_LINE(retval(cnt));
        cnt := retval.NEXT(cnt);
    END LOOP;
END;
/

Asia/Baku
-----
263.4.10 GET_MAX_CHARACTER_SIZE Function

This function returns the maximum character size of a given character set.

Syntax

```
UTL_I18N.GET_MAX_CHARACTER_SIZE(
    charset_name       IN VARCHAR2 CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset_name</td>
<td>Specifies a valid character set name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

For shift-sensitive character sets, the returned maximum character size will include the possible extra shift characters.

Examples

```
UTL_I18N.GET_MAX_CHARACTER_SIZE('AL32UTF8');
```

This returns 4.
263.4.11 GET_TRANSLATION Function

This function returns the translation of the language and territory name in the specified translation language.

Syntax

```
UTL_I18N.GET_TRANSLATION (  
  parameter        IN VARCHAR2 CHARACTER SET ANY_CS,  
  trans_language   IN VARCHAR2 'AMERICAN',  
  flag             IN PLS_INTEGER DEFAULT LANGUAGE_TRANS)  
RETURN VARCHAR2 CHARACTER SET parameter%CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Specifies a valid language name, territory name, or a combined string in the form of language_territory. It is case-insensitive.</td>
</tr>
<tr>
<td>trans_language</td>
<td>Specifies a translation language name. For example, ITALIAN is for the Italian language. The default is AMERICAN, which indicates American English.</td>
</tr>
</tbody>
</table>
| flag         | Specifies the translation type:  
  • LANGUAGE_TRANS: The function returns the language translation.  
  • TERRITORY_TRANS: The function returns the territory translation.  
  • LANGUAGE_TERRITORY_TRANS: The function returns the language and territory translation.  
  The default translation type is LANGUAGE_TRANS. |

Usage Notes

If VARCHAR2 is used as a parameter type, the returned translation text can be corrupted due to the conversion to the database character set. Using NVARCHAR2 as the parameter type will preserve the translation text because Unicode can encode all translated languages.

If the specified translation language is not available or an invalid name is provided, the default "American English" translations are returned. For example, Oracle does not provide GUJARATI translations, so the returned translation would be in American English.

Examples

The following returns the names of all the Oracle-supported languages in Italian.

```
DECLARE  
  CURSOR c1 IS  
    SELECT value FROM V$NLS_VALID_VALUES  
    WHERE parameter = 'LANGUAGE'  
    ORDER BY value;  
  retval NVARCHAR2(100);  
BEGIN  
  FOR item IN c1 LOOP  
    retval := UTL_I18N.GET_TRANSLATION (TO_NCHAR(item.value), 'italian');  
  END LOOP;  
END;
```
263.4.12 MAP_CHARSET Function

This function maps a character set to another character set.

It maps the following:

- An Oracle character set name to an IANA character set name.
- An IANA character set name to an Oracle character set name.
- An Oracle character set to an e-mail safe character set name.

Syntax

```sql
UTL_I18N.MAP_CHARSET(
    charset   IN VARCHAR2,
    context   IN PLS_INTEGER DEFAULT GENERIC_CONTEXT,
    flag      IN PLS_INTEGER DEFAULT ORACLE_TO_IANA)
RETURN VARCHAR2;
```

Parameters

Table 263-13  MAP_CHARSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charset</td>
<td>Specifies the character set name to be mapped. The mapping is case-insensitive.</td>
</tr>
<tr>
<td>context</td>
<td>GENERIC_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>GENERIC_CONTEXT: The mapping is between an Oracle character set name and an IANA character set name. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>MAIL_CONTEXT: The mapping is between an Oracle character set name and an email safe character set name.</td>
</tr>
<tr>
<td>flag</td>
<td>ORACLE_TO_IANA</td>
</tr>
<tr>
<td></td>
<td>ORACLE_TO_IANA: Map from an Oracle character set name to an IANA character set name. This is the default.</td>
</tr>
<tr>
<td></td>
<td>IANA_TO_ORACLE: Map from an IANA character set name to an Oracle character set name.</td>
</tr>
<tr>
<td></td>
<td>MAIL_GENERIC</td>
</tr>
<tr>
<td></td>
<td>MAIL_GENERIC: Map from an Oracle character set name to an email safe character set name on a non-Windows platform.</td>
</tr>
<tr>
<td></td>
<td>MAIL_WINDOWS: Map from an Oracle character set name to an email safe character set name on a Windows platform.</td>
</tr>
</tbody>
</table>

Usage Notes

An e-mail safe character set is an Oracle character set that is commonly used by applications when they submit e-mail messages. The character set is usually used to convert contents in the database character set to e-mail safe contents. To specify the character set name in the mail header, you should use the corresponding IANA character set name obtained by calling the MAP_CHARSET function with the ORACLE_TO_IANA option, providing the e-mail safe character set name as input.
For example, no e-mail client recognizes message contents in the \texttt{WEBDEC} character set, whose corresponding IANA name is \texttt{DEC-MCS}. If \texttt{WEBDEC} is passed to the \texttt{MAP_CHARSET} function with the \texttt{MAIL_CONTEXT} option, then the function returns \texttt{WE8ISO8859P1}. Its corresponding IANA name, \texttt{ISO-8859-1}, is recognized by most e-mail clients.

The steps in this example are as follows:

1. Call the \texttt{MAP_CHARSET} function with the \texttt{MAIL_CONTEXT | MAIL_GENERIC} option with the database character set name, \texttt{WEBDEC}. The result is \texttt{WE8ISO8859P1}.

2. Convert the contents stored in the database to \texttt{WE8ISO8859P1}.

3. Call the \texttt{MAP_CHARSET} function with the \texttt{ORACLE_TO_IANA | GENERIC_CONTEXT} option with the e-mail safe character set, \texttt{WE8ISO8859P1}. The result is \texttt{ISO-8859-1}.

4. Specify \texttt{ISO-8859-1} in the mail header when the e-mail message is submitted.

The function returns a character set name if a match is found. If no match is found or if the flag is invalid, then it returns \texttt{NULL}.

\begin{quote}
\textbf{Note:}
Many Oracle character sets can map to one e-mail safe character set. There is no function that maps an e-mail safe character set to an Oracle character set name.
\end{quote}

\textbf{Examples}

\textbf{Generic Context}

\begin{verbatim}
UTL_I18N.MAP_CHARSET('iso-8859-1',UTL_I18N.GENERIC_CONTEXT,UTL_I18N.IANA_TO_ORACLE)
\end{verbatim}

This returns \texttt{WE8ISO8859P1}.

\textbf{Context}

\begin{verbatim}
UTL_I18N.MAP_CHARSET('WEBDEC', utl_i18n.mail_context, utl_i18n.mail_generic)
\end{verbatim}

This returns \texttt{WE8ISO8859P1}.

\begin{quote}

\end{quote}

\textit{Oracle Database Globalization Support Guide} for a list of valid Oracle character sets.

\subsection{MAP_FROM_SHORT_LANGUAGE Function}

This function maps an Oracle short language name to an Oracle language name.

\textbf{Syntax}

\begin{verbatim}
UTL_I18N.MAP_FROM_SHORT_LANGUAGE ( 
    language            IN VARCHAR2 CHARACTER SET ANY_CS) 
RETURN VARCHAR2;
\end{verbatim}
Parameters

Table 263-14 MAP_FROM_SHORT_LANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid short language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the default linguistic sort name for the customer with the ID of 9000. Note that the table customers is from the oe user in the Common Schema. Because the customer's language preference is stored using a short language name, you need to convert to a full language name by calling the GET_DEFAULT_LINGUISTIC_SORT procedure.

```sql
DECLARE
    short_n VARCHAR2(10);
    ling_n VARCHAR2(50);
BEGIN
    SELECT nls_language INTO short
    FROM customers WHERE customer_id = 9000;
    ling_n := UTL_I18N.GET_DEFAULT_LINGUISTIC_SORT (UTL_I18N.MAP_FROM_SHORT_LANGUAGE(short_n));
    DBMS_OUTPUT.PUT_LINE(ling_n);
END;
/```

263.4.14 MAP_LANGUAGE_FROM_ISO Function

This function returns an Oracle language name from an ISO locale name.

Syntax

```sql
UTL_I18N.MAP_LANGUAGE_FROM_ISO(
    isolocale IN VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 263-15 MAP_LANGUAGE_FROM_ISO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the language (for example, en_ instead of en_US), then the function returns the default language name for the specified language (for example, American).
Examples

    UTL_I18N.MAP_LANGUAGE_FROM_ISO('en_US')

This returns 'American'.

See Also:

Oracle Database Globalization Support Guide for a list of valid Oracle languages

263.4.15 MAP_LOCALE_TO_ISO Function

This function returns an ISO locale name from an Oracle language name and an Oracle territory name.

A valid string must include at least one of the following: a valid Oracle language name or a valid Oracle territory name.

Syntax

    UTL_I18N.MAP_LOCALE_TO_ISO (    ora_language   IN VARCHAR2,    ora_territory  IN VARCHAR2)    RETURN VARCHAR2;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ora_language</td>
<td>Specifies an Oracle language name. It is case-insensitive.</td>
</tr>
<tr>
<td>ora_territory</td>
<td>Specifies an Oracle territory name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid string, then the function returns a NULL string.

Examples

    UTL_I18N.MAP_LOCALE_TO_ISO('American','America')

This returns 'en_US'.

See Also:

Oracle Database Globalization Support Guide for a list of valid Oracle languages and territories
263.4.16 MAP_TERRITORY_FROM_ISO Function

This function returns an Oracle territory name from an ISO locale.

Syntax

```sql
UTL_I18N.MAP_TERRITORY_FROM_ISO (
    isolocale IN VARCHAR2
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>isolocale</td>
<td>Specifies the ISO locale. The mapping is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid locale string, then the function returns a NULL string.

If the user specifies a locale string that includes only the territory (for example, _fr instead of fr_fr), then the function returns the default territory name for the specified territory (for example, France).

Examples

```sql
UTL_I18N.MAP_TERRITORY_FROM_ISO('en_US')
```

This returns 'America'.

See Also:

*Oracle Database Globalization Support Guide* for a list of valid Oracle territories

263.4.17 MAP_TO_SHORT_LANGUAGE Function

This function maps an Oracle language name to an Oracle short language name.

Syntax

```sql
UTL_I18N.MAP_TO_SHORT_LANGUAGE (
    language   IN VARCHAR2 CHARACTER SET ANY_CS
) RETURN VARCHAR2;
```
Parameters

Table 263-18 MAP_TO_SHORT_LANGUAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>language</td>
<td>Specifies a valid full language name. It is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid language name, then the function returns a NULL string.

Examples

Returns the short language name for the language.

DECLARE  retval VARCHAR2(100);BEGIN  retval :=  UTL_I18N.MAP_TO_SHORT_LANGUAGE('american');  DBMS_OUTPUT.PUT_LINE(retval);END;/US

263.4.18 RAW_TO_CHAR Functions

This function converts RAW data from a valid Oracle character set to a VARCHAR2 string in the database character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

UTL_I18N.RAW_TO_CHAR(
  data          IN RAW,
  src_charset   IN VARCHAR2 DEFAULT NULL)
RETURN VARCHAR2;

Piecewise conversion converts raw data into character data piece by piece:

UTL_I18N.RAW_TO_CHAR (  
  data          IN RAW,
  src_charset   IN VARCHAR2 DEFAULT NULL,
  scanned_length OUT PLS_INTEGER,
  shift_status  IN OUT PLS_INTEGER)
RETURN VARCHAR2;

Parameters

Table 263-19 RAW_TO_CHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to a VARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
</tbody>
</table>
Table 263-19  (Cont.) RAW_TO_CHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| shift_status | Specifies the shift status at the end of the scan. The user must set it to SHIFT_IN the first time it is called in piecewise conversion. **Note:** ISO 2022 character sets use escape sequences instead of shift characters to indicate the encoding method. shift_status cannot hold the encoding method information that is provided by the escape sequences for the next function call. As a result, this function cannot be used to reconstruct ISO 2022 character from raw data in a piecewise way unless each unit of input can be guaranteed to be a closed string. A closed string begins and ends in a 7-bit escape state.

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'), 'utf8')

This returns the following string in the database character set:

'abcde'||chr(170)

Piecewise Conversion

UTL_I18N.RAW_TO_CHAR(hextoraw('616263646566C2AA'),'utf8',shf,slen)

This expression returns the following string in the database character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the database character set.

```
rvalue RAW(1050);
  nvalue VARCHAR2(1024);
  conversion_state  PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;
  ...
  conn := utl_tcp.open_connection ( remote_host => 'localhost',
    remote_port => 2000);
  LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_char(rvalue, 'JA16SJIS', converted_len,
      conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
      then
```
rtemp := utl_raw.substr(rvalue, converted_len+1);
else
  rtemp := '';
end if;
/* do anything you want with nvalue */
/* e.g htp.prn(nvalue); */
END LOOP;
util_tcp.close_connection(conn);
EXCEPTION
  WHEN util_tcp.end_of_input THEN
    util_tcp.close_connection(conn);
END;

263.4.19 RAW_TO_NCHAR Functions

This function converts RAW data from a valid Oracle character set to an NVARCHAR2 string in the national character set.

The function is overloaded. The different forms of functionality are described along with the syntax declarations.

Syntax

Buffer Conversion:

UTL_I18N.RAW_TO_NCHAR (
  data IN RAW,
  src_charset IN VARCHAR2 DEFAULT NULL)
RETURN NVARCHAR2;

Piecewise conversion converts raw data into character data piece by piece:

UTL_I18N.RAW_TO_NCHAR (
  data IN RAW,
  src_charset IN VARCHAR2 DEFAULT NULL,
  scanned_length OUT PLS_INTEGER,
  shift_status IN OUT PLS_INTEGER)
RETURN NVARCHAR2;

Parameters

Table 263-20  RAW_TO_NCHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the RAW data to be converted to an NVARCHAR2 string</td>
</tr>
<tr>
<td>src_charset</td>
<td>Specifies the character set that the RAW data was derived from. If src_charset is NULL, then the database character set is used.</td>
</tr>
<tr>
<td>scanned_length</td>
<td>Specifies the number of bytes of source data scanned</td>
</tr>
</tbody>
</table>
Table 263-20  (Cont.) RAW_TO_NCHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shift_status</td>
<td>Specifies the shift status at the end of the scan. The user must set it to</td>
</tr>
<tr>
<td></td>
<td>SHIFT_IN the first time it is called in piecewise conversion.</td>
</tr>
<tr>
<td></td>
<td>Note: ISO 2022 character sets use escape sequences instead of shift</td>
</tr>
<tr>
<td></td>
<td>characters to indicate the encoding method. shift_status cannot hold</td>
</tr>
<tr>
<td></td>
<td>the encoding method information that is provided by the escape</td>
</tr>
<tr>
<td></td>
<td>sequences for the next function call. As a result, this function cannot be</td>
</tr>
<tr>
<td></td>
<td>used to reconstruct ISO 2022 character from raw data in a piecewise</td>
</tr>
<tr>
<td></td>
<td>way unless each unit of input can be guaranteed to be a closed string. A</td>
</tr>
<tr>
<td></td>
<td>closed string begins and ends in a 7-bit escape state.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set, NULL data, or data whose length is 0, then the function returns a NULL string.

Examples

Buffer Conversion

UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8')

This returns the following string in the national character set:

'abcde'||chr(170)

Piecewise Conversion

UTL_I18N.RAW_TO_NCHAR(hextoraw('616263646566C2AA'),'utf8', shf, slen)

This expression returns the following string in the national character set:

'abcde'||chr(170)

It also sets shf to SHIFT_IN and slen to 8.

The following example converts data from the Internet piece by piece to the national character set.

rvalue RAW(1050);
  nvalue NVARCHAR2(1024);
  conversion_state PLS_INTEGER = 0;
  converted_len   PLS_INTEGER;
  rtemp  RAW(10) = '';
  conn   utl_tcp.connection;
  tlen PLS_INTEGER;
...

  conn := utl_tcp.open_connection ( remote_host => 'localhost',
                                    remote_port => 2000);

  LOOP
    tlen := utl_tcp.read_raw(conn, rvalue, 1024);
    rvalue := utl_raw.concat(rtemp, rvalue);
    nvalue := utl_i18n.raw_to_nchar(rvalue, 'JA16SJIS', converted_len,
                                    conversion_stat);
    if (converted_len < utl_raw.length(rvalue) )
      then
263.4.20 STRING_TO_RAW Function

This function converts a VARCHAR2 or NVARCHAR2 string to another valid Oracle character set and returns the result as RAW data.

Syntax

```
UTL_I18N.STRING_TO_RAW(
    data          IN VARCHAR2 CHARACTER SET ANY_CS,
    dst_charset   IN VARCHAR2 DEFAULT NULL)
RETURN RAW;
```

Parameters

Table 263-21   STRING_TO_RAW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the VARCHAR2 or NVARCHAR2 string to convert.</td>
</tr>
<tr>
<td>dst_charset</td>
<td>Specifies the destination character set. If dst_charset is NULL, then the database character set is used for CHAR data and the national character set is used for NCHAR data.</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies an invalid character set, a NULL string, or a string whose length is 0, then the function returns a NULL string.

Examples

```
DECLARE
    r raw(50);
    s varchar2(20);
BEGIN
    s:='abcdef'||chr(170);
    r:=utl_i18n.string_to_raw(s,'utf8');
    dbms_output.put_line(rawtohex(r));
END;
/
```

This returns a hex value of '616263646566C2AA'.

263.4.21 TRANSLITERATE Function

This function performs script transliteration. In this release, the TRANSLITERATE function only supports Japanese Kana conversion.

Syntax

```sql
UTL_I18N.TRANSLITERATE (  
    data IN VARCHAR2 CHARACTER SET ANY_CS,  
    name IN VARCHAR2)  
RETURN VARCHAR2 CHARACTER SET data%_CHARSET;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Specifies the data to be converted. Either CHAR or NCHAR datatype can be specified.</td>
</tr>
<tr>
<td>name</td>
<td>Specifies the transliteration name string. For a list of valid names, see Table 263-23.</td>
</tr>
</tbody>
</table>

Constants

These options specify Japanese Kana conversions.

<table>
<thead>
<tr>
<th>Constant Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KANA_FWKATAKANA</td>
<td>'kana_fwkatakana'</td>
<td>Converts any type of Kana character to a fullwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HWKATAKANA</td>
<td>'kana_hwkatakana'</td>
<td>Converts any type of Kana character to a halfwidth Katakana character.</td>
</tr>
<tr>
<td>KANA_HIRAGANA</td>
<td>'kana_hiragana'</td>
<td>Converts any type of Kana character to a fullwidth Hiragana character.</td>
</tr>
<tr>
<td>FWKATAKANA_HWKATAKANA</td>
<td>'fwkatakana_hwkatakana'</td>
<td>Converts only fullwidth Katakana characters to halfwidth Katakana characters.</td>
</tr>
<tr>
<td>FWKATAKANA_HIRAGANA</td>
<td>'fwkatakana_hiragana'</td>
<td>Converts only fullwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>HWKATAKANA_FWKATAKANA</td>
<td>'hwkatakana_fwkatakana'</td>
<td>Converts only halfwidth Katakana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>HWKATAKANA_HIRAGANA</td>
<td>'hwkatakana_hiragana'</td>
<td>Converts only halfwidth Katakana characters to fullwidth Hiragana characters.</td>
</tr>
<tr>
<td>HIRAGANA_FWKATAKANA</td>
<td>'hiragana_fwkatakana'</td>
<td>Converts only fullwidth Hiragana characters to fullwidth Katakana characters.</td>
</tr>
<tr>
<td>HIRAGANA_HWKATAKANA</td>
<td>'hiragana_hwkatakana'</td>
<td>Converts only fullwidth Hiragana characters to halfwidth Katakana characters.</td>
</tr>
</tbody>
</table>
Usage Notes
The function returns the converted string.

Examples
Given a table `japanese_emp`, containing an `NVARCHAR2` column `ename`, the following statement can be used to normalize all the kana names in `ename` to hiragana:

```
UPDATE japanese_emp
SET ename = UTL_I18N.TRANSLITERATE (ename, 'kana_hiragana');
```

The following figure shows how this output might look.

Figure 263-1   Loading Locale-Specific Data to the Database

The following statement normalizes one kana name to hiragana:

```
DECLARE
    Name  japanese_emp.ename%TYPE;
    Eno   CONSTANT  NUMBER(4) := 1;
BEGIN
    SELECT ename INTO name FROM japanese_emp WHERE enumber = eno;
    name := UTL_I18N.TRANSLITERATE(name, UTL_I18N.KANA_HIRAGANA);
    UPDATE japanese_emp SET ename = name WHERE enumber = eno;
EXCEPTION
    WHEN UTL_I18N.UNSUPPORTED_TRANSLITERATION THEN
        DBMS_OUTPUT.PUT_LINE('transliteration not supported');
END;
```

263.4.22 UNESCAPEREFERENCE Function
This function returns a string from an input string that contains character references. It decodes each character reference to the corresponding character value.

See Also:
"ESCAPE_REFERENCE Function" for more information about escape sequences
Syntax

UTL_I18N.UNESCAPE_REFERENCE (  
    str IN VARCHAR2 CHARACTER SET ANY_CS)  
RETURN VARCHAR2 CHARACTER SET str%CHARSET;

Parameters

Table 263-24   UNESCAPE_REFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>Specifies the input string</td>
</tr>
</tbody>
</table>

Usage Notes

If the user specifies a NULL string or a string whose length is 0, then the function returns a NULL string. If the function fails, then it returns the original string.

Examples

UTL_I18N.UNESCAPE_REFERENCE('hello &lt; &amp;x5e;')

This returns 'hello &lt;' || chr(229).
UTL_IDENT

The UTL_IDENT package specifies which Database or client PL/SQL is running.

This chapter contains the following topics:

- Overview
- Security Model
- Constants

264.1 UTL_IDENT Overview

The UTL_IDENT package is intended for use for conditional compilation of PL/SQL packages that are supported by Oracle, TimesTen Database, and clients such as Oracle Forms.

264.2 UTL_IDENT Security Model

The UTL_IDENT package runs as the package owner SYS. The public synonym UTL_IDENT, and EXECUTE permission on this package is granted to PUBLIC.

264.3 UTL_IDENT Constants

The UTL_IDENT package defines several constants to use when specifying parameter values.

These constants are shown in the following table.

**Table 264-1  UTL_IDENT Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_ORACLE_SERVER</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Server or not</td>
</tr>
<tr>
<td>IS_ORACLE_CLIENT</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Client or not</td>
</tr>
<tr>
<td>IS_TIMESTEN</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if TimesTen or not</td>
</tr>
<tr>
<td>IS_ORACLE_FORMS</td>
<td>BOOLEAN</td>
<td>TRUE/FALSE</td>
<td>Stipulates if Oracle Forms or not</td>
</tr>
</tbody>
</table>
The UTL_INADDR package provides a PL/SQL procedures to support internet addressing. It provides an API to retrieve host names and IP addresses of local and remote hosts.

This chapter contains the following topics:

- Security Model
- Exceptions
- Examples
- Summary of UTL_INADDR Subprograms

### 265.1 UTL_INADDR Security Model

This package is an invoker's rights package, which means that the invoking user must be granted the connect privilege in the access control list assigned to the remote network host to which he or she wishes to connect.

*Note:* For more information about managing fine-grained access, see Oracle Database Security Guide.

### 265.2 UTL_INADDR Exceptions

This table describes exceptions raised by UTL_INADDR subprograms.

<table>
<thead>
<tr>
<th>Number</th>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24247</td>
<td>NETWORK_ACCESS_DENIED</td>
<td>Access to network is denied.</td>
</tr>
<tr>
<td>ORA-29257</td>
<td>UNKNOWN_HOST</td>
<td>The host is unknown.</td>
</tr>
</tbody>
</table>

### 265.3 UTL_INADDR Examples

This UTL_INADDR example retrieves the local host name and IP address.

```sql
SET serveroutput on
BEGIN
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_NAME);  -- get local host name
  DBMS_OUTPUT.PUT_LINE(UTL_INADDR.GET_HOST_ADDRESS);  -- get local IP addr
END;
```
265.4 Summary of UTL_INADDR Subprograms

This table lists the UTL_INADDR subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_HOST_ADDRESS</td>
<td>Retrieves the IP address of the local or remote host given its name</td>
</tr>
<tr>
<td>GET_HOST_NAME</td>
<td>Retrieves the name of the local or remote host given its IP address</td>
</tr>
</tbody>
</table>

265.4.1 GET_HOST_ADDRESS Function

This function retrieves the IP address of the specified host.

Syntax

```sql
UTL_INADDR.GET_HOST_ADDRESS (host IN VARCHAR2 DEFAULT NULL) RETURN host_address VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The name of the host to retrieve the IP address.</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_address</td>
<td>The IP address of the specified host, or that of the local host if host is NULL.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege on LOCALHOST.
265.4.2 GET_HOST_NAME Function

This function retrieves the name of the local or remote host given its IP address.

Syntax

```
UTL_INADDR.GET_HOST_NAME (  
    ip   IN VARCHAR2 DEFAULT NULL)  
RETURN host_name VARCHAR2;
```

Parameters

Table 265-5   GET_HOST_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip</td>
<td>The IP address of the host used to determine its host name. If ip is not NULL, the official name of the host with its domain name is returned. If this is NULL, the name of the local host is returned and the name does not contain the domain to which the local host belongs.</td>
</tr>
</tbody>
</table>

Return Values

Table 265-6   GET_HOST_NAME Function Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>The name of the local or remote host of the specified IP address.</td>
</tr>
</tbody>
</table>

Exceptions

UNKNOWN_HOST: The specified IP address is unknown

Usage Notes

The permission to obtain the host name or IP address of the current host is controlled by the resolve privilege granted through DBMS_NETWORK_ACL_ADMIN on LOCALHOST.
UTL_LMS retrieves and formats error messages in different languages.

This chapter contains the following topics:

- Security Model
- Summary of UTL_LMS Subprograms

See Also:
Oracle Database Globalization Support Guide

266.1 UTL_LMS Security Model

This package must be created as the user SYS.

266.2 Summary of UTL_LMS Subprograms

This table lists the UTL_LMS subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMAT_MESSAGE Function</td>
<td>Formats a retrieved error message</td>
</tr>
<tr>
<td>GET_MESSAGE Function</td>
<td>Retrieves an error message based on error number, product, facility, language, and message specified</td>
</tr>
</tbody>
</table>

266.2.1 FORMAT_MESSAGE Function

This function formats a message retrieved by the GET_MESSAGE function and returns the formatted message. If the function fails, then it returns a NULL result.

The following table shows special characters that can be used in the format string.

<table>
<thead>
<tr>
<th>Special Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'%s'</td>
<td>Substitute the next string argument</td>
</tr>
<tr>
<td>'%d'</td>
<td>Substitute the next integer argument</td>
</tr>
<tr>
<td>'%%'</td>
<td>Represents the special character %</td>
</tr>
</tbody>
</table>
Syntax

```
UTL_LMS.FORMAT_MESSAGE (  
    format IN VARCHAR2 CHARACTER SET ANY_CS,  
    args   IN VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL)  
RETURN VARCHAR2 CHARACTER SET format%CHARSET;
```

Parameters

Table 266-2  FORMAT_MESSAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Specifies the string to format</td>
</tr>
<tr>
<td>args</td>
<td>Specifies the list of arguments</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    s varchar2(200);
    i  pls_integer;
BEGIN
    i:= utl_lms.get_message(26052, 'rdbms', 'ora', 'french', s);
    dbms_output.put_line('before format, message is: '||s);
    dbms_output.put_line('formatted message is: '||utl_lms.format_message(s, 9, 'my_column_name');
END;
/

The following is an unformatted message:

Type %d non pris en charge pour l'expression SQL sur la colonne %s.

The following is the formatted message:

Type 9 non pris en charge pour l'expression SQL sur la colonne my_column_name.

266.2.2 GET_MESSAGE Function

This function retrieves an Oracle error message. The user can define user-specific error messages with the lmsgen utility.

It returns 0 when it is successful. It returns -1 when it fails.

See Also:

Oracle Database Globalization Support Guide for more information about the lmsgen utility

Syntax

```
UTL_LMS.GET_MESSAGE (  
    errnum    IN PLS_INTEGER,  
    product   IN VARCHAR2,  
```
facility IN VARCHAR2,
language IN VARCHAR2,
message OUT NOCOPY VARCHAR2CHARACTER SET ANY_CS)
RETURN PLS_INTEGER;

Parameters

Table 266-3 GET_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| errnum    | Specifies the error number.  
Example: '972' (for ORA-00972) |
| product   | Specifies the product to which the error message applies  
Example: 'rdbms' |
| facility  | Specifies the error message prefix  
Example: 'ora' |
| language  | Specifies the language of the message. The parameter is case-insensitive. The default is NULL, which causes GET_MESSAGE to use the value of the NLS_LANGUAGE session parameter. |
| message   | Specifies the output buffer for the retrieved message |

Usage Notes

If the language parameter is set to NULL, then the value of the NLS_LANGUAGE session parameter is used as the default.

Examples

DECLARE
    s VARCHAR2(200);
i pls_integer;
BEGIN
    i:=utl_lms.get_message(601, 'rdbms', 'oci', 'french', s);
dbms_output.put_line('OCI-00601 is: '||s);
END
/

The following output results:

OCI-00601 is: Echec du processus de nettoyage.
The UTL_MAIL package is a utility for managing email which includes commonly used email features, such as attachments, CC, and BCC.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Rules and Limits
- Summary of UTL_MAIL Subprograms

### 267.1 UTL_MAIL Security Model

UTL_MAIL is not installed by default because of the SMTP_OUT_SERVER configuration requirement and the security exposure this involves. In installing UTL_MAIL, you should take steps to prevent the port defined by SMTP_OUT_SERVER being swamped by data transmissions.

This package is now an invoker's rights package and the invoking user will need the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

*Note:*

For more information about managing fine-grained access, see Oracle Database Security Guide.

### 267.2 UTL_MAIL Operational Notes

You must both install UTL_MAIL and define the SMTP_OUT_SERVER.

- To install UTL_MAIL:

  ```sql
  sqlplus sys/<pwd>
  SQL> @$ORACLE_HOME/rdbms/admin/utlmail.sql
  SQL> @$ORACLE_HOME/rdbms/admin/prvtmail.plb
  ```

- You define the SMTP_OUT_SERVER parameter in the init.ora rdbms initialization file. However, if SMTP_OUT_SERVER is not defined, this invokes a default of DB_DOMAIN which is guaranteed to be defined to perform appropriately.
267.3 UTL_MAIL Rules and Limits

Use UTL_MAIL only within the context of the ASCII (American Standard Code for Information Interchange) and EBCDIC (Extended Binary-Coded Decimal Interchange Code) codes.

267.4 Summary of UTL_MAIL Subprograms

This table lists the UTL_MAIL subprograms and briefly describes them.

Table 267-1 UTL_MAIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEND Procedure</td>
<td>Packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.</td>
</tr>
<tr>
<td>SEND_ATTACH_RAW</td>
<td>Represents the SEND Procedure overloaded for RAW attachments.</td>
</tr>
<tr>
<td>SEND_ATTACH_VARCHAR2</td>
<td>Represents the SEND Procedure overloaded for VARCHAR2 attachments.</td>
</tr>
</tbody>
</table>

267.4.1 SEND Procedure

This procedure packages an email message into the appropriate format, locates SMTP information, and delivers the message to the SMTP server for forwarding to the recipients.

It hides the SMTP API and exposes a one-line email facility for ease of use.

Syntax

```sql
UTL_MAIL.SEND (
    sender      IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients  IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message     IN    VARCHAR2 CHARACTER SET ANY_CS,
    mime_type   IN    VARCHAR2 DEFAULT 'text/plain; charset=us-ascii',
    priority    IN    PLS_INTEGER DEFAULT 3,
    replyto     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 267-2 SEND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
</tbody>
</table>
Table 267-2  (Cont.) SEND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>

267.4.2 SEND_ATTACH_RAW Procedure

This procedure is the SEND Procedure overloaded for RAW attachments.

Syntax

```sql
UTL_MAIL.SEND_ATTACH_RAW (  
    sender           IN    VARCHAR2 CHARACTER SET ANY_CS, 
    recipients       IN    VARCHAR2 CHARACTER SET ANY_CS, 
    cc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL, 
    bcc              IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL, 
    subject          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL, 
    message          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL, 
    mime_type        IN    VARCHAR2 DEFAULT CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii', 
    priority         IN    PLS_INTEGER DEFAULT 3, 
    attachment       IN    RAW, 
    att_inline       IN    BOOLEAN DEFAULT TRUE, 
    att_mime_type    IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii', 
    att_filename     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL, 
    replyto          IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL); 
```

Parameters

Table 267-3  SEND_ATTACH_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>
</tr>
<tr>
<td>recipients</td>
<td>Email addresses of the recipient(s), separated by commas</td>
</tr>
<tr>
<td>cc</td>
<td>Email addresses of the CC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>bcc</td>
<td>Email addresses of the BCC recipient(s), separated by commas, default is NULL</td>
</tr>
<tr>
<td>subject</td>
<td>String to be included as email subject string, default is NULL</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>message</td>
<td>Text message body</td>
</tr>
<tr>
<td>mime_type</td>
<td>Mime type of the message, default is 'text/plain; charset=us-ascii'</td>
</tr>
<tr>
<td>priority</td>
<td>Message priority, which maps to the X-priority field. 1 is the highest priority and 5 the lowest. The default is 3.</td>
</tr>
<tr>
<td>attachment</td>
<td>RAW attachment</td>
</tr>
<tr>
<td>att_inline</td>
<td>Specifies whether the attachment is viewable inline with the message body, default is TRUE</td>
</tr>
<tr>
<td>att_mime_type</td>
<td>Mime type of the attachment, default is 'application/octet'</td>
</tr>
<tr>
<td>att_filename</td>
<td>String specifying a filename containing the attachment, default is NULL</td>
</tr>
<tr>
<td>replyto</td>
<td>Defines to whom the reply email is to be sent</td>
</tr>
</tbody>
</table>

267.4.3 SEND_ATTACH_VARCHAR2 Procedure

This procedure is the SEND Procedure overloaded for VARCHAR2 attachments.

Syntax

```sql
UTL_MAIL.SEND_ATTACH_VARCHAR2 ( 
    sender            IN    VARCHAR2 CHARACTER SET ANY_CS,
    recipients        IN    VARCHAR2 CHARACTER SET ANY_CS,
    cc                IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    bcc               IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    subject           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    message           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    mime_type         IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',
    priority          IN    PLS_INTEGER DEFAULT 3,
    attachment        IN    VARCHAR2 CHARACTER SET ANY_CS,
    att_inline        IN    BOOLEAN DEFAULT TRUE,
    att_mime_type     IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT 'text/plain; charset=us-ascii',
    att_filename      IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL,
    replyto           IN    VARCHAR2 CHARACTER SET ANY_CS DEFAULT NULL);
```

Parameters

Table 267-4  SEND_ATTACH_VARCHAR2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>Email address of the sender</td>

</tbody>
</table>
The **UTL_MATCH** package facilitates matching two records. This is typically used to match names, such as two First Names or two Last Names.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of UTL_MATCH Subprograms

### 268.1 UTL_MATCH Overview

**UTL_MATCH** can use either the Edit Distance algorithm or Jaro-Winkler algorithm when determining matches.

Edit Distance, also known as Levenshtein Distance (named after the Russian scientist Vladimir Levenshtein, who devised the algorithm in 1965), is a measure of similarity between two strings, $s_1$ and $s_2$. The distance is the number of insertions, deletions or substitutions required to transform $s_1$ to $s_2$.

The Edit Distance between strings *shackelford* and *shackelford* = 2.

The "Jaro-Winkler algorithm" is another way of calculating Edit distance between two strings. This method, developed at the U.S. Census, is a String Comparator measure that gives values of partial agreement between two strings. The string comparator accounts for length of strings and partially accounts for typical human errors made in alphanumeric strings.

The following table shows similarity values returned by Jaro-Winkler and Edit Distance.

<table>
<thead>
<tr>
<th>String 1</th>
<th>String 2</th>
<th>Jaro Winkler</th>
<th>Edit Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dunningham</td>
<td>Cunningham</td>
<td>89</td>
<td>80</td>
</tr>
<tr>
<td>Abroms</td>
<td>Abrams</td>
<td>92</td>
<td>83</td>
</tr>
<tr>
<td>Lampley</td>
<td>Campley</td>
<td>90</td>
<td>86</td>
</tr>
<tr>
<td>Marhta</td>
<td>Martha</td>
<td>96</td>
<td>67</td>
</tr>
<tr>
<td>Jonathon</td>
<td>Jonathan</td>
<td>95</td>
<td>88</td>
</tr>
<tr>
<td>Jeraldine</td>
<td>Geraldine</td>
<td>92</td>
<td>89</td>
</tr>
</tbody>
</table>

### 268.2 UTL_MATCH Security Model

The **UTL_MATCH** package runs with definer's rights. **UTL_MATCH** must be created under **SYS**. Operations provided by this package are performed with **SYS** privileges.
268.3 Summary of UTL_MATCH Subprograms

This table lists the `UTL_MATCH` subprograms and briefly describes them.

Table 268-2  UTL.Match Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EDIT_DISTANCE Function</td>
<td>Calculates the number of changes required to transform string-1 into string-2.</td>

</tr>
</tbody>
</table>

268.3.1 EDIT_DISTANCE Function

This function calculates the number of insertions, deletions or substitutions required to transform string-1 into string-2.

Syntax

```
UTL_MATCH.EDIT_DISTANCE (  
  s1  IN  VARCHAR2,  
  s2  IN  VARCHAR2)  
RETURN PLS_INTEGER;
```

Parameters

Table 268-3  EDIT_DISTANCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

```
SELECT UTL_MATCH.EDIT_DISTANCE('shackleford', 'shackelford') FROM DUAL;
-------------
returns 2
```

268.3.2 EDIT_DISTANCE_SIMILARITY Function

This function calculates the number of insertions, deletions or substations required to transform string-1 into string-2, and returns the Normalized value of the Edit Distance between two strings.

The value is typically between 0 (no match) and 100 (perfect match).
Syntax

UTL_MATCH.EDIT_DISTANCE_SIMILARITY (  
   s1  IN  VARCHAR2,  
   s2  IN  VARCHAR2)  
RETURN PLS_INTEGER;

Parameters

Table 268-4  EDIT_DISTANCE_SIMILARITY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>The string to be transformed</td>
</tr>
<tr>
<td>s2</td>
<td>The string into which s1 is to be transformed</td>
</tr>
</tbody>
</table>

Examples

SELECT UTL_MATCH.EDIT_DISTANCE_SIMILARITY('shackleford', 'shackelford') FROM DUAL;  
--------------  
returns 82

268.3.3 JARO_WINKLER Function

This function calculates the measure of agreement between two strings.

Syntax

UTL_MATCH.JARO_WINKLER (  
   s1  IN  VARCHAR2,  
   s2  IN  VARCHAR2)  
RETURN BINARY_DOUBLE;

Parameters

Table 268-5  JARO_WINKLER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>input</td>
</tr>
</tbody>
</table>

Examples

SELECT UTL_MATCH.JARO_WINKLER('shackleford', 'shackelford') FROM DUAL;  
--------------  
returns 9.818E-001
268.3.4 JARO_WINKLER_SIMILARITY Function

This function calculates the measure of agreement between two strings, and returns a score between 0 (no match) and 100 (perfect match).

Syntax

```sql
UTL_MATCH.JARO_WINKLER_SIMILARITY ( 
    s1  IN  VARCHAR2,
    s2  IN  VARCHAR2) 
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>s1</td>
<td>Input</td>
</tr>
<tr>
<td>s2</td>
<td>input</td>
</tr>
</tbody>
</table>

Examples

```sql
SELECT UTL_MATCH.JARO_WINKLER_SIMILARITY('shackleford', 'shackelford') FROM DUAL;
-------------------
returns 98
```
The UTL_NLA package exposes a subset of the BLAS and LAPACK (Version 3.0) operations on vectors and matrices represented as VARRAYs.

This chapter contains the following topics:

- Overview
- Rules and Limits
- Security Model
- Subprogram Groups
  - BLAS Level 1 (Vector-Vector Operations) Subprograms
  - BLAS Level 2 (Matrix-Vector Operations) Subprograms
  - BLAS Level 3 (Matrix-Matrix Operations) Subprograms
  - LAPACK Driver Routines (Linear Equations) Subprograms
  - LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms
- Summary of UTL_NLA Subprograms

269.1 UTL_NLA Overview

The UTL_NLA package exposes a subset of the BLAS (Basic Linear Algebra Subprograms) and LAPACK (Linear Algebra PACKage) (Version 3.0) operations on vectors and matrices represented as VARRAYs.

Standards

For more information on the BLAS and LAPACK standards see

http://www.netlib.org/blas/
http://www.netlib.org/lapack/

Required Expertise

Users of this package are expected to have a sound grasp of linear algebra in general and of the BLAS and LAPACK libraries in particular.

Implementation

The mapping between BLAS and LAPACK procedures and their corresponding PL/SQL calls is one-to-one.

- All BLAS functions have the BLAS_ prefix (for example, the BLAS_ASUM Functions). The subroutines and functions in BLAS are mapped to PL/SQL procedures and functions, respectively.
- All LAPACK functions have the LAPACK_ prefix (for example, the LAPACK_GBSV Procedures). The subroutines in LAPACK are mapped to PL/SQL procedures.
Procedures that perform the same operation but differ only on the datatype of the arguments have the same overloaded names.

The mapping between BLAS and LAPACK procedure parameters and those of their corresponding PL/SQL subprograms is almost one-to-one.

- Also in the PL/SQL interface for LAPACK, all /work/ arguments have been removed. The UTL_NLA package manages the allocation and de-allocation of all work areas required by the libraries.
- A new optional parameter, pack, has been added to the end of each LAPACK procedure that specifies if the matrix has been linearized in the row-major or column-major (default) format.

269.2 UTL_NLA Rules and Limits

Vectors and matrices are stored in VARRAYs with a maximum size of one million entries. Given this restriction, UTL_NLA vectors can be up to one million entries but matrices need to be of size RxC <= 1,000,000.

269.3 UTL_NLA Security Model

The UTL_NLA package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The routines in the package are run with invokers’ rights (run with the privileges of the current user).

269.4 Subprogram Groups

The UTL_NLA package contains subprogram groups for BLAS and LAPACK operations.

- BLAS Level 1 (Vector-Vector Operations) Subprograms
- BLAS Level 2 (Matrix-Vector Operations) Subprograms
- BLAS Level 3 (Matrix-Matrix Operations) Subprograms
- LAPACK Driver Routines (Linear Equations) Subprograms
- LAPACK Driver Routines (LLS and Eigenvalue Problems) Subprograms

269.4.1 UTL_NLA BLAS Level 1 (Vector-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 1 Vector-Vector Operations subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLAS_ASUM Functions</td>
<td>Computes the sum of the absolute values of the vector components</td>
</tr>
<tr>
<td>BLAS_AXPY Procedures</td>
<td>Copies $\alpha * x + y$ into vector $y$</td>
</tr>
<tr>
<td>BLAS_COPY Procedures</td>
<td>Copies the contents of vector $x$ to vector $y$</td>
</tr>
</tbody>
</table>
Table 269-1  (Cont.) BLAS Level 1 (Vector-Vector Operations) Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLAS_DOT Functions</td>
<td>Returns the dot (scalar) product of two vectors ( x ) and ( y )</td>
</tr>
<tr>
<td>BLAS_IAMAX Functions</td>
<td>Computes the index of the first element of a vector that has the largest absolute value</td>
</tr>
<tr>
<td>BLAS_NRM2 Functions</td>
<td>Computes the vector 2-norm (Euclidean norm)</td>
</tr>
<tr>
<td>BLAS_ROT Procedures</td>
<td>Returns the plane rotation of points</td>
</tr>
<tr>
<td>BLAS_ROTG Procedures</td>
<td>Returns the Givens rotation of points</td>
</tr>
<tr>
<td>BLAS_SCAL Procedures</td>
<td>Scales a vector by a constant</td>
</tr>
<tr>
<td>BLAS_SWAP Procedures</td>
<td>Swaps the contents of two vectors each of size ( n )</td>
</tr>
</tbody>
</table>

269.4.2 UTL_NLA BLAS Level 2 (Matrix-Vector Operations) Subprograms

This table lists and briefly describes the UTL_NLA BLAS Level 2 Matrix-Vector Operations subprograms.

Table 269-2  BLAS Level 2 (Matrix-Vector Operations) Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

#### 269.5.8 BLAS_GER Procedures

This procedure performs the rank 1 operation: \(A := \alpha x^\top y + A\) where \(\alpha\) is a scalar, \(x\) is an \(m\) element vector, \(y\) is an \(n\) element vector and \(A\) is an \(m\) by \(n\) matrix.

**See Also:**

BLAS Level 2 (Matrix-Vector Operations) Subprograms for other subprograms in this group

### Syntax

```sql
UTL_NLA.BLAS_GER (  
  m      IN     POSITIVEN,  
  n      IN     POSITIVEN,  
  alpha IN     SCALAR_DBL,  
  x      IN OUT  UTL_NLA_ARRAY_DBL,  
  incx   IN     POSITIVEN,  
  y      IN     UTL_NLA_ARRAY_DBL,

On exit, the array \(ap\) is overwritten by the upper triangular part of the updated matrix. |
|           | Before entry with \text{uplo} = 'L' or 'l', the array \(ap\) must contain the lower triangular part of the symmetric matrix packed sequentially, column by column, so that \(ap(1)\) contains \(a(1,1)\), \(ap(2)\) and \(ap(3)\) contain \(a(2,1)\) and \(a(3,1)\) respectively, and so on. On exit, the array \(ap\) is overwritten by the lower triangular part of the updated matrix |
| lda       | Specifies the first dimension of \(a\) as declared in the calling (sub)program. lda must be at least \((k + 1)\). |
| pack      | (Optional) Flags the packing of the matrices: |
|           | • 'C': column-major (default) |
|           | • 'R': row-major |

269.5.17 BLAS_SBMV Procedures

This procedure performs the matrix-vector operation \(y := \alpha A x + \beta y\), where \(\alpha\) and \(\beta\) are scalars, \(x\) and \(y\) are \(n\) element vectors and \(A\) is an \(n\) by \(n\) symmetric band matrix, with \(x\) super-diagonals.

```
### Parameters

#### Table 269-31 BLAS_TBMV Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **uplo**  | Specifies whether the matrix is an upper or lower triangular matrix:  
  - uplo = 'U' or 'u'. A is an upper triangular matrix.  
  - uplo = 'L' or 'l'. A is a lower triangular matrix. |
| **trans** | Specifies the operation to be performed:  
  - trans = 'N' or 'n'. x := A*x  
  - trans = 'T' or 't'. x := A'*x  
  - trans = 'C' or 'c'. x := A'*x |
| **diag**  | Specifies whether or not A is unit triangular:  
  - diag = 'U' or 'u'. A is assumed to be unit triangular.  
  - diag = 'N' or 'n'. A is not assumed to be unit triangular. |
| **n**     | Specifies the order of the matrix A. n must be at least zero. |
| **k**     | Specifies whether or not A is unit triangular:  
  - with uplo = 'U' or 'u', K specifies the number of super-diagonals of the matrix A.  
  - with uplo = 'L' or 'l', K specifies the number of sub-diagonals of the matrix A.  
  K must satisfy \(0 \leq k\). |
| **a**     | UTL_NLA_ARRAY_FLT/DBL of DIMENSION(lda, n).  
Before entry with uplo = 'U' or 'u', the leading (k+1) by n part of the array A must contain the upper triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row (k+1) of the array, the first super-diagonal starting at position 2 in row k, and so on. The top left k by k triangle of the array A is not referenced.  
Before entry with uplo = 'L' or 'l', the leading (k+1) by n part of the array A must contain the lower triangular band part of the matrix of coefficients, supplied column by column, with the leading diagonal of the matrix in row 1 of the array, the first sub-diagonal starting at position 1 in row 2, and so on. The bottom right k by k triangle of the array A is not referenced.  
Note that when diag = 'U' or 'u', the elements of the array A corresponding to the diagonal elements of the matrix are not referenced, but are assumed to be unity. |
| **lda**   | Specifies the first dimension of a as declared in the calling (sub) program. lda must be at least (k+1). |
| **incx**  | UTLNLA_ARRAY_FLT/DBL of dimension at least (1+ \(n-1\)*abs(incx)). Before entry, the incremented array X must contain the n element vector x. On exit, X is overwritten with the transformed vector x. |

|           | Before entry with uplo = 'L' or 'l', the array ap must contain the lower triangular matrix packed sequentially, column by column, so that ap(1) contains a(1,1), ap(2) and ap(3) contain a(2,1) and a(3,1) respectively, and so on. |
|           | Note that when diag = 'U' or 'u', the diagonal elements of A are not referenced, but are assumed to be unity. |
| x         | UTL_NLA_ARRAY_FLT/DBL of dimension at least 
\((1 + (n - 1) *abs(incx))\) |
|           | Before entry, the incremented array x must contain the n element right-hand side vector b. On exit, x is overwritten with the solution vector x. |
| incx      | Specifies the increment for the elements of x. incx must not be zero. |
| pack      | (Optional) Flags the packing of the matrices: \n\n- 'C': column-major (default) \n- 'R': row-major |

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.

269.5.29 BLAS_TRMM Procedures

This procedure performs a matrix-matrix operation.

It performs one of the following matrix-matrix operations:

\[ B := \alpha \text{op}(A) \ast B \]

or

\[ B := \alpha B \ast \text{op}(A) \]

where \( \alpha \) is a scalar, \( B \) is an \( m \times n \) matrix, \( A \) is a unit, or non-unit, upper or lower triangular matrix and \( \text{op}(A) \) is one of

\[ \text{op}(A) = A \]

or

\[ \text{op}(A) = A' \]

269.5.31 BLAS_TRSM Procedures

This procedure performs a matrix-matrix operation. It performs one of the matrix-matrix operations:

\[
\text{op}( A ) \cdot X = \alpha \cdot B \\
\text{or}
\]

\[
X \cdot \text{op}( A ) = \alpha \cdot B
\]

where \( \alpha \) is a scalar, \( X \) and \( B \) are \( m \) by \( n \) matrices, \( A \) is a unit, or non-unit, upper or lower triangular matrix and \( \text{op}( A ) \) is one of

\[
\text{op}( A ) = A \\
\text{or}
\]

\[
\text{op}( A ) = A'
\]

The matrix \( X \) is overwritten on \( B \).

Usage Notes

No test for singularity or near-singularity is included in this routine. Such tests must be performed before calling this routine.
269.5.33 LAPACK_GBSV Procedures

This procedure computes the solution to a real system of linear equations $a \times x = b$, where $a$ is a band matrix of order $n$ with $kl$ sub diagonals and $ku$ superdiagonals, and $x$ and $b$ are $n$ by $nrhs$ matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor $A$ as $a = L \times U$

where $L$ is a product of permutation and unit lower triangular matrices with $kl$ sub diagonals, and $U$ is upper triangular with $kl+ku$ superdiagonals. The factored form of $a$ is then used to solve the system of equations $a \times x = b$

269.5.34 LAPACK_GEES Procedures

This procedure computes for an \( n \) by \( n \) real nonsymmetric matrix \( A \), the eigenvalues, the real Schur form \( T \), and, optionally, the matrix of Schur vectors \( Z \). This gives the Schur factorization \( A = Z*T*(Z^T) \).
A matrix is in real Schur form if it is upper quasi-triangular with 1 by 1 and 2 by 2 blocks. 2 by 2 blocks will be standardized in the form

\[
\begin{bmatrix}
  a & b \\
  c & a \\
\end{bmatrix}
\]

where \(bc < 0\). The eigenvalues of such a block are \(a \pm \sqrt{bc}\).

### 269.5.35 LAPACK_GELS Procedures

This procedure solves overdetermined or underdetermined real linear systems involving an m by n matrix A, or its transpose, using a QR or LQ factorization of A. It is assumed that A has full rank.

The following options are provided:

1. **If TRANS = 'N' and m >= n**: find the least squares solution of an overdetermined system, that is, solve the least squares problem. minimize || B - AX ||

2. **If TRANS = 'N' and m < n**: find the minimum norm solution of an underdetermined system A X = B.

3. **If TRANS = 'T' and m >= n**: find the minimum norm solution of an underdetermined system A**T X = B.

4. **If TRANS = 'T' and m < n**: find the least squares solution of an overdetermined system, that is, solve the least squares problem minimize || B - A**T X ||.

269.5.36 LAPACK_GESDD Procedures

This procedures computes the singular value decomposition (SVD) of a real m by n matrix A, optionally computing the left and right singular vectors. If singular vectors are desired, it uses a divide-and-conquer algorithm that makes mild assumptions about floating point arithmetic.

The SVD is written

\[ A = U \cdot \text{SIGMA} \cdot \text{transpose}(V) \]

where SIGMA is an n by n matrix which is zero except for its \( \min(m, n) \) diagonal elements, U is an m by m orthogonal matrix, and V is an n by n orthogonal matrix. The diagonal elements of SIGMA are the singular values of A, they are real and non-negative, and are returned in descending order. The first \( \min(m, n) \) columns of U and V are the left and right singular vectors of A.

Note that the routine returns \( V^{**T} \), not V.

269.5.37 LAPACK_GESV Procedure

This procedure computes the solution to a real system of linear equations \( a \cdot x = b \), where \( a \) is an \( n \) by \( n \) matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The LU decomposition with partial pivoting and row interchanges is used to factor \( A \) as \( a = P \cdot L \cdot U \)
where $P$ is a permutation matrix, $L$ is unit lower triangular, and $U$ is upper triangular. The factored form of $a$ is then used to solve the system of equations

$$a \times x = b$$

269.5.39 LAPACK_GEEV Procedures

This procedure computes for an n by n real nonsymmetric matrix A, the eigenvalues and, optionally, the left and/or right eigenvectors.

- The right eigenvector v(j) of A satisfies A * v(j) = lambda(j) * v(j) where lambda(j) is its eigenvalue.
- The left eigenvector u(j) of A satisfies u(j)**H * A = lambda(j) * u(j)**H where u(j)**H denotes the conjugate transpose of u(j).

The computed eigenvectors are normalized to have Euclidean norm equal to 1 and largest component real.

### 269.5.40 LAPACK_GTSV Procedure

This procedure solves the equation \( a \times x = b \), where \( a \) is an \( n \) by \( n \) tridiagonal matrix, by Gaussian elimination with partial pivoting.

Note that the equation \( a^T x = b \) may be solved by interchanging the order of the arguments du and dl.

269.5.41 LAPACK_PBSV Procedures

This procedure computes the solution to a real system of linear equations \( a \times x = b \), where \( a \) is an \( n \) by \( n \) symmetric positive definite band matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The Cholesky decomposition is used to factor \( A \) as

\[
A = U^T U \quad \text{if } \text{UPLO} = 'U' \\
or
A = L \times L^T \quad \text{if } \text{UPLO} = 'L'
\]

where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A \times X = B \).

269.5.42 LAPACK_POSV Procedures

This procedure computes the solution to a real system of linear equations \( a * x = b \), where \( a \) is an \( n \) by \( n \) symmetric positive definite matrix and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The Cholesky decomposition is used to factor \( A \) as

\[
A = U^{**T} \cdot U \text{ if } \text{uplo} = 'U'
\]

or

\[
A = L \cdot L^{**T} \text{ if } \text{UPLO} = 'L'
\]

where \( U \) is an upper triangular matrix and \( L \) is a lower triangular matrix. The factored form of \( A \) is then used to solve the system of equations \( A * X = B \).

269.5.43 LAPACK_PPSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b where a is an n by n symmetric positive definite matrix stored in packed format and x and b are n by nrhs matrices.

The Cholesky decomposition is used to factor A as

A = U**T* U if UPLO = 'U'

or

A = L * L**T if UPLO = 'L'
where $U$ is an upper triangular matrix and $L$ is a lower triangular matrix. The factored form of $A$ is then used to solve the system of equations $A \times X = B$.

### 269.5.49 LAPACK_SPSV Procedures

This procedure computes the solution to a real system of linear equations \( A \times x = b \), where \( A \) is an \( n \) by \( n \) symmetric matrix stored in packed format, and \( x \) and \( b \) are \( n \) by \( nrhs \) matrices.

The diagonal pivoting method is used to factor \( A \) as

\[
A = U \times D \times U^T, \text{ if } \text{UPLO} = 'U'
\]

or

\[
A = L \times D \times L^T, \text{ if } \text{UPLO} = 'L'
\]

where \( U \) (or \( L \)) is a product of permutation and unit upper (lower) triangular matrices, and \( D \) is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of \( A \) is then used to solve the system of equations \( A \times X = B \).

• If uplo = 'L', the leading n by n lower triangular part of a contains the lower triangular part of the matrix a. On exit:  
• If jobz = 'V', then if info = 0, a contains the orthonormal eigenvectors of the matrix a.  
• If jobz = 'N', then on exit the lower triangle (if uplo = 'L') or the upper triangle (if uplo='U') of a, including the diagonal, is destroyed. |
| lda       | The leading dimension of the array a. lda >= max(1,n). |
| w         | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (n). If info = 0, the eigenvalues in ascending order. |
| info      | = 0 : successful exit  
< 0 : if info = -i, the i-th argument had an illegal value  
> 0 : if info = i, the algorithm failed to converge; i off-diagonal elements of an intermediate tridiagonal form did not converge to zero |
| pack      | (Optional) Flags the packing of the matrices:  
• 'C': column-major (default)  
• 'R': row-major |

269.5.53 LAPACK_SYEVD Procedures

This procedure computes all eigenvalues and, optionally, eigenvectors of a real symmetric matrix A. If eigenvectors are desired, it uses a divide and conquer algorithm that makes mild assumptions about floating point arithmetic.

269.5.54 LAPACK_SYSV Procedures

This procedure computes the solution to a real system of linear equations a * x = b, where a is an n by n symmetric matrix, and x and b are n by nrhs matrices.

The diagonal pivoting method is used to factor a as
A = U * D * U^T, if UPLO = 'U'

or

A = L * D * L^T, if UPLO = 'L'

where U (or L) is a product of permutation and unit upper (lower) triangular matrices, and D is symmetric and block diagonal with 1 by 1 and 2 by 2 diagonal blocks. The factored form of A is then used to solve the system of equations A * X = B.

<td>The leading dimension of the array a. lda &gt;= max(1,n)</td>
</tr>
</tbody>
</table>
| **ipiv** | INTEGER array, DIMENSION (ldb, nrhs). Details of the interchanges and the block structure of d, as determined by SSYTRF.  
• If ipiv(k) > 0, then rows and columns k and ipiv(k) were interchanged, and d(k,k) is a 1 by 1 diagonal block.  
• If uplo = 'U' and ipiv(k) = ipiv(k-1) < 0, then rows and columns k-1 and -ipiv(k) were interchanged and d(k-1:k,k-1:k) is a 2 by 2 diagonal block.  
• If uplo = 'L' and ipiv(k) = ipiv(k+1) < 0, then rows and columns k+1 and -ipiv(k) were interchanged and d(k:k+1,k:k+1) is a 2 by 2 diagonal block. |
| **b** | UTL_NLA_ARRAY_FLT/DBL, DIMENSION (ldb, nrhs). On entry, the n by nrhs matrix of right hand side matrix b. On exit, if info = 0, the n by nrhs solution matrix X. |
| **ldb** | The leading dimension of the array b. ldb >= max(1,n) |
| **info** | • = 0 : successful exit  
• < 0 : if info = -i , the i-th argument had an illegal value  
• > 0 : if info = i, d(i,i) is exactly zero. The factorization has been completed, but the block diagonal matrix d is exactly singular, so the solution could not be computed. |
| **pack** | (Optional) Flags the packing of the matrices:  
• 'C': column-major (default)  
• 'R': row-major |
The UTL_RAW package provides SQL functions for manipulating RAW datatypes.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of UTL_RAW Subprograms

### 270.1 UTL_RAW Overview

This package is necessary because normal SQL functions do not operate on RAWs, and PL/SQL does not allow overloading between a RAW and a CHAR datatype. UTL_RAW also includes subprograms that convert various COBOL number formats to, and from, RAWs.

UTL_RAW is not specific to the database environment, and it may actually be used in other environments. For this reason, the prefix UTL has been given to the package, instead of DBMS.

### 270.2 UTL_RAW Operational Notes

UTL_RAW allows a RAW "record" to be composed of many elements. By using the RAW datatype, character set conversion will not be performed, keeping the RAW in its original format when being transferred through remote procedure calls.

With the RAW functions, you can manipulate binary data that was previously limited to the hextoraw and rawtohex functions.

**Note:**

Notes on datatypes:

- The PLS_INTEGER and BINARY_INTEGER datatypes are identical. This document uses BINARY_INTEGER to indicate datatypes in reference information (such as for table types, record types, subprogram parameters, or subprogram return values), but may use either in discussion and examples.

- The INTEGER and NUMBER(38) datatypes are also identical. This document uses INTEGER throughout.

### 270.3 Summary of UTL_RAW Subprograms

This table lists the UTL_RAW subprograms and briefly describes them.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIT_AND Function</td>
<td>Performs bitwise logical &quot;and&quot; of the values in RAW r1 with RAW r2 and returns the &quot;anded&quot; result RAW</td>
</tr>
<tr>

<tr>
<td>CAST_TO_NUMBER Function</td>
<td>Casts the RAW binary representation of a NUMBER into a NUMBER</td>
</tr>
<tr>
<td>CAST_TO_NVARCHAR2 Function</td>
<td>Converts a RAW value into a VARCHAR2 value</td>
</tr>
<tr>
<td>CAST_TO_RAW Function</td>
<td>Converts a VARCHAR2 value into a RAW value</td>
</tr>
<tr>
<td>CAST_TO_VARCHAR2 Function</td>
<td>Converts a RAW value into a VARCHAR2 value</td>
</tr>
<tr>
<td>COMPARE Function</td>
<td>Compares RAW r1 against RAW r2</td>
</tr>
<tr>
<td>CONCAT Function</td>
<td>Concatenates up to 12 RAWs into a single RAW</td>
</tr>
<tr>
<td>CONVERT Function</td>
<td>Converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW</td>
</tr>
<tr>
<td>COPIES Function</td>
<td>Returns n copies of r concatenated together</td>
</tr>
<tr>
<td>LENGTH Function</td>
<td>Returns the length in bytes of a RAW r</td>
</tr>
<tr>
<td>OVERLAY Function</td>
<td>Overlays the specified portion of target RAW with overlay RAW, starting from byte position pos of target and proceeding for len bytes</td>
</tr>
<tr>
<td>REVERSE Function</td>
<td>Reverses a byte sequence in RAW r from end to end</td>
</tr>
<tr>
<td>SUBSTR Function</td>
<td>Returns len bytes, starting at pos from RAW r</td>
</tr>
<tr>
<td>TRANSLATE Function</td>
<td>Translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set</td>
</tr>
</tbody>
</table>
Table 270-1  (Cont.) UTL_RAW Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSLITERATE Function</td>
<td>Converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set</td>
</tr>
<tr>
<td>XRANGE Function</td>
<td>Returns a RAW containing all valid 1-byte encodings in succession, beginning with the value start_byte and ending with the value end_byte</td>
</tr>
</tbody>
</table>

270.3.1 BIT_AND Function

This function performs bitwise logical "and" of the values in RAW r1 with RAW r2 and returns the "anded" result RAW.

Syntax

```plaintext
UTL_RAW.BIT_AND ( 
    r1 IN RAW, 
    r2 IN RAW) 
RETURN RAW;
```

Pragmas

```plaintext
pragma restrict_references(bit_and, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-2  BIT_AND Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;and&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;and&quot; with r1</td>
</tr>
</tbody>
</table>

Return Values

Table 270-3  BIT_AND Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;and&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, the and operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.
270.3.2 BIT_COMPLEMENT Function

This function performs bitwise logical "complement" of the values in RAW r and returns the complemented result RAW. The result length equals the input RAW r length.

Syntax

UTIL_RAW.BIT_COMPLEMENT (
    r IN RAW
)  RETURN RAW;

Pragmas

pragma restrict_references(bit_complement, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 270-4  BIT_COMPLEMENT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to perform &quot;complement&quot; operation</td>
</tr>
</tbody>
</table>

Return Values

Table 270-5  BIT_COMPLEMENT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>The &quot;complement&quot; of r1</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>

270.3.3 BIT_OR Function

This function performs bitwise logical "or" of the values in RAW r1 with RAW r2 and returns the or'd result RAW.

Syntax

UTIL_RAW.BIT_OR (
    r1 IN RAW,
    r2 IN RAW
) RETURN RAW;

Pragmas

pragma restrict_references(bit_or, WNDS, RNDS, WNPS, RNPS);
Parameters

**Table 270-6 BIT_OR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;or&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;or&quot; with r1</td>
</tr>
</tbody>
</table>

Return Values

**Table 270-7 BIT_OR Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;or&quot; of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>Either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the "or" operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

270.3.4 BIT_XOR Function

This function performs bitwise logical "exclusive or" of the values in RAW r1 with RAW r2 and returns the xor'd result RAW.

**Syntax**

```
UTL_RAW.BIT_XOR (  
  r1 IN RAW,  
  r2 IN RAW)  
RETURN RAW;
```

**Pragmas**

```
pragma restrict_references(bit_xor, WNDs, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 270-8 BIT_XOR Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>RAW to &quot;xor&quot; with r2</td>
</tr>
<tr>
<td>r2</td>
<td>RAW to &quot;xor&quot; with r1</td>
</tr>
</tbody>
</table>
Return Values

Table 270-9  BIT_XOR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the ”xor” of r1 and r2</td>
</tr>
<tr>
<td>NULL</td>
<td>If either r1 or r2 input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

If r1 and r2 differ in length, then the ”xor” operation is terminated after the last byte of the shorter of the two RAWs, and the unprocessed portion of the longer RAW is appended to the partial result. The result length equals the longer of the two input RAWs.

270.3.5 CAST_FROM_BINARY_DOUBLE Function

This function returns the RAW binary representation of a BINARY_DOUBLE value.

Syntax

```sql
UTL_RAW.CAST_FROM_BINARY_DOUBLE(
  n          IN BINARY_DOUBLE,
  endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(cast_from_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-10  CAST_FROM_BINARY_DOUBLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_DOUBLE value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the BINARY_DOUBLE value, or NULL if the input is NULL.

Usage Notes

- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  - byte 0: bit 63 ~ bit 56
  - byte 1: bit 55 ~ bit 48
  - byte 2: bit 47 ~ bit 40
• The parameter endianess describes how the bytes of BINARY_DOUBLE are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in BINARY_DOUBLE.

<table>
<thead>
<tr>
<th>endianess</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td>little_endian</td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>

• In case of machine-endian, the 8 bytes of the BINARY_DOUBLE argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

270.3.6 CAST_FROM_BINARY_FLOAT Function

This function returns the RAW binary representation of a BINARY_FLOAT value.

Syntax

UTL_RAW.CAST_FROM_BINARY_FLOAT(
    n          IN BINARY_FLOAT,
    endianess IN PLS_INTEGER DEFAULT 1)
RETURN RAW;

Pragma

pragma restrict_references(cast_from_binary_float, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 270-11   CAST_FROM_BINARY_FLOAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_FLOAT value</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

Return Values

The binary representation (RAW) of the BINARY_FLOAT value, or NULL if the input is NULL.

Usage Notes

• A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th>Endianess</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fb0</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

In case of machine-endian, the 4 bytes of the BINARY_FLOAT argument are copied straight across into the RAW return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

### 270.3.7 CAST_FROM_BINARY_INTEGER Function

This function returns the RAW binary representation of a BINARY_INTEGER value.

#### Syntax

```sql
UTL_RAW.CAST_FROM_BINARY_INTEGER (n          IN BINARY_INTEGER
                       endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)
RETURN RAW;
```

#### Pragmas

```sql
pragma restrict_references(cast_from_binary_integer, WNDS, RNDS, WNPS, RNPS);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>BINARY_INTEGER value.</td>
</tr>
<tr>
<td>endianess</td>
<td>A BINARY_INTEGER value indicating the endianess. The function recognizes the defined constants big_endian (1), little_endian (2), and machine_endian (3). The default is big_endian. A setting of machine_endian has the same effect as big_endian on a big endian machine, or the same effect as little_endian on a little endian machine.</td>
</tr>
</tbody>
</table>

#### Return Values

The binary representation of the BINARY_INTEGER value.
270.3.8 CAST_FROM_NUMBER Function

This function returns the RAW binary representation of a NUMBER value.

Syntax

```
UTL_RAW.CAST_FROM_NUMBER (
   n  IN NUMBER)
RETURN RAW;
```

Pragmas

```
pragma restrict_references(cast_from_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-13  CAST_FROM_NUMBER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>n</td>
<td>NUMBER value</td>
</tr>
</tbody>
</table>

Return Values

The binary representation of the NUMBER value.

270.3.9 CAST_TO_BINARY_DOUBLE Function

This function casts the RAW binary representation of a BINARY_DOUBLE into a BINARY_DOUBLE.

Syntax

```
UTL_RAW.CAST_TO_BINARY_DOUBLE (
   r          IN RAW
   endianess  IN PLS_INTEGER DEFAULT 1)
RETURN BINARY_DOUBLE;
```

Pragmas

```
pragma restrict_references(cast_to_binary_double, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-14  CAST_TO_BINARY_DOUBLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_DOUBLE</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_DOUBLE value.
Usage Notes

- If the `RAW` argument is more than 8 bytes, only the first 8 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value `BINARY_DOUBLE_NAN` is returned.
- If the `RAW` argument is less than 8 bytes, a `VALUE_ERROR` exception is raised.
- An 8-byte binary_double value maps to the IEEE 754 double-precision format as follows:
  byte 0: bit 63 ~ bit 56
  byte 1: bit 55 ~ bit 48
  byte 2: bit 47 ~ bit 40
  byte 3: bit 39 ~ bit 32
  byte 4: bit 31 ~ bit 24
  byte 5: bit 23 ~ bit 16
  byte 6: bit 15 ~ bit  8
  byte 7: bit  7 ~ bit  0
- The parameter `endianess` describes how the bytes of `BINARY_DOUBLE` are mapped to the bytes of `RAW`. In the following matrix, rb0 ~ rb7 refer to the bytes in raw and db0 ~ db7 refer to the bytes in `BINARY_DOUBLE`.

<table>
<thead>
<tr>
<th>Architecture</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
<th>rb4</th>
<th>rb5</th>
<th>rb6</th>
<th>rb7</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>db0</td>
<td>db1</td>
<td>db2</td>
<td>db3</td>
<td>db4</td>
<td>db5</td>
<td>db6</td>
<td>db7</td>
</tr>
<tr>
<td>little_endian</td>
<td>db7</td>
<td>db6</td>
<td>db5</td>
<td>db4</td>
<td>db3</td>
<td>db2</td>
<td>db1</td>
<td>db0</td>
</tr>
</tbody>
</table>
- In case of machine-endian, the 8 bytes of the `RAW` argument are copied straight across into the `BINARY_DOUBLE` return value. The effect is the same if the user has passed `big_endian` on a big-endian machine, or `little_endian` on a little-endian machine.

270.3.10 CAST_TO_BINARY_FLOAT Function

This function casts the RAW binary representation of a `BINARY_FLOAT` into a `BINARY_FLOAT`.

Syntax

```sql
UTL_RAW.CAST_TO_BINARY_FLOAT (  
    r          IN RAW  
    endianess  IN PLS_INTEGER DEFAULT 1)  
RETURN BINARY_FLOAT;
```

Pragmas

```sql
pragma restrict_references(cast_to_binary_float, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-15  CAST_TO_BINARY_FLOAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a <code>BINARY_FLOAT</code></td>
</tr>
</tbody>
</table>
Table 270-15  (Cont.) CAST_TO_BINARY_FLOAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_FLOAT value.

Usage Notes

- If the RAW argument is more than 4 bytes, only the first 4 bytes are used and the rest of the bytes are ignored. If the result is -0, +0 is returned. If the result is NaN, the value BINARY_FLOAT_NAN is returned.
- If the RAW argument is less than 4 bytes, a VALUE_ERROR exception is raised.
- A 4-byte binary_float value maps to the IEEE 754 single-precision format as follows:
  - byte 0: bit 31 ~ bit 24
  - byte 1: bit 23 ~ bit 16
  - byte 2: bit 15 ~ bit  8
  - byte 3: bit  7 ~ bit  0
- The parameter endianess describes how the bytes of BINARY_FLOAT are mapped to the bytes of RAW. In the following matrix, rb0 ~ rb3 refer to the bytes in RAW and fb0 ~ fb3 refer to the bytes in BINARY_FLOAT.

<table>
<thead>
<tr>
<th>Endianness</th>
<th>rb0</th>
<th>rb1</th>
<th>rb2</th>
<th>rb3</th>
</tr>
</thead>
<tbody>
<tr>
<td>big_endian</td>
<td>fbo</td>
<td>fb1</td>
<td>fb2</td>
<td>fb3</td>
</tr>
<tr>
<td>little_endian</td>
<td>fb3</td>
<td>fb2</td>
<td>fb1</td>
<td>fb0</td>
</tr>
</tbody>
</table>

- In case of machine-endian, the 4 bytes of the RAW argument are copied straight across into the BINARY_FLOAT return value. The effect is the same if the user has passed big_endian on a big-endian machine, or little_endian on a little-endian machine.

270.3.11 CAST_TO_BINARY_INTEGER Function

This function casts the RAW binary representation of a BINARY_INTEGER into a BINARY_INTEGER.

Syntax

UTL_RAW.CAST_TO_BINARY_INTEGER (  
    r    IN RAW  
    endianess  IN PLS_INTEGER DEFAULT BIG_ENDIAN)  
RETURN BINARY_INTEGER;

Pragmas

pragma restrict_references(cast_to_binary_integer, WNDS, RNDS, WNPS, RNPS);
Parameters

Table 270-16  CAST_TO_BINARY_INTEGER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a BINARY_INTEGER</td>
</tr>
<tr>
<td>endianess</td>
<td>A PLS_INTEGER representing big-endian or little-endian architecture. The default is big-endian.</td>
</tr>
</tbody>
</table>

Return Values

The BINARY_INTEGER value

270.3.12 CAST_TO_NUMBER Function

This function casts the RAW binary representation of a NUMBER into a NUMBER.

Syntax

```sql
UTL_RAW.CAST_TO_NUMBER (
    r  IN RAW)
RETURN NUMBER;
```

Pragmas

```sql
pragma restrict_references(cast_to_number, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-17  CAST_TO_NUMBER function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>Binary representation of a NUMBER</td>
</tr>
</tbody>
</table>

Return Values

The NUMBER value.

270.3.13 CAST_TO_NVARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into an NVARCHAR2 value with that number of data bytes.

Note:

When casting to a NVARCHAR2, the current Globalization Support character set is used for the characters within that NVARCHAR2 value.
Syntax

```
UTL_RAW.CAST_TO_NVARCHAR2 (
    r IN RAW)
RETURN NVARCHAR2;
```

Pragma

```
pragma restrict_references(cast_to_NVARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 270-18  CAST_TO_NVARCHAR2 Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a NVARCHAR2</td>
</tr>
</tbody>
</table>

Return Values

**Table 270-19  CAST_TO_NVARCHAR2 Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NVARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If r input parameter was NULL</td>
</tr>
</tbody>
</table>

### 270.3.14 CAST_TO_RAW Function

This function converts a VARCHAR2 value represented using some number of data bytes into a RAW value with that number of data bytes. The data itself is not modified in any way, but its datatype is recast to a RAW datatype.

Syntax

```
UTL_RAW.CAST_TO_RAW (
    c IN VARCHAR2)
RETURN RAW;
```

Pragma

```
pragma restrict_references(cast_to_raw, WNDS, RNDS, WNPS, RNPS);
```

Parameters

**Table 270-20  CAST_TO_RAW Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>VARCHAR2 to be changed to a RAW</td>
</tr>
</tbody>
</table>
Return Values

Table 270-21  CAST_TO_RAW Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the same data as the input VARCHAR2 and equal byte length as the input VARCHAR2 and without a leading length field</td>
</tr>
<tr>
<td>NULL</td>
<td>If input parameter was NULL</td>
</tr>
</tbody>
</table>

270.3.15 CAST_TO_VARCHAR2 Function

This function converts a RAW value represented using some number of data bytes into a VARCHAR2 value with that number of data bytes.

**Note:**

When casting to a VARCHAR2, the current Globalization Support character set is used for the characters within that VARCHAR2.

Syntax

```
UTL_RAW.CAST_TO_VARCHAR2 (
    r IN RAW)
RETURN VARCHAR2;
```

Pragmas

```
pragma restrict_references(cast_to_VARCHAR2, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-22  CAST_TO_VARCHAR2 Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW (without leading length field) to be changed to a VARCHAR2</td>
</tr>
</tbody>
</table>

Return Values

Table 270-23  CAST_TO_VARCHAR2 Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR2</td>
<td>Containing having the same data as the input RAW</td>
</tr>
<tr>
<td>NULL</td>
<td>If input parameter was NULL</td>
</tr>
</tbody>
</table>
270.3.16 COMPARE Function

This function compares two RAW values. If they differ in length, then the shorter is extended on the right according to the optional pad parameter.

Syntax

```
UTL_RAW.COMpare
  (r1 IN RAW,
   r2 IN RAW,
   pad IN RAW DEFAULT NULL)
RETURN NUMBER;
```

Pragmas

```
pragma restrict_references(compare, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-24 COMPARE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r1</td>
<td>1st RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>r2</td>
<td>2nd RAW to be compared, may be NULL or 0 length</td>
</tr>
<tr>
<td>pad</td>
<td>This is an optional parameter. Byte to extend whichever of r1 or r2 is shorter. The default: x'00'</td>
</tr>
</tbody>
</table>

Return Values

Table 270-25 COMPARE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Equals 0 if RAW byte strings are both NULL or identical; or, Equals position (numbered from 1) of the first mismatched byte</td>
</tr>
</tbody>
</table>

270.3.17 CONCAT Function

This function concatenates up to 12 RAWs into a single RAW. If the concatenated size exceeds 32K, then an error is returned.

Syntax

```
UTL_RAW.CONCat
  (r1 IN RAW DEFAULT NULL,
   r2 IN RAW DEFAULT NULL,
   r3 IN RAW DEFAULT NULL,
   r4 IN RAW DEFAULT NULL,
   r5 IN RAW DEFAULT NULL,
   r6 IN RAW DEFAULT NULL,
   r7 IN RAW DEFAULT NULL,
   r8 IN RAW DEFAULT NULL,
   r9 IN RAW DEFAULT NULL,
   r10 IN RAW DEFAULT NULL,
   r11 IN RAW DEFAULT NULL,
   r12 IN RAW DEFAULT NULL)
RETURN NUMBER;
```
CONCAT Function

CONCAT Function

Parameters

Table 270-26  CONCAT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the items concatenated</td>
</tr>
</tbody>
</table>

Exceptions

There is an error if the sum of the lengths of the inputs exceeds the maximum allowable length for a RAW, which is 32767 bytes.

270.3.18 CONVERT Function

This function converts RAW r from character set from_charset to character set to_charset and returns the resulting RAW.

Both from_charset and to_charset must be supported character sets defined to the Oracle server.

Syntax

UTL_RAW.CONVERT (
    r            IN RAW,
    to_charset   IN VARCHAR2,
    from_charset IN VARCHAR2)
RETURN RAW;

Pragmas

pragma restrict_references(convert, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 270-27  CONVERT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte-string to be converted</td>
</tr>
<tr>
<td>to_charset</td>
<td>Name of the character set to which r is converted</td>
</tr>
<tr>
<td>from_charset</td>
<td>Name of the character set in which r is supplied</td>
</tr>
</tbody>
</table>
Return Values

Table 270-28  CONVERT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Byte string ( r ) converted according to the specified character sets.</td>
</tr>
</tbody>
</table>

Exceptions

Table 270-29  CONVERT Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-06502</td>
<td>PL/SQL: numeric or value error</td>
</tr>
<tr>
<td>ORA-12703</td>
<td>This character set conversion is not supported</td>
</tr>
<tr>
<td>ORA-12705</td>
<td>Cannot access NLS data files or invalid environment specified</td>
</tr>
</tbody>
</table>

Usage Notes

- The NLS_LANG parameter form `language_territory.character set` is also accepted for `to_charset` and `from_charset`. However, this form is deprecated and should be avoided. Note that `language` and `territory` are ignored by this subprogram.
- The converted value is silently truncated if it exceeds the maximum length of a `RAW` value, which is 32767 bytes. Do not convert values longer than \( \text{floor}(32767/4) = 8191 \) bytes if you want to avoid this truncation for all possible combinations of `to_charset` and `from_charset`. You can use the maximum character width of the target character set `to_charset`, if known, to expand the limit to a less pessimistic value. For example, if the target character set is ZHS16GBK, the maximum safe source string length is \( \text{floor}(32767/2) = 16383 \) bytes. For single-byte target character sets, no truncation is ever necessary.

270.3.19 COPIES Function

This function returns \( n \) copies of \( r \) concatenated together.

Syntax

```sql
UTL_RAW.COPIES (
    r IN RAW,
    n IN NUMBER)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(copies, WNDS, RNDS, WNPS, RNPS);
```
Parameters

Table 270-30  COPIES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to be copied</td>
</tr>
<tr>
<td>n</td>
<td>Number of times to copy the RAW (must be positive)</td>
</tr>
</tbody>
</table>

Return Values

This returns the RAW copied n times.

Exceptions

Table 270-31  COPIES Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- r is missing, NULL or 0 length</td>
</tr>
<tr>
<td></td>
<td>- n &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- Length of result exceeds maximum length of a RAW</td>
</tr>
</tbody>
</table>

270.3.20 LENGTH Function

This function returns the length in bytes of a RAW r.

Syntax

```sql
UTL_RAW.LENGTH (r IN RAW)
RETURN NUMBER;
```

Pragmas

```sql
pragma restrict_references(length, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-32  LENGTH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte stream to be measured</td>
</tr>
</tbody>
</table>

Return Values

Table 270-33  LENGTH Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Current length of the RAW</td>
</tr>
</tbody>
</table>
270.3.21 OVERLAY Function

This function overlays the specified portion of target RAW with overlay_str RAW, starting from byte position pos of target and proceeding for len bytes.

Syntax

```sql
UTL_RAW.OVERLAY (    overlay_str IN RAW,
                     target      IN RAW,
                     pos         IN BINARY_INTEGER DEFAULT 1,
                     len         IN BINARY_INTEGER DEFAULT NULL,
                     pad         IN RAW            DEFAULT NULL)
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(overlay, WNDS, RNDS, WNPS, RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Table 270-34</th>
<th>OVERLAY Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameters</td>
<td>Description</td>
</tr>
<tr>
<td>overlay_str</td>
<td>Byte-string used to overlay target</td>
</tr>
<tr>
<td>target</td>
<td>Byte-string which is to be overlaid</td>
</tr>
<tr>
<td>pos</td>
<td>Position in target (numbered from 1) to start overlay</td>
</tr>
<tr>
<td>len</td>
<td>The number of target bytes to overlay</td>
</tr>
<tr>
<td>pad</td>
<td>Pad byte used when overlay len exceeds overlay_str length or pos exceeds target length</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

<table>
<thead>
<tr>
<th>Table 270-35</th>
<th>OVERLAY Function Optional Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>pos</td>
<td>1</td>
</tr>
<tr>
<td>len</td>
<td>To the length of overlay_str</td>
</tr>
<tr>
<td>pad</td>
<td>'x'00'</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Table 270-36</th>
<th>OVERLAY Function Return Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Return</td>
<td>Description</td>
</tr>
<tr>
<td>RAW</td>
<td>The target byte_string overlaid as specified.</td>
</tr>
</tbody>
</table>
Usage Notes

If overlay_str has less than len bytes, then it is extended to len bytes using the pad byte. If overlay_str exceeds len bytes, then the extra bytes in overlay_str are ignored. If len bytes beginning at position pos of target exceeds the length of target, then target is extended to contain the entire length of overlay_str.

If len is specified, it must be greater than or equal to 0. If pos is specified, it must be greater than or equal to 1. If pos exceeds the length of target, then target is padded with pad bytes to position pos, and target is further extended with overlay_str bytes.

Exceptions

Table 270-37  OVERLAY Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- Overlay_str is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- Target is missing or undefined</td>
</tr>
<tr>
<td></td>
<td>- Length of target exceeds maximum length of a RAW</td>
</tr>
<tr>
<td></td>
<td>- len &lt; 0</td>
</tr>
<tr>
<td></td>
<td>- pos &lt; 1</td>
</tr>
</tbody>
</table>

270.3.22 REVERSE Function

This function reverses a byte sequence in RAW r from end to end.

For example, x'0102F3' would be reversed to x'F30201', and 'xyz' would be reversed to 'zyx'. The result length is the same as the input RAW length.

Syntax

UTL_RAW.REVERSE (  
  r IN RAW  
)  
RETURN RAW;

Pragmas

pragma restrict_references(reverse, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 270-38  REVERSE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW to reverse</td>
</tr>
</tbody>
</table>
### Return Values

**Table 270-39**  REVERSE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing the &quot;reverse&quot; of r</td>
</tr>
</tbody>
</table>

### Exceptions

**Table 270-40**  REVERSE Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>r is NULL or has 0 length</td>
</tr>
</tbody>
</table>

#### 270.3.23 SUBSTR Function

This function returns `len` bytes, starting at `pos` from RAW `r`.

**Syntax**

```sql
UTL_RAW.SUBSTR (r   IN RAW,
                pos IN BINARY_INTEGER,
                len IN BINARY_INTEGER DEFAULT NULL)
RETURN RAW;
```

**Pragmas**

```sql
pragma restrict_references(substr, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 270-41**  SUBSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW byte-string from which a portion is extracted</td>
</tr>
<tr>
<td>pos</td>
<td>Byte position in r at which to begin extraction</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes from pos to extract from r (optional)</td>
</tr>
</tbody>
</table>

**Defaults and Optional Parameters**

**Table 270-42**  SUBSTR Function Optional Parameter

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>Position pos through to the end of r</td>
</tr>
</tbody>
</table>
Return Values

Table 270-43  SUBSTR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>portion of r</td>
<td>Beginning at pos for len bytes long</td>
</tr>
<tr>
<td>NULL</td>
<td>r input parameter was NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- If pos is positive, then SUBSTR counts from the beginning of r to find the first byte. If pos is negative, then SUBSTR counts backward from the end of the r. The value pos cannot be 0.
- If len is omitted, then SUBSTR returns all bytes to the end of r. The value len cannot be less than 1.

Exceptions

Table 270-44  SUBSTR Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>VALUE_ERROR is returned if:</td>
</tr>
<tr>
<td></td>
<td>• pos = 0 or &gt; length of r</td>
</tr>
<tr>
<td></td>
<td>• len &lt; 1 or &gt; length of r - (pos - 1)</td>
</tr>
</tbody>
</table>

270.3.24 TRANSLATE Function

This function translates the bytes in the input RAW r according to the bytes in the translation RAWs from_set and to_set.

If a byte in r has a matching byte in from_set, then it is replaced by the byte in the corresponding position in to_set, or deleted.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored.

Syntax

```
UTL_RAW.TRANSLATE (  
  r        IN RAW,     
  from_set IN RAW,     
  to_set   IN RAW)     
RETURN RAW;
```

Note:

Be aware that to_set and from_set are reversed in the calling sequence compared to TRANSLITERATE.
Pragmas

pragma restrict_references(translate, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 270-45  TRANSLATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW source byte-string to be translated</td>
</tr>
<tr>
<td>from_set</td>
<td>RAW byte-codes to be translated, if present in r</td>
</tr>
<tr>
<td>to_set</td>
<td>RAW byte-codes to which corresponding from_set bytes are translated</td>
</tr>
</tbody>
</table>

Return Values

Table 270-46  TRANSLATE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Translated byte-string</td>
</tr>
</tbody>
</table>

Usage Notes

• If to_set is shorter than from_set, the extra from_set bytes have no corresponding translation bytes. Bytes from the input RAW that match any such from_set bytes are not translated or included in the result. They are effectively translated to NULL.

• If to_set is longer than from_set, the extra to_set bytes are ignored.

• If a byte value is repeated in from_set, the repeated occurrence is ignored.

Note:

Differences from the TRANSLITERATE Function:

• The from_set parameter comes before the to_set parameter in the calling sequence.

• Bytes from r that appear in from_set but have no corresponding values in to_set are not translated or included in the result.

• The resulting RAW value may be shorter than the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.
Exceptions

Table 270-47  TRANSLATE Function Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- r is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- from_set is NULL or has 0 length</td>
</tr>
<tr>
<td></td>
<td>- to_set is NULL or has 0 length</td>
</tr>
</tbody>
</table>

270.3.25 TRANSLITERATE Function

This function converts the bytes in the input RAW r according to the bytes in the transliteration RAWs from_set and to_set.

Successive bytes in r are looked up in the from_set, and, if not found, copied unaltered to the result RAW. If found, then they are replaced in the result RAW by either corresponding bytes in the to_set, or the pad byte when no correspondence exists.

Bytes in r, but undefined in from_set, are copied to the result. Only the first (leftmost) occurrence of a byte in from_set is used. Subsequent duplicates are not scanned and are ignored. The result RAW is always the same length as r.

Syntax

```sql
UTL_RAW.TRANSLITERATE (r        IN RAW,
                      to_set   IN RAW DEFAULT NULL,
                      from_set IN RAW DEFAULT NULL,
                      pad      IN RAW DEFAULT NULL)
RETURN RAW;
```

**Note:**

Be aware that to_set and from_set are reversed in the calling sequence compared to TRANSLATE.

Pragmas

```sql
pragma restrict_references(transliterate, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-48  TRANSLITERATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>r</td>
<td>RAW input byte-string to be converted</td>
</tr>
<tr>
<td>to_set</td>
<td>RAW byte-codes to which corresponding from_set bytes are converted (any length)</td>
</tr>
</tbody>
</table>
Table 270-48  (Cont.) TRANSLITERATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_set</td>
<td>RAW byte-codes to be converted, if presenting r (any length)</td>
</tr>
<tr>
<td>pad</td>
<td>1 byte used when to-set is shorter than the from_set</td>
</tr>
</tbody>
</table>

Defaults and Optional Parameters

Table 270-49  TRANSLITERATE Function Optional Parameters

<table>
<thead>
<tr>
<th>Optional Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>to_set</td>
<td>To the NULL string and effectively extended with pad to the length of from_set as necessary</td>
</tr>
<tr>
<td>from_set</td>
<td>x'00' through x'fff'</td>
</tr>
<tr>
<td>pad</td>
<td>x'00'</td>
</tr>
</tbody>
</table>

Return Values

Table 270-50  TRANSLITERATE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Converted byte-string.</td>
</tr>
</tbody>
</table>

Usage Notes

- If to_set is shorter than from_set, the extra from_set bytes have no corresponding conversion bytes. Bytes from the input RAW that match any such from_set bytes are converted in the result to the pad byte instead.
- If to_set is longer than from_set, the extra to_set bytes are ignored.
- If a byte value is repeated in from_set, the repeated occurrence is ignored.

Note:

Differences from the TRANSLATE Function:

- The to_set parameter comes before the from_set parameter in the calling sequence.
- Bytes from r that appear in from_set but have no corresponding values in to_set are replaced by pad in the result.
- The resulting RAW value always has the same length as the input RAW value.

Note that TRANSLATE and TRANSLITERATE only differ in functionality when to_set has fewer bytes than from_set.
Exceptions

Table 270-51    TRANSLITERATE Function Exceptions

<table>

</table>

270.3.26 XRANGE Function

This function returns a RAW value containing the succession of one-byte encodings beginning and ending with the specified byte-codes. The specified byte-codes must be single-byte RAW values. If the start_byte value is greater than the end_byte value, then the succession of resulting bytes begins with start_byte, wraps through x'FF' back to x'00', then ends at end_byte.

Syntax

```sql
UTL_RAW.XRANGE (  
    start_byte IN RAW DEFAULT NULL,  
    end_byte   IN RAW DEFAULT NULL)  
RETURN RAW;
```

Pragmas

```sql
pragma restrict_references(xrange, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 270-52    XRANGE Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_byte</td>
<td>Beginning byte-code value of resulting sequence. The default is x'00'.</td>
</tr>
<tr>
<td>end_byte</td>
<td>Ending byte-code value of resulting sequence. The default is x'FF'.</td>
</tr>
</tbody>
</table>

Return Values

Table 270-53    XRANGE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Containing succession of 1-byte hexadecimal encodings</td>
</tr>
</tbody>
</table>
The UTL_RECOMP package recompiles invalid PL/SQL modules, invalid views, Java classes, index types and operators in a database, either sequentially or in parallel.

This chapter contains the following topics:

- Overview
- Operational Notes
- Examples
- Summary of UTL_RECOMP Subprograms

### 271.1 UTL_RECOMP Overview

This script is particularly useful after a major-version upgrade that typically invalidates all PL/SQL and Java objects. Although invalid objects are recompiled automatically on use, it is useful to run this script prior to operation because this will either eliminate or minimize subsequent latencies due to on-demand automatic recompilation at runtime.

Parallel recompilation can exploit multiple CPUs to reduce the time taken to recompile invalid objects. The degree of parallelism is specified by the first argument to the RECOMP_PARALLEL Procedure.

In general, a parallelism setting of one thread for each available CPU provides a good initial setting. However, please note that the process of recompiling an invalid object writes a significant amount of data to system tables and is fairly I/O intensive. A slow disk system may be a significant bottleneck and limit speedups available from a higher degree of parallelism.

### 271.2 UTL_RECOMP Operational Notes

**UTL_RECOMP** has several operational notes.

- This package uses the job queue for parallel recompilation.
- This package must be run using SQL*PLUS.
- You must be connected as SYSDBA to run this script.
- This package expects the following packages to have been created with VALID status:
  - STANDARD (standard.sql)
  - DBMS_STANDARD (dbmsstdx.sql)
  - DBMS_JOB (dbmsjob.sql)
  - DBMS_RANDOM (dbmsrand.sql)
- There should be no other DDL on the database while running entries in this package. Not following this recommendation may lead to deadlocks.
271.3 UTL_RECOMP Examples

These examples show various ways that UTL_RECOMP can recompile objects.

- Recompile all objects sequentially:
  
  ```sql
  EXECUTE UTL_RECOMP.RECOMP_SERIAL();
  ```

- Recompile objects in schema SCOTT sequentially:
  
  ```sql
  EXECUTE UTL_RECOMP.RECOMP_SERIAL('SCOTT');
  ```

- Recompile all objects using 4 parallel threads:
  
  ```sql
  EXECUTE UTL_RECOMP.RECOMP_PARALLEL(4);
  ```

- Recompile objects in schema JOE using the number of threads specified in the parameter JOB_QUEUE_PROCESSES:
  
  ```sql
  EXECUTE UTL_RECOMP.RECOMP_PARALLEL(NULL, 'JOE');
  ```

271.4 Summary of UTL_RECOMP Subprograms

This table lists the UTL_RECOMP subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECOMP_PARALLEL</td>
<td>Recompiles invalid objects in a given schema, or all invalid objects in the database, in parallel</td>
</tr>
<tr>
<td>RECOMP_SERIAL</td>
<td>Recompiles invalid objects in a given schema or all invalid objects in the database</td>
</tr>
</tbody>
</table>

271.4.1 RECOMP_PARALLEL Procedure

This procedure uses the information exposed in the DBA_Dependencies view to recompile invalid objects in the database, or in a given schema, in parallel.

Syntax

```sql
UTL_RECOMP.RECOMP_PARALLEL(
  threads  IN   PLS_INTEGER DEFAULT NULL,
  schema   IN   VARCHAR2    DEFAULT NULL,
  flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threads</td>
<td>The number of recompile threads to run in parallel. If NULL, use the value of 'job_queue_processes'.</td>
</tr>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
</tbody>
</table>
Table 271-2  (Cont.) RECOMP_PARALLEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>

Usage Notes

The parallel recompile exploits multiple CPUs to reduce the time taken to recompile invalid objects. However, please note that recompilation writes significant amounts of data to system tables, so the disk system may be a bottleneck and prevent significant speedups.

271.4.2 RECOMP_SERIAL Procedure

This procedure recompiles invalid objects in a given schema or all invalid objects in the database.

Syntax

```sql
UTL_RECOMP.RECOMP_SERIAL(
  schema   IN   VARCHAR2    DEFAULT NULL,
  flags    IN   PLS_INTEGER DEFAULT 0);
```

Parameters

Table 271-3  RECOMP_SERIAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>The schema in which to recompile invalid objects. If NULL, all invalid objects in the database are recompiled.</td>
</tr>
<tr>
<td>flags</td>
<td>Flag values are intended for internal testing and diagnosability only.</td>
</tr>
</tbody>
</table>
The UTL_REF package provides PL/SQL procedures to support reference-based operations. Unlike SQL, UTL_REF procedures enable you to write generic type methods without knowing the object table name.

This chapter contains the following topics:

- Overview
- Security Model
- Types
- Exceptions
- Summary of UTL_REF Subprograms

272.1 UTL_REF Overview

UTL_REF procedures enable you to write generic type methods without knowing the object table name.

Oracle supports user-defined composite type or object type. Any instance of an object type is called an object. An object type can be used as the type of a column or as the type of a table.

In an object table, each row of the table stores an object. You can uniquely identify an object in an object table with an object identifier.

A reference is a persistent pointer to an object, and each reference can contain an object identifier. The reference can be an attribute of an object type, or it can be stored in a column of a table. Given a reference, an object can be retrieved.

272.2 UTL_REF Security Model

The procedural option is needed to use this package. This package must be created under SYS (CONNECT /AS SYSDBA). Operations provided by this package are performed under the current calling user, not under the package owner SYS.

You can use the UTL_REF package from stored PL/SQL procedures/packages on the server, as well as from client/side PL/SQL code.

When invoked from PL/SQL procedures/packages on the server, UTL_REF verifies that the invoker has the appropriate privileges to access the object pointed to by the REF.
Note:

This is in contrast to PL/SQL packages/procedures on the server which operate with definer's privileges, where the package owner must have the appropriate privileges to perform the desired operations.

Thus, if UTL_REF is defined under user SYS, and user A invokes UTL_REF.SELECT to select an object from a reference, then user A (the invoker) requires the privileges to check.

When invoked from client-side PL/SQL code, UTL_REF operates with the privileges of the client session under which the PL/SQL execution is being done.

272.3 UTL_REF Types

An object type is a composite datatype defined by the user or supplied as a library type.

You can create the object type employee_type using the following syntax:

```sql
CREATE TYPE employee_type AS OBJECT (
    name VARCHAR2(20),
    id NUMBER,

    member function GET_ID
    (name VARCHAR2)
    RETURN MEMBER);
```

The object type employee_type is a user-defined type that contains two attributes, name and id, and a member function, GET_ID().

You can create an object table using the following SQL syntax:

```sql
CREATE TABLE employee_table OF employee_type;
```

272.4 UTL_REF Exceptions

Exceptions can be returned during execution of UTL_REF functions for various reasons.

For example, the following scenarios would result in exceptions:

- The object selected does not exist. This could be because either:
  1. The object has been deleted, or the given reference is dangling (invalid).
  2. The object table was dropped or does not exist.

- The object cannot be modified or locked in a serializable transaction. The object was modified by another transaction after the serializable transaction started.

- You do not have the privilege to select or modify the object. The caller of the UTL_REF subprogram must have the proper privilege on the object that is being selected or modified.
Table 272-1  UTL_REF Exceptions

<table>
<thead>
<tr>
<th>Exceptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errnum == 942</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 1031</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td>errnum == 8177</td>
<td>Unable to serialize, if in a serializable transaction.</td>
</tr>
<tr>
<td>errnum == 60</td>
<td>Deadlock detected.</td>
</tr>
<tr>
<td>errnum == 1403</td>
<td>No data found (if the REF is NULL, and so on.).</td>
</tr>
</tbody>
</table>

The UTL_REF package does not define any named exceptions. You may define exception handling blocks to catch specific exceptions and to handle them appropriately.

272.5 Summary of UTL_REF Subprograms

This table lists the UTL_REF subprograms and briefly describes them.

Table 272-2  UTL_REF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_OBJECT Procedure</td>
<td>Deletes an object given a reference</td>
</tr>
<tr>
<td>LOCK_OBJECT Procedure</td>
<td>Locks an object given a reference</td>
</tr>
<tr>
<td>SELECT_OBJECT Procedure</td>
<td>Selects an object given a reference</td>
</tr>
<tr>
<td>UPDATE_OBJECT Procedure</td>
<td>Updates an object given a reference</td>
</tr>
</tbody>
</table>

272.5.1 DELETE_OBJECT Procedure

This procedure deletes an object given a reference.

The semantic of this subprogram is similar to the following SQL statement:

```
DELETE FROM object_table
WHERE REF(t) = reference;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides.

Syntax

```
UTL_REF.DELETE_OBJECT (
    reference IN REF "<typename>");
```

Parameters

Table 272-3  DELETE_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to delete.</td>
</tr>
</tbody>
</table>
Exceptions

May be raised.

Examples

The following example illustrates usage of the UTL_REF package to implement this scenario: if an employee of a company changes their address, their manager should be notified.

... declarations of Address_t and others...

CREATE OR REPLACE TYPE Person_t {
    name VARCHAR2(64),
    gender CHAR(1),
    address Address_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t)
};

CREATE OR REPLACE TYPE BODY Person_t {
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
    BEGIN
        address := addr;
        END;
    }

CREATE OR REPLACE TYPE Employee_t {

Under Person_t: Simulate implementation of inheritance using a REF to Person_t and delegation of setAddress to it.

    thePerson  REF Person_t,
    empno      NUMBER(5),
    deptREF    Department_t,
    mgrREF     Employee_t,
    reminders  StringArray_t,
    MEMBER PROCEDURE setAddress(addr IN Address_t),
    MEMBER procedure addReminder(reminder VARCHAR2);
};

CREATE TYPE BODY Employee_t {
    MEMBER PROCEDURE setAddress(addr IN Address_t) IS
        myMgr Employee_t;
        meAsPerson Person_t;
        BEGIN
            Update the address by delegating the responsibility to thePerson. Lock the Person object from the reference, and also select it:

            UTL_REF.LOCK_OBJECT(thePerson, meAsPerson);
            meAsPerson.setAddress(addr);

            Delegate to thePerson:

            UTL_REF.UPDATE_OBJECT(thePerson, meAsPerson);
            if mgr is NOT NULL THEN

            Give the manager a reminder:

            UTL_REF.LOCK_OBJECT(mgr);
            UTL_REF.SELECT_OBJECT(mgr, myMgr);
myMgr.addReminder
('Update address in the employee directory for' ||
 thePerson.name 'new address: ' || addr.asString);
UTL_REF.UPDATE_OBJECT(mgr, myMgr);
END IF;
EXCEPTION
  WHEN OTHERS THEN
    errnum := SQLCODE;
    errmsg := SUBSTR(SQLERRM, 1, 200);

272.5.2 LOCK_OBJECT Procedure

This procedure locks an object given a reference. In addition, this procedure lets the program select the locked object.

The semantic of this subprogram is similar to the following SQL statement:

```
SELECT VALUE(t)
  INTO object
  FROM object_table t
  WHERE REF(t) = reference
  FOR UPDATE;
```

Unlike the preceding SQL statement, this subprogram does not require you to specify the object table name where the object resides. It is not necessary to lock an object before updating/deleting it.

Syntax

```
UTL_REF.LOCK_OBJECT ( reference IN REF "<typename>");
```

```
UTL_REF.LOCK_OBJECT ( reference IN REF "<typename>",
  object    IN OUT "<typename>");
```

Parameters

Table 272-4  LOCK_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to lock.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the locked object. This variable should be of the same object type as the locked object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.

272.5.3 SELECT_OBJECT Procedure

This procedure selects an object given its reference. The selected object is retrieved from the database and its value is put into the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:
SELECT VALUE(t)
INTO object
FROM object_table t
WHERE REF(t) = reference;

Unlike the preceding SQL statement, this subprogram does not require you to specify
the object table name where the object resides.

Syntax

UTL_REF.SELECT_OBJECT ( 
    reference IN REF "<typename>",
    object    IN OUT "<typename>";

Parameters

Table 272-5  SELECT_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference to the object to select or retrieve.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that stores the selected object; this variable should be of the same object type as the referenced object.</td>
</tr>
</tbody>
</table>

Exceptions

May be raised.

272.5.4 UPDATE_OBJECT Procedure

This procedure updates an object given a reference. The referenced object is updated
with the value contained in the PL/SQL variable 'object'.

The semantic of this subprogram is similar to the following SQL statement:

UPDATE object_table t
SET VALUE(t) = object
WHERE REF(t) = reference;

Unlike the preceding SQL statement, this subprogram does not require you to specify
the object table name where the object resides.

Syntax

UTL_REF.UPDATE_OBJECT ( 
    reference IN REF "<typename>",
    object    IN "<typename>";

Parameters

Table 272-6  UPDATE_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reference</td>
<td>Reference of the object to update.</td>
</tr>
<tr>
<td>object</td>
<td>The PL/SQL variable that contains the new value of the object. This variable should be of the same object type as the object to update.</td>
</tr>
</tbody>
</table>
Exceptions

May be raised.
The `UTL_SMTP` package is designed for sending electronic mails (e-mails) over Simple Mail Transfer Protocol (SMTP) as specified by RFC821.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Types
- Reply Codes
- `UTL_SMTP` Operational Notes
- Exceptions
- Rules and Limits
- Examples
- Summary of `UTL_SMTP` Subprograms

---

**See Also:**

*Oracle Database Development Guide*

### 273.1 UTL_SMTP Overview

The `UTL_SMTP` protocol consists of a set of commands for an e-mail client to dispatch e-mails to an SMTP server. The `UTL_SMTP` package provides interfaces to the SMTP commands.

For many of the commands, the package provides both a procedural and a functional interface. The functional form returns the reply from the server for processing by the client. The procedural form checks the reply and raises an exception if the reply indicates a transient (400-range reply code) or permanent error (500-range reply code). Otherwise, it discards the reply.

Note that the original SMTP protocol communicates using 7-bit ASCII. Using `UTL_SMTP`, all text data (in other words, those in `VARCHAR2`) is converted to `US7ASCII` before it is sent to the server. Some implementations of SMTP servers that support SMTP extension 8BITMIME [RFC1652] support full 8-bit communication between client and server. The body of the DATA command can be transferred in full 8 bits, but the rest of the SMTP command and response must be in 7 bits. When the target SMTP server supports 8BITMIME extension, users of multibyte databases may convert their non-US7ASCII, multibyte `VARCHAR2` data to `RAW` and use the `WRITE_RAW_DATA` subprogram to send multibyte data using 8-bit MIME encoding.
UTL_SMTP provides for SMTP communication as specified in RFC821, but does not provide an API to format the content of the message according to RFC 822 (for example, setting the subject of an electronic mail). You must format the message appropriately. In addition, UTL_SMTP does not have the functionality to implement an SMTP server for an e-mail clients to send e-mails using SMTP.

273.2 UTL_SMTP Security Model

This package is an invoker's rights package. The invoking user must have the connect privilege granted in the access control list assigned to the remote network host to which the user must connect.

Note:
For more information on managing fine-grained access, see Oracle Database Security Guide

273.3 UTL_SMTP Constants

UTL_SMTP defines several constants to use when specifying parameter values. These are shown in the following table.

Table 273-1  UTL_SMTP Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL_SCHEMES</td>
<td>VARCHAR2 (256)</td>
<td>'CRAM-MD5,  Plain, LOGIN'</td>
<td>List of all authentication schemes UTL_SMTP supports, in order of their relative security strength. The subset of the schemes in ALL_SCHEMES (namely, Plain and LOGIN) in which cleartext passwords are sent over SMTP must be used only in SMTP connections that are secured by Secure Socket Layer / Transport Layer Security (SSL/TLS).</td>
</tr>
<tr>
<td>NON_CLEARTEXT_PASSWORD_SCHEMES</td>
<td>VARCHAR2 (256)</td>
<td>'CRAM-MD5'</td>
<td>List of authentication schemes that UTL_SMTP supports and in which no cleartext passwords are sent over SMTP. They can be used in SMTP connections that are not secured by SSL/TLS. Note that these schemes may still be weak when used in an insecure SMTP connection.</td>
</tr>
</tbody>
</table>

273.4 UTL_SMTP Types

UTL_SMTP uses a CONNECTION record type and REPLY_REPLIES record types.

CONNECTION Record Type
This is a PL/SQL record type used to represent an SMTP connection.
Syntax

TYPE connection IS RECORD (  
host VARCHAR2(255),  
port PLS_INTEGER,  
tx_timeout PLS_INTEGER,  
private_tcp_con utl_tcp.connection,  
private_state PLS_INTEGER);

Fields

Table 273-2 CONNECTION Record Type Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>port</td>
<td>Port number of the remote SMTP server connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation in this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>private_tcp_con</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
<tr>
<td>private_state</td>
<td>Private, for implementation use only. You should not modify this field.</td>
</tr>
</tbody>
</table>

Usage Notes

The read-only fields in a connection record are used to return information about the SMTP connection after the connection is successfully made with the OPEN_CONNECTION Functions. Changing the values of these fields has no effect on the connection. The fields private_tcp_con and private_state for implementation use only. You should not modify these fields.

REPLY_REPLIES Record Types

These are PL/SQL record types used to represent an SMTP reply line. Each SMTP reply line consists of a reply code followed by a text message. While a single reply line is expected for most SMTP commands, some SMTP commands expect multiple reply lines. For those situations, a PL/SQL table of reply records is used to represent multiple reply lines.

Syntax

TYPE reply IS RECORD (  
code PLS_INTEGER,  
text VARCHAR2(508));

TYPE replies IS TABLE OF reply INDEX BY BINARY_INTEGER;
Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>3-digit reply code</td>
</tr>
<tr>
<td>text</td>
<td>Text message of the reply</td>
</tr>
</tbody>
</table>

### 273.5 UTL_SMTP Reply Codes

SMTP servers send reply codes that indicate message or server status.

The following is a list of the SMTP reply codes.

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>211</td>
<td>System status, or system help reply</td>
</tr>
<tr>
<td>214</td>
<td>Help message [Information on how to use the receiver or the meaning of a particular non-standard command; this reply is useful only to the human user]</td>
</tr>
<tr>
<td>220</td>
<td>&lt;domain&gt; Service ready</td>
</tr>
<tr>
<td>221</td>
<td>&lt;domain&gt; Service closing transmission channel</td>
</tr>
<tr>
<td>250</td>
<td>Requested mail action okay, completed</td>
</tr>
<tr>
<td>251</td>
<td>User not local; forwards to &lt;forward-path&gt;</td>
</tr>
<tr>
<td>252</td>
<td>OK, pending messages for node &lt;node&gt; started. Cannot VRFY user (for example, info is not local), but takes message for this user and attempts delivery.</td>
</tr>
<tr>
<td>253</td>
<td>OK, &lt;messages&gt; pending messages for node &lt;node&gt; started</td>
</tr>
<tr>
<td>354</td>
<td>Start mail input; end with &lt;CRLF.CRLF&gt;</td>
</tr>
<tr>
<td>355</td>
<td>Octet-offset is the transaction offset</td>
</tr>
<tr>
<td>421</td>
<td>&lt;domain&gt; Service not available, closing transmission channel (This can be a reply to any command if the service knows it must shut down.)</td>
</tr>
<tr>
<td>450</td>
<td>Requested mail action not taken: mailbox unavailable [for example, mailbox busy]</td>
</tr>
<tr>
<td>451</td>
<td>Requested action terminated: local error in processing</td>
</tr>
<tr>
<td>452</td>
<td>Requested action not taken: insufficient system storage</td>
</tr>
<tr>
<td>453</td>
<td>You have no mail.</td>
</tr>
<tr>
<td>454</td>
<td>TLS not available due to temporary reason. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>458</td>
<td>Unable to queue messages for node &lt;node&gt;</td>
</tr>
<tr>
<td>459</td>
<td>Node &lt;node&gt; not allowed: reason</td>
</tr>
<tr>
<td>500</td>
<td>Syntax error, command unrecognized (This may include errors such as command line too long.)</td>
</tr>
<tr>
<td>501</td>
<td>Syntax error in parameters or arguments</td>
</tr>
</tbody>
</table>
Table 273-4  (Cont.) SMTP Reply Codes

<table>
<thead>
<tr>
<th>Reply Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>502</td>
<td>Command not implemented</td>
</tr>
<tr>
<td>503</td>
<td>Bad sequence of commands</td>
</tr>
<tr>
<td>504</td>
<td>Command parameter not implemented</td>
</tr>
<tr>
<td>521</td>
<td>&lt;Machine&gt; does not accept mail.</td>
</tr>
<tr>
<td>530</td>
<td>Must issue a STARTTLS command first. Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>534</td>
<td>Authentication mechanism is too weak.</td>
</tr>
<tr>
<td>538</td>
<td>Encryption required for requested authentication mechanism.</td>
</tr>
<tr>
<td>550</td>
<td>Requested action not taken: mailbox unavailable [for, mailbox not found, no access]</td>
</tr>
<tr>
<td>551</td>
<td>User not local; please try &lt;forward-path&gt;</td>
</tr>
<tr>
<td>552</td>
<td>Requested mail action terminated: exceeded storage allocation</td>
</tr>
<tr>
<td>553</td>
<td>Requested action not taken: mailbox name not allowed [for example, mailbox syntax incorrect]</td>
</tr>
<tr>
<td>554</td>
<td>Transaction failed</td>
</tr>
</tbody>
</table>

273.6 UTL_SMTP Operational Notes

An SMTP connection is initiated by a call to OPEN_CONNECTION Functions which returns a SMTP connection.

After a connection is established, the following calls are required to send a mail:

- **HELO Function and Procedure** - identify the domain of the sender
- **MAIL Function and Procedure** - start a mail, specify the sender
- **RCPT Function** - specify the recipient
- **OPEN_DATA Function and Procedure** - start the mail body
- **WRITE_RAW_DATA Procedure** - write the mail body (multiple calls allowed)
- **CLOSE_DATA Function and Procedure** - close the mail body and send the mail

The SMTP connection is closed by calling the QUIT Function and Procedure.

Related Topics

- **OPEN_CONNECTION Functions**
  These functions open a connection to an SMTP server.
- **QUIT Function and Procedure**
  This subprogram terminates an SMTP session and disconnects from the server.
273.7 UTL_SMTP Exceptions

This table lists the exceptions that can be raised by the interface of the UTL_SMTP package.

The network error is transferred to a reply code of 421- service not available.

Table 273-5    UTL_SMTP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_OPERATION</td>
<td>Raised when an invalid operation is made.</td>
</tr>
<tr>
<td></td>
<td>In other words, calling API other than the WRITE_DATA Procedure, the</td>
</tr>
<tr>
<td></td>
<td>WRITE_RAW_DATA Procedure or the CLOSE_DATA Function after the OPEN_DATA</td>
</tr>
<tr>
<td></td>
<td>Function and Procedure is called, or calling WRITE_DATA, WRITE_RAW_DATA or</td>
</tr>
<tr>
<td></td>
<td>CLOSE_DATA without first calling OPEN_DATA.</td>
</tr>
<tr>
<td>TRANSIENT_ERROR</td>
<td>Raised when receiving a reply code in 400 range</td>
</tr>
<tr>
<td>PERMANENT_ERROR</td>
<td>Raised when receiving a reply code in 500 range</td>
</tr>
</tbody>
</table>

273.8 UTL_SMTP Rules and Limits

The API imposes no imitation or range-checking. However, you must be aware of the limitations on various elements of SMTP. Sending data that exceed these limits may result in errors returned by the server.

The following table describes the size limitations encountered by the UTL_SMTP subprograms.

Table 273-6    SMTP Size Limitation

<table>
<thead>
<tr>
<th>Element</th>
<th>Size Limitation</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Maximum total length of a user name is 64 characters</td>
</tr>
<tr>
<td>domain</td>
<td>Maximum total length of a domain name or number is 64 characters</td>
</tr>
<tr>
<td>path</td>
<td>Maximum total length of a reverse-path or forward-path is 256 characters</td>
</tr>
<tr>
<td>command line</td>
<td>(including the punctuation and element separators)</td>
</tr>
<tr>
<td>reply line</td>
<td>Maximum total length of a reply line including the reply code and the</td>
</tr>
<tr>
<td></td>
<td>&lt;CRLF&gt; is 512 characters</td>
</tr>
<tr>
<td>text line</td>
<td>Maximum total length of a text line including the &lt;CRLF&gt; is 1000 characters</td>
</tr>
<tr>
<td>recipients buffer</td>
<td>Maximum total number of recipients that must be buffered is 100 recipients</td>
</tr>
</tbody>
</table>
273.9 UTL_SMTP Examples

This example illustrates how UTL_SMTP is used by an application to send e-mail. The application connects to an SMTP server at port 25 and sends a simple text message.

```sql
DECLARE
    c UTL_SMTP.CONNECTION;

PROCEDURE send_header(name IN VARCHAR2, header IN VARCHAR2) AS
BEGIN
    UTL_SMTP.WRITE_DATA(c, name || ': ' || header || UTL_TCP.CRLF);
END;

BEGIN
    c := UTL_SMTP.OPEN_CONNECTION('smtp-server.acme.com');
    UTL_SMTP.HELO(c, 'foo.com');
    UTL_SMTP.MAIL(c, 'sender@foo.com');
    UTL_SMTP.RCPT(c, 'recipient@foo.com');
    UTL_SMTP.OPEN_DATA(c);
    send_header('From',    "Sender" <sender@foo.com>");
    send_header('To',      "Recipient" <recipient@foo.com>");
    send_header('Subject', 'Hello');
    UTL_SMTP.WRITE_DATA(c, UTL_TCP.CRLF || 'Hello, world!');
    UTL_SMTP.CLOSE_DATA(c);
    UTL_SMTP.QUIT(c);
EXCEPTION
    WHEN utl_smtp.transient_error OR utl_smtp.permanent_error THEN
        BEGIN
            UTL_SMTP.QUIT(c);
        EXCEPTION
            WHEN UTL_SMTP.TRANSIENT_ERROR OR UTL_SMTP.PERMANENT_ERROR THEN
                NULL; -- When the SMTP server is down or unavailable, we don't have
                -- a connection to the server. The QUIT call raises an
                -- exception that we can ignore.
        END;
        raise_application_error(-20000, 'Failed to send mail due to the following error: ' || sqlerrm);
END;
```

273.10 Summary of UTL_SMTP Subprograms

This table lists the UTL_SMTP subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTH Function and Procedure</td>
<td>Sends the AUTH command to authenticate to the SMTP server</td>
</tr>
<tr>
<td>CLOSE_CONNECTION Procedure</td>
<td>Closes the SMTP connection, causing the current SMTP operation to terminate</td>
</tr>
<tr>
<td>CLOSE_DATA Function and Procedure</td>
<td>Closes the data session</td>
</tr>
<tr>
<td>COMMAND Function and Procedure</td>
<td>Performs a generic SMTP command</td>
</tr>
</tbody>
</table>
Table 273-7  (Cont.) UTL_SMTP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMAND_REPLIES Function</td>
<td>Performs a generic SMTP command and retrieves multiple reply lines</td>
</tr>
<tr>
<td>DATA Function and Procedure</td>
<td>Sends the e-mail body</td>
</tr>
<tr>
<td>EHLO Function and Procedure</td>
<td>Performs the initial handshake with SMTP server using the <strong>EHLO</strong> command</td>
</tr>
<tr>
<td>HELO Function and Procedure</td>
<td>Performs the initial handshake with SMTP server using the <strong>HELO</strong> command</td>
</tr>
<tr>
<td>HELP Function</td>
<td>Sends <strong>HELP</strong> command</td>
</tr>
<tr>
<td>MAIL Function and Procedure</td>
<td>Initiates an e-mail transaction with the server, the destination is a mailbox</td>
</tr>
<tr>
<td>NOOP Function and Procedure</td>
<td><strong>NULL</strong> command</td>
</tr>
<tr>
<td>OPEN_CONNECTION Functions</td>
<td>Opens a connection to an SMTP server</td>
</tr>
<tr>
<td>OPEN_DATA Function and Procedure</td>
<td>Sends the <strong>DATA</strong> command</td>
</tr>
<tr>
<td>QUIT Function and Procedure</td>
<td>Terminates an SMTP session and disconnects from the server</td>
</tr>
<tr>
<td>RCPT Function</td>
<td>Specifies the recipient of an e-mail message</td>
</tr>
<tr>
<td>RSET Function and Procedure</td>
<td>Terminates the current e-mail transaction</td>
</tr>
<tr>
<td>STARTTLS Function and Procedure</td>
<td>Sends <strong>STARTTLS</strong> command to secure the SMTP connection using SSL/TLS</td>
</tr>
<tr>
<td>VRFY Function</td>
<td>Verifies the validity of a destination e-mail address</td>
</tr>
<tr>
<td>WRITE_DATA Procedure</td>
<td>Writes a portion of the e-mail message</td>
</tr>
<tr>
<td>WRITE_RAW_DATA Procedure</td>
<td>Writes a portion of the e-mail message with <strong>RAW</strong> data</td>
</tr>
</tbody>
</table>

273.10.1 AUTH Function and Procedure

This subprogram sends the **AUTH** command to authenticate to the SMTP server. The **UTL_SMTP** package goes through the user's choices of authentication schemes, skips any that is not supported by the SMTP server and uses the first supported.

To determine the schemes the SMTP server supports from its **EHLO** reply, the user must call the **EHLO Function and Procedure**. Otherwise, **UTL_SMTP** uses the first scheme in the list.

**Syntax**

```sql
UTL_SMTP.AUTH (c          IN OUT NOCOPY connection,
    username   IN            VARCHAR2,
    password   IN            VARCHAR2,
    schemes    IN            VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES)
RETURN reply;
```
UTL_SMTP.AUTH ( 
  c IN OUT NOCOPY connection,
  username IN VARCHAR2,
  password IN VARCHAR2,
  schemes IN VARCHAR2 DEFAULT NON_CLEARTEXT_PASSWORD_SCHEMES);

Parameters

Table 273-8 AUTH Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>username</td>
<td>Username</td>
</tr>
<tr>
<td>password</td>
<td>Password</td>
</tr>
<tr>
<td>schemes</td>
<td>Space-separated list of authentication schemes UTL_SMTP is allowed to use in the preferred order. See the ALL_SCHEMES and NON_CLEARTEXT_PASSWORD_SCHEMES constants for suggestions.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-9 AUTH Function and Procedure Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLACE_REPLEIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- Currently only PLAIN, LOGIN and CRAM-MD5 authentication schemes are supported by UTL_SMTP.
- Since the SMTP server may change the authentication schemes it supports after the SMTP connection is secured by SSL/TLS after the STARTTLS command (for example, adding PLAIN and LOGIN), the caller must call the EHLO Function and Procedure again for UTL_SMTP to update the list after the STARTTLS Function and Procedure is called.

Examples

DECLARE
  c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  UTL_SMTP.STARTTLS(c);
  UTL_SMTP.AUTH(
    c => c,
    username => 'scott',
    password => 'password'
273.10.2 CLOSE_CONNECTION Procedure

This procedure closes the SMTP connection, causing the current SMTP operation to terminate. Use this procedure only to cancel an e-mail in the middle of the data session.

To end the SMTP connection properly, use the QUIT Function and Procedure.

Syntax

```
UTL_SMTP.CLOSE_CONNECTION (c IN OUT NOCOPY connection);
```

Parameters

Table 273-10  CLOSE_CONNECTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

273.10.3 CLOSE_DATA Function and Procedure

This subprogram ends the e-mail message by sending the sequence <CR><LF>.<CR><LF> (a single period at the beginning of a line).

Syntax

```
UTL_SMTP.CLOSE_DATA (c IN OUT NOCOPY connection)
RETURN reply;
```

```
UTL_SMTP.CLOSE_DATA (c IN OUT NOCOPY connection);
```

Parameters

Table 273-11  CLOSE_DATA Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 273-12  CLOSE_DATA Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_ REPLES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>
Usage Notes

The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

CLOSE_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

Note that there is no function form of WRITE_DATA because the SMTP server does not respond until the data-terminator is sent during the call to CLOSE_DATA.

273.10.4 COMMAND Function and Procedure

This subprogram performs a generic SMTP command.

Syntax

```sql
UTL_SMTP.COMMAND (  
  c     IN OUT NOCOPY    connection,  
  cmd   IN               VARCHAR2,  
  arg   IN               VARCHAR2 DEFAULT NULL)  
RETURN reply;
```

```sql
UTL_SMTP.COMMAND (  
  c     IN OUT NOCOPY    connection,  
  cmd   IN               VARCHAR2,  
  arg   IN               VARCHAR2 DEFAULT NULL);
```

Parameters

Table 273-13 COMMAND Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-14 COMMAND Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>
**Usage Notes**

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.

### 273.10.5 COMMAND_REPLIES Function

This function performs a generic SMTP command and retrieves multiple reply lines.

#### Syntax

```
UTL_SMTP.COMMAND_REPLIES (
   c     IN OUT NOCOPY    connection,
   cmd   IN               VARCHAR2,
   arg   IN               VARCHAR2 DEFAULT NULL
) RETURN replies;
```

#### Parameters

**Table 273-15 COMMAND_REPLIES Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>cmd</td>
<td>SMTP command to send to the server</td>
</tr>
<tr>
<td>arg</td>
<td>Optional argument to the SMTP argument. A space is inserted between cmd and arg.</td>
</tr>
</tbody>
</table>

#### Return Values

**Table 273-16 COMMAND_REPLIES Function Return Values**

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types)</td>
</tr>
</tbody>
</table>

**Usage Notes**

This function is used to invoke generic SMTP commands. Use `COMMAND` if only a single reply line is expected. Use `COMMAND_REPLIES` if multiple reply lines are expected.

For `COMMAND`, if multiple reply lines are returned from the SMTP server, it returns the last reply line only.
273.10.6 DATA Function and Procedure

This subprogram specifies the body of an e-mail message.

Syntax

    UTL_SMTP.DATA ( 
            c     IN OUT NOCOPY connection 
            body  IN VARCHAR2 CHARACTER SET ANY_CS) 
    RETURN reply;

    UTL_SMTP.DATA ( 
            c     IN OUT NOCOPY connection 
            body  IN VARCHAR2 CHARACTER SET ANY_CS);

Parameters

Table 273-17  DATA Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP Connection</td>
</tr>
<tr>
<td>body</td>
<td>Text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Return Values

Table 273-18  DATA Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The DATA routine terminates the message with a `<CR><LF>,<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>,<CR><LF>` (single period) in body to `<CR><LF>,<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

The DATA subprogram must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL and RCPT have been called. The connection to the SMTP server must be open, and a mail transaction must be active when this routine is called.

The expected response from the server is a message beginning with status code 250. The 354 response received from the initial DATA command is not returned to the caller.
273.10.7 EHLO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the EHLO command.

Syntax

```
UTL_SMTP.EHLO (
    c       IN OUT NOCOPY connection,
    domain  IN)
RETURN replies;
```

```
UTL_SMTP.EHLO (
    c       IN OUT NOCOPY connection,
    domain  IN);
```

Parameters

Table 273-19   EHLO Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-20   EHLO Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types).</td>
</tr>
</tbody>
</table>

Usage Notes

The EHLO interface is identical to HELO except that it allows the server to return more descriptive information about its configuration. [RFC1869] specifies the format of the information returned, which the PL/SQL application can retrieve using the functional form of this call. For compatibility with HELO, each line of text returned by the server begins with status code 250.

Related Functions

HELO Function and Procedure
273.10.8 HELO Function and Procedure

This subprogram performs the initial handshake with SMTP server using the HELO command.

**Syntax**

```
UTL_SMTP.HELO (    
    c IN OUT NOCOPY connection,    
    domain IN VARCHAR2)    
RETURN reply;
```

```
UTL_SMTP.HELO (    
    c IN OUT NOCOPY connection,    
    domain IN VARCHAR2);
```

**Parameters**

**Table 273-21**  HELO Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>domain</td>
<td>Domain name of the local (sending) host. Used for identification purposes.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 273-22**  HELO Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

**Usage Notes**

RFC 821 specifies that the client must identify itself to the server after connecting. This routine performs that identification. The connection must have been opened through a call to OPEN_CONNECTION Functions before calling this routine.

The expected response from the server is a message beginning with status code 250.

**Related Functions**

EHLO Function and Procedure
273.10.9 HELP Function

This function sends the HELP command.

Syntax

```
UTL_SMTP.HELP (
    c         IN OUT NOCOPY   connection,
    command   IN              VARCHAR2 DEFAULT NULL)
RETURN replies;
```

Parameters

Table 273-23   HELP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>command</td>
<td>Command to get the help message</td>
</tr>
</tbody>
</table>

Return Values

Table 273-24   HELP Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replies</td>
<td>Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types)</td>
</tr>
</tbody>
</table>

273.10.10 MAIL Function and Procedure

This subprogram initiate a mail transaction with the server. The destination is a mailbox.

Syntax

```
UTL_SMTP.MAIL (
    c           IN OUT NOCOPY   connection,
    sender      IN              VARCHAR2,
    parameters  IN              VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.MAIL (
    c           IN OUT NOCOPY   connection,
    sender      IN              VARCHAR2,
    parameters  IN              VARCHAR2 DEFAULT NULL);
```

Parameters

Table 273-25   MAIL Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>
Table 273-25  (Cont.) MAIL Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender</td>
<td>E-mail address of the user sending the message.</td>
</tr>
<tr>
<td>parameters</td>
<td>Additional parameters to mail command as defined in Section 6 of [RFC1869]. It must follow the format of &quot;XXX=XXX (XXX=XXX ....).&quot;</td>
</tr>
</tbody>
</table>

Return Values

Table 273-26  MAIL Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

This command does not send the message; it simply begins its preparation. It must be followed by calls to RCPT and DATA to complete the transaction. The connection to the SMTP server must be open and a HELO or EHLO command must have already been sent.

The expected response from the server is a message beginning with status code 250.

273.10.11 NOOP Function and Procedure

This subprogram issues the NULL command.

Syntax

UTL_SMTP.NOOP (  
  c IN OUT NOCOPY connection)  
RETURN reply;  

UTL_SMTP.NOOP (  
  c IN OUT NOCOPY connection);

Parameter

Table 273-27  NOOP Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>
Return Values

Table 273-28  NOOP Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- This command has no effect except to elicit a successful reply from the server. It can be issued at any time after the connection to the server has been established with OPEN_CONNECTION. The NOOP command can be used to verify that the server is still connected and is listening properly.
- This command replies with a single line beginning with status code 250.

273.10.12 OPEN_CONNECTION Functions

These functions open a connection to an SMTP server.

Syntax

```
UTL_SMTP.OPEN_CONNECTION (
    host                            IN  VARCHAR2,
    port                            IN  PLS_INTEGER DEFAULT 25,
    c                               OUT connection,
    tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
    wallet_path                     IN  VARCHAR2 DEFAULT NULL,
    wallet_password                 IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE,
    secure_host                     IN  VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.OPEN_CONNECTION (
    host                            IN  VARCHAR2,
    port                            IN  PLS_INTEGER DEFAULT 25,
    tx_timeout                      IN  PLS_INTEGER DEFAULT NULL,
    wallet_path                     IN  VARCHAR2 DEFAULT NULL,
    wallet_password                 IN  VARCHAR2 DEFAULT NULL,
    secure_connection_before_smtp   IN  BOOLEAN DEFAULT FALSE,
    secure_host                     IN  VARCHAR2 DEFAULT NULL)
RETURN connection;
```

Parameters

Table 273-29  OPEN_CONNECTION Functions Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Name of the SMTP server host</td>
</tr>
<tr>
<td>port</td>
<td>Port number on which SMTP server is listening (usually 25)</td>
</tr>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>
Table 273-29  (Cont.) OPEN_CONNECTION Functions Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_SMTP package waits before timing out in a read or write operation for this connection. In read operations, this package times out if no data is available for reading immediately. In write operations, this package times out if the output buffer is full and no data is to be sent into the network without being blocked. 0 indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet for SSL/TLS. The format is file:&lt;directory-path&gt;</td>
</tr>
<tr>
<td>wallet_password</td>
<td>Password to open the wallet. When the wallet is auto-login enabled, the password can be set to NULL.</td>
</tr>
<tr>
<td>secure_connection_before_smtp</td>
<td>If TRUE, a secure connection with SSL/TLS is made before SMTP communication. If FALSE, no connection is made.</td>
</tr>
<tr>
<td>secure_host</td>
<td>The host name to be matched against the common name (CN) of the SMTP server's certificate when a secure connection is used. It can also be a domain name like **.example.com&quot;. If NULL, the SMTP host name to connect to will be used.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-30  OPEN_CONNECTION Functions Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLEYS Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The expected response from the server is a message beginning with status code 220.
- The version of OPEN_CONNECTION that returns UTL_SMTP.CONNECTION record checks the reply code returned by an SMTP server when the connection is first established. It raises an exception when the reply indicates an error. Otherwise, it discards the reply. If you want to examine the reply, invoke the version of OPEN_CONNECTION that returns REPLY.
- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

DECLARE
  c utl_smtp.connection;
BEGIN
  c := UTL_SMTP.OPEN_CONNECTION(
        host => 'smtp.example.com',
        port => 465,
        tx_timeout => 30,
        wallet_path => '/path/to/wallet',
        wallet_password => 'password',
        secure_connection_before_smtp => TRUE, 
        secure_host => 'example.com');
273.10.13 OPEN_DATA Function and Procedure

This subprogram sends the DATA command after which you can use WRITE_DATA and WRITE_RAW_DATA to write a portion of the e-mail message.

Syntax

UTL_SMTP.OPEN_DATA {
   c     IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.OPEN_DATA {
   c     IN OUT NOCOPY connection};

Parameters

Table 273-31   OPEN_DATA Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in RFC822 format.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-32   OPEN_DATA Function and Procedure Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to OPEN_DATA, WRITE_DATA, WRITE_RAW_DATA and CLOSE_DATA must be made in the right order. A program calls OPEN_DATA to send the DATA command to the SMTP server. After that, it can call WRITE_DATA or WRITE_RAW_DATA repeatedly to send the actual data. The data is terminated by calling CLOSE_DATA. After OPEN_DATA is called, the only subprograms that can be called are WRITE_DATA, WRITE_RAW_DATA, or CLOSE_DATA. A call to other subprograms results in an INVALID_OPERATION exception being raised.

- OPEN_DATA must be called only after OPEN_CONNECTION, HELO or EHLO, MAIL, and RCPT have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.
273.10.14 QUIT Function and Procedure

This subprogram terminates an SMTP session and disconnects from the server.

Syntax

```sql
UTL_SMTP.QUIT (  
    c  IN OUT NOCOPY connection)  
RETURN reply;
```

Parameter

Table 273-33    QUIT Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 273-34    QUIT Function and Procedure Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The QUIT command informs the SMTP server of the client's intent to terminate the session. It then closes the connection established by OPEN_CONNECTION which must have been called before executing this command. If a mail transaction is in progress when QUIT is issued, it is canceled in the same manner as RSET.

The function form of this command returns a single line beginning with the status code 221 on successful termination. In all cases, the connection to the SMTP server is closed. The fields REMOTE_HOST and REMOTE_PORT of c are reset.

Related Functions

RSET Function and Procedure

273.10.15 RCPT Function

This subprogram specifies the recipient of an e-mail message.

Syntax

```sql
UTL_SMTP.RCPT (  
    c          IN OUT NOCOPY connection,  
    recipient  IN           VARCHAR2,  
);
```
parameters IN VARCHAR2 DEFAULT NULL)
RETURN reply;

UTL_SMTP.RCPT {
  c IN OUT NOCOPY connection,
  recipient IN VARCHAR2,
  parameters IN VARCHAR2 DEFAULT NULL);

Table 273-35  RCPT Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>recipient</td>
<td>E-mail address of the user to which the message is being sent</td>
</tr>
<tr>
<td>parameters</td>
<td>Additional parameters to RCPT command as defined in Section 6 of [RFC1869]. It must follow the format of &quot;XXX=XXX (XXX=XXX ....)&quot;.</td>
</tr>
</tbody>
</table>

Return Values

Table 273-36  RCPT Function and Procedure Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

To send a message to multiple recipients, call this routine multiple times. Each invocation schedules delivery to a single e-mail address. The message transaction must have been begun by a prior call to MAIL, and the connection to the mail server must have been opened and initialized by prior calls to OPEN_CONNECTION and HELO or EHLO respectively.

The expected response from the server is a message beginning with status code 250 or 251.

273.10.16 RSET Function and Procedure

This subprogram terminates the current mail transaction.

Syntax

UTL_SMTP.RSET {
  c IN OUT NOCOPY connection)
RETURN reply;

UTL_SMTP.RSET {
  c IN OUT NOCOPY connection);
Parameters

Table 273-37  RSET Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
</tbody>
</table>

Return Values

Table 273-38  RSET Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

• This command allows the client to cancel an e-mail message it was in the process of composing. No mail is sent. The client can call RSET at any time after the connection to the SMTP server has been opened by means of OPEN_CONNECTION until DATA or OPEN_DATA is called. Once the e-mail data has been sent, it is too late to prevent the e-mail from being sent.

• The server responds to RSET with a message beginning with status code 250.

Related Functions

QUIT Function and Procedure

273.10.17 STARTTLS Function and Procedure

This subprogram sends the STARTTLS command to secure the SMTP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Functions.

Syntax

```
UTL_SMTP.STARTTLS (c            IN OUT NOCOPY  connection,
                   secure_host  IN     VARCHAR2 DEFAULT NULL)
RETURN reply;
```

```
UTL_SMTP.STARTTLS (c            IN OUT NOCOPY  connection,
                   secure_host  IN     VARCHAR2 DEFAULT NULL);
```
Parameters

### Table 273-39  STARTTLS Function and Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>secure_host</td>
<td>The host name to be matched against the common name (CN) of the SMTP server's certificate. It can also be a domain name like &quot;*.example.com&quot;. If NULL, the SMTP host name to connect to will be used.</td>
</tr>
</tbody>
</table>

Return Values

### Table 273-40  STARTTLS Function and Procedure Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>SMTP reply</td>
</tr>
</tbody>
</table>

Usage Notes

The `STARTTLS` command must only be issued on an unencrypted connection and when the SMTP server indicates the support of the command in the reply of the `EHLO` command. The wallet to be used for encryption must have been specified when the initial SMTP connection was opened by the `OPEN_CONNECTION` function.

Examples

```sql
DECLARE
c utl_smtp.connection;
BEGIN
  c := utl_smtp.open_connection(
    host => 'smtp.example.com',
    port => 25,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => 'password',
    secure_connection_before_smtp => FALSE);
  utl_smtp.starttls(c);
END
```

### 273.10.18 VRFY Function

This function verifies the validity of a destination e-mail address.

**Syntax**

```sql
UTL_SMTP.VRFY (c IN OUT NOCOPY connection,
               recipient IN VARCHAR2)
RETURN reply;
```
Parameters

Table 273-41  VRFY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>recipient</td>
<td>E-mail address to be verified</td>
</tr>
</tbody>
</table>

Return Values

Table 273-42  VRFY Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reply</td>
<td>Reply of the command (see REPLY_ REPLIES Record Types in UTL_SMTP Types). In cases where there are multiple replies, the last reply is returned.</td>
</tr>
</tbody>
</table>

Usage Notes

The server attempts to resolve the destination address recipient. If successful, it returns the recipient's full name and fully qualified mailbox path. The connection to the server must have already been established by means of OPEN_CONNECTION and HELO or EHLO before making this request.

Successful verification returns one or more lines beginning with status code 250 or 251.

273.10.19 WRITE_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to WRITE_DATA appends data to the e-mail message.

Syntax

UTL_SMTP.WRITE_DATA (  
  c     IN OUT NOCOPY connection,  
  data  IN VARCHAR2 CHARACTER SET ANY_CS);  

Parameters

Table 273-43  WRITE_DATA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

Usage Notes

- The calls to the OPEN_DATA Function and Procedure, WRITE_DATA Procedure, WRITE_RAW_DATA Procedure and CLOSE_DATA Function and Procedure must
be made in the correct order. A program calls \texttt{OPEN\_DATA} to send the \texttt{DATA} command to the SMTP server. After that, it can call \texttt{WRITE\_DATA} or \texttt{WRITE\_RAW\_DATA} repeatedly to send the actual data. The data is terminated by calling \texttt{CLOSE\_DATA}. After \texttt{OPEN\_DATA} is called, the only subprograms that can be called are \texttt{WRITE\_DATA}, \texttt{WRITE\_RAW\_DATA}, or \texttt{CLOSE\_DATA}. A call to other subprograms results in an \texttt{INVALID\_OPERATION} exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The \texttt{DATA} routine terminates the message with a \texttt{<CR><LF>.<CR><LF>} sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of \texttt{<CR><LF>.<CR><LF>} (single period) in the body to \texttt{<CR><LF>.<CR><LF>} (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The \texttt{OPEN\_DATA Function and Procedure, WRITE\_DATA Procedure, WRITE\_RAW\_DATA Procedure and CLOSE\_DATA Function and Procedure} must be called only after \texttt{OPEN\_CONNECTION Functions, HELO Function and Procedure, or EHLO Function and Procedure, MAIL Function and Procedure, and RCPT Function} have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the \texttt{WRITE\_DATA Procedure} because the SMTP server does not respond until the data-terminator is sent during the call to \texttt{CLOSE\_DATA Function and Procedure}.

- Text (\texttt{VARCHAR2}) data sent using \texttt{WRITE\_DATA} is converted to US7ASCII before it is sent. If the text contains multibyte characters, each multibyte character in the text that cannot be converted to US7ASCII is replaced by a “?” character. If 8BITMIME extension is negotiated with the SMTP server using the \texttt{EHLO} subprogram, multibyte \texttt{VARCHAR2} data can be sent by first converting the text to \texttt{RAW} using the \texttt{UTL\_RAW package}, and then sending the \texttt{RAW} data using \texttt{WRITE\_RAW\_DATA}.

### 273.10.20 WRITE\_RAW\_DATA Procedure

This procedure writes a portion of the e-mail message. A repeat call to \texttt{WRITE\_RAW\_DATA} appends data to the e-mail message.

**Syntax**

```sql
UTL_SMTP.WRITE_RAW_DATA (  
    c IN OUT NOCOPY connection  
    data IN RAW);
```

**Parameters**

**Table 273-44  WRITE\_RAW\_DATA Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>SMTP connection</td>
</tr>
<tr>
<td>data</td>
<td>Portion of the text of the message to be sent, including headers, in [RFC822] format</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The calls to the \texttt{OPEN\_DATA Function and Procedure, WRITE\_DATA Procedure, WRITE\_RAW\_DATA Procedure and CLOSE\_DATA Function and Procedure} must
be made in the correct order. A program calls `OPEN_DATA` to send the `DATA` command to the SMTP server. After that, it can call `WRITE_DATA` or `WRITE_RAW_DATA` repeatedly to send the actual data. The data is terminated by calling `CLOSE_DATA`. After `OPEN_DATA` is called, the only subprograms that can be called are `WRITE_DATA`, `WRITE_RAW_DATA`, or `CLOSE_DATA`. A call to other subprograms results in an `INVALID_OPERATION` exception being raised.

- The application must ensure that the contents of the body parameter conform to the MIME(RFC822) specification. The `DATA` routine terminates the message with a `<CR><LF>.<CR><LF>` sequence (a single period at the beginning of a line), as required by RFC821. It also translates any sequence of `<CR><LF>.<CR><LF>` (single period) in the body to `<CR><LF>.<CR><LF>` (double period). This conversion provides the transparency as described in Section 4.5.2 of RFC821.

- The `OPEN_DATA Function and Procedure`, `WRITE_DATA Procedure`, `WRITE_RAW_DATA Procedure` and `CLOSE_DATA Function and Procedure` must be called only after `OPEN_CONNECTION Functions`, `HELO Function and Procedure`, or `EHLO Function and Procedure`, `MAIL Function and Procedure`, and `RCPT Function` have been called. The connection to the SMTP server must be open and a mail transaction must be active when this routine is called.

- Note that there is no function form of the `WRITE_DATA Procedure` because the SMTP server does not respond until the data-terminator is sent during the call to `CLOSE_DATA Function and Procedure`. 

The UTL_SPADV package, one of a set of Oracle Streams packages, provides subprograms to collect and analyze statistics for the Oracle Streams components in a distributed database environment. This package uses the Oracle Streams Performance Advisor to gather statistics.

This chapter contains the following topic:

• Overview
• Security Model
• Operational Notes
• Summary of UTL_SPADV Subprograms

See Also:
Oracle Streams Concepts and Administration for more information about this package and the Oracle Streams Performance Advisor

274.1 UTL_SPADV Overview

This package enables you to collect and analyze statistics about the performance or Oracle Streams components. You can either collect statistics on demand or you can create a monitoring job that continually monitors Oracle Streams performance.

When this package is used on an Oracle Database 11g Release 2 (11.2) database, it can monitor Oracle Database 10g Release 2 (10.2) and later databases. It cannot monitor databases before release 10.2.

See Also:
Oracle Streams Concepts and Administration

274.2 DBMS_COMPARISON Security Model

Security on this package can be controlled by either granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.
To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also:

Oracle Streams Replication Administrator's Guide for information about configuring an Oracle Streams administrator

274.3 UTL_SPADV Operational Notes

To use this package, you must connect to an Oracle database as an Oracle Streams administrator and run the utlspadv.sql script in the rdbms/admin directory in ORACLE_HOME.

The utlspadv.sql script creates the following tables:

- STREAMS$_PA_COMPONENT Table
- STREAMS$_PA_COMPONENT_LINK Table
- STREAMS$_PA_COMPONENT_PROP Table
- STREAMS$_PA_COMPONENT_STAT Table
- STREAMS$_PA_CONTROL Table
- STREAMS$_PA_DATABASE Table
- STREAMS$_PA_DATABASE_PROP Table
- STREAMS$_PA_MONITORING Table
- STREAMS$_PA_PATH_BOTTLENECK Table
- STREAMS$_PA_PATH_STAT Table
- STREAMS$_PA_SHOW_COMP_STAT Table
- STREAMS$_PA_SHOW_PATH_STAT Table

The Oracle Streams Performance Advisor populates these tables when it is run.

See Also:

Oracle Streams Concepts and Administration

STREAMS$_PA_COMPONENT Table

The STREAMS$_PA_COMPONENT table displays information about the Oracle Streams components at each database.
Table 274-1  STREAMS$_PA_COMPONENT Table

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>NULL</th>
<th>Description</th>

</tbody>
</table>

Only capture processes and apply processes have subcomponents. The following capture process subcomponent types are possible:

- LOGMINER READER for a builder server of a capture process
- LOGMINER PREPARATOR for a preparer server of a capture process
- LOGMINER BUILDER for a reader server of a capture process
- CAPTURE SESSION for a capture process session

The following apply process subcomponent types are possible:

- PROPAGATION SENDER+RECEIVER for sending LCRs from a capture process directly to an apply process in a combined capture and apply configuration in which both the capture process and apply process run on a single database
- APPLY READER for a reader server of an apply process
- APPLY COORDINATOR for a coordinator process of an apply process
- APPLY SERVER for a reader server of an apply process
Table 274-4  (Cont.) STREAMS$_PA_COMPONENT_STAT Table

<tr>
<td>START_MONITORING</td>
<td>Starts a monitoring job.</td>
</tr>
<tr>
<td>STOP_MONITORING</td>
<td>Stops a monitoring job.</td>
</tr>
</tbody>
</table>
274.4.1 ALTER_MONITORING Procedure

This procedure alters the monitoring job submitted by the current user.

Syntax

```sql
UTL_SPADV.ALTER_MONITORING(
    interval                      IN NUMBER  DEFAULT NULL,
    top_event_threshold           IN NUMBER  DEFAULT NULL,
    bottleneck_idle_threshold     IN NUMBER  DEFAULT NULL,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT NULL,
    retention_time               IN NUMBER  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>top_event_threshold</td>
<td>A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>bottleneck_idle_threshold</td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>bottleneck_flowctrl_threshold</td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis. If NULL, then the current value is not changed.</td>
</tr>
<tr>
<td>retention_time</td>
<td>The number of hours to retain monitoring results. If NULL, then the current value is not changed.</td>
</tr>
</tbody>
</table>
274.4.2 COLLECT_STATS Procedure

This procedure uses the Oracle Streams Performance Advisor to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

**Note:**

This procedure commits.

**See Also:**

*Oracle Streams Concepts and Administration* for more information about the Oracle Streams Performance Advisor

**Syntax**

```sql
UTL_SPADV.COLLECT_STATS(
    interval                      IN NUMBER  DEFAULT 60,
    num_runs                      IN NUMBER  DEFAULT 10,
    comp_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$$_ADVISOR_COMP_STAT',
    path_stat_table             IN VARCHAR2  DEFAULT 'STREAMS$$_ADVISOR_PATH_STAT',
    top_event_threshold           IN NUMBER  DEFAULT 15,
    bottleneck_idle_threshold     IN NUMBER  DEFAULT 50,
    bottleneck_flowctrl_threshold IN NUMBER  DEFAULT 50);
```

**Parameters**

**Table 274-16  COLLECT_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interval</td>
<td>The amount of time, in seconds, between each Performance Advisor run. The maximum is 3600 seconds.</td>
</tr>
<tr>
<td>num_runs</td>
<td>The number of times that the Oracle Streams Performance Advisor is run by the procedure.</td>
</tr>
</tbody>
</table>
### Table 274-16  (Cont.) COLLECT_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_stat_table</td>
<td>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_COMP_STAT. See “Usage Notes” for more information about this parameter.</td>
</tr>
<tr>
<td>path_stat_table</td>
<td>The name of the table that stores the statistics collected for stream paths. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. The procedure creates the specified table if it does not exist. Oracle recommends that you use the default table STREAMS$_ADVISOR_PATH_STAT. See “Usage Notes” for more information about this parameter.</td>
</tr>
<tr>
<td>top_event_threshold</td>
<td>A percentage that determines whether a top wait event statistic is collected. The percentage for a wait event must be greater than the value specified in this parameter for the procedure to collect the wait event statistic. For example, if 15 is specified, then only wait events with a value larger than 15% are collected.</td>
</tr>
<tr>
<td>bottleneck_idle_threshold</td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its IDLE percentage. The IDLE percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are idle 50% of the time or less are eligible for bottleneck analysis.</td>
</tr>
<tr>
<td>bottleneck_flowctrl_threshold</td>
<td>A percentage that determines whether an Oracle Streams component session is eligible for bottleneck analysis based on its FLOW CONTROL percentage. The FLOW CONTROL percentage must be less than or equal to the value specified in this parameter for the Oracle Streams component session to be eligible for bottleneck analysis. For example, if 50 is specified, then only components that are paused for flow control 50% of the time or less are eligible for bottleneck analysis.</td>
</tr>
</tbody>
</table>
Usage Notes

The table specified in the path_stat_table parameter stores stream path statistics. This table also concatenates the component and subcomponent statistics stored in the table specified in the comp_stat_table parameter. The SHOW_STATS procedure in this package shows only the statistics stored in the table specified in the path_stat_table parameter.

274.4.3 IS_MONITORING Function

This function checks whether a monitoring job is currently running. This function either returns **TRUE** if a monitoring job is currently running or **FALSE** if a monitoring job is not currently running.

A monitoring job is submitted using the START_MONITORING procedure.

**See Also:**

"START_MONITORING Procedure"

Syntax

UTL_SPADV.IS_MONITORING(
    job_name    IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
    client_name IN VARCHAR2  DEFAULT NULL)
RETURN BOOLEAN;

Parameters

<table>
<thead>
<tr>
<th>Table 274-17 IS_MONITORING Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>-----------------</td>
</tr>
<tr>
<td>job_name</td>
</tr>
<tr>
<td>client_name</td>
</tr>
</tbody>
</table>

274.4.4 SHOW_STATS Procedure

This procedure generates output that includes the statistics gathered by the COLLECT_STATS and START_MONITORING procedures.

The output is formatted so that it can be imported into a spreadsheet for analysis.

**Note:**

This procedure does not commit.
See Also:

- "COLLECT_STATS Procedure"
- "START_MONITORING Procedure"
- Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

Syntax

```sql
UTL_SPADV.SHOW_STATS(
    path_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR_PATH_STAT',
    path_id           IN NUMBER    DEFAULT NULL,
    bgn_run_id        IN NUMBER    DEFAULT -1,
    end_run_id        IN NUMBER    DEFAULT -10,
    show_path_id      IN BOOLEAN   DEFAULT TRUE,
    show_run_id       IN BOOLEAN   DEFAULT TRUE,
    show_run_time     IN BOOLEAN   DEFAULT TRUE,
    show_optimization IN BOOLEAN   DEFAULT TRUE,
    show_setting      IN BOOLEAN   DEFAULT FALSE,
    show_stat         IN BOOLEAN   DEFAULT TRUE,
    show_sess         IN BOOLEAN   DEFAULT FALSE,
    show_legend       IN BOOLEAN   DEFAULT TRUE);
```

Parameters

**Table 274-18  SHOW_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path_stat_table</td>
<td>The name of the table that contains the stream path statistics. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the path_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$_ADVISOR_PATH_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$_PA_MONITORING view. The default table for a monitoring job is STREAMS$_PA_SHOW_PATH_STAT.</td>
</tr>
<tr>
<td>path_id</td>
<td>A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.</td>
</tr>
<tr>
<td>bgn_run_id</td>
<td>The first Oracle Streams Performance Advisor run ID to show in the range of runs. See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>end_run_id</td>
<td>The last Oracle Streams Performance Advisor run ID to show in the range of runs. See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
</tbody>
</table>
### Table 274-18 (Cont.) SHOW_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show_path_id</td>
<td>If TRUE, then the path ID for each stream path is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the path ID for each stream path is not included in the output.</td>
</tr>
<tr>
<td>show_run_id</td>
<td>If TRUE, then the Oracle Streams Performance Advisor run ID is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the Oracle Streams Performance Advisor run ID is not included in the output.</td>
</tr>
<tr>
<td>show_run_time</td>
<td>If TRUE, then the Oracle Streams Performance Advisor run time is included in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the Oracle Streams Performance Advisor run time is not included in the output.</td>
</tr>
<tr>
<td>show_optimization</td>
<td>If TRUE, then path output includes information pertaining to the combined capture and apply optimization.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then path output does not include information pertaining to the combined capture and apply optimization.</td>
</tr>
<tr>
<td>show_setting</td>
<td>If TRUE, then the settings for the threshold parameters are included in the output. The threshold parameters are the top_event_threshold, bottleneck_idle_threshold, and bottleneck_flowctrl_threshold parameters in the COLLECT_STATS procedure.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the settings for the threshold parameters are not included in the output.</td>
</tr>
<tr>
<td>show_stat</td>
<td>If TRUE, then the component-level and subcomponent-level statistics are included in the output. These components include capture processes, queues, propagation senders, propagation receivers, and apply processes. The subcomponents are the subcomponents for capture processes and apply processes.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the component-level and subcomponent-level statistics are not included in the output.</td>
</tr>
<tr>
<td>show_sess</td>
<td>If TRUE, then the session-level statistics are included in the output. Session-level statistics include IDLE, FLOW CONTROL, and EVENT statistics.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the session-level statistics are not included in the output.</td>
</tr>
<tr>
<td>show_legend</td>
<td>If TRUE, then the legend is included in the output. The legend describes the abbreviations used in the output.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the legend is not included in the output.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Use the bgn_run_id and end_run_id together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.
However, if \texttt{bgn\_run\_id} is set to \texttt{-1} and \texttt{end\_run\_id} is set to \texttt{-10}, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.

\textbf{See Also:}

\emph{Oracle Streams Concepts and Administration} for information about the combined capture and apply optimization

### 274.4.5 \texttt{SHOW\_STATS\_HTML} Procedure

This procedure generates HTML output that includes the statistics gathered by the \texttt{COLLECT\_STATS} and \texttt{START\_MONITORING} procedures.

\textbf{Note:}

This procedure does not commit.

\textbf{See Also:}

- "\texttt{COLLECT\_STATS} Procedure"
- "\texttt{START\_MONITORING} Procedure"
- \emph{Oracle Streams Concepts and Administration} for more information about the Oracle Streams Performance Advisor

\textbf{Syntax}

```sql
UTL_SPADV.SHOW\_STATS\_HTML(
  directory       IN VARCHAR2,
  reportname      IN VARCHAR2  DEFAULT 'SPADVREPORT.HTML',
  comp_stat_table IN VARCHAR2  DEFAULT 'STREAMS$_ADVISOR\_COMP\_STAT',
  path_id         IN NUMBER    DEFAULT NULL,
  bgn_run_id      IN NUMBER    DEFAULT -1,
  end_run_id      IN NUMBER    DEFAULT -10,
  detailed        IN BOOLEAN   DEFAULT TRUE);
```

\textbf{Parameters}

\textbf{Table 274-19  \texttt{SHOW\_STATS\_HTML} Procedure Parameters}

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>The directory object for the directory on the local computer system into which the generated HTML report is placed. The specified directory object must be created using the SQL statement \texttt{CREATE DIRECTORY}, and the user who invokes the procedure must have \texttt{READ} and \texttt{WRITE} privilege on each one.</td>
</tr>
</tbody>
</table>
Table 274-19 (Cont.) SHOW_STATS_HTML Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reportname</td>
<td>The name of the HTML report</td>
</tr>
<tr>
<td>comp_stat_table</td>
<td>The name of the table that stores the statistics collected for Oracle Streams components and subcomponents. Specify the table name as [schema_name.]object_name. If the schema is not specified, then the current user is the default. When you gather statistics using the COLLECT_STATS procedure, this table is specified in the comp_stat_table parameter in the COLLECT_STATS procedure. The default table is STREAMS$$_ADVISOR_COMP_STAT. When you gather statistics using the START_MONITORING procedure, you can determine the name for this table by querying the SHOW_STATS_TABLE column in the STREAMS$$_PA_MONITORING view. The default table for a monitoring job is STREAMS$$_PA_SHOW_PATH_STAT. Oracle recommends that you start a monitoring job with the START_MONITORING procedure in this package and use the appropriate the STREAMS$$_PA_SHOW_PATH_STAT table.</td>
</tr>
<tr>
<td>path_id</td>
<td>A stream path ID. If non-NULL, then the procedure shows output for the specified stream path only. If NULL, then the procedure shows output for all active stream paths.</td>
</tr>
<tr>
<td>bgn_run_id</td>
<td>The first Oracle Streams Performance Advisor run ID to show in the range of runs. See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>end_run_id</td>
<td>The last Oracle Streams Performance Advisor run ID to show in the range of runs. See &quot;Usage Notes&quot; for more information about this parameter.</td>
</tr>
<tr>
<td>detailed</td>
<td>If TRUE, then the procedure generates component-level statistics. If FALSE, then the procedure does not generate component-level statistics.</td>
</tr>
</tbody>
</table>

Usage Notes

Use the bgn_run_id and end_run_id together to specify the range of Oracle Streams Performance Advisor runs to display. Positive numbers show statistics from an earlier run forward. Negative numbers show statistics from a later run backward.

For example, if bgn_run_id is set to 1 and end_run_id is set to 10, then the procedure shows statistics for the first ten Oracle Streams Performance Advisor runs.

However, if bgn_run_id is set to -1 and end_run_id is set to -10, then the procedure shows statistics for the last ten Oracle Streams Performance Advisor runs.
274.4.6 START_MONITORING Procedure

This procedure starts a monitoring job.

This procedure runs the COLLECT_STATS procedure to gather statistics about the Oracle Streams components and subcomponents in a distributed database environment.

Note:
This procedure commits.

See Also:
• "COLLECT_STATS Procedure"
• Oracle Streams Concepts and Administration for more information about the Oracle Streams Performance Advisor

Syntax

UTL_SPADV.START_MONITORING(
  job_name                      IN VARCHAR2  DEFAULT 'STREAMS$_MONITORING_JOB',
  client_name                   IN VARCHAR2  DEFAULT NULL,
  query_user_name               IN VARCHAR2  DEFAULT NULL,
  interval                      IN NUMBER    DEFAULT 60,
  top_event_threshold           IN NUMBER    DEFAULT 15,
  bottleneck_idle_threshold     IN NUMBER    DEFAULT 50,
  bottleneck_flowctrl_threshold IN NUMBER    DEFAULT 50,
  retention_time                IN NUMBER    DEFAULT 24);

Parameters

Table 274-20 START_MONITORING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

<tr>
<td>ORA-20112</td>
<td>cannot start monitoring due to active Streams monitoring job</td>
</tr>
<tr>
<td></td>
<td>Stop the Streams monitoring job, and run the START_MONITORING procedure</td>
</tr>
<tr>
<td></td>
<td>again.</td>
</tr>
</tbody>
</table>

Usage Notes

The following are usage notes for the START_MONITORING procedure:

- Requirements for the User Running the Procedure
- Full Monitoring Job Names
- Restrictions on Monitoring Jobs

Requirements for the User Running the Procedure
The user who runs the `START_MONITORING` procedure must meet the following requirements:

- The user must have access to a database link to each database that contains Oracle Streams components.
- The user must have been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure, and each database link must connect to a user at the remote database that has been granted privileges using the `DBMS_STREAMS_AUTH.GRANT_ADMIN_PRIVILEGE` procedure.

Full Monitoring Job Names

When you submit a monitoring job, the client name and job name are concatenated to form the full monitoring job name. You specify the client name using the `client_name` parameter and the job name using the `job_name` parameter when you run the `START_MONITORING` procedure. The client name for a monitoring job submitted by Oracle Enterprise Manager is always `EM`.

The following table show examples of full monitoring job names:

<table>
<thead>
<tr>
<th>Setting for client_name Parameter</th>
<th>Setting for job_name parameter</th>
<th>Full Monitoring Job Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>STREAMS$_MONITORING_JOB</td>
<td>STREAMS$_MONITORING_JOB</td>
</tr>
<tr>
<td>EM</td>
<td>STREAMS$_MONITORING_JOB</td>
<td>EMSTREAMS$_MONITORING_JOB</td>
</tr>
<tr>
<td>strm</td>
<td>STREAMS$_MONITORING_JOB</td>
<td>strmSTREAMS$_MONITORING_JOB</td>
</tr>
<tr>
<td>strm</td>
<td>mjob1</td>
<td>strmjob1</td>
</tr>
</tbody>
</table>

Restrictions on Monitoring Jobs

The following restrictions apply to monitoring jobs:

- The limit for the length of the full monitoring job name is 30 bytes.
- Two monitoring jobs cannot have the same full monitoring job name, even if the monitoring jobs were submitted by different schemas. The name check is not case-sensitive. For example, `strmSTREAMS$_MONITORING_JOB` and `STRMSTREAMS$_MONITORING_JOB` are considered to be the same name.
- Oracle Enterprise Manager can have at most one monitoring job for each database.
- Each schema can have at most one monitoring job.

274.4.7 STOP_MONITORING Procedure

This procedure stops a monitoring job that was submitted by the current user.

Syntax

```sql
UTL_SPADV.STOP_MONITORING(
    purge IN BOOLEAN  DEFAULT FALSE);
```
Parameters

Table 274-22  STOP_MONITORING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge</td>
<td>If TRUE, then the procedure purges information about the monitoring job from the result tables. If FALSE, then the procedure retains information about the monitoring job in the result tables.</td>
</tr>
</tbody>
</table>
UTL_TCP

With the UTL_TCP package and its procedures and functions, PL/SQL applications can communicate with external TCP/IP-based servers using TCP/IP. Because many Internet application protocols are based on TCP/IP, this package is useful to PL/SQL applications that use Internet protocols and e-mail.

This chapter contains the following topics:

• Overview
• Security Model
• Types
• Exceptions
• Rules and Limits
• Examples
• Summary of UTL_TCP Subprograms

275.1 UTL_TCP Overview

The UTL_TCP package provides TCP/IP client-side access functionality in PL/SQL.

275.2 UTL_TCP Security Model

This package is an invoker's rights package and the invoking user needs the connect privilege granted in the access control list assigned to the remote network host to which he wants to connect.

Note:

For more information about managing fine-grained access, see Oracle Database Security Guide

275.3 UTL_TCP Types

The UTL_TCP package includes a CONNECTION type and a carriage-return line-feed (CRLF) type.

CONNECTION Type

This is a PL/SQL record type used to represent a TCP/IP connection.
Syntax

TYPE connection IS RECORD (  
  remote_host VARCHAR2(255),  
  remote_port PLS_INTEGER,  
  local_host VARCHAR2(255),  
  local_port PLS_INTEGER,  
  charset VARCHAR2(30),  
  newline VARCHAR2(2),  
  tx_timeout PLS_INTEGER,  
  private_sd PLS_INTEGER);

Fields

Table 275-1  Connection Record Type Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the remote host when connection is established. NULL when no connection is established.</td>
</tr>
<tr>
<td>remote_port</td>
<td>Port number of the remote host connected. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number of the local host used to establish the connection. NULL when no connection is established.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network.</td>
</tr>
<tr>
<td>newline</td>
<td>Newline character sequence. This newline character sequence is appended to the text line sent by WRITE_LINE API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the UTL_TCP package waits before giving up in a read or write operation in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Usage Notes

The fields in a connection record are used to return information about the connection, which is often made using OPEN_CONNECTION. Changing the values of those fields has no effect on the connection. The fields private_XXXX are for implementation use only. You should not modify the values.

In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields are not set in the connection record returned by the function.
Time out on write operations is not supported in the current release of the UTL_TCP package.

CRLF
The character sequence carriage-return line-feed. It is the newline sequence commonly used by many communication standards.

Syntax
CRLF CONSTANT VARCHAR2(2 CHAR);

Usage Notes
This package variable defines the newline character sequence commonly used in many Internet protocols. This is the default value of the newline character sequence for WRITE_LINE, specified when a connection is opened. While such protocols use \<CR><LF>\ to denote a new line, some implementations may choose to use just line-feed to denote a new line. In such cases, users can specify a different newline character sequence when a connection is opened.

275.4 UTL_TCP Exceptions

UTL_TCP will raise an exception when it encounters a processing issue.

The exceptions raised by the TCP/IP package are listed in the following table.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFER_TOO_SMALL</td>
<td>Buffer is too small for input that requires look-ahead</td>
</tr>
<tr>
<td>END_OF_INPUT</td>
<td>Raised when no more data is available to read from the connection</td>
</tr>
<tr>
<td>NETWORK_ERROR</td>
<td>Generic network error</td>
</tr>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument passed in an API call (for example, a negative buffer size)</td>
</tr>
<tr>
<td>TRANSFER_TIMEOUT</td>
<td>No data is read and a read time out occurred</td>
</tr>
<tr>
<td>PARTIAL_MULTIBYTE_CHAR</td>
<td>No complete character is read and a partial multibyte character is found at the end of the input</td>
</tr>
</tbody>
</table>

275.5 UTL_TCP Rules and Limits

The interface provided in the package only allows connections to be initiated by the PL/SQL program. It does not allow the PL/SQL program to accept connections initiated outside the program.
275.6 UTL_TCP Examples

Some possible uses for UTL_TCP include retrieving a Web page over HTTP or sending an e-mail.

The following code example illustrates how the TCP/IP package can be used to retrieve a Web page over HTTP. It connects to a Web server listening at port 80 (standard port for HTTP) and requests the root document.

```sql
DECLARE
  c  utl_tcp.connection;  -- TCP/IP connection to the Web server
  ret_val pls_integer;
BEGIN
  c := utl_tcp.open_connection(remote_host => 'www.acme.com',
                               remote_port => 80,
                               charset => 'US7ASCII');  -- open connection
  ret_val := utl_tcp.write_line(c, 'GET / HTTP/1.0');    -- send HTTP request
  ret_val := utl_tcp.write_line(c);
  BEGIN
    LOOP
      dbms_output.put_line(utl_tcp.get_line(c, TRUE));  -- read result
    END LOOP;
  EXCEPTION
    WHEN utl_tcp.end_of_input THEN
      NULL; -- end of input
  END;
  utl_tcp.close_connection(c);
END;
```

The following code example illustrates how the TCP/IP package can be used by an application to send e-mail (also known as email from PL/SQL). The application connects to an SMTP server at port 25 and sends a simple text message.

```sql
PROCEDURE send_mail (sender    IN VARCHAR2,
                      recipient IN VARCHAR2,
                      message   IN VARCHAR2) IS
  mailhost   VARCHAR2(30) := 'mailhost.mydomain.com';
  smtp_error  EXCEPTION;
  mail_conn   utl_tcp.connection;
  PROCEDURE smtp_command(command IN VARCHAR2,
                          ok      IN VARCHAR2 DEFAULT '250') IS
    response varchar2(3);
    len pls_integer;
    BEGIN
      len := utl_tcp.write_line(mail_conn, command);
      response := substr(utl_tcp.get_line(mail_conn), 1, 3);
      IF (response <> ok) THEN
        RAISE smtp_error;
      END IF;
    END;
BEGIN
  mail_conn := utl_tcp.open_connection(remote_host => mailhost,
                                        remote_port => 25,
                                        charset     => 'US7ASCII');
  smtp_command('HELO ' || mailhost);
  smtp_command('MAIL FROM: ' || sender);
  smtp_command('RCPT TO: ' || recipient);
  smtp_command('DATA ');
  smtp_command(message);
  smtp_command('QUIT ');
END;
```

---

Chapter 275

UTL_TCP Examples

---

275-4
smtp_command('DATA', '354');
smtp_command(message);
smtp_command('QUIT', '221');
utl_tcp.close_connection(mail_conn);

EXCEPTION
WHEN OTHERS THEN
    -- Handle the error
END;

275.7 Summary of UTL_TCP Subprograms

This table lists the UTL_TCP subprograms and briefly describes them.

Table 275-3   UTL_TCP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE Function</td>
<td>Determines the number of bytes available for reading from a TCP/IP connection</td>
</tr>
<tr>
<td>CLOSE_ALL_CONNECTIONS Procedure</td>
<td>Closes all open TCP/IP connections</td>
</tr>
<tr>
<td>CLOSE_CONNECTION Procedure</td>
<td>Closes an open TCP/IP connection</td>
</tr>
<tr>
<td>FLUSH Procedure</td>
<td>Transmits immediately to the server all data in the output buffer, if a buffer is used</td>
</tr>
<tr>
<td>GET_LINE Function</td>
<td>Returns the line of data read</td>
</tr>
<tr>
<td>GET_LINE_NCHAR Function</td>
<td>Returns the line of data read in NCHAR form</td>
</tr>
<tr>
<td>GET_RAW Function</td>
<td>Return the data read instead of the amount of data read</td>
</tr>
<tr>
<td>GET_TEXT Function</td>
<td>Returns the text data read</td>
</tr>
<tr>
<td>GET_TEXT_NCHAR Function</td>
<td>Returns the text data read in NCHAR form</td>
</tr>
<tr>
<td>OPEN_CONNECTION Function</td>
<td>Opens a TCP/IP connection to a specified service</td>
</tr>
<tr>
<td>READ_LINE Function</td>
<td>Receives a text line from a service on an open connection</td>
</tr>
<tr>

<td>Receives text data from a service on an open connection</td>
</tr>
<tr>
<td>SECURE_CONNECTION Procedure</td>
<td>Secures a TCP/IP connection using SSL/TLS</td>
</tr>
<tr>
<td>WRITE_LINE Function</td>
<td>Transmits a text line to a service on an open connection</td>
</tr>
<tr>
<td>WRITE_RAW Function</td>
<td>Transmits a binary message to a service on an open connection</td>
</tr>
<tr>
<td>WRITE_TEXT Function</td>
<td>Transmits a text message to a service on an open connection</td>
</tr>
</tbody>
</table>
275.7.1 AVAILABLE Function

This function determines the number of bytes available for reading from a TCP/IP connection. It is the number of bytes that can be read immediately without blocking. Determines if data is ready to be read from the connection.

Syntax

```sql
UTL_TCP.AVAILABLE (  
  c        IN OUT NOCOPY connection,  
  timeout  IN PLS_INTEGER DEFAULT 0)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-4 AVAILABLE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to determine the amount of data that is available to be read</td>
</tr>
<tr>
<td>timeout</td>
<td>Time in seconds to wait before giving up and reporting that no data is available. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes available for reading without blocking

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Users may use this API to determine if data is available to be read before calling the read API so that the program are not blocked because data is not ready to be read from the input.

The number of bytes available for reading returned by this function may be less than what is actually available. On some platforms, this function may only return 1, to indicate that some data is available. If you are concerned about the portability of your application, then assume that this function returns a positive value when data is available for reading, and 0 when no data is available. This function returns a positive value when all the data at a particular connection has been read and the next read result in the END_OF_INPUT exception.

The following example illustrates using this function in a portable manner:

```sql
DECLARE  
  c   utl_tcp.connection  
  data VARCHAR2(256);  
  len  PLS_INTEGER;  
BEGIN  
  c := utl_tcp.open_connection(...);  
  LOOP  
    IF (utl_tcp.available(c) > 0) THEN  
      len := utl_tcp.read_text(c, data, 256);  
    ELSE  
      ---do some other things
```
275.7.2 CLOSE_ALL_CONNECTIONS Procedure

This procedure closes all open TCP/IP connections.

Syntax

UTL_TCP.CLOSE_ALL_CONNECTIONS;

Usage Notes

This call is provided to close all connections before a PL/SQL program ends to avoid dangling connections.

275.7.3 CLOSE_CONNECTION Procedure

This procedure closes an open TCP/IP connection.

Syntax

UTL_TCP.CLOSE_CONNECTION (c IN OUT NOCOPY connection);

Parameters

Table 275-5  CLOSE_CONNECTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to close</td>
</tr>
</tbody>
</table>

Usage Notes

Connection must have been opened by a previous call to OPEN_CONNECTION. The fields remote_host, remote_port, local_host, local_port and charset of c are reset after the connection is closed.

An open connection must be closed explicitly. An open connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

275.7.4 FLUSH Procedure

This procedure transfers immediately to the server all data in the output buffer, if a buffer is used.

Syntax

UTL_TCP.FLUSH (c IN OUT NOCOPY connection);
Parameters

Table 275-6  FLUSH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
</tbody>
</table>

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

275.7.5 GET_LINE Function

This function returns the line of data read.

Syntax

```
UTL_TCP.GET_LINE (
    c           IN OUT NOCOPY connection,
    remove_crlf IN            BOOLEAN DEFAULT FALSE,
    peek        IN            BOOLEAN DEFAULT FALSE
) RETURN VARCHAR2;
```

Parameters

Table 275-7  GET_LINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.
275.7.6 GET_LINE_NCHAR Function

This function returns the line of data read in NCHAR form.

Syntax

```sql
UTL_TCP.GET_LINE_NCHAR (  
    c           IN OUT NOCOPY connection,  
    remove_crlf IN            BOOLEAN DEFAULT FALSE,  
    peek        IN            BOOLEAN DEFAULT FALSE)  
RETURN NVARCHAR2;
```

Parameters

Table 275-8   GET_LINE_NCHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The text line read

Usage Notes

- The connection must have already been opened through a call to OPEN_CONNECTION.
- See READ_LINE for the read time out, character set conversion, buffer size, and multibyte character issues.

275.7.7 GET_RAW Function

This function returns the data read instead of the amount of data read.

Syntax

```sql
UTL_TCP.GET_RAW (  
    c      IN OUT NOCOPY connection,  
    len    IN            PLS_INTEGER DEFAULT 1,  
    peek   IN            BOOLEAN DEFAULT FALSE)  
RETURN RAW;
```
Parameters

Table 275-9  GET_RAW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The binary data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding READ_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

275.7.8 GET_TEXT Function

This function returns the text data read.

Syntax

UTL_TCP.GET_TEXT ( 
  c IN OUT NOCOPY connection, 
  len IN PLS_INTEGER DEFAULT 1, 
  peek IN BOOLEAN DEFAULT FALSE) 
RETURN VARCHAR2;

Parameters

Table 275-10  GET_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes (or characters for VARCHAR2) of data to receive. Default is 1.</td>
</tr>
</tbody>
</table>
Table 275-10  (Cont.) GET_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values

The text data read

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

275.7.9 GET_TEXT_NCHAR Function

This function returns the text data read in NCHAR form.

Syntax

```
UTL_TCP.GET_TEXT_NCHAR (  
  c IN OUT NOCOPY connection,  
  len IN PLS_INTEGER DEFAULT 1,  
  peek IN BOOLEAN DEFAULT FALSE)  
RETURN NVARCHAR2;
```

Parameters

Table 275-11  GET_TEXT_NCHAR Function Parameters

<table>
<thead>
<tr>

Table 275-11  (Cont.) GET_TEXT_NCHAR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one ore more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>

Return Values
The text data read

Usage Notes
The connection must have already been opened through a call to OPEN_CONNECTION.

For all the get_* APIs described in this section, see the corresponding read_* API for the read time out issue. For GET_TEXT and GET_LINE, see the corresponding READ_* API for character set conversion, buffer size, and multibyte character issues.

275.7.10 OPEN_CONNECTION Function

This function opens a TCP/IP connection to a specified service.

Syntax

```sql
UTL_TCP.OPEN_CONNECTION (remote_host IN VARCHAR2,
                          remote_port IN PLS_INTEGER,
                          local_host IN VARCHAR2 DEFAULT NULL,
                          local_port IN PLS_INTEGER DEFAULT NULL,
                          in_buffer_size IN PLS_INTEGER DEFAULT NULL,
                          out_buffer_size IN PLS_INTEGER DEFAULT NULL,
                          charset IN VARCHAR2 DEFAULT NULL,
                          newline IN VARCHAR2 DEFAULT CRLF,
                          tx_timeout IN PLS_INTEGER DEFAULT NULL,
                          wallet_path IN VARCHAR2 DEFAULT NULL,
                          wallet_password IN VARCHAR2 DEFAULT NULL,
                          RETURN connection;
```

Parameters

Table 275-12  OPEN_CONNECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_host</td>
<td>Name of the host providing the service. When remote_host is NULL, it connects to the local host.</td>
</tr>
</tbody>
</table>
### Table 275-12  (Cont.) OPEN_CONNECTION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_port</td>
<td>Port number on which the service is listening for connections</td>
</tr>
<tr>
<td>local_host</td>
<td>Name of the host providing the service. NULL means does not care.</td>
</tr>
<tr>
<td>local_port</td>
<td>Port number on which the service is listening for connections. NULL means don't care.</td>
</tr>
<tr>
<td>in_buffer_size</td>
<td>The size of input buffer. The use of an input buffer can speed up execution performance in receiving data from the server. The appropriate size of the buffer depends on the flow of data between the client and the server, and the traffic/latency on the network. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the input buffer is 32767 bytes.</td>
</tr>
<tr>
<td>out_buffer_size</td>
<td>The size of output buffer. The use of an output buffer can speed up execution performance in sending data to the server. The appropriate size of buffer depends on the flow of data between the client and the server, and the network condition. A zero value means no buffer should be used. A NULL value means the caller does not care if a buffer is used or not. The maximum size of the output buffer is 32767 bytes.</td>
</tr>
<tr>
<td>charset</td>
<td>The on-the-wire character set. Since text messages in the database may be encoded in a character set that is different from the one expected on the wire (that is, the character set specified by the communication protocol, or the one stipulated by the other end of the communication), text messages in the database are converted to and from the on-the-wire character set as they are sent and received on the network using <code>READ_TEXT</code>, <code>READ_LINE</code>, <code>WRITE_TEXT</code> and <code>WRITE_LINE</code>. Set this parameter to <code>NULL</code> when no conversion is needed.</td>
</tr>
<tr>
<td>newline</td>
<td>Newline character sequence. This newline character sequence is appended to the text line sent by <code>WRITE_LINE</code> API.</td>
</tr>
<tr>
<td>tx_timeout</td>
<td>Time in seconds that the <code>UTL_TCP</code> package should wait before giving up in a read or write operations in this connection. In read operations, this package gives up if no data is available for reading immediately. In write operations, this package gives up if the output buffer is full and no data is to be sent in the network without being blocked. Zero (0) indicates not to wait at all. NULL indicates to wait forever.</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path that contains the Oracle wallet for SSL/TLS. The format is <code>file:directory-path</code></td>
</tr>
<tr>
<td>wallet_password</td>
<td>Password to open the wallet. When the wallet is auto-login enabled, the password may be set to <code>NULL</code>.</td>
</tr>
</tbody>
</table>

### Return Values

A connection to the targeted TCP/IP service

### Usage Notes

- Note that connections opened by this `UTL_TCP` package can remain open and be passed from one database call to another in a shared server configuration.
However, the connection must be closed explicitly. The connection remains open when the PL/SQL record variable that stores the connection goes out-of-scope in the PL/SQL program. Failing to close unwanted connections may result in unnecessary tying up of local and remote system resources.

- In the current release of the UTL_TCP package, the parameters local_host and local_port are ignored when open_connection makes a TCP/IP connection. It does not attempt to use the specified local host and port number when the connection is made. The local_host and local_port fields is not set in the connection record returned by the function.

- tx_timeout is intended to govern both the read operations and the write operations. However, an implementation restriction prevents tx_timeout from governing write operations in the current release.

Examples

```sql
DECLARE
  c UTL_TCP.CONNECTION;
BEGIN
  c := UTL_TCP.OPEN_CONNECTION(
    host => 'www.example.com',
    port => 443,
    wallet_path => 'file:/oracle/wallets/smtp_wallet',
    wallet_password => '****');
  UTL_TCP.SECURE_CONNECTION (c => c);
END;
```

275.7.11 READ_LINE Function

This function receives a text line from a service on an open connection.

A line is terminated by a line-feed, a carriage-return or a carriage-return followed by a line-feed.

Syntax

```sql
UTL_TCP.READ_LINE (  
  c IN OUT NOCOPY connection,
  data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  peek IN BOOLEAN DEFAULT FALSE)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received.</td>
</tr>
<tr>
<td>remove_crlf</td>
<td>If TRUE, then one or more trailing CRLF characters are removed from the received message.</td>
</tr>
</tbody>
</table>
Table 275-13  (Cont.) READ_LINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the end-of-line have been reached, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.

275.7.12 READ_RAW Function

This function receives binary data from a service on an open connection.

Syntax

```sql
UTL_TCP.READ_RAW (  
    c IN OUT NOCOPY connection,  
    data IN OUT NOCOPY RAW,  
    len IN PLS_INTEGER DEFAULT 1,  
    peek IN BOOLEAN DEFAULT FALSE)  
RETURN PLS_INTEGER;
```
Parameters

Table 275-14    READ_RAW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of bytes of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, you want to read the data and remove it from the input queue, that is, consume it. In some situations, you may just want to look ahead at the data, that is, peek at it, without removing it from the input queue, so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and set up an input buffer before the connection is opened. The amount of data you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of bytes have been read, or the end of input has been reached.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

275.7.13 READ_TEXT Function

This function receives text data from a service on an open connection.

Syntax

UTL_TCP.READ_TEXT (  
  c    IN OUT NOCOPY connection,
  data IN OUT NOCOPY VARCHAR2 CHARACTER SET ANY_CS,
  len  IN            PLS_INTEGER DEFAULT 1,
  peek IN            BOOLEAN     DEFAULT FALSE)
RETURN PLS_INTEGER;

Parameters

Table 275-15    READ_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
</tbody>
</table>
Table 275-15  (Cont.) READ_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Data received</td>
</tr>
<tr>
<td>len</td>
<td>Number of characters of data to receive</td>
</tr>
<tr>
<td>peek</td>
<td>Normally, users want to read the data and remove it from the input queue, that is, consume it. In some situations, users may just want to look ahead at the data without removing it from the input queue so that it is still available for reading (or even peeking) in the next call. To keep the data in the input queue, set this flag to TRUE and an input buffer must be set up when the connection is opened. The amount of data that you can peek at (that is, read but keep in the input queue) must be less than the size of input buffer.</td>
</tr>
</tbody>
</table>

Return Values

The number of characters of data received

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. This function does not return until the specified number of characters has been read, or the end of input has been reached. Text messages is converted from the on-the-wire character set, specified when the connection was opened, to the database character set before they are returned to the caller.

Unless explicitly overridden, the size of a VARCHAR2 buffer is specified in terms of bytes, while the parameter len refers to the maximum number of characters to be read. When the database character set is multibyte, where a single character may consist of more than 1 byte, you should ensure that the buffer can hold the maximum of characters. In general, the size of the VARCHAR2 buffer should equal the number of characters to be read, multiplied by the maximum number of bytes of a character of the database character set.

If transfer time out is set when the connection is opened, then this function waits for each data packet to be ready to read until time out occurs. If it occurs, then this function stops reading and returns all the data read successfully. If no data is read successfully, then the transfer_timeout exception is raised. The exception can be handled and the read operation can be retried later.

If a partial multibyte character is found at the end of input, then this function stops reading and returns all the complete multibyte characters read successfully. If no complete character is read successfully, then the partial_multibyte_char exception is raised. The exception can be handled and the bytes of that partial multibyte character can be read as binary by the READ_RAW function. If a partial multibyte character is seen in the middle of the input because the remaining bytes of the character have not arrived and read time out occurs, then the transfer_timeout exception is raised instead. The exception can be handled and the read operation can be retried later.
275.7.14 SECURE_CONNECTION Procedure

This procedure secures a TCP/IP connection using SSL/TLS.

SSL/TLS requires an Oracle wallet which must be specified when the connection was opened by the OPEN_CONNECTION Function.

Syntax

```
UTL_TCP.SECURE_CONNECTION (  
c    IN OUT NOCOPY connection);
```

Parameters

Table 275-16  SECURE_CONNECTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection from which to receive data</td>
</tr>
</tbody>
</table>

275.7.15 WRITE_LINE Function

This function transmits a text line to a service on an open connection. The newline character sequence is appended to the message before it is transmitted.

Syntax

```
UTL_TCP.WRITE_LINE (  
c    IN OUT NOCOPY connection,  
data IN            VARCHAR2 DEFAULT NULL CHARACTER SET ANY_CS)  
RETURN PLS_INTEGER;
```

Parameters

Table 275-17  WRITE_LINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
</tbody>
</table>

Return Values

The actual number of characters of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
275.7.16 WRITE_RAW Function

This function transmits a binary message to a service on an open connection. The function does not return until the specified number of bytes have been written.

Syntax

```sql
UTL_TCP.WRITE_RAW (  
    c    IN OUT NOCOPY connection,  
    data IN            RAW,  
    len  IN            PLS_INTEGER DEFAULT NULL)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
<tr>
<td>len</td>
<td>The number of bytes of data to transmit. When len is NULL, the whole length of data is written.</td>
</tr>
</tbody>
</table>

Return Values

The number of bytes of data transmitted

Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION.

275.7.17 WRITE_TEXT Function

This function transmits a text message to a service on an open connection.

Syntax

```sql
UTL_TCP.WRITE_TEXT (  
    c    IN OUT NOCOPY connection,  
    data IN            VARCHAR2 CHARACTER SET ANY_CS,  
    len  IN            PLS_INTEGER DEFAULT NULL)  
RETURN num_chars PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>TCP connection to which to send data</td>
</tr>
<tr>
<td>data</td>
<td>Buffer containing the data to be sent</td>
</tr>
</tbody>
</table>
### Table 275-19  (Cont.) WRITE_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>len</td>
<td>The number of characters of data to transmit. When len is NULL, the whole length of data is written. The actual amount of data written may be less because of network condition.</td>
</tr>
</tbody>
</table>

#### Return Values

The actual number of characters of data transmitted

#### Usage Notes

The connection must have already been opened through a call to OPEN_CONNECTION. Text messages are converted to the on-the-wire character set, specified when the connection was opened, before they are transmitted on the wire.
276

UTL_URL

The UTL_URL package has two functions: ESCAPE and UNESCAPE.

This chapter contains the following topics:

- Overview
- Exceptions
- Examples
- Summary of UTL_URL Subprograms

See Also:
UTL_HTTP

276.1 UTL_URL Overview

A Uniform Resource Locator (URL) is a string that identifies a Web resource, such as a page or a picture. Use a URL to access such resources by way of the HyperText Transfer Protocol (HTTP).

For example, the URL for Oracle's Web site is:

http://www.oracle.com

Normally, a URL contains English alphabetic characters, digits, and punctuation symbols. These characters are known as the unreserved characters. Any other characters in URLs, including multibyte characters or binary octet codes, must be escaped to be accurately processed by Web browsers or Web servers. Some punctuation characters, such as dollar sign ($), question mark (?), colon (:), and equals sign (=), are reserved as delimiters in a URL. They are known as the reserved characters. To literally process these characters, instead of treating them as delimiters, they must be escaped.

The unreserved characters are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent (‘), left parenthesis (‘), right parenthesis (’)

The reserved characters are:

- Semi-colon (;) slash (/), question mark (?), colon (:), at sign (@), ampersand (&), equals sign (=), plus sign (+), dollar sign ($), percentage sign (%), and comma (,)
URL is used to fetch a Web page by way of the UTL_HTTP package. Use the unescape function to unescape an escaped URL before information is extracted from the URL.

For more information, refer to the Request For Comments (RFC) document RFC2396. Note that this URL escape and unescape mechanism is different from the x-www-form-urlencoded encoding mechanism described in the HTML specification:

http://www.w3.org/TR/html

### 276.2 UTL_URL Exceptions

UTL_URL raises an exception when it encounters a processing issue.

The following table lists the exceptions that can be raised when the UTL_URL package API is invoked.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_URL</td>
<td>29262</td>
<td>The URL contains badly formed escape code sequences</td>
</tr>
<tr>
<td>BAD_FIXED_WIDTH_CHARSET</td>
<td>29274</td>
<td>Fixed-width multibyte character set is not allowed as a URL character set.</td>
</tr>
</tbody>
</table>

### 276.3 UTL_URL Examples

UTL_URL can be used for encoding and decoding.

You can implement the x-www-form-urlencoded encoding using the UTL_URL.ESCAPE function as follows:

```sql
CREATE OR REPLACE FUNCTION form_url_encode (data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.escape(data, TRUE, charset); -- note use of TRUE
END;
```

For decoding data encoded with the form-URL-encode scheme, the following function implements the decoding scheme:

```sql
CREATE OR REPLACE FUNCTION form_url_decode(data IN VARCHAR2, charset IN VARCHAR2) RETURN VARCHAR2 AS
BEGIN
    RETURN utl_url.unescape(utl_url.escape(data, TRUE, charset));
END;
```

### 276.4 Summary of UTL_URL Subprograms

This table lists and briefly describes the UTL_URL subprograms.
Table 276-2  UTL_URL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESCAPE Function</td>
<td>Returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format</td>
</tr>
<tr>
<td>UNESCAPE Function</td>
<td>Unescapes the escape character sequences to their original forms in a URL. Convert the %XX escape character sequences to the original characters</td>
</tr>
</tbody>
</table>

276.4.1 ESCAPE Function

This function returns a URL with illegal characters (and optionally reserved characters) escaped using the %2-digit-hex-code format.

Syntax

```
UTL_URL.ESCAPE (  
    url                   IN VARCHAR2 CHARACTER SET ANY_CS,  
    escape_reserved_chars IN BOOLEAN DEFAULT FALSE,  
    url_charset           IN VARCHAR2 DEFAULT utl_http.body_charset)  
RETURN VARCHAR2;
```

Parameters

Table 276-3  ESCAPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The original URL</td>
</tr>
<tr>
<td>escape_reserved_chars</td>
<td>Indicates whether the URL reserved characters should be escaped. If set to TRUE, both the reserved and illegal URL characters are escaped. Otherwise, only the illegal URL characters are escaped. The default value is FALSE.</td>
</tr>
<tr>
<td>url_charset</td>
<td>When escaping a character (single-byte or multibyte), determine the target character set that character should be converted to before the character is escaped in %hex-code format. If url_charset is NULL, the database charset is assumed and no character set conversion will occur. The default value is the current default body character set of the UTL_HTTP package, whose default value is ISO-8859-1. The character set can be named in Internet Assigned Numbers Authority (IANA) or in the Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

Use this function to escape URLs that contain illegal characters as defined in the URL specification RFC 2396. The legal characters in URLs are:

- A through Z, a through z, and 0 through 9
- Hyphen (-), underscore (_), period (.), exclamation point (!), tilde (~), asterisk (*), accent (‘), left parenthesis ( ( ), right parenthesis ( )

The reserved characters consist of:
Many of the reserved characters are used as delimiters in the URL. You should escape characters beyond those listed here by using escape_url. Also, to use the reserved characters in the name-value pairs of the query string of a URL, those characters must be escaped separately. An escape_url cannot recognize the need to escape those characters because once inside a URL, those characters become indistinguishable from the actual delimiters. For example, to pass a name-value pair $logon=scott/tiger into the query string of a URL, escape the $ and / separately as %24logon=scott%2Ftiger and use it in the URL.

Normally, you will escape the entire URL, which contains the reserved characters (delimiters) that should not be escaped. For example:

```sql
utl_url.escape('http://www.acme.com/a url with space.html')
```

Returns:

http://www.acme.com/a%20url%20with%20space.html

In other situations, you may want to send a query string with a value that contains reserved characters. In that case, escape only the value fully (with escape_reserved_chars set to TRUE) and then concatenate it with the rest of the URL. For example:

```sql
url := 'http://www.acme.com/search?check=' || utl_url.escape('Is the use of the "$" sign okay?', TRUE);
```

This expression escapes the question mark (?), dollar sign ($), and space characters in 'Is the use of the "$" sign okay?' but not the ? after search in the URL that denotes the use of a query string.

The Web server that you intend to fetch Web pages from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be escaped are escaped in the target character set. For example, a user of an EBCDIC database who wants to access an ASCII Web server should escape the URL using US7ASCII so that a space is escaped as %20 (hex code of a space in ASCII) instead of %40 (hex code of a space in EBCDIC).

This function does not validate a URL for the proper URL format.

### 276.4.2 UNESCAPE Function

This function unescapes the escape character sequences to its original form in a URL, to convert the %XX escape character sequences to the original characters.

**Syntax**

```sql
UTL_URL.UNESCAPE ( url IN VARCHAR2 CHARACTER SET ANY_CS,
               url_charset IN VARCHAR2 DEFAULT utl_http.body_charset)
RETURN VARCHAR2;
```
Parameters

Table 276-4  UNESCAPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>The URL to unescape</td>
</tr>
<tr>
<td>url_charset</td>
<td>After a character is unescaped, the character is assumed to be in the source_charset character set and it will be converted from the source_charset to the database character set before the URL is returned. If source_charset is NULL, the database charset is assumed and no character set conversion occurred. The default value is the current default body character set of the UTL_HTTP package, whose default value is “ISO-8859-1”. The character set can be named in Internet Assigned Numbers Authority (IANA) or Oracle naming convention.</td>
</tr>
</tbody>
</table>

Usage Notes

The Web server that you receive the URL from may use a character set that is different from that of your database. In that case, specify the url_charset as the Web server character set so that the characters that need to be unescaped are unescaped in the source character set. For example, a user of an EBCDIC database who receives a URL from an ASCII Web server should unescape the URL using US7ASCII so that %20 is unescaped as a space (0x20 is the hex code of a space in ASCII) instead of a ? (because 0x20 is not a valid character in EBCDIC).

This function does not validate a URL for the proper URL format.
WPG_DOCLOAD

The WPG_DOCLOAD package provides an interface to download files, BLOBs and BFILES.

See Also:
For more information about implementation of this package:

• Oracle Fusion Middleware Administrator's Guide for Oracle HTTP Server
• Oracle Fusion Middleware User's Guide for mod_plsql

The chapter contains the following topics:

• Constants
• Summary of WPG_DOCLOAD Subprograms

277.1 WPG_DOCLOAD Constants

WPG_DOCLOAD defines several constants to use when specifying parameter values.

The WPG_DOCLOAD constants are listed below:

• NAME_COL_LEN
• MIME_TYPE_COL_LEN
• MAX_DOCTABLE_NAME_LEN

NAME_COL_LEN

The NAME column in your document table must be the same as the value of name_col_len.

name_col_len CONSTANT pls_integer := 64;

MIME_TYPE_COL_LEN

The MIME_TYPE column in your document table must be the same as the value of mimet_col_len.

mimet_col_len CONSTANT pls_integer := 48;

MAX_DOCTABLE_NAME_LEN

The name length of your document table must be less than max_doctable_name_len.

max_doctable_name_len CONSTANT pls_integer := 256;
277.2 Summary of WPG_DOCLOAD Subprograms

The WPG_DOCLOAD package uses one subprogram, the DOWNLOAD_FILE procedure.

Table 277-1  WPG_DOCLOAD Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DOWNLOAD_FILE Procedures</td>
<td>Downloads files, BLOBs and BFILES</td>
</tr>
</tbody>
</table>

277.2.1 DOWNLOAD_FILE Procedures

There are three versions of this download file procedure.

- The first version downloads files and is invoked from within a document download procedure to signal the PL/SQL Gateway that `p_filename` is to be downloaded from the document table to the client's browser.
- The second version can be called from within any procedure to signal the PL/SQL Gateway that `p_blob` is to be downloaded to the client's browser.
- The third version can be called from within any procedure to signal the PL/SQL Gateway that `p_bfile` is to be downloaded to the client's browser.

Syntax

```sql
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_filename      IN             VARCHAR2,
  p_bcaching      IN             BOOLEAN DEFAULT TRUE);
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_blob          IN OUT NOCOPY  BLOB);
WPG_DOCLOAD.DOWNLOAD_FILE(
  p_bfile         IN OUT         BFILE);
```

Parameters

Table 277-2  DOWNLOAD_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_filename</td>
<td>The file to download from the document table.</td>
</tr>
<tr>
<td>p_blob</td>
<td>The BLOB to download.</td>
</tr>
<tr>
<td>p_bfile</td>
<td>The BFILE to download (see Usage Notes).</td>
</tr>
<tr>
<td>p_bcaching</td>
<td>Whether browser caching is enabled (see Usage Notes).</td>
</tr>
</tbody>
</table>

Usage Notes

- Normally, a document will be downloaded to the browser unless the browser sends an 'If-Modified-Since' header to the gateway indicating that it has the requested document in its cache. In that case, the gateway will determine if the browser's cached copy is up to date, and if it is, it will send an HTTP 304 status
message to the browser indicating that the browser should display the cached
copy. However, because a document URL and a document do not necessarily
have a one-to-one relationship in the PL/SQL Web Gateway, in some cases it may
be undesirable to have the cached copy of a document displayed. In those cases,
the p_bcaching parameter should be set to FALSE to indicate to the gateway to
ignore the 'If-Modified-Since' header, and download the document.

- p_bfile and p_blob are declared as IN OUT because the locator is initially opened to
  check for file accessibility and existence. The open operation can only be
  performed if the locator is writable and readable.
ANYDATA TYPE

An ANYDATA TYPE contains an instance of a given type, plus a description of the type. In this sense, an ANYDATA is self-describing. An ANYDATA can be persistently stored in the database.

This chapter contains the following topics:

• Restrictions
• Operational Notes
• Summary of ANYDATA Subprograms

278.1 ANYDATA TYPE Restrictions

Persistent storage of ANYDATA instances whose type contains embedded LOBs other than BFILES is not currently supported.

278.2 ANYDATA TYPE Operational Notes

This section contains notes related to ANYDATA TYPE construction and access.

Construction

There are 2 ways to construct an ANYDATA. The CONVERT* calls enable construction of the ANYDATA in its entirety with a single call. They serve as explicit CAST functions from any type in the Oracle ORDBMS to ANYDATA.

STATIC FUNCTION ConvertBDouble(db IN BINARY_DOUBLE) return ANYDATA,
STATIC FUNCTION ConvertBFile(b IN BFILE) RETURN ANYDATA,
STATIC FUNCTION ConvertBFloat(f1 IN BINARY_FLOAT) return ANYDATA,
STATIC FUNCTION ConvertBlob(b IN BLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertChar(c IN CHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertClob(c IN CLOB) RETURN ANYDATA,
STATIC FUNCTION ConvertCollection(col IN "collection_type") RETURN ANYDATA,
STATIC FUNCTION ConvertDate(dat IN DATE) RETURN ANYDATA,
STATIC FUNCTION ConvertIntervalDS(inv IN INTERVAL DAY TO SECOND) return ANYDATA,
STATIC FUNCTION ConvertIntervalYM(invIN INTERVAL YEAR TO MONTH) return ANYDATA,
STATIC FUNCTION ConvertNChar(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertNClob(nc IN NCLOB) return ANYDATA,
STATIC FUNCTION ConvertNumber(num IN NUMBER) RETURN ANYDATA,
STATIC FUNCTION ConvertNVarchar2(nc IN NCHAR) return ANYDATA,
STATIC FUNCTION ConvertObject(obj IN "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertRaw(r IN RAW) RETURN ANYDATA,
STATIC FUNCTION ConvertRef(rf IN REF "<object_type>") RETURN ANYDATA,
STATIC FUNCTION ConvertTimestamp(ts IN TIMESTAMP) return ANYDATA,
STATIC FUNCTION ConvertTimestampTz(ts IN TIMESTAMP WITH TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertTimestampLtz(ts IN TIMESTAMP WITH LOCAL TIMEZONE) return ANYDATA,
STATIC FUNCTION ConvertURowid(rid IN UROWID) return ANYDATA,
STATIC FUNCTION ConvertVarchar(c IN VARCHAR) RETURN ANYDATA,
STATIC FUNCTION ConvertVarchar2(c IN VARCHAR2) RETURN ANYDATA,
The second way to construct an ANYDATA is a piece by piece approach. The \texttt{BEGINCREATE Static Procedure} call begins the construction process and \texttt{ENDCREATE Member Procedure} call finishes the construction process. In between these two calls, the individual attributes of an object type or the elements of a collection can be set using \texttt{SET*} calls. For piece by piece access of the attributes of objects and elements of collections, the \texttt{PIECEWISE Member Procedure} should be invoked prior to \texttt{GET*} calls.

Note: The ANYDATA has to be constructed or accessed sequentially starting from its first attribute (or collection element). The \texttt{BEGINCREATE} call automatically begins the construction in a piece-wise mode. There is no need to call \texttt{PIECEWISE} immediately after \texttt{BEGINCREATE}. \texttt{ENDCREATE} should be called to finish the construction process (before which any access calls can be made).

Access

Access functions are available based on SQL. These functions do not throw exceptions on type-mismatch. Instead, they return \texttt{NULL} if the type of the ANYDATA does not correspond to the type of access. If you wish to use only ANYDATA functions of the appropriate types returned in a query, you should use a \texttt{WHERE} clause which uses \texttt{GETTYPENAME} and choose the type you are interested in (say "SYS.NUMBER"). Each of these functions returns the value of a specified datatype inside a \texttt{SYS.ANYDATA} wrapper.

\begin{verbatim}
MEMBER FUNCTION AccessBDouble(self IN ANYDATA) return BINARY_DOUBLE
       DETERMINISTIC,
MEMBER FUNCTION AccessBfile(self IN ANYDATA) return BFILE,
MEMBER FUNCTION AccessBFLOAT(self IN ANYDATA) return BINARY_FLOAT
       DETERMINISTIC,
MEMBER FUNCTION AccessBlob(self IN ANYDATA) return BLOB,
MEMBER FUNCTION AccessChar(self IN ANYDATA) return CHAR,
MEMBER FUNCTION AccessClob(self IN ANYDATA) return CLOB,
MEMBER FUNCTION AccessDate(self IN ANYDATA) return DATE,
MEMBER FUNCTION AccessIntervalYM(self IN ANYDATA) return INTERVAL YEAR TO MONTH,
MEMBER FUNCTION AccessIntervalDS(self IN ANYDATA) return INTERVAL DAY TO SECOND,
MEMBER FUNCTION AccessNchar(self IN ANYDATA) return NCHAR,
MEMBER FUNCTION AccessNClob(self IN ANYDATA) return NCLOB,
MEMBER FUNCTION AccessNumber(self IN ANYDATA) return NUMBER,
MEMBER FUNCTION AccessNVarchar2(self IN ANYDATA) return NVARCHAR2,
MEMBER FUNCTION AccessRaw(self IN ANYDATA) return RAW,
MEMBER FUNCTION AccessTimestamp(self IN ANYDATA) return TIMESTAMP,
MEMBER FUNCTION AccessTimestampLTZ(self IN ANYDATA) return TIMESTAMP WITH LOCAL
       TIMEZONE,
MEMBER FUNCTION AccessURowid(self IN ANYDATA) return UROWID DETERMINISTIC,
MEMBER FUNCTION AccessVarchar(self IN ANYDATA) return VARCHAR,
MEMBER FUNCTION AccessVarchar2(self IN ANYDATA) return VARCHAR2,
\end{verbatim}

278.3 Summary of ANYDATA Subprograms

This table lists the ANYDATA subprograms in alphabetical order and briefly describes them.
Table 278-1   ANYDATA Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGINCREATE Static Procedure</td>
<td>Begins creation process on a new ANYDATA</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure</td>
<td>Ends creation of an ANYDATA</td>
</tr>
<tr>
<td>GET* Member Functions</td>
<td>Gets the current data value (which should be of appropriate type)</td>
</tr>
<tr>
<td>GETTYPE Member Function</td>
<td>Gets the Type of the ANYDATA</td>
</tr>
<tr>
<td>GETTYPENAME Member Function</td>
<td>Get the fully qualified type name for the ANYDATA</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure</td>
<td>Sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT)</td>
</tr>
<tr>
<td>SET* Member Procedures</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>

278.3.1 BEGINCREATE Static Procedure

This procedure begins the creation process on a new ANYDATA.

Syntax

```plaintext
STATIC PROCEDURE BeginCreate(
    dtype          IN OUT NOCOPY AnyType,
    adata          OUT NOCOPY ANYDATA);
```

Parameters

Table 278-2   BEGINCREATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtype</td>
<td>The type of the ANYDATA. (Should correspond to OCI_TYPECODE_OBJECT or a Collection typecode.)</td>
</tr>
<tr>
<td>adata</td>
<td>ANYDATA being constructed.</td>
</tr>
</tbody>
</table>

Exception

DBMS_TYPES.INVALID_PARAMETERS: dtype is invalid (not fully constructed, and similar deficits.)

Usage Notes

There is no need to call PIECEWISE immediately after this call. The construction process begins in a piece-wise manner automatically.
### 278.3.2 ENDCREATE Member Procedure

This procedure ends creation of an ANYDATA. Other creation functions cannot be called after this call.

**Syntax**

```plaintext
MEMBER PROCEDURE EndCreate(
    self        IN OUT NOCOPY ANYDATA);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>

### 278.3.3 GET* Member Functions

These functions get the current data value (which should be of appropriate type).

The type of the current data value depends on the MODE by which it is accessed (depending on whether the PIECEWISE call is invoked).

If PIECEWISE has NOT been called, the ANYDATA is accessed in its entirety and the type of the data value should match the type of the ANYDATA.

If PIECEWISE has been called, the ANYDATA is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

**Syntax**

```plaintext
MEMBER FUNCTION GetBDouble(
    self        IN ANYDATA,
    dbl         OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBfile(
    self        IN ANYDATA,
    b           OUT NOCOPY BFILE)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetBFloat(
    self        IN ANYDATA,
    fl          OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetBlob(
    self        IN ANYDATA,
    b           OUT NOCOPY BLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetChar(
    self        IN ANYDATA,
    c           OUT NOCOPY CHAR)
```
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetClob(
   self         IN ANYDATA,
   c            OUT NOCOPY CLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetCollection(
   self         IN ANYDATA,
   col          OUT NOCOPY "<collection_type>")
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetDate(
   self         IN ANYDATA,
   dat          OUT NOCOPY DATE)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalDS(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetIntervalYM(
   self         IN ANYDATA,
   inv          OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNchar(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNClob(
   self         IN ANYDATA,
   nc           OUT NOCOPY NCLOB)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNumber(
   self         IN ANYDATA,
   num          OUT NOCOPY NUMBER)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetNVarchar2(
   self         IN ANYDATA,
   nc           OUT NOCOPY NVARCHAR2)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetObject(
   self         IN ANYDATA,
   obj          OUT NOCOPY "<object_type>")
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRaw(
   self         IN ANYDATA,
   r            OUT NOCOPY RAW)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetRef(
   self         IN ANYDATA,
   rf           OUT NOCOPY REF "<object_type>")
RETURN       PLS_INTEGER;
MEMBER FUNCTION GetTimestamp(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampT2(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetTimestampLtZ(
    self         IN ANYDATA,
    ts           OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GetVarchar(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR)
RETURN       PLS_INTEGER;

MEMBER FUNCTION GetVarchar2(
    self         IN ANYDATA,
    c            OUT NOCOPY VARCHAR2)
RETURN       PLS_INTEGER;

Parameters

Table 278-4    GET* Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
278.3.4 GETTYPE Member Function

This function gets the typecode of the ANYDATA.

Syntax

```plsql
MEMBER FUNCTION GETTYPE(
    self          IN ANYDATA,
    typ           OUT NOCOPY AnyType)
RETURN        PLS_INTEGER;
```

Parameters

Table 278-5  GETTYPE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>typ</td>
<td>The AnyType corresponding to the ANYDATA. May be NULL if it does not represent a user-defined type.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.

278.3.5 GETTYPENAME Member Function

This function gets the fully qualified type name for the ANYDATA.

If the ANYDATA is based on a built-in type, this function will return NUMBER and other relevant information.

If it is based on a user defined type, this function will return `schema_name.type_name`, for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

```plsql
MEMBER FUNCTION GETTYPENAME(
    self         IN ANYDATA)
RETURN       VARCHAR2;
```

Parameters

Table 278-6  GETTYPENAME Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATA.
278.3.6 PIECEWISE Member Procedure

This procedure sets the MODE of access of the current data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of access of the data value to be a collection element at a time (if the data value is of collection type). Once this call has been made, subsequent calls to SET* and GET* will sequentially obtain individual attributes or collection elements.

Syntax

MEMBER PROCEDURE PIECEWISE(
   self         IN OUT NOCOPY ANYDATA);

Parameters

Table 278-7 PIECEWISE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The current data value.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS
- DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an OBJECT or COLLECTION type before this call can be made.

Piece-wise construction and access of nested attributes that are of object or collection types is not supported.

278.3.7 SET* Member Procedures

This procedure sets the current data value.

This is a list of procedures that should be called depending on the type of the current data value. The type of the data value should be the type of the attribute at the current position during the piece-wise construction process.

Syntax

MEMBER PROCEDURE SETBDOUBLE(
   self         IN OUT NOCOPY ANYDATA,
   dbl          IN BINARY_DOUBLE,
   last_elem    IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
   self         IN OUT NOCOPY ANYDATA,
   b            IN BFILE,
   last_elem    IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
MEMBER PROCEDURE SETBLOB(
    self IN OUT NOCOPY ANYDATA,
    b IN BLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self IN OUT NOCOPY ANYDATA,
    c IN CHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self IN OUT NOCOPY ANYDATA,
    c IN CLOB,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETCOLLECTION(
    self IN OUT NOCOPY ANYDATA,
    col IN "collection_type",
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self IN OUT NOCOPY ANYDATA,
    dat IN DATE,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self IN OUT NOCOPY ANYDATA,
    inv IN INTERVAL DAY TO SECOND,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self IN OUT NOCOPY ANYDATA,
    inv IN INTERVAL YEAR TO MONTH,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self IN OUT NOCOPY ANYDATA,
    nc IN NCHAR,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self IN OUT NOCOPY ANYDATA,
    nc IN NClob,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self IN OUT NOCOPY ANYDATA,
    num IN NUMBER,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETNVARCHAR2(
    self IN OUT NOCOPY ANYDATA,
    nc IN NVarchar2,
    last_elem IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self IN OUT NOCOPY ANYDATA,
MEMBER PROCEDURE SETRAW(
    self        IN OUT NOCOPY ANYDATA,
    r           IN RAW,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self        IN OUT NOCOPY ANYDATA,
    rf          IN REF "<object_type>",
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self       IN OUT NOCOPY ANYDATA,
    ts         IN TIMESTAMP,
    last_elem  IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
    self IN OUT NOCOPY ANYDATA,
    ts          IN TIMESTAMP WITH TIME ZONE,
    last_elem   IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
    self IN OUT NOCOPY ANYDATA,
    ts IN TIMESTAMP WITH LOCAL TIME ZONE,
    last_elem IN boolean DEFAULT FALSE),

MEMBER PROCEDURE SETVARCHAR(
    self        IN OUT NOCOPY ANYDATA,
    c           IN VARCHAR,
    last_elem   IN boolean DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self        IN OUT NOCOPY ANYDATA,
    c           IN VARCHAR2,
    last_elem   IN boolean DEFAULT FALSE);

Parameters

Table 278-8  SET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>An ANYDATA.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if ANYDATA represents a collection. Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
Usage Notes

When `BEGINCREATE` is called, construction has already begun in a piece-wise fashion. Subsequent calls to `SET*` will set the successive attribute values.

If the `ANYDATA` is a standalone collection, the `SET*` call will set the successive collection elements.
ANYDATASET TYPE

An ANYDATASET TYPE contains a description of a given type plus a set of data instances of that type. An ANYDATASET can be persistently stored in the database if desired, or it can be used as interface parameters to communicate self-descriptive sets of data, all of which belong to a certain type.

This chapter contains the following topics:

• Construction
• Summary of ANYDATASET TYPE Subprograms

279.1 ANYDATASET TYPE Construction

The ANYDATASET needs to be constructed value by value, sequentially.

For each data instance (of the type of the ANYDATASET), the ADDINSTANCE function must be invoked. This adds a new data instance to the ANYDATASET. Subsequently, SET* can be called to set each value in its entirety.

The mode of construction/access can be changed to attribute/collection element wise by making calls to PIECEWISE.

• If the type of the ANYDATASET is TYPECODE_OBJECT, individual attributes will be set with subsequent SET* calls. Likewise on access.
• If the type of the current data value is a collection type individual collection elements will be set with subsequent SET* calls. Likewise on access. This call is very similar to ANYDATA.PIECEWISE call defined for the type ANYDATA.

Note that there is no support for piece-wise construction and access of nested (not top level) attributes that are of object types or collection types.

ENDCREATE should be called to finish the construction process (before which no access calls can be made).

279.2 Summary of ANYDATASET TYPE Subprograms

This table lists the ANYDATASET Type subprograms and briefly describes them.

Table 279-1   ANYDATASET Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDINSTANCE Member Procedure</td>
<td>Adds a new data instance to an ANYDATASET.</td>
</tr>
<tr>
<td>BEGINCREATE Static Procedure</td>
<td>Creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure</td>
<td>Ends Creation of a ANYDATASET. Other creation functions cannot be called after this call.</td>
</tr>
</tbody>
</table>
Table 279-1  (Cont.) ANYDATASET Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET* Member Functions</td>
<td>Gets the current data value (which should be of appropriate type).</td>
</tr>
<tr>
<td>GETCOUNT Member Function</td>
<td>Gets the number of data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>GETINSTANCE Member Function</td>
<td>Gets the next instance in an ANYDATASET.</td>
</tr>
<tr>
<td>GETTYPE Member Function</td>
<td>Gets the ANYTYPE describing the type of the data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>GETTYPENAME Member Function</td>
<td>Gets the AnyType describing the type of the data instances in an ANYDATASET.</td>
</tr>
<tr>
<td>PIECEWISE Member Procedure</td>
<td>Sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).</td>
</tr>
<tr>
<td>SET* Member Procedures</td>
<td>Sets the current data value.</td>
</tr>
</tbody>
</table>

279.2.1 ADDINSTANCE Member Procedure

This procedure adds a new data instance to an ANYDATASET.

Syntax

MEMBER PROCEDURE AddInstance(
    self          IN OUT NOCOPY ANYDATASET);

Parameters

Table 279-2  ADDINSTANCE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: Invalid parameters.
DBMS_TYPES.incorrect_usage: On incorrect usage.

Usage Notes

The data instances have to be added sequentially. The previous data instance must be fully constructed (or set to NULL) before a new one can be added.

This call DOES NOT automatically set the mode of construction to be piece-wise. The user has to explicitly call PIECEWISE if a piece-wise construction of the instance is intended.
279.2.2 BEGINCREATE Static Procedure

This procedure creates a new ANYDATASET which can be used to create a set of data values of the given ANYTYPE.

Syntax

STATIC PROCEDURE BeginCreate(
    typecode    IN PLS_INTEGER,
    rtype       IN OUT NOCOPY AnyType,
    aset        OUT NOCOPY ANYDATASET);

Parameters

Table 279-3  BEGINCREATE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typecode</td>
<td>The typecode for the type of the ANYDATASET.</td>
</tr>
<tr>
<td>dtype</td>
<td>The type of the data values. This parameter is a must for user-defined types like TYPECODE_OBJECT, Collection typecodes, and similar others.</td>
</tr>
<tr>
<td>aset</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.invalid_parameters: dtype is invalid (not fully constructed, and like errors.)

279.2.3 ENDCREATE Member Procedure

This procedure ends creation of a ANYDATASET. Other creation functions cannot be called after this call.

Syntax

MEMBER PROCEDURE ENDCREATE(
    self              IN OUT NOCOPY ANYDATASET);

Parameters

Table 279-4  ENDCREATE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

279.2.4 GET* Member Functions

These functions get the current data value (which should be of the appropriate type).

The type of the current data value depends on the MODE used for accessing it (depending on how the PIECEWISE call is invoked). If PIECEWISE has not been called, the
instance is accessed in its entirety, and the type of the data value should match the type of the ANYDATASET.

If PIECEWISE has been called, the instance is accessed piece-wise. The type of the data value should match the type of the attribute (or collection element) at the current position.

Syntax

MEMBER FUNCTION GETBDOUBLE(
    self        IN ANYDATASET,
    dbl         OUT NOCOPY BINARY_DOUBLE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFLOAT(
    self        IN ANYDATASET,
    fl          OUT NOCOPY BINARY_FLOAT)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBFILE(
    self        IN ANYDATASET,
    b           OUT NOCOPY BFILE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETBLOB(
    self        IN ANYDATASET,
    b           OUT NOCOPY BLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCHAR(
    self        IN ANYDATASET,
    c           OUT NOCOPY CHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCLOB(
    self        IN ANYDATASET,
    c           OUT NOCOPY CLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETCOLLECTION(
    self        IN ANYDATASET,
    col         OUT NOCOPY "<collection_type>"
RETURN PLS_INTEGER;

MEMBER FUNCTION GETDATE(
    self        IN ANYDATASET,
    dat         OUT NOCOPY DATE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALDS(
    self        IN ANYDATASET,
    inv         IN OUT NOCOPY INTERVAL DAY TO SECOND)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETINTERVALYM(
    self        IN ANYDATASET,
    inv IN OUT NOCOPY INTERVAL YEAR TO MONTH)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNCHAR(
    self        IN ANYDATASET,
MEMBER FUNCTION GETNCLOB(
    self IN ANYDATASET,
    nc OUT NOCOPY NCLOB)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNUMBER(
    self IN ANYDATASET,
    num OUT NOCOPY NUMBER)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETNVARCHAR2(
    self IN ANYDATASET,
    nc OUT NOCOPY NVARCHAR2)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETOBJECT(
    self IN ANYDATASET,
    obj OUT NOCOPY "<object_type>" )
RETURN PLS_INTEGER;

MEMBER FUNCTION GETRAW(
    self IN ANYDATASET,
    r OUT NOCOPY RAW)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETREF(
    self IN ANYDATASET,
    rf OUT NOCOPY REF "<object_type>" )
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMP ( 
    self IN ANYDATASET,
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPPLTZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH LOCAL TIME ZONE)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETTIMESTAMPTZ(
    self IN ANYDATASET,
    ts OUT NOCOPY TIMESTAMP WITH TIME ZONE)
RETURN PLS_INTEGER,

MEMBER FUNCTION GETUROWID(
    self IN ANYDATASET,
    rid OUT NOCOPY UROWID)
RETURN PLS_INTEGER

MEMBER FUNCTION GETVARCHAR ( 
    self IN ANYDATASET,
    c OUT NOCOPY VARCHAR)
RETURN PLS_INTEGER;

MEMBER FUNCTION GETVARCHAR2 ( 
    self IN ANYDATASET,
    c OUT NOCOPY VARCHAR2)
RETURN PLS_INTEGER;
Parameters

Table 279-5   GET* Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be obtained.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

The return value is relevant only if PIECEWISE has been already called (for a collection). In such a case, DBMS_TYPES.NO_DATA signifies the end of the collection when all elements have been accessed.

Exceptions

DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (if it is not appropriate to add a number at this point in the creation process).

DBMS_TYPES.INCORRECT_USAGE: Incorrect usage

DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.

279.2.5 GETCOUNT Member Function

This function gets the number of data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GetCount (    self        IN ANYDATASET)    RETURN      PLS_INTEGER;

Parameter

Table 279-6   GETCOUNT Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

The number of data instances.
279.2.6 GETINSTANCE Member Function

This function gets the next instance in an ANYDATASET. Only sequential access to the instances in an ANYDATASET is allowed.

After this function has been called, the GET* functions can be invoked on the ANYDATASET to access the current instance. If PIECEWISE is called before doing the GET* calls, the individual attributes (or collection elements) can be accessed.

It is an error to invoke this function before the ANYDATASET is fully created.

Syntax

MEMBER FUNCTION GETINSTANCE(
    self IN OUT NOCOPY ANYDATASET)
RETURN PLS_INTEGER;

Parameters

Table 279-7   GETINSTANCE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_TYPES.SUCCESS or DBMS_TYPES.NO_DATA

DBMS_TYPES.NO_DATA signifies the end of the ANYDATASET (all instances have been accessed).

Usage Notes

This function should be called even before accessing the first instance.

279.2.7 GETTYPE Member Function

This function gets the AnyType describing the type of the data instances in an ANYDATASET.

Syntax

MEMBER FUNCTION GETTYPE(
    self IN ANYDATASET,
    typ OUT NOCOPY AnyType)
RETURN PLS_INTEGER;

Parameters

Table 279-8   GETTYPE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET.</td>
</tr>
</tbody>
</table>
Table 279-8  (Cont.) GETTYPE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>typ</td>
<td>The ANYTYPE corresponding to the AnyData. May be NULL if it does not represent a user-defined function.</td>
</tr>
</tbody>
</table>

Return Values

The typecode corresponding to the type of the ANYDATA.

279.2.8 GETTYPENAME Member Function

This procedure gets the fully qualified type name for the ANYDATASET.

If the ANYDATASET is based on a built-in, this function will return NUMBER and associated information.

If it is based on a user defined type, this function will return schema_name.type_name. for example, SCOTT.FOO.

If it is based on a transient anonymous type, this function will return NULL.

Syntax

MEMBER FUNCTION GETTYPENAME(  
self     IN ANYDATASET)  
RETURN       VARCHAR2;

Parameter

Table 279-9  GETTYPENAME Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Return Values

Type name of the ANYDATASET.

279.2.9 PIECEWISE Member Procedure

This procedure sets the MODE of construction, access of the data value to be an attribute at a time (if the data value is of TYPECODE_OBJECT).

It sets the MODE of construction, access of the data value to be a collection element at a time (if the data value is of a collection TYPE). Once this call has been made, subsequent SET* and GET* calls will sequentially obtain individual attributes or collection elements.

Syntax

MEMBER PROCEDURE PIECEWISE(  
self     IN OUT NOCOPY ANYDATASET);
Parameters

Table 279-10 PIECEWISE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being constructed.</td>
</tr>
</tbody>
</table>

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters.

DBMS_TYPES.INCORRECT_USAGE: On incorrect usage.

Usage Notes

The current data value must be of an object or collection type before this call can be made. There is no support for piece-wise construction or access of embedded object type attributes or nested collections.

279.2.10 SET* Member Procedures

This procedure sets the current data value.

The type of the current data value depends on the MODE with which we are constructing (depending on how we have invoked the PIECEWISE call). The type of the current data should be the type of the ANYDATASET if PIECEWISE has NOT been called. The type should be the type of the attribute at the current position if PIECEWISE has been called.

Syntax

MEMBER PROCEDURE SETBDOUBLE(
    self              IN OUT NOCOPY ANYDATASET,
    dbl               IN BINARY_DOUBLE,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFLOAT(
    self              IN OUT NOCOPY ANYDATASET,
    fl                IN BINARY_FLOAT,
    last_elem         IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBFILE(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BFILE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETBLOB(
    self              IN OUT NOCOPY ANYDATASET,
    b                 IN BLOB,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCHAR(
    self              IN OUT NOCOPY ANYDATASET,
    c                 IN CHAR,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETCLOB(
    self              IN OUT NOCOPY ANYDATASET,
MEMBER PROCEDURE SETCOLLECTION(
    self IN OUT NOCOPY ANYDATASET,
    col IN "<collection_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETDATE(
    self IN OUT NOCOPY ANYDATASET,
    dat IN DATE,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALDS(
    self IN OUT NOCOPY ANYDATASET,
    inv IN INTERVAL DAY TO SECOND,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETINTERVALYM(
    self IN OUT NOCOPY ANYDATASET,
    inv IN INTERVAL YEAR TO MONTH,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCHAR(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NCHAR,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNCLOB(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NClob,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETNUMBER(
    self IN OUT NOCOPY ANYDATASET,
    num IN NUMBER,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
    self IN OUT NOCOPY ANYDATASET,
    nc IN NVarchar2,
    last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETOBJECT(
    self IN OUT NOCOPY ANYDATASET,
    obj IN "<object_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETRAW(
    self IN OUT NOCOPY ANYDATASET,
    r IN RAW,
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETREF(
    self IN OUT NOCOPY ANYDATASET,
    rf IN REF "<object_type>",
    last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMP(
    self IN OUT NOCOPY ANYDATASET,
    ts IN TIMESTAMP,
last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPLTZ(
  self IN OUT NOCOPY ANYDATASET,
  ts IN TIMESTAMP WITH LOCAL TIME ZONE,
  last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETTIMESTAMPTZ(
  self IN OUT NOCOPY ANYDATASET,
  ts IN TIMESTAMP WITH TIME ZONE,
  last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETUROWID(
  self IN OUT NOCOPY ANYDATASET,
  rid IN UROWID,
  last_elem IN BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR(
  self IN OUT NOCOPY ANYDATASET,
  c IN VARCHAR,
  last_elem BOOLEAN DEFAULT FALSE);

MEMBER PROCEDURE SETVARCHAR2(
  self IN OUT NOCOPY ANYDATASET,
  c IN VARCHAR2,
  last_elem BOOLEAN DEFAULT FALSE);

Parameters

Table 279-11  SET* Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYDATASET being accessed.</td>
</tr>
<tr>
<td>num</td>
<td>The number, and associated information, that is to be set.</td>
</tr>
<tr>
<td>last_elem</td>
<td>Relevant only if PIECEWISE has already called (for a collection). Set to TRUE if it is the last element of the collection, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETERS: Invalid parameters (if it is not appropriate to add a number at this point in the creation process).
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage.
- DBMS_TYPES.TYPE_MISMATCH: When the expected type is different from the passed in type.
ANYTYPE TYPE

An ANYTYPE TYPE can contain a type description of any persistent SQL type, named or unnamed, including object types and collection types. It can also be used to construct new transient type descriptions.

New persistent types can only be created using the CREATE TYPE statement. Only new transient types can be constructed using the ANYTYPE interfaces.

This chapter discusses the following:

• Summary of ANYTYPE Subprograms

280.1 Summary of ANYTYPE Subprograms

This table lists the ANYTYPE subprograms in alphabetical order and briefly describes them.

Table 280-1 ANYTYPE Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGINCREATE Static Procedure</td>
<td>Creates a new instance of ANYTYPE which can be used to create a transient type description.</td>
</tr>
<tr>
<td>SETINFO Member Procedure</td>
<td>Sets any additional information required for constructing a COLLECTION or builtin type.</td>
</tr>
<tr>
<td>ADDATTR Member Procedure</td>
<td>Adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPENCODE_OBJECT).</td>
</tr>
<tr>
<td>ENDCREATE Member Procedure</td>
<td>Ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.</td>
</tr>
<tr>
<td>GETPERSISTENT Static Function</td>
<td>Returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.</td>
</tr>
<tr>
<td>GETINFO Member Function</td>
<td>Gets the type information for the ANYTYPE.</td>
</tr>
<tr>
<td>GETATTRELEMINFO Member Function</td>
<td>Gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the self parameter is of a collection type.</td>
</tr>
</tbody>
</table>

280.1.1 BEGINCREATE Static Procedure

This procedure creates a new instance of ANYTYPE which can be used to create a transient type description.

Syntax

```
STATIC PROCEDURE BEGINCREATE(
    typecode IN PLS_INTEGER,
    atype OUT NOCOPY ANYTYPE);
```
Parameters

Table 280-2  BEGINCREATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| typecode  | Use a constant from DBMS_TYPES package. Typecodes for user-defined type:  
  • DBMS_TYPES.TYPETCODE_OBJECT  
  • DBMS_TYPES.TYPETCODE_VARRAY or  
  • DBMS_TYPES.TYPETCODE_TABLE  
Typecodes for builtin types:  
  • DBMS_TYPES.TYPETCODE_NUMBER, and similar types. |
| atype     | ANYTYPE for a transient type |

280.1.2 SETINFO Member Procedure

This procedure sets any additional information required for constructing a COLLECTION or builtin type.

Syntax

MEMBER PROCEDURE SETINFO(  
  self          IN OUT NOCOPY ANYTYPE,  
  prec          IN PLS_INTEGER,  
  scale         IN PLS_INTEGER,  
  len           IN PLS_INTEGER,  
  csid          IN PLS_INTEGER,  
  csfrm         IN PLS_INTEGER,  
  atype         IN ANYTYPE DEFAULT NULL,  
  elem_tc       IN PLS_INTEGER DEFAULT NULL,  
  elem_count    IN PLS_INTEGER DEFAULT 0);  

Parameters

Table 280-3  SETINFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Required if typecode represents types requiring character information such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
</tbody>
</table>
Table 280-3  (Cont.) SETINFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>atype</td>
<td>Optional. Required if collection element typecode is a user-defined type such as TYPECODE_OBJECT, and similar others. It is also required for a built-in type that needs user-defined type information such as TYPECODE_REF. This parameter is not needed otherwise.</td>
</tr>
</tbody>
</table>

The Following Parameters Are Required For Collection Types

Table 280-4  SETINFO Procedure Parameters - Collection Types

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elem_tc</td>
<td>Must be of the collection element's typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>elem_count</td>
<td>Pass 0 for elem_count if the self represents a nested table (TYPECODE_TABLE). Otherwise pass the collection count if self represents a VARRAY.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS_TYPES.INVALID_PARAMETER: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling ENDCREATE, and similar actions.)

Usage Notes

It is an error to call this function on an ANYTYPE that represents a persistent user defined type.

280.1.3 ADDATTR Member Procedure

This procedure adds an attribute to an ANYTYPE (of typecode DBMS_TYPES.TYPECODE_OBJECT).

Syntax

```
MEMBER PROCEDURE ADDATTR(
    self IN OUT NOCOPY ANYTYPE,
    aname IN VARCHAR2,
    typecode IN PLS_INTEGER,
    prec IN PLS_INTEGER,
    scale IN PLS_INTEGER,
    len IN PLS_INTEGER,
    csid IN PLS_INTEGER,
    csfrm IN PLS_INTEGER,
    attr_type IN ANYTYPE DEFAULT NULL);
```
Parameters

Table 280-5  ADDATTR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed. Must be of type DBMS_TYPES.TYPECODE_OBJECT.</td>
</tr>
<tr>
<td>aname</td>
<td>Optional. Attribute's name. Could be NULL.</td>
</tr>
<tr>
<td>typecode</td>
<td>Attribute's typecode. Can be built-in or user-defined typecode (from DBMS_TYPES package).</td>
</tr>
<tr>
<td>prec</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>Optional. Required if typecode represents a NUMBER. Give precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>Optional. Required if typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Give length.</td>
</tr>
<tr>
<td>csid</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>csfrm</td>
<td>Optional. Required if typecode represents a type requiring character information, such as CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>attr_type</td>
<td>Optional. ANYTYPE corresponding to a user-defined type. This parameter is required if the attribute is a user defined type.</td>
</tr>
</tbody>
</table>

Exceptions

- DBMS.Types.INVALID_PARAMETERS: Invalid Parameters (typecode, typeinfo)
- DBMS_TYPES.INCORRECT_USAGE: Incorrect usage (cannot call after calling EndCreate, and similar actions.)

280.1.4 ENDCREATE Member Procedure

This procedure ends creation of a transient ANYTYPE. Other creation functions cannot be called after this call.

Syntax

MEMBER PROCEDURE ENDCREATE(
    self             IN OUT NOCOPY ANYTYPE);

Parameter

Table 280-6  ENDCREATE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The transient ANYTYPE that is being constructed.</td>
</tr>
</tbody>
</table>
280.1.5 GETPERSISTENT Static Function

This procedure returns an ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

Syntax

STATIC FUNCTION GETPERSISTENT(
    schema_name IN VARCHAR2,
    type_name  IN VARCHAR2,
    version    IN VARCHAR2 DEFAULT NULL
) RETURN ANYTYPE;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the type.</td>
</tr>
<tr>
<td>type_name</td>
<td>Type name.</td>
</tr>
<tr>
<td>version</td>
<td>Type version.</td>
</tr>
</tbody>
</table>

Return Values

An ANYTYPE corresponding to a persistent type created earlier using the CREATE TYPE SQL statement.

280.1.6 GETINFO Member Function

This function gets the type information for the ANYTYPE.

Syntax

MEMBER FUNCTION GETINFO (
    self IN ANYTYPE,
    prec OUT PLS_INTEGER,
    scale OUT PLS_INTEGER,
    len  OUT PLS_INTEGER,
    csid OUT PLS_INTEGER,
    csfrm OUT PLS_INTEGER,
    schema_name OUT VARCHAR2,
    type_name  OUT VARCHAR2,
    version    OUT VARCHAR2,
    numelems  OUT PLS_INTEGER
) RETURN PLS_INTEGER;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
</tbody>
</table>
Table 280-8  (Cont.) GETINFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prec</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If typecode represents a number. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Type's schema (if persistent).</td>
</tr>
<tr>
<td>type_name</td>
<td>Type's typename.</td>
</tr>
<tr>
<td>version</td>
<td>Type's version.</td>
</tr>
<tr>
<td>numelems</td>
<td>If self is a TYPECODE_VARRAY, this gives the VARRAY count. If self is of TYPECODE_OBJECT, this gives the number of attributes.</td>
</tr>
</tbody>
</table>

Return Values
The typecode of self.

Exceptions
- DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly Constructed).

280.1.7 GETATTRELEMINFO Member Function

This function gets the type information for an attribute of the type (if it is of TYPECODE_OBJECT). Gets the type information for a collection's element type if the self parameter is of a collection type.

Syntax

MEMBER FUNCTION GETATTRELEMINFO (  
  self           IN ANYTYPE,  
  pos            IN PLS_INTEGER,  
  prec           OUT PLS_INTEGER,  
  scale          OUT PLS_INTEGER,  
  len            OUT PLS_INTEGER,  
  csid           OUT PLS_INTEGER,  
  csfrm          OUT PLS_INTEGER,  
  attr_elt_type  OUT ANYTYPE  
  aname          OUT VARRCHAR2)  
RETURN         PLS_INTEGER;
Parameters

Table 280-9    GETATTRELEMINFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>The ANYTYPE.</td>
</tr>
<tr>
<td>pos</td>
<td>If self is of TYPECODE_OBJECT, this gives the attribute position (starting at 1). It is ignored otherwise.</td>
</tr>
<tr>
<td>prec</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>scale</td>
<td>If attribute/collection element typecode represents a NUMBER. Gives precision and scale. Ignored otherwise.</td>
</tr>
<tr>
<td>len</td>
<td>If typecode represents a RAW, CHAR, VARCHAR, or VARCHAR2 type. Gives length.</td>
</tr>
<tr>
<td>csid, csfrm</td>
<td>If typecode represents a type requiring character information such as: CHAR, VARCHAR, or VARCHAR2. Gives character set ID, character set form.</td>
</tr>
<tr>
<td>attr_elt_type</td>
<td>If attribute/collection element typecode represents a user-defined type, this returns the ANYTYPE corresponding to it. User can subsequently describe the attr_elt_type.</td>
</tr>
<tr>
<td>aname</td>
<td>Attribute name (if it is an attribute of an object type, NULL otherwise).</td>
</tr>
</tbody>
</table>

Return Values

The typecode of the attribute or collection element.

Exceptions

DBMS_TYPES.INVALID_PARAMETERS: Invalid Parameters (position is beyond bounds or the ANYTYPE is not properly constructed).
Oracle Database Advanced Queuing (AQ) Types

This chapter describes the types used with Oracle Database Advanced Queuing (AQ) packages for PL/SQL, DBMS_AQ, and DBMS_AQADM.

This chapter contains the following topics:

- Security Model
- Summary of Types

See Also:

281.1 Advanced Queuing (AQ) Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

281.2 Oracle Database Advanced Queuing (AQ) Types — Summary of Types

Oracle Database Advanced Queuing (AQ) uses types to specify certain types of information.

- AQ$_AGENT Type
- AQ$_AGENT_LIST_T Type
- AQ$_DESCRIPTOR Type
- AQ$_NTFN_DESCRIPTOR Type
- AQ$_NTFN_MSGID_ARRAY Type
- AQ$_POST_INFO Type
- AQ$_POST_INFO_LIST Type
- AQ$_PURGE_OPTIONS_T Type
- AQ$_RECIPIENT_LIST_T Type
- AQ$_REG_INFO Type
- AQ$_REG_INFO_LIST Type
- AQ$_SUBSCRIBER_LIST_T Type
281.2.1 AQ$_AGENT Type

This type identifies a producer or a consumer of a message.

Syntax

```sql
TYPE SYS.AQ$_AGENT IS OBJECT (
    name VARCHAR2(512),
    address VARCHAR2(1024),
    protocol NUMBER);
```

Attributes

Table 281-1  AQ$_AGENT Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of a producer or consumer of a message. The name must follow object name guidelines in the <em>Oracle Database SQL Language Reference</em> with regard to reserved characters.</td>
</tr>
<tr>
<td>address</td>
<td>Protocol-specific address of the recipient. If the protocol is 0, then the address is of the form <code>[schema.]queue[@dblink]</code>. For example, a queue named <code>emp_messages</code> in the <code>HR</code> queue at the site <code>dbs1.net</code> has the address: <code>hr.emp_messages@dbs1.net</code></td>
</tr>
<tr>
<td>protocol</td>
<td>Protocol to interpret the address and propagate the message. Protocols 1-127 are reserved for internal use. If the protocol number is in the range 128 - 255, the address of the recipient is not interpreted by Oracle Database Advanced Queuing.</td>
</tr>
</tbody>
</table>

281.2.2 AQ$_AGENT_LIST_T Type

This type identifies the list of agents for which `DBMS_AQLISTEN` listens.

```
See Also:

"AQ$_AGENT Type"
```

Syntax

```sql
TYPE SYS.AQ$_AGENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
    INDEX BY BINARY INTEGER;
```
281.2.3 AQ$_DESCRIPTOR Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

See Also:
"MESSAGE_PROPERTIES_T Type"

Syntax

```
TYPE SYS.AQ$_DESCRIPTOR IS OBJECT (   queue_name VARCHAR2(261),   consumer_name VARCHAR2(512),   msg_id RAW(16),   msg_prop MSG_PROP_T,   gen_desc AQ$_NTFN_DESCRIPTOR,   msgid_array SYS.AQ$_NTFN_MSGID_ARRAY,   ntfnsRecdInGrp NUMBER);
```

Attributes

Table 281-2  AQ$_DESCRIPTOR Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>Name of the queue in which the message was enqueued which resulted in the notification</td>
</tr>
<tr>
<td>consumer_name</td>
<td>Name of the consumer for the multiconsumer queue</td>
</tr>
<tr>
<td>msg_id</td>
<td>Identification number of the message</td>
</tr>
<tr>
<td>msg_prop</td>
<td>Message properties specified by the MSG_PROP_T type</td>
</tr>
<tr>

<td>Indicates the timeout specifications</td>
</tr>
<tr>
<td>msgid_array</td>
<td>Group notification message ID list</td>
</tr>
<tr>
<td>ntfnsRecdInGrp</td>
<td>Notifications received in group</td>
</tr>
</tbody>
</table>

281.2.4 AQ$_NTFN_DESCRIPTOR Type

This type is for storing a generic notification descriptor regarding PL/SQL notification flags.

Syntax

```
TYPE SYS.AQ$_NTFN_DESCRIPTOR IS OBJECT(   ntfn_flags NUMBER)
```
Attributes

Table 281-3  AQ$_NTFN_DESCRIPTOR Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntfn_flags</td>
<td>Set to 1 if the notifications are already removed after a stipulated timeout. Set 2 to denote grouping. Default is 0.</td>
</tr>
</tbody>
</table>

281.2.5 AQ$_NTFN_MSGID_ARRAY Type

This type is for storing grouping notification data for AQ namespace, value $2^{30}$ which is the max varray size.

Syntax

```sql
TYPE SYS.AQ$_NTFN_MSGID_ARRAY   AS VARRAY(1073741824)OF RAW(16);
```

281.2.6 AQ$_POST_INFO Type

This type specifies anonymous subscriptions to which you want to post messages.

Syntax

```sql
TYPE SYS.AQ$_POST_INFO IS OBJECT (  
   name        VARCHAR2(512),
   namespace   NUMBER,
   payload     RAW(32767));
```

Attributes

Table 281-4  AQ$_POST_INFO Attributes

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the anonymous subscription to which you want to post</td>
</tr>
<tr>
<td>namespace</td>
<td>To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ.NAMESPACE_ANONYMOUS</td>
</tr>
<tr>
<td>payload</td>
<td>The payload to be posted to the anonymous subscription</td>
</tr>
</tbody>
</table>
281.2.7 AQ$_POST_INFO_LIST Type

This type identifies the list of anonymous subscriptions to which you want to post messages.

See Also:
- AQ$_POST_INFO Type

Syntax

```
TYPE SYS.AQ$_POST_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_POST_INFO;
```

281.2.8 AQ$_PURGE_OPTIONS_T Type

This type specifies the options available for purging a queue table.

See Also:
- PURGE_QUEUE_TABLE Procedure.

Syntax

```
TYPE AQ$_PURGE_OPTIONS_T is RECORD (
    block           BOOLEAN       DEFAULT FALSE,
    delivery_mode   PLS_INTEGER   DEFAULT PERSISTENT);
```

Table 281-5  AQ$_PURGE_OPTIONS_T Type Attributes

<tr>
<td></td>
<td>• If block is TRUE, then an exclusive lock on all the queues in the queue</td>
</tr>
<tr>
<td></td>
<td>table is held while purging the queue table. This will cause concurrent</td>
</tr>
<tr>
<td></td>
<td>enqueuers and dequeuers to block while the queue table is purged. The purge</td>
</tr>
<tr>
<td></td>
<td>call always succeeds if block is TRUE.</td>
</tr>
<tr>
<td></td>
<td>• The default for block is FALSE. This will not block enqueuers and</td>
</tr>
<tr>
<td></td>
<td>dequeuers, but it can cause the purge to fail with an error during high</td>
</tr>
<tr>
<td></td>
<td>concurrency times.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>Kind of messages to purge, either DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT</td>
</tr>
</tbody>
</table>
281.2.9 AQ$_RECIPIENT_LIST_T Type

Identifies the list of agents that receive the message. This type can be used only when the queue is enabled for multiple dequeses.

See Also:

"AQ$_AGENT Type"

Syntax

TYPE SYS.AQ$_RECIPIENT_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;

281.2.10 AQ$_REG_INFO Type

This type identifies a producer or a consumer of a message.

Syntax

TYPE SYS.AQ$_REG_INFO IS OBJECT {
    name                              VARCHAR2(512),
    namespace                         NUMBER,
    callback                          VARCHAR2(4000),
    context                           RAW(2000) DEFAULT NULL,
    anyctx                            ANYDATA,
    ctxtype                           NUMBER,
    payloadcbk                        VARCHAR2(4000),
    timeout                           NUMBER,
    ntfn_grouping_class               NUMBER,
    ntfn_grouping_value               NUMBER DEFAULT 600,
    ntfn_grouping_type                NUMBER,
    ntfn_grouping_start_time          TIMESTAMP(6) WITH TIME ZONE,
    ntfn_grouping_repeat_count        NUMBER};

Attributes

Table 281-6    AQ$_REG_INFO Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the name of the subscription. The subscription name is of the form schema.queue if the registration is for a single consumer queue or schema.queue:consumer_name if the registration is for a multiconsumer queues.</td>
</tr>
</tbody>
</table>
Table 281-6  (Cont.) AQ$_REG_INFO Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Specifies the namespace of the subscription. To receive notification from Oracle Database Advanced Queuing queues, the namespace must be DBMS_AQ_NAMESPACE_AQ. To receive notifications from other applications through DBMS_AQ.POST or OCISubscriptionPost(), the namespace must be DBMS_AQ_NAMESPACE_ANONYMOUS.</td>
</tr>
<tr>
<td>callback</td>
<td>Specifies the action to be performed on message notification. For HTTP notifications, use <a href="http://www.company.com:8080">http://www.company.com:8080</a>. For e-mail notifications, use mailto://xyz@company.com. For raw message payload for the PLSQLCALLBACK procedure, use plsql://schema.procedure?PR=0. For user-defined type message payload converted to XML for the PLSQLCALLBACK procedure, use plsql://schema.procedure?PR=1.</td>
</tr>
<tr>
<td>context</td>
<td>Specifies the context that is to be passed to the callback function.</td>
</tr>
<tr>
<td>timeout</td>
<td>Specifies the time in seconds.</td>
</tr>
<tr>
<td>ntnfn_grouping_class</td>
<td>Currently, only the following flag can be set to specify criterion for grouping. The default value will be 0. If ntnfn_grouping_class is 0, all other notification grouping attributes must be 0.</td>
</tr>
<tr>
<td></td>
<td>• NTFN_GROUPING_CLASS_TIME - Notifications grouped by time, that is, the user specifies a time value and a single notification gets published at the end of that time.</td>
</tr>
<tr>
<td>ntnfn_grouping_value</td>
<td>Time-period of grouping notifications specified in seconds, meaning the time after which grouping notification would be sent periodically until ntnfn_grouping_repeat_count is exhausted.</td>
</tr>
<tr>
<td>ntnfn_grouping_type</td>
<td>• NTFN_GROUPING_TYPE_SUMMARY - Summary of all notifications that occurred in the time interval. (Default)</td>
</tr>
<tr>
<td></td>
<td>• NTFN_GROUPING_TYPE_LAST - Last notification that occurred in the interval.</td>
</tr>
<tr>
<td>ntnfn_grouping_start_time</td>
<td>Notification grouping start time. Notification grouping can start from a user-specified time that should a valid timestamp with time zone. If ntnfn_grouping_start_time is not specified when using grouping, the default is to current timestamp with time zone</td>
</tr>
</tbody>
</table>
Table 281-6  (Cont.) AQ$_REG_INFO Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ntfn_grouping_repeat_count</td>
<td>Grouping notifications will be sent as many times as specified by the notification grouping repeat count and after that revert to regular notifications. The ntfn_grouping_repeat_count, if not specified, will default to</td>
</tr>
<tr>
<td></td>
<td>• NTFN_GROUPING_FOREVER - Keep sending grouping notifications forever.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use the following notification mechanisms:

- OCI callback
- e-mail callback
- PL/SQL callback

Table 281-7 shows the actions performed for nonpersistent queues for different notification mechanisms when RAW presentation is specified. Table 281-8 shows the actions performed when XML presentation is specified.

Table 281-7  Actions Performed for Nonpersistent Queues When RAW Presentation Specified

</tbody>
</table>
281.2.11 AQ$_REG_INFO_LIST Type

Identifies the list of registrations to a queue.

See Also:

"AQ$_REG_INFO Type"

Syntax

TYPE SYS.AQ$_REG_INFO_LIST AS VARRAY(1024) OF SYS.AQ$_REG_INFO;

281.2.12 AQ$_SUBSCRIBER_LIST_T Type

This type identifies the list of subscribers that subscribe to a queue.

See Also:

"AQ$_AGENT Type"

Syntax

TYPE SYS.AQ$_SUBSCRIBER_LIST_T IS TABLE OF SYS.AQ$_AGENT
INDEX BY BINARY_INTEGER;

281.2.13 DEQUEUE_OPTIONS_T Type

DEQUEUE_OPTIONS_T specifies the options available for the dequeue operation.

Syntax

TYPE DEQUEUE_OPTIONS_T IS RECORD (  
consumer_name VARCHAR2(30) DEFAULT NULL,  
dequeue_mode BINARY_INTEGER DEFAULT REMOVE,  
navigation BINARY_INTEGER DEFAULT NEXT_MESSAGE,  
visibility BINARY_INTEGER DEFAULT ON_COMMIT,  
wait BINARY_INTEGER DEFAULT FOREVER,  
msgid RAW(16) DEFAULT NULL,  
correlation VARCHAR2(128) DEFAULT NULL,  
deq_condition VARCHAR2(4000) DEFAULT NULL,  
signature aq$_sig_prop DEFAULT NULL,  
transformation VARCHAR2(61) DEFAULT NULL,  
delivery_mode PLS_INTEGER DEFAULT PERSISTENT);
## Attributes

### Table 281-9 DEQUEUE_OPTIONS_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_name</td>
<td>Name of the consumer. Only those messages matching the consumer name are accessed. If a queue is not set up for multiple consumers, then this field should be set to NULL. For secure queues, consumer_name must be a valid AQ agent name, mapped to the database user performing the dequeue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call.</td>
</tr>
</tbody>
</table>
| dequeue_mode   | Specifies the locking behavior associated with the dequeue. Possible settings are:  
- **BROWSE**: Read the message without acquiring any lock on the message. This specification is equivalent to a select statement.  
- **LOCKED**: Read and obtain a write lock on the message. The lock lasts for the duration of the transaction. This setting is equivalent to a select for update statement.  
- **REMOVE**: Read the message and delete it. This setting is the default. The message can be retained in the queue table based on the retention properties.  
- **REMOVE_NODATA**: Mark the message as updated or deleted. The message can be retained in the queue table based on the retention properties. |
| navigation     | Specifies the position of the message that will be retrieved. First, the position is determined. Second, the search criterion is applied. Finally, the message is retrieved. Possible settings are:  
- **NEXT_MESSAGE**: Retrieve the next message that is available and matches the search criteria. If the previous message belongs to a message group, then AQ retrieves the next available message that matches the search criteria and belongs to the message group. This setting is the default.  
- **NEXT_TRANSACTION**: Skip the remainder of the current transaction group (if any) and retrieve the first message of the next transaction group. This setting can only be used if message grouping is enabled for the current queue.  
- **FIRST_MESSAGE**: Retrieves the first message which is available and matches the search criteria. This setting resets the position to the beginning of the queue.  
- **FIRST_MESSAGE_MULTI_GROUP**: indicates that a call to `DBMS_AQ.DEQUEUE_ARRAY` will reset the position to the beginning of the queue and dequeue messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the `ARRAY_SIZE` limit. Refer to the `TRANSACTION_GROUP` attribute for the message to distinguish between transaction groups.  
- **NEXT_MESSAGE_MULTI_GROUP**: indicates that a call to `DBMS_AQ.DEQUEUE_ARRAY` will dequeue the next set of messages (possibly across different transaction groups) that are available and match the search criteria, until reaching the `ARRAY_SIZE` limit. Refer to the `TRANSACTION_GROUP` attribute for the message to distinguish between transaction groups. |
### Table 281-9  (Cont.) DEQUEUE_OPTIONS_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>Specifies whether the new message is dequeued as part of the current transaction. The visibility parameter is ignored when using the BROWSE dequeue mode. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td><strong>ON_COMMIT</strong>: The dequeue will be part of the current transaction. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>IMMEDIATE</strong>: The dequeue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation.</td>
</tr>
<tr>
<td>wait</td>
<td>Specifies the wait time if there is currently no message available which matches the search criteria. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td><strong>FOREVER</strong>: Wait forever. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td><strong>NO_WAIT</strong>: Do not wait.</td>
</tr>
<tr>
<td></td>
<td><strong>number</strong>: Wait time in seconds.</td>
</tr>
<tr>
<td>msgid</td>
<td>Specifies the message identifier of the message to be dequeued.</td>
</tr>
<tr>
<td>correlation</td>
<td>Specifies the correlation identifier of the message to be dequeued. Special pattern matching characters, such as the percent sign (%) and the underscore (_) can be used. If more than one message satisfies the pattern, then the order of dequeuing is undetermined.</td>
</tr>
<tr>
<td>deq_condition</td>
<td>A conditional expression based on the message properties, the message data properties, and PL/SQL functions. A deq_condition is specified as a Boolean expression using syntax similar to the WHERE clause of a SQL query. This Boolean expression can include conditions on message properties, user data properties (object payloads only), and PL/SQL or SQL functions (as specified in the WHERE clause of a SQL query). Message properties include priority, corr and other columns in the queue table. To specify dequeue conditions on a message payload (object payload), use attributes of the object type in clauses. You must prefix each attribute with tab.user_data as a qualifier to indicate the specific column of the queue table that stores the payload. The deq_condition parameter cannot exceed 4000 characters. If more than one message satisfies the dequeue condition, then the order of dequeuing is undetermined.</td>
</tr>
<tr>
<td>signature</td>
<td>Currently not implemented</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied after dequeuing the message. The source type of the transformation must match the type of the queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The dequeuer specifies the delivery mode of the messages it wishes to dequeue in the dequeue options. It can be BUFFERED or PERSISTENT or PERSISTENT_OR_BUFFERED. The message properties of the dequeued message indicate the delivery mode of the dequeued message. Array dequeue is only supported for buffered messages with an array size of '1'.</td>
</tr>
</tbody>
</table>
281.2.14 ENQUEUE_OPTIONS_T Type

ENQUEUE_OPTIONS_T Type specifies the options available for the enqueue operation.

Syntax

```plaintext
TYPE SYS.ENQUEUE_OPTIONS_T IS RECORD (
    visibility            BINARY_INTEGER  DEFAULT ON_COMMIT,
    relative_msgid        RAW(16)         DEFAULT NULL,
    sequence_deviation    BINARY_INTEGER  DEFAULT NULL,
    transformation        VARCHAR2(61)    DEFAULT NULL,
    delivery_mode         PLS_INTEGER     NOT NULL DEFAULT PERSISTENT);
```

Attributes

Table 281-10 ENQUEUE_OPTIONS_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>visibility</td>
<td>Specifies the transactional behavior of the enqueue request. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>ON_COMMIT: The enqueue is part of the current transaction. The operation is complete when the transaction commits. This setting is the default.</td>
</tr>
<tr>
<td></td>
<td>IMMEDIATE: The enqueue operation is not part of the current transaction, but an autonomous transaction which commits at the end of the operation. This is the only value allowed when enqueuing to a non-persistent queue.</td>
</tr>
<tr>
<td>relative_msgid</td>
<td>Specifies the message identifier of the message which is referenced in the sequence deviation operation. This field is valid only if BEFORE is specified in sequence_deviation. This parameter is ignored if sequence deviation is not specified.</td>
</tr>
<tr>
<td>sequence_deviation</td>
<td>Specifies whether the message being enqueued should be dequeued before other messages already in the queue. Possible settings are:</td>
</tr>
<tr>
<td></td>
<td>BEFORE: The message is enqueued ahead of the message specified by relative_msgid.</td>
</tr>
<tr>
<td></td>
<td>TOP: The message is enqueued ahead of any other messages.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies a transformation that will be applied before enqueuing the message. The return type of the transformation function must match the type of the queue.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The enqueuer specifies the delivery mode of the messages it wishes to enqueue in the enqueue options. It can be BUFFERED or PERSISTENT. The message properties of the enqueued message indicate the delivery mode of the enqueued message. Array enqueue is only supported for buffered messages with an array size of '1'.</td>
</tr>
</tbody>
</table>
### 281.2.15 QUEUE_PROPS_T Type

This type specifies the Oracle Database Advanced Queuing descriptor received by the AQ PL/SQL callbacks upon notification.

**Syntax**

```sql
TYPE QUEUE_PROPS_T IS RECORD (
    retry_delay     NUMBER         DEFAULT 0,
    retention_time  NUMBER         DEFAULT 0,
    sort_list       VARCHAR2(30)   DEFAULT NULL,
    cache_hint      BINARY_INTEGER DEFAULT AUTO
);```

**Attributes**

**Table 281-11  QUEUE_PROPS_T Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retry_delay</td>
<td>Specifies the number of seconds after which this message is scheduled for processing again after an application rollback</td>
</tr>
<tr>
<td>retention_time</td>
<td>Specifies the number of seconds a message is retained in the queue table after being dequeued from the queue</td>
</tr>
<tr>
<td>sort_list</td>
<td>Sharded queues can be sorted by <code>ENQ_TIME</code> or <code>PRIORITY</code>, <code>ENQ_TIME</code>.</td>
</tr>
<tr>
<td>cache_hint</td>
<td>Specifies a hint to sharded queue whether to cache messages or not. User can specify following:</td>
</tr>
<tr>
<td></td>
<td>• UNCAUCACHED: Message cache will not cache messages</td>
</tr>
<tr>
<td></td>
<td>• CACHED: Message cache will cache messages and give preference to those queues with CACHED hint.</td>
</tr>
<tr>
<td></td>
<td>• AUTO: Message cache does best effort based on available memory</td>
</tr>
</tbody>
</table>

### 281.2.16 SYS.MSG_PROP_T Type

This type is used in PL/SQL notification, as one field in `aq$_descriptor`, to pass message properties of an AQ message to the PL/SQL notification client callback.

**Syntax**

```sql
CREATE or replace TYPE sys.msg_prop_t AS OBJECT (
    priority         NUMBER,
    delay            NUMBER,
    expiration       NUMBER,
    correlation      VARCHAR2(128),
    attempts         NUMBER,
    exception_queue  VARCHAR2(51),
    enqueue_time     DATE,
    state            NUMBER,
    sender_id        aq$_agent,
    original_msgid   RAW(16),
    delivery_mode    NUMBER);
```
Parameters

Table 281-12  SYS.MSG_PROP_T Type Attributes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeuing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. DELAY processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
<tr>
<td>expiration</td>
<td>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</td>
</tr>
<tr>
<td>correlation</td>
<td>Returns the identifier supplied by the producer of the message at enqueue time.</td>
</tr>
<tr>
<td>attempts</td>
<td>Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.</td>
</tr>
</tbody>
</table>
Table 281-12  (Cont.) SYS.MSG_PROP_T Type Attributes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exception_queue</td>
<td>Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:</td>
</tr>
<tr>
<td></td>
<td>• RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.</td>
</tr>
<tr>
<td></td>
<td>For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view. If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.</td>
</tr>
<tr>
<td></td>
<td>• A message was not dequeued before the expiration time elapsed.</td>
</tr>
<tr>
<td></td>
<td>• Message propagation to the specified destination queue failed with one of the following errors:</td>
</tr>
<tr>
<td></td>
<td>* There were no recipients for the multiconsumer destination queue.</td>
</tr>
<tr>
<td></td>
<td>* Recipients were specified for a single-consumer destination queue.</td>
</tr>
<tr>
<td></td>
<td>* Destination queue was an exception queue</td>
</tr>
<tr>
<td></td>
<td>* There was an error when applying transformation.</td>
</tr>
<tr>
<td></td>
<td>The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time.</td>
</tr>
<tr>
<td>enqueue_time</td>
<td>Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time.</td>
</tr>
<tr>
<td>state</td>
<td>Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_AQ.READY: The message is ready to be processed.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_AQ.WAITING: The message delay has not yet been reached.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_AQ.PROCESSED: The message has been processed and is retained.</td>
</tr>
<tr>
<td></td>
<td>• DBMSAQ.EXPIRED: The message has been moved to the exception queue.</td>
</tr>
</tbody>
</table>
Table 281-12  (Cont.) SYS.MSG_PROP_T Type Attributes

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender_id</td>
<td>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent.</td>
</tr>
<tr>
<td></td>
<td>Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through the dbms_aqadm.enable_db_access procedure call. Sender address and protocol should not be specified.</td>
</tr>
<tr>
<td></td>
<td>The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [Format source_queue@source_database_name]</td>
</tr>
<tr>
<td>original_msgid</td>
<td>This parameter is used by Oracle Database Advanced Queuing for propagating messages.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>DBMS_AQ.BUFFERED or DBMS_AQ.PERSISTENT.</td>
</tr>
</tbody>
</table>

281.2.17 MESSAGE_PROPERTIES_T Type

This type is defined inside the DBMS_AQ package, and describes the information that AQ uses to convey the state of individual messages. These are set at enqueue time, and their values are returned at dequeue time.

```sql
TYPE message_properties_t IS RECORD (  
priority             BINARY_INTEGER  NOT NULL DEFAULT 1,  
delay                BINARY_INTEGER  NOT NULL DEFAULT NO_DELAY,  
expiration           BINARY_INTEGER  NOT NULL DEFAULT NEVER,  
 correlation          VARCHAR2(128)   DEFAULT NULL,  
 attempts             BINARY_INTEGER,  
 recipient_list       AQ$_RECIPIENT_LIST_T,  
 exception_queue      VARCHAR2(61)    DEFAULT NULL,  
 enqueue_time         DATE,  
 state                BINARY_INTEGER,  
 sender_id            SYS.AQ$_AGENT   DEFAULT NULL,  
 original_msgid       RAW(16)         DEFAULT NULL,  
 signature            aq$_sig_prop    DEFAULT NULL,  
 transaction_group    VARCHAR2(30)    DEFAULT NULL,  
 user_property        SYS.ANYDATA     DEFAULT NULL  
 delivery_mode        PLS_INTEGER     NOT NULL DEFAULT DBMS_AQ.PERSISTENT);
```
# Attributes

## Table 281-13 MESSAGE_PROPERTIES_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>priority</td>
<td>Specifies the priority of the message. A smaller number indicates higher priority. The priority can be any number, including negative numbers.</td>
</tr>
<tr>
<td>delay</td>
<td>Specifies the delay of the enqueued message. The delay represents the number of seconds after which a message is available for dequeuing. Dequeueing by msgid overrides the delay specification. A message enqueued with delay set is in the WAITING state, and when the delay expires, the message goes to the READY state. Delay processing requires the queue monitor to be started. However the queue monitor is started automatically by the system if needed. Delay is set by the producer who enqueues the message. The possible settings follow: NO_DELAY: The message is available for immediate dequeuing number: The number of seconds to delay the message</td>
</tr>
<tr>
<td>expiration</td>
<td>Specifies the expiration of the message. It determines, in seconds, the duration the message is available for dequeuing. This parameter is an offset from the time the message is ready for dequeue. Expiration processing requires the queue monitor to be running. However the queue monitor is started automatically by the system if needed. The possible settings follow: NEVER: The message does not expire number: The number of seconds message remains in READY state. If the message is not dequeued before it expires, then it is moved to the exception queue in the EXPIRED state.</td>
</tr>
<tr>
<td>correlation</td>
<td>Returns the identifier supplied by the producer of the message at enqueue time.</td>
</tr>
<tr>
<td>attempts</td>
<td>Returns the number of attempts that have been made to dequeue the message. This parameter cannot be set at enqueue time.</td>
</tr>
<tr>
<td>recipient_list</td>
<td>This parameter is only valid for queues that allow multiple consumers. The default recipients are the queue subscribers. This parameter is not returned to a consumer at dequeue time. For type definition, see the &quot;AQ$_AGENT Type&quot;.</td>
</tr>
</tbody>
</table>
Table 281-13 (Cont.) MESSAGE_PROPERTIES_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| exception_queue| Specifies the name of the queue into which the message is moved if it cannot be processed successfully. Messages are moved automatically into the exception queue. Messages are moved into the exception queue in the following cases:  
  • RETRY_COUNT, the number of unsuccessful dequeue attempts, has exceeded the specification for the MAX_RETRIES parameter in the DBMS_AQADM.CREATE_QUEUE procedure during queue creation.  
  For multiconsumer queues, the message becomes eligible to be moved to the exception queue even if failed dequeue attempts exceeds the MAX_RETRIES parameter for only one of the consumers. But the message will not be moved until either all other consumers have successfully consumed the message or failed more than MAX_RETRIES. You can view MAX_RETRIES for a queue in the ALL_QUEUES data dictionary view.  
  If a dequeue transaction fails because the server process dies (including ALTER SYSTEM KILL SESSION) or SHUTDOWN ABORT on the instance, then RETRY_COUNT is not incremented.  
  • A message was not dequeued before the expiration time elapsed.  
  • Message propagation to the specified destination queue failed with one of the following errors:  
    * There were no recipients for the multiconsumer destination queue.  
    * Recipients were specified for a single-consumer destination queue.  
    * Destination queue was an exception queue  
    * There was an error when applying transformation.  
  The default is the exception queue associated with the queue table. If the exception queue specified does not exist at the time of the move, then the message is moved to the default exception queue associated with the queue table, and a warning is logged in the alert log. If the default exception queue is specified, then the parameter returns a NULL value at dequeue time. |
| enqueue_time    | Specifies the time the message was enqueued. This value is determined by the system and cannot be set by the user at enqueue time. |
| state           | Specifies the state of the message at the time of the dequeue. This parameter cannot be set at enqueue time. The possible states follow:  
  • DBMS_AQ.READY: The message is ready to be processed.  
  • DBMS_AQ.WAITING: The message delay has not yet been reached.  
  • DBMS_AQ.PROCESSED: The message has been processed and is retained.  
  • DBMSAQ.EXPIRED: The message has been moved to the exception queue. |
### Table 281-13  (Cont.) MESSAGE_PROPERTIES_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sender_id</td>
<td>The application-sender identification specified at enqueue time by the message producer. Sender id is of type aq$_agent. Sender name is required for secure queues at enqueue time. This must be a valid AQ agent name, mapped to the database user performing the enqueue operation, through <code>dbms_aqadm.enable_db_access</code> procedure call. Sender address and protocol should not be specified. The Sender id in the message properties returned at dequeue time may have a sender address if the message was propagated from another queue. The value of the address is the source_queue, source database name if it was a remote database [format source_queue@source_database_name]</td>
</tr>
<tr>
<td>original_msgid</td>
<td>This parameter is used by Oracle Database Advanced Queuing for propagating messages.</td>
</tr>
<tr>
<td>signature</td>
<td>Currently not implemented</td>
</tr>
<tr>
<td>transaction_group</td>
<td>Specifies the transaction_group for the dequeued message. Messages belonging to the same transaction group will have the same value for this attribute. This attribute is only set by the <code>DBMS_AQ.DEQUEUE_ARRAY</code>. This attribute cannot be used to set the transaction group of a message through <code>DBMS_AQ.ENQUEUE</code> or <code>DBMS_AQ.ENQUEUE_ARRAY</code> calls.</td>
</tr>
<tr>
<td>user_property</td>
<td>This optional attribute is used to store additional information about the payload.</td>
</tr>
<tr>
<td>delivery_mode</td>
<td>The message publisher specifies the delivery mode in the message_properties. This can be <code>DBMS_AQ.BUFFERED</code> or <code>DBMS_AQ.PERSISTENT</code>. Array enqueue is only supported for buffered messages with an array size of '1'.</td>
</tr>
</tbody>
</table>

### 281.2.18 MESSAGE_PROPERTIES_ARRAY_T Type

This type is used by `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message properties.

Each element in the `payload_array` should have a corresponding element in the `MESSAGE_PROPERTIES_ARRAY_T` VARRAY.

```
See Also:
"MESSAGE_PROPERTIES_T Type"
```

```
Syntax

TYPE MESSAGE_PROPERTIES_ARRAY_T IS VARRAY (2147483647) OF MESSAGE_PROPERTIES_T;
```
281.2.19 MSGID_ARRAY_T Type

The `msgid_array_t` type is used in `dbms_aq.enqueue_array` and `dbms_aq.dequeue_array` calls to hold the set of message IDs that correspond to the enqueued or dequeued messages.

**Syntax**

```plaintext
TYPE MSGID_ARRAY_T IS TABLE OF RAW(16) INDEX BY BINARY_INTEGER
```
DBFS Content Interface Types are public types that support the DBMS_DBFS_CONTENT interface.

This chapter contains the following topics:

• Overview
• Security Model
• Data Structures

Related Topics

• DBMS_DBFS_CONTENT
  The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

282.1 DDBFS Content Interface Types Overview

The type definitions described in this chapter support the DBMS_DBFS_CONTENT interface in implementing metadata tables, packages, views, dependent application-side entities, and service-provider entities.

282.2 DBFS Content Interface Types Security Model

The user can access the content operational and administrative interfaces (packages, types, tables, and so on) with the DBFS_ROLE. This role can be granted to users as needed.

282.3 DBFS Content Interface Types —Data Structures

Types that support the DBMS_DBFS_CONTENT interface include both Object and Table types.

Object Types

• DBMS_DBFS_CONTENT_CONTEXT_T Object Type
• DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type
• DBMS_DBFS_CONTENT_PROPERTY_T Object Type

Table Types

• DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type
• DBMS_DBFS_CONTENT_PROPERTIES_T Table Type
• DBMS_DBFS_CONTENT_RAW_T Table Type
282.3.1 DBMS_DBFS_CONTENT_CONTEXT_T Object Type

This type describes the execution context for the providers. It provides the user performing the operation with the Access Control List, the owner of the item(s), a timestamp for doing asof queries, and whether or not the item(s) are read_only. This type can be used both as input, in the case of path item creation functions, and output, in the case of path item query, or both.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_context_t
  AUTHID DEFINER
AS OBJECT ( principal VARCHAR2(32),
             acl VARCHAR2(1024),
             owner VARCHAR2(32),
             asof TIMESTAMP,
             read_only INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>File system user</td>
</tr>
<tr>
<td>acl</td>
<td>Access control list</td>
</tr>
<tr>
<td>owner</td>
<td>Path item owner</td>
</tr>
<tr>
<td>asof</td>
<td>Timestamp</td>
</tr>
<tr>
<td>read_only</td>
<td>Nonzero if the path item is read-only</td>
</tr>
</tbody>
</table>

282.3.2 DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type

This type describes a type to assist in listing the contents of a directory.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_item_t
  AUTHID DEFINER
AS OBJECT ( path VARCHAR2(1024),
             item_name VARCHAR2(256),
             item_type INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Path to the path item</td>
</tr>
<tr>
<td>item_name</td>
<td>Name of the path item</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of path item. (See Table 48-4</td>
</tr>
</tbody>
</table>
282.3.3 DBMS_DBFS_CONTENT_PROPERTY_T Object Type

This type describes a single \((\text{name}, \text{value}, \text{typecode})\) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

The type is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_property_t
    AUTHID DEFINER
AS OBJECT (
    propname     VARCHAR2(32),
    propvalue    VARCHAR2(1024),
    typecode     INTEGER);
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_name</td>
<td>Name of property</td>
</tr>
<tr>
<td>prop_value</td>
<td>Value of property</td>
</tr>
<tr>
<td>typecode</td>
<td>Property type (See Constants in DBMS_TYPES)</td>
</tr>
</tbody>
</table>

282.3.4 DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

This type is a variable-sized array of DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_list_items_t AS
    TABLE OF dbms_dbfs_content_list_item_t;
```

Related Topics

- **DBMS_DBFS_CONTENT_LIST_ITEM_T Object Type**
  This type describes a type to assist in listing the contents of a directory.

- **DBMS_DBFS_CONTENT**
  The **DBMS_DBFS_CONTENT** package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.
282.3.5 DBMS_DBFS_CONTENT_PROPERTIES_T Table Type

This type is a variable-sized array of property tuples of DBMS_DBFS_CONTENT_PROPERTY_T Object Type. It is used by both the client-facing interfaces and by store providers for the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_properties_t AS
    TABLE OF dbms_dbfs_content_property_t;
```

Related Topics

- **DBMS_DBFS_CONTENT_PROPERTY_T Object Type**
  This type describes a single (name, value, typecode) property tuple. All properties (standard, optional, and user-defined) are described using such tuples.

282.3.6 DBMS_DBFS_CONTENT_RAW_T Table Type

This type is an array of RAW. It is to enable RAW data transport for batch interfaces in the DBMS_DBFS_CONTENT interface.

Syntax

```
CREATE OR REPLACE TYPE dbms_dbfs_content_raw_t AS
    TABLE OF RAW(32767);
```

Related Topics

- **DBMS_DBFS_CONTENT**
  The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.
Oracle supports the UriType family of types that can be used to store and query Uri-ref inside the database. The UriType itself is an abstract object type and the HTTPURITYPE, XDBURITYPE and DBURITYPE are subtypes of it.

You can create a UriType column and store instances of the DBURITYPE, XDBURITYPE or the HTTPURITYPE inside of it. You can also define your own subtypes of the UriType to handle different URL protocols.

Oracle also provides a UriFactory package that can be used as a factory method to automatically generate various instances of these UriTypes by scanning the prefix, such as http:// or /oradb. You can also register your subtype and provide the prefix that you support. For instance, if you have written a subtype to handle the gopher protocol, you can register the prefix gopher:// to be handled by your subtype. The UriFactory will then generate your subtype instance for any URL starting with that prefix.

This chapter contains the following topics:

- Summary of URITYPE Supertype Subprograms
- Summary of HTTPURITYPE Subtype Subprograms
- Summary of DBURITYPE Subtype Subprograms
- Summary of XDBURITYPE Subtype Subprograms
- Summary of URIFACTORY Package Subprograms

See Also:

- Oracle XML DB Developer's Guide

283.1 Summary of URITYPE Supertype Subprograms

The UriType is the abstract super type. It provides a standard set of functions to get the value pointed to by the URI. The actual implementation of the protocol must be defined by the subtypes of this type.

Instances of this type cannot be created directly. However, you can create columns of this type and store subtype instances in it, and also select from columns without knowing the instance of the URL stored.

Table 283-1    URITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETBLOB</td>
<td>Returns the BLOB located at the address specified by the URL.</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>GETCLOB</td>
<td>Returns the CLOB located at the address specified by the URL.</td>
</tr>
<tr>
<td>GETCONTENTTYPE</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETEXTERNALURL</td>
<td>Returns the URL, in escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETURL</td>
<td>Returns the URL, in non-escaped format, stored inside the UriType instance.</td>
</tr>
<tr>
<td>GETXML</td>
<td>Returns the XMLType located at the address specified by the URL.</td>
</tr>
</tbody>
</table>

283.1.1 UriType Supertype GETBLOB

This function returns the BLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the BLOB located at the address specified by the URL.

**Syntax**

```plaintext
MEMBER FUNCTION getBlob()
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL and the content type.

**Syntax**

```plaintext
MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;
```

This function returns the BLOB located at the address specified by the URL in the specified character set.

**Syntax**

```plaintext
FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;
```

Table 283-2  UriType Supertype GETBLOB Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error</td>
</tr>
</tbody>
</table>
283.1.2 UriType Supertype GETCLOB

This function returns the CLOB located at the address specified by the URL.

This function can be overridden in the subtype instances. This function returns either a permanent CLOB or a temporary CLOB. If a temporary CLOB is returned, it must be freed. The options are described below.

This function returns the CLOB located at the address specified by the URL.

**Syntax**

```
MEMBER FUNCTION getClob()
    RETURN CLOB;
```

This function returns the CLOB located at the address specified by the URL and the content type.

**Syntax**

```
MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>

283.1.3 UriType Supertype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

This function can be overridden in the subtype instances. This function returns the content type as VARCHAR2.

**Syntax**

```
MEMBER FUNCTION getContentType()
    RETURN VARCHAR2;
```

283.1.4 UriType Supertype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

**Syntax**

```
MEMBER FUNCTION getExternalUrl()
    RETURN varchar2;
```
283.1.5 UriType Supertype GETURL

This function returns the URL, in non-escaped format, stored inside the UriType instance.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE function does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason, use the getExternalUrl function or the getUrl function to get to the URL value instead of using the attribute present in the UriType instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;

283.1.6 UriType Supertype GETXML

This function returns the XMLType located at the address specified by the URL.

This function can be overridden in the subtype instances. The options are described below.

This function returns the XMLType located at the address specified by the URL.

Syntax

MEMBER FUNCTION getXML()
RETURN XMLType;

MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;

<table>
<thead>
<tr>
<th>Table 283-4  UriType Supertype GETXML Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>content</td>
</tr>
</tbody>
</table>

283.2 Summary of HTTPURITYPE Subtype Subprograms

The HTTPURITYPE is a subtype of the UriType that provides support for the HTTP protocol. This uses the UTL_HTTP package underneath to access the HTTP URLs. Proxy and secure wallets are not supported in this release.
Table 283-5  HTTPURITYPE Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATEURI</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>

</tr>
<tr>
<td>HTTPURITYPE</td>
<td>Creates an instance of HTTPURITYPE from the given URI.</td>
</tr>
</tbody>
</table>

283.2.1 HttpUriType Subtype CREATEURI

This static function constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

```sql
STATIC FUNCTION createUri(
    url IN varchar2)
RETURN HTTPURITYPE;
```

Table 283-6  HttpUriType Subtype CREATEURI Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL; escaped format.</td>
</tr>
</tbody>
</table>

283.2.2 HttpUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the HTTP URL.

The subprograms of the URI Subtype ATTPURITYPE member subprogram GETBLOB are described below.

This function returns the BLOB located at the address specified by the HTTP URL.

Syntax

```sql
MEMBER FUNCTION getBlob()
RETURN BLOB;
```

This function returns the BLOB located at the address specified by the HTTP URL and the content type.
Syntax

MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;

Table 283-7  HttpUriType Subtype GETBLOB Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>

<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>

283.2.3HttpUriType Subtype GETCLOB

This function returns the CLOB located by the HTTP URL address. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype HTTPURITYPE member subprogram GETCLOB are described below.

Returns the CLOB located at the address specified by the HTTP URL.

Syntax

MEMBER FUNCTION getClob()
    RETURN CLOB;

Returns the CLOB located at the address specified by the HTTP URL and the content type.

Syntax

MEMBER FUNCTION getClob(content OUT VARCHAR2)
    RETURN CLOB;

Table 283-8  HttpUriType Subtype GETCLOB Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>
283.2.4 HttpUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

MEMBER FUNCTION getContentType()
RETURN VARCHAR2;

283.2.5 HttpUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the HTTPURITYPE instance. The subtype instances override this member function.

The HTTPURITYPE function does not store the prefix http://, but generates it for the external URL.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;

283.2.6 HttpUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the HTTPURITYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;

283.2.7 HttpUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL. An error is thrown if the address does not point to a valid XML document.

The subprograms of the URI Subtype HttpUriType member subprogram GETXML are described below.

This function returns the XMLType located at the address specified by the URL.

Syntax

MEMBER FUNCTION getXML()
RETURN XMLType;

This function returns the XMLType located at the address specified by the URL and the content type.

Syntax

MEMBER FUNCTION getXML(content OUT VARCHAR2)
RETURN XMLType;
Table 283-9  HttpUriType Subtype GETXML Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>

283.2.8 HttpUriType Subtype HTTPURITYPE

This constructs a HTTPURITYPE instance. The HTTPURITYPE instance does not contain the prefix http:// in the stored URL.

Syntax

CONSTRUCTOR FUNCTION HTTPURITYPE(
  url IN VARCHAR2);

Table 283-10  HttpUriType Subtype HTTPURITYPE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid HTTP URL. The URL string is expected in escaped format. For example, non-url characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>

283.3 Summary of DBURITYPE Subtype Subprograms

The DBURITYPE is a subtype of the UriType that provides support for DBUri-refs. A DBUri-ref is an intra-database URL that can be used to reference any row or row-column data in the database.

The URL is specified as an XPath expression over a XML visualization of the database. The schemas become elements which contain tables and views. These tables and views further contain the rows and columns inside them.

Table 283-11  DBURITYPE Type Subprograms

<table>

</table>

283.3.1 DBUriType Subtype CREATEURI

This static function constructs a DBURITYPE instance. Parses the URL given and creates a DBURITYPE instance.

Syntax

STATIC FUNCTION createUri(
    url IN varchar2)
RETURN DBURITYPE;

Table 283-12  DBUriType Subtype CREATEURI Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid DBURITYPE.</td>
</tr>
</tbody>
</table>

283.3.2 DBUriType Subtype DBURITYPE

This constructs a DBURITYPE instance.

Syntax

CONSTRUCTOR FUNCTION DBURITYPE(
    url IN varchar2);

Table 283-13  DBUriType Subtype DBURITYPE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string containing a valid DBURITYPE. The URL string is expected in escaped format. For example, non-URL characters are represented as the hexadecimal value for the UTF-8 encoding of those characters.</td>
</tr>
</tbody>
</table>

283.3.3 DBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the URL.

The subprograms of the URI Subtype DBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.
Syntax

MEMBER FUNCTION getBlob()
   RETURN BLOB;

This function returns the **BLOB** located at the address specified by the URL and the content type.

Syntax

MEMBER FUNCTION getBlob(content OUT VARCHAR2)
   RETURN BLOB;

This function returns the **BLOB** located at the address specified by the URL in the specified character set.

Syntax

FUNCTION getBlob(csid IN NUMBER)
   RETURN BLOB;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>OUT</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>IN</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>

283.3.4 DBUriType Subtype GETCLOB

This function returns the **CLOB** located at the address specified by the **DBUritype** instance.

If a temporary **CLOB** is returned, it must be freed. The document returned may be an XML document or a text document. When the DBUri-ref identifies an element in the XPath, the result is a well-formed XML document. On the other hand, if it identifies a text node, then what is returned is only the text content of the column or attribute. The options are described below.

The following function returns the **CLOB** located at the address specified by the **DBUritype** instance.

Syntax

MEMBER FUNCTION getClob()
   RETURN CLOB;

The following function returns the **CLOB** located at the address specified by the **DBUritype** instance and the content type.

Syntax

MEMBER FUNCTION getClob(content OUT VARCHAR2)
   RETURN CLOB;
Table 283-15  DBUriType Subtype GETCLOB Parameters

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>

283.3.5 DBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI.

Syntax

MEMBER FUNCTION getContentType()
RETURN VARCHAR2;

283.3.6 DBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the DBURITYPE instance. The DBuri Servlet URL that processes the DBURITYPE has to be appended before using the escaped URL in Web pages.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;

283.3.7 DBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the DBURITYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;

283.3.8 DBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype DBPURITYPE member subprogram GETXML are described below. The options are described in the following table.

This function returns the XMLType located at the address specified by the URL.

Syntax

MEMBER FUNCTION getXML()
RETURN XMLType;

This function returns the XMLType located at the address specified by the URL and the content type.
Syntax

```sql
MEMBER FUNCTION getXML(content OUT VARCHAR2)
    RETURN XMLType;
```

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

### 283.4 Summary of XDBURIType Subtype Subprograms

**XDBURIType** is a new subtype of URIType. It provides a way to expose documents in the Oracle XML DB hierarchy as URIs that can be embedded in any URIType column in a table.

The URL part of the URI is the hierarchical name of the XML document it refers to. The optional fragment part uses the XPath syntax, and is separated from the URL part by '#'. The more general XPointer syntax for specifying a fragment is not currently supported.

</tr>
</tbody>
</table>

#### 283.4.1 XDBURIType Subtype CREATEURI

This static function constructs a XDBURIType instance. It parses the given URL and creates a XDBURIType instance.

Syntax

```sql
STATIC FUNCTION createUri(
    url IN varchar2)
    RETURN XDBURIType;
```
283.4.2 XDBUriType Subtype GETBLOB

This function returns the BLOB located at the address specified by the XDBURITYPE instance.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETBLOB are described below. The options are described in the following table.

This function returns the BLOB located at the address specified by the URL.

Syntax

MEMBER FUNCTION getBlob()
    RETURN BLOB;

This function returns the BLOB located at the address specified by the URL and the content type.

Syntax

MEMBER FUNCTION getBlob(content OUT VARCHAR2)
    RETURN BLOB;

This function returns the BLOB located at the address specified by the URL in the specified character set.

Syntax

FUNCTION getBlob(csid IN NUMBER)
    RETURN BLOB;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
<tr>
<td>csid</td>
<td>(IN)</td>
<td>Character set id of the document. Must be a valid Oracle id and greater than 0; otherwise returns an error.</td>
</tr>
</tbody>
</table>

283.4.3 XDBUriType Subtype GETCLOB

This function returns the CLOB located at the address specified by the XDBURITYPE instance. If a temporary CLOB is returned, it must be freed.

The subprograms of the URI Subtype XDBURITYPE member subprogram GETCLOB are described below. The options are described in the following table.

Returns the CLOB located at the address specified by the XDBUriType instance.
Syntax

MEMBER FUNCTION getClob()
RETURN CLOB;

Returns the CLOB located at the address specified by the XDBUriType instance and the content type.

Syntax

MEMBER FUNCTION getClob(content OUT VARCHAR2)
RETURN CLOB;

Table 283-19  XDBUriType Subtype GETCLOB Parameters

</thead>
<tbody>
<tr>
<td>content</td>
<td>(OUT)</td>
<td>Content type of the document to which URI is pointing.</td>
</tr>
</tbody>
</table>

283.4.4 XDBUriType Subtype GETCONTENTTYPE

This function returns the content type of the document pointed to by the URI. This function returns the content type as VARCHAR2.

Syntax

MEMBER FUNCTION getContentType()
RETURN VARCHAR2;

283.4.5 XDBUriType Subtype GETEXTERNALURL

This function returns the URL, in escaped format, stored inside the XDBURI TYPE instance.

Syntax

MEMBER FUNCTION getExternalUrl()
RETURN varchar2;

283.4.6 XDBUriType Subtype GETURL

This function returns the URL, in non-escaped format, stored inside the XDBURI TYPE instance.

Syntax

MEMBER FUNCTION getUrl()
RETURN varchar2;

283.4.7 XDBUriType Subtype GETXML

This function returns the XMLType located at the address specified by the URL.

The subprograms of the URI Subtype XDBURI TYPE member subprogram GETXML are described below. The options are described in the following table.
This function returns the XMLType located at the address specified by the URL.

**Syntax**

MEMBER FUNCTION getXML()
  RETURN XMLType;

This function returns the XMLType located at the address specified by the URL and the content type.

**Syntax**

MEMBER FUNCTION getXML(content OUT VARCHAR2)
  RETURN XMLType;

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
283.5 Summary of URIFACTORY Package Subprograms

The UriFactory package contains factory methods that can be used to generate the appropriate instance of the URI types without having to hard code the implementation in the program.

The UriFactory package also provides the ability to register new subtypes of the UriType to handle various other protocols. For example, you can invent a new protocol ecom:// and define a subtype of the UriType to handle that protocol and register it with UriFactory. After that any factory method would generate the new subtype instance if it sees the ecom:// prefix.

Table 283-22  URIFACTORY Type Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETURI</td>
<td>Returns the correct URI handler for the given URI string.</td>
</tr>
<tr>
<td>ESCAPEURI</td>
<td>Returns a URL in escaped format.</td>
</tr>
<tr>
<td>UNESCAPEURI</td>
<td>Returns a URL in unescaped format.</td>
</tr>
<tr>
<td>REGISTERURLHANDLER</td>
<td>Registers a particular type name for handling a particular URL.</td>
</tr>
<tr>
<td>UNREGISTERURLHANDLER</td>
<td>Unregisters a URL handler.</td>
</tr>
</tbody>
</table>

283.5.1 UriFactory Package GETURI

This factory method returns the correct URI handler for the given URI string.

It returns a subtype instance of the UriType that can handle the protocol. By default, it always creates an XDBURITYPE instance, if it cannot resolve the URL. A URL handler can be registered for a particular prefix using the REGISTERURLHANDLER function. If the prefix matches, GETURI would then use that subtype.

Syntax

```sql
FUNCTION getUri(
    url IN Varchar2)
RETURN UriType;
```

Table 283-23  UriFactory Package GETURI Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>(IN)</td>
<td>The URL string, in escaped format, containing a valid HTTP URL.</td>
</tr>
</tbody>
</table>

283.5.2 UriFactory Package ESCAPEURI

This function returns a URL in escaped format.

The subtype instances override this member function to provide additional semantics. For instance, the HTTPURITYPE does not store the prefix http:// in the URL itself. When generating the external URL, it appends the prefix and generates it. For this reason,
use the `GETEXTERNALURL` function or the `GETURI` function to get to the URL value instead of using the attribute present in the `UriType`.

**Syntax**

MEMBER FUNCTION escapeUri()
RETURN varchar2;

**Table 283-24 UriFactory Package ESCAPEURI Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in escaped format.</td>
</tr>
</tbody>
</table>

**283.5.3 UriFactory Package UNESCAPEURI**

This function returns a URL in unescaped format.

This function is the reverse of the `ESCAPEURI` function. This function scans the string and converts any non-URL hexadecimal characters into the equivalent UTF-8 characters. Since the return type is a `VARCHAR2`, the characters would be converted into the equivalent characters as defined by the database character set.

**Syntax**

FUNCTION unescapeUri()
RETURN varchar2;

**Table 283-25 UriFactory Package UNESCAPEURI Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>url</td>
<td>(IN)</td>
<td>The URL string to be returned in unescaped format.</td>
</tr>
</tbody>
</table>

**283.5.4 UriFactory Package REGISTERURLHANDLER**

This package registers a particular type name for handling a particular URL.

The type specified must be valid and must be a subtype of the `UriType` or one of its subtypes. It must also implement the `createUri` static member function. This function is called by the `GETURI` function to generate an instance of the type. The `stripprefix` parameter indicates that the prefix must be stripped off before calling this function.

**Syntax**

PROCEDURE registerUrlHandler(
    prefix IN varchar2,
    schemaName IN varchar2,
    typename IN varchar2,
    ignoreCase IN boolean := true,
    stripprefix IN boolean := true);
Table 283-26  UriFactory Package REGISTERURLHANDLER Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to handle; for example, http://.</td>
</tr>
<tr>
<td>schemaName</td>
<td>(IN)</td>
<td>Name of the schema where the type resides; case sensitive.</td>
</tr>
<tr>
<td>typename</td>
<td>(IN)</td>
<td>The name of the type to handle the URL; case sensitive.</td>
</tr>
<tr>
<td>ignoreCase</td>
<td>(IN)</td>
<td>Ignore case when matching prefixes.</td>
</tr>
<tr>
<td>stripprefix</td>
<td>(IN)</td>
<td>Strip prefix before generating the instance of the type.</td>
</tr>
</tbody>
</table>

283.5.5 UriFactory Package UNREGISTERURLHANDLER

This procedure unregisters a URL handler. This only unregisters user registered handler prefixes and not predefined system prefixes such as http://.

Syntax

PROCEDURE unregisterUrlHandler(
    prefix IN VARCHAR2);

Table 283-27  UriFactory Package UNREGISTERURLHANDLER Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>(IN)</td>
<td>The prefix to be unregistered.</td>
</tr>
</tbody>
</table>
PL/SQL users can use the `DBMS_AQ` package to enqueue and dequeue messages from JMS queues.

The JMS types member and static functions and procedures in this chapter are needed to populate JMS messages for enqueuing or to interpret a dequeued JMS message.

This chapter contains these topics:

- Overview
- Security Model
- Java Versus PL/SQL Datatypes
- More on Bytes_Stream and Map Messages
- Upcasting and Downcasting Between General and Specific Messages
- JMS Types Error Reporting
- Oracle JMS Type Constants
- JMS Types Error Reporting
- Oracle JMS Type Constants
- `CONVERT_JMS_SELECTOR`
- Summary of JMS Types

### 284.1 JMS Types Overview

Java Message Service (JMS) is a well known public standard interface for accessing messaging systems. Oracle JMS (OJMS) implements JMS based on Oracle Streams Advanced Queuing (AQ) and a relational database system (RDBMS). Messages are stored in queues as OJMS specific ADTs. Java clients use OJMS packages to enqueue, dequeue, and manipulate these messages.

PL/SQL users, on the other hand, use the `DBMS_AQ` package to enqueue and dequeue JMS messages and the member functions in this chapter to populate and interpret them. Oracle Database Advanced Queuing offers such member functions for the following JMS ADTs:

- `aq$j_mms_header`
- `aq$j_mms_message`
- `aq$j_mms_text_message`
- `aq$j_mms_bytes_message`
- `aq$j_mms_map_message`
- `aq$j_mms_stream_message`
In addition to these populating and interpreting member functions, Oracle Database Advanced Queuing offers:

- Casting between `aq$_jms_message` and other message ADTs.
- PL/SQL stored procedures for converting JMS selectors to equivalent Oracle Database Advanced Queuing rules.

### 284.2 JMS Types Security Model

PUBLIC is granted EXECUTE privilege in these JMS types.

- SYS.AQ$ _JMS_MESSAGE Type
- SYS.AQ$ _JMS_TEXT_MESSAGE Type
- SYS.AQ$ _JMS_BYTES_MESSAGE Type
- SYS.AQ$ _JMS_MAP_MESSAGE Type
- SYS.AQ$ _JMS_STREAM_MESSAGE Type
- SYS.AQ$ _JMS_OBJECT_MESSAGE Type
- SYS.AQ$ _JMS_NAMEARRAY Type
- SYS.AQ$ _JMS_VALUE Type
- SYS.AQ$ _JMS_EXCEPTION Type

### 284.3 Java Versus PL/SQL Datatypes

Datatypes do not map one-to-one between PL/SQL and Java.

Some Java types, such as `byte` and `short`, are not present in PL/SQL. PL/SQL type `int` was chosen to represent these types. If a PL/SQL `int` value intended to hold a Java `byte` or `short` value exceeds the corresponding range Java enforces, an out-of-range error is thrown.

Other Java types have more than one counterpart in PL/SQL with different capabilities. A Java String can be represented by both `VARCHAR2` and `CLOB`, but `VARCHAR2` has a maximum limit of 4000 bytes. When retrieving TEXT data from map, stream, and bytes message types, a `CLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `VARCHAR2` or `CLOB`.

Similarly, a Java `byte array` can be represented by both `RAW` and `BLOB`, with `RAW` having a maximum size of 32767. When retrieving `BYTE_ARRAY` data from map, stream, and bytes message types, a `BLOB` is always returned. When updating the map, stream and bytes message types, users can submit either a `RAW` or `BLOB`.

**See Also:**

JMS specification 3.11.3, Conversion Provided by StreamMessage and MapMessage
New JMS Support in Oracle Database 10g

In Oracle Database 10g, a new AQ$_JMS_VALUE ADT has been added in the SYS schema for OJMS PL/SQL users. It is specifically used to implement the read_object procedure of aq$_jms_stream_message and get_object procedure of aq$_jms_map_message, to mimic the Java general object class Object. AQ$_JMS_VALUE ADT can represent any datatype that JMS StreamMessage and MapMessage can hold.

The collection ADT AQ$_JMS_NAMEARRAY was added for the getNames method of MapMessage. It holds an array of names.

In this release the ADT AQ$_JMS_EXCEPTION was added to represent a Java exception thrown in an OJMS JAVA stored procedure on the PL/SQL side. Now you can retrieve a Java exception thrown by an OJMS stored procedure and analyze it on the PL/SQL side.

284.4 More on Bytes, Stream and Map Messages

Oracle uses Java stored procedure to implement some of the procedures of AQ$_MAP_MESSAGE, AQ$_JMS_STREAM_MESSAGE, and AQ$_JMS_BYTES_MESSAGE types. These types have some common functionality that are different from AQ$_JMS_TEXT_MESSAGE type. This section discusses this common functionality.

This section contains these topics:

- Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages
- Initialize the Jserv Static Variable
- Get the Payload Data Back to PL/SQL
- Garbage Collect the Static Variable
- Use a Message Store: A Static Variable Collection
- Typical Calling Sequences
- Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages
- Differences Between Bytes and Stream Messages
- Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

Using Java Stored Procedures to Encode and Decode Oracle Database Advanced Queuing Messages

The major difference between map, stream, bytes, and other messages is that the message payload is encoded as a byte stream by JAVA. Retrieving and updating these payloads in PL/SQL therefore requires Oracle JAVA stored procedures.

A message payload is stored in two places during processing. On the PL/SQL side it is stored as the data members of a JMS message ADT, and on the Jserv side it is stored as a static variable. (Jserv is the JVM inside Oracle Database.) When the payload is processed, the payload data is first transformed to a static variable on the Jserv side. Once the static variable is initialized, all later updates on the message payload are performed on this static variable. At the end of processing, payload data is flushed back to the PL/SQL side.
Oracle provides member procedures that maintain the status of the Jserv static variable and enforce rules when calling these member procedures. These procedures are in the following ADTs:

- `aq$_jms_bytes_message`
- `aq$_jms_map_message`
- `aq$_jms_stream_message`

**Initialize the Jserv Static Variable**

Before you make any other calls to manipulate the payload data, the Jserv static variable must be properly initialized. This is done by calling the `prepare` or `clear_body` procedure. The `prepare` procedure uses the payload data in PL/SQL ADTs to initialize the static variable, while `clear_body` initializes the static variable to an empty payload (empty hashtable or stream).

**Note:**

It is important to call the `prepare` or `clear_body` procedure before any other calls to properly initialize the Jserv static variables. Usually these two methods are called once at the beginning. But they can be called multiple times for one message. Any call of these two methods without first calling the `flush` procedure wipes out all updates made to the messages.

**Get the Payload Data Back to PL/SQL**

Calling the `flush` procedure synchronizes changes made to the Jserv static variable back to the PL/SQL ADTs. The `flush` call is required when you want the changes made to be reflected in the ADT payload. It is important to synchronize the changes back to the ADT, because it is the ADT payload that matters.

**Garbage Collect the Static Variable**

The `clean` procedure forces garbage collection of the static variable. It is there to do cleanup and free JVM memory. You can avoid memory leaks by doing it immediately after finishing processing the message.

**Use a Message Store: A Static Variable Collection**

Instead of a single static variable, Oracle uses a collection of static variables to process the message payload on the Jserv side. This collection is called the message store. Each map, bytes, or stream message type has its own message store within one session.

Oracle uses the operation ID parameter to locate the correct static variable to work on within the message store. Initialization calls such as `prepare` and `clear_body` give users an operation ID, which is used in later message access.

After users complete message processing, they must call the `clean` procedure with the operation ID to clean up the message store. This avoids possible memory leaks. The `clean_all` static procedures of message ADTs `aq$_jms_bytes_message`, `aq$_jms_map_message`, and `aq$_jms_stream_message` clean up all static variables of their corresponding message stores.
Typical Calling Sequences

This section describes typical procedures for retrieving and populating messages.

Here is a typical procedure for retrieving messages:

1. Call `prepare` for a message.
   - This call also gives you an operation ID if you do not specify one.
2. Call multiple retrieving procedures with the provided operation ID.
3. Call the `clean` procedure with the provided operation ID.

Here is a typical procedure for populating messages:

1. Call `clear_body` for a message.
   - For `ag$.jms_map_message`, you can also call `prepare` to update the message based on the existing payload. This call also gives you an operation ID if you do not specify one.
2. Call multiple updating procedures with the provided operation ID.
3. Call the `flush` method with the provided operation ID.
4. Call the `clean` procedure with the provided operation ID.

Read-Only and Write-Only Modes Enforced for Stream and Bytes Messages

According to the JMS specification, when a message is received, its body is read-only. Users can call the `clear_body` method to make the body writable. This method erases the current message body and sets the message body to be empty.

The OJMS JAVA API follows the rule set by JMS specification. In updating the JMS message ADTs in PL/SQL, however, Oracle enforces the rule selectively:

- **Map messages**
  - The restriction is relaxed, because adding more entries on top of a existing map payload is a convenient way for users to update the payload. Therefore there are no read-only or write-only modes for map messages.

- **Stream and bytes messages**
  - The restriction is not relaxed, because these payloads use a stream when reading and writing data. It is difficult to update the payload while in the middle of a stream.
  - Oracle enforces read-only and write-only modes in processing stream and bytes message payloads. Calling the `prepare` procedure initializes the message payload in read-only mode. Calling the `clear_body` procedure initializes the message payload in write-only mode.

  Calling the `reset` procedure resets the pointer to the beginning of the stream and switches the mode from write-only to read-only. The `reset` procedure keeps the updates made to the message payload in the `Jserv` static variable.

  The `prepare` procedure, on the other hand, overwrites the message payload in the `Jserv` static variable with the payload in the PL/SQL ADT.

  Oracle provides member function `get_mode` for users to query the mode.
Differences Between Bytes and Stream Messages

Member functions of bytes messages are not exactly the same as those of stream messages. Stream messages are encoded using Java `ObjectOutputStream` and bytes messages are encoded using Java `DataOutputStream`. In stream messages each primitive type is written and read as a Java Object, but in a bytes message they are written and read as raw bytes according to the encoding mechanism of `DataOutputStream`.

For stream messages, the `read_bytes` method works on a stream of bytes to the end of the byte array field written by the corresponding `write_bytes` method. The `read_bytes` method of bytes message works on a stream of bytes to the end of the whole byte stream. This is why the `read_bytes` member procedure of `aq$$_bytes_message` also requires a `length` parameter to tell how long it is to read.

You will not see a type conversion error raised by bytes message, because bytes messages do not support type conversion.

Methods `get_unsigned_byte` and `get_unsigned_short` are available for bytes messages, but not for stream messages. This is because stream messages read Java objects, and there are no Java objects as unsigned bytes or unsigned shorts.

Methods `read_string` and `write_string` methods are not available for bytes messages. The bytes message ADT must enforce some character encoding. It has methods `read_utf` and `write_utf` which support `utf-8` encoding.

**Note:**

All data written by bytes messages use `DataOutputStream` as the basis. See JDK API documentation JavaSoft.com for details on how the data is encoded into bytes.

Getting and Setting Bytes, Map, and Stream Messages as RAW Bytes

The payloads of bytes, map, and stream message types are stored as either `RAW` or `BLOB` in the database. In this release Oracle Database Advanced Queuing provides the following member functions to set and get these payloads as raw bytes without interpreting them:

- `set_bytes(payload IN BLOB)`
- `set_bytes(payload IN RAW)`
- `get_bytes(payload OUT BLOB)`
- `get_bytes(payload OUT RAW)`

These functions were provided for bytes messages in Oracle9i Release 2 (9.2).

284.5 Upcasting and Downcasting Between General and Specific Messages

OJMS ADT `aq$$_jms_message` is used to represent a general message, so that different types of messages can reside on the same Oracle Database Advanced Queuing queue. Oracle Database Advanced Queuing supports retrieving and populating of
aq$_jms_message by supporting upcasting and downcasting between this ADT and ADTs of specific message types.

To read an aq$_jms_message, you must first downcast it to a specific message type according to its message_type field

To populate an aq$_jms_message, you must first populate a specific message and upcast it to aq$_jms_message. This avoids copying all member functions of other specific message ADTs to this ADT. It also guarantees that the manipulation of this ADT is consistent with other specific message ADTs.

### 284.6 JMS Types Error Reporting

This table lists Oracle JMS types related errors.

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms_jms_plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24190</td>
<td>ERROR_DATA_OVERFLOW</td>
<td>The payload data exceeds the size that an out parameter can hold. For example, the get_text procedure with a VARCHAR2 parameter of aq$_jms_text_message or get_bytes procedure with a RAW parameter of aq$_jms_bytes_message.</td>
</tr>
<tr>
<td>ORA-24191</td>
<td>ERROR_PROP_NAME_EXIST</td>
<td>Setting a property that is previous set</td>
</tr>
<tr>
<td>ORA-24192</td>
<td>ERROR_PROP_NAME_NULL</td>
<td>Occurs when setting a property with null property name.</td>
</tr>
<tr>
<td>ORA-24193</td>
<td>ERROR_EXCEED_RANGE</td>
<td>PL/SQL number type exceeds the valid range of the respective Java type. For example set_byte_property, set_short_property of aq$_jms_head ADT, set_byte and set_short of aq$_jms_map_message ADT, write_byte and write_short of aq$_jms_stream_message and aq$_jms_bytes_message ADT.</td>
</tr>
<tr>
<td>ORA-24194</td>
<td>ERROR_TYPE_MISMATCH</td>
<td>The type conversion between the Java type of the retrieving method and the Java type of a field of the payload is not valid.</td>
</tr>
<tr>
<td>ORA-24195</td>
<td>ERROR_MAP_TOO_LARGE</td>
<td>The size of the map exceeds the aq$_jms_namearray ADT capacity. The current size limit is 1024. You can use the get_names function with offset and length parameters to retrieve the name array in multiple small chunks.</td>
</tr>
<tr>
<td>ORA-24196</td>
<td>ERROR_WRONG_MODE</td>
<td>The message payload is being accessed with a wrong access mode. For example, trying to read a message payload with write-only mode or trying to write a message payload with the read-only mode.</td>
</tr>
<tr>
<td>ORA-24197</td>
<td>ERROR_JAVA_EXCEPTION</td>
<td>ORA-24197 error is raised when a Java exception is raised that does not fit in any of the other error categories. You can use the get_exception static procedure of aq$_jms_map_message, aq$_jms_bytes_message, and aq$_jms_stream_message to retrieve the exception information last thrown by the Java stored procedure. A single static variable is used to store the last exception and is overwritten if another exception is thrown before you retrieve it. A new ADT aq$_jms_exception is created to represent the exception information on the PL/SQL side.</td>
</tr>
<tr>
<td>ORA-24198</td>
<td>ERROR_INVALID_ID</td>
<td>An invalid operation ID is being provided to access a message.</td>
</tr>
</tbody>

Table 284-1 (Cont.) Oracle JMS Types Errors

<table>
<thead>
<tr>
<th>ORA error number</th>
<th>dbms_jms_plsql package constants</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24199</td>
<td>ERROR_STORE_OVERFLOW</td>
<td>The number of messages (with the same type) that users are trying to manipulate exceeds the size of the message store on the Java stored procedure side. The current size of the store is 20. It unusual to need to manipulate more than 20 messages at the same time. A common mistake is to forget to call the clean procedure after using one message. The clean procedure frees the message slot for use by other messages attempting access.</td>
</tr>
</tbody>
</table>

284.7 Oracle JMS Type Constants

These constants can be useful when dealing with message type functions.

**DBMS_AQ Package Constants**

DBMS_AQ package constants specify different types of JMS messages. They are useful when dealing with general message types during upcasting and downcasting or constructing a general message with a specific message type:

- JMS_TEXT_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_BYTE_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_STREAM_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_MAP_MESSAGE CONSTANT BINARY_INTEGER;
- JMS_OBJECT_MESSAGE CONSTANT BINARY_INTEGER;

**SYS.DBMS_JMS_PLSQL Package Constants**

SYS.DBMS_JMS_PLSQL package constants are new in Oracle Database 10g.

These constants specify the mode of message payload. They are useful when interpreting the mode of the message payload returned from the get_mode function:

- MESSAGE_ACCESS_READONLY CONSTANT PLS_INTEGER;
- MESSAGE_ACCESS_WRITEONLY CONSTANT PLS_INTEGER;

These constants specify the ADT type of an Oracle Database Advanced Queuing queue. They are useful during the conversion of JMS selectors to Oracle Database Advanced Queuing rules:

- DESTPLOAD_JMSTYPE CONSTANT PLS_INTEGER;
- DESTPLOAD_USERADT CONSTANT PLS_INTEGER;
- DESTPLOAD_ANYDATA CONSTANT PLS_INTEGER;

These constants specify the type of data that can be held by a aq$_jms_value type. They are useful when interpreting the aq$_jms_value returned by the get_object method of AQ$_JMS_MAP_MESSAGE or read_object method of AQ$_JMS_STREAM_MESSAGE:

- DATA_TYPE_BYTE CONSTANT PLS_INTEGER;
- DATA_TYPE_SHORT CONSTANT PLS_INTEGER;
- DATA_TYPE_INTEGER CONSTANT PLS_INTEGER;
- DATA_TYPE_LONG CONSTANT PLS_INTEGER;
- DATA_TYPE_FLOAT CONSTANT PLS_INTEGER;
- DATA_TYPE_DOUBLE CONSTANT PLS_INTEGER;
- DATA_TYPE_BOOLEAN CONSTANT PLS_INTEGER;
DATA_TYPE_CHARACTER    CONSTANT PLS_INTEGER;
DATA_TYPE_STRING       CONSTANT PLS_INTEGER;
DATA_TYPE_BYTES        CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_BYTE CONSTANT PLS_INTEGER;
DATA_TYPE_UNSIGNED_SHORT CONSTANT PLS_INTEGER;

These constants specify the error number of the ORA errors that can be raised by the functions of message type ADTs. They are useful in user error handlers:

ERROR_DATA_OVERFLOW   CONSTANT PLS_INTEGER := -24190;
ERROR_PROP_NAME_EXIST CONSTANT PLS_INTEGER := -24191;
ERROR_PROP_NAME_NULL  CONSTANT PLS_INTEGER := -24192;
ERROR_EXCEED_RANGE    CONSTANT PLS_INTEGER := -24193;
ERROR_TYPE_MISMATCH   CONSTANT PLS_INTEGER := -24194;
ERROR_MAP_TOO_LARGE   CONSTANT PLS_INTEGER := -24195;
ERROR_WRONG_MODE      CONSTANT PLS_INTEGER := -24196;
ERROR_JAVA_EXCEPTION  CONSTANT PLS_INTEGER := -24197;
ERROR_INVALID_ID      CONSTANT PLS_INTEGER := -24198;
ERROR_STORE_OVERFLOW  CONSTANT PLS_INTEGER := -24199;

284.8 CONVERT_JMS_SELECTOR

Oracle Database includes three stored procedures to help users convert JMS selectors into Oracle Database Advanced Queuing rules. These rules can be used in ADD_SUBSCRIBER operations as subscriber rules or in DEQUEUE operations as dequeue conditions. These procedures are in the SYS.dbms_jms_plsql package.

Convert with Minimal Specification

The first procedure assumes the destination payload type is one of the JMS ADTs whose corresponding constant is dbms_jms_plsql.DESTPLOAD_JMSTYPE and also assumes that the J2EE compliant mode is true.

Syntax

Function convert_jms_selector(selector IN VARCHAR2) RETURN VARCHAR2

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type Specified

The second procedure takes one more parameter: dest_pload_type. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if this parameter is SYS.dbms_jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms_jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms_jms_plsql.DESTPLOAD_USERADT. The function returns null if dest_pload_type parameter is none of these three constants.

This function assumes that the J2EE compliant mode is true.
Syntax

Function convert_jms_selector(
    selector IN VARCHAR2,
    dest_pload_type IN PLS_INTEGER)
RETURN VARCHAR2

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

Convert with Destination Payload Type and Compliant Mode Specified

The third procedure takes a dest_pload_type parameter and a compliant parameter. The conversion of a JMS selector to an Oracle Database Advanced Queuing rule happens only if the dest_pload_type parameter is SYS.dbms.jms_plsql.DESTPLOAD_JMSTYPE or SYS.dbms.jms_plsql.DESTPLOAD_ANYDATA. The function returns exactly the same VARCHAR2 value as the selector parameter if the dest_pload_type parameter is SYS.dbms.jms_plsql.DESTPLOAD_USERADT. The function returns null if the dest_pload_type parameter is none of these three constants.

The compliant parameter controls if the conversion is in J2EE compliant mode or not. The noncompliant conversion of a JMS selector is for backward compatibility.

Syntax

Function convert_jms_selector(
    selector         IN  VARCHAR2,
    dest_pload_type  IN  PLS_INTEGER,
    compliant        IN  BOOLEAN )

Returns

The converted Oracle Database Advanced Queuing rule or null if there is any conversion error.

Exceptions

ORA-24197 if the Java stored procedure throws an exception during execution.

284.9 Summary of JMS Types

This lists shows the JMS types.

- SYS.AQ$_JMS_MESSAGE Type
- SYS.AQ$_JMS_TEXT_MESSAGE Type
- SYS.AQ$_JMS_BYTES_MESSAGE Type
- SYS.AQ$_JMS_MAP_MESSAGE Type
- SYS.AQ$_JMS_STREAM_MESSAGE Type
- SYS.AQ$_JMS_OBJECT_MESSAGE Type
284.9.1 SYS.AQ$_JMS_MESSAGE Type

This ADT type can represent any of five different JMS message types: text message, bytes message, stream message, map message, or object message. Queues created using this ADT can therefore store all five types of JMS messages.

This section contains these topics:

- CONSTRUCT Static Functions
- Cast Methods
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

```sql
TYPE AQ$_JMS_MESSAGE AS OBJECT(

MEMBER PROCEDURE get_bytes  (payload  OUT RAW),
MEMBER PROCEDURE get_bytes  (payload  OUT BLOB));

CONSTRUCT Static Functions

There are six CONSTRUCT static functions in this type.

STATIC FUNCTION construct (mtype IN INT) RETURN aq$_jms_message
Creates an instance of aq$_jms_message, which can hold a specific type of JMS message (TextMessage, BytesMessage, MapMessage, StreamMessage or ObjectMessage). The message type of the created aq$_jms_message instance depends on the mtype parameter passed to the construct method. Once a message has been constructed, it can be used to store JMS messages of the type it has been constructed to hold.

The mtype parameter must be one of the following constants described in "Oracle JMS Type Constants":

DBMS_AQ.JMS_TEXT_MESSAGE
DBMS_AQ.JMS_BYTES_MESSAGE
DBMS_AQ.JMS_STREAM_MESSAGE
DBMS_AQ.JMS_MAP_MESSAGE
DBMS_AQ.JMS_OBJECT_MESSAGE
STATIC FUNCTION construct (text_msg IN aq$_jms_text_message) RETURN aq$_jms_message
Creates an aq$_jms_message from an aq$_jms_text_message.

STATIC FUNCTION construct (bytes_msg IN aq$_jms_bytes_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_bytes_message.

STATIC FUNCTION construct (stream_msg IN aq$_jms_stream_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_stream_message.

STATIC FUNCTION construct (map_msg IN aq$_jms_map_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_map_message.

STATIC FUNCTION construct (object_msg IN aq$_jms_object_message) RETURN aq$_jms_message;
Creates an aq$_jms_message from an aq$_jms_object_message.

Cast Methods

cast_to_bytes_msg RETURN aq$_jms_bytes_message
Casts an aq$_jms_message to an aq$_jms_bytes_message. Returns an aq$_jms_bytes_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_BYTES_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_BYTES_MESSAGE.

cast_to_map_msg RETURN aq$_jms_map_message
Casts an aq$_jms_message to an aq$_jms_map_message. Returns an aq$_jms_map_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_MAP_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_MAP_MESSAGE.

cast_to_object_msg RETURN aq$_jms_object_message
Casts an aq$_jms_message to an aq$_jms_object_message. Returns an aq$_jms_object_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_OBJECT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_OBJECT_MESSAGE.

cast_to_stream_msg RETURN aq$_jms_stream_message
Casts an aq$_jms_message to an aq$_jms_stream_message. Returns an aq$_jms_stream_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_STREAM_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_STREAM_MESSAGE.

cast_to_text_msg RETURN aq$_jms_text_message
Casts an aq$_jms_message to an aq$_jms_text_message. Returns an aq$_jms_text_message or null if the message_type attribute of the aq$_jms_message is not DBMS_AQ.JMS_TEXT_MESSAGE. This function raises ORA-24198 if the message_type field of the aq$_jms_message is not DBMS_AQJMS.JMS_TEXT_MESSAGE.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo.
get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text and corresponds to JMSType.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSGroupID.

get_groupseq RETURN VARCHAR
Returns groupseq, which corresponds to JMSGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value in an internal representation (a NUMBER type). Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the byte datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.
set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because the INT datatype is 38 bits in PL/SQL and Oracle Database. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If it is not null, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If it is not null, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.
get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a
FLOAT property, then this function returns the value of the property. Otherwise it returns
a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
Integer property, then this function returns the value of the property. Otherwise it returns
a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a
long property, then this function returns the value of the property. Otherwise it returns
a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
short property, then this function returns the value of the property. Otherwise it returns
a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a
STRING property, then this function returns the value of the property. Otherwise it returns
a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB),
Sets the payload, a CLOB value, to an internal representation.

set_bytes (payload IN RAW)
Sets the payload, a RAW value, to an internal representation.

set_bytes (payload IN BLOB)
Sets the payload, a BLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.

get_bytes (payload OUT RAW)
Puts the internal representation of the payload into a RAW variable payload.

get_bytes (payload OUT BLOB)
Puts the internal representation of the payload into a BLOB variable payload.

284.9.2 SYS.AQ$_JMS_TEXT_MESSAGE Type

This type is the ADT used to store a TextMessage in an Oracle Database Advanced
Queueing queue.

This section contains these topics:
• CONSTRUCT aq$_jms_text_message Function
• JMS Header Methods
• System Properties Methods
• User Properties Methods
• Payload Methods

Syntax

TYPE aq$_jms_text_message AS OBJECT(
  header aq$_jms_header,
  text_len INT,
  text_vc varchar2(4000),
  text_lob clob,
  STATIC FUNCTION construct RETURN aq$_jms_text_message,
  MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
  MEMBER PROCEDURE set_type (type IN VARCHAR),
  MEMBER FUNCTION get_replyto RETURN sys.aq$_agent,
  MEMBER FUNCTION get_type RETURN VARCHAR,
  MEMBER PROCEDURE set_userid (userid IN VARCHAR),
  MEMBER PROCEDURE set_appid (appid IN VARCHAR),

  MEMBER PROCEDURE set_groupseq (groupseq IN INT),
  MEMBER FUNCTION get_userid RETURN VARCHAR,
  MEMBER FUNCTION get_appid RETURN VARCHAR,
  MEMBER FUNCTION get_groupid RETURN VARCHAR,
  MEMBER FUNCTION get_groupseq RETURN INT,
  MEMBER PROCEDURE clear_properties,
  MEMBER PROCEDURE set_boolean_property(property_name IN VARCHAR, property_value IN BOOLEAN),
  MEMBER PROCEDURE set_byte_property (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION),
  MEMBER PROCEDURE set_float_property (property_name IN VARCHAR, property_value IN FLOAT),
  MEMBER PROCEDURE set_int_property (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_long_property (property_name IN VARCHAR, property_value IN NUMBER),
  MEMBER PROCEDURE set_short_property (property_name IN VARCHAR, property_value IN INT),
  MEMBER PROCEDURE set_string_property (property_name IN VARCHAR, property_value IN VARCHAR),
  MEMBER FUNCTION get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN,
  MEMBER FUNCTION get_byte_property (property_name IN VARCHAR) RETURN INT,
  MEMBER FUNCTION get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION,
  MEMBER FUNCTION get_float_property (property_name IN VARCHAR) RETURN FLOAT,
  MEMBER FUNCTION get_int_property (property_name IN VARCHAR) RETURN INT,
  MEMBER FUNCTION get_long_property (property_name IN VARCHAR) RETURN NUMBER,
  MEMBER FUNCTION get_short_property (property_name IN VARCHAR) RETURN INT,
  MEMBER FUNCTION get_string_property (property_name IN VARCHAR) RETURN VARCHAR,
  MEMBER PROCEDURE set_text (payload IN VARCHAR2),
  MEMBER PROCEDURE set_text (payload IN CLOB),
  MEMBER PROCEDURE get_text (payload OUT VARCHAR2),
  MEMBER PROCEDURE get_text (payload OUT CLOB));
CONSTRUCT aq$_jms_text_message Function

STATIC FUNCTION construct RETURN aq$_jms_text_message
Creates an empty aq$_jms_text_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_apppid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.

set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_apppid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN INT
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores
property_value in an internal representation. Raises exception ORA-24191 if the
property name exists or ORA-24192 if the property name is null.
set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether
property_value is within -128 to 127 (8-bits). This check is necessary because neither
PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the
property name exists, ORA-24192 if the property name is null, or ORA-24193 if the
property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE
PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. Raises exception ORA-24191 if the property name exists or
ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. Raises exception ORA-24191 if the property name exists or
ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether
property_value is within -2147483648 to 2147483647 (32-bits). This check is
necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits.
Raises exception ORA-24191 if the property name exists, ORA-24192 if the property
name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In
Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises
exception ORA-24191 if the property name exists or ORA-24192 if the property name
is null.

set_short_property property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether
property_value is within -32768 to 32767 (16-bits). This check is necessary because
neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191
if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if
the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN
VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. Raises exception ORA-24191 if the property name exists or
ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a
BOOLEAN property, then this function returns the value of the property. Otherwise it
returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
BYTE property, then this function returns the value of the property. Otherwise it returns
a null.
get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_text (payload IN VARCHAR2)
Sets the payload, a VARCHAR2 value, to an internal representation.

set_text (payload IN CLOB)
Sets the payload, a CLOB value, to an internal representation.

get_text (payload OUT VARCHAR2)
Puts the internal representation of the payload into a VARCHAR2 variable payload.

get_text (payload OUT CLOB)
Puts the internal representation of the payload into a CLOB variable payload.

284.9.3 SYS.AQ$_JMS_BYTES_MESSAGE Type

The SYS.AQ$_JMS_BYTES_MESSAGE type is the ADT used to store a BytesMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

• CONSTRUCT aq$_jms_bytes_message Function
• JMS Header Methods
• System Properties Methods
• User Properties Methods
• Payload Methods

Syntax

TYPE AQ$_JMS_BYTES_MESSAGE AS OBJECT(
  header     aq$_jms_header,
  bytes_len  INT,
  bytes_raw  raw(2000),
  bytes_lob  blob,
  STATIC FUNCTION construct RETURN aq$_jms_bytes_message,

MEMBER PROCEDURE write_utf (id IN PLS_INTEGER, value IN CLOB));

CONSTRUCT aq$_jms_bytes_message Function

STATIC FUNCTION construct RETURN aq$_jms_bytes_message
Creates an empty aq$_jms_bytes_message.

JMS Header Methods

set_replyto (replyto IN sys.aq$_agent)
Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

set_type (type IN VARCHAR)
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

get_replyto RETURN sys.aq$_agent
Returns replyto, which corresponds to JMSReplyTo.

get_type RETURN VARCHAR
Returns type, which corresponds to JMSType.

System Properties Methods

set_userid (userid IN VARCHAR)
Sets userid, which corresponds to JMSXUserID in JMS.

set_appid (appid IN VARCHAR)
Sets appid, which corresponds to JMSXAppID in JMS.
set_groupid (groupid IN VARCHAR)
Sets groupid, which corresponds to JMSXGroupID in JMS.

set_groupseq (groupseq IN INT)
Sets groupseq, which corresponds to JMSXGroupSeq in JMS.

get_userid RETURN VARCHAR
Returns userid, which corresponds to JMSXUserID.

get_appid RETURN VARCHAR
Returns appid, which corresponds to JMSXAppID.

get_groupid RETURN VARCHAR
Returns groupid, which corresponds to JMSXGroupID.

get_groupseq RETURN NUMBER
Returns groupseq, which corresponds to JMSXGroupSeq.

User Properties Methods

clear_properties
Clears all user properties. This procedure does not affect system properties.

set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)
Checks whether property_name is null or exists. If not, the procedure stores property_value in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_byte_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_value is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_float_property (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.
set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In
Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises
exception ORA-24191 if the property name exists or ORA-24192 if the property name
is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether
property_value is within -32768 to 32767 (16-bits). This check is necessary because
neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191
if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if
the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores
property_value. Raises exception ORA-24191 if the property name exists or
ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a
BOOLEAN property, then this function returns the value of the property. Otherwise it
returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
BYTE property, then this function returns the value of the property. Otherwise it returns
a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE
PRECISION
If the property with the corresponding property name passed in exists, and if it is a
DOUBLE property, then this function returns the value of the property. Otherwise it
returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a
FLOAT property, then this function returns the value of the property. Otherwise it returns
a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
Integer property, then this function returns the value of the property. Otherwise it returns
a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a
long property, then this function returns the value of the property. Otherwise it returns
a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a
short property, then this function returns the value of the property. Otherwise it returns
a null.
get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload in RAW)
Sets the payload, a RAW value, to an internal representation.

set_bytes (payload in BLOB)
Sets the payload, a BLOB value, to an internal representation.

get_bytes (payload out RAW)
Puts the internal representation of the payload into a RAW variable payload. Raises exception ORA-24190 if the length of the internal payload is more than 32767 (the maximum length of RAW in PL/SQL).

get_bytes (payload out BLOB)
Puts the internal representation of the payload into a BLOB variable payload.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_bytes_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
This function also sets the message access mode to MESSAGE_ACCESS_READONLY. Subsequent calls of write_XXX procedure raise an ORA-24196 error. Users can call the clear_body procedure to set the message access mode to MESSAGE_ACCESS_READONLY. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

reset (id IN PLS_INTEGER)
Resets the starting position of the stream to the beginning and puts the bytes message in read-only mode. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to the aq$_jms_bytes_message. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID. It also sets the message access mode to MESSAGE_ACCESS_WRITEONLY. Later calls of read_XXX procedure raise ORA-24196 error. Users can call the reset or prepare
procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$JMS_BYTES_MESSAGE`. They do not affect the header functions. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

**clean (id IN PLS_INTEGER)**
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**clean_all**
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

**get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Returns the current mode of this message. The return value is either `SYS.dbms_jms.plsql.MESSAGE_ACCESS_READONLY` or `SYS.dbms_jms.plsql.MESSAGE_ACCESS_WRITEONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN**
Reads a Boolean value from the bytes message and returns the Boolean value read. Null is returned if the end of the message stream has been reached. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a `BYTE` value from the bytes message and returns the `BYTE` value read. Null is returned if the end of the stream has been reached. Because there is no `BYTE` type in PL/SQL, Oracle Database uses `PLS_INTEGER` to represent a `BYTE`. Although PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Parameter `id` is the operation ID. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_bytes (id IN PLS_INTEGER, value OUT NO COPY BLOB, length IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads length of the bytes from bytes message stream into value and returns the total number of bytes read. If there is no more data (because the end of the stream has been reached), then it returns -1. Raises exceptions ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads a character value from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored
procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads a double from the bytes message and returns the character value read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads a float from the bytes message and returns the float read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN INT**
Reads an INT from the bytes message and returns the INT read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads a long from the bytes message and returns the long read. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads a short value from the bytes message and returns the short value read. Null is returned if the end of the stream has been reached. Because there is no short type in PL/SQL, **PLS_INTEGER** is used to represent a SHORT. Although PL/SQL users get an **PLS_INTEGER**, they are guaranteed that the value is in the Java short value range. If this value is issued with a **write_short** function, then there will not be an out of range error. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 8-bit number from the bytes message stream and returns the next byte from the bytes message stream, interpreted as an unsigned 8-bit number. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_unsigned_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads an unsigned 16-bit number from the bytes message stream and returns the next two bytes from the bytes message stream, interpreted as an unsigned 16-bit integer. Null is returned if the end of the stream has been reached. Raises exception ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_utf (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string that has been encoded using a UTF-8 format from the bytes message. Null is returned if the end of the stream has been reached. Raises exception
ORA-24196 if the bytes message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)
Writes a Boolean to the bytes message stream as a 1-byte value. The value `true` is written as the value (byte)1. The value `false` is written as the value (byte)0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_byte (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a byte to the bytes message. Because there is no `BYTE` type in PL/SQL, `PLS_INTEGER` is used to represent a `BYTE`. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes an array of bytes to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN PLS_INTEGER, length IN PLS_INTEGER)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array to the bytes message stream. Parameter `offset` is the initial offset within the byte array. If the range `[offset, offset+length]` exceeds the boundary of the byte array value, then a Java `IndexOutOfBoundsException` exception is thrown in the Java stored procedure and this procedure raises error ORA-24197. The index starts from 0. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the bytes message. If this value has multiple characters, it is the first character that is written. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an INT to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the bytes message. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the bytes message as two bytes, high byte first. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exception ORA-24193 if the parameter value exceeds the valid range, ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_utf (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the bytes message stream using UTF-8 encoding in a machine-independent manner. Raises exception ORA-24196 if the bytes message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

### 284.9.4 SYS.AQ$_JMS_MAP_MESSAGE Type

This type is the ADT used to store a MapMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:

- CONSTRUCT aq$_jms_map_message Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

**Syntax**

```sql
TYPE aq$_jms_map_message AS object(
header aq$_jms_header,
bytes_len int,
bytes_raw raw(2000),
bytes_lob blob,
STATIC FUNCTION construct RETURN aq$_jms_map_message,
```
MEMBER PROCEDURE set_replyto (replyto IN sys.aq$_agent),
MEMBER PROCEDURE set_type     (type    IN VARCHAR),
MEMBER FUNCTION get_replyto  RETURN sys.aq$_agent,
MEMBER FUNCTION get_type     RETURN VARCHAR,

**CONSTRUCT aq$_jms_map_message Function**

**STATIC FUNCTION construct RETURN aq$_jms_map_message**

Creates an empty aq$_jms_map_message object.

---

**JMS Header Methods**

**set_replyto (replyto IN sys.aq$_agent)**

Sets the replyto parameter, which corresponds to JMSReplyTo in JMS.

**set_type (type IN VARCHAR)**

Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

**get_replyto RETURN sys.aq$_agent**

Returns replyto, which corresponds to JMSReplyTo.

**get_type RETURN VARCHAR**

Returns type, which corresponds to JMSType.
System Properties Methods

**set_userid (userid IN VARCHAR)**
Sets `userid`, which corresponds to `JMSXUserID` in JMS.

**set_appid (appid IN VARCHAR)**
Sets `appid`, which corresponds to `JMSXAppID` in JMS.

**set_groupid (groupid IN VARCHAR)**
Sets `groupid`, which corresponds to `JMSXGroupID` in JMS.

**set_groupseq (groupseq IN INT)**
Sets `groupseq`, which corresponds to `JMSXGroupSeq` in JMS.

**get_userid RETURN VARCHAR**
Returns `userid`, which corresponds to `JMSXUserID`.

**get_appid RETURN VARCHAR**
Returns `appid`, which corresponds to `JMSXAppID`.

**get_groupid RETURN VARCHAR**
Returns `groupid`, which corresponds to `JMSXGroupID`.

**get_groupseq RETURN NUMBER**
Returns `groupseq`, which corresponds to `JMSXGroupSeq`.

User Properties Methods

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the `BYTE` datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property (property_name IN VARCHAR, property_value IN FLOAT)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value`. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.
set_int_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_long_property (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

set_short_property (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

set_string_property (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

get_boolean_property (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

get_byte_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

get_double_property (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.

get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.
get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

set_bytes (payload IN RAW)
Sets the internal payload as a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a RAW variable without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exceptions ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of aq$_jms_map_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_map_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID. This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

flush (id IN PLS_INTEGER)
Takes the static variable in Jserv and synchronizes the content back to aq$_jms_map_message. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
clear_body (id IN PLS_INTEGER)
Sets the Java stored procedure static variable to empty payload. Parameter id is used
to identify the slot where the Java object is stored in the Oracle Database JVM
session memory. If id is null, a new slot is created for this PL/SQL object. Subsequent
JMS operations on the payload need to provide this operation ID.
This function raises ORA-24197 if the Java stored procedure throws an exception
during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java
stored procedure message store overflows.

clean (id IN PLS_INTEGER)
Closes and cleans up the DataInputStream or DataOutputStream at the Java stored
procedure side corresponding to the operation ID. It is very important to call this
procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java
stored procedure throws an exception during execution or ORA-24198 if the operation
ID is invalid.

clean_all
Closes and cleans up all the messages in the corresponding type of message store at
the Java stored procedure side. This procedure raises ORA-24197 if the Java stored
procedure throws an exception during execution.

set_boolean (id IN PLS_INTEGER, name IN VARCHAR2, value IN BOOLEAN)
Sets the Boolean value with the specified name in the map. Raises exception
ORA-24197 if the Java stored procedure throws an exception during execution or
ORA-24198 if the operation ID is invalid.

set_byte (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)
Sets the BYTE value with the specified name in the map. Because there is no BYTE type
in PL/SQL, PLS_INTEGER is used to represent a byte. Raises exception ORA-24197 if
the Java stored procedure throws an exception during execution or ORA-24198 if the
operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW)
Sets the byte array value with the specified name in the map. Raises exception
ORA-24197 if the Java stored procedure throws an exception during execution or
ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN RAW, offset IN
INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter
offset is the initial offset within the byte array, and parameter length is the number of
bytes to use. If the range [offset ... offset+length] exceeds the boundary of the byte
array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored
procedure and this procedure raises an ORA-24197 error. The index starts from 0.
Raises exception ORA-24197 if the Java stored procedure throws an exception during
execution or ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB)
Sets the byte array value with the specified name in the map. Raises exception
ORA-24197 if the Java stored procedure throws an exception during execution or
ORA-24198 if the operation ID is invalid.

set_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value IN BLOB, offset IN
INT, length IN INT)
Sets a portion of the byte array value with the specified name in the map. Parameter
offset is the initial offset within the byte array, and parameter length is the number of
bytes to use. If the range [offset ... offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure, and this procedure raises an ORA-24197 error. The index starts from 0. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_char (id IN PLS_INTEGER, name IN VARCHAR2, value IN CHAR)**
Sets the character value with the specified name in the map. If this value has multiple characters, then it is the first character that is used. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_double (id IN PLS_INTEGER, name IN VARCHAR2, value IN DOUBLE PRECISION)**
Sets the double value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_float (id IN PLS_INTEGER, name IN VARCHAR2, value IN FLOAT)**
This procedure is to set the float value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_int (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the int value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_long (id IN PLS_INTEGER, name IN VARCHAR2, value IN NUMBER)**
Sets the long value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_short (id IN PLS_INTEGER, name IN VARCHAR2, value IN PLS_INTEGER)**
Sets the short value with the specified name in the map. Because there is no short type in PL/SQL, PLS_INTEGER is used to represent a short. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**set_string (id IN PLS_INTEGER, name IN VARCHAR2, value IN VARCHAR2)**
Sets the string value with the specified name in the map. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

**get_boolean (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN**
Retrieves the Boolean value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
get_byte (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the BYTE value with the specified name. If there is no item by this name, then
null is returned. Because there is no BYTE type in PL/SQL, PLS_INTEGER is used to
represent a byte. Although the PL/SQL users get an PLS_INTEGER, they are guaranteed
that the value is in the Java BYTE value range. If this value is issued with a set_byte
function, then there will not be an out of range error. Raises exception ORA-24194 if
the type conversion between the type of real value and the expected type is invalid,
ORA-24197 if the Java stored procedure throws an exception during execution, or
ORA-24198 if the operation ID is invalid.

get_bytes (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY
BLOB)
Retrieves the byte array value with the specified name. If there is no item by this
name, then null is returned. Because the size of the array might be larger than the
limit of PL/SQL RAW type, a BLOB is always returned here. The BLOB returned is a copy,
which means it can be modified without affecting the message payload. Raises
exception ORA-24194 if the type conversion between the type of real value and the
expected type is invalid, ORA-24197 if the Java stored procedure throws an exception
during execution, or ORA-24198 if the operation ID is invalid.

get_char (id IN PLS_INTEGER, name IN VARCHAR2) RETURN CHAR
Retrieves and returns the character value with the specified name. If there is no item
by this name, then null is returned. Raises exception ORA-24194 if the type
conversion between the type of real value and the expected type is invalid.

get_double (id IN PLS_INTEGER, name IN VARCHAR2) RETURN DOUBLE
PRECISION
Retrieves and returns the double value with the specified name. If there is no item by
this name, then null is returned. Raises exception ORA-24194 if the type conversion
between the type of real value and the expected type is invalid.

get_float (id IN PLS_INTEGER, name IN VARCHAR2) RETURN FLOAT
Retrieves the float value with the specified name. If there is no item by this name,
then null is returned. Raises exception ORA-24194 if the type conversion between the
type of real value and the expected type is invalid, ORA-24197 if the Java stored
procedure throws an exception during execution, or ORA-24198 if the operation ID is
invalid.

get_int (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the INT value with the specified name. If there is no item by this name, then
null is returned. Raises exception ORA-24194 if the type conversion between the type
of real value and the expected type is invalid, ORA-24197 if the Java stored
procedure throws an exception during execution, or ORA-24198 if the operation ID is
invalid.

get_long (id IN PLS_INTEGER, name IN VARCHAR2) RETURN NUMBER
Retrieves the long value with the specified name. If there is no item by this name,
then null is returned. Raises exception ORA-24194 if the type conversion between the
type of real value and the expected type is invalid, ORA-24197 if the Java stored
procedure throws an exception during execution, or ORA-24198 if the operation ID is
invalid.

get_short (id IN PLS_INTEGER, name IN VARCHAR2) RETURN PLS_INTEGER
Retrieves the short value with the specified name. If there is no item by this name,
then null is returned. Because there is no short type in PL/SQL, INT is used to
represent a `short`. Although the PL/SQL users get a `PLS_INTEGER`, they are guaranteed that the value is in the Java short value range. If this value is issued with a `set_short` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_string (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY CLOB)
Retrieves the string value with the specified name. If there is no item by this name, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

get_names (id IN PLS_INTEGER) RETURN aq$_jms_namearray
Retrieves all the names within the map message and returns them in a varray. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if the size of the name array of the payload exceeds the limit. Raises exception ORA-24195 if the size of the name array or the size of a name exceeds the limit.

get_names (id IN PLS_INTEGER, names OUT aq$_jms_namearray, offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves a portion of the names within the map message. Because `aq$_jms_namearray` has a size as 1024 and each element is a `VARCHAR(200)`, this function will return an error if either limits are exceeded during the retrieval. (This means there is no sense to put a `length` parameter greater than 1024.) The index of the names of a map messages begins from 0. Parameter `offset` is the offset from which to start retrieving.
The function returns the number of names that have been retrieved. The names retrieved is the intersection of the interval `[offset, offset+length-1]` and interval `[0, size-1]` where size is the size of this map message. If the intersection is an empty set, then names will be returned as null and the function returns 0 as the number of names retrieved. If users iterate the names by retrieving in small steps, then this can be used to test that there are no more names to read from map message. Raises exception ORA-24195 if the size of the name array or the size of a name exceed the limit, ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

get_object (id IN PLS_INTEGER, name IN VARCHAR2, value OUT NOCOPY AQ$_JMS_VALUE)
Returns a general value ADT `AQ$_JMS_VALUE`. If there is no item by this name, then null is returned. Users can use the `type` attribute of this ADT to interpret the data. See the map in the `AQ$_JMS_VALUE` ADT for the correspondence among `dbms_jms_plsql` package constants, Java datatype and `AQ$_JMS_VALUE` attribute. Note this member procedure might bring additional overhead compared to other `get` member procedures or functions. It is used only if the user does not know the datatype of the fields within a message before hand. Otherwise it is a good idea to use a specific `get` member procedure or function. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.
get_size (id IN PLS_INTEGER) RETURN PLS_INTEGER
Retrieves the size of the map message. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

item_exists (id IN PLS_INTEGER, name IN VARCHAR2) RETURN BOOLEAN
Indicates that an item exists in this map message by returning TRUE. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

284.9.5 SYS.AQ$_JMS_STREAM_MESSAGE Type
This type is the ADT used to store a StreamMessage in an Oracle Database Advanced Queuing queue.

This section contains these topics:
- CONSTRUCT aq$_jms_stream_message Function
- JMS Header Methods
- System Properties Methods
- User Properties Methods
- Payload Methods

Syntax

TYPE aq$_jms_stream_message AS object(
  header    aq$_jms_header,

JMS Header Methods

**set_replyto (replyto IN sys.aq$_agent)**
Sets the `replyto` parameter, which corresponds to JMSReplyTo in JMS.

**set_type (type IN VARCHAR)**
Sets the JMS type, which can be any text, and which corresponds to JMSType in JMS.

**get_replyto RETURN sys.aq$_agent**
Returns `replyto`, which corresponds to JMSReplyTo.

**get_type RETURN VARCHAR**
Returns `type`, which corresponds to JMSType.

System Properties Methods

**set_userid (userid IN VARCHAR)**
Sets `userid`, which corresponds to JMSXUserID in JMS.

**set_appid (appid IN VARCHAR)**
Sets `appid`, which corresponds to JMSXAppID in JMS.

**set_groupid (groupid IN VARCHAR)**
Sets `groupid`, which corresponds to JMSXGroupID in JMS.

**set_groupseq (groupseq IN INT)**
Sets `groupseq`, which corresponds to JMSXGroupSeq in JMS.

**get_userid RETURN VARCHAR**
Returns `userid`, which corresponds to JMSXUserID.

**get_appid RETURN VARCHAR**
Returns `appid`, which corresponds to JMSXAppID.

**get_groupid RETURN VARCHAR**
Returns `groupid`, which corresponds to JMSXGroupID.

**get_groupseq RETURN NUMBER**
Returns `groupseq`, which corresponds to JMSXGroupSeq.

User Properties Methods

**clear_properties**
Clears all user properties. This procedure does not affect system properties.

**set_boolean_property (property_name IN VARCHAR, property_value IN BOOLEAN)**
Checks whether `property_name` is null or exists. If not, the procedure stores `property_value` in an internal representation. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_byte_property (property_name IN VARCHAR, property_value IN INT)**
Checks whether `property_name` is null or exists. If not, the procedure checks whether `property_value` is within -128 to 127 (8-bits). This check is necessary because neither PL/SQL nor RDBMS defines the BYTE datatype. Raises exception ORA-24191 if the
property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_double_property** (property_name IN VARCHAR, property_value IN DOUBLE PRECISION)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_float_property** (property_name IN VARCHAR, property_value IN FLOAT)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_int_property** (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -2147483648 to 2147483647 (32-bits). This check is necessary because in PL/SQL and Oracle Database, the INT datatype is 38 bits. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_long_property** (property_name IN VARCHAR, property_value IN NUMBER)
Checks whether property_name is null or exists. If not, the procedure stores property_value. In PL/SQL and Oracle Database, the NUMBER datatype is 38 bits. In Java, the long datatype is 64 bits. Therefore, no range check is needed. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**set_short_property** (property_name IN VARCHAR, property_value IN INT)
Checks whether property_name is null or exists. If not, the procedure checks whether property_value is within -32768 to 32767 (16-bits). This check is necessary because neither PL/SQL nor RDBMS defines the short datatype. Raises exception ORA-24191 if the property name exists, ORA-24192 if the property name is null, or ORA-24193 if the property value exceeds the valid range.

**set_string_property** (property_name IN VARCHAR, property_value IN VARCHAR)
Checks whether property_name is null or exists. If not, the procedure stores property_value. Raises exception ORA-24191 if the property name exists or ORA-24192 if the property name is null.

**get_boolean_property** (property_name IN VARCHAR) RETURN BOOLEAN
If the property with the corresponding property name passed in exists, and if it is a BOOLEAN property, then this function returns the value of the property. Otherwise it returns a null.

**get_byte_property** (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a BYTE property, then this function returns the value of the property. Otherwise it returns a null.

**get_double_property** (property_name IN VARCHAR) RETURN DOUBLE PRECISION
If the property with the corresponding property name passed in exists, and if it is a DOUBLE property, then this function returns the value of the property. Otherwise it returns a null.
get_float_property (property_name IN VARCHAR) RETURN FLOAT
If the property with the corresponding property name passed in exists, and if it is a FLOAT property, then this function returns the value of the property. Otherwise it returns a null.

get_int_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a Integer property, then this function returns the value of the property. Otherwise it returns a null.

get_long_property (property_name IN VARCHAR) RETURN NUMBER
If the property with the corresponding property name passed in exists, and if it is a long property, then this function returns the value of the property. Otherwise it returns a null.

get_short_property (property_name IN VARCHAR) RETURN INT
If the property with the corresponding property name passed in exists, and if it is a short property, then this function returns the value of the property. Otherwise it returns a null.

get_string_property (property_name IN VARCHAR) RETURN VARCHAR
If the property with the corresponding property name passed in exists, and if it is a STRING property, then this function returns the value of the property. Otherwise it returns a null.

Payload Methods

get_bytes (payload OUT RAW)
Puts the internal payload into a RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as raw bytes without interpreting it. Raises exception ORA-24190 if the length of internal payload is more than 32767.

get_bytes (payload OUT BLOB)
Puts the internal payload into a BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function gets a payload as a BLOB variable without interpreting it.

set_bytes (payload IN RAW)
Sets the internal payload as the RAW variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as raw bytes without interpreting it.

set_bytes (payload IN BLOB)
Sets the internal payload as the BLOB variable without any interpretation. The payload of type aq$_jms_stream_message is stored as either RAW or BLOB in the database. This member function sets a payload as a BLOB variable without interpreting it.

prepare (id IN PLS_INTEGER) RETURN PLS_INTEGER
Takes the byte array stored in aq$_jms_stream_message and decodes it as a Java object in the Java stored procedure. The result of the decoding is stored as a static variable in Jserv session memory. Parameter id is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If id is null, then a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.
This function also sets the message access mode to `MESSAGE_ACCESS_READONLY`. Subsequent calls of `write_XXX` procedure raise an ORA-24196 error. Users can call the `clear_body` procedure to set the message access mode to `MESSAGE_ACCESS_READONLY`.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

```reset (id IN PLS_INTEGER)```
Resets the starting position of the stream to the beginning and puts the stream message in `MESSAGE_ACCESS_READONLY` mode.

```flush (id IN PLS_INTEGER)```
Takes the static variable in Jserv and synchronizes the content back to `aq$_jms_stream_message`. This procedure will not affect the underlying access mode. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

```clear_body (id IN PLS_INTEGER)```
Sets the Java stored procedure static variable to empty payload. Parameter `id` is used to identify the slot where the Java object is stored in the Oracle Database JVM session memory. If `id` is null, a new slot is created for this PL/SQL object. Subsequent JMS operations on the payload need to provide this operation ID.

It also sets the message access mode to `MESSAGE_ACCESS_WRITEONLY`. Later calls of `read_XXX` procedure raise ORA-24196 error. Users can call the `reset` or `prepare` procedures to set the message access mode to `MESSAGE_ACCESS_READONLY`. Write-only and read-only modes affect only the payload functions of `AQ$_JMS_BYTES_MESSAGE`. They do not affect the header functions.

This function raises ORA-24197 if the Java stored procedure throws an exception during execution, ORA-24198 if the operation ID is invalid, or ORA-24199 if the Java stored procedure message store overflows.

```clean (id IN PLS_INTEGER)```
Closes and cleans up the `DataInputStream` or `DataOutputStream` at the Java stored procedure side corresponding to the operation ID. It is very important to call this procedure to avoid memory leaks. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

```clean_all```
Closes and cleans up all the messages in the corresponding type of message store at the Java stored procedure side. This procedure raises ORA-24197 if the Java stored procedure throws an exception during execution.

```get_mode (id IN PLS_INTEGER) RETURN PLS_INTEGER```
Returns the current mode of this message. The return value is either `SYS.dbms_aqjms.READ_ONLY` or `SYS.dbms_aqjms.WRITE_ONLY`. Raises exception ORA-24197 if the Java stored procedure throws an exception during execution or ORA-24198 if the operation ID is invalid.

```read_boolean (id IN PLS_INTEGER) RETURN BOOLEAN```
Reads and returns a Boolean value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if
the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_byte (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a byte value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no `BYTE` type in PL/SQL, `INT` is used to represent a byte. Although PL/SQL users get an `INT`, they are guaranteed that the value is in the Java `BYTE` value range. If this value is issued with a `write_byte` function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_bytes (id IN PLS_INTEGER) RETURN BLOB**
Reads and returns a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_bytes (id IN PLS_INTEGER, value OUT NOCOPY BLOB)**
Reads a byte array from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_char (id IN PLS_INTEGER) RETURN CHAR**
Reads and returns a character value from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_double (id IN PLS_INTEGER) RETURN DOUBLE PRECISION**
Reads and returns a double from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_float (id IN PLS_INTEGER) RETURN FLOAT**
Reads and returns a float from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_int (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns an `INT` from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type...
conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_long (id IN PLS_INTEGER) RETURN NUMBER**
Reads and returns a long from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_short (id IN PLS_INTEGER) RETURN PLS_INTEGER**
Reads and returns a short value from the stream message. If the end of the message stream has been reached, then null is returned. Because there is no short type in PL/SQL, **PLS_INTEGER** is used to represent a SHORT. Although PL/SQL users get an INT, they are guaranteed that the value is in the Java short value range. If this value is issued with a write_short function, then there will not be an out of range error. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**read_string RETURN CLOB**
Reads and returns a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_string (id IN PLS_INTEGER, value OUT NOCOPY CLOB)**
Reads a string from the stream message. If the end of the message stream has been reached, then null is returned. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid or ORA-24196 if the stream message is in write-only mode.

**read_object (id IN PLS_INTEGER, value OUT NOCOPY AQ$_JMS_VALUE)**
Returns a general value ADT AQ$_JMS_VALUE. Users can use the type attribute of this ADT to interpret the data. See Table 284-2 for the correspondence among dbms.jms_plsql package constants, Java datatype and AQ$_JMS_VALUE attribute. This member procedure might bring additional overhead compared to other read member procedures or functions. It is used only if the user does not know the datatype of the fields within a message beforehand. Otherwise it is a good idea to use a specific read member procedure or function. Raises exception ORA-24194 if the type conversion between the type of real value and the expected type is invalid, ORA-24196 if the stream message is in write-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

**write_boolean (id IN PLS_INTEGER, value IN BOOLEAN)**
Writes a Boolean to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_byte (id IN PLS_INTEGER, value IN INT)
Writes a byte to the stream message. Because there is no BYTE type in PL/SQL, INT is used to represent a byte. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN RAW, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure. The index starts from 0. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB)
Writes a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_bytes (id IN PLS_INTEGER, value IN BLOB, offset IN INT, length IN INT)
Writes a portion of a byte array as a byte array field to the stream message. Consecutively written byte array fields are treated as two distinct fields when the fields are read. Parameter offset is the initial offset within the byte array, and parameter length is the number of bytes to use. If the range [offset, offset+length] exceeds the boundary of the byte array value, then a Java IndexOutOfBoundsException exception is thrown in the Java stored procedure. The index starts from 0. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_char (id IN PLS_INTEGER, value IN CHAR)
Writes a character value to the stream message. If this value has multiple characters, then it is the first character that is written. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_double (id IN PLS_INTEGER, value IN DOUBLE PRECISION)
Writes a double to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.
write_float (id IN PLS_INTEGER, value IN FLOAT)
Writes a float to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_int (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes an INT to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_long (id IN PLS_INTEGER, value IN NUMBER)
Writes a long to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_short (id IN PLS_INTEGER, value IN PLS_INTEGER)
Writes a short to the stream message. Because there is no short type in PL/SQL, INT is used to represent a short. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN VARCHAR2)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

write_string (id IN PLS_INTEGER, value IN CLOB)
Writes a string to the stream message. Raises exceptions ORA-24196 if the stream message is in read-only mode, ORA-24197 if the Java stored procedure throws an exception during execution, or ORA-24198 if the operation ID is invalid.

284.9.6 SYS.AQ$_JMS_OBJECT_MESSAGE Type
This type is the ADT used to store an ObjectMessage in an Oracle Database Advanced Queuing queue.

Syntax
```
TYPE aq$_jms_object_message AS object{
    header     aq$_jms_header,
    bytes_len  int,
    bytes_raw  raw(2000),
    bytes_lob  blob);
```

284.9.7 SYS.AQ$_JMS_NAMEARRAY Type
This type represents the name array returned by the get_names procedure of aq$_jms_map_message.
The maximum number of names this type can hold is 1024. The maximum length of each name is 200 characters.

Syntax
```
CREATE OR REPLACE TYPE AQ$_JMS_NAMEARRAY AS VARRAY(1024) OF VARCHAR(100);
```
Usage Notes

If the names array in the message payload is greater than 1024, then use the following function to retrieve the names in multiple portions:

```sql
MEMBER FUNCTION get_names(id IN PLS_INTEGER, names OUT aq$_jms_namearray,
   offset IN PLS_INTEGER, length IN PLS_INTEGER) RETURN PLS_INTEGER;
```

### 284.9.8 SYS.AQ$_JMS_VALUE Type

This type represents the general data returned by the `get_object` procedure of `aq$_jms_map_message` and the `read_object` procedure of `aq$_jms_stream_message`.

The `type` field in this ADT is used to decide which type of data this object is really holding. The following table lists the mapping between the `sys.dbms_jms_plsql` type constants, the corresponding Java type, and the data field of ADT `aq$_jms_value which effectively holds the data.

#### Syntax

```sql
CREATE OR REPLACE TYPE AQ$_JMS_VALUE AS object(
   type      number(2),
   num_val   number,
   char_val  char(1),
   text_val  clob,
   bytes_val blob);
```

<table>
<thead>
<tr>
<th>Type</th>
<th>Java Type</th>
<th><code>aq$_jms_value</code> Data Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_BYTE</td>
<td>byte</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_SHORT</td>
<td>short</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_INTEGER</td>
<td>int</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_LONG</td>
<td>long</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_FLOAT</td>
<td>float</td>
<td>num_val</td>
</tr>
<tr>
<td>DBMS_JMS_PLSQL.DATA_TYPE_DOUBLE</td>
<td>double</td>
<td>num_val</td>
</tr>
</tbody>
</table>
| DBMS_JMS_PLSQL.DATA_TYPE_BOOLEAN | boolean   | num_val:
|                               |            | 0 FALSE, 1 TRUE           |
| DBMS_JMS_PLSQL.DATA_TYPE_CHARACTER | char     | char_val                   |
| DBMS_JMS_PLSQL.DATA_TYPE_STRING | java.lang.String | text_val |
| DBMS_JMS_PLSQL.DATA_TYPE_BYTES | byte[]     | bytes_val                  |

### 284.9.9 SYS.AQ$_JMS_EXCEPTION Type

This type represents a Java exception thrown on the Java stored procedure side.

The `id` field is reserved for future use. The `exp_name` stores the Java exception name, the `err_msg` field stores the Java exception error message, and the `stack` field stores the stack trace of the Java exception.
Syntax

CREATE OR REPLACE TYPE AQ$_JMS_EXCEPTION AS OBJECT (
    id number, -- Reserved and not used. Right now always return 0.
    exp_name varchar2(200),
    err_msg varchar2(500),
    stack varchar2(4000));
JSON Data Structures

To work with JSON data in PL/SQL, you can use these data structures:

- JSON_ELEMENT_T Object Type
- JSON_OBJECT_T Object Type
- JSON_ARRAY_T Object Type
- JSON_SCALAR_T Object Type
- JSON_KEY_LIST Type

Related Topics

- Oracle Database JSON Developer’s Guide
- The JSON standard

285.1 JSON_ELEMENT_T Object Type

JSON_ELEMENT_T is the supertype for the JSON_OBJECT_T, JSON_SCALAR_T, and JSON_ARRAY_T object types.

Description

Note the following:

- To create an instance of JSON_ELEMENT_T, use the parse function. See the “Constructors” section below for details.
- You cannot create an empty JSON_ELEMENT_T instance. To create an empty JSON container, create it based on one of the subtypes.
- To cast a JSON_ELEMENT_T into a subtype (for example, JSON_OBJECT_T), you need to perform an explicit cast using TREAT AS. For example:

  ```sql
  TREAT (elem AS JSON_OBJECT_T)
  ```

Constructors

You create a JSON_ELEMENT_T instance using the parse function. The function takes as input VARCHAR2, CLOB, or BLOB data, and returns a JSON_ELEMENT_T instance.

```sql
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json CLOB)     RETURN JSON_ELEMENT_T
STATIC FUNCTION parse(json BLOB)     RETURN JSON_ELEMENT_T
```

Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. Valid JSON has to pass the lax check of the “IS JSON” SQL condition.
Serialization

Serialization is the inverse of the parse function. The serialization operation takes the in-memory representation of the JSON data and prints it to a string. The serialization functions and procedures are:

MEMBER FUNCTION to_String    RETURN VARCHAR2
MEMBER FUNCTION to_Number    RETURN NUMBER
MEMBER FUNCTION to_Date      RETURN DATE
MEMBER FUNCTION to_Timestamp RETURN TIMESTAMP
MEMBER FUNCTION to_Boolean   RETURN BOOLEAN
MEMBER FUNCTION to_Clob      RETURN CLOB
MEMBER FUNCTION to_Blob      RETURN BLOB

MEMBER PROCEDURE to_Clob(c IN OUT CLOB)
MEMBER PROCEDURE to_Blob(c IN OUT BLOB)

The to_Clob and to_Blob procedures accept a CLOB or BLOB input and enable you to provide a LOB to be used as the serialization destination. For instance, EMPTY_LOB can be provided. The input LOB cannot be NULL.

If the to_Clob function is used, then a new CLOB is created. If you do not want to create a CLOB first, then you can use the to_Clob or to_Blob functions, which take no parameter and generate a temp lob.

to_Blob serializes to UTF8 format only.

Introspection

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

MEMBER FUNCTION is_Object    RETURN BOOLEAN
MEMBER FUNCTION is_Array     RETURN BOOLEAN
MEMBER FUNCTION is_Scalar    RETURN BOOLEAN
MEMBER FUNCTION is_String    RETURN BOOLEAN
MEMBER FUNCTION is_Number    RETURN BOOLEAN
MEMBER FUNCTION is_Boolean   RETURN BOOLEAN
MEMBER FUNCTION is_True      RETURN BOOLEAN
MEMBER FUNCTION is_False     RETURN BOOLEAN
MEMBER FUNCTION is_Null      RETURN BOOLEAN
MEMBER FUNCTION is_Date      RETURN BOOLEAN
MEMBER FUNCTION is_Timestamp RETURN BOOLEAN
MEMBER FUNCTION get_Size     RETURN NUMBER

The return value of the get_size function depends on the JSON type:

- For a scalar, it returns 1.
- For an object, it returns the number of keys.
- For an array, it returns the number of items.

Note that JSON does not support dates and timestamps natively. Instead they are typically modeled as strings. The DOM API enables you to add dates and timestamps as scalar values and preserve them until serialization to JSON, where they are printed as string following the ISO 8601 format. If a SQL value of type date or timestamp has been added, then the is_Date and is_Timestamp functions return true. If a date has been added as a string (e.g. as ISO 8601), then the is_Date and is_Timestamp functions
return false. You can use Oracle conversion function `to_Date` and `to_Timestamp` to convert a string representation of a date, and timestamp to the Oracle representation.

**Error Handling**

You can set the level of error handling for JSON processing. You might not want an error to be raised for every mismatch. The `on_Error` procedure enables you to specify when errors should be raised:

```sql
MEMBER PROCEDURE on_Error(value NUMBER)
```

The `on_Error` procedure defines what happens if an error is encountered during a PL/SQL operation, for instance, a get call.

The default is to not raise an error but to return NULL instead.

You invoke `On_error` on a JSON_ELEMENT_T instance and it sets the error behavior for all subsequent calls. To reset the behavior to the default, you can call `on_Error(0)`.

Values for the `value` parameter are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Reset to the default behavior, which is to return NULL instead of raising an error.</td>
</tr>
<tr>
<td>1</td>
<td>Raise all errors.</td>
</tr>
<tr>
<td>2</td>
<td>Raise an error if no value is detected.</td>
</tr>
<tr>
<td>3</td>
<td>Raise an error if the data types do not match, for example, if you call <code>GET_NUMBER</code> on a string value.</td>
</tr>
<tr>
<td>4</td>
<td>Raise an error if the input is invalid, for example, if the array is out of bounds.</td>
</tr>
</tbody>
</table>

You can combine values. For example, you can specify 7 to indicate a combination of 3 and 4.

In the following example, an error is raised because the value of “a” is “xyz”, which cannot be converted to a number. If the `on_Error` procedure had not been called, then NULL would be returned, and no error would be raised.

```sql
declare
    jo JSON_OBJECT_T;
begin
    jo := JSON_OBJECT_T.parse('{a:"xyz"}');
    jo.on_error(1);
    dbms_output.put_line(jo.get_Number('a'));
end;
/```
### 285.2 JSON_OBJECT_T Object Type

JSON_OBJECT_T is a subtype of the JSON_ELEMENT_T object type. It corresponds to the JSON object structure.

**Constructors**

You can create an empty JSON_OBJECT_T instance using the following constructor.

```sql
CONSTRUCTOR FUNCTION JSON_OBJECT_T RETURN SELF AS RESULT
```

You can create a JSON_OBJECT_T instance using one of the following `parse` functions:

```sql
STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json CLOB) RETURN JSON_OBJECT_T
STATIC FUNCTION parse(json BLOB) RETURN JSON_OBJECT_T
```

You can also create a JSON_OBJECT_T instance using one of the following constructors:

```sql
CONSTRUCTOR FUNCTION JSON_OBJECT_T(json VARCHAR2) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(json CLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(json BLOB) RETURN SELF AS RESULT,
CONSTRUCTOR FUNCTION JSON_OBJECT_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
```

Only UTF8-encoded JSON is passed as a BLOB.

The `parse` function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not a valid JSON object, then an error message is raised. The input has to specify a JSON object, not an array.

**Get Functions and Procedures**

The following functions and procedures enable you to retrieve the value of the JSON object:

```sql
MEMBER FUNCTION get(key VARCHAR2) RETURN JSON_ELEMENT_T
MEMBER FUNCTION get_String(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get_Number(key VARCHAR2) RETURN NUMBER
MEMBER FUNCTION get_Date(key VARCHAR2) RETURN DATE
MEMBER FUNCTION get_Timestamp(key VARCHAR2) RETURN TIMESTAMP
MEMBER FUNCTION get_Boolean(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get_Clob(key VARCHAR2) RETURN CLOB
MEMBER FUNCTION get_Blob(key VARCHAR2) RETURN BLOB
MEMBER FUNCTION get_Object(key VARCHAR2) RETURN JSON_OBJECT_T
MEMBER FUNCTION get_Array(key VARCHAR2) RETURN JSON_ARRAY_T
MEMBER PROCEDURE get_Clob(key NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(key NUMBER, c IN OUT BLOB)
```

**Note:**

- The `get` function has reference semantics. This means that if the returned JSON_ELEMENT_T is modified, then the containing JSON_ELEMENT_T is also changed. See the Reference Semantics section below for details.
The \texttt{GET\_STRING} function converts the value to a string if it is not already a string. Thus, the \texttt{GET\_STRING} function returns a non-null value even if \texttt{IS\_STRING} returns false.

All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what \texttt{ON\_ERROR} is set to.

The \texttt{GET\_CLOB} and \texttt{GET\_BLOB} procedures, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, \texttt{EMPTY\_LOB} can be provided. If you use the \texttt{GET\_CLOB} function instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the \texttt{GET\_CLOB} or \texttt{GET\_BLOB} functions, which take no parameter and generates a temp LOB.

\texttt{GET\_BLOB} serializes to UTF8 format only.

\section*{Set Procedures}

The following procedures enable you to set the value of a JSON object. Existing values, if present, will be overwritten.

\begin{verbatim}
MEMBER PROCEDURE put(key VARCHAR2, value JSON\_ELEMENT\_T)
MEMBER PROCEDURE put(key VARCHAR2, value VARCHAR2)
MEMBER PROCEDURE put(key VARCHAR2, value NUMBER)
MEMBER PROCEDURE put(key VARCHAR2, value BOOLEAN)
MEMBER PROCEDURE put(key VARCHAR2, value DATE)
MEMBER PROCEDURE put(key VARCHAR2, value TIMESTAMP)
MEMBER PROCEDURE put\_Null(key VARCHAR2)
\end{verbatim}

\section*{Introspection Functions}

Introspection enables you to discover properties of JSON objects without modifying them. The introspection functions are:

\begin{verbatim}
MEMBER FUNCTION has(key VARCHAR2) RETURN BOOLEAN
MEMBER FUNCTION get\_Type(key VARCHAR2) RETURN VARCHAR2
MEMBER FUNCTION get\_Keys RETURN JSON\_KEY\_LIST
\end{verbatim}

The \texttt{GET\_KEYS} function returns an object type of \texttt{JSON\_KEY\_LIST}, which is a varray of \texttt{VARCHAR2(4000)}. The varray contains the names of keys in the JSON object. The example below walks through the items of the varray to build a \texttt{JSON\_ARRAY\_T} object that contains all key names.

\begin{verbatim}
declare
    jo JSON\_OBJECT\_T;
    ja JSON\_ARRAY\_T;
    keys JSON\_KEY\_LIST;
    keys\_string VARCHAR2(100);
begin
    ja := new JSON\_ARRAY\_T;
    jo := JSON\_OBJECT\_T.parse("{"name":"fred",
    "jobTitle":"codemonkey",
    "projects":["json", "xml"]}");
    keys := jo.get\_keys;
    for i in 1..keys.count loop
        ja.append(keys(i));
    end loop;
    keys\_string := ja.to\_string;
    dbms\_output.put\_line(keys\_string);
end;
\end{verbatim}
The output is:

["name","jobTitle","projects"]

Modification Procedures

The following procedures enable you to remove or rename keys in a JSON object.

MEMBER PROCEDURE remove(key VARCHAR2)
MEMBER PROCEDURE rename_key(keyOld VARCHAR2, keyNew VARCHAR2)

Duplicate key names are not supported and will raise an error.

Clone Function

This function makes a copy of the JSON object. Reference semantics is changed to value semantics.

MEMBER FUNCTION clone RETURN JSON_OBJECT_T

Reference Semantics

Calling the get function that returns a JSON_ELEMENT_T object always returns a reference to the complex values instead of a copy. This means that changing the returned value affects its container. See the example below.

```sql
declare
data JSON_OBJECT_T;
data := new JSON_OBJECT_T('{
    "first": "John",
    "last": "Doe",
    "address": {
        "country": "USA",
        "zip": "94065"
    }
};
address := data.get_object('address');
dbms_output.put_line(address.to_string);
-- 1) VALUE SEMANTICS for scalar values
-- (changing the value has no effect on container)
zip := address.get_number('zip');
dbms_output.put_line(zip);
zip := 12345;
dbms_output.put_line(zip);
-- address is still the same
dbms_output.put_line(address.to_string);
-- 2) REFERENCE SEMANTICS for complex values
-- 'address' is a reference to the complex address values inside 'data'
address.put('zip', 12345);
address.put('street', 'Detour Road');
```
dbms_output.put_line(data.to_string);
end;
/

In cases where you do not want the reference semantics, you can use the clone function to create a copy of the returned object. This decouples the value from its container. In the example above, you can create a copy of the “address” object by replacing this line:

address := data.get_object('address');

with this line:

address := data.get_object('address').clone;

After this, changing the address with have no effect on the value of the ‘data’ containing object.

Update Example

The following example updates the price of an item by 10%.

WITH
  FUNCTION updatePrice(jsonTxt in VARCHAR2 ) RETURN VARCHAR2 IS
    jo JSON_OBJECT_T;
    oldPrice NUMBER;
  BEGIN
    jo := new JSON_OBJECT_T(jsonTxt);
    oldPrice := jo.get_number('price');
    jo.put('price', oldPrice * 1.1);
    RETURN jo.to_string();
  END;
SELECT updatePrice(col)
FROM   t1;

285.3 JSON_ARRAY_T Object Type

JSON_ARRAY_T is a subtype of the JSON_ELEMENT_T object type. JSON_ARRAY_T corresponds to the JSON array structure.

Constructors

You can create an empty JSON_ARRAY_T instance using the following constructor.

CONSTRUCTOR FUNCTION JSON_ARRAY_T RETURN SELF AS RESULT

You can create a JSON_ARRAY_T instance using one the following parse functions:

STATIC FUNCTION parse(json VARCHAR2) RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json CLOB)     RETURN JSON_ARRAY_T
STATIC FUNCTION parse(json BLOB)     RETURN JSON_ARRAY_T

You can also create a JSON_ARRAY_T instance using one the following constructors:

CONSTRUCTOR FUNCTION JSON_Array_T(jsn VARCHAR2) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn CLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(jsn BLOB) RETURN SELF AS RESULT
CONSTRUCTOR FUNCTION JSON_Array_T(e JSON_ELEMENT_T) RETURN SELF AS RESULT
Only UTF8-encoded JSON is passed as a BLOB.

The parse function takes a JSON string as input and sets up an internal representation of the JSON data. If the provided input is not valid JSON, then an error message is raised. The input has to specify a JSON array, not an object.

**Get Functions and Procedures**

The following functions and procedures enable you to retrieve the value of the JSON array:

- MEMBER FUNCTION get(pos NUMBER) RETURN JSON_ELEMENT_T
- MEMBER FUNCTION get_String(pos NUMBER) RETURN VARCHAR2
- MEMBER FUNCTION get_Number(pos NUMBER) RETURN NUMBER
- MEMBER FUNCTION get_Date(pos NUMBER) RETURN DATE
- MEMBER FUNCTION get_Timestamp(pos NUMBER) RETURN TIMESTAMP
- MEMBER FUNCTION get_Boolean(pos NUMBER) RETURN BOOLEAN
- MEMBER FUNCTION get_Clob(pos NUMBER) RETURN CLOB
- MEMBER FUNCTION get_Blob(pos NUMBER) RETURN BLOB

MEMBER PROCEDURE get_Clob(pos NUMBER, c IN OUT CLOB)
MEMBER PROCEDURE get_Blob(pos NUMBER, c IN OUT BLOB)

**Note:**

- The get function has reference semantics. This means that if the returned JSON_ELEMENT_T is modified, then the containing JSON_ELEMENT_T is changed too.
- The GET_STRING function converts the value to a string if it is not already a string. The function returns a non-null value even if IS_STRING returns false.
- All the “get” functions perform a conversion if possible. If no conversion is possible, then an error might be raised, depending on what ON_ERROR is set to.

The GET_CLOB and GET_BLOB procedures, which accept a CLOB or BLOB as input, enable you to provide a LOB to be used as serialization destination. For instance, EMPTY_LOB can be provided. If you use the GET_CLOB function instead, then a new CLOB will be created implicitly. The input LOB cannot be NULL. If you do not want to create a BLOB or CLOB first, you can use the GET_CLOB or GET_BLOB functions, which take no parameter and generates a temp LOB.

GET_BLOB serializes to UTF8 format only.

**Set Procedures**

The following procedures enable you to set the value at the specified position in the JSON array. These procedures insert (not overwrite) at the specified position unless overwrite is requested.

MEMBER PROCEDURE put(pos NUMBER, value VARCHAR2, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value NUMBER, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value BOOLEAN, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value JSON_ELEMENT_T, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value DATE, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put(pos NUMBER, value TIMESTAMP, overwrite BOOLEAN DEFAULT FALSE)
MEMBER PROCEDURE put_Null(pos NUMBER, overwrite BOOLEAN DEFAULT FALSE)

The following procedures append the specified value to the end of the JSON array:
MEMBER PROCEDURE append(value JSON_ELEMENT_T)
MEMBER PROCEDURE append(value VARCHAR2)
MEMBER PROCEDURE append(value NUMBER)
MEMBER PROCEDURE append(value BOOLEAN)
MEMBER PROCEDURE append(value DATE)
MEMBER PROCEDURE append(value TIMESTAMP)
MEMBER PROCEDURE append_Null

Introspection Function
Introspection enables you to discover properties of the JSON array without modifying them.

MEMBER FUNCTION get_Type(pos NUMBER) RETURN VARCHAR2

Modification Procedure
The following procedure enables you to remove the value at the specified position in the JSON array.

MEMBER PROCEDURE remove(pos NUMBER)

Clone Function
This function makes a copy of the JSON array. Reference semantics is changed to value semantics.

MEMBER FUNCTION clone RETURN JSON_ARRAY_T

285.4 JSON_SCALAR_T Object Type

JSON_SCALAR_T is a subtype of the JSON_ELEMENT_T object type.

Description
A JSON_SCALAR_T instance captures one scalar values, for example, the string “fred” or the number 1. This type does not have any functions or procedures other than the ones inherited from JSON_ELEMENT_T. You cannot create an instance of this type directly.

285.5 JSON_KEY_LIST Type

JSON_KEY_LIST is a varray of VARCHAR2(4000).

Description
This type is used by the get_Keys function in the JSON_OBJECT_T Object Type.
Logical Change Record TYPEs

This chapter describes the logical change record (LCR) types.

This chapter contains these topics:

• Overview
• Security Model
• Summary of Logical Change Record Types
• Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD

286.1 Logical Change Record TYPEs Overview

In Oracle Streams, logical change records (LCRs) are message payloads that contain information about changes to a database. These changes can include changes to the data, which are data manipulation language (DML) changes, and changes to database objects, which are data definition language (DDL) changes.

When you use Oracle Streams, the capture process captures changes in the form of LCRs and enqueues them into a queue. These LCRs can be propagated from a queue in one database to a queue in another database. Finally, the apply process can apply LCRs at a destination database. You also have the option of creating, enqueuing, and dequeuing LCRs manually.

See Also:
Oracle Streams Concepts and Administration for more information about LCRs

286.2 Logical Change Record Types Security Model

PUBLIC is granted EXECUTE privilege on the types described in this chapter.

286.3 Summary of Logical Change Record Types

This table lists the Logical Change Record TYPEs and briefly describes them.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCR$_DDL_RECORD Type</td>
<td>Represents a data definition language (DDL) change to a database object</td>
</tr>
</tbody>
</table>
Table 286-1  (Cont.) Logical Change Record (LCR) Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCR$ ROW RECORD Type</td>
<td>Represents a data manipulation language (DML) change to a database object</td>
</tr>
<tr>
<td>LCR$ ROW LIST Type</td>
<td>Identifies a list of column values for a row in a table</td>
</tr>
<tr>
<td>LCR$ ROW UNIT Type</td>
<td>Identifies the value for a column in a row</td>
</tr>
</tbody>
</table>

These logical change record (LCR) types can be used with the following Oracle-supplied PL/SQL packages:

- DBMS_APPLY_ADM
- DBMS_AQ
- DBMS_AQADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
- DBMS_RULE
- DBMS_RULE_ADM
- DBMS_STREAMS
- DBMS_STREAMS_ADM
- DBMS_TRANSFORM

286.3.1 LCR$ DDL_RECORD Type

This type represents a data definition language (DDL) change to a database object.

If you create or modify a DDL logical change record (DDL LCR), then make sure the `ddl_text` is consistent with the `base_table_name`, `base_table_owner`, `object_type`, `object_owner`, `object_name`, and `command_type` attributes.

This topic contains information about the constructor for row LCRs and information about the member subprograms for this type.

**Note:**

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.
LCR$_DDL_RECORD Constructor

Creates a SYS.LCR$_DDL_RECORD object with the specified information.

STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type          IN  VARCHAR2,
    object_owner          IN  VARCHAR2,
    object_name           IN  VARCHAR2,
    object_type           IN  VARCHAR2,
    ddl_text              IN  CLOB,
    logon_user            IN  VARCHAR2,
    current_schema        IN  VARCHAR2,
    base_table_owner      IN  VARCHAR2,
    base_table_name       IN  VARCHAR2,
    tag                   IN  RAW       DEFAULT NULL,
    transaction_id        IN  VARCHAR2  DEFAULT NULL,
    scn                   IN  NUMBER    DEFAULT NULL,
    position              IN  RAW       DEFAULT NULL,
    edition_name          IN  VARCHAR2  DEFAULT NULL,
    root_name             IN  VARCHAR2  DEFAULT NULL)
RETURN SYS.LCR$_DDL_RECORD;

LCR$_DDL_RECORD Constructor Function Parameters

</table>
Table 286-2  (Cont.) Constructor Function Parameters for LCR$_DDL_RECORD

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_schema</td>
<td>The schema that is used if no schema is specified explicitly for the modified database objects in <code>ddl_text</code></td>
</tr>
<tr>
<td></td>
<td>If a schema is specified in <code>ddl_text</code> that differs from the one specified for <code>current_schema</code>, then the function uses the schema specified in <code>ddl_text</code>.</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
<tr>
<td>base_table_owner</td>
<td>If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_owner</code> specifies the owner of the table involved. Otherwise, <code>base_table_owner</code> is NULL.</td>
</tr>
<tr>
<td>base_table_name</td>
<td>If the DDL statement is a table-related DDL (such as <code>CREATE TABLE</code> and <code>ALTER TABLE</code>), or if the DDL statement involves a table (such as creating a trigger on a table), then <code>base_table_name</code> specifies the name of the table involved. Otherwise, <code>base_table_name</code> is NULL.</td>
</tr>
<tr>
<td>tag</td>
<td>A binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DDL statement if apply forwarding is used.</td>
</tr>
<tr>
<td>transaction_id</td>
<td>The identifier of the transaction</td>
</tr>
<tr>
<td>scn</td>
<td>The SCN at the time when the change record for a captured LCR was written to the redo log. The SCN value is meaningless for a user-created LCR.</td>
</tr>
<tr>
<td>position</td>
<td>The position of the LCR. LCR position is commonly used in XStream configurations. Using XStream requires purchasing a license for the Oracle GoldenGate product.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition in which the DDL statement was executed</td>
</tr>
<tr>
<td>root_name</td>
<td>If the LCRs is associated with a CDB, then this field specifies the global name of the root in the CDB. If the LCR is associated with a non-CDB, then this field is NULL.</td>
</tr>
</tbody>
</table>

Summary of LCR$_DDL_RECORD Subprograms

</tbody>
</table>

**Common Subprograms**

See "Common Subprograms for LCR$_DDL_RECORD and LCR$_ROW_RECORD" for a list of subprograms common to the SYS.LCR$_ROW_RECORD and SYS.LCR$_DDL_RECORD types.

### EXECUTE Member Procedure

Executes the DDL LCR under the security domain of the current user. Apply handlers are not run when the LCR is applied using this procedure.

#### Note:

The EXECUTE member procedure can be invoked only in an apply handler for an Oracle Streams apply process.

**Syntax**

MEMBER PROCEDURE EXECUTE;

**GET_BASE_TABLE_NAME Member Function**

Gets the base (dependent) table name.
**Syntax**

MEMBER FUNCTION GET_BASE_TABLE_NAME()
RETURN VARCHAR2;

**GET_BASE_TABLE_OWNER Member Function**

Gets the base (dependent) table owner.

**Syntax**

MEMBER FUNCTION GET_BASE_TABLE_OWNER()
RETURN VARCHAR2;

**GET_CURRENT_SCHEMA Member Function**

Gets the current schema name.

**Syntax**

MEMBER FUNCTION GET_CURRENT_SCHEMA()
RETURN VARCHAR2;

**GET_DDL_TEXT Member Procedure**

Gets the DDL text in a CLOB.

For example, the following PL/SQL code uses this procedure to get the DDL text in a DDL LCR:

```plsql
CREATE OR REPLACE PROCEDURE ddl_in_lcr (ddl_lcr in SYS.LCR$_DDL_RECORD)
IS
    ddl_text   CLOB;
BEGIN
    DBMS_OUTPUT.PUT_LINE('  -----------------------------------------' );
    DBMS_OUTPUT.PUT_LINE('  Displaying DDL text in a DDL LCR: ');
    DBMS_OUTPUT.PUT_LINE('  -----------------------------------------' );
    DBMS_LOB.CREATETEMPORARY(ddl_text, true);
    ddl_lcr.GET_DDL_TEXT(ddl_text);
    DBMS_OUTPUT.PUT_LINE('DDL text:' || ddl_text);
    DBMS_LOB.FREETEMPORARY(ddl_text);
END;
/
```

**Note:**

GET_DDL_TEXT is a member procedure and not a member function to make it easier for you to manage the space used by the CLOB. Notice that the previous example creates temporary space for the CLOB and then frees the temporary space when it is no longer needed.

**Syntax**

MEMBER FUNCTION GET_DDL_TEXT(
    ddl_text  IN/OUT  CLOB);
Parameter

Table 286-4  GET_DDL_TEXT Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl_text</td>
<td>The DDL text in the DDL LCR</td>
</tr>
</tbody>
</table>

GET_EDITION_NAME Member Function

Gets the name of the edition in which the DDL statement was executed.

See Also:
Oracle Database Development Guide

Syntax

MEMBER FUNCTION GET_EDITION_NAME()
RETURN VARCHAR2;

GET_LOGON_USER Member Function

Gets the logon user name.

Syntax

MEMBER FUNCTION GET_LOGON_USER()
RETURN VARCHAR2;

GET_OBJECT_TYPE Member Function

Gets the type of the object involved for the DDL.

Syntax

MEMBER FUNCTION GET_OBJECT_TYPE()
RETURN VARCHAR2;

SET_BASE_TABLE_NAME Member Procedure

Sets the base (dependent) table name.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_NAME(
   base_table_name IN VARCHAR2);
Parameter

Table 286-5  SET_BASE_TABLE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base_table_name</td>
<td>The name of the base table</td>
</tr>
</tbody>
</table>

SET_BASE_TABLE_OWNER Member Procedure

Sets the base (dependent) table owner.

Syntax

MEMBER PROCEDURE SET_BASE_TABLE_OWNER(
    base_table_owner  IN  VARCHAR2);

Parameter

Table 286-6  SET_BASE_TABLE_OWNER Procedure Parameter

<table>
<thead>
<tr>

LINK represents a database link.
NULL is also a valid object type. Specify NULL for all object types not listed. The GET_OBJECT_TYPE member procedure returns NULL for object types not listed.

286.3.2 LCR$_ROW_RECORD Type

This type represents a data manipulation language (DML) change to a row in a table. This type uses the LCR$_ROW_LIST type.

If you create or modify a row logical change record (row LCR), then make sure the command_type attribute is consistent with the presence or absence of old column values and the presence or absence of new column values.

This topic contains information about the constructor for DDL LCRs and information about the member subprograms for this type.
Note:

- When passing a name as a parameter to an LCR constructor, you can enclose the name in double quotes to handle names that use mixed case or lower case for database objects. For example, if a name contains any lower case characters, then you must enclose it in double quotes.
- The application does not need to specify a transaction identifier or SCN when it creates an LCR because the apply process generates these values and stores them in memory. If a transaction identifier or SCN is specified in the LCR, then the apply process ignores it and assigns a new value.

See Also:

- LCR$_ROW_LIST Type

LCR$_ROW_RECORD Constructor

Creates a SYS.LCR$_ROW_RECORD object with the specified information.

```sql
STATIC FUNCTION CONSTRUCT(
    source_database_name  IN  VARCHAR2,
    command_type          IN  VARCHAR2,
    object_owner          IN  VARCHAR2,
    object_name           IN  VARCHAR2,
    tag                   IN  RAW                DEFAULT NULL,
    transaction_id        IN  VARCHAR2           DEFAULT NULL,
    scn                   IN  NUMBER             DEFAULT NULL,
    old_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    new_values            IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    position              IN  RAW                DEFAULT NULL,
    statement             IN  VARCHAR2           DEFAULT NULL,
    bind_variables        IN  SYS.LCR$_ROW_LIST  DEFAULT NULL,
    bind_by_position      IN  VARCHAR2           DEFAULT 'N',
    root_name             IN  VARCHAR2           DEFAULT NULL)
RETURN SYS.LCR$_ROW_RECORD;
```
LCR$_ROW_RECORD Constructor Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_database_name | The database where the row change occurred  
If the LCRs originated in a CDB, then this field specifies the global name of the container where the row change occurred.  
If you do not include the domain name, then the function appends the local domain to the database name automatically. For example, if you specify DBS1 and the local domain is EXAMPLE.COM, then the function specifies DBS1.EXAMPLE.COM automatically. Set this parameter to a non-NULL value. |
| command_type       | The type of command executed in the DML statement  
Set this parameter to a non-NULL value.  
Valid values are the following:  
INSERT  
UPDATE  
DELETE  
LOB ERASE  
LOB WRITE  
LOB TRIM  
If INSERT, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection.  
If UPDATE, then ensure that the LCR has a new_values collection that is not empty and an old_values collection that is not empty.  
If DELETE, then ensure that the LCR has a NULL or empty new_values collection and an old_values collection that is not empty.  
If LOB ERASE, LOB WRITE, or LOB TRIM, then ensure that the LCR has a new_values collection that is not empty and an empty or NULL old_values collection. |
| object_owner       | The user who owns the table on which the row change occurred  
Set this parameter to a non-NULL value. |
| object_name        | The table on which the DML statement was executed  
Set this parameter to a non-NULL value. |
| tag                | A binary tag that enables tracking of the LCR  
For example, this tag can be used to determine the original source database of the DML change when apply forwarding is used.  
See Also: Oracle Streams Replication Administrator’s Guide |
| transaction_id     | The identifier of the transaction |
| scn                | The SCN at the time when the change record was written to the redo log  
The SCN value is meaningless for a user-created LCR. |
Table 286-12  (Cont.) Constructor Function Parameters for LCR$_{ROW\_RECORD}$

</tr>
</tbody>
</table>

### ADD_COLUMN Member Procedure

Adds the value as old or new, depending on the value type specified, for the column. An error is raised if a value of the same type already exists for the column.

Note:

To set a column value that already exists, run SET_VALUE.
Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), you use this member procedure in the handler procedure to add a LOB column to a row LCR. If `assemble_lobs` is set to `FALSE` for the handler, then you cannot use this member procedure to add a LOB column to a row LCR.

To use a DML or error handler to add a LOB column, specify the LOB locator for the `column_value` parameter in the member procedure. The `ADD_COLUMN` member procedure verifies that an `ANYDATA` encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated LOB locator.
- An attempt is made to add an LOB column that is set incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure to add a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure to add a `LONG` or `LONG RAW` column.

**Syntax**

```sql
MEMBER PROCEDURE ADD_COLUMN(
  value_type    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  column_value  IN  ANYDATA);
```

**Parameters**

**Table 286-14   ADD_COLUMN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to add for the column. Specify <code>old</code> to add the old value of the column. Specify <code>new</code> to add the new value of the column.</td>
</tr>
</tbody>
</table>
Table 286-14  (Cont.) ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>This name is not validated. An error can be raised during application of the LCRs if an invalid name is specified.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the column</td>
</tr>
<tr>
<td></td>
<td>If NULL, then this procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then a LOB locator can be specified.</td>
</tr>
<tr>
<td></td>
<td>A NULL column value can be specified by encapsulating the NULL value in an ANYDATA wrapper.</td>
</tr>
</tbody>
</table>

CONVERT_LONG_TO_LOB_CHUNK Member Procedure

Converts LONG data in a row LCR into a CLOB, or converts LONG RAW data in a row LCR into a BLOB.

This procedure can change the operation code from LONG WRITE to LOB WRITE for the row LCR.

This member procedure can be used in rule-based transformations.

The following restrictions apply to this member procedure:

- This member procedure cannot be used in apply handlers.
- LONG data can be sent as a part of a row LCR with one of the following operation codes: INSERT, UPDATE, or LONG_WRITE. Because LONG data can be sent in multiple pieces, make sure that this method is invoked on either none or all LONG pieces.
- LOB to LONG conversion is not supported.
- A row LCR on which this procedure is executed must have been created by a capture process. That is, this procedure does not support persistent row LCRs.

See Also:

Oracle Streams Replication Administrator's Guide

Syntax

MEMBER PROCEDURE CONVERT_LONG_TO_LOB_CHUNK;

DELETE_COLUMN Member Procedure

Deletes the old value, the new value, or both, for the specified column, depending on the value type specified.
Syntax

```
MEMBER PROCEDURE DELETE_COLUMN(
    column_name  IN  VARCHAR2,
    value_type   IN  VARCHAR2  DEFAULT '*');
```

Parameters

**Table 286-15  DELETE_COLUMN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td></td>
<td>An error is raised if the column does not exist in the LCR.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value to delete for the column</td>
</tr>
<tr>
<td></td>
<td>Specify old to delete the old value of the column. Specify new to delete the new value of the column. If * is specified, then the procedure deletes both the old and new values.</td>
</tr>
</tbody>
</table>

**EXECUTE Member Procedure**

Executes the row LCR under the security domain of the current user. Any apply handlers that would be run for an LCR are not run when the LCR is applied using this procedure.

This member procedure can be run on a row LCR under any of the following conditions:

- The LCR is being processed by an apply handler.
- The LCR is in a queue and was last enqueued by a mechanism other than an Oracle Streams capture process, such as an Oracle Streams apply process or an application.
- The LCR has been constructed using the LCR$_ROW_RECORD constructor function but has not been enqueued.
- The LCR is in the error queue.

**Note:**

Do not run this member procedure in a custom rule-based transformation on a row LCR. Doing so could execute the row LCR outside of its transactional context.

**Considerations for LOB Columns**

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the `assemble_lobs` parameter is set to `TRUE` for the handler), this member procedure executes the assembled row LCR. An assembled row LCR represents a LOB value with a LOB locator or `NULL`.

If `assemble_lobs` is set to `FALSE` for the handler, then this member procedure executes the nonassembled row LCRs. Nonassembled row LCRs represent LOB values with
VARCHAR2 and RAW data types. These nonassembled row LCRs might have been modified by the handler.

An error is raised under the following conditions:

- A DML or error handler configured with assemble_lobs set to FALSE attempts to execute a row LCR that contains a LOB locator.
- A DML or error handler configured with assemble_lobs set to TRUE attempts to execute a row LCR that contains one or more LOB values represented with VARCHAR2 or RAW data types.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

Syntax

```plaintext
MEMBER PROCEDURE EXECUTE(
    conflict_resolution  IN  BOOLEAN);
```

Parameters

### Table 286-16  EXECUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| conflict_resolution | If TRUE, then any conflict resolution defined for the table using the SET_UPDATE_CONFLICT_HANDLER procedure in the DBMS_APPLY_ADM package is used to resolve conflicts resulting from the execution of the LCR.  
If FALSE, then conflict resolution is not used.  
An error is raised if this parameter is not specified or is set to NULL. |

GET_LOB_INFORMATION Member Function

Gets the LOB information for the column.

The return value can be one of the following:

- `DBMS_LCR.NOT_A_LOB` CONSTANT NUMBER := 1;
- `DBMS_LCR.NULL_LOB` CONSTANT NUMBER := 2;
- `DBMS_LCR.INLINE_LOB` CONSTANT NUMBER := 3;
- `DBMS_LCR.EMPTY_LOB` CONSTANT NUMBER := 4;
- `DBMS_LCR.LOB_CHUNK` CONSTANT NUMBER := 5;
- `DBMS_LCR.LAST_LOB_CHUNK` CONSTANT NUMBER := 6;

Returns NULL if the specified column does not exist.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of the columns.

Syntax

```plaintext
MEMBER FUNCTION GET_LOB_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2 DEFAULT 'Y')
RETURN NUMBER;
```
Parameters

Table 286-17 GET_LOB_INFORMATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

GET_LOB_OFFSET Member Function

Gets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:
- • The value exists for the column
- • The column value is an out-of-line LOB. That is, the information is DBMS_LCR.LAST_LOB_CHUNK or DBMS_LCR.LOB_CHUNK
- • The command type is LOB_ERASE or LOB_WRITE

Otherwise, returns NULL.

Syntax

GET_LOB_OFFSET(
    value_type IN VARCHAR2,
    column_name IN VARCHAR2)
RETURN NUMBER;

Parameters

Table 286-18 GET_LOB_OFFSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, currently, only new can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

GET_LOB_OPERATION_SIZE Member Function

Gets the operation size for the LOB column in the number of characters for CLOB columns and the number of bytes for BLOB columns. Returns a non-NULL value only if all of the following conditions are met:
- • The value exists for the column
- The column value is an out-of-line LOB
- The command type is **LOB ERASE** or **LOB TRIM**
- The information is **DBMS_LCR.LAST_LOB_CHUNK**

Otherwise, returns **NULL**.

**Syntax**

```sql
MEMBER FUNCTION GET_LOB_OPERATION_SIZE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2)
RETURN NUMBER,
```

**Parameters**

**Table 286-19**  GET_LOB_OPERATION_SIZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column</td>
</tr>
<tr>
<td></td>
<td>Currently, only <strong>new</strong> can be specified.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

**GET_LONG_INFORMATION** Member Function

Gets the **LONG** information for the column.

The return value can be one of the following:

- **DBMS_LCR.NOT_A_LONG**  CONSTANT NUMBER := 1;
- **DBMS_LCR.NULL_LONG**  CONSTANT NUMBER := 2;
- **DBMS_LCR.INLINE_LONG**  CONSTANT NUMBER := 3;
- **DBMS_LCR.LONG_CHUNK**  CONSTANT NUMBER := 4;
- **DBMS_LCR.LAST_LONG_CHUNK**  CONSTANT NUMBER := 5;

Returns **NULL** if the specified column does not exist.

If the command type of the row LCR is **UPDATE**, then specifying 'Y' for the **use_old** parameter is a convenient way to get the value of the columns.

**Syntax**

```sql
MEMBER FUNCTION GET_LONG_INFORMATION(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN NUMBER;
```

**Parameters**

**Table 286-20**  GET_LONG_INFORMATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to return for the column, either old or new</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
</tbody>
</table>
Table 286-20  (Cont.) GET_LONG_INFORMATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, and no new value exists, then the function returns the corresponding old value. If N and value_type is new, then the function does not return the old value if no new value exists. If value_type is old or if the command_type of the row LCR is not UPDATE, then the function ignores the value of the use_old parameter. NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

GET_ROW_TEXT Member Procedure

Gets the SQL statement for the change that is encapsulated in the row LCR. This method performs SQL generation in PL/SQL.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

The following procedure returns the SQL statement in a CLOB datatype.

MEMBER PROCEDURE GET_ROW_TEXT(
  row_text  IN/OUT  CLOB);

The following procedure returns the SQL statement with bind variables in a CLOB datatype.

MEMBER PROCEDURE GET_ROW_TEXT(
  row_text       IN/OUT  CLOB,
  variable_list  IN/OUT  LCR$_ROW_LIST,
  bind_var_syntax IN      VARCHAR2  DEFAULT ':');

<td>• Specify ? for bind values to be in the form ?.</td>
</tr>
</tbody>
</table>

GET_VALUE Member Function

Gets the old or new value for the specified column, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the value of a column.

Syntax

MEMBER FUNCTION GET_VALUE(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    use_old      IN  VARCHAR2  DEFAULT 'Y')
RETURN ANYDATA;

Parameters

<td>NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

GET_VALUES Member Function

Gets a list of old or new values, depending on the value type specified.

If the command type of the row LCR is UPDATE, then specifying 'Y' for the use_old parameter is a convenient way to get the values of all columns.
Syntax

MEMBER FUNCTION GET_VALUES(
    value_type  IN  VARCHAR2,
    use_old     IN  VARCHAR2  DEFAULT 'Y')
RETURN SYS.LCR$_ROW_LIST;

Parameters

Table 286-23  GET_VALUES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of values to return</td>
</tr>
<tr>
<td></td>
<td>Specify old to return a list of old values. Specify new to return a</td>
</tr>
<tr>
<td></td>
<td>list of new values.</td>
</tr>
<tr>
<td>use_old</td>
<td>If Y and value_type is new, then the function returns a list of all</td>
</tr>
<tr>
<td></td>
<td>new values in the LCR. If a new value does not exist in the list,</td>
</tr>
<tr>
<td></td>
<td>then the function returns the corresponding old value. Therefore,</td>
</tr>
<tr>
<td></td>
<td>the returned list contains all existing new values and the old values</td>
</tr>
<tr>
<td></td>
<td>where there are no new values.</td>
</tr>
<tr>
<td></td>
<td>If N and value_type is new, then the function returns a list of all</td>
</tr>
<tr>
<td></td>
<td>new values in the LCR without returning any old values.</td>
</tr>
<tr>
<td></td>
<td>If value_type is old or if the command_type of the row LCR is not UPDATE,</td>
</tr>
<tr>
<td></td>
<td>then the function ignores the value of the use_old parameter.</td>
</tr>
<tr>
<td></td>
<td>NULL is not a valid specification for the use_old parameter.</td>
</tr>
</tbody>
</table>

GET_WHERE_CLAUSE Member Procedure

Gets a WHERE clause for the change that is encapsulated in the row LCR.

Use the WHERE clause returned by GET_WHERE_CLAUSE instead of using the ROWID, because the ROWID is not ANSI compatible. The generated WHERE clause might not match the WHERE clause in the original DML operation.

The ROWID of an INSERT statement is the ROWID of the new row created by the INSERT. The WHERE clause generated for an INSERT operation identifies the new row. Therefore, the generated WHERE clause includes all of the new values inserted.

For example, consider the following insert into the hr.departments table:

```sql
INSERT INTO hr.departments (
    department_id, department_name, manager_id, location_id)
VALUES (10, 'HR', 20, 40);
```

The generated WHERE clause represents the row with the values 10, 'HR', 20, and 40. Hence, the generated WHERE clause is the following:

```sql
WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'HR' AND
     "MANAGER_ID" = 20 AND "LOCATION_ID" = 40
```

The ROWID of an UPDATE statement is the ROWID of the row that was updated. The WHERE clause generated for an UPDATE operation identifies the row after the UPDATE executes. The generated WHERE clause is based on the old and new values of the UPDATE.

For example, consider the following update to the hr.departments table:
UPDATE hr.departments SET department_name='Management'
WHERE department_name='Administration' AND location_id = 20 AND
    manager_id = 30 AND department_id = 10;

The values of the row after the UPDATE are 10, 'Management', 30, and 20. Hence, the
generated WHERE clause to identify the row is the following:

WHERE "DEPARTMENT_ID" = 10 AND "DEPARTMENT_NAME" = 'MANAGEMENT' AND
    "MANAGER_ID" = 30 AND "LOCATION_ID" = 20

Notice that the new value is used for "DEPARTMENT_NAME", because the new value is the
value of the column after the UPDATE. For the rest of the columns, the old values are
used.

The ROWID of a DELETE operation is the row that existed before it was deleted. The
generated WHERE clause consists of all the old column values present in the DELETE
operation.

LOB columns do not appear in generated WHERE clauses. The generated WHERE clause is
not affected by the presence of LOB columns in the LCR.

This method is overloaded. The different functionality of each form of syntax is
presented along with the definitions.

Syntax

The following procedure returns the WHERE clause of a SQL statement in a CLOB
datatype.

MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause  IN/OUT  CLOB);

The following procedure returns the WHERE clause of a SQL statement with bind
variables in a CLOB datatype.

MEMBER PROCEDURE GET_WHERE_CLAUSE(
    where_clause IN/OUT  CLOB,
    variable_list IN/OUT  LCR$_ROW_LIST,
    bind_var_syntax IN      VARCHAR2  DEFAULT ':');

See Also:
- LCR$_ROW_LIST Type

</tr>
<tr>
<td></td>
<td>• Specify ? for bind values to be in the form ?.</td>
</tr>
</tbody>
</table>

GET_XML_INFORMATION Member Function

Gets the XML information for the specified column.

The return value can be one of the following:

- DBMS_LCR.NOT_XML indicates that the column is not an XMLType column.
- DBMS_LCR.XML_DOC indicates that the column contains an XML document.
- DBMS_LCR.XML_DIFF indicates that the column contains an XML document that describes a change made by an update operation. This XML document describes the differences in the column's XML document. The entire XML document is not replaced.
- DBMS_LCR.XML_DIFF indicates that the column contains differences between old and new XML documents for an update operation.

Returns NULL if the specified column does not exist.

Syntax

MEMBER FUNCTION GET_XML_INFORMATION(
    column_name  IN  VARCHAR2)
RETURN NUMBER;

Parameter

dbms_lcr.xml

Table 286-25  GET_XML_INFORMATION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
</tbody>
</table>

IS_STATEMENT_LCR Member Function

This function is reserved for internal use only.

KEEP_COLUMNS Member Procedure

This procedure keeps a list of columns in a row LCR. The procedure deletes columns that are not in the list from the row LCR.
Syntax

MEMBER PROCEDURE KEEP_COLUMNS(
    column_list  IN  VARCHAR2,
    value_type   IN  VARCHAR2  DEFAULT '*');

Parameters

Table 286-26  KEEP_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_list</td>
<td>The names of the columns kept for the row LCR. Specify a comma-delimited list of type VARCHAR2. This procedure removes columns that are not in the list from the current row LCR.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to keep the columns. Specify old to keep the old values of the columns. An error is raised if the old values do not exist in the LCR. Specify new to keep the new values of the columns. An error is raised if the new values do not exist in the LCR. If * is specified, then the procedure keeps both the old and the new columns.</td>
</tr>
</tbody>
</table>

RENAME_COLUMN Member Procedure

Renames a column in a row LCR.

Syntax

MEMBER PROCEDURE RENAME_COLUMN(
    from_column_name  IN  VARCHAR2,
    to_column_name    IN  VARCHAR2,
    value_type        IN  VARCHAR2  DEFAULT '*');

Parameters

Table 286-27  RENAME_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>from_column_name</td>
<td>The existing column name</td>
</tr>
<tr>
<td>to_column_name</td>
<td>The new column name. An error is raised if a column with the specified name already exists.</td>
</tr>
<tr>
<td>value_type</td>
<td>The type of value for which to rename the column. Specify old to rename the old value of the column. An error is raised if the old value does not exist in the LCR. Specify new to rename the new value of the column. An error is raised if the new value does not exist in the LCR. If * is specified, then the procedure renames the column names for both old and new value. The procedure raises an error if either column value does not exist in the LCR.</td>
</tr>
</tbody>
</table>
SET_LOB_INFORMATION Member Procedure

Sets LOB information for the column.

**Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

**Syntax**

```sql
MEMBER PROCEDURE SET_LOB_INFORMATION(
  value_type       IN  VARCHAR2,
  column_name      IN  VARCHAR2,
  lob_information  IN  NUMBER);
```

**Parameters**

**Table 286-28 SET_LOB_INFORMATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column, either old or new</td>
</tr>
<tr>
<td></td>
<td>Specify old only if lob_information is set to DBMS_LCR.NOT_A_LOB.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column.</td>
</tr>
<tr>
<td></td>
<td>An exception is raised if the column value does not exist. You must set</td>
</tr>
<tr>
<td></td>
<td>this parameter for non-LOB columns.</td>
</tr>
<tr>
<td>lob_information</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.NULL_LOB constant NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.INLINE_LOB constant NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.EMPTY_LOB constant NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LOB_CHUNK constant NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>DBMS_LCR.LAST_LOB_CHUNK constant NUMBER := 6;</td>
</tr>
</tbody>
</table>

SET_LOB_OFFSET Member Procedure

Sets the LOB offset for the specified column in the number of characters for CLOB columns and the number of bytes for BLOB columns.

**Note:**

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.
Syntax

```plsql
MEMBER PROCEDURE SET_LOB_OFFSET(
    value_type   IN  VARCHAR2,
    column_name  IN  VARCHAR2,
    lob_offset   IN  NUMBER);
```

Parameters

Table 286-29  SET_LOB_OFFSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column</td>
</tr>
<tr>
<td>column_name</td>
<td>The column name</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset number</td>
</tr>
</tbody>
</table>

Note:

When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure.

Syntax

```plsql
MEMBER PROCEDURE SET_LOB_OPERATION_SIZE(
    value_type          IN  VARCHAR2,
    column_name         IN  VARCHAR2,
    lob_operation_size  IN  NUMBER);
```

Parameters

Table 286-30  SET_LOB_OPERATION_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value_type</td>
<td>The type of value to set for the column</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the LOB column</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is or will be DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE. Otherwise, set to NULL.</td>
</tr>
</tbody>
</table>

SET_ROW_TEXT Member Procedure

This procedure is reserved for internal use only.

SET_VALUE Member Procedure

Overwrites the old or new value of the specified column.

One reason to overwrite an old value for a column is to resolve an error that resulted from a conflict.

Note:
To add a column to a row LCR, run ADD_COLUMN.

See Also:
ADD_COLUMN Member Procedure

Considerations for LOB Columns

When processing a row LCR with LOB columns with a procedure DML handler or error handler, and the handler is using LOB assembly (the assemble_lobs parameter is set to TRUE for the handler), you can use this member procedure in the handler procedure on a LOB column in a row LCR. If assemble_lobs is set to FALSE for the handler, then you cannot use this member procedure on a LOB column.

To use a DML or error handler to set the value of a LOB column, specify the LOB locator for the column_value parameter in the member procedure. The SET_VALUE member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.
If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB is represented by the original (nonassembled) row LCRs.

**Note:**

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on a LOB column.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on a `LONG` or `LONG RAW` column.

**Considerations for XMLType Columns**

When processing a row LCR with `XMLType` columns with a procedure DML handler or error handler, any `XMLType` columns and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more `XMLType` columns.

To use a DML or error handler to set the value an `XMLType` column, specify the `XMLType` for the `column_value` parameter. The `SET_VALUE` member procedure verifies that an `ANYDATA` encapsulated `XMLType` is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an `ANYDATA` encapsulated `XMLType`.
- An attempt is made to set a `XMLType` column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the `XMLType` column is represented by the original (nonassembled) row LCRs.

**Note:**

- Database compatibility must be 11.1.0 or higher to process row LCRs with `XMLType` columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on `XMLType` columns.

**Syntax**

```sql
MEMBER PROCEDURE SET_VALUE(
  value_type    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  column_value  IN  ANYDATA);
```
Parameters

Table 286-31 SET_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| value_type  | The type of value to set  
Specify old to set the old value of the column. Specify new to set the new value of the column. |
| column_name | The column name  
An error is raised if the specified column_value does not exist in the LCR for the specified column_type. |
| column_value| The new value of the column  
If NULL is specified, then this procedure raises an error. To set the value to NULL, encapsulate the NULL in an ANYDATA instance.  
If the member procedure is used in a procedure DML handler or error handler that uses LOB assembly, then specify a LOB locator for LOB columns. |

SET_VALUES Member Procedure

Replaces all old values or all new values for the LCR, depending on the value type specified.

Considerations for LOB Columns

You can use this procedure when processing a row LCR with LOB columns with a procedure DML handler or error handler. If the handler is using LOB assembly (the assemble_lob parameter is set to TRUE for the handler), then you can use this member procedure in the handler procedure. If assemble_lob is set to FALSE for the handler, then you cannot use this member procedure on a row LCR.

To use a DML or error handler to set the value of one or more LOB columns in a row LCR, specify a LOB locator for each LOB column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated LOB locator is processed with a DML or error handler that is using LOB assembly. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated LOB locator.
- An attempt is made to set a LOB column incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the LOB columns are represented by the original (nonassembled) row LCRs.
Note:

- Database compatibility must be 10.2.0 or higher to use LOB assembly.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on LOB columns.
- When you are processing a row LCR with a rule-based transformation, procedure DML handler, or error handler, you cannot use this member procedure on LONG or LONG RAW columns.

Considerations for XMLType Columns

When processing a row LCR with XMLType columns with a procedure DML handler or error handler, any XMLType and LOB columns in the LCR are always assembled using LOB assembly. You can use this member procedure in the handler procedure on a row LCR that contains one or more XMLType columns.

To use a DML or error handler to set the value of one or more XMLType columns in a row LCR, specify an XMLType for each XMLType column in the value_list parameter. The SET_VALUES member procedure verifies that an ANYDATA encapsulated XMLType is processed with a DML or error handler. An error is raised under the following conditions:

- The handler attempts to enqueue a row LCR with an ANYDATA encapsulated XMLType.
- An attempt is made to set a XMLType incorrectly.

If an error is raised because of one of these conditions, then the transaction that includes the row LCR is moved to the error queue, and the XMLType columns are represented by the original (nonassembled) row LCRs.

Note:

- Database compatibility must be 11.1.0 or higher to process row LCRs with XMLType columns.
- When you are processing a row LCR with a rule-based transformation, you cannot use this member procedure on XMLType columns.

Syntax

```sql
MEMBER PROCEDURE SET_VALUES(
    value_type  IN  VARCHAR2,
    value_list  IN  SYS.LCR$_ROW_LIST);
```
Parameters

### GET_COMMAND_TYPE Member Function

Gets the command type of the LCR.

**See Also:**

The "SQL Command Codes" table in the *Oracle Call Interface Programmer’s Guide* for a complete list of command types

**Syntax**

```sql
MEMBER FUNCTION GET_COMMAND_TYPE() RETURN VARCHAR2;
```

### GET_COMMIT_SCN Member Function

Gets the commit system change number (SCN) of the transaction to which the current LCR belongs.

The commit SCN for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit SCN might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit SCN. If the commit SCN is not available for an LCR, then this function returns `NULL`.  

---

**Oracle**

286-36
Syntax

MEMBER FUNCTION GET_COMMIT_SCN()
RETURN NUMBER;

GET_COMMIT_SCN_FROM_POSITION Static Function

Gets the commit system change number (SCN) of a transaction from the input position, which is generated by an XStream outbound server.

Syntax

STATIC FUNCTION GET_COMMIT_SCN_FROM_POSITION(
    position  IN  RAW
) RETURN NUMBER;

Parameters

Table 286-35  GET_COMMIT_SCN_FROM_POSITION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>The position</td>
</tr>
<tr>
<td></td>
<td>You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

GET_COMMIT_TIME

Gets the commit time of the transaction to which the current LCR belongs.

The commit time for a transaction is available only during apply or during error transaction execution. This function can be used only in a procedure DML handler, DDL handler, or error handler.

The commit time might not be available for an LCR that is part of an incomplete transaction. For example, persistent LCRs might not have a commit time. If the commit time is not available for an LCR, then this function returns NULL.

Syntax

MEMBER FUNCTION GET_COMMIT_TIME()
RETURN DATE;

GET_COMPATIBLE Member Function

Gets the minimal database compatibility required to support the LCR. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

The return value for this function can be one of the following:
Return Value | COMPATIBLE Initialization Parameter Equivalent
--- | ---
DBMS_STREAMS.COMPATIBLE_9_2 | 9.2.0
DBMS_STREAMS.COMPATIBLE_10_1 | 10.1.0
DBMS_STREAMS.COMPATIBLE_10_2 | 10.2.0
DBMS_STREAMS.COMPATIBLE_11_1 | 11.1.0
DBMS_STREAMS.COMPATIBLE_11_2 | 11.2.0

DDL LCRs always return DBMS_STREAMS.COMPATIBLE_9_2.

You can use the following functions in the DBMS_STREAMS package for constant compatibility return values:

- The COMPATIBLE_9_2 function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.
- The COMPATIBLE_10_1 function returns DBMS_STREAMS.COMPATIBLE_10_1 constant.
- The COMPATIBLE_10_2 function returns DBMS_STREAMS.COMPATIBLE_10_2 constant.
- The COMPATIBLE_11_1 function returns DBMS_STREAMS.COMPATIBLE_11_1 constant.
- The COMPATIBLE_11_2 function returns DBMS_STREAMS.COMPATIBLE_11_2 constant.
- The MAX_COMPATIBLE function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

You can use these functions with the GET_COMPATIBLE member function for an LCR in rule conditions and apply handlers.

**Note:**

You can determine which database objects in a database are not supported by Oracle Streams by querying the DBA_STREAMS_UNSUPPORTED data dictionary view.

**See Also:**

- Oracle Streams Concepts and Administration for examples of rules that discard changes that are not supported by Oracle Streams
- DBMS_STREAMS and DBMS_STREAMS_ADM
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

**Syntax**

MEMBER FUNCTION GET_COMPATIBLE()
RETURN NUMBER;
GET_EXTRA_ATTRIBUTE Member Function

Gets the value for the specified extra attribute in the LCR. The returned extra attribute is contained within an ANYDATA instance. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also:

INCLUDE_EXTRA_ATTRIBUTE Procedure

Syntax

MEMBER FUNCTION GET_EXTRA_ATTRIBUTE(
    attribute_name  IN  VARCHAR2)
RETURN ANYDATA;

Parameters

Table 286-36  GET_EXTRA_ATTRIBUTE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>The name of the extra attribute to return</td>
</tr>
<tr>
<td></td>
<td>Valid names are:</td>
</tr>
<tr>
<td></td>
<td>• row_id</td>
</tr>
<tr>
<td></td>
<td>The rowid of the row changed in a row LCR. This attribute is not included</td>
</tr>
<tr>
<td></td>
<td>in DDL LCRs, nor in row LCRs for index-organized tables. The type is UROWID.</td>
</tr>
<tr>
<td></td>
<td>• serial#</td>
</tr>
<tr>
<td></td>
<td>The serial number of the session that performed the change captured in</td>
</tr>
<tr>
<td></td>
<td>the LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• session#</td>
</tr>
<tr>
<td></td>
<td>The identifier of the session that performed the change captured in the</td>
</tr>
<tr>
<td></td>
<td>LCR. The type is NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• thread#</td>
</tr>
<tr>
<td></td>
<td>The thread number of the instance in which the change captured in the</td>
</tr>
<tr>
<td></td>
<td>LCR was performed. Typically, the thread number is relevant only in an</td>
</tr>
<tr>
<td></td>
<td>Oracle Real Application Clusters (Oracle RAC) environment. The type is</td>
</tr>
<tr>
<td></td>
<td>NUMBER.</td>
</tr>
<tr>
<td></td>
<td>• tx_name</td>
</tr>
<tr>
<td></td>
<td>The name of the transaction that includes the LCR. The type is VARCHAR2.</td>
</tr>
<tr>
<td></td>
<td>• username</td>
</tr>
<tr>
<td></td>
<td>The name of the current user who performed the change captured in the</td>
</tr>
<tr>
<td></td>
<td>LCR. The type is VARCHAR2.</td>
</tr>
</tbody>
</table>

An error is raised if the specified attribute_name is not valid. If no value exists for the specified extra attribute, then the function returns a NULL.

See Also: Oracle Database PL/SQL Language Reference for more information about the current user.
GET_OBJECT_NAME Member Function

Gets the name of the object that is changed by the LCR.

Syntax

MEMBER FUNCTION GET_OBJECT_NAME()
RETURN VARCHAR2;

GET_OBJECT_OWNER Member Function

Gets the owner of the object that is changed by the LCR.

Syntax

MEMBER FUNCTION GET_OBJECT_OWNER()
RETURN VARCHAR2;

GET_POSITION Member Function

Gets the position of the current LCR. The position uniquely identifies each LCR. The position strictly increases within each transaction and across transactions.

LCR position is commonly used in XStream configurations.

Syntax

MEMBER FUNCTION GET_POSITION()
RETURN RAW;

Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

GET_ROOT_NAME Member Function

Gets the global name of the root in a CDB, which is the root name for the LCR.

Syntax

MEMBER FUNCTION GET_ROOT_NAME()
RETURN VARCHAR2;

GET_SCN Member Function

Gets the system change number (SCN) of the LCR.

Syntax

MEMBER FUNCTION GET_SCN()
RETURN NUMBER;

GET_SCN_FROM_POSITION Static Function

Gets the system change number (SCN) from the input position, which is generated by an XStream outbound server.
Syntax

STATIC FUNCTION GET_SCN_FROM_POSITION(
    position IN RAW)
RETURN NUMBER;

Parameters

Table 286-37  GET_SCN_FROM_POSITION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>position</td>
<td>The position You can obtain the position by using the GET_POSITION member function or by querying the DBA_XSTREAM_OUTBOUND_PROGRESS data dictionary view.</td>
</tr>
</tbody>
</table>

Note:

Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

GET_SOURCE_DATABASE_NAME Member Function

Gets the global name of the source database. The source database is the database where the change occurred.

Syntax

MEMBER FUNCTION GET_SOURCE_DATABASE_NAME()
RETURN VARCHAR2;

GET_SOURCE_TIME Member Function

Gets the time when the change in an LCR captured by a capture process was generated in the redo log of the source database, or the time when a persistent LCR was created.

Syntax

MEMBER FUNCTION GET_SOURCE_TIME()
RETURN DATE;

GET_TAG Member Function

Gets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the DML or DDL change when apply forwarding is used.
See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```java
MEMBER FUNCTION GET_TAG()
RETURN RAW;
```

#### GET_THREAD_NUMBER Member Function

Gets the thread number of the database instance that made the change that is encapsulated in the LCR. Typically, the thread number is relevant in an Oracle Real Application Clusters configuration.

See Also:

*Oracle Real Application Clusters Administration and Deployment Guide*

### Syntax

```java
MEMBER FUNCTION GET_THREAD_NUMBER()
RETURN NUMBER;
```

#### GET_TRANSACTION_ID Member Function

Gets the transaction identifier of the LCR.

### Syntax

```java
MEMBER FUNCTION GET_TRANSACTION_ID()
RETURN VARCHAR2;
```

#### IS_NULL_TAG Member Function

Returns `Y` if the tag for the LCR is `NULL`, or returns `N` if the tag for the LCR is not `NULL`.

See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

### Syntax

```java
MEMBER FUNCTION IS_NULL_TAG()
RETURN VARCHAR2;
```
SET_COMMAND_TYPE Member Procedure

Sets the command type in the LCR. If the command type specified cannot be interpreted, then this procedure raises an error. For example, changing INSERT to GRANT would raise an error.

See Also:
- The description of the command_type parameter in LCR$_DDL_RECORD Constructor Function Parameters
- The description of the command_type parameter in LCR$_ROW_RECORD Type
- The "SQL Command Codes" table in the Oracle Call Interface Programmer's Guide for a complete list of command types

Syntax

MEMBER PROCEDURE SET_COMMAND_TYPE(
    command_type  IN  VARCHAR2);

Parameter

Table 286-38  SET_COMMAND_TYPE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>command_type</td>
<td>The command type</td>
</tr>
<tr>
<td></td>
<td>Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>

SET_EXTRA_ATTRIBUTE Member Procedure

Sets the value for the specified extra attribute in the LCR. You can use the INCLUDE_EXTRA_ATTRIBUTE procedure in the DBMS_CAPTURE_ADM package to instruct a capture process to capture one or more extra attributes.

See Also:

INCLUDE_EXTRA_ATTRIBUTE Procedure

Syntax

MEMBER PROCEDURE SET_EXTRA_ATTRIBUTE(
    attribute_name   IN  VARCHAR2,
    attribute_value  IN  ANYDATA);
Parameters

Table 286-39  SET_EXTRA_ATTRIBUTE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| attribute_name | The name of the extra attribute to set  
   Valid names are:  
   - row_id  
     The rowid of the row changed in a row LCR. This attribute is not included in DDL LCRs, nor in row LCRs for index-organized tables. The type is VARCHAR2.  
   - serial#  
     The serial number of the session that performed the change captured in the LCR. The type is NUMBER.  
   - session#  
     The identifier of the session that performed the change captured in the LCR. The type is NUMBER.  
   - thread#  
     The thread number of the instance in which the change captured in the LCR was performed. Typically, the thread number is relevant only in an Oracle Real Application Clusters (Oracle RAC) environment. The type is NUMBER.  
   - tx_name  
     The name of the transaction that includes the LCR. The type is VARCHAR2.  
   - username  
     The name of the current user who performed the change captured in the LCR. The type is VARCHAR2.  
An error is raised if the specified attribute_name is not valid.  
See Also: Oracle Database PL/SQL Language Reference for more information about the current user |
| attribute_value | The value to which the specified extra attribute is set  
   If set to NULL, then this procedure removes the specified extra attribute from the LCR. To set to NULL, encapsulate the NULL in an ANYDATA instance. |

SET_OBJECT_NAME Member Procedure

Sets the name of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_OBJECT_NAME(  
   object_name IN VARCHAR2);  

Parameter

Table 286-40  SET_OBJECT_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the object</td>
</tr>
</tbody>
</table>
SET_OBJECT_OWNER Member Procedure
Sets the owner of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_OBJECT_OWNER(
    object_owner IN VARCHAR2);

Parameter

Table 286-41 SET_OBJECT_OWNER Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema that contains the object</td>
</tr>
</tbody>
</table>

SET_ROOT_NAME Member Procedure
Sets the global name of the root in a CDB. The setting is the root name for the LCR.

Syntax

MEMBER PROCEDURE SET_ROOT_NAME(
    root_name IN VARCHAR2);

Parameter

Table 286-42 SET_ROOT_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>root_name</td>
<td>The global name of the root</td>
</tr>
</tbody>
</table>

SET_SOURCE_DATABASE_NAME Member Procedure
Sets the source database name of the object that is changed by the LCR.

Syntax

MEMBER PROCEDURE SET_SOURCE_DATABASE_NAME(
    source_database_name IN VARCHAR2);

Parameter

Table 286-43 SET_SOURCE_DATABASE_NAME Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_database_name</td>
<td>The source database of the change</td>
</tr>
<tr>
<td></td>
<td>If you do not include the domain name, then the procedure</td>
</tr>
<tr>
<td></td>
<td>appends the local domain to the database name automatically.</td>
</tr>
<tr>
<td></td>
<td>For example, if you specify DBS1 and the local domain is</td>
</tr>
<tr>
<td></td>
<td>EXAMPLE.COM, then the procedure specifies DBS1.EXAMPLE.COM</td>
</tr>
<tr>
<td></td>
<td>automatically. Set this parameter to a non-NULL value.</td>
</tr>
</tbody>
</table>
SET_TAG Member Procedure

Sets the tag for the LCR. An LCR tag is a binary tag that enables tracking of the LCR. For example, this tag can be used to determine the original source database of the change when apply forwarding is used.

See Also:

Oracle Streams Replication Administrator's Guide for more information about tags

Syntax

MEMBER PROCEDURE SET_TAG(
    tag IN RAW);

Parameter

Table 286-44  SET_TAG Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for the LCR</td>
</tr>
<tr>
<td></td>
<td>The size limit for a tag value is two kilobytes.</td>
</tr>
</tbody>
</table>

286.3.4 LCR$_ROW_LIST Type

This type identifies a list of column values for a row in a table.

It uses the LCR$_ROW_UNIT type and is used in the LCR$_ROW_RECORD type.

See Also:

- LCR$_ROW_UNIT Type
- LCR$_ROW_RECORD Type

Syntax

CREATE TYPE SYS.LCR$_ROW_LIST AS TABLE OF SYS.LCR$_ROW_UNIT
/

286.3.5 LCR$_ROW_UNIT Type

This type identifies the value for a column in a row.

It is used in the LCR$_ROW_LIST type.
**LCR$_ROW_LIST Type**

**Syntax**

```
CREATE TYPE LCR$_ROW_UNIT AS OBJECT(
  column_name          VARCHAR2(4000),
  data                 ANYDATA,
  lob_information      NUMBER,
  lob_offset           NUMBER,
  lob_operation_size   NUMBER,
  long_information     NUMBER);
/
```

**Attributes**

**Table 286-45  LCR$_ROW_UNIT Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_name</td>
<td>The name of the column</td>
</tr>
<tr>
<td>data</td>
<td>The data contained in the column</td>
</tr>
<tr>
<td>lob_information</td>
<td>Contains the LOB information for the column and contains one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.NOT_A_LOB CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.NULL_LOB CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.INLINE_LOB CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.EMPTY_LOB CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.LOB_CHUNK CONSTANT NUMBER := 5;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.LAST_LOB_CHUNK CONSTANT NUMBER := 6;</td>
</tr>
<tr>
<td>lob_offset</td>
<td>The LOB offset specified in the number of characters for CLOB columns and the number of bytes for BLOB columns</td>
</tr>
<tr>
<td></td>
<td>Valid values are NULL or a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
<tr>
<td>lob_operation_size</td>
<td>If lob_information for the LOB is DBMS_LCR.LAST_LOB_CHUNK, then this parameter can be set to either a valid LOB ERASE value or a valid LOB TRIM value. A LOB ERASE value must be a positive integer less than or equal to DBMS_LOB.LOBMAXSIZE. A LOB TRIM value must be a nonnegative integer less than or equal to DBMS_LOB.LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>If lob_information is not DBMS_LCR.LAST_LOB_CHUNK and for all other operations, is NULL.</td>
</tr>
<tr>
<td>long_information</td>
<td>Contains the LONG information for the column and contains one of the following values:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.not_a_long CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.null_long CONSTANT NUMBER := 2;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.inline_long CONSTANT NUMBER := 3;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.long_chunk CONSTANT NUMBER := 4;</td>
</tr>
<tr>
<td></td>
<td>- DBMS_LCR.last_long_chunk CONSTANT NUMBER := 5;</td>
</tr>
</tbody>
</table>
Oracle Multimedia ORDAudio TYPE

The Oracle Multimedia ORDAudio object type supports the storage and management of audio data.

Audio data can have different formats, encoding types, compression types, numbers of channels, sampling rates, sample sizes, and playing times (duration) depending upon how the audio data is digitally recorded. Oracle Multimedia ORDAudio can store and retrieve audio data of any data format. Oracle Multimedia ORDAudio can extract metadata from audio data of a variety of popular audio formats. Oracle Multimedia ORDAudio can also extract application attributes and store them in the comments attribute of the object in XML form.

For a complete description of this type within the context of Oracle Multimedia, see ORDAudio in the Oracle Multimedia Reference.
Oracle Multimedia ORDDicom TYPE

The Oracle Multimedia ORDDicom object type supports the storage, management, and manipulation of Digital Imaging and Communications in Medicine (DICOM) data.

Note:

Oracle Multimedia ORDDicom is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The DICOM standard is the dominant standard for radiology imaging and communication, to which all major manufacturers of radiological devices must conform. Oracle Multimedia DICOM provides native support for DICOM format medical images and other objects. These include objects such as single frame and multiframe images, waveforms, slices of 3-D volumes, video segments, and structured reports.

Oracle Multimedia ORDDicom provides methods to extract standard and private DICOM metadata from DICOM content into customizable XML documents, to perform image processing operations such as format conversion and thumbnail image generation, and to create new DICOM objects. Oracle Multimedia ORDDicom also provides methods to check DICOM objects for conformance based on a set of user-specified conformance rules, and to make DICOM objects anonymous based on user-defined rules that specify the set of attributes to be made anonymous and the actions to be taken to make those attributes anonymous.

For a complete description of this type within the context of Oracle Multimedia, see ORDDicom in the Oracle Multimedia DICOM Developer's Guide.
The Oracle Multimedia ORDDoc object type supports the storage and management of heterogeneous media data including image, audio, and video.

Heterogeneous media data can have different formats depending upon the application generating the media data. Oracle Multimedia can store and retrieve media data of any data format. Oracle Multimedia ORDDoc datatype can be used in applications that require you to store different types of heterogeneous media data in the same column so you can build a common metadata index on all the different types of media data. Using this index, you can search across all the different types of heterogeneous media data. However, you cannot use this same search technique if the different types of heterogeneous media data are stored in different types of objects in different columns of relational tables.

For a complete description of this type within the context of Oracle Multimedia, see ORDDoc in the Oracle Multimedia Reference.
The Oracle Multimedia ORDImage object type supports the storage, management, and manipulation of image data.

Digitized images consist of the image data (digitized bits) and attributes that describe and characterize the image data.

The image data (pixels) can have varying depths (bits for each pixel) depending on how the image was captured, and can be organized in various ways. The organization of the image data is known as the data format. Oracle Multimedia ORDImage can store and retrieve image data of any data format. Oracle Multimedia ORDImage can process (cut, scale, and generate thumbnails) of images, convert the format of images, extract properties of images of a variety of popular data formats, and extract and embed application metadata in images.

For a complete description of this type within the context of Oracle Multimedia, see ORDImage in the Oracle Multimedia Reference.
Oracle Multimedia provides support for the SQL/MM Still Image Standard, which supports the storage, retrieval, and modification of images in the database and the ability to locate images using visual predicates.

**Note:**

SQL/MM Still Image is deprecated in Oracle Database 12c Release 2 (12.2). Oracle recommends that you do not use deprecated features. Support for deprecated features is for backward compatibility only.

The following object relational types for images and image characteristics are included in this support:

- SI_AverageColor
- SI_Color
- SI_ColorHistogram
- SI_FeatureList
- SI_PositionalColor
- SI_StillImage
- SI_Texture

For a complete description of this type within the context of Oracle Multimedia, see SQL/MM Still Image in the Oracle Multimedia Reference.
The Oracle Multimedia ORDVideo object type supports the storage and management of video data.

Digitized video consists of the video data (digitized bits) and the attributes that describe and characterize the video data. Video applications sometimes associate application-specific information, such as the description of the video training tape, date recorded, instructor's name, producer's name, and so on, within the video data.

The video data can have different formats, compression types, frame rates, frame sizes, frame resolutions, playing times, compression types, number of colors, and bit rates depending upon how the video data was digitally recorded. Oracle Multimedia ORDVideo can store and retrieve video data of any data format. Oracle Multimedia ORDVideo can extract metadata from video data of a variety of popular video formats. Oracle Multimedia ORDVideo can also extract application attributes and store them in the comments attribute of the object in XML form.

For a complete description of this type within the context of Oracle Multimedia, see ORDVideo in the Oracle Multimedia Reference.
MGD_ID Package Types

The MGD_ID package provides an extensible framework that supports current radio-frequency ID (RFID) tags with the standard family of EPC bit encodings for the supported encoding types. The MGD_ID Package also supports new and evolving tag encodings that are not included in the current EPC standard (EPC v1.1 specification).

The MGD_ID package contains several predefined types.

See Also:
Oracle Database Development Guide for more information.

This chapter contains the following topics:

- Security Model
- Summary of Types
- Summary of MGD_ID Subprograms

The method described in this reference chapter show examples based on the examples shown in the constructor functions.

The examples in this chapter assume that you have run the following set of commands before running the contents of each script:

```
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by mgduser;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser
Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

293.1 MGD_ID Package Types Security Model

You must run the catmgd.sql script to load the DBMS_MGD_ID_UTL package and create the required Identity Code Package schema objects in the MGDSYS schema.

MGD_ID is a MGDSYS-owned object type. Any MGD_ID subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the MGD_ID object type and its subprograms.

EXECUTE privilege is granted to PUBLIC for this ADT: MGD_ID.

A public synonym, by the same name, is created for this ADT: MGD_ID.
293.2 Summary of Types

This table lists and briefly describes the MGD_ID Package object types.

Table 293-1  MGD_ID Package Object Types

<table>
<thead>
<tr>
<th>Object Type Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGD_ID_COMPONENT Object Type</td>
<td>Datatype that specifies the name and value pair attributes that define a component</td>
</tr>
<tr>
<td>MGD_ID_COMPONENT_VARRAY Object Type</td>
<td>Datatype that specifies a list of up to 128 components as name-value attribute pairs used in two constructor functions for creating an identity code type object</td>
</tr>
<tr>
<td>MGD_ID Object Type</td>
<td>Represents an MGD_ID object that specifies the category identifier for the code category for this identity code and its list of components</td>
</tr>
</tbody>
</table>

293.2.1 MGD_ID_COMPONENT Object Type

The MGD_ID_COMPONENT type is a datatype that specifies the name and value pair attributes that define a component.

Syntax

```sql
MGD_ID_COMPONENT as object (name VARCHAR2(256),
value VARCHAR2(1024));
```

Attributes

Table 293-2  MGD_ID_COMPONENT Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of component</td>
</tr>
<tr>
<td>value</td>
<td>Value of the component as a character</td>
</tr>
</tbody>
</table>

Examples

See the MGD_ID Constructor Function for an example.

293.2.2 MGD_ID_COMPONENT_VARRAY Object Type

The MGD_ID_COMPONENT_VARRAY type is a datatype that specifies a list of up to 128 components as name-value attribute pairs for use in two constructor functions for creating a product code type object with its list of components.

Syntax

```sql
MGD_ID_COMPONENT_VARRAY is VARRAY (128) of MGD_ID_COMPONENT;
```
Examples
See the **MGD_ID Constructor Function** for an example.

### 293.2.3 MGD_ID Object Type

The **MGD_ID** type represents an identity code in an RFID application. This type represents RFID tags with standard EPC bit encoding as well as tag encodings that are not included in the EPC standard.

#### Syntax

```
MGD_ID as object (category_id VARCHAR2(256),
                   components MGD_ID_COMPONENT_VARRAY);
```

#### Attributes

**Table 293-3  MGD_ID Object Type Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category identifier for the code category of this code</td>
</tr>
<tr>
<td>components</td>
<td>List of components as name-value attributes</td>
</tr>
</tbody>
</table>

#### Methods

**Table 293-5** describes the methods of the **MGD_ID** object type.

**Table 293-4  MGD_ID Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGD_ID constructor function</td>
<td>Creates an MGD_ID object based on the parameters passed in and returns self as a result</td>
</tr>
<tr>
<td>FORMAT function</td>
<td>Returns the string representation of the MGD_ID in the specified format</td>
</tr>
<tr>
<td>GET_COMPONENT function</td>
<td>Returns the string value of the specified MGD_ID component</td>
</tr>
<tr>
<td>TO_STRING function</td>
<td>Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object</td>
</tr>
<tr>
<td>TRANSLATE function</td>
<td>Returns the result of the conversion of the identifier from one format to the specified format</td>
</tr>
</tbody>
</table>

#### Examples

See the **Summary of MGD_ID Subprograms** section and the section about using the Identity Code package in Using the Identity Code Package in *Oracle Database Development Guide* for examples.
293.3 Summary of MGD_ID Subprograms

This table describes the subprograms in the MGD_ID object type. All the values and names passed to the procedures defined in the MGD_ID object type are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 293-5  MGD_ID Object Type Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MGD_ID Constructor Function</td>
<td>Creates an MGD_ID object based on the parameters passed in and returns self as a result</td>
</tr>
<tr>
<td>FORMAT Function</td>
<td>Returns the string representation of the MGD_ID object in the specified format</td>
</tr>
<tr>
<td>GET_COMPONENT Function</td>
<td>Returns the string value of the specified MGD_ID component</td>
</tr>
<tr>
<td>TO_STRING Function</td>
<td>Returns the string value of semicolon (;) separated component name value pairs of the MGD_ID object</td>
</tr>
<tr>
<td>TRANSLATE Function</td>
<td>Returns the result of the conversion of the identifier from one format to the specified format</td>
</tr>
</tbody>
</table>

293.3.1 MGD_ID Constructor Function

This constructor function constructs an identity code type object, MGD_ID. The constructor function is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Constructs an MGD_ID object type based on the category ID and a list of components.

```sql
MGD_ID (  
category_id      IN VARCHAR2,  
components       IN MGD_ID_COMPONENT_VARRAY)  
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category ID, the identifier string, and the list of additional parameters required to create it.

```sql
MGD_ID (  
category_id        VARCHAR2,  
identifier         VARCHAR2,  
parameter_list      VARCHAR2)  
RETURN SELF AS RESULT DETERMINISTIC;
```

Constructs an MGD_ID object type based on the category name, category version, and a list of components.

```sql
MGD_ID (  
category_name      VARCHAR2,  
category_version   VARCHAR2,  
components         MGD_ID_COMPONENT_VARRAY)  
RETURN SELF AS RESULT DETERMINISTIC;
```
Constructs an MGD_ID object type based on the category name, category version, the identifier string, and the list of additional parameters required to create it.

```sql
MGD_ID (  
category_name      VARCHAR2,  
category_version   VARCHAR2,  
identifier         VARCHAR2,  
parameter_list      VARCHAR2)  
RETURN SELF AS RESULT DETERMINISTIC;
```

**Parameters**

**Table 293-6  MGD_ID Constructor Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category identifier</td>
</tr>
<tr>
<td>components</td>
<td>List of component name value pairs</td>
</tr>
<tr>
<td>category_name</td>
<td>Category name, such as EPC</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version for the specified category name will be used.</td>
</tr>
<tr>
<td>identifier</td>
<td>Identifier string in any format of an encoding scheme in the specified category. For example, for SGTIN-96 encoding, the identifier can be in the format of BINARY, PURE_IDENTITY, TAG_ENCODING, or LEGACY. Express this identifier as a string according to the appropriate grammar or pattern in the tag data translation (TDT) markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as <code>gtin=00037000302414;serial=10419703</code> for a SGTIN coding scheme.</td>
</tr>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: <code>filter=3;companyprefixlength=7;taglength=96</code></td>
</tr>
</tbody>
</table>

**Usage Notes**

- Use `MGD_ID_UTL.EPC_ENCODINGCATEGORY_ID` as `category_id`.
- If the category is not already registered, an error is raised.
- If the `bit_length` parameter is NULL, the `bit_length` is `8` times the length of `bit_encoding`.
- If the component list does not contain all required components, an exception `MGD_ID_UTL.e_LackComponent` will be thrown.

**Examples**

The following examples construct identity code type objects.

Construct an MGD_ID object (SGTIN-64) passing in the category ID and a list of components.
--Contents of constructor11.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    MGD_ID_COMPONENT_VARRAY(
        MGD_ID_COMPONENT('companyprefix', '0037000'),
        MGD_ID_COMPONENT('itemref', '030241'),
        MGD_ID_COMPONENT('serial', '1041970'),
        MGD_ID_COMPONENT('schemes', 'SGTIN-64')
    )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @constructor11.sql

Constructs an MGD_ID object (SGTIN-64) passing in the category ID, the tag identifier, and the list of additional parameters that may be required to create it.

--Contents of constructor22.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category('1');
select MGD_ID('1',
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
SQL> @constructor22.sql

Construct an MGD_ID object (SGTIN-64) passing in the category name, category version (if NULL, then the latest version will be used), and a list of components.

--Contents of constructor33.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    MGD_ID_COMPONENT_VARRAY(
        MGD_ID_COMPONENT('companyprefix', '0037000'),
        MGD_ID_COMPONENT('itemref', '030241')
    )
) from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
Constructs an `MDG_ID` object (SGTIN-64) passing in the category name and category version, the tag identifier, and the list of additional parameters that may be required to create it.

```
--Contents of constructor4.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
call DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
select MGD_ID('EPC', NULL,
    'urn:epc:id:sgtin:0037000.030241.1041970',
    'filter=3;scheme=SGTIN-64') from dual;
call DBMS_MGD_ID_UTL.remove_proxy();
```

### 293.3.2 FORMAT Function

This function returns the string representation of the `MDG_ID` object in the specified format.

**Syntax**

```
FORMAT (parameter_list IN VARCHAR2,
        output_format   IN VARCHAR2)
RETURN VARCHAR2 DETERMINISTIC;
```
Parameters

Table 293-7  FORMAT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96</td>
</tr>
</tbody>
</table>
| output_format   | One of the supported output formats into which an MGD_ID component is formatted:  
  • BINARY  
  • LEGACY  
  • TAG_ENCODING  
  • PURE.IDENTITY  
  • ONS_HOSTNAME |

Examples

See the example for the GET_COMPONENT Function.

293.3.3 GET_COMPONENT Function

This function returns the value of the specified MGD_ID component.

Syntax

```
GET_COMPONENT (  
  component_name  IN  VARCHAR2)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 293-8  GET_COMPONENT Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>component_name</td>
<td>Name of component</td>
</tr>
</tbody>
</table>

Usage Notes

- If the code is an invalid code, meaning its structure is not defined in the metadata table, an error is raised.
- If the code is valid, but it does not contain the required component, NULL is returned.

Examples

The following example returns the general manager, object class, and serial number components for this GID-96 identity component:
-- Contents of get_components.sql file

```sql
-- Contents of get_components.sql file
CALL DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
  id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  ---------------
  --PURE_IDENTIT
  ---------------
  DBMS_OUTPUT.PUT_LINE('..Testing constructor with pure identity');
  -------------------------------
  -- PURE_IDENTITY representation can be translated to BINARY and
  -- TAG_ENCODING ONLY when BOTH scheme and filter are provided.
  -------------------------------
  id := MGD_ID('EPC', NULL, 'urn:epc:id:sgtin:0037000.030241.1041970', 'scheme=SGTIN-64;filter=3');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
  DBMS_OUTPUT.PUT_LINE('filter         = ' || id.get_component('filter'));
  DBMS_OUTPUT.PUT_LINE('company prefix = ' || id.get_component('companyprefix'));
  DBMS_OUTPUT.PUT_LINE('itemref        = ' || id.get_component('itemref'));
  DBMS_OUTPUT.PUT_LINE('serial         = ' || id.get_component('serial'));
  DBMS_OUTPUT.PUT_LINE('BINARY format  = ' || id.format(NULL, 'BINARY'));
  DBMS_OUTPUT.PUT_LINE('PURE_IDENTITY format  = ' || id.format(NULL, 'PURE_IDENTITY'));
  DBMS_OUTPUT.PUT_LINE('TAG_ENCODING format   = ' || id.format(NULL, 'TAG_ENCODING'));
END;
/
SHOW ERRORS;
CALL DBMS_MGD_ID_UTL.remove_proxy();
SQL> @get_component.sql
.
.
..Testing constructor with pure identity

PL/SQL procedure successfully completed.
.
.
293.3.4 TO_STRING Function

This function returns the semicolon (;) separated component name value pairs of the
MGD_ID object.

Syntax

TO_STRING
  RETURN VARCHAR2;

Examples

The following example converts the MGD_ID object into a string value:
-- Contents of toString3.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
id MGD_ID;
BEGIN
DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
dbms_output.put_line('Testing to_string');
id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970', 'scheme=GID-96');
DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();
connect / as sysdba;
drop user mgduser cascade;

SQL> @toString3.sql
.
.
..Testing to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager = 0037000;scheme = GID-96;1 = 1;serial = 1041970
PL/SQL procedure successfully completed.
.
.
293.3.5 TRANSLATE Function

This static function translates between different representations directly without first constructing an MGD_ID object.

This method is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Converts the identifier in one format to another given the category name, the tag identifier, the parameter list, and the output format.

TRANSLATE (category_name IN VARCHAR2, identifier IN VARCHAR2, parameter_list IN VARCHAR2, output_format IN VARCHAR2) RETURN VARCHAR2 DETERMINISTIC;

Converts the identifier in one format to another given the category name, category version, the tag identifier, the parameter list, and the output format.

TRANSLATE (category_name IN VARCHAR2, category_version IN VARCHAR2, identifier IN VARCHAR2, parameter_list IN VARCHAR2, output_format IN VARCHAR2) RETURN VARCHAR2 DETERMINISTIC;
### Parameters

**Table 293-9  TRANSLATE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version. If NULL, the latest version of the specified category name will be used.</td>
</tr>
<tr>
<td>identifier</td>
<td>EPC identifier, expressed as a string in accordance with one of the grammars or patterns in the TDT markup file. For example, a binary string consisting of characters 0 and 1, a URI (either tag-encoding or pure-identity formats), or a serialized legacy code expressed as a string format for input, such as gtin=00037000302414;serial=10419703 for a SGTIN coding scheme.</td>
</tr>
<tr>
<td>parameter_list</td>
<td>List of additional parameters required to create the object in the representation. The list is expressed as a parameter string containing key-value pairs, separated by the semicolon (;) as a delimiter between key-value pairs. For example, for a GTIN code, the parameter string would look as follows: filter=3;companyprefixlength=7;taglength=96</td>
</tr>
<tr>
<td>output_format</td>
<td>One of the supported output formats into which an MGD_ID component shall be converted: BINARY, LEGACY, TAG_ENCODING, PURE_IDENTITY, ONS_HOSTNAME</td>
</tr>
</tbody>
</table>

### Usage Notes

When converting from a pure identity representation to a binary representation, the filter value must be supplied as a value using the parameter_list parameter.

### Examples

The following examples translates one GiD-96 representation into another:

```sql
-- Contents of translate1.sql file
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
    id          MGD_ID;
BEGIN
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is BINARY');
    dbms_output.put_line(
        mgd_id.translate('EPC',
            NULL,'001101010000000000001001000010001000000000000111011000100001000000000000000011111110011000110010',
            NULL, 'BINARY'));
    dbms_output.put_line('Category ID is EPC, Identifier is BINARY, Output format is PURE_IDENTITY');
    dbms_output.put_line(
        mgd_id.translate('EPC',
            NULL,'001101010000000000001001000010001000000000000111011000100001000000000000000011111110011000110010',
            NULL, 'BINARY'));
END;
```

.
This chapter describes the types used with rules, rule sets, and evaluation contexts.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of Rule Types

### 294.1 Rule TYPES Overview

These types are used in rules and enable clients to evaluate rules with the rules engine.

See Also:

- DBMS_RULE
- DBMS_RULE_ADM
- Oracle Streams Extended Examples for examples that use rule types

### 294.2 Rule TYPES Security Model

PUBLIC is granted EXECUTE privilege on these RULE types.

See Also:

Oracle Database Security Guide for more information about user group PUBLIC

### 294.3 Summary of Rule Types

This table lists the Rule Types and briefly describes them.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE$ATTRIBUTE_VALUE Type</td>
<td>Specifies the value of a variable attribute</td>
</tr>
<tr>
<td>RE$ATTRIBUTE_VALUE_LIST Type</td>
<td>Identifies a list of attribute values</td>
</tr>
</tbody>
</table>
Table 294-1  (Cont.) Rule Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RE$COLUMN_VALUE Type</td>
<td>Specifies the value of a table column</td>
</tr>
<tr>
<td>RE$COLUMN_VALUE_LIST Type</td>
<td>Identifies a list of column values</td>
</tr>
<tr>
<td>RE$NAME_ARRAY Type</td>
<td>Identifies a list of names</td>
</tr>
<tr>
<td>RE$NAME_ARRAY Type</td>
<td>Identifies a list of name-value pairs</td>
</tr>
<tr>
<td>RE$NV_LIST Type</td>
<td>Identifies an object containing a list of name-value pairs and methods that operate on this list. This object type is used to represent the event context and the action context for a rule</td>
</tr>
<tr>
<td>RE$NV_NODE Type</td>
<td>Identifies a name-value pair</td>
</tr>
<tr>
<td>RE$RULE_HIT Type</td>
<td>Specifies a rule found because of evaluation</td>
</tr>
<tr>
<td>RE$RULE_HIT_LIST Type</td>
<td>Identifies a list of rules found because of evaluation</td>
</tr>
<tr>
<td>RE$RULE_NAME Type</td>
<td>Allows users to pass a list of rule as argument.</td>
</tr>
<tr>
<td>RE$RULE_NAME_LIST Type</td>
<td>Identifies a list of Rule Name values</td>
</tr>
<tr>
<td>RE$TABLE_ALIAS Type</td>
<td>Provides the table corresponding to an alias used in a rule evaluation context</td>
</tr>
<tr>
<td>RE$TABLE_ALIAS_LIST Type</td>
<td>Identifies a list of table aliases used in a rule evaluation context</td>
</tr>
<tr>
<td>RE$TABLE_VALUE Type</td>
<td>Specifies the value of a table row using a ROWID</td>
</tr>
<tr>
<td>RE$TABLE_VALUE_LIST Type</td>
<td>Identifies a list of table values</td>
</tr>
<tr>
<td>RE$VALUE Type</td>
<td>Represents one datapoint value element</td>
</tr>
<tr>
<td>RE$VALUE_LIST Type</td>
<td>Defines a list of RE$VALUE type</td>
</tr>
<tr>
<td>RE$VARIABLE_TYPE Type</td>
<td>Provides the type of a variable used in a rule evaluation context</td>
</tr>
<tr>
<td>RE$VARIABLE_TYPE_LIST Type</td>
<td>Identifies a list of variables used in a rule evaluation context</td>
</tr>
<tr>
<td>RE$VARIABLE_VALUE Type</td>
<td>Specifies the value of a variable</td>
</tr>
<tr>
<td>RE$VARIABLE_VALUE_LIST Type</td>
<td>Identifies a list of variable values</td>
</tr>
</tbody>
</table>

Rule types are used with the following Oracle-supplied PL/SQL packages:

- DBMS_RULE
- DBMS_RULE_ADM

You can use the DBMS_RULE_ADM package to create and administer rules, rule sets, and evaluation contexts, and you can use the DBMS_RULE package to evaluate rules.

When you use Oracle Streams, rules determine which changes are captured by a capture process, which messages are propagated by a propagation, which messages are applied by an apply process, and which messages are dequeued by a messaging client. The following Oracle Streams packages use rules:

- DBMS_APPLY_ADM
- DBMS_CAPTURE_ADM
- DBMS_PROPAGATION_ADM
294.3.1 RE$ATTRIBUTE_VALUE Type

RE$ATTRIBUTE_VALUE type specifies the value of a variable attribute.

**Note:**

Enclose the variable name and attribute name in double quotation marks ("") if the name contains special characters.

**Syntax**

```sql
TYPE SYS.RE$ATTRIBUTE_VALUE ( 
  variable_name  VARCHAR2(32),
  attribute_name VARCHAR2(4000),
  attribute_value ANYDATA);
```

**Attributes**

**Table 294-2  RE$ATTRIBUTE_VALUE Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable used in a rule</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the attribute name. The attribute name can be a multi-component name, such as a1.b2.c3.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the attribute value</td>
</tr>
</tbody>
</table>

294.3.2 RE$ATTRIBUTE_VALUE_LIST Type

The RE$ATTRIBUTE_VALUE_LIST type identifies a list of attribute values.

**Syntax**

```sql
TYPE SYS.RE$ATTRIBUTE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$ATTRIBUTE_VALUE;
```
294.3.3 RE$COLUMN_VALUE Type

RE$COLUMN_VALUE type specifies the value of a table column.

Note:
Enclose the column name in double quotation marks (") if the name contains special characters.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE {
    table_alias VARCHAR2(32),
    column_name VARCHAR2(4000),
    column_value ANYDATA);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the column name</td>
</tr>
<tr>
<td>column_value</td>
<td>Specifies the column value</td>
</tr>
</tbody>
</table>

294.3.4 RE$COLUMN_VALUE_LIST Type

RE$COLUMN_VALUE_LIST type identifies a list of column values.

Syntax

```
TYPE SYS.RE$COLUMN_VALUE_LIST AS VARRAY(1024) OF SYS.RE$COLUMN_VALUE;
```

294.3.5 RE$NAME_ARRAY Type

RE$NAME_ARRAY type identifies a list of names.

Syntax

```
TYPE SYS.RE$NAME_ARRAY AS VARRAY(1024) OF VARCHAR2(30);
```

294.3.6 RE$NV_ARRAY Type

RE$NV_ARRAY type identifies a list of name-value pairs.

Syntax

```
TYPE SYS.RE$NV_ARRAY AS VARRAY(1024) OF SYS.RE$NV_NODE;
```
294.3.7 RE$NV_LIST Type

identifies an object containing a list of name-value pairs and methods that operate on this list.

This object type is used to represent the event context for rule set evaluation and the action context for a rule.

Syntax

```
TYPE SYS.RE$NV_LIST AS OBJECT(
   actx_list SYS.RE$NV_ARRAY);
```

Attributes

Table 294-4 RE$NV_LIST Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>actx_list</td>
<td>The list of name-value pairs</td>
</tr>
</tbody>
</table>

RE$NV_LIST Subprograms

This section describes the following member procedures and member functions of the SYS.RE$NV_LIST type:

- ADD_PAIR Member Procedure
- GET_ALL_NAMES Member Function
- GET_VALUE Member Function
- REMOVE_PAIR Member Procedure

ADD_PAIR Member Procedure

 Adds a name-value pair to the list of name-value pairs.

**Note:**

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

```
MEMBER PROCEDURE ADD_PAIR(
   name   IN  VARCHAR2,
   value  IN  ANYDATA);
```

Parameters
Table 294-5   ADD_PAIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name in the name-value pair being added to the list. If the name exists in the list, then this procedure raises an error.</td>
</tr>
<tr>
<td>value</td>
<td>The value in the name-value pair being added to the list</td>
</tr>
</tbody>
</table>

GET_ALL_NAMES Member Function

Returns a list of all the names in the name-value pair list.

Syntax

MEMBER FUNCTION GET_ALL_NAMES()
RETURN SYS.RE$NAME_ARRAY;

GET_VALUE Member Function

Returns the value for the specified name in a name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

MEMBER FUNCTION GET_VALUE(
    name  IN  VARCHAR2)
RETURN ANYDATA;

Parameters

Table 294-6   GET_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name whose value to return</td>
</tr>
</tbody>
</table>

REMOVE_PAIR Member Procedure

Removes the name-value pair with the specified name from the name-value pair list.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.
Syntax

MEMBER PROCEDURE REMOVE_PAIR(
    name IN VARCHAR2);

Parameters

Table 294-7  REMOVE_PAIR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the pair to remove</td>
</tr>
</tbody>
</table>

294.3.8 RE$NV_NODE Type

RE$COLUMN_VALUE type identifies a name-value pair.

Note:

Enclose the name in double quotation marks (") if the name contains special characters.

Syntax

TYPE SYS.RE$NV_NODE (  
nvn_name VARCHAR2(30),  
nvn_value ANYDATA);  

Attributes

Table 294-8  RE$NV_NODE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nvn_name</td>
<td>Specifies the name in the name-value pair</td>
</tr>
<tr>
<td>nvn_value</td>
<td>Specifies the value in the name-value pair</td>
</tr>
</tbody>
</table>

294.3.9 RE$RULE_HIT Type

The RE$RULE_HIT type specifies a rule found because of an evaluation.

See Also:

- CREATE_RULE Procedure
- ALTER_RULE Procedure
Syntax

TYPE SYS.RE$RULE_HIT (  
    rule_name            VARCHAR2(65),  
    rule_action_context  RE$NV_LIST);  

Attributes

Table 294-9  RE$RULE_HIT Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The rule name in the form schema_name.rule_name. For example, a rule named</td>
</tr>
<tr>
<td></td>
<td>employee_rule in the hr schema is returned in the form &quot;hr&quot;.&quot;employee_rule&quot;.</td>
</tr>
<tr>
<td>rule_action_context</td>
<td>The rule action context as specified in the CREATE_RULE or ALTER_RULE</td>
</tr>
<tr>
<td></td>
<td>procedure of the DBMS_RULE_ADM package</td>
</tr>
</tbody>
</table>

294.3.10 RE$RULE_HIT_LIST Type

The RE$RULE_HIT_LIST type identifies a list of rules found because of an evaluation.

Syntax

TYPE SYS.RE$RULE_HIT_LIST AS VARRAY(1024) OF SYS.RE$RULE_HIT;

294.3.11 RE$RULE_NAME Type

The RE$RULE_HIT type is create to allow use to pass a list of rule as argument.

Syntax

CREATE OR REPLACE TYPE SYS.RE$RULE_NAME AS OBJECT(  
    rule_name            IN       varchar2,  
    evaluation_context   IN       varchar2);  

Attributes

Table 294-10  RE$RULE_NAME Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The rule name in the form SCHEMA_NAME.RULE_NAME. For example, a rule named</td>
</tr>
<tr>
<td></td>
<td>employee_rule in the hr schema is returned in the form &quot;hr&quot;.&quot;employee_rule&quot;.</td>
</tr>
<tr>
<td>Evaluation_context</td>
<td>The evaluation context as specified in the CREATE_RULE or ALTER_RULE</td>
</tr>
<tr>
<td></td>
<td>procedure of the DBMS_RULE_ADM package</td>
</tr>
</tbody>
</table>
294.3.12 RE$RULE_NAME_LIST Type

RE$RULE_HIT_LIST type Identifies a list of Rule Name values.

Syntax

CREATE OR REPLACE TYPE SYS.RE$RULE_NAME_LIST AS VARRAY(1024) OF SYS.RE$RULE_NAME;

294.3.13 RE$TABLE_ALIAS Type

RE$TABLE_ALIAS type provides the table corresponding to an alias used in a rule evaluation context.

A specified table name must satisfy the schema object naming rules.

Note:

Enclose the table name in double quotation marks (""") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

TYPE SYS.RE$TABLE_ALIAS IS OBJECT(
  table_alias VARCHAR2(32),
  table_name VARCHAR2(194));

Attributes

Table 294-11 RE$TABLE_ALIAS Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>The alias used for the table in a rule</td>
</tr>
<tr>
<td>table_name</td>
<td>The table name referred to by the alias. A synonym can be specified. The table name is resolved in the evaluation context schema. The format is one of the following: schema_name.table_name table_name For example, if the schema_name is hr and the table_name is employees, then enter the following: hr.employees</td>
</tr>
</tbody>
</table>
294.3.14 RE$TABLE_ALIAS_LIST Type

The RE$TABLE_ALIAS_LIST type identifies a list of table aliases used in a rule evaluation context.

Syntax

TYPE SYS.RE$TABLE_ALIAS_LIST AS VARRAY(1024) OF SYS.RE$TABLE_ALIAS;

294.3.15 RE$TABLE_VALUE Type

The RE$TABLE_VALUE type specifies the value of a table row using a ROWID.

Syntax

TYPE SYS.RE$TABLE_VALUE(  
  table_alias  VARCHAR2(32),  
  table_rowid  VARCHAR2(18));

Attributes

Table 294-12  RE$TABLE_VALUE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_alias</td>
<td>Specifies the alias used for the table in a rule</td>
</tr>
<tr>
<td>table_rowid</td>
<td>Specifies the rowid for the table row</td>
</tr>
</tbody>
</table>

294.3.16 RE$TABLE_VALUE_LIST Type

The RE$TABLE_VALUE_LIST type identifies a list of table values.

Note:

Each table alias in the list in the list must be unique.

Syntax

TYPE SYS.RE$TABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$TABLE_VALUE;

294.3.17 RE$VALUE Type

The RE$VALUE type represents one datapoint value element.

Syntax

TYPE SYS.RE$VALUE  
  (  
    table_values          IN       SYS.RE$TABLE_VALUE_LIST:= NULL,  
    column_values         IN       SYS.RE$COLUMN_VALUE_LIST:= NULL,  
    variable_values       IN       SYS.RE$VARIABLE_VALUE_LIST:= NULL,  
    attribute_values      IN       SYS.RE$ATTRIBUTE_VALUE_LIST:= NULL)
Attributes

Table 294-13 RE$VALUE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_values</td>
<td>ROWID of table row for expression evaluation</td>
</tr>
<tr>
<td>column_values</td>
<td>Values of columns referred in the expression</td>
</tr>
<tr>
<td>variable_values</td>
<td>Values of variables referred in expression</td>
</tr>
<tr>
<td>attribute_values</td>
<td>Values of attributes referred in expression</td>
</tr>
</tbody>
</table>

294.3.18 RE$VALUE_LIST Type

RE$TABLE_VALUE_LIST type is a varray for defining a list of RE$VALUE type. It represents a list of datapoint element.

Syntax

CREATE OR REPLACE TYPE SYS.RE$VALUE_LIST AS VARRAY(1024) OF SYS.RE$VALUE;

294.3.19 RE$VARIABLE_TYPE Type

The RE$VARIABLE_TYPE type provides the type of a variable used in a rule evaluation context. A specified variable name must satisfy the schema object naming rules.

Note:

Enclose the variable name in double quotation marks (") if the name contains special characters.

See Also:

Oracle Database SQL Language Reference for information about schema object naming rules

Syntax

TYPE SYS.RE$VARIABLE_TYPE (   variable_name   VARCHAR2(32),   variable_type   VARCHAR2(4000),   variable_value_function   VARCHAR2(228),   variable_method_function   VARCHAR2(228));
Attributes

Table 294-14  RE$VARIABLE_TYPE Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>The variable name used in a rule</td>
</tr>
<tr>
<td>variable_type</td>
<td>The type that is resolved in the evaluation context schema. Any valid Oracle built-in datatype, user-defined type, or Oracle-supplied type can be specified. See the Oracle Database SQL Language Reference for more information about these types.</td>
</tr>
<tr>
<td>variable_value_function</td>
<td>A value function that can be specified for implicit variables. A synonym can be specified. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
<tr>
<td>variable_method_function</td>
<td>Specifies a value function, which can return the result of a method invocation. Specifying such a function can speed up evaluation, if there are many simple rules that invoke the method on the variable. The function can be a synonym or a remote function. The function name is resolved in the evaluation context schema. It is executed on behalf of the owner of a rule set using the evaluation context or containing a rule that uses the evaluation context. See the &quot;Usage Notes&quot; for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

The functions for both the for the variable_value_function parameter and variable_method_function parameter have the following format:

```
schema_name.package_name.function_name@dblink
```

Any of the following parts of the format can be omitted: schema_name, package_name, and @dblink.

For example, if the schema_name is hr, the package_name is var_pac, the function_name is func_value, and the dblink is dbs1.net, then enter the following:

```
hr.var_pac.func_value@dbs1.net
```

The following sections describe the signature of the functions.

Signature for variable_value_function

The function must have the following signature:

```
FUNCTION variable_value_function_name(
    evaluation_context_schema   IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_name              IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST )
RETURN SYS.RE$VARIABLE_VALUE;
```
Signature for `variable_method_function`

This function must have the following signature:

```sql
FUNCTION variable_method_function_name(
    evaluation_context_schema IN VARCHAR2,
    evaluation_context_name    IN VARCHAR2,
    variable_value             IN SYS.RE$VARIABLE_VALUE,
    method_name                IN VARCHAR2,
    event_context              IN SYS.RE$NV_LIST)
RETURN SYS.RE$ATTRIBUTE_VALUE;
```

294.3.20 `RE$VARIABLE_TYPE_LIST` Type

The `RE$VARIABLE_TYPE_LIST` type identifies a list of variables and their types used in a rule evaluation context.

Syntax

```sql
TYPE SYS.RE$VARIABLE_TYPE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_TYPE;
```

294.3.21 `RE$VARIABLE_VALUE` Type

The `RE$VARIABLE_VALUE` type specifies the value of a variable.

**Note:**

Enclose the variable name in double quotation marks (") if the name contains special characters.

Syntax

```sql
TYPE SYS.RE$VARIABLE_VALUE (
    variable_name  VARCHAR2(32),
    variable_data  ANYDATA);
```

Attributes

**Table 294-15  RE$VARIABLE_VALUE Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Specifies the variable name used in a rule</td>
</tr>
<tr>
<td>variable_data</td>
<td>Specifies the data for the variable value</td>
</tr>
</tbody>
</table>

294.3.22 `RE$VARIABLE_VALUE_LIST` Type

The `RE$VARIABLE_VALUE_LIST` type identifies a list of variable values.

Syntax

```sql
TYPE SYS.RE$VARIABLE_VALUE_LIST AS VARRAY(1024) OF SYS.RE$VARIABLE_VALUE;
```
UTL Streams Types describe abstract types used with Oracle XML functionality.

Four abstract PL/SQL streams are introduced and defined within the 'sys' schema. The streams may be referenced by PUBLIC and are described in the following sections.

This chapter contains the following topics:

- Security Model
- Summary of UTL Binary Streams Types

See Also:
For more information, see Oracle XML DB Developer’s Guide

295.1 UTL Streams Types Security Model

EXECUTE on UTL Streams Types is granted to PUBLIC.

295.2 Summary of UTL Binary Streams Types

This table lists the UTL Binary Streams Types and briefly describes them.

<table>
<thead>
<tr>
<th>Table 295-1</th>
<th>UTL Streams Types</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Type</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>UTL_BINARYINPUTSTREAM Type</td>
<td>Reads bytes and closes a stream.</td>
</tr>
<tr>
<td>UTL_BINARYOUTPUTSTREAM Type</td>
<td>Writes bytes and closes a stream.</td>
</tr>
<tr>
<td>UTL_CHARACTERINPUTSTREAM Type</td>
<td>Reads chars and closes a stream.</td>
</tr>
<tr>
<td>UTL_CHARACTEROUTPUTSTREAM Type</td>
<td>Writes chars and closes a stream.</td>
</tr>
</tbody>
</table>

295.2.1 UTL_BINARYINPUTSTREAM Type

This type is similar to java.io.InputStream in that it can only read and close a stream.

Syntax

```
CREATE OR REPLACE TYPE Utl_BinaryInputStream AS OBJECT {
```

MEMBER FUNCTION available (self IN OUT NOCOPY Utl_BinaryInputStream)
    RETURN INTEGER,

MEMBER FUNCTION read ( self IN OUT NOCOPY Utl_BinaryInputStream, numBytes IN INTEGER DEFAULT 1)
    RETURN RAW,

MEMBER PROCEDURE read ( self IN OUT NOCOPY Utl_BinaryInputStream, bytes IN OUT NOCOPY RAW,
    numBytes IN OUT INTEGER),

MEMBER PROCEDURE read ( self IN OUT NOCOPY Utl_BinaryInputStream, bytes IN OUT NOCOPY RAW,
    offset IN INTEGER,
    numBytes IN OUT INTEGER),

member function close ( self In Out Nocopy Utl_BinaryInputStream)
)
 NOT FINAL;

Attributes

Table 295-2 UTL_BINARYINPUTSTREAM Type Member Subprograms

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td>#1 - Reads the number of bytes specified by numBytes (default is 1) and returns the bytes as a RAW. If there are no remaining bytes a value of NULL is returned.</td>
</tr>
<tr>
<td></td>
<td>#2 - Reads the number of bytes specified in numBytes into the parameter bytes. Additionally, the actual number of bytes read is returned in parameter numBytes. If this parameter is set to 0 then there are no more bytes to be read.</td>
</tr>
<tr>
<td></td>
<td>#3 - Reads the number of bytes specified in numBytes into the parameter bytes, beginning at the offset specified by parameter offset. The actual number of bytes read is returned in parameter numBytes. If this value is 0, then there are no additional bytes to be read.</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Releases all resources held on the node to support the stream</td>
</tr>
</tbody>
</table>

295.2.2 UTL_BINARYOUTPUTSTREAM Type

This type is similar to java.io.OutputStream in that it can only write and close a stream.

Syntax

CREATE OR REPLACE TYPE Utl_BinaryOutputStream AS OBJECT ( |
    MEMBER FUNCTION write ( self IN OUT NOCOPY sys.utl_BinaryOutputStream, bytes IN RAW,
    numBytes IN INTEGER DEFAULT 1) |
)
RETURN INTEGER,

MEMBER PROCEDURE write ( -- #2
  self       IN OUT NOCOPY  sys.utl_BinaryOutputStream,
  bytes      IN NOCOPY      RAW,
  numBytes   IN OUT         INTEGER),

MEMBER PROCEDURE write ( -- #3
  self       IN OUT NOCOPY  utl_BinaryOutputStream,        bytes      IN
  NOCOPY      RAW,
  offset     IN             INTEGER,
  numBytes   IN OUT         INTEGER),

MEMBER PROCEDURE flush ( self       IN OUT NOCOPY  utl_BinaryOutputStream),

MEMBER PROCEDURE close ( self       IN OUT NOCOPY utl_BinaryOutputStream)
)
) NOT FINAL;

Attributes

Table 295-3  UTL_BINARYOUTPUTSTREAM Type Member Subprograms

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRITE</td>
<td>#1 - Writes the number of bytes specified by numBytes (default is 1) from RAW into the stream. The actual number of bytes written is returned.</td>
</tr>
<tr>
<td></td>
<td>#2 - Writes the number of bytes specified in parameter numBytes from parameter bytes to the stream. The actual number of bytes written is returned in parameter numBytes.</td>
</tr>
<tr>
<td></td>
<td>#3 - Writes the number of bytes specified by numBytes to the stream, beginning at the offset specified by parameter offset. The actual number of bytes written is returned in parameter numBytes.</td>
</tr>
<tr>
<td>FLUSH</td>
<td>Insures that any buffered bytes are copied to the node destination</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Frees all resources associated with the stream</td>
</tr>
</tbody>
</table>

295.2.3 UTL_CHARACTERINPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

CREATE OR REPLACE TYPE Utl_CharacterInputStream AS OBJECT (  

MEMBER FUNCTION available ( self       IN OUT NOCOPY   utl_CharacterInputStream)  
  RETURN INTEGER,  

MEMBER FUNCTION read ( -- #1
  self       IN OUT NOCOPY   utl_CharacterInputStream,
  numChars   IN              INTEGER DEFAULT 1,  
  lineFeed   IN              BOOLEAN DEFAULT FALSE)  
  RETURN VARCHAR2,  
)
MEMBER PROCEDURE read { -- #2
  self IN OUT NOCOPY utl_CharacterInputStream,
  chars IN OUT NOCOPY VARCHAR2,
  numChars IN OUT INTEGER,
  lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE read { -- #3
  self IN OUT NOCOPY utl_CharacterInputStream,
  chars IN OUT NOCOPY VARCHAR2,
  offset IN INTEGER,
  numChars IN OUT INTEGER,
  lineFeed IN BOOLEAN DEFAULT FALSE),

MEMBER PROCEDURE close (
  self IN OUT NOCOPY utl_CharacterInputStream)
} NOT FINAL;

Attributes

Table 295-4  UTL_CHARACTERINPUTSTREAM Type Member Subprograms

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVAILABLE</td>
<td>Returns the number of bytes available to be read</td>
</tr>
<tr>
<td>READ</td>
<td>• #1 - Returns the number of characters remaining to be read</td>
</tr>
<tr>
<td></td>
<td>• #2 - Reads the number of characters specified by numChars (default value is 1) and returns the characters as a VARCHAR2. If the value of lineFeed is true (default value is FALSE) then the reading stops if a linefeed character is found. If there are no remaining characters a value of NULL is returned.</td>
</tr>
<tr>
<td></td>
<td>• #3 - Reads reads the number of characters specified by parameter numChars into the parameter chars. Additionally, the actual number of characters read is returned in parameter numChars. If this value is 0, then there are no more characters to be read. If the value of lineFeed is TRUE (default is FALSE), then reading stops if a linefeed character is encountered.</td>
</tr>
<tr>
<td>CLOSE</td>
<td>Releases all resources held by the stream</td>
</tr>
</tbody>
</table>

295.2.4 UTL_CHARACTEROUTPUTSTREAM Type

This type is similar to java.io.Reader in that it can only read characters (chars) and close a stream.

Syntax

CREATE OR REPLACE TYPE utl_CharacterOutputStream AS OBJECT (

MEMBER FUNCTION write { -- #1
  self IN OUT NOCOPY utl_CharacterOutputStream,
  chars IN VARCHAR2,
  numChars IN INTEGER DEFAULT 1,
  lineFeed IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER,

MEMBER PROCEDURE write { -- #2
  self IN OUT NOCOPY utl_CharacterOutputStream,
  chars IN VARCHAR2,
  numChars IN OUT INTEGER,
member procedure write { -- #3
  self     IN OUT NOCOPY    utl_CharacterOutputStream,
  chars    IN  NOCOPY       varchar2,
  offset   IN               integer,
  numChars IN OUT           integer,
  lineFeed IN               boolean default false),
MEMBER PROCEDURE flush { 
  self     IN OUT NOCOPY    utl_CharacterOutputStream),
MEMBER PROCEDURE close { 
  self     IN OUT NOCOPY utl_CharacterOutputStream)}
) NOT FINAL;

Attributes

**Table 295-5  UTL_CHARACTEROUTPUTSTREAM Type Member Subprograms**

<table>
<thead>
<tr>
<th>Member Subprogram</th>
<th>Description</th>
</tr>
</thead>
</table>
| WRITE             | • #1 - Writes the number of characters specified by `numChars` (default is 1) from parameter `chars` into the stream and returns the actual number of characters written. If the value of `lineFeed` is TRUE (default is FALSE) a `lineFeed` character is inserted after the last character.  
• #2 - Writes the number of characters specified by parameter `numChars`, from parameter `chars` into the stream. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is FALSE) a `lineFeed` character is inserted after the last character.  
• #3 - Writes the number of characters specified by parameter `numChars`, from parameter `chars`, beginning at `offset` specified by parameter `offset`. The actual number of characters written is returned in parameter `numChars`. If the value of `lineFeed` is true (default is FALSE) a `lineFeed` character is inserted after the last character. |
| FLUSH             | Copies all characters that may be contained within buffers to the node value |
| CLOSE             | Releases all resources held by the stream |
XMLType is a system-defined opaque type for handling XML data. It has predefined member functions on it to extract XML nodes and fragments.

You can create columns of XMLType and insert XML documents into it. You can also generate XML documents as XMLType instances dynamically using the SYS_XMLAGG SQL function.

This chapter contains the following topics:

- Summary of XMLType Subprograms

### 296.1 Summary of XMLType Subprograms

This table summarizes functions and procedures of XMLType.

<table>
<thead>
<tr>
<th>Table 296-1</th>
<th>XMLTYPE Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Description</td>
</tr>
<tr>
<td>CREATEXML</td>
<td>Static function for creating and returning an XMLType instance.</td>
</tr>
<tr>
<td>EXISTSNODE</td>
<td>Takes a XMLType instance and a XPath and returns 1 or 0 indicating if applying the XPath returns a non-empty set of nodes.</td>
</tr>
<tr>
<td>EXTRACT</td>
<td>Takes a XMLType instance and an XPath, applies the XPath expression and returns the results as an XMLType.</td>
</tr>
<tr>
<td>GETBLOBVAL</td>
<td>Returns the value of the XMLType instance as a BLOB.</td>
</tr>
<tr>
<td>GETCLOBVAL</td>
<td>Returns the value of the XMLType instance as a CLOB.</td>
</tr>
<tr>
<td>GETNAMESPACE</td>
<td>Returns the namespace for the top level element in a schema based document.</td>
</tr>
<tr>
<td>GETNUMBERVAL</td>
<td>Returns the value of the XMLType instance as a NUMBER. This is only valid if the input XMLType instance contains a simple text node and is convertible to a number.</td>
</tr>
</tbody>
</table>
Table 296-1  (Cont.) XMLTYPE Subprograms

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETROOTELEMENT</td>
<td>Returns the root element of the input instance. Returns NULL if the instance is a fragment</td>
</tr>
<tr>
<td>GETSCHEMAURL</td>
<td>Returns the XML schema URL if the input is an XML Schema based.</td>
</tr>
<tr>
<td>GETSTRINGVAL</td>
<td>Returns the value of the XMLType instance as a string.</td>
</tr>
<tr>
<td>ISFRAGMENT</td>
<td>Checks if the input XMLType instance is a fragment or not. A fragment is a XML instance, which has more than one root element.</td>
</tr>
<tr>
<td>ISSCHEMABASED</td>
<td>Returns 1 or 0 indicating if the input XMLType instance is a schema based one or not.</td>
</tr>
<tr>
<td>ISSCHEMAVALID</td>
<td>Checks if the input instance is schema valid according to the given schema URL.</td>
</tr>
<tr>
<td>ISSCHEMAVALIDATED</td>
<td>Checks if the instance has been validated against the schema.</td>
</tr>
<tr>
<td>SCHEMAVALIDATE</td>
<td>Validates the input instance according to the XML Schema. Raises error if the input instance is non-schema based.</td>
</tr>
<tr>
<td>SETSCHEMAVALIDATED</td>
<td>Sets the schema valid flag to avoid costly schema validation.</td>
</tr>
<tr>
<td>TOOBJECT</td>
<td>Converts the XMLType instance to an object type.</td>
</tr>
<tr>
<td>TRANSFORM</td>
<td>Takes an XMLType instance and an associated stylesheet (which is also an XMLType instance), applies the stylesheet and returns the result as XML.</td>
</tr>
<tr>
<td>XMLTYPE</td>
<td>Constructs an instance of the XMLType datatype. The constructor can take in the XML as a CLOB, VARCHAR2 or take in a object type.</td>
</tr>
</tbody>
</table>

296.1.1 CREATENONSCHEMABASEDXML

This member function creates a non-schema based XML document from a schema based instance.

Syntax

```sql
MEMBER FUNCTION CREATENONSCHEMABASEDXML
return XMLType deterministic;
```

296.1.2 CREATESCHEMABASEDXML

This member function creates a schema based XMLType instance from a non-schema based XMLType value.

It uses either the supplied SCHEMA URL, or the SCHEMALLOCATION attribute of the instance.

Syntax

```sql
MEMBER FUNCTION createSchemaBasedXML(
    schema IN varchar2 := NULL)
return XMLType deterministic;
```
Table 296-2  CREATESCHEMABASEDXML Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>Optional XMLSchema URL used to convert the value to the specified schema.</td>
</tr>
</tbody>
</table>

296.1.3 CREATEXML

This static function creates and returns an XMLType instance. The string and CLOB parameters used to pass in the date must contain well-formed and valid XML documents.

The options are described in the following table.

Table 296-3  CREATEXML Subprograms

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN varchar2) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a string.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML(xmlData IN clob) RETURN XMLType deterministic;</td>
<td>Creates the XMLType instance from a CLOB.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML (xmlData IN clob, schema IN varchar2, validated IN number := 0, wellformed IN number := 0 ) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML (xmlData IN varchar2, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) RETURN XMLType deterministic;</td>
<td>This static function creates a schema-based XMLType instance using the specified schema and xml data parameters.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML (xmlData IN &quot;&lt;ADT_1&gt;&quot;, schema IN varchar2 := NULL, element IN varchar2 := NULL, validated IN NUMBER := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from an instance of an user-defined type.</td>
</tr>
</tbody>
</table>

<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN SYS_REFCURSOR, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN XMLType deterministic;</td>
<td>Creates an XML instance from a cursor reference. You can pass in any arbitrary SQL query as a CURSOR.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN AnyData, schema in varchar2 := NULL, element in varchar2 := NULL, validated in number := 0) RETURN sys.XMLType deterministic parallel_enable</td>
<td>Creates an XML instance from ANYDATA. If the ANYDATA instance contains an ADT, the XMLType returned is the same as would be returned for a call directly on the ADT. If the ANYDATA contains a scalar, the XMLType contains a leaf node with the scalar value. The element name for this node is taken from the optional element string if present, and is &quot;ANYDATA&quot; if it is not.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN blob, csid IN number, schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic</td>
<td>Creates an XML instance from a BLOB.</td>
</tr>
<tr>
<td>STATIC FUNCTION createXML ( xmlData IN bfile, csid IN number, Schema IN varchar2, validated IN number := 0, wellformed IN number := 0) return sys.XMLType deterministic</td>
<td>Creates an XML instance from a BFILE.</td>
</tr>
</tbody>
</table>

Table 296-4 CREATEXML Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmlData</td>
<td>The actual data in the form of a BFILE, BLOB, CLOB, REF cursor, VARCHAR2 or object type.</td>
</tr>
<tr>
<td>schema</td>
<td>Optional Schema URL to be used to make the input conform to the given schema. Caution: Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer’s Guide).</td>
</tr>
<tr>
<td>validated</td>
<td>Flag to indicate that the instance is valid according to the given XML Schema. (Default is 0)</td>
</tr>
<tr>
<td>wellformed</td>
<td>Flag to indicate that the input is well formed. If set, then the database would not do well formed check on the input instance. (Default is 0)</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td><strong>csid</strong></td>
<td>The character set id of input XML data.</td>
</tr>
</tbody>
</table>

### 296.1.4 EXISTSNODE

This member function checks if the node exists.

If the XPath string is NULL or the document is empty, then a value of 0 is returned, otherwise returns 1.

The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| MEMBER FUNCTION existsNode(xpath IN varchar2)
  RETURN number deterministic; | Given an XPath expression, checks if the XPath applied over the document can return any valid nodes. |
| MEMBER FUNCTION existsNode(xpath in varchar2,
  nsmap in varchar2)
  RETURN number deterministic; | This member function uses the XPath expression with the namespace information and checks if applying the XPath returns any nodes or not. |

### 296.1.5 EXTRACT

This member function extracts an XMLType fragment and returns an XMLType instance containing the result nodes. If the XPath does not result in any nodes, it then returns NULL.

The options are described in the following table.

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| MEMBER FUNCTION extract(xpath IN varchar2)
  RETURN XMLType deterministic; | Given an XPath expression, applies the XPath to the document and returns the fragment as an XMLType. |
### Syntax

```sql
MEMBER FUNCTION extract(
    xpath IN varchar2,
    nsmap IN varchar2)
RETURN XMLType deterministic;
```

This member function applies the XPath expression and namespace mapping, over the XML data to return a XMLType instance containing the resultant fragment.

### Table 296-6  EXTRACT Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xpath</td>
<td>The XPath expression to apply.</td>
</tr>
<tr>
<td>nsmap</td>
<td>Optional prefix to namespace mapping information.</td>
</tr>
</tbody>
</table>

---

### 296.1.6 GETBLOBVAL

This member function returns a BLOB containing the serialized XML representation. If the BLOB returned is temporary, it must be freed after use.

**Syntax**

```sql
MEMBER FUNCTION getBlobVal(
    csid   IN   NUMBER)
RETURN BLOB DETERMINISTIC;
```

### Table 296-7  GETBLOBVAL Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>csid</td>
<td>The desired character set ID of output BLOB</td>
</tr>
</tbody>
</table>

---

### 296.1.7 GETCLOBVAL

This member function returns a CLOB containing the serialized XML representation. If the CLOB returned is temporary, it must be freed after use.

**Syntax**

```sql
MEMBER FUNCTION getClobVal()
RETURN clob deterministic;
```

---

### 296.1.8 GETNAMESPACE

**GETNAMESPACE** is a member function. It returns the namespace of the top level element in the instance. It returns NULL if the input is a fragment or is a non-schema based instance.

**Syntax**

```sql
MEMBER FUNCTION getNamespace
return varchar2 deterministic;
```
296.1.9 GETNUMBERVAL

This is a member function. It returns a numeric value, formatted from the text value pointed to by the XMLType instance. The XMLType must point to a valid text node that contains a numerical value.

The options are described in the following table.

Syntax

MEMBER FUNCTION getNumberVal()
RETURN number deterministic;

296.1.10 GETROOTELEMENT

This member function gets the root element of the XMLType instance. It returns NULL if the instance is a fragment.

Syntax

MEMBER FUNCTION getRootElement
return varchar2 deterministic;

296.1.11 GETSCHEMAURL

This member function returns the XML Schema URL corresponding to the XMLType instance, if the XMLType instance is a schema-based document. Otherwise, it returns NULL.

Syntax

MEMBER FUNCTION getSchemaURL
return varchar2 deterministic;

296.1.12 GETSTRINGVAL

This member function returns the document as a string. It returns a string containing the serialized XML representation, or in the case of text nodes, the text itself.

If the XML document exceeds the VARCHAR2 maximum size (4000), then an error is raised at run time.

Syntax

MEMBER FUNCTION getStringVal()
RETURN varchar2 deterministic;
296.1.13 ISFRAGMENT

ISFRAGMENT determines if the XMLType instance corresponds to a well-formed document, or a fragment. It returns 1 or 0 indicating if the XMLType instance contains a fragment or a well-formed document.

Syntax

MEMBER FUNCTION isFragment()
RETURN number deterministic;

296.1.14 ISSCHEMABASED

This member function determines whether the XMLType instance is schema-based or not. It returns 1 or 0 depending on whether the XMLType instance is schema-based.

Syntax

MEMBER FUNCTION isSchemaBased
return number deterministic;

296.1.15 ISSCHEMAVALID

This member function checks if the input instance conforms to a specified schema. It does not change the validation status of the XML instance.

If an XML Schema URL is not specified and the xml document is schema based, the conformance is checked against the XMLType instance’s own schema.

Syntax

member function isSchemaValid(
  schurl IN VARCHAR2 := NULL,
  elem IN VARCHAR2 := NULL)
return NUMBER deterministic;

Table 296-8  ISSCHEMAVALID Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schurl</td>
<td>(IN)</td>
<td>The URL of the XML Schema against which to check conformance.</td>
</tr>
<tr>
<td>elem</td>
<td>(IN)</td>
<td>Element of a specified schema, against which to validate. This is useful when we have a XML Schema which defines more than one top level element, and we want to check conformance against a specific one of these elements.</td>
</tr>
</tbody>
</table>
296.1.16 ISSCHEMAVALIDATED

This member function returns the validation status of the XMLType instance to tell if a schema-based instance has been actually validated against its schema. It returns 1 if the instance has been validated against the schema, 0 otherwise.

Syntax

```
MEMBER FUNCTION isSchemaValidated
return NUMBER deterministic;
```

296.1.17 SCHEMAVALIDATE

This member procedure validates the XML instance against its schema, if it has not already been done.

For non-schema based documents an error is raised. If validation fails an error is raised; else, the document's status is changed to validated.

Syntax

```
MEMBER PROCEDURE schemaValidate(
   self IF OUT NOCOPY XMLType);
```

Table 296-9 SCHEMAVALIDATE Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance being validated against the schema.</td>
</tr>
</tbody>
</table>

296.1.18 SETSCHEMAVALIDATED

This member function sets the VALIDATION state of the input XML instance.

Syntax

```
MEMBER PROCEDURE setSchemaValidated(
   self IF OUT NOCOPY XMLType,
   flag IN BINARY_INTEGER := 1);
```

Table 296-10 SETSCHEMAVALIDATED Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>self</td>
<td>(OUT)</td>
<td>XML instance.</td>
</tr>
<tr>
<td>flag</td>
<td>(IN)</td>
<td>0 - NOT VALIDATED; 1 - VALIDATED (Default)</td>
</tr>
</tbody>
</table>

296.1.19 TOOBJECT

This member procedure converts the XML value to an object type using the XMLSCHEMA mapping, if available. If a SCHEMA is not supplied or the input is a non-schema based
XML, the procedure uses canonical mapping between elements and object type attributes.

Syntax

MEMBER PROCEDURE toObject{
    SELF in XMLType,
    object OUT "<ADT_1>",
    schema in varchar2 := NULL,
    element in varchar2 := NULL};

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SELF</td>
<td>(IN)</td>
<td>Instance to be converted. Implicit if used as a member procedure.</td>
</tr>
<tr>
<td>object</td>
<td>(IN)</td>
<td>Converted object. An object instance of the required type may be passed in to this function</td>
</tr>
<tr>
<td>schema</td>
<td>(IN)</td>
<td>Schema URL. The mapping of the XMLType instance to the converted object instance may be specified using a schema. Caution: Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer's Guide).</td>
</tr>
<tr>
<td>element</td>
<td>(IN)</td>
<td>Top-level element name. An XML Schema document does not specify the top-level element for a conforming XML instance document without this parameter. Caution: Oracle does not support use of types generated by Schema Registration (see Oracle XML DB Developer's Guide).</td>
</tr>
</tbody>
</table>

296.1.20 TRANSFORM

This member function transforms the XML data using the XSL stylesheet argument and the top-level parameters passed as a string of name=value pairs

If any of the arguments other than the parammap is NULL, then a NULL is returned.

Syntax

MEMBER FUNCTION transform{
    xsl IN XMLType,
    parammap in varchar2 := NULL)
RETURN XMLType deterministic;

<table>
<thead>
<tr>
<th>Parameter</th>
<th>IN / OUT</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xsl</td>
<td>(IN)</td>
<td>The XSL stylesheet describing the transformation</td>
</tr>
<tr>
<td>parammap</td>
<td>(IN)</td>
<td>Top level parameters to the XSL - string of name=value pairs</td>
</tr>
</tbody>
</table>

296.1.21 XMLTYPE

This is an XMLType constructor.

The options are described in the following table.
### Table 296-13  XMLTYPE Member Subprogram Parameters

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>constructor function XMLType(</td>
