Changes in This Release for Oracle Database SQL Language Reference

| Changes in Oracle Database 12c Release 2 (12.2.0.1) | xxviii |
| Changes in Oracle Database 12c Release 1 (12.1.0.2) | xxxix |
| Changes in Oracle Database 12c Release 1 (12.1.0.1) | xli |

1 Introduction to Oracle SQL

| 1.1 History of SQL | 1-1 |
| 1.2 SQL Standards | 1-1 |
| 1.2.1 How SQL Works | 1-2 |
| 1.2.2 Common Language for All Relational Databases | 1-2 |
| 1.3 Using Enterprise Manager | 1-2 |
| 1.4 Lexical Conventions | 1-3 |
| 1.5 Tools Support | 1-3 |

2 Basic Elements of Oracle SQL

| 2.1 Data Types | 2-1 |
| 2.1.1 Oracle Built-in Data Types | 2-6 |
| 2.1.1.1 Character Data Types | 2-9 |
| 2.1.1.2 Numeric Data Types | 2-14 |
| 2.1.1.3 LONG Data Type | 2-18 |
| 2.1.1.4 Datetime and Interval Data Types | 2-20 |
| 2.1.1.5 RAW and LONG RAW Data Types | 2-29 |
| 2.1.1.6 Large Object (LOB) Data Types | 2-30 |
2.1.1.7 Extended Data Types 2-33
2.1.2 Rowid Data Types 2-34
  2.1.2.1 ROWID Data Type 2-34
  2.1.2.2 UROWID Data Type 2-35
2.1.3 ANSI, DB2, and SQL/DS Data Types 2-35
2.1.4 User-Defined Types 2-37
  2.1.4.1 Object Types 2-37
  2.1.4.2 REF Data Types 2-38
  2.1.4.3 Varrays 2-38
  2.1.4.4 Nested Tables 2-38
2.1.5 Oracle-Supplied Types 2-39
2.1.6 Any Types 2-39
  2.1.6.1 ANYPYRE 2-39
  2.1.6.2 ANYDATA 2-39
  2.1.6.3 ANYDATASET 2-39
2.1.7 XML Types 2-40
  2.1.7.1 XMLType 2-40
  2.1.7.2 URI Data Types 2-40
  2.1.7.3 URI Factory Package 2-41
2.1.8 Spatial Types 2-42
  2.1.8.1 SDO_GEOMETRY 2-42
  2.1.8.2 SDO_TOPO_GEOMETRY 2-42
  2.1.8.3 SDO_GEORASTER 2-43
2.1.9 Media Types 2-43
2.2 Data Type Comparison Rules 2-45
  2.2.1 Numeric Values 2-45
  2.2.2 Datetime Values 2-45
  2.2.3 Binary Values 2-45
  2.2.4 Character Values 2-46
  2.2.5 Object Values 2-49
  2.2.6 Varrays and Nested Tables 2-49
  2.2.7 Data Type Precedence 2-49
  2.2.8 Data Conversion 2-49
    2.2.8.1 Implicit and Explicit Data Conversion 2-50
    2.2.8.2 Implicit Data Conversion 2-50
    2.2.8.3 Implicit Data Conversion Examples 2-53
    2.2.8.4 Explicit Data Conversion 2-53
  2.2.9 Security Considerations for Data Conversion 2-55
2.3 Literals 2-56
  2.3.1 Text Literals 2-57
  2.3.2 Numeric Literals 2-58
2.6.4.14  FACT Hint  
2.6.4.15  FIRST_ROWS Hint  
2.6.4.16  FRESH_MV Hint  
2.6.4.17  FULL Hint  
2.6.4.18  GATHER_OPTIMIZER_STATISTICS Hint  
2.6.4.19  GROUPING Hint  
2.6.4.20  HASH Hint  
2.6.4.21  IGNORE_ROW_ON_DUPKEY_INDEX Hint  
2.6.4.22  INDEX Hint  
2.6.4.23  INDEX_ASC Hint  
2.6.4.24  INDEX_COMBINE Hint  
2.6.4.25  INDEX_DESC Hint  
2.6.4.26  INDEX_FFS Hint  
2.6.4.27  INDEX_JOIN Hint  
2.6.4.28  INDEX_SS Hint  
2.6.4.29  INDEX_SS_ASC Hint  
2.6.4.30  INDEX_SS_DESC Hint  
2.6.4.31  INMEMORY Hint  
2.6.4.32  INMEMORY_PRUNING Hint  
2.6.4.33  LEADING Hint  
2.6.4.34  MERGE Hint  
2.6.4.35  MODEL_MIN_ANALYSIS Hint  
2.6.4.36  MONITOR Hint  
2.6.4.37  NATIVE_FULL_OUTER_JOIN Hint  
2.6.4.38  NOAPPEND Hint  
2.6.4.39  NOCACHE Hint  
2.6.4.40  NO_CLUSTERING Hint  
2.6.4.41  NO_EXPAND Hint  
2.6.4.42  NO_FACT Hint  
2.6.4.43  NO_GATHER_OPTIMIZER_STATISTICS Hint  
2.6.4.44  NO_INDEX Hint  
2.6.4.45  NO_INDEX_FFS Hint  
2.6.4.46  NO_INDEX_SS Hint  
2.6.4.47  NO_INMEMORY Hint  
2.6.4.48  NO_INMEMORY_PRUNING Hint  
2.6.4.49  NO_MERGE Hint  
2.6.4.50  NO_MONITOR Hint  
2.6.4.51  NO_NATIVE_FULL_OUTER_JOIN Hint  
2.6.4.52  NO_PARALLEL Hint  
2.6.4.53  NOPARALLEL Hint  
2.6.4.54  NO_PARALLEL_INDEX Hint
2.6.4.55  NOPARALLEL_INDEX Hint 2-118
2.6.4.56  NO_PQ_CONCURRENT_UNION Hint 2-118
2.6.4.57  NO_PQ_SKEW Hint 2-119
2.6.4.58  NO_PUSH_PRED Hint 2-119
2.6.4.59  NO_PUSH_SUBQ Hint 2-119
2.6.4.60  NO_PX_JOIN_FILTER Hint 2-120
2.6.4.61  NO_QUERY_TRANSFORMATION Hint 2-120
2.6.4.62  NO_RESULT_CACHE Hint 2-120
2.6.4.63  NO_REWRITE Hint 2-120
2.6.4.64  NOREWRITE Hint 2-121
2.6.4.65  NO_STAR_TRANSFORMATION Hint 2-121
2.6.4.66  NO_STATEMENT_QUEUING Hint 2-121
2.6.4.67  NO_UNNEST Hint 2-122
2.6.4.68  NO_USE_BAND Hint 2-122
2.6.4.69  NO_USE_CUBE Hint 2-122
2.6.4.70  NO_USE_HASH Hint 2-122
2.6.4.71  NO_USE_MERGE Hint 2-123
2.6.4.72  NO_USE_NL Hint 2-123
2.6.4.73  NO_XML_QUERY_REWRITE Hint 2-123
2.6.4.74  NO_XMLINDEX_REWRITE Hint 2-124
2.6.4.75  NO_ZONEMAP Hint 2-124
2.6.4.76  OPT_PARAM Hint 2-125
2.6.4.77  ORDERED Hint 2-125
2.6.4.78  PARALLEL Hint 2-126
2.6.4.79  PARALLEL_INDEX Hint 2-128
2.6.4.80  PQ_CONCURRENT_UNION Hint 2-129
2.6.4.81  PQ_DISTRIBUTE Hint 2-129
2.6.4.82  PQ_FILTER Hint 2-132
2.6.4.83  PQ_SKEW Hint 2-132
2.6.4.84  PUSH_PRED Hint 2-132
2.6.4.85  PUSH_SUBQ Hint 2-133
2.6.4.86  PX_JOIN_FILTER Hint 2-133
2.6.4.87  QB_NAME Hint 2-133
2.6.4.88  RESULT_CACHE Hint 2-134
2.6.4.89  RETRY_ON_ROW_CHANGE Hint 2-134
2.6.4.90  REWRITE Hint 2-135
2.6.4.91  STAR_TRANSFORMATION Hint 2-135
2.6.4.92  STATEMENT_QUEUING Hint 2-136
2.6.4.93  UNNEST Hint 2-136
2.6.4.94  USE_BAND Hint 2-137
2.6.4.95  USE_CONCAT Hint 2-137
2.6.4.96 USE_CUBE Hint
2.6.4.97 USE_HASH Hint
2.6.4.98 USE_MERGE Hint
2.6.4.99 USE_NL Hint
2.6.4.100 USE_NL_WITH_INDEX Hint
2.7 Database Objects
  2.7.1 Schema Objects
  2.7.2 Nonschema Objects
2.8 Database Object Names and Qualifiers
  2.8.1 Database Object Naming Rules
  2.8.2 Schema Object Naming Examples
  2.8.3 Schema Object Naming Guidelines
2.9 Syntax for Schema Objects and Parts in SQL Statements
  2.9.1 How Oracle Database Resolves Schema Object References
  2.9.2 References to Objects in Other Schemas
  2.9.3 References to Objects in Remote Databases
    2.9.3.1 Creating Database Links
    2.9.3.2 References to Database Links
  2.9.4 References to Partitioned Tables and Indexes
  2.9.5 References to Object Type Attributes and Methods

3 Pseudocolumns

3.1 Hierarchical Query Pseudocolumns
  3.1.1 CONNECT_BY_ISCYCLE Pseudocolumn
  3.1.2 CONNECT_BY_ISLEAF Pseudocolumn
  3.1.3 LEVEL Pseudocolumn
3.2 Sequence Pseudocolumns
  3.2.1 Where to Use Sequence Values
  3.2.2 How to Use Sequence Values
3.3 Version Query Pseudocolumns
3.4 COLUMN_VALUE Pseudocolumn
3.5 OBJECT_ID Pseudocolumn
3.6 OBJECT_VALUE Pseudocolumn
3.7 ORA_ROWSCN Pseudocolumn
3.8 ROWID Pseudocolumn
3.9 ROWNUM Pseudocolumn
3.10 XMLDATA Pseudocolumn
Operators

4.1 About SQL Operators 4-1
  4.1.1 Unary and Binary Operators 4-1
  4.1.2 Operator Precedence 4-2
4.2 Arithmetic Operators 4-2
4.3 COLLATE Operator 4-3
4.4 Concatenation Operator 4-4
4.5 Hierarchical Query Operators 4-5
  4.5.1 PRIOR 4-5
  4.5.2 CONNECT_BY_ROOT 4-6
4.6 Set Operators 4-6
4.7 Multiset Operators 4-6
  4.7.1 MULTISET EXCEPT 4-7
  4.7.2 MULTISET INTERSECT 4-8
  4.7.3 MULTISET UNION 4-9
4.8 User-Defined Operators 4-10

Expressions

5.1 About SQL Expressions 5-1
5.2 Simple Expressions 5-3
5.3 Compound Expressions 5-4
5.4 Calculated Measure Expressions 5-5
  5.4.1 Analytic View Measure Expressions 5-6
  5.4.2 Analytic View Simple Expressions 5-15
  5.4.3 Single Row Function Expression 5-16
  5.4.4 Examples of Calculated Measure Expressions 5-16
5.5 CASE Expressions 5-18
5.6 Column Expressions 5-20
5.7 CURSOR Expressions 5-21
5.8 Datetime Expressions 5-22
5.9 Function Expressions 5-24
5.10 Interval Expressions 5-25
5.11 JSON Object Access Expressions 5-26
5.12 Model Expressions 5-28
5.13 Object Access Expressions 5-30
5.14 Placeholder Expressions 5-31
5.15 Scalar Subquery Expressions 5-31
5.16 Type Constructor Expressions 5-32
Conditions

6.1 About SQL Conditions 6-1
  6.1.1 Condition Precedence 6-3
6.2 Comparison Conditions 6-4
  6.2.1 Simple Comparison Conditions 6-5
  6.2.2 Group Comparison Conditions 6-7
6.3 Floating-Point Conditions 6-8
6.4 Logical Conditions 6-9
6.5 Model Conditions 6-10
  6.5.1 IS ANY Condition 6-10
  6.5.2 IS PRESENT Condition 6-11
6.6 Multiset Conditions 6-12
  6.6.1 IS A SET Condition 6-12
  6.6.2 IS EMPTY Condition 6-13
  6.6.3 MEMBER Condition 6-14
  6.6.4 SUBMULTISET Condition 6-14
6.7 Pattern-matching Conditions 6-15
  6.7.1 LIKE Condition 6-15
  6.7.2 REGEXP_LIKE Condition 6-19
6.8 Null Conditions 6-21
6.9 XML Conditions 6-22
  6.9.1 EQUALS_PATH Condition 6-22
  6.9.2 UNDER_PATH Condition 6-23
6.10 SQL/JSON Conditions 6-23
  6.10.1 IS JSON Condition 6-24
  6.10.2 JSON_EXISTS Condition 6-26
  6.10.3 JSON_TEXTCONTAINS Condition 6-29
6.11 Compound Conditions 6-31
6.12 BETWEEN Condition 6-32
6.13 EXISTS Condition 6-33
6.14 IN Condition 6-33
6.15 IS OF type Condition 6-36

Functions

7.1 About SQL Functions 7-2
7.2 Single-Row Functions 7-4
  7.2.1 Numeric Functions 7-4
7.2.2 Character Functions Returning Character Values 7-5
7.2.3 Character Functions Returning Number Values 7-5
7.2.4 Character Set Functions 7-6
7.2.5 Collation Functions 7-6
7.2.6 Datetime Functions 7-6
7.2.7 General Comparison Functions 7-7
7.2.8 Conversion Functions 7-7
7.2.9 Large Object Functions 7-8
7.2.10 Collection Functions 7-8
7.2.11 Hierarchical Functions 7-8
7.2.12 Data Mining Functions 7-9
7.2.13 XML Functions 7-9
7.2.14 JSON Functions 7-10
7.2.15 Encoding and Decoding Functions 7-11
7.2.16 NULL-Related Functions 7-11
7.2.17 Environment and Identifier Functions 7-11
7.3 Aggregate Functions 7-12
7.4 Analytic Functions 7-14
7.5 Object Reference Functions 7-21
7.6 Model Functions 7-21
7.7 OLAP Functions 7-21
7.8 Data Cartridge Functions 7-22
7.9 ABS 7-22
7.10 ACOS 7-22
7.11 ADD_MONTHS 7-23
7.12 APPENDCHILDXML 7-24
7.13 APPROX_COUNT_DISTINCT 7-25
7.14 APPROX_COUNT_DISTINCT_AGG 7-26
7.15 APPROX_COUNT_DISTINCT_DETAIL 7-27
7.16 APPROX_MEDIAN 7-30
7.17 APPROX_PERCENTILE 7-33
7.18 APPROX_PERCENTILE_AGG 7-36
7.19 APPROX_PERCENTILE_DETAIL 7-37
7.20 ASCII 7-41
7.21 ASCIISTR 7-42
7.22 ASIN 7-43
7.23 ATAN 7-43
7.24 ATAN2 7-44
7.25 AVG 7-45
7.26 BFILENAME 7-46
7.27 BIN_TO_NUM 7-47
7.28 BITAND 7-48

Index
Preface

This reference contains a complete description of the Structured Query Language (SQL) used to manage information in an Oracle Database. Oracle SQL is a superset of the American National Standards Institute (ANSI) and the International Organization for Standardization (ISO) SQL standard.

This Preface contains these topics:

• Audience
• Documentation Accessibility
• Related Documents
• Conventions

Audience

The Oracle Database SQL Language Reference is intended for all users of Oracle SQL.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Documents

For more information, see these Oracle resources:

• Oracle Database PL/SQL Language Reference for information on PL/SQL, the procedural language extension to Oracle SQL

Many of the examples in this book use the sample schemas, which are installed by default when you select the Basic Installation option with an Oracle Database
installation. Refer to *Oracle Database Sample Schemas* for information on how these schemas were created and how you can use them yourself.

**Conventions**

The following text conventions are used in this document:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface</td>
<td>Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.</td>
</tr>
<tr>
<td>italic</td>
<td>Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.</td>
</tr>
<tr>
<td>monospace</td>
<td>Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.</td>
</tr>
</tbody>
</table>
Changes in Oracle Database 12c Release 2 (12.2.0.1)

The following are changes in Oracle Database SQL Language Reference for Oracle Database 12c Release 2 (12.2.0.1).

New Features

The following features are new in this release:

Long Identifiers

The maximum length for most database object names has increased from 30 bytes to 128 bytes.

See Database Object Naming Rules.

Data-Bound Collation and Case-Insensitive Databases

Data-bound collation allows you to declare character comparison rules at the column level. The collation declared for a column is automatically applied to all collation-sensitive SQL operations that reference the column. This enables applications to consistently apply language-specific comparison rules to the exact data that requires these rules. Data-bound collation also allows you to declare a case-insensitive collation for a table or a schema, so that all columns in a table or schema can be compared in a case-insensitive manner. This enables you to create a case-insensitive database.

See Data-Bound Collation.

Features that Introduce New SQL Statements

The following features introduce new SQL statements:

Analytic views are metadata objects that provide a fast and efficient way to create and store analytic queries of data in existing database tables and views. With analytic views you can easily create complex analytic queries on large amounts of hierarchical and dimensional data. Attribute dimensions, hierarchies, and analytic views are new database schema objects.
See the following new statements:

- CREATE ANALYTIC VIEW
- CREATE ATTRIBUTE DIMENSION
- CREATE HIERARCHY
- ALTER ANALYTIC VIEW
- ALTER ATTRIBUTE DIMENSION
- ALTER HIERARCHY
- DROP ANALYTIC VIEW
- DROP ATTRIBUTE DIMENSION
- DROP HIERARCHY

- **Join groups** allow you to optimize join queries for table columns that are populated in the In-Memory Column Store.

See the following new statements:

- CREATE INMEMORY JOIN GROUP
- ALTER INMEMORY JOIN GROUP
- DROP INMEMORY JOIN GROUP

- **Oracle Sharding** supports distribution and replication of data across a pool of discrete Oracle databases that share no hardware or software.

See the following new statements:

- CREATE TABLESPACE SET
- ALTER TABLESPACE SET
- DROP TABLESPACE SET

See the new clauses **SHARDED** and **DUPlicated** of CREATE TABLE.

- **PDB lockdown profiles** in a multitenant container database (CDB) to restrict user operations in PDBs.

See the following new statements:

- CREATE LOCKDOWN PROFILE
- ALTER LOCKDOWN PROFILE
- DROP LOCKDOWN PROFILE

**ADMINISTER KEY MANAGEMENT Enhancements**

- You can instruct the database to force a keystore open for certain operations.

See Notes on the FORCE KEYSTORE Clause.

- You can use keystore passwords stored in an external store.

See the new clause **EXTERNAL STORE** in Notes on Specifying Keystore Passwords.

- You can specify an encryption algorithm for a master key.

See the new clause **USING ALGORITHM** of set_key and create_key.
ALTER SESSION Enhancement

- When you switch to a different container in a CDB, you can specify the service you would like to use in the new container.
  
  See the new clause SERVICE.

AUDIT and NOAUDIT (Unified Auditing) Enhancements

- You can enable or disable unified audit policies for users who have been directly granted specific roles.
  
  See the new clauses by_users_with_roles of AUDIT and NOAUDIT.

CREATE DATABASE and ALTER DATABASE Enhancements

- You can specify a local temporary tablespace for your database.
  
  See the clause default_temp_tablespace of CREATE DATABASE and the DEFAULT [LOCAL] TEMPORARY TABLESPACE Clause of ALTER DATABASE.

- You can specify local undo mode or shared undo mode for a CDB.
  
  See the new undo_mode_clause of CREATE DATABASE and undo_mode_clause of ALTER DATABASE.

- For Oracle Real Application Clusters (Oracle RAC) or Oracle RAC One Node databases, you can control the number of instances on a physical standby that Redo Apply uses.
  
  See the new clause USING INSTANCES of ALTER DATABASE.

- You can perform offline encryption or decryption of a data file using Transparent Data Encryption (TDE).
  
  See the new clauses ENCRYPT | DECRYPT of ALTER DATABASE.

CREATE DIRECTORY Enhancement

- You can create directories that are application common objects. Application common objects can be shared by application PDBs in an application container.
  
  See the new clause SHARING of CREATE DIRECTORY.

CREATE DISKGROUP and ALTER DISKGROUP Enhancements

- You can create Oracle ASM flex disk groups, which support quota groups and file groups. Flex disk groups enable you to define a quota limit for the files of a group of databases within a disk group.
  
  See:
  
  - The new FLEX keyword in the REDUNDANCY Clause of CREATE DISKGROUP.
  - The new quotagroup_clauses of ALTER DISKGROUP.
  - The new filegroup_clauses of ALTER DISKGROUP.

- You can pause, restart, and change the power of active disk group rebalance operations. You can also specify which phases of a rebalance operation to perform.
  
  See the rebalance_diskgroup_clause of ALTER DISKGROUP.
• The following new Oracle ASM disk group attributes are listed in Table 13-2:
  – LOGICAL_SECTOR_SIZE allows you to set the logical sector size of a disk group.
  – PREFERRED_READ.ENABLED allows you to specify whether preferred read functionality is enabled for a disk group in an Oracle extended cluster.

CREATE INDEX, ALTER INDEX, and DROP INDEX Enhancements

• You can specify whether to invalidate dependent cursors while creating an index, rebuilding an index, marking an index UNUSABLE, or dropping an index.

  See the new clause \{ DEFERRED | IMMEDIATE \} INVALIDATION of CREATEINDEX, ALTERINDEX, and DROPINDEX.

• Advanced index compression provides a HIGH compression level.

  See the new HIGH keyword of the clause advanced_index_compression of CREATE INDEX.

CREATE JAVA Enhancement

• You can create Java schema objects that are application common objects. Application common objects can be shared by application PDBs in an application container.

  See the new clause SHARING of CREATE JAVA.

CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW Enhancements

• A real-time materialized view provides fresh data to user queries even when the materialized view is not in sync with its base tables due to data changes.

  See the new clause \{ ENABLE | DISABLE \} ON QUERY COMPUTATION of CREATEMATERIALIZEDVIEW and ALTERMATERIALIZEDVIEW.

• The ON STATEMENT refresh mode causes an automatic refresh to occur every time a DML operation is performed on any of a materialized view's base tables.

  See the new ON STATEMENT Clause of CREATE MATERIALIZED VIEW.

CREATE PLUGGABLE DATABASE and ALTER PLUGGABLE DATABASE Enhancements

• An application container is a component of a CDB that stores data for one or more applications. It consists of an application root, an optional application seed, and application PDBs.

  See the new clauses AS APPLICATION CONTAINER and AS SEED of CREATE PLUGGABLE DATABASE.

• You can perform the following operations in an application container:
  – Install, patch, upgrade, and uninstall applications
  – Register application versions and patch numbers
  – Keep applications in sync between the application root and application PDBs

  See the new application_clauses of ALTER PLUGGABLE DATABASE.

• You can create a refreshable PDB when cloning a PDB. Changes in the source PDB can be propagated to the refreshable PDB, either manually or automatically.
See the new `pdb_refresh_mode_clause` of `CREATE PLUGGABLE DATABASE` and the new clauses `REFRESH` and `pdb_refresh_mode_clause` of `ALTER PLUGGABLE DATABASE`.

- **A proxy PDB** references a PDB in a different CDB and provides fully functional access to the referenced PDB.
  See the new clauses `AS PROXY FROM` and `HOST and PORT` of `CREATE PLUGGABLE DATABASE`.

- You can relocate a PDB from one CDB to another.
  See the new clause `RELOCATE` of `CREATE PLUGGABLE DATABASE`.

- When cloning a PDB, you can instruct the database to clone a tablespace using storage snapshots or clone the data model definition of a tablespace, but not the tablespace's data.
  See the new clauses `{ SNAPSHOT COPY | NO DATA }` of `CREATE PLUGGABLE DATABASE`.

- When plugging in a PDB, you can instruct the database to copy or move tablespace files to a new location.
  See the new clauses `{ COPY | MOVE | NOCOPY }` of `CREATE PLUGGABLE DATABASE`.

- In earlier releases, you could specify a permanent default tablespace only when creating a PDB from seed. You can now also specify a permanent default tablespace when cloning a PDB or plugging in a PDB.
  See the clause `default_tablespace` of `CREATE PLUGGABLE DATABASE`.

- You can use parallel execution servers to copy a new PDB's data files to a new location. This may result in faster creation of the PDB.
  See the new `parallel_pdb_creation_clause` of `CREATE PLUGGABLE DATABASE`.

**CREATE PROFILE** and **ALTER PROFILE** Enhancements

- In profiles, you can specify the permitted number of consecutive days of no logins after which an account will be locked.
  See the new `INACTIVE_ACCOUNT_TIME` setting of `CREATE PROFILE` and `ALTER PROFILE`.

**CREATE RESTORE POINT** Enhancement

- You can create restore points for a PDB.
  See the new clauses `CLEAN` and `FOR PLUGGABLE DATABASE` of `CREATE RESTORE POINT`.

**CREATE SEQUENCE** Enhancement

- You can create sequences that are application common objects. Application common objects can be shared by application PDBs in an application container.
  See the new clause `SHARING` of `CREATE SEQUENCE`.

**CREATE SYNONYM** Enhancement

- You can create synonyms that are application common objects. Application common objects can be shared by application PDBs in an application container.
See the new clause **SHARING** of CREATE SYNONYM.

**CREATE TABLE and ALTER TABLE Enhancements**

- You can create partitioned external tables.
  
  See the **external_table_clause** of CREATE TABLE and the clause **alter_external_table** of ALTER TABLE.

- You can specify constraints on external tables.
  
  See [External Table Constraints](#).

- You can specify up to 16 partitioning key columns for list-partitioned tables, and up to 16 subpartitioning key columns for composite-partitioned tables that use list subpartitioning. In earlier releases, you could specify only one partitioning or subpartitioning key column.
  
  See the **list_values_clause** of CREATE TABLE and ALTER TABLE.

- You can create an automatic list-partitioned table. This type of table enables the database to create additional list partitions on demand.
  
  See the new clauses **AUTOMATIC** of CREATE TABLE and **alter_automatic_partitioning** of ALTER TABLE.

- You can change a nonpartitioned table to a partitioned table.
  
  See the new clause **modify_to_partitioned** of ALTER TABLE.

- You can create a table that matches the structure of an existing partitioned table. The two tables are then eligible for exchanging partitions and subpartitions.
  
  See the new clause **FOR EXCHANGE WITH TABLE** of CREATE TABLE.

- You can specify which rows to preserve during the following operations: moving, splitting, or merging table partitions or subpartitions; moving a table; or converting a nonpartitioned table to a partitioned table.
  
  See the new clause **filter_condition** of ALTER TABLE.

- You can specify read-only mode for a table, partition, or subpartition.
  
  See the new **read_only_clause** of CREATE TABLE and ALTER TABLE.

- DML operations on a table are allowed while splitting its partitions and subpartitions.
  
  See the new **ONLINE** keyword of the clauses **split_table_partition** and **split_table_subpartition** of ALTER TABLE.

- Nonpartitioned tables can be moved as an online operation without blocking any concurrent DML operations. A table move operation now also supports automatic index maintenance as part of the move.
  
  See the **move_table_clause** of ALTER TABLE.

- You can specify whether to invalidate dependent cursors while performing table partition maintenance operations.
  
  See the new clause **{ DEFERRED | IMMEDIATE } INVALIDATION** of ALTER TABLE.

- You can create tables that are application common objects. Application common objects can be shared by application PDBs in an application container.
  
  See the new clause **SHARING** of CREATE TABLE.
• Table column encryption supports the following additional algorithms: ARIA192, ARIA256, GOST256, and SEED128.

See the clause `encryption_spec` of `CREATE TABLE` and `ALTER TABLE`.

• When specifying default In-Memory Column Store (IM column store) settings for a table, you can specify the Oracle RAC or Oracle Active Data Guard instances in which the table is eligible to be populated in the IM column store.

See the new clause `FOR SERVICE` of `CREATE TABLE` and `ALTER TABLE`.

• You can create Automatic Data Optimization policies that enable, disable, or recompress tables in the IM column store.

See the new clause `ilm_inmemory_policy` of `CREATE TABLE` and `ALTER TABLE`.

• Automatic Data Optimization compression policies support an additional compression method: COLUMN STORE COMPRESS FOR QUERY.

See the clause `ilm_compression_policy` of `CREATE TABLE` and `ALTER TABLE`.

CREATE TABLESPACE and ALTER TABLESPACE Enhancements

• Tablespace encryption enhancements: You can encrypt both offline and online tablespaces. You can encrypt undo tablespaces, temporary tablespaces, and the SYSTEM and SYSAUX tablespaces. Tablespace encryption supports the following additional algorithms: ARIA192, ARIA256, GOST256, and SEED128.

See the new `tablespace_encryption_clause` of `CREATE TABLESPACE` and the new clause `alter_tablespace_encryption` of `ALTER TABLESPACE`.

• You can create local temporary tablespaces, which are useful for Oracle Real Application Clusters and Oracle Flex Clusters. They store a separate, nonshared temp file for each database instance, which can improve I/O performance.

See the new `LOCAL TEMPORARY TABLESPACE clause` of the `temporary_tablespace_clause` of `CREATE TABLESPACE`.

• You can specify a default index compression method for a tablespace.

See the new clause `default_index_compression` of `CREATE TABLESPACE` and the clause `default_tablespace_params` of `ALTER TABLESPACE`.

• In earlier releases of Oracle Database, you could specify a default table compression method for a tablespace. You can still do this in Oracle Database 12c Release 2 (12.2), however, the syntax now includes the `TABLE` keyword to differentiate it from the new default index compression syntax.

See the new clause `default_table_compression` of `CREATE TABLESPACE` and the clause `default_tablespace_params` of `ALTER TABLESPACE`.

CREATE USER and ALTER USER Enhancements

• You can assign a local temporary tablespace to a user.

See the new `LOCAL` keyword for the `TEMPORARY TABLESPACE clause` of `CREATEUSER` and `ALTERUSER`.

CREATE VIEW Enhancement

• You can create views that are application common objects. Application common objects can be shared by application PDBs in an application container.
See the new clause **SHARING** of **CREATE VIEW**.

**FLASHBACK DATABASE** Enhancement

- You can flash back a PDB.
  
  See the new clause **PLUGGABLE** of **FLASHBACK DATABASE**.

**SELECT** Enhancement

- The **query_table_expression** clause of the **FROM** clause of the **SELECT** statement now accepts a hierarchy or an analytic view in a subquery.
  
  See the clause **query_table_expression** of **SELECT**.

**New Operator**

- The new **COLLATE** operator determines the collation for an expression. This operator enables you to override the collation that the database would have derived for the expression using standard collation derivation rules.
  
  See **COLLATE Operator**.

**New or Enhanced Expressions**

- The new calculated measure expression defines a calculated measure in an analytic view.
  
  See **Calculated Measure Expressions**.

- JSON object access expressions have been enhanced to let you access specific elements of a JSON array.
  
  See the clause **array_step** of **JSON Object Access Expressions**.

**Enhanced Condition**

- The **JSON_EXISTS** condition now lets you pass values to the path expression.
  
  See the new clause **JSON_passing_clause** of **JSON_EXISTS**.

**New or Enhanced Functions**

- **Approximate Query Processing Functions**
  
  The following new functions return approximate results with negligible deviation from the exact result:

  - **APPROX_MEDIAN** takes a numeric or datetime value and returns an approximate median value.
  
  - **APPROX_PERCENTILE** takes a percentile value and a sort specification, and returns the value that would fall into that percentile value with respect to the sort specification.

  The following new functions support materialized view-based summary aggregation strategies for approximate distinct value counts:

  - **APPROX_COUNT_DISTINCT_DETAIL** calculates information about the approximate number of rows that contain a distinct value for an expression and returns a **BLOB** value, called a detail, which contains that information in a special format.
– APPROX_COUNT_DISTINCT_AGG takes as its input a column of details containing information about approximate distinct value counts, and enables you to perform aggregations of those counts.

– TO_APPROX_COUNT_DISTINCT takes as its input a detail containing information about an approximate distinct value count, and converts it to a NUMBER value.

The following new functions support materialized view-based summary aggregation strategies for approximate percentile values:

– APPROX_PERCENTILE_DETAIL calculates approximate percentile information for the values and returns a BLOB value, called a detail, which contains that information in a special format.

– APPROX_PERCENTILE_AGG takes as its input a column of details containing approximate percentile information, and enables you to perform aggregations of that information.

– TO_APPROX_PERCENTILE takes as its input a detail containing approximate percentile information, a percentile value, and a sort specification, and returns an approximate value that would fall into that percentile value with respect to the sort specification.

• Collation Functions

The following new functions return information about collation settings:

– COLLATION returns the name of the derived collation for an expression.

– NLS_COLLATION_ID takes as its argument a collation name and returns the corresponding collation ID number.

– NLS_COLLATION_NAME takes as its argument a collation ID number and returns the corresponding collation name.

• Conversion Functions

The following conversion functions now allow you to specify a value to be returned if a conversion error occurs:

– CAST - In addition, this function now lets you specify a format model and NLS parameters to be applied for the conversion.

– TO_BINARY_DOUBLE
– TO_BINARY_FLOAT
– TO_DATE
– TO_DSINTERVAL
– TO_NUMBER
– TO_TIMESTAMP
– TO_TIMESTAMP_TZ
– TO_YMINTERVAL

The following new function lets you determine whether an expression can be converted to a specified data type:

– VALIDATE_CONVERSION

The following new functions allow additional data types to be converted to BLOB, character, and CLOB values:
- **TO_BLOB (bfile)** converts a BFILE value to a BLOB value.
- **TO_CHAR (bfile|blob)** converts BFILE or BLOB data to the database character set.
- **TO_CLOB (bfile|blob)** converts BFILE or BLOB data to the database character set and returns the data as a CLOB value.

**Data Mining Functions**

The data mining functions are enhanced so they can be applied to models built using the native algorithms of Oracle, as well as those built using R through the extensibility mechanism of Oracle Advanced Analytics. See Data Mining Functions.

The following are new data mining functions:

- **FEATURE_COMPARE** uses a Feature Extraction model to compare two different documents.
- **ORA_DM_PARTITION_NAME** returns the name of the partition associated with the input row.

The syntax of the following functions is enhanced so that the functions can use the GROUPING hint when scoring a partitioned model:

- **CLUSTER_DETAILS**
- **CLUSTER_DISTANCE**
- **CLUSTER_ID**
- **CLUSTER_PROBABILITY**
- **CLUSTER_SET**
- **FEATURE_COMPARE**
- **FEATURE_DETAILS**
- **FEATURE_ID**
- **FEATURE_SET**
- **FEATURE_VALUE**
- **ORA_DM_PARTITION_NAME**
- **PREDICTION**
- **PREDICTION_BOUNDS**
- **PREDICTION_COST**
- **PREDICTION_DETAILS**
- **PREDICTION_PROBABILITY**
- **PREDICTION_SET**

**JSON Functions**

The following new functions enable you to query and generate JavaScript Object Notation (JSON) data:

- **JSON_ARRAY** takes as its input one or more SQL expressions, converts each expression to a JSON value, and returns a JSON array that contains those JSON values.
– **JSON_ARRAYAGG** takes as its input a column of SQL expressions, converts each expression to a JSON value, and returns a single JSON array that contains those JSON values.

– **JSON_DATAGUIDE** takes as its input a table column of JSON data. Each row in the column is referred to as a JSON document. For each JSON document in the column, this function returns a CLOB value that contains a flat data guide for that JSON document.

– **JSON_OBJECT** takes as its input one or more property key-value pairs, and returns a JSON object that contains an object member for each of those key-value pairs.

– **JSON_OBJECTAGG** takes as its input a property key-value pair, constructs an object member for each key-value pair, and returns a single JSON object that contains those object members.

The following JSON functions have been enhanced to let you specify a return value when no match is found:

– **JSON_QUERY**

– **JSON_VALUE**

• **LISTAGG Function**

– **LISTAGG** now allows you to control how the function behaves when the return value exceeds the maximum length of the return data type.

**New or Enhanced Privileges**

The following are new or enhanced system privileges and object privileges:

• The following system privileges, which are listed in Table 18-1, have been enhanced:

  – CREATE JOB and CREATE ANY JOB now allow you to manage resource objects and incompatibility resource objects.

• The following new system privileges are listed in Table 18-1:

  – These system privileges allow the creation and management of analytic views:

    CREATE ANALYTIC VIEW, CREATE ANY ANALYTIC VIEW, ALTER ANY ANALYTIC VIEW, DROP ANY ANALYTIC VIEW

    CREATE ATTRIBUTE DIMENSION, CREATE ANY ATTRIBUTE DIMENSION, ALTER ANY ATTRIBUTE DIMENSION

    CREATE HIERARCHY, CREATE ANY HIERARCHY, ALTER ANY HIERARCHY, and DROP ANY HIERARCHY

  – CREATE LOCKDOWN PROFILE, ALTER LOCKDOWN PROFILE, and DROP LOCKDOWN PROFILE allow you to manage PDB lockdown profiles.

  – INHERIT ANY REMOTE PRIVILEGES allows you to execute definer's rights procedures or functions that contain current user database links.

  – USE ANY JOB RESOURCE allows you to associate any schedule resource object with any program or job in the grantee’s schema.

• The following new object privileges are listed in Table 18-2:

  – INHERIT REMOTE PRIVILEGES can be granted on a user to users and roles. It allows the user on whom this privilege is granted to execute definer's rights
procedures or functions that contain current user database links and are owned by the grantee.

- The **USE** privilege can be granted on job scheduler objects. It allows you to associate the specified scheduler resource object with programs and jobs.

**New Hints**

The following are new hints:

- The **CONTAINERS Hint** lets you pass a hint to the query of each PDB in a CDB or application container during a `SELECT ... containers_clause ... query`.

- The **FRESH_MV Hint** is part of the new real-time materialized view feature. This hint allows you to fetch up-to-date data from a stale real-time materialized view.

- The **GROUPING Hint** applies to data mining scoring functions when scoring partitioned models.

- The **USE_BAND Hint** and **NO_USE_BAND Hint** allow you to use or exclude band joins in a query. Band joins are new for this release. For more information, see [Band Joins](#).

**Deprecated Features**

The following features are deprecated in this release, and may be desupported in a future release:

- The **XMLROOT** function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you instead use the SQL/XML function `XMLSERIALIZE` with a version number. See [Oracle XML DB Developer's Guide](#) for more information on the `XMLSERIALIZE` function.

**Desupported Features**

Some features previously described in this document are desupported in Oracle Database 12c Release 2 (12.2). See [Oracle Database Upgrade Guide](#) for a list of desupported features.

**Changes in Oracle Database 12c Release 1 (12.1.0.2)**

The following are changes in *Oracle Database SQL Language Reference* for Oracle Database 12c Release 1 (12.1.0.2).

**New Features**

The following features are new in this release:
• The **In-Memory Column Store** (IM column store) is an optional, static SGA pool that stores copies of tables and partitions in a special columnar format optimized for rapid scans.

  See the `inmemory_table_clause` of `CREATE TABLE`, the `inmemory_clause` of `CREATE TABLESPACE`, and the `inmemory_table_clause` of `CREATE MATERIALIZED VIEW`.

  See the following hints:
  - **INMEMORY** Hint
  - **NO_INMEMORY** Hint
  - **INMEMORY_PRUNING** Hint
  - **NO_INMEMORY_PRUNING** Hint

• Oracle Database now supports **JavaScript Object Notation (JSON)**.

  See the following conditions:
  - **IS JSON** Condition
  - **JSON_EXISTS** Condition
  - **JSON_TEXTCONTAINS** Condition

  See the following functions:
  - **JSON_QUERY**
  - **JSON_TABLE**
  - **JSON_VALUE**

  See "**JSON Object Access Expressions**"

• **Attribute clustering** lets you cluster table data in close physical proximity based on the content of specified columns.

  See the `attribute_clustering_clause` of `CREATE TABLE` and the `attribute_clustering_clause` of `ALTER TABLE`.

  See the following hints:
  - **CLUSTERING** Hint
  - **NO_CLUSTERING** Hint

• **Zone maps** let you reduce the I/O and CPU costs of table scans by tracking the sets of contiguous data blocks, or zones, in which certain column values are stored. You can use zone maps with or without attribute clustering.

  See the statements `CREATE MATERIALIZED ZONEMAP`, `ALTER MATERIALIZED ZONEMAP`, and `DROP MATERIALIZED ZONEMAP`, and the `zonemap_clause` of `CREATE TABLE`.

  See the **NO_ZONEMAP** Hint and the function **SYS_OP_ZONE_ID**

• You can now create **range-partitioned hash clusters**.

  See the `cluster_range_partitions` clause of `CREATE CLUSTER` and the `allocate_extent_clause` of `ALTER CLUSTER`.

• The new function **APPROX_COUNT_DISTINCT** returns the approximate number of distinct values for a column. This function is an alternative to the **COUNT** function. It processes large amounts of data significantly faster than **COUNT**, with negligible deviation from the exact result.
• A new type of index compression called advanced index compression lets you improve compression ratios significantly while still providing efficient access to indexes.

See the advanced_index_compression clause of CREATE INDEX

• For tables compressed with Hybrid Columnar Compression, you can now control whether row-level locking is used during DML operations.

See the [NO] ROW LEVEL LOCKING clause of CREATE TABLE

• The database now supports force full database caching mode, which allows you to designate the entire database, including NOCACHE LOBs, as eligible for caching in the buffer cache.

See the [NO] FORCE FULL DATABASE CACHING clause of ALTER DATABASE

• When you grant a database role to a user who is responsible for CBAC grants, you can now specify WITH DELEGATE OPTION in the GRANT statement to prevent giving the grantee additional privileges on the role. WITH DELEGATE OPTION is an alternative to WITH ADMIN OPTION. It enables a role to be granted to program units, but it does not permit the granting of the role to other principals or the administration of the role itself.

See the WITH DELEGATE OPTION clause of GRANT

• The new READ object privilege and READ ANY TABLE system privilege allow users to query tables, materialized views, views, and their synonyms.

The READ object privilege is an alternative to the SELECT object privilege. In addition to querying objects, the SELECT object privilege allows users lock rows of a table with the LOCK TABLE and SELECT ... FOR UPDATE statements. The READ object privilege only allows users to query objects. See Table 18-2 for more information.

The READ ANY TABLE system privilege is an alternative to the SELECT ANY TABLE system privilege. In addition to querying objects, the SELECT ANY TABLE privilege allows users to lock rows of a table with the SELECT ... FOR UPDATE statement. The READ ANY TABLE privilege only allows users to query objects. See Table 18-1 for more information.

Changes in Oracle Database 12c Release 1 (12.1.0.1)

The following are changes in Oracle Database SQL Language Reference for Oracle Database 12c Release 1 (12.1.0.1).

New Features

The following features are new in this release:

Features that Introduce New SQL Statements

The following features introduce new SQL statements:

• The multitenant architecture offers the capability that enables an Oracle database to function as a multitenant container database (CDB). A CDB is an Oracle database that includes one or more pluggable databases (PDBs). A PDB is a portable collection of schemas, schema objects, and nonschema objects that
appears to an Oracle client as a non-CDB. You can unplug a PDB from a CDB and plug it into a different CDB.

See the following new statements:

- CREATE PLUGGABLE DATABASE
- ALTER PLUGGABLE DATABASE
- DROP PLUGGABLE DATABASE

- **Unified auditing** provides a full set of enhanced auditing features. It enables you to create named unified audit policies, enable or disable unified audit policies, apply users to or exclude users from policies, and set whether an audit record is created if the audited behavior fails, succeeds, or both. It also enables you to capture application context values in audit records.

See the following new statements:

- CREATE AUDIT POLICY (Unified Auditing)
- ALTER AUDIT POLICY (Unified Auditing)
- DROP AUDIT POLICY (Unified Auditing)
- AUDIT (Unified Auditing)
- NOAUDIT (Unified Auditing)

- A new unified key management interface for Transparent Data Encryption (TDE) eases key administration tasks, provides for better compliance and tracking, and improves separation of duty between the database administrator and security administrator.

See the new ADMINISTER KEY MANAGEMENT statement.

**ALTER DATABASE Enhancements**

The following features provide enhancements to the ALTER DATABASE statement:

- **Storage Snapshot Optimization** enables you to use a third-party storage snapshot of the database taken without backup mode for all types of recovery operations, including point-in-time recovery. The ALTER DATABASE statement has been enhanced with the new SNAPSHOTTIME clause to enable you to recover the database using such a storage snapshot.

See the new SNAPSHOTTIME clause of the ALTER DATABASE full_database_recovery clause.

- Move an online data file to a new location while the database is open and accessing the data file.

See the new move_datafile_clause of ALTER DATABASE.

- Create a control file for a Data Guard far sync instance.

See the enhanced controlfile_clauses of ALTER DATABASE.

- Performing switchovers and failovers to a physical standby database is simplified.

See the new ALTER DATABASE clauses switchover_clause and failover_clause.

- Real-time apply is now enabled by default during Redo Apply on a physical standby database. You can disable real-time apply by specifying USING ARCHIVED LOGFILE.
See the enhanced `managed_standby_recovery` clause of `ALTER DATABASE`.

**ALTER SYSTEM Enhancements**

The following features provide enhancements to the `ALTER SYSTEM` statement:

- Relocate a client to the least loaded Oracle ASM instance.
  See the new `RELOCATE CLIENT` clause of `ALTER SYSTEM`.
- Apply one-off patches released for Oracle ASM in a rolling manner.
  See the new `rolling_patch_clauses` of `ALTER SYSTEM`.

**AUDIT and NOAUDIT (Traditional Auditing) Enhancements**

The following feature provides enhancements to the `AUDIT` and `NOAUDIT` statements for traditional auditing:

- Audit operations on a SQL translation profile.
  See the new clause `ON SQL TRANSLATION PROFILE` of `AUDIT`.

**CREATE DISKGROUP and ALTER DISKGROUP Enhancements**

The following features provide enhancements to the `CREATE DISKGROUP` statement, `ALTER DISKGROUP` statement, or both:

- Check logical data corruptions and repair them automatically in normal and high redundancy Oracle ASM disks groups.
  See the new `scrub_clause` of `ALTER DISKGROUP`.
- Replace a user in an Oracle ASM disk group.
  See the enhanced `user_clauses` of `ALTER DISKGROUP`.
- Change the permissions, owner, and user group of an Oracle ASM disk group file while it is open.
  See the enhanced `ALTER DISKGROUP` clauses `file_permissions_clause` and the `file_owner_clause`.
- Replace one or more disks in an Oracle ASM disk group with a single operation.
  See the new `replace_disk_clause` of `ALTER DISKGROUP`.
- Rename a disk in an Oracle ASM disk group.
  See the new `rename_disk_clause` of `ALTER DISKGROUP`.
- The following are new Oracle ASM disk group attributes:
  - `CONTENT_CHECK` allows you to enable or disable content checking when performing data copy operations for rebalancing a disk group.
  - `FAILGROUP_REPAIR_TIME` allows you to specify a default repair time for the failure groups in the disk group.
  - `PHYS_META_REPLICATED` allows you to track the replication status of a disk group.
  - `THIN_PROVISIONED` allows you to enable or disable the functionality to discard unused storage space after a disk group rebalance is completed.

See Table 13-2.
CREATE FLASHBACK ARCHIVE and ALTER FLASHBACK ARCHIVE Enhancements

The following feature provides enhancements to the CREATE FLASHBACK ARCHIVE and ALTER FLASHBACK ARCHIVE statements:

- Instruct the database to optimize the storage of data in history tables.
  See the new clause [NO] OPTIMIZE DATA of CREATE FLASHBACK ARCHIVE and the new clause [NO] OPTIMIZE DATA of ALTER FLASHBACK ARCHIVE.

CREATE INDEX and ALTER INDEX Enhancements

The following features provide enhancements to the CREATE INDEX statement, ALTER INDEX statement, or both:

- Create partial indexes on a subset of the partitions of a table.
  See the new partial_index_clause of CREATE INDEX.
- Remove orphaned index entries for records that were previously dropped or truncated by a table partition maintenance operation.
  See the new keyword CLEANUP of ALTER INDEX ... COALESCE and the new keyword CLEANUP of ALTER INDEX ... MODIFY PARTITION ... COALESCE.
- Create multiple indexes on the same set of columns, column expressions, or both if the indexes are of different types, use different partitioning, or have different uniqueness properties.
  See the index_expr clause of CREATE INDEX.

CREATE INDEXTYPE and ALTER INDEXTYPE Enhancements

The following feature provides enhancements to the CREATE INDEXTYPE and ALTER INDEXTYPE statements:

- Create domain indexes on hash- and interval-partitioned tables.
  See CREATE INDEXTYPE and ALTER INDEXTYPE.

CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW Enhancements

The following feature provides enhancements to the CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW statements:

- Materialized views, which are noneditioned objects, can depend on editioned objects.
  See:
  - The new clauses evaluation_edition_clause and unusable_editions_clause of CREATE MATERIALIZED VIEW
  - The new clauses evaluation_edition_clause and unusable_editions_clause of ALTER MATERIALIZED VIEW

CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG Enhancements

The following feature provides enhancements to the CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG statements:
• Specify the refresh method for which a materialized view log will be used. You can specify synchronous refresh, which is introduced in Oracle Database 12c, or fast refresh, which is also available in earlier releases.

See:
– The new `for_refresh_clause` of `CREATE MATERIALIZED VIEW LOG`
– The new `for_refresh_clause` of `ALTER MATERIALIZED VIEW LOG`

**CREATE SEQUENCE** and **ALTER SEQUENCE** Enhancements

The following features provide enhancements to the **CREATE SEQUENCE** and **ALTER SEQUENCE** statements:

• Control whether the sequence pseudocolumn `NEXTVAL` retains its original value during replay for Application Continuity.

See:
– The new clauses `KEEP` and `NOKEEP` of `CREATE SEQUENCE`
– The new clauses `KEEP` and `NOKEEP` of `ALTER SEQUENCE`

• Create a session sequence, which is a special type of sequence that is specifically designed to be used with global temporary tables that have session visibility.

See:
– The new clauses `SESSION` and `GLOBAL` of `CREATE SEQUENCE`
– The new clauses `SESSION` and `GLOBAL` of `ALTER SEQUENCE`

**CREATE TABLE** and **ALTER TABLE** Enhancements

The following features provide enhancements to the **CREATE TABLE** statement, **ALTER TABLE** statement, or both:

• The maximum size for the `VARCHAR2`, `NVARCHAR2`, and `RAW` data types is increased to 32767 bytes.

See “Extended Data Types”.

• **Temporal Validity** support enables you to associate a valid time dimension with a table. You can use Oracle Flashback Query to retrieve rows from that table based on whether they are considered valid as of a specified time or during a specified time period.

See:
– The new `CREATE TABLE` clause `period_definition`
– The new `ALTER TABLE` clauses `add_period_clause` and `drop_period_clause`
– The enhanced `SELECT` `flashback_query_clause`

• Virtual columns, which are noneditioned objects, can depend on editioned objects.

See:
– The new clauses `evaluation_edition_clause` and `unusable_editions_clause` of `CREATE TABLE`
– The new clause `modify_virtcol_properties` of `ALTER TABLE`
• Performance has been improved when you specify a \texttt{DEFAULT} value for a nullable column.

  See the \texttt{DEFAULT} clause of \texttt{ALTER TABLE}.

• Specify a default column value that includes the sequence pseudocolumns \texttt{CURRVAL} and \texttt{NEXTVAL}.

  See:
  – The \texttt{DEFAULT} clause of \texttt{CREATE TABLE}
  – The \texttt{DEFAULT} clause of \texttt{ALTER TABLE}

• The \texttt{DEFAULT} clause has the new clause \texttt{ON NULL}, which instructs the database to assign a specified default column value when an \texttt{INSERT} statement attempts to assign a value that evaluates to \texttt{NULL}.

  See:
  – The \texttt{ON NULL} clause of \texttt{CREATE TABLE}
  – The \texttt{ON NULL} clause of \texttt{ALTER TABLE}

• Specify an identity column, which is assigned an increasing or decreasing integer value from a sequence generator.

  See:
  – The new clauses \texttt{identity\_clause} of \texttt{CREATE TABLE} and \texttt{identity\_options} of \texttt{CREATE TABLE}
  – The new clauses \texttt{identity\_clause} of \texttt{ALTER TABLE} and \texttt{identity\_options} of \texttt{ALTER TABLE}

• Hide and unhide columns in tables.

  See:
  – The new clauses \texttt{VISIBLE | INVISIBLE} of \texttt{CREATE TABLE}
  – The new clauses \texttt{VISIBLE | INVISIBLE} of \texttt{CREATE TABLE} for virtual columns
  – The new clause \texttt{modify\_col\_visibility} of \texttt{ALTER TABLE}

• Recursively cascade a truncate operation to child tables.

  See the new keyword \texttt{CASCADE} of the clause \texttt{truncate\_partition\_subpart} of \texttt{ALTER TABLE}.

• Recursively cascade an exchange operation to child tables.

  See the new keyword \texttt{CASCADE} of the clause \texttt{exchange\_partition\_subpart} of \texttt{ALTER TABLE}.

• Store \texttt{XMLType} data, and abstract data types that contain attributes of type \texttt{XMLType}, \texttt{CLOB}, \texttt{BLOB}, or \texttt{NCLOB}, in an \texttt{ANYDATA} column.

  See the new clause \texttt{modify\_opaque\_type} of \texttt{ALTER TABLE}.

• Enable a table for row archival for In-Database Archiving.

  See the new \texttt{ROW ARCHIVAL} clause of \texttt{CREATE TABLE}.

• Manage policies for Automatic Data Optimization.

  See the new \texttt{ilm\_clause} of \texttt{CREATE TABLE} and the new \texttt{ilm\_clause} of \texttt{ALTER TABLE}. 
• Create a reference-partitioned child table whose parent is an interval-partitioned table.
  See the enhanced clause reference_partitioning of CREATE TABLE.

• Specify multiple table partitions or table subpartitions for the following ALTER TABLE operations:
  – Add one or more range, list, or system partitions to a table. See add_table_partition.
  – Add one or more range subpartitions to a partition. See add_range_subpartition.
  – Add one or more list subpartitions to a partition. See add_list_subpartition.
  – Split one range or list partition into two or more partitions. See split_table_partition.
  – Split one range or list subpartition into two or more subpartitions. See split_table_subpartition.
  – Merge two or more range, list, or system partitions into one new partition. See merge_table_partitions.
  – Merge two or more range or list subpartitions into one new subpartition. See merge_table_subpartitions.
  – Truncate one or more partitions or subpartitions. See truncate_partition_subpart.
  – Drop one or more partitions. See drop_table_partition.
  – Drop one or more subpartitions. See drop_table_subpartition.

• In earlier releases, the following DDL operations required a DML-blocking lock. You can use the new ONLINE keyword to allow the execution of DML statements during the following DDL operations:
  – Dropping an index (using DROP INDEX ... ONLINE ...)
  – Marking an index as UNUSABLE (using ALTER INDEX ... UNUSABLE ONLINE)
  – Marking a column as UNUSED (using ALTER TABLE ... SET UNUSED ... ONLINE ...)
  – Dropping a constraint (using ALTER TABLE ... DROP ... ONLINE ...)
  – Moving a table partition (using ALTER TABLE ... MOVE PARTITION ... ONLINE)
  – Moving a table subpartition (using ALTER TABLE ... MOVE SUBPARTITION ... ONLINE)

CREATE VIEW Enhancements

The following features provide enhancements to the CREATE VIEW statement:

• Hide and unhide columns in views.
  See the new clause VISIBLE | INVISIBLE of CREATE VIEW.

• Specify whether functions referenced in the view are executed using the view invoker's rights or the view definer's rights.
  See the new clause BEQUEATH of CREATE VIEW.
GRANT and REVOKE Enhancements

The following features provide enhancements to the **GRANT** and **REVOKE** statements:

- **Grant object privileges on a user** to users and roles.
  
  See:
  
  - The new clause **ON USER** of **GRANT**
  - The new clause **ON USER** of **REVOKE**

- **Grant object privileges on a SQL translation profile to users and roles.**
  
  See:
  
  - The new clause **ON SQL TRANSLATION PROFILE** of **GRANT**
  - The new clause **ON SQL TRANSLATION PROFILE** of **REVOKE**

- **Grant code based access control (CBAC) roles to program units.**
  
  See:
  
  - The new clause **grant_roles_to_programs** of **GRANT**
  - The new clause **revoke_roles_from_programs** of **REVOKE**

SELECT Enhancements

The following features provide enhancements to the **SELECT** statement:

- **Pattern matching** enables you to recognize patterns found across multiple rows in a table.
  
  See the new **row_pattern_clause** of **SELECT**.

- Perform top-N queries by specifying an offset, and the number of rows or percentage of rows to return.
  
  See the new **row_limiting_clause** of **SELECT**.

- In a query that performs outer joins of more than two pairs of tables, a single table can now be the null-generated table for multiple tables.
  
  See "Outer Joins ".

- Perform a variation of an ANSI **CROSS JOIN** or an ANSI **LEFT OUTER JOIN** with **left** correlation support. You can specify a table reference or collection expression on the right side of the join clause.
  
  See the new **cross_outer_apply_clause** of **SELECT**.

- Specify a lateral inline view in a query expression.
  
  See the new keyword **LATERAL** of **SELECT**.

- Declare and define PL/SQL functions and procedures in the **WITH** clause of a query. You can then reference the PL/SQL functions in the query and its subqueries.
  
  See the new clause **plsql_declarations** on **SELECT**.

TRUNCATE TABLE Enhancements

The following feature provides enhancements to the **TRUNCATE TABLE** statement:
• Recursively truncate child tables.
  See the new clause CASCADE of TRUNCATE TABLE.

New or Enhanced Functions
The following are new or enhanced functions:

• CLUSTER_DETAILS is a new function that predicts cluster membership for each row. It can use a pre-defined clustering model or perform dynamic clustering. The function returns an XML string that describes the predicted cluster or a specified cluster.

• CLUSTER_DISTANCE is a new function that predicts cluster membership for each row. It can use a pre-defined clustering model or perform dynamic clustering. The function returns the raw distance between each row and the centroid of either the predicted cluster or a specified.

• CLUSTER_ID has been enhanced so that it can either use a pre-defined clustering model or perform dynamic clustering.

• CLUSTER_PROBABILITY has been enhanced so that it can either use a pre-defined clustering model or perform dynamic clustering. The data type of the return value has been changed from NUMBER to BINARY_DOUBLE.

• CLUSTER_SET has been enhanced so that it can either use a pre-defined clustering model or perform dynamic clustering. The data type of the returned probability has been changed from NUMBER to BINARY_DOUBLE.

• FEATURE_DETAILS is a new function that predicts feature matches for each row. It can use a pre-defined feature extraction model or perform dynamic feature extraction. The function returns an XML string that describes the predicted feature or a specified feature.

• FEATURE_ID has been enhanced so that it can either use a pre-defined feature extraction model or perform dynamic feature extraction.

• FEATURE_SET has been enhanced so that it can either use a pre-defined feature extraction model or perform dynamic feature extraction. The data type of the return value has been changed from NUMBER to BINARY_DOUBLE.

• FEATURE_VALUE has been enhanced so that it can either use a pre-defined feature extraction model or perform dynamic feature extraction. The data type of the return value has been changed from NUMBER to BINARY_DOUBLE.

• ORA_INVOKING_USER is a new function that returns the name of the database user who invoked the current statement or view. This function takes into account the BEQUEATH property of intervening views referenced in the statement.

• ORA_INVOKING_USERID is a new function that returns the identifier of the database user who invoked the current statement or view. This function takes into account the BEQUEATH property of intervening views referenced in the statement.

• PREDICTION has been enhanced so that it can either use a pre-defined predictive model or perform dynamic prediction.

• PREDICTION_BOUNDS now returns the upper and lower bounds of the prediction as the BINARY_DOUBLE data type. It previously returned these values as the NUMBER data type.
• **PREDICTION_COST** has been enhanced so that it can either use a pre-defined predictive model or perform dynamic prediction. The data type of the returned cost has been changed from **NUMBER** to **BINARY_DOUBLE**.

• **PREDICTION_DETAILS** has been enhanced so that it can either use a pre-defined predictive model or perform dynamic prediction.

• **PREDICTION_PROBABILITY** has been enhanced so that it can either use a pre-defined predictive model or perform dynamic prediction. The data type of the returned probability has been changed from **NUMBER** to **BINARY_DOUBLE**.

• **PREDICTION_SET** has been enhanced so that it can either use a pre-defined predictive model or perform dynamic prediction. The data type of the returned probability has been changed from **NUMBER** to **BINARY_DOUBLE**.

• **STANDARD_HASH** is a new function that computes a hash value for a given expression using one of several standardized hash algorithms.

• **SYS_CONTEXT** enables you to query a new built-in namespace, **SYS_SESSION_ROLES**, which allows you to determine if a specified role is currently enabled for the session.

**New or Enhanced Privileges**

The following are new or enhanced system privileges and object privileges:

• The behavior has changed for the following system privilege, which is listed in Table 18-1:
  – **SELECT ANY DICTIONARY** now does not allow you to query the following objects in the **SYS** schema: **DEFAULT_PWD$**, **ENC$**, **LINK$**, **USER$**, **USER_HISTORY$**, and **XS$VERIFIER$**.

• The following new system privileges are listed in Table 18-1:
  – **CREATE SQL TRANSLATION PROFILE**, **CREATE ANY SQL TRANSLATION PROFILE**, **ALTER ANY SQL TRANSLATION PROFILE**, **USE ANY SQL TRANSLATION PROFILE**, and **DROP ANY SQL TRANSLATION PROFILE** allow you to manage SQL translation profiles.
  – **EXEMPT REDACTION POLICY** allows you to bypass any existing Oracle Data Redaction policies.
  – **INHERIT ANY PRIVILEGES** allows you to execute invoker’s rights procedures with the privileges of the invoker.
  – **KEEP DATE TIME** allows the **SYSDATE** and **SYSTIMESTAMP** functions to return their original values during replay for Application Continuity.
  – **KEEP SYS_GUID** allows the **SYS_GUID** function to return its original value during replay for Application Continuity.
  – **LOGMINING** allows you to perform LogMiner operations in a multitenant container database (CDB).
  – **PURGE DBA_RECYCLEBIN** allows you to remove all objects from the system-wide recycle bin.
  – **SYSBACKUP** allows you to perform backup and recovery tasks.
  – **SYSDG** allows you to manage Oracle Data Guard.
  – **SYSKM** allows you to perform encryption key management.
TRANSLATE ANY SQL allows you to translate SQL for any user.

- The following new object privileges are listed in Table 18-2:
  - The `ALTER` and `USE` privileges authorize operations on SQL translation profiles.
  - `INHERIT PRIVILEGES` is a new type of object privilege that can be granted on a user to users and roles. It allows invoker's rights procedures owned by the grantee to be executed with the privileges of the invoker when the invoker is the user on whom this privilege is granted.
  - `KEEP SEQUENCE` allows the sequence pseudocolumn `NEXTVAL` to retain its original value during replay for Application Continuity.
  - `TRANSLATE SQL` is a new type of object privilege that can be granted on a user to users and roles. It allows the grantee to translate SQL through the grantee's SQL translation profile for the user on whom this privilege is granted.

New Hints

The following are new hints:

- The `GATHER_OPTIMIZER_STATISTICS` Hint and `NO_GATHER_OPTIMIZER_STATISTICS` Hint allow you to enable and disable statistics gathering during bulk loads.
- The `PQ_CONCURRENT_UNION` Hint and `NO_PQ_CONCURRENT_UNION` Hint allow you to enable and disable concurrent processing of `UNION` and `UNION ALL` operations.
- The `PQ_FILTER` Hint allows you to instruct the optimizer on how to process rows when filtering correlated subqueries.
- The `PQ_SKEW` Hint and `NO_PQ_SKEW` Hint allow you to advise the optimizer of whether the distribution of the values of the join keys for a parallel join is skewed.
- The `USE_CUBE` Hint and `NO_USE_CUBE` Hint allow you to specify whether to use or exclude cube joins.

Deprecated Features

The following features are deprecated in this release, and may be desupported in a future release:

- Stored outlines are deprecated. They are still supported for backward compatibility. However, Oracle recommends that you use SQL plan management instead. SQL plan management creates SQL plan baselines, which offer superior SQL performance stability compared with stored outlines.
  See Oracle Database SQL Tuning Guide for more information about SQL plan management.
- The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the `ADMINISTER KEY MANAGEMENT` statement.
Desupported Features

Some features previously described in this document are desupported in Oracle Database 12c Release 1 (12.1). See Oracle Database Upgrade Guide for a list of desupported features.
1
Introduction to Oracle SQL

Structured Query Language (SQL) is the set of statements with which all programs and users access data in an Oracle Database. Application programs and Oracle tools often allow users access to the database without using SQL directly, but these applications in turn must use SQL when executing the user's request. This chapter provides background information on SQL as used by most database systems.

This chapter contains these topics:

• History of SQL
• SQL Standards
• Lexical Conventions
• Tools Support

1.1 History of SQL

Dr. E. F. Codd published the paper, "A Relational Model of Data for Large Shared Data Banks", in June 1970 in the Association of Computer Machinery (ACM) journal, *Communications of the ACM*. Codd’s model is now accepted as the definitive model for relational database management systems (RDBMS). The language, Structured English Query Language (SEQUEL) was developed by IBM Corporation, Inc., to use Codd’s model. SEQUEL later became SQL (still pronounced "sequel"). In 1979, Relational Software, Inc. (now Oracle) introduced the first commercially available implementation of SQL. Today, SQL is accepted as the standard RDBMS language.

1.2 SQL Standards

Oracle strives to comply with industry-accepted standards and participates actively in SQL standards committees. Industry-accepted committees are the American National Standards Institute (ANSI) and the International Organization for Standardization (ISO), which is affiliated with the International Electrotechnical Commission (IEC). Both ANSI and the ISO/IEC have accepted SQL as the standard language for relational databases. When a new SQL standard is simultaneously published by these organizations, the names of the standards conform to conventions used by the organization, but the standards are technically identical.

See Also:

*Oracle and Standard SQL* for a detailed description of Oracle Database conformance to the SQL standard
1.2.1 How SQL Works

The strengths of SQL provide benefits for all types of users, including application programmers, database administrators, managers, and end users. Technically speaking, SQL is a data sublanguage. The purpose of SQL is to provide an interface to a relational database such as Oracle Database, and all SQL statements are instructions to the database. In this SQL differs from general-purpose programming languages like C and BASIC. Among the features of SQL are the following:

- It processes sets of data as groups rather than as individual units.
- It provides automatic navigation to the data.
- It uses statements that are complex and powerful individually, and that therefore stand alone. Flow-control statements, such as begin-end, if-then-else, loops, and exception condition handling, were initially not part of SQL and the SQL standard, but they can now be found in ISO/IEC 9075-4 - Persistent Stored Modules (SQL/PSM). The PL/SQL extension to Oracle SQL is similar to PSM.

SQL lets you work with data at the logical level. You need to be concerned with the implementation details only when you want to manipulate the data. For example, to retrieve a set of rows from a table, you define a condition used to filter the rows. All rows satisfying the condition are retrieved in a single step and can be passed as a unit to the user, to another SQL statement, or to an application. You need not deal with the rows one by one, nor do you have to worry about how they are physically stored or retrieved. All SQL statements use the optimizer, a part of Oracle Database that determines the most efficient means of accessing the specified data. Oracle also provides techniques that you can use to make the optimizer perform its job better.

SQL provides statements for a variety of tasks, including:

- Querying data
- Inserting, updating, and deleting rows in a table
- Creating, replacing, altering, and dropping objects
- Controlling access to the database and its objects
- Guaranteeing database consistency and integrity

SQL unifies all of the preceding tasks in one consistent language.

1.2.2 Common Language for All Relational Databases

All major relational database management systems support SQL, so you can transfer all skills you have gained with SQL from one database to another. In addition, all programs written in SQL are portable. They can often be moved from one database to another with very little modification.

1.3 Using Enterprise Manager

Many of the operations you can accomplish using SQL syntax can be done much more easily using Enterprise Manager. For more information, see the Oracle Enterprise Manager documentation set, Oracle Database 2 Day DBA, or any of the Oracle Database 2 Day + books.
1.4 Lexical Conventions

The following lexical conventions for issuing SQL statements apply specifically to the Oracle Database implementation of SQL, but are generally acceptable in other SQL implementations.

When you issue a SQL statement, you can include one or more tabs, carriage returns, spaces, or comments anywhere a space occurs within the definition of the statement. Thus, Oracle Database evaluates the following two statements in the same manner:

```
SELECT last_name,salary*12,MONTHS_BETWEEN(SYSDATE,hire_date)
FROM employees
WHERE department_id = 30
ORDER BY last_name;
```

```
SELECT last_name,
salary * 12,
MONTHS_BETWEEN( SYSDATE, hire_date )
FROM employees
WHERE department_id=30
ORDER BY last_name;
```

Case is insignificant in reserved words, keywords, identifiers, and parameters. However, case is significant in text literals and quoted names. Refer to Text Literals for a syntax description of text literals.

Note:

SQL statements are terminated differently in different programming environments. This documentation set uses the default SQL*Plus character, the semicolon (;).

1.5 Tools Support

Oracle provides a number of utilities to facilitate your SQL development process:

- Oracle SQL Developer is a graphical tool that lets you browse, create, edit, and delete (drop) database objects, edit and debug PL/SQL code, run SQL statements and scripts, manipulate and export data, and create and view reports. With SQL Developer, you can connect to any target Oracle Database schema using standard Oracle Database authentication. Once connected, you can perform operations on objects in the database. You can also connect to schemas for selected third-party (non-Oracle) databases, such as MySQL, Microsoft SQL Server, and Microsoft Access, view metadata and data in these databases, and migrate these databases to Oracle.

- SQL*Plus is an interactive and batch query tool that is installed with every Oracle Database server or client installation. It has a command-line user interface and a Web-based user interface called iSQL*Plus.

- Oracle JDeveloper is a multiple-platform integrated development environment supporting the complete lifecycle of development for Java, Web services, and SQL. It provides a graphical interface for executing and tuning SQL statements.
and a visual schema diagrammer (database modeler). It also supports editing, compiling, and debugging PL/SQL applications.

- Oracle Application Express is a hosted environment for developing and deploying database-related Web applications. SQL Workshop is a component of Oracle Application Express that lets you view and manage database objects from a Web browser. SQL Workshop offers quick access to a SQL command processor and a SQL script repository.

See Also:

*SQL*Plus User's Guide and Reference and Oracle Application Express App Builder User’s Guide for more information on these products

The Oracle Call Interface and Oracle precompilers let you embed standard SQL statements within a procedure programming language.

- The Oracle Call Interface (OCI) lets you embed SQL statements in C programs.
- The Oracle precompilers, Pro*C/C++ and Pro*COBOL, interpret embedded SQL statements and translate them into statements that can be understood by C/C++ and COBOL compilers, respectively.

See Also:

Most (but not all) Oracle tools also support all features of Oracle SQL. This reference describes the complete functionality of SQL. If the Oracle tool that you are using does not support this complete functionality, then you can find a discussion of the restrictions in the manual describing the tool, such as SQL*Plus User’s Guide and Reference.
Basic Elements of Oracle SQL

This chapter contains reference information on the basic elements of Oracle SQL. These elements are the simplest building blocks of SQL statements. Therefore, before using the SQL statements described in this book, you should familiarize yourself with the concepts covered in this chapter.

This chapter contains these sections:

- Data Types
- Data Type Comparison Rules
- Literals
- Format Models
- Nulls
- Comments
- Database Objects
- Database Object Names and Qualifiers
- Syntax for Schema Objects and Parts in SQL Statements

2.1 Data Types

Each value manipulated by Oracle Database has a **data type**. The data type of a value associates a fixed set of properties with the value. These properties cause Oracle to treat values of one data type differently from values of another. For example, you can add values of **NUMBER** data type, but not values of **RAW** data type.

When you create a table or cluster, you must specify a data type for each of its columns. When you create a procedure or stored function, you must specify a data type for each of its arguments. These data types define the domain of values that each column can contain or each argument can have. For example, **DATE** columns cannot accept the value February 29 (except for a leap year) or the values 2 or ‘SHOE’. Each value subsequently placed in a column assumes the data type of the column. For example, if you insert '01-JAN-98' into a **DATE** column, then Oracle treats the '01-JAN-98' character string as a **DATE** value after verifying that it translates to a valid date.

Oracle Database provides a number of built-in data types as well as several categories for user-defined types that can be used as data types. The syntax of Oracle data types appears in the diagrams that follow. The text of this section is divided into the following sections:

- Oracle Built-in Data Types
- ANSI, DB2, and SQL/DS Data Types
- User-Defined Types
- Oracle-Supplied Types
• Data Type Comparison Rules
• Data Conversion

A data type is either scalar or nonscalar. A scalar type contains an atomic value, whereas a nonscalar (sometimes called a “collection”) contains a set of values. A large object (LOB) is a special form of scalar data type representing a large scalar value of binary or character data. LOBs are subject to some restrictions that do not affect other scalar types because of their size. Those restrictions are documented in the context of the relevant SQL syntax.

See Also:
Restrictions on LOB Columns

The Oracle precompilers recognize other data types in embedded SQL programs. These data types are called external data types and are associated with host variables. Do not confuse built-in data types and user-defined types with external data types. For information on external data types, including how Oracle converts between them and built-in data types or user-defined types, see Pro*C/C++ Programmer’s Guide.

2.1.1 Oracle Built-in Data Types

The table that follows summarizes Oracle built-in data types. Refer to the syntax in the preceding sections for the syntactic elements. The codes listed for the data types are used internally by Oracle Database. The data type code of a column or object attribute is returned by the DUMP function.
### Table 2-1 Built-in Data Type Summary

<table>
<thead>
<tr>
<th>Code</th>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | VARCHAR2(size [BYTE | CHAR]) | Variable-length character string having maximum length size bytes or characters. You must specify size for VARCHAR2. Minimum size is 1 byte or 1 character. Maximum size is:  
  - 32767 bytes or characters if MAX_STRING_SIZE = EXTENDED  
  - 4000 bytes or characters if MAX_STRING_SIZE = STANDARD  
  Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter.  
  BYTE indicates that the column will have byte length semantics.  
  CHAR indicates that the column will have character semantics. |
| 1    | NVARCHAR2(size) | Variable-length Unicode character string having maximum length size characters. You must specify size for NVARCHAR2. The number of bytes can be up to two times size for AL16UTF16 encoding and three times size for UTF8 encoding. Maximum size is determined by the national character set definition, with an upper limit of:  
  - 32767 bytes if MAX_STRING_SIZE = EXTENDED  
  - 4000 bytes if MAX_STRING_SIZE = STANDARD  
  Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter. |
<p>| 2    | NUMBER [(p [, s])] | Number having precision $p$ and scale $s$. The precision $p$ can range from 1 to 38. The scale $s$ can range from -84 to 127. Both precision and scale are in decimal digits. A NUMBER value requires from 1 to 22 bytes. |
| 2    | FLOAT [(p)] | A subtype of the NUMBER data type having precision $p$. A FLOAT value is represented internally as NUMBER. The precision $p$ can range from 1 to 126 binary digits. A FLOAT value requires from 1 to 22 bytes. |
| 8    | LONG | Character data of variable length up to 2 gigabytes, or $2^{31} - 1$ bytes. Provided for backward compatibility. |
| 12   | DATE | Valid date range from January 1, 4712 BC, to December 31, 9999 AD. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is fixed at 7 bytes. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It does not have fractional seconds or a time zone. |
| 100  | BINARY_FLOAT | 32-bit floating point number. This data type requires 4 bytes. |
| 101  | BINARY_DOUBLE | 64-bit floating point number. This data type requires 8 bytes. |</p>

<td>TIMESTAMP ([fractional_seconds_precision])</td>
<td>Year, month, and day values of date, as well as hour, minute, and second values of time, where <code>fractional_seconds_precision</code> is the number of digits in the fractional part of the SECOND datetime field. Accepted values of <code>fractional_seconds_precision</code> are 0 to 9. The default is 6. The default format is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is 7 or 11 bytes, depending on the precision. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It contains fractional seconds but does not have a time zone.</td>
</tr>
<tr>
<td>181</td>
<td>TIMESTAMP ([fractional_seconds_precision]) WITH TIME ZONE</td>
<td>All values of TIMESTAMP as well as time zone displacement value, where <code>fractional_seconds_precision</code> is the number of digits in the fractional part of the SECOND datetime field. Accepted values are 0 to 9. The default is 6. The default date format for the TIMESTAMP WITH TIME ZONE data type is determined by the NLS_TIMESTAMP_TZ_FORMAT initialization parameter. The size is fixed at 13 bytes. This data type contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, SECOND, TIMEZONE_HOUR, and TIMEZONE_MINUTE. It has fractional seconds and an explicit time zone.</td>
</tr>
</tbody>
</table>
| 231  | TIMESTAMP ([fractional_seconds_precision]) WITH LOCAL TIME ZONE | All values of TIMESTAMP WITH TIME ZONE, with the following exceptions:
- Data is normalized to the database time zone when it is stored in the database.
- When the data is retrieved, users see the data in the session time zone. The default format is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is 7 or 11 bytes, depending on the precision. |
| 182  | INTERVAL YEAR ([year_precision]) TO MONTH | Stores a period of time in years and months, where `year_precision` is the number of digits in the YEAR datetime field. Accepted values are 0 to 9. The default is 2. The size is fixed at 5 bytes. |
| 183  | INTERVAL DAY ([day_precision]) TO SECOND ([fractional_seconds_precision]) | Stores a period of time in days, hours, minutes, and seconds, where
- `day_precision` is the maximum number of digits in the DAY datetime field. Accepted values are 0 to 9. The default is 2.
- `fractional_seconds_precision` is the number of digits in the fractional part of the SECOND field. Accepted values are 0 to 9. The default is 6. The size is fixed at 11 bytes. |
The sections that follow describe the Oracle data types as they are stored in Oracle Database. For information on specifying these data types as literals, refer to Literals.

### 2.1.1.1 Character Data Types

Character data types store character (alphanumeric) data, which are words and free-form text, in the database character set or national character set. They are less restrictive than other data types and consequently have fewer properties. For example,
character columns can store all alphanumeric values, but `NUMBER` columns can store only numeric values.

Character data is stored in strings with byte values corresponding to one of the character sets, such as 7-bit ASCII or EBCDIC, specified when the database was created. Oracle Database supports both single-byte and multibyte character sets.

These data types are used for character data:

- **CHAR Data Type**
- **NCHAR Data Type**
- **VARCHAR2 Data Type**
- **NVARCHAR2 Data Type**

For information on specifying character data types as literals, refer to [Text Literals](#).

### 2.1.1.1 CHAR Data Type

The **CHAR** data type specifies a fixed-length character string in the database character set. You specify the database character set when you create your database.

When you create a table with a **CHAR** column, you specify the column length as `size` optionally followed by a length qualifier. The qualifier **BYTE** denotes byte length semantics while the qualifier **CHAR** denotes character length semantics. In the byte length semantics, `size` is the number of bytes to store in the column. In the character length semantics, `size` is the number of code points in the database character set to store in the column. A code point may have from 1 to 4 bytes depending on the database character set and the particular character encoded by the code point. Oracle recommends that you specify one of the length qualifiers to explicitly document the desired length semantics of the column. If you do not specify a qualifier, the value of the **NLS_LENGTH_SEMANTICS** parameter of the session creating the column defines the length semantics, unless the table belongs to the schema **SYS**, in which case the default semantics is **BYTE**.

Oracle ensures that all values stored in a **CHAR** column have the length specified by `size` in the selected length semantics. If you insert a value that is shorter than the column length, then Oracle blank-pads the value to column length. If you try to insert a value that is too long for the column, then Oracle returns an error. Note that if the column length is expressed in characters (code points), blank-padding does not guarantee that all column values have the same byte length.

You can omit `size` from the column definition. The default value is 1.

The maximum value of `size` is 2000, which means 2000 bytes or characters (code points), depending on the selected length semantics. However, independently, the absolute maximum length of any character value that can be stored into a **CHAR** column is 2000 bytes. For example, even if you define the column length to be 2000 characters, Oracle returns an error if you try to insert a 2000-character value in which one or more code points are wider than 1 byte. The value of `size` in characters is a length constraint, not guaranteed capacity. If you want a **CHAR** column to be always able to store `size` characters in any database character set, use a value of `size` that is less than or equal to 500.

To ensure proper data conversion between databases and clients with different character sets, you must ensure that **CHAR** data consists of well-formed strings.
2.1.1.2 NCHAR Data Type

The NCHAR data type specifies a fixed-length character string in the national character set. You specify the national character set as either AL16UTF16 or UTF8 when you create your database. AL16UTF16 and UTF8 are two encoding forms of the Unicode character set (UTF-16 and CESU-8, correspondingly) and hence NCHAR is a Unicode-only data type.

When you create a table with an NCHAR column, you specify the column length as size characters, or more precisely, code points in the national character set. One code point has always 2 bytes in AL16UTF16 and from 1 to 3 bytes in UTF8, depending on the particular character encoded by the code point.

Oracle ensures that all values stored in an NCHAR column have the length of size characters. If you insert a value that is shorter than the column length, then Oracle blank-pads the value to the column length. If you try to insert a value that is too long for the column, then Oracle returns an error. Note that if the national character set is UTF8, blank-padding does not guarantee that all column values have the same byte length.

You can omit size from the column definition. The default value is 1.

The maximum value of size is 1000 characters when the national character set is AL16UTF16, and 2000 characters when the national character set is UTF8. However, independently, the absolute maximum length of any character value that can be stored into an NCHAR column is 2000 bytes. For example, even if you define the column length to be 1000 characters, Oracle returns an error if you try to insert a 1000-character value but the national character set is UTF8 and all code points are 3 bytes wide. The value of size is a length constraint, not guaranteed capacity. If you want an NCHAR column to be always able to store size characters in both national character sets, use a value of size that is less than or equal to 666.

To ensure proper data conversion between databases and clients with different character sets, you must ensure that NCHAR data consists of well-formed strings.

If you assign a CHAR value to an NCHAR column, the value is implicitly converted from the database character set to the national character set. If you assign an NCHAR value to a CHAR column, the value is implicitly converted from the national character set to the database character set. If some of the characters from the NCHAR value cannot be represented in the database character set, then if the value of the session parameter NLS_NCHAR_CONV_EXCP is TRUE, then Oracle reports an error. If the value of the parameter is FALSE, non-representable characters are replaced with the default replacement character of the database character set, which is usually the question mark ‘?’ or the inverted question mark ‘¿’. 
2.1.1.3 VARCHAR2 Data Type

The `VARCHAR2` data type specifies a variable-length character string in the database character set. You specify the database character set when you create your database.

When you create a table with a `VARCHAR2` column, you must specify the column length as `size` optionally followed by a length qualifier. The qualifier `BYTE` denotes byte length semantics while the qualifier `CHAR` denotes character length semantics. In the byte length semantics, `size` is the maximum number of bytes that can be stored in the column. In the character length semantics, `size` is the maximum number of code points in the database character set that can be stored in the column. A code point may have from 1 to 4 bytes depending on the database character set and the particular character encoded by the code point. Oracle recommends that you specify one of the length qualifiers to explicitly document the desired length semantics of the column. If you do not specify a qualifier, the value of the `NLS_LENGTH_SEMANTICS` parameter of the session creating the column defines the length semantics, unless the table belongs to the schema `SYS`, in which case the default semantics is `BYTE`.

Oracle stores a character value in a `VARCHAR2` column exactly as you specify it, without any blank-padding, provided the value does not exceed the length of the column. If you try to insert a value that exceeds the specified length, then Oracle returns an error.

The minimum value of `size` is 1. The maximum value is:

- 32767 bytes if `MAX_STRING_SIZE = EXTENDED`
- 4000 bytes if `MAX_STRING_SIZE = STANDARD`

Refer to Extended Data Types for more information on the `MAX_STRING_SIZE` initialization parameter and the internal storage mechanisms for extended data types.

While `size` may be expressed in bytes or characters (code points) the independent absolute maximum length of any character value that can be stored into a `VARCHAR2` column is 32767 or 4000 bytes, depending on `MAX_STRING_SIZE`. For example, even if you define the column length to be 32767 characters, Oracle returns an error if you try to insert a 32767-character value in which one or more code points are wider than 1 byte. The value of `size` in characters is a length constraint, not guaranteed capacity. If you want a `VARCHAR2` column to be always able to store `size` characters in any database character set, use a value of `size` that is less than or equal to 8191, if `MAX_STRING_SIZE = EXTENDED`, or 1000, if `MAX_STRING_SIZE = STANDARD`.

Oracle compares `VARCHAR2` values using non-padded comparison semantics.

To ensure proper data conversion between databases with different character sets, you must ensure that `VARCHAR2` data consists of well-formed strings. See Oracle Database Globalization Support Guide for more information on character set support.
2.1.1.4 VARCHAR Data Type

Do not use the VARCHAR data type. Use the VARCHAR2 data type instead. Although the VARCHAR data type is currently synonymous with VARCHAR2, the VARCHAR data type is scheduled to be redefined as a separate data type used for variable-length character strings compared with different comparison semantics.

2.1.1.5 NVARCHAR2 Data Type

The NVARCHAR2 data type specifies a variable-length character string in the national character set. You specify the national character set as either AL16UTF16 or UTF8 when you create your database. AL16UTF16 and UTF8 are two encoding forms of the Unicode character set (UTF-16 and CESU-8, correspondingly) and hence NVARCHAR2 is a Unicode-only data type.

When you create a table with an NVARCHAR2 column, you must specify the column length as size characters, or more precisely, code points in the national character set. One code point has always 2 bytes in AL16UTF16 and from 1 to 3 bytes in UTF8, depending on the particular character encoded by the code point.

Oracle stores a character value in an NVARCHAR2 column exactly as you specify it, without any blank-padding, provided the value does not exceed the length of the column. If you try to insert a value that exceeds the specified length, then Oracle returns an error.

The minimum value of size is 1. The maximum value is:

- 16383 if MAX_STRING_SIZE = EXTENDED and the national character set is AL16UTF16
- 32767 if MAX_STRING_SIZE = EXTENDED and the national character set is UTF8
- 2000 if MAX_STRING_SIZE = STANDARD and the national character set is AL16UTF16
- 4000 if MAX_STRING_SIZE = STANDARD and the national character set is UTF8

Refer to Extended Data Types for more information on the MAX_STRING_SIZE initialization parameter and the internal storage mechanisms for extended data types.

Independently of the maximum column length in characters, the absolute maximum length of any value that can be stored into an NVARCHAR2 column is 32767 or 4000 bytes, depending on MAX_STRING_SIZE. For example, even if you define the column length to be 16383 characters, Oracle returns an error if you try to insert a 16383-character value but the national character set is UTF8 and all code points are 3 bytes wide. The value of size is a length constraint, not guaranteed capacity. If you want an NVARCHAR2 column to be always able to store size characters in both national character sets, use a value of size that is less than or equal to 10922, if MAX_STRING_SIZE = EXTENDED, or 1333, if MAX_STRING_SIZE = STANDARD.

Oracle compares NVARCHAR2 values using non-padded comparison semantics.
To ensure proper data conversion between databases and clients with different character sets, you must ensure that `NVARCHAR2` data consists of well-formed strings.

If you assign a `VARCHAR2` value to an `NVARCHAR2` column, the value is implicitly converted from the database character set to the national character set. If you assign an `NVARCHAR2` value to a `VARCHAR2` column, the value is implicitly converted from the national character set to the database character set. If some of the characters from the `NVARCHAR2` value cannot be represented in the database character set, then if the value of the session parameter `NLS_NCHAR_CONV_EXCP` is `TRUE`, then Oracle reports an error. If the value of the parameter is `FALSE`, non-representable characters are replaced with the default replacement character of the database character set, which is usually the question mark `?` or the inverted question mark `¿`.

See Also:

`Oracle Database Globalization Support Guide` for information on Unicode data type support.

2.1.1.2 Numeric Data Types

The Oracle Database numeric data types store positive and negative fixed and floating-point numbers, zero, infinity, and values that are the undefined result of an operation—"not a number" or `NAN`. For information on specifying numeric data types as literals, refer to `Numeric Literals`.

2.1.1.2.1 NUMBER Data Type

The `NUMBER` data type stores zero as well as positive and negative fixed numbers with absolute values from $1.0 \times 10^{-130}$ to but not including $1.0 \times 10^{126}$. If you specify an arithmetic expression whose value has an absolute value greater than or equal to $1.0 \times 10^{126}$, then Oracle returns an error. Each `NUMBER` value requires from 1 to 22 bytes.

Specify a fixed-point number using the following form:

`NUMBER(p, s)`

where:

- \( p \) is the **precision**, or the maximum number of significant decimal digits, where the most significant digit is the left-most nonzero digit, and the least significant digit is the right-most known digit. Oracle guarantees the portability of numbers with precision of up to 20 base-100 digits, which is equivalent to 39 or 40 decimal digits depending on the position of the decimal point.

- \( s \) is the **scale**, or the number of digits from the decimal point to the least significant digit. The scale can range from -84 to 127.
  - Positive scale is the number of significant digits to the right of the decimal point to and including the least significant digit.
  - Negative scale is the number of significant digits to the left of the decimal point, to but not including the least significant digit. For negative scale the least significant digit is on the left side of the decimal point, because the actual data is rounded to the specified number of places to the left of the decimal point. For example, a specification of \((10,-2)\) means to round to hundreds.
Scale can be greater than precision, most commonly when e notation is used. When scale is greater than precision, the precision specifies the maximum number of significant digits to the right of the decimal point. For example, a column defined as `NUMBER(4, 5)` requires a zero for the first digit after the decimal point and rounds all values past the fifth digit after the decimal point.

It is good practice to specify the scale and precision of a fixed-point number column for extra integrity checking on input. Specifying scale and precision does not force all values to a fixed length. If a value exceeds the precision, then Oracle returns an error. If a value exceeds the scale, then Oracle rounds it.

Specify an integer using the following form:

```
NUMBER(p)
```

This represents a fixed-point number with precision `p` and scale 0 and is equivalent to `NUMBER(p, 0)`.

Specify a floating-point number using the following form:

```
NUMBER
```

The absence of precision and scale designators specifies the maximum range and precision for an Oracle number.

2.1.1.2.2 FLOAT Data Type

The **FLOAT** data type is a subtype of **NUMBER**. It can be specified with or without precision, which has the same definition it has for **NUMBER** and can range from 1 to 126. Scale cannot be specified, but is interpreted from the data. Each **FLOAT** value requires from 1 to 22 bytes.

To convert from binary to decimal precision, multiply \( n \) by 0.30103. To convert from decimal to binary precision, multiply the decimal precision by 3.32193. The maximum of 126 digits of binary precision is roughly equivalent to 38 digits of decimal precision.

The difference between **NUMBER** and **FLOAT** is best illustrated by example. In the following example the same values are inserted into **NUMBER** and **FLOAT** columns:

```sql
CREATE TABLE test (col1 NUMBER(5,2), col2 FLOAT(5));
INSERT INTO test VALUES (1.23, 1.23);
INSERT INTO test VALUES (7.89, 7.89);
INSERT INTO test VALUES (12.79, 12.79);
INSERT INTO test VALUES (123.45, 123.45);
SELECT * FROM test;
```

<table>
<thead>
<tr>
<th>COL1</th>
<th>COL2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.23</td>
<td>1.2</td>
</tr>
<tr>
<td>7.89</td>
<td>7.9</td>
</tr>
<tr>
<td>12.79</td>
<td>13</td>
</tr>
<tr>
<td>123.45</td>
<td>120</td>
</tr>
</tbody>
</table>

In this example, the **FLOAT** value returned cannot exceed 5 binary digits. The largest decimal number that can be represented by 5 binary digits is 31. The last row contains decimal values that exceed 31. Therefore, the **FLOAT** value must be truncated so that its significant digits do not require more than 5 binary digits. Thus 123.45 is rounded to 120, which has only two significant decimal digits, requiring only 4 binary digits.

Oracle Database uses the Oracle **FLOAT** data type internally when converting ANSI **FLOAT** data. Oracle **FLOAT** is available for you to use, but Oracle recommends that you use the **BINARY_FLOAT** and **BINARY_DOUBLE** data types instead, as they are more robust. Refer to Floating-Point Numbers for more information.

2.1.1.2.3 Floating-Point Numbers

Floating-point numbers can have a decimal point anywhere from the first to the last digit or can have no decimal point at all. An exponent may optionally be used following the number to increase the range, for example, 1.777 e\(^{-20}\). A scale value is not applicable to floating-point numbers, because the number of digits that can appear after the decimal point is not restricted.
Binary floating-point numbers differ from NUMBER in the way the values are stored internally by Oracle Database. Values are stored using decimal precision for NUMBER. All literals that are within the range and precision supported by NUMBER are stored exactly as NUMBER. Literals are stored exactly because literals are expressed using decimal precision (the digits 0 through 9). Binary floating-point numbers are stored using binary precision (the digits 0 and 1). Such a storage scheme cannot represent all values using decimal precision exactly. Frequently, the error that occurs when converting a value from decimal to binary precision is undone when the value is converted back from binary to decimal precision. The literal 0.1 is such an example.

Oracle Database provides two numeric data types exclusively for floating-point numbers:

2.1.1.2.3.1 BINARY_FLOAT

BINARY_FLOAT is a 32-bit, single-precision floating-point number data type. Each BINARY_FLOAT value requires 4 bytes.

2.1.1.2.3.2 BINARY_DOUBLE

BINARY_DOUBLE is a 64-bit, double-precision floating-point number data type. Each BINARY_DOUBLE value requires 8 bytes.

In a NUMBER column, floating point numbers have decimal precision. In a BINARY_FLOAT or BINARY_DOUBLE column, floating-point numbers have binary precision. The binary floating-point numbers support the special values infinity and NaN (not a number).

You can specify floating-point numbers within the limits listed in Table 2-3. The format for specifying floating-point numbers is defined in Numeric Literals.

Table 2-3  Floating Point Number Limits

<table>
<thead>
<tr>

<td>2.22507485850720E-308</td>
</tr>
</tbody>
</table>

2.1.1.2.3.3 IEEE754 Conformance

The Oracle implementation of floating-point data types conforms substantially with the Institute of Electrical and Electronics Engineers (IEEE) Standard for Binary Floating-Point Arithmetic, IEEE Standard 754-1985 (IEEE754). The floating-point data types conform to IEEE754 in the following areas:

- The SQL function SQRT implements square root. See SQRT.
- The SQL function REMAINDER implements remainder. See REMAINDER.
- Arithmetic operators conform. See Arithmetic Operators.
- Comparison operators conform, except for comparisons with NaN. Oracle orders NaN greatest with respect to all other values, and evaluates NaN equal to NaN. See Floating-Point Conditions.
- Conversion operators conform. See Conversion Functions.
- The default rounding mode is supported.
- The default exception handling mode is supported.
2.1.1.2.4 Numeric Precedence

Numeric precedence determines, for operations that support numeric data types, the data type Oracle uses if the arguments to the operation have different data types. BINARY DOUBLE has the highest numeric precedence, followed by BINARY_FLOAT, and finally by NUMBER. Therefore, in any operation on multiple numeric values:

- If any of the operands is BINARY_DOUBLE, then Oracle attempts to convert all the operands implicitly to BINARY_DOUBLE before performing the operation.
- If none of the operands is BINARY_DOUBLE but any of the operands is BINARY_FLOAT, then Oracle attempts to convert all the operands implicitly to BINARY_FLOAT before performing the operation.
- Otherwise, Oracle attempts to convert all the operands to NUMBER before performing the operation.

If any implicit conversion is needed and fails, then the operation fails. Refer to Table 2-8 for more information on implicit conversion.

In the context of other data types, numeric data types have lower precedence than the datetime/interval data types and higher precedence than character and all other data types.

2.1.1.3 LONG Data Type

Do not create tables with LONG columns. Use LOB columns (CLOB, NCLOB, BLOB) instead. LONG columns are supported only for backward compatibility.

LONG columns store variable-length character strings containing up to 2 gigabytes -1, or 2^31-1 bytes. LONG columns have many of the characteristics of VARCHAR2 columns. You can use LONG columns to store long text strings. The length of LONG values may be limited by the memory available on your computer. LONG literals are formed as described for Text Literals .

Oracle also recommends that you convert existing LONG columns to LOB columns. LOB columns are subject to far fewer restrictions than LONG columns. Further, LOB functionality is enhanced in every release, whereas LONG functionality has been static.
for several releases. See the `modify_col_properties` clause of `ALTER TABLE` and `TO_LOB` for more information on converting `LONG` columns to LOB.

You can reference `LONG` columns in SQL statements in these places:

- SELECT lists
- SET clauses of UPDATE statements
- VALUES clauses of INSERT statements

The use of `LONG` values is subject to these restrictions:

- A table can contain only one `LONG` column.
- You cannot create an object type with a `LONG` attribute.
- `LONG` columns cannot appear in WHERE clauses or in integrity constraints (except that they can appear in NULL and NOT NULL constraints).
- `LONG` columns cannot be indexed.
- `LONG` data cannot be specified in regular expressions.
- A stored function cannot return a `LONG` value.
- You can declare a variable or argument of a PL/SQL program unit using the `LONG` data type. However, you cannot then call the program unit from SQL.
- Within a single SQL statement, all `LONG` columns, updated tables, and locked tables must be located on the same database.
- `LONG` and `LONG_RAW` columns cannot be used in distributed SQL statements and cannot be replicated.
- If a table has both `LONG` and LOB columns, then you cannot bind more than 4000 bytes of data to both the `LONG` and LOB columns in the same SQL statement. However, you can bind more than 4000 bytes of data to either the `LONG` or the LOB column.

In addition, `LONG` columns cannot appear in these parts of SQL statements:

- GROUP BY clauses, ORDER BY clauses, or CONNECT BY clauses or with the DISTINCT operator in SELECT statements
- The UNIQUE operator of a SELECT statement
- The column list of a CREATE CLUSTER statement
- The CLUSTER clause of a CREATE MATERIALIZED VIEW statement
- SQL built-in functions, expressions, or conditions
- SELECT lists of queries containing GROUP BY clauses
- SELECT lists of subqueries or queries combined by the UNION, INTERSECT, or MINUS set operators
- SELECT lists of CREATE TABLE ... AS SELECT statements
- ALTER TABLE ... MOVE statements
- SELECT lists in subqueries in INSERT statements

Triggers can use the `LONG` data type in the following manner:

- A SQL statement within a trigger can insert data into a `LONG` column.
• If data from a LONG column can be converted to a constrained data type (such as CHAR and VARCHAR2), then a LONG column can be referenced in a SQL statement within a trigger.

• Variables in triggers cannot be declared using the LONG data type.

• :NEW and :OLD cannot be used with LONG columns.

You can use Oracle Call Interface functions to retrieve a portion of a LONG value from the database.

See Also:
Oracle Call Interface Programmer's Guide

2.1.1.4 Datetime and Interval Data Types

The datetime data types are DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE. Values of datetime data types are sometimes called datetimes. The interval data types are INTERVAL YEAR TO MONTH and INTERVAL DAY TO SECOND. Values of interval data types are sometimes called intervals. For information on expressing datetime and interval values as literals, refer to Datetime Literals and Interval Literals.

Both datetimes and intervals are made up of fields. The values of these fields determine the value of the data type. Table 2-4 lists the datetime fields and their possible values for datetimes and intervals.

To avoid unexpected results in your DML operations on datetime data, you can verify the database and session time zones by querying the built-in SQL functions DBTIMEZONE and SESSIONTIMEZONE. If the time zones have not been set manually, then Oracle Database uses the operating system time zone by default. If the operating system time zone is not a valid Oracle time zone, then Oracle uses UTC as the default value.

Table 2-4   Datetime Fields and Values

<table>

<td>00 to 59.9(n), where 9(n) is the precision of time fractional seconds. The 9(n) portion is not applicable for DATE.</td>
<td>0 to 59.9(n), where 9(n) is the precision of interval fractional seconds</td>
</tr>
</tbody>
</table>
### Table 2-4  (Cont.) Datetime Fields and Values

<table>
<thead>
<tr>
<th>Datetime Field</th>
<th>Valid Values for Datetime</th>
<th>Valid Values for INTERVAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>TIMEZONE_HOUR</td>
<td>-12 to 14 (This range accommodates daylight saving time changes.) Not applicable for DATE or TIMESTAMP.</td>
<td>Not applicable</td>
</tr>
<tr>
<td>TIMEZONE_MINUTE</td>
<td>00 to 59. Not applicable for DATE or TIMESTAMP.</td>
<td>Not applicable</td>
</tr>
<tr>
<td>TIMEZONE_REGION</td>
<td>Query the TZNAME column of the V$TIMEZONE_NAMES data dictionary view. Not applicable for DATE or TIMESTAMP. For a complete listing of all time zone region names, refer to Oracle Database Globalization Support Guide.</td>
<td>Not applicable</td>
</tr>
<tr>
<td>TIMEZONE_ABBR</td>
<td>Query the TZABBREV column of the V$TIMEZONE_NAMES data dictionary view. Not applicable for DATE or TIMESTAMP.</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

**Note:**

TIMEZONE_HOUR and TIMEZONE_MINUTE are specified together and interpreted as an entity in the format +|- hh:mm, with values ranging from -12:59 to +14:00. Refer to Oracle Data Provider for .NET Developer's Guide for Microsoft Windows for information on specifying time zone values for that API.

## 2.1.1.4.1 DATE Data Type

The DATE data type stores date and time information. Although date and time information can be represented in both character and number data types, the DATE data type has special associated properties. For each DATE value, Oracle stores the following information: year, month, day, hour, minute, and second.

You can specify a DATE value as a literal, or you can convert a character or numeric value to a date value with the TO_DATE function. For examples of expressing DATE values in both these ways, refer to Datetime Literals.

### 2.1.1.4.1.1 Using Julian Days

A Julian day number is the number of days since January 1, 4712 BC. Julian days allow continuous dating from a common reference. You can use the date format model "J" with date functions TO_DATE and TO_CHAR to convert between Oracle DATE values and their Julian equivalents.
Oracle Database uses the astronomical system of calculating Julian days, in which the year 4713 BC is specified as -4712. The historical system of calculating Julian days, in contrast, specifies 4713 BC as -4713. If you are comparing Oracle Julian days with values calculated using the historical system, then take care to allow for the 365-day difference in BC dates. For more information, see [http://aa.usno.navy.mil/faq/docs/millennium.php](http://aa.usno.navy.mil/faq/docs/millennium.php).

The default date values are determined as follows:

- The year is the current year, as returned by `SYSDATE`.
- The month is the current month, as returned by `SYSDATE`.
- The day is 01 (the first day of the month).
- The hour, minute, and second are all 0.

These default values are used in a query that requests date values where the date itself is not specified, as in the following example, which is issued in the month of May:

```sql
SELECT TO_DATE('2009', 'YYYY')
FROM DUAL;
```

```
TO_DATE('2009', 'YYYY')
---------
01-MAY-09
```

**Example**

This statement returns the Julian equivalent of January 1, 2009:

```sql
SELECT TO_CHAR(TO_DATE('01-01-2009', 'MM-DD-YYYY'),'J')
FROM DUAL;
```

```
TO_CHAR(TO_DATE('01-01-2009', 'MM-DD-YYYY'),'J')
---------
2454833
```

**See Also:**

[Selecting from the DUAL Table](#) for a description of the `DUAL` table

### 2.1.4.2 TIMESTAMP Data Type

The `TIMESTAMP` data type is an extension of the `DATE` data type. It stores the year, month, and day of the `DATE` data type, plus hour, minute, and second values. This data type is useful for storing precise time values and for collecting and evaluating date information across geographic regions. Specify the `TIMESTAMP` data type as follows:

```sql
TIMESTAMP [(fractional_seconds_precision)]
```
where `fractional_seconds_precision` optionally specifies the number of digits Oracle stores in the fractional part of the `SECOND` datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

**See Also:**

- `TO_TIMESTAMP` for information on converting character data to `TIMESTAMP` data

### 2.1.1.4.3 TIMESTAMP WITH TIME ZONE Data Type

`TIMESTAMP WITH TIME ZONE` is a variant of `TIMESTAMP` that includes a time zone region name or a time zone offset in its value. The time zone offset is the difference (in hours and minutes) between local time and UTC (Coordinated Universal Time—formerly Greenwich Mean Time). This data type is useful for preserving local time zone information.

Specify the `TIMESTAMP WITH TIME ZONE` data type as follows:

```
TIMESTAMP [(fractional_seconds_precision)] WITH TIME ZONE
```

where `fractional_seconds_precision` optionally specifies the number of digits Oracle stores in the fractional part of the `SECOND` datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

Oracle time zone data is derived from the public domain information available at [http://www.iana.org/time-zones/](http://www.iana.org/time-zones/). Oracle time zone data may not reflect the most recent data available at this site.

**See Also:**

- Oracle Database Globalization Support Guide for more information on Oracle time zone data
- Support for Daylight Saving Times and Table 2-19 for information on daylight saving support
- `TO_TIMESTAMP_TZ` for information on converting character data to `TIMESTAMP WITH TIME ZONE` data
- `ALTER SESSION` for information on the `ERROR_ON_OVERLAP_TIME` session parameter

### 2.1.1.4.4 TIMESTAMP WITH LOCAL TIME ZONE Data Type

`TIMESTAMP WITH LOCAL TIME ZONE` is another variant of `TIMESTAMP` that is sensitive to time zone information. It differs from `TIMESTAMP WITH TIME ZONE` in that data stored in the database is normalized to the database time zone, and the time zone information is not stored as part of the column data. When a user retrieves the data, Oracle
returns it in the user's local session time zone. This data type is useful for date information that is always to be displayed in the time zone of the client system in a two-tier application.

Specify the `TIMESTAMP WITH LOCAL TIME ZONE` data type as follows:

```sql
TIMESTAMP [((fractional_seconds_precision)] WITH LOCAL TIME ZONE
```

where `fractional_seconds_precision` optionally specifies the number of digits Oracle stores in the fractional part of the `SECOND` datetime field. When you create a column of this data type, the value can be a number in the range 0 to 9. The default is 6.

Oracle time zone data is derived from the public domain information available at [http://www.iana.org/time-zones/](http://www.iana.org/time-zones/). Oracle time zone data may not reflect the most recent data available at this site.

### See Also:

#### 2.1.1.4.5 INTERVAL YEAR TO MONTH Data Type

`INTERVAL YEAR TO MONTH` stores a period of time using the `YEAR` and `MONTH` datetime fields. This data type is useful for representing the difference between two datetime values when only the year and month values are significant.

Specify `INTERVAL YEAR TO MONTH` as follows:

```sql
INTERVAL YEAR [(year_precision)] TO MONTH
```

where `year_precision` is the number of digits in the `YEAR` datetime field. The default value of `year_precision` is 2.

You have a great deal of flexibility when specifying interval values as literals. Refer to *Interval Literals* for detailed information on specifying interval values as literals. Also see *Datetime and Interval Examples* for an example using intervals.

#### 2.1.1.4.6 INTERVAL DAY TO SECOND Data Type

`INTERVAL DAY TO SECOND` stores a period of time in terms of days, hours, minutes, and seconds. This data type is useful for representing the precise difference between two datetime values.

Specify this data type as follows:

```sql
INTERVAL DAY [(day_precision)] TO SECOND [((fractional_seconds_precision)]
```

where
• *day_precision* is the number of digits in the `DAY` datetime field. Accepted values are 0 to 9. The default is 2.

• *fractional_seconds_precision* is the number of digits in the fractional part of the `SECOND` datetime field. Accepted values are 0 to 9. The default is 6.

You have a great deal of flexibility when specifying interval values as literals. Refer to Interval Literals for detailed information on specify interval values as literals. Also see Datetime and Interval Examples for an example using intervals.

### 2.1.1.4.7 Datetime/Interval Arithmetic

You can perform a number of arithmetic operations on date (DATE), timestamp (TIMESTAMP, TIMESTAM MP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE) and interval (INTERVAL DAY TO SECOND and INTERVAL YEAR TO MONTH) data. Oracle calculates the results based on the following rules:

• You can use NUMBER constants in arithmetic operations on date and timestamp values, but not interval values. Oracle internally converts timestamp values to date values and interprets NUMBER constants in arithmetic datetime and interval expressions as numbers of days. For example, `SYSDATE + 1` is tomorrow. `SYSDATE - 7` is one week ago. `SYSDATE + (10/1440)` is ten minutes from now. Subtracting the hire_date column of the sample table employees from `SYSDATE` returns the number of days since each employee was hired. You cannot multiply or divide date or timestamp values.

• Oracle implicitly converts BINARY_FLOAT and BINARY_DOUBLE operands to NUMBER.

• Each DATE value contains a time component, and the result of many date operations include a fraction. This fraction means a portion of one day. For example, 1.5 days is 36 hours. These fractions are also returned by Oracle built-in functions for common operations on DATE data. For example, the MONTHS_BETWEEN function returns the number of months between two dates. The fractional portion of the result represents that portion of a 31-day month.

• If one operand is a DATE value or a numeric value, neither of which contains time zone or fractional seconds components, then:
  
  – Oracle implicitly converts the other operand to DATE data. The exception is multiplication of a numeric value times an interval, which returns an interval.
  
  – If the other operand has a time zone value, then Oracle uses the session time zone in the returned value.
  
  – If the other operand has a fractional seconds value, then the fractional seconds value is lost.

• When you pass a timestamp, interval, or numeric value to a built-in function that was designed only for the DATE data type, Oracle implicitly converts the non-DATE value to a DATE value. Refer to Datetime Functions for information on which functions cause implicit conversion to DATE.

• When interval calculations return a datetime value, the result must be an actual datetime value or the database returns an error. For example, the next two statements return errors:

```sql
SELECT TO_DATE('31-AUG-2004','DD-MON-YYYY') + TO_YMINTERVAL('0-1') FROM DUAL;
SELECT TO_DATE('29-FEB-2004','DD-MON-YYYY') + TO_YMINTERVAL('1-0') FROM DUAL;
```
The first fails because adding one month to a 31-day month would result in September 31, which is not a valid date. The second fails because adding one year to a date that exists only every four years is not valid. However, the next statement succeeds, because adding four years to a February 29 date is valid:

```sql
SELECT TO_DATE('29-FEB-2004', 'DD-MON-YYYY') + TO_YMINTERVAL('4-0')
FROM DUAL;
```

Oracle performs all timestamp arithmetic in UTC time. For `TIMESTAMP WITH LOCAL TIME ZONE`, Oracle converts the datetime value from the database time zone to UTC and converts back to the database time zone after performing the arithmetic. For `TIMESTAMP WITH TIME ZONE`, the datetime value is always in UTC, so no conversion is necessary.

Table 2-5 is a matrix of datetime arithmetic operations. Dashes represent operations that are not supported.

### Table 2-5 Matrix of Datetime Arithmetic

<table>
<thead>
<tr>
<th>Operand &amp; Operator</th>

</tbody>
</table>
Examples

You can add an interval value expression to a start time. Consider the sample table oe.orders with a column order_date. The following statement adds 30 days to the value of the order_date column:

```sql
SELECT order_id, order_date + INTERVAL '30' DAY AS "Due Date"
FROM orders
ORDER BY order_id, "Due Date";
```

2.1.1.4.8 Support for Daylight Saving Times

Oracle Database automatically determines, for any given time zone region, whether daylight saving is in effect and returns local time values accordingly. The datetime value is sufficient for Oracle to determine whether daylight saving time is in effect for a given region in all cases except boundary cases. A boundary case occurs during the period when daylight saving goes into or comes out of effect. For example, in the US-Pacific region, when daylight saving goes into effect, the time changes from 2:00 a.m. to 3:00 a.m. The one hour interval between 2 and 3 a.m. does not exist. When daylight saving goes out of effect, the time changes from 2:00 a.m. back to 1:00 a.m., and the one-hour interval between 1 and 2 a.m. is repeated.

To resolve these boundary cases, Oracle uses the TZR and TZD format elements, as described in Table 2-19. TZR represents the time zone region name in datetime input strings. Examples are 'Australia/North', 'UTC', and 'Singapore'. TZD represents an abbreviated form of the time zone region name with daylight saving information. Examples are 'PST' for US/Pacific standard time and 'PDT' for US/Pacific daylight time.

To see a listing of valid values for the TZR and TZD format elements, query the TZNAME and TZABBREV columns of the V$TIMEZONE_NAMES dynamic performance view.

 ttk Note:

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see Oracle Database Globalization Support Guide.

For a complete listing of the time zone region names in both files, refer to Oracle Database Globalization Support Guide.

Oracle time zone data is derived from the public domain information available at http://www.iana.org/time-zones/. Oracle time zone data may not reflect the most recent data available at this site.
2.1.1.4.9 Datetime and Interval Examples

The following example shows how to specify some datetime and interval data types.

```sql
CREATE TABLE time_table
(
    start_time    TIMESTAMP,
    duration_1    INTERVAL DAY (6) TO SECOND (5),
    duration_2    INTERVAL YEAR TO MONTH);
```

The `start_time` column is of type `TIMESTAMP`. The implicit fractional seconds precision of `TIMESTAMP` is 6.

The `duration_1` column is of type `INTERVAL DAY TO SECOND`. The maximum number of digits in field `DAY` is 6 and the maximum number of digits in the fractional second is 5. The maximum number of digits in all other datetime fields is 2.

The `duration_2` column is of type `INTERVAL YEAR TO MONTH`. The maximum number of digits of the value in each field (`YEAR` and `MONTH`) is 2.

Interval data types do not have format models. Therefore, to adjust their presentation, you must combine character functions such as `EXTRACT` and concatenate the components. For example, the following examples query the `hr.employees` and `oe.orders` tables, respectively, and change interval output from the form "yy-mm" to "yy years mm months" and from "dd-hh" to "dddd days hh hours":

```sql
SELECT last_name, EXTRACT(YEAR FROM (SYSDATE - hire_date) YEAR TO MONTH)
 || ' years ' 
 || EXTRACT(MONTH FROM (SYSDATE - hire_date) YEAR TO MONTH) 
 || ' months' "Interval"
FROM employees;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>OConnell</td>
<td>2 years 3 months</td>
</tr>
<tr>
<td>Grant</td>
<td>1 years 9 months</td>
</tr>
<tr>
<td>Whalen</td>
<td>6 years 1 months</td>
</tr>
<tr>
<td>Hartstein</td>
<td>5 years 8 months</td>
</tr>
<tr>
<td>Fay</td>
<td>4 years 2 months</td>
</tr>
<tr>
<td>Mavris</td>
<td>7 years 4 months</td>
</tr>
<tr>
<td>Baer</td>
<td>7 years 4 months</td>
</tr>
<tr>
<td>Higgins</td>
<td>7 years 4 months</td>
</tr>
<tr>
<td>Gietz</td>
<td>7 years 4 months</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
</tr>
</tbody>
</table>

```sql
SELECT order_id, EXTRACT(DAY FROM (SYSDATE - order_date) DAY TO SECOND)
 || ' days ' 
```

The **RAW** and **LONG RAW** data types store data that is not to be explicitly converted by Oracle Database when moving data between different systems. These data types are intended for binary data or byte strings. For example, you can use **LONG RAW** to store graphics, sound, documents, or arrays of binary data, for which the interpretation is dependent on the use.

Oracle strongly recommends that you convert **LONG RAW** columns to binary LOB (**BLOB**) columns. LOB columns are subject to far fewer restrictions than **LONG** columns. See **TO_LOB** for more information.

**RAW** is a variable-length data type like **VARCHAR2**, except that Oracle Net (which connects client software to a database or one database to another) and the Oracle import and export utilities do not perform character conversion when transmitting **RAW** or **LONG RAW** data. In contrast, Oracle Net and the Oracle import and export utilities automatically convert **CHAR**, **VARCHAR2**, and **LONG** data between different database character sets, if data is transported between databases, or between the database character set and the client character set, if data is transported between a database and a client. The client character set is determined by the type of the client interface, such as OCI or JDBC, and the client configuration (for example, the **NLS_LANG** environment variable).

When Oracle implicitly converts **RAW** or **LONG RAW** data to character data, the resulting character value contains a hexadecimal representation of the binary input, where each character is a hexadecimal digit (0-9, A-F) representing four consecutive bits of **RAW** data. For example, one byte of **RAW** data with bits 11001011 becomes the value CB.

When Oracle implicitly converts character data to **RAW** or **LONG RAW**, it interprets each consecutive input character as a hexadecimal representation of four consecutive bits of binary data and builds the resulting **RAW** or **LONG RAW** value by concatenating those bits. If any of the input characters is not a hexadecimal digit (0-9, A-F, a-f), then an error is reported. If the number of characters is odd, then the result is undefined.

The SQL functions **RAWTOHEX** and **HEXTORAW** perform explicit conversions that are equivalent to the above implicit conversions. Other types of conversions between **RAW** and character data are possible with functions in the Oracle-supplied PL/SQL packages **UTL_RAW** and **UTL_I18N**.
2.1.1.6 Large Object (LOB) Data Types

The built-in LOB data types BLOB, CLOB, and NCLOB (stored internally) and BFILE (stored externally) can store large and unstructured data such as text, image, video, and spatial data. The size of BLOB, CLOB, and NCLOB data can be up to \((2^{32} - 1)\) bytes * (the value of the \texttt{CHUNK} parameter of LOB storage). If the tablespaces in your database are of standard block size, and if you have used the default value of the \texttt{CHUNK} parameter of LOB storage when creating a LOB column, then this is equivalent to \((2^{32} - 1)\) bytes * (database block size). BFILE data can be up to \(2^{64}\) bytes, although your operating system may impose restrictions on this maximum.

When creating a table, you can optionally specify different tablespace and storage characteristics for LOB columns or LOB object attributes from those specified for the table.

CLOB, NCLOB, and BLOB values up to approximately 4000 bytes are stored inline if you enable storage in row at the time the LOB column is created. LOBs greater than 4000 bytes are always stored externally. Refer to \texttt{ENABLE STORAGE IN ROW} for more information.

LOB columns contain LOB locators that can refer to internal (in the database) or external (outside the database) LOB values. Selecting a LOB from a table actually returns the LOB locator and not the entire LOB value. The \texttt{DBMS_LOB} package and Oracle Call Interface (OCI) operations on LOBs are performed through these locators.

LOBs are similar to \texttt{LONG} and \texttt{LONG RAW} types, but differ in the following ways:

- LOBs can be attributes of an object type (user-defined data type).
- The LOB locator is stored in the table column, either with or without the actual LOB value. BLOB, NCLOB, and CLOB values can be stored in separate tablespaces. BFILE data is stored in an external file on the server.
- When you access a LOB column, the locator is returned.
- A LOB can be up to \((2^{32} - 1)\) bytes * (database block size) in size. BFILE data can be up to \(2^{64}\) bytes, although your operating system may impose restrictions on this maximum.
- LOBs permit efficient, random, piece-wise access to and manipulation of data.
- You can define more than one LOB column in a table.
- With the exception of NCLOB, you can define one or more LOB attributes in an object.
- You can declare LOB bind variables.
- You can select LOB columns and LOB attributes.
- You can insert a new row or update an existing row that contains one or more LOB columns or an object with one or more LOB attributes. In update operations, you can set the internal LOB value to \texttt{NULL}, empty, or replace the entire LOB with data. You can set the BFILE to \texttt{NULL} or make it point to a different file.
- You can update a LOB row-column intersection or a LOB attribute with another LOB row-column intersection or LOB attribute.
- You can delete a row containing a LOB column or LOB attribute and thereby also delete the LOB value. For BFILES, the actual operating system file is not deleted.
You can access and populate rows of an inline LOB column (a LOB column stored in the database) or a LOB attribute (an attribute of an object type column stored in the database) simply by issuing an `INSERT` or `UPDATE` statement.

**Restrictions on LOB Columns**

LOB columns are subject to a number of rules and restrictions. See *Oracle Database SecureFiles and Large Objects Developer's Guide* for a complete listing.

See Also:
- *Oracle Database PL/SQL Packages and Types Reference* and *Oracle Call Interface Programmer's Guide* for more information about these interfaces and LOBs
- the `modify_col_properties` clause of `ALTER TABLE` and `TO_LOB` for more information on converting `LONG` columns to LOB columns

### 2.1.1.6.1 BFILE Data Type

The **BFILE** data type enables access to binary file LOBs that are stored in file systems outside Oracle Database. A **BFILE** column or attribute stores a **BFILE** locator, which serves as a pointer to a binary file on the server file system. The locator maintains the directory name and the filename.

You can change the filename and path of a **BFILE** without affecting the base table by using the **BFILENAME** function. Refer to **BFILENAME** for more information on this built-in SQL function.

Binary file LOBs do not participate in transactions and are not recoverable. Rather, the underlying operating system provides file integrity and durability. **BFILE** data can be up to $2^{64}-1$ bytes, although your operating system may impose restrictions on this maximum.

The database administrator must ensure that the external file exists and that Oracle processes have operating system read permissions on the file.

The **BFILE** data type enables read-only support of large binary files. You cannot modify or replicate such a file. Oracle provides APIs to access file data. The primary interfaces that you use to access file data are the **DBMS_LOB** package and Oracle Call Interface (OCI).

See Also:
- *Oracle Database SecureFiles and Large Objects Developer's Guide* and *Oracle Call Interface Programmer's Guide* for more information about LOBs and **CREATE DIRECTORY**
2.1.1.6.2 BLOB Data Type

The BLOB data type stores unstructured binary large objects. BLOB objects can be thought of as bitstreams with no character set semantics. BLOB objects can store binary data up to \((4 \text{ gigabytes} - 1) \times (\text{the value of the CHUNK parameter of LOB storage})\). If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to \(4 \text{ gigabytes} - 1\) \times (database block size).

BLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or Oracle Call Interface (OCI) participate fully in the transaction. BLOB value manipulations can be committed and rolled back. However, you cannot save a BLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

2.1.1.6.3 CLOB Data Type

The CLOB data type stores single-byte and multibyte character data. Both fixed-width and variable-width character sets are supported, and both use the database character set. CLOB objects can store up to \((4 \text{ gigabytes} -1) \times (\text{the value of the CHUNK parameter of LOB storage})\) of character data. If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to \(4 \text{ gigabytes} - 1\) \times (database block size).

CLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or Oracle Call Interface (OCI) participate fully in the transaction. CLOB value manipulations can be committed and rolled back. However, you cannot save a CLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

2.1.1.6.4 NCLOB Data Type

The NCLOB data type stores Unicode data. Both fixed-width and variable-width character sets are supported, and both use the national character set. NCLOB objects can store up to \((4 \text{ gigabytes} -1) \times (\text{the value of the CHUNK parameter of LOB storage})\) of character text data. If the tablespaces in your database are of standard block size, and if you have used the default value of the CHUNK parameter of LOB storage when creating a LOB column, then this is equivalent to \(4 \text{ gigabytes} - 1\) \times (database block size).

NCLOB objects have full transactional support. Changes made through SQL, the DBMS_LOB package, or OCI participate fully in the transaction. NCLOB value manipulations can be committed and rolled back. However, you cannot save an NCLOB locator in a PL/SQL or OCI variable in one transaction and then use it in another transaction or session.

See Also:

Oracle Database Globalization Support Guide for information on Unicode data type support
2.1.1.7 Extended Data Types

Beginning with Oracle Database 12c, you can specify a maximum size of 32767 bytes for the VARCHAR2, NVARCHAR2, and RAW data types. You can control whether your database supports this new maximum size by setting the initialization parameter MAX_STRING_SIZE as follows:

- If MAX_STRING_SIZE = STANDARD, then the size limits for releases prior to Oracle Database 12c apply: 4000 bytes for the VARCHAR2 and NVARCHAR2 data types, and 2000 bytes for the RAW data type. This is the default.
- If MAX_STRING_SIZE = EXTENDED, then the size limit is 32767 bytes for the VARCHAR2, NVARCHAR2, and RAW data types.

**See Also:**

Setting MAX_STRING_SIZE = EXTENDED may update database objects and possibly invalidate them. Refer to Oracle Database Reference for complete information on the implications of this parameter and how to set and enable this new functionality.

A VARCHAR2 or NVARCHAR2 data type with a declared size of greater than 4000 bytes, or a RAW data type with a declared size of greater than 2000 bytes, is an extended data type. Extended data type columns are stored out-of-line, leveraging Oracle's LOB technology. The LOB storage is always aligned with the table. In tablespaces managed with Automatic Segment Space Management (ASSM), extended data type columns are stored as SecureFiles LOBs. Otherwise, they are stored as BasicFiles LOBs. The use of LOBs as a storage mechanism is internal only. Therefore, you cannot manipulate these LOBs using the DBMS_LOB package.

**Note:**

- Oracle strongly discourages the use of BasicFiles LOBs as a storage mechanism. BasicFiles LOBs not only impose restrictions on the capabilities of extended data type columns, but the BasicFiles data type is planned to be deprecated in a future release.
- Extended data types are subject to the same rules and restrictions as LOBs. Refer to Oracle Database SecureFiles and Large Objects Developer's Guide for more information.

Note that, although you must set MAX_STRING_SIZE = EXTENDED in order to set the size of a RAW data type to greater than 2000 bytes, a RAW data type is stored as an out-of-line LOB only if it has a size of greater than 4000 bytes. For example, you must set MAX_STRING_SIZE = EXTENDED in order to declare a RAW(3000) data type. However, the column is stored inline.

You can use extended data types just as you would standard data types, with the following considerations:
• For special considerations when creating an index on an extended data type column, or when requiring an index to enforce a primary key or unique constraint, see Creating an Index on an Extended Data Type Column.

• If the partitioning key column for a list partition is an extended data type column, then the list of values that you want to specify for a partition may exceed the 4K byte limit for the partition bounds. See the list_partitions clause of CREATE TABLE for information on how to work around this issue.

• The value of the initialization parameter MAX_STRING_SIZE affects the following:
  – The maximum length of a text literal. See Text Literals for more information.
  – The size limit for concatenating two character strings. See Concatenation Operator for more information.
  – The length of the collation key returned by the NLSSORT function. See NLSSORT.
  – The size of some of the attributes of the XMLFormat object. See XML Format Model for more information.
  – The size of some expressions in the following XML functions: XMLCOLATTVAL, XMLELEMENT, XMLFOREST, XMLPI, and XMLTABLE.

2.1.2 Rowid Data Types

Each row in the database has an address. The sections that follow describe the two forms of row address in an Oracle Database.

2.1.2.1 ROWID Data Type

The rows in heap-organized tables that are native to Oracle Database have row addresses called rowids. You can examine a rowid row address by querying the pseudocolumn ROWID. Values of this pseudocolumn are strings representing the address of each row. These strings have the data type ROWID. You can also create tables and clusters that contain actual columns having the ROWID data type. Oracle Database does not guarantee that the values of such columns are valid rowids. Refer to Pseudocolumns for more information on the ROWID pseudocolumn.

Rowids contain the following information:

• The data block of the file containing the row. The length of this string depends on your operating system.

• The row in the data block.

• The database file containing the row. The first data file has the number 1. The length of this string depends on your operating system.

• The data object number, which is an identification number assigned to every database segment. You can retrieve the data object number from the database dictionary views USER_OBJECTS, DBA_OBJECTS, and ALL_OBJECTS. Objects that share the same segment (clustered tables in the same cluster, for example) have the same object number.

Rowids are stored as base 64 values that can contain the characters A-Z, a-z, 0-9, and the plus sign (+) and forward slash (/). Rowids are not available directly. You can
use the supplied package DBMS_ROWID to interpret rowid contents. The package functions extract and provide information on the four rowid elements listed above.

See Also:
Oracle Database PL/SQL Packages and Types Reference for information on the functions available with the DBMS_ROWID package and how to use them.

2.1.2.2 UROWID Data Type

The rows of some tables have addresses that are not physical or permanent or were not generated by Oracle Database. For example, the row addresses of index-organized tables are stored in index leaves, which can move. Rowids of foreign tables (such as DB2 tables accessed through a gateway) are not standard Oracle rowids.

Oracle uses universal rowids (urowids) to store the addresses of index-organized and foreign tables. Index-organized tables have logical urowids and foreign tables have foreign urowids. Both types of urowid are stored in the ROWID pseudocolumn (as are the physical rowids of heap-organized tables).

Oracle creates logical rowids based on the primary key of the table. The logical rowids do not change as long as the primary key does not change. The ROWID pseudocolumn of an index-organized table has a data type of UROWID. You can access this pseudocolumn as you would the ROWID pseudocolumn of a heap-organized table (using a SELECT ... ROWID statement). If you want to store the rowids of an index-organized table, then you can define a column of type UROWID for the table and retrieve the value of the ROWID pseudocolumn into that column.

2.1.3 ANSI, DB2, and SQL/DS Data Types

SQL statements that create tables and clusters can also use ANSI data types and data types from the IBM products SQL/DS and DB2. Oracle recognizes the ANSI or IBM data type name that differs from the Oracle Database data type name. It converts the data type to the equivalent Oracle data type, records the Oracle data type as the name of the column data type, and stores the column data in the Oracle data type based on the conversions shown in the tables that follow.

<table>
<thead>
<tr>
<th>ANSI SQL Data Type</th>
<th>Oracle Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARACTER (n)</td>
<td>CHAR (n)</td>
</tr>
<tr>
<td>CHAR (n)</td>
<td></td>
</tr>
<tr>
<td>CHARACTER VARYING (n)</td>
<td>VARCHAR2 (n)</td>
</tr>
<tr>
<td>CHAR VARYING (n)</td>
<td></td>
</tr>
<tr>
<td>NATIONAL CHARACTER (n)</td>
<td>NCHAR (n)</td>
</tr>
<tr>
<td>NATIONAL CHAR (n)</td>
<td></td>
</tr>
<tr>
<td>NCHAR (n)</td>
<td></td>
</tr>
</tbody>
</table>
Table 2-6  (Cont.) ANSI Data Types Converted to Oracle Data Types

<table>
<thead>
<tr>
<th>ANSI SQL Data Type</th>
<th>Oracle Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>NATIONAL CHARACTER VARYING(n)</td>
<td>NVARCHAR2(n)</td>
</tr>
<tr>
<td>NATIONAL CHAR VARYING(n)</td>
<td></td>
</tr>
<tr>
<td>NCHAR VARYING(n)</td>
<td></td>
</tr>
<tr>
<td>NUMERIC[(p,s)]</td>
<td>NUMBER(p,s)</td>
</tr>
<tr>
<td>DECIMAL[(p,s)] (Note 1)</td>
<td></td>
</tr>
<tr>
<td>INTEGER</td>
<td>NUMBER(p,0)</td>
</tr>
<tr>
<td>INT</td>
<td></td>
</tr>
<tr>
<td>SMALLINT</td>
<td></td>
</tr>
<tr>
<td>FLOAT (Note 2)</td>
<td>FLOAT(126)</td>
</tr>
<tr>
<td>DOUBLE PRECISION (Note 3)</td>
<td>FLOAT(126)</td>
</tr>
<tr>
<td>REAL (Note 4)</td>
<td>FLOAT(63)</td>
</tr>
</tbody>
</table>

Notes:

1. The NUMERIC and DECIMAL data types can specify only fixed-point numbers. For those data types, the scale (s) defaults to 0.
2. The FLOAT data type is a floating-point number with a binary precision b. The default precision for this data type is 126 binary, or 38 decimal.
3. The DOUBLE PRECISION data type is a floating-point number with binary precision 126.
4. The REAL data type is a floating-point number with a binary precision of 63, or 18 decimal.

Do not define columns with the following SQL/DS and DB2 data types, because they have no corresponding Oracle data type:

- GRAPHIC
- LONG VARGRAPHIC
- VARGRAPHIC
- TIME

Note that data of type TIME can also be expressed as Oracle datetime data.

![See Also: Datetime and Interval Data Types](image)

Table 2-7  SQL/DS and DB2 Data Types Converted to Oracle Data Types

<table>
<thead>
<tr>
<th>SQL/DS or DB2 Data Type</th>
<th>Oracle Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHARACTER(n)</td>
<td>CHAR(n)</td>
</tr>
</tbody>
</table>
Table 2-7  (Cont.) SQL/DS and DB2 Data Types Converted to Oracle Data Types

<table>
<thead>
<tr>
<th>SQL/DS or DB2 Data Type</th>

</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR (n)</td>
<td>VARCHAR (n)</td>
</tr>
<tr>
<td>LONG VARCHAR</td>
<td>LONG</td>
</tr>
<tr>
<td>DECIMAL (p, s) (Note 1)</td>
<td>NUMBER (p, s)</td>
</tr>
<tr>
<td>INTEGER</td>
<td>NUMBER (p, 0)</td>
</tr>
<tr>
<td>SMALLINT</td>
<td>NUMBER</td>
</tr>
<tr>
<td>FLOAT (Note 2)</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

Notes:

1. The DECIMAL data type can specify only fixed-point numbers. For this data type, s defaults to 0.
2. The FLOAT data type is a floating-point number with a binary precision b. The default precision for this data type is 126 binary or 38 decimal.

2.1.4 User-Defined Types

User-defined data types use Oracle built-in data types and other user-defined data types as the building blocks of object types that model the structure and behavior of data in applications. The sections that follow describe the various categories of user-defined types.

See Also:

- Oracle Database Concepts for information about Oracle built-in data types
- CREATE TYPE and the CREATE TYPE BODY for information about creating user-defined types
- Oracle Database Object-Relational Developer's Guide for information about using user-defined types

2.1.4.1 Object Types

Object types are abstractions of the real-world entities, such as purchase orders, that application programs deal with. An object type is a schema object with three kinds of components:

- A name, which identifies the object type uniquely within that schema.
- Attributes, which are built-in types or other user-defined types. Attributes model the structure of the real-world entity.
- Methods, which are functions or procedures written in PL/SQL and stored in the database, or written in a language like C or Java and stored externally. Methods implement operations the application can perform on the real-world entity.
2.1.4.2 REF Data Types

An **object identifier** (represented by the keyword **OID**) uniquely identifies an object and enables you to reference the object from other objects or from relational tables. A data type category called **REF** represents such references. A **REF** data type is a container for an object identifier. **REF** values are pointers to objects.

When a **REF** value points to a nonexistent object, the **REF** is said to be "dangling". A dangling **REF** is different from a null **REF**. To determine whether a **REF** is dangling or not, use the condition `IS [NOT] Dangling`. For example, given object view **oc_orders** in the sample schema **oe**, the column **customer_ref** is of type **REF** to type **customer_typ**, which has an attribute **cust_email**:

```sql
SELECT o.customer_ref.cust_email
FROM oc_orders o
WHERE o.customer_ref IS NOT DANNLING;
```

2.1.4.3 Varrays

An array is an ordered set of data elements. All elements of a given array are of the same data type. Each element has an **index**, which is a number corresponding to the position of the element in the array.

The number of elements in an array is the size of the array. Oracle arrays are of variable size, which is why they are called **varrays**. You must specify a maximum size when you declare the varray.

When you declare a varray, it does not allocate space. It defines a type, which you can use as:

- The data type of a column of a relational table
- An object type attribute
- A PL/SQL variable, parameter, or function return type

Oracle normally stores an array object either in line (as part of the row data) or out of line (in a LOB), depending on its size. However, if you specify separate storage characteristics for a varray, then Oracle stores it out of line, regardless of its size. Refer to the **varray_col_properties** of **CREATE TABLE** for more information about varray storage.

2.1.4.4 Nested Tables

A nested table type models an unordered set of elements. The elements may be built-in types or user-defined types. You can view a nested table as a single-column table or, if the nested table is an object type, as a multicolumn table, with a column for each attribute of the object type.

A nested table definition does not allocate space. It defines a type, which you can use to declare:

- The data type of a column of a relational table
- An object type attribute
- A PL/SQL variable, parameter, or function return type
When a nested table appears as the type of a column in a relational table or as an attribute of the underlying object type of an object table, Oracle stores all of the nested table data in a single table, which it associates with the enclosing relational or object table.

2.1.5 Oracle-Supplied Types

Oracle provides SQL-based interfaces for defining new types when the built-in or ANSI-supported types are not sufficient. The behavior for these types can be implemented in C/C++, Java, or PL/SQL. Oracle Database automatically provides the low-level infrastructure services needed for input-output, heterogeneous client-side access for new data types, and optimizations for data transfers between the application and the database.

These interfaces can be used to build user-defined (or object) types and are also used by Oracle to create some commonly useful data types. Several such data types are supplied with the server, and they serve both broad horizontal application areas (for example, the Any types) and specific vertical ones (for example, the spatial types).

The Oracle-supplied types, along with cross-references to the documentation of their implementation and use, are described in the following sections:

- Any Types
- XML Types
- Spatial Types
- Media Types

2.1.6 Any Types

The Any types provide highly flexible modeling of procedure parameters and table columns where the actual type is not known. These data types let you dynamically encapsulate and access type descriptions, data instances, and sets of data instances of any other SQL type. These types have OCI and PL/SQL interfaces for construction and access.

2.1.6.1 ANYTYPE

This type can contain a type description of any named SQL type or unnamed transient type.

2.1.6.2 ANYDATA

This type contains an instance of a given type, with data, plus a description of the type. ANYDATA can be used as a table column data type and lets you store heterogeneous values in a single column. The values can be of SQL built-in types as well as user-defined types.

2.1.6.3 ANYDATASET

This type contains a description of a given type plus a set of data instances of that type. ANYDATASET can be used as a procedure parameter data type where such flexibility is needed. The values of the data instances can be of SQL built-in types as well as user-defined types.
2.1.7 XML Types

Extensible Markup Language (XML) is a standard format developed by the World Wide Web Consortium (W3C) for representing structured and unstructured data on the World Wide Web. Universal resource identifiers (URIs) identify resources such as Web pages anywhere on the Web. Oracle provides types to handle XML and URI data, as well as a class of URIs called DBURIRef types to access data stored within the database itself. It also provides a set of types to store and access both external and internal URIs from within the database.

2.1.7.1 XMLType

This Oracle-supplied type can be used to store and query XML data in the database. XMLType has member functions you can use to access, extract, and query the XML data using XPath expressions. XPath is another standard developed by the W3C committee to traverse XML documents. Oracle XMLType functions support many W3C XPath expressions. Oracle also provides a set of SQL functions and PL/SQL packages to create XMLType values from existing relational or object-relational data.

XMLType is a system-defined type, so you can use it as an argument of a function or as the data type of a table or view column. You can also create tables and views of XMLType. When you create an XMLType column in a table, you can choose to store the XML data in a CLOB column, as binary XML (stored internally as a CLOB), or object relationally.

You can also register the schema (using the DBMS_XMLSCHEMA package) and create a table or column conforming to the registered schema. In this case Oracle stores the XML data in underlying object-relational columns by default, but you can specify storage in a CLOB or binary XML column even for schema-based data.

Queries and DML on XMLType columns operate the same regardless of the storage mechanism.

2.1.7.2 URI Data Types

Oracle supplies a family of URI types—URIType, DBURIType, XDBURIType, and HTTPURIType—which are related by an inheritance hierarchy. URIType is an object type and the others are subtypes of URIType. Since URIType is the supertype, you can
create columns of this type and store DBURIType or HTTPURIType type instances in this column.

HTTPURIType

You can use HTTPURIType to store URLs to external Web pages or to files. Oracle accesses these files using HTTP (Hypertext Transfer Protocol).

XDBURIType

You can use XDBURIType to expose documents in the XML database hierarchy as URIs that can be embedded in any URIType column in a table. The XDBURIType consists of a URL, which comprises the hierarchical name of the XML document to which it refers and an optional fragment representing the XPath syntax. The fragment is separated from the URL part by a pound sign (#). The following lines are examples of XDBURIType:

```
/home/oe/doc1.xml
/home/oe/doc1.xml#/orders/order_item
```

DBURIType

DBURIType can be used to store DBURIRef values, which reference data inside the database. Storing DBURIRef values lets you reference data stored inside or outside the database and access the data consistently.

DBURIRef values use an XPath-like representation to reference data inside the database. If you imagine the database as an XML tree, then you would see the tables, rows, and columns as elements in the XML document. For example, the sample human resources user hr would see the following XML tree:

```
<HR>
  <EMPLOYEES>
    <ROW>
      <EMPLOYEE_ID>205</EMPLOYEE_ID>
      <LAST_NAME>Higgins</LAST_NAME>
      <SALARY>12008</SALARY>
      ... <!-- other columns -->
    </ROW>
    ... <!-- other rows -->
  </EMPLOYEES>
</HR>
```

The DBURIRef is an XPath expression over this virtual XML document. So to reference the SALARY value in the EMPLOYEES table for the employee with employee number 205, you can write a DBURIRef as,

```
/HR/EMPLOYEES/ROW[EMPLOYEE_ID=205]/SALARY
```

Using this model, you can reference data stored in CLOB columns or other columns and expose them as URLs to the external world.

2.1.7.3 URIFactory Package

Oracle also provides the URIFactory package, which can create and return instances of the various subtypes of the URITypes. The package analyzes the URL string,
identifies the type of URL (HTTP, DBURI, and so on), and creates an instance of the subtype. To create a DBURI instance, the URL must begin with the prefix /oradb. For example, URIFactory.getURI('/oradb/HR/EMPLOYEES') would create a DBURIType instance and URIFactory.getUri('/sys/schema') would create an XDBURIType instance.

See Also:

- Oracle Database Object-Relational Developer's Guide for general information on object types and type inheritance
- Oracle XML DB Developer's Guide for more information about these supplied types and their implementation
- Oracle Database Advanced Queuing User's Guide for information about using XMLType with Oracle Advanced Queuing

2.1.8 Spatial Types

Oracle Spatial and Graph is designed to make spatial data management easier and more natural to users of location-enabled applications, geographic information system (GIS) applications, and geoimaging applications. After the spatial data is stored in an Oracle Database, you can easily manipulate, retrieve, and relate it to all the other data stored in the database. The following data types are available only if you have installed Oracle Spatial and Graph.

2.1.8.1 SDO_GEOMETRY

The geometric description of a spatial object is stored in a single row, in a single column of object type SDO_GEOMETRY in a user-defined table. Any table that has a column of type SDO_GEOMETRY must have another column, or set of columns, that defines a unique primary key for that table. Tables of this sort are sometimes called geometry tables.

The SDO_GEOMETRY object type has the following definition:

```sql
CREATE TYPE SDO_GEOMETRY AS OBJECT
    (sgo_gtype NUMBER,
     sdo_srid NUMBER,
     sdo_point SDO_POINT_TYPE,
     sdo_elem_info SDO_ELEM_INFO_ARRAY,
     sdo_ordinates SDO_ORDINATE_ARRAY);
/
```

2.1.8.2 SDO_TOPO_GEOMETRY

This type describes a topology geometry, which is stored in a single row, in a single column of object type SDO_TOPO_GEOMETRY in a user-defined table.

The SDO_TOPO_GEOMETRY object type has the following definition:

```sql
CREATE TYPE SDO_TOPO_GEOMETRY AS OBJECT
    (tg_type NUMBER,
     tg_id NUMBER,
     /*...*/
```
2.1.8.3 SDO_GEORASTER

In the GeoRaster object-relational model, a raster grid or image object is stored in a single row, in a single column of object type SDO_GEORASTER in a user-defined table. Tables of this sort are called GeoRaster tables.

The SDO_GEORASTER object type has the following definition:

```sql
CREATE TYPE SDO_GEORASTER AS OBJECT
(rasterType NUMBER,
spatialExtent SDO_GEOMETRY,
rasterDataTable VARCHAR2(32),
rasterID NUMBER,
metadata XMLType);
```

See Also:

*Oracle Spatial and Graph Developer's Guide*, *Oracle Spatial and Graph Topology Data Model and Network Data Model Graph Developer's Guide*, and *Oracle Spatial and Graph GeoRaster Developer's Guide* for information on the full implementation of the spatial data types and guidelines for using them.

2.1.9 Media Types

Oracle Multimedia can use object types, similar to Java or C++ classes, to describe multimedia data. An instance of these object types consists of attributes, including metadata and the media data, and methods. The Multimedia data types are created in the ORDSYS schema. Public synonyms exist for all the data types, so you can access them without specifying the schema name.

Oracle Multimedia provides the following object types:

- **ORDAudio**
  
  Supports the storage and management of audio data.

- **ORDDicom**
  
  Supports the storage and management of Digital Imaging and Communications in Medicine (DICOM), the format universally recognized as the standard for medical imaging.

- **ORDDoc**
  
  Supports storage and management of any type of media data, including audio, image and video data. Use this type when you want all media to be stored in a single column.

- **ORDImage**
  
  Supports the storage and management of image data.
• ORDVideo
  Supports the storage and management of video data.

The following data types provide compliance with the ISO-IEC 13249-5 Still Image standard, commonly referred to as SQL/MM StillImage:

• SI_AverageColor
  Represents a feature that characterizes an image by its average color.

• SI_Color
  Encapsulates color values.

• SI_ColorHistogram
  Represents a feature that characterizes an image by the relative frequencies of the colors exhibited by samples of the raw image.

• SI_FeatureList
  A list containing up to four of the image features represented by the preceding object types (SI_AverageColor, SI_ColorHistogram, SI_PositionalColor, and SI_Texture), where each feature is associated with a feature weight.

• SI_PositionalColor
  Given an image divided into $n$ by $m$ rectangles, the SI_PositionalColor object type represents the feature that characterizes an image by the $n$ by $m$ most significant colors of the rectangles.

• SI_StillImage
  Represents digital images with inherent image characteristics such as height, width, and format.

• SI_Texture
  Represents a feature that characterizes an image by the size of repeating items (coarseness), brightness variations (contrast), and predominant direction (directionality).

---

**Note:**

The Oracle Multimedia support for object types that comply with the first edition of the ISO/IEC 13249-5:2001 SQLMM Part5:StillImage standard (commonly referred to as the SQL/MM Still Image standard) is deprecated in Oracle Database 12c Release 2 (12.2), and may be desupported in a future release. See Oracle Multimedia Reference for more information.

---

• Oracle Multimedia Reference for information on all other object types listed in this section
2.2 Data Type Comparison Rules

This section describes how Oracle Database compares values of each data type.

2.2.1 Numeric Values

A larger value is considered greater than a smaller one. All negative numbers are less than zero and all positive numbers. Thus, -1 is less than 100; -100 is less than -1.

The floating-point value NaN (not a number) is greater than any other numeric value and is equal to itself.

See Also:

Numeric Precedence and Floating-Point Numbers for more information on comparison semantics

2.2.2 Datetime Values

A later date or timestamp is considered greater than an earlier one. For example, the date equivalent of '29-MAR-2005' is less than that of '05-JAN-2006' and the timestamp equivalent of '05-JAN-2006 1:35pm' is greater than that of '05-JAN-2005 10:09am'.

When two timestamps with time zone are compared, they are first normalized to UTC, that is, to the timezone offset '+00:00'. For example, the timestamp with time zone equivalent of '16-OCT-2016 05:59am Europe/Warsaw' is equal to that of '15-OCT-2016 08:59pm US/Pacific'. Both represent the same absolute point in time, which represented in UTC is October 16th, 2016, 03:59am.

2.2.3 Binary Values

A binary value of the data type RAW or BLOB is a sequence of bytes. When two binary values are compared, the corresponding, consecutive bytes of the two byte sequences are compared in turn. If the first bytes of both compared values are different, the binary value that contains the byte with the lower numeric value is considered smaller. If the first bytes are equal, second bytes are compared analogously, and so on, until either the compared bytes differ or the comparison process reaches the end of one of the values. In the latter case, the value that is shorter is considered smaller.

Binary values of the data type BLOB cannot be compared directly in comparison conditions. However, they can be compared with the PL/SQL function DBMS_LOB_COMPARE.

See Also:

Oracle Database PL/SQL Packages and Types Reference for more information on the DBMS_LOB_COMPARE function
2.2.4 Character Values

Character values are compared on the basis of two measures:

- Binary or linguistic collation
- Blank-padded or nonpadded comparison semantics

The following subsections describe the two measures.

**Binary and Linguistic Collation**

In binary collation, which is the default, Oracle compares character values like binary values. Two sequences of bytes that form the encodings of two character values in their storage character set are treated as binary values and compared as described in Binary Values. The result of this comparison is returned as the result of the binary comparison of the source character values.

> **See Also:**

*Oracle Database Globalization Support Guide* for more information on character sets

For many languages, the binary collation can yield a linguistically incorrect ordering of character values. For example, in most common character sets, all the uppercase Latin letters have character codes with lower values than all the lowercase Latin letters. Hence, the binary collation yields the following order:

MacDonald
MacIntosh
Macdonald
Macintosh

However, most users expect these four values to be presented in the order:

MacDonald
Macdonald
MacIntosh
Macintosh

This shows that binary collation may not be suitable even for English character values.

Oracle Database supports linguistic collations that order strings according to rules of various spoken languages. It also supports collation variants that match character values case- and accent-insensitively. Linguistic collations are more expensive but they provide superior user experience.
Restrictions for Linguistic Collations

Comparison conditions, ORDER BY, GROUP BY and MATCH_RECOGNIZE query clauses, COUNT (DISTINCT) and statistical aggregate functions, LIKE conditions, and ORDER BY and PARTITION BY analytic clauses generate collation keys when using linguistic collations. The collation keys are the same values that are returned by the function NLSSORT and are subject to the same restrictions that are described in NLSSORT.

Blank-Padded and Nonpadded Comparison Semantics

With blank-padded semantics, if the two values have different lengths, then Oracle first adds blanks to the end of the shorter one so their lengths are equal. Oracle then compares the values character by character up to the first character that differs. The value with the greater character in the first differing position is considered greater. If two values have no differing characters, then they are considered equal. This rule means that two values are equal if they differ only in the number of trailing blanks. Oracle uses blank-padded comparison semantics only when both values in the comparison are either expressions of data type CHAR, NCHAR, text literals, or values returned by the USER function.

With nonpadded semantics, Oracle compares two values character by character up to the first character that differs. The value with the greater character in that position is considered greater. If two values of different length are identical up to the end of the shorter one, then the longer value is considered greater. If two values of equal length have no differing characters, then the values are considered equal. Oracle uses nonpadded comparison semantics whenever one or both values in the comparison have the data type VARCHAR2 or NVARCHAR2.

The results of comparing two character values using different comparison semantics may vary. The table that follows shows the results of comparing five pairs of character values using each comparison semantic. Usually, the results of blank-padded and nonpadded comparisons are the same. The last comparison in the table illustrates the differences between the blank-padded and nonpadded comparison semantics.

<table>
<thead>
<tr>
<th>Blank-Padded</th>
<th>Nonpadded</th>
</tr>
</thead>
<tbody>
<tr>
<td>'ac' &gt; 'ab'</td>
<td>'ac' &gt; 'ab'</td>
</tr>
<tr>
<td>'ab' &gt; 'a '</td>
<td>'ab' &gt; 'a '</td>
</tr>
<tr>
<td>'ab' &gt; 'a'</td>
<td>'ab' &gt; 'a'</td>
</tr>
<tr>
<td>'ab' = 'ab'</td>
<td>'ab' = 'ab'</td>
</tr>
<tr>
<td>'a ' = 'a'</td>
<td>'a ' &gt; 'a'</td>
</tr>
</tbody>
</table>

Data-Bound Collation

Starting with Oracle Database 12c Release 2 (12.2), the collation to use when comparing or matching a given character value is associated with the value itself. It is
called the **data-bound collation**. The data-bound collation can be viewed as an attribute of the data type of the value.

In previous Oracle Database releases, the session parameters NLS_COMP and NLS_SORT coarsely determined the collation for all collation-sensitive SQL operations in a database session. The data-bound collation architecture enables applications to consistently apply language-specific comparison rules to exactly the data that needs these rules.

Oracle Database 12c Release 2 (12.2) allows you to declare a collation for a table column. When a column is passed as an argument to a collation-sensitive SQL operation, the SQL operation uses the column's declared collation to process the column's values. If the SQL operation has multiple character arguments that are compared to each other, the **collation determination rules** determine the collation to use.

There are two types of data-bound collations:

- **Named Collation**: This collation is a particular set of collating rules specified by a collation name. Named collations are the same collations that are specified as values for the NLS_SORT parameter. A named collation can be either a binary collation or a linguistic collation.

- **Pseudo-collation**: This collation does not directly specify the collating rules for a SQL operation. Instead, it instructs the operation to check the values of the session parameters NLS_SORT and NLS_COMP for the actual named collation to use. Pseudo-collations are the bridge between the new declarative method of specifying collations and the old method that uses session parameters. In particular, the pseudo-collation USING_NLS_COMP directs a SQL operation to behave exactly as it used to behave before Oracle Database 12c Release 2.

When you declare a named collation for a column, you statically determine how the column values are compared. When you declare a pseudo-collation, you can dynamically control comparison behavior with the session parameter NLS_COMP and NLS_SORT. However, static objects, such as indexes and constraints, defined on a column declared with a pseudo-collation, fall back to using a binary collation. Dynamically settable collating rules cannot be used to compare values for a static object.

The collation for a character literal or bind variable that is used in an expression is derived from the default collation of the database object containing the expression, such as a view or materialized view query, a PL/SQL stored unit code, a user-defined type method code, or a standalone DML or query statement. In Oracle Database 12c Release 2, the default collation of PL/SQL stored units, user-defined type methods, and standalone SQL statements is always the pseudo-collation USING_NLS_COMP. The default collation of views and materialized views can be specified in the DEFAULT COLLATION clause of the CREATE VIEW and CREATE MATERIALIZED VIEW statements.

If a SQL operation returns character values, the **collation derivation rules** determine the derived collation for the result, so that its collation is known, when the result is passed as an argument to another collation-sensitive SQL operation in the expression tree or to a top-level consumer, such as an SQL statement clause in a SELECT statement. If a SQL operation operates on character argument values, then the derived collation of its character result is based on the collations of the arguments. Otherwise, the derivation rules are the same as for a character literal.

You can override the derived collation of an expression node, such as a simple expression or an operator result, by using the COLLABE operator.
Oracle Database allows you to declare a case-insensitive collation for a column, table or schema, so that the column or all character columns in a table or a schema can be always compared in a case-insensitive way.

- Oracle Database Globalization Support Guide for more information on data-bound collation architecture, including the detailed collation derivation and determination rules
- COLLATE Operator

### 2.2.5 Object Values

Object values are compared using one of two comparison functions: MAP and ORDER. Both functions compare object type instances, but they are quite different from one another. These functions must be specified as part of any object type that will be compared with other object types.

See Also:

CREATE TYPE for a description of MAP and ORDER methods and the values they return

### 2.2.6 Varrays and Nested Tables

Comparison of nested tables is described in Comparison Conditions.

### 2.2.7 Data Type Precedence

Oracle uses data type precedence to determine implicit data type conversion, which is discussed in the section that follows. Oracle data types take the following precedence:

- Datetime and interval data types
- BINARY_DOUBLE
- BINARY_FLOAT
- NUMBER
- Character data types
- All other built-in data types

### 2.2.8 Data Conversion

Generally an expression cannot contain values of different data types. For example, an expression cannot multiply 5 by 10 and then add 'JAMES'. However, Oracle supports both implicit and explicit conversion of values from one data type to another.
2.2.8.1 Implicit and Explicit Data Conversion

Oracle recommends that you specify explicit conversions, rather than rely on implicit or automatic conversions, for these reasons:

- SQL statements are easier to understand when you use explicit data type conversion functions.
- Implicit data type conversion can have a negative impact on performance, especially if the data type of a column value is converted to that of a constant rather than the other way around.
- Implicit conversion depends on the context in which it occurs and may not work the same way in every case. For example, implicit conversion from a datetime value to a VARCHAR2 value may return an unexpected year depending on the value of the NLS_DATE_FORMAT parameter.
- Algorithms for implicit conversion are subject to change across software releases and among Oracle products. Behavior of explicit conversions is more predictable.
- If implicit data type conversion occurs in an index expression, then Oracle Database might not use the index because it is defined for the pre-conversion data type. This can have a negative impact on performance.

2.2.8.2 Implicit Data Conversion

Oracle Database automatically converts a value from one data type to another when such a conversion makes sense.

Table 2-8 is a matrix of Oracle implicit conversions. The table shows all possible conversions, without regard to the direction of the conversion or the context in which it is made. The rules governing these details follow the table.

</tbody>
</table>

1 You cannot convert LONG to INTERVAL directly, but you can convert LONG to VARCHAR2 using TO_CHAR(interval), and then convert the resulting VARCHAR2 value to INTERVAL.

The following rules govern implicit data type conversions:

- During INSERT and UPDATE operations, Oracle converts the value to the data type of the affected column.
- During SELECT FROM operations, Oracle converts the data from the column to the type of the target variable.
- When manipulating numeric values, Oracle usually adjusts precision and scale to allow for maximum capacity. In such cases, the numeric data type resulting from such operations can differ from the numeric data type found in the underlying tables.
- When comparing a character value with a numeric value, Oracle converts the character data to a numeric value.
- Conversions between character values or NUMBER values and floating-point number values can be inexact, because the character types and NUMBER use decimal precision to represent the numeric value, and the floating-point numbers use binary precision.
- When converting a CLOB value into a character data type such as VARCHAR2, or converting BLOB to RAW data, if the data to be converted is larger than the target data type, then the database returns an error.
- During conversion from a timestamp value to a DATE value, the fractional seconds portion of the timestamp value is truncated. This behavior differs from earlier releases of Oracle Database, when the fractional seconds portion of the timestamp value was rounded.
- Conversions from BINARY_FLOAT to BINARY_DOUBLE are exact.
• Conversions from `BINARY_DOUBLE` to `BINARY_FLOAT` are inexact if the `BINARY_DOUBLE` value uses more bits of precision that supported by the `BINARY_FLOAT`.

• When comparing a character value with a `DATE` value, Oracle converts the character data to `DATE`.

• When you use a SQL function or operator with an argument of a data type other than the one it accepts, Oracle converts the argument to the accepted data type.

• When making assignments, Oracle converts the value on the right side of the equal sign (`=`) to the data type of the target of the assignment on the left side.

• During concatenation operations, Oracle converts from noncharacter data types to `CHAR` or `NCHAR`.

• During arithmetic operations on and comparisons between character and noncharacter data types, Oracle converts from any character data type to a numeric, date, or rowid, as appropriate. In arithmetic operations between `CHAR/VARCHAR2` and `NCHAR/NVARCHAR2`, Oracle converts to a `NUMBER`.

• Most SQL character functions are enabled to accept `CLOB` s as parameters, and Oracle performs implicit conversions between `CLOB` and character types. Therefore, functions that are not yet enabled for `CLOBs` can accept `CLOBs` through implicit conversion. In such cases, Oracle converts the `CLOB` to `CHAR` or `VARCHAR2` before the function is invoked. If the `CLOB` is larger than 4000 bytes, then Oracle converts only the first 4000 bytes to `CHAR`.

• When converting `RAW` or `LONG RAW` data to or from character data, the binary data is represented in hexadecimal form, with one hexadecimal character representing every four bits of `RAW` data. Refer to "RAW and LONG RAW Data Types" for more information.

• Comparisons between `CHAR` and `VARCHAR2` and between `NCHAR` and `NVARCHAR2` types may entail different character sets. The default direction of conversion in such cases is from the database character set to the national character set. Table 2-9 shows the direction of implicit conversions between different character types.

<table>

<td>--</td>
<td>NVARCHAR2</td>
</tr>
<tr>
<td>from NVARCHAR2</td>
<td>NVARCHAR2</td>
<td>NVARCHAR2</td>
<td>NVARCHAR2</td>
<td>--</td>
</tr>
</tbody>
</table>

User-defined types such as collections cannot be implicitly converted, but must be explicitly converted using `CAST ... MULTISET`.

Table 2-9 Conversion Direction of Different Character Types
2.2.8.3 Implicit Data Conversion Examples

**Text Literal Example**

The text literal '10' has data type CHAR. Oracle implicitly converts it to the NUMBER data type if it appears in a numeric expression as in the following statement:

```sql
SELECT salary + '10'
FROM employees;
```

**Character and Number Values Example**

When a condition compares a character value and a NUMBER value, Oracle implicitly converts the character value to a NUMBER value, rather than converting the NUMBER value to a character value. In the following statement, Oracle implicitly converts '200' to 200:

```sql
SELECT last_name
FROM employees
WHERE employee_id = '200';
```

**Date Example**

In the following statement, Oracle implicitly converts '24-JUN-06' to a DATE value using the default date format 'DD-MON-YY':

```sql
SELECT last_name
FROM employees
WHERE hire_date = '24-JUN-06';
```

2.2.8.4 Explicit Data Conversion

You can explicitly specify data type conversions using SQL conversion functions. Table 2-10 shows SQL functions that explicitly convert a value from one data type to another.

You cannot specify LONG and LONG RAW values in cases in which Oracle can perform implicit data type conversion. For example, LONG and LONG RAW values cannot appear in expressions with functions or operators. Refer to LONG Data Type for information on the limitations on LONG and LONG RAW data types.

2.2.9 Security Considerations for Data Conversion

When a datetime value is converted to text, either by implicit conversion or by explicit conversion that does not specify a format model, the format model is defined by one of the globalization session parameters. Depending on the source data type, the parameter name is NLS_DATE_FORMAT, NLS_TIMESTAMP_FORMAT, or NLS_TIMESTAMP_TZ_FORMAT. The values of these parameters can be specified in the client environment or in an ALTER SESSION statement.

The dependency of format models on session parameters can have a negative impact on database security when conversion without an explicit format model is applied to a datetime value that is being concatenated to text of a dynamic SQL statement. Dynamic SQL statements are those statements whose text is concatenated from fragments before being passed to a database for execution. Dynamic SQL is frequently associated with the built-in PL/SQL package DBMS_SQL or with the PL/SQL statement EXECUTE IMMEDIATE, but these are not the only places where dynamically constructed SQL text may be passed as argument. For example:

```sql
EXECUTE IMMEDIATE
'SELECT last_name FROM employees WHERE hire_date > ''' || start_date || '''';
```

where start_date has the data type DATE.

In the above example, the value of start_date is converted to text using a format model specified in the session parameter NLS_DATE_FORMAT. The result is concatenated into SQL text. A datetime format model can consist simply of literal text enclosed in double quotation marks. Therefore, any user who can explicitly set globalization parameters for a session can decide what text is produced by the above conversion. If the SQL statement is executed by a PL/SQL procedure, the procedure becomes vulnerable to SQL injection through the session parameter. If the procedure runs with definer's rights, with higher privileges than the session itself, the user can gain unauthorized access to sensitive data.
2.3 Literals

The terms literal and constant value are synonymous and refer to a fixed data value. For example, 'JACK', 'BLUE ISLAND', and '101' are all character literals; 5001 is a numeric literal. Character literals are enclosed in single quotation marks so that Oracle can distinguish them from schema object names.

This section contains these topics:

- Text Literals
- Numeric Literals
- Datetime Literals
- Interval Literals

Many SQL statements and functions require you to specify character and numeric literal values. You can also specify literals as part of expressions and conditions. You can specify character literals with the 'text' notation, national character literals with the N'text' notation, and numeric literals with the integer or number notation, depending on the context of the literal. The syntactic forms of these notations appear in the sections that follow.
To specify a datetime or interval data type as a literal, you must take into account any optional precisions included in the data types. Examples of specifying datetime and interval data types as literals are provided in the relevant sections of Data Types.

2.3.1 Text Literals

Use the text literal notation to specify values whenever string appears in the syntax of expressions, conditions, SQL functions, and SQL statements in other parts of this reference. This reference uses the terms text literal, character literal, and string interchangeably. Text, character, and string literals are always surrounded by single quotation marks. If the syntax uses the term char, then you can specify either a text literal or another expression that resolves to character data — for example, the last_name column of the hr.employees table. When char appears in the syntax, the single quotation marks are not used.

The syntax of text literals or strings follows:

```
string ::= 

   N
   n
   c
   Q
   q
   quote_delimiter
   c
   quote_delimiter
```

where N or n specifies the literal using the national character set (NCHAR or NVARCHAR2 data). By default, text entered using this notation is translated into the national character set by way of the database character set when used by the server. To avoid potential loss of data during the text literal conversion to the database character set, set the environment variable ORA_NCHAR_LITERAL_REPLACE to TRUE. Doing so transparently replaces the n' internally and preserves the text literal for SQL processing.

See Also:
Oracle Database Globalization Support Guide for more information about N-quoted literals

In the top branch of the syntax:
- c is any member of the user's character set. A single quotation mark (') within the literal must be preceded by an escape character. To represent one single quotation mark within a literal, enter two single quotation marks.
- " " are two single quotation marks that begin and end text literals.

In the bottom branch of the syntax:
- Q or q indicates that the alternative quoting mechanism will be used. This mechanism allows a wide range of delimiters for the text string.
• The outermost ' ' are two single quotation marks that precede and follow, respectively, the opening and closing quote_delimiter.

• c is any member of the user's character set. You can include quotation marks (") in the text literal made up of c characters. You can also include the quote_delimiter, as long as it is not immediately followed by a single quotation mark.

• quote_delimiter is any single- or multibyte character except space, tab, and return. The quote_delimiter can be a single quotation mark. However, if the quote_delimiter appears in the text literal itself, ensure that it is not immediately followed by a single quotation mark.

  If the opening quote_delimiter is one of [, {, <, or (, then the closing quote_delimiter must be the corresponding }, }, >, or ). In all other cases, the opening and closing quote_delimiter must be the same character.

Text literals have properties of both the CHAR and VARCHAR2 data types:

• Within expressions and conditions, Oracle treats text literals as though they have the data type CHAR by comparing them using blank-padded comparison semantics.

• A text literal can have a maximum length of 4000 bytes if the initialization parameter MAX_STRING_SIZE = STANDARD, and 32767 bytes if MAX_STRING_SIZE = EXTENDED. See Extended Data Types for more information.

Here are some valid text literals:

'Hello'
'ORACLE.dbs'
'Jackie''s raincoat'
'09-MAR-98'
N'nchar literal'

Here are some valid text literals using the alternative quoting mechanism:

q'!name LIKE "%DBMS_%"!'  
q'"So," she said, "It's finished."'  
q'{SELECT * FROM employees WHERE last_name = 'Smith';}'  
nq'I ÿ1234 I'  
q'*name like '["'"

See Also:
Blank-Padded and Nonpadded Comparison Semantics

2.3.2 Numeric Literals

Use numeric literal notation to specify fixed and floating-point numbers.

2.3.2.1 Integer Literals

You must use the integer notation to specify an integer whenever integer appears in expressions, conditions, SQL functions, and SQL statements described in other parts of this reference.

The syntax of integer follows:
integer ::= 

where digit is one of 0, 1, 2, 3, 4, 5, 6, 7, 8, 9.

An integer can store a maximum of 38 digits of precision.

Here are some valid integers:

7
+255

2.3.2.2 NUMBER and Floating-Point Literals

You must use the number or floating-point notation to specify values whenever number or n appears in expressions, conditions, SQL functions, and SQL statements in other parts of this reference.

The syntax of number follows:

number ::= 

where

• + or - indicates a positive or negative value. If you omit the sign, then a positive value is the default.
• digit is one of 0, 1, 2, 3, 4, 5, 6, 7, 8 or 9.
• e or E indicates that the number is specified in scientific notation. The digits after the E specify the exponent. The exponent can range from -130 to 125.
• f or F indicates that the number is a 32-bit binary floating point number of type BINARY_FLOAT.
• d or D indicates that the number is a 64-bit binary floating point number of type
   BINARY_DOUBLE.

   If you omit f or F and d or D, then the number is of type NUMBER.

   The suffixes f (F) and d (D) are supported only in floating-point number literals, not
   in character strings that are to be converted to NUMBER. For example, if Oracle is
   expecting a NUMBER and it encounters the string '9', then it converts the string to
   the number 9. However, if Oracle encounters the string '9f', then conversion fails
   and an error is returned.

   A number of type NUMBER can store a maximum of 38 digits of precision. If the literal
   requires more precision than provided by NUMBER, BINARY_FLOAT, or BINARY_DOUBLE,
   then Oracle truncates the value. If the range of the literal exceeds the range supported
   by NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, then Oracle raises an error.

   Numeric literals are SQL syntax elements, which are not sensitive to NLS settings.
   The decimal separator character in numeric literals is always the period (.). However, if
   a text literal is specified where a numeric value is expected, then the text literal is
   implicitly converted to a number in an NLS-sensitive way. The decimal separator
   contained in the text literal must be the one established with the initialization
   parameter NLS_NUMERIC_CHARACTERS. Oracle recommends that you use numeric
   literals in SQL scripts to make them work independently of the NLS environment.

   The following examples illustrate the behavior of decimal separators in numeric literals
   and text literals. These examples assume that you have established the comma (,) as
   the NLS decimal separator for the current session with the following statement:

   ALTER SESSION SET NLS_NUMERIC_CHARACTERS=',';  

   The previous statement also establishes the period (.) as the NLS group separator, but
   that is irrelevant for these examples.

   This example uses the required decimal separator (.) in the numeric literal 1.23 and
   the established NLS decimal separator (,) in the text literal '2,34'. The text literal is
   converted to the numeric value 2.34, and the output is displayed using commas for the
   decimal separators.

   SELECT 2 * 1.23, 3 * '2,34' FROM DUAL;

   2*1.23   3* '2,34'
   2,46    7,02

   The next example shows that a comma is not treated as part of a numeric literal.
   Rather, the comma is treated as the delimiter in a list of two numeric expressions: 2*1 and
   23.

   SELECT 2 * 1,23 FROM DUAL;

   2*1    23
   2   23

   The next example shows that the decimal separator in a text literal must match the
   NLS decimal separator in order for implicit text-to-number conversion to succeed. The
   following statement fails because the decimal separator (,) does not match the
   established NLS decimal separator (,):
SELECT 3 * '2.34' FROM DUAL;

* ERROR at line 1:
ORA-01722: invalid number

ALTER SESSION and Oracle Database Reference

Here are some valid NUMBER literals:

25
+6.34
0.5
25e-03
-1

Here are some valid floating-point number literals:

25f
+6.34F
0.5d
-1D

You can also use the following supplied floating-point literals in situations where a value cannot be expressed as a numeric literal:

Table 2-11  Floating-Point Literals

<table>
<thead>
<tr>
<th>Literal</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>binary_float_nan</td>
<td>A value of type BINARY_FLOAT for which the condition IS NAN is true</td>
<td>SELECT COUNT(*) FROM employees WHERE TO_BINARY_FLOAT(commission_pct) != BINARY_FLOAT_NAN;</td>
</tr>
<tr>
<td>binary_float_infinity</td>
<td>Single-precision positive infinity</td>
<td>SELECT COUNT(*) FROM employees WHERE salary &lt; BINARY_FLOAT_INFINITY;</td>
</tr>
<tr>
<td>binary_double_nan</td>
<td>A value of type BINARY_DOUBLE for which the condition IS NAN is true</td>
<td>SELECT COUNT(*) FROM employees WHERE TO_BINARY_FLOAT(commission_pct) != BINARY_FLOAT_NAN;</td>
</tr>
<tr>
<td>binary_double_infinity</td>
<td>Double-precision positive infinity</td>
<td>SELECT COUNT(*) FROM employees WHERE salary &lt; BINARY_DOUBLE_INFINITY;</td>
</tr>
</tbody>
</table>
2.3.3 Datetime Literals

Oracle Database supports four datetime data types: DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE.

**Date Literals**

You can specify a DATE value as a string literal, or you can convert a character or numeric value to a date value with the TO_DATE function. DATE literals are the only case in which Oracle Database accepts a TO_DATE expression in place of a string literal.

To specify a DATE value as a literal, you must use the Gregorian calendar. You can specify an ANSI literal, as shown in this example:

```
DATE '1998-12-25'
```

The ANSI date literal contains no time portion, and must be specified in the format 'YYYY-MM-DD'. Alternatively you can specify an Oracle date value, as in the following example:

```
TO_DATE('98-DEC-25 17:30','YY-MON-DD HH24:MI')
```

The default date format for an Oracle DATE value is specified by the initialization parameter NLS_DATE_FORMAT. This example date format includes a two-digit number for the day of the month, an abbreviation of the month name, the last two digits of the year, and a 24-hour time designation.

Oracle automatically converts character values that are in the default date format into date values when they are used in date expressions.

If you specify a date value without a time component, then the default time is midnight (00:00:00 or 12:00:00 for 24-hour and 12-hour clock time, respectively). If you specify a date value without a date, then the default date is the first day of the current month.

Oracle DATE columns always contain both the date and time fields. Therefore, if you query a DATE column, then you must either specify the time field in your query or ensure that the time fields in the DATE column are set to midnight. Otherwise, Oracle may not return the query results you expect. You can use the TRUNC date function to set the time field to midnight, or you can include a greater-than or less-than condition in the query instead of an equality or inequality condition.

Here are some examples that assume a table my_table with a number column row_num and a DATE column datecol:

```
INSERT INTO my_table VALUES (1, SYSDATE);
INSERT INTO my_table VALUES (2, TRUNC(SYSDATE));

SELECT *  
FROM my_table;

<table>
<thead>
<tr>
<th>ROW_NUM</th>
<th>DATECOL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>03-OCT-02</td>
</tr>
<tr>
<td>2</td>
<td>03-OCT-02</td>
</tr>
</tbody>
</table>
```

```
SELECT *  
FROM my_table
WHERE datecol > TO_DATE('02-OCT-02', 'DD-MON-YY');
```
If you know that the time fields of your DATE column are set to midnight, then you can query your DATE column as shown in the immediately preceding example, or by using the DATE literal:

```
SELECT *
FROM my_table
WHERE datecol = DATE '2002-10-03';
```

However, if the DATE column contains values other than midnight, then you must filter out the time fields in the query to get the correct result. For example:

```
SELECT *
FROM my_table
WHERE TRUNC(datecol) = DATE '2002-10-03';
```

Oracle applies the TRUNC function to each row in the query, so performance is better if you ensure the midnight value of the time fields in your data. To ensure that the time fields are set to midnight, use one of the following methods during inserts and updates:

- **Use the TO_DATE function to mask out the time fields:**
  ```
  INSERT INTO my_table
  VALUES (3, TO_DATE('3-OCT-2002', 'DD-MON-YYYY'));
  ```

- **Use the DATE literal:**
  ```
  INSERT INTO my_table
  VALUES (4, '03-OCT-02');
  ```

- **Use the TRUNC function:**
  ```
  INSERT INTO my_table
  VALUES (5, TRUNC(SYSDATE));
  ```

The date function SYSDATE returns the current system date and time. The function CURRENT_DATE returns the current session date. For information on SYSDATE, the TO_* datetime functions, and the default date format, see Datetime Functions.
TIMESTAMP Literals

The TIMESTAMP data type stores year, month, day, hour, minute, and second, and fractional second values. When you specify TIMESTAMP as a literal, the fractional_seconds_precision value can be any number of digits up to 9, as follows:

TIMESTAMP '1997-01-31 09:26:50.124'

TIMESTAMP WITH TIME ZONE Literals

The TIMESTAMP WITH TIME ZONE data type is a variant of TIMESTAMP that includes a time zone region name or time zone offset. When you specify TIMESTAMP WITH TIME ZONE as a literal, the fractional_seconds_precision value can be any number of digits up to 9. For example:

TIMESTAMP '1997-01-31 09:26:56.66 +02:00'

Two TIMESTAMP WITH TIME ZONE values are considered identical if they represent the same instant in UTC, regardless of the TIME ZONE offsets stored in the data. For example,

TIMESTAMP '1999-04-15 8:00:00 -8:00'

is the same as

TIMESTAMP '1999-04-15 11:00:00 -5:00'

8:00 a.m. Pacific Standard Time is the same as 11:00 a.m. Eastern Standard Time.

You can replace the UTC offset with the TZR (time zone region name) format element. For example, the following example has the same value as the preceding example:

TIMESTAMP '1999-04-15 8:00:00 US/Pacific'

To eliminate the ambiguity of boundary cases when the daylight saving time switches, use both the TZR and a corresponding TZD format element. The following example ensures that the preceding example will return a daylight saving time value:

TIMESTAMP '1999-10-29 01:30:00 US/Pacific PDT'

You can also express the time zone offset using a datetime expression:

SELECT TIMESTAMP '2009-10-29 01:30:00' AT TIME ZONE 'US/Pacific'
    FROM DUAL;

See Also:

Datetime Expressions for more information

If you do not add the TZD format element, and the datetime value is ambiguous, then Oracle returns an error if you have the ERROR_ON_OVERLAP_TIME session parameter set to TRUE. If that parameter is set to FALSE, then Oracle interprets the ambiguous datetime as standard time in the specified region.
TIMESTAMP WITH LOCAL TIME ZONE Literals

The `TIMESTAMP WITH LOCAL TIME ZONE` data type differs from `TIMESTAMP WITH TIME ZONE` in that data stored in the database is normalized to the database time zone. The time zone offset is not stored as part of the column data. There is no literal for `TIMESTAMP WITH LOCAL TIME ZONE`. Rather, you represent values of this data type using any of the other valid datetime literals. The table that follows shows some of the formats you can use to insert a value into a `TIMESTAMP WITH LOCAL TIME ZONE` column, along with the corresponding value returned by a query.

<table>
<thead>
<tr>
<th>Value Specified in INSERT Statement</th>
<th>Value Returned by Query</th>
</tr>
</thead>
<tbody>
<tr>
<td>'19-FEB-2004'</td>
<td>19-FEB-2004.00.00.000000 AM</td>
</tr>
<tr>
<td>SYSTIMESTAMP</td>
<td>19-FEB-04 02.54.36.497659 PM</td>
</tr>
<tr>
<td>TO_TIMESTAMP('19-FEB-2004', 'DD-MON-YYYY')</td>
<td>19-FEB-04 12.00.00.000000 AM</td>
</tr>
<tr>
<td>SYSDATE</td>
<td>19-FEB-04 02.55.29.000000 PM</td>
</tr>
<tr>
<td>TO_DATE('19-FEB-2004', 'DD-MON-YYYY')</td>
<td>19-FEB-04 12.00.00.000000 AM</td>
</tr>
<tr>
<td>TIMESTAMP'2004-02-19 8:00:00 US/Pacific'</td>
<td>19-FEB-04 08.00.00.000000 AM</td>
</tr>
</tbody>
</table>

Notice that if the value specified does not include a time component (either explicitly or implicitly), then the value returned defaults to midnight.

2.3.4 Interval Literals

An interval literal specifies a period of time. You can specify these differences in terms of years and months, or in terms of days, hours, minutes, and seconds. Oracle Database supports two types of interval literals, `YEAR TO MONTH` and `DAY TO SECOND`. Each type contains a leading field and may contain a trailing field. The leading field defines the basic unit of date or time being measured. The trailing field defines the smallest increment of the basic unit being considered. For example, a `YEAR TO MONTH` interval considers an interval of years to the nearest month. A `DAY TO MINUTE` interval considers an interval of days to the nearest minute.

If you have date data in numeric form, then you can use the `NUMTOYMINTERVAL` or `NUMTODSINTERVAL` conversion function to convert the numeric data into interval values.

Interval literals are used primarily with analytic functions.

**See Also:**

Analytic Functions, `NUMTODSINTERVAL`, and `NUMTOYMINTERVAL`
2.3.4.1 INTERVAL YEAR TO MONTH

Specify `YEAR TO MONTH` interval literals using the following syntax:

```
interval_year_to_month ::= 
```

![Diagram](image)

where

- `'integer [-integer]` specifies integer values for the leading and optional trailing field of the literal. If the leading field is `YEAR` and the trailing field is `MONTH`, then the range of integer values for the month field is 0 to 11.
- `precision` is the maximum number of digits in the leading field. The valid range of the leading field precision is 0 to 9 and its default value is 2.

Restriction on the Leading Field

If you specify a trailing field, then it must be less significant than the leading field. For example, `INTERVAL '0-1' MONTH TO YEAR` is not valid.

The following `INTERVAL YEAR TO MONTH` literal indicates an interval of 123 years, 2 months:

```
INTERVAL '123-2' YEAR(3) TO MONTH
```

Examples of the other forms of the literal follow, including some abbreviated versions:

<table>
<thead>
<tr>
<th>Form of Interval Literal</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>INTERVAL '123-2' YEAR(3) TO MONTH</code></td>
<td>An interval of 123 years, 2 months. You must specify the leading field precision if it is greater than the default of 2 digits.</td>
</tr>
<tr>
<td><code>INTERVAL '123' YEAR(3)</code></td>
<td>An interval of 123 years 0 months.</td>
</tr>
<tr>
<td><code>INTERVAL '300' MONTH(3)</code></td>
<td>An interval of 300 months.</td>
</tr>
<tr>
<td><code>INTERVAL '4' YEAR</code></td>
<td>Maps to <code>INTERVAL '4-0' YEAR TO MONTH</code> and indicates 4 years.</td>
</tr>
<tr>
<td><code>INTERVAL '50' MONTH</code></td>
<td>Maps to <code>INTERVAL '4-2' YEAR TO MONTH</code> and indicates 50 months or 4 years 2 months.</td>
</tr>
<tr>
<td><code>INTERVAL '123' YEAR</code></td>
<td>Returns an error, because the default precision is 2, and '123' has 3 digits.</td>
</tr>
</tbody>
</table>
You can add or subtract one INTERVAL YEAR TO MONTH literal to or from another to yield another INTERVAL YEAR TO MONTH literal. For example:

\[
\text{INTERVAL '5-3' YEAR TO MONTH + INTERVAL '20' MONTH = INTERVAL '6-11' YEAR TO MONTH}
\]

2.3.4.2 INTERVAL DAY TO SECOND

Specify DAY TO SECOND interval literals using the following syntax:

\[
\text{interval_day_to_second ::=}
\]

\[
\text{INTERVAL integer integer time_expr time_expr DAY HOUR MINUTE (leading_precision) SECOND (fractional_seconds_precision) TO DAY HOUR MINUTE SECOND (fractional_seconds_precision)}
\]

where

- `integer` specifies the number of days. If this value contains more digits than the number specified by the leading precision, then Oracle returns an error.
- `time_expr` specifies a time in the format `HH:[MI:SS.[n]n]` or `MI:[SS.[n]n]` or `SS.[n]`, where `n` specifies the fractional part of a second. If `n` contains more digits than the number specified by `fractional_seconds_precision`, then `n` is rounded to the number of digits specified by the `fractional_seconds_precision` value. You can specify `time_expr` following an integer and a space only if the leading field is `DAY`.
- `leading_precision` is the number of digits in the leading field. Accepted values are 0 to 9. The default is 2.
- `fractional_seconds_precision` is the number of digits in the fractional part of the `SECOND` datetime field. Accepted values are 1 to 9. The default is 6.
Restriction on the Leading Field:

If you specify a trailing field, then it must be less significant than the leading field. For example, `INTERVAL MINUTE TO DAY` is not valid. As a result of this restriction, if `SECOND` is the leading field, the interval literal cannot have any trailing field.

The valid range of values for the trailing field are as follows:

- **HOUR**: 0 to 23
- **MINUTE**: 0 to 59
- **SECOND**: 0 to 59.999999999

Examples of the various forms of `INTERVAL DAY TO SECOND` literals follow, including some abbreviated versions:

Table 2-14 Forms of `INTERVAL DAY TO SECOND` Literals

<table>
<thead>
<tr>
<th>Form of Interval Literal</th>
<th>Interpretation</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>INTERVAL '4 5:12:10.222' DAY TO SECOND(3)</code></td>
<td>4 days, 5 hours, 12 minutes, 10 seconds, and 222 thousandths of a second.</td>
</tr>
<tr>
<td><code>INTERVAL '4 5:12' DAY TO MINUTE</code></td>
<td>4 days, 5 hours and 12 minutes.</td>
</tr>
<tr>
<td><code>INTERVAL '400 5' DAY(3) TO HOUR</code></td>
<td>400 days 5 hours.</td>
</tr>
<tr>
<td><code>INTERVAL '400' DAY(3)</code></td>
<td>400 days.</td>
</tr>
<tr>
<td><code>INTERVAL '11:12:10.2222222' HOUR TO SECOND(7)</code></td>
<td>11 hours, 12 minutes, and 10.2222222 seconds.</td>
</tr>
<tr>
<td><code>INTERVAL '11:20' HOUR TO MINUTE</code></td>
<td>11 hours and 20 minutes.</td>
</tr>
<tr>
<td><code>INTERVAL '10' HOUR</code></td>
<td>10 hours.</td>
</tr>
<tr>
<td><code>INTERVAL '10:22' MINUTE TO SECOND</code></td>
<td>10 minutes 22 seconds.</td>
</tr>
<tr>
<td><code>INTERVAL '10' MINUTE</code></td>
<td>10 minutes.</td>
</tr>
<tr>
<td><code>INTERVAL '4' DAY</code></td>
<td>4 days.</td>
</tr>
<tr>
<td><code>INTERVAL '25' HOUR</code></td>
<td>25 hours.</td>
</tr>
<tr>
<td><code>INTERVAL '40' MINUTE</code></td>
<td>40 minutes.</td>
</tr>
<tr>
<td><code>INTERVAL '120' HOUR(3)</code></td>
<td>120 hours.</td>
</tr>
<tr>
<td><code>INTERVAL '30.12345' SECOND(2,4)</code></td>
<td>30.1235 seconds. The fractional second '12345' is rounded to '1235' because the precision is 4.</td>
</tr>
</tbody>
</table>

You can add or subtract one `DAY TO SECOND` interval literal from another `DAY TO SECOND` literal. For example:

`INTERVAL '20' DAY - INTERVAL '240' HOUR = INTERVAL '10-0' DAY TO SECOND`

2.4 Format Models

A **format model** is a character literal that describes the format of datetime or numeric data stored in a character string. A format model does not change the internal representation of the value in the database. When you convert a character string into a date or number, a format model determines how Oracle Database interprets the string.
In SQL statements, you can use a format model as an argument of the `TO_CHAR` and `TO_DATE` functions to specify:

- The format for Oracle to use to return a value from the database
- The format for a value you have specified for Oracle to store in the database

For example:

- The datetime format model for the string '17:45:29' is 'HH24:MI:SS'.
- The datetime format model for the string '11-Nov-1999' is 'DD-Mon-YYYY'.
- The number format model for the string '$2,304.25' is '$9,999.99'.

For lists of number and datetime format model elements, see Table 2-15 and Table 2-17.

The values of some formats are determined by the value of initialization parameters. For such formats, you can specify the characters returned by these format elements implicitly using the initialization parameter `NLS_TERRITORY`. You can change the default date format for your session with the `ALTER SESSION` statement.

This remainder of this section describes how to use the following format models:

- Number Format Models
- Datetime Format Models
- Format Model Modifiers

### 2.4.1 Number Format Models

You can use number format models in the following functions:

- In the `TO_CHAR` function to translate a value of `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE` data type to `VARCHAR2` data type
- In the `TO_NUMBER` function to translate a value of `CHAR` or `VARCHAR2` data type to `NUMBER` data type
- In the `TO_BINARY_FLOAT` and `TO_BINARY_DOUBLE` functions to translate `CHAR` and `VARCHAR2` expressions to `BINARY_FLOAT` or `BINARY_DOUBLE` values

All number format models cause the number to be rounded to the specified number of significant digits. If a value has more significant digits to the left of the decimal place than are specified in the format, then pound signs (#) replace the value. This event...
typically occurs when you are using `TO_CHAR` with a restrictive number format string, causing a rounding operation.

- If a positive `NUMBER` value is extremely large and cannot be represented in the specified format, then the infinity sign (`~`) replaces the value. Likewise, if a negative `NUMBER` value is extremely small and cannot be represented by the specified format, then the negative infinity sign replaces the value (`-~`).
- If a `BINARY_FLOAT` or `BINARY_DOUBLE` value is converted to `CHAR` or `NCHAR`, and the input is either infinity or `NaN` (not a number), then Oracle always returns the pound signs to replace the value. However, if you omit the format model, then Oracle returns either `Inf` or `Nan` as a string.

### 2.4.1.1 Number Format Elements

A number format model is composed of one or more number format elements. The tables that follow list the elements of a number format model and provide some examples.

Negative return values automatically contain a leading negative sign and positive values automatically contain a leading space unless the format model contains the `MI`, `S`, or `PR` format element.

#### Table 2-15  Number Format Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>, (comma)</td>
<td>9,999</td>
<td>Returns a comma in the specified position. You can specify multiple commas in a number format model.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Restrictions:</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A comma element cannot begin a number format model.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• A comma cannot appear to the right of a decimal character or period in a number format model.</td>
</tr>
<tr>
<td>. (period)</td>
<td>99.99</td>
<td>Returns a decimal point, which is a period (.) in the specified position.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Restriction:</strong> You can specify only one period in a number format model.</td>
</tr>
<tr>
<td>$</td>
<td>$9999</td>
<td>Returns value with a leading dollar sign.</td>
</tr>
<tr>
<td>0</td>
<td>0999</td>
<td>Returns leading zeros.</td>
</tr>
<tr>
<td></td>
<td>9990</td>
<td>Returns trailing zeros.</td>
</tr>
<tr>
<td>9</td>
<td>9999</td>
<td>Returns value with the specified number of digits with a leading space if positive or with a leading minus if negative. Leading zeros are blank, except for a zero value, which returns a zero for the integer part of the fixed-point number.</td>
</tr>
<tr>
<td>B</td>
<td>B9999</td>
<td>Returns blanks for the integer part of a fixed-point number when the integer part is zero (regardless of zeros in the format model).</td>
</tr>
<tr>
<td>C</td>
<td>C999</td>
<td>Returns in the specified position the ISO currency symbol (the current value of the <code>NLS_ISO_CURRENCY</code> parameter).</td>
</tr>
<tr>
<td>D</td>
<td>99D99</td>
<td>Returns in the specified position the decimal character, which is the current value of the <code>NLS_NUMERIC_CHARACTER</code> parameter. The default is a period (.).</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Restriction:</strong> You can specify only one decimal character in a number format model.</td>
</tr>
<tr>
<td>EEEE</td>
<td>9.9EEEE</td>
<td>Returns a value using in scientific notation.</td>
</tr>
</tbody>
</table>
Table 2-15  (Cont.) Number Format Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>G</td>
<td>9G999</td>
<td>Returns in the specified position the group separator (the current value of the NLS_NUMERIC_CHARACTER parameter). You can specify multiple group separators in a number format model. <strong>Restriction:</strong> A group separator cannot appear to the right of a decimal character or period in a number format model.</td>
</tr>
<tr>
<td>L</td>
<td>L999</td>
<td>Returns in the specified position the local currency symbol (the current value of the NLS_CURRENCY parameter).</td>
</tr>
<tr>
<td>MI</td>
<td>9999MI</td>
<td>Returns negative value with a trailing minus sign (-). Returns positive value with a trailing blank. <strong>Restriction:</strong> The MI format element can appear only in the last position of a number format model.</td>
</tr>
<tr>
<td>PR</td>
<td>9999PR</td>
<td>Returns negative value in &lt;angle brackets&gt;. Returns positive value with a leading and trailing blank. <strong>Restriction:</strong> The PR format element can appear only in the last position of a number format model.</td>
</tr>
<tr>
<td>RN</td>
<td>RN</td>
<td>Returns a value as Roman numerals in uppercase. Returns a value as Roman numerals in lowercase. Value can be an integer between 1 and 3999.</td>
</tr>
<tr>
<td>S</td>
<td>$9999</td>
<td>Returns negative value with a leading minus sign (-). Returns positive value with a leading plus sign (+). Returns negative value with a trailing minus sign (-). Returns positive value with a trailing plus sign (+). <strong>Restriction:</strong> The S format element can appear only in the first or last position of a number format model.</td>
</tr>
</tbody>
</table>
| TM      | TM      | The text minimum number format model returns (in decimal output) the smallest number of characters possible. This element is case insensitive. The default is TM9, which returns the number in fixed notation unless the output exceeds 64 characters. If the output exceeds 64 characters, then Oracle Database automatically returns the number in scientific notation. **Restrictions:**  
- You cannot precede this element with any other element.  
- You can follow this element only with one 9 or one E (or e), but not with any combination of these. The following statement returns an error:  
  ```sql
  SELECT TO_CHAR(1234, 'TM9e') FROM DUAL;
  ``` |
| U       | U9999   | Returns in the specified position the Euro (or other) dual currency symbol, determined by the current value of the NLS_DUAL_CURRENCY parameter. |
| V       | 9999V99 | Returns a value multiplied by \(10^n\) (and if necessary, round it up), where \(n\) is the number of 9's after the V. |
Table 2-15  (Cont.) Number Format Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>XXXX</td>
<td>Returns the hexadecimal value of the specified number of digits. If the specified number is not an integer, then Oracle Database rounds it to an integer.</td>
</tr>
<tr>
<td></td>
<td>xxxx</td>
<td></td>
</tr>
</tbody>
</table>

Restrictions:
- This element accepts only positive values or 0. Negative values return an error.
- You can precede this element only with 0 (which returns leading zeroes) or FM. Any other elements return an error. If you specify neither 0 nor FM with X, then the return always has one leading blank. Refer to the format model modifier FM for more information.

Table 2-16 shows the results of the following query for different values of number and 'fmt':

```
SELECT TO_CHAR(number, 'fmt')
FROM DUAL;
```

<table>

</table>
2.4.2 Datetime Format Models

You can use datetime format models in the following functions:

- In the `TO_*` datetime functions to translate a character value that is in a format other than the default format into a datetime value. (The `TO_*` datetime functions are `TO_DATE`, `TO_TIMESTAMP`, and `TO_TIMESTAMP_TZ`.)
- In the `TO_CHAR` function to translate a datetime value into a character value that is in a format other than the default format (for example, to print the date from an application)

The total length of a datetime format model cannot exceed 22 characters.

The default datetime formats are specified either explicitly with the NLS session parameters `NLS_DATE_FORMAT`, `NLS_TIMESTAMP_FORMAT`, and `NLS_TIMESTAMP_TZ_FORMAT`, or implicitly with the NLS session parameter `NLS_TERRITORY`. You can change the default datetime formats for your session with the `ALTER SESSION` statement.

> See Also: `ALTER SESSION` and *Oracle Database Globalization Support Guide* for information on the NLS parameters

2.4.2.1 Datetime Format Elements

A datetime format model is composed of one or more datetime format elements as listed in Table 2-17.

- For input format models, format items cannot appear twice, and format items that represent similar information cannot be combined. For example, you cannot use 'SYYYY' and 'BC' in the same format string.
- The second column indicates whether the format element can be used in the `TO_*` datetime functions. All format elements can be used in the `TO_CHAR` function.
- The following datetime format elements can be used in timestamp and interval format models, but not in the original `DATE` format model: `FF`, `TZD`, `TZH`, `TZM`, and `TZR`.
- Many datetime format elements are padded with blanks or leading zeroes to a specific length. Refer to the format model modifier `FM` for more information.
Note:

Oracle recommends that you use the 4-digit year element (YYYY) instead of the shorter year elements for these reasons:

• The 4-digit year element eliminates ambiguity.
• The shorter year elements may affect query optimization because the year is not known at query compile time and can only be determined at run time.

2.4.2.1.1 Uppercase Letters in Date Format Elements

Capitalization in a spelled-out word, abbreviation, or Roman numeral follows capitalization in the corresponding format element. For example, the date format model 'DAY' produces capitalized words like 'MONDAY'; 'Day' produces 'Monday'; and 'day' produces 'monday'.

2.4.2.1.2 Punctuation and Character Literals in Datetime Format Models

You can include these characters in a date format model:

• Punctuation such as hyphens, slashes, commas, periods, and colons
• Character literals, enclosed in double quotation marks

These characters appear in the return value in the same location as they appear in the format model.

Table 2-17 Datetime Format Elements

<table>
<thead>
<tr>

</tbody>
</table>
Table 2-17  (Cont.) Datetime Format Elements

<table>
<thead>
<tr>
<th>Element</th>
<th>TO_ *datetime functions?</th>
<th>Description</th>
</tr>
</thead>
</table>
| CC      | Yes                      | Century.  
  - If the last 2 digits of a 4-digit year are between 01 and 99 (inclusive), then the century is one greater than the first 2 digits of that year.  
  - If the last 2 digits of a 4-digit year are 00, then the century is the same as the first 2 digits of that year. For example, 2002 returns 21; 2000 returns 20. |
| SCC     | Yes                      | Day of week (1-7). This element depends on the NLS territory of the session. |
| D       | Yes                      | Name of day. |
| DD      | Yes                      | Day of month (1-31). |
| DDD     | Yes                      | Day of year (1-366). |
| DL      | Yes                      | Returns a value in the long date format, which is an extension of the Oracle Database DATE format, determined by the current value of the NLS_DATE_FORMAT parameter. Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'fmDay, Month dd, yyyy'. In the GERMAN_GERMANY locale, it is equivalent to specifying the format 'fmDay, dd. Month yyyy'.  
  **Restriction:** You can specify this format only with the TS element, separated by white space. |
| DS      | Yes                      | Returns a value in the short date format. Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'MM/DD/RRRR'. In the ENGLISH_UNITED_KINGDOM locale, it is equivalent to specifying the format 'DD/MM/RRRR'.  
  **Restriction:** You can specify this format only with the TS element, separated by white space. |
| DY      | Yes                      | Abbreviated name of day. |
| E       | Yes                      | Abbreviated era name (Japanese Imperial, ROC Official, and Thai Buddha calendars). |
| EE      | Yes                      | Full era name (Japanese Imperial, ROC Official, and Thai Buddha calendars). |

</tbody>
</table>

Oracle Database converts strings to dates with some flexibility. For example, when the TO_DATE function is used, a format model containing punctuation characters matches an input string lacking some or all of these characters, provided each numerical element in the input string contains the maximum allowed number of digits—for example, two digits '05' for 'MM' or four digits '2007' for 'YYYY'. The following statement does not return an error:

```sql
SELECT TO_CHAR (TO_DATE ('0207', 'MM/YY'), 'MM/YY') FROM DUAL;
```

```
TO_CH
-----
02/07
```

However, the following format string does return an error, because the FX (format exact) format modifier requires an exact match of the expression and the format string:

```sql
SELECT TO_CHAR (TO_DATE ('0207', 'fxmm/yy'), 'mm/yy') FROM DUAL;
SELECT TO_CHAR (TO_DATE ('0207', 'fxmm/yy'), 'mm/yy') FROM DUAL;
```

```
ERROR at line 1:
ORA-01861: literal does not match format string
```

Any non-alphanumeric character is allowed to match the punctuation characters in the format model. For example, the following statement does not return an error:

```sql
SELECT TO_CHAR (TO_DATE ('02#07', 'MM/YY'), 'MM/YY') FROM DUAL;
```

```
TO_CH
-----
02/07
```

See Also:

Format Model Modifiers and String-to-Date Conversion Rules for more information
2.4.2.2 Datetime Format Elements and Globalization Support

The functionality of some datetime format elements depends on the country and language in which you are using Oracle Database. For example, these datetime format elements return spelled values:

- MONTH
- MON
- DAY
- DY
- BC or AD or B.C. or A.D.
- AM or PM or A.M or P.M.

The language in which these values are returned is specified either explicitly with the initialization parameter `NLS_DATE_LANGUAGE` or implicitly with the initialization parameter `NLS_LANGUAGE`. The values returned by the `YEAR` and `SYEAR` datetime format elements are always in English.

The datetime format element `D` returns the number of the day of the week (1-7). The day of the week that is numbered 1 is specified implicitly by the initialization parameter `NLS_TERRITORY`.

See Also:
Oracle Database Reference and Oracle Database Globalization Support Guide for information on globalization support initialization parameters.

2.4.2.3 ISO Standard Date Format Elements

Oracle calculates the values returned by the datetime format elements `IYYY`, `IYY`, `IY`, `I`, and `IW` according to the ISO standard. For information on the differences between these values and those returned by the datetime format elements `YYYY`, `YYY`, `YY`, `Y`, and `WW`, see the discussion of globalization support in Oracle Database Globalization Support Guide.

2.4.2.4 The RR Datetime Format Element

The RR datetime format element is similar to the YY datetime format element, but it provides additional flexibility for storing date values in other centuries. The RR datetime format element lets you store 20th century dates in the 21st century by specifying only the last two digits of the year.

If you use the `TO_DATE` function with the YY datetime format element, then the year returned always has the same first 2 digits as the current year. If you use the RR datetime format element instead, then the century of the return value varies according to the specified two-digit year and the last two digits of the current year.

That is:

- If the specified two-digit year is 00 to 49, then
If the last two digits of the current year are 00 to 49, then the returned year has the same first two digits as the current year.

If the last two digits of the current year are 50 to 99, then the first 2 digits of the returned year are 1 greater than the first 2 digits of the current year.

• If the specified two-digit year is 50 to 99, then
  • If the last two digits of the current year are 00 to 49, then the first 2 digits of the returned year are 1 less than the first 2 digits of the current year.
  • If the last two digits of the current year are 50 to 99, then the returned year has the same first two digits as the current year.

The following examples demonstrate the behavior of the RR datetime format element.

2.4.2.4.1 RR Datetime Format Examples

Assume these queries are issued between 1950 and 1999:

SELECT TO_CHAR(TO_DATE('27-OCT-98', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
1998

SELECT TO_CHAR(TO_DATE('27-OCT-17', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
2017

Now assume these queries are issued between 2000 and 2049:

SELECT TO_CHAR(TO_DATE('27-OCT-98', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
1998

SELECT TO_CHAR(TO_DATE('27-OCT-17', 'DD-MON-RR'), 'YYYY') "Year" FROM DUAL;

Year
----
2017

Note that the queries return the same values regardless of whether they are issued before or after the year 2000. The RR datetime format element lets you write SQL statements that will return the same values from years whose first two digits are different.

2.4.2.5 Datetime Format Element Suffixes

Table 2-18 lists suffixes that can be added to datetime format elements:
<table>
<thead>
<tr>
<th>Suffix</th>
<th>Meaning</th>
<th>Example Element</th>
<th>Example Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>TH</td>
<td>Ordinal Number</td>
<td>DDTH</td>
<td>4TH</td>
</tr>
<tr>
<td>SP</td>
<td>Spelled Number</td>
<td>DDSP</td>
<td>FOUR</td>
</tr>
<tr>
<td>SPTH or THSP</td>
<td>Spelled, ordinal number</td>
<td>DDPSTH</td>
<td>FOURTH</td>
</tr>
</tbody>
</table>

**Notes on date format element suffixes:**

- When you add one of these suffixes to a datetime format element, the return value is always in English.
- Datetime suffixes are valid only to format output. You cannot use them to insert a date into the database.

### 2.4.3 Format Model Modifiers

The **FM** and **FX** modifiers, used in format models in the `TO_CHAR` function, control blank padding and exact format checking.

A modifier can appear in a format model more than once. In such a case, each subsequent occurrence toggles the effects of the modifier. Its effects are enabled for the portion of the model following its first occurrence, and then disabled for the portion following its second, and then reenabled for the portion following its third, and so on.

**FM**

Fill mode. Oracle uses trailing blank characters and leading zeroes to fill format elements to a constant width. The width is equal to the display width of the largest element for the relevant format model:

- Numeric elements are padded with leading zeros to the width of the maximum value allowed for the element. For example, the `YYYY` element is padded to four digits (the length of '9999'), `HH24` to two digits (the length of '23'), and `DDD` to three digits (the length of '366').
- The character elements `MONTH`, `MON`, `DAY`, and `DY` are padded with trailing blanks to the width of the longest full month name, the longest abbreviated month name, the longest full date name, or the longest abbreviated day name, respectively, among valid names determined by the values of `NLS_DATE_LANGUAGE` and `NLS_DATE_FORMAT` parameters. For example, when `NLS_DATE_LANGUAGE` is AMERICAN and `NLS_DATE_FORMAT` is GREGORIAN (the default), the largest element for `MONTH` is SEPTEMBER, so all values of the `MONTH` format element are padded to nine display characters. The values of the `NLS_DATE_LANGUAGE` and `NLS_DATE_FORMAT` parameters are specified in the third argument to `TO_CHAR` and `TO_*` datetime functions or they are retrieved from the NLS environment of the current session.
- The character element `RM` is padded with trailing blanks to the length of 4, which is the length of 'vii'.
- Other character elements and spelled-out numbers (**SP**, **SPTH**, and **THSP** suffixes) are not padded.

The **FM** modifier suppresses the above padding in the return value of the `TO_CHAR` function.
FX

Format exact. This modifier specifies exact matching for the character argument and datetime format model of a `TO_DATE` function:

- Punctuation and quoted text in the character argument must exactly match (except for case) the corresponding parts of the format model.
- The character argument cannot have extra blanks. Without FX, Oracle ignores extra blanks.
- Numeric data in the character argument must have the same number of digits as the corresponding element in the format model. Without FX, numbers in the character argument can omit leading zeros.
  
  When FX is enabled, you can disable this check for leading zeros by using the FM modifier as well.

If any portion of the character argument violates any of these conditions, then Oracle returns an error message.

2.4.3.1 Format Model Examples

The following statement uses a date format model to return a character expression:

```sql
SELECT TO_CHAR(SYSDATE, 'fmDDTH') || ' of ' || TO_CHAR(SYSDATE, 'fmMonth') || ',', ' ' || TO_CHAR(SYSDATE, 'YYYY') "Ides"
FROM DUAL;
```

Ides
------------------
3RD of April, 2008

The preceding statement also uses the FM modifier. If FM is omitted, then the month is blank-padded to nine characters:

```sql
SELECT TO_CHAR(SYSDATE, 'DDTH') || ' of ' || TO_CHAR(SYSDATE, 'Month') || ',', ' ' || TO_CHAR(SYSDATE, 'YYYY') "Ides"
FROM DUAL;
```

Ides
-----------------------
03RD of April, 2008

The following statement places a single quotation mark in the return value by using a date format model that includes two consecutive single quotation marks:

```sql
SELECT TO_CHAR(SYSDATE, 'fmDay') || '''s Special' "Menu"
FROM DUAL;
```

Menu
-----------------
Tuesday's Special

Two consecutive single quotation marks can be used for the same purpose within a character literal in a format model.
Table 2-19 shows whether the following statement meets the matching conditions for different values of `char` and `'fmt'` using FX (the table named `table` has a column `date_column` of data type `DATE`):

```sql
UPDATE table
SET date_column = TO_DATE(char, 'fmt');
```

<table>
<thead>
<tr>
<th><code>char</code></th>
<th><code>'fmt'</code></th>
<th>Match or Error?</th>
</tr>
</thead>
<tbody>
<tr>
<td>'15/ JAN /1998'</td>
<td>'DD-MON-YYYY'</td>
<td>Match</td>
</tr>
<tr>
<td>' 15! JAN % /1998'</td>
<td>'DD-MON-YYYY'</td>
<td>Error</td>
</tr>
<tr>
<td>'15/JAN/1998'</td>
<td>'FXDD-MON-YYYY'</td>
<td>Error</td>
</tr>
<tr>
<td>'15-JAN-1998'</td>
<td>'FXDD-MON-YYYY'</td>
<td>Match</td>
</tr>
<tr>
<td>'1-JAN-1998'</td>
<td>'FXDD-MON-YYYY'</td>
<td>Error</td>
</tr>
<tr>
<td>'01-JAN-1998'</td>
<td>'FXDD-MON-YYYY'</td>
<td>Match</td>
</tr>
<tr>
<td>'1-JAN-1998'</td>
<td>'FXFMDD-MON-YYYY'</td>
<td>Match</td>
</tr>
</tbody>
</table>

Format of Return Values: Examples

You can use a format model to specify the format for Oracle to use to return values from the database to you.

The following statement selects the salaries of the employees in Department 80 and uses the `TO_CHAR` function to convert these salaries into character values with the format specified by the number format model `'$99,990.99'`:

```sql
SELECT last_name employee, TO_CHAR(salary, '$99,990.99')
FROM employees
WHERE department_id = 80;
```

Because of this format model, Oracle returns salaries with leading dollar signs, commas every three digits, and two decimal places.

The following statement selects the date on which each employee from Department 20 was hired and uses the `TO_CHAR` function to convert these dates to character strings with the format specified by the date format model `'fmMonth DD, YYYY'`:

```sql
SELECT last_name employee, TO_CHAR(hire_date,'fmMonth DD, YYYY') hiredate
FROM employees
WHERE department_id = 20;
```

With this format model, Oracle returns the hire dates without blank padding (as specified by `fm`), two digits for the day, and the century included in the year.

🔗 See Also:
`Format Model Modifiers` for a description of the `fm` format element
Supplying the Correct Format Model: Examples

When you insert or update a column value, the data type of the value that you specify must correspond to the column data type of the column. You can use format models to specify the format of a value that you are converting from one data type to another data type required for a column.

For example, a value that you insert into a DATE column must be a value of the DATE data type or a character string in the default date format (Oracle implicitly converts character strings in the default date format to the DATE data type). If the value is in another format, then you must use the TO_DATE function to convert the value to the DATE data type. You must also use a format model to specify the format of the character string.

The following statement updates Hunold's hire date using the TO_DATE function with the format mask 'YYYY MM DD' to convert the character string '2008 05 20' to a DATE value:

```
UPDATE employees
SET hire_date = TO_DATE('2008 05 20','YYYY MM DD')
WHERE last_name = 'Hunold';
```

2.4.4 String-to-Date Conversion Rules

The following additional formatting rules apply when converting string values to date values (unless you have used the FX or FXFM modifiers in the format model to control exact format checking):

- You can omit punctuation included in the format string from the date string if all the digits of the numerical format elements, including leading zeros, are specified. For example, specify 02 and not 2 for two-digit format elements such as MM, DD, and YY.
- You can omit time fields found at the end of a format string from the date string.
- You can use any non-alphanumeric character in the date string to match the punctuation symbol in the format string.
- If a match fails between a datetime format element and the corresponding characters in the date string, then Oracle attempts alternative format elements, as shown in Table 2-20.

<table>
<thead>
<tr>
<th>Original Format Element</th>
<th>Additional Format Elements to Try in Place of the Original</th>
</tr>
</thead>
<tbody>
<tr>
<td>'MM'</td>
<td>'MON' and 'MONTH'</td>
</tr>
<tr>
<td>'MON'</td>
<td>'MONTH'</td>
</tr>
<tr>
<td>'MONTH'</td>
<td>'MON'</td>
</tr>
<tr>
<td>'YY'</td>
<td>'YYYY'</td>
</tr>
<tr>
<td>'RR'</td>
<td>'RRRR'</td>
</tr>
</tbody>
</table>
2.4.5 XML Format Model

The `SYS_XMLAgg` and `SYS_XMLGen` (deprecated) functions return an instance of type `XMLType` containing an XML document. Oracle provides the `XMLFormat` object, which lets you format the output of these functions.

Table 2-21 lists and describes the attributes of the `XMLFormat` object. The function that implements this type follows the table.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Data Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enclTag</code></td>
<td>VARCHAR2(4000) or</td>
<td>The name of the enclosing tag for the result of the <code>SYS_XMLAgg</code> or <code>SYS_XMLGen</code> (deprecated) function.</td>
</tr>
<tr>
<td></td>
<td>VARCHAR2(32767)¹</td>
<td><code>SYS_XMLAgg</code>: The default is <code>ROWSET</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><code>SYS_XMLGen</code>: If the input to the function is a column name, then the default is the column name. Otherwise the default is <code>ROW</code>.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>When <code>schemaType</code> is set to <code>USE_GIVEN_SCHEMA</code>, this attribute also gives the name of the XMLSchema element.</td>
</tr>
<tr>
<td><code>schemaType</code></td>
<td>VARCHAR2(100)</td>
<td>The type of schema generation for the output document. Valid values are 'NO_SCHEMA' and 'USE_GIVEN_SCHEMA'. The default is 'NO_SCHEMA'.</td>
</tr>
<tr>
<td><code>schemaName</code></td>
<td>VARCHAR2(4000) or</td>
<td>The name of the target schema Oracle uses if the value of the <code>schemaType</code> is 'USE_GIVEN_SCHEMA'. If you specify <code>schemaName</code>, then Oracle uses the enclosing tag as the element name.</td>
</tr>
<tr>
<td></td>
<td>VARCHAR2(32767)¹</td>
<td><code>targetNameSpace</code></td>
</tr>
<tr>
<td><code>dburlPrefix</code></td>
<td>VARCHAR2(4000) or</td>
<td>The URL to the database to use if <code>WITH_SCHEMA</code> is specified. If this attribute is not specified, then Oracle declares the URL to the types as a relative URL reference.</td>
</tr>
<tr>
<td></td>
<td>VARCHAR2(32767)¹</td>
<td><code>processingIns</code></td>
</tr>
</tbody>
</table>

¹ The data type for this attribute is `VARCHAR2(4000)` if the initialization parameter `MAX_STRING_SIZE` = `STANDARD`, and `VARCHAR2(32767)` if `MAX_STRING_SIZE` = `EXTENDED`. See Extended Data Types for more information.

The function that implements the `XMLFormat` object follows:

```sql
STATIC FUNCTION createFormat(
    enclTag IN VARCHAR2 := 'ROWSET',
```
2.5 Nulls

If a column in a row has no value, then the column is said to be null, or to contain null. Nulls can appear in columns of any data type that are not restricted by NOT NULL or PRIMARY KEY integrity constraints. Use a null when the actual value is not known or when a value would not be meaningful.

Oracle Database treats a character value with a length of zero as null. However, do not use null to represent a numeric value of zero, because they are not equivalent.

Any arithmetic expression containing a null always evaluates to null. For example, null added to 10 is null. In fact, all operators (except concatenation) return null when given a null operand.

2.5.1 Nulls in SQL Functions

For information on null handling in SQL functions, see Nulls in SQL Functions.
2.5.2 Nulls with Comparison Conditions

To test for nulls, use only the comparison conditions `IS NULL` and `IS NOT NULL`. If you use any other condition with nulls and the result depends on the value of the null, then the result is `UNKNOWN`. Because null represents a lack of data, a null cannot be equal or unequal to any value or to another null. However, Oracle considers two nulls to be equal when evaluating a `DECODE` function. Refer to `DECODE` for syntax and additional information.

Oracle also considers two nulls to be equal if they appear in compound keys. That is, Oracle considers identical two compound keys containing nulls if all the non-null components of the keys are equal.

2.5.3 Nulls in Conditions

A condition that evaluates to `UNKNOWN` acts almost like `FALSE`. For example, a `SELECT` statement with a condition in the `WHERE` clause that evaluates to `UNKNOWN` returns no rows. However, a condition evaluating to `UNKNOWN` differs from `FALSE` in that further operations on an `UNKNOWN` condition evaluation will evaluate to `UNKNOWN`. Thus, `NOT FALSE` evaluates to `TRUE`, but `NOT UNKNOWN` evaluates to `UNKNOWN`.

Table 2-22 shows examples of various evaluations involving nulls in conditions. If the conditions evaluating to `UNKNOWN` were used in a `WHERE` clause of a `SELECT` statement, then no rows would be returned for that query.

### Table 2-22  Conditions Containing Nulls

<table>
<thead>
<tr>
<th>Condition</th>
<th>Value of A</th>
<th>Evaluation</th>
</tr>
</thead>
<tbody>
<tr>
<td>a IS NULL</td>
<td>10</td>
<td>FALSE</td>
</tr>
<tr>
<td>a IS NOT NULL</td>
<td>10</td>
<td>TRUE</td>
</tr>
<tr>
<td>a IS NULL</td>
<td>NULL</td>
<td>TRUE</td>
</tr>
<tr>
<td>a IS NOT NULL</td>
<td>NULL</td>
<td>FALSE</td>
</tr>
<tr>
<td>a = NULL</td>
<td>10</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>a != NULL</td>
<td>10</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>a = NULL</td>
<td>NULL</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>a != NULL</td>
<td>NULL</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>a = 10</td>
<td>NULL</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>a != 10</td>
<td>NULL</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

For the truth tables showing the results of logical conditions containing nulls, see Table 6-5, Table 6-6, and Table 6-7.

2.6 Comments

You can create two types of comments:

- Comments within SQL statements are stored as part of the application code that executes the SQL statements.
• Comments associated with individual schema or nonschema objects are stored in
the data dictionary along with metadata on the objects themselves.

2.6.1 Comments Within SQL Statements

Comments can make your application easier for you to read and maintain. For
example, you can include a comment in a statement that describes the purpose of
the statement within your application. With the exception of hints, comments within SQL
statements do not affect the statement execution. Refer to Hints on using this
particular form of comment.

A comment can appear between any keywords, parameters, or punctuation marks in a
statement. You can include a comment in a statement in two ways:

• Begin the comment with a slash and an asterisk (/*). Proceed with the text of the
  comment. This text can span multiple lines. End the comment with an asterisk and
  a slash (*. The opening and terminating characters need not be separated from
  the text by a space or a line break.

• Begin the comment with -- (two hyphens). Proceed with the text of the comment.
  This text cannot extend to a new line. End the comment with a line break.

Some of the tools used to enter SQL have additional restrictions. For example, if you
are using SQL*Plus, by default you cannot have a blank line inside a multiline
comment. For more information, refer to the documentation for the tool you use as an
interface to the database.

A SQL statement can contain multiple comments of both styles. The text of a comment
can contain any printable characters in your database character set.

Example

These statements contain many comments:

```
SELECT last_name, employee_id, salary + NVL(commission_pct, 0),
       job_id, e.department_id
/* Select all employees whose compensation is
greater than that of Pataballa.*/
FROM employees e, departments d
/*The DEPARTMENTS table is used to get the department name.*/
WHERE e.department_id = d.department_id
    AND salary + NVL(commission_pct,0) > /* Subquery: */
        (SELECT salary + NVL(commission_pct,0)
         /* total compensation is salary + commission_pct */
         FROM employees
         WHERE last_name = 'Pataballa'
    )
ORDER BY last_name, employee_id;
```

```
SELECT last_name,                                 -- select the name
       employee_id                                  -- employee id
       salary + NVL(commission_pct, 0),             -- total compensation
       job_id,                                      -- job
       e.department_id                              -- and department
FROM employees e,                                 -- of all employees
       departments d
WHERE e.department_id = d.department_id
    AND salary + NVL(commission_pct,0) >        -- whose compensation
                                                -- is greater than
        (SELECT salary + NVL(commission_pct,0)  -- the compensation
         FROM employees
     )
```
WHERE last_name = 'Pataballa') -- of Pataballa
ORDER BY last_name
-- and order by last name
    employee_id -- and employee id.

;

2.6.2 Comments on Schema and Nonschema Objects

You can use the COMMENT command to associate a comment with a schema object (table, view, materialized view, operator, indextype, mining model) or a nonschema object (edition) using the COMMENT command. You can also create a comment on a column, which is part of a table schema object. Comments associated with schema and nonschema objects are stored in the data dictionary. Refer to COMMENT for a description of this form of comment.

2.6.3 Hints

Hints are comments in a SQL statement that pass instructions to the Oracle Database optimizer. The optimizer uses these hints to choose an execution plan for the statement, unless some condition exists that prevents the optimizer from doing so.

Hints were introduced in Oracle7, when users had little recourse if the optimizer generated suboptimal plans. Now Oracle provides a number of tools, including the SQL Tuning Advisor, SQL plan management, and SQL Performance Analyzer, to help you address performance problems that are not solved by the optimizer. Oracle strongly recommends that you use those tools rather than hints. The tools are far superior to hints, because when used on an ongoing basis, they provide fresh solutions as your data and database environment change.

Hints should be used sparingly, and only after you have collected statistics on the relevant tables and evaluated the optimizer plan without hints using the EXPLAIN PLAN statement. Changing database conditions as well as query performance enhancements in subsequent releases can have significant impact on how hints in your code affect performance.

The remainder of this section provides information on some commonly used hints. If you decide to use hints rather than the more advanced tuning tools, be aware that any short-term benefit resulting from the use of hints may not continue to result in improved performance over the long term.

Using Hints

A statement block can have only one comment containing hints, and that comment must follow the SELECT, UPDATE, INSERT, MERGE, or DELETE keyword.

The following syntax diagram shows hints contained in both styles of comments that Oracle supports within a statement block. The hint syntax must follow immediately after an INSERT, UPDATE, DELETE, SELECT, or MERGE keyword that begins the statement block.
The plus sign (+) causes Oracle to interpret the comment as a list of hints. The plus sign must follow immediately after the comment delimiter. No space is permitted.

*hint* is one of the hints discussed in this section. The space between the plus sign and the hint is optional. If the comment contains multiple hints, then separate the hints by at least one space.

*string* is other commenting text that can be interspersed with the hints.

The `+-` syntax requires that the entire comment be on a single line.

Oracle Database ignores hints and does not return an error under the following circumstances:

- The hint contains misspellings or syntax errors. However, the database does consider other correctly specified hints in the same comment.
- The comment containing the hint does not follow a `DELETE`, `INSERT`, `MERGE`, `SELECT`, or `UPDATE` keyword.
- A combination of hints conflict with each other. However, the database does consider other hints in the same comment.
- The database environment uses PL/SQL version 1, such as Forms version 3 triggers, Oracle Forms 4.5, and Oracle Reports 2.5.
- A global hint refers to multiple query blocks. Refer to Specifying Multiple Query Blocks in a Global Hint for more information.

### Specifying a Query Block in a Hint

You can specify an optional query block name in many hints to specify the query block to which the hint applies. This syntax lets you specify in the outer query a hint that applies to an inline view.

The syntax of the query block argument is of the form `@queryblock`, where `queryblock` is an identifier that specifies a query block in the query. The `queryblock` identifier can either be system-generated or user-specified. When you specify a hint in the query block itself to which the hint applies, you omit the `@queryblock` syntax.

- The system-generated identifier can be obtained by using `EXPLAIN PLAN` for the query. Pretransformation query block names can be determined by running `EXPLAIN PLAN` for the query using the `NO_QUERY_TRANSFORMATION` hint. See NO_QUERY_TRANSFORMATION Hint.
- The user-specified name can be set with the `QB_NAME` hint. See QB_NAME Hint.
Specifying Global Hints

Many hints can apply both to specific tables or indexes and more globally to tables within a view or to columns that are part of indexes. The syntactic elements `tablespec` and `indexspec` define these global hints.

```
tablespec ::= view | table
```

You must specify the table to be accessed exactly as it appears in the statement. If the statement uses an alias for the table, then use the alias rather than the table name in the hint. However, do not include the schema name with the table name within the hint, even if the schema name appears in the statement.

**Note:**

Specifying a global hint using the `tablespec` clause does not work for queries that use ANSI joins, because the optimizer generates additional views during parsing. Instead, specify `@queryblock` to indicate the query block to which the hint applies.

```
indexspec ::= index (table . column)
```

When `tablespec` is followed by `indexspec` in the specification of a hint, a comma separating the table name and index name is permitted but not required. Commas are also permitted, but not required, to separate multiple occurrences of `indexspec`.

Specifying Multiple Query Blocks in a Global Hint

Oracle Database ignores global hints that refer to multiple query blocks. To avoid this issue, Oracle recommends that you specify the object alias in the hint instead of using `tablespec` and `indexspec`.

For example, consider the following view `v` and table `t`:

```
CREATE VIEW v AS
  SELECT e.last_name, e.department_id, d.location_id
  FROM employees e, departments d
  WHERE e.department_id = d.department_id;

CREATE TABLE t AS
```
SELECT * from employees
WHERE employee_id < 200;

**Note:**

The following examples use the `EXPLAIN PLAN` statement, which enables you to display the execution plan and determine if a hint is honored or ignored. Refer to `EXPLAIN PLAN` for more information.

The `LEADING` hint is ignored in the following query because it refers to multiple query blocks, that is, the main query block containing table `t` and the view query block `v`:

```sql
EXPLAIN PLAN
SET STATEMENT_ID = 'Test 1'
INTO plan_table FOR
(SELECT /*+ LEADING(v.e v.d t) */ *
FROM t, v
WHERE t.department_id = v.department_id);
```

The following `SELECT` statement returns the execution plan, which shows that the `LEADING` hint was ignored:

```sql
SELECT id, LPAD(' ',2*(LEVEL-1))||operation operation, options, object_name, object_alias
FROM plan_table
START WITH id = 0 AND statement_id = 'Test 1'
CONNECT BY PRIOR id = parent_id AND statement_id = 'Test 1'
ORDER BY id;
```

```
ID OPERATION            OPTIONS    OBJECT_NAME   OBJECT_ALIAS
--- -------------------- ---------- ------------- -------------------
0 SELECT STATEMENT
1   HASH JOIN
2     HASH JOIN
3       TABLE ACCESS   FULL       DEPARTMENTS D@SEL$2
4       TABLE ACCESS   FULL       EMPLOYEES  E@SEL$2
5       TABLE ACCESS   FULL       T        T@SEL$1
```

The `LEADING` hint is honored in the following query because it refers to object aliases, which can be found in the execution plan that was returned by the previous query:

```sql
EXPLAIN PLAN
SET STATEMENT_ID = 'Test 2'
INTO plan_table FOR
(SELECT /*+ LEADING(E@SEL$2 D@SEL$2 T@SEL$1) */ *
FROM t, v
WHERE t.department_id = v.department_id);
```

The following `SELECT` statement returns the execution plan, which shows that the `LEADING` hint was honored:

```sql
SELECT id, LPAD(' ',2*(LEVEL-1))||operation operation, options, object_name, object_alias
FROM plan_table
START WITH id = 0 AND statement_id = 'Test 2'
CONNECT BY PRIOR id = parent_id AND statement_id = 'Test 2'
ORDER BY id;
```
### Hints by Functional Category

Table 2-23 lists the hints by functional category and contains cross-references to the syntax and semantics for each hint. An alphabetical reference of the hints follows the table.

2.6.4 Alphabetical Listing of Hints

This section provides syntax and semantics for all hints in alphabetical order.
2.6.4.1 ALL_ROWS Hint

The ALL_ROWS hint instructs the optimizer to optimize a statement block with a goal of best throughput, which is minimum total resource consumption. For example, the optimizer uses the query optimization approach to optimize this statement for best throughput:

```
SELECT /*+ ALL_ROWS */ employee_id, last_name, salary, job_id
  FROM employees
  WHERE employee_id = 107;
```

If you specify either the ALL_ROWS or the FIRST_ROWS hint in a SQL statement, and if the data dictionary does not have statistics about tables accessed by the statement, then the optimizer uses default statistical values, such as allocated storage for such tables, to estimate the missing statistics and to subsequently choose an execution plan. These estimates might not be as accurate as those gathered by the DBMS_STATS package, so you should use the DBMS_STATS package to gather statistics.

If you specify hints for access paths or join operations along with either the ALL_ROWS or FIRST_ROWS hint, then the optimizer gives precedence to the access paths and join operations specified by the hints.

2.6.4.2 APPEND Hint

The APPEND hint instructs the optimizer to use direct-path INSERT with the subquery syntax of the INSERT statement.

- Conventional INSERT is the default in serial mode. In serial mode, direct path can be used only if you include the APPEND hint.
- Direct-path INSERT is the default in parallel mode. In parallel mode, conventional insert can be used only if you specify the NOAPPEND hint.

The decision whether the INSERT will go parallel or not is independent of the APPEND hint.

In direct-path INSERT, data is appended to the end of the table, rather than using existing space currently allocated to the table. As a result, direct-path INSERT can be considerably faster than conventional INSERT.

The APPEND hint is only supported with the subquery syntax of the INSERT statement, not the VALUES clause. If you specify the APPEND hint with the VALUES clause, it is ignored and conventional insert will be used. To use direct-path INSERT with the VALUES clause, refer to "APPEND_VALUES Hint ".

---

ORACLE
2.6.4.3 APPEND_VALUES Hint

The \texttt{APPEND\_VALUES} hint instructs the optimizer to use direct-path \texttt{INSERT} with the \texttt{VALUES} clause. If you do not specify this hint, then conventional \texttt{INSERT} is used.

In direct-path \texttt{INSERT}, data is appended to the end of the table, rather than using existing space currently allocated to the table. As a result, direct-path \texttt{INSERT} can be considerably faster than conventional \texttt{INSERT}.

The \texttt{APPEND\_VALUES} hint can be used to greatly enhance performance. Some examples of its uses are:

- In an Oracle Call Interface (OCI) program, when using large array binds or array binds with row callbacks
- In PL/SQL, when loading a large number of rows with a \texttt{FORALL} loop that has an \texttt{INSERT} statement with a \texttt{VALUES} clause

The \texttt{APPEND\_VALUES} hint is only supported with the \texttt{VALUES} clause of the \texttt{INSERT} statement. If you specify the \texttt{APPEND\_VALUES} hint with the subquery syntax of the \texttt{INSERT} statement, it is ignored and conventional insert will be used. To use direct-path \texttt{INSERT} with a subquery, refer to "\texttt{APPEND\_VALUES\_APPEND} Hint".

See Also:

\textit{Oracle Database Administrator's Guide} for information on direct-path inserts

2.6.4.4 CACHE Hint

The \texttt{CACHE} hint instructs the optimizer to place the blocks retrieved for the table at the most recently used end of the LRU list in the buffer cache when a full table scan is performed. This hint is useful for small lookup tables.

See Also:

\textit{Oracle Database Administrator's Guide} for information on direct-path inserts
In the following example, the `CACHE` hint overrides the default caching specification of the table:

```sql
SELECT /*+ FULL (hr_emp) CACHE(hr_emp) */ last_name
FROM employees hr_emp;
```

The `CACHE` and `NOCACHE` hints affect system statistics table scans (long tables) and table scans (short tables), as shown in the `V$SYSSTAT` data dictionary view.

### 2.6.4.5 CHANGE_DUPKEY_ERROR_INDEX Hint

The `CHANGE_DUPKEY_ERROR_INDEX` hint provides a mechanism to unambiguously identify a unique key violation for a specified set of columns or for a specified index. When a unique key violation occurs for the specified index, an ORA-38911 error is reported instead of an ORA-001.

This hint applies to `INSERT`, `UPDATE` operations. If you specify an index, then the index must exist and be unique. If you specify a column list instead of an index, then a unique index whose columns match the specified columns in number and order must exist.

This use of this hint results in error messages if specific rules are violated. Refer to `IGNORE_ROW_ON_DUPKEY_INDEX` Hint for details.

### 2.6.4.6 CLUSTER Hint

This hint disables both `APPEND` mode and parallel DML.
The CLUSTER hint instructs the optimizer to use a cluster scan to access the specified table. This hint applies only to tables in an indexed cluster.

### 2.6.4.7 CLUSTERING Hint

```sql
/*+ CLUSTERING */
```

This hint is valid only for `INSERT` and `MERGE` operations on tables that are enabled for attribute clustering. The `CLUSTERING` hint enables attribute clustering for direct-path inserts (serial or parallel). This results in partially-clustered data, that is, data that is clustered per each insert or merge operation. This hint overrides a `NO ON LOAD` setting in the DDL that created or altered the table. This hint has no effect on tables that are not enabled for attribute clustering.

**See Also:**
- `clustering_when` clause of `CREATE TABLE` for more information on the `NO ON LOAD` setting
- `NO_CLUSTERING` Hint

### 2.6.4.8 CONTAINERS Hint

```sql
/*+ CONTAINERS ( DEFAULT_PDB_HINT = 'hint' ) */
```

The `CONTAINERS` hint is useful in a multitenant container database (CDB). You can specify this hint in a `SELECT` statement that contains the `CONTAINERS()` clause. Such a statement lets you query data in the specified table or view across all containers in a CDB or application container.

- To query data in a CDB, you must be a common user connected to the CDB root, and the table or view must exist in the root and all PDBs. The query returns all rows from the table or view in the CDB root and in all open PDBs.
- To query data in an application container, you must be a common user connected to the application root, and the table or view must exist in the application root and all PDBs in the application container. The query returns all rows from the table or view in the application root and in all open PDBs in the application container.

Statements that contain the `CONTAINERS()` clause generate and execute recursive SQL statements in each queried PDB. You can use the `CONTAINERS` hint to pass a default PDB hint to each recursive SQL statement. For `hint`, you can specify any SQL hint that is appropriate for the `SELECT` statement.
In the following example, the `NO_PARALLEL` hint is passed to each recursive SQL statement that is executed as part of the evaluation of the `CONTAINERS()` clause:

```sql
SELECT /*+ CONTAINERS(DEFAULT_PDB_HINT='NO_PARALLEL') */
(CASE WHEN COUNT(*) < 10000
    THEN 'Less than 10,000'
    ELSE '10,000 or more' END) "Number of Tables"
FROM CONTAINERS(DBA_TABLES);
```

See Also:
`containers_clause` for more information on the `CONTAINERS()` clause

### 2.6.4.9 CURSOR_SHARING_EXACT Hint

```
/*+ CURSOR_SHARING_EXACT */
```

Oracle can replace literals in SQL statements with bind variables, when it is safe to do so. This replacement is controlled with the `CURSOR_SHARING` initialization parameter. The `CURSOR_SHARING_EXACT` hint instructs the optimizer to switch this behavior off. When you specify this hint, Oracle executes the SQL statement without any attempt to replace literals with bind variables.

### 2.6.4.10 DISABLE_PARALLEL_DML Hint

```
/*+ DISABLE_PARALLEL_DML */
```

The `DISABLE_PARALLEL_DML` hint disables parallel DML for `DELETE`, `INSERT`, `MERGE`, and `UPDATE` statements. You can use this hint to disable parallel DML for an individual statement when parallel DML is enabled for the session with the `ALTER SESSION ENABLE PARALLEL DML` statement.

### 2.6.4.11 DRIVING_SITE Hint

```
/*+ DRIVING_SITE (@queryblock tabelspec) */
```

(See Specifying a Query Block in a Hint , `tabelspec::=`)

The `DRIVING_SITE` hint instructs the optimizer to execute the query at a different site than that selected by the database. This hint is useful if you are using distributed query optimization.
For example:

```sql
SELECT /*+ DRIVING_SITE(departments) */ *
FROM employees, departments@rsite
WHERE employees.department_id = departments.department_id;
```

If this query is executed without the hint, then rows from `departments` are sent to the local site, and the join is executed there. With the hint, the rows from `employees` are sent to the remote site, and the query is executed there and the result set is returned to the local site.

### 2.6.4.12 DYNAMIC_SAMPLING Hint

The `DYNAMIC_SAMPLING` hint instructs the optimizer how to control dynamic sampling to improve server performance by determining more accurate predicate selectivity and statistics for tables and indexes.

You can set the value of `DYNAMIC_SAMPLING` to a value from 0 to 10. The higher the level, the more effort the compiler puts into dynamic sampling and the more broadly it is applied. Sampling defaults to cursor level unless you specify `tablespec`.

The `integer` value is 0 to 10, indicating the degree of sampling.

If a cardinality statistic already exists for the table, then the optimizer uses it. Otherwise, the optimizer enables dynamic sampling to estimate the cardinality statistic.

If you specify `tablespec` and the cardinality statistic already exists, then:

- If there is no single-table predicate (a `WHERE` clause that evaluates only one table), then the optimizer trusts the existing statistics and ignores this hint. For example, the following query will not result in any dynamic sampling if `employees` is analyzed:

  ```sql
  SELECT /*+ DYNAMIC_SAMPLING(e 1) */ count(*)
  FROM employees e;
  ```

- If there is a single-table predicate, then the optimizer uses the existing cardinality statistic and estimates the selectivity of the predicate using the existing statistics.

To apply dynamic sampling to a specific table, use the following form of the hint:

```sql
SELECT /*+ DYNAMIC_SAMPLING(employees 1) */ *
FROM employees
WHERE ...
```

See Also:

*Oracle Database SQL Tuning Guide* for information about dynamic sampling and the sampling levels that you can set.
2.6.4.13 ENABLE_PARALLEL_DML Hint

The `ENABLE_PARALLEL_DML` hint enables parallel DML for `DELETE`, `INSERT`, `MERGE`, and `UPDATE` statements. You can use this hint to enable parallel DML for an individual statement, rather than enabling parallel DML for the session with the `ALTER SESSION ENABLE PARALLEL DML` statement.

**See Also:**

*Oracle Database VLDB and Partitioning Guide* for information about enabling parallel DML.

2.6.4.14 FACT Hint

The `FACT` hint is used in the context of the star transformation. It instructs the optimizer that the table specified in `tablespec` should be considered as a fact table.

(See Specifying a Query Block in a Hint , `tablespec::=`)

2.6.4.15 FIRST_ROWS Hint

The `FIRST_ROWS` hint instructs Oracle to optimize an individual SQL statement for fast response, choosing the plan that returns the first `n` rows most efficiently. For `integer`, specify the number of rows to return.

For example, the optimizer uses the query optimization approach to optimize the following statement for best response time:

```sql
SELECT /*+ FIRST_ROWS(10) */ employee_id, last_name, salary, job_id 
FROM employees 
WHERE department_id = 20;
```

In this example each department contains many employees. The user wants the first 10 employees of department 20 to be displayed as quickly as possible.

The optimizer ignores this hint in `DELETE` and `UPDATE` statement blocks and in `SELECT` statement blocks that include any blocking operations, such as sorts or groupings.
Such statements cannot be optimized for best response time, because Oracle Database must retrieve all rows accessed by the statement before returning the first row. If you specify this hint in any such statement, then the database optimizes for best throughput.

See Also:
ALL_ROWS Hint for additional information on the FIRST_ROWS hint and statistics

2.6.4.16 FRESH_MV Hint

The FRESH_MV hint applies when querying a real-time materialized view. This hint instructs the optimizer to use on-query computation to fetch up-to-date data from the materialized view, even if the materialized view is stale.

The optimizer ignores this hint in SELECT statement blocks that query an object that is not a real-time materialized view, and in all UPDATE, INSERT, MERGE, and DELETE statement blocks.

See Also:
The { ENABLE | DISABLE } ON QUERY COMPUTATION clause of CREATE MATERIALIZED VIEW for more information on real-time materialized views

2.6.4.17 FULL Hint

The FULL hint instructs the optimizer to perform a full table scan for the specified table. For example:

```sql
SELECT /*+ FULL(e) */ employee_id, last_name
FROM hr.employees e
WHERE last_name LIKE :b1;
```

Oracle Database performs a full table scan on the employees table to execute this statement, even if there is an index on the last_name column that is made available by the condition in the WHERE clause.
The employees table has alias e in the FROM clause, so the hint must refer to the table by its alias rather than by its name. Do not specify schema names in the hint even if they are specified in the FROM clause.

2.6.4.18 GATHER_OPTIMIZER_STATISTICS Hint

The GATHER_OPTIMIZER_STATISTICS hint instructs the optimizer to enable statistics gathering during the following types of bulk loads:

- CREATE TABLE ... AS SELECT
- INSERT INTO ... SELECT into an empty table using a direct-path insert

See Also:
Oracle Database SQL Tuning Guide for more information on statistics gathering for bulk loads

2.6.4.19 GROUPING Hint

The GROUPING hint applies to data mining scoring functions when scoring partitioned models. This hint results in partitioning the input data set into distinct data slices so that each partition is scored in its entirety before advancing to the next partition; however, parallelism by partition is still available. Data slices are determined by the partitioning key columns that were used when the model was built. This method can be used with any data mining function against a partitioned model. The hint may yield a query performance gain when scoring large data that is associated with many partitions, but may negatively impact performance when scoring large data with few partitions on large systems. Typically, there is no performance gain if you use this hint for single row queries.

In the following example, the GROUPING hint is used in the PREDICTION function.

SELECT PREDICTION( /*+ GROUPING */ my_model USING *) pred FROM <input table>;

See Also:
Data Mining Functions
2.6.4.20 HASH Hint

```sql
/*+ HASH (@ queryblock tablespec) */
```

(See Specifying a Query Block in a Hint, `tablespec ::=`) The `HASH` hint instructs the optimizer to use a hash scan to access the specified table. This hint applies only to tables in a hash cluster.

2.6.4.21 IGNORE_ROW_ON_DUPKEY_INDEX Hint

```sql
/*+ IGNORE_ROW_ON_DUPKEY_INDEX (table index table (column)) */
```

Note: The `CHANGE_DUPKEY_ERROR_INDEX`, `IGNORE_ROW_ON_DUPKEY_INDEX`, and `RETRY_ON_ROW_CHANGE` hints are unlike other hints in that they have a semantic effect. The general philosophy explained in Hints does not apply for these three hints.

The `IGNORE_ROW_ON_DUPKEY_INDEX` hint applies only to single-table INSERT operations. It is not supported for UPDATE, DELETE, MERGE, or multitable insert operations. `IGNORE_ROW_ON_DUPKEY_INDEX` causes the statement to ignore a unique key violation for a specified set of columns or for a specified index. When a unique key violation is encountered, a row-level rollback occurs and execution resumes with the next input row. If you specify this hint when inserting data with DML error logging enabled, then the unique key violation is not logged and does not cause statement termination.

The semantic effect of this hint results in error messages if specific rules are violated:

- If you specify `index`, then the index must exist and be unique. Otherwise, the statement causes ORA-38913.
- You must specify exactly one index. If you specify no index, then the statement causes ORA-38912. If you specify more than one index, then the statement causes ORA-38915.
- You can specify either a `CHANGE_DUPKEY_ERROR_INDEX` or `IGNORE_ROW_ON_DUPKEY_INDEX` hint in an INSERT statement, but not both. If you specify both, then the statement causes ORA-38915.

As with all hints, a syntax error in the hint causes it to be silently ignored. The result will be that ORA-00001 will be caused, just as if no hint were used.
Note:
This hint disables both APPEND mode and parallel DML.

See Also:
CHANGE_DUPKEY_ERROR_INDEX Hint

2.6.4.22 INDEX Hint

(See Specifying a Query Block in a Hint , tablespec::=, indexspec::=)

The INDEX hint instructs the optimizer to use an index scan for the specified table. You can use the INDEX hint for function-based, domain, B-tree, bitmap, and bitmap join indexes.

The behavior of the hint depends on the indexspec specification:

- If the INDEX hint specifies a single available index, then the database performs a scan on this index. The optimizer does not consider a full table scan or a scan of another index on the table.
- For a hint on a combination of multiple indexes, Oracle recommends using INDEX_COMBINE rather than INDEX, because it is a more versatile hint. If the INDEX hint specifies a list of available indexes, then the optimizer considers the cost of a scan on each index in the list and then performs the index scan with the lowest cost. The database can also choose to scan multiple indexes from this list and merge the results, if such an access path has the lowest cost. The database does not consider a full table scan or a scan on an index not listed in the hint.
- If the INDEX hint specifies no indexes, then the optimizer considers the cost of a scan on each available index on the table and then performs the index scan with the lowest cost. The database can also choose to scan multiple indexes and merge the results, if such an access path has the lowest cost. The optimizer does not consider a full table scan.

For example:

```
SELECT /*+ INDEX (employees emp_department_ix)*/ employee_id, department_id
FROM employees
WHERE department_id > 50;
```

2.6.4.23 INDEX_ASC Hint
The `INDEX_asc` hint instructs the optimizer to use an index scan for the specified table. If the statement uses an index range scan, then Oracle Database scans the index entries in ascending order of their indexed values. Each parameter serves the same purpose as in `INDEX` hint.

The default behavior for a range scan is to scan index entries in ascending order of their indexed values, or in descending order for a descending index. This hint does not change the default order of the index, and therefore does not specify anything more than the `INDEX` hint. However, you can use the `INDEX_asc` hint to specify ascending range scans explicitly should the default behavior change.

### 2.6.4.24 INDEX_COMBINE Hint

(See Specifying a Query Block in a Hint, `tablespec::=`, `indexspec::=`)

The `INDEX_COMBINE` hint instructs the optimizer to use a bitmap access path for the table. If `indexspec` is omitted from the `INDEX_COMBINE` hint, then the optimizer uses whatever Boolean combination of indexes has the best cost estimate for the table. If you specify `indexspec`, then the optimizer tries to use some Boolean combination of the specified indexes. Each parameter serves the same purpose as in `INDEX` hint.

For example:

```sql
SELECT /*+ INDEX_COMBINE(e emp_manager_ix emp_department_ix) */ *
FROM employees e
WHERE manager_id = 108
  OR department_id = 110;
```

### 2.6.4.25 INDEX_DESC Hint

(See Specifying a Query Block in a Hint, `tablespec::=`, `indexspec::=`)

The `INDEX_DESC` hint instructs the optimizer to use a descending index scan for the specified table. If the statement uses an index range scan and the index is ascending, then Oracle scans the index entries in descending order of their indexed values. In a partitioned index, the results are in descending order within each partition. For a descending index, this hint effectively cancels out the descending order, resulting in a scan of the index entries in ascending order. Each parameter serves the same purpose as in `INDEX` hint.

For example:

```sql
SELECT /*+ INDEX_DESC(e emp_name_ix) */ *
FROM employees e;
```
2.6.4.26 INDEX_FFS Hint

The `INDEX_FFS` hint instructs the optimizer to perform a fast full index scan rather than a full table scan.

Each parameter serves the same purpose as in `INDEX Hint`. For example:

```
SELECT /*+ INDEX_FFS(e emp_name_ix) */ first_name
FROM employees e;
```

2.6.4.27 INDEX_JOIN Hint

The `INDEX_JOIN` hint instructs the optimizer to use an index join as an access path. For the hint to have a positive effect, a sufficiently small number of indexes must exist that contain all the columns required to resolve the query.

Each parameter serves the same purpose as in `INDEX Hint`. For example, the following query uses an index join to access the `manager_id` and `department_id` columns, both of which are indexed in the `employees` table.

```
SELECT /*+ INDEX_JOIN(e emp_manager_ix emp_department_ix) */ department_id
FROM employees e
WHERE manager_id < 110
AND department_id < 50;
```

2.6.4.28 INDEX_SS Hint

(See `Specifying a Query Block in a Hint`, `tablespec::=`, `indexspec::=`)

```
/*+ INDEX_SS */
```

(See `Specifying a Query Block in a Hint`, `tablespec::=`, `indexspec::=`)
The INDEX_SS hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan, then Oracle scans the index entries in ascending order of their indexed values. In a partitioned index, the results are in ascending order within each partition.

Each parameter serves the same purpose as in INDEX Hint. For example:

```sql
SELECT /*+ INDEX_SS(e emp_name_ix) */ last_name
FROM employees e
WHERE first_name = 'Steven';
```

See Also:
Oracle Database SQL Tuning Guide for information on index skip scans

### 2.6.4.29 INDEX_SS_ASC Hint

The INDEX_SS_ASC hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan, then Oracle Database scans the index entries in ascending order of their indexed values. In a partitioned index, the results are in ascending order within each partition. Each parameter serves the same purpose as in INDEX Hint.

The default behavior for a range scan is to scan index entries in ascending order of their indexed values, or in descending order for a descending index. This hint does not change the default order of the index, and therefore does not specify anything more than the INDEX_SS hint. However, you can use the INDEX_SS_ASC hint to specify ascending range scans explicitly should the default behavior change.

See Also:
Oracle Database SQL Tuning Guide for information on index skip scans

### 2.6.4.30 INDEX_SS_DESC Hint

(See Specifying a Query Block in a Hint, tablespec::=, indexspec::=)

The INDEX_SS_DESC hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan, then Oracle Database scans the index entries in descending order of their indexed values. In a partitioned index, the results are in descending order within each partition. Each parameter serves the same purpose as in INDEX Hint.

The default behavior for a range scan is to scan index entries in ascending order of their indexed values, or in descending order for a descending index. This hint does not change the default order of the index, and therefore does not specify anything more than the INDEX_SS hint. However, you can use the INDEX_SS_DESC hint to specify descending range scans explicitly should the default behavior change.

See Also:
Oracle Database SQL Tuning Guide for information on index skip scans
The INDEX_SS_DESC hint instructs the optimizer to perform an index skip scan for the specified table. If the statement uses an index range scan and the index is ascending, then Oracle scans the index entries in descending order of their indexed values. In a partitioned index, the results are in descending order within each partition. For a descending index, this hint effectively cancels out the descending order, resulting in a scan of the index entries in ascending order.

Each parameter serves the same purpose as in the INDEX Hint. For example:

```
SELECT /*+ INDEX_SS_DESC(e emp_name_ix) */ last_name
FROM employees e
WHERE first_name = 'Steven';
```

See Also:
Oracle Database SQL Tuning Guide for information on index skip scans

2.6.4.31 INMEMORY Hint

```
/*+ INMEMORY
@ queryblock
tablespec */
```

(See Specifying a Query Block in a Hint, tablespec::=)

The INMEMORY hint enables In-Memory queries.

This hint does not instruct the optimizer to perform a full table scan. If a full table scan is desired, then also specify the FULL Hint.

2.6.4.32 INMEMORY_PRUNING Hint

```
/*+ INMEMORY_PRUNING
@ queryblock
tablespec */
```

(See Specifying a Query Block in a Hint, tablespec::=)

The INMEMORY_PRUNING hint enables pruning of In-Memory queries.

2.6.4.33 LEADING Hint

```
/*+ LEADING
@ queryblock
tablespec */
```

(See Specifying a Query Block in a Hint, tablespec::=)
The **LEADING** hint instructs the optimizer to use the specified set of tables as the prefix in the execution plan. This hint is more versatile than the **ORDERED** hint. For example:

```sql
SELECT /*+ LEADING(e j) */ * FROM employees e, departments d, job_history j WHERE e.department_id = d.department_id AND e.hire_date = j.start_date;
```

The **LEADING** hint is ignored if the tables specified cannot be joined first in the order specified because of dependencies in the join graph. If you specify two or more conflicting **LEADING** hints, then all of them are ignored. If you specify the **ORDERED** hint, it overrides all **LEADING** hints.

### 2.6.4.34 MERGE Hint

(See [Specifying a Query Block in a Hint](#), `tablespec::=`)

The **MERGE** hint lets you merge views in a query.

If a view's query block contains a **GROUP BY** clause or **DISTINCT** operator in the **SELECT** list, then the optimizer can merge the view into the accessing statement only if complex view merging is enabled. Complex merging can also be used to merge an **IN** subquery into the accessing statement if the subquery is uncorrelated.

For example:

```sql
SELECT /*+ MERGE(v) */ e1.last_name, e1.salary, v.avg_salary FROM employees e1, (SELECT department_id, avg(salary) avg_salary FROM employees e2 GROUP BY department_id) v WHERE e1.department_id = v.department_id AND e1.salary > v.avg_salary ORDER BY e1.last_name;
```

When the **MERGE** hint is used without an argument, it should be placed in the view query block. When **MERGE** is used with the view name as an argument, it should be placed in the surrounding query.

### 2.6.4.35 MODEL_MIN_ANALYSIS Hint

The **MODEL_MIN_ANALYSIS** hint instructs the optimizer to omit some compile-time optimizations of spreadsheet rules—primarily detailed dependency graph analysis. Other spreadsheet optimizations, such as creating filters to selectively populate spreadsheet access structures and limited rule pruning, are still used by the optimizer.
This hint reduces compilation time because spreadsheet analysis can be lengthy if the number of spreadsheet rules is more than several hundreds.

2.6.4.36 MONITOR Hint

```
/*+ MONITOR */
```

The `MONITOR` hint forces real-time SQL monitoring for the query, even if the statement is not long running. This hint is valid only when the parameter `CONTROL_MANAGEMENT_PACK_ACCESS` is set to `DIAGNOSTIC+TUNING`.

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about real-time SQL monitoring

2.6.4.37 NATIVE_FULL_OUTER_JOIN Hint

```
/*+ NATIVE_FULL_OUTER_JOIN */
```

The `NATIVE_FULL_OUTER_JOIN` hint instructs the optimizer to use native full outer join, which is a native execution method based on a hash join.

**See Also:**

- `NO_NATIVE_FULL_OUTER_JOIN` Hint
- *Oracle Database SQL Tuning Guide* for more information about native full outer joins

2.6.4.38 NOAPPEND Hint

```
/*+ NOAPPEND */
```

The `NOAPPEND` hint instructs the optimizer to use conventional `INSERT` by disabling parallel mode for the duration of the `INSERT` statement. Conventional `INSERT` is the default in serial mode, and direct-path `INSERT` is the default in parallel mode.
2.6.4.39 NOCACHE Hint

The NOCACHE hint instructs the optimizer to place the blocks retrieved for the table at the least recently used end of the LRU list in the buffer cache when a full table scan is performed. This is the normal behavior of blocks in the buffer cache. For example:

```
SELECT /*+ FULL(hr_emp) NOCACHE(hr_emp) */ last_name 
FROM employees hr_emp;
```

The CACHE and NOCACHE hints affect system statistics table scans (long tables) and table scans (short tables), as shown in the V$SYSSTAT view.

2.6.4.40 NO_CLUSTERING Hint

This hint is valid only for INSERT and MERGE operations on tables that are enabled for attribute clustering. The NO_CLUSTERING hint disables attribute clustering for direct-path inserts (serial or parallel). This hint overrides a YES ON LOAD setting in the DDL that created or altered the table. This hint has no effect on tables that are not enabled for attribute clustering.

See Also:

- clustering_when clause of CREATE TABLE for more information on the YES ON LOAD setting
- CLUSTERING Hint

2.6.4.41 NO_EXPAND Hint

The NO_EXPAND hint instructs the optimizer not to consider OR-expansion for queries having OR conditions or IN-lists in the WHERE clause. Usually, the optimizer considers
using OR expansion and uses this method if it decides that the cost is lower than not using it. For example:

```sql
SELECT /*+ NO_EXPAND */ * 
FROM employees e, departments d 
WHERE e.manager_id = 108 
  OR d.department_id = 110;
```

See Also:
The USE_CONCAT Hint, which is the opposite of this hint

2.6.42 NO_FACT Hint

```sql
/*+ NO_FACT */
(See Specifying a Query Block in a Hint, `tablespec::=`)
```

The NO_FACT hint is used in the context of the star transformation. It instruct the optimizer that the queried table should not be considered as a fact table.

2.6.43 NO_GATHER_OPTIMIZER_STATISTICS Hint

```sql
/*+ NO_GATHER_OPTIMIZER_STATISTICS */
```

The NO_GATHER_OPTIMIZER_STATISTICS hint instructs the optimizer to disable statistics gathering during the following types of bulk loads:

- CREATE TABLE AS SELECT
- INSERT INTO ... SELECT into an empty table using a direct path insert

See Also:
Oracle Database SQL Tuning Guide for more information on statistics gathering for bulk loads

2.6.44 NO_INDEX Hint
The NO_INDEX hint instructs the optimizer not to use one or more indexes for the specified table. For example:

```sql
SELECT /*+ NO_INDEX(employees emp_empid) */ employee_id
FROM employees
WHERE employee_id > 200;
```

Each parameter serves the same purpose as in INDEX Hint with the following modifications:

- If this hint specifies a single available index, then the optimizer does not consider a scan on this index. Other indexes not specified are still considered.
- If this hint specifies a list of available indexes, then the optimizer does not consider a scan on any of the specified indexes. Other indexes not specified in the list are still considered.
- If this hint specifies no indexes, then the optimizer does not consider a scan on any index on the table. This behavior is the same as a NO_INDEX hint that specifies a list of all available indexes for the table.

The NO_INDEX hint applies to function-based, B-tree, bitmap, cluster, or domain indexes. If a NO_INDEX hint and an index hint (INDEX, INDEX_ASC, INDEX_DESC, INDEX_COMBINE, or INDEX_FFS) both specify the same indexes, then the database ignores both the NO_INDEX hint and the index hint for the specified indexes and considers those indexes for use during execution of the statement.

2.6.45 NO_INDEX_FFS Hint

```sql
/*+ NO_INDEX_FFS(items item_order_ix) */
SELECT order_id
FROM order_items items;
```

2.6.46 NO_INDEX_SS Hint

```sql
/*+ NO_INDEX_SS(items item_order_ix) */
SELECT order_id
FROM order_items items;
```
The **NO_INDEX_SS** hint instructs the optimizer to exclude a skip scan of the specified indexes on the specified table. Each parameter serves the same purpose as in the **NO_INDEX Hint**.

**See Also:**

*Oracle Database SQL Tuning Guide* for information on index skip scans

### 2.6.47 NO_INMEMORY Hint

```sql
/*+ NO_INMEMORY (@ queryblock tablespec ) */
```

(See [Specifying a Query Block in a Hint](#), `tablespec ::=`)

The **NO_INMEMORY** hint disables In-Memory queries.

### 2.6.48 NO_INMEMORY_PRUNING Hint

```sql
/*+ NO_INMEMORY_PRUNING (@ queryblock tablespec ) */
```

(See [Specifying a Query Block in a Hint](#), `tablespec ::=`)

The **NO_INMEMORY_PRUNING** hint disables pruning of In-Memory queries.

### 2.6.49 NO_MERGE Hint

```sql
/*+ NO_MERGE (@ queryblock tablespec ) */
```

(See [Specifying a Query Block in a Hint](#), `tablespec ::=`)

The **NO_MERGE** hint instructs the optimizer not to combine the outer query and any inline view queries into a single query.

This hint lets you have more influence over the way in which the view is accessed. For example, the following statement causes view `seattle_dept` not to be merged:

```sql
SELECT /*+ NO_MERGE(seattle_dept) */ e1.last_name, seattle_dept.department_name
FROM employees e1,
     (SELECT location_id, department_id, department_name
      FROM departments
```
WHERE location_id = 1700) seattle_dept
WHERE e1.department_id = seattle_dept.department_id;

When you use the NO_MERGE hint in the view query block, specify it without an argument. When you specify NO_MERGE in the surrounding query, specify it with the view name as an argument.

2.6.4.50 NO_MONITOR Hint

```sql
/*+ NO_MONITOR */
```

The NO_MONITOR hint disables real-time SQL monitoring for the query, even if the query is long running.

2.6.4.51 NO_NATIVE_FULL_OUTER_JOIN Hint

```sql
/*+ NO_NATIVE_FULL_OUTER_JOIN */
```

The NO_NATIVE_FULL_OUTER_JOIN hint instructs the optimizer to exclude the native execution method when joining each specified table. Instead, the full outer join is executed as a union of left outer join and anti-join.

See Also:

NATIVE_FULL_OUTER_JOIN Hint

2.6.4.52 NO_PARALLEL Hint

```sql
/*+ NO_PARALLEL(hr_emp) */
```

(See Specifying a Query Block in a Hint, `tablespec::=`)

The NO_PARALLEL hint instructs the optimizer to run the statement serially. This hint overrides the value of the PARALLEL_DEGREE_POLICY initialization parameter. It also overrides a PARALLEL parameter in the DDL that created or altered the table. For example, the following SELECT statement will run serially:

```sql
ALTER TABLE employees PARALLEL 8;
SELECT /*+ NO_PARALLEL(hr_emp) */ last_name
FROM employees hr_emp;
```
2.6.4.53 NOPARALLEL Hint

The NOPARALLEL hint has been deprecated. Use the NO_PARALLEL hint instead.

2.6.4.54 NO_PARALLEL_INDEX Hint

(See Specifying a Query Block in a Hint , tablespec::=, indexspec::=)

The NO_PARALLEL_INDEX hint overrides a PARALLEL parameter in the DDL that created or altered the index, thus avoiding a parallel index scan operation.

2.6.4.55 NOPARALLEL_INDEX Hint

The NOPARALLEL_INDEX hint has been deprecated. Use the NO_PARALLEL_INDEX hint instead.

2.6.4.56 NO_PQ_CONCURRENT_UNION Hint

(See Specifying a Query Block in a Hint)

The NO_PQ_CONCURRENT_UNION hint instructs the optimizer to disable concurrent processing of UNION and UNION ALL operations.
2.6.4.57 NO_PQ_SKEW Hint

The NO_PQ_SKEW hint advises the optimizer that the distribution of the values of the join keys for a parallel join is not skewed—that is, a high percentage of rows do not have the same join key values. The table specified in `tablespec` is the probe table of the hash join.

2.6.4.58 NO_PUSH_PRED Hint

The NO_PUSH_PRED hint instructs the optimizer not to push a join predicate into the view. For example:

```sql
SELECT /*+ NO_MERGE(v) NO_PUSH_PRED(v) */ * 
FROM employees e,
     (SELECT manager_id 
      FROM employees) v 
WHERE e.manager_id = v.manager_id(+)
AND e.employee_id = 100;
```

2.6.4.59 NO_PUSH_SUBQ Hint

(See Specifying a Query Block in a Hint )
The NO_PUSH_SUBQ hint instructs the optimizer to evaluate nonmerged subqueries as
the last step in the execution plan. Doing so can improve performance if the subquery
is relatively expensive or does not reduce the number of rows significantly.

2.6.40 NO_PX_JOIN_FILTER Hint

This hint prevents the optimizer from using parallel join bitmap filtering.

2.6.41 NO_QUERY_TRANSFORMATION Hint

The NO_QUERY_TRANSFORMATION hint instructs the optimizer to skip all query
transformations, including but not limited to OR-expansion, view merging, subquery
unnesting, star transformation, and materialized view rewrite. For example:

```
SELECT /*+ NO_QUERY_TRANSFORMATION */ employee_id, last_name
FROM (SELECT * FROM employees e) v
WHERE v.last_name = 'Smith';
```

2.6.42 NO_RESULT_CACHE Hint

The optimizer caches query results in the result cache if the RESULT_CACHE_MODE
initialization parameter is set to FORCE. In this case, the NO_RESULT_CACHE hint disables
such caching for the current query.

If the query is executed from OCI client and OCI client result cache is enabled, then
the NO_RESULT_CACHE hint disables caching for the current query.

2.6.43 NO_REWRITE Hint

(See Specifying a Query Block in a Hint)

The NO_REWRITE hint instructs the optimizer to disable query rewrite for the query
block, overriding the setting of the parameter QUERY_REWRITE_ENABLED. For example:

```
SELECT /*+ NO_REWRITE */ sum(s.amount_sold) AS dollars
FROM sales s, times t
```
WHERE s.time_id = t.time_id
GROUP BY t.calendar_month_desc;

2.6.4.64 NOREWRITE Hint

The NOREWRITE hint has been deprecated. Use the NO_REWRITE hint instead.

2.6.4.65 NO_STAR_TRANSFORMATION Hint

```
/*+ NO_STAR_TRANSFORMATION
( @ queryblock ) */
```

(See Specifying a Query Block in a Hint )

The NO_STAR_TRANSFORMATION hint instructs the optimizer not to perform star query transformation.

2.6.4.66 NO_STATEMENT_QUEUING Hint

```
/*+ NO_STATEMENT_QUEUING */
```

The NO_STATEMENT_QUEUING hint influences whether or not a statement is queued with parallel statement queuing.

When PARALLEL_DEGREE_POLICY is set to AUTO, this hint enables a statement to bypass the parallel statement queue. However, a statement that bypasses the statement queue can potentially cause the system to exceed the maximum number of parallel execution servers defined by the value of the PARALLEL_SERVERS_TARGET initialization parameter, which determines the limit at which parallel statement queuing is initiated.

There is no guarantee that the statement that bypasses the parallel statement queue receives the number of parallel execution servers requested because only the number of parallel execution servers available on the system, up to the value of the PARALLEL_MAX_SERVERS initialization parameter, can be allocated.

For example:

```
SELECT /*+ NO_STATEMENT_QUEUING */ emp.last_name, dpt.department_name
FROM employees emp, departments dpt
WHERE emp.department_id = dpt.department_id;
```

See Also:

STATEMENT_QUEUING Hint
2.6.4.67 NO_UNNEST Hint

(See Specifying a Query Block in a Hint)

Use of the NO_UNNEST hint turns off unnesting.

2.6.4.68 NO_USE_BAND Hint

(See Specifying a Query Block in a Hint, tablespec::=)

The NO_USE_BAND hint instructs the optimizer to exclude band joins when joining each specified table to another row source. For example:

```sql
SELECT /*+ NO_USE_BAND(e1 e2) */
    e1.last_name
|| ' has salary between 100 less and 100 more than '
|| e2.last_name AS "SALARY COMPARISON"
FROM employees e1, employees e2
WHERE e1.salary BETWEEN e2.salary - 100 AND e2.salary + 100;
```

2.6.4.69 NO_USE_CUBE Hint

(See Specifying a Query Block in a Hint, tablespec::=)

The NO_USE_CUBE hint instructs the optimizer to exclude cube joins when joining each specified table to another row source using the specified table as the inner table.

2.6.4.70 NO_USE_HASH Hint

(See Specifying a Query Block in a Hint, tablespec::=)
The NO_USE_HASH hint instructs the optimizer to exclude hash joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_HASH(e d) */ *
FROM employees e, departments d
WHERE e.department_id = d.department_id;
```

2.6.4.71 NO_USE_MERGE Hint

The NO_USE_MERGE hint instructs the optimizer to exclude sort-merge joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_MERGE(e d) */ *
FROM employees e, departments d
WHERE e.department_id = d.department_id
ORDER BY d.department_id;
```

2.6.4.72 NO_USE_NL Hint

The NO_USE_NL hint instructs the optimizer to exclude nested loops joins when joining each specified table to another row source using the specified table as the inner table. For example:

```
SELECT /*+ NO_USE_NL(l h) */ *
FROM orders h, order_items l
WHERE l.order_id = h.order_id
AND l.order_id > 2400;
```

When this hint is specified, only hash join and sort-merge joins are considered for the specified tables. However, in some cases tables can be joined only by using nested loops. In such cases, the optimizer ignores the hint for those tables.

2.6.4.73 NO_XML_QUERY_REWRITE Hint

The NO_XML_QUERY_REWRITE hint instructs the optimizer to prohibit the rewriting of XPath expressions in SQL statements. By prohibiting the rewriting of XPath
expressions, this hint also prohibits the use of any XMLIndexes for the current query. For example:

```sql
SELECT /*+NO_XML_QUERY_REWRITE*/ XMLQUERY('<A/>' RETURNING CONTENT) FROM DUAL;
```

**See Also:**

- **NO_XMLINDEX_REWRITE Hint**

### 2.6.4.74 NO_XMLINDEX_REWRITE Hint

The **NO_XMLINDEX_REWRITE** hint instructs the optimizer not to use any XMLIndex indexes for the current query. For example:

```sql
SELECT /*+NO_XMLINDEX_REWRITE*/ count(*) FROM warehouses
    WHERE existsNode(warehouse_spec, '/Warehouse/Building') = 1;
```

**See Also:**

- **NO_XML_QUERY_REWRITE Hint** for another way to disable the use of XMLIndexes

### 2.6.4.75 NO_ZONEMAP Hint

(See Specifying a Query Block in a Hint, `tablespec::=`)

The **NO_ZONEMAP** hint disables the use of a zone map for different types of pruning. This hint overrides an **ENABLE PRUNING** setting in the DDL that created or altered the zone map.

Specify one of the following options:

- **SCAN** - Disables the use of a zone map for scan pruning.
- **JOIN** - Disables the use of a zone map for join pruning.
- **PARTITION** - Disables the use of a zone map for partition pruning.
See Also:

- \texttt{ENABLE | DISABLE PRUNING} clause of \texttt{CREATE MATERIALIZED ZONEMAP}
- \textit{Oracle Database Data Warehousing Guide} for more information on pruning with zone maps

2.6.4.76 \texttt{OPT_PARAM} Hint

\[
/*+ OPT_PARAM\parameter_name\ parameter_value */
\]

The \texttt{OPT_PARAM} hint lets you set an initialization parameter for the duration of the current query only. This hint is valid only for the following parameters: \texttt{APPROX\_FOR\_AGGREGATION}, \texttt{APPROX\_FOR\_COUNT\_DISTINCT}, \texttt{APPROX\_FOR\_PERCENTILE}, \texttt{OPTIMIZER\_DYNAMIC\_SAMPLING}, \texttt{OPTIMIZER\_INDEX\_CACHING}, \texttt{OPTIMIZER\_INDEX\_COST\_ADJ}, \texttt{OPTIMIZER\_SECURE\_VIEW\_MERGING}, and \texttt{STAR\_TRANSFORMATION\_ENABLED}.

For example, the following hint sets the parameter \texttt{STAR\_TRANSFORMATION\_ENABLED} to \texttt{TRUE} for the statement to which it is added:

\[
\text{SELECT /*+ OPT_PARAM('star_transformation_enabled' 'true') */ * FROM ... ;}
\]

Parameter values that are strings are enclosed in single quotation marks. Numeric parameter values are specified without quotation marks.

2.6.4.77 \texttt{ORDERED} Hint

\[
/*+ ORDERED */
\]

The \texttt{ORDERED} hint instructs Oracle to join tables in the order in which they appear in the \texttt{FROM} clause. Oracle recommends that you use the \texttt{LEADING} hint, which is more versatile than the \texttt{ORDERED} hint.

When you omit the \texttt{ORDERED} hint from a SQL statement requiring a join, the optimizer chooses the order in which to join the tables. You might want to use the \texttt{ORDERED} hint to specify a join order if you know something that the optimizer does not know about the number of rows selected from each table. Such information lets you choose an inner and outer table better than the optimizer could.

The following query is an example of the use of the \texttt{ORDERED} hint:

\[
\text{SELECT /*+ ORDERED */ o.order_id, c.customer_id, l.unit_price * l.quantity FROM customers c, order_items l, orders o WHERE c.cust_last_name = 'Taylor' AND o.customer_id = c.customer_id AND o.order_id = l.order_id;}
\]
2.6.4.78 PARALLEL Hint

Note on Parallel Hints

Beginning with Oracle Database 11g Release 2, the PARALLEL and NO_PARALLEL hints are statement-level hints and supersede the earlier object-level hints: PARALLEL_INDEX, NO_PARALLEL_INDEX, and previously specified PARALLEL and NO_PARALLEL hints. For PARALLEL, if you specify integer, then that degree of parallelism will be used for the statement. If you omit integer, then the database computes the degree of parallelism. All the access paths that can use parallelism will use the specified or computed degree of parallelism.

In the syntax diagrams below, parallel_hint_statement shows the syntax for statement-level hints, and parallel_hint_object shows the syntax for object-level hints. Object-level hints are supported for backward compatibility, and are superseded by statement-level hints.

\[
\text{parallel_hint_statement} ::= \\
\]

\[
\text{parallel_hint_object} ::= \\
\]

(See Specifying a Query Block in a Hint, tablespec::=)

The PARALLEL hint instructs the optimizer to use the specified number of concurrent servers for a parallel operation. This hint overrides the value of the PARALLEL_DEGREE_POLICY initialization parameter. It applies to the SELECT, INSERT, MERGE, UPDATE, and DELETE portions of a statement, as well as to the table scan portion. If any parallel restrictions are violated, then the hint is ignored.

\[\text{Note:}\]

The number of servers that can be used is twice the value in the PARALLEL hint, if sorting or grouping operations also take place.

For a statement-level PARALLEL hint:
• **PARALLEL**: The statement always is run parallel, and the database computes the degree of parallelism, which can be 2 or greater.

• **PARALLEL (DEFAULT)**: The optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.

• **PARALLEL (AUTO)**: The database computes the degree of parallelism, which can be 1 or greater. If the computed degree of parallelism is 1, then the statement runs serially.

• **PARALLEL (MANUAL)**: The optimizer is forced to use the parallel settings of the objects in the statement.

• **PARALLEL (integer)**: The optimizer uses the degree of parallelism specified by integer.

In the following example, the optimizer calculates the degree of parallelism. The statement always runs in parallel.

```
SELECT /*+ PARALLEL */ last_name
FROM employees;
```

In the following example, the optimizer calculates the degree of parallelism, but that degree may be 1, in which case the statement will run serially.

```
SELECT /*+ PARALLEL (AUTO) */ last_name
FROM employees;
```

In the following example, the `PARALLEL` hint advises the optimizer to use the degree of parallelism currently in effect for the table itself, which is 5:

```
CREATE TABLE parallel_table (col1 number, col2 VARCHAR2(10)) PARALLEL 5;

SELECT /*+ PARALLEL (MANUAL) */ col2
FROM parallel_table;
```

For an **object-level PARALLEL** hint:

• **PARALLEL**: The query coordinator should examine the settings of the initialization parameters to determine the default degree of parallelism.

• **PARALLEL (integer)**: The optimizer uses the degree of parallelism specified by integer.

• **PARALLEL (DEFAULT)**: The optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.

In the following example, the `PARALLEL` hint overrides the degree of parallelism specified in the `employees` table definition:

```
SELECT /*+ FULL(hr_emp) PARALLEL(hr_emp, 5) */ last_name
FROM employees hr_emp;
```

In the next example, the `PARALLEL` hint overrides the degree of parallelism specified in the `employees` table definition and instructs the optimizer to calculate a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the `PARALLEL_THREADS_PER_CPU` initialization parameter.

```
SELECT /*+ FULL(hr_emp) PARALLEL(hr_emp, DEFAULT) */ last_name
FROM employees hr_emp;
```
Refer to CREATE TABLE and Oracle Database Concepts for more information on parallel execution.

**See Also:**
- CREATE TABLE and Oracle Database Concepts for more information on parallel execution.
- Oracle Database PL/SQL Packages and Types Reference for information on the DBMS_PARALLEL_EXECUTE package, which provides methods to apply table changes in chunks of rows. Changes to each chunk are independently committed when there are no errors.
- Oracle Database Reference for more information on the PARALLEL_DEGREE_POLICY initialization parameter
- NO_PARALLEL Hint

### 2.6.4.79 PARALLEL_INDEX Hint

(The See Specifying a Query Block in a Hint, tablespec::=, indexspec::=)

The PARALLEL_INDEX hint instructs the optimizer to use the specified number of concurrent servers to parallelize index range scans, full scans, and fast full scans for partitioned indexes.

The integer value indicates the degree of parallelism for the specified index. Specifying DEFAULT or no value signifies that the query coordinator should examine the settings of the initialization parameters to determine the default degree of parallelism. For example, the following hint indicates three parallel execution processes are to be used:

```
SELECT /*+ PARALLEL_INDEX{table1, index1, 3} */
```

**See Also:**
Note on Parallel Hints for more information on the parallel hints
2.6.4.80 PQ_CONCURRENT_UNION Hint

The PQ_CONCURRENT_UNION hint instructs the optimizer to enable concurrent processing of UNION and UNION ALL operations.

See Also:
- NO_PQ_CONCURRENT_UNION Hint
- Oracle Database VLDB and Partitioning Guide for information about using this hint

2.6.4.81 PQ_DISTRIBUTE Hint

The PQ_DISTRIBUTE hint instructs the optimizer how to distribute rows among producer and consumer query servers. You can control the distribution of rows for either joins or for load.

Control of Distribution for Load

You can control the distribution of rows for parallel INSERT ... SELECT and parallel CREATE TABLE ... AS SELECT statements to direct how rows should be distributed between the producer (query) and the consumer (load) servers. Use the upper branch of the syntax by specifying a single distribution method. The values of the distribution methods and their semantics are described in Table 2-24.
Table 2-24  Distribution Values for Load

<table>
<thead>
<tr>
<th>Distribution</th>
<th>Description</th>
</tr>
</thead>
</table>
| NONE         | No distribution. That is the query and load operation are combined into each query server. All servers will load all partitions. This lack of distribution is useful to avoid the overhead of distributing rows where there is no skew. Skew can occur due to empty segments or to a predicate in the statement that filters out all rows evaluated by the query. If skew occurs due to using this method, then use either RANDOM or RANDOM_LOCAL distribution instead.  
**Note:** Use this distribution with care. Each partition loaded requires a minimum of 512 KB per process of PGA memory. If you also use compression, then approximately 1.5 MB of PGA memory is consumer per server. |
| PARTITION    | This method uses the partitioning information of tablespc to distribute the rows from the query servers to the load servers. Use this distribution method when it is not possible or desirable to combine the query and load operations, when the number of partitions being loaded is greater than or equal to the number of load servers, and the input data will be evenly distributed across the partitions being loaded—that is, there is no skew. |
| RANDOM       | This method distributes the rows from the producers in a round-robin fashion to the consumers. Use this distribution method when the input data is highly skewed. |
| RANDOM_LOCAL | This method distributes the rows from the producers to a set of servers that are responsible for maintaining a given set of partitions. Two or more servers can be loading the same partition, but no servers are loading all partitions. Use this distribution method when the input data is skewed and combining query and load operations is not possible due to memory constraints. |

For example, in the following direct-path insert operation, the query and load portions of the operation are combined into each query server:

```
INSERT /*+ APPEND PARALLEL(target_table, 16) PQ_DISTRIBUTE(target_table, NONE) */
  INTO target_table
  SELECT * FROM source_table;
```

In the following table creation example, the optimizer uses the partitioning of target_table to distribute the rows:

```
CREATE /*+ PQ_DISTRIBUT(target_table, PARTITION) */ TABLE target_table
  NOLOGGING PARALLEL 16
  PARTITION BY HASH (l_orderkey) PARTITIONS 512
  AS SELECT * FROM source_table;
```

**Control of Distribution for Joins**

You control the distribution method for joins by specifying two distribution methods, as shown in the lower branch of the syntax diagram, one distribution for the outer table and one distribution for the inner table.

* outer_distribution is the distribution for the outer table.
• *inner_distribution* is the distribution for the inner table.

The values of the distributions are **HASH**, **BROADCAST**, **PARTITION**, and **NONE**. Only six combinations table distributions are valid, as described in Table 2-25:

**Table 2-25  Distribution Values for Joins**

<table>
<thead>
<tr>
<th>Distribution</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HASH, HASH</td>
<td>The rows of each table are mapped to consumer query servers, using a hash function on the join keys. When mapping is complete, each query server performs the join between a pair of resulting partitions. This distribution is recommended when the tables are comparable in size and the join operation is implemented by hash-join or sort merge join.</td>
</tr>
<tr>
<td>BROADCAST, NONE</td>
<td>All rows of the outer table are broadcast to each query server. The inner table rows are randomly partitioned. This distribution is recommended when the outer table is very small compared with the inner table. As a general rule, use this distribution when the inner table size multiplied by the number of query servers is greater than the outer table size.</td>
</tr>
<tr>
<td>NONE, BROADCAST</td>
<td>All rows of the inner table are broadcast to each consumer query server. The outer table rows are randomly partitioned. This distribution is recommended when the inner table is very small compared with the outer table. As a general rule, use this distribution when the inner table size multiplied by the number of query servers is less than the outer table size.</td>
</tr>
<tr>
<td>PARTITION, NONE</td>
<td>The rows of the outer table are mapped using the partitioning of the inner table. The inner table must be partitioned on the join keys. This distribution is recommended when the number of partitions of the outer table is equal to or nearly equal to a multiple of the number of query servers; for example, 14 partitions and 15 query servers. Note: The optimizer ignores this hint if the inner table is not partitioned or not equijoined on the partitioning key.</td>
</tr>
<tr>
<td>NONE, PARTITION</td>
<td>The rows of the inner table are mapped using the partitioning of the outer table. The outer table must be partitioned on the join keys. This distribution is recommended when the number of partitions of the outer table is equal to or nearly equal to a multiple of the number of query servers; for example, 14 partitions and 15 query servers. Note: The optimizer ignores this hint if the outer table is not partitioned or not equijoined on the partitioning key.</td>
</tr>
<tr>
<td>NONE, NONE</td>
<td>Each query server performs the join operation between a pair of matching partitions, one from each table. Both tables must be equipartitioned on the join keys.</td>
</tr>
</tbody>
</table>

For example, given two tables *r* and *s* that are joined using a hash join, the following query contains a hint to use hash distribution:

```
SELECT /*+ORDERED PQ_DISTRIBUTE(s HASH, HASH) USE_HASH (s)*/ column_list
FROM r,s
WHERE r.c=s.c;
```

To broadcast the outer table *r*, the query is:
The `PQ_FILTER` hint instructs the optimizer on how to process rows when filtering correlated subqueries.

- **SERIAL**: Process rows serially on the left and right sides of the filter. Use this option when the overhead of parallelization is too high for the query, for example, when the left side has very few rows.
- **NONE**: Process rows in parallel on the left and right sides of the filter. Use this option when there is no skew in the distribution of the data on the left side of the filter and you would like to avoid distribution of the left side, for example, due to the large size of the left side.
- **HASH**: Process rows in parallel on the left side of the filter using a hash distribution. Process rows serially on the right side of the filter. Use this option when there is no skew in the distribution of data on the left side of the filter.
- **RANDOM**: Process rows in parallel on the left side of the filter using a random distribution. Process rows serially on the right side of the filter. Use this option when there is skew in the distribution of data on the left side of the filter.

**2.6.4.83 PQ_SKEW Hint**

(See Specifying a Query Block in a Hint, `tablespec ::=`)  

The `PQ_SKEW` hint advises the optimizer that the distribution of the values of the join keys for a parallel join is highly skewed—that is, a high percentage of rows have the same join key values. The table specified in `tablespec` is the probe table of the hash join.

**2.6.4.84 PUSH_PRED Hint**
The **PUSH_PRED** hint instructs the optimizer to push a join predicate into the view. For example:

```sql
SELECT /*+ NO_MERGE(v) PUSH_PRED(v) */ *
FROM employees e,
     (SELECT manager_id
      FROM employees) v
WHERE e.manager_id = v.manager_id(+)
  AND e.employee_id = 100;
```

### 2.6.4.85 PUSH_SUBQ Hint

(See Specifying a Query Block in a Hint )

The **PUSH_SUBQ** hint instructs the optimizer to evaluate nonmerged subqueries at the earliest possible step in the execution plan. Generally, subqueries that are not merged are executed as the last step in the execution plan. If the subquery is relatively inexpensive and reduces the number of rows significantly, then evaluating the subquery earlier can improve performance.

This hint has no effect if the subquery is applied to a remote table or one that is joined using a merge join.

### 2.6.4.86 PX_JOIN_FILTER Hint

(See Specifying a Query Block in a Hint )

This hint forces the optimizer to use parallel join bitmap filtering.

### 2.6.4.87 QB_NAME Hint

(See Specifying a Query Block in a Hint )

Use the **QB_NAME** hint to define a name for a query block. This name can then be used in a hint in the outer query or even in a hint in an inline view to affect query execution on the tables appearing in the named query block.

If two or more query blocks have the same name, or if the same query block is hinted twice with different names, then the optimizer ignores all the names and the hints referencing that query block. Query blocks that are not named using this hint have unique system-generated names. These names can be displayed in the plan table and can also be used in hints within the query block, or in query block hints. For example:
SELECT /*+ QB_NAME(qb) FULL(@qb e) */ employee_id, last_name
FROM employees e
WHERE last_name = 'Smith';

2.6.4.88 RESULT_CACHE Hint

The RESULT_CACHE hint instructs the database to cache the results of the current query or query fragment in memory and then to use the cached results in future executions of the query or query fragment. The hint is recognized in the top-level query, the subquery_factoring_clause, or FROM clause inline view. The cached results reside in the result cache memory portion of the shared pool.

A cached result is automatically invalidated whenever a database object used in its creation is successfully modified. This hint takes precedence over settings of the RESULT_CACHE_MODE initialization parameter.

The query is eligible for result caching only if all functions entailed in the query—for example, built-in or user-defined functions or virtual columns—are deterministic.

If the query is executed from OCI client and OCI client result cache is enabled, then RESULT_CACHE hint enables client caching for the current query.

See Also:
Oracle Database Performance Tuning Guide for information about using this hint, Oracle Database Reference for information about the RESULT_CACHE_MODE initialization parameter, and Oracle Call Interface Programmer’s Guide for more information about the OCI result cache and usage guidelines

2.6.4.89 RETRY_ON_ROW_CHANGE Hint

This hint is valid only for UPDATE and DELETE operations. It is not supported for INSERT or MERGE operations. When you specify this hint, the operation is retried when the

Note:
The CHANGE_DUPKEY_ERROR_INDEX, IGNORE_ROW_ON_DUPKEY_INDEX, and RETRY_ON_ROW_CHANGE hints are unlike other hints in that they have a semantic effect. The general philosophy explained in Hints does not apply for these three hints.
ORA_ROWSCN for one or more rows in the set has changed from the time the set of rows to be modified is determined to the time the block is actually modified.

See Also:
- IGNORE_ROW_ON_DUPKEY_INDEX Hint and CHANGE_DUPKEY_ERROR_INDEX Hint

2.6.4.90 REWRITE Hint

(See Specifying a Query Block in a Hint )

The REWRITE hint instructs the optimizer to rewrite a query in terms of materialized views, when possible, without cost consideration. Use the REWRITE hint with or without a view list. If you use REWRITE with a view list and the list contains an eligible materialized view, then Oracle uses that view regardless of its cost.

Oracle does not consider views outside of the list. If you do not specify a view list, then Oracle searches for an eligible materialized view and always uses it regardless of the cost of the final plan.

See Also:
- Oracle Database Concepts for more information on materialized views
- Oracle Database Data Warehousing Guide for more information on using REWRITE with materialized views

2.6.4.91 STAR_TRANSFORMATION Hint

(See Specifying a Query Block in a Hint )

The STAR_TRANSFORMATION hint instructs the optimizer to use the best plan in which the transformation has been used. Without the hint, the optimizer could make a query optimization decision to use the best plan generated without the transformation, instead of the best plan for the transformed query. For example:

```
SELECT /*+ STAR_TRANSFORMATION */ s.time_id, s.prod_id, s.channel_id
FROM sales s, times t, products p, channels c
```
WHERE s.time_id = t.time_id
  AND s.prod_id = p.prod_id
  AND s.channel_id = c.channel_id
  AND c.channel_desc = 'Tele Sales';

Even if the hint is specified, there is no guarantee that the transformation will take place. The optimizer generates the subqueries only if it seems reasonable to do so. If no subqueries are generated, then there is no transformed query, and the best plan for the untransformed query is used, regardless of the hint.

See Also:

- Oracle Database Data Warehousing Guide for a full discussion of star transformation.
- Oracle Database Reference for more information on the STAR_TRANSFORMATION_ENABLED initialization parameter.

2.6.4.92 STATEMENT_QUEUING Hint

The NO_STATEMENT_QUEUING hint influences whether or not a statement is queued with parallel statement queuing.

When PARALLEL_DEGREE_POLICY is not set to AUTO, this hint enables a statement to be considered for parallel statement queuing, but to run only when enough parallel processes are available to run at the requested DOP. The number of available parallel execution servers, before queuing is enabled, is equal to the difference between the number of parallel execution servers in use and the maximum number allowed in the system, which is defined by the PARALLEL_SERVERS_TARGET initialization parameter.

For example:

SELECT /*+ STATEMENT_QUEUING */ emp.last_name, dpt.department_name
  FROM employees emp, departments dpt
  WHERE emp.department_id = dpt.department_id;

See Also:

NO_STATEMENT_QUEUING Hint

2.6.4.93 UNNEST Hint
The **UNNEST** hint instructs the optimizer to unnest and merge the body of the subquery into the body of the query block that contains it, allowing the optimizer to consider them together when evaluating access paths and joins.

Before a subquery is unnested, the optimizer first verifies whether the statement is valid. The statement must then pass heuristic and query optimization tests. The **UNNEST** hint instructs the optimizer to check the subquery block for validity only. If the subquery block is valid, then subquery unnesting is enabled without checking the heuristics or costs.

### See Also:
- **Collection Unnesting: Examples** for more information on unnesting nested subqueries and the conditions that make a subquery block valid
- **Oracle Database SQL Tuning Guide** for additional information on subquery unnesting

### 2.6.4.94 USE_BAND Hint

```sql
/*+ USE_BAND (queryblock) */
```

The **USE_BAND** hint instructs the optimizer to join each specified table with another row source using a band join. For example:

```sql
SELECT /*+ USE_BAND(e1 e2) */
  e1.last_name
|| ' has salary between 100 less and 100 more than ' ||
  e2.last_name AS "SALARY COMPARISON"
FROM employees e1, employees e2
WHERE e1.salary BETWEEN e2.salary - 100 AND e2.salary + 100;
```

### 2.6.4.95 USE_CONCAT Hint

```sql
/*+ USE_CONCAT */
```

The **USE_CONCAT** hint instructs the optimizer to transform combined OR-conditions in the **WHERE** clause of a query into a compound query using the **UNION ALL** set operator. Without this hint, this transformation occurs only if the cost of the query using the concatenations is cheaper than the cost without them. The **USE_CONCAT** hint overrides the cost consideration. For example:
SELECT /*+ USE_CONCAT */ *
FROM employees e
WHERE manager_id = 108
  OR department_id = 110;

See Also:
The NO_EXPAND Hint, which is the opposite of this hint

2.6.4.96 USE_CUBE Hint

(See Specifying a Query Block in a Hint, tablespec::=)
When the right-hand side of the join is a cube, the USE_CUBE hint instructs the optimizer
to join each specified table with another row source using a cube join. If the optimizer
decides not to use the cube join based on statistical analysis, then you can use
USE_CUBE to override that decision.

2.6.4.97 USE_HASH Hint

(See Specifying a Query Block in a Hint, tablespec::=)
The USE_HASH hint instructs the optimizer to join each specified table with another row
source using a hash join. For example:

SELECT /*+ USE_HASH(l h) */ *
FROM orders h, order_items l
WHERE l.order_id = h.order_id
  AND l.order_id > 2400;

2.6.4.98 USE_MERGE Hint

(See Specifying a Query Block in a Hint, tablespec::=)
The USE_MERGE hint instructs the optimizer to join each specified table with another row
source using a sort-merge join. For example:
SELECT /*+ USE_MERGE(employees departments) */ *  
FROM employees, departments  
WHERE employees.department_id = departments.department_id;

Use of the USE_NL and USE_MERGE hints is recommended with the LEADING and ORDERED 
hints. The optimizer uses those hints when the referenced table is forced to be the 
inner table of a join. The hints are ignored if the referenced table is the outer table.

2.6.4.99 USE_NL Hint

The USE_NL hint instructs the optimizer to join each specified table to another row 
source with a nested loops join, using the specified table as the inner table.

Use of the USE_NL and USE_MERGE hints is recommended with the LEADING and ORDERED 
hints. The optimizer uses those hints when the referenced table is forced to be the 
inner table of a join. The hints are ignored if the referenced table is the outer table.

In the following example, where a nested loop is forced through a hint, orders is 
accessed through a full table scan and the filter condition l.order_id = h.order_id 
is applied to every row. For every row that meets the filter condition, order_items is 
accessed through the index order_id.

SELECT /*+ USE_NL(l h) */ h.customer_id, l.unit_price * l.quantity  
FROM orders h, order_items l  
WHERE l.order_id = h.order_id;

Adding an INDEX hint to the query could avoid the full table scan on orders, resulting in 
an execution plan similar to one used on larger systems, even though it might not be 
particularly efficient here.

2.6.4.100 USE_NL_WITH_INDEX Hint

The USE_NL_WITH_INDEX hint instructs the optimizer to join the specified table to 
another row source with a nested loops join using the specified table as the inner 
table. For example:

SELECT /*+ USE_NL_WITH_INDEX(l item_product_ix) */ *  
FROM orders h, order_items l
WHERE l.order_id = h.order_id
AND l.order_id > 2400;

The following conditions apply:

• If no index is specified, then the optimizer must be able to use some index with at least one join predicate as the index key.

• If an index is specified, then the optimizer must be able to use that index with at least one join predicate as the index key.

2.7 Database Objects

Oracle Database recognizes objects that are associated with a particular schema and objects that are not associated with any particular schema, as described in the sections that follow.

2.7.1 Schema Objects

A schema is a collection of logical structures of data, or schema objects. A schema is owned by a database user and has the same name as that user. Each user owns a single schema. Schema objects can be created and manipulated with SQL and include the following types of objects:

- Analytic views
- Attribute dimensions
- Clusters
- Constraints
- Database links
- Database triggers
- Dimensions
- External procedure libraries
- Hierarchies
- Index-organized tables
- Indexes
- Indextypes
- Java classes
- Java resources
- Java sources
- Join groups
- Materialized views
- Materialized view logs
- Mining models
- Object tables
- Object types
- Object views
- Operators
- Packages
- Sequences
- Stored functions
- Stored procedures
- Synonyms
2.7.2 Nonschema Objects

Other types of objects are also stored in the database and can be created and manipulated with SQL but are not contained in a schema:

- Contexts
- Directories
- Editions
- Flashback archives
- Lockdown profiles
- Profiles
- Restore points
- Roles
- Rollback segments
- Tablespaces
- Tablespace sets
- Unified audit policies
- Users

In this reference, each type of object is described in the section devoted to the statement that creates the database object. These statements begin with the keyword `CREATE`. For example, for the definition of a cluster, see `CREATE CLUSTER`.

See Also:

Oracle Database Concepts for an overview of database objects

You must provide names for most types of database objects when you create them. These names must follow the rules listed in the sections that follow.

2.8 Database Object Names and Qualifiers

Some database objects are made up of parts that you can or must name, such as the columns in a table or view, index and table partitions and subpartitions, integrity constraints on a table, and objects that are stored within a package, including procedures and stored functions. This section provides:

- Rules for naming database objects and database object location qualifiers
- Guidelines for naming database objects and qualifiers
Note:
Oracle uses system-generated names beginning with "SYS_" for implicitly generated database objects and subobjects, and names beginning with "ORA_" for some Oracle-supplied objects. Oracle discourages you from using these prefixes in the names you explicitly provide to your database objects and subobjects to avoid possible conflict in name resolution.

2.8.1 Database Object Naming Rules

Every database object has a name. In a SQL statement, you represent the name of an object with a quoted identifier or a nonquoted identifier.

• A quoted identifier begins and ends with double quotation marks ("."). If you name a schema object using a quoted identifier, then you must use the double quotation marks whenever you refer to that object.

• A nonquoted identifier is not surrounded by any punctuation.

You can use either quoted or nonquoted identifiers to name any database object. However, database names, global database names, database link names, disk group names, and pluggable database (PDB) names are always case insensitive and are stored as uppercase. If you specify such names as quoted identifiers, then the quotation marks are silently ignored.

See Also:
CREATE USER for additional rules for naming users and passwords

Note:
Oracle does not recommend using quoted identifiers for database object names. These quoted identifiers are accepted by SQL*Plus, but they may not be valid when using other tools that manage database objects.

The following list of rules applies to both quoted and nonquoted identifiers unless otherwise indicated:

1. The maximum length of identifier names depends on the value of the COMPATIBLE initialization parameter.

• If COMPATIBLE is set to a value of 12.2 or higher, then names must be from 1 to 128 bytes long with these exceptions:
  – Names of databases are limited to 8 bytes.
  – Names of disk groups, pluggable databases (PDBs), rollback segments, tablespaces, and tablespace sets are limited to 30 bytes.

If an identifier includes multiple parts separated by periods, then each attribute can be up to 128 bytes long. Each period separator, as well as any
surrounding double quotation marks, counts as one byte. For example, suppose you identify a column like this:

"schema"."table"."column"

The schema name can be 128 bytes, the table name can be 128 bytes, and the column name can be 128 bytes. Each of the quotation marks and periods is a single-byte character, so the total length of the identifier in this example can be up to 392 bytes.

- **If COMPATIBLE is set to a value lower than 12.2**, then names must be from 1 to 30 bytes long with these exceptions:
  - Names of databases are limited to 8 bytes.
  - Names of database links can be as long as 128 bytes.

If an identifier includes multiple parts separated by periods, then each attribute can be up to 30 bytes long. Each period separator, as well as any surrounding double quotation marks, counts as one byte. For example, suppose you identify a column like this:

"schema"."table"."column"

The schema name can be 30 bytes, the table name can be 30 bytes, and the column name can be 30 bytes. Each of the quotation marks and periods is a single-byte character, so the total length of the identifier in this example can be up to 98 bytes.

2. Nonquoted identifiers cannot be Oracle SQL reserved words. Quoted identifiers can be reserved words, although this is not recommended.

Depending on the Oracle product you plan to use to access a database object, names might be further restricted by other product-specific reserved words.

---

**Note:**

The reserved word **ROWID** is an exception to this rule. You cannot use the uppercase word **ROWID**, either quoted or nonquoted, as a column name. However, you can use the uppercase word as a quoted identifier that is not a column name, and you can use the word with one or more lowercase letters (for example, "Rowid" or "rowid") as any quoted identifier, including a column name.

---

**See Also:**

- [Oracle SQL Reserved Words](#) for a listing of all Oracle SQL reserved words
- The manual for a specific product, such as [Oracle Database PL/SQL Language Reference](#), for a list of the reserved words of that product

3. The Oracle SQL language contains other words that have special meanings. These words include data types, schema names, function names, the dummy system table **DUAL**, and keywords (the uppercase words in SQL statements, such
as `DIMENSION`, `SEGMENT`, `ALLOCATE`, `DISABLE`, and so forth). These words are not reserved. However, Oracle uses them internally in specific ways. Therefore, if you use these words as names for objects and object parts, then your SQL statements may be more difficult to read and may lead to unpredictable results.

In particular, do not use words beginning with `SYS_` or `ORA_` as schema object names, and do not use the names of SQL built-in functions for the names of schema objects or user-defined functions.

See Also:

- Oracle SQL Keywords for information how to obtain a list of keywords
- Data Types, About SQL Functions, and Selecting from the DUAL Table

4. You should use characters from the ASCII repertoire in database names, global database names, and database link names, because these characters provide optimal compatibility across different platforms and operating systems. You must use only characters from the ASCII repertoire in names of common users and common roles in a multitenant container database (CDB).

5. You can include multibyte characters in passwords.

6. Nonquoted identifiers must begin with an alphabetic character from your database character set. Quoted identifiers can begin with any character.

7. Nonquoted identifiers can only contain alphanumeric characters from your database character set and the underscore (_). Database links can contain periods (.) and “at” signs (@).

   Quoted identifiers can contain any characters and punctuations marks as well as spaces. However, neither quoted nor nonquoted identifiers can contain double quotation marks or the null character (\0).

8. Within a namespace, no two objects can have the same name.

The following schema objects share one namespace:

- Packages
- Private synonyms
- Sequences
- Stand-alone procedures
- Stand-alone stored functions
- Tables
- User-defined operators
- User-defined types
- Views

Each of the following schema objects has its own namespace:

- Clusters
- Constraints
• Database triggers
• Dimensions
• Indexes
• Materialized views (When you create a materialized view, the database creates an internal table of the same name. This table has the same namespace as the other tables in the schema. Therefore, a schema cannot contain a table and a materialized view of the same name.)
• Private database links

Because tables and sequences are in the same namespace, a table and a sequence in the same schema cannot have the same name. However, tables and indexes are in different namespaces. Therefore, a table and an index in the same schema can have the same name.

Each schema in the database has its own namespaces for the objects it contains. This means, for example, that two tables in different schemas are in different namespaces and can have the same name.

Each of the following nonschema objects also has its own namespace:

• Editions
• Parameter files (PFILEs) and server parameter files (SPFILEs)
• Profiles
• Public database links
• Public synonyms
• Tablespaces
• User roles

Because the objects in these namespaces are not contained in schemas, these namespaces span the entire database.

9. Nonquoted identifiers are not case sensitive. Oracle interprets them as uppercase. Quoted identifiers are case sensitive.

By enclosing names in double quotation marks, you can give the following names to different objects in the same namespace:

"employees"
"Employees"
"EMPLOYEES"

Note that Oracle interprets the following names the same, so they cannot be used for different objects in the same namespace:

employees
EMPLOYEES
"EMPLOYEES"

10. When Oracle stores or compares identifiers in uppercase, the uppercase form of each character in the identifiers is determined by applying the uppercasing rules of the database character set. Language-specific rules determined by the session setting NLS_SORT are not considered. This behavior corresponds to applying the SQL function UPPER to the identifier rather than the function NLS_UPPER.

The database character set uppercasing rules can yield results that are incorrect when viewed as being in a certain natural language. For example, small letter
sharp s ("ß"), used in German, does not have an uppercase form according to the database character set uppercasing rules. It is not modified when an identifier is converted into uppercase, while the expected uppercase form in German is the sequence of two characters capital letter S ("SS"). Similarly, the uppercase form of small letter i, according to the database character set uppercasing rules, is capital letter I. However, the expected uppercase form in Turkish and Azerbaijani is capital letter I with dot above.

The database character set uppercasing rules ensure that identifiers are interpreted the same in any linguistic configuration of a session. If you want an identifier to look correctly in a certain natural language, then you can quote it to preserve the lowercase form or you can use the linguistically correct uppercase form whenever you use that identifier.

11. Columns in the same table or view cannot have the same name. However, columns in different tables or views can have the same name.

12. Procedures or functions contained in the same package can have the same name, if their arguments are not of the same number and data types. Creating multiple procedures or functions with the same name in the same package with different arguments is called overloading the procedure or function.

2.8.2 Schema Object Naming Examples

The following examples are valid schema object names:

```
last_name
horse
hr.hire_date
"EVEN THIS & THAT!"
a_very_long_and_valid_name
```

All of these examples adhere to the rules listed in Database Object Naming Rules.

2.8.3 Schema Object Naming Guidelines

Here are several helpful guidelines for naming objects and their parts:

- Use full, descriptive, pronounceable names (or well-known abbreviations).
- Use consistent naming rules.
- Use the same name to describe the same entity or attribute across tables.

When naming objects, balance the objective of keeping names short and easy to use with the objective of making names as descriptive as possible. When in doubt, choose the more descriptive name, because the objects in the database may be used by many people over a period of time. Your counterpart ten years from now may have difficulty understanding a table column with a name like `pmdd` instead of `payment_due_date`.

Using consistent naming rules helps users understand the part that each table plays in your application. One such rule might be to begin the names of all tables belonging to the `FINANCE` application with `fin_`.

Use the same names to describe the same things across tables. For example, the department number columns of the sample `employees` and `departments` tables are both named `department_id`. 
2.9 Syntax for Schema Objects and Parts in SQL Statements

This section tells you how to refer to schema objects and their parts in the context of a SQL statement. This section shows you:

- The general syntax for referring to an object
- How Oracle resolves a reference to an object
- How to refer to objects in schemas other than your own
- How to refer to objects in remote databases
- How to refer to table and index partitions and subpartitions

The following diagram shows the general syntax for referring to an object or a part:

```
database_object_or_part ::= 
```

where:

- `object` is the name of the object.
- `schema` is the schema containing the object. The schema qualifier lets you refer to an object in a schema other than your own. You must be granted privileges to refer to objects in other schemas. If you omit `schema`, then Oracle assumes that you are referring to an object in your own schema.

Only schema objects can be qualified with `schema`. Schema objects are shown with list item 8. Nonschema objects, also shown with list item 8, cannot be qualified with `schema` because they are not schema objects. An exception is public synonyms, which can optionally be qualified with "PUBLIC". The quotation marks are required.

- `part` is a part of the object. This identifier lets you refer to a part of a schema object, such as a column or a partition of a table. Not all types of objects have parts.
- `dblink` applies only when you are using the Oracle Database distributed functionality. This is the name of the database containing the object. The `dblink` qualifier lets you refer to an object in a database other than your local database. If you omit `dblink`, then Oracle assumes that you are referring to an object in your local database. Not all SQL statements allow you to access objects on remote databases.

You can include spaces around the periods separating the components of the reference to the object, but it is conventional to omit them.
2.9.1 How Oracle Database Resolves Schema Object References

When you refer to an object in a SQL statement, Oracle considers the context of the SQL statement and locates the object in the appropriate namespace. After locating the object, Oracle performs the operation specified by the statement on the object. If the named object cannot be found in the appropriate namespace, then Oracle returns an error.

The following example illustrates how Oracle resolves references to objects within SQL statements. Consider this statement that adds a row of data to a table identified by the name `departments`:

```sql
INSERT INTO departments
    VALUES (280, 'ENTERTAINMENT_CLERK', 206, 1700);
```

Based on the context of the statement, Oracle determines that `departments` can be:

- A table in your own schema
- A view in your own schema
- A private synonym for a table or view
- A public synonym

Oracle always attempts to resolve an object reference within the namespaces in your own schema before considering namespaces outside your schema. In this example, Oracle attempts to resolve the name `departments` as follows:

1. First, Oracle attempts to locate the object in the namespace in your own schema containing tables, views, and private synonyms. If the object is a private synonym, then Oracle locates the object for which the synonym stands. This object could be in your own schema, another schema, or on another database. The object could also be another synonym, in which case Oracle locates the object for which this synonym stands.

2. If the object is in the namespace, then Oracle attempts to perform the statement on the object. In this example, Oracle attempts to add the row of data to `departments`. If the object is not of the correct type for the statement, then Oracle returns an error. In this example, `departments` must be a table, view, or a private synonym resolving to a table or view. If `departments` is a sequence, then Oracle returns an error.

3. If the object is not in any namespace searched in thus far, then Oracle searches the namespace containing public synonyms. If the object is in that namespace, then Oracle attempts to perform the statement on it. If the object is not of the correct type for the statement, then Oracle returns an error. In this example, if `departments` is a public synonym for a sequence, then Oracle returns an error.

If a public synonym has any dependent tables or user-defined types, then you cannot create an object with the same name as the synonym in the same schema as the dependent objects.

If a synonym does not have any dependent tables or user-defined types, then you can create an object with the same name in the same schema as the dependent objects. Oracle invalidates any dependent objects and attempts to revalidate them when they are next accessed.
2.9.2 References to Objects in Other Schemas

To refer to objects in schemas other than your own, prefix the object name with the schema name:

```
schema.object
```

For example, this statement drops the `employees` table in the sample schema `hr`:

```
DROP TABLE hr.employees;
```

2.9.3 References to Objects in Remote Databases

To refer to objects in databases other than your local database, follow the object name with the name of the database link to that database. A database link is a schema object that causes Oracle to connect to a remote database to access an object there. This section tells you:

- How to create database links
- How to use database links in your SQL statements

2.9.3.1 Creating Database Links

You create a database link with the statement `CREATE DATABASE LINK`. The statement lets you specify this information about the database link:

- The name of the database link
- The database connect string to access the remote database
- The username and password to connect to the remote database

Oracle stores this information in the data dictionary.

2.9.3.1.1 Database Link Names

When you create a database link, you must specify its name. Database link names are different from names of other types of objects. They can be as long as 128 bytes and can contain periods (.) and the "at" sign (@).

The name that you give to a database link must correspond to the name of the database to which the database link refers and the location of that database in the hierarchy of database names. The following syntax diagram shows the form of the name of a database link:
\texttt{dblink}::=

\begin{center}
\begin{tikzpicture}
  \node (database) at (0,0) {$\text{database}$};
  \node (domain) at (2,0) {$\text{domain}$};
  \node (connection_qualifier) at (3,0) {$\text{connection\_qualifier}$};
  \draw[->] (database) to node[midway] {$-$} (domain);
  \draw[->] (domain) to node[midway] {$@$} (connection_qualifier);
\end{tikzpicture}
\end{center}

where:

- \texttt{database} should specify the name portion of the global name of the remote database to which the database link connects. This global name is stored in the data dictionary of the remote database. You can see this name in the \texttt{GLOBAL\_NAME} data dictionary view.

- \texttt{domain} should specify the domain portion of the global name of the remote database to which the database link connects. If you omit \texttt{domain} from the name of a database link, then Oracle qualifies the database link name with the domain of your local database as it currently exists in the data dictionary.

- \texttt{connection\_qualifier} lets you further qualify a database link. Using connection qualifiers, you can create multiple database links to the same database. For example, you can use connection qualifiers to create multiple database links to different instances of the Oracle Real Application Clusters that access the same database.

\textbf{See Also:}

\begin{itemize}
  \item \textit{Oracle Database Administrator's Guide} for more information on connection qualifiers
\end{itemize}

The combination \texttt{database.domain} is sometimes called the \textbf{service name}.

\textbf{See Also:}

\begin{itemize}
  \item \textit{Oracle Database Net Services Administrator's Guide}
\end{itemize}

2.9.3.1.2 Username and Password

Oracle uses the username and password to connect to the remote database. The username and password for a database link are optional.

2.9.3.1.3 Database Connect String

The database connect string is the specification used by Oracle Net to access the remote database. For information on writing database connect strings, see the Oracle Net documentation for your specific network protocol. The database connect string for a database link is optional.
2.9.3.2 References to Database Links

Database links are available only if you are using Oracle distributed functionality. When you issue a SQL statement that contains a database link, you can specify the database link name in one of these forms:

- The complete database link name as stored in the data dictionary, including the `database`, `domain`, and optional `connection_qualifier` components.

- The partial database link name is the `database` and optional `connection_qualifier` components, but not the `domain` component.

Oracle performs these tasks before connecting to the remote database:

1. If the database link name specified in the statement is partial, then Oracle expands the name to contain the domain of the local database as found in the global database name stored in the data dictionary. (You can see the current global database name in the `GLOBAL_NAME` data dictionary view.)

2. Oracle first searches for a private database link in your own schema with the same name as the database link in the statement. Then, if necessary, it searches for a public database link with the same name.
   - Oracle always determines the username and password from the first matching database link (either private or public). If the first matching database link has an associated username and password, then Oracle uses it. If it does not have an associated username and password, then Oracle uses your current username and password.
   - If the first matching database link has an associated database string, then Oracle uses it. Otherwise Oracle searches for the next matching (public) database link. If no matching database link is found, or if no matching link has an associated database string, then Oracle returns an error.

3. Oracle uses the database string to access the remote database. After accessing the remote database, if the value of the `GLOBAL_NAMES` parameter is `true`, then Oracle verifies that the `database.domain` portion of the database link name matches the complete global name of the remote database. If this condition is true, then Oracle proceeds with the connection, using the username and password chosen in Step 2. If not, Oracle returns an error.

4. If the connection using the database string, username, and password is successful, then Oracle attempts to access the specified object on the remote database using the rules for resolving object references and referring to objects in other schemas discussed earlier in this section.

You can disable the requirement that the `database.domain` portion of the database link name must match the complete global name of the remote database by setting to `FALSE` the initialization parameter `GLOBAL_NAMES` or the `GLOBAL_NAMES` parameter of the `ALTER SYSTEM` or `ALTER SESSION` statement.

See Also:

*Oracle Database Administrator’s Guide* for more information on remote name resolution.
2.9.4 References to Partitioned Tables and Indexes

Tables and indexes can be partitioned. When partitioned, these schema objects consist of a number of parts called partitions, all of which have the same logical attributes. For example, all partitions in a table share the same column and constraint definitions, and all partitions in an index share the same index columns.

Partition-extended and subpartition-extended names let you perform some partition-level and subpartition-level operations, such as deleting all rows from a partition or subpartition, on only one partition or subpartition. Without extended names, such operations would require that you specify a predicate (WHERE clause). For range- and list-partitioned tables, trying to phrase a partition-level operation with a predicate can be cumbersome, especially when the range partitioning key uses more than one column. For hash partitions and subpartitions, using a predicate is more difficult still, because these partitions and subpartitions are based on a system-defined hash function.

Partition-extended names let you use partitions as if they were tables. An advantage of this method, which is most useful for range-partitioned tables, is that you can build partition-level access control mechanisms by granting (or revoking) privileges on these views to (or from) other users or roles. To use a partition as a table, create a view by selecting data from a single partition, and then use the view as a table.

Syntax

You can specify partition-extended or subpartition-extended table names in any SQL statement in which the partition_extended_name or subpartition_extended_name element appears in the syntax.

\[
\text{partition\_extended\_name} ::= \\
\text{PARTITION} \text{partition} \text{PARTITION FOR}\ (\text{partition\_key\_value})
\]

\[
\text{subpartition\_extended\_name} ::= \\
\text{SUBPARTITION} \text{subpartition} \text{SUBPARTITION FOR}\ (\text{subpartition\_key\_value})
\]

The DML statements INSERT, UPDATE, and DELETE and the ANALYZE statement require parentheses around the partition or subpartition name. This small distinction is reflected in the partition_extension_clause:
partition_extension_clause ::= 

\[
\begin{aligned}
\text{PARTITION} & \to \text{partition} \to \text{FOR} \to \text{partition_key_value} \\
\text{SUBPARTITION} & \to \text{subpartition} \to \text{FOR} \to \text{subpartition_key_value}
\end{aligned}
\]

In partition_extended_name, subpartition_extended_name, and
partition_extension_clause, the PARTITION FOR and SUBPARTITION FOR clauses let you refer to a partition without using its name. They are valid with any type of partitioning and are especially useful for interval partitions. Interval partitions are created automatically as needed when data is inserted into a table.

For the respective partition_key_value or subpartition_key_value, specify one value for each partitioning key column. For multicolumn partitioning keys, specify one value for each partitioning key. For composite partitions, specify one value for each partitioning key, followed by one value for each subpartitioning key. All partitioning key values are comma separated. For interval partitions, you can specify only one partition_key_value, and it must be a valid NUMBER or datetime value. Your SQL statement will operate on the partition or subpartitions that contain the values you specify.

See Also:
The CREATE TABLE INTERVAL Clause for more information on interval partitions

Restrictions on Extended Names
Currently, the use of partition-extended and subpartition-extended table names has the following restrictions:

- No remote tables: A partition-extended or subpartition-extended table name cannot contain a database link (dblink) or a synonym that translates to a table with a dblink. To use remote partitions and subpartitions, create a view at the remote site that uses the extended table name syntax and then refer to the remote view.
- No synonyms: A partition or subpartition extension must be specified with a base table. You cannot use synonyms, views, or any other objects.
- The PARTITION FOR and SUBPARTITION FOR clauses are not valid for DDL operations on views.
- In the PARTITION FOR and SUBPARTITION FOR clauses, you cannot specify the keywords DEFAULT or MAXVALUE or a bind variable for the partition_key_value or subpartition_key_value.
• In the PARTITION and SUBPARTITION clauses, you cannot specify a bind variable for the partition or subpartition name.

Example

In the following statement, sales is a partitioned table with partition sales_q1_2000. You can create a view of the single partition sales_q1_2000, and then use it as if it were a table. This example deletes rows from the partition.

```
CREATE VIEW Q1_2000_sales AS
    SELECT *
    FROM sales PARTITION (SALES_Q1_2000);

DELETE FROM Q1_2000_sales
    WHERE amount_sold < 0;
```

2.9.5 References to Object Type Attributes and Methods

To refer to object type attributes or methods in a SQL statement, you must fully qualify the reference with a table alias. Consider the following example from the sample schema oe, which contains a type cust_address_typ and a table customers with a cust_address column based on the cust_address_typ:

```
CREATE TYPE cust_address_typ
    OID '82A4AF6A4CD1656DE034080020E0EE3D'
    AS OBJECT
        (street_address    VARCHAR2(40),
        postal_code       VARCHAR2(10),
        city              VARCHAR2(30),
        state_province    VARCHAR2(10),
        country_id        CHAR(2));
/
CREATE TABLE customers
    (customer_id        NUMBER(6),
    cust_first_name    VARCHAR2(20) CONSTRAINT cust_fname_nn NOT NULL,
    cust_last_name     VARCHAR2(20) CONSTRAINT cust_lname_nn NOT NULL,
    cust_address       cust_address_typ,
    . . .

In a SQL statement, reference to the postal_code attribute must be fully qualified using a table alias, as illustrated in the following example:

```
SELECT c.cust_address.postal_code
    FROM customers c;
```

```
UPDATE customers c
    SET c.cust_address.postal_code = '14621-2604'
    WHERE c.cust_address.city = 'Rochester'
        AND c.cust_address.state_province = 'NY';
```

To reference a member method that does not accept arguments, you must provide empty parentheses. For example, the sample schema oe contains an object table categories_tab, based on catalog_typ, which contains the member function getCatalogName. In order to call this method in a SQL statement, you must provide empty parentheses as shown in this example:

```
SELECT TREAT(VALUE(c) AS catalog_typ).getCatalogName() "Catalog Type"
    FROM categories_tab c
    WHERE category_id = 90;
```
Catalog Type

------------------------------------
online catalog
Pseudocolumns

A pseudocolumn behaves like a table column, but is not actually stored in the table. You can select from pseudocolumns, but you cannot insert, update, or delete their values. A pseudocolumn is also similar to a function without arguments (refer to Functions). However, functions without arguments typically return the same value for every row in the result set, whereas pseudocolumns typically return a different value for each row.

This chapter contains the following sections:

• Hierarchical Query Pseudocolumns
• Sequence Pseudocolumns
• Version Query Pseudocolumns
• COLUMN_VALUE Pseudocolumn
• OBJECT_ID Pseudocolumn
• OBJECT_VALUE Pseudocolumn
• ORA_ROWSCN Pseudocolumn
• ROWID Pseudocolumn
• ROWNUM Pseudocolumn
• XMLDATA Pseudocolumn

3.1 Hierarchical Query Pseudocolumns

The hierarchical query pseudocolumns are valid only in hierarchical queries. The hierarchical query pseudocolumns are:

• CONNECT_BY_ISCYCLE Pseudocolumn
• CONNECT_BY_ISLEAF Pseudocolumn
• LEVEL Pseudocolumn

To define a hierarchical relationship in a query, you must use the CONNECT BY clause.

3.1.1 CONNECT_BY_ISCYCLE Pseudocolumn

The CONNECT_BY_ISCYCLE pseudocolumn returns 1 if the current row has a child which is also its ancestor. Otherwise it returns 0.

You can specify CONNECT_BY_ISCYCLE only if you have specified the NOCYCLE parameter of the CONNECT BY clause. NOCYCLE enables Oracle to return the results of a query that would otherwise fail because of a CONNECT BY loop in the data.
3.1.2 CONNECT_BY_ISLEAF Pseudocolumn

The CONNECT_BY_ISLEAF pseudocolumn returns 1 if the current row is a leaf of the tree defined by the CONNECT BY condition. Otherwise it returns 0. This information indicates whether a given row can be further expanded to show more of the hierarchy.

CONNECT_BY_ISLEAF Example

The following example shows the first three levels of the hr.employees table, indicating for each row whether it is a leaf row (indicated by 1 in the IsLeaf column) or whether it has child rows (indicated by 0 in the IsLeaf column):

```sql
SELECT last_name "Employee", CONNECT_BY_ISLEAF "IsLeaf",
       LEVEL, SYS_CONNECT_BY_PATH(last_name, '/') "Path"
FROM employees
WHERE LEVEL <= 3 AND department_id = 80
START WITH employee_id = 100
CONNECT BY PRIOR employee_id = manager_id AND LEVEL <= 4
ORDER BY "Employee", "IsLeaf";
```

3.1.3 LEVEL Pseudocolumn

For each row returned by a hierarchical query, the LEVEL pseudocolumn returns 1 for a root row, 2 for a child of a root, and so on. A root row is the highest row within an inverted tree. A child row is any nonroot row. A parent row is any row that has children. A leaf row is any row without children. Figure 3-1 shows the nodes of an inverted tree with their LEVEL values.
3.2 Sequence Pseudocolumns

A **sequence** is a schema object that can generate unique sequential values. These values are often used for primary and unique keys. You can refer to sequence values in SQL statements with these pseudocolumns:

- **CURRVAL**: Returns the current value of a sequence
- **NEXTVAL**: Increments the sequence and returns the next value

You must qualify **CURRVAL** and **NEXTVAL** with the name of the sequence:

```
sequence.CURRVAL
sequence.NEXTVAL
```

To refer to the current or next value of a sequence in the schema of another user, you must have been granted either **SELECT object privilege on the sequence** or **SELECT ANY SEQUENCE system privilege**, and you must qualify the sequence with the schema containing it:

```
schema.sequence.CURRVAL
schema.sequence.NEXTVAL
```

To refer to the value of a sequence on a remote database, you must qualify the sequence with a complete or partial name of a database link:

```
schema.sequence.CURRVAL@dblink
schema.sequence.NEXTVAL@dblink
```

A sequence can be accessed by many users concurrently with no waiting or locking.
3.2.1 Where to Use Sequence Values

You can use CURRVAL and NEXTVAL in the following locations:

- The select list of a SELECT statement that is not contained in a subquery, materialized view, or view
- The select list of a subquery in an INSERT statement
- The VALUES clause of an INSERT statement
- The SET clause of an UPDATE statement

Restrictions on Sequence Values

You cannot use CURRVAL and NEXTVAL in the following constructs:

- A subquery in a DELETE, SELECT, or UPDATE statement
- A query of a view or of a materialized view
- A SELECT statement with the DISTINCT operator
- A SELECT statement with a GROUP BY clause or ORDER BY clause
- A SELECT statement that is combined with another SELECT statement with the UNION, INTERSECT, or MINUS set operator
- The WHERE clause of a SELECT statement
- The condition of a CHECK constraint

Within a single SQL statement that uses CURRVAL or NEXTVAL, all referenced LONG columns, updated tables, and locked tables must be located on the same database.

3.2.2 How to Use Sequence Values

When you create a sequence, you can define its initial value and the increment between its values. The first reference to NEXTVAL returns the initial value of the sequence. Subsequent references to NEXTVAL increment the sequence value by the defined increment and return the new value. Any reference to CURRVAL always returns the current value of the sequence, which is the value returned by the last reference to NEXTVAL.

Before you use CURRVAL for a sequence in your session, you must first initialize the sequence with NEXTVAL. Refer to CREATE SEQUENCE for information on sequences.

Within a single SQL statement containing a reference to NEXTVAL, Oracle increments the sequence once:

- For each row returned by the outer query block of a SELECT statement. Such a query block can appear in the following places:
A top-level SELECT statement

An INSERT ... SELECT statement (either single-table or multitable). For a multitable insert, the reference to NEXTVAL must appear in the VALUES clause, and the sequence is updated once for each row returned by the subquery, even though NEXTVAL may be referenced in multiple branches of the multitable insert.

A CREATE TABLE ... AS SELECT statement

A CREATE MATERIALIZED VIEW ... AS SELECT statement

For each row updated in an UPDATE statement

For each INSERT statement containing a VALUES clause

For each INSERT ... [ALL | FIRST] statement (multitable insert). A multitable insert is considered a single SQL statement. Therefore, a reference to the NEXTVAL of a sequence will increase the sequence only once for each input record coming from the SELECT portion of the statement. If NEXTVAL is specified more than once in any part of the INSERT ... [ALL | FIRST] statement, then the value will be the same for all insert branches, regardless of how often a given record might be inserted.

For each row merged by a MERGE statement. The reference to NEXTVAL can appear in the merge_insert_clause or the merge_update_clause or both. The NEXTVALUE value is incremented for each row updated and for each row inserted, even if the sequence number is not actually used in the update or insert operation. If NEXTVAL is specified more than once in any of these locations, then the sequence is incremented once for each row and returns the same value for all occurrences of NEXTVAL for that row.

For each input row in a multitable INSERT ALL statement. NEXTVAL is incremented once for each row returned by the subquery, regardless of how many occurrences of the insert_into_clause map to each row.

If any of these locations contains more than one reference to NEXTVAL, then Oracle increments the sequence once and returns the same value for all occurrences of NEXTVAL.

If any of these locations contains references to both CURRVAL and NEXTVAL, then Oracle increments the sequence and returns the same value for both CURRVAL and NEXTVAL.

Finding the next value of a sequence: Example

This example selects the next value of the employee sequence in the sample schema hr:

```
SELECT employees_seq.nextval
FROM DUAL;
```

Inserting sequence values into a table: Example

This example increments the employee sequence and uses its value for a new employee inserted into the sample table hr.employees:

```
INSERT INTO employees
VALUES (employees_seq.nextval, 'John', 'Doe', 'jdoe', '555-1212',
TO_DATE(SYSDATE), 'PU_CLERK', 2500, null, null, 30);
```
Reusing the current value of a sequence: Example

This example adds a new order with the next order number to the master order table. It then adds suborders with this number to the detail order table:

```sql
INSERT INTO orders (order_id, order_date, customer_id)
VALUES (orders_seq.nextval, TO_DATE(SYSDATE), 106);

INSERT INTO order_items (order_id, line_item_id, product_id)
VALUES (orders_seq.currval, 1, 2359);

INSERT INTO order_items (order_id, line_item_id, product_id)
VALUES (orders_seq.currval, 2, 3290);

INSERT INTO order_items (order_id, line_item_id, product_id)
VALUES (orders_seq.currval, 3, 2381);
```

### 3.3 Version Query Pseudocolumns

The version query pseudocolumns are valid only in Oracle Flashback Version Query, which is a form of Oracle Flashback Query. The version query pseudocolumns are:

- **VERSIONS_STARTSCN** and **VERSIONS_STARTTIME**: Starting System Change Number (SCN) or TIMESTAMP when the row version was created. This pseudocolumn identifies the time when the data first had the values reflected in the row version. Use this pseudocolumn to identify the past target time for Oracle Flashback Table or Oracle Flashback Query. If this pseudocolumn is `NULL`, then the row version was created before start.

- **VERSIONS_ENDSCN** and **VERSIONS_ENDTIME**: SCN or TIMESTAMP when the row version expired. If the pseudocolumn is `NULL`, then either the row version was current at the time of the query or the row corresponds to a DELETE operation.

- **VERSIONS_XID**: Identifier (a RAW number) of the transaction that created the row version.

- **VERSIONS_OPERATION**: Operation performed by the transaction: `I` for insertion, `D` for deletion, or `U` for update. The version is that of the row that was inserted, deleted, or updated; that is, the row after an INSERT operation, the row before a DELETE operation, or the row affected by an UPDATE operation.

For user updates of an index key, Oracle Flashback Version Query might treat an UPDATE operation as two operations, DELETE plus INSERT, represented as two version rows with a D followed by an I VERSIONS_OPERATION.

**See Also:**

- `flashback_query_clause` for more information on version queries
- *Oracle Database Development Guide* for more information on using Oracle Flashback Version Query
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules for values of the VERSIONS_OPERATION pseudocolumn
3.4 COLUMN_VALUE Pseudocolumn

When you refer to an `XMLTable` construct without the `COLUMNS` clause, or when you use the `TABLE` collection expression to refer to a scalar nested table type, the database returns a virtual table with a single column. This name of this pseudocolumn is `COLUMN_VALUE`.

In the context of `XMLTable`, the value returned is of data type `XMLType`. For example, the following two statements are equivalent, and the output for both shows `COLUMN_VALUE` as the name of the column being returned:

```sql
SELECT *
FROM XMLTABLE('<a>123</a>');

COLUMN_VALUE
-----------------------
<a>123</a>

SELECT COLUMN_VALUE
FROM (XMLTable('<a>123</a>'));

COLUMN_VALUE
------------------------
<a>123</a>
```

In the context of a `TABLE` collection expression, the value returned is the data type of the collection element. The following statements create the two levels of nested tables illustrated in Creating a Table: Multilevel Collection Example to show the uses of `COLUMN_VALUE` in this context:

```sql
CREATE TYPE phone AS TABLE OF NUMBER;
/
CREATE TYPE phone_list AS TABLE OF phone;
/

The next statement uses `COLUMN_VALUE` to select from the `phone` type:

```sql
SELECT t.COLUMN_VALUE
FROM TABLE(phone(1,2,3)) t;

COLUMN_VALUE
-------------
1
2
3
```

In a nested type, you can use the `COLUMN_VALUE` pseudocolumn in both the select list and the `TABLE` collection expression:

```sql
SELECT t.COLUMN_VALUE
FROM TABLE(phone_list(phone(1,2,3))) p, TABLE(p.COLUMN_VALUE) t;

COLUMN_VALUE
-------------
1
2
3
```
The keyword COLUMN_VALUE is also the name that Oracle Database generates for the scalar value of an inner nested table without a column or attribute name, as shown in the example that follows. In this context, COLUMN_VALUE is not a pseudocolumn, but an actual column name.

```sql
CREATE TABLE my_customers (  cust_id NUMBER,  name VARCHAR2(25),  phone_numbers phone_list,  credit_limit NUMBER)  NESTED TABLE phone_numbers STORE AS outer_ntab  (NESTED TABLE COLUMN_VALUE STORE AS inner_ntab);
```

### See Also:
- `XMLTABLE` for information on that function
- `table_collection_expression::=` for information on the `TABLE` collection expression
- `ALTER TABLE` examples in Nested Tables: Examples
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules for values of the COLUMN_VALUE pseudocolumn

### 3.5 OBJECT_ID Pseudocolumn

The `OBJECT_ID` pseudocolumn returns the object identifier of a column of an object table or view. Oracle uses this pseudocolumn as the primary key of an object table. `OBJECT_ID` is useful in `INSTEAD OF` triggers on views and for identifying the ID of a substitutable row in an object table.

**Note:**

In earlier releases, this pseudocolumn was called `SYS_NC_OID$`. That name is still supported for backward compatibility. However, Oracle recommends that you use the more intuitive name `OBJECT_ID`.

### See Also:
- *Oracle Database Object-Relational Developer's Guide* for examples of the use of this pseudocolumn

### 3.6 OBJECT_VALUE Pseudocolumn

The `OBJECT_VALUE` pseudocolumn returns system-generated names for the columns of an object table, `XMLType` table, object view, or `XMLType` view. This pseudocolumn is
useful for identifying the value of a substitutable row in an object table and for creating object views with the WITH OBJECT IDENTIFIER clause.

**Note:**

In earlier releases, this pseudocolumn was called `SYS_NC_ROWINFO$`. That name is still supported for backward compatibility. However, Oracle recommends that you use the more intuitive name `OBJECT_VALUE`.

**See Also:**

- `object_table` and `object_view_clause` for more information on the use of this pseudocolumn
- *Oracle Database Object-Relational Developer’s Guide* for examples of the use of this pseudocolumn

### 3.7 ORA_ROWSCN Pseudocolumn

ORA_ROWSCN reflects the system change-number (SCN) of the most recent change to a row. This change can be at the level of a block (coarse) or at the level of a row (fine-grained). The latter is provided by row-level dependency tracking. Refer to CREATE TABLE ... NOROWDEPENDENCIES | ROWDEPENDENCIES for more information on row-level dependency tracking. In the absence of row-level dependencies, ORA_ROWSCN reflects block-level dependencies.

Whether at the block level or at the row level, the ORA_ROWSCN should not be considered to be an exact SCN. For example, if a transaction changed row R in a block and committed at SCN 10, it is not always true that the ORA_ROWSCN for the row would return 10. While a value less than 10 would never be returned, any value greater than or equal to 10 could be returned. That is, the ORA_ROWSCN of a row is not always guaranteed to be the exact commit SCN of the transaction that last modified that row. However, with fine-grained ORA_ROWSCN, if two transactions T1 and T2 modified the same row R, one after another, and committed, a query on the ORA_ROWSCN of row R after the commit of T1 will return a value lower than the value returned after the commit of T2. If a block is queried twice, then it is possible for the value of ORA_ROWSCN to change between the queries even though rows have not been updated in the time between the queries. The only guarantee is that the value of ORA_ROWSCN in both queries is greater than the commit SCN of the transaction that last modified that row.

You cannot use the ORA_ROWSCN pseudocolumn in a query to a view. However, you can use it to refer to the underlying table when creating a view. You can also use this pseudocolumn in the WHERE clause of an UPDATE or DELETE statement.

ORA_ROWSCN is not supported for Flashback Query. Instead, use the version query pseudocolumns, which are provided explicitly for Flashback Query. Refer to the SELECT ... `flashback_query_clause` for information on Flashback Query and Version Query Pseudocolumns for additional information on those pseudocolumns.
Restriction on ORA_ROWSCN: This pseudocolumn is not supported for external tables.

Example

The first statement below uses the ORA_ROWSCN pseudocolumn to get the system change number of the last operation on the employees table. The second statement uses the pseudocolumn with the SCN_TO_TIMESTAMP function to determine the timestamp of the operation:

```sql
SELECT ORA_ROWSCN, last_name
FROM employees
WHERE employee_id = 188;

SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN), last_name
FROM employees
WHERE employee_id = 188;
```

See Also:

SCN_TO_TIMESTAMP

3.8 ROWID Pseudocolumn

For each row in the database, the ROWID pseudocolumn returns the address of the row. Oracle Database rowid values contain information necessary to locate a row:

- The data object number of the object
- The data block in the data file in which the row resides
- The position of the row in the data block (first row is 0)
- The data file in which the row resides (first file is 1). The file number is relative to the tablespace.

Usually, a rowid value uniquely identifies a row in the database. However, rows in different tables that are stored together in the same cluster can have the same rowid.

Values of the ROWID pseudocolumn have the data type ROWID or UROWID. Refer to Rowid Data Types and UROWID Data Type for more information.

Rowid values have several important uses:

- They are the fastest way to access a single row.
- They can show you how the rows in a table are stored.
- They are unique identifiers for rows in a table.

You should not use ROWID as the primary key of a table. If you delete and reinsert a row with the Import and Export utilities, for example, then its rowid may change. If you delete a row, then Oracle may reassign its rowid to a new row inserted later.

Although you can use the ROWID pseudocolumn in the SELECT and WHERE clause of a query, these pseudocolumn values are not actually stored in the database. You cannot insert, update, or delete a value of the ROWID pseudocolumn.
Example

This statement selects the address of all rows that contain data for employees in department 20:

```sql
SELECT ROWID, last_name
FROM employees
WHERE department_id = 20;
```

3.9 ROWNUM Pseudocolumn

Note:

- The `ROW_NUMBER` built-in SQL function provides superior support for ordering the results of a query. Refer to `ROW_NUMBER` for more information.
- The `row_limiting_clause` of the `SELECT` statement provides superior support for limiting the number of rows returned by a query. Refer to `row_limiting_clause` for more information.

For each row returned by a query, the ROWNUM pseudocolumn returns a number indicating the order in which Oracle selects the row from a table or set of joined rows. The first row selected has a ROWNUM of 1, the second has 2, and so on.

You can use ROWNUM to limit the number of rows returned by a query, as in this example:

```sql
SELECT *
FROM employees
WHERE ROWNUM < 11;
```

If an ORDER BY clause follows ROWNUM in the same query, then the rows will be reordered by the ORDER BY clause. The results can vary depending on the way the rows are accessed. For example, if the ORDER BY clause causes Oracle to use an index to access the data, then Oracle may retrieve the rows in a different order than without the index. Therefore, the following statement does not necessarily return the same rows as the preceding example:

```sql
SELECT *
FROM employees
WHERE ROWNUM < 11
ORDER BY last_name;
```

If you embed the ORDER BY clause in a subquery and place the ROWNUM condition in the top-level query, then you can force the ROWNUM condition to be applied after the ordering of the rows. For example, the following query returns the employees with the 10 smallest employee numbers. This is sometimes referred to as top-N reporting:

```sql
SELECT *
FROM (SELECT * FROM employees ORDER BY employee_id)
WHERE ROWNUM < 11;
```
In the preceding example, the **ROWNUM** values are those of the top-level **SELECT** statement, so they are generated after the rows have already been ordered by `employee_id` in the subquery.

Conditions testing for **ROWNUM** values greater than a positive integer are always false. For example, this query returns no rows:

```sql
SELECT * 
FROM employees 
WHERE ROWNUM > 1;
```

The first row fetched is assigned a **ROWNUM** of 1 and makes the condition false. The second row to be fetched is now the first row and is also assigned a **ROWNUM** of 1 and makes the condition false. All rows subsequently fail to satisfy the condition, so no rows are returned.

You can also use **ROWNUM** to assign unique values to each row of a table, as in this example:

```sql
UPDATE my_table 
SET column1 = ROWNUM;
```

Refer to the function **ROW_NUMBER** for an alternative method of assigning unique numbers to rows.

---

**Note:**

Using **ROWNUM** in a query can affect view optimization.

### 3.10 XMLDATA Pseudocolumn

Oracle stores **XMLType** data either in LOB or object-relational columns, based on XMLSchema information and how you specify the storage clause. The **XMLDATA** pseudocolumn lets you access the underlying LOB or object relational column to specify additional storage clause parameters, constraints, indexes, and so forth.

**Example**

The following statements illustrate the use of this pseudocolumn. Suppose you create a simple table of **XMLType** with one **CLOB** column:

```sql
CREATE TABLE xml_lob_tab of XMLTYPE
    XMLTYPE STORE AS CLOB;
```

To change the storage characteristics of the underlying LOB column, you can use the following statement:

```sql
ALTER TABLE xml_lob_tab
    MODIFY LOB (XMLDATA) (STORAGE (MAXSIZE 2G) CACHE);
```

Now suppose you have created an XMLSchema-based table like the `xwarehouses` table created in **Using XML in SQL Statements**. You could then use the **XMLDATA** column to set the properties of the underlying columns, as shown in the following statement:
ALTER TABLE xwarehouses
  ADD (UNIQUE(XMLDATA."WarehouseId"));
4
Operators

An operator manipulates data items and returns a result. Syntactically, an operator appears before or after an operand or between two operands.

This chapter contains these sections:

- About SQL Operators
- Arithmetic Operators
- COLLATE Operator
- Concatenation Operator
- Hierarchical Query Operators
- Set Operators
- Multiset Operators
- User-Defined Operators

This chapter discusses nonlogical (non-Boolean) operators. These operators cannot by themselves serve as the condition of a WHERE or HAVING clause in queries or subqueries. For information on logical operators, which serve as conditions, refer to Conditions.

4.1 About SQL Operators

Operators manipulate individual data items called operands or arguments. Operators are represented by special characters or by keywords. For example, the multiplication operator is represented by an asterisk (*).

If you have installed Oracle Text, then you can use the `SCORE` operator, which is part of that product, in Oracle Text queries. You can also create conditions with the built-in Text operators, including CONTAINS, CATSEARCH, and MATCHES. For more information on these Oracle Text elements, refer to Oracle Text Reference.

4.1.1 Unary and Binary Operators

The two general classes of operators are:

- **unary**: A unary operator operates on only one operand. A unary operator typically appears with its operand in this format:
  
  `operator operand`

- **binary**: A binary operator operates on two operands. A binary operator appears with its operands in this format:
  
  `operand1 operator operand2`
Other operators with special formats accept more than two operands. If an operator is given a null operand, then the result is always null. The only operator that does not follow this rule is concatenation (||).

### 4.1.2 Operator Precedence

**Precedence** is the order in which Oracle Database evaluates different operators in the same expression. When evaluating an expression containing multiple operators, Oracle evaluates operators with higher precedence before evaluating those with lower precedence. Oracle evaluates operators with equal precedence from left to right within an expression.

Table 4-1 lists the levels of precedence among SQL operators from high to low. Operators listed on the same line have the same precedence.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>+, -, (as unary operators), PRIOR, CONNECT_BY_ROOT, COLLATE</td>
<td>Identity, negation, location in hierarchy</td>
</tr>
<tr>
<td>+, /</td>
<td>Multiplication, division</td>
</tr>
<tr>
<td>+, - (as binary operators),</td>
<td></td>
</tr>
<tr>
<td>SQL conditions are evaluated after SQL operators</td>
<td>See “Condition Precedence”</td>
</tr>
</tbody>
</table>

**Precedence Example**

In the following expression, multiplication has a higher precedence than addition, so Oracle first multiplies 2 by 3 and then adds the result to 1.

\[ 1 + 2 \times 3 \]

You can use parentheses in an expression to override operator precedence. Oracle evaluates expressions inside parentheses before evaluating those outside.

SQL also supports set operators (UNION, UNION ALL, INTERSECT, and MINUS), which combine sets of rows returned by queries, rather than individual data items. All set operators have equal precedence.

**See Also:**

Hierarchical Query Operators and Hierarchical Queries for information on the PRIOR operator, which is used only in hierarchical queries.

### 4.2 Arithmetic Operators

You can use an arithmetic operator with one or two arguments to negate, add, subtract, multiply, and divide numeric values. Some of these operators are also used in datetime and interval arithmetic. The arguments to the operator must resolve to
numeric data types or to any data type that can be implicitly converted to a numeric data type.

Unary arithmetic operators return the same data type as the numeric data type of the argument. For binary arithmetic operators, Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type. Table 4-2 lists arithmetic operators.

See Also:
Table 2-8 for more information on implicit conversion, Numeric Precedence for information on numeric precedence, and Datetime/Interval Arithmetic.

| Table 4-2     Arithmetic Operators |
|---------------|-----------------------------------|
| Operator      | Purpose                           | Example                                                        |
| + -           | When these denote a positive or negative expression, they are unary operators. | SELECT *
|               |                                  | FROM order_items
|               |                                  | WHERE quantity = -1
|               |                                  | ORDER BY order_id,
|               |                                  |   line_item_id, product_id; |
|               |                                  | SELECT *
|               |                                  | FROM employees
|               |                                  | WHERE -salary < 0
|               |                                  | ORDER BY employee_id; |
| + -           | When they add or subtract, they are binary operators. | SELECT hire_date
|               |                                  | FROM employees
|               |                                  | WHERE SYSDATE - hire_date > 365
|               |                                  | ORDER BY hire_date; |
| * /           | Multiply, divide. These are binary operators. | UPDATE employees
|               |                                  | SET salary = salary * 1.1;

Do not use two consecutive minus signs (--) in arithmetic expressions to indicate double negation or the subtraction of a negative value. The characters -- are used to begin comments within SQL statements. You should separate consecutive minus signs with a space or parentheses. Refer to Comments for more information on comments within SQL statements.

4.3 COLLATE Operator

The COLLATE operator determines the collation for an expression. This operator enables you to override the collation that the database would have derived for the expression using standard collation derivation rules.

COLLATE is a postfix unary operator. It has the same precedence as other unary operators, but it is evaluated after all prefix unary operators have been evaluated.
You can apply this operator to expressions of type `VARCHAR2`, `CHAR`, `LONG`, `NVARCHAR`, or `NCHAR`.

The `COLLATE` operator takes one argument, `collation_name`, for which you can specify a named collation or pseudo-collation. If the collation name contains a space, then you must enclose the name in double quotation marks.

Table 4-3 describes the `COLLATE` operator.

### Table 4-3  COLLATE Operator

<table>
<thead>
<tr>
<th>Operator</th>
<th>Purpose</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>COLLATE collation_name</code></td>
<td>Determines the collation for an expression</td>
<td><code>SELECT last_name FROM employees ORDER BY last_name COLLATE GENERIC_M;</code></td>
</tr>
</tbody>
</table>

See Also:
- Compound Expressions for information on using the `COLLATE` operator in a compound expression
- Oracle Database Globalization Support Guide for more information on the `COLLATE` operator

### 4.4 Concatenation Operator

The concatenation operator manipulates character strings and `CLOB` data. Table 4-4 describes the concatenation operator.

### Table 4-4  Concatenation Operator

<table>
<thead>
<tr>
<th>Operator</th>
<th>Purpose</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>`</td>
<td></td>
<td>`</td>
</tr>
</tbody>
</table>

The result of concatenating two character strings is another character string. If both character strings are of data type `CHAR`, then the result has data type `CHAR` and is limited to 2000 characters. If either string is of data type `VARCHAR2`, then the result has data type `VARCHAR2` and is limited to 32767 characters if the initialization parameter `MAX_STRING_SIZE = EXTENDED` and 4000 characters if `MAX_STRING_SIZE = STANDARD`. Refer to Extended Data Types for more information. If either argument is a `CLOB`, the result is a temporary `CLOB`. Trailing blanks in character strings are preserved by concatenation, regardless of the data types of the string or `CLOB`.

On most platforms, the concatenation operator is two solid vertical bars, as shown in Table 4-4. However, some IBM platforms use broken vertical bars for this operator. When moving SQL script files between systems having different character sets, such
as between ASCII and EBCDIC, vertical bars might not be translated into the vertical bar required by the target Oracle Database environment. Oracle provides the CONCAT character function as an alternative to the vertical bar operator for cases when it is difficult or impossible to control translation performed by operating system or network utilities. Use this function in applications that will be moved between environments with differing character sets.

Although Oracle treats zero-length character strings as nulls, concatenating a zero-length character string with another operand always results in the other operand, so null can result only from the concatenation of two null strings. However, this may not continue to be true in future versions of Oracle Database. To concatenate an expression that might be null, use the NVL function to explicitly convert the expression to a zero-length string.

See Also:

- Character Data Types for more information on the differences between the CHAR and VARCHAR2 data types
- The functions CONCAT and NVL
- Oracle Database SecureFiles and Large Objects Developer’s Guide for more information about CLOBs
- Oracle Database Globalization Support Guide for the collation derivation rules for the concatenation operator

Concatenation Example

This example creates a table with both CHAR and VARCHAR2 columns, inserts values both with and without trailing blanks, and then selects these values and concatenates them. Note that for both CHAR and VARCHAR2 columns, the trailing blanks are preserved.

```
CREATE TABLE tab1 (col1 VARCHAR2(6), col2 CHAR(6),
                    col3 VARCHAR2(6), col4 CHAR(6));

INSERT INTO tab1 (col1, col2, col3, col4)
    VALUES ('abc', 'def   ', 'ghi   ', 'jkl');

SELECT col1 || col2 || col3 || col4 "Concatenation"
    FROM tab1;

Concatenation
--------------
abcdef   ghi   jkl
```

4.5 Hierarchical Query Operators

Two operators, PRIOR and CONNECT_BY_ROOT, are valid only in hierarchical queries.

4.5.1 PRIOR

In a hierarchical query, one expression in the CONNECT BY condition must be qualified by the PRIOR operator. If the CONNECT BY condition is compound, then only one
condition requires the PRIOR operator, although you can have multiple PRIOR conditions. PRIOR evaluates the immediately following expression for the parent row of the current row in a hierarchical query.

PRIOR is most commonly used when comparing column values with the equality operator. (The PRIOR keyword can be on either side of the operator.) PRIOR causes Oracle to use the value of the parent row in the column. Operators other than the equal sign (=) are theoretically possible in CONNECT BY clauses. However, the conditions created by these other operators can result in an infinite loop through the possible combinations. In this case Oracle detects the loop at run time and returns an error. Refer to Hierarchical Queries for more information on this operator, including examples.

4.5.2 CONNECT_BY_ROOT

CONNECT_BY_ROOT is a unary operator that is valid only in hierarchical queries. When you qualify a column with this operator, Oracle returns the column value using data from the root row. This operator extends the functionality of the CONNECT BY [PRIOR] condition of hierarchical queries.

Restriction on CONNECT_BY_ROOT

You cannot specify this operator in the START WITH condition or the CONNECT BY condition.

See Also:

CONNECT_BY_ROOT Examples

4.6 Set Operators

Set operators combine the results of two component queries into a single result. Queries containing set operators are called compound queries. Table 4-5 lists SQL set operators. They are fully described, including examples and restrictions on these operators, in The UNION [ALL], INTERSECT, MINUS Operators.

Table 4-5 Set Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNION</td>
<td>All distinct rows selected by either query</td>
</tr>
<tr>
<td>UNION ALL</td>
<td>All rows selected by either query, including all duplicates</td>
</tr>
<tr>
<td>INTERSECT</td>
<td>All rows selected by both queries</td>
</tr>
<tr>
<td>MINUS</td>
<td>All distinct rows selected by the first query but not the second</td>
</tr>
</tbody>
</table>

4.7 Multiset Operators

Multiset operators combine the results of two nested tables into a single nested table.
The examples related to multiset operators require that two nested tables be created and loaded with data as follows:

First, make a copy of the `oe.customers` table called `customers_demo`:

```
CREATE TABLE customers_demo AS
    SELECT * FROM customers;
```

Next, create a table type called `cust_address_tab_typ`. This type will be used when creating the nested table columns.

```
CREATE TYPE cust_address_tab_typ AS
    TABLE OF cust_address_typ;
/
```

Now, create two nested table columns in the `customers_demo` table:

```
ALTER TABLE customers_demo
    ADD (cust_address_ntab cust_address_tab_typ,
        cust_address2_ntab cust_address_tab_typ);
NESTED TABLE cust_address_ntab STORE AS cust_address_ntab_store
NESTED TABLE cust_address2_ntab STORE AS cust_address2_ntab_store;
```

Finally, load data into the two new nested table columns using data from the `cust_address` column of the `oe.customers` table:

```
UPDATE customers_demo cd
    SET cust_address_ntab =
        CAST(MULTISET(SELECT cust_address
                        FROM customers c
                        WHERE c.customer_id =
                            cd.customer_id) as cust_address_tab_typ);

UPDATE customers_demo cd
    SET cust_address2_ntab =
        CAST(MULTISET(SELECT cust_address
                        FROM customers c
                        WHERE c.customer_id =
                            cd.customer_id) as cust_address_tab_typ);
```

### 4.7.1 MULTISET EXCEPT

`MULTISET EXCEPT` takes as arguments two nested tables and returns a nested table whose elements are in the first nested table but not in the second nested table. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The `ALL` keyword instructs Oracle to return all elements in `nested_table1` that are not in `nested_table2`. For example, if a particular element occurs `m` times in `nested_table1` and `n` times in `nested_table2`, then the result will have `(m-n)` occurrences of the element if `m > n` and 0 occurrences if `m <= n`. `ALL` is the default.
• The **DISTINCT** keyword instructs Oracle to eliminate any element in `nested_table1` which is also in `nested_table2`, regardless of the number of occurrences.

• The element types of the nested tables must be comparable. Refer to **Comparison Conditions** for information on the comparability of nonscalar types.

**Example**

The following example compares two nested tables and returns a nested table of those elements found in the first nested table but not in the second nested table:

```sql
SELECT customer_id, cust_address_ntab
MULTISET EXCEPT DISTINCT cust_address2_ntab multiset_except
FROM customers_demo
ORDER BY customer_id;
```

<table>
<thead>
<tr>
<th>CUSTOMER_ID</th>
<th>MULTISET_EXCEPT(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>CUST_ADDRESS_TAB_TYP()</td>
</tr>
<tr>
<td>102</td>
<td>CUST_ADDRESS_TAB_TYP()</td>
</tr>
<tr>
<td>103</td>
<td>CUST_ADDRESS_TAB_TYP()</td>
</tr>
<tr>
<td>104</td>
<td>CUST_ADDRESS_TAB_TYP()</td>
</tr>
<tr>
<td>105</td>
<td>CUST_ADDRESS_TAB_TYP()</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to **Multiset Operators** to create this table and nested table columns.

**4.7.2 MULTISET INTERSECT**

**MULTISET INTERSECT** takes as arguments two nested tables and returns a nested table whose values are common in the two input nested tables. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The **ALL** keyword instructs Oracle to return all common occurrences of elements that are in the two input nested tables, including duplicate common values and duplicate common `NULL` occurrences. For example, if a particular value occurs \( m \) times in `nested_table1` and \( n \) times in `nested_table2`, then the result would contain the element \( \min(m, n) \) times. **ALL** is the default.
- The **DISTINCT** keyword instructs Oracle to eliminate duplicates from the returned nested table, including duplicates of `NULL`, if they exist.
- The element types of the nested tables must be comparable. Refer to **Comparison Conditions** for information on the comparability of nonscalar types.

**Example**

The following example compares two nested tables and returns a nested table of those elements found in both input nested tables:

```sql
SELECT customer_id, cust_address_ntab
MULTISET INTERSECT DISTINCT cust_address2_ntab multiset_intersect
FROM customers_demo;
```
The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.

### 4.7.3 MULTISET UNION

MULTISET UNION takes as arguments two nested tables and returns a nested table whose values are those of the two input nested tables. The two input nested tables must be of the same type, and the returned nested table is of the same type as well.

- The `ALL` keyword instructs Oracle to return all elements that are in the two input nested tables, including duplicate values and duplicate `NULL` occurrences. This is the default.
- The `DISTINCT` keyword instructs Oracle to eliminate duplicates from the returned nested table, including duplicates of `NULL`, if they exist.
- The element types of the nested tables must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

**Example**

The following example compares two nested tables and returns a nested table of elements from both input nested tables:

```sql
SELECT customer_id, cust_address_ntab
  MULTISET UNION cust_address2_ntab multiset_union
FROM customers_demo
ORDER BY customer_id;
```

<table>
<thead>
<tr>
<th>CUSTOMER_ID</th>
<th>MULTISET_UNION(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))</td>
</tr>
<tr>
<td>102</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Boyd Ave', '46218', 'Indianapolis', 'IN', 'US'))</td>
</tr>
<tr>
<td>103</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))</td>
</tr>
<tr>
<td>104</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))</td>
</tr>
<tr>
<td>105</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3Rd St', '47404', 'Bloomington', 'IN', 'US'))</td>
</tr>
<tr>
<td>. . .</td>
<td>. . .</td>
</tr>
</tbody>
</table>

Chapter 4
Multiset Operators
4-9
The preceding example requires the table `customers_demo` and two nested table columns containing data. Refer to `Multiset Operators` to create this table and nested table columns.

### 4.8 User-Defined Operators

Like built-in operators, user-defined operators take a set of operands as input and return a result. However, you create them with the `CREATE OPERATOR` statement, and they are identified by user-defined names. They reside in the same namespace as tables, views, types, and standalone functions.

After you have defined a new operator, you can use it in SQL statements like any other built-in operator. For example, you can use user-defined operators in the select list of a `SELECT` statement, the condition of a `WHERE` clause, or in `ORDER BY` clauses and `GROUP BY` clauses. However, you must have `EXECUTE` privilege on the operator to do so, because it is a user-defined object.

**See Also:**

- `CREATE OPERATOR` for an example of creating an operator and `Oracle Database Data Cartridge Developer’s Guide` for more information on user-defined operators
5 Expressions

This chapter describes how to combine values, operators, and functions into expressions.

This chapter includes these sections:

• About SQL Expressions
• Simple Expressions
• Compound Expressions
• Calculated Measure Expressions
• CASE Expressions
• Column Expressions
• CURSOR Expressions
• Datetime Expressions
• Function Expressions
• Interval Expressions
• JSON Object Access Expressions
• Model Expressions
• Object Access Expressions
• Placeholder Expressions
• Scalar Subquery Expressions
• Type Constructor Expressions
• Expression Lists

5.1 About SQL Expressions

An expression is a combination of one or more values, operators, and SQL functions that evaluates to a value. An expression generally assumes the data type of its components.

This simple expression evaluates to 4 and has data type NUMBER (the same data type as its components):

2*2

The following expression is an example of a more complex expression that uses both functions and operators. The expression adds seven days to the current date, removes the time component from the sum, and converts the result to CHAR data type:

TO_CHAR(TRUNC(SYSDATE+7))

You can use expressions in:
• The select list of the `SELECT` statement
• A condition of the `WHERE` clause and `HAVING` clause
• The `CONNECT BY`, `START WITH`, and `ORDER BY` clauses
• The `VALUES` clause of the `INSERT` statement
• The `SET` clause of the `UPDATE` statement

For example, you could use an expression in place of the quoted string 'Smith' in this `UPDATE` statement `SET` clause:

```
SET last_name = 'Smith';
```

This `SET` clause has the expression `INITCAP(last_name)` instead of the quoted string 'Smith':

```
SET last_name = INITCAP(last_name);
```

Expressions have several forms, as shown in the following syntax:

```
expr ::= simple_expression | compound_expression | calc_meas_expression | case_expression | cursor_expression | datetime_expression | function_expression | interval_expression | JSON_object_access_expr | model_expression | object_access_expression | scalar_subquery_expression | type_constructor_expression | variable_expression
```

Oracle Database does not accept all forms of expressions in all parts of all SQL statements. Refer to the section devoted to a particular SQL statement in this book for information on restrictions on the expressions in that statement.

You must use appropriate expression notation whenever `expr` appears in conditions, SQL functions, or SQL statements in other parts of this reference. The sections that follow describe and provide examples of the various forms of expressions.
5.2 Simple Expressions

A simple expression specifies a column, pseudocolumn, constant, sequence number, or null.

\[
\text{simple_expression} ::= 
\]

In addition to the schema of a user, `schema` can also be "PUBLIC" (double quotation marks required), in which case it must qualify a public synonym for a table, view, or materialized view. Qualifying a public synonym with "PUBLIC" is supported only in data manipulation language (DML) statements, not data definition language (DDL) statements.

You can specify `ROWID` only with a table, not with a view or materialized view. `NCHAR` and `NVARCHAR2` are not valid pseudocolumn data types.

See Also:

Pseudocolumns for more information on pseudocolumns and subquery_factoring_clause for information on `query_name`

Some valid simple expressions are:

```
employees.last_name
'this is a text string'
10
N'this is an NCHAR string'
```
5.3 Compound Expressions

A compound expression specifies a combination of other expressions.

\[ \text{compound_expression} ::= \]

\begin{figure}
\centering
\includegraphics[width=0.5\textwidth]{compound_expression_diagram.png}
\caption{Diagram of a compound expression.}
\end{figure}

You can use any built-in function as an expression (Function Expressions). However, in a compound expression, some combinations of functions are inappropriate and are rejected. For example, the \texttt{LENGTH} function is inappropriate within an aggregate function.

The \texttt{PRIOR} operator is used in \texttt{CONNECT BY} clauses of hierarchical queries.

The \texttt{COLLATE} operator determines the collation for an expression. This operator overrides the collation that the database would have derived for the expression using standard collation derivation rules.

See Also:

- Operator Precedence
- Hierarchical Queries
- COLLATE Operator

Some valid compound expressions are:

\begin{itemize}
  \item \texttt{('CLARK' || 'SMITH')}
  \item \texttt{LENGTH('MOOSE') * 57}
  \item \texttt{SQRT(144) + 72}
  \item \texttt{my_fun(TO_CHAR(sysdate,'DD-MMM-YY'))}
  \item \texttt{name COLLATE BINARY_CI}
\end{itemize}
5.4 Calculated Measure Expressions

A calculated measure expression defines a calculated measure in an analytic view. You use a calculated measure expression as the `calc_meas_expression` parameter in a `calc_measure_clause` in a `CREATE ANALYTIC VIEW` statement.

Tip:

You can view and run SQL scripts that create analytic views with calculated measures at the Oracle Live SQL website at https://livesql.oracle.com/apex/livesql/file/index.html. The website has scripts and tutorials that demonstrate the creation and use of analytic views.

Syntax

```
calc_meas_expression ::= av_meas_expression
                        | av_simple_expression
                        | single_row_function_expression
                        | case_expression
                        | compound_expression
                        | datetime_expression
                        | interval_expression
```

Semantics

**calc_meas_expression**

The calculated measure expressions that have syntax specific to analytic views are described in the following topics:

- Analytic View Measure Expressions
- Analytic View Simple Expressions
- Single Row Function Expression

For the other types of permissible expressions for a calculated measure, see the following topics:

- CASE Expressions
- Compound Expressions
- Datetime Expressions
- Interval Expressions
5.4.1 Analytic View Measure Expressions

An analytic view measure expression is based on a measure in an analytic view.

**Tip:**

You can view and run SQL scripts that create analytic views with calculated measures at the Oracle Live SQL website at https://livesql.oracle.com/apex/livesql/file/index.html. The website has scripts and tutorials that demonstrate the creation and use of analytic views.

**Syntax**

```
av_meas_expression ::= 

lead_lag_expression 

window_expression 

share_of_expression 

qdr_expression 

lead_lag_expression ::= 

lead_lag_function_name(calc_meas_expression) OVER(lead_lag_clause) 

lead_lag_function_name ::= 

LAG  

LAG_DIFF  

LAG_DIF_PERCENT  

LEAD  

LEAD_DIFF  

LEAD_DIFF_PERCENT
```
lead_lag_clause ::= 

\[ \text{HIERARCHY hierarchy_ref OFFSET offset_expr WITHIN LEVEL PARENT ACROSS ANCESTOR AT LEVEL level_ref \text{ POSITION FROM BEGINNING END}} \]

hier_lead_lag_clause::=
\[ qdr\_expression::= \]
\[ \text{QUALIFY} ( \text{calc\_meas\_expression}, \text{qualifier} ) \]

\[ \text{qualifier::=} \]
\[ \text{hierarchy\_ref} = \text{member\_expression} \]

**Semantics**

*av\_meas\_expression*

An expression that performs hierarchical navigation to locate related measure values.

*lead\_lag\_expression*

An expression that specifies a lead or lag operation that locates a related measure value by navigating forward or backward by some number of members within a hierarchy.

The `calc\_meas\_expression` parameter is evaluated in the new context created by the `lead\_lag\_expression`. This context has the same members as the outer context, except that the member of the specified hierarchy is changed to the related member specified by the lead or lag operation. The lead or lag function is run over the hierarchy members specified by the `lead\_lag\_clause` parameter.

*lead\_lag\_function\_name*

The lead or lag function may be one of the following:

- **LAG** returns the measure value of an earlier member.
- **LAG\_DIFF** returns the difference between the measure value of the current member and the measure value of an earlier member.
- **LAG\_DIFF\_PERCENT** returns the percent difference between the measure value of the current member and the measure value of an earlier member.
- **LEAD** returns the measure value of a later member.
- **LEAD\_DIFF** returns the difference between the measure value of the current member and the measure value of a later member.
- **LEAD\_DIFF\_PERCENT** returns the percent difference between the measure value of the current member and the measure value of a later member.

*lead\_lag\_clause*

Specifies the hierarchy to evaluate and an offset value. The parameters of the `lead\_lag\_clause` are the following:

- **HIERARCHY hierarchy\_ref** specifies the name of a hierarchy in the analytic view.
- **OFFSET offset\_expr** specifies a `calc\_meas\_expression` that resolves to a number. The number specifies how many members to move either forward or backward.
from the current member. The ordering of members within a level is determined by the definition of the attribute dimension used by the hierarchy.

- **WITHIN LEVEL** specifies locating the related member by moving forward or backward by the offset number of members within the members that have the same level depth as the current member. The ordering of members within the level is determined by the definition of the attribute dimension used by the hierarchy.

The **WITHIN LEVEL** operation is the default if neither the **WITHIN LEVEL** nor the **ACROSS ANCESTOR AT LEVEL** keywords are specified.

- **WITHIN PARENT** specifies locating the related member by moving forward or backward by the offset number of members within the members that have the same parent as the current member.

- **ACROSS ANCESTOR AT LEVEL level_ref** specifies locating the related member by navigating up to the ancestor (or to the member itself if no ancestor exists) of the current member at the level specified by `level_ref`, and noting the position of each ancestor member (including the member itself) within its parent. The `level_ref` parameter is the name of a level in the specified hierarchy.

Once the ancestor member is found, navigation moves either forward or backward the offset number of members within the members that have the same depth as the ancestor member. After locating the related ancestor, navigation proceeds back down the hierarchy from this member, matching the position within the parent as recorded on the way up (in reverse order). The position within the parent is either an offset from the first child or the last child depending on whether **POSITION FROM BEGINNING** or **POSITION FROM END** is specified. The default value is **POSITION FROM BEGINNING**. The ordering of members within the level is determined by the definition of the attribute dimension used by the hierarchy.

### window_expression

A **window_expression** selects the set of members that are in the specified range starting from the current member and that are at the same depth as the current member. You can further restrict the selection of members by specifying a hierarchical relationship using a **WITHIN** phrase. Aggregation is then performed over the selected measure values to produce a single result for the expression.

The parameters for a **window_expression** are the following:

- **aggregate_function** is any existing SQL aggregate function except **COLLECT**, **GROUP_ID**, **GROUPING**, **GROUPING_ID**, **SYS_XMLAGG**, **XMLAGG**, and any multi-argument function. A user defined aggregate function is also allowed. The arguments to the aggregate function are **calc_meas_expression** expressions. These expressions are evaluated using the outer context, with the member of the specified hierarchy changed to each member in the related range. Therefore, each expression argument is evaluated once per related member. The results are then aggregated using the **aggregate_function**.

- **OVER (window_clause)** specifies the hierarchy to use and the boundaries of the window to consider.

> See Also:

* Aggregate Functions
**window_clause**

The `window_clause` parameter selects a range of members related to the current member. The range is between the members specified by the `preceding_boundary` or `following_boundary` parameters. The range is always computed over members at the same level as the current member.

The parameters for a `window_clause` are the following:

- **HIERARCHY hierarchy_ref** specifies the name of the hierarchy in the analytic view.
- **BETWEEN preceding_boundary or following_boundary** defines the set of members to relate to the current member.
- **WITHIN LEVEL** selects the related members by applying the boundary clause to all members of the current level. This is the default when the `WITHIN` keyword is not specified.
- **WITHIN PARENT** selects the related members by applying the boundary clause to all members that share a parent with the current member.
- **WITHIN ANCESTOR AT LEVEL** selects the related members by applying the boundary clause to all members at the current depth that share an ancestor (or is the member itself) at the specified level with the current member. The value of the window expression is `NULL` if the current member is above the specified level. If the level is not in the specified hierarchy, then an error occurs.

**preceding_boundary**

The `preceding_boundary` parameter defines a range of members from the specified number of members backward in the level from the current member and forward to the specified end of the boundary. The following parameters specify the range:

- **UNBOUNDED PRECEDING** begins the range at the first member in the level.
- **offset_expr PRECEDING** begins the range at the `offset_expr` number of members backward from the current member. The `offset_expr` expression is a `calc_meas_expression` that resolves to a number. If the offset number is greater than the number of members from the current member to the first member in the level, then the first member is used as the start of the range.
- **CURRENT MEMBER** ends the range at the current member.
- **offset_expr PRECEDING** ends the range at the member that is `offset_expr` backward from the current member.
- **offset_expr FOLLOWING** ends the range at the member that is `offset_expr` forward from the current member.
- **UNBOUNDED FOLLOWING** ends the range at the last member in the level.

**following_boundary**

The `following_boundary` parameter defines a range of members from the specified number of members from the current member forward to the specified end of the range. The following parameters specify the range:

- **CURRENT MEMBER** begins the range at the current member.
- **offset_expr FOLLOWING** begins the range at the member that is `offset_expr` forward from the current member.
• **offset_expr** **FOLLOWING** ends the range at the member that is **offset_expr** forward from the current member.

• **UNBOUNDED** **FOLLOWING** ends the range at the last member in the level.

**hierarchy_ref**

A reference to a hierarchy of an analytic view. The **hier_alias** parameter specifies the name of a hierarchy in the definition of the analytic view. You may use double quotes to escape special characters or preserve case, or both.

The optional **attr_dim_alias** parameter is the name of an alias specified in the definition of the analytic view. You may use the **attr_dim_alias** parameter to resolve the ambiguity if the specified hierarchy alias conflicts with another hierarchy alias in the analytic view or if an attribute dimension is used more than once in the analytic view definition. You may use the **attr_dim_alias** parameter even when a name conflict does not exist.

**share_of_expression**

A **share_of_expression** expression calculates the ratio of an expression's value for the current context over the expression's value at a related context. The expression is a **calc_meas_expression** that is evaluated at the current context and the related context. The **share_clause** specification determines the related context to use.

**share_clause**

A **share_clause** modifies the outer context by setting the member for the specified hierarchy to a related member.

The parameters of the share clause are the following:

• **HIERARCHY** **hierarchy_ref** specifies the name of the hierarchy that is the outer context for the **share_of_expression** calculations.

• **PARENT** specifies that the related member is the parent of the current member.

• **LEVEL** **level_ref** specifies that the related member is the ancestor (or is the member itself) of the current member at the specified level in the hierarchy. If the current member is above the specified level, then **NULL** is returned for the share expression. If the level is not in the hierarchy, then an error occurs.

• **MEMBER** **member_expression** specifies that the related member is the member returned after evaluating the **member_expression** in the current context. If the value of the specified member is **NULL**, then **NULL** is returned for the share expression.

**level_member_literal**

A **level_member_literal** is an expression that resolves to a single member of the hierarchy. The expression contains the name of the level and one or more member keys. The member key or keys may be identified by position or by name. If the specified level is not in the context hierarchy, then an error occurs.

**pos_member_keys**

The **member_key_expr** expression resolves to the key value for the member. When specified by position, all components of the key must be given in the order found in the **ALL_HIER_LEVEL_ID_ATTRS** dictionary view. For a hierarchy in which the specified level
is not determined by the child level, then all member key values of all such child levels must be provided preceding the current level's member key or keys. Duplicate key components are only specified the first time they appear.

The primary key is used when `level_member_literal` is specified using the `pos_member_keys` phrase. You can reference an alternate key by using the `named_member_keys` phrase.

**named_member_keys**

The `member_key_expr` expression resolves to the key value for the member. The `attr_name` parameter is an identifier for the name of the attribute. If all of the attribute names do not make up a key or alternate key of the specified level, then an error occurs.

When specified by name, all components of the key must be given and all must use the attribute `name = value` form, in any order. For a hierarchy in which the specified level is not determined by the child level, then all member key values of all such child levels must be provided, also using the named form. Duplicate key components are only specified once.

**hier_navigation_expression**

A `hier_navigation_expression` expression navigates from the specified member to a different member in the hierarchy.

**hier_ancestor_expression**

Navigates from the specified member to the ancestor member (or to the member itself) at the specified level or depth. The depth is specified as an expression that must resolve to a number. If the member is at a level or depth above the specified member or the member is `NULL`, then `NULL` is returned for the expression value. If the specified level is not in the context hierarchy, then an error occurs.

**member_expression**

A `member_expression` evaluates to a member of the specified hierarchy. The hierarchy can always be determined from the outer expression (enforced by the syntax). A `member_expression` can be one of the following:

- `level_member_literal` is an expression that evaluates to a hierarchy member.
- `hier_navigation_expr` is an expression that relates one member of the hierarchy to another member.
- `CURRENT MEMBER` specifies the member of the hierarchy as determined by the outer context.
- `NULL` is a way to specify a non-existent member.
- `ALL` specifies the single topmost member of every hierarchy.

**hier_parent_expression**

Navigates from the specified member to the parent member.
**hier_lead_lag_expression**

Navigates from the specified member to a related member by moving forward or backward some number of members within the context hierarchy. The HIER_LEAD keyword returns a later member. The HIER_LAG keyword returns an earlier member.

**hier_lead_lag_clause**

Navigates the offset Expr number of members forward or backward from the specified member. The ordering of members within a level is specified in the definition of the attribute dimension.

The optional parameters of hier_lead_lag_clause are the following:

- **WITHIN LEVEL** locates the related member by moving forward or backward offset Expr members within the members that have the same depth as the current member. The ordering of members within the level is determined by the definition of the attribute dimension. The WITHIN LEVEL operation is the default if neither the WITHIN nor the ACROSS keywords are used.

- **WITHIN PARENT** locates the related member by moving forward or backward offset Expr members within the members that have the same depth as the current member, but only considers members that share a parent with the current member. The ordering of members within the level is determined by the definition of the attribute dimension.

- **WITHIN ACROSS ANCESTOR AT LEVEL** locates the related member by navigating up to the ancestor of the current member (or to the member itself) at the specified level, noting the position of each ancestor member (including the member itself) within its parent. Once the ancestor member is found, navigation moves forward or backward offset Expr members within the members that have the same depth as the ancestor member.

After locating the related ancestor, navigation moves back down the hierarchy from that member, matching the position within the parent as recorded on the way up (in reverse order). The position within the parent is either an offset from the first child or the last child depending on whether POSITION FROM BEGINNING or POSITION FROM END is specified, defaulting to POSITION FROM BEGINNING. The ordering of members within the level is determined by the definition of the attribute dimension.

**qdr_expression**

A qdr_expression is a qualified data reference that evaluates the specified calc_meas_expression in a new context and sets the hierarchy member to the new value.

**qualifier**

A qualifier modifies the outer context by setting the member for the specified hierarchy to the member resulting from evaluating member_expression. If member_expression is NULL, then the result of the qdr_expression selection is NULL.

### 5.4.2 Analytic View Simple Expressions

A calculated measure expression may be an analytic view simple expression. An analytic view simple expression may be any SQL literal or a reference to a measure in an analytic view.
av_simple_expression ::= 

measure_ref ::= 

measure_ref

A reference to a measure in an analytic view. The meas_name parameter must be the name of a measure in the definition of an analytic view. You may use double quotes to escape special characters or preserve case, or both. If the measure name conflicts with the name of an attribute dimension used by the analytic view, then you may use the optional measures keyword to resolve the ambiguity. You may use the measures keyword even when a name conflict does not exist.

5.4.3 Single Row Function Expression

A calculated measure expression may be any SQL single row function expression.

See Also:

- Function Expressions
- Single-Row Functions

5.4.4 Examples of Calculated Measure Expressions

This topic contains examples that show calculated measures defined in the measures clause of an analytic view. For more examples, see the tutorials on analytic views at the SQL Live website at https://livesql.oracle.com/apex/livesql/file/index.html.

Examples of LAG Expressions

These calculated measures different LAG operations.

-- These calculated measures are from the measures_clause of the -- sales_av analytic view.
MEASURES
(sales FACT sales, -- A base measure
Example of a Window Expression

This calculated measure uses a window operation.

MEASURES
(sales FACT sales,
units FACT units,
sales_qtd AS
(SUM(sales) OVER (HIERARCHY time_hier
BETWEEN UNBOUNDED PRECEDING AND CURRENT MEMBER
WITHIN ANCESTOR AT LEVEL QUARTER)),
sales_ytd AS
(SUM(sales) OVER (HIERARCHY time_hier
BETWEEN UNBOUNDED PRECEDING AND CURRENT MEMBER
WITHIN ANCESTOR AT LEVEL YEAR))
)

Examples of SHARE OF Expressions

These calculated measures use SHARE OF expressions.

MEASURES
(sales FACT sales,
units FACT units,
sales_shr_parent_prod AS
(SHARE_OF(sales HIERARCHY product_hier PARENT)),
sales_shr_parent_geog AS
(SHARE_OF(sales HIERARCHY geography_hier PARENT)),
sales_shr_region AS
(SHARE_OF(sales HIERARCHY geography_hier LEVEL REGION))
)
Examples of QDR Expressions

These calculated measures use the QUALIFY keyword to specify qualified data reference expressions.

MEASURES
(sales FACT sales,
units FACT units,
sales_2011 AS (QUALIFY (sales, time_hier = year['11'])),
sales_pct_chg_2011 AS ((sales - (QUALIFY (sales, time_hier = year['11']))) / (QUALIFY (sales, time_hier = year['11']))))

5.5 CASE Expressions

CASE expressions let you use IF ... THEN ... ELSE logic in SQL statements without having to invoke procedures. The syntax is:

```
CASE
  simple_case_expression
  searched_case_expression
  else_clause
END
```

**simple_case_expression::=**

```
expr
  WHEN comparison_expr
  THEN return_expr
```

**searched_case_expression::=**

```
  WHEN condition
  THEN return_expr
```

**else_clause::=**

```
ELSE else_expr
```

In a simple CASE expression, Oracle Database searches for the first WHEN ... THEN pair for which expr is equal to comparison_expr and returns return_expr. If none of the WHEN ... THEN pairs meet this condition, and an ELSE clause exists, then Oracle returns else_expr. Otherwise, Oracle returns null.

In a searched CASE expression, Oracle searches from left to right until it finds an occurrence of condition that is true, and then returns return_expr. If no condition is
found to be true, and an ELSE clause exists, then Oracle returns `else_expr`. Otherwise, Oracle returns null.

Oracle Database uses **short-circuit evaluation**. For a simple `CASE` expression, the database evaluates each `comparison_expr` value only before comparing it to `expr`, rather than evaluating all `comparison_expr` values before comparing any of them with `expr`. Consequently, Oracle never evaluates a `comparison_expr` if a previous `comparison_expr` is equal to `expr`. For a searched `CASE` expression, the database evaluates each `condition` to determine whether it is true, and never evaluates a `condition` if the previous `condition` was true.

For a simple `CASE` expression, the `expr` and all `comparison_expr` values must either have the same data type (`CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`, `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`) or must all have a numeric data type. If all expressions have a numeric data type, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

For both simple and searched `CASE` expressions, all of the `return_exprs` must either have the same data type (`CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`, `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`) or must all have a numeric data type. If all return expressions have a numeric data type, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The maximum number of arguments in a `CASE` expression is 65535. All expressions count toward this limit, including the initial expression of a simple `CASE` expression and the optional `ELSE` expression. Each `WHEN ... THEN` pair counts as two arguments. To avoid exceeding this limit, you can nest `CASE` expressions so that the `return_expr` itself is a `CASE` expression.

The comparison performed by the simple `CASE` expression is collation-sensitive if the compared arguments have a character data type (`CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`). The collation determination rules determine the collation to use.

**See Also:**
- Table 2-8 for more information on implicit conversion
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation and determination rules for the `CASE` expression
- Numeric Precedence for information on numeric precedence
- `COALESCE` and `NULLIF` for alternative forms of `CASE` logic
- Oracle Database Data Warehousing Guide for examples using various forms of the `CASE` expression

**Simple CASE Example**

For each customer in the sample `oe.customers` table, the following statement lists the credit limit as "Low" if it equals $100, "High" if it equals $5000, and "Medium" if it equals anything else.
SELECT cust_last_name,
    CASE credit_limit WHEN 100 THEN 'Low'
    WHEN 5000 THEN 'High'
    ELSE 'Medium' END AS credit
FROM customers
ORDER BY cust_last_name, credit;

<table>
<thead>
<tr>
<th>CUST_LAST_NAME</th>
<th>CREDIT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adjani</td>
<td>Medium</td>
</tr>
<tr>
<td>Adjani</td>
<td>Medium</td>
</tr>
<tr>
<td>Alexander</td>
<td>Medium</td>
</tr>
<tr>
<td>Alexander</td>
<td>Medium</td>
</tr>
<tr>
<td>Altman</td>
<td>High</td>
</tr>
<tr>
<td>Altman</td>
<td>Medium</td>
</tr>
</tbody>
</table>

Searched CASE Example

The following statement finds the average salary of the employees in the sample table oe.employees, using $2000 as the lowest salary possible:

```
SELECT AVG(CASE WHEN e.salary > 2000 THEN e.salary
    ELSE 2000 END) "Average Salary" FROM employees e;
```

<table>
<thead>
<tr>
<th>Average Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>6461.68224</td>
</tr>
</tbody>
</table>

5.6 Column Expressions

A column expression, which is designated as `column_expression` in subsequent syntax diagrams, is a limited form of `expr`. A column expression can be a simple expression, compound expression, function expression, or expression list, but it can contain only the following forms of expression:

- Columns of the subject table — the table being created, altered, or indexed
- Constants (strings or numbers)
- Deterministic functions — either SQL built-in functions or user-defined functions

No other expression forms described in this chapter are valid. In addition, compound expressions using the `PRIOR` keyword are not supported, nor are aggregate functions.

You can use a column expression for these purposes:

- To create a function-based index.
- To explicitly or implicitly define a virtual column. When you define a virtual column, the defining `column_expression` must refer only to columns of the subject table that have already been defined, in the current statement or in a prior statement.

The combined components of a column expression must be deterministic. That is, the same set of input values must return the same set of output values.
5.7 CURSOR Expressions

A CURSOR expression returns a nested cursor. This form of expression is equivalent to the PL/SQL REF CURSOR and can be passed as a REF CURSOR argument to a function.

A nested cursor is implicitly opened when the cursor expression is evaluated. For example, if the cursor expression appears in a select list, a nested cursor will be opened for each row fetched by the query. The nested cursor is closed only when:

- The nested cursor is explicitly closed by the user
- The parent cursor is reexecuted
- The parent cursor is closed
- The parent cursor is cancelled
- An error arises during fetch on one of its parent cursors (it is closed as part of the clean-up)

Restrictions on CURSOR Expressions

The following restrictions apply to CURSOR expressions:

- If the enclosing statement is not a SELECT statement, then nested cursors can appear only as REF CURSOR arguments of a procedure.
- If the enclosing statement is a SELECT statement, then nested cursors can also appear in the outermost select list of the query specification or in the outermost select list of another nested cursor.
- Nested cursors cannot appear in views.
- You cannot perform BIND and EXECUTE operations on nested cursors.

Examples

The following example shows the use of a CURSOR expression in the select list of a query:

```
SELECT department_name, CURSOR(SELECT salary, commission_pct
   FROM employees e
   WHERE e.department_id = d.department_id)
FROM departments d
ORDER BY department_name;
```

The next example shows the use of a CURSOR expression as a function argument. The example begins by creating a function in the sample OE schema that can accept the REF CURSOR argument. (The PL/SQL function body is shown in italics.)
CREATE FUNCTION f(cur SYS_REFCURSOR, mgr_hiredate DATE)
RETURN NUMBER IS
emp_hiredate DATE;
before number :=0;
after number:=0;
begin
loop
fetch cur into emp_hiredate;
exit when cur%NOTFOUND;
if emp_hiredate > mgr_hiredate then
after:=after+1;
else
before:=before+1;
end if;
end loop;
close cur;
if before > after then
return 1;
else
return 0;
end if;
end;
/

The function accepts a cursor and a date. The function expects the cursor to be a query returning a set of dates. The following query uses the function to find those managers in the sample employees table, most of whose employees were hired before the manager.

SELECT e1.last_name FROM employees e1
WHERE f(
CURSOR(SELECT e2.hire_date FROM employees e2
WHERE e1.employee_id = e2.manager_id),
e1.hire_date) = 1
ORDER BY last_name;

5.8 Datetime Expressions

A datetime expression yields a value of one of the datetime data types.
The initial `expr` is any expression, except a scalar subquery expression, that evaluates to a value of data type `TIMESTAMP`, `TIMESTAMP WITH TIME ZONE`, or `TIMESTAMP WITH LOCAL TIME ZONE`. The `DATE` data type is not supported. If this `expr` is itself a `datetime_expression`, then it must be enclosed in parentheses.

Datetimes and intervals can be combined according to the rules defined in Table 2-5. The three combinations that yield datetime values are valid in a datetime expression.

If you specify `AT LOCAL`, then Oracle uses the current session time zone.

The settings for `AT TIME ZONE` are interpreted as follows:

- The string `'+|-'hh:mi'` specifies a time zone as an offset from UTC. For `hh`, specify the number of hours. For `mi`, specify the number of minutes.
- `DBTIMEZONE`: Oracle uses the database time zone established (explicitly or by default) during database creation.
- `SESSIONTIMEZONE`: Oracle uses the session time zone established by default or in the most recent `ALTER SESSION` statement.
- `time_zone_name`: Oracle returns the `datetime_value_expr` in the time zone indicated by `time_zone_name`. For a listing of valid time zone region names, query the `V$TIMEZONE_NAMES` dynamic performance view.

**Note:**

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see *Oracle Database Globalization Support Guide*. 
See Also:

- Oracle Database Globalization Support Guide for a complete listing of the time zone region names in both files
- Oracle Database Reference for information on the dynamic performance views

• expr: If expr returns a character string with a valid time zone format, then Oracle returns the input in that time zone. Otherwise, Oracle returns an error.

Example

The following example converts the datetime value of one time zone to another time zone:

```sql
SELECT FROM_TZ(CAST(TO_DATE('1999-12-01 11:00:00',
    'YYYY-MM-DD HH:MI:SS') AS TIMESTAMP), 'America/New_York')
AT TIME ZONE 'America/Los_Angeles' "West Coast Time"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>West Coast Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>01-DEC-99 08.00.00.000000 AM AMERICA/LOS_ANGELES</td>
</tr>
</tbody>
</table>

5.9 Function Expressions

You can use any built-in SQL function or user-defined function as an expression. Some valid built-in function expressions are:

- LENGTH('BLAKE')
- ROUND(1234.567*43)
- SYSDATE

See Also:

- About SQL Functions ' and Aggregate Functions for information on built-in functions

A user-defined function expression specifies a call to:

- A function in an Oracle-supplied package (see Oracle Database PL/SQL Packages and Types Reference)
- A function in a user-defined package or type or in a standalone user-defined function (see About User-Defined Functions )
- A user-defined function or operator (see CREATE OPERATOR , CREATE FUNCTION , and Oracle Database Data Cartridge Developer's Guide)

Some valid user-defined function expressions are:

- circle_area(radius)
- payroll.tax_rate(empno)
hr.employees.comm_pct@remote(dependents, empno)
DBMS_LOB.getlength(column_name)
my_function(a_column)

In a user-defined function being used as an expression, positional, named, and mixed notation are supported. For example, all of the following notations are correct:

CALL my_function(arg1 => 3, arg2 => 4) ...
CALL my_function(3, 4) ...
CALL my_function(3, arg2 => 4) ...

Restriction on User-Defined Function Expressions

You cannot pass arguments of object type or XMLType to remote functions and procedures.

5.10 Interval Expressions

An interval expression yields a value of Interval Year to Month or Interval Day to Second.

interval_expression ::= 

(expr1 – expr2)
DAY
(leading_field_precision)
TO SECOND
(fractional_second_precision)
YEAR
(leading_field_precision)
TO MONTH

The expressions expr1 and expr2 can be any expressions that evaluate to values of data type DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE.

Datetimes and intervals can be combined according to the rules defined in Table 2-5. The six combinations that yield interval values are valid in an interval expression.

Both leading_field_precision and fractional_second_precision can be any integer from 0 to 9. If you omit the leading_field_precision for either DAY or YEAR, then Oracle Database uses the default value of 2. If you omit the fractional_second_precision for second, then the database uses the default value of 6. If the value returned by a query contains more digits than the default precision, then Oracle Database returns an error. Therefore, it is good practice to specify a precision that you know will be at least as large as any value returned by the query.

For example, the following statement subtracts the value of the order_date column in the sample table orders (a datetime value) from the system timestamp (another datetime value) to yield an interval value expression. It is not known how many days ago the oldest order was placed, so the maximum value of 9 for the DAY leading field precision is specified:
SELECT (SYSTIMESTAMP - order_date) DAY(9) TO SECOND FROM orders
WHERE order_id = 2458;

5.11 JSON Object Access Expressions

A JSON object access expression is used only when querying a column of JavaScript Object Notation (JSON) data. It yields a character string that contains one or more JSON values found in that data. The syntax for this type of expression is called dot-notation syntax.

\[
\text{JSON\_object\_access\_expr} ::= \\
\text{table\_alias} \cdot \text{JSON\_column} \cdot \text{JSON\_object\_key} \cdot \text{array\_step} \\
\text{array\_step} ::= \\
\text{integer} \rightarrow \text{integer} \cdot \text{integer} \\
\text{integer} \rightarrow \text{integer} \cdot * \\
\text{integer} \rightarrow * \\
\text{integer} \rightarrow * 
\]

- For \text{table\_alias}, specify the alias for the table that contains the column of JSON data. This table alias is required and must be assigned to the table elsewhere in the SQL statement.
- For \text{JSON\_column}, specify the name of the column of JSON data. The column must be of data type \text{VARCHAR2}, \text{CLOB}, or \text{BLOB} and an IS \text{JSON} check constraint must be defined on the column.
- You can optionally specify one or more JSON object keys. The object keys allow you to target specific JSON values in the JSON data. The first \text{JSON\_object\_key} must be a case-sensitive match to the key (property) name of an object member in the top level of the JSON data. If the value of that object member is another JSON object, then you can specify a second \text{JSON\_object\_key} that matches the key name of a member of that object, and so on. If a JSON array is encountered during any of these iterations, and you do not specify an \text{array\_step}, then the array is implicitly unwrapped and the elements of the array are evaluated using the \text{JSON\_object\_key}.
- If the JSON value is an array, then you can optionally specify one or more \text{array\_step} clauses. This allows you to access specific elements of the JSON array.
  - Use \text{integer} to specify the element at index \text{integer} in a JSON array. Use \text{integer} \rightarrow \text{integer} to specify the range of elements between the two index \text{integer} values, inclusive. If the specified elements exist in the JSON array being evaluated, then the array step results in a match to those elements.
Otherwise, the array step does not result in a match. The first element in a JSON array has index 0.

- Use the asterisk wildcard symbol (*) to specify all elements in a JSON array. If the JSON array being evaluated contains at least one element, then the array step results in a match to all elements in the JSON array. Otherwise, the array step does not result in a match.

A JSON object access expression yields a character string of data type VARCHAR2(4000), which contains the targeted JSON value(s) as follows:

- For a single targeted value, the character string contains that value, whether it is a JSON scalar value, object, or array.
- For multiple targeted values, the character string contains a JSON array whose elements are those values.

If you omit JSON_object_key, then the expression yields a character string that contains the JSON data in its entirety. In this case, the character string is of the same data type as the column of JSON data being queried.

A JSON object access expression cannot return a value larger than 4K bytes. If the value surpasses this limit, then the expression returns null. To obtain the actual value, instead use the JSON_QUERY function or the JSON_VALUE function and specify an appropriate return type with the RETURNING clause.

The collation derivation rules for the JSON object access expression are the same as for the JSON_QUERY function.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules for the JSON_QUERY function

Examples

The following examples use the j_purchaseorder table, which is created in Creating a Table That Contains a JSON Document: Example. This table contains a column of JSON data called po_document. These examples return JSON values from column po_document.

The following statement returns the value of the property with key name PONumber:

```
SELECT po.po_document.PONumber
FROM j_purchaseorder po;
```

```
PONumber
--------
1600
```

The following statement first targets the property with key name ShippingInstructions, whose value is a JSON object. The statement then targets the property with key name Phone within that object. The statement returns the value of Phone, which is a JSON array.

```
SELECT po.po_document.ShippingInstructions.Phone
FROM j_purchaseorder po;
```
The following statement first targets the property with key name `LineItems`, whose value is a JSON array. The expression implicitly unwraps the array and evaluates its elements, which are JSON objects. Next, the statement targets the properties with key name `Part`, within the unwrapped objects, and finds two objects. The statement then targets the properties with key name `Description` within those two objects and finds string values. Because more than one value is returned, the values are returned as elements of a JSON array.

```sql
SELECT po.po_document.LineItems.Part.Description
FROM j_purchaseorder po;
```

**LINEITEMS**

[One Magic Christmas, Lethal Weapon]

---

**See Also:**

*Oracle Database JSON Developer's Guide* for more information on querying JSON data using dot-notation syntax

### 5.12 Model Expressions

A model expression is used only in the `model_clause` of a SELECT statement and then only on the right-hand side of a model rule. It yields a value for a cell in a measure column previously defined in the `model_clause`. For additional information, refer to `model_clause`.

**model_expression::=**

```sql
measure_column [condition expr], aggregate_function [condition expr], single_column_for_loop, multi_column_for_loop
```
When you specify a measure column in a model expression, any conditions and expressions you specify must resolve to single values.

When you specify an aggregate function in a model expression, the argument to the function is a measure column that has been previously defined in the model_clause. An aggregate function can be used only on the right-hand side of a model rule.

Specifying an analytic function on the right-hand side of the model rule lets you express complex calculations directly in the model_clause. The following restrictions apply when using an analytic function in a model expression:

- Analytic functions can be used only in an UPDATE rule.
- You cannot specify an analytic function on the right-hand side of the model rule if the left-hand side of the rule contains a FOR loop or an ORDER BY clause.
- The arguments in the OVER clause of the analytic function cannot contain an aggregate.
- The arguments before the OVER clause of the analytic function cannot contain a cell reference.

See Also:

The MODEL clause: Examples for an example of using an analytic function on the right-hand side of a model rule

When expr is itself a model expression, it is referred to as a nested cell reference. The following restrictions apply to nested cell references:

- Only one level of nesting is allowed.
- A nested cell reference must be a single-cell reference.
- When AUTOMATIC ORDER is specified in the model_rules_clause, a nested cell reference can be used on the left-hand side of a model rule only if the measures used in the nested cell reference remain static.

The model expressions shown below are based on the model_clause of the following SELECT statement:

```sql
SELECT country, prod, year, s
FROM sales_view_ref
MODEL
PARTITION BY (country)
DIMENSION BY (prod, year)
MEASURES (sale s)
IGNORE NAV
UNIQUE DIMENSION
RULES UPSERT SEQUENTIAL ORDER
{
    s[prod='Mouse Pad', year=2000] =
    s['Mouse Pad', 1998] + s['Mouse Pad', 1999],
}
ORDER BY country, prod, year;
```
The following model expression represents a single cell reference using symbolic notation. It represents the sales of the Mouse Pad for the year 2000.

\[ s[\text{prod='Mouse Pad',year}=2000] \]

The following model expression represents a multiple cell reference using positional notation, using the CV function. It represents the sales of the current value of the dimension column prod for the year 2001.

\[ s[\text{CV(prod), 2001}] \]

The following model expression represents an aggregate function. It represents the sum of sales of the Mouse Pad for the years between the current value of the dimension column year less two and the current value of the dimension column year less one.

\[ \text{SUM}(s[\text{\{}'Mouse Pad', year \text{ BETWEEN CV()-2 AND CV()-1}\text{\}}]) \]

See Also:

CV and model_clause

5.13 Object Access Expressions

An object access expression specifies attribute reference and method invocation.

\[ \text{object_access_expression}::= \]

The column parameter can be an object or REF column. If you specify expr, then it must resolve to an object type.

When a type’s member function is invoked in the context of a SQL statement, if the SELF argument is null, Oracle returns null and the function is not invoked.

Examples

The following example creates a table based on the sample oe.order_item_typ object type, and then shows how you would update and select from the object column attributes.

```
CREATE TABLE short_orders (  
  sales_rep VARCHAR2(25), item order_item_typ);
```
5.14 Placeholder Expressions

A placeholder expression provides a location in a SQL statement for which a third-generation language bind variable will provide a value. You can specify the placeholder expression with an optional indicator variable. This form of expression can appear only in embedded SQL statements or SQL statements processed in an Oracle Call Interface (OCI) program.

placeholder_expression ::= :

Some valid placeholder expressions are:

:employee_name INDICATOR :employee_name_indicator_var
:department_location

See Also:
Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules for the placeholder expression with a character data type

5.15 Scalar Subquery Expressions

A scalar subquery expression is a subquery that returns exactly one column value from one row. The value of the scalar subquery expression is the value of the select list item of the subquery. If the subquery returns 0 rows, then the value of the scalar subquery expression is NULL. If the subquery returns more than one row, then Oracle returns an error.

You can use a scalar subquery expression in most syntax that calls for an expression (expr). In all cases, a scalar subquery must be enclosed in its own parentheses, even if its syntactic location already positions it within parentheses (for example, when the scalar subquery is used as the argument to a built-in function).

Scalar subqueries are not valid expressions in the following places:

- As default values for columns
- As hash expressions for clusters
- In the RETURNING clause of DML statements
- As the basis of a function-based index
- In CHECK constraints
5.16 Type Constructor Expressions

A type constructor expression specifies a call to a constructor method. The argument to the type constructor is any expression. Type constructors can be invoked anywhere functions are invoked.

\[
\text{type.constructor.expression ::= NEW schema.type.name(expr)}
\]

The `NEW` keyword applies to constructors for object types but not for collection types. It instructs Oracle to construct a new object by invoking an appropriate constructor. The use of the `NEW` keyword is optional, but it is good practice to specify it.

If `type.name` is an object type, then the expressions must be an ordered list, where the first argument is a value whose type matches the first attribute of the object type, the second argument is a value whose type matches the second attribute of the object type, and so on. The total number of arguments to the constructor must match the total number of attributes of the object type.

If `type.name` is a varray or nested table type, then the expression list can contain zero or more arguments. Zero arguments implies construction of an empty collection. Otherwise, each argument corresponds to an element value whose type is the element type of the collection type.

Restriction on Type Constructor Invocation

In an invocation of a type constructor method, the number of parameters (`expr`) specified cannot exceed 999, even if the object type has more than 999 attributes. This limitation applies only when the constructor is called from SQL. For calls from PL/SQL, the PL/SQL limitations apply.

See Also:

* Oracle Database Object-Relational Developer's Guide* for additional information on constructor methods and *Oracle Database PL/SQL Language Reference* for information on PL/SQL limitations on calls to type constructors

Expression Example

This example uses the `cust_address_typ` type in the sample `oe` schema to show the use of an expression in the call to a constructor method (the PL/SQL is shown in italics):

```sql
CREATE TYPE address_book_t AS TABLE OF cust_address_typ;
DECLARE
```
myaddr cust_address_typ := cust_address_typ('500 Oracle Parkway', 94065, 'Redwood Shores', 'CA', 'USA');
alladdr address_book_t := address_book_t();
BEGIN
    INSERT INTO customers VALUES (666999, 'Joe', 'Smith', myaddr, NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL, NULL);
END;
/

Subquery Example

This example uses the warehouse_typ type in the sample schema oe to illustrate the use of a subquery in the call to the constructor method.

CREATE TABLE warehouse_tab OF warehouse_typ;

INSERT INTO warehouse_tab VALUES (warehouse_typ(101, 'new_wh', 201));

CREATE TYPE facility_typ AS OBJECT {
    facility_id NUMBER,
    warehouse_ref REF warehouse_typ};

CREATE TABLE buildings (b_id NUMBER, building facility_typ);

INSERT INTO buildings VALUES (10, facility_typ(102, (SELECT REF(w) FROM warehouse_tab w WHERE warehouse_name = 'new_wh')));

SELECT b.b_id, b.building.facility_id "FAC_ID",
DEREF(b.building.warehouse_ref) "WH" FROM buildings b;

<table>
<thead>
<tr>
<th>B_ID</th>
<th>FAC_ID</th>
<th>WH(WAREHOUSE_ID, WAREHOUSE_NAME, LOCATION_ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>102</td>
<td>WAREHOUSE_TYP(101, 'new_wh', 201)</td>
</tr>
</tbody>
</table>

5.17 Expression Lists

An expression list is a combination of other expressions.

expression_list ::= expr

Expression lists can appear in comparison and membership conditions and in GROUP BY clauses of queries and subqueries. An expression list in a comparison or membership condition is sometimes referred to as a row value constructor or row constructor.
Comparison and membership conditions appear in the conditions of WHERE clauses. They can contain either one or more comma-delimited expressions or one or more sets of expressions where each set contains one or more comma-delimited expressions. In the latter case (multiple sets of expressions):

- Each set is bounded by parentheses
- Each set must contain the same number of expressions
- The number of expressions in each set must match the number of expressions before the operator in the comparison condition or before the IN keyword in the membership condition.

A comma-delimited list of expressions can contain no more than 1000 expressions. A comma-delimited list of sets of expressions can contain any number of sets, but each set can contain no more than 1000 expressions.

The following are some valid expression lists in conditions:

(10, 20, 40)
('SCOTT', 'BLAKE', 'TAYLOR')
(('Guy', 'Himuro', 'GHIMURO'), ('Karen', 'Colmenares', 'KCOLMENA'))

In the third example, the number of expressions in each set must equal the number of expressions in the first part of the condition. For example:

```
SELECT * FROM employees
WHERE (first_name, last_name, email) IN
  (('Guy', 'Himuro', 'GHIMURO'), ('Karen', 'Colmenares', 'KCOLMENA'))
```

See Also:

Comparison Conditions and IN Condition conditions

In a simple GROUP BY clause, you can use either the upper or lower form of expression list:

```
SELECT department_id, MIN(salary) min, MAX(salary) max FROM employees
GROUP BY department_id, salary
ORDER BY department_id, min, max;
```

```
SELECT department_id, MIN(salary) min, MAX(salary) max FROM employees
GROUP BY (department_id, salary)
```

In ROLLUP, CUBE, and GROUPING SETS clauses of GROUP BY clauses, you can combine individual expressions with sets of expressions in the same expression list. The following example shows several valid grouping sets expression lists in one SQL statement:

```
SELECT
  prod_category, prod_subcategory, country_id, cust_city, count(*)
FROM products, sales, customers
WHERE sales.prod_id = products.prod_id
  AND sales.cust_id = customers.cust_id
  AND sales.time_id = '01-oct-00'
GROUP BY GROUPING SETS
```
{  
  (prod_category, prod_subcategory, country_id, cust_city),  
  (prod_category, prod_subcategory, country_id),  
  (prod_category, prod_subcategory),  
  country_id  
}
ORDER BY prod_category, prod_subcategory, country_id, cust_city;

See Also:

SELECT
A **condition** specifies a combination of one or more expressions and logical (Boolean) operators and returns a value of **TRUE**, **FALSE**, or **UNKNOWN**.

This chapter contains the following sections:

- About SQL Conditions
- Comparison Conditions
- Floating-Point Conditions
- Logical Conditions
- Model Conditions
- Multiset Conditions
- Pattern-matching Conditions
- Null Conditions
- XML Conditions
- SQL/JSON Conditions
- Compound Conditions
- BETWEEN Condition
- EXISTS Condition
- IN Condition
- IS OF type Condition

### 6.1 About SQL Conditions

Conditions can have several forms, as shown in the following syntax.
If you have installed Oracle Text, then you can create conditions with the built-in operators that are part of that product, including CONTAINS, CATSEARCH, and MATCHES. For more information on these Oracle Text elements, refer to Oracle Text Reference.

The sections that follow describe the various forms of conditions. You must use appropriate condition syntax whenever condition appears in SQL statements.

You can use a condition in the WHERE clause of these statements:

- DELETE
- SELECT
- UPDATE

You can use a condition in any of these clauses of the SELECT statement:

- WHERE
- START WITH
- CONNECT BY
- HAVING

A condition could be said to be of a logical data type, although Oracle Database does not formally support such a data type.

The following simple condition always evaluates to TRUE:

\[ 1 = 1 \]
The following more complex condition adds the `salary` value to the `commission_pct` value (substituting the value 0 for null) and determines whether the sum is greater than the number constant 25000:

\[
\text{NVL}(\text{salary}, 0) + \text{NVL}(\text{salary} + (\text{salary} \times \text{commission_pct}, 0) > 25000)
\]

Logical conditions can combine multiple conditions into a single condition. For example, you can use the `AND` condition to combine two conditions:

\[(1 = 1) \text{ AND } (5 < 7)\]

Here are some valid conditions:

- `name = 'SMITH'`
- `employees.department_id = departments.department_id`
- `hire_date > '01-JAN-08'`
- `job_id IN ('SA_MAN', 'SA_REP')`
- `salary BETWEEN 5000 AND 10000`
- `commission_pct IS NULL AND salary = 2100`

Oracle Database does not accept all conditions in all parts of all SQL statements. Refer to the section devoted to a particular SQL statement in this book for information on restrictions on the conditions in that statement.

### 6.1.1 Condition Precedence

**Precedence** is the order in which Oracle Database evaluates different conditions in the same expression. When evaluating an expression containing multiple conditions, Oracle evaluates conditions with higher precedence before evaluating those with lower precedence. Oracle evaluates conditions with equal precedence from left to right within an expression, with the following exceptions:

- Left to right evaluation is not guaranteed for multiple conditions connected using **AND**
- Left to right evaluation is not guaranteed for multiple conditions connected using **OR**

Table 6-1 lists the levels of precedence among SQL condition from high to low. Conditions listed on the same line have the same precedence. As the table indicates, Oracle evaluates operators before conditions.

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>SQL operators are evaluated before SQL</td>
<td>See Operator Precedence</td>
</tr>
<tr>
<td>conditions</td>

<td></td>
</tr>
<tr>
<td><strong>NOT</strong></td>
<td>exponentiation, logical negation</td>
</tr>
<tr>
<td><strong>AND</strong></td>
<td>conjunction</td>
</tr>
<tr>
<td><strong>OR</strong></td>
<td>disjunction</td>
</tr>
</tbody>
</table>
6.2 Comparison Conditions

Comparison conditions compare one expression with another. The result of such a comparison can be **TRUE**, **FALSE**, or **UNKNOWN**.

Large objects (LOBs) are not supported in comparison conditions. However, you can use PL/SQL programs for comparisons on **CLOB** data.

When comparing numeric expressions, Oracle uses numeric precedence to determine whether the condition compares **NUMBER**, **BINARY_FLOAT**, or **BINARY_DOUBLE** values. Refer to **Numeric Precedence** for information on numeric precedence.

When comparing character expressions, Oracle uses the rules described in **Data Type Comparison Rules**. The rules define how the character sets of the expressions are aligned before the comparison, the use of binary or linguistic comparison (collation), the use of blank-padded comparison semantics, and the restrictions resulting from limits imposed on collation keys, including reporting of the error **ORA-12742: unable to create the collation key**.

Two objects of nonscalar type are comparable if they are of the same named type and there is a one-to-one correspondence between their elements. In addition, nested tables of user-defined object types, even if their elements are comparable, must have **MAP** methods defined on them to be used in equality or **IN** conditions.

**See Also:**

*Oracle Database Object-Relational Developer’s Guide* for information on using **MAP** methods to compare objects

**Table 6-2** lists comparison conditions.

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Purpose</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Equality test.</td>
<td>SELECT * FROM employees WHERE salary = 2500 ORDER BY employee_id;</td>
</tr>
<tr>
<td>! =</td>
<td>Inequality test. Some forms of the inequality condition may be unavailable on some platforms.</td>
<td>SELECT * FROM employees WHERE salary != 2500 ORDER BY employee_id;</td>
</tr>
<tr>
<td>^=</td>
<td>logical_negation_symbol=</td>
<td></td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>Logical negation symbol</td>
<td></td>
</tr>
<tr>
<td>Type of Condition</td>
<td>Purpose</td>
<td>Example</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| >                 | Greater-than and less-than tests. | `SELECT * FROM employees`<br>`WHERE salary > 2500`<br>`ORDER BY employee_id;`
| <                 |          | `SELECT * FROM employees`<br>`WHERE salary < 2500`<br>`ORDER BY employee_id;` |
| >=                | Greater-than-or-equal-to and less-than-or-equal-to tests. | `SELECT * FROM employees`<br>`WHERE salary >= 2500`<br>`ORDER BY employee_id;`
| <=                |          | `SELECT * FROM employees`<br>`WHERE salary <= 2500`<br>`ORDER BY employee_id;` |
| op ANY            | "op" must be one of =, !=, >, <, <=, or >=. | `SELECT * FROM employees`<br>`WHERE salary = ANY`<br>`(SELECT salary`<br>`FROM employees`<br>`WHERE department_id = 30)`<br>`ORDER BY employee_id;` |
| op SOME           | op ANY compares a value on the left side either to each value in a list, or to each value returned by a query, whichever is specified on the right side, using the condition op. If any of these comparisons returns TRUE, op ANY returns TRUE. If all of these comparisons return FALSE, or the subquery on the right side returns no rows, op ANY returns FALSE. Otherwise, the return value is UNKNOWN. op ANY and op SOME are synonymous. |
| op ALL            | "op" must be one of =, !=, >, <, <=, or >=. | `SELECT * FROM employees`<br>`WHERE salary >= ALL (1400, 3000)`<br>`ORDER BY employee_id;` |

Note 1: `logical_negation_symbol` is the ASCII character with decimal value 170.

6.2.1 Simple Comparison Conditions

A simple comparison condition specifies a comparison with expressions or subquery results.
simple_comparison_condition ::= 

expression_list ::= 

If you use the lower form of this condition with a single expression to the left of the operator, then you can use the upper or lower form of expression_list. If you use the lower form of this condition with multiple expressions to the left of the operator, then you must use the lower form of expression_list. In either case, the expressions in expression_list must match in number and data type the expressions to the left of the operator. If you specify subquery, then the values returned by the subquery must match in number and data type the expressions to the left of the operator.

See Also:

Expression Lists for more information about combining expressions and SELECT for information about subqueries
6.2.2 Group Comparison Conditions

A group comparison condition specifies a comparison with any or all members in a list or subquery.

\[
\text{group\_comparison\_condition ::=}
\]

\[
\text{expression\_list ::=}
\]

If you use the upper form of this condition (with a single expression to the left of the operator), then you must use the upper form of \text{expression\_list}. If you use the lower form of this condition (with multiple expressions to the left of the operator), then you must use the lower form of \text{expression\_list}, and the expressions in each \text{expression\_list} must match in number and data type the expressions to the left of the operator. If you specify \text{subquery}, then the values returned by the subquery must match in number and data type the expressions to the left of the operator.
6.3 Floating-Point Conditions

The floating-point conditions let you determine whether an expression is infinite or is the undefined result of an operation (is not a number or NaN).

\[
\textit{floating\_point\_condition} ::= \\
\]

In both forms of floating-point condition, \( expr \) must resolve to a numeric data type or to any data type that can be implicitly converted to a numeric data type. Table 6-3 describes the floating-point conditions.

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Operation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS  [NOT] NAN</td>
<td>Returns TRUE if ( expr ) is the special value NaN when NOT is not specified. Returns TRUE if ( expr ) is not the special value NaN when NOT is specified.</td>
<td>SELECT COUNT(*) FROM employees WHERE commission_pct IS NOT NAN;</td>
</tr>
<tr>
<td>IS  [NOT] INFINITE</td>
<td>Returns TRUE if ( expr ) is the special value +INF or -INF when NOT is not specified. Returns TRUE if ( expr ) is neither +INF nor -INF when NOT is specified.</td>
<td>SELECT last_name FROM employees WHERE salary IS NOT INFINITE;</td>
</tr>
</tbody>
</table>

See Also:

- Floating-Point Numbers for more information on the Oracle implementation of floating-point numbers
- Implicit Data Conversion for more information on how Oracle converts floating-point data types

See Also:

- Expression Lists
- SELECT
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for comparison conditions
6.4 Logical Conditions

A logical condition combines the results of two component conditions to produce a single result based on them or to invert the result of a single condition. Table 6-4 lists logical conditions.

Table 6-4 Logical Conditions

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Operation</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT</td>
<td>Returns TRUE if the following condition is FALSE. Returns FALSE if it is TRUE. If it is UNKNOWN, then it remains UNKNOWN.</td>
<td>SELECT * FROM employees WHERE NOT (job_id IS NULL) ORDER BY employee_id; SELECT * FROM employees WHERE NOT (salary BETWEEN 1000 AND 2000) ORDER BY employee_id;</td>
</tr>
<tr>
<td>AND</td>
<td>Returns TRUE if both component conditions are TRUE. Returns FALSE if either is FALSE. Otherwise returns UNKNOWN.</td>
<td>SELECT * FROM employees WHERE job_id = 'PU_CLERK' AND department_id = 30 ORDER BY employee_id;</td>
</tr>
<tr>
<td>OR</td>
<td>Returns TRUE if either component condition is TRUE. Returns FALSE if both are FALSE. Otherwise returns UNKNOWN.</td>
<td>SELECT * FROM employees WHERE job_id = 'PU_CLERK' OR department_id = 10 ORDER BY employee_id;</td>
</tr>
</tbody>
</table>

Table 6-5 shows the result of applying the NOT condition to an expression.

Table 6-5 NOT Truth Table

<table>
<thead>
<tr>
<th>--</th>
<th>TRUE</th>
<th>FALSE</th>
<th>UNKNOWN</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOT</td>
<td>FALSE</td>
<td>TRUE</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

Table 6-6 shows the results of combining the AND condition to two expressions.

Table 6-6 AND Truth Table

<table>
<thead>
<tr>
<th>AND</th>
<th>TRUE</th>
<th>FALSE</th>
<th>UNKNOWN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>TRUE</td>
<td>FALSE</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>FALSE</td>
<td>FALSE</td>
<td>FALSE</td>
<td>FALSE</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>UNKNOWN</td>
<td>FALSE</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>
For example, in the WHERE clause of the following SELECT statement, the AND logical condition is used to ensure that only those hired before 2004 and earning more than $2500 a month are returned:

```sql
SELECT * FROM employees
WHERE hire_date < TO_DATE('01-JAN-2004', 'DD-MON-YYYY')
    AND salary > 2500
ORDER BY employee_id;
```

Table 6-7 shows the results of applying OR to two expressions.

<table>
<thead>
<tr>
<th>OR</th>
<th>TRUE</th>
<th>FALSE</th>
<th>UNKNOWN</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRUE</td>
<td>TRUE</td>
<td>TRUE</td>
<td>TRUE</td>
</tr>
<tr>
<td>FALSE</td>
<td>TRUE</td>
<td>FALSE</td>
<td>UNKNOWN</td>
</tr>
<tr>
<td>UNKNOWN</td>
<td>TRUE</td>
<td>UNKNOWN</td>
<td>UNKNOWN</td>
</tr>
</tbody>
</table>

For example, the following query returns employees who have a 40% commission rate or a salary greater than $20,000:

```sql
SELECT employee_id FROM employees
WHERE commission_pct = .4 OR salary > 20000
ORDER BY employee_id;
```

6.5 Model Conditions

Model conditions can be used only in the MODEL clause of a SELECT statement.

6.5.1 IS ANY Condition

The IS ANY condition can be used only in the model_clause of a SELECT statement. Use this condition to qualify all values of a dimension column, including NULL.

```sql
is_any_condition ::= 

| dimension_column | IS | ANY |
```

The condition always returns a Boolean value of TRUE in order to qualify all values of the column.

- model_clause and Model Expressions for information

Example

The following example sets sales for each product for year 2000 to 0:
SELECT country, prod, year, s
FROM sales_view_ref
MODEL
  PARTITION BY (country)
  DIMENSION BY (prod, year)
  MEASURES (sale s)
  IGNORE NAV
  UNIQUE DIMENSION
  RULES UPSERT SEQUENTIAL ORDER
  {
    s[ANY, 2000] = 0
  }
ORDER BY country, prod, year;

<table>
<thead>
<tr>
<th>COUNTRY</th>
<th>PROD</th>
<th>YEAR</th>
<th>S</th>
</tr>
</thead>
<tbody>
<tr>
<td>France</td>
<td>Mouse Pad</td>
<td>1998</td>
<td>2509.42</td>
</tr>
<tr>
<td>France</td>
<td>Mouse Pad</td>
<td>1999</td>
<td>3678.69</td>
</tr>
<tr>
<td>France</td>
<td>Mouse Pad</td>
<td>2000</td>
<td>0</td>
</tr>
<tr>
<td>France</td>
<td>Mouse Pad</td>
<td>2001</td>
<td>3269.09</td>
</tr>
<tr>
<td>France</td>
<td>Standard Mouse</td>
<td>1998</td>
<td>2390.83</td>
</tr>
<tr>
<td>France</td>
<td>Standard Mouse</td>
<td>1999</td>
<td>2280.45</td>
</tr>
<tr>
<td>France</td>
<td>Standard Mouse</td>
<td>2000</td>
<td>0</td>
</tr>
<tr>
<td>France</td>
<td>Standard Mouse</td>
<td>2001</td>
<td>2164.54</td>
</tr>
<tr>
<td>Germany</td>
<td>Mouse Pad</td>
<td>1998</td>
<td>5827.87</td>
</tr>
<tr>
<td>Germany</td>
<td>Mouse Pad</td>
<td>1999</td>
<td>8346.44</td>
</tr>
<tr>
<td>Germany</td>
<td>Mouse Pad</td>
<td>2000</td>
<td>0</td>
</tr>
<tr>
<td>Germany</td>
<td>Mouse Pad</td>
<td>2001</td>

<td>2000</td>
<td>0</td>
</tr>
<tr>
<td>Germany</td>
<td>Standard Mouse</td>
<td>2001</td>
<td>6456.13</td>
</tr>
</tbody>
</table>

16 rows selected.

The preceding example requires the view sales_view_ref. Refer to The MODEL clause: Examples to create this view.

6.5.2 IS PRESENT Condition

\textit{is\_present\_condition}:=

The \textit{IS PRESENT} condition can be used only in the \textit{model\_clause} of a \textit{SELECT} statement. Use this condition to test whether the cell referenced is present prior to the execution of the \textit{model\_clause}.

\begin{equation}
\text{cell\_reference} \text{ IS PRESENT}
\end{equation}

The condition returns \textit{TRUE} if the cell exists prior to the execution of the \textit{model\_clause} and \textit{FALSE} if it does not.

\textit{See Also:}

\textit{model\_clause} and Model Expressions for information
Example

In the following example, if sales of the Mouse Pad for year 1999 exist, then sales of the Mouse Pad for year 2000 is set to sales of the Mouse Pad for year 1999. Otherwise, sales of the Mouse Pad for year 2000 is set to 0.

```
SELECT country, prod, year, s
FROM sales_view_ref
MODEL
  PARTITION BY (country)
  DIMENSION BY (prod, year)
  MEASURES (sale s)
  IGNORE NAV
  UNIQUE DIMENSION
  RULES UPSERT SEQUENTIAL ORDER
  {
    s['Mouse Pad', 2000] =
      CASE WHEN s['Mouse Pad', 1999] IS PRESENT
        THEN s['Mouse Pad', 1999]
        ELSE 0
      END
  }
ORDER BY country, prod, year;
```

<table>
<thead>

</tr>
</tbody>
</table>
16 rows selected.

The preceding example requires the view `sales_view_ref`. Refer to The MODEL clause: Examples to create this view.

6.6 Multiset Conditions

Multiset conditions test various aspects of nested tables.

6.6.1 IS A SET Condition

Use IS A SET conditions to test whether a specified nested table is composed of unique elements. The condition returns UNKNOWN if the nested table is NULL. Otherwise, it returns TRUE if the nested table is a set, even if it is a nested table of length zero, and FALSE otherwise.
### is_a_set_condition::=

\[\text{nested_table} \rightarrow \text{IS} \rightarrow \text{NOT} \rightarrow \text{A} \rightarrow \text{SET} \]

**Example**

The following example selects from the table `customers_demo` those rows in which the `cust_address_ntab` nested table column contains unique elements:

```sql
SELECT customer_id, cust_address_ntab
FROM customers_demo
WHERE cust_address_ntab IS A SET
ORDER BY customer_id;
```

<table>
<thead>
<tr>
<th>CUSTOMER_ID</th>
<th>CUST_ADDRESS_NTAB(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('514 W Superior St', '46901', 'Kokomo', 'IN', 'US'))</td>
</tr>
<tr>
<td>102</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US'))</td>
</tr>
<tr>
<td>103</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US'))</td>
</tr>
<tr>
<td>104</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US'))</td>
</tr>
<tr>
<td>105</td>
<td>CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP('4019 W 3rd St', '47404', 'Bloomington', 'IN', 'US'))</td>
</tr>
</tbody>
</table>

The preceding example requires the table `customers_demo` and a nested table column containing data. Refer to "Multiset Operators" to create this table and nested table column.

### 6.6.2 IS EMPTY Condition

Use the `IS [NOT] EMPTY` conditions to test whether a specified nested table is empty. A nested table that consists of a single value, a `NULL`, is not considered an empty nested table.

### is_empty_condition::=

\[\text{nested_table} \rightarrow \text{IS} \rightarrow \text{NOT} \rightarrow \text{EMPTY} \]

The condition returns a Boolean value: `TRUE` for an `IS EMPTY` condition if the collection is empty, and `TRUE` for an `IS NOT EMPTY` condition if the collection is not empty. If you specify `NULL` for the nested table or varray, then the result is `NULL`.

**Example**

The following example selects from the sample table `pm.print_media` those rows in which the `ad_textdocs_ntab` nested table column is not empty:

```sql
SELECT product_id, TO_CHAR(ad_finaltext) AS text
FROM print_media
WHERE ad_textdocs_ntab IS NOT EMPTY
ORDER BY product_id, text;
```
6.6.3 MEMBER Condition

A member_condition is a membership condition that tests whether an element is a member of a nested table. The return value is TRUE if expr is equal to a member of the specified nested table or varray. The return value is NULL if expr is null or if the nested table is empty.

- expr must be of the same type as the element type of the nested table.
- The OF keyword is optional and does not change the behavior of the condition.
- The NOT keyword reverses the Boolean output: Oracle returns FALSE if expr is a member of the specified nested table.
- The element types of the nested table must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

Example

The following example selects from the table customers_demo those rows in which the cust_address_ntab nested table column contains the values specified in the WHERE clause:

```
SELECT customer_id, cust_address_ntab
FROM customers_demo
WHERE cust_address_typ('8768 N State Rd 37', 47404,
    'Bloomington', 'IN', 'US')
MEMBER OF cust_address_ntab
ORDER BY customer_id;
```

The preceding example requires the table customers_demo and a nested table column containing data. Refer to Multiset Operators to create this table and nested table column.

6.6.4 SUBMULTISET Condition

The SUBMULTISET condition tests whether a specified nested table is a submultiset of another specified nested table.

The operator returns a Boolean value. TRUE is returned when nested_table1 is a submultiset of nested_table2. nested_table1 is a submultiset of nested_table2 when one of the following conditions occur:

- nested_table1 is not null and contains no rows. TRUE is returned even if nested_table2 is null since an empty multiset is a submultiset of any non-null replacement for nested_table2.
• nested_table1 and nested_table2 are not null, nested_table1 does not contain a null element, and there is a one-to-one mapping of each element in nested_table1 to an equal element in nested_table2.

NULL is returned when one of the following conditions occurs:

• nested_table1 is null.
• nested_table2 is null, and nested_table1 is not null and not empty.
• nested_table1 is a submultiset of nested_table2 after modifying each null element of nested_table1 and nested_table2 to some non-null value, enabling a one-to-one mapping of each element in nested_table1 to an equal element in nested_table2.

If none of the above conditions occur, then FALSE is returned.

**submultiset_condition ::=**

```
  nested_table1
  NOT
  SUBMULTISET
  OF
  nested_table2
```

• The **OF** keyword is optional and does not change the behavior of the operator.
• The **NOT** keyword reverses the Boolean output: Oracle returns FALSE if nested_table1 is a subset of nested_table2.
• The element types of the nested table must be comparable. Refer to Comparison Conditions for information on the comparability of nonscalar types.

**Example**

The following example selects from the customers_demo table those rows in which the cust_address_ntab nested table is a submultiset of the cust_address2_ntab nested table:

```sql
SELECT customer_id, cust_address_ntab
FROM customers_demo
WHERE cust_address_ntab SUBMULTISET OF cust_address2_ntab
ORDER BY customer_id;
```

The preceding example requires the table customers_demo and two nested table columns containing data. Refer to Multiset Operators to create this table and nested table columns.

### 6.7 Pattern-matching Conditions

The pattern-matching conditions compare character data.

#### 6.7.1 LIKE Condition

The **LIKE** conditions specify a test involving pattern matching. Whereas the equality operator (=) exactly matches one character value to another, the **LIKE** conditions match a portion of one character value to another by searching the first value for the pattern specified by the second. **LIKE** calculates strings using characters as defined by
the input character set. LIKEC uses Unicode complete characters. LIKE2 uses UCS2 code points. LIKE4 uses UCS4 code points.

like_condition::=

In this syntax:

- char1 is a character expression, such as a character column, called the search value.
- char2 is a character expression, usually a literal, called the pattern.
- esc_char is a character expression, usually a literal, called the escape character.

The LIKE condition is the best choice in almost all situations. Use the following guidelines to determine whether any of the variations would be helpful in your environment:

- Use LIKE2 to process strings using UCS-2 semantics. LIKE2 treats a Unicode supplementary character as two characters.
- Use LIKE4 to process strings using UCS-4 semantics. LIKE4 treats a Unicode supplementary character as one character.
- Use LIKEC to process strings using Unicode complete character semantics. LIKEC treats a composite character as one character.

If esc_char is not specified, then there is no default escape character. If any of char1, char2, or esc_char is null, then the result is unknown. Otherwise, the escape character, if specified, must be a character string of length 1.

All of the character expressions (char1, char2, and esc_char) can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. If they differ, then Oracle converts all of them to the data type of char1.

The pattern can contain special pattern-matching characters:

- An underscore (_) in the pattern matches exactly one character (as opposed to one byte in a multibyte character set) in the value.
- A percent sign (%) in the pattern can match zero or more characters (as opposed to bytes in a multibyte character set) in the value. The pattern '%' cannot match a null.

You can include the actual characters % or _ in the pattern by using the ESCAPE clause, which identifies the escape character. If the escape character precedes the character % or _ in the pattern, then Oracle interprets this character literally in the pattern rather than as a special pattern-matching character. You can also search for the escape character itself by repeating it. For example, if @ is the escape character, then you can use @@ to search for @.
Note:

Only ASCII-equivalent underscore (_) and percent (%) characters are recognized as pattern-matching characters. Their full-width variants, present in East Asian character sets and in Unicode, are treated as normal characters.

Table 6-8 describes the LIKE conditions.

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Operation</th>
<th>Example</th>
</tr>
</thead>
</table>
| x [NOT] LIKE y    | TRUE if x does [not] match the pattern y. Within y, the character % matches any string of zero or more characters except null. The character _ matches any single character. Any character can follow ESCAPE except percent (%) and underbar (_). A wildcard character is treated as a literal if preceded by the escape character. | SELECT last_name
FROM employees
WHERE last_name LIKE '%A\_B%' ESCAPE '\'
ORDER BY last_name; |

To process the LIKE conditions, Oracle divides the pattern into subpatterns consisting of one or two characters each. The two-character subpatterns begin with the escape character and the other character is %, or _, or the escape character.

Let \( P_1, P_2, ..., P_n \) be these subpatterns. The like condition is true if there is a way to partition the search value into substrings \( S_1, S_2, ..., S_n \) so that for all \( i \) between 1 and \( n \):

- If \( P_i \) is _, then \( S_i \) is a single character.
- If \( P_i \) is %, then \( S_i \) is any string.
- If \( P_i \) is two characters beginning with an escape character, then \( S_i \) is the second character of \( P_i \).
- Otherwise, \( P_i = S_i \).

With the LIKE conditions, you can compare a value to a pattern rather than to a constant. The pattern must appear after the LIKE keyword. For example, you can issue the following query to find the salaries of all employees with names beginning with 'R':

```
SELECT salary
FROM employees
WHERE last_name LIKE 'R%'
ORDER BY salary;
```

The following query uses the = operator, rather than the LIKE condition, to find the salaries of all employees with the name 'R%':

```
SELECT salary
FROM employees
WHERE last_name = 'R%
ORDER BY salary;
```
The following query finds the salaries of all employees with the name 'SM%'. Oracle interprets 'SM%' as a text literal, rather than as a pattern, because it precedes the LIKE keyword:

```sql
SELECT salary
FROM employees
WHERE 'SM%' LIKE last_name
ORDER BY salary;
```

**Collation and Case Sensitivity**

The LIKE condition is collation-sensitive. Oracle Database compares the subpattern Pi to the substring Si in the processing algorithm above using the collation determined from the derived collations of `char1` and `char2`. If this collation is case-insensitive, the pattern-matching is case-insensitive as well.

**See Also:**

*Oracle Database Globalization Support Guide* for more information on case- and accent-insensitive collations and on collation determination rules for the LIKE condition

**Pattern Matching on Indexed Columns**

When you use LIKE to search an indexed column for a pattern, Oracle can use the index to improve performance of a query if the leading character in the pattern is not % or _. In this case, Oracle can scan the index by this leading character. If the first character in the pattern is % or _, then the index cannot improve performance because Oracle cannot scan the index.

**LIKE Condition: General Examples**

This condition is true for all `last_name` values beginning with Ma:

```
last_name LIKE 'Ma'
```

All of these `last_name` values make the condition true:

```
Mallin, Markle, Marlow, Marvins, Mavris, Matos
```

Case is significant, so `last_name` values beginning with MA, ma, and mA make the condition false.

Consider this condition:

```
last_name LIKE 'SMITH_'
```

This condition is true for these `last_name` values:

```
SMITHE, SMITHY, SMITHS
```

This condition is false for SMITH because the special underscore character (_) must match exactly one character of the `last_name` value.
ESCAPE Clause Example

The following example searches for employees with the pattern A_B in their name:

```sql
SELECT last_name
FROM employees
WHERE last_name LIKE '%A\_B%' ESCAPE '\'
ORDER BY last_name;
```

The **ESCAPE** clause identifies the backslash (\) as the escape character. In the pattern, the escape character precedes the underscore (_). This causes Oracle to interpret the underscore literally, rather than as a special pattern matching character.

Patterns Without % Example

If a pattern does not contain the % character, then the condition can be true only if both operands have the same length. Consider the definition of this table and the values inserted into it:

```sql
CREATE TABLE ducks (f CHAR(6), v VARCHAR2(6));
INSERT INTO ducks VALUES ('DUCK', 'DUCK');
SELECT '*'||f||'*' "char",
     '*'||v||'*' "varchar"
FROM ducks;
```

<table>
<thead>
<tr>
<th>char</th>
<th>varchar</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>DUCK</em></td>
<td><em>DUCK</em></td>
</tr>
</tbody>
</table>

Because Oracle blank-pads CHAR values, the value of `f` is blank-padded to 6 bytes. `v` is not blank-padded and has length 4.

6.7.2 REGEXP_LIKE Condition

**REGEXP_LIKE** is similar to the LIKE condition, except **REGEXP_LIKE** performs regular expression matching instead of the simple pattern matching performed by LIKE. This condition evaluates strings using characters as defined by the input character set.

This condition complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

```sql
regexp_like_condition ::= REGEXP_LIKE ( source_char , pattern
match_param
)
```

- **source_char** is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.
- **pattern** is the regular expression. It is usually a text literal and can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. It can contain up to 512 bytes. If the data type of **pattern** is different from the data type of **source_char**, ...
Oracle converts `pattern` to the data type of `source_char`. For a listing of the operators you can specify in `pattern`, refer to Oracle Regular Expression Support.

- `match_param` is a character expression of the data type `VARCHAR2` or `CHAR` that lets you change the default matching behavior of the condition.

  The value of `match_param` can include one or more of the following characters:
  
  - 'i' specifies case-insensitive matching, even if the determined collation of the condition is case-sensitive.
  - 'c' specifies case-sensitive and accent-sensitive matching, even if the determined collation of the condition is case-insensitive or accent-insensitive.
  - 'n' allows the period (.), which is the match-any-character wildcard character, to match the newline character. If you omit this parameter, then the period does not match the newline character.
  - 'm' treats the source string as multiple lines. Oracle interprets `^` and `$` as the start and end, respectively, of any line anywhere in the source string, rather than only at the start or end of the entire source string. If you omit this parameter, then Oracle treats the source string as a single line.
  - 'x' ignores whitespace characters. By default, whitespace characters match themselves.

  If the value of `match_param` contains multiple contradictory characters, then Oracle uses the last character. For example, if you specify 'ic', then Oracle uses case-sensitive and accent-sensitive matching. If the value contains a character other than those shown above, then Oracle returns an error.

If you omit `match_param`, then:

- The default case and accent sensitivity are determined by the determined collation of the `REGEXP_LIKE` condition.
- A period (.) does not match the newline character.
- The source string is treated as a single line.

Similar to the `LIKE` condition, the `REGEXP_LIKE` condition is collation-sensitive.

---

**See Also:**

- LIKE Condition
- `REGEXP_INSTR`, `REGEXP_REPLACE`, and `REGEXP_SUBSTR` for functions that provide regular expression support
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for the `REGEXP_LIKE` condition

---

**Examples**

The following query returns the first and last names for those employees with a first name of Steven or Stephen (where `first_name` begins with Ste and ends with en and in between is either v or ph):

```
SELECT first_name, last_name
FROM employees
```
WHERE REGEXP_LIKE (first_name, '^Ste(v|ph)en$')
ORDER BY first_name, last_name;

<table>
<thead>
<tr>
<th>FIRST_NAME</th>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steven</td>
<td>King</td>
</tr>
<tr>
<td>Steven</td>
<td>Markle</td>
</tr>
<tr>
<td>Stephen</td>
<td>Stiles</td>
</tr>
</tbody>
</table>

The following query returns the last name for those employees with a double vowel in their last name (where last_name contains two adjacent occurrences of either a, e, i, o, or u, regardless of case):

```sql
SELECT last_name
FROM employees
WHERE REGEXP_LIKE (last_name, '([aeiou])\1', 'i')
ORDER BY last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>De Haan</td>
</tr>
<tr>
<td>Greenberg</td>
</tr>
<tr>
<td>Khoo</td>
</tr>
<tr>
<td>Gee</td>
</tr>
<tr>
<td>Greene</td>
</tr>
<tr>
<td>Lee</td>
</tr>
<tr>
<td>Bloom</td>
</tr>
<tr>
<td>Feeney</td>
</tr>
</tbody>
</table>

### 6.8 Null Conditions

A NULL condition tests for nulls. This is the only condition that you should use to test for nulls.

```
null_condition::=
```

![null_condition](image)

**Table 6-9** lists the null conditions.

**Table 6-9  Null Condition**

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Operation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS [NOT] NULL</td>
<td>Tests for nulls. See Also: Nulls</td>
<td>SELECT last_name FROM employees WHERE commission_pct IS NULL ORDER BY last_name;</td>
</tr>
</tbody>
</table>
6.9 XML Conditions

XML conditions determine whether a specified XML resource can be found in a specified path.

6.9.1 EQUALS_PATH Condition

The EQUALS_PATH condition determines whether a resource in the Oracle XML database can be found in the database at a specified path.

Use this condition in queries to RESOURCE_VIEW and PATH_VIEW. These public views provide a mechanism for SQL access to data stored in the XML database repository. RESOURCE_VIEW contains one row for each resource in the repository, and PATH_VIEW contains one row for each unique path in the repository.

```
equals_path_condition ::= 

EQUALS_PATH (column, path_string, correlation_integer)
```

This condition applies only to the path as specified. It is similar to but more restrictive than UNDER_PATH.

For path_string, specify the (absolute) path name to resolve. This can contain components that are hard or weak resource links.

The optional correlation_integer argument correlates the EQUALS_PATH condition with its ancillary functions DEPTH and PATH.

See Also:

UNDER_PATH Condition, DEPTH, and PATH

Example

The view RESOURCE_VIEW computes the paths (in the any_path column) that lead to all XML resources (in the res column) in the database repository. The following example queries the RESOURCE_VIEW view to find the paths to the resources in the sample schema oe. The EQUALS_PATH condition causes the query to return only the specified path:

```
SELECT ANY_PATH FROM RESOURCE_VIEW
    WHERE EQUALS_PATH(res, '/sys/schemas/OE/www.example.com')=1;
```

```
ANY_PATH
-------------------------------
/sys/schemas/OE/www.example.com
```

Compare this example with that for UNDER_PATH Condition.
6.9.2 UNDER_PATH Condition

The UNDER_PATH condition determines whether resources specified in a column can be found under a particular path specified by path_string in the Oracle XML database repository. The path information is computed by the RESOURCE_VIEW view, which you query to use this condition.

Use this condition in queries to RESOURCE_VIEW and PATH_VIEW. These public views provide a mechanism for SQL access to data stored in the XML database repository. RESOURCE_VIEW contains one row for each resource in the repository, and PATH_VIEW contains one row for each unique path in the repository.

```
under_path_condition ::= 
```

The optional levels argument indicates the number of levels down from path_string Oracle should search. For levels, specify any nonnegative integer.

The optional correlation_integer argument correlates the UNDER_PATH condition with its ancillary functions PATH and DEPTH.

See Also:
The related condition EQUALS_PATH Condition and the ancillary functions DEPTH and PATH

Example

The view RESOURCE_VIEW computes the paths (in the any_path column) that lead to all XML resources (in the res column) in the database repository. The following example queries the RESOURCE_VIEW view to find the paths to the resources in the sample schema oe. The query returns the path of the XML schema that was created in XMLType Table Examples:

```
SELECT ANY_PATH FROM RESOURCE_VIEW
   WHERE UNDER_PATH(res, '/sys/schemas/OE/www.example.com')=1;
```

```
ANY_PATH
----------------------------------------------
/sys/schemas/OE/www.example.com/xwarehouses.xsd
```

6.10 SQL/JSON Conditions

SQL/JSON conditions allow you to test JavaScript Object Notation (JSON) data as follows:

- **IS JSON Condition** lets you test whether an expression is syntactically correct JSON data
- **JSON_EXISTS Condition** lets you test whether a specified JSON value exists in JSON data.
- **JSON_TEXTCONTAINS Condition** lets you test whether a specified character string exists in JSON property values.

**JSON_condition**:=

6.10.1 IS JSON Condition

Use this SQL/JSON condition to test whether an expression is syntactically correct, or well-formed, JSON data.

- If you specify **IS JSON**, then this condition returns **TRUE** if the expression is well-formed JSON data and **FALSE** if the expression is not well-formed JSON data.
- If you specify **IS NOT JSON**, then this condition returns **TRUE** if the expression is not well-formed JSON data and **FALSE** if the expression is well-formed JSON data.

**is_JSON_condition**:=

- Use **expr** to specify the JSON data to be evaluated. Specify an expression that evaluates to a text literal. If **expr** is a column, then the column must be of data type VARCHAR2, CLOB, or BLOB. If **expr** evaluates to null or a text literal of length zero, then this condition returns **UNKNOWN**.
- You must specify **FORMAT JSON** if **expr** is a column of data type BLOB.
- If you specify **STRICT**, then this condition considers only strict JSON syntax to be well-formed JSON data. If you specify **LAX**, then this condition also considers lax JSON syntax to be well-formed JSON data. The default is **LAX**. Refer to *Oracle Database JSON Developer’s Guide* for more information on strict and lax JSON syntax.
- If you specify **WITH UNIQUE KEYS**, then this condition considers JSON data to be well-formed only if key names are unique within each object. If you specify **WITHOUT UNIQUE KEYS**, then this condition considers JSON data to be well-formed.
even if duplicate key names occur within an object. A WITHOUT UNIQUE KEYS test performs faster than a WITH UNIQUE KEYS test. The default is WITHOUT UNIQUE KEYS.

Examples

Testing for STRICT or LAX JSON Syntax: Example

The following statement creates table t with column coll:

CREATE TABLE t (coll VARCHAR2(100));

The following statements insert values into column coll of table t:

INSERT INTO t VALUES ( '[ "LIT192", "CS141", "HIS160" ]' );
INSERT INTO t VALUES ( '{ "Name": "John" }' );
INSERT INTO t VALUES ( '{ "Grade Values" : { A : 4.0, B : 3.0, C : 2.0 } }' );
INSERT INTO t VALUES ( '{ "isEnrolled" : true }' );
INSERT INTO t VALUES ( '{ "isMatriculated" : false }' );
INSERT INTO t VALUES (NULL);
INSERT INTO t VALUES ("This is not well-formed JSON data");

The following statement queries table t and returns coll values that are well-formed JSON data. Because neither the STRICT nor LAX keyword is specified, this example uses the default LAX setting. Therefore, this query returns values that use strict or lax JSON syntax.

```
SELECT coll
FROM t
WHERE coll IS JSON;
```

<table>
<thead>
<tr>
<th>COL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ &quot;LIT192&quot;, &quot;CS141&quot;, &quot;HIS160&quot; ]</td>
</tr>
<tr>
<td>{ &quot;Name&quot;: &quot;John&quot; }</td>
</tr>
<tr>
<td>{ &quot;Grade Values&quot; : { A : 4.0, B : 3.0, C : 2.0 } }</td>
</tr>
<tr>
<td>{ &quot;isEnrolled&quot; : true }</td>
</tr>
<tr>
<td>{ &quot;isMatriculated&quot; : false }</td>
</tr>
</tbody>
</table>

The following statement queries table t and returns coll values that are well-formed JSON data. This example specifies the STRICT setting. Therefore, this query returns only values that use strict JSON syntax.

```
SELECT coll
FROM t
WHERE coll IS JSON STRICT;
```

<table>
<thead>
<tr>
<th>COL1</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ &quot;LIT192&quot;, &quot;CS141&quot;, &quot;HIS160&quot; ]</td>
</tr>
<tr>
<td>{ &quot;Name&quot;: &quot;John&quot; }</td>
</tr>
<tr>
<td>{ &quot;isEnrolled&quot; : true }</td>
</tr>
</tbody>
</table>

The following statement queries table t and returns coll values that use lax JSON syntax, but omits coll values that use strict JSON syntax. Therefore, this query returns only values that contain the exceptions allowed in lax JSON syntax.

```
SELECT coll
FROM t
WHERE coll IS NOT JSON STRICT AND coll IS JSON LAX;
```
COL1
--------------------------------------------------
{ "Grade Values" : { A : 4.0, B : 3.0, C : 2.0 } }
{ "isMatriculated" : False }

Testing for Unique Keys: Example

The following statement creates table `t` with column `col1`:

```
CREATE TABLE t (col1 VARCHAR2(100));
```

The following statements insert values into column `col1` of table `t`:

```
INSERT INTO t VALUES ('{a:100, b:200, c:300}');
INSERT INTO t VALUES ('{a:100, a:200, b:300}');
INSERT INTO t VALUES ('{a:100, b : {a:100, c:300}}');
```

The following statement queries table `t` and returns `col1` values that are well-formed JSON data with unique key names within each object:

```
SELECT col1 FROM t 
WHERE col1 IS JSON WITH UNIQUE KEYS;
```

```
{a:100, b:200, c:300}
{a:100, b : {a:100, c:300}}
```

The second row is returned because, while the key name `a` appears twice, it is in two different objects.

The following statement queries table `t` and returns `col1` values that are well-formed JSON data, regardless of whether there are unique key names within each object:

```
SELECT col1 FROM t 
WHERE col1 IS JSON WITHOUT UNIQUE KEYS;
```

```
{a:100, b:200, c:300}
{a:100, a:200, b:300}
{a:100, b : {a:100, c:300}}
```

Using IS JSON as a Check Constraint: Example

The following statement creates table `j_purchaseorder`, which will store JSON data in column `po_document`. The statement uses the IS JSON condition as a check constraint to ensure that only well-formed JSON is stored in column `po_document`.

```
CREATE TABLE j_purchaseorder
(id RAW (16) NOT NULL,
 date_loaded TIMESTAMP(6) WITH TIME ZONE,
 po_document CLOB CONSTRAINT ensure_json CHECK (po_document IS JSON));
```

6.10.2 JSON_EXISTS Condition

Use the SQL/JSON condition `JSON_EXISTS` to test whether a specified JSON value exists in JSON data. This condition returns `TRUE` if the JSON value exists and `FALSE` if the JSON value does not exist.
JSON_exists_condition ::= 

```
JSON_EXISTS(expr
FORMAT JSON
, JSON_basic_path_expression
JSON_passing_clause JSON_exists_on_error_clause)
```

(\textit{JSON_basic_path_expression}: See Oracle Database JSON Developer’s Guide)

\textbf{JSON_passing_clause ::=}

```
PASSING expr AS identifier
```

\textbf{JSON_exists_on_error_clause ::=}

```
ERROR | TRUE | FALSE
```

\textit{expr}

Use this clause to specify the JSON data to be evaluated. For \textit{expr}, specify an expression that evaluates to a text literal. If \textit{expr} is a column, then the column must be of data type \texttt{VARCHAR2}, \texttt{CLOB}, or \texttt{BLOB}. If \textit{expr} evaluates to null or a text literal of length zero, then the condition returns \texttt{UNKNOWN}.

If \textit{expr} is not a text literal of well-formed JSON data using strict or lax syntax, then the condition returns \texttt{FALSE} by default. You can use the \textit{JSON_exists_on_error_clause} to override this default behavior. Refer to the \texttt{JSON_exists_on_error_clause}.

**FORMAT JSON**

You must specify \texttt{FORMAT JSON} if \textit{expr} is a column of data type \texttt{BLOB}.

\textbf{JSON_basic_path_expression}

Use this clause to specify a SQL/JSON path expression. The condition uses the path expression to evaluate \textit{expr} and determine if a JSON value that matches, or satisfies, the path expression exists. The path expression must be a text literal, but it can contain variables whose values are passed to the path expression by the \textit{JSON_passing_clause}. See Oracle Database JSON Developer’s Guide for the full semantics of \textit{JSON_basic_path_expression}. 
**JSON_passing_clause**

Use this clause to pass values to the path expression. For \textit{expr}, specify a value of data type \texttt{VARCHAR2}, \texttt{NUMBER}, \texttt{BINARY_DOUBLE}, \texttt{DATE}, \texttt{TIMESTAMP}, or \texttt{TIMESTAMP WITH TIME ZONE}. The result of evaluating \textit{expr} is bound to the corresponding identifier in the \texttt{JSON_basic_path_expression}.

**JSON_exists_on_error_clause**

Use this clause to specify the value returned by this condition when \textit{expr} is not well-formed JSON data.

You can specify the following clauses:

- **ERROR ON ERROR** - Returns the appropriate Oracle error when \textit{expr} is not well-formed JSON data.
- **TRUE ON ERROR** - Returns \texttt{TRUE} when \textit{expr} is not well-formed JSON data.
- **FALSE ON ERROR** - Returns \texttt{FALSE} when \textit{expr} is not well-formed JSON data. This is the default.

**Examples**

The following statement creates table \texttt{t} with column \texttt{name}:

```
CREATE TABLE t (name VARCHAR2(100));
```

The following statements insert values into column \texttt{name} of table \texttt{t}:

```
INSERT INTO t VALUES ('[[first:"John"], {middle:"Mark"}, {last:"Smith"}]');
INSERT INTO t VALUES ('[[first:"Mary"], {last:"Jones"}]');
INSERT INTO t VALUES ('[[first:"Jeff"], {last:"Williams"}]');
INSERT INTO t VALUES ('[[first:"Jean"], {middle:"Anne"}, {last:"Brown"}]');
INSERT INTO t VALUES (NULL);
INSERT INTO t VALUES ('This is not well-formed JSON data');
```

The following statement queries column \texttt{name} in table \texttt{t} and returns JSON data that consists of an array whose first element is an object with property name \texttt{first}. The \texttt{ON ERROR} clause is not specified. Therefore, the \texttt{JSON_EXISTS} condition returns \texttt{FALSE} for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[0].first');
```

```
 NAME
-----------------------------
[[first:"John"], {middle:"Mark"}, {last:"Smith"}]
[[first:"Mary"], {last:"Jones"}]
[[first:"Jeff"], {last:"Williams"}]
[[first:"Jean"], {middle:"Anne"}, {last:"Brown"}]
```

The following statement queries column \texttt{name} in table \texttt{t} and returns JSON data that consists of an array whose second element is an object with property name \texttt{middle}. The \texttt{ON ERROR} clause is not specified. Therefore, the \texttt{JSON_EXISTS} condition returns \texttt{FALSE} for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[1].middle');
```
The following statement is similar to the previous statement, except that the `TRUE ON ERROR` clause is specified. Therefore, the `JSON_EXISTS` condition returns `TRUE` for values that are not well-formed JSON data.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[1].middle' TRUE ON ERROR);
```

This is not well-formed JSON data

The following statement queries column `name` in table `t` and returns JSON data that consists of an array that contains an element that is an object with property name `last`. The wildcard symbol (`*`) is specified for the array index. Therefore, the query returns arrays that contain such an object, regardless of its index number in the array.

```
SELECT name FROM t
  WHERE JSON_EXISTS(name, '$[*].last');
```

6.10.3 JSON_TEXTCONTAINS Condition

Use the SQL/JSON condition `JSON_TEXTCONTAINS` to test whether a specified character string exists in JSON property values. You can use this condition to filter JSON data on a specific word or number.

This condition takes the following arguments:

- A table or view column that contains JSON data. A JSON search index, which is an Oracle Text index designed specifically for use with JSON data, must be defined on the column. Each row of JSON data in the column is referred to as a JSON document.
- A SQL/JSON path expression. The path expression is applied to each JSON document in an attempt to match a specific JSON object within the document. The path expression can contain only JSON object steps; it cannot contain JSON array steps.
- A character string. The condition searches for the character string in all of the string and numeric property values in the matched JSON object, including array values. The string must exist as a separate word in the property value. For example, if you search for 'beth', then a match will be found for string property value "beth smith", but not for "elizabeth smith". If you search for '10', then a match will be found for numeric property value 10 or string property value "10 main street", but a match will not be found for numeric property value 110 or string property value "102 main street".
This condition returns true if a match is found, and false if a match is not found.

\[
\text{JSON\textunderscore textcontains\textunderscore condition::=}
\]

\[
\text{JSON\textunderscore TEXTCONTAINS (column, JSON\_basic\_path\_expression, string)}
\]

\(\text{(JSON\_basic\_path\_expression: See Oracle Database JSON Developer's Guide)}\)

**column**

Specify the name of the table or view column containing the JSON data to be tested. The column must be of data type VARCHAR2, CLOB, or BLOB. A JSON search index, which is an Oracle Text index designed specifically for use with JSON data, must be defined on the column. If a column value is a null or a text literal of length zero, then the condition returns unknown.

If a column value is not a text literal of well-formed JSON data using strict or lax syntax, then the condition returns false.

**JSON\_basic\_path\_expression**

Use this clause to specify a SQL/JSON path expression. The condition uses the path expression to evaluate column and determine if a JSON value that matches, or satisfies, the path expression exists. The path expression must be a text literal. See Oracle Database JSON Developer's Guide for the full semantics of JSON\_basic\_path\_expression.

**string**

The condition searches for the character string specified by string. The string must be enclosed in single quotation marks.

**Examples**

The following statement creates table families with column family_doc:

```
CREATE TABLE families (family_doc VARCHAR2(200));
```

The following statement creates a JSON search index on column family_doc:

```
CREATE INDEX ix
ON families(family_doc)
INDEXTYPE IS CTXSYS.CONTEXT
PARAMETERS ('SECTION GROUP CTXSYS.JSON\_SECTION\_GROUP SYNCR (ON COMMIT)');
```

The following statements insert JSON documents that describe families into column family_doc:

```
INSERT INTO families
VALUES ('{family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}}');

INSERT INTO families
VALUES ('{family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}}');

INSERT INTO families
VALUES ('{family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}}');
```
The following statement commits the transaction:

```sql
COMMIT;
```

The following query returns the JSON documents that contain 10 in any property value in the document:

```sql
SELECT family_doc FROM families
WHERE JSON_TEXTCONTAINS(family_doc, '$', '10');
```

FAMILY_DOC

| {family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}} |
| {family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}} |
| {family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}} |

The following query returns the JSON documents that contain 10 in the id property value:

```sql
SELECT family_doc FROM families
WHERE JSON_TEXTCONTAINS(family_doc, '$.family.id', '10');
```

FAMILY_DOC

| {family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}} |

The following query returns the JSON documents that have a 10 in the array of values for the ages property:

```sql
SELECT family_doc FROM families
WHERE JSON_TEXTCONTAINS(family_doc, '$.family.ages', '10');
```

FAMILY_DOC

| {family : {id:11, ages:[42,40,10,5], address : {street : "200 East Street", apt : 20}}} |

The following query returns the JSON documents that have a 10 in the address property value:

```sql
SELECT family_doc FROM families
WHERE JSON_TEXTCONTAINS(family_doc, '$.family.address', '10');
```

FAMILY_DOC

| {family : {id:10, ages:[40,38,12], address : {street : "10 Main Street"}}} |
| {family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}} |

The following query returns the JSON documents that have a 10 in the apt property value:

```sql
SELECT family_doc FROM families
WHERE JSON_TEXTCONTAINS(family_doc, '$.family.address.apt', '10');
```

FAMILY_DOC

| {family : {id:12, ages:[25,23], address : {street : "300 Oak Street", apt : 10}}} |

6.11 Compound Conditions

A compound condition specifies a combination of other conditions.
6.12 BETWEEN Condition

A BETWEEN condition determines whether the value of one expression is in an interval defined by two other expressions.

All three expressions must be numeric, character, or datetime expressions. In SQL, it is possible that expr1 will be evaluated more than once. If the BETWEEN expression appears in PL/SQL, expr1 is guaranteed to be evaluated only once. If the expressions are not all the same data type, then Oracle Database implicitly converts the expressions to a common data type. If it cannot do so, then it returns an error.

The value of

expr1 NOT BETWEEN expr2 AND expr3

is the value of the expression

NOT (expr1 BETWEEN expr2 AND expr3)

And the value of

expr1 BETWEEN expr2 AND expr3

is the value of the boolean expression:
expr2 <= expr1 AND expr1 <= expr3

If expr3 < expr2, then the interval is empty. If expr1 is NULL, then the result is NULL. If expr1 is not NULL, then the value is FALSE in the ordinary case and TRUE when the keyword NOT is used.

The boolean operator AND may produce unexpected results. Specifically, in the expression x AND y, the condition x IS NULL is not sufficient to determine the value of the expression. The second operand still must be evaluated. The result is FALSE if the second operand has the value FALSE and NULL otherwise. See Logical Conditions for more information on AND.

<table>
<thead>
<tr>
<th>Table 6-10</th>
<th>BETWEEN Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of Condition</td>
<td>Operation</td>
</tr>
<tr>
<td>[NOT] BETWEEN x AND y</td>
<td>[NOT] (expr2 less than or equal to expr1 AND expr1 less than or equal to expr3)</td>
</tr>
</tbody>
</table>

### 6.13 EXISTS Condition

An EXISTS condition tests for existence of rows in a subquery.

An EXISTS condition tests for existence of rows in a subquery.

**Table 6-11** shows the EXISTS condition.

<table>
<thead>
<tr>
<th>Table 6-11</th>
<th>EXISTS Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of Condition</td>
<td>Operation</td>
</tr>
<tr>
<td>EXISTS</td>
<td>TRUE if a subquery returns at least one row.</td>
</tr>
</tbody>
</table>

### 6.14 IN Condition

An in_condition is a membership condition. It tests a value for membership in a list of values or subquery.
\textit{in\_condition} ::= 

\begin{align*}
\text{expr} & \quad \text{NOT} \quad \text{IN} \quad \text{expression\_list} \quad \text{subquery} \\
\text{expr} & \quad \text{IN} \quad \text{expression\_list} \quad \text{subquery} \\
\text{expr} & \quad \text{NOT} \quad \text{IN} \quad \text{expression\_list} \quad \text{subquery}
\end{align*}

\textit{expression\_list} ::= 

\begin{align*}
\text{expr} & \quad , \\
\text{expr} & \quad , \quad \text{expr}
\end{align*}

If you use the upper form of the \textit{in\_condition} condition (with a single expression to the left of the operator), then you must use the upper form of \textit{expression\_list}. If you use the lower form of this condition (with multiple expressions to the left of the operator), then you must use the lower form of \textit{expression\_list}, and the expressions in each \textit{expression\_list} must match in number and data type the expressions to the left of the operator. You can specify up to 1000 expressions in \textit{expression\_list}.

Oracle Database does not always evaluate the expressions in an \textit{expression\_list} in the order in which they appear in the \textit{IN} list. However, expressions in the select list of a subquery are evaluated in their specified order.

\begin{quote}
\textbf{See Also:}

Expression Lists
\end{quote}

Table 6-12 lists the form of \textit{IN} condition.
Table 6-12  IN Condition

<table>
<thead>
<tr>
<th>Type of Condition</th>
<th>Operation</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN</td>
<td>Equal-to-any-member-of test. Equivalent to =ANY.</td>
<td>SELECT * FROM employees WHERE job_id IN ('PU_CLERK','SH_CLERK')</td>
</tr>
<tr>
<td></td>
<td></td>
<td>ORDER BY employee_id; SELECT * FROM employees WHERE salary IN</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(SELECT salary FROM employees WHERE department_id =30) ORDER BY employee_id;</td>
</tr>
<tr>
<td>NOT IN</td>
<td>Equivalent to !=ALL. Evaluates to FALSE if any member of the set is NULL.</td>
<td>SELECT * FROM employees WHERE salary NOT IN (SELECT salary FROM employees</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WHERE department_id = 30) ORDER BY employee_id; SELECT * FROM employees</td>
</tr>
<tr>
<td></td>
<td></td>
<td>WHERE job_id NOT IN ('PU_CLERK','SH_CLERK') ORDER BY employee_id;</td>
</tr>
</tbody>
</table>

If any item in the list following a NOT IN operation evaluates to null, then all rows evaluate to FALSE or UNKNOWN, and no rows are returned. For example, the following statement returns the string 'True' for each row:

```sql
SELECT 'True' FROM employees WHERE department_id NOT IN (10, 20);
```

However, the following statement returns no rows:

```sql
SELECT 'True' FROM employees WHERE department_id NOT IN (10, 20, NULL);
```

The preceding example returns no rows because the WHERE clause condition evaluates to:

department_id != 10 AND department_id != 20 AND department_id != null

Because the third condition compares department_id with a null, it results in an UNKNOWN, so the entire expression results in FALSE (for rows with department_id equal to 10 or 20). This behavior can easily be overlooked, especially when the NOT IN operator references a subquery.

Moreover, if a NOT IN condition references a subquery that returns no rows at all, then all rows will be returned, as shown in the following example:

```sql
SELECT 'True' FROM employees WHERE department_id NOT IN (SELECT 0 FROM DUAL WHERE 1=2);
```

For character arguments, the IN condition is collation-sensitive. The collation determination rules determine the collation to use.
Restriction on LEVEL in WHERE Clauses

In a [NOT] IN condition in a WHERE clause, if the right-hand side of the condition is a subquery, you cannot use LEVEL on the left-hand side of the condition. However, you can specify LEVEL in a subquery of the FROM clause to achieve the same result. For example, the following statement is not valid:

```
SELECT employee_id, last_name FROM employees
WHERE (employee_id, LEVEL) IN (SELECT employee_id, 2 FROM employees)
START WITH employee_id = 2
CONNECT BY PRIOR employee_id = manager_id;
```

But the following statement is valid because it encapsulates the query containing the LEVEL information in the FROM clause:

```
SELECT v.employee_id, v.last_name, v.lev FROM
(SELECT employee_id, last_name, LEVEL lev
FROM employees v
START WITH employee_id = 100
CONNECT BY PRIOR employee_id = manager_id) v
WHERE (v.employee_id, v.lev) IN
(SELECT employee_id, 2 FROM employees);
```

6.15 IS OF type Condition

Use the IS OF type condition to test object instances based on their specific type information.

```
is_of_type_condition::=
```

You must have EXECUTE privilege on all types referenced by type, and all types must belong to the same type family.

This condition evaluates to null if expr is null. If expr is not null, then the condition evaluates to true (or false if you specify the NOT keyword) under either of these circumstances:

- The most specific type of expr is the subtype of one of the types specified in the type list and you have not specified ONLY for the type, or
- The most specific type of expr is explicitly specified in the type list.

The expr frequently takes the form of the VALUE function with a correlation variable.
The following example uses the sample table `oe.persons`, which is built on a type hierarchy in *Substitutable Table and Column Examples*. The example uses the `IS OF` type condition to restrict the query to specific subtypes:

```sql
SELECT * FROM persons p
    WHERE VALUE(p) IS OF TYPE (employee_t);
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>SSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Joe</td>
<td>32456</td>
</tr>
<tr>
<td>Tim</td>
<td>5678</td>
</tr>
</tbody>
</table>

```sql
SELECT * FROM persons p
    WHERE VALUE(p) IS OF (ONLY part_time_emp_t);
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>SSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tim</td>
<td>5678</td>
</tr>
</tbody>
</table>
Functions

Functions are similar to operators in that they manipulate data items and return a result. Functions differ from operators in the format of their arguments. This format enables them to operate on zero, one, two, or more arguments:

\[ \text{function}(\text{argument}, \text{argument}, \ldots) \]

A function without any arguments is similar to a pseudocolumn (refer to Pseudocolumns). However, a pseudocolumn typically returns a different value for each row in the result set, whereas a function without any arguments typically returns the same value for each row.

This chapter contains these sections:

- About SQL Functions
- Single-Row Functions
  - Numeric Functions
  - Character Functions Returning Character Values
  - Character Functions Returning Number Values
  - Character Set Functions
  - Collation Functions
  - Datetime Functions
  - General Comparison Functions
  - Conversion Functions
  - Large Object Functions
  - Collection Functions
  - Hierarchical Functions
  - Data Mining Functions
  - XML Functions
  - JSON Functions
  - Encoding and Decoding Functions
  - NULL-Related Functions
  - Environment and Identifier Functions
- Aggregate Functions
- Analytic Functions
- Object Reference Functions
- Model Functions
- OLAP Functions
7.1 About SQL Functions

SQL functions are built into Oracle Database and are available for use in various appropriate SQL statements. Do not confuse SQL functions with user-defined functions written in PL/SQL.

If you call a SQL function with an argument of a data type other than the data type expected by the SQL function, then Oracle attempts to convert the argument to the expected data type before performing the SQL function.

See Also:
About User-Defined Functions for information on user functions and Data Conversion for implicit conversion of data types

Nulls in SQL Functions

Most scalar functions return null when given a null argument. You can use the NVL function to return a value when a null occurs. For example, the expression
\[
\text{NVL(commission\_pct,0)} \text{ returns 0 if commission\_pct is null or the value of commission\_pct if it is not null.}
\]

For information on how aggregate functions handle nulls, see Aggregate Functions.

Syntax for SQL Functions

In the syntax diagrams for SQL functions, arguments are indicated by their data types. When the parameter function appears in SQL syntax, replace it with one of the functions described in this section. Functions are grouped by the data types of their arguments and their return values.

Note:
When you apply SQL functions to LOB columns, Oracle Database creates temporary LOBs during SQL and PL/SQL processing. You should ensure that temporary tablespace quota is sufficient for storing these temporary LOBs for your application.

A SQL function may be collation-sensitive, which means that character value comparison or matching that it performs is controlled by a collation. The particular collation to use by the function is determined from the collations of the function’s arguments.

If the result of a SQL function has a character data type, the collation derivation rules define the collation to associate with the result.
The syntax showing the categories of functions follows:

\[
\text{function::=}
\]

\[
\text{single_row_function::=}
\]

See Also:
Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation and determination rules for SQL functions
The sections that follow list the built-in SQL functions in each of the groups illustrated in the preceding diagrams except user-defined functions. All of the built-in SQL functions are then described in alphabetical order.

See Also:
- About User-Defined Functions and CREATE FUNCTION

7.2 Single-Row Functions

Single-row functions return a single result row for every row of a queried table or view. These functions can appear in select lists, WHERE clauses, START WITH and CONNECT BY clauses, and HAVING clauses.

7.2.1 Numeric Functions

Numeric functions accept numeric input and return numeric values. Most numeric functions return NUMBER values that are accurate to 38 decimal digits. The transcendental functions COS, COSH, EXP, LN, LOG, SIN, SINH, SQRT, TAN, and TANH are accurate to 36 decimal digits. The transcendental functions ACOS, ASIN, ATAN, and ATAN2 are accurate to 30 decimal digits. The numeric functions are:

- ABS
- ACOS
- ASIN
- ATAN
- ATAN2
- BITAND
- CEIL
- COS
- COSH
- EXP
- FLOOR
- LN
- LOG
- MOD
- NANVL
- POWER
- REMAINDER
- ROUND (number)
- SIGN
- SIN
- SINH
- SQRT
- TAN
- TANH
- TRUNC (number)
- WIDTH_BUCKET
7.2.2 Character Functions Returning Character Values

Character functions that return character values return values of the following data types unless otherwise documented:

- If the input argument is `CHAR` or `VARCHAR2`, then the value returned is `VARCHAR2`.
- If the input argument is `NCHAR` or `NVARCHAR2`, then the value returned is `NVARCHAR2`.

The length of the value returned by the function is limited by the maximum length of the data type returned.

- For functions that return `CHAR` or `VARCHAR2`, if the length of the return value exceeds the limit, then Oracle Database truncates it and returns the result without an error message.
- For functions that return `CLOB` values, if the length of the return values exceeds the limit, then Oracle raises an error and returns no data.

The character functions that return character values are:

- `CHR`
- `CONCAT`
- `INITCAP`
- `LOWER`
- `LPAD`
- `LTRIM`
- `NCHR`
- `NLS_INITCAP`
- `NLS_LOWER`
- `NLS_UPPER`
- `NLSSORT`
- `REGEXP_REPLACE`
- `REGEXP_SUBSTR`
- `REPLACE`
- `RPAD`
- `RTRIM`
- `SOUNDEX`
- `SUBSTR`
- `TRANSLATE`
- `TRANSLATE ... USING`
- `TRIM`
- `UPPER`

7.2.3 Character Functions Returning Number Values

Character functions that return number values can take as their argument any character data type. The character functions that return number values are:

- `ASCII`
- `INSTR`
- `LENGTH`
- `REGEXP_COUNT`
7.2.4 Character Set Functions

The character set functions return information about the character set. The character set functions are:

- NLS_CHARSET_DECL_LEN
- NLS_CHARSET_ID
- NLS_CHARSET_NAME

7.2.5 Collation Functions

The collation functions return information about collation settings. The collation functions are:

- COLLATION
- NLS_COLLATION_ID
- NLS_COLLATION_NAME

7.2.6 Datetime Functions

Datetime functions operate on date (DATE), timestamp (TIMESTAMP, TIMESTAMP WITH TIME ZONE, and TIMESTAMP WITH LOCAL TIME ZONE), and interval (INTERVAL DAY TO SECOND, INTERVAL YEAR TO MONTH) values.

Some of the datetime functions were designed for the Oracle DATE data type (ADD_MONTHS, CURRENT_DATE, LAST_DAY, NEW_TIME, and NEXT_DAY). If you provide a timestamp value as their argument, then Oracle Database internally converts the input type to a DATE value and returns a DATE value. The exceptions are the MONTHS_BETWEEN function, which returns a number, and the ROUND and TRUNC functions, which do not accept timestamp or interval values at all.

The remaining datetime functions were designed to accept any of the three types of data (date, timestamp, and interval) and to return a value of one of these types.

All of the datetime functions that return current system datetime information, such as SYSDATE, SYSTIMESTAMP, CURRENT_TIMESTAMP, and so forth, are evaluated once for each SQL statement, regardless how many times they are referenced in that statement.

The datetime functions are:

- ADD_MONTHS
- CURRENT_DATE
- CURRENT_TIMESTAMP
- DBTIMEZONE
- EXTRACT (datetime)
- FROM_TZ
- LAST_DAY
- LOCALTIMESTAMP
- MONTHS_BETWEEN
- NEW_TIME
- NEXT_DAY
7.2.7 General Comparison Functions

The general comparison functions determine the greatest and or least value from a set of values. The general comparison functions are:

- **GREATEST**
- **LEAST**

7.2.8 Conversion Functions

Conversion functions convert a value from one data type to another. Generally, the form of the function names follows the convention `datatype TO datatype`. The first data type is the input data type. The second data type is the output data type. The SQL conversion functions are:

- **ASCIISTR**
- **BIN_TO_NUM**
- **CAST**
- **CHARTOROWID**
- **COMPOSE**
- **CONVERT**
- **DECOMPOSE**
- **HEXTORAW**
- **NUMTODSINTERVAL**
- **NUMTOYMINTERVAL**
- **RAWTOHEX**
- **RAWTONHEX**
- **ROWIDTOCHAR**
- **ROWIDTONCHAR**
- **SCN_TO_TIMESTAMP**
- **TIMESTAMP_TO_SCN**
- **TO_BINARY_DOUBLE**
- **TO_BINARY_FLOAT**
7.2.9 Large Object Functions

The large object functions operate on LOBs. The large object functions are:

- BFILENAME
- EMPTY_BLOB, EMPTY_CLOB

7.2.10 Collection Functions

The collection functions operate on nested tables and varrays. The SQL collection functions are:

- CARDINALITY
- COLLECT
- POWERMULTISET
- POWERMULTISET_BY_CARDINALITY
- SET

7.2.11 Hierarchical Functions

Hierarchical functions applies hierarchical path information to a result set. The hierarchical function is:

- SYS_CONNECT_BY_PATH
7.2.12 Data Mining Functions

The data mining functions use Oracle Advanced Analytics to score data. The functions can apply a mining model schema object to the data, or they can dynamically mine the data by executing an analytic clause. The data mining functions can be applied to models built using the native algorithms of Oracle, as well as those built using R through the extensibility mechanism of Oracle Advanced Analytics.

The data mining functions are:

- CLUSTER_DETAILS
- CLUSTER_DISTANCE
- CLUSTER_ID
- CLUSTER_PROBABILITY
- CLUSTER_SET
- FEATURE_COMPARE
- FEATUREDETAILS
- FEATURE_ID
- FEATURE_SET
- FEATURE_VALUE
- ORA_DM_PARTITION_NAME
- PREDICTION
- PREDICTION_BOUNDS
- PREDICTION_COST
- PREDICTION_DETAILS
- PREDICTION_PROBABILITY
- PREDICTION_SET

See Also:

- Oracle Data Mining Concepts to learn about Oracle Data Mining
- Oracle Data Mining User’s Guide for information about scoring

7.2.13 XML Functions

The XML functions operate on or return XML documents or fragments. These functions use arguments that are not defined as part of the ANSI/ISO/IEC SQL Standard but are defined as part of the World Wide Web Consortium (W3C) standards. The processing and operations that the functions perform are defined by the relevant W3C standards. The table below provides a link to the appropriate section of the W3C standard for the rules and guidelines that apply to each of these XML-related arguments. A SQL statement that uses one of these XML functions, where any of the arguments does not conform to the relevant W3C syntax, will result in an error. Of special note is the fact that not every character that is allowed in the value of a database column is considered legal in XML.
Syntax Element | W3C Standard URL
--- | ---
value_expr | http://www.w3.org/TR/2006/REC-xml-20060816
Xpath_string | http://www.w3.org/TR/1999/REC-xpath-19991116
XQuery_string | http://www.w3.org/TR/2007/REC-xquery-semantics-20070123/
 | http://www.w3.org/TR/xquery-update-10/
namespace_string | http://www.w3.org/TR/2006/REC-xml-names-20060816/
identifier | http://www.w3.org/TR/2006/REC-xml-20060816/#NT-Nmtoken

For more information about selecting and querying XML data using these functions, including information on formatting output, refer to Oracle XML DB Developer's Guide

The SQL XML functions are:

- DEPTH
- EXISTSNODE
- EXTRACT (XML)
- EXTRACTVALUE
- PATH
- SYS_DATABASE
- SYS_XMLAGG
- SYS_XMLGEN
- XMLAGG
- XMLCAST
- XMLCDATA
- XMLCOLATTVAL
- XMLCOMMENT
- XMLCONCAT
- XMLELEMENT
- XMLQUERY
- XMLQUERY
- XMLSEQUENCE
- XMLSERIALIZE
- XMLTABLE
- XMLTRANSFORM

7.2.14 JSON Functions

JavaScript Object Notation (JSON) functions allow you to query and generate JSON data.
The following SQL/JSON functions allow you to query JSON data:

- JSON_QUERY
- JSON_TABLE
- JSON_VALUE

The following SQL/JSON functions allow you to generate JSON data:

- JSON_ARRAY
- JSON_ARRAYAGG
- JSON_OBJECT
- JSON_OBJECTAGG

The following Oracle SQL function creates a JSON data guide:

- JSON_DATAGUIDE

### 7.2.15 Encoding and Decoding Functions

The encoding and decoding functions let you inspect and decode data in the database. The encoding and decoding functions are:

- DECODE
- DUMP
- ORA_HASH
- STANDARD_HASH
- VSIZE

### 7.2.16 NULL-Related Functions

The NULL-related functions facilitate null handling. The NULL-related functions are:

- COALESCE
- LNNVL
- NANVL
- NULLIF
- NVL
- NVL2

### 7.2.17 Environment and Identifier Functions

The environment and identifier functions provide information about the instance and session. The environment and identifier functions are:

- CON_DBID_TO_ID
- CON_GUID_TO_ID
- CON_NAME_TO_ID
- CON_UID_TO_ID
- ORA_INVOKING_USER
- ORA_INVOKING_USERID
- SYS_CONTEXT
- SYS_GUID
- SYS_TYPEID
- UID
7.3 Aggregate Functions

Aggregate functions return a single result row based on groups of rows, rather than on single rows. Aggregate functions can appear in select lists and in ORDER BY and HAVING clauses. They are commonly used with the GROUP BY clause in a SELECT statement, where Oracle Database divides the rows of a queried table or view into groups. In a query containing a GROUP BY clause, the elements of the select list can be aggregate functions, GROUP BY expressions, constants, or expressions involving one of these. Oracle applies the aggregate functions to each group of rows and returns a single result row for each group.

If you omit the GROUP BY clause, then Oracle applies aggregate functions in the select list to all the rows in the queried table or view. You use aggregate functions in the HAVING clause to eliminate groups from the output based on the results of the aggregate functions, rather than on the values of the individual rows of the queried table or view.

See Also:

- Using the GROUP BY Clause: Examples and the HAVING Clause for more information on the GROUP BY clause and HAVING clauses in queries and subqueries
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for expressions in the ORDER BY clause of an aggregate function

Many (but not all) aggregate functions that take a single argument accept these clauses:

- DISTINCT and UNIQUE, which are synonymous, cause an aggregate function to consider only distinct values of the argument expression. The syntax diagrams for aggregate functions in this chapter use the keyword DISTINCT for simplicity.
- ALL causes an aggregate function to consider all values, including all duplicates.

For example, the DISTINCT average of 1, 1, 1, and 3 is 2. The ALL average is 1.5. If you specify neither, then the default is ALL.

Some aggregate functions allow the windowing clause, which is part of the syntax of analytic functions. Refer to windowing clause for information about this clause. In the listing of aggregate functions at the end of this section, the functions that allow the windowing clause are followed by an asterisk (*).

All aggregate functions except COUNT(*), GROUPING, and GROUPING_ID ignore nulls. You can use the NVL function in the argument to an aggregate function to substitute a value for a null. COUNT and REGR_COUNT never return null, but return either a number or zero. For all the remaining aggregate functions, if the data set contains no rows, or contains only rows with nulls as arguments to the aggregate function, then the function returns null.
The aggregate functions MIN, MAX, SUM, AVG, COUNT, VARIANCE, and STDDEV, when followed by the KEEP keyword, can be used in conjunction with the FIRST or LAST function to operate on a set of values from a set of rows that rank as the FIRST or LAST with respect to a given sorting specification. Refer to FIRST for more information.

You can nest aggregate functions. For example, the following example calculates the average of the maximum salaries of all the departments in the sample schema hr:

```sql
SELECT AVG(MAX(salary))
FROM employees
GROUP BY department_id;
```

```
AVG(MAX(SALARY))
----------------
10926.3333
```

This calculation evaluates the inner aggregate (MAX(salary)) for each group defined by the GROUP BY clause (department_id), and aggregates the results again.

In the list of aggregate functions that follows, functions followed by an asterisk (*) allow the windowing_clause.

```

7.4 Analytic Functions

Analytic functions compute an aggregate value based on a group of rows. They differ from aggregate functions in that they return multiple rows for each group. The group of rows is called a window and is defined by the analytic_clause. For each row, a sliding window of rows is defined. The window determines the range of rows used to perform the calculations for the current row. Window sizes can be based on either a physical number of rows or a logical interval such as time.

Analytic functions are the last set of operations performed in a query except for the final ORDER BY clause. All joins and all WHERE, GROUP BY, and HAVING clauses are completed before the analytic functions are processed. Therefore, analytic functions can appear only in the select list or ORDER BY clause.

Analytic functions are commonly used to compute cumulative, moving, centered, and reporting aggregates.

\[
\text{analytic\_function ::=}
\]

```
analytic\_function (arguments) OVER (analytic\_clause)
```

\[
\text{analytic\_clause ::=}
\]

```
query\_partition\_clause ORDER BY windowing\_clause
```
query_partition_clause::= 

PARTITION BY expr, ( expr, )

order_by_clause::= 

ORDER SIBLINGS BY expr position c_alias ASC DESC NULLS FIRST NULLS LAST,

windowing_clause::= 

ROWS RANGE BETWEEN UNBOUNDED PRECEDING CURRENT ROW value_expr PRECEDING FOLLOWING AND CURRENT ROW value_expr PRECEDING FOLLOWING

The semantics of this syntax are discussed in the sections that follow.

analytic_function

Specify the name of an analytic function (see the listing of analytic functions following this discussion of semantics).

arguments

Analytic functions take 0 to 3 arguments. The arguments can be any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence and implicitly converts the remaining arguments to that data type. The return type is also that data type, unless otherwise noted for an individual function.
**analytic_clause**

Use **OVER analytic_clause** to indicate that the function operates on a query result set. This clause is computed after the FROM, WHERE, GROUP BY, and HAVING clauses. You can specify analytic functions with this clause in the select list or ORDER BY clause. To filter the results of a query based on an analytic function, nest these functions within the parent query, and then filter the results of the nested subquery.

**Notes on the analytic_clause:**

The following notes apply to the **analytic_clause**:

- You cannot nest analytic functions by specifying any analytic function in any part of the **analytic_clause**. However, you can specify an analytic function in a subquery and compute another analytic function over it.
- You can specify **OVER analytic_clause** with user-defined analytic functions as well as built-in analytic functions. See **CREATE FUNCTION**.
- The **PARTITION BY** and **ORDER BY** clauses in the **analytic_clause** are collation-sensitive.

**query_partition_clause**

Use the **PARTITION BY** clause to partition the query result set into groups based on one or more **value_expr**. If you omit this clause, then the function treats all rows of the query result set as a single group.

To use the **query_partition_clause** in an analytic function, use the upper branch of the syntax (without parentheses). To use this clause in a model query (in the **model_column_clauses**) or a partitioned outer join (in the **outer_join_clause**), use the lower branch of the syntax (with parentheses).

You can specify multiple analytic functions in the same query, each with the same or different **PARTITION BY** keys.

If the objects being queried have the parallel attribute, and if you specify an analytic function with the **query_partition_clause**, then the function computations are parallelized as well.

Valid values of **value_expr** are constants, columns, nonanalytic functions, function expressions, or expressions involving any of these.
order_by_clause

Use the order_by_clause to specify how data is ordered within a partition. For all analytic functions you can order the values in a partition on multiple keys, each defined by a value_expr and each qualified by an ordering sequence.

Within each function, you can specify multiple ordering expressions. Doing so is especially useful when using functions that rank values, because the second expression can resolve ties between identical values for the first expression.

Whenever the order_by_clause results in identical values for multiple rows, the function behaves as follows:

- CUME_DIST, DENSE_RANK, NTILE, PERCENT_RANK, and RANK return the same result for each of the rows.
- ROW_NUMBER assigns each row a distinct value even if there is a tie based on the order_by_clause. The value is based on the order in which the row is processed, which may be nondeterministic if the ORDER BY does not guarantee a total ordering.
- For all other analytic functions, the result depends on the window specification. If you specify a logical window with the RANGE keyword, then the function returns the same result for each of the rows. If you specify a physical window with the ROWS keyword, then the result is nondeterministic.

Restrictions on the ORDER BY Clause

The following restrictions apply to the ORDER BY clause:

- When used in an analytic function, the order_by_clause must take an expression (expr). The SIBLINGS keyword is not valid (it is relevant only in hierarchical queries). Position (position) and column aliases (c_alias) are also invalid. Otherwise this order_by_clause is the same as that used to order the overall query or subquery.
- An analytic function that uses the RANGE keyword can use multiple sort keys in its ORDER BY clause if it specifies any of the following windows:
  - RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. The short form of this is RANGE UNBOUNDED PRECEDING.
  - RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING
  - RANGE BETWEEN CURRENT ROW AND CURRENT ROW
  - RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING

Window boundaries other than these four can have only one sort key in the ORDER BY clause of the analytic function. This restriction does not apply to window boundaries specified by the ROW keyword.

ASC | DESC

Specify the ordering sequence (ascending or descending). ASC is the default.

NULLS FIRST | NULLS LAST

Specify whether returned rows containing nulls should appear first or last in the ordering sequence.
NULLS LAST is the default for ascending order, and NULLS FIRST is the default for descending order.

Analytic functions always operate on rows in the order specified in the order_by_clause of the function. However, the order_by_clause of the function does not guarantee the order of the result. Use the order_by_clause of the query to guarantee the final result ordering.

**See Also:**

order_by_clause of SELECT for more information on this clause

**windowing_clause**

Some analytic functions allow the windowing_clause. In the listing of analytic functions at the end of this section, the functions that allow the windowing_clause are followed by an asterisk (*).

**ROWS | RANGE**

These keywords define for each row a window (a physical or logical set of rows) used for calculating the function result. The function is then applied to all the rows in the window. The window moves through the query result set or partition from top to bottom.

- **ROWS** specifies the window in physical units (rows).
- **RANGE** specifies the window as a logical offset.

You cannot specify this clause unless you have specified the order_by_clause. Some window boundaries defined by the RANGE clause let you specify only one expression in the order_by_clause. Refer to Restrictions on the ORDER BY Clause.

The value returned by an analytic function with a logical offset is always deterministic. However, the value returned by an analytic function with a physical offset may produce nondeterministic results unless the ordering expression results in a unique ordering. You may have to specify multiple columns in the order_by_clause to achieve this unique ordering.

**BETWEEN ... AND**

Use the BETWEEN ... AND clause to specify a start point and end point for the window. The first expression (before AND) defines the start point and the second expression (after AND) defines the end point.

If you omit BETWEEN and specify only one end point, then Oracle considers it the start point, and the end point defaults to the current row.

**UNBOUNDED PRECEDING**

Specify UNBOUNDED PRECEDING to indicate that the window starts at the first row of the partition. This is the start point specification and cannot be used as an end point specification.
UNBOUNDED FOLLOWING

Specify **UNBOUNDED FOLLOWING** to indicate that the window ends at the last row of the partition. This is the end point specification and cannot be used as a start point specification.

CURRENT ROW

As a start point, **CURRENT ROW** specifies that the window begins at the current row or value (depending on whether you have specified **ROW** or **RANGE**, respectively). In this case the end point cannot be **value_expr PRECEDING**.

As an end point, **CURRENT ROW** specifies that the window ends at the current row or value (depending on whether you have specified **ROW** or **RANGE**, respectively). In this case the start point cannot be **value_expr FOLLOWING**.

**value_expr PRECEDING** or **value_expr FOLLOWING**

For **RANGE** or **ROW**:

- If **value_expr FOLLOWING** is the start point, then the end point must be **value_expr FOLLOWING**.
- If **value_expr PRECEDING** is the end point, then the start point must be **value_expr PRECEDING**.

If you are defining a logical window defined by an interval of time in numeric format, then you may need to use conversion functions.

See Also:

**NUMTOYMINTERVAL** and **NUMTODSINTERVAL** for information on converting numeric times into intervals

If you specified **ROWS**:

- **value_expr** is a physical offset. It must be a constant or expression and must evaluate to a positive numeric value.
- If **value_expr** is part of the start point, then it must evaluate to a row before the end point.

If you specified **RANGE**:

- **value_expr** is a logical offset. It must be a constant or expression that evaluates to a positive numeric value or an interval literal. Refer to **Literals** for information on interval literals.
- You can specify only one expression in the **order_by_clause**.
- If **value_expr** evaluates to a numeric value, then the **ORDER BY expr** must be a numeric or **DATE** data type.
- If **value_expr** evaluates to an interval value, then the **ORDER BY expr** must be a **DATE** data type.
If you omit the `windowing_clause` entirely, then the default is `RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW`.

Analytic functions are commonly used in data warehousing environments. In the list of analytic functions that follows, functions followed by an asterisk (*) allow the full syntax, including the `windowing_clause`.

7.5 Object Reference Functions

Object reference functions manipulate **REF** values, which are references to objects of specified object types. The object reference functions are:

- DEREF
- MAKE_REF
- REF
- REFTOHEX
- VALUE

See Also:

*Oracle Database Data Warehousing Guide* for more information on these functions and for scenarios illustrating their use.

7.6 Model Functions

Model functions can be used only in the *model_clause* of the *SELECT* statement. The model functions are:

- CV
- ITERATION_NUMBER
- PRESENTNNV
- PRESENTV
- PREVIOUS

7.7 OLAP Functions

OLAP functions returns data from a dimensional object in two-dimension relational format. The OLAP function is:

- CUBE_TABLE
7.8 Data Cartridge Functions

Data Cartridge functions are useful for Data Cartridge developers. The Data Cartridge functions are:

- DATAOBJ_TO_MAT_PARTITION
- DATAOBJ_TO_PARTITION

7.9 ABS

Syntax

\[ \text{ABS}(n) \]

Purpose

ABS returns the absolute value of \( n \).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns the absolute value of -15:

```sql
SELECT ABS(-15) "Absolute"
FROM DUAL;
```

```
Absolute
----------
 15
```

7.10 ACOS

Syntax

\[ \text{ACOS}(n) \]

Purpose

ACOS returns the arc cosine of \( n \). The argument \( n \) must be in the range of -1 to 1, and the function returns a value in the range of 0 to \( \pi \), expressed in radians.
This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:
Table 2-8 for more information on implicit conversion

Examples
The following example returns the arc cosine of .3:

```
SELECT ACOS(.3) "Arc_Cosine"
FROM DUAL;
```

```
<table>
<thead>
<tr>
<th>Arc_Cosine</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.26610367</td>
</tr>
</tbody>
</table>
```

7.11 ADD_MONTHS

Syntax

```
ADD_MONTHS ( date , integer )
```

Purpose

ADD_MONTHS returns the date date plus integer months. A month is defined by the session parameter NLS_CALENDAR. The date argument can be a datetime value or any value that can be implicitly converted to DATE. The integer argument can be an integer or any value that can be implicitly converted to an integer. The return type is always DATE, regardless of the data type of date. If date is the last day of the month or if the resulting month has fewer days than the day component of date, then the result is the last day of the resulting month. Otherwise, the result has the same day component as date.

See Also:

Table 2-8 for more information on implicit conversion

Examples
The following example returns the month after the hire_date in the sample table employees:

```
SELECT TO_CHAR(ADD_MONTHS(hire_date, 1), 'DD-MON-YYYY') "Next month"
FROM employees
WHERE last_name = 'Baer';
```
7.12 APPENDCHILDXML

**Note:**

The APPENDCHILDXML function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See Oracle XML DB Developer’s Guide for more information.

**Syntax**

```sql
APPENDCHILDXML (XMLType_instance, XPath_string, value_expr, namespace_string)
```

**Purpose**

APPENDCHILDXML appends a user-supplied value onto the target XML as the child of the node indicated by an XPath expression.

- **XMLType_instance** is an instance of XMLType.
- **XPath_string** is an XPath expression indicating one or more nodes onto which one or more child nodes are to be appended. You can specify an absolute XPath_string with an initial slash or a relative XPath_string by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node.
- **value_expr** specifies one or more nodes of XMLType. It must resolve to a string.
- The optional **namespace_string** provides namespace information for the XPath_string. This parameter must be of type VARCHAR2.

**See Also:**

Oracle XML DB Developer’s Guide for more information about this function

**Examples**

The following example adds an /Owner node to the /Warehouse/Building node of warehouse_spec in the oe.warehouses table if the value of the /Building node is "Rented":

```sql
UPDATE warehouses
SET warehouse_spec = APPENDCHILDXML(warehouse_spec, 'Warehouse/Building', XMLType('<Owner>Grandco</Owner>'))
WHERE EXTRACTVALUE(warehouse_spec, '/Warehouse/Building') = 'Rented';
```
SELECT warehouse_id, warehouse_name, 
       EXTRACTVALUE(warehouse_spec, '/Warehouse/Building/Owner') "Prop.Owner"
FROM warehouses
WHERE EXISTSNODE(warehouse_spec, '/Warehouse/Building/Owner') = 1;

<table>
<thead>
<tr>
<th>WAREHOUSE_ID</th>
<th>WAREHOUSE_NAME</th>
<th>Prop.Owner</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>San Francisco</td>
<td>Grandco</td>
</tr>
<tr>
<td>3</td>
<td>New Jersey</td>
<td>Grandco</td>
</tr>
</tbody>
</table>

### 7.13 APPROX_COUNT_DISTINCT

#### Syntax

```
APPROX_COUNT_DISTINCT(expr)
```

#### Purpose

**APPROX_COUNT_DISTINCT** returns the approximate number of rows that contain a distinct value for **expr**.

This function provides an alternative to the **COUNT (DISTINCT expr)** function, which returns the exact number of rows that contain distinct values of **expr**. **APPROX_COUNT_DISTINCT** processes large amounts of data significantly faster than **COUNT**, with negligible deviation from the exact result.

For **expr**, you can specify a column of any scalar data type other than **BFILE**, **BLOB**, **CLOB**, **LONG**, **LONG RAW**, or **NCLOB**.

**APPROX_COUNT_DISTINCT** ignores rows that contain a null value for **expr**. This function returns a **NUMBER**.

#### See Also:

- **COUNT** for more information on the **COUNT (DISTINCT expr)** function
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation **APPROX_COUNT_DISTINCT** uses to compare character values for **expr**

#### Examples

The following statement returns the approximate number of rows with distinct values for **manager_id**:

```sql
SELECT APPROX_COUNT_DISTINCT(manager_id) AS "Active Managers"
FROM employees;
```

<table>
<thead>
<tr>
<th>Active Managers</th>
</tr>
</thead>
<tbody>
<tr>
<td>18</td>
</tr>
</tbody>
</table>
The following statement returns the approximate number of distinct customers for each product:

```sql
SELECT prod_id, APPROX_COUNT_DISTINCT(cust_id) AS "Number of Customers"
FROM sales
GROUP BY prod_id
ORDER BY prod_id;
```

<table>
<thead>
<tr>
<th>PROD_ID</th>
<th>Number of Customers</th>
</tr>
</thead>
<tbody>
<tr>
<td>13</td>
<td>2516</td>
</tr>
<tr>
<td>14</td>
<td>2030</td>
</tr>
<tr>
<td>15</td>
<td>2105</td>
</tr>
<tr>
<td>16</td>
<td>2367</td>
</tr>
<tr>
<td>17</td>
<td>2093</td>
</tr>
<tr>
<td>18</td>
<td>2975</td>
</tr>
<tr>
<td>19</td>
<td>2630</td>
</tr>
<tr>
<td>20</td>
<td>3791</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

### 7.14 APPROX_COUNT_DISTINCT_AGG

**Syntax**

```sql
APPROX_COUNT_DISTINCT_AGG ( detail )
```

**Purpose**

`APPROX_COUNT_DISTINCT_AGG` takes as its input a column of details containing information about approximate distinct value counts, and enables you to perform aggregations of those counts.

For `detail`, specify a column of details created by the `APPROX_COUNT_DISTINCT_DETAIL` function or the `APPROX_COUNT_DISTINCT_AGG` function. This column is of data type `BLOB`.

You can specify this function in a `SELECT` statement with a `GROUP BY` clause to aggregate the information contained in the details within each group of rows and return a single detail for each group.

This function returns a `BLOB` value, called a detail, which contains information about the count aggregations in a special format. You can store details returned by this function in a table or materialized view, and then again use the `APPROX_COUNT_DISTINCT_AGG` function to further aggregate those details, or use the `TO_APPROX_COUNT_DISTINCT` function to convert the detail values to human-readable `NUMBER` values.

**See Also:**

- `APPROX_COUNT_DISTINCT_DETAIL`
- `TO_APPROX_COUNT_DISTINCT`
Examples

Refer to APPROX_COUNT_DISTINCT_AGG: Examples for examples of using the APPROX_COUNT_DISTINCT_AGG function in conjunction with the APPROX_COUNT_DISTINCT_DETAIL and TO_APPROX_COUNT_DISTINCT functions.

7.15 APPROX_COUNT_DISTINCT_DETAIL

Syntax

```
APPROX_COUNT_DISTINCT_DETAIL(expr)
```

Purpose

APPROX_COUNT_DISTINCT_DETAIL calculates information about the approximate number of rows that contain a distinct value for expr and returns a BLOB value, called a detail, which contains that information in a special format.

For expr, you can specify a column of any scalar data type other than BFILE, BLOB, CLOB, LONG, LONG RAW, or NCLOB. This function ignores rows for which the value of expr is null.

This function is commonly used with the GROUP BY clause in a SELECT statement. When used in this way, it calculates approximate distinct value count information for expr within each group of rows and returns a single detail for each group.

The details returned by APPROX_COUNT_DISTINCT_DETAIL can be used as input to the APPROX_COUNT_DISTINCT_AGG function, which enables you to perform aggregations of the details, or the TO_APPROX_COUNT_DISTINCT function, which converts a detail to a human-readable distinct count value. You can use these three functions together to perform resource-intensive approximate count calculations once, store the resulting details, and then perform efficient aggregations and queries on those details. For example:

1. Use the APPROX_COUNT_DISTINCT_DETAIL function to calculate approximate distinct value count information and store the resulting details in a table or materialized view. These could be highly-granular details, such as city demographic counts or daily sales counts.
2. Use the APPROX_COUNT_DISTINCT_AGG function to aggregate the details obtained in the previous step and store the resulting details in a table or materialized view. These could be details of lower granularity, such as state demographic counts or monthly sales counts.
3. Use the TO_APPROX_COUNT_DISTINCT function to convert the stored detail values to human-readable NUMBER values. You can use the TO_APPROX_COUNT_DISTINCT function to query detail values created by the APPROX_COUNT_DISTINCTDETAIL function or the APPROX_COUNT_DISTINCT_AGG function.
Examples

The examples in this section demonstrate how to use the APPROX_COUNT_DISTINCT_DETAIL, APPROX_COUNT_DISTINCT_AGG, and TO_APPROX_COUNT_DISTINCT functions together to perform resource-intensive approximate count calculations once, store the resulting details, and then perform efficient aggregations and queries on those details.

APPROX_COUNT_DISTINCT_DETAIL: Example

The following statement queries the tables sh.times and sh.sales for the approximate number of distinct products sold each day. The APPROX_COUNT_DISTINCT_DETAIL function returns the information in a detail, called daily_detail, for each day that products were sold. The returned details are stored in a materialized view called daily_prod_count_mv.

```sql
CREATE MATERIALIZED VIEW daily_prod_count_mv AS
    SELECT t.calendar_year year,
           t.calendar_month_number month,
           t.day_number_in_month day,
           APPROX_COUNT_DISTINCT_DETAIL(s.prod_id) daily_detail
    FROM times t, sales s
    WHERE t.time_id = s.time_id
    GROUP BY t.calendar_year, t.calendar_month_number, t.day_number_in_month;
```

APPROX_COUNT_DISTINCT_AGG: Examples

The following statement uses the APPROX_COUNT_DISTINCT_AGG function to read the daily details stored in daily_prod_count_mv and create aggregated details that contain the approximate number of distinct products sold each month. These aggregated details are stored in a materialized view called monthly_prod_count_mv.

```sql
CREATE MATERIALIZED VIEW monthly_prod_count_mv AS
    SELECT year,
           month,
           APPROX_COUNT_DISTINCT_AGG(daily_detail) monthly_detail
    FROM daily_prod_count_mv
    GROUP BY year, month;
```

The following statement is similar to the previous statement, except it creates aggregated details that contain the approximate number of distinct products sold each year. These aggregated details are stored in a materialized view called annual_prod_count_mv.

```sql
CREATE MATERIALIZED VIEW annual_prod_count_mv AS
    SELECT year,
           APPROX_COUNT_DISTINCT_AGG(daily_detail) annual_detail
    FROM daily_prod_count_mv
    GROUP BY year;
```

TO_APPROX_COUNT_DISTINCT: Examples
The following statement uses the `TO_APPROX_COUNT_DISTINCT` function to query the daily detail information stored in `daily_prod_count_mv` and return the approximate number of distinct products sold each day:

```
SELECT year,  
    month,  
    day,  
    TO_APPROX_COUNT_DISTINCT(daily_detail) "NUM PRODUCTS"  
FROM daily_prod_count_mv  
ORDER BY year, month, day;
```

<table>
<thead>
<tr>
<th>YEAR</th>
<th>MONTH</th>
<th>DAY</th>
<th>NUM PRODUCTS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1998</td>
<td>1</td>
<td>1</td>
<td>24</td>
</tr>
<tr>
<td>1998</td>
<td>1</td>
<td>2</td>
<td>25</td>
</tr>
<tr>
<td>1998</td>
<td>1</td>
<td>3</td>
<td>11</td>
</tr>
<tr>
<td>1998</td>
<td>1</td>
<td>4</td>
<td>34</td>
</tr>
<tr>

<td>9</td>
<td>25</td>
</tr>
<tr>
<td>1998</td>
<td>1</td>
<td>10</td>
<td>38</td>
</tr>
</tbody>
</table>

... 

The following statement uses the `TO_APPROX_COUNT_DISTINCT` function to query the monthly detail information stored in `monthly_prod_count_mv` and return the approximate number of distinct products sold each month:

```
SELECT year,  
    month,  
    TO_APPROX_COUNT_DISTINCT(monthly_detail) "NUM PRODUCTS"  
FROM monthly_prod_count_mv  
ORDER BY year, month;
```

<table>
<thead>
<tr>
<th>YEAR</th>
<th>MONTH</th>
<th>NUM PRODUCTS</th>

7.16 APPROX_MEDIAN

Syntax

```
APPROX_MEDIAN ( expr
DETERMINISTIC
, 'ERROR_RATE'
'CONFIDENCE'
)
```

Purpose

`APPROX_MEDIAN` is an approximate inverse distribution function that assumes a continuous distribution model. It takes a numeric or datetime value and returns an approximate middle value or an approximate interpolated value that would be the middle value once the values are sorted. Nulls are ignored in the calculation.

This function provides an alternative to the `MEDIAN` function, which returns the exact middle value or interpolated value. `APPROX_MEDIAN` processes large amounts of data significantly faster than `MEDIAN`, with negligible deviation from the exact result.

For `expr`, specify the expression for which the approximate median value is being calculated. The acceptable data types for `expr`, and the return value data type for this function, depend on the algorithm that you specify with the `DETERMINISTIC` clause.

**DETERMINISTIC**

This clause lets you specify the type of algorithm this function uses to calculate the approximate median value.

- If you specify `DETERMINISTIC`, then this function calculates a deterministic approximate median value. In this case, `expr` must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value. The function returns the same data type as the numeric data type of its argument.

- If you omit `DETERMINISTIC`, then this function calculates a nondeterministic approximate median value. In this case, `expr` must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or
datetime value. The function returns the same data type as the numeric or
datetime data type of its argument.

**ERROR_RATE | CONFIDENCE**

These clauses let you determine the accuracy of the value calculated by this function. If you specify one of these clauses, then instead of returning the approximate median value for `expr`, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify `ERROR_RATE`, then the return value represents the error rate for the approximate median value calculation for `expr`.
- If you specify `CONFIDENCE`, then the return value represents the confidence level for the error rate that is returned when you specify `ERROR_RATE`.

### See Also:

- MEDIAN
- APPROX_PERCENTILE which returns, for a given percentile, the approximate value that corresponds to that percentile by way of interpolation. APPROX_MEDIAN is the specific case of APPROX_PERCENTILE where the percentile value is 0.5.

### Examples

The following query returns the deterministic approximate median salary for each department in the `hr.employees` table:

```sql
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC) "Median Salary"
FROM employees
GROUP BY department_id
ORDER BY department_id;
```

<table>
<thead>
<tr>
<th>Department</th>
<th>Median Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4400</td>
</tr>
<tr>
<td>20</td>
<td>6000</td>
</tr>
<tr>
<td>30</td>
<td>2765</td>
</tr>
<tr>
<td>40</td>
<td>6500</td>
</tr>
<tr>
<td>50</td>
<td>3100</td>
</tr>
<tr>
<td>60</td>
<td>4800</td>
</tr>
<tr>
<td>70</td>
<td>10000</td>
</tr>
<tr>
<td>80</td>
<td>9003</td>
</tr>
<tr>
<td>90</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>7739</td>
</tr>
<tr>
<td>110</td>
<td>8300</td>
</tr>
<tr>
<td>7000</td>
<td></td>
</tr>
</tbody>
</table>

The following query returns the error rates for the approximate median salaries that were returned by the previous query:

```sql
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC, 'ERROR_RATE') "Error Rate"
FROM employees
```
GROUP BY department_id
ORDER BY department_id;

Department Error Rate
------------ -----------
10  .002718282
20  .021746255
30  .021746255
40  .002718282
50  .019027973
60  .019027973
70  .002718282
80  .021746255
90  .021746255
100 .019027973
110 .019027973
  .002718282

The following query returns the confidence levels for the error rates that were returned by the previous query:

```sql
SELECT department_id "Department",
       APPROX_MEDIAN(salary DETERMINISTIC, 'CONFIDENCE') "Confidence Level"
FROM employees
GROUP BY department_id
ORDER BY department_id;

Department Confidence Level
------------ ----------------
10       .997281718
20       .999660215
30       .999660215
40       .997281718
50       .999611674
60       .999611674
70       .997281718
80       .999660215
90       .999660215
100      .999611674
110      .999611674
  .997281718
```

The following query returns the nondeterministic approximate median hire date for each department in the `hr.employees` table:

```sql
SELECT department_id "Department",
       APPROX_MEDIAN(hire_date) "Median Hire Date"
FROM employees
GROUP BY department_id
ORDER BY department_id;

Department Median Hire Date
------------ ----------------
10        17-SEP-03
20        17-FEB-04
30        24-JUL-05
40        07-JUN-02
50        15-MAR-06
60        05-FEB-06
70        07-JUN-02
80        23-MAR-06
```
### 7.17 APPROX_PERCENTILE

#### Syntax

```
APPROX_PERCENTILE(expr, DETERMINISTIC, 'ERROR_RATE', 'CONFIDENCE', WITHIN GROUP (ORDER BY expr))
```

#### Purpose

**APPROX_PERCENTILE** is an approximate inverse distribution function. It takes a percentile value and a sort specification, and returns the value that would fall into that percentile value with respect to the sort specification. Nulls are ignored in the calculation.

This function provides an alternative to the **PERCENTILE_CONT** and **PERCENTILE_DISC** functions, which returns the exact results. **APPROX_PERCENTILE** processes large amounts of data significantly faster than **PERCENTILE_CONT** and **PERCENTILE_DISC**, with negligible deviation from the exact result.

The first `expr` is the percentile value, which must evaluate to a numeric value between 0 and 1.

The second `expr`, which is part of the **ORDER BY** clause, is a single expression over which this function calculates the result. The acceptable data types for `expr`, and the return value data type for this function, depend on the algorithm that you specify with the **DETERMINISTIC** clause.

**DETERMINISTIC**

This clause lets you specify the type of algorithm this function uses to calculate the return value.

- If you specify **DETERMINISTIC**, then this function calculates a deterministic result. In this case, the **ORDER BY** clause expression must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value, in the range -2,147,483,648 through 2,147,483,647. The function rounds numeric input to the closest integer. The function returns the same data type as the numeric data type of the **ORDER BY** clause expression. The return value is not necessarily one of the values of `expr`.

- If you omit **DETERMINISTIC**, then this function calculates a nondeterministic result. In this case, the **ORDER BY** clause expression must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or datetime value.
The function returns the same data type as the numeric or datetime data type of the ORDER BY clause expression. The return value is one of the values of \textit{expr}.

**ERROR\_RATE | CONFIDENCE**

These clauses let you determine the accuracy of the result calculated by this function. If you specify one of these clauses, then instead of returning the value that would fall into the specified percentile value for \textit{expr}, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify \textit{ERROR\_RATE}, then the return value represents the error rate for calculating the value that would fall into the specified percentile value for \textit{expr}.
- If you specify \textit{CONFIDENCE}, then the return value represents the confidence level for the error rate that is returned when you specify \textit{ERROR\_RATE}.

**DESC | ASC**

Specify the sort specification for the calculating the value that would fall into the specified percentile value. Specify \textit{DESC} to sort the ORDER BY clause expression values in descending order, or \textit{ASC} to sort the values in ascending order. \textit{ASC} is the default.

**See Also:**

- \textit{PERCENTILE\_CONT} and \textit{PERCENTILE\_DISC}
- \textit{APPROX\_MEDIAN}, which is the specific case of \textit{APPROX\_PERCENTILE} where the percentile value is 0.5

**Examples**

The following query returns the deterministic approximate 25th percentile, 50th percentile, and 75th percentile salaries for each department in the \textit{hr.employees} table. The salaries are sorted in ascending order for the interpolation calculation.

```sql
SELECT department_id "Department",
       APPROX_PERCENTILE(0.25 DETERMINISTIC) WITHIN GROUP (ORDER BY salary ASC) "25th Percentile Salary",
       APPROX_PERCENTILE(0.50 DETERMINISTIC) WITHIN GROUP (ORDER BY salary ASC) "50th Percentile Salary",
       APPROX_PERCENTILE(0.75 DETERMINISTIC) WITHIN GROUP (ORDER BY salary ASC) "75th Percentile Salary"
FROM employees
GROUP BY department_id
ORDER BY department_id;
```

<table>

7.18 APPROX_PERCENTILE_AGG

Syntax

APPROX_PERCENTILE_AGG ( expr )

Purpose

APPROX_PERCENTILE_AGG takes as its input a column of details containing approximate percentile information, and enables you to perform aggregations of that information.

For detail, specify a column of details created by the APPROX_PERCENT_DETAIL function or the APPROX_PERCENTILE_AGG function. This column is of data type BLOB.

You can specify this function in a SELECT statement with a GROUP BY clause to aggregate the information contained in the details within each group of rows and return a single detail for each group.

This function returns a BLOB value, called a detail, which contains approximate percentile information in a special format. You can store details returned by this function in a table or materialized view, and then again use the APPROX_PERCENTILE_AGG function to further aggregate those details, or use the TO_APPROX_PERCENTILE function to convert the details to specified percentile values.

See Also:

- APPROX_PERCENTILE_DETAIL
- TO_APPROX_PERCENTILE
Examples

Refer to APPROX_PERCENTILE_AGG: Examples for examples of using the APPROX_PERCENTILE_AGG function in conjunction with the APPROX_PERCENTILE_DETAIL and TO_APPROX_PERCENTILE functions.

7.19 APPROX_PERCENTILE_DETAIL

Syntax

APPROX_PERCENTILE_DETAIL(expr)

DETERMINISTIC

Purpose

APPROX_PERCENTILE_DETAIL calculates approximate percentile information for the values of expr and returns a BLOB value, called a detail, which contains that information in a special format.

The acceptable data types for expr depend on the algorithm that you specify with the DETERMINISTIC clause. Refer to the DETERMINISTIC clause for more information.

This function is commonly used with the GROUP BY clause in a SELECT statement. It calculates approximate percentile information for expr within each group of rows and returns a single detail for each group.

The details returned by APPROX_PERCENTILE_DETAIL can be used as input to the APPROX_PERCENTILE_AGG function, which enables you to perform aggregations of the details, or the TO_APPROX_PERCENTILE function, which converts a detail to a specified percentile value. You can use these three functions together to perform resource-intensive approximate percentile calculations once, store the resulting details, and then perform efficient aggregations and queries on those details. For example:

1. Use the APPROX_PERCENTILE_DETAIL function to perform approximate percentile calculations and store the resulting details in a table or materialized view. These could be highly-granular percentile details, such as income percentile information for cities.

2. Use the APPROX_PERCENTILE_AGG function to aggregate the details obtained in the previous step and store the resulting details in a table or materialized view. These could be details of lower granularity, such as income percentile information for states.

3. Use the TO_APPROX_PERCENTILE function to convert the stored detail values to percentile values. You can use the TO_APPROX_PERCENTILE function to query detail values created by the APPROX_PERCENTILE_DETAIL function or the APPROX_PERCENTILE_AGG function.

DETERMINISTIC

This clause lets you control the type of algorithm used to calculate the approximate percentile values.
• If you specify `DETERMINISTIC`, then this function calculates deterministic approximate percentile information. In this case, `expr` must evaluate to a numeric value, or to a value that can be implicitly converted to a numeric value.

• If you omit `DETERMINISTIC`, then this function calculates nondeterministic approximate percentile information. In this case, `expr` must evaluate to a numeric or datetime value, or to a value that can be implicitly converted to a numeric or datetime value.

---

See Also:

- `APPROX_PERCENTILE_AGG`
- `TO_APPROX_PERCENTILE`

Examples

The examples in this section demonstrate how to use the `APPROX_PERCENTILE_DETAIL`, `APPROX_PERCENTILE_AGG`, and `TO_APPROX_PERCENTILE` functions together to perform resource-intensive approximate percentile calculations once, store the resulting details, and then perform efficient aggregations and queries on those details.

**APPROX_PERCENTILE_DETAIL: Example**

The following statement queries the tables `sh.customers` and `sh.sales` for the monetary amounts for products sold to each customer. The `APPROX_PERCENTILE_DETAIL` function returns the information in a detail, called `city_detail`, for each city in which customers reside. The returned details are stored in a materialized view called `amt_sold_by_city_mv`.

```
CREATE MATERIALIZED VIEW amt_sold_by_city_mv
ENABLE QUERY REWRITE AS
SELECT c.country_id country,
       c.cust_state_province state,
       c.cust_city city,
       APPROX_PERCENTILE_DETAIL(s.amount_sold) city_detail
FROM customers c, sales s
WHERE c.cust_id = s.cust_id
GROUP BY c.country_id, c.cust_state_province, c.cust_city;
```

**APPROX_PERCENTILE_AGG: Examples**

The following statement uses the `APPROX_PERCENTILE_AGG` function to read the details stored in `amt_sold_by_city_mv` and create aggregated details that contain the monetary amounts for products sold to customers in each state. These aggregated details are stored in a materialized view called `amt_sold_by_state_mv`.

```
CREATE MATERIALIZED VIEW amt_sold_by_state_mv AS
SELECT state,
       APPROX_PERCENTILE_AGG(city_detail) state_detail
FROM amt_sold_by_city_mv
GROUP BY state;
```

The following statement is similar to the previous statement, except it creates aggregated details that contain the approximate monetary amounts for products sold...
to customers in each country. These aggregated details are stored in a materialized view called `amt_sold_by_country_mv`.

CREATE MATERIALIZED VIEW amt_sold_by_country_mv AS
SELECT country,
    APPROX_PERCENTILE_AGG(city_detail) country_detail
FROM amt_sold_by_city_mv
GROUP BY country;

**TO_APPROX_PERCENTILE: Examples**

The following statement uses the `TO_APPROX_PERCENTILE` function to query the details stored in `amt_sold_by_city_mv` and return approximate 25th percentile, 50th percentile, and 75th percentile values for monetary amounts for products sold to customers in each city:

```sql
SELECT country,
    state,
    city,
    TO_APPROX_PERCENTILE(city_detail, .25, 'NUMBER') "25th Percentile",
    TO_APPROX_PERCENTILE(city_detail, .50, 'NUMBER') "50th Percentile",
    TO_APPROX_PERCENTILE(city_detail, .75, 'NUMBER') "75th Percentile"
FROM amt_sold_by_city_mv
ORDER BY country, state, city;
```

<table>
<thead>
<tr>
<th>COUNTRY</th>
<th>STATE</th>
<th>CITY</th>
<th>25th Percentile</th>
<th>50th Percentile</th>
<th>75th Percentile</th>
</tr>
</thead>
<tbody>

...

APPROX_PERCENTILE_AGG takes as its input a column of details containing approximate percentile information, and enables you to perform aggregations of that information. The following statement demonstrates how approximate percentile details can be interpreted by APPROX_PERCENTILE_AGG to provide an input to the TO_APPROX_PERCENTILE function. Like the previous example, this query returns approximate 25th percentile values for monetary amounts for products sold to customers in each country. Note that the results are identical to those returned for the 25th percentile in the previous example.

SELECT country,
    TO_APPROX_PERCENTILE(APPROX_PERCENTILE_AGG(city_detail), .25, 'NUMBER') "25th Percentile"
FROM amt_sold_by_city_mv
GROUP BY country
ORDER BY country;

COUNTRY 25th Percentile
--------- ---------------
52769            19.1
52770           19.29
52771           11.99
52772           18.08
52773           15.67
...

Query Rewrite and Materialized Views Based on Approximate Queries: Example

In APPROX_PERCENTILE_DETAIL: Example, the ENABLE QUERY REWRITE clause is specified when creating the materialized view amt_sold_by_city_mv. This enables queries that contain approximation functions, such as APPROX_MEDIAN or APPROX_PERCENTILE, to be rewritten using the materialized view.

For example, ensure that query rewrite is enabled at either the database level or for the current session, and run the following query:

SELECT c.country_id country,
    APPROX_MEDIAN(s.amount_sold) amount_median
FROM customers c, sales s
WHERE c.cust_id = s.cust_id
GROUP BY c.country_id;

Explain the plan by querying DBMS_XPLAN:
As shown in the following plan, the optimizer used the materialized view `amt_sold_by_city_mv` for the query:

```sql
SELECT c.country_id country, APPROX_MEDIAN(s.amount_sold) amount_median
FROM customers c, sales s WHERE c.cust_id = s.cust_id
GROUP BY c.country_id
```

Plan hash value: 2232676046

### 7.20 ASCII

#### Syntax

```sql
ASCII (char)
```

#### Purpose

`ASCII` returns the decimal representation in the database character set of the first character of `char`.

`char` can be of data type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The value returned is of data type `NUMBER`. If your database character set is 7-bit ASCII, then this function returns an ASCII value. If your database character set is EBCDIC Code, then this function returns an EBCDIC value. There is no corresponding EBCDIC character function.

This function does not support `CLOB` data directly. However, `CLOBs` can be passed in as arguments through implicit data conversion.

#### See Also:

[Data Type Comparison Rules](#) for more information

#### Examples

The following example returns employees whose last names begin with the letter L, whose ASCII equivalent is 76:
SELECT last_name
    FROM employees
    WHERE ASCII(SUBSTR(last_name, 1, 1)) = 76
    ORDER BY last_name;

LAST_NAME
-------------------------
Ladwig
Landry
Lee
Livingston
Lorentz

### 7.21 ASCIISTR

#### Syntax

```
    ASCIISTR(char)
```

#### Purpose

`ASCIISTR` takes as its argument a string, or an expression that resolves to a string, in any character set and returns an ASCII version of the string in the database character set. Non-ASCII characters are converted to the form `\xxxx`, where `xxxx` represents a UTF-16 code unit.

#### See Also:

- Oracle Database Globalization Support Guide for information on Unicode character sets and character semantics
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of `ASCIISTR`

#### Examples

The following example returns the ASCII string equivalent of the text string "ABÄCDE":

```
SELECT ASCIISTR('ABÄCDE')
    FROM DUAL;

ASCIISTR('AB\00C4CDE')
-------
AB\00C4CDE
```
7.22 ASIN

Syntax

\[
\text{ASIN}(n)
\]

Purpose

ASIN returns the arc sine of \( n \). The argument \( n \) must be in the range of -1 to 1, and the function returns a value in the range of \(-\pi/2\) to \(\pi/2\), expressed in radians.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns the arc sine of .3:

```sql
SELECT ASIN(.3) "Arc_Sine"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Arc_Sine</th>
</tr>
</thead>
<tbody>
<tr>
<td>.304692654</td>
</tr>
</tbody>
</table>

7.23 ATAN

Syntax

\[
\text{ATAN}(n)
\]

Purpose

ATAN returns the arc tangent of \( n \). The argument \( n \) can be in an unbounded range and returns a value in the range of \(-\pi/2\) to \(\pi/2\), expressed in radians.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.
### Examples

The following example returns the arc tangent of .3:

```sql
SELECT ATAN(.3) "Arc_Tangent"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Arc_Tangent</th>
</tr>
</thead>
<tbody>
<tr>
<td>.291456794</td>
</tr>
</tbody>
</table>

### 7.24 ATAN2

#### Syntax

```
ATAN2(n1, n2)
```

#### Purpose

The `ATAN2` function returns the arc tangent of `n1` and `n2`. The argument `n1` can be in an unbounded range and returns a value in the range of `−pi` to `+pi`, depending on the signs of `n1` and `n2`, expressed in radians.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is `BINARY_FLOAT` or `BINARY_DOUBLE`, then the function returns `BINARY_DOUBLE`. Otherwise, the function returns `NUMBER`.

#### See Also:

- [ATAN](#) for information on the `ATAN` function and Table 2-8 for more information on implicit conversion

### Examples

The following example returns the arc tangent of .3 and .2:

```sql
SELECT ATAN2(.3, .2) "Arc_Tangent2"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Arc_Tangent2</th>
</tr>
</thead>
<tbody>
<tr>
<td>.982793723</td>
</tr>
</tbody>
</table>
7.25 AVG

Syntax

AVG

DISTINCT

expr

OVER

analytic_clause

See Also:

Analytic Functions for information on syntax, semantics, and restrictions

Purpose

AVG returns average value of expr.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

If you specify DISTINCT, then you can specify only the query_partition_clause of the analytic_clause. The order_by_clause and windowing_clause are not allowed.

See Also:

About SQL Expressions for information on valid forms of expr and Aggregate Functions

Aggregate Example

The following example calculates the average salary of all employees in the hr.employees table:

SELECT AVG(salary) "Average"
  FROM employees;

Average

------------------

6461.83178
Analytic Example

The following example calculates, for each employee in the `employees` table, the average salary of the employees reporting to the same manager who were hired in the range just before through just after the employee:

```sql
SELECT manager_id, last_name, hire_date, salary,
       AVG(salary) OVER (PARTITION BY manager_id ORDER BY hire_date
                    ROWS BETWEEN 1 PRECEDING AND 1 FOLLOWING) AS c_mavg
FROM employees
ORDER BY manager_id, hire_date, salary;
```

</tbody>
</table>

...

7.26 BFILENAME

Syntax

```
BFILENAME ( 'directory' , 'filename' )
```

Purpose

`BFILENAME` returns a `BFILE` locator that is associated with a physical LOB binary file on the server file system.

- `'directory'` is a database object that serves as an alias for a full path name on the server file system where the files are actually located.
- `'filename'` is the name of the file in the server file system.

You must create the directory object and associate a `BFILE` value with a physical file before you can use them as arguments to `BFILENAME` in a SQL or PL/SQL statement, `DBMS_LOB` package, or OCI operation.

You can use this function in two ways:

- In a DML statement to initialize a `BFILE` column
- In a programmatic interface to access `BFILE` data by assigning a value to the `BFILE` locator

The directory argument is case sensitive. You must ensure that you specify the directory object name exactly as it exists in the data dictionary. For example, if an "Admin" directory object was created using mixed case and a quoted identifier in the `CREATE DIRECTORY` statement, then when using the `BFILENAME` function you must refer to the directory object as 'Admin'. You must specify the filename argument according to the case and punctuation conventions for your operating system.
See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide and Oracle Call Interface Programmer's Guide for more information on LOBs and for examples of retrieving BFILE data
- CREATE DIRECTORY

Examples

The following example inserts a row into the sample table pm.print_media. The example uses the BFILENAME function to identify a binary file on the server file system in the directory /demo/schema/product_media. The example shows how the directory database object media_dir was created in the pm schema.

CREATE DIRECTORY media_dir AS '/demo/schema/product_media';

INSERT INTO print_media (product_id, ad_id, ad_graphic)
VALUES (3000, 31001, BFILENAME('MEDIA_DIR', 'modem_comp_ad.gif'));

7.27 BIN_TO_NUM

Syntax

```
BIN_TO_NUM ( expr
, expr
)
```

Purpose

BIN_TO_NUM converts a bit vector to its equivalent number. Each argument to this function represents a bit in the bit vector. This function takes as arguments any numeric data type, or any nonnumeric data type that can be implicitly converted to NUMBER. Each expr must evaluate to 0 or 1. This function returns Oracle NUMBER.

BIN_TO_NUM is useful in data warehousing applications for selecting groups of interest from a materialized view using grouping sets.

See Also:

- group_by_clause for information on GROUPING SETS syntax
- Table 2-8 for more information on implicit conversion
- Oracle Database Data Warehousing Guide for information on data aggregation in general

Examples

The following example converts a binary value to a number:
SELECT BIN_TO_NUM(1,0,1,0)
   FROM DUAL;

BIN_TO_NUM(1,0,1,0)
------------
   10

The next example converts three values into a single binary value and uses
BIN_TO_NUM to convert that binary into a number. The example uses a PL/SQL
declaration to specify the original values. These would normally be derived from actual
data sources.

SELECT order_status
   FROM orders
   WHERE order_id = 2441;

ORDER_STATUS
------------
   5

DECLARE
   warehouse NUMBER := 1;
   ground    NUMBER := 1;
   insured   NUMBER := 1;
   result    NUMBER;
BEGIN
   SELECT BIN_TO_NUM(warehouse, ground, insured) INTO result FROM DUAL;
   UPDATE orders SET order_status = result WHERE order_id = 2441;
END;
/
PL/SQL procedure successfully completed.

SELECT order_status
   FROM orders
   WHERE order_id = 2441;

ORDER_STATUS
------------
   7

Refer to the examples for BITAND for information on reversing this process by
extracting multiple values from a single column value.

7.28 BITAND

Syntax

```
BITAND (expr1, expr2)
```

Purpose

The BITAND function treats its inputs and its output as vectors of bits; the output is the
bitwise AND of the inputs.

The types of `expr1` and `expr2` are NUMBER, and the result is of type NUMBER. If either
argument to BITAND is NULL, the result is NULL.
The arguments must be in the range \(-2^{(n-1)} \ldots (2^{(n-1)} )-1\). If an argument is out of this range, the result is undefined.

The result is computed in several steps. First, each argument \( A \) is replaced with the value \( \text{SIGN}(A) \times \text{FLOOR}( \text{ABS}(A)) \). This conversion has the effect of truncating each argument towards zero. Next, each argument \( A \) (which must now be an integer value) is converted to an \( n \)-bit two's complement binary integer value. The two bit values are combined using a bitwise \text{AND} \) operation. Finally, the resulting \( n \)-bit two's complement value is converted back to \text{NUMBER}.

Notes on the BITAND Function

- The current implementation of \text{BITAND} defines \( n = 128 \).
- PL/SQL supports an overload of \text{BITAND} for which the types of the inputs and of the result are all \text{BINARY_INTEGER} and for which \( n = 32 \).

Examples

The following example performs an \text{AND} \) operation on the numbers 6 (binary 1,1,0) and 3 (binary 0,1,1):

```sql
SELECT BITAND(6,3)
  FROM DUAL;
```

```
BITAND(6,3)
---------
  2
```

This is the same as the following example, which shows the binary values of 6 and 3. The \text{BITAND} \) function operates only on the significant digits of the binary values:

```sql
SELECT BITAND(
  BIN_TO_NUM(1,1,0),
  BIN_TO_NUM(0,1,1)) "Binary"
  FROM DUAL;
```

```
Binary
--------
   2
```

Refer to the example for \text{BIN_TO_NUM} \) for information on encoding multiple values in a single column value.

The following example supposes that the \text{order_status} \) column of the sample table \text{oe.orders} \) encodes several choices as individual bits within a single numeric value. For example, an order still in the warehouse is represented by a binary value 001 (decimal 1). An order being sent by ground transportation is represented by a binary value 010 (decimal 2). An insured package is represented by a binary value 100 (decimal 4). The example uses the \text{DECODE} \) function to provide two values for each of the three bits in the \text{order_status} \) value, one value if the bit is turned on and one if it is turned off.

```sql
SELECT order_id, customer_id, order_status,
  DECODE(BITAND(order_status, 1), 1, 'Warehouse', 'PostOffice') "Location",
  DECODE(BITAND(order_status, 2), 2, 'Ground', 'Air') "Method",
  DECODE(BITAND(order_status, 4), 4, 'Insured', 'Certified') "Receipt"
  FROM orders
WHERE sales_rep_id = 160
ORDER BY order_id;
```
<table>
<thead>
<tr>
<th>ORDER_ID</th>
<th>CUSTOMER_ID</th>
<th>ORDER_STATUS</th>
<th>Location</th>
<th>Method</th>
<th>Receipt</th>
</tr>
</thead>
<tbody>
<tr>
<td>2416</td>
<td>104</td>
<td>6</td>
<td>PostOffice</td>
<td>Ground</td>
<td>Insured</td>
</tr>
<tr>
<td>2419</td>
<td>107</td>
<td>3</td>
<td>Warehouse</td>
<td>Ground</td>
<td>Certified</td>
</tr>
<tr>
<td>2420</td>
<td>108</td>
<td>2</td>
<td>PostOffice</td>
<td>Ground</td>
<td>Certified</td>
</tr>
<tr>
<td>2423</td>
<td>145</td>
<td>3</td>
<td>Warehouse</td>
<td>Ground</td>
<td>Certified</td>
</tr>
<tr>
<td>2441</td>
<td>106</td>
<td>5</td>
<td>Warehouse</td>
<td>Air</td>
<td>Insured</td>
</tr>
<tr>
<td>2455</td>
<td>145</td>
<td>7</td>
<td>Warehouse</td>
<td>Ground</td>
<td>Insured</td>
</tr>
</tbody>
</table>

For the Location column, BITAND first compares order_status with 1 (binary 001). Only significant bit values are compared, so any binary value with a 1 in its rightmost bit (any odd number) will evaluate positively and return 1. Even numbers will return 0. The DECODE function compares the value returned by BITAND with 1. If they are both 1, then the location is "Warehouse". If they are different, then the location is "PostOffice".

The Method and Receipt columns are calculated similarly. For Method, BITAND performs the AND operation on order_status and 2 (binary 010). For Receipt, BITAND performs the AND operation on order_status and 4 (binary 100).

### 7.29 CARDINALITY

**Syntax**

```
CARDINALITY ( nested_table )
```

**Purpose**

CARDINALITY returns the number of elements in a nested table. The return type is NUMBER. If the nested table is empty, or is a null collection, then CARDINALITY returns NULL.

**Examples**

The following example shows the number of elements in the nested table column ad_textdocs_ntab of the sample table pm.print_media:

```sql
SELECT product_id, CARDINALITY(ad_textdocs_ntab) cardinality
FROM print_media
ORDER BY product_id;
```

<table>
<thead>
<tr>
<th>PRODUCT_ID</th>
<th>CARDINALITY</th>
</tr>
</thead>
<tbody>
<tr>
<td>2056</td>
<td>3</td>
</tr>
<tr>
<td>2268</td>
<td>3</td>
</tr>
<tr>
<td>3060</td>
<td>3</td>
</tr>
<tr>
<td>3106</td>
<td>3</td>
</tr>
</tbody>
</table>
7.30 CAST

Syntax

```
CAST ( expr MULTISET ( subquery ) AS type_name
DEFAULT return_value ON CONVERSION ERROR , fmt
, ' nlsparam '
)
```

Purpose

CAST lets you convert built-in data types or collection-typed values of one type into another built-in data type or collection type. You can cast an unnamed operand (such as a date or the result set of a subquery) or a named collection (such as a varray or a nested table) into a type-compatible data type or named collection. The `type_name` must be the name of a built-in data type or collection type and the operand must be a built-in data type or must evaluate to a collection value.

For the operand, `expr` can be either a built-in data type, a collection type, or an instance of an ANYDATA type. If `expr` is an instance of an ANYDATA type, then CAST tries to extract the value of the ANYDATA instance and return it if it matches the cast target type, otherwise, null will be returned. MULTISET informs Oracle Database to take the result set of the subquery and return a collection value. Table 7-1 shows which built-in data types can be cast into which other built-in data types. (CAST does not support LONG, LONG RAW, or the Oracle-supplied types.)

CAST does not directly support any of the LOB data types. When you use CAST to convert a CLOB value into a character data type or a BLOB value into the RAW data type, the database implicitly converts the LOB value to character or raw data and then explicitly casts the resulting value into the target data type. If the resulting value is larger than the target type, then the database returns an error.

When you use CAST ... MULTISET to get a collection value, each select list item in the query passed to the CAST function is converted to the corresponding attribute type of the target collection element type.

<table>
<thead>
<tr>
<th>Table 7-1</th>
<th>Casting Built-In Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Destination Data Type</td>

<tr>
<td>to BINARY_FLOAT, BINARY_DOUBLE</td>
<td>X (Note 3)</td>
</tr>
</tbody>
</table>
### Table 7-1 (Cont.) Casting Built-In Data Types

<table>
<thead>
<tr>
<th>Destination Data Type</th>
<th>from BINARY_FLOAT, BINARY_DOUBLE</th>
<th>from CHAR, VARCHAR2</th>
<th>from NUMBER/INTEGER</th>
<th>from DATETIME / INTERVAL (Note 1)</th>
<th>from RAW</th>
<th>from ROWID, UROWID (Note 2)</th>
<th>from NCHAR, NVARCHAR2</th>
</tr>
</thead>
<tbody>
<tr>
<td>to CHAR, VARCHAR2</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>--</td>
</tr>
<tr>
<td>to NUMBER/INTEGER</td>
<td>X (Note 3)</td>
<td>X (Note 3)</td>
<td>X (Note 3)</td>
<td>--</td>
<td>--</td>
<td>--</td>
<td>X (Note 3)</td>
</tr>
<tr>
<td>to DATETIME/INTERVAL</td>
<td>--</td>
<td>X (Note 3)</td>
<td>--</td>
<td>X (Note 3)</td>
<td>--</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td>to RAW</td>
<td>--</td>
<td>X</td>
<td>--</td>
<td>--</td>
<td>X</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td>to ROWID, UROWID</td>
<td>--</td>
<td>X</td>
<td>--</td>
<td>--</td>
<td>--</td>
<td>--</td>
<td>--</td>
</tr>
<tr>
<td>to NCHAR, NVARCHAR2</td>
<td>X</td>
<td>--</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Note 1:** Datetime/interval includes DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, INTERVAL DAY TO SECOND, and INTERVAL YEAR TO MONTH.

**Note 2:** You cannot cast a UROWID to a ROWID if the UROWID contains the value of a ROWID of an index-organized table.

**Note 3:** You can specify the DEFAULT return_value ON CONVERSION ERROR clause for this type of conversion. You can specify the fmt and nlsparam clauses for this type of conversion with the following exceptions: you cannot specify fmt when converting to INTERVAL DAY TO SECOND, and you cannot specify fmt or nlsparam when converting to INTERVAL YEAR TO MONTH.

If you want to cast a named collection type into another named collection type, then the elements of both collections must be of the same type.

**MULTISET**

If the result set of subquery can evaluate to multiple rows, then you must specify the MULTISET keyword. The rows resulting from the subquery form the elements of the result set.
collection value into which they are cast. Without the MULTISET keyword, the subquery is treated as a scalar subquery.

**Restriction on MULTISET**

If you specify the MULTISET keyword, then you cannot specify the DEFAULT return_value ON CONVERSION ERROR, fmt, or nlsparam clauses.

**DEFAULT return_value ON CONVERSION ERROR**

This clause allows you to specify the value returned by this function if an error occurs while converting expr to type_name. This clause has no effect if an error occurs while evaluating expr.

This clause is valid if expr evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, and type_name is BINARY_DOUBLE, BINARY_FLOAT, DATE, INTERVAL DAY TO SECOND, INTERVAL YEAR TO MONTH, NUMBER, TIMESTAMP, TIMESTAMP WITH TIME ZONE, or TIMESTAMP WITH LOCAL TIME ZONE.

The return_value can be a string literal, null, constant expression, or a bind variable, and must evaluate to null or a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2. If return_value cannot be converted to type_name, then the function returns an error.

**fmt and nlsparam**

The fmt argument lets you specify a format model and the nlsparam argument lets you specify NLS parameters. If you specify these arguments, then they are applied when converting expr and return_value, if specified, to type_name.

You can specify fmt and nlsparam if type_name is one of the following data types:

- **BINARY_DOUBLE**
  
  If you specify BINARY_DOUBLE, then the optional fmt and nlsparam arguments serve the same purpose as for the TO_BINARY_DOUBLE function. Refer to TO_BINARY_DOUBLE for more information.

- **BINARY_FLOAT**
  
  If you specify BINARY_FLOAT, then the optional fmt and nlsparam arguments serve the same purpose as for the TO_BINARY_FLOAT function. Refer to TO_BINARY_FLOAT for more information.

- **DATE**
  
  If you specify DATE, then the optional fmt and nlsparam arguments serve the same purpose as for the TO_DATE function. Refer to TO_DATE for more information.

- **NUMBER**
  
  If you specify NUMBER, then the optional fmt and nlsparam arguments serve the same purpose as for the TO_NUMBER function. Refer to TO_NUMBER for more information.

- **TIMESTAMP**
  
  If you specify TIMESTAMP, then the optional fmt and nlsparam arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit fmt, then expr must be in the default format of the TIMESTAMP data type, which is determined explicitly by the NLS_TIMESTAMP_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. Refer to TO_TIMESTAMP for more information.
• **TIMESTAMP WITH TIME ZONE**

If you specify `TIMESTAMP WITH TIME ZONE`, then the optional `fmt` and `nlsparam` arguments serve the same purpose as for the `TO_TIMESTAMP_TZ` function. If you omit `fmt`, then `expr` must be in the default format of the `TIMESTAMP WITH TIME ZONE` data type, which is determined explicitly by the `NLS_TIMESTAMP_TZ_FORMAT` parameter or implicitly by the `NLS_TERRITORY` parameter. Refer to `TO_TIMESTAMP_TZ` for more information.

• **TIMESTAMP WITH LOCAL TIME ZONE**

If you specify `TIMESTAMP WITH LOCAL TIME ZONE` then the optional `fmt` and `nlsparam` arguments serve the same purpose as for the `TO_TIMESTAMP` function. If you omit `fmt`, then `expr` must be in the default format of the `TIMESTAMP` data type, which is determined explicitly by the `NLS_TIMESTAMP_FORMAT` parameter or implicitly by the `NLS_TERRITORY` parameter. Refer to `TO_TIMESTAMP` for more information.

**Built-In Data Type Examples**

The following examples use the `CAST` function with scalar data types. The first example converts text to a timestamp value by applying the format model provided in the session parameter `NLS_TIMESTAMP_FORMAT`. If you want to avoid dependency on this NLS parameter, then you can use the `TO_DATE` as shown in the second example.

```sql
SELECT CAST('22-OCT-1997' AS TIMESTAMP WITH LOCAL TIME ZONE)
FROM DUAL;

SELECT CAST(TO_DATE('22-Oct-1997', 'DD-Mon-YYYY') AS TIMESTAMP WITH LOCAL TIME ZONE)
FROM DUAL;
```

In the preceding example, `TO_DATE` converts from text to `DATE`, and `CAST` converts from `DATE` to `TIMESTAMP WITH LOCAL TIME ZONE`, interpreting the date in the session time zone (`SESSIONTIMEZONE`).

```sql
SELECT product_id, CAST(ad_sourcetext AS VARCHAR2(30)) text
FROM print_media
ORDER BY product_id;
```

The following examples return a default value if an error occurs while converting the specified value to the specified data type. In these examples, the conversions occurs without error.

```sql
SELECT CAST(200 AS NUMBER DEFAULT 0 ON CONVERSION ERROR)
FROM DUAL;

SELECT CAST('January 15, 1989, 11:00 A.M.' AS DATE DEFAULT NULL ON CONVERSION ERROR,
'Month dd, YYYY, HH:MI A.M.')
FROM DUAL;

SELECT CAST('1999-12-01 11:00:00 -8:00' AS TIMESTAMP WITH TIME ZONE DEFAULT '2000-01-01 01:00:00 -8:00' ON CONVERSION ERROR,
'YYYY-MM-DD HH:MI:SS TZH:TZM',
'YYYY-MM-DD HH:MI:SS TZH:TZM' AS TIMESTAMP WITH TIME ZONE)
FROM DUAL;
```
'NLS_DATE_LANGUAGE = American')
FROM DUAL;

In the following example, an error occurs while converting 'N/A' to a NUMBER value. Therefore, the CAST function returns the default value of 0.

SELECT CAST('N/A' AS NUMBER DEFAULT '0' ON CONVERSION ERROR) FROM DUAL;

Collection Examples

The CAST examples that follow build on the cust_address_typ found in the sample order entry schema, oe.

CREATE TYPE address_book_t AS TABLE OF cust_address_typ;
/
CREATE TYPE address_array_t AS VARRAY(3) OF cust_address_typ;
/
CREATE TABLE cust_address (
  custno NUMBER,
  street_address VARCHAR2(40),
  postal_code VARCHAR2(10),
  city VARCHAR2(30),
  state_province VARCHAR2(10),
  country_id CHAR(2));
CREATE TABLE cust_short (custno NUMBER, name VARCHAR2(31));
CREATE TABLE states (state_id NUMBER, addresses address_array_t);

This example casts a subquery:

SELECT s.custno, s.name,
  CAST(MULTISET(SELECT ca.street_address,
                 ca.postal_code,
                 ca.city,
                 ca.state_province,
                 ca.country_id
                 FROM cust_address ca
                 WHERE s.custno = ca.custno)
  AS address_book_t)
FROM cust_short s
ORDER BY s.custno;

CAST converts a varray type column into a nested table:

SELECT CAST(s.addresses AS address_book_t)
FROM states s
WHERE s.state_id = 111;

The following objects create the basis of the example that follows:

CREATE TABLE projects
  (employee_id NUMBER, project_name VARCHAR2(10));

CREATE TABLE emps_short
  (employee_id NUMBER, last_name VARCHAR2(10));

CREATE TYPE project_table_typ AS TABLE OF VARCHAR2(10);
/
The following example of a \texttt{MULTISET} expression uses these objects:

\begin{verbatim}
SELECT e.last_name,
     CAST(MULTISET(SELECT p.project_name
        FROM projects p
        WHERE p.employee_id = e.employee_id
        ORDER BY p.project_name)
     AS project_table_typ)
FROM emps_short e
ORDER BY e.last_name;
\end{verbatim}

### 7.31 CEIL

**Syntax**

\begin{center}
\texttt{CEIL}(n)
\end{center}

**Purpose**

\texttt{CEIL} returns the smallest integer that is greater than or equal to \( n \). The number \( n \) can always be written as the difference of an integer \( k \) and a positive fraction \( f \) such that \( 0 \leq f < 1 \) and \( n = k - f \). The value of \texttt{CEIL} is the integer \( k \). Thus, the value of \texttt{CEIL} is \( n \) itself if and only if \( n \) is precisely an integer.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

**See Also:**

Table 2-8 for more information on implicit conversion and \texttt{FLOOR}

**Examples**

The following example returns the smallest integer greater than or equal to the order total of a specified order:

\begin{verbatim}
SELECT order_total, CEIL(order_total)
FROM orders
WHERE order_id = 2434;
\end{verbatim}

<table>
<thead>
<tr>
<th>ORDER_TOTAL</th>
<th>CEIL(ORDER_TOTAL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>268651.8</td>
<td>268652</td>
</tr>
</tbody>
</table>

### 7.32 CHARTOROWID

**Syntax**

\begin{center}
\texttt{CHARTOROWID}(char)
\end{center}
Purpose

CHARTOROWID converts a value from CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type to ROWID data type.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also:

Data Type Comparison Rules for more information.

Examples

The following example converts a character rowid representation to a rowid. (The actual rowid is different for each database instance.)

```sql
SELECT last_name
FROM employees
WHERE ROWID = CHARTOROWID('AAAFd1AAFAAAAABSAA/');
```

LAST_NAME
-------------------------
Greene

7.33 CHR

Syntax

```
CHR ( n USING NCHAR_CS )
```

Purpose

CHR returns the character having the binary equivalent to \( n \) as a VARCHAR2 value in either the database character set or, if you specify USING NCHAR_CS, the national character set.

For single-byte character sets, if \( n > 256 \), then Oracle Database returns the binary equivalent of \( n \mod 256 \). For multibyte character sets, \( n \) must resolve to one entire code point. Invalid code points are not validated, and the result of specifying invalid code points is indeterminate.

This function takes as an argument a NUMBER value, or any value that can be implicitly converted to NUMBER, and returns a character.
Note:

Use of the \texttt{CHR} function (either with or without the optional \texttt{USING NCHAR_CS} clause) results in code that is not portable between ASCII- and EBCDIC-based machine architectures.

See Also:

- \texttt{NCHR} and Table 2-8 for more information on implicit conversion
- Appendix C in \textit{Oracle Database Globalization Support Guide} for the collation derivation rules, which define the collation assigned to the character return value of \texttt{CHR}

Examples

The following example is run on an ASCII-based machine with the database character set defined as \texttt{WE8ISO8859P1}:

```sql
SELECT CHR(67)||CHR(65)||CHR(84) "Dog"
FROM DUAL;
```

```
Dog
---
CAT
```

To produce the same results on an EBCDIC-based machine with the \texttt{WE8EBCDIC1047} character set, the preceding example would have to be modified as follows:

```sql
SELECT CHR(195)||CHR(193)||CHR(227) "Dog"
FROM DUAL;
```

```
Dog
---
CAT
```

For multibyte character sets, this sort of concatenation gives different results. For example, given a multibyte character whose hexadecimal value is \texttt{a1a2} (\texttt{a1} representing the first byte and \texttt{a2} the second byte), you must specify for \texttt{n} the decimal equivalent of \texttt{a1a2}, or \texttt{41378}:

```sql
SELECT CHR(41378)
FROM DUAL;
```

You cannot specify the decimal equivalent of \texttt{a1} concatenated with the decimal equivalent of \texttt{a2}, as in the following example:

```sql
SELECT CHR(161)||CHR(162)
FROM DUAL;
```

However, you can concatenate whole multibyte code points, as in the following example, which concatenates the multibyte characters whose hexadecimal values are \texttt{a1a2} and \texttt{a1a3}:
7.34 CLUSTER_DETAILS

Syntax

\[
\text{cluster\_details::=}
\]

\[
\text{CLUSTER\_DETAILS (}
\text{schema . model ,}
\text{cluster\_id ,}
\text{topN DESC ASC ABS}
\text{mining\_attribute\_clause)}
\]

Analytic Syntax

\[
\text{cluster\_details\_analytic::=}
\]

\[
\text{CLUSTER\_DETAILS (}
\text{INTO n ,}
\text{cluster\_id ,}
\text{topN DESC ASC ABS}
\text{mining\_attribute\_clause)}
\text{OVER (}
\text{mining\_analytic\_clause)}
\]

\[
\text{mining\_attribute\_clause::=}
\]

\[
\text{USING}
\text{schema . table . * expr AS alias ,}
\]
mining_analytic_clause ::= 

See Also:

Analytic Functions for information on the syntax, semantics, and restrictions of mining_analytic_clause

Purpose

CLUSTER_DETAILS returns cluster details for each row in the selection. The return value is an XML string that describes the attributes of the highest probability cluster or the specified cluster_id.

topN

If you specify a value for topN, the function returns the N attributes that most influence the cluster assignment (the score). If you do not specify topN, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on cluster assignment. A positive weight indicates an increased likelihood of assignment. A negative weight indicates a decreased likelihood of assignment.

By default, CLUSTER_DETAILS returns the attributes with the highest positive weights (DESC). If you specify ASC, the attributes with the highest negative weights are returned. If you specify ABS, the attributes with the greatest weights, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

CLUSTER_DETAILS can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.

- Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. Include INTO n, where n is the number of clusters to compute, and mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See analytic_clause::=.)

The syntax of the CLUSTER_DETAILS function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.
mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See mining_attribute_clause::=.)

See Also:

- Oracle Data Mining User's Guide for information about scoring.
- Oracle Data Mining Concepts for information about clustering.

Note:

The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User's Guide.

Example

This example lists the attributes that have the greatest impact (more than 20% probability) on cluster assignment for customer ID 100955. The query invokes the CLUSTER_DETAILS and CLUSTER_SET functions, which apply the clustering model em_sh_clus_sample.

```
SELECT S.cluster_id, probability prob,
     CLUSTER_DETAILS(em_sh_clus_sample, S.cluster_id, 5 USING T.*) det
FROM
    (SELECT v.*, CLUSTER_SET(em_sh_clus_sample, NULL, 0.2 USING *) pset
     FROM mining_data_apply_v v
     WHERE cust_id = 100955) T,
     TABLE(T.pset) S
ORDER BY 2 DESC;
```

<table>
<thead>
<tr>
<th>CLUSTER_ID</th>
<th>PROB</th>
</tr>
</thead>
<tbody>
<tr>
<td>14</td>
<td>0.6761</td>
</tr>
<tr>
<td>3</td>
<td>0.3227</td>
</tr>
</tbody>
</table>

```
14 .6761 <Details algorithm="Expectation Maximization" cluster="14">
   <Attribute name="AGE" actualValue="51" weight=".676" rank="1"/>
   <Attribute name="HOME_THEATER_PACKAGE" actualValue="1" weight=".557" rank="2"/>
   <Attribute name="FLAT_PANEL_MONITOR" actualValue="0" weight=".412" rank="3"/>
   <Attribute name="Y_BOX_GAMES" actualValue="0" weight="-.003" rank="4"/>
   <Attribute name="BOOKKEEPING_APPLICATION" actualValue="1" weight="-.003" rank="5"/>
</Details>

3 .3227 <Details algorithm="Expectation Maximization" cluster="3">
   <Attribute name="YRS_RESIDENCE" actualValue="3" weight=".323" rank="1"/>
   <Attribute name="BULK_PACK_DISKETTES" actualValue="1" weight=".265" rank="2"/>
   <Attribute name="EDUCATION" actualValue="HS-grad" weight=".172" rank="3"/>
   <Attribute name="AFFINITY_CARD" actualValue="0" weight=".125" rank="4"/>
   <Attribute name="OCCUPATION" actualValue="Crafts" weight=".055" rank="5"/>
</Details>
```
Analytic Example

This example divides the customer database into four segments based on common characteristics. The clustering functions compute the clusters and return the score without a predefined clustering model.

```sql
SELECT * FROM ( 
    SELECT cust_id,
    CLUSTER_ID(INTO 4 USING *) OVER () cls,
    CLUSTER_DETAILS(INTO 4 USING *) OVER () cls_details
    FROM mining_data_apply_v)
WHERE cust_id <= 100003
ORDER BY 1;

    <Attribute name="HOME_THEATER_PACKAGE" actualValue="0" weight=".113" rank="3"/>
    <Attribute name="AFFINITY_CARD" actualValue="0" weight=".007" rank="4"/>
    <Attribute name="CUST_ID" actualValue="100003" weight=".006" rank="5"/>
</Details>

7.35 CLUSTER_DISTANCE

Syntax

``cluster_distance``::=

```sql
CLUSTER_DISTANCE ( schema . model , cluster_id , mining_attribute_clause )
```
Analytic Syntax

\[ \text{cluster\_distance\_analytic} ::= \]

\[
\text{CLUSTER\_DISTANCE} \ (\text{INTO}\ n, \ \text{cluster\_id}\ \text{mining\_attribute\_clause}) \ \text{OVER}\ (\text{mining\_analytic\_clause})
\]

\[ \text{mining\_attribute\_clause} ::= \]

\[
\text{USING} * \ \text{schema} . \ \text{table} . * \ \text{expr} \ AS \ \text{alias},
\]

\[ \text{mining\_analytic\_clause} ::= \]

\[
\text{query\_partition\_clause} \ \text{order\_by\_clause}
\]

See Also:

* Analytic Functions for information on the syntax, semantics, and restrictions of \text{mining\_analytic\_clause}.

Purpose

\text{CLUSTER\_DISTANCE} returns a cluster distance for each row in the selection. The cluster distance is the distance between the row and the centroid of the highest probability cluster or the specified \text{cluster\_id}. The distance is returned as \text{BINARY\_DOUBLE}.

Syntax Choice

\text{CLUSTER\_DISTANCE} can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.
• **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include \texttt{INTO n}, where \( n \) is the number of clusters to compute, and \texttt{mining_analytic_clause}, which specifies if the data should be partitioned for multiple model builds. The \texttt{mining_analytic_clause} supports a \texttt{query_partition_clause} and an \texttt{order_by_clause}. (See \texttt{analytic_clause}.)

The syntax of the \texttt{CLUSTER\_DISTANCE} function can use an optional \texttt{GROUPING} hint when scoring a partitioned model. See \texttt{GROUPING} Hint.

**mining\_attribute\_clause**

\texttt{mining\_attribute\_clause} identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, this data is also used for building the transient models. The \texttt{mining\_attribute\_clause} behaves as described for the \texttt{PREDICTION} function. (See \texttt{mining\_attribute\_clause}.)

\text{schema . table . * expr AS alias,} \]

\[ \text{mining_analytic_clause} ::= \]

\[
\text{query_partition_clause order_by_clause} \]

See Also:

Analytic Functions for information on the syntax, semantics, and restrictions of \text{mining_analytic_clause}

Purpose

\text{CLUSTER_ID} returns the identifier of the highest probability cluster for each row in the selection. The cluster identifier is returned as an Oracle \text{NUMBER}.
Syntax Choice

CLUSTER_ID can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

• Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.

• Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. Include INTO n, where n is the number of clusters to compute, and mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See analytic_clause::=.)

The syntax of the CLUSTER_ID function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See mining_attribute_clause::=.)

7.37 CLUSTER_PROBABILITY

Syntax

```
cluster_probability ::=  
  CLUSTER_PROBABILITY (schema . model , cluster_id mining_attribute_clause )
```

Chapter 7

CLUSTER_PROBABILITY

7-67
Analytic Syntax

\[
\text{cluster\_prob\_analytic} ::= \\
\text{CLUSTER\_PROBABILITY} \rightarrow \text{INTO} \rightarrow \text{cluster\_id} \rightarrow \text{mining\_attribute\_clause} \rightarrow \text{OVER} \rightarrow \text{mining\_analytic\_clause} \\
\]

\[
\text{mining\_attribute\_clause} ::= \\
\text{USING} \rightarrow \ast \rightarrow \text{schema} \rightarrow \text{.} \rightarrow \text{table} \rightarrow \ast \rightarrow \text{expr} \rightarrow \text{AS} \rightarrow \text{alias} \rightarrow \\
\text{query\_partition\_clause} \rightarrow \text{order\_by\_clause} \\
\]

\[
\text{mining\_analytic\_clause} ::= \\
\text{query\_partition\_clause} \rightarrow \text{order\_by\_clause} \\
\]

See Also:

Analytic Functions for information on the syntax, semantics, and restrictions of \text{mining\_analytic\_clause}

Purpose

CLUSTER\_PROBABILITY returns a probability for each row in the selection. The probability refers to the highest probability cluster or to the specified \text{cluster\_id}. The cluster probability is returned as BINARY\_DOUBLE.

Syntax Choice

CLUSTER\_PROBABILITY can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.
• **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO n`, where `n` is the number of clusters to compute, and `mining_analytic_clause`, which specifies if the data should be partitioned for multiple model builds. The `mining_analytic_clause` supports a `query_partition_clause` and an `order_by_clause`. (See `analytic_clause`::=.)

The syntax of the `CLUSTER_PROBABILITY` function can use an optional `GROUPING` hint when scoring a partitioned model. See `GROUPING Hint`.

**mining_attribute_clause**

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The `mining_attribute_clause` behaves as described for the `PREDICTION` function. (See `mining_attribute_clause`::=.)

```
7.38 CLUSTER_SET

Syntax

\[
\text{cluster\_set} ::= CLUSTER\_SET (\text{schema} . \text{model}, \text{topN}, \text{cutoff}\) \text{mining\_attribute\_clause})
\]

Analytic Syntax

\[
\text{cluster\_set\_analytic} ::= CLUSTER\_SET (\text{INTO} \text{n}, \text{topN}, \text{cutoff}\) \text{mining\_attribute\_clause}) \text{OVER}(\text{mining\_analytic\_clause})
\]

\[
\text{mining\_attribute\_clause} ::= \text{USING} \ast \text{schema} . \text{table} . \ast \text{expr} AS \text{alias}
\]

\[
\text{mining\_analytic\_clause} ::= \text{query\_partition\_clause order\_by\_clause}
\]

See Also:

Analytic Functions for information on the syntax, semantics, and restrictions of \text{mining\_analytic\_clause}
Purpose

CLUSTER_SET returns a set of cluster ID and probability pairs for each row in the selection. The return value is a varray of objects with field names CLUSTER_ID and PROBABILITY. The cluster identifier is an Oracle NUMBER; the probability is BINARY_DOUBLE.

taxon and cutoff

You can specify topN and cutoff to limit the number of clusters returned by the function. By default, both topN and cutoff are null and all clusters are returned.

- topN is the N most probable clusters. If multiple clusters share the Nth probability, then the function chooses one of them.
- cutoff is a probability threshold. Only clusters with probability greater than or equal to cutoff are returned. To filter by cutoff only, specify NULL for topN.

To return up to the N most probable clusters that are greater than or equal to cutoff, specify both topN and cutoff.

Syntax Choice

CLUSTER_SET can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a clustering model.
- Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. Include INTO n, where n is the number of clusters to compute, and mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See analytic_clause::=.)

The syntax of the CLUSTER_SET function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See mining_attribute_clause::=.)

See Also:

- Oracle Data Mining User’s Guide for information about scoring.
- Oracle Data Mining Concepts for information about clustering.
The following example is excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User’s Guide.

Example

This example lists the attributes that have the greatest impact (more that 20% probability) on cluster assignment for customer ID 100955. The query invokes the CLUSTER DETAILS and CLUSTER SET functions, which apply the clustering model em_sh_clus_sample.

```
SELECT S.cluster_id, probability prob, 
       CLUSTER_DETAILS(em_sh_clus_sample, S.cluster_id, 5 USING T.*) det
FROM
  (SELECT v.*, CLUSTER_SET(em_sh_clus_sample, NULL, 0.2 USING *) pset
   FROM mining_data_apply_v v
   WHERE cust_id = 100955) T,
  TABLE(T.pset) S
ORDER BY 2 DESC;
```

<table>
<thead>
<tr>
<th>CLUSTER_ID</th>
<th>PROB</th>
<th>DET</th>
</tr>
</thead>
</table>
| 14         | .6761| <Details algorithm="Expectation Maximization" cluster="14">
|            |      |     |
|            |      |     |
|            |      |     |
|            |      |     |
|            |      |     |
|            |      |     |
| 3          | .3227| <Details algorithm="Expectation Maximization" cluster="3">
|            |      |     |
|            |      |     |
|            |      |     |
|            |      |     |
|            |      |     |

7.39 COALESCE

Syntax

```
COALESCE(expr)
```

Purpose

COALESCE returns the first non-null expr in the expression list. You must specify at least two expressions. If all occurrences of expr evaluate to null, then the function returns null.
Oracle Database uses **short-circuit evaluation**. The database evaluates each `expr` value and determines whether it is `NULL`, rather than evaluating all of the `expr` values before determining whether any of them is `NULL`.

If all occurrences of `expr` are numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type, then Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

**See Also:**
- Table 2-8 for more information on implicit conversion and Numeric Precedence for information on numeric precedence
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of `COALESCE` when it is a character value

This function is a generalization of the `NVL` function.

You can also use `COALESCE` as a variety of the `CASE` expression. For example,

```sql
COALESCE(expr1, expr2)
```

is equivalent to:

```sql
CASE WHEN expr1 IS NOT NULL THEN expr1 ELSE expr2 END
```

Similarly,

```sql
COALESCE(expr1, expr2, ..., exprn)
```

where `n >= 3`, is equivalent to:

```sql
CASE WHEN expr1 IS NOT NULL THEN expr1
    ELSE COALESCE (expr2, ..., exprn) END
```

**See Also:**
- `NVL` and `CASE` Expressions

**Examples**

The following example uses the sample `oe.product_information` table to organize a clearance sale of products. It gives a 10% discount to all products with a list price. If there is no list price, then the sale price is the minimum price. If there is no minimum price, then the sale price is "5":

```sql
SELECT product_id, list_price, min_price,
COALESCE(0.9*list_price, min_price, 5) "Sale"
FROM product_information
WHERE supplier_id = 102050
ORDER BY product_id;
```
### 7.40 COLLATION

#### Syntax

```sql
COLLATION(expr)
```

#### Purpose

The `COLLATION` function returns the name of the derived collation for `expr`. This function returns named collations and pseudo-collations. If the derived collation is a Unicode Collation Algorithm (UCA) collation, then the function returns the long form of its name. This function is evaluated during compilation of the SQL statement that contains it. If the derived collation is undefined due to a collation conflict while evaluating `expr`, then the function returns `null`.

`expr` must evaluate to a character string of type `CHAR`, `VARCHAR2`, `LONG`, `NCHAR`, or `NVARCHAR2`.

This function returns a `VARCHAR2` value.

#### Note:

The `COLLATION` function returns only the data-bound collation, and not the dynamic collation set by the `NLS_SORT` parameter. Thus, for a column declared as `COLLATE USING_NLS_SORT`, the function returns the character value `'USING_NLS_SORT'`, not the actual value of the session parameter `NLS_SORT`. You can use the built-in function `SYS_CONTEXT('USERENV','NLS_SORT')` to get the actual value of the session parameter `NLS_SORT`.

#### See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `COLLATION`.

#### Examples

The following example returns the derived collation of columns `name` and `id` in table `id_table`: 

---

**PRODUCT_ID LIST_PRICE MIN_PRICE       Sale**

<table>
<thead>
<tr>
<th>PRODUCT_ID</th>
<th>LIST_PRICE</th>
<th>MIN_PRICE</th>
<th>Sale</th>
</tr>
</thead>
<tbody>
<tr>
<td>1769</td>
<td>48</td>
<td>43.2</td>
<td></td>
</tr>
<tr>
<td>1770</td>
<td></td>
<td>73</td>
<td>73</td>
</tr>
<tr>
<td>2378</td>
<td>305</td>
<td>247</td>
<td>274.5</td>
</tr>
<tr>
<td>2382</td>
<td>850</td>
<td>731</td>
<td>765</td>
</tr>
<tr>
<td>3355</td>
<td></td>
<td></td>
<td>5</td>
</tr>
</tbody>
</table>

---

**COLLATION**

Syntax

**COLLATION**(expr)

Purpose

**COLLATION** returns the name of the derived collation for `expr`. This function returns named collations and pseudo-collations. If the derived collation is a Unicode Collation Algorithm (UCA) collation, then the function returns the long form of its name. This function is evaluated during compilation of the SQL statement that contains it. If the derived collation is undefined due to a collation conflict while evaluating `expr`, then the function returns `null`.

`expr` must evaluate to a character string of type `CHAR`, `VARCHAR2`, `LONG`, `NCHAR`, or `NVARCHAR2`.

This function returns a `VARCHAR2` value.

**Note:**

The `COLLATION` function returns only the data-bound collation, and not the dynamic collation set by the `NLS_SORT` parameter. Thus, for a column declared as `COLLATE USING_NLS_SORT`, the function returns the character value `'USING_NLS_SORT'`, not the actual value of the session parameter `NLS_SORT`. You can use the built-in function `SYS_CONTEXT('USERENV','NLS_SORT')` to get the actual value of the session parameter `NLS_SORT`.

**See Also:**

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `COLLATION`.

**Examples**

The following example returns the derived collation of columns `name` and `id` in table `id_table`:
CREATE TABLE id_table
(name VARCHAR2(64) COLLATE BINARY_AI,
id VARCHAR2(8) COLLATE BINARY_CI);

INSERT INTO id_table VALUES('Christopher', 'ABCD1234');

SELECT COLLATION(name), COLLATION(id)
FROM id_table;

COLLATION COLLATION
--------- ---------
BINARY_AI BINARY_CI

7.41 COLLECT

Syntax

COLLECT (DISTINCT UNIQUE column ORDER BY expr)

Purpose

COLLECT is an aggregate function that takes as its argument a column of any type and creates a nested table of the input type out of the rows selected. To get accurate results from this function you must use it within a CAST function.

If column is itself a collection, then the output of COLLECT is a nested table of collections. If column is of a user-defined type, then column must have a MAP or ORDER method defined on it in order for you to use the optional DISTINCT, UNIQUE, and ORDER BY clauses.

See Also:

- CAST and Aggregate Functions
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation COLLECT uses to compare character values for the DISTINCT and ORDER BY clauses

Examples

The following example creates a nested table from the varray column of phone numbers in the sample table oe.customers. The nested table includes only the phone numbers of customers with an income level of L: 300,000 and above.

CREATE TYPE phone_book_t AS TABLE OF phone_list_typ;
/

SELECT CAST(COLLECT(phone_numbers) AS phone_book_t) "Income Level L Phone Book"
FROM customers
WHERE income_level = 'L: 300,000 and above';
The following example creates a nested table from the column of warehouse names in the sample table `oe.warehouses`. It uses ORDER BY to order the warehouse names.

```sql
CREATE TYPE warehouse_name_t AS TABLE OF VARCHAR2(35);
/
SELECT CAST(COLLECT(warehouse_name ORDER BY warehouse_name)
          AS warehouse_name_t) "Warehouses"
FROM warehouses;
```

```
WAREHOUSE_NAME_TYP('Beijing', 'Bombay', 'Mexico City', 'New Jersey', 'San Francisco', 'Seattle, Washington', 'Southlake, Texas', 'Sydney', 'Toronto')
```

## 7.42 COMPOSE

### Syntax

```
COMPOSE(char)
```

### Purpose

`COMPOSE` takes as its argument a string, or an expression that resolves to a string, in any data type, and returns a Unicode string in the same character set as the input. `char` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. For example, an o code point qualified by an umlaut code point will be returned as the o-umlaut code point.

`COMPOSE` returns the string in NFC normal form. For a more exclusive setting, you can first call `DECOMPOSE` with the `CANONICAL` setting and then `COMPOSE`. This combination returns the string in NFKC normal form.

CLOB and NCLOB values are supported through implicit conversion. If char is a character LOB value, then it is converted to a VARCHAR value before the `COMPOSE` operation. The operation will fail if the size of the LOB value exceeds the supported length of the VARCHAR in the particular development environment.
See Also:

- Oracle Database Globalization Support Guide for information on Unicode character sets and character semantics
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of `COMPOSE`
- `DECOMPOSE`

Examples

The following example returns the o-umlaut code point:

```sql
SELECT COMPOSE( 'o' || UNISTR(‘\0308’) )
FROM DUAL;
```

CO
--
ö

See Also:

- `UNISTR`

7.43 CON_DBID_TO_ID

Syntax

```sql
CON_DBID_TO_ID ( container_dbid )
```

Purpose

`CON_DBID_TO_ID` takes as its argument a container DBID and returns the container ID. For `container_dbid`, specify a `NUMBER` value or any value that can be implicitly converted to `NUMBER`. The function returns a `NUMBER` value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and DBID for all containers in a CDB. The sample output shown is for the purpose of this example.

```sql
SELECT CON_ID, DBID
FROM V$CONTAINERS;
```

CON_ID       DBID
---------- ----------
The following statement returns the ID for the container with DBID 2256797992:

```
SELECT CON_DBID_TO_ID(2256797992) "Container ID"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Container ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

### 7.44 CON_GUID_TO_ID

#### Syntax

```
CON_GUID_TO_ID (container_guid)
```

#### Purpose

CON_GUID_TO_ID takes as its argument a container GUID (globally unique identifier) and returns the container ID. For container_guid, specify a raw value. The function returns a NUMBER value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

#### Example

The following query displays the ID and GUID for all containers in a CDB. The GUID is stored as a 16-byte RAW value in the V$CONTAINERS view. The query returns the 32-character hexadecimal representation of the GUID. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, GUID
FROM V$CONTAINERS;
```

<table>
<thead>
<tr>
<th>CON_ID</th>
<th>GUID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>DB0A9F33DF99567FE04305B4F00A667D</td>
</tr>
<tr>
<td>2</td>
<td>D990C280C309591EE04305B4F00A593E</td>
</tr>
<tr>
<td>4</td>
<td>D990F4BD938865C1E04305B4F00AACA18</td>
</tr>
</tbody>
</table>

The following statement returns the ID for the container whose GUID is represented by the hexadecimal value D990F4BD938865C1E04305B4F00AACA18. The HEXTORAW function converts the GUID's hexadecimal representation to a raw value.

```
SELECT CON_GUID_TO_ID(HEXTORAW('D990F4BD938865C1E04305B4F00AACA18')) "Container ID"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Container ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>
7.45 CON_NAME_TO_ID

Syntax

CON_NAME_TO_ID (container_name)

Purpose

CON_NAME_TO_ID takes as its argument a container name and returns the container ID. For container_name, specify a string, or an expression that resolves to a string, in any data type. The function returns a NUMBER value.

This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

Example

The following query displays the ID and name for all containers in a CDB. The sample output shown is for the purpose of this example.

```
SELECT CON_ID, NAME
FROM V$CONTAINERS;
```

<table>
<thead>
<tr>
<th>CON_ID</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CDB$ROOT</td>
</tr>
<tr>
<td>2</td>
<td>PDB$SEED</td>
</tr>
<tr>
<td>4</td>
<td>SALESPDB</td>
</tr>
</tbody>
</table>

The following statement returns the ID for the container named SALESPDB:

```
SELECT CON_NAME_TO_ID('SALESPDB') "Container ID"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Container ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

7.46 CON_UID_TO_ID

Syntax

CON_UID_TO_ID (container_uid)

Purpose

CON_UID_TO_ID takes as its argument a container UID (unique identifier) and returns the container ID. For container_uid, specify a NUMBER value or any value that can be implicitly converted to NUMBER. The function returns a NUMBER value.
This function is useful in a multitenant container database (CDB). If you use this function in a non-CDB, then it returns 0.

**Example**

The following query displays the ID and UID for all containers in a CDB. The sample output shown is for the purpose of this example.

```sql
SELECT CON_ID, CON_UID
FROM V$CONTAINERS;
```

<table>
<thead>
<tr>
<th>CON_ID</th>
<th>CON_UID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>2</td>
<td>4054529501</td>
</tr>
<tr>
<td>4</td>
<td>2256797992</td>
</tr>
</tbody>
</table>

The following query returns the ID for the container with UID 2256797992:

```sql
SELECT CON_UID_TO_ID(2256797992) "Container ID"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Container ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

### 7.47 CONCAT

**Syntax**

```sql
CONCAT (char1, char2)
```

**Purpose**

CONCAT returns char1 concatenated with char2. Both char1 and char2 can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is in the same character set as char1. Its data type depends on the data types of the arguments.

In concatenations of two different data types, Oracle Database returns the data type that results in a lossless conversion. Therefore, if one of the arguments is a LOB, then the returned value is a LOB. If one of the arguments is a national data type, then the returned value is a national data type. For example:

- CONCAT(CLOB, NCLOB) returns NCLOB
- CONCAT(NCLOB, NCHAR) returns NCLOB
- CONCAT(NCLOB, CHAR) returns NCLOB
- CONCAT(NCHAR, CLOB) returns NCLOB

This function is equivalent to the concatenation operator (||).
See Also:

- Concatenation Operator for information on the `CONCAT` operator
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of `CONCAT`

Examples

This example uses nesting to concatenate three character strings:

```sql
SELECT CONCAT(CONCAT(last_name, '''s job category is '), job_id) "Job"
FROM employees
WHERE employee_id = 152;
```

<table>
<thead>
<tr>
<th>Job</th>
</tr>
</thead>
<tbody>
<tr>
<td>---------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hall's job category is SA_REP</td>
</tr>
</tbody>
</table>

7.48 CONVERT

Syntax

```
CONVERT (char, dest_char_set, source_char_set)
```

Purpose

`CONVERT` converts a character string from one character set to another.

- The `char` argument is the value to be converted. It can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`.
- The `dest_char_set` argument is the name of the character set to which `char` is converted.
- The `source_char_set` argument is the name of the character set in which `char` is stored in the database. The default value is the database character set.

The return value for `CHAR` and `VARCHAR2` is `VARCHAR2`. For `NCHAR` and `NVARCHAR2`, it is `NVARCHAR2`. For `CLOB`, it is `CLOB`, and for `NCLOB`, it is `NCLOB`.

Both the destination and source character set arguments can be either literals or columns containing the name of the character set.

For complete correspondence in character conversion, it is essential that the destination character set contains a representation of all the characters defined in the source character set. Where a character does not exist in the destination character set, a replacement character appears. Replacement characters can be defined as part of a character set definition.
Note:

Oracle discourages the use of the `CONVERT` function in the current Oracle Database release. The return value of `CONVERT` has a character data type, so it should be either in the database character set or in the national character set, depending on the data type. Any `dest_char_set` that is not one of these two character sets is unsupported. The `char` argument and the `source_char_set` have the same requirements. Therefore, the only practical use of the function is to correct data that has been stored in a wrong character set.

Values that are in neither the database nor the national character set should be processed and stored as `RAW` or `BLOB`. Procedures in the PL/SQL packages `UTL_RAW` and `UTL_I18N`—for example, `UTL_RAW.CONVERT`—allow limited processing of such values. Procedures accepting a `RAW` argument in the packages `UTL_FILE`, `UTL_TCP`, `UTL_HTTP`, and `UTL_SMTP` can be used to output the processed data.

See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `CONVERT`.

Examples

The following example illustrates character set conversion by converting a Latin-1 string to ASCII. The result is the same as importing the same string from a WE8ISO8859P1 database to a US7ASCII database.

```sql
SELECT CONVERT('Ä Ê Í Õ Ø A B C D E ', 'US7ASCII', 'WE8ISO8859P1')
FROM DUAL;
```

```sql
CONVERT('ÄÊÍÕØABCDE'
---------------------
A E I ? ? A B C D E ?
```

You can query the `V$NLS_VALID_VALUES` view to get a listing of valid character sets, as follows:

```sql
SELECT * FROM V$NLS_VALID_VALUES WHERE parameter = 'CHARACTERSET';
```

See Also:

*Oracle Database Globalization Support Guide* for the list of character sets that Oracle Database supports and *Oracle Database Reference* for information on the `V$NLS_VALID_VALUES` view.
### 7.49 CORR

**Syntax**

```
CORR(expr1, expr2) OVER (analytic_clause)
```

**See Also:**

[Analytic Functions](#) for information on syntax, semantics, and restrictions

**Purpose**

`CORR` returns the coefficient of correlation of a set of number pairs. You can use it as an aggregate or analytic function.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

**See Also:**

- [Table 2-8](#) for more information on implicit conversion and [Numeric Precedence](#) for information on numeric precedence

Oracle Database applies the function to the set of `(expr1, expr2)` after eliminating the pairs for which either `expr1` or `expr2` is null. Then Oracle makes the following computation:

\[
\text{COVAR}_{\text{POP}}(\text{expr1}, \text{expr2}) / (\text{STDDEV}_{\text{POP}}(\text{expr1}) \times \text{STDDEV}_{\text{POP}}(\text{expr2}))
\]

The function returns a value of type `NUMBER`. If the function is applied to an empty set, then it returns null.

**Note:**

The `CORR` function calculates the Pearson's correlation coefficient, which requires numeric expressions as arguments. Oracle also provides the `CORR_S` (Spearman's rho coefficient) and `CORR_K` (Kendall's tau-b coefficient) functions to support nonparametric or rank correlation.
See Also:

- Aggregate Functions
- About SQL Expressions for information on valid forms of expr, and CORR_* for information on the CORR_S and CORR_K functions

Aggregate Example

The following example calculates the coefficient of correlation between the list prices and minimum prices of products by weight class in the sample table oe.product_information:

```sql
SELECT weight_class, CORR(list_price, min_price) "Correlation"
FROM product_information
GROUP BY weight_class
ORDER BY weight_class, "Correlation";
```

<table>
<thead>
<tr>
<th>WEIGHT_CLASS</th>
<th>Correlation</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0.999149795</td>
</tr>
<tr>
<td>2</td>
<td>0.999022941</td>
</tr>
<tr>
<td>3</td>
<td>0.998484472</td>
</tr>
<tr>
<td>4</td>
<td>0.999359909</td>
</tr>
<tr>
<td>5</td>
<td>0.999536087</td>
</tr>
</tbody>
</table>

Analytic Example

The following example shows the correlation between duration at the company and salary by the employee's position. The result set shows the same correlation for each employee in a given job:

```sql
SELECT employee_id, job_id,
       TO_CHAR((SYSDATE - hire_date) YEAR TO MONTH ) "Yrs-Mns",
       salary,
       CORR(SYSDATE-hire_date, salary)
OVER(PARTITION BY job_id) AS "Correlation"
FROM employees
WHERE department_id in (50, 80)
ORDER BY job_id, employee_id;
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>JOB_ID</th>
<th>Yrs-Mns</th>
<th>SALARY</th>
<th>Correlation</th>
</tr>
</thead>
<tbody>
<tr>
<td>145</td>
<td>SA_MAN</td>
<td>+04-09</td>
<td>14000</td>
<td>0.912385598</td>
</tr>
<tr>
<td>146</td>

<td>0.80436755</td>
</tr>
</tbody>
</table>

. . .

7.50 CORR_*

The CORR_* functions are:
• CORR_S
• CORR_K

Syntax

correlation::=

Purpose

The CORR function (see CORR) calculates the Pearson’s correlation coefficient and requires numeric expressions as input. The CORR_* functions support nonparametric or rank correlation. They let you find correlations between expressions that are ordinal scaled (where ranking of the values is possible). Correlation coefficients take on a value ranging from -1 to 1, where 1 indicates a perfect relationship, -1 a perfect inverse relationship (when one variable increases as the other decreases), and a value close to 0 means no relationship.

These functions takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, makes the calculation, and returns NUMBER.

See Also:

- Table 2-8 for more information on implicit conversion and Numeric Precedence for information on numeric precedence
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation CORR_K and CORR_S use to compare characters from expr1 with characters from expr2

expr1 and expr2 are the two variables being analyzed. The third argument is a return value of type VARCHAR2. If you omit the third argument, then the default is COEFFICIENT. The meaning of the return values is shown in the table that follows:
### Table 7-2  CORR_* Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COEFFICIENT</td>
<td>Coefficient of correlation</td>
</tr>
<tr>
<td>ONE_SIDED_SIG</td>
<td>Positive one-tailed significance of the correlation</td>
</tr>
<tr>
<td>ONE_SIDED_SIG_POS</td>
<td>Same as ONE_SIDED_SIG</td>
</tr>
<tr>
<td>ONE_SIDED_SIG_NEG</td>
<td>Negative one-tailed significance of the correlation</td>
</tr>
<tr>
<td>TWO_SIDED_SIG</td>
<td>Two-tailed significance of the correlation</td>
</tr>
</tbody>
</table>

#### 7.50.1 CORR_S

CORR_S calculates the Spearman's rho correlation coefficient. The input expressions should be a set of \((x_i, y_i)\) pairs of observations. The function first replaces each value with a rank. Each value of \(x_i\) is replaced with its rank among all the other \(x_i\s\) in the sample, and each value of \(y_i\) is replaced with its rank among all the other \(y_i\s\). Thus, each \(x_i\) and \(y_i\) take on a value from 1 to \(n\), where \(n\) is the total number of pairs of values. Ties are assigned the average of the ranks they would have had if their values had been slightly different. Then the function calculates the linear correlation coefficient of the ranks.

**CORR_S Example**

Using Spearman's rho correlation coefficient, the following example derives a coefficient of correlation for each of two different comparisons -- salary and commission_pct, and salary and employee_id:

```sql
SELECT COUNT(*) count,
       CORR_S(salary, commission_pct) commission,
       CORR_S(salary, employee_id) empid
FROM employees;
```

<table>
<thead>
<tr>
<th>COUNT</th>
<th>COMMISSION</th>
<th>EMPID</th>
</tr>
</thead>
<tbody>
<tr>
<td>107</td>
<td>.735837022</td>
<td>-.04473016</td>
</tr>
</tbody>
</table>

#### 7.50.2 CORR_K

CORR_K calculates the Kendall's tau-b correlation coefficient. As for CORR_S, the input expressions are a set of \((x_i, y_i)\) pairs of observations. To calculate the coefficient, the function counts the number of concordant and discordant pairs. A pair of observations is concordant if the observation with the larger \(x\) also has a larger value of \(y\). A pair of observations is discordant if the observation with the larger \(x\) has a smaller \(y\).

The significance of tau-b is the probability that the correlation indicated by tau-b was due to chance—a value of 0 to 1. A small value indicates a significant correlation for positive values of tau-b (or anticorrelation for negative values of tau-b).

**CORR_K Example**

Using Kendall's tau-b correlation coefficient, the following example determines whether a correlation exists between an employee's salary and commission percent:
SELECT `CORR_K`(salary, commission_pct, 'COEFFICIENT') coefficient,
       `CORR_K`(salary, commission_pct, 'TWO_SIDED_SIG') two_sided_p_value
FROM employees;

<table>
<thead>
<tr>
<th>COEFFICIENT</th>
<th>TWO_SIDED_P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>.603079768</td>
<td>3.4702E-07</td>
</tr>
</tbody>
</table>

### 7.51 COS

**Syntax**

\[ \text{COS}(n) \]

**Purpose**

\( \text{COS} \) returns the cosine of \( n \) (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is \( \text{BINARY_FLOAT} \), then the function returns \( \text{BINARY_DOUBLE} \). Otherwise the function returns the same numeric data type as the argument.

**See Also:**

Table 2-8 for more information on implicit conversion

**Examples**

The following example returns the cosine of 180 degrees:

```sql
SELECT \text{COS}(180 \times 3.14159265359/180) "Cosine of 180 degrees"
FROM DUAL;
```

Cosine of 180 degrees
---------------------
-1

### 7.52 COSH

**Syntax**

\[ \text{COSH}(n) \]

**Purpose**

\( \text{COSH} \) returns the hyperbolic cosine of \( n \).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is...
BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:
Table 2-8 for more information on implicit conversion

Examples
The following example returns the hyperbolic cosine of zero:

```sql
SELECT COSH(0) "Hyperbolic cosine of 0"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Hyperbolic cosine of 0</th>
</tr>
</thead>
<tbody>
<tr>
<td>----------------------</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

### 7.53 COUNT

**Syntax**

```sql
COUNT
```

**Purpose**

COUNT returns the number of rows returned by the query. You can use it as an aggregate or analytic function.

If you specify DISTINCT, then you can specify only the query_partition_clause of the analytic_clause. The order_by_clause and windowing_clause are not allowed.

If you specify expr, then COUNT returns the number of rows where expr is not null. You can count either all rows, or only distinct values of expr.

If you specify the asterisk (*), then this function returns all rows, including duplicates and nulls. COUNT never returns null.

See Also:

Analytic Functions for information on syntax, semantics, and restrictions
Note:

Before performing a `COUNT (DISTINCT expr)` operation on a large amount of data, consider using one of the following methods to obtain approximate results more quickly than exact results:

- Set the `APPROX_FOR_COUNT_DISTINCT` initialization parameter to true before using the `COUNT (DISTINCT expr)` function. Refer to [Oracle Database Reference](https://docs.oracle.com/en/database/oracle/oracle-database/19/radb/guide-d19882566.html) for more information on this parameter.
- Use the `APPROX_COUNT_DISTINCT` function instead of the `COUNT (DISTINCT expr)` function. Refer to [APPROX_COUNT_DISTINCT](https://docs.oracle.com/en/database/oracle/oracle-database/19/radb/guide-d19882566.html).

See Also:

- Appendix C in [Oracle Database Globalization Support Guide](https://docs.oracle.com/en/database/oracle/oracle-database/19/radb/guide-d19882566.html) for the collation determination rules, which define the collation `COUNT` uses to compare character values for the `DISTINCT` clause.

Aggregate Examples

The following examples use `COUNT` as an aggregate function:

```
SELECT COUNT(*) "Total"
FROM employees;

Total
------
107

SELECT COUNT(*) "Allstars"
FROM employees
WHERE commission_pct > 0;

Allstars
--------
35

SELECT COUNT(commission_pct) "Count"
FROM employees;

Count
------
35

SELECT COUNT(DISTINCT manager_id) "Managers"
FROM employees;

Managers
--------
18
```
Analytic Example

The following example calculates, for each employee in the employees table, the moving count of employees earning salaries in the range 50 less than through 150 greater than the employee's salary.

```
SELECT last_name, salary,
       COUNT(*) OVER (ORDER BY salary RANGE BETWEEN 50 PRECEDING AND
                      150 FOLLOWING) AS mov_count
FROM employees
ORDER BY salary, last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>MOV_COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Olson</td>
<td>2100</td>
<td>3</td>
</tr>
<tr>
<td>Markle</td>

<td>10</td>
</tr>
<tr>
<td>Patel</td>
<td>2500</td>
<td>10</td>
</tr>
</tbody>
</table>

... 

7.54 COVAR_POP

Syntax

```
COVAR_POP(expr1, expr2)
OVER(analytic_clause)
```

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions

Purpose

COVAR_POP returns the population covariance of a set of number pairs. You can use it as an aggregate or analytic function.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

See Also:

Table 2-8 for more information on implicit conversion and Numeric Precedence for information on numeric precedence
Oracle Database applies the function to the set of \((\text{expr1}, \text{expr2})\) pairs after eliminating all pairs for which either \text{expr1} or \text{expr2} is null. Then Oracle makes the following computation:

\[
\frac{\text{SUM(}\text{expr1} \times \text{expr2}) - \text{SUM(}\text{expr2}) \times \text{SUM(}\text{expr1})}{\text{n}} / \text{n}
\]

where \(n\) is the number of \((\text{expr1}, \text{expr2})\) pairs where neither \text{expr1} nor \text{expr2} is null. The function returns a value of type \text{NUMBER}. If the function is applied to an empty set, then it returns null.

See Also:

- About SQL Expressions for information on valid forms of \text{expr} and \text{Aggregate Functions}

Aggregate Example

The following example calculates the population covariance and sample covariance for time employed \((\text{SYSDATE} - \text{hire_date})\) and salary using the sample table \text{hr.employees}:

```
SELECT job_id,
       COVAR_POP(SYSDATE-hire_date, salary) AS covar_pop,
       COVAR_SAMP(SYSDATE-hire_date, salary) AS covar_samp
FROM employees
WHERE department_id in (50, 80)
GROUP BY job_id
ORDER BY job_id, covar_pop, covar_samp;
```

<table>
<thead>
<tr>
<th>JOB_ID</th>
<th>COVAR_POP</th>
<th>COVAR_SAMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>SA_MAN</td>
<td>660700</td>
<td>825875</td>
</tr>
<tr>
<td>SA_REP</td>
<td>579988.466</td>
<td>600702.34</td>
</tr>
<tr>
<td>SH_CLERK</td>
<td>212432.5</td>
<td>223613.158</td>
</tr>
<tr>
<td>ST_CLERK</td>
<td>176577.25</td>
<td>185870.789</td>
</tr>
<tr>
<td>ST_MAN</td>
<td>436092</td>
<td>545115</td>
</tr>
</tbody>
</table>

Analytic Example

The following example calculates cumulative sample covariance of the list price and minimum price of the products in the sample schema \text{oe}:

```
SELECT product_id, supplier_id,
       COVAR_POP(list_price, min_price)
       OVER (ORDER BY product_id, supplier_id) AS CUM_COVP,
       COVAR_SAMP(list_price, min_price)
       OVER (ORDER BY product_id, supplier_id) AS CUM_COVS
FROM product_information p
WHERE category_id = 29
ORDER BY product_id, supplier_id;
```

<table>
<thead>
<tr>
<th>PRODUCT_ID</th>
<th>SUPPLIER_ID</th>
<th>CUM_COVP</th>
<th>CUM_COVS</th>
</tr>
</thead>
<tbody>
<tr>
<td>1774</td>
<td>103088</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
7.55 COVAR_SAMP

Syntax

```
COVAR_SAMP ( expr1, expr2 )
OVER ( analytic_clause )
```

See Also:

- [Analytic Functions](#) for information on syntax, semantics, and restrictions

Purpose

COVAR_SAMP returns the sample covariance of a set of number pairs. You can use it as an aggregate or analytic function.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

See Also:

- [Table 2-8](#) for more information on implicit conversion and [Numeric Precedence](#) for information on numeric precedence

Oracle Database applies the function to the set of \((expr1, expr2)\) pairs after eliminating all pairs for which either \(expr1\) or \(expr2\) is null. Then Oracle makes the following computation:

\[
\frac{(\sum(expr1 \cdot expr2) - \sum(expr1) \cdot \sum(expr2)) / n}{n-1}
\]

where \(n\) is the number of \((expr1, expr2)\) pairs where neither \(expr1\) nor \(expr2\) is null.

The function returns a value of type \(NUMBER\). If the function is applied to an empty set, then it returns null.
7.56 CUBE_TABLE

Syntax

Purpose

CUBE_TABLE extracts data from a cube or dimension and returns it in the two-dimensional format of a relational table, which can be used by SQL-based applications.

The function takes a single VARCHAR2 argument. The optional hierarchy clause enables you to specify a dimension hierarchy. A cube can have multiple hierarchy clauses, one for each dimension.

You can generate these different types of tables:

- A cube table contains a key column for each dimension and a column for each measure and calculated measure in the cube. To create a cube table, you can specify the cube with or without a cube hierarchy clause. For a dimension with multiple hierarchies, this clause limits the return values to the dimension members and levels in the specified hierarchy. Without a hierarchy clause, all dimension members and all levels are included.

- A dimension table contains a key column, and a column for each level and each attribute. It also contains a MEMBER_TYPE column, which identifies each member with one of the following codes:
There are three types of dimension members:

- L - Loaded from a table, view, or synonym
- A - Loaded member and the single root of all hierarchies in the dimension, that is, the "all" aggregate member
- C - Calculated member

All dimension members and all levels are included in the table. To create a dimension table, specify the dimension without a dimension hierarchy clause.

- A hierarchy table contains all the columns of a dimension table plus a column for the parent member and a column for each source level. It also contains a MEMBER_TYPE column, as described for dimension tables. Any dimension members and levels that are not part of the named hierarchy are excluded from the table. To create a hierarchy table, specify the dimension with a dimension hierarchy clause.

CUBE_TABLE is a table function and is always used in the context of a SELECT statement with this syntax:

```
SELECT ... FROM TABLE(CUBE_TABLE('arg'));
```

**See Also:**

- Oracle OLAP User's Guide for information about dimensional objects and about the tables generated by CUBE_TABLE.
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by CUBE_TABLE.

**Examples**

The following examples require Oracle Database with the OLAP option and the GLOBAL sample schema. Refer to Oracle OLAP User's Guide for information on downloading and installing the GLOBAL sample schema.

The following SELECT statement generates a dimension table of CHANNEL in the GLOBAL schema.

```
SELECT dim_key, level_name, long_description, channel_total_id tot_id, channel_channel_id chan_id, channel_long_description chan_desc, total_long_description tot_desc
FROM TABLE(CUBE_TABLE('global.channel'));
```

<table>
<thead>
<tr>
<th>DIM_KEY</th>
<th>LEVEL_NAME</th>
<th>LONG_DESCRIPTION</th>
<th>TOT_ID</th>
<th>CHAN_ID</th>
<th>CHAN_DESC</th>
<th>TOT_DESC</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHANNEL_CAT</td>
<td>CHANNEL</td>
<td>Catalog</td>
<td>TOTAL</td>
<td>CAT</td>
<td>Catalog</td>
<td>Total Channel</td>
</tr>
<tr>
<td>CHANNEL_DIR</td>
<td>CHANNEL</td>
<td>Direct Sales</td>
<td>TOTAL</td>
<td>DIR</td>
<td>Direct Sales</td>
<td>Total Channel</td>
</tr>
<tr>
<td>CHANNEL_INT</td>
<td>CHANNEL</td>
<td>Internet</td>
<td>TOTAL</td>
<td>INT</td>
<td>Internet</td>
<td>Total Channel</td>
</tr>
<tr>
<td>TOTAL_TOTAL</td>
<td>TOTAL</td>
<td>Total Channel</td>
<td>TOTAL</td>
<td></td>
<td></td>
<td>Total Channel</td>
</tr>
</tbody>
</table>

The next statement generates a cube table of UNITS_CUBE. It restricts the table to the MARKET and CALENDAR hierarchies.

```
SELECT sales, units, cost, time, customer, product, channel
FROM TABLE(CUBE_TABLE('global.units_cube HIERARCHY customer market HIERARCHY time calendar'))
WHERE rownum < 20;
```
### 7.57 CUME_DIST

**Aggregate Syntax**

\[
\text{cume\_dist\_aggregate}::= \\
\text{CUME\_DIST} (\text{expr}) \text{ WITHIN GROUP (ORDER BY expr DESC ASC NULLS FIRST LAST)}, \\
\text{expr} \rightarrow \text{expr}, \\
\text{GROUP} \rightarrow \text{GROUP}, \\
\text{ORDER} \rightarrow \text{ORDER}, \\
\text{BY} \rightarrow \text{BY}, \\
\text{ASC} \rightarrow \text{ASC}, \\
\text{DESC} \rightarrow \text{DESC}, \\
\text{NULLS} \rightarrow \text{NULLS}, \\
\text{FIRST} \rightarrow \text{FIRST}, \\
\text{LAST} \rightarrow \text{LAST}, \\
\rightarrow \rightarrow \\
\]

**Analytic Syntax**

\[
\text{cume\_dist\_analytic}::= \\
\text{CUME\_DIST} (\text{expr}) \text{ OVER (query\_partition\_clause order\_by\_clause)}, \\
\text{expr} \rightarrow \text{expr}, \\
\text{query\_partition\_clause} \rightarrow \text{query\_partition\_clause}, \\
\text{order\_by\_clause} \rightarrow \text{order\_by\_clause}, \\
\rightarrow \rightarrow \\
\]

- **See Also:**
  - [Analytic Functions](#) for information on syntax, semantics, and restrictions

#### Purpose

CUME_DIST calculates the cumulative distribution of a value in a group of values. The range of values returned by CUME_DIST is >0 to <=1. Tie values always evaluate to the same cumulative distribution value.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, makes the calculation, and returns NUMBER.
See Also:

Table 2-8 for more information on implicit conversion and Numeric Precedence for information on numeric precedence

- As an aggregate function, `CUME_DIST` calculates, for a hypothetical row $r$ identified by the arguments of the function and a corresponding sort specification, the relative position of row $r$ among the rows in the aggregation group. Oracle makes this calculation as if the hypothetical row $r$ were inserted into the group of rows to be aggregated over. The arguments of the function identify a single hypothetical row within each aggregate group. Therefore, they must all evaluate to constant expressions within each aggregate group. The constant argument expressions and the expressions in the `ORDER BY` clause of the aggregate match by position. Therefore, the number of arguments must be the same and their types must be compatible.

- As an analytic function, `CUME_DIST` computes the relative position of a specified value in a group of values. For a row $r$, assuming ascending ordering, the `CUME_DIST` of $r$ is the number of rows with values lower than or equal to the value of $r$, divided by the number of rows being evaluated (the entire query result set or a partition).

Aggregate Example

The following example calculates the cumulative distribution of a hypothetical employee with a salary of $15,500 and commission rate of 5% among the employees in the sample table `oe.employees`:

```sql
SELECT CUME_DIST(15500, .05) WITHIN GROUP (ORDER BY salary, commission_pct) "Cume-Dist of 15500"
FROM employees;
```

```
Cume-Dist of 15500
------------------
.972222222
```

Analytic Example

The following example calculates the salary percentile for each employee in the purchasing division. For example, 40% of clerks have salaries less than or equal to Himuro.

```sql
SELECT job_id, last_name, salary, CUME_DIST() OVER (PARTITION BY job_id ORDER BY salary) AS cume_dist
FROM employees
WHERE job_id LIKE 'PU%'
ORDER BY job_id, last_name, salary, cume_dist;
```

```
<table>
<thead>
<tr>
<th>JOB_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>CUME_DIST</th>
</tr>
</thead>
<tbody>
<tr>
<td>PU_CLERK</td>
<td>Baida</td>
<td>2900</td>
<td>0.8</td>
</tr>
<tr>
<td>PU_CLERK</td>
<td>Colmenares</td>
<td>2500</td>
<td>0.2</td>
</tr>
<tr>
<td>PU_CLERK</td>
<td>Himuro</td>
<td>2600</td>
<td>0.4</td>
</tr>
<tr>
<td>PU_CLERK</td>
<td>Khoo</td>
<td>3100</td>
<td>1.0</td>
</tr>
<tr>
<td>PU_CLERK</td>
<td>Tobias</td>
<td>2800</td>
<td>0.6</td>
</tr>
<tr>
<td>PU_MAN</td>
<td>Raphaely</td>
<td>11000</td>
<td>1.0</td>
</tr>
</tbody>
</table>
```
7.58 CURRENT_DATE

Syntax

```sql
CURRENT_DATE
``` 

Purpose

`CURRENT_DATE` returns the current date in the session time zone, in a value in the Gregorian calendar of data type `DATE`.

Examples

The following example illustrates that `CURRENT_DATE` is sensitive to the session time zone:

```
ALTER SESSION SET TIME_ZONE = '-5:0';
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
SELECT SESSIONTIMEZONE, CURRENT_DATE FROM DUAL;
```

```
SESSIONTIMEZONE CURRENT_DATE
--------------- --------------------
-05:00          29-MAY-2000 13:14:03
```

```
ALTER SESSION SET TIME_ZONE = '-8:0';
SELECT SESSIONTIMEZONE, CURRENT_DATE FROM DUAL;
```

```
SESSIONTIMEZONE CURRENT_DATE
--------------- --------------------
-08:00          29-MAY-2000 10:14:33
```

7.59 CURRENT_TIMESTAMP

Syntax

```sql
CURRENT_TIMESTAMP
```

Purpose

`CURRENT_TIMESTAMP` returns the current date and time in the session time zone, in a value of data type `TIMESTAMP` with `TIME ZONE`. The time zone offset reflects the current local time of the SQL session. If you omit `precision`, then the default is 6. The difference between this function and `LOCALTIMESTAMP` is that `CURRENT_TIMESTAMP` returns a `TIMESTAMP` with `TIME ZONE` value while `LOCALTIMESTAMP` returns a `TIMESTAMP` value.

In the optional argument, `precision` specifies the fractional second precision of the time value returned.
Examples

The following example illustrates that CURRENT_TIMESTAMP is sensitive to the session time zone:

```
ALTER SESSION SET TIME_ZONE = '-5:0';
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
SELECT SESSIONTIMEZONE, CURRENT_TIMESTAMP FROM DUAL;
```

<table>
<thead>
<tr>
<th>SESSIONTIMEZONE</th>
<th>CURRENT_TIMESTAMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>-05:00</td>
<td>04-APR-00 01.17.56.917550 PM -05:00</td>
</tr>
</tbody>
</table>

```
ALTER SESSION SET TIME_ZONE = '-8:0';
SELECT SESSIONTIMEZONE, CURRENT_TIMESTAMP FROM DUAL;
```

<table>
<thead>
<tr>
<th>SESSIONTIMEZONE</th>
<th>CURRENT_TIMESTAMP</th>
</tr>
</thead>
<tbody>
<tr>
<td>-08:00</td>
<td>04-APR-00 10.18.21.366065 AM -08:00</td>
</tr>
</tbody>
</table>

When you use the CURRENT_TIMESTAMP with a format mask, take care that the format mask matches the value returned by the function. For example, consider the following table:

```
CREATE TABLE current_test (col1 TIMESTAMP WITH TIME ZONE);
```

The following statement fails because the mask does not include the TIME_ZONE portion of the type returned by the function:

```
INSERT INTO current_test VALUES (TO_TIMESTAMP_TZ(CURRENT_TIMESTAMP, 'DD-MON-RR HH.MI.SSXFF PM'));
```

The following statement uses the correct format mask to match the return type of CURRENT_TIMESTAMP:

```
INSERT INTO current_test VALUES (TO_TIMESTAMP_TZ(CURRENT_TIMESTAMP, 'DD-MON-RR HH.MI.SSXFF PM TZH:TZM'));
```

7.60 CV

Syntax

```
CV (dimension_column)
```

Purpose

The CV function can be used only in the model_clause of a SELECT statement and then only on the right-hand side of a model rule. It returns the current value of a dimension column or a partitioning column carried from the left-hand side to the right-hand side of...
a rule. This function is used in the `model_clause` to provide relative indexing with respect to the dimension column. The return type is that of the data type of the dimension column. If you omit the argument, then it defaults to the dimension column associated with the relative position of the function within the cell reference.

The `CV` function can be used outside a cell reference. In this case, `dimension_column` is required.

### See Also:
- `model_clause` and Model Expressions for the syntax and semantics
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of `CV` when it is a character value

### Examples

The following example assigns the sum of the sales of the product represented by the current value of the dimension column (Mouse Pad or Standard Mouse) for years 1999 and 2000 to the sales of that product for year 2001:

```sql
SELECT country, prod, year, s
FROM sales_view_ref
MODEL
  PARTITION BY (country)
  DIMENSION BY (prod, year)
  MEASURES (sale s)
  IGNORE NAV
  UNIQUE DIMENSION
  RULES UPSERT SEQUENTIAL ORDER
  {
    s[FOR prod IN ('Mouse Pad', 'Standard Mouse'), 2001] =
    s[CV( ), 1999] + s[CV( ), 2000]
  }
ORDER BY country, prod, year;
```

<table>
<thead>
<tr>
<th>COUNTRY</th>
<th>PROD</th>

### 7.61 DATAOBJ_TO_MAT_PARTITION

**Syntax**

```sql
DATAOBJ_TO_MAT_PARTITION ( table , partition_id )
```

**Purpose**

`DATAOBJ_TO_MAT_PARTITION` is useful only to Data Cartridge developers who are performing data maintenance or query operations on system-partitioned tables that are used to store domain index data. The DML or query operations are triggered by corresponding operations on the base table of the domain index.

This function takes as arguments the name of the base table and the partition ID of the base table partition, both of which are passed to the function by the appropriate ODCIIndex method. The function returns the materialized partition number of the corresponding system-partitioned table, which can be used to perform the operation (DML or query) on that partition of the system-partitioned table.

If the base table is interval partitioned, then Oracle recommends that you use this function instead of the `DATAOBJ_TO_PARTITION` function. The `DATAOBJ_TO_PARTITION` function determines the absolute partition number, given the physical partition identifier. However, if the base table is interval partitioned, then there might be holes in the partition numbers corresponding to unmaterialized partitions. Because the system partitioned table only has materialized partitions, `DATAOBJ_TO_PARTITION` numbers can cause a mis-match between the partitions of the base table and the partitions of the underlying system partitioned index storage tables. The `DATAOBJ_TO_MAT_PARTITION` function returns the materialized partition number (as opposed to the absolute partition number) and helps keep the two tables in sync. Indextypes planning to support local domain indexes on interval partitioned tables should migrate to the use of this function.

**See Also:**

- `DATAOBJ_TO_PARTITION`
- *Oracle Database Data Cartridge Developer’s Guide* for information on the use of the `DATAOBJ_TO_MAT_PARTITION` function, including examples

### 7.62 DATAOBJ_TO_PARTITION

**Syntax**

```sql
DATAOBJ_TO_PARTITION ( table , partition_id )
```
**Purpose**

`DATAOBJ_TO_PARTITION` is useful only to Data Cartridge developers who are performing data maintenance or query operations on system-partitioned tables that are used to store domain index data. The DML or query operations are triggered by corresponding operations on the base table of the domain index.

This function takes as arguments the name of the base table and the partition ID of the base table partition, both of which are passed to the function by the appropriate ODCIIndex method. The function returns the absolute partition number of the corresponding system-partitioned table, which can be used to perform the operation (DML or query) on that partition of the system-partitioned table.

**Note:**

If the base table is interval partitioned, then Oracle recommends that you instead use the `DATAOBJ_TO_MAT_PARTITION` function. Refer to `DATAOBJ_TO_MAT_PARTITION` for more information.

**See Also:**

*Oracle Database Data Cartridge Developer's Guide* for information on the use of the `DATAOBJ_TO_PARTITION` function, including examples.

---

**7.63 DBTIMEZONE**

**Syntax**

```
DBTIMEZONE
```

**Purpose**

`DBTIMEZONE` returns the value of the database time zone. The return type is a time zone offset (a character type in the format `'[+-]'TZH:TZM'`) or a time zone region name, depending on how the user specified the database time zone value in the most recent `CREATE DATABASE` or `ALTER DATABASE` statement.

**See Also:**

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `DBTIMEZONE`
**Examples**

The following example assumes that the database time zone is set to UTC time zone:

```
SELECT DBTIMEZONE
FROM DUAL;
```

```
DBTIME
------
+00:00
```

---

**7.64 DECODE**

**Syntax**

```
DECODE ( expr , search , result
,
, default
)
```

**Purpose**

DECODE compares `expr` to each `search` value one by one. If `expr` is equal to a `search`, then Oracle Database returns the corresponding `result`. If no match is found, then Oracle returns `default`. If `default` is omitted, then Oracle returns null.

The arguments can be any of the numeric types (`NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`) or character types.

- If `expr` and `search` are character data, then Oracle compares them using nonpadded comparison semantics. `expr`, `search`, and `result` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The string returned is of `VARCHAR2` data type and is in the same character set as the first `result` parameter.

- If the first `search-result` pair are numeric, then Oracle compares all `search-result` expressions and the first `expr` to determine the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The `search`, `result`, and `default` values can be derived from expressions. Oracle Database uses short-circuit evaluation. The database evaluates each `search` value only before comparing it to `expr`, rather than evaluating all `search` values before comparing any of them with `expr`. Consequently, Oracle never evaluates a `search` if a previous `search` is equal to `expr`.

Oracle automatically converts `expr` and each `search` value to the data type of the first `search` value before comparing. Oracle automatically converts the return value to the same data type as the first `result`. If the first `result` has the data type `CHAR` or if the first `result` is null, then Oracle converts the return value to the data type `VARCHAR2`.

In a `DECODE` function, Oracle considers two nulls to be equivalent. If `expr` is null, then Oracle returns the `result` of the first `search` that is also null.

The maximum number of components in the `DECODE` function, including `expr`, `searches`, `results`, and `default`, is 255.
See Also:

- Data Type Comparison Rules for information on comparison semantics
- Data Conversion for information on data type conversion in general
- Floating-Point Numbers for information on floating-point comparison semantics
- Implicit and Explicit Data Conversion for information on the drawbacks of implicit conversion
- COALESCE and CASE Expressions, which provide functionality similar to that of DECODE
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation DECODE uses to compare characters from expr with characters from search, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

This example decodes the value warehouse_id. If warehouse_id is 1, then the function returns 'Southlake'; if warehouse_id is 2, then it returns 'San Francisco'; and so forth. If warehouse_id is not 1, 2, 3, or 4, then the function returns 'Non domestic'.

```sql
SELECT product_id,
    DECODE (warehouse_id, 1, 'Southlake',
        2, 'San Francisco',
        3, 'New Jersey',
        4, 'Seattle',
        'Non domestic') "Location"
FROM inventories
WHERE product_id < 1775
ORDER BY product_id, "Location";
```

7.65 DECOMPOSE

Syntax

```sql
DECOMPOSE (string
    ,
    ' CANONICAL '
' COMPATIBILITY '
)
```

Purpose

DECOMPOSE is valid only for Unicode characters. DECOMPOSE takes as its argument a string in any data type and returns a Unicode string after decomposition in the same character set as the input. For example, an o-umlaut code point will be returned as the "o" code point followed by an umlaut code point.
• *string* can be any of the data types **CHAR**, **VARCHAR2**, **NCHAR**, **NVARCHAR2**, **CLOB**, or **NCLOB**.

• **CANONICAL** causes canonical decomposition, which allows recomposition (for example, with the **COMPOSE** function) to the original string. This is the default and returns the string in NFD normal form.

• **COMPATIBILITY** causes decomposition in compatibility mode. In this mode, recomposition is not possible. This mode is useful, for example, when decomposing half-width and full-width **katakana** characters, where recomposition might not be desirable without external formatting or style information. It returns the string in NFKD normal form.

**CLOB** and **NCLOB** values are supported through implicit conversion. If **char** is a character LOB value, then it is converted to a **VARCHAR** value before the **COMPOSE** operation. The operation will fail if the size of the LOB value exceeds the supported length of the **VARCHAR** in the particular development environment.

---

**See Also:**

- *Oracle Database Globalization Support Guide* for information on Unicode character sets and character semantics
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of **DECOMPOSE**
- **COMPOSE**

---

**Examples**

The following example decomposes the string “Châteaux” into its component code points:

```
SELECT DECOMPOSE ('Châteaux')
FROM DUAL;
```

```
DECOMPOSE
---------
Châteaux
```

---

**Note:**

The results of this example can vary depending on the character set of your operating system.
7.66 DELETEXML

Note:
The DELETEXML function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See Oracle XML DB Developer's Guide for more information.

Syntax

```
DELETEXML ( XMLType_instance, XPath_string
, namespace_string
)
```

Purpose

DELETEXML deletes the node or nodes matched by the XPath expression in the target XML.

- `XMLType_instance` is an instance of `XMLType`.
- `XPath_string` is an XPath expression indicating one or more nodes that are to be deleted. You can specify an absolute `XPath_string` with an initial slash or a relative `XPath_string` by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node. Any child nodes of the nodes specified by `XPath_string` are also deleted.
- The optional `namespace_string` provides namespace information for the `XPath_string`. This parameter must be of type `VARCHAR2`.

See Also:
Oracle XML DB Developer's Guide for more information about this function

Examples

The following example removes the `/Owner` node from the `warehouse_spec` of one of the warehouses modified in the example for APPENDCHILDXML:

```
UPDATE warehouses
SET warehouse_spec = DELETEXML(warehouse_spec, '/Warehouse/Building/Owner')
WHERE warehouse_id = 2;

SELECT warehouse_id, warehouse_spec
FROM warehouses WHERE warehouse_id in (2,3);
```

<table>
<thead>
<tr>
<th>ID</th>
<th>WAREHOUSE_SPEC</th>
</tr>
</thead>
</table>
| 2  | `<xml version="1.0"?>
  <Warehouse>` |
7.67 DENSE_RANK

Aggregate Syntax

dense_rank_aggregate::=

```
DENSE_RANK ( expr, ) WITHIN GROUP ( ORDER BY expr DESC ASC NULLS FIRST LAST, )
```

Analytic Syntax

dense_rank_analytic::=

```
DENSE_RANK OVER ( query_partition_clause order_by_clause )
```

See Also:

Analytic Functions for information on syntax, semantics, and restrictions
Purpose

DENSE_RANK computes the rank of a row in an ordered group of rows and returns the rank as a NUMBER. The ranks are consecutive integers beginning with 1. The largest rank value is the number of unique values returned by the query. Rank values are not skipped in the event of ties. Rows with equal values for the ranking criteria receive the same rank. This function is useful for top-N and bottom-N reporting.

This function accepts as arguments any numeric data type and returns NUMBER.

- As an aggregate function, DENSE_RANK calculates the dense rank of a hypothetical row identified by the arguments of the function with respect to a given sort specification. The arguments of the function must all evaluate to constant expressions within each aggregate group, because they identify a single row within each group. The constant argument expressions and the expressions in the order_by_clause of the aggregate match by position. Therefore, the number of arguments must be the same and types must be compatible.

- As an analytic function, DENSE_RANK computes the rank of each row returned from a query with respect to the other rows, based on the values of the value_exprs in the order_by_clause.

See Also:
Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation DENSE_RANK uses to compare character values for the ORDER BY clause

Aggregate Example

The following example computes the ranking of a hypothetical employee with the salary $15,500 and a commission of 5% in the sample table oe.employees:

```sql
SELECT DENSE_RANK(15500, .05) WITHIN GROUP
  (ORDER BY salary DESC, commission_pct) "Dense Rank"
FROM employees;
```

<table>
<thead>
<tr>
<th>Dense Rank</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
</tr>
</tbody>
</table>

Analytic Example

The following statement ranks the employees in the sample hr schema in department 60 based on their salaries. Identical salary values receive the same rank. However, no rank values are skipped. Compare this example with the analytic example for RANK.

```sql
SELECT department_id, last_name, salary,
  DENSE_RANK() OVER (PARTITION BY department_id ORDER BY salary) DENSE_RANK
FROM employees WHERE department_id = 60
ORDER BY DENSE_RANK, last_name;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>DENSE_RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>60</td>
<td>Lorentz</td>
<td>4200</td>
<td>1</td>
</tr>
</tbody>
</table>
7.68 DEPTH

Syntax

```
DEPTH ( correlation_integer )
```

Purpose

DEPTH is an ancillary function used only with the UNDER_PATH and EQUALS_PATH conditions. It returns the number of levels in the path specified by the UNDER_PATH condition with the same correlation variable.

The correlation_integer can be any NUMBER integer. Use it to correlate this ancillary function with its primary condition if the statement contains multiple primary conditions. Values less than 1 are treated as 1.

See Also:

- EQUALS_PATH Condition, UNDER_PATH Condition, and the related function PATH

Examples

The EQUALS_PATH and UNDER_PATH conditions can take two ancillary functions, DEPTH and PATH. The following example shows the use of both ancillary functions. The example assumes the existence of the XMLSchema warehouses.xsd (created in Using XML in SQL Statements).

```
SELECT PATH(1), DEPTH(2)
FROM RESOURCE_VIEW
WHERE UNDER_PATH(res, '/sys/schemas/OE', 1)=1
  AND UNDER_PATH(res, '/sys/schemas/OE', 2)=1;
```

<table>
<thead>
<tr>
<th>PATH(1)</th>
<th>DEPTH(2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>. .</td>
<td>. .</td>
</tr>
<tr>
<td><a href="http://www.example.com">www.example.com</a></td>
<td>1</td>
</tr>
<tr>
<td><a href="http://www.example.com/xwarehouses.xsd">www.example.com/xwarehouses.xsd</a></td>
<td>2</td>
</tr>
<tr>
<td>. .</td>
<td>. .</td>
</tr>
</tbody>
</table>

7.69 DEREF

Syntax

```
DEREF ( expr )
```

Chapter 7

DEPTH

7-108
Purpose

DEREF returns the object reference of argument expr, where expr must return a REF to an object. If you do not use this function in a query, then Oracle Database returns the object ID of the REF instead, as shown in the example that follows.

See Also:

MAKE_REF

Examples

The sample schema oe contains an object type cust_address_typ. The REF Constraint Examples create a similar type, cust_address_typ_new, and a table with one column that is a REF to the type. The following example shows how to insert into such a column and how to use DEREF to extract information from the column:

```
INSERT INTO address_table VALUES ('1 First', 'G45 EU8', 'Paris', 'CA', 'US');
INSERT INTO customer_addresses SELECT 999, REF(a) FROM address_table a;
SELECT address FROM customer_addresses ORDER BY address;
```

```
ADDRESS
--------------------------------------------------------------------------------
000022020876B2245DBE325C5FE03400400B40DCB176B2245DBE305C5FE03400400B40DCB1
```

```
SELECT DEREF(address) FROM customer_addresses;
```

```
DEREF(ADDRESS)(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
--------------------------------------------------------------------------------
CUST_ADDRESS_TYP_NEW('1 First', 'G45 EU8', 'Paris', 'CA', 'US')
```

7.70 DUMP

Syntax

```
DUMP ( expr
, return_fmt
, start_position
, length
)
```

Purpose

DUMP returns a VARCHAR2 value containing the data type code, length in bytes, and internal representation of expr. The returned result is always in the database character set. For the data type corresponding to each code, see Table 2-1.
The argument `return_fmt` specifies the format of the return value and can have any of the following values:

- 8 returns result in octal notation.
- 10 returns result in decimal notation.
- 16 returns result in hexadecimal notation.
- 17 returns each byte printed as a character if and only if it can be interpreted as a printable character in the character set of the compiler—typically ASCII or EBCDIC. Some ASCII control characters may be printed in the form ^X as well. Otherwise the character is printed in hexadecimal notation. All NLS parameters are ignored. Do not depend on any particular output format for `DUMP` with `return_fmt` 17.

By default, the return value contains no character set information. To retrieve the character set name of `expr`, add 1000 to any of the preceding format values. For example, a `return_fmt` of 1008 returns the result in octal and provides the character set name of `expr`.

The arguments `start_position` and `length` combine to determine which portion of the internal representation to return. The default is to return the entire internal representation in decimal notation.

If `expr` is null, then this function returns `NULL`.

This function does not support `CLOB` data directly. However, `CLOB`s can be passed in as arguments through implicit data conversion.

**See Also:**

- Data Type Comparison Rules for more information
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of `DUMP`

**Examples**

The following examples show how to extract dump information from a string expression and a column:

```sql
SELECT DUMP('abc', 1016)
FROM DUAL;

DUMP('ABC', 1016)
------------------------------------------
Typ=96 Len=3 CharacterSet=WE8DEC: 61,62,63

SELECT DUMP(last_name, 8, 3, 2) "OCTAL"
FROM employees
WHERE last_name = 'Hunold'
ORDER BY employee_id;

OCTAL
------------------------------------------
Typ=1 Len=6: 156,157
```
SELECT DUMP(last_name, 10, 3, 2) "ASCII"  
FROM employees  
WHERE last_name = 'Hunold'  
ORDER BY employee_id;

ASCII

-------------------------------------------------------------
Typ=1 Len=6: 110,111

7.71 EMPTY_BLOB, EMPTY_CLOB

Syntax

empty_LOB::=

EMPTY_BLOB

EMPTY_CLOB

Purpose

EMPTY_BLOB and EMPTY_CLOB return an empty LOB locator that can be used to initialize a LOB variable or, in an INSERT or UPDATE statement, to initialize a LOB column or attribute to EMPTY. EMPTY means that the LOB is initialized, but not populated with data.

Note:

An empty LOB is not the same as a null LOB, and an empty CLOB is not the same as a LOB containing a string of 0 length. For more information, see Oracle Database SecureFiles and Large Objects Developer’s Guide.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of EMPTY_CLOB

Restriction on LOB Locators

You cannot use the locator returned from this function as a parameter to the DBMS_LOB package or the OCI.

Examples

The following example initializes the ad_photo column of the sample pm.print_media table to EMPTY:

UPDATE print_media  
SET ad_photo = EMPTY_BLOB();
7.72 EXISTSNODE

**Note:**

The `EXISTSNODE` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the `XMLEXISTS` function instead. See `XMLEXISTS` for more information.

### Syntax

```
EXISTSNODE (XMLType_instance, XPath_string
, namespace_string
)
```

### Purpose

`EXISTSNODE` determines whether traversal of an XML document using a specified path results in any nodes. It takes as arguments the `XMLType` instance containing an XML document and a `VARCHAR2` XPath string designating a path. The optional `namespace_string` must resolve to a `VARCHAR2` value that specifies a default mapping or namespace mapping for prefixes, which Oracle Database uses when evaluating the XPath expression(s).

The `namespace_string` argument defaults to the namespace of the root element. If you refer to any subelement in `XPath_string`, then you must specify `namespace_string`, and you must specify the "who" prefix in both of these arguments.

### See Also:

Using XML in SQL Statements for examples that specify `namespace_string` and use the "who" prefix.

The return value is `NUMBER`:

- 0 if no nodes remain after applying the XPath traversal on the document
- 1 if any nodes remain

### Examples

The following example tests for the existence of the `/Warehouse/Dock` node in the XML path of the `warehouse_spec` column of the sample table `oe.warehouses`:

```
SELECT warehouse_id, warehouse_name
FROM warehouses
WHERE EXISTSNODE(warehouse_spec, '/Warehouse/Docks') = 1
ORDER BY warehouse_id;
```

WAREHOUSE_ID WAREHOUSE_NAME
7.73 EXP

Syntax

\[ \text{EXP}(\text{n}) \]

Purpose

\text{EXP} returns \( e \) raised to the \( n \)th power, where \( e = 2.71828183... \). The function returns a value of the same type as the argument.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is \text{BINARY\_FLOAT}, then the function returns \text{BINARY\_DOUBLE}. Otherwise the function returns the same numeric data type as the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns \( e \) to the 4th power:

```sql
SELECT \text{EXP}(4) "e to the 4th power"
FROM DUAL;
```

```
e to the 4th power
------------------
54.59815
```
7.74 EXTRACT (datetime)

Syntax

\[\text{extract_datetime ::= }\]

\[
\text{EXTRACT } \begin{cases} \text{YEAR} \\ \text{MONTH} \\ \text{DAY} \\ \text{HOUR} \\ \text{MINUTE} \\ \text{SECOND} \\ \text{TIMEZONE\_HOUR} \\ \text{TIMEZONE\_MINUTE} \\ \text{TIMEZONE\_REGION} \\ \text{TIMEZONE\_ABBREV} \end{cases} \text{ FROM expr} \]

Purpose

EXTRACT extracts and returns the value of a specified datetime field from a datetime or interval expression. The \text{expr} can be any expression that evaluates to a datetime or interval data type compatible with the requested field:

- If \text{YEAR} or \text{MONTH} is requested, then \text{expr} must evaluate to an expression of data type \text{DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL YEAR TO MONTH}.
- If \text{DAY} is requested, then \text{expr} must evaluate to an expression of data type \text{DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL DAY TO SECOND}.
- If \text{HOUR, MINUTE, or SECOND} is requested, then \text{expr} must evaluate to an expression of data type \text{TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, or INTERVAL DAY TO SECOND}. \text{DATE} is not valid here, because Oracle Database treats it as ANSI \text{DATE} data type, which has no time fields.
- If \text{TIMEZONE\_HOUR, TIMEZONE\_MINUTE, TIMEZONE\_ABBREV, TIMEZONE\_REGION, or TIMEZONE\_OFFSET} is requested, then \text{expr} must evaluate to an expression of data type \text{TIMESTAMP WITH TIME ZONE or TIMESTAMP WITH LOCAL TIME ZONE}.

EXTRACT interprets \text{expr} as an ANSI datetime data type. For example, \text{EXTRACT} treats \text{DATE} not as legacy \text{Oracle} \text{DATE} but as ANSI \text{DATE}, without time elements. Therefore, you can extract only \text{YEAR, MONTH, and DAY} from a \text{DATE} value. Likewise, you can extract \text{TIMEZONE\_HOUR} and \text{TIMEZONE\_MINUTE} only from the \text{TIMESTAMP WITH TIME ZONE} data type.

When you specify \text{TIMEZONE\_REGION} or \text{TIMEZONE\_ABBREV} (abbreviation), the value returned is a \text{VARCHAR2} string containing the appropriate time zone region name or abbreviation. When you specify any of the other datetime fields, the value returned is
an integer value of NUMBER data type representing the datetime value in the Gregorian calendar. When extracting from a datetime with a time zone value, the value returned is in UTC. For a listing of time zone region names and their corresponding abbreviations, query the V$TIMEZONE_NAMES dynamic performance view.

This function can be very useful for manipulating datetime field values in very large tables, as shown in the first example below.

### Note:

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see Oracle Database Globalization Support Guide.

Some combinations of datetime field and datetime or interval value expression result in ambiguity. In these cases, Oracle Database returns UNKNOWN (see the examples that follow for additional information).

### See Also:

- Oracle Database Globalization Support Guide for a complete listing of the time zone region names in both files
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of EXTRACT
- Datetime/Interval Arithmetic for a description of datetime_value_expr and interval_value_expr
- Oracle Database Reference for information on the dynamic performance views

### Examples

The following example returns from the oe.orders table the number of orders placed in each month:

```sql
SELECT EXTRACT(month FROM order_date) "Month", COUNT(order_date) "No. of Orders"
FROM orders
GROUP BY EXTRACT(month FROM order_date)
ORDER BY "No. of Orders" DESC, "Month";
```

<table>
<thead>
<tr>
<th>Month</th>
<th>No. of Orders</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>15</td>
</tr>
<tr>
<td>6</td>
<td>14</td>
</tr>
<tr>
<td>7</td>
<td>14</td>
</tr>
<tr>
<td>3</td>
<td>11</td>
</tr>
<tr>
<td>5</td>
<td>10</td>
</tr>
</tbody>
</table>
The following example returns the year 1998.

```
SELECT EXTRACT(YEAR FROM DATE '1998-03-07')
FROM DUAL;
```

```
EXTRACT(YEARFROMDATE '1998-03-07')
---------------------------------
1998
```

The following example selects from the sample table `hr.employees` all employees who were hired after 2007:

```
SELECT last_name, employee_id, hire_date
FROM employees
WHERE EXTRACT(YEAR FROM TO_DATE(hire_date, 'DD-MON-RR')) > 2007
ORDER BY hire_date;
```

```
LAST_NAME                 EMPLOYEE_ID   HIRE_DATE
------------------------- ----------- ---------
Johnson                           179 04-JAN-08
Grant                             199 13-JAN-08
Marvins                           164 24-JAN-08
... 
```

The following example results in ambiguity, so Oracle returns `UNKNOWN`:

```
SELECT EXTRACT(TIMEZONE_REGION FROM TIMESTAMP '1999-01-01 10:00:00 -08:00')
FROM DUAL;
```

```
EXTRACT(TIMEZONE_REGION FROM TIMESTAMP '1999-01-01 10:00:00 -08:00')
-----------------------------------
UNKNOWN
```

The ambiguity arises because the time zone numerical offset is provided in the expression, and that numerical offset may map to more than one time zone region name.

### 7.75 EXTRACT (XML)

#### Note:

The `EXTRACT (XML)` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the `XMLQUERY` function instead. See `XMLQUERY` for more information.
Syntax

\textit{extract\_xml::=}

\begin{verbatim}
EXTRACT (XMLType_instance, XPath_string, namespace_string)
\end{verbatim}

Purpose

\texttt{EXTRACT (XML)} is similar to the \texttt{EXISTS\_NODE} function. It applies a \texttt{VARCHAR2} XPath string and returns an XMLType instance containing an XML fragment. You can specify an absolute \texttt{XPath\_string} with an initial slash or a relative \texttt{XPath\_string} by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node. The optional \texttt{namespace\_string} is required if the XML you are handling uses a namespace prefix. This argument must resolve to a \texttt{VARCHAR2} value that specifies a default mapping or namespace mapping for prefixes, which Oracle Database uses when evaluating the XPath expression(s).

Examples

The following example extracts the value of the \texttt{/Warehouse/Docks} node of the XML path of the \texttt{warehouse\_spec} column in the sample table \texttt{oe.warehouses}:

\begin{verbatim}
SELECT warehouse_name,
    EXTRACT(warehouse_spec, '/Warehouse/Docks') "Number of Docks"
FROM warehouses
WHERE warehouse_spec IS NOT NULL
ORDER BY warehouse_name;
\end{verbatim}

\begin{tabular}{ll}
WAREHOUSE\_NAME & Number of Docks \\
\hline
New Jersey & \texttt{<Docks>1</Docks>} \\
San Francisco & \texttt{<Docks>1</Docks>} \\
Seattle, Washington & \texttt{<Docks>3</Docks>} \\
Southlake, Texas & \texttt{<Docks>2</Docks>}
\end{tabular}

Compare this example with the example for \texttt{EXTRACT\_VALUE}, which returns the scalar value of the XML fragment.

\section*{7.76 \texttt{EXTRACT\_VALUE}}

\textbf{Note:}

The \texttt{EXTRACT\_VALUE} function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the \texttt{XMLTABLE} function, or the \texttt{XMLCAST} and \texttt{XMLQUERY} functions instead. See \texttt{XMLTABLE}, \texttt{XMLCAST}, and \texttt{XMLQUERY} for more information.
The `EXTRACTVALUE` function takes as arguments an `XMLType` instance and an XPath expression and returns a scalar value of the resultant node. The result must be a single node and be either a text node, attribute, or element. If the result is an element, then the element must have a single text node as its child, and it is this value that the function returns. You can specify an absolute `XPath_string` with an initial slash or a relative `XPath_string` by omitting the initial slash. If you omit the initial slash, the context of the relative path defaults to the root node.

If the specified XPath points to a node with more than one child, or if the node pointed to has a non-text node child, then Oracle returns an error. The optional `namespace_string` must resolve to a `VARCHAR2` value that specifies a default mapping or namespace mapping for prefixes, which Oracle uses when evaluating the XPath expression(s).

For documents based on XML schemas, if Oracle can infer the type of the return value, then a scalar value of the appropriate type is returned. Otherwise, the result is of type `VARCHAR2`. For documents that are not based on XML schemas, the return type is always `VARCHAR2`.

### See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `EXTRACTVALUE`.

### Examples

The following example takes as input the same arguments as the example for `EXTRACT (XML)`. Instead of returning an XML fragment, as does the `EXTRACT` function, it returns the scalar value of the XML fragment:

```sql
SELECT warehouse_name, EXTRACTVALUE(e.warehouse_spec, '/Warehouse/Docks') "Docks"
FROM warehouses e
WHERE warehouse_spec IS NOT NULL
ORDER BY warehouse_name;
```

<table>

7.77 FEATURE_COMPARE

Syntax

\[
\text{feature_compare} ::= \\
\text{FEATURE_COMPARE} (\text{schema} \cdot \text{model} \text{mining_attribute_clause} \text{AND} \text{mining_attribute_clause})
\]

\[
\text{mining_attribute_clause} ::= \\
\text{USING} \cdot \text{schema} \cdot \text{table} \cdot \text{expr} \text{AS} \text{alias}
\]

Purpose

The \text{FEATURE_COMPARE} function uses a Feature Extraction model to compare two different documents, including short ones such as keyword phrases or two attribute lists, for similarity or dissimilarity. The \text{FEATURE_COMPARE} function can be used with Feature Extraction algorithms such as Singular Value Decomposition (SVD), Principal Component Analysis (PCA), Non-Negative Matrix Factorization (NMF), and Explicit Semantic Analysis (ESA). This function is applicable not only to documents, but also to numeric and categorical data.

The input to the \text{FEATURE_COMPARE} function is a single feature model built using the Feature Extraction algorithms of Oracle Data Mining, such as NMF, SVD, and ESA. The double \text{USING} clause provides a mechanism to compare two different documents or constant keyword phrases, or any combination of the two, for similarity or dissimilarity using the extracted features in the model.

The syntax of the \text{FEATURE_COMPARE} function can use an optional \text{GROUPING} hint when scoring a partitioned model. See \text{GROUPING Hint}.

\text{mining_attribute_clause}

The \text{mining_attribute_clause} identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The \text{mining_attribute_clause} behaves as described for the \text{PREDICTION} function. See \text{mining_attribute_clause}. 
See Also:

- *Oracle Data Mining User's Guide* for information about scoring
- *Oracle Data Mining Concepts* for information about clustering

Note:

The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in *Oracle Data Mining User's Guide*.

Examples

An ESA model is built against a 2005 Wiki dataset rendering over 200,000 features. The documents are mined as text and the document titles are considered as the Feature IDs.

The examples show the `FEATURECOMPARE` function with the ESA algorithm, which compares a similar set of texts and then a dissimilar set of texts.

**Similar texts**

```sql
SELECT 1 - FEATURE_COMPARE(esa_wiki_mod USING 'There are several PGA tour golfers from South Africa' text AND USING 'Nick Price won the 2002 Mastercard Colonial Open' text) similarity FROM DUAL;
```

```
SIMILARITY
----------
.258
```

The output metric shows the results of a distance calculation. Therefore, a smaller number represents more similar texts. So 1 minus the distance in the queries represents a document similarity metric.

**Dissimilar texts**

```sql
SELECT 1 - FEATURE_COMPARE(esa_wiki_mod USING 'There are several PGA tour golfers from South Africa' text AND USING 'John Elway played quarterback for the Denver Broncos' text) similarity FROM DUAL;
```

```
SIMILARITY
----------
.007
```
7.78 FEATURE_DETAILS

Syntax

feature_details ::=  

Analytic Syntax

feature_details_analytic ::=  

mining_attribute_clause ::=  

mining_analytic_clause ::=  

Chapter 7
FEATURE_DETAILS
7-121
Purpose

FEATUREDETAILS returns feature details for each row in the selection. The return value is an XML string that describes the attributes of the highest value feature or the specified feature_id.

topN

If you specify a value for topN, the function returns the N attributes that most influence the feature value. If you do not specify topN, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on the value of the feature. A positive weight indicates a higher feature value. A negative weight indicates a lower feature value.

By default, FEATUREDETAILS returns the attributes with the highest positive weight (DESC). If you specify ASC, the attributes with the highest negative weight are returned. If you specify ABS, the attributes with the greatest weight, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

FEATUREDETAILS can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.
- Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. Include INTO n, where n is the number of features to extract, and mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See "analytic_clause::=".)

The syntax of the FEATUREDETAILS function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See "mining_attribute_clause::=".)

### Note:
The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in *Oracle Data Mining User’s Guide*.

### Example
This example uses the feature extraction model `nmf_sh_sample` to score the data. The query returns the three features that best represent customer 100002 and the attributes that most affect those features.

```sql
SELECT S.feature_id fid, value val,
       FEATURE_DETAILS(nmf_sh_sample, S.feature_id, 5 using T.*) det
FROM
(SELECT v.*, FEATURE_SET(nmf_sh_sample, 3 USING *) fset
     FROM mining_data_apply_v v
     WHERE cust_id = 100002) T,
     TABLE(T.fset) S
ORDER BY 2 DESC;
```

<table>
<thead>
<tr>

7.79 FEATURE_ID

Syntax

```plaintext
feature_id::=
```

Analytic Syntax

```plaintext
feature_id_analytic::=
```

```plaintext
mining_attribute_clause::=
```
**mining_analytic_clause::=**

| query_partition_clause | order_by_clause |

**Purpose**

`FEATURE_ID` returns the identifier of the highest value feature for each row in the selection. The feature identifier is returned as an Oracle `NUMBER`.

**Syntax Choice**

`FEATURE_ID` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.

- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO n`, where `n` is the number of features to extract, and `mining_analytic_clause`, which specifies if the data should be partitioned for multiple model builds. The `mining_analytic_clause` supports a `query_partition_clause` and an `order_by_clause`. (See "analytic_clause::=".)

The syntax of the `FEATURE_ID` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

**mining_attribute_clause**

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The `mining_attribute_clause` behaves as described for the `PREDICTION` function. (See "mining_attribute_clause::=".)

**See Also:**

- Oracle Data Mining User's Guide for information about scoring.

<td>6</td>
</tr>
<tr>
<td>6</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

7.80 FEATURE_SET

Syntax

```
feature_set ::= 

FEATURE_SET ( schema . model , topN , cutoff mining_attribute_clause )
```

Analytic Syntax

```
feature_set_analytic ::= 

FEATURE_SET ( INTO n , topN , cutoff mining_attribute_clause ) OVER ( mining_analytic_clause )
```

OVER ( mining_analytic_clause )
**mining_attribute_clause:**

```
mining_attribute_clause::= 
  USING 
  expr AS alias 
```

**mining_analytic_clause:**

```
mining_analytic_clause::= 
  query_partition_clause order_by_clause
```

---

See Also:

"Analytic Functions " for information on the syntax, semantics, and restrictions of `mining_analytic_clause`

---

**Purpose**

`FEATURE_SET` returns a set of feature ID and feature value pairs for each row in the selection. The return value is a varray of objects with field names `FEATURE_ID` and `VALUE`. The data type of both fields is `NUMBER`.

**topN and cutoff**

You can specify `topN` and `cutoff` to limit the number of features returned by the function. By default, both `topN` and `cutoff` are null and all features are returned.

- `topN` is the `N` highest value features. If multiple features have the `N`th value, then the function chooses one of them.
- `cutoff` is a value threshold. Only features that are greater than or equal to `cutoff` are returned. To filter by `cutoff` only, specify NULL for `topN`.

To return up to `N` features that are greater than or equal to `cutoff`, specify both `topN` and `cutoff`.

**Syntax Choice**

`FEATURE_SET` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.
• **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO n`, where `n` is the number of features to extract, and `mining_analytic_clause`, which specifies if the data should be partitioned for multiple model builds. The `mining_analytic_clause` supports a `query_partition_clause` and an `order_by_clause`. (See "analytic_clause::=".)

The syntax of the `FEATURE_SET` function can use an optional `GROUPING` hint when scoring a partitioned model. See `GROUPING Hint`.

**mining_attribute_clause**

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The `mining_attribute_clause` behaves as described for the `PREDICTION` function. (See "mining_attribute_clause::=".)

---

---

**Note:**

The following example is excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in *Oracle Data Mining User's Guide*.

---

**Example**

This example lists the top features corresponding to a given customer record and determines the top attributes for each feature (based on coefficient > 0.25).

```sql
WITH feat_tab AS (
  SELECT F.feature_id fid,
         A.attribute_name attr,
         TO_CHAR(A.attribute_value) val,
         A.coefficient coeff
  FROM TABLE(DBMS_DATA_MINING.GET_MODEL_DETAILS_NMF('nmf_sh_sample')) F,
         TABLE(F.attribute_set) A
  WHERE A.coefficient > 0.25
),
  feat AS (
    SELECT fid,
           CAST(COLLECT(Featattr(attr, val, coeff)) AS Featattrs) f_attrs
    FROM feat_tab
    GROUP BY fid
  ),
  cust_10_features AS (
    SELECT T.cust_id, S.feature_id, S.value
    FROM (SELECT cust_id, FEATURE_SET(nmf_sh_sample, 10 USING *) pset
```
FROM nmf_sh_sample_apply_prepared
WHERE cust_id = 100002) T,
    TABLE(T.pset) S
)

7.81 FEATURE_VALUE

Syntax

feature_value ::= 

Analytic Syntax

feature_value_analytic ::= 

OVER mining_analytic_clause

Chapter 7

FEATURE_VALUE

7-129
**mining_attribute_clause**:=

```
USING schema . table . expr AS alias ,
```

**mining_analytic_clause**:=

```
query_partition_clause order_by_clause
```

---

**See Also:**

"Analytic Functions" for information on the syntax, semantics, and restrictions of `mining_analytic_clause`

---

**Purpose**

`FEATURE_VALUE` returns a feature value for each row in the selection. The value refers to the highest value feature or to the specified `feature_id`. The feature value is returned as `BINARY_DOUBLE`.

**Syntax Choice**

`FEATURE_VALUE` can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose **Syntax** or **Analytic Syntax**:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a feature extraction model.

- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. Include `INTO n`, where `n` is the number of features to extract, and `mining_analytic_clause`, which specifies if the data should be partitioned for multiple model builds. The `mining_analytic_clause` supports a `query_partition_clause` and an `order_by_clause`. (See "analytic_clause::=".)

The syntax of the `FEATURE_VALUE` function can use an optional `GROUPING` hint when scoring a partitioned model. See **GROUPING Hint**.

**mining_attribute_clause**

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, this data is also used...
for building the transient models. The `mining_attribute_clause` behaves as described for the `PREDICTION` function. (See "mining_attribute_clause::=".)

7.82 FIRST

Syntax

\[ \text{first} ::= \]

\[ \text{aggregate_function \ KEEP} \]

\[ \text{DENSE_RANK \ FIRST \ ORDER \ BY \ expr} \]

\[ \text{DESC} \ ASC \ NULLS \ FIRST \ LAST \]

\[ \text{OVER (query_partition_clause)} \]

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions of the \text{ORDER BY clause} and \text{OVER clause}

Purpose

\text{FIRST} and \text{LAST} are very similar functions. Both are aggregate and analytic functions that operate on a set of values from a set of rows that rank as the FIRST or LAST with respect to a given sorting specification. If only one row ranks as FIRST or LAST, then the aggregate operates on the set with only one element.

If you omit the \text{OVER clause}, then the \text{FIRST} and \text{LAST} functions are treated as aggregate functions. You can use these functions as analytic functions by specifying the \text{OVER clause}. The \text{query_partition_clause} is the only part of the \text{OVER clause} valid with these functions. If you include the \text{OVER clause} but omit the \text{query_partition_clause}, then the function is treated as an analytic function, but the window defined for analysis is the entire table.

These functions take as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

When you need a value from the first or last row of a sorted group, but the needed value is not the sort key, the \text{FIRST} and \text{LAST} functions eliminate the need for self-joins or views and enable better performance.

- The \text{aggregate_function} argument is any one of the MIN, MAX, SUM, AVG, COUNT, VARIANCE, or STDDEV functions. It operates on values from the rows that rank either \text{FIRST} or \text{LAST}. If only one row ranks as \text{FIRST} or \text{LAST}, then the aggregate operates on a singleton (nonaggregate) set.
• The **KEEP** keyword is for semantic clarity. It qualifies `aggregate_function`, indicating that only the **FIRST** or **LAST** values of `aggregate_function` will be returned.

• **DENSE_RANK FIRST** or **DENSE_RANK LAST** indicates that Oracle Database will aggregate over only those rows with the minimum (**FIRST**) or the maximum (**LAST**) dense rank (also called olympic rank).

**See Also:**

- Table 2-8 for more information on implicit conversion and **LAST**

---

**Aggregate Example**

The following example returns, within each department of the sample table `hr.employees`, the minimum salary among the employees who make the lowest commission and the maximum salary among the employees who make the highest commission:

```sql
SELECT department_id,
       MIN(salary) KEEP (DENSE_RANK FIRST ORDER BY commission_pct) "Worst",
       MAX(salary) KEEP (DENSE_RANK LAST ORDER BY commission_pct) "Best"
FROM employees
GROUP BY department_id
ORDER BY department_id;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>Worst</th>
<th>Best</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4400</td>
<td>4400</td>
</tr>
<tr>
<td>20</td>
<td>6000</td>
<td>13000</td>
</tr>
<tr>
<td>30</td>
<td>2500</td>
<td>11000</td>
</tr>
<tr>
<td>40</td>
<td>6500</td>
<td>6500</td>
</tr>
<tr>
<td>50</td>
<td>2100</td>
<td>8200</td>
</tr>
<tr>
<td>60</td>
<td>4200</td>
<td>9000</td>
</tr>
<tr>
<td>70</td>
<td>10000</td>
<td>10000</td>
</tr>
<tr>
<td>80</td>
<td>6100</td>
<td>14000</td>
</tr>
<tr>
<td>90</td>
<td>17000</td>
<td>24000</td>
</tr>
<tr>
<td>100</td>
<td>6900</td>
<td>12008</td>
</tr>
<tr>
<td>110</td>
<td>8300</td>
<td>12008</td>
</tr>
<tr>
<td>7000</td>
<td>7000</td>
<td></td>
</tr>
</tbody>
</table>

**Analytic Example**

The next example makes the same calculation as the previous example but returns the result for each employee within the department:

```sql
SELECT last_name, department_id, salary,
       MIN(salary) KEEP (DENSE_RANK FIRST ORDER BY commission_pct) OVER (PARTITION BY department_id) "Worst",
       MAX(salary) KEEP (DENSE_RANK LAST ORDER BY commission_pct) OVER (PARTITION BY department_id) "Best"
FROM employees
ORDER BY department_id, salary, last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>DEPARTMENT_ID</th>
<th>SALARY</th>
<th>Worst</th>
<th>Best</th>
</tr>
</thead>
<tbody>
<tr>
<td>Whalen</td>
<td>10</td>
<td>4400</td>
<td>4400</td>
<td>4400</td>
</tr>
</tbody>
</table>
7.83 FIRST_VALUE

Syntax

See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions, including valid forms of expr

Purpose

FIRST_VALUE is an analytic function. It returns the first value in an ordered set of values. If the first value in the set is null, then the function returns NULL unless you specify IGNORE NULLS. This setting is useful for data densification.

Note:

The two forms of this syntax have the same behavior. The top branch is the ANSI format, which Oracle recommends for ANSI compatibility.

{RESPECT | IGNORE} NULLS determines whether null values of expr are included in or eliminated from the calculation. The default is RESPECT NULLS. If you specify IGNORE NULLS, then FIRST_VALUE returns the first non-null value in the set, or NULL if all values are null. Refer to "Using Partitioned Outer Joins: Examples" for an example of data densification.

You cannot nest analytic functions by using FIRST_VALUE or any other analytic function for expr. However, you can use other built-in function expressions for expr. Refer to "About SQL Expressions " for information on valid forms of expr.
Examples
The following example selects, for each employee in Department 90, the name of the employee with the lowest salary.

```sql
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC ROWS UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER BY hire_date);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>FV</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>De Haan</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>De Haan</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>De Haan</td>
</tr>
</tbody>
</table>

The example illustrates the nondeterministic nature of the `FIRST_VALUE` function. Kochhar and DeHaan have the same salary, so are in adjacent rows. Kochhar appears first because the rows returned by the subquery are ordered by `hire_date`. However, if the rows returned by the subquery are ordered by `hire_date` in descending order, as in the next example, then the function returns a different value:

```sql
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC ROWS UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER by hire_date DESC);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>FV</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>Kochhar</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>Kochhar</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>Kochhar</td>
</tr>
</tbody>
</table>

The following two examples show how to make the `FIRST_VALUE` function deterministic by ordering on a unique key. By ordering within the function by both salary and the unique key `employee_id`, you can ensure the same result regardless of the ordering in the subquery.

```sql
SELECT employee_id, last_name, salary, hire_date,
       FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC, employee_id ROWS UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER BY hire_date);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>FV</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>Kochhar</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>Kochhar</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>Kochhar</td>
</tr>
<tr>
<td>EMPLOYEE_ID</td>
<td>LAST_NAME</td>
<td>SALARY</td>
<td>HIRE_DATE</td>
<td></td>
</tr>
<tr>
<td>------------</td>
<td>-----------</td>
<td>---------</td>
<td>---------------</td>
<td></td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05 Kochhar</td>
<td></td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01 Kochhar</td>
<td></td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03 Kochhar</td>
<td></td>
</tr>
</tbody>
</table>

SELECT employee_id, last_name, salary, hire_date,
FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC, employee_id ROWS UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date DESC);

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05 Kochhar</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01 De Haan</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03 De Haan</td>
</tr>
</tbody>
</table>

SELECT employee_id, last_name, salary, hire_date,
FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC RANGE UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date);

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01 De Haan</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05 De Haan</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03 De Haan</td>
</tr>
</tbody>
</table>

SELECT employee_id, last_name, salary, hire_date,
FIRST_VALUE(last_name)
OVER (ORDER BY salary ASC RANGE UNBOUNDED PRECEDING) AS fv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date DESC);

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01 De Haan</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05 De Haan</td>
</tr>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03 De Haan</td>
</tr>
</tbody>
</table>

The following two examples show that the FIRST_VALUE function is deterministic when you use a logical offset (RANGE instead of ROWS). When duplicates are found for the ORDER BY expression, the FIRST_VALUE is the lowest value of expr:

7.84 FLOOR

Syntax

| FLOOR | n | 1 | n |
### Purpose

`FLOOR` returns the largest integer equal to or less than \( n \). The number \( n \) can always be written as the sum of an integer \( k \) and a positive fraction \( f \) such that \( 0 \leq f < 1 \) and \( n = k + f \). The value of `FLOOR` is the integer \( k \). Thus, the value of `FLOOR` is \( n \) itself if and only if \( n \) is precisely an integer.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

### See Also:

See Table 2-8 for more information on implicit conversion and `CEIL`.

### Examples

The following example returns the largest integer equal to or less than 15.7:

```sql
SELECT FLOOR(15.7) "Floor"
FROM DUAL;
```

```
Floor
----------
15
```

### 7.85 FROM_TZ

#### Syntax

```sql
FROM_TZ ( timestamp_value , time_zone_value )
```

#### Purpose

`FROM_TZ` converts a timestamp value and a time zone to a `TIMESTAMP` with time zone value. `time_zone_value` is a character string in the format `'TZH:TZM'` or a character expression that returns a string in `TZR` with optional `TZD` format.

#### Examples

The following example returns a timestamp value to `TIMESTAMP` with time zone:

```sql
SELECT FROM_TZ(TIMESTAMP '2000-03-28 08:00:00', '3:00')
FROM DUAL;
```

```
FROM_TZ(TIMESTAMP'2000-03-2808:00:00','3:00')
---------------------------------------------------------------
28-MAR-00 08.00.000000000 AM +03:00
```
7.86 GREATEST

Syntax

```
GREATEST(expr)
```

Purpose

GREATEST returns the greatest of a list of one or more expressions. Oracle Database uses the first `expr` to determine the return type. If the first `expr` is numeric, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type before the comparison, and returns that data type. If the first `expr` is not numeric, then each `expr` after the first is implicitly converted to the data type of the first `expr` before the comparison.

Oracle Database compares each `expr` using nonpadded comparison semantics. The comparison is binary by default and is linguistic if the NLS_COMP parameter is set to LINGUISTIC and the NLS_SORT parameter has a setting other than BINARY. Character comparison is based on the numerical codes of the characters in the database character set and is performed on whole strings treated as one sequence of bytes, rather than character by character. If the value returned by this function is character data, then its data type is VARCHAR2 if the first `expr` is a character data type and NVARCHAR2 if the first `expr` is a national character data type.

See Also:

- "Data Type Comparison Rules " for more information on character comparison
- Table 2-8 for more information on implicit conversion and "Floating-Point Numbers " for information on binary-float comparison semantics
- "LEAST ", which returns the least of a list of one or more expressions
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation GREATEST uses to compare character values for `expr`, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

The following statement selects the string with the greatest value:

```
SELECT GREATEST('HARRY', 'HARRIOT', 'HAROLD') "Greatest"
FROM DUAL;
```

Greatest
--------
HARRY
In the following statement, the first argument is numeric. Oracle Database determines that the argument with the highest numeric precedence is the second argument, converts the remaining arguments to the data type of the second argument, and returns the greatest value as that data type:

```sql
SELECT GREATEST (1, '3.925', '2.4') "Greatest"
FROM DUAL;
```

Greatest
--------
3.925

---

### 7.87 GROUP_ID

**Syntax**

```
GROUP_ID(
)
```

**Purpose**

The `GROUP_ID` function distinguishes duplicate groups resulting from a `GROUP BY` specification. It is useful in filtering out duplicate groupings from the query result. It returns an Oracle `NUMBER` to uniquely identify duplicate groups. This function is applicable only in a `SELECT` statement that contains a `GROUP BY` clause.

If there are `n` duplicates exist for a particular grouping, then `GROUP_ID` returns numbers in the range 0 to `n-1`.

**Examples**

The following example assigns the value 1 to the duplicate `co.country_region` grouping from a query on the sample tables `sh.countries` and `sh.sales`:

```sql
SELECT co.country_region, co.country_subregion,
       SUM(s.amount_sold) "Revenue", GROUP_ID() g
FROM sales s, customers c, countries co
WHERE s.cust_id = c.cust_id
  AND c.country_id = co.country_id
  AND s.time_id = '1-JAN-00'
  AND co.country_region IN ('Americas', 'Europe')
GROUP BY GROUPING SETS ( (co.country_region, co.country_subregion),
                         (co.country_region, co.country_subregion) )
ORDER BY co.country_region, co.country_subregion, "Revenue", g;
```

<table>
<thead>
<tr>
<th>COUNTRY_REGION</th>
<th>COUNTRY_SUBREGION</th>
<th>Revenue</th>
<th>G</th>
</tr>
</thead>
<tbody>
<tr>
<td>Americas</td>
<td>Northern America</td>
<td>944.6</td>
<td>0</td>
</tr>
<tr>
<td>Americas</td>
<td>Northern America</td>
<td>944.6</td>
<td>1</td>
</tr>
<tr>
<td>Europe</td>
<td>Western Europe</td>
<td>566.39</td>
<td>0</td>
</tr>
<tr>
<td>Europe</td>
<td>Western Europe</td>
<td>566.39</td>
<td>1</td>
</tr>
</tbody>
</table>

To ensure that only rows with `GROUP_ID < 1` are returned, add the following `HAVING` clause to the end of the statement:

```sql
HAVING GROUP_ID() < 1
```
GROUPING distinguishes superaggregate rows from regular grouped rows. GROUP BY extensions such as ROLLUP and CUBE produce superaggregate rows where the set of all values is represented by null. Using the GROUPING function, you can distinguish a null representing the set of all values in a superaggregate row from a null in a regular row.

The expr in the GROUPING function must match one of the expressions in the GROUP BY clause. The function returns a value of 1 if the value of expr in the row is a null representing the set of all values. Otherwise, it returns zero. The data type of the value returned by the GROUPING function is Oracle NUMBER. Refer to the SELECT group_by_clause for a discussion of these terms.

Examples

In the following example, which uses the sample tables hr.departments and hr.employees, if the GROUPING function returns 1 (indicating a superaggregate row rather than a regular row from the table), then the string "All Jobs" appears in the "JOB" column instead of the null that would otherwise appear:

```
SELECT DECODE(GROUPING(department_name), 1, 'ALL DEPARTMENTS', department_name)
  AS department,
  DECODE(GROUPING(job_id), 1, 'All Jobs', job_id) AS job,
  COUNT(*) "Total Empl",
  AVG(salary) * 12 "Average Sal"
FROM employees e, departments d
WHERE d.department_id = e.department_id
GROUP BY ROLLUP (department_name, job_id)
ORDER BY department, job;
```

<table>
<thead>
<tr>
<th>DEPARTMENT</th>
<th>JOB</th>
<th>Total Empl</th>
<th>Average Sal</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL DEPARTMENTS</td>
<td>All Jobs</td>
<td>106</td>
<td>77481.0566</td>
</tr>
<tr>
<td>Accounting</td>
<td>AC_ACCOUNT</td>
<td>1</td>
<td>99600</td>
</tr>
<tr>
<td>Accounting</td>
<td>AC_MGR</td>
<td>1</td>
<td>144096</td>
</tr>
<tr>
<td>Accounting</td>
<td>All Jobs</td>
<td>2</td>
<td>121848</td>
</tr>
<tr>
<td>Administration</td>
<td>AD_ASST</td>
<td>1</td>
<td>52800</td>
</tr>
<tr>
<td>Administration</td>
<td>All Jobs</td>
<td>1</td>
<td>52800</td>
</tr>
<tr>
<td>Executive</td>
<td>AD_PRES</td>
<td>1</td>
<td>288000</td>

</tr>
<tr>
<td>Finance</td>
<td>FI_ACCOUNT</td>
<td>5</td>
<td>95040</td>
</tr>
<tr>
<td>..</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
GROUPING_ID

Syntax

```
GROUPING_ID(expr)
```

Purpose

GROUPING_ID returns a number corresponding to the GROUPING bit vector associated with a row. GROUPING_ID is applicable only in a SELECT statement that contains a GROUP BY extension, such as ROLLUP or CUBE, and a GROUPING function. In queries with many GROUP BY expressions, determining the GROUP BY level of a particular row requires many GROUPING functions, which leads to cumbersome SQL. GROUPING_ID is useful in these cases.

GROUPING_ID is functionally equivalent to taking the results of multiple GROUPING functions and concatenating them into a bit vector (a string of ones and zeros). By using GROUPING_ID you can avoid the need for multiple GROUPING functions and make row filtering conditions easier to express. Row filtering is easier with GROUPING_ID because the desired rows can be identified with a single condition of `GROUPING_ID = n`. The function is especially useful when storing multiple levels of aggregation in a single table.

Examples

The following example shows how to extract grouping IDs from a query of the sample table `sh.sales`:

```
SELECT channel_id, promo_id, sum(amount_sold) s_sales,
       GROUPING(channel_id) gc,
       GROUPING(promo_id) gp,
       GROUPING_ID(channel_id, promo_id) gcp,
       GROUPING_ID(promo_id, channel_id) gpc
FROM sales
WHERE promo_id > 496
GROUP BY CUBE(channel_id, promo_id)
ORDER BY channel_id, promo_id, s_sales, gc;
```

<table>
<thead>
<tr>
<th>CHANNEL_ID</th>
<th>PROMO_ID</th>
<th>S_SALES</th>
<th>GC</th>
<th>GP</th>
<th>GCP</th>
<th>GPC</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>999</td>
<td>25797563.2</td>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>

<td>3</td>
<td>3</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
7.90 HEXTORAW

Syntax

\[ \text{HEXTORAW}(\text{char}) \]

Purpose

HEXTORAW converts char containing hexadecimal digits in the CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type to a raw value.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also:

"Data Type Comparison Rules" for more information.

Examples

The following example creates a simple table with a raw column, and inserts a hexadecimal value that has been converted to RAW:

CREATE TABLE test (raw_col RAW(10));

INSERT INTO test VALUES (HEXTORAW('7D'));

The following example converts hexadecimal digits to a raw value and casts the raw value to VARCHAR2:

SELECT UTL_RAW.CAST_TO_VARCHAR2(HEXTORAW('4041424344'))
FROM DUAL;

UTL_RAW.CAST_TO_VARCHAR2(HEXTORAW('4041424344'))
------------------------------------------------
@ABCD

See Also:

"RAW and LONG RAW Data Types" and RAWTOHEX

7.91 INITCAP

Syntax

\[ \text{INITCAP}(\text{char}) \]
Purpose

**INITCAP** returns `char`, with the first letter of each word in uppercase, all other letters in lowercase. Words are delimited by white space or characters that are not alphanumeric.

`char` can be of any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The return value is the same data type as `char`. The database sets the case of the initial characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive uppercase and lowercase, refer to NLS_INITCAP.

This function does not support `CLOB` data directly. However, `CLOBs` can be passed in as arguments through implicit data conversion.

**See Also:**

- “Data Type Comparison Rules” for more information.
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of **INITCAP**.

**Examples**

The following example capitalizes each word in the string:

```sql
SELECT INITCAP('the soap') "Capitals"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Capitals</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Soap</td>
</tr>
</tbody>
</table>

### 7.92 INSERTCHILDXML

**Note:**

The **INSERTCHILDXML** function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See *Oracle XML DB Developer's Guide* for more information.

**Syntax**

```
INSERTCHILDXML( XMLType_instance, XPath_string, child_expr, value_expr, namespace_string )
```
Purpose

`INSERTCHILDXML` inserts a user-supplied value into the target XML at the node indicated by the XPath expression. Compare this function with `INSERTXMLBEFORE`.

- `XMLType_instance` is an instance of `XMLType`.
- `XPath_string` is an Xpath expression indicating one or more nodes into which the one or more child nodes are to be inserted. You can specify an absolute `XPath_string` with an initial slash or a relative `XPath_string` by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node.
- `child_expr` specifies the one or more element or attribute nodes to be inserted.
- `value_expr` is an fragment of `XMLType` that specifies one or more notes being inserted. It must resolve to a string.
- The optional `namespace_string` provides namespace information for the `XPath_string`. This parameter must be of type `VARCHAR2`.

See Also:

Oracle XML DB Developer's Guide for more information about this function

Examples

The following example adds a second `/Owner` node to the `warehouse_spec` of one of the warehouses updated in the example for `APPENDCHILDXML`:

```
UPDATE warehouses
SET warehouse_spec = INSERTCHILDXML(warehouse_spec, '/Warehouse/Building',
   'Owner', XMLType('<Owner>LesserCo</Owner>'))
WHERE warehouse_id = 3;

SELECT warehouse_spec
FROM warehouses WHERE warehouse_id = 3;
```

```
WAREHOUSE_SPEC
<?xml version="1.0"?>
<Warehouse>
  <Building>Rented
    <Owner>Grandco</Owner>
    <Owner>LesserCo</Owner>
  </Building>
  <Area>85700</Area>
  <DockType/>
  <WaterAccess>N</WaterAccess>
  <RailAccess>N</RailAccess>
  <Parking>Street</Parking>
  <VClearance>11.5 ft</VClearance>
</Warehouse>
```
7.93 INSERTCHILDXMLAFTER

Note:
The INSERTCHILDXMLAFTER function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See Oracle XML DB Developer's Guide for more information.

Syntax

```plaintext
INSERTCHILDXMLAFTER
( XMLType_instance , XPath_string , child_expr , value_expr
, namespace_string
)
```

Purpose

INSERTXMLCHILDAFTER inserts one or more collection elements as children of target parent elements. The insertion for each target occurs immediately after a specified existing collection element. The existing XML document that is the target of the insertion can be schema-based or non-schema-based.

- `XMLType_instance` identifies the XML data that is the target of the insertion.
- `XPath_string` locates the parent elements within target-data; child-data is inserted under each parent element.
- `child_expr` is a relative XPath 1.0 expression that locates the existing child that will precede the inserted child-data. It must name a child element of the element indicated by parent-xpath, and it can include a predicate.
- `value_expr` is the XMLType child element data to insert. Each top-level element node in this argument must have the same data type as the element indicated by child_expr.
- The optional `namespace_string` specifies the namespace for the parent elements, existing child element, and child element XML data to be inserted.

See Also:

Oracle XML DB Developer's Guide for more information about this function

Examples

The following example is similar to that for INSERTCHILDXML, but it adds a third /Owner node after the /Owner node added in the other example. The output of the query has been formatted for readability.
UPDATE warehouses
SET warehouse_spec = INSERTCHILDXMLAFTER(warehouse_spec, '/Warehouse/Building', 'Owner[2]', XMLType('<Owner>ThirdOwner</Owner>'))
WHERE warehouse_id = 3;

SELECT warehouse_name,
    EXTRACT(warehouse_spec, '/Warehouse/Building/Owner') "Owners"
FROM warehouses
WHERE warehouse_id = 3;

<table>
<thead>
<tr>
<th>WAREHOUSE_NAME</th>
<th>Owners</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Jersey</td>
<td>&lt;Owner&gt;GrandCo&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;LesserCo&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;ThirdOwner&lt;/Owner&gt;</td>
</tr>
</tbody>
</table>

7.94 INSERTCHILDXMLBEFORE

Note:
The INSERTCHILDXMLBEFORE function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See Oracle XML DB Developer's Guide for more information.

Syntax

```
INSERTCHILDXMLBEFORE
( XMLType_instance , XPath_string , child_expr , value_expr
, namespace_string
)
```

Purpose

INSERTCHILDXMLBEFORE inserts one or more collection elements as children of target parent elements. The insertion for each target occurs immediately before a specified existing collection element. The existing XML document that is the target of the insertion can be schema-based or non-schema-based.

- **XMLType_instance** identifies the XML data that is the target of the insertion.
- **XPath_string** locates the parent elements within target-data; child-data is inserted under each parent element.
- **child_expr** is a relative XPath 1.0 expression that locates the existing child that will follow the inserted child-data. It must name a child element of the element indicated by parent-xpath, and it can include a predicate.
- **value_expr** is the XMLType child element data to insert. Each top-level element node in this argument must have the same data type as the element indicated by child_expr.
The optional namespace_string specifies the namespace for the parent elements, existing child element, and child element XML data to be inserted.

See Also:

Oracle XML DB Developer's Guide for more information about this function

Examples

The following example is similar to that for INSERTCHILDXML, but it adds a third /Owner node before the /Owner node added in the other example. The output of the query has been formatted for readability.

```sql
UPDATE warehouses
SET warehouse_spec = INSERTXMLAFTER(warehouse_spec, '/Warehouse/Building', 'Owner[2]', XMLType('<Owner>ThirdOwner</Owner>'))
WHERE warehouse_id = 3;

SELECT warehouse_name, EXTRACT(warehouse_spec, '/Warehouse/Building/Owner') "Owners"
FROM warehouses
WHERE warehouse_id = 3;

WAREHOUSE_NAME Owners
------------------- ------------------------------
New Jersey <Owner>GrandCo</Owner>
<Owner>ThirdOwner</Owner>
<Owner>LesserCo</Owner>
```

7.95 INSERTXMLAFTER

Note:

The INSERTXMLAFTER function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See Oracle XML DB Developer's Guide for more information.

Syntax

```
INSERTXMLAFTER( XMLType_instance, XPath_string, value_expr, namespace_string )
```

Purpose

INSERTXMLAFTER inserts one or more nodes of any kind immediately after a target node that is not an attribute node. The XML document that is the target of the insertion can be schema-based or non-schema-based. This function is similar to insertXMLbefore, but it inserts after, not before, the target node.
**XMLType_instance** specifies the target node of the insertion.

- **XPath_string** is an XPath 1.0 expression that locates in the target node zero or more nodes of any kind except attribute nodes. XML-data is inserted immediately after each of these nodes; that is, each node specified becomes the preceding sibling node of a node specified in **value_expr**.

- **value_expr** is the XML data to be inserted. You can specify one or more nodes of any kind. The order of the nodes is preserved after the insertion.

- The optional **namespace_string** is the namespace for the target node.

---

### See Also:

*Oracle XML DB Developer's Guide* for more information about this function

---

### Examples

The following example is similar to that for INSERTCHILDXML, but it adds a third `/Owner` node after the `/Owner` node added in the other example. The output of the query has been formatted for readability.

```sql
UPDATE warehouses
SET warehouse_spec = INSERTXMLAFTER(warehouse_spec, '/Warehouse/Building/Owner[1]', XMLType('<Owner>SecondOwner</Owner>'))
WHERE warehouse_id = 3;

SELECT warehouse_name, EXTRACT(warehouse_spec, '/Warehouse/Building/Owner') "Owners"
FROM warehouses
WHERE warehouse_id = 3;
```

<table>
<thead>
<tr>
<th>WAREHOUSE_NAME</th>
<th>Owners</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Jersey</td>
<td>&lt;Owner&gt;GrandCo&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;SecondOwner&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;LesserCo&lt;/Owner&gt;</td>
</tr>
</tbody>
</table>

---

### 7.96 INSERTXMLBEFORE

**Note:**

The **INSERTXMLBEFORE** function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See *Oracle XML DB Developer's Guide* for more information.

### Syntax

```
}  }  XMLType_instance , XPath_string , value_expr
    namespace_string

```
Purpose

INSERTXMLBEFORE inserts a user-supplied value into the target XML before the node indicated by the XPath expression. This function is similar to INSERTXMLAFTER, but it inserts before, not after, the target node. Compare this function with INSERTCHILDXML.

- XMLType_instance is an instance of XMLType.
- XPath_string is an Xpath expression indicating one or more nodes into which one or more child nodes are to be inserted. You can specify an absolute XPath_string with an initial slash or a relative XPath_string by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node.
- value_expr is a fragment of XMLType that defines one or more nodes being inserted and their position within the parent node. It must resolve to a string.
- The optional namespace_string provides namespace information for the XPath_string. This parameter must be of type VARCHAR2.

See Also:

Oracle XML DB Developer's Guide for more information about this function

Examples

The following example is similar to that for INSERTCHILDXML, but it adds a third /Owner node before the /Owner node added in the other example. The output of the query has been formatted for readability.

```sql
UPDATE warehouses
SET warehouse_spec = INSERTXMLBEFORE(warehouse_spec, '/Warehouse/Building/Owner[2]', XMLType('<Owner>ThirdOwner</Owner>'))
WHERE warehouse_id = 3;

SELECT warehouse_name, EXTRACT(warehouse_spec, '/Warehouse/Building/Owner') "Owners"
FROM warehouses
WHERE warehouse_id = 3;

<table>
<thead>
<tr>
<th>WAREHOUSE_NAME</th>
<th>Owners</th>
</tr>
</thead>
<tbody>
<tr>
<td>New Jersey</td>
<td>&lt;Owner&gt;GrandCo&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;ThirdOwner&lt;/Owner&gt;</td>
</tr>
<tr>
<td></td>
<td>&lt;Owner&gt;LesserCo&lt;/Owner&gt;</td>
</tr>
</tbody>
</table>
```

7.97 INSTR
Purpose

The INSTR functions search string for substring. The search operation is defined as comparing the substring argument with substrings of string of the same length for equality until a match is found or there are no more substrings left. Each consecutive compared substring of string begins one character to the right (for forward searches) or one character to the left (for backward searches) from the first character of the previous compared substring. If a substring that is equal to substring is found, then the function returns an integer indicating the position of the first character of this substring. If no such substring is found, then the function returns zero.

- position is an nonzero integer indicating the character of string where Oracle Database begins the search—that is, the position of the first character of the first substring to compare with substring. If position is negative, then Oracle counts backward from the end of string and then searches backward from the resulting position.

- occurrence is an integer indicating which occurrence of substring in string Oracle should search for. The value of occurrence must be positive. If occurrence is greater than 1, then the database does not return on the first match but continues comparing consecutive substrings of string, as described above, until match number occurrence has been found.

INSTR accepts and returns positions in characters as defined by the input character set, with the first character of string having position 1. INSTRB uses bytes instead of characters. INSTRC uses Unicode complete characters. INSTR2 uses UCS2 code points. INSTR4 uses UCS4 code points.

string can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The exceptions are INSTRC, INSTR2, and INSTR4, which do not allow string to be a CLOB or NCLOB.

substring can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.

The value returned is of NUMBER data type.

Both position and occurrence must be of data type NUMBER, or any data type that can be implicitly converted to NUMBER, and must resolve to an integer. The default values of both position and occurrence are 1, meaning Oracle begins searching at the first character of string for the first occurrence of substring. The return value is relative to the beginning of string, regardless of the value of position.
See Also:

- Table 2-8 for more information on implicit conversion
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation the INSTR functions use to compare the substring argument with substrings of string.

Examples

The following example searches the string CORPORATE FLOOR, beginning with the third character, for the string "OR". It returns the position in CORPORATE FLOOR at which the second occurrence of "OR" begins:

```sql
SELECT INSTR('CORPORATE FLOOR','OR', 3, 2) "Instring"
FROM DUAL;
```

Instring
---------
14

In the next example, Oracle counts backward from the last character to the third character from the end, which is the first O in FLOOR. Oracle then searches backward for the second occurrence of OR, and finds that this second occurrence begins with the second character in the search string:

```sql
SELECT INSTR('CORPORATE FLOOR','OR', -3, 2) "Reversed Instring"
FROM DUAL;
```

Reversed Instring
-----------------
2

The next example assumes a double-byte database character set.

```sql
SELECT INSTRB('CORPORATE FLOOR','OR',5,2) "Instring in bytes"
FROM DUAL;
```

Instring in bytes
------------------
27

7.98 ITERATION_NUMBER

Syntax

```
ITERATION_NUMBER
```

Purpose

The ITERATION_NUMBER function can be used only in the model_clause of the SELECT statement and then only when ITERATE(number) is specified in the
model_rules_clause. It returns an integer representing the completed iteration through the model rules. The ITERATION_NUMBER function returns 0 during the first iteration. For each subsequent iteration, the ITERATION_NUMBER function returns the equivalent of iteration_number plus one.

See Also:

model_clause and "Model Expressions" for the syntax and semantics

Examples

The following example assigns the sales of the Mouse Pad for the years 1998 and 1999 to the sales of the Mouse Pad for the years 2001 and 2002 respectively:

```sql
SELECT country, prod, year, s
FROM sales_view_ref
MODEL
  PARTITION BY (country)
  DIMENSION BY (prod, year)
  MEASURES (sale s)
  IGNORE NAV
  UNIQUE DIMENSION
  RULES UPSERT SEQUENTIAL ORDER ITERATE(2)
  (
    s['Mouse Pad', 2001 + ITERATION_NUMBER] =
    s['Mouse Pad', 1998 + ITERATION_NUMBER]
  )
ORDER BY country, prod, year;
```

<table>

</tr>
</tbody>
</table>

18 rows selected.

The preceding example requires the view sales_view_ref. Refer to "The MODEL clause: Examples" to create this view.
7.99 JSON_ARRAY

Syntax

```sql
JSON_ARRAY ( expr
FORMAT JSON
,
JSON_on_null_clause JSON_returning_clause
)
```

**JSON_on_null_clause::=**

```sql
NULL
ABSENT
ON NULL
```

**JSON_returning_clause::=**

```sql
RETURNING VARCHAR2
( size
BYTE
CHAR
)
```

Purpose

The SQL/JSON function `JSON_ARRAY` takes as its input one or more SQL expressions, converts each expression to a JSON value, and returns a JSON array that contains those JSON values.

**expr**

For `expr`, you can specify any SQL expression that evaluates to a JSON object, a JSON array, a numeric literal, a text literal, or null. This function converts a numeric literal to a JSON number value and a text literal to a JSON string value.

**FORMAT JSON**

This clause is optional and is provided for semantic clarity.

**JSON_on_null_clause**

Use this clause to specify the behavior of this function when `expr` evaluates to null.

- **NULL ON NULL** - If you specify this clause, then the function returns the JSON null value.
• **ABSENT ON NULL** - If you specify this clause, then the function omits the value from the JSON array. This is the default.

**JSON_returning_clause**

The character string returned by this function is of data type `VARCHAR2`. This clause allows you to specify the size of the `VARCHAR2` data type. Use `BYTE` to specify the size as a number of bytes or `CHAR` to specify the size as a number of characters. The default is `BYTE`. If you omit this clause, or if you specify this clause but omit the `size` value, then `JSON_ARRAY` returns a character string of type `VARCHAR2(4000)`.

Refer to **VARCHAR2 Data Type** for more information. Note that when specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in the **JSON_returning_clause** you can omit the size.

**Examples**

The following example constructs a JSON array from a JSON object, a JSON array, a numeric literal, a text literal, and null:

```sql
SELECT JSON_ARRAY (  
    JSON_OBJECT('percentage' VALUE .50),  
    JSON_ARRAY(1,2,3),  
    100,  
    'California',  
    null  
    NULL ON NULL  
) "JSON Array Example"  
FROM DUAL;
```

**7.100 JSON_ARRAYAGG**

**Syntax**

```
JSON_ARRAYAGG ( expr
FORMAT JSON order_by_clause
JSON_on_null_clause JSON_agg_returning_clause
)
```

(See `order_by_clause::=` in the documentation on `SELECT` for the syntax of this clause)

**JSON_on_null_clause::=**

```sql
NULL
ABSENT
ON NULL
```
**Purpose**

The SQL/JSON function `JSON_ARRAYAGG` is an aggregate function. It takes as its input a column of SQL expressions, converts each expression to a JSON value, and returns a single JSON array that contains those JSON values.

**expr**

For `expr`, you can specify any SQL expression that evaluates to a JSON object, a JSON array, a numeric literal, a text literal, or null. This function converts a numeric literal to a JSON number value and a text literal to a JSON string value.

**FORMAT JSON**

This clause is optional and is provided for semantic clarity.

**order_by_clause**

This clause allows you to order the JSON values within the JSON array returned by the statement. Refer to the `order_by_clause` in the documentation on `SELECT` for the full semantics of this clause.

**JSON_on_null_clause**

Use this clause to specify the behavior of this function when `expr` evaluates to null.

- **NULL ON NULL** - If you specify this clause, then the function returns the JSON null value.
- **ABSENT ON NULL** - If you specify this clause, then the function omits the value from the JSON array. This is the default.

**JSON_agg_returning_clause**

Use this clause to specify the data type of the character string returned by this function. You can specify the following data types:

- **VARCHAR2[size [BYTE,CHAR]]**
  
  When specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size.

- **CLOB**

If you omit this clause, or if you specify `VARCHAR2` but omit the `size` value, then `JSON_ARRAYAGG` returns a character string of type `VARCHAR2(4000)`.

Refer to "Data Types " for more information on the preceding data types.
Examples

The following statements create a table `id_table`, which contains ID numbers:

```sql
CREATE TABLE id_table (id NUMBER);
INSERT INTO id_table VALUES(624);
INSERT INTO id_table VALUES(null);
INSERT INTO id_table VALUES(925);
INSERT INTO id_table VALUES(585);
```

The following example constructs a JSON array from the ID numbers in table `id_table`:

```sql
SELECT JSON_ARRAYAGG(id ORDER BY id RETURNING VARCHAR2(100)) ID_NUMBERS
  FROM id_table;
```

<table>
<thead>
<tr>
<th>ID_NUMBERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>[585, 624, 925]</td>
</tr>
</tbody>
</table>

**7.101 JSON_DATAGUIDE**

**Syntax**

```
JSON_DATAGUIDE(column_name)
```

**Purpose**

The Oracle SQL function `JSON_DATAGUIDE` takes as its input a table column of JSON data. Each row in the column is referred to as a JSON document. For each JSON document in the column, this function returns a `CLOB` value that contains a flat data guide for that JSON document.

*column_name*

Specify the name of the column of JSON data for which you would like to create data guides.

**Restriction on JSON_DATAGUIDE**

You cannot run this function on a shard catalog server.

**See Also:**

Oracle Database JSON Developer's Guide for more information on data guides

**Examples**

The following example uses the `j_purchaseorder` table, which is created in "Creating a Table That Contains a JSON Document: Example". This table contains a column of
JSON data called po_document. This examples returns a flat data guide for each JSON document in the column po_document.

```
SELECT EXTRACT(YEAR FROM date_loaded) YEAR,
       JSON_DATAGUIDE(po_document) "DATA GUIDE"
FROM j_purchaseorder
GROUP BY extract(YEAR FROM date_loaded)
ORDER BY extract(YEAR FROM date_loaded) DESC;
```

<table>
<thead>
<tr>
<th>YEAR</th>
<th>DATA GUIDE</th>
</tr>
</thead>
<tbody>
<tr>
<td>2016</td>
<td>[</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
</tbody>
</table>
|      |     "o:path" : "$\.PO_ID",
|      |     "type" : "number",
|      |     "o:length" : 4
|      |   },
|      |     {       |
|      |       "o:path" : "$\.PO_Ref",
|      |       "type" : "string",
|      |       "o:length" : 16
|      |   },
|      |     {       |
|      |       "o:path" : "$\.PO_Items",
|      |       "type" : "array",
|      |       "o:length" : 64
|      |   },
|      |     {       |
|      |       "o:path" : "$\.PO_Items\.Part_No",
|      |       "type" : "number",
|      |       "o:length" : 16
|      |   },
|      |     {       |
|      |       "o:path" : "$\.PO_Items\.Item_Quantity",
|      |       "type" : "number",
|      |       "o:length" : 2
|      |   ]        |
|      | ...        |
```

### 7.102 JSON_OBJECT

#### Syntax

```
JSON_OBJECT(  
  KEY string VALUE expr
,  \n  JSON_on_null_clause JSON_returning_clause
)
```

---

Chapter 7

JSON_OBJECT

7-157
Purpose

The SQL/JSON function `JSON_OBJECT` takes as its input one or more property key-value pairs. It returns a JSON object that contains an object member for each of those key-value pairs.

**[KEY] string VALUE expr**

Use this clause to specify a property key-value pair.

- **KEY** is optional and is provided for semantic clarity.
- Use **string** to specify the property key name as a case-sensitive text literal.
- Use **expr** to specify the property value. For **expr**, you can specify any expression that evaluates to a SQL numeric literal or text literal. If **expr** evaluates to a numeric literal, then the resulting property value is a JSON number value; otherwise, the resulting property value is a case-sensitive JSON string value enclosed in double quotation marks.

**FORMAT JSON**

This clause is optional and is provided for semantic clarity.

**JSON_on_null_clause**

Use this clause to specify the behavior of this function when **expr** evaluates to null.

- **NULL ON NULL** - If you specify this clause, then the function returns the JSON null value. This is the default.
- **ABSENT ON NULL** - If you specify this clause, then the function omits the property key-value pair from the JSON object.

**JSON_returning_clause**

The character string returned by this function is of data type **VARCHAR2**. This clause allows you to specify the size of the **VARCHAR2** data type. Use **BYTE** to specify the size as a number of bytes or **CHAR** to specify the size as a number of characters. The
Chapter 7

JSON_OBJECTAGG

default is BYTE. If you omit this clause, or if you specify this clause but omit the size
value, then JSON_OBJECT returns a character string of type VARCHAR2(4000).
Refer to VARCHAR2 Data Type for more information. Note that when specifying the
VARCHAR2 data type elsewhere in SQL, you are required to specify a size. However, in
the JSON_returning_clause you can omit the size.
Examples
The following example returns JSON objects that each contain two property key-value
pairs:
SELECT JSON_OBJECT (
KEY 'deptno' IS d.department_id FORMAT JSON,
KEY 'deptname' IS d.department_name FORMAT JSON
) "Department Objects"
FROM departments d
ORDER BY d.department_id;
Department Objects
---------------------------------------{"deptno":10,"deptname":Administration}
{"deptno":20,"deptname":Marketing}
{"deptno":30,"deptname":Purchasing}
{"deptno":40,"deptname":Human Resources}
{"deptno":50,"deptname":Shipping}
. . .

7.103 JSON_OBJECTAGG
Syntax

KEY
JSON_OBJECTAGG

(

FORMAT
string

JSON_on_null_clause

VALUE

JSON

expr

JSON_agg_returning_clause
)

JSON_on_null_clause::=

NULL
ON

NULL

ABSENT

7-159


Purpose

The SQL/JSON function JSON_OBJECTAGG is an aggregate function. It takes as its input a property key-value pair. Typically, the property key, the property value, or both are columns of SQL expressions. This function constructs an object member for each key-value pair and returns a single JSON object that contains those object members.

[KEY] string VALUE expr

Use this clause to specify property key-value pairs.

- KEY is optional and is provided for semantic clarity.
- Use string to specify the property key name as a case-sensitive text literal.
- Use expr to specify the property value. For expr, you can specify any expression that evaluates to a SQL numeric literal or text literal. If expr evaluates to a numeric literal, then the resulting property value is a JSON number value; otherwise, the resulting property value is a case-sensitive JSON string value enclosed in double quotation marks.

FORMAT JSON

This clause is optional and is provided for semantic clarity.

JSON_on_null_clause

Use this clause to specify the behavior of this function when expr evaluates to null.

- NULL ON NULL - If you specify this clause, then the function returns the JSON null value. This is the default.
- ABSENT ON NULL - If you specify this clause, then the function omits the property key-value pair from the JSON object.

JSON_agg_returning_clause

Use this clause to specify the data type of the character string returned by this function. You can specify the following data types:

- VARCHAR2[size [BYTE,CHAR]]

  When specifying the VARCHAR2 data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size.

- CLOB

  If you omit this clause, or if you specify VARCHAR2 but omit the size value, then JSON_OBJECTAGG returns a character string of type VARCHAR2(4000).
Refer to "Data Types " for more information on the preceding data types.

Examples

The following example constructs a JSON object whose members contain department names and department numbers:

```
SELECT JSON_OBJECTAGG(KEY department_name VALUE department_id) "Department Numbers"
FROM departments
WHERE department_id <= 30;
```

Department Numbers

<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Administration&quot;:10,&quot;Marketing&quot;:20,&quot;Purchasing&quot;:30</td>
</tr>
</tbody>
</table>

### 7.104 JSON_QUERY

**Syntax**

```
JSON_QUERY ( expr
FORMAT JSON
, JSON_basic_path_expression
JSON_query_returning_clause JSON_query_wrapper_clause
JSON_query_on_error_clause JSON_query_on_empty_clause
)
```

*(JSON_basic_path_expression: See Oracle Database JSON Developer's Guide)*

**JSON_query_returning_clause ::=**

```
RETURNING JSON_query_return_type PRETTY ASCII
```

**JSON_query_return_type ::=**

```
VARCHAR2
```

**JSON_query_wrapper_clause ::=**

```
WITHOUT ARRAYWRAPPER
WITH UNCONDITIONAL CONDITIONAL ARRAYWRAPPER
```
Purpose
The SQL/JSON function \texttt{JSON\_QUERY} finds one or more specified JSON values in JSON data and returns the values in a character string.

\textit{See Also:}
Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character value returned by \texttt{JSON\_QUERY}.

\texttt{expr}
Use this clause to specify the JSON data to be evaluated. For \texttt{expr}, specify an expression that evaluates to a text literal. If \texttt{expr} is a column, then the column must be of data type \texttt{VARCHAR2}, \texttt{CLOB}, or \texttt{BLOB}. If \texttt{expr} is null, then the function returns null.

If \texttt{expr} is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the \texttt{JSON\_query\_on\_error\_clause} to override this default behavior. Refer to \texttt{JSON\_query\_on\_error\_clause}.

\texttt{FORMAT JSON}
You must specify \texttt{FORMAT JSON} if \texttt{expr} is a column of data type \texttt{BLOB}.

\texttt{JSON\_basic\_path\_expression}
Use this clause to specify a SQL/JSON path expression. The function uses the path expression to evaluate \texttt{expr} and find one or more JSON values that match, or satisfy,
the path expression. The path expression must be a text literal. See Oracle Database
JSON Developer’s Guide for the full semantics of JSON_basic_path_expression.

**JSON_query Returning Clause**

Use this clause to specify the data type and format of the character string returned by
this function.

**RETURNING**

Use the RETURNING clause to specify the data type of the character string. If you omit
this clause, then JSON_QUERY returns a character string of type VARCHAR2(4000).

You can use the JSON_return_type_clause to specify the following data type:

- VARCHAR2[ (size [BYTE,CHAR]) ]

  When specifying the VARCHAR2 data type elsewhere in SQL, you are required to
  specify a size. However, in this clause you can omit the size. In this case,
  JSON_QUERY returns a character string of type VARCHAR2(4000).

  Refer to "VARCHAR2 Data Type " for more information.

If the data type is not large enough to hold the return character string, then this
function returns null by default. You can use the JSON_query_on_error_clause to
override this default behavior. Refer to the JSON_query_on_error_clause.

**PRETTY**

Specify PRETTY to pretty-print the return character string by inserting newline
characters and indenting.

**ASCII**

Specify ASCII to automatically escape any non-ASCII Unicode characters in the return
character string, using standard ASCII Unicode escape sequences.

**JSON_query_wrapper_clause**

Use this clause to control whether this function wraps the values matched by the path
expression in an array wrapper—that is, encloses the sequence of values in square
brackets ([]).

- Specify WITHOUT WRAPPER to omit the array wrapper. You can specify this clause
only if the path expression matches a single JSON object or JSON array. This is
the default.

- Specify WITH WRAPPER to include the array wrapper. You must specify this clause if
the path expression matches a single scalar value (a value that is not a JSON
object or JSON array) or multiple values of any type.

- Specifying the WITH UNCONDITIONAL WRAPPER clause is equivalent to specifying the
WITH WRAPPER clause. The UNCONDITIONAL keyword is provided for semantic clarity.

- Specify WITH CONDITIONAL WRAPPER to include the array wrapper only if the path
expression matches a single scalar value or multiple values of any type. If the path
expression matches a single JSON object or JSON array, then the array wrapper
is omitted.

The ARRAY keyword is optional and is provided for semantic clarity.
If the function returns a single scalar value, or multiple values of any type, and you do not specify `WITH [UNCONDITIONAL | CONDITIONAL] WRAPPER`, then the function returns null by default. You can use the `JSON_query_on_error_clause` to override this default behavior. Refer to the `JSON_query_on_error_clause`.

**JSON_query_on_error_clause**

Use this clause to specify the value returned by this function when the following errors occur:

- `expr` is not well-formed JSON data using strict or lax JSON syntax
- No match is found when the JSON data is evaluated using the SQL/JSON path expression. You can override the behavior for this type of error by specifying the `JSON_query_on_empty_clause`.
- The return value data type is not large enough to hold the return character string
- The function matches a single scalar value or, multiple values of any type, and the `WITH [UNCONDITIONAL | CONDITIONAL] WRAPPER` clause is not specified

You can specify the following clauses:

- **NULL ON ERROR** - Returns null when an error occurs. This is the default.
- **ERROR ON ERROR** - Returns the appropriate Oracle error when an error occurs.
- **EMPTY ON ERROR** - Specifying this clause is equivalent to specifying `EMPTY ARRAY ON ERROR`.
- **EMPTY ARRAY ON ERROR** - Returns an empty JSON array (`[]`) when an error occurs.
- **EMPTY OBJECT ON ERROR** - Returns an empty JSON object (`{}`) when an error occurs.

**JSON_query_on_empty_clause**

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression. This clause allows you to specify a different outcome for this type of error than the outcome specified with the `JSON_query_on_error_clause`.

You can specify the following clauses:

- **NULL ON EMPTY** - Returns null when no match is found.
- **ERROR ON EMPTY** - Returns the appropriate Oracle error when no match is found.
- **EMPTY ON EMPTY** - Specifying this clause is equivalent to specifying `EMPTY ARRAY ON EMPTY`.
- **EMPTY ARRAY ON EMPTY** - Returns an empty JSON array (`[]`) when no match is found.
- **EMPTY OBJECT ON EMPTY** - Returns an empty JSON object (`{}`) when no match is found.

If you omit this clause, then the `JSON_query_on_error_clause` determines the value returned when no match is found.
Examples

The following query returns the context item, or the specified string of JSON data. The path expression matches a single JSON object, which does not require an array wrapper. Note that the JSON data is converted to strict JSON syntax in the returned value—that is, the object property names are enclosed in double quotation marks.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$') AS value
FROM DUAL;

VALUE
----------------------------------------
{"a":100,"b":200,"c":300}
```

The following query returns the value of the member with property name a. The path expression matches a scalar value, which must be enclosed in an array wrapper. Therefore, the WITH WRAPPER clause is specified.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.a' WITH WRAPPER) AS value
FROM DUAL;

VALUE
-------------------------------
[100]
```

The following query returns the values of all object members. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the WITH WRAPPER clause is specified.

```
SELECT JSON_QUERY('{a:100, b:200, c:300}', '$.*' WITH WRAPPER) AS value
FROM DUAL;

VALUE
----------------------------------------
[100,200,300]
```

The following query returns the context item, or the specified string of JSON data. The path expression matches a single JSON array, which does not require an array wrapper.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$') AS value
FROM DUAL;

VALUE
-------------------------------
[0,1,2,3,4]
```

The following query is similar to the previous query, except the WITH WRAPPER clause is specified. Therefore, the JSON array is wrapped in an array wrapper.

```
SELECT JSON_QUERY('[0,1,2,3,4]', '$' WITH WRAPPER) AS value
FROM DUAL;

VALUE
----------------------------------------
[[0,1,2,3,4]]
```
The following query returns all elements in a JSON array. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the WITH WRAPPER clause is specified.

```sql
SELECT JSON_QUERY('[0,1,2,3,4]', '$[*]' WITH WRAPPER) AS value
FROM DUAL;
```

VALUE

```
[0,1,2,3,4]
```

The following query returns the elements at indexes 0, 3 through 5, and 7 in a JSON array. The path expression matches multiple values, which together must be enclosed in an array wrapper. Therefore, the WITH WRAPPER clause is specified.

```sql
SELECT JSON_QUERY('[0,1,2,3,4,5,6,7,8]', '$[0, 3 TO 5, 7]' WITH WRAPPER) AS value
FROM DUAL;
```

VALUE

```
[0,3,4,5,7]
```

The following query returns the fourth element in a JSON array. The path expression matches a scalar value, which must be enclosed in an array wrapper. Therefore, the WITH WRAPPER clause is specified.

```sql
SELECT JSON_QUERY('[0,1,2,3,4]', '$[3]' WITH WRAPPER) AS value
FROM DUAL;
```

VALUE

```
[3]
```

The following query returns the first element in a JSON array. The WITH CONDITIONAL WRAPPER clause is specified and the path expression matches a single JSON object. Therefore, the value returned is not wrapped in an array. Note that the JSON data is converted to strict JSON syntax in the returned value—that is, the object property name is enclosed in double quotation marks.

```sql
SELECT JSON_QUERY('[{a:100},{b:200},{c:300}]', '$[0]' WITH CONDITIONAL WRAPPER) AS value
FROM DUAL;
```

VALUE

```
{"a":100}
```

The following query returns all elements in a JSON array. The WITH CONDITIONAL WRAPPER clause is specified and the path expression matches multiple JSON objects. Therefore, the value returned is wrapped in an array.

```sql
SELECT JSON_QUERY('[{"a":100},{"b":200},{"c":300}]', '{$[*]}' WITH CONDITIONAL WRAPPER) AS value
FROM DUAL;
```

VALUE

```
[{"a":100},{"b":200},{"c":300}]
```
The following query is similar to the previous query, except that the value returned is of data type VARCHAR2(100).

```sql
SELECT JSON_QUERY('[["a":100],,"b":200],,"c":300])', '$[*]' RETURNING VARCHAR2(100) WITH CONDITIONAL WRAPPER) AS value FROM DUAL;
```

```
VALUE
--------------------------------------------------------------------------------
[["a":100],,"b":200],,"c":300]]
```

The following query returns the fourth element in a JSON array. However, the supplied JSON array does not contain a fourth element, which results in an error. The `EMPTY ON ERROR` clause is specified. Therefore, the query returns an empty JSON array.

```sql
SELECT JSON_QUERY('[["a":100],,"b":200],,"c":300])', '$[3]' EMPTY ON ERROR) AS value FROM DUAL;
```

```
VALUE
--------------------------------------------------------------------------------
[]
```

### 7.105 JSON_TABLE

**Syntax**

```
JSON_TABLE ( expr
FORMAT JSON
, JSON_basic_path_expression
JSON_table_on_error_clause
JSON_columns_clause )
```

**(JSON_basic_path_expression): See Oracle Database JSON Developer's Guide, JSON_table_on_error_clause::=, JSON_columns_clause::=)**

**JSON_table_on_error_clause::=**

```
ERROR
NULL
DEFAULT literal
ON ERROR
```

**JSON_columns_clause::=**

```
COLUMNS ( JSON_column_definition
, )
```
**JSON_column_definition::=**

- **JSON_exists_column**
- **JSON_query_column**
- **JSON_value_column**
- **JSON_nested_path**
- **ordinality_column**

ordinality_column::= 

→ column_name FOR ORDINALITY

Purpose

The SQL/JSON function JSON_TABLE creates a relational view of JSON data. It maps the result of a JSON data evaluation into relational rows and columns. You can query the result returned by the function as a virtual relational table using SQL. The main purpose of JSON_TABLE is to create a row of relational data for each object inside a JSON array and output JSON values from within that object as individual SQL column values.

You must specify JSON_TABLE only in the FROM clause of a SELECT statement. The function first applies a path expression, called a SQL/JSON row path expression, to the supplied JSON data. The JSON value that matches the row path expression is called a row source in that it generates a row of relational data. The COLUMNS clause evaluates the row source, finds specific JSON values within the row source, and returns those JSON values as SQL values in individual columns of a row of relational data.

The COLUMNS clause enables you to search for JSON values in different ways by using the following clauses:

• JSON_exists_column - Evaluates JSON data in the same manner as the JSON_EXISTS condition, that is, determines if a specified JSON value exists, and returns either a VARCHAR2 column of values 'true' or 'false', or a NUMBER column of values 1 or 0.

• JSON_query_column - Evaluates JSON data in the same manner as the JSON_QUERY function, that is, finds one or more specified JSON values, and returns a column of character strings that contain those JSON values.

• JSON_value_column - Evaluates JSON data in the same manner as the JSON_VALUE function, that is, finds a specified scalar JSON value, and returns a column of those JSON values as SQL values.

• JSON_nested_path - Allows you to flatten JSON values in a nested JSON object or JSON array into individual columns in a single row along with JSON values from the parent object or array. You can use this clause recursively to project data from multiple layers of nested objects or arrays into a single row.

• ordinality_column - Returns a column of generated row numbers.
The column definition clauses allow you to specify a name for each column of data that they return. You can reference these column names elsewhere in the SELECT statement, such as in the SELECT list and the WHERE clause.

See Also:
Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by JSON_TABLE.

**expr**
Use this clause to specify the JSON data to be evaluated. For `expr`, specify an expression that evaluates to a text literal. If `expr` is a column, then the column must be of data type VARCHAR2, CLOB, or BLOB. If `expr` is null, then the function returns null.

If `expr` is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the `JSON_table_on_error_clause` to override this default behavior. Refer to `JSON_table_on_error_clause`.

**FORMAT JSON**
You must specify `FORMAT JSON` if `expr` is a column of data type BLOB.

**JSON_basic_path_expression**
Use this clause to specify the SQL/JSON row path expression. The function uses the row path expression to evaluate `expr` and find the a JSON value, called the row source, that matches, or satisfy, the path expression. This row source is then evaluated by the `COLUMNS` clause. The path expression must be a text literal. See Oracle Database JSON Developer's Guide for the full semantics of `JSON_basic_path_expression`.

**JSON_table_on_error_clause**
Use this clause to specify the value returned by this function when the following errors occur:

- `expr` is not well-formed JSON data using strict or lax JSON syntax
- No match is found when the JSON data is evaluated using the row path expression

You can specify the following clauses:

- **NULL ON ERROR** - Returns null when an error occurs. This is the default.
- **ERROR ON ERROR** - Returns the appropriate Oracle error when an error occurs.
- **DEFAULT literal ON ERROR** - Returns `literal` when an error occurs. If the data type of the value returned by this function is VARCHAR2, then you must specify a text literal. If the data type is NUMBER, then you must specify a numeric literal.
**JSON_columns_clause**

Use the `COLUMNS` clause to define the columns in the virtual relational table returned by the `JSON_TABLE` function.

**JSON_exists_column**

This clause evaluates JSON data in the same manner as the `JSON_EXISTS` condition, that is, it determines if a specified JSON value exists. It returns either a `VARCHAR2` column of values 'true' or 'false', or a `NUMBER` column of values 1 or 0. A value of 'true' or 1 indicates that the JSON value exists and a value of 'false' or 0 indicates that the JSON value does not exist.

You can use the `JSON_value_return_type` clause to control the data type of the returned column. If you omit this clause, then the data type is `VARCHAR2(4000)`. Use `column_name` to specify the name of the returned column. The rest of the clauses of `JSON_exists_column` have the same semantics here as they have for the `JSON_EXISTS` condition. For full information on these clauses, refer to "JSON_EXISTS Condition". Also see "Using JSON_exists_column: Examples" for an example.

**JSON_query_column**

This clause evaluates JSON data in the same manner as the `JSON_QUERY` function, that is, it finds one or more specified JSON values, and returns a column of character strings that contain those JSON values.

Use `column_name` to specify the name of the returned column. The rest of the clauses of `JSON_query_column` have the same semantics here as they have for the `JSON_QUERY` function. For full information on these clauses, refer to `JSON_QUERY`. Also see "Using JSON_query_column: Example" for an example.

**JSON_value_column**

This clause evaluates JSON data in the same manner as the `JSON_VALUE` function, that is, it finds a specified scalar JSON value, and returns a column of those JSON values as SQL values.

Use `column_name` to specify the name of the returned column. The rest of the clauses of `JSON_value_column` have the same semantics here as they have for the `JSON_VALUE` function. For full information on these clauses, refer to `JSON_VALUE`. Also see "Using JSON_value_column: Example" for an example.

**JSON_nested_path**

Use this clause to flatten JSON values in a nested JSON object or JSON array into individual columns in a single row along with JSON values from the parent object or array. You can use this clause recursively to project data from multiple layers of nested objects or arrays into a single row.

Specify the `JSON_basic_path_expression` clause to match the nested object or array. This path expression is relative to the SQL/JSON row path expression specified in the `JSON_TABLE` function.

Use the `COLUMNS` clause to define the columns of the nested object or array to be returned. This clause is recursive—you can specify the `JSON_nested_path` clause within another `JSON_nested_path` clause. Also see "Using JSON_nested_path: Examples" for an example.
**ordinality_column**

This clause returns a column of generated row numbers of data type NUMBER. You can specify at most one ordinality_column. Also see "Using JSON_value_column: Example" for an example of using the ordinality_column clause.

**Examples**

**Creating a Table That Contains a JSON Document: Example**

This example shows how to create and populate table j_purchaseorder, which is used in the rest of the JSON_TABLE examples in this section.

The following statement creates table j_purchaseorder. Column po_document is for storing JSON data and, therefore, has an IS JSON check constraint to ensure that only well-formed JSON is stored in the column.

```
CREATE TABLE j_purchaseorder
    (id RAW (16) NOT NULL,
     date_loaded TIMESTAMP(6) WITH TIME ZONE,
     po_document CLOB CONSTRAINT ensure_json CHECK (po_document IS JSON));
```

The following statement inserts one row, or one JSON document, into table j_purchaseorder:

```
INSERT INTO j_purchaseorder
VALUES (
    SYS_GUID(),
    SYSTIMESTAMP,
    '{"PONumber" : 1600,
     "Reference" : "ABULL-20140421",
     "Requestor" : "Alexis Bull",
     "User" : "ABULL",
     "CostCenter" : "A50",
     "ShippingInstructions" : {"name" : "Alexis Bull",
                              "Address" : {"street" : "200 Sporting Green",
                                           "city" : "South San Francisco",
                                           "state" : "CA",
                                           "zipCode" : 99236,
                                           "country" : "United States of America"},
                              "Phone" : [{"type" : "Office", "number" : "909-555-7307"},
                                         {"type" : "Mobile", "number" : "415-555-1234"}],
     "Special Instructions" : null,
     "AllowPartialShipment" : true,
     "LineItems" : [{"ItemNumber" : 1,
                     "Part" : {"Description" : "One Magic Christmas",
                                "UnitPrice" : 19.95,
                                "UPCCode" : 13131092899},
                     "Quantity" : 9.0},
                    {"ItemNumber" : 2,
                     "Part" : {"Description" : "Lethal Weapon",
                                "UnitPrice" : 19.95,
                                "UPCCode" : 85391628927},
                     "Quantity" : 5.0}]}
);
```

**Using JSON_query_column: Example**

The statement in this example queries JSON data for a specific JSON property using the JSON_query_column clause, and returns the property value in a column.
The statement first applies a SQL/JSON row path expression to column `po_document`, which results in a match to the `ShippingInstructions` property. The `COLUMNS` clause then uses the `JSON_query_column` clause to return the `Phone` property value in a VARCHAR2(100) column.

```sql
SELECT jt.phones
FROM j_purchaseorder,
JSON_TABLE(po_document, '$.ShippingInstructions'
COLUMNS
  (phones VARCHAR2(100) FORMAT JSON PATH '$.Phone')) AS jt;
```

<table>
<thead>
<tr>
<th>PHONES</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;type&quot;:&quot;Office&quot;,&quot;number&quot;:&quot;909-555-7307&quot;], [&quot;type&quot;:&quot;Mobile&quot;,&quot;number&quot;:&quot;415-555-1234&quot;]</td>
</tr>
</tbody>
</table>

**Using JSON_value_column: Example**

The statement in this example refines the statement in the previous example by querying JSON data for specific JSON values using the `JSON_value_column` clause, and returns the JSON values as SQL values in relational rows and columns.

The statement first applies a SQL/JSON row path expression to column `po_document`, which results in a match to the elements in the JSON array `Phone`. These elements are JSON objects that contain two members named `type` and `number`. The statement uses the `COLUMNS` clause to return the `type` value for each object in a VARCHAR2(10) column called `phone_type`, and the `number` value for each object in a VARCHAR2(20) column called `phone_num`. The statement also returns an ordinal column named `row_number`.

```sql
SELECT jt.*
FROM j_purchaseorder,
JSON_TABLE(po_document, '$.ShippingInstructions.Phone[*]' COLUMNS
  (row_number FOR ORDINALITY,
   phone_type VARCHAR2(10) PATH '$.type',
   phone_num VARCHAR2(20) PATH '$.number')) AS jt;
```

<table>
<thead>
<tr>
<th>ROW_NUMBER</th>
<th>PHONE_TYPE</th>
<th>PHONE_NUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Office</td>
<td>909-555-7307</td>
</tr>
<tr>
<td>2</td>
<td>Mobile</td>
<td>415-555-1234</td>
</tr>
</tbody>
</table>

**Using JSON_exists_column: Examples**

The statements in this example test whether a JSON value exists in JSON data using the `JSON_exists_column` clause. The first example returns the result of the test as a 'true' or 'false' value in a column. The second example uses the result of the test in the `WHERE` clause.

The following statement first applies a SQL/JSON row path expression to column `po_document`, which results in a match to the entire context item, or JSON document. It then uses the `COLUMNS` clause to return the requestor's name and a string value of 'true' or 'false' indicating whether the JSON data for that requestor contains a zip code. The `COLUMNS` clause first uses the `JSON_value_column` clause to return the `Requestor` value in a VARCHAR2(32) column called `requestor`. It then uses the `JSON_exists_column` clause to determine if the `zipCode` object exists and returns the result in a VARCHAR2(5) column called `has_zip`.

```sql
SELECT requestor, has_zip
FROM j_purchaseorder,
```
The following statement is similar to the previous statement, except that it uses the value of `has_zip` in the WHERE clause to determine whether to return the `Requestor` value:

```sql
SELECT requestor
FROM j_purchaseorder,
JSON_TABLE(po_document, '$'
  COLUMNS
  (requestor VARCHAR2(32) PATH '$.Requestor',
   has_zip VARCHAR2(5) EXISTS PATH '$.ShippingInstructions.Address.zipCode'))
WHERE (has_zip = 'true');
```

<table>
<thead>
<tr>
<th>REQUESTOR</th>
<th>HAS ZIP</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alexis Bull</td>
<td>true</td>
</tr>
</tbody>
</table>

**Using JSON_nested_path: Examples**

The following two simple statements demonstrate the functionality of the `JSON_nested_path` clause. They operate on a simple JSON array that contains three elements. The first two elements are numbers. The third element is a nested JSON array that contains two string value elements.

The following statement does not use the `JSON_nested_path` clause. It returns the three elements in the array in a single row. The nested array is returned in its entirety.

```sql
SELECT *
FROM JSON_TABLE('[1,2,["a","b"]]', '$'
  COLUMNS (outer_value_0 NUMBER PATH '$[0]',
            outer_value_1 NUMBER PATH '$[1]',
            outer_value_2 VARCHAR2(20) FORMAT JSON PATH '$[2]'));
```

<table>
<thead>
<tr>
<th>OUTER_VALUE_0</th>
<th>OUTER_VALUE_1</th>
<th>OUTER_VALUE_2</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>[&quot;a&quot;,&quot;b&quot;]</td>
</tr>
</tbody>
</table>

The following statement is different from the previous statement because it uses the `JSON_nested_path` clause to return the individual elements of the nested array in individual columns in a single row along with the parent array elements.

```sql
SELECT *
FROM JSON_TABLE('[1,2,["a","b"]]', '$'
  COLUMNS (outer_value_0 NUMBER PATH '$[0]',
            outer_value_1 NUMBER PATH '$[1]',
            NESTED PATH '$[2]'
              COLUMNS (nested_value_0 VARCHAR2(1) PATH '$[0]',
                        nested_value_1 VARCHAR2(1) PATH '$[1]')));
```

<table>
<thead>
<tr>
<th>OUTER_VALUE_0</th>
<th>OUTER_VALUE_1</th>
<th>NESTED_VALUE_0</th>
<th>NESTED_VALUE_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
<td>a</td>
<td>b</td>
</tr>
</tbody>
</table>
The previous example shows how to use `JSON_nested_path` with a nested JSON array. The following example shows how to use the `JSON_nested_path` clause with a nested JSON object by returning the individual elements of the nested object in individual columns in a single row along with the parent object elements.

```sql
SELECT *
FROM JSON_TABLE('{a:100, b:200, c:{d:300, e:400}}', '$'
COLUMNS (outer_value_0 NUMBER PATH '$.a',
           outer_value_1 NUMBER PATH '$.b',
           NESTED PATH '$.c'
            COLUMNS (nested_value_0 NUMBER PATH '$.d',
                      nested_value_1 NUMBER PATH '$.e')));
```

<table>
<thead>
<tr>
<th>OUTER_VALUE_0</th>
<th>OUTER_VALUE_1</th>
<th>NESTED_VALUE_0</th>
<th>NESTED_VALUE_1</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>200</td>
<td>300</td>
<td>400</td>
</tr>
</tbody>
</table>

The following statement uses the `JSON_nested_path` clause when querying the `j_purchaseorder` table. It first applies a row path expression to column `po_document`, which results in a match to the entire context item, or JSON document. It then uses the `COLUMNS` clause to return the `Requestor` value in a `VARCHAR2(32)` column called `requestor`. It then uses the `JSON_nested_path` clause to return the property values of the individual objects in each member of the nested `Phone` array. Note that a row is generated for each member of the nested array, and each row contains the corresponding `Requestor` value.

```sql
SELECT jt.*
FROM j_purchaseorder,
     JSON_TABLE(po_document, '$'
                COLUMNS (requestor VARCHAR2(32) PATH '$.Requestor',
                         NESTED PATH '$.ShippingInstructions.Phone[*]'
                          COLUMNS (phone_type VARCHAR2(32) PATH '$.type',
                                   phone_num VARCHAR2(20) PATH '$.number')))
     AS jt;
```

<table>
<thead>
<tr>
<th>REQUESTOR</th>
<th>PHONE_TYPE</th>
<th>PHONE_NUM</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alexis Bull</td>
<td>Office</td>
<td>909-555-7307</td>
</tr>
<tr>
<td>Alexis Bull</td>
<td>Mobile</td>
<td>415-555-1234</td>
</tr>
</tbody>
</table>

### 7.106 JSON_VALUE

**Syntax**
Purpose
The SQL/JSON function `JSON_VALUE` finds a specified scalar JSON value in JSON data and returns it as a SQL value.
See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the value returned by this function when it is a character value.

`expr`

Use this clause to specify the JSON data to be evaluated. For `expr`, specify an expression that evaluates to a text literal. If `expr` is a column, then the column must be of data type `VARCHAR2`, `CLOB`, or `BLOB`. If `expr` is null, then the function returns null.

If `expr` is not a text literal of well-formed JSON data using strict or lax syntax, then the function returns null by default. You can use the `JSON_value_on_error_clause` to override this default behavior. Refer to the `JSON_value_on_error_clause`.

**FORMAT JSON**

You must specify `FORMAT JSON` if `expr` is a column of data type `BLOB`.

`JSON_basic_path_expression`

Use this clause to specify a SQL/JSON path expression. The function uses the path expression to evaluate `expr` and find a scalar JSON value that matches, or satisfies, the path expression. The path expression must be a text literal. See Oracle Database JSON Developer’s Guide for the full semantics of `JSON_basic_path_expression`.

`JSON_value_returning_clause`

Use this clause to specify the data type and format of the value returned by this function.

**RETURNING**

Use the `RETURNING` clause to specify the data type of the return value. If you omit this clause, then `JSON_VALUE` returns a value of type `VARCHAR2(4000)`.

You can use `JSON_value_return_type` to specify the following data types:

- `VARCHAR2([size [BYTE,CHAR]])`
  
  If you specify this data type, then the scalar value returned by this function can be a character or number value. A number value will be implicitly converted to a `VARCHAR2`. When specifying the `VARCHAR2` data type elsewhere in SQL, you are required to specify a size. However, in this clause you can omit the size. In this case, `JSON_VALUE` returns a value of type `VARCHAR2(4000)`.

- `NUMBER([precision [, scale]])`
  
  If you specify this data type, then the scalar value returned by this function must be a number value.

- `DATE`
  
  If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a `DATE` data type.

- `TIMESTAMP`
If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a `TIMESTAMP` data type.

- **TIMESTAMP WITH TIME ZONE**

  If you specify this data type, then the scalar value returned by this function must be a character value that can be implicitly converted to a `TIMESTAMP WITH TIME ZONE` data type.

- **SDO_GEOMETRY**

  This data type is used for Oracle Spatial and Graph data. If you specify this data type, then `expr` must evaluate to a text literal containing GeoJSON data, which is a format for encoding geographic data in JSON. If you specify this data type, then the scalar value returned by this function must be an object of type `SDO_GEOMETRY`.

Refer to "Data Types " for more information on the preceding data types.

If the data type is not large enough to hold the return value, then this function returns null by default. You can use the `JSON_value_on_error_clause` to override this default behavior. Refer to the `JSON_value_on_error_clause`.

**ASCII**

Specify ASCII to automatically escape any non-ASCII Unicode characters in the return value, using standard ASCII Unicode escape sequences.

**JSON_value_on_error_clause**

Use this clause to specify the value returned by this function when the following errors occur:

- `expr` is not well-formed JSON data using strict or lax JSON syntax
- A nonscalar value is found when the JSON data is evaluated using the SQL/JSON path expression
- No match is found when the JSON data is evaluated using the SQL/JSON path expression. You can override the behavior for this type of error by specifying the `JSON_value_on_empty_clause`.
- The return value data type is not large enough to hold the return value

You can specify the following clauses:

- **NULL ON ERROR** - Returns null when an error occurs. This is the default.
- **ERROR ON ERROR** - Returns the appropriate Oracle error when an error occurs.
- **DEFAULT literal ON ERROR** - Returns literal when an error occurs. The data type of literal must match the data type of the value returned by this function.

**JSON_value_on_empty_clause**

Use this clause to specify the value returned by this function if no match is found when the JSON data is evaluated using the SQL/JSON path expression. This clause allows you to specify a different outcome for this type of error than the outcome specified with the `JSON_value_on_error_clause`.

You can specify the following clauses:

- **NULL ON EMPTY** - Returns null when no match is found.
• **ERROR ON EMPTY** - Returns the appropriate Oracle error when no match is found.

• **DEFAULT literal ON EMPTY** - Returns `literal` when no match is found. The data type of `literal` must match the data type of the value returned by this function.

If you omit this clause, then the `JSON_value_on_error_clause` determines the value returned when no match is found.

### Examples

The following query returns the value of the member with property name `a`. Because the **RETURNING** clause is not specified, the value is returned as a `VARCHAR2(4000)` data type:

```sql
SELECT JSON_VALUE('{a:100}', '$.a') AS value
FROM DUAL;
```

<table>
<thead>
<tr>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
</tr>
</tbody>
</table>

The following query returns the value of the member with property name `a`. Because the **RETURNING NUMBER** clause is specified, the value is returned as a `NUMBER` data type:

```sql
SELECT JSON_VALUE('{a:100}', '$.a' RETURNING NUMBER) AS value
FROM DUAL;
```

<table>
<thead>
<tr>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
</tr>
</tbody>
</table>

The following query returns the value of the member with property name `b`, which is in the value of the member with property name `a`:

```sql
SELECT JSON_VALUE('{a:{b:100}}', '$.a.b') AS value
FROM DUAL;
```

<table>
<thead>
<tr>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
</tr>
</tbody>
</table>

The following query returns the value of the member with property name `d` in any object:

```sql
SELECT JSON_VALUE('{a:{b:100}, c:{d:200}, e:{f:300}}', '$.*.d') AS value
FROM DUAL;
```

<table>
<thead>
<tr>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>200</td>
</tr>
</tbody>
</table>

The following query returns the value of the first element in an array:

```sql
SELECT JSON_VALUE('[0, 1, 2, 3]', '[$0]') AS value
FROM DUAL;
```

<table>
<thead>
<tr>
<th>VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>
The following query returns the value of the third element in an array. The array is the value of the member with property name a.

```
SELECT JSON_VALUE('{a:[5, 10, 15, 20]}', '$.a[2]') AS value
FROM DUAL;
```

```
VALUE
-----
15
```

The following query returns the value of the member with property name a in the second object in an array:

```
SELECT JSON_VALUE('[{a:100}, {a:200}, {a:300}]', '$[1].a') AS value
FROM DUAL;
```

```
VALUE
-----
200
```

The following query returns the value of the member with property name c in any object in an array:

```
SELECT JSON_VALUE('[{a:100}, {b:200}, {c:300}]', '$[*].c') AS value
FROM DUAL;
```

```
VALUE
-----
300
```

The following query attempts to return the value of the member that has property name lastname. However, such a member does not exist in the specified JSON data, resulting in no match. Because the ON ERROR clause is not specified, the statement uses the default NULL ON ERROR and returns null.

```
SELECT JSON_VALUE('{firstname:"John"}', '$.lastname') AS "Last Name"
FROM DUAL;
```

```
Last Name
---------
```

The following query results in an error because it attempts to return the value of the member with property name lastname, which does not exist in the specified JSON. Because the ON ERROR clause is specified, the statement returns the specified text literal.

```
SELECT JSON_VALUE('{firstname:"John"}', '$.lastname'
DEFAULT 'No last name found' ON ERROR) AS "Last Name"
FROM DUAL;
```

```
Last Name
---------
No last name found
```
7.107 LAG

Syntax

OVER (query_partition_clause order_by_clause)

LAG
( value_expr
, offset
, default
)
RESPECT
IGNORE
NULLS
( value_expr
RESPECT
IGNORE
NULLS
, offset
, default
)

Purpose

LAG is an analytic function. It provides access to more than one row of a table at the same time without a self join. Given a series of rows returned from a query and a position of the cursor, LAG provides access to a row at a given physical offset prior to that position.

For the optional offset argument, specify an integer that is greater than zero. If you do not specify offset, then its default is 1. The optional default value is returned if the offset goes beyond the scope of the window. If you do not specify default, then its default is null.

{RESPECT | IGNORE} NULLS determines whether null values of value_expr are included in or eliminated from the calculation. The default is RESPECT NULLS.

You cannot nest analytic functions by using LAG or any other analytic function for value_expr. However, you can use other built-in function expressions for value_expr.

See Also:

• “About SQL Expressions” for information on valid forms of expr and LEAD
• Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of LAG when it is a character value
Examples

The following example provides, for each purchasing clerk in the employees table, the salary of the employee hired just before:

```
SELECT hire_date, last_name, salary, 
    LAG(salary, 1, 0) OVER (ORDER BY hire_date) AS prev_sal
FROM employees
WHERE job_id = 'PU_CLERK'
ORDER BY hire_date;
```

<table>
<thead>
<tr>
<th>HIRE_DATE</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>PREV_SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>18-MAY-03</td>
<td>Khoo</td>
<td>3100</td>
<td>0</td>
</tr>
<tr>
<td>24-JUL-05</td>
<td>Tobias</td>
<td>2800</td>
<td>3100</td>
</tr>
<tr>
<td>24-DEC-05</td>
<td>Baida</td>
<td>2900</td>
<td>2800</td>
</tr>
<tr>
<td>15-NOV-06</td>
<td>Himuro</td>
<td>2600</td>
<td>2900</td>
</tr>
<tr>
<td>10-AUG-07</td>
<td>Colmenares</td>
<td>2500</td>
<td>2600</td>
</tr>
</tbody>
</table>

7.108 LAST

Syntax

```
last::=
```

```
  aggregate_function
      KEEP
          ( DENSE_RANK LAST ORDER BY expr
               DESC
               ASC
               NULLS
               FIRST
               LAST
          ,
      )
  OVER (query_partition_clause)
```

See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions of the `query_partitioning_clause`

Purpose

`FIRST` and `LAST` are very similar functions. Both are aggregate and analytic functions that operate on a set of values from a set of rows that rank as the `FIRST` or `LAST` with respect to a given sorting specification. If only one row ranks as `FIRST` or `LAST`, then the aggregate operates on the set with only one element.

Refer to `FIRST` for complete information on this function and for examples of its use.
7.109 LAST_DAY

Syntax

```
LAST_DAY(date)
```

Purpose

LAST_DAY returns the date of the last day of the month that contains date. The last day of the month is defined by the session parameter NLS_CALENDAR. The return type is always DATE, regardless of the data type of date.

Examples

The following statement determines how many days are left in the current month.

```
SELECT SYSDATE,
       LAST_DAY(SYSDATE) "Last",
       LAST_DAY(SYSDATE) - SYSDATE "Days Left"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>SYSDATE</th>
<th>Last</th>
<th>Days Left</th>
</tr>
</thead>
<tbody>
<tr>
<td>30-MAY-09</td>
<td>31-MAY-09</td>
<td>1</td>
</tr>
</tbody>
</table>

The following example adds 5 months to the hire date of each employee to give an evaluation date:

```
SELECT last_name, hire_date,
       TO_CHAR(ADD_MONTHS(LAST_DAY(hire_date), 5)) "Eval Date"
FROM employees
ORDER BY last_name, hire_date;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>HIRE_DATE</th>
<th>Eval Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abel</td>
<td>11-MAY-04</td>
<td>31-OCT-04</td>
</tr>
<tr>
<td>Ande</td>
<td>24-MAR-08</td>
<td>31-AUG-08</td>
</tr>
<tr>
<td>Atkinson</td>
<td>30-OCT-05</td>
<td>31-MAR-06</td>
</tr>
<tr>
<td>Austin</td>
<td>25-JUN-05</td>
<td>30-NOV-05</td>
</tr>
<tr>
<td>Baer</td>
<td>07-JUN-02</td>
<td>30-NOV-02</td>
</tr>
<tr>
<td>Baida</td>
<td>24-DEC-05</td>
<td>31-MAY-06</td>
</tr>
<tr>
<td>Banda</td>
<td>21-APR-08</td>
<td>30-SEP-08</td>
</tr>
<tr>
<td>Bates</td>
<td>24-MAR-07</td>
<td>31-AUG-07</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### 7.110 LAST_VALUE

**Syntax**

![Syntax Diagram]

- `LAST_VALUE(expr)`
- `RESPECT NULLS` or `IGNORE NULLS`
- `OVER (analytic_clause)`

**See Also:**

"Analytic Functions" for information on syntax, semantics, and restrictions, including valid forms of `expr`.

**Purpose**

`LAST_VALUE` is an analytic function that is useful for data densification. It returns the last value in an ordered set of values.

**Note:**

The two forms of this syntax have the same behavior. The top branch is the ANSI format, which Oracle recommends for ANSI compatibility.

- `{RESPECT | IGNORE} NULLS` determines whether null values of `expr` are included in or eliminated from the calculation. The default is `RESPECT NULLS`. If the last value in the set is null, then the function returns `NULL` unless you specify `IGNORE NULLS`. If you specify `IGNORE NULLS`, then `LAST_VALUE` returns the last non-null value in the set, or `NULL` if all values are null. Refer to "Using Partitioned Outer Joins: Examples" for an example of data densification.

You cannot nest analytic functions by using `LAST_VALUE` or any other analytic function for `expr`. However, you can use other built-in function expressions for `expr`. Refer to "About SQL Expressions" for information on valid forms of `expr`.

If you omit the `windowing_clause` of the `analytic_clause`, it defaults to `RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW`. This default sometimes returns an unexpected value, because the last value in the window is at the bottom of the window, which is not fixed. It keeps changing as the current row changes. For expected results, specify the `windowing_clause` as `RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING`. Alternatively, you can specify the `windowing_clause` as `RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING.`
See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Examples

The following example returns, for each row, the hire date of the employee earning the lowest salary:

```sql
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
       OVER (ORDER BY salary DESC ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER BY hire_date);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>13-JAN-01</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>13-JAN-01</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>13-JAN-01</td>
</tr>
</tbody>
</table>

This example illustrates the nondeterministic nature of the LAST_VALUE function. Kochhar and De Haan have the same salary, so they are in adjacent rows. Kochhar appears first because the rows in the subquery are ordered by hire_date. However, if the rows are ordered by hire_date in descending order, as in the next example, then the function returns a different value:

```sql
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
       OVER (ORDER BY salary DESC ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER BY hire_date DESC);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>21-SEP-05</td>
</tr>
</tbody>
</table>

The following two examples show how to make the LAST_VALUE function deterministic by ordering on a unique key. By ordering within the function by both salary and the unique key employee_id, you can ensure the same result regardless of the ordering in the subquery.

```sql
SELECT employee_id, last_name, salary, hire_date,
       LAST_VALUE(hire_date)
       OVER (ORDER BY salary DESC, employee_id ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
       WHERE department_id = 90
       ORDER BY hire_date);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>21-SEP-05</td>
</tr>
</tbody>
</table>
### LAST_VALUE

The following two examples show that the `LAST_VALUE` function is deterministic when you use a logical offset (`RANGE` instead of `ROWS`). When duplicates are found for the `ORDER BY expression`, the `LAST_VALUE` is the highest value of `expr`:

```sql
SELECT employee_id, last_name, salary, hire_date,
LAST_VALUE(hire_date)
OVER (ORDER BY salary DESC, employee_id ROWS BETWEEN UNBOUNDED PRECEDING
AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date DESC);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>13-JAN-01</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>13-JAN-01</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>13-JAN-01</td>
</tr>
</tbody>
</table>

```sql
SELECT employee_id, last_name, salary, hire_date,
LAST_VALUE(hire_date)
OVER (ORDER BY salary DESC, employee_id RANGE BETWEEN UNBOUNDED PRECEDING
AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date DESC);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>21-SEP-05</td>
</tr>
</tbody>
</table>

```sql
SELECT employee_id, last_name, salary, hire_date,
LAST_VALUE(hire_date)
OVER (ORDER BY salary DESC, employee_id RANGE BETWEEN UNBOUNDED PRECEDING
AND UNBOUNDED FOLLOWING) AS lv
FROM (SELECT * FROM employees
WHERE department_id = 90
ORDER BY hire_date DESC);
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>HIRE_DATE</th>
<th>LV</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>King</td>
<td>24000</td>
<td>17-JUN-03</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>17000</td>
<td>13-JAN-01</td>
<td>21-SEP-05</td>
</tr>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>17000</td>
<td>21-SEP-05</td>
<td>21-SEP-05</td>
</tr>
</tbody>
</table>
7.111 LEAD

Syntax

\[
\text{LEAD} \left( \text{value_expr}, \text{offset}, \text{default} \right) \text{ RESPECT \overline{IGNORE} NULLS (value_expr \text{ RESPECT \overline{IGNORE} NULLS}, \text{offset}, \text{default}) OVER (query_partition_clause \text{ order_by_clause})}
\]

See Also:

“Analytic Functions” for information on syntax, semantics, and restrictions, including valid forms of `value_expr`

Purpose

`LEAD` is an analytic function. It provides access to more than one row of a table at the same time without a self join. Given a series of rows returned from a query and a position of the cursor, `LEAD` provides access to a row at a given physical offset beyond that position.

If you do not specify `offset`, then its default is 1. The optional `default` value is returned if the offset goes beyond the scope of the table. If you do not specify `default`, then its default value is null.

\{\text{RESPECT | IGNORE}\} \text{ NULLS} determines whether null values of `value_expr` are included in or eliminated from the calculation. The default is \text{RESPECT NULLS}.

You cannot nest analytic functions by using `LEAD` or any other analytic function for `value_expr`. However, you can use other built-in function expressions for `value_expr`.

See Also:

• “About SQL Expressions” for information on valid forms of `expr` and `LAG`
• Appendix C in `Oracle Database Globalization Support Guide` for the collation derivation rules, which define the collation assigned to the return value of `LEAD` when it is a character value
Examples

The following example provides, for each employee in Department 30 in the employees table, the hire date of the employee hired just after:

```sql
SELECT hire_date, last_name,
       LEAD(hire_date, 1) OVER (ORDER BY hire_date) AS "NextHired"
FROM employees
WHERE department_id = 30
ORDER BY hire_date;
```

<table>
<thead>
<tr>
<th>HIRE_DATE</th>
<th>LAST_NAME</th>
<th>Next Hired</th>
</tr>
</thead>
<tbody>
<tr>
<td>07-DEC-02</td>
<td>Raphaely</td>
<td>18-MAY-03</td>
</tr>
<tr>

</table>

7.112 LEAST

Syntax

```
LEAST(expr)
```

Purpose

LEAST returns the least of a list of one or more expressions. Oracle Database uses the first `expr` to determine the return type. If the first `expr` is numeric, then Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type before the comparison, and returns that data type. If the first `expr` is not numeric, then each `expr` after the first is implicitly converted to the data type of the first `expr` before the comparison.

Oracle Database compares each `expr` using nonpadded comparison semantics. The comparison is binary by default and is linguistic if the `NLS_COMP` parameter is set to `LINGUISTIC` and the `NLS_SORT` parameter has a setting other than `BINARY`. Character comparison is based on the numerical codes of the characters in the database character set and is performed on whole strings treated as one sequence of bytes, rather than character by character. If the value returned by this function is character data, then its data type is `VARCHAR2` if the first `expr` is a character data type and `NVARCHAR2` if the first `expr` is a national character data type.
Examples

The following statement selects the string with the least value:

```sql
SELECT LEAST('HARRY','HARRIOT','HAROLD') "Least"
FROM DUAL;
```

```
Least
-----
HAROLD
```

In the following statement, the first argument is numeric. Oracle Database determines that the argument with the highest numeric precedence is the third argument, converts the remaining arguments to the data type of the third argument, and returns the least value as that data type:

```sql
SELECT LEAST (1, '2.1', '.000832') "Least"
FROM DUAL;
```

```
Least
-----
.000832
```

## 7.113 LENGTH

### Syntax

```
length ::= ...
```
Purpose

The **LENGTH** functions return the length of `char`. **LENGTH** calculates length using characters as defined by the input character set. **LENGTHB** uses bytes instead of characters. **LENGTHC** uses Unicode complete characters. **LENGTH2** uses UCS2 code points. **LENGTH4** uses UCS4 code points.

`char` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The exceptions are **LENGTHC**, **LENGTH2**, and **LENGTH4**, which do not allow `char` to be a `CLOB` or `NCLOB`. The return value is of data type `NUMBER`. If `char` has data type `CHAR`, then the length includes all trailing blanks. If `char` is null, then this function returns null.

Restriction on **LENGTHB**

The **LENGTHB** function is supported for single-byte LOBs only. It cannot be used with `CLOB` and `NCLOB` data in a multibyte character set.

Examples

The following example uses the **LENGTH** function using a single-byte database character set:

```
SELECT LENGTH('CANDIDE') "Length in characters"
FROM DUAL;
```

Length in characters
---------------------
7

The next example assumes a double-byte database character set.

```
SELECT LENGTHB ('CANDIDE') "Length in bytes"
FROM DUAL;
```

Length in bytes
---------------
14

### 7.114 LISTAGG

**Syntax**

```
LISTAGG ( ALL | measure_expr [ delimiter ] listagg_overflow_clause )
WITHIN GROUP ( order_by_clause )
OVER ( query_partition_clause )
```

(listagg_overflow_clause::=, order_by_clause::=, query_partition_clause::=)
**listagg_overflow_clause::=**

- **ON OVERFLOW ERROR**
- **ON OVERFLOW TRUNCATE**
- **truncation-indicator**
- **WITH**
- **WITHOUT**
- **COUNT**

> **See Also:**

"Analytic Functions " for information on syntax, semantics, and restrictions of the `ORDER BY` clause and `OVER` clause

## Purpose

For a specified measure, `LISTAGG` orders data within each group specified in the `ORDER BY` clause and then concatenates the values of the measure column.

- **As a single-set aggregate function,** `LISTAGG` operates on all rows and returns a single output row.
- **As a group-set aggregate,** the function operates on and returns an output row for each group defined by the `GROUP BY` clause.
- **As an analytic function,** `LISTAGG` partitions the query result set into groups based on one or more expression in the `query_partition_clause`.

The arguments to the function are subject to the following rules:

- The **ALL** keyword is optional and is provided for semantic clarity.
- The **measure_expr** is the measure column and can be any expression. Null values in the measure column are ignored.
- The **delimiter** designates the string that is to separate the measure column values. This clause is optional and defaults to `NULL`. If `measure_expr` is of type `RAW`, then the delimiter must be of type `RAW`. You can achieve this by specifying the delimiter as a character string that can be implicitly converted to `RAW`, or by explicitly converting the delimiter to `RAW`, for example, using the `UTL_RAW.CAST_TO_RAW` function.
- The **order_by_clause** determines the order in which the concatenated values are returned. The function is deterministic only if the `ORDER BY` column list achieved unique ordering.

If the measure column is of type `RAW`, then the return data type is `RAW`. Otherwise, the return data type is `VARCHAR2`.

The maximum length of the return data type depends on the value of the `MAX_STRING_SIZE` initialization parameter. If `MAX_STRING_SIZE = EXTENDED`, then the maximum length is 32767 bytes for the `VARCHAR2` and `RAW` data types. If `MAX_STRING_SIZE = STANDARD`, then the maximum length is 4000 bytes for the
VARCHAR2 data type and 2000 bytes for the RAW data type. A final delimiter is not included when determining if the return value fits in the return data type.

See Also:

• **Extended Data Types** for more information on the MAX_STRING_SIZE initialization parameter
• Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of LISTAGG

**listagg_overflow_clause**

This clause controls how the function behaves when the return value exceeds the maximum length of the return data type.

**ON OVERFLOW ERROR** If you specify this clause, then the function returns an ORA-01489 error. This is the default.

**ON OVERFLOW TRUNCATE** If you specify this clause, then the function returns a truncated list of measure values.

• The truncation_indicator designates the string that is to be appended to the truncated list of measure values. If you omit this clause, then the truncation indicator is an ellipsis (...).

  If measure_expr is of type RAW, then the truncation indicator must be of type RAW. You can achieve this by specifying the truncation indicator as a character string that can be implicitly converted to RAW, or by explicitly converting the truncation indicator to RAW, for example, using the UTL_RAW.CAST_TO_RAW function.

• If you specify WITH COUNT, then after the truncation indicator, the database appends the number of truncated values, enclosed in parentheses. In this case, the database truncates enough measure values to allow space in the return value for a final delimiter, the truncation indicator, and 24 characters for the number value enclosed in parentheses.

• If you specify WITHOUT COUNT, then the database omits the number of truncated values from the return value. In this case, the database truncates enough measure values to allow space in the return value for a final delimiter and the truncation indicator.

If you do not specify WITH COUNT or WITHOUT COUNT, then the default is WITH COUNT.

**Aggregate Examples**

The following single-set aggregate example lists all of the employees in Department 30 in the hr.employees table, ordered by hire date and last name:

```sql
SELECT LISTAGG(last_name, '; ') WITHIN GROUP (ORDER BY hire_date, last_name) "Emp_list",
       MIN(hire_date) "Earliest"
FROM employees
WHERE department_id = 30;
```

<table>
<thead>
<tr>
<th>Emp_list</th>
<th>Earliest</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The following group-set aggregate example lists, for each department ID in the hr.employees table, the employees in that department in order of their hire date:

```sql
SELECT department_id "Dept.",
       LISTAGG(last_name, '; ') WITHIN GROUP (ORDER BY hire_date) "Employees"
FROM employees
GROUP BY department_id
ORDER BY department_id;
```

<table>
<thead>
<tr>
<th>Dept.</th>
<th>Employees</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Whalen</td>
</tr>
<tr>
<td>20</td>
<td>Hartstein; Fay</td>
</tr>
<tr>
<td>30</td>
<td>Raphaely; Khoo; Tobias; Baida; Himuro; Colmenares</td>
</tr>
<tr>
<td>40</td>
<td>Mavris</td>
</tr>
<tr>
<td>50</td>
<td>Kaufling; Ladwig; Rajs; Sarchand; Bell; Mallin; Weiss; Davie; Marlow; Bull; Everett; Fripp; Chung; Nayer; Dilly; Bisson; Vollman; Stiles; Atkinson; Taylor; Seo; Fleaur; Mats; Pat; Walsh; Feeney; Dellingher; McCain; Vargas; Gates; Rogers; Mikkilineni; Landry; Cabrio; Jones; Olson; O'Connell; Sullivan; Mourgos; Gee; Perkins; Grant; Geoni; Philtanker; Markle</td>
</tr>
<tr>
<td>60</td>
<td>Austin; Hunold; Pataballa; Lorentz; Ernst</td>
</tr>
<tr>
<td>70</td>
<td>Baer</td>
</tr>
</tbody>
</table>

The following example is identical to the previous example, except it contains the ON OVERFLOW TRUNCATE clause. For the purpose of this example, assume that the maximum length of the return value is an artificially small number of 200 bytes. Because the list of employees for department 50 exceeds 200 bytes, the list is truncated and appended with a final delimiter '; ', the specified truncation indicator '...', and the number of truncated values '(23)'.

```sql
SELECT department_id "Dept.",
       LISTAGG(last_name, '; ' ON OVERFLOW TRUNCATE '...') WITHIN GROUP (ORDER BY hire_date) "Employees"
FROM employees
GROUP BY department_id
ORDER BY department_id;
```

<table>
<thead>
<tr>
<th>Dept.</th>
<th>Employees</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Whalen</td>
</tr>
<tr>
<td>20</td>
<td>Hartstein; Fay</td>
</tr>
<tr>
<td>30</td>
<td>Raphaely; Khoo; Tobias; Baida; Himuro; Colmenares</td>
</tr>
<tr>
<td>40</td>
<td>Mavris</td>
</tr>
<tr>
<td>50</td>
<td>Kaufling; Ladwig; Rajs; Sarchand; Bell; Mallin; Weiss; Davie; Marlow; Bull; Everett; Fripp; Chung; Nayer; Dilly; Bisson; Vollman; Stiles; Atkinson; Taylor; Seo; Fleaur; ... (23)</td>
</tr>
<tr>
<td>60</td>
<td>Austin; Hunold; Pataballa; Lorentz; Ernst</td>
</tr>
<tr>
<td>70</td>
<td>Baer</td>
</tr>
</tbody>
</table>

**Analytic Example**

The following analytic example shows, for each employee hired earlier than September 1, 2003, the employee's department, hire date, and all other employees in that department also hired before September 1, 2003:
SELECT department_id "Dept", hire_date "Date", last_name "Name",
    LISTAGG(last_name, '; ') WITHIN GROUP (ORDER BY hire_date, last_name)
    OVER (PARTITION BY department_id) as "Emp_list"
FROM employees
WHERE hire_date < '01-SEP-2003'
ORDER BY "Dept", "Date", "Name";

<table>
<thead>
<tr>
<th>Dept</th>
<th>Date</th>
<th>Name</th>
<th>Emp_list</th>
</tr>
</thead>
<tbody>
<tr>
<td>30</td>
<td>07-DEC-02</td>
<td>Raphaely</td>
<td>Raphaely; Khoo</td>
</tr>
<tr>
<td>30</td>
<td>18-MAY-03</td>
<td>Khoo</td>
<td>Raphaely; Khoo</td>
</tr>
<tr>
<td>40</td>
<td>07-JUN-02</td>
<td>Mavris</td>
<td>Mavris</td>
</tr>
<tr>
<td>50</td>
<td>01-MAY-03</td>
<td>Kaufling</td>
<td>Kaufling; Ladwig</td>
</tr>
<tr>
<td>50</td>
<td>14-JUL-03</td>
<td>Ladwig</td>
<td>Kaufling; Ladwig</td>
</tr>
<tr>
<td>70</td>
<td>07-JUN-02</td>
<td>Baer</td>
<td>Baer</td>
</tr>
<tr>
<td>90</td>
<td>13-JAN-01</td>
<td>De Haan</td>
<td>De Haan; King</td>
</tr>
<tr>
<td>90</td>
<td>17-JUN-03</td>
<td>King</td>
<td>De Haan; King</td>
</tr>
<tr>
<td>100</td>
<td>16-AUG-02</td>
<td>Faviet</td>
<td>Faviet; Greenberg</td>
</tr>
<tr>
<td>100</td>
<td>17-AUG-02</td>
<td>Greenberg</td>
<td>Faviet; Greenberg</td>
</tr>
<tr>
<td>110</td>
<td>07-JUN-02</td>
<td>Gietz</td>
<td>Gietz; Higgins</td>
</tr>
<tr>
<td>110</td>
<td>07-JUN-02</td>
<td>Higgins</td>
<td>Gietz; Higgins</td>
</tr>
</tbody>
</table>

7.115 LN

Syntax

\[
\text{\textbf{LN}}(\text{n})
\]

Purpose

\(\text{LN}\) returns the natural logarithm of \(n\), where \(n\) is greater than 0.

This function takes as an argument any numeric data type or any nonnumeric data
type that can be implicitly converted to a numeric data type. If the argument is
\text{BINARY\_FLOAT}, then the function returns \text{BINARY\_DOUBLE}. Otherwise the function
returns the same numeric data type as the argument.

See Also:

\[\text{Table 2-8}\] for more information on implicit conversion

Examples

The following example returns the natural logarithm of 95:

SELECT \text{LN}(95) "Natural log of 95"
FROM DUAL;

Natural log of 95
-----------------  
\[4.55387689\]
7.116 LNNVL

Syntax

```
LNNVL ( condition )
```

Purpose

LNNVL provides a concise way to evaluate a condition when one or both operands of the condition may be null. The function can be used in the WHERE clause of a query, or as the WHEN condition in a searched CASE expression. It takes as an argument a condition and returns TRUE if the condition is FALSE or UNKNOWN and FALSE if the condition is TRUE. LNNVL can be used anywhere a scalar expression can appear, even in contexts where the IS [NOT] NULL, AND, or OR conditions are not valid but would otherwise be required to account for potential nulls.

Oracle Database sometimes uses the LNNVL function internally in this way to rewrite NOT IN conditions as NOT EXISTS conditions. In such cases, output from EXPLAIN PLAN shows this operation in the plan table output. The condition can evaluate any scalar values but cannot be a compound condition containing AND, OR, or BETWEEN.

The table that follows shows what LNNVL returns given that a = 2 and b is null.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Truth of Condition</th>
<th>LNNVL Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>a = 1</td>
<td>FALSE</td>
<td>TRUE</td>
</tr>
<tr>
<td>a = 2</td>
<td>TRUE</td>
<td>FALSE</td>
</tr>
<tr>
<td>a IS NULL</td>
<td>FALSE</td>
<td>TRUE</td>
</tr>
<tr>
<td>b = 1</td>
<td>UNKNOWN</td>
<td>TRUE</td>
</tr>
<tr>
<td>b IS NULL</td>
<td>TRUE</td>
<td>FALSE</td>
</tr>
<tr>
<td>a = b</td>
<td>UNKNOWN</td>
<td>TRUE</td>
</tr>
</tbody>
</table>

Examples

Suppose that you want to know the number of employees with commission rates of less than 20%, including employees who do not receive commissions. The following query returns only employees who actually receive a commission of less than 20%:

```sql
SELECT COUNT(*)
FROM employees
WHERE commission_pct < .2;
```

```
COUNT(*)
----------
   11
```

To include the 72 employees who receive no commission at all, you could rewrite the query using the LNNVL function as follows:

```sql
SELECT COUNT(*)
FROM employees
```
WHERE LNNVL(commission_pct >= .2);

COUNT(*)
----------
     83

7.117 LOCALTIMESTAMP

Syntax

```
LOCALTIMESTAMP {timestamp_precision}
```

Purpose

LOCALTIMESTAMP returns the current date and time in the session time zone in a value of data type TIMESTAMP. The difference between this function and CURRENT_TIMESTAMP is that LOCALTIMESTAMP returns a TIMESTAMP value while CURRENT_TIMESTAMP returns a TIMESTAMP WITH TIME ZONE value.

The optional argument `timestamp_precision` specifies the fractional second precision of the time value returned.

See Also:

```
CURRENT_TIMESTAMP , "TIMESTAMP Data Type ", and "TIMESTAMP WITH TIME ZONE Data Type "
```

Examples

This example illustrates the difference between LOCALTIMESTAMP and CURRENT_TIMESTAMP:

```
ALTER SESSION SET TIME_ZONE = '-5:00';
SELECT CURRENT_TIMESTAMP, LOCALTIMESTAMP FROM DUAL;

CURRENT_TIMESTAMP                    LOCALTIMESTAMP
-------------------------------------------------------------------
04-APR-00 01.27.18.999220 PM -05:00  04-APR-00 01.27.19 PM

ALTER SESSION SET TIME_ZONE = '-8:00';
SELECT CURRENT_TIMESTAMP, LOCALTIMESTAMP FROM DUAL;

CURRENT_TIMESTAMP                    LOCALTIMESTAMP
-----------------------------------  ------------------------------
04-APR-00 10.27.45.132474 AM -08:00  04-APR-00 10.27.451 AM
```

When you use the LOCALTIMESTAMP with a format mask, take care that the format mask matches the value returned by the function. For example, consider the following table:

```
CREATE TABLE local_test (col1 TIMESTAMP WITH LOCAL TIME ZONE);
```
The following statement fails because the mask does not include the `TIME ZONE` portion of the return type of the function:

```sql
INSERT INTO local_test
VALUES (TO_TIMESTAMP(LOCALTIMESTAMP, 'DD-MON-RR HH.MM.SSXFF'));
```

The following statement uses the correct format mask to match the return type of `LOCALTIMESTAMP`:

```sql
INSERT INTO local_test
VALUES (TO_TIMESTAMP(LOCALTIMESTAMP, 'DD-MON-RR HH.MM.SSXFF PM'));
```

### 7.118 LOG

**Syntax**

```sql
LOG (n2, n1)
```

**Purpose**

`LOG` returns the logarithm, base `n2`, of `n1`. The base `n2` can be any positive value other than 0 or 1 and `n1` can be any positive value.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is `BINARY_FLOAT` or `BINARY_DOUBLE`, then the function returns `BINARY_DOUBLE`. Otherwise the function returns `NUMBER`.

**See Also:**

- Table 2-8 for more information on implicit conversion

**Examples**

The following example returns the log of 100:

```sql
SELECT LOG(10,100) "Log base 10 of 100"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Log base 10 of 100</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
</tr>
</tbody>
</table>

### 7.119 LOWER

**Syntax**

```sql
LOWER(char)
```

**Examples**
Purpose

LOWER returns char, with all letters lowercase. char can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The return value is the same data type as char. The database sets the case of the characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive lowercase, refer to NLS_LOWER.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of LOWER.

Examples

The following example returns a string in lowercase:

```
SELECT LOWER('MR. SCOTT MCMILLAN') "Lowercase"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Lowercase</th>
<th>-----------------</th>
</tr>
</thead>
<tbody>
<tr>
<td>mr. scott mcmillan</td>
<td></td>
</tr>
</tbody>
</table>

7.120 LPAD

Syntax

```
LPAD(expr1, n, expr2)
```

Purpose

LPAD returns expr1, left-padded to length n characters with the sequence of characters in expr2. This function is useful for formatting the output of a query.

Both expr1 and expr2 can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if expr1 is a character data type, NVARCHAR2 if expr1 is a national character data type, and a LOB if expr1 is a LOB data type. The string returned is in the same character set as expr1. The argument n must be a NUMBER integer or a value that can be implicitly converted to a NUMBER integer.

If you do not specify expr2, then the default is a single blank. If expr1 is longer than n, then this function returns the portion of expr1 that fits in n.

The argument n is the total length of the return value as it is displayed on your terminal screen. In most character sets, this is also the number of characters in the return value. However, in some multibyte character sets, the display length of a character string can differ from the number of characters in the string.
Examples

The following example left-pads a string with the asterisk (*) and period (.) characters:

```sql
SELECT LPAD('Page 1',15,'*.') "LPAD example"
FROM DUAL;
```

LPAD example
---------------

```
*.*.*.*.*Page 1
```

7.121 LTRIM

Syntax

```
LTRIM ( char
, set
)
```

Purpose

LTRIM removes from the left end of char all of the characters contained in set. If you do not specify set, then it defaults to a single blank. Oracle Database begins scanning char from its first character and removes all characters that appear in set until reaching a character not in set and then returns the result.

Both char and set can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if char is a character data type, NVARCHAR2 if char is a national character data type, and a LOB if char is a LOB data type.

See Also:

- RTRIM
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation assigned to the character return value of this function
Examples

The following example trims all the left-most occurrences of less than sign (<), greater than sign (>) , and equal sign (=) from a string:

```
SELECT LTRIM('<<<<BROWNING>>>>', '=<') "LTRIM Example"
FROM DUAL;
```

LTRIM Example
---------------
BROWNING<<<<>

7.122 MAKE_REF

Syntax

```
MAKE_REF (view, key)
```

Purpose

MAKE_REF creates a REF to a row of an object view or a row in an object table whose object identifier is primary key based. This function is useful, for example, if you are creating an object view

See Also:

Oracle Database Object-Relational Developer's Guide for more information about object views and DEREF

Examples

The sample schema oe contains an object view oc_inventories based on inventory_typ. The object identifier is product_id. The following example creates a REF to the row in the oc_inventories object view with a product_id of 3003:

```
SELECT MAKE_REF (oc_inventories, 3003)
FROM DUAL;
```

```
MAKE_REF(OC_INVENTORIES,3003)
---------------------------------------------------------------
00004A03B8A0046857C146171411109EE034080020B2543600000014260100010001
00290099060002A00078401FE000000000B03C21F040000000000000000000000
0000000000
```
MAX

Syntax

MAX(DISTINCT ALL expr) OVER (analytic_clause)

See Also:
"Analytic Functions" for information on syntax, semantics, and restrictions

Purpose

MAX returns maximum value of expr. You can use it as an aggregate or analytic function.

See Also:
• "About SQL Expressions" for information on valid forms of expr,
• "Floating-Point Numbers" for information on binary-float comparison semantics, and "Aggregate Functions"
• Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation MAX uses to compare character values for expr, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

Aggregate Example

The following example determines the highest salary in the hr.employees table:

SELECT MAX(salary) "Maximum"
FROM employees;

Maximum
----------
24000

Analytic Examples

The following example calculates, for each employee, the highest salary of the employees reporting to the same manager as the employee.

SELECT manager_id, last_name, salary,
       MAX(salary) OVER (PARTITION BY manager_id) AS mgr_max
FROM employees;
ORDER BY manager_id, last_name, salary;

<table>
<thead>
<tr>
<th>MANAGER_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>MGR_MAX</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>Cambrault</td>
<td>11000</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>De Haan</td>
<td>17000</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Errazuriz</td>
<td>12000</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Fripp</td>
<td>8200</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Hartstein</td>
<td>13000</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Kaufling</td>
<td>7900</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Kochhar</td>
<td>17000</td>
<td>17000</td>
</tr>
</tbody>
</table>

...  

If you enclose this query in the parent query with a predicate, then you can determine the employee who makes the highest salary in each department:

```sql
SELECT manager_id, last_name, salary
FROM (SELECT manager_id, last_name, salary, 
   MAX(salary) OVER (PARTITION BY manager_id) AS rmax_sal
   FROM employees)
WHERE salary = rmax_sal
ORDER BY manager_id, last_name, salary;
```

<table>
<thead>
<tr>
<th>MANAGER_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>De Haan</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Kochhar</td>
<td>17000</td>
</tr>
<tr>
<td>101</td>
<td>Greenberg</td>
<td>12008</td>
</tr>
<tr>
<td>101</td>
<td>Higgins</td>
<td>12008</td>
</tr>
<tr>
<td>102</td>
<td>Hunold</td>
<td>9000</td>
</tr>
<tr>
<td>103</td>
<td>Ernst</td>
<td>6000</td>
</tr>
<tr>
<td>108</td>
<td>Faviet</td>
<td>9000</td>
</tr>
<tr>
<td>114</td>
<td>Khoo</td>
<td>3100</td>
</tr>
<tr>
<td>120</td>
<td>Nayer</td>
<td>3200</td>
</tr>
<tr>
<td>120</td>
<td>Taylor</td>
<td>3200</td>
</tr>
<tr>
<td>121</td>
<td>Sarchand</td>
<td>4200</td>
</tr>
<tr>
<td>122</td>
<td>Chung</td>
<td>3800</td>
</tr>
<tr>
<td>123</td>
<td>Bell</td>
<td>4000</td>
</tr>
<tr>
<td>124</td>
<td>Rajs</td>
<td>3500</td>
</tr>
<tr>
<td>145</td>
<td>Tucker</td>
<td>10000</td>
</tr>
<tr>
<td>146</td>
<td>King</td>
<td>10000</td>
</tr>
<tr>
<td>147</td>
<td>Vishney</td>
<td>10500</td>
</tr>
<tr>
<td>148</td>
<td>Ozer</td>
<td>11500</td>
</tr>
<tr>
<td>149</td>
<td>Abel</td>
<td>11000</td>
</tr>
<tr>
<td>201</td>
<td>Fay</td>
<td>6000</td>
</tr>
<tr>
<td>205</td>
<td>Gietz</td>
<td>8300</td>
</tr>
<tr>
<td>King</td>
<td></td>
<td>24000</td>
</tr>
</tbody>
</table>

22 rows selected.

### 7.124 MEDIAN

**Syntax**

```
MEDIAN ( expr )
OVER ( query_partition_clause )
```
Purpose

MEDIAN is an inverse distribution function that assumes a continuous distribution model. It takes a numeric or datetime value and returns the middle value or an interpolated value that would be the middle value once the values are sorted. Nulls are ignored in the calculation.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you specify only `expr`, then the function returns the same data type as the numeric data type of the argument. If you specify the `OVER` clause, then Oracle Database determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The result of `MEDIAN` is computed by first ordering the rows. Using N as the number of rows in the group, Oracle calculates the row number (`RN`) of interest with the formula `RN = (1 + (0.5*(N-1)))`. The final result of the aggregate function is computed by linear interpolation between the values from rows at row numbers `CRN = CEILING(RN)` and `FRN = FLOOR(RN)`.

The final result will be:

```
if (CRN = FRN = RN) then
   (value of expression from row at RN)
else
   (CRN - RN) * (value of expression for row at FRN) +
   (RN - FRN) * (value of expression for row at CRN)
```

You can use `MEDIAN` as an analytic function. You can specify only the `query_partition_clause` in its `OVER` clause. It returns, for each row, the value that would fall in the middle among a set of values within each partition.

Compare this function with these functions:

- `PERCENTILE_CONT`, which returns, for a given percentile, the value that corresponds to that percentile by way of interpolation. `MEDIAN` is the specific case of `PERCENTILE_CONT` where the percentile value defaults to 0.5.
- `PERCENTILE_DISC`, which is useful for finding values for a given percentile without interpolation.
Aggregate Example

The following query returns the median salary for each department in the `hr.employees` table:

```sql
SELECT department_id, MEDIAN(salary) 
FROM employees 
GROUP BY department_id 
ORDER BY department_id;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>MEDIAN(SALARY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4400</td>
</tr>
<tr>
<td>20</td>
<td>9500</td>
</tr>
<tr>
<td>30</td>
<td>2850</td>
</tr>
<tr>
<td>40</td>
<td>6500</td>
</tr>
<tr>
<td>50</td>
<td>3100</td>
</tr>
<tr>
<td>60</td>
<td>4800</td>
</tr>
<tr>
<td>70</td>
<td>10000</td>
</tr>
<tr>
<td>80</td>
<td>8900</td>
</tr>
<tr>
<td>90</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>8000</td>
</tr>
<tr>
<td>110</td>
<td>10154</td>
</tr>
<tr>
<td>7000</td>
<td></td>
</tr>
</tbody>
</table>

Analytic Example

The following query returns the median salary for each manager in a subset of departments in the `hr.employees` table:

```sql
SELECT manager_id, employee_id, salary, 
  MEDIAN(salary) OVER (PARTITION BY manager_id) "Median by Mgr" 
FROM employees 
WHERE department_id > 60 
ORDER BY manager_id, employee_id;
```

<table>
<thead>
<tr>
<th>MANAGER_ID</th>
<th>EMPLOYEE_ID</th>
<th>SALARY</th>
<th>Median by Mgr</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>101</td>
<td>17000</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>102</td>
<td>17000</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>145</td>
<td>14000</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>146</td>
<td>13500</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>147</td>
<td>12000</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>148</td>
<td>11000</td>
<td>13500</td>
</tr>
<tr>
<td>100</td>
<td>149</td>
<td>10500</td>
<td>13500</td>
</tr>
<tr>
<td>101</td>
<td>108</td>
<td>12008</td>
<td>12008</td>
</tr>
<tr>
<td>101</td>
<td>204</td>
<td>10000</td>
<td>12008</td>
</tr>
<tr>
<td>101</td>
<td>205</td>
<td>12000</td>
<td>12008</td>
</tr>
<tr>
<td>108</td>
<td>109</td>
<td>9000</td>
<td>7800</td>
</tr>
<tr>
<td>108</td>
<td>110</td>
<td>8200</td>
<td>7800</td>
</tr>
<tr>
<td>108</td>
<td>111</td>
<td>7700</td>
<td>7800</td>
</tr>
<tr>
<td>108</td>
<td>112</td>
<td>7800</td>
<td>7800</td>
</tr>
<tr>
<td>108</td>
<td>113</td>
<td>6900</td>
<td>7800</td>
</tr>
<tr>
<td>145</td>
<td>150</td>
<td>10000</td>
<td>8500</td>
</tr>
<tr>
<td>145</td>
<td>151</td>
<td>9500</td>
<td>8500</td>
</tr>
<tr>
<td>145</td>
<td>152</td>
<td>9000</td>
<td>8500</td>
</tr>
</tbody>
</table>

...
## 7.125 MIN

### Syntax

\[
\text{MIN} \big( \text{DISTINCT} \big( \text{ALL} \big( \text{expr} \big) \big) \big) \text{ OVER( analytic_clause )}
\]

### See Also:

- "Analytic Functions" for information on syntax, semantics, and restrictions

### Purpose

MIN returns minimum value of \textit{expr}. You can use it as an aggregate or analytic function.

### See Also:

- "About SQL Expressions" for information on valid forms of \textit{expr}, "Floating-Point Numbers" for information on binary-float comparison semantics, and "Aggregate Functions"
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation MIN uses to compare character values for \textit{expr}, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value

### Aggregate Example

The following statement returns the earliest hire date in the hr.employees table:

```sql
SELECT MIN(hire_date) "Earliest"
FROM employees;
```

Earliest
--------
13-JAN-01

### Analytic Example

The following example determines, for each employee, the employees who were hired on or before the same date as the employee. It then determines the subset of employees reporting to the same manager as the employee, and returns the lowest salary in that subset.
SELECT manager_id, last_name, hire_date, salary,
    MIN(salary) OVER(PARTITION BY manager_id ORDER BY hire_date
        RANGE UNBOUNDED PRECEDING) AS p_cmin
FROM employees
ORDER BY manager_id, last_name, hire_date, salary;

<table>
<thead>
<tr>
<th>MANAGER_ID</th>
<th>LAST_NAME</th>
<th>HIRE_DATE</th>
<th>SALARY</th>
<th>P_CMIN</th>
</tr>
</thead>
<tbody>
<tr>
<td>100</td>
<td>Cambrault</td>
<td>15-OCT-07</td>
<td>11000</td>
<td>6500</td>
</tr>
<tr>
<td>100</td>
<td>De Haan</td>
<td>13-JAN-01</td>
<td>17000</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>Errazuriz</td>
<td>10-MAR-05</td>
<td>12000</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Fripp</td>
<td>10-APR-05</td>
<td>8200</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Hartstein</td>
<td>17-FEB-04</td>
<td>13000</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Kauffling</td>
<td>01-MAY-03</td>
<td>7900</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Kochhar</td>
<td>21-SEP-05</td>
<td>17000</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Mourgos</td>
<td>16-NOV-07</td>
<td>5800</td>
<td>5800</td>
</tr>
<tr>
<td>100</td>
<td>Partners</td>
<td>05-JAN-05</td>
<td>13500</td>
<td>7900</td>
</tr>
<tr>
<td>100</td>
<td>Raphaely</td>
<td>07-DEC-02</td>
<td>11000</td>
<td>11000</td>
</tr>
<tr>
<td>100</td>
<td>Russell</td>
<td>01-OCT-04</td>
<td>14000</td>
<td>7900</td>
</tr>
</tbody>
</table>

... 

### 7.126 MOD

#### Syntax

`MOD(n2, n1)`

`n2` divided by `n1`. Returns `n2` if `n1` is 0.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

#### Purpose

`MOD` returns the remainder of `n2` divided by `n1`. Returns `n2` if `n1` is 0.

#### Examples

The following example returns the remainder of 11 divided by 4:

```sql
SELECT MOD(11,4) "Modulus"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Modulus</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
</tr>
</tbody>
</table>
This function behaves differently from the classical mathematical modulus function when \( m \) is negative. The classical modulus can be expressed using the \( \text{MOD} \) function with this formula:

\[
n2 - n1 \times \text{FLOOR}(n2/n1)
\]

The following table illustrates the difference between the \( \text{MOD} \) function and the classical modulus:

<table>
<thead>
<tr>
<th>( n2 )</th>
<th>( n1 )</th>
<th>( \text{MOD}(n2,n1) )</th>
<th>Classical Modulus</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>4</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>11</td>
<td>-4</td>
<td>3</td>
<td>-1</td>
</tr>
<tr>
<td>-11</td>
<td>4</td>
<td>-3</td>
<td>1</td>
</tr>
<tr>
<td>-11</td>
<td>-4</td>
<td>-3</td>
<td>-3</td>
</tr>
</tbody>
</table>

See Also:

- \( \text{FLOOR} \) and \( \text{REMAINDER} \), which is similar to \( \text{MOD} \), but uses \( \text{ROUND} \) in its formula instead of \( \text{FLOOR} \)

### 7.127 MONTHS_BETWEEN

**Syntax**

\[
\text{MONTHS_BETWEEN}( \text{date1}, \text{date2} )
\]

**Purpose**

\( \text{MONTHS_BETWEEN} \) returns number of months between dates \( \text{date1} \) and \( \text{date2} \). The month and the last day of the month are defined by the parameter \( \text{NLS_CALENDAR} \). If \( \text{date1} \) is later than \( \text{date2} \), then the result is positive. If \( \text{date1} \) is earlier than \( \text{date2} \), then the result is negative. If \( \text{date1} \) and \( \text{date2} \) are either the same days of the month or both last days of months, then the result is always an integer. Otherwise Oracle Database calculates the fractional portion of the result based on a 31-day month and considers the difference in time components \( \text{date1} \) and \( \text{date2} \).

**Examples**

The following example calculates the months between two dates:

```sql
SELECT MONTHS_BETWEEN (TO_DATE('02-02-1995','MM-DD-YYYY'),
                      TO_DATE('01-01-1995','MM-DD-YYYY')) "Months"
FROM DUAL;
```

```
Months
-------
1.03225806
```
7.128 NANVL

Syntax

```
NANVL(n2, n1)
```

Purpose

The `NANVL` function is useful only for floating-point numbers of type `BINARY_FLOAT` or `BINARY_DOUBLE`. It instructs Oracle Database to return an alternative value `n1` if the input value `n2` is `NaN` (not a number). If `n2` is `not NaN`, then Oracle returns `n2`.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

**See Also:**

Table 2-8 for more information on implicit conversion, "Floating-Point Numbers" for information on binary-float comparison semantics, and "Numeric Precedence" for information on numeric precedence.

Examples

Using table `float_point_demo` created for `TO_BINARY_DOUBLE`, insert a second entry into the table:

```
INSERT INTO float_point_demo
VALUES (0,'NaN','NaN');
```

```
SELECT *
FROM float_point_demo;
```

```
DEC_NUM BIN_DOUBLE BIN_FLOAT
---------- ---------- ----------
1234.56 1.235E+003 1.235E+003
0       Nan        Nan
```

The following example returns `bin_float` if it is a number. Otherwise, 0 is returned.

```
SELECT bin_float, NANVL(bin_float,0)
FROM float_point_demo;
```

```
BIN_FLOAT NANVL(BIN_FLOAT,0)
---------- ------------------
1.235E+003         1.235E+003
Nan                  0
```
7.129 NCHR

Syntax

\[
\text{NCHR}(\text{number})
\]

Purpose

NCHR returns the character having the binary equivalent to \textit{number} in the national character set. The value returned is always NVARCHAR2. This function is equivalent to using the \texttt{CHR} function with the \texttt{USING NCHAR_CS} clause.

This function takes as an argument a \texttt{NUMBER} value, or any value that can be implicitly converted to \texttt{NUMBER}, and returns a character.

\begin{itemize}
\item \texttt{CHR}
\item Appendix C in \textit{Oracle Database Globalization Support Guide} for the collation derivation rules, which define the collation assigned to the character return value of \texttt{NCHR}
\end{itemize}

Examples

The following examples return the nchar character 187:

\begin{verbatim}
SELECT NCHR(187)
FROM DUAL;
\end{verbatim}

\begin{verbatim}
\texttt{N} >
\end{verbatim}

\begin{verbatim}
SELECT CHR(187 USING NCHAR_CS)
FROM DUAL;
\end{verbatim}

\begin{verbatim}
\texttt{C} >
\end{verbatim}

7.130 NEW_TIME

Syntax

\[
\text{NEW_TIME}(\text{date}, \text{timezone1}, \text{timezone2})
\]
Purpose

NEW_TIME returns the date and time in time zone timezone2 when date and time in time zone timezone1 are date. Before using this function, you must set the NLS_DATE_FORMAT parameter to display 24-hour time. The return type is always DATE, regardless of the data type of date.

Note:

This function takes as input only a limited number of time zones. You can have access to a much greater number of time zones by combining the FROM_TZ function and the datetime expression. See FROM_TZ and the example for "Datetime Expressions ".

The arguments timezone1 and timezone2 can be any of these text strings:

- AST, ADT: Atlantic Standard or Daylight Time
- BST, BDT: Bering Standard or Daylight Time
- CST, CDT: Central Standard or Daylight Time
- EST, EDT: Eastern Standard or Daylight Time
- GMT: Greenwich Mean Time
- HST, HDT: Alaska-Hawaii Standard Time or Daylight Time.
- MST, MDT: Mountain Standard or Daylight Time
- NST: Newfoundland Standard Time
- PST, PDT: Pacific Standard or Daylight Time
- YST, YDT: Yukon Standard or Daylight Time

Examples

The following example returns an Atlantic Standard time, given the Pacific Standard time equivalent:

```
ALTER SESSION SET NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';

SELECT NEW_TIME(TO_DATE('11-10-09 01:23:45', 'MM-DD-YY HH24:MI:SS'), 'AST', 'PST')
  "New Date and Time"
FROM DUAL;
```

New Date and Time
-------------------
09-NOV-2009 21:23:45

7.131 NEXT_DAY

Syntax

```
NEXT_DAY (date, char)
```

Chapter 7
Purpose

NEXT_DAY returns the date of the first weekday named by char that is later than the date date. The return type is always DATE, regardless of the data type of date. The argument char must be a day of the week in the date language of your session, either the full name or the abbreviation. The minimum number of letters required is the number of letters in the abbreviated version. Any characters immediately following the valid abbreviation are ignored. The return value has the same hours, minutes, and seconds component as the argument date.

Examples

This example returns the date of the next Tuesday after October 15, 2009:

```sql
SELECT NEXT_DAY('15-OCT-2009','TUESDAY') "NEXT DAY"
FROM DUAL;
```

```
NEXT DAY
-------------------
20-OCT-2009 00:00:00
```

7.132 NLS_CHARSET_DECL_LEN

Syntax

```sql
NLS_CHARSET_DECL_LEN ( byte_count , char_set_id )
```

Purpose

NLS_CHARSET_DECL_LEN returns the declaration length (in number of characters) of an NCHAR column. The byte_count argument is the width of the column. The char_set_id argument is the character set ID of the column.

Examples

The following example returns the number of characters that are in a 200-byte column when you are using a multibyte character set:

```sql
SELECT NLS_CHARSET_DECL_LEN(200, nls_charset_id('ja16eucfixed'))
FROM DUAL;
```

```
NLS_CHARSET_DECL_LEN(200,NLS_CHARSET_ID('JA16EUCFIXED'))
--------------------------------------------------------
100
```

7.133 NLS_CHARSET_ID

Syntax

```sql
NLS_CHARSET_ID ( string )
```
### NLS_CHARSET_ID

NLS_CHARSET_ID returns the character set ID number corresponding to character set name string. The string argument is a run-time VARCHAR2 value. The string value 'CHAR_CS' returns the database character set ID number of the server. The string value 'NCHAR_CS' returns the national character set ID number of the server.

Invalid character set names return null.

#### See Also:

Oracle Database Globalization Support Guide for a list of character sets

### Examples

The following example returns the character set ID of a character set:

```sql
SELECT NLS_CHARSET_ID('ja16euc')
FROM DUAL;
```

<table>
<thead>
<tr>
<th>NLS_CHARSET_ID('JA16EUC')</th>
</tr>
</thead>
<tbody>
<tr>
<td>830</td>
</tr>
</tbody>
</table>

### NLS_CHARSET_NAME

NLS_CHARSET_NAME returns the name of the character set corresponding to ID number number. The character set name is returned as a VARCHAR2 value in the database character set. If number is not recognized as a valid character set ID, then this function returns null.

This function returns a VARCHAR2 value.

#### See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of NLS_CHARSET_NAME

### Examples

The following example returns the character set corresponding to character set ID number 2:

```sql
SELECT NLS_CHARSET_NAME(2)
```

7.134 NLS_CHARSET_NAME
SELECT NLS_CHARSET_NAME(2)  
    FROM DUAL;  

NLS_CH  
-----  
WEBDEC

7.135 NLS_COLLATION_ID

Syntax

NLS_COLLATION_ID(expr)

Purpose

NLS_COLLATION_ID takes as its argument a collation name and returns the corresponding collation ID number. Collation IDs are used in the data dictionary tables and in Oracle Call Interface (OCI). Collation names are used in SQL statements and data dictionary views.

For expr, specify the collation name as a VARCHAR2 value. You can specify a valid named collation or a pseudo-collation, in any combination of uppercase and lowercase letters.

This function returns a NUMBER value. If you specify an invalid collation name, then this function returns null.

Examples

The following example returns the collation ID of collation BINARY_CI:

SELECT NLS_COLLATION_ID('BINARY_CI')  
    FROM DUAL;  

NLS_COLLATION_ID('BINARY_CI')  
-------------------------------  
147455

7.136 NLS_COLLATION_NAME

Syntax

NLS_COLLATION_NAME(expr,flag)

Purpose

NLS_COLLATION_NAME takes as its argument a collation ID number and returns the corresponding collation name. Collation IDs are used in the data dictionary tables and in Oracle Call Interface (OCI). Collation names are used in SQL statements and data dictionary views.
For `expr`, specify the collation ID as a `NUMBER` value.

This function returns a `VARCHAR2` value. If you specify an invalid collation ID, then this function returns null.

The optional `flag` parameter applies only to Unicode Collation Algorithm (UCA) collations. This parameter determines whether the function returns the short form or long form of the collation name. The parameter must be a character expression evaluating to the value 'S', 's', 'L', or 'l', with the following meaning:

- 'S' or 's' – Returns the short form of the collation name
- 'L' or 'l' – Returns the long form of the collation name

If you omit `flag`, then the default is 'L'.

---

**See Also:**

- *Oracle Database Globalization Support Guide* for more information on UCA collations
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `NLS_COLLATION_NAME`

---

**Examples**

The following example returns the name of the collation corresponding to collation ID number 81919:

```sql
SELECT NLS_COLLATION_NAME(81919)
FROM DUAL;
```

```
NLS_COLLATION_NAME(81919)
---------
BINARY_AI
```

The following example returns the short form of the name of the UCA collation corresponding to collation ID number 208897:

```sql
SELECT NLS_COLLATION_NAME(208897,'S')
FROM DUAL;
```

```
NLS_COLLATION_NAME(208897,'S')
--------------------------
UCA0610_DUCET
```

The following example returns the long form of the name of the UCA collation corresponding to collation ID number 208897:

```sql
SELECT NLS_COLLATION_NAME(208897,'L')
FROM DUAL;
```

```
NLS_COLLATION_NAME(208897,'L')
----------------------------------------
UCA0610_DUCET_S4_VS_BN_NY_EN_FN_HN_DN_MN
```
7.137 NLS_INITCAP

Syntax

```
NLS_INITCAP( char, 'nlsparam' )
```

Purpose

NLS_INITCAP returns char, with the first letter of each word in uppercase, all other letters in lowercase. Words are delimited by white space or characters that are not alphanumeric.

Both char and 'nlsparam' can be any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The string returned is of VARCHAR2 data type and is in the same character set as char.

The value of 'nlsparam' can have this form:

'NLS_SORT = sort'

where sort is a named collation. The collation handles special linguistic requirements for case conversions. These requirements can result in a return value of a different length than the char. If you omit 'nlsparam', then this function uses the determined collation of the function.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

**See Also:**

- "Data Type Comparison Rules" for more information.
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for NLS_INITCAP, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following examples show how the linguistic sort sequence results in a different return value from the function:

```sql
SELECT NLS_INITCAP('ijsland') "InitCap"
FROM DUAL;

InitCap
-------
Ijsland
```

```sql
SELECT NLS_INITCAP('ijsland', 'NLS_SORT = XDutch') "InitCap"
FROM DUAL;
```

```sql
SELECT NLS_INITCAP('ijsland', 'NLS_SORT = XDutch') "InitCap"
FROM DUAL;
```
7.138 NLS_LOWER

Syntax

```
NLS_LOWER ( char
, ' nlsparam '
)
```

Purpose

NLS_LOWER returns char, with all letters lowercase.

Both char and 'nlsparam' can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if char is a character data type and a LOB if char is a LOB data type. The return string is in the same character set as char.

The 'nlsparam' can have the same form and serve the same purpose as in the NLS_INITCAP function.

Examples

The following statement returns the lowercase form of the character string 'NOKTASINDA' using the XTurkish linguistic sort sequence. The Turkish uppercase I becoming a small, dotless i.

```
SELECT NLS_LOWER('NOKTASINDA', 'NLS_SORT = XTurkish') "Lowercase"
FROM DUAL;
```
### 7.139 NLS_UPPER

**Syntax**

```
NLS_UPPER ( char
, ' nlsparam '
)
```

**Purpose**

NLS_UPPER returns `char`, with all letters uppercase.

Both `char` and `'nlsparam'` can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if `char` is a character data type and a LOB if `char` is a LOB data type. The return string is in the same character set as `char`.

The `nlsparam` can have the same form and serve the same purpose as in the NLS_INITCAP function.

**See Also:**

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for NLS_UPPER, and for the collation derivation rules, which define the collation assigned to the character return value of this function.

**Examples**

The following example returns a string with all the letters converted to uppercase:

```sql
SELECT NLS_UPPER('große') "Uppercase"
FROM DUAL;

Uppercase
-------
GROßE

SELECT NLS_UPPER('große', 'NLS_SORT = XGerman') "Uppercase"
FROM DUAL;

Uppercase
-------
GROSSE
```

**See Also:**

NLS_INITCAP
7.140 NLSSORT

Syntax

```
NLSSORT (char, 'nlsparam')
```

Purpose

NLSSORT returns a collation key for the character value `char` and an explicitly or implicitly specified collation. A collation key is a string of bytes used to sort `char` according to the specified collation. The property of the collation keys is that mutual ordering of two such keys generated for the given collation when compared according to their binary order is the same as mutual ordering of the source character values when compared according to the given collation.

Both `char` and `'nlsparam' can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`.

The value of `'nlsparam' must have the form

```
'NLS_SORT = collation'
```

where `collation` is the name of a linguistic collation or `BINARY`. NLSSORT uses the specified collation to generate the collation key. If you omit `'nlsparam'`, then this function uses the derived collation of the argument `char`. If you specify `BINARY`, then this function returns the `char` value itself cast to `RAW` and possibly truncated as described below.

If you specify `'nlsparam'`, then you can append to the linguistic collation name the suffix `_ai` to request an accent-insensitive collation or `_ci` to request a case-insensitive collation. Refer to Oracle Database Globalization Support Guide for more information on accent- and case-insensitive sorting. Using accent-insensitive or case-insensitive collations with the `ORDER BY` query clause is not recommended as it leads to a nondeterministic sort order.

The returned collation key is of `RAW` data type. The length of the collation key resulting from a given `char` value for a given collation may exceed the maximum length of the `RAW` value returned by NLSSORT. In this case, the behavior of NLSSORT depends on the value of the initialization parameter `MAX_STRING_SIZE`. If `MAX_STRING_SIZE = EXTENDED`, then the maximum length of the return value is 32767 bytes. If the collation key exceeds this limit, then the function fails with the error "ORA-12742: unable to create the collation key". This error may also be reported for short input strings if they contain a high percentage of Unicode characters with very high decomposition ratios.

See Also:

Oracle Database Globalization Support Guide for details of when the ORA-12742 error is reported and how to prevent application availability issues that the error could cause.
If `MAX_STRING_SIZE = STANDARD`, then the maximum length of the return value is 2000 bytes. If the value to be returned exceeds the limit, then `NLSSORT` calculates the collation key for a maximum prefix, or initial substring, of `char` so that the calculated result does not exceed the maximum length. For monolingual collations, for example `FRENCH`, the prefix length is typically 1000 characters. For multilingual collations, for example `GENERIC_M`, the prefix is typically 500 characters. For Unicode Collation Algorithm (UCA) collations, for example `UCA0610_DUCET`, the prefix is typically 285 characters. The exact length may be lower or higher depending on the collation and the characters contained in `char`.

The behavior when `MAX_STRING_SIZE = STANDARD` implies that two character values whose collation keys (`NLSSORT` results) are compared to find the linguistic ordering are considered equal if they do not differ in the prefix even though they may differ at some further character position. Because the `NLSSORT` function is used implicitly to find linguistic ordering for comparison conditions, the BETWEEN condition, the IN condition, ORDER BY, GROUP BY, and COUNT (DISTINCT), those operations may return results that are only approximate for long character values. If you want guarantee that the results of those operations are exact, then migrate your database to use `MAX_STRING_SIZE = EXTENDED`.

Refer to "Extended Data Types" for more information on the `MAX_STRING_SIZE` initialization parameter.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

**See Also:**

- "Data Type Comparison Rules" for more information.

### Examples

This function can be used to specify sorting and comparison operations based on a linguistic sort sequence rather than on the binary value of a string. The following example creates a test table containing two values and shows how the values returned can be ordered by the `NLSSORT` function:

```sql
CREATE TABLE test (name VARCHAR2(15));
INSERT INTO test VALUES ('Gaardiner');
INSERT INTO test VALUES ('Gaberd');
INSERT INTO test VALUES ('Gaasten');

SELECT * FROM test ORDER BY name;
```

<table>
<thead>
<tr>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gaardiner</td>
</tr>
<tr>
<td>Gaasten</td>
</tr>
<tr>
<td>Gaberd</td>
</tr>
</tbody>
</table>
SELECT *
FROM test
ORDER BY NLSSORT(name, 'NLS_SORT = XDanish');

NAME
---------------
Gaberd
Gaardiner
Gaasten

The following example shows how to use the NLSSORT function in comparison operations:

SELECT *
FROM test
WHERE name > 'Gaberd'
ORDER BY name;

no rows selected

SELECT *
FROM test
WHERE NLSSORT(name, 'NLS_SORT = XDanish') > 
    NLSSORT('Gaberd', 'NLS_SORT = XDanish')
ORDER BY name;

NAME
---------------
Gaardiner
Gaasten

If you frequently use NLSSORT in comparison operations with the same linguistic sort sequence, then consider this more efficient alternative: Set the NLS_COMP parameter (either for the database or for the current session) to LINGUISTIC, and set the NLS_SORT parameter for the session to the desired sort sequence. Oracle Database will use that sort sequence by default for all sorting and comparison operations during the current session:

ALTER SESSION SET NLS_COMP = 'LINGUISTIC';
ALTER SESSION SET NLS_SORT = 'XDanish';

SELECT *
FROM test
WHERE name > 'Gaberd'
ORDER BY name;

NAME
---------------
Gaardiner
Gaasten

Oracle Database Globalization Support Guide for information on sort sequences
### 7.141 NTH_VALUE

#### Syntax

```
NTH_VALUE
    (measure_expr, n)
FROM FIRST LAST RESPECT IGNORE NULLS
OVER (analytic_clause)
```

#### See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions of the `analytic_clause`

#### Purpose

The NTH_VALUE function returns the `measure_expr` value of the `n`th row in the window defined by the `analytic_clause`. The returned value has the data type of the `measure_expr`.

- `{RESPECT | IGNORE} NULLS` determines whether null values of `measure_expr` are included in or eliminated from the calculation. The default is RESPECT NULLS.
- `n` determines the `n`th row for which the measure value is to be returned. `n` can be a constant, bind variable, column, or an expression involving them, as long as it resolves to a positive integer. The function returns NULL if the data source window has fewer than `n` rows. If `n` is null, then the function returns an error.
- `FROM {FIRST | LAST}` determines whether the calculation begins at the first or last row of the window. The default is FROM FIRST.

If you omit the `windowing_clause` of the `analytic_clause`, it defaults to RANGE BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW. This default sometimes returns an unexpected value for NTH_VALUE ... FROM LAST ... , because the last value in the window is at the bottom of the window, which is not fixed. It keeps changing as the current row changes. For expected results, specify the `windowing_clause` as RANGE BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING. Alternatively, you can specify the `windowing_clause` as RANGE BETWEEN CURRENT ROW AND UNBOUNDED FOLLOWING.

#### See Also:

- Oracle Database Data Warehousing Guide for more information on the use of this function
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of NTH_VALUE when it is a character value
Examples

The following example shows the minimum `amount_sold` value for the second `channel_id` in ascending order for each `prod_id` between 13 and 16:

```sql
SELECT prod_id, channel_id, MIN(amount_sold),
       NTH_VALUE(MIN(amount_sold), 2) OVER (PARTITION BY prod_id ORDER BY channel_id
       ROWS BETWEEN UNBOUNDED PRECEDING AND UNBOUNDED FOLLOWING) nv
FROM sales
WHERE prod_id BETWEEN 13 and 16
GROUP BY prod_id, channel_id;
```

</tbody>
</table>

13 rows selected.

7.142 NTILE

Syntax

```
NTILE( expr ) OVER (query_partition_clause order_by_clause)
```

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions, including valid forms of `expr`

Purpose

`NTILE` is an analytic function. It divides an ordered data set into a number of buckets indicated by `expr` and assigns the appropriate bucket number to each row. The buckets are numbered 1 through `expr`. The `expr` value must resolve to a positive constant for each partition. Oracle Database expects an integer, and if `expr` is a noninteger constant, then Oracle truncates the value to an integer. The return value is `NUMBER`. 

---

7-222
The number of rows in the buckets can differ by at most 1. The remainder values (the remainder of number of rows divided by buckets) are distributed one for each bucket, starting with bucket 1.

If \( expr \) is greater than the number of rows, then a number of buckets equal to the number of rows will be filled, and the remaining buckets will be empty.

You cannot nest analytic functions by using \( \text{NTILE} \) or any other analytic function for \( expr \). However, you can use other built-in function expressions for \( expr \).

**See Also:**  
"About SQL Expressions" for information on valid forms of \( expr \) and Table 2-8 for more information on implicit conversion

### Examples

The following example divides into 4 buckets the values in the \( \text{salary} \) column of the \textit{oe.employees} table from Department 100. The \( \text{salary} \) column has 6 values in this department, so the two extra values (the remainder of 6 / 4) are allocated to buckets 1 and 2, which therefore have one more value than buckets 3 or 4.

```sql
SELECT last_name, salary, NTILE(4) OVER (ORDER BY salary DESC) AS quartile
FROM employees
WHERE department_id = 100
ORDER BY last_name, salary, quartile;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>QUARTILE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chen</td>
<td>8200</td>
<td>2</td>
</tr>
<tr>
<td>Faviet</td>
<td>9000</td>
<td>1</td>
</tr>
<tr>
<td>Greenberg</td>
<td>12008</td>
<td>1</td>
</tr>
<tr>
<td>Popp</td>
<td>6900</td>
<td>4</td>
</tr>
<tr>
<td>Sciarra</td>
<td>7700</td>
<td>3</td>
</tr>
<tr>
<td>Urman</td>
<td>7800</td>
<td>2</td>
</tr>
</tbody>
</table>

### 7.143 NULLIF

#### Syntax

\[
\text{NULLIF}\left(\text{expr1}, \text{expr2}\right)
\]

#### Purpose

\( \text{NULLIF} \) compares \( \text{expr1} \) and \( \text{expr2} \). If they are equal, then the function returns null. If they are not equal, then the function returns \( \text{expr1} \). You cannot specify the literal NULL for \( \text{expr1} \).

If both arguments are numeric data types, then Oracle Database determines the argument with the higher numeric precedence, implicitly converts the other argument to that data type, and returns that data type. If the arguments are not numeric, then they must be of the same data type, or Oracle returns an error.
The **NULLIF** function is logically equivalent to the following **CASE** expression:

```
CASE WHEN expr1 = expr2 THEN NULL ELSE expr1 END
```

**See Also:**

- "**CASE Expressions**"
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation **NULLIF** uses to compare characters from `expr1` with characters from `expr2`, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value.

**Examples**

The following example selects those employees from the sample schema `hr` who have changed jobs since they were hired, as indicated by a `job_id` in the `job_history` table different from the current `job_id` in the `employees` table:

```sql
SELECT e.last_name, NULLIF(j.job_id, e.job_id) "Old Job ID"
FROM employees e, job_history j
WHERE e.employee_id = j.employee_id
ORDER BY last_name, "Old Job ID";
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>Old Job ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>De Haan</td>
<td>IT_PROG</td>
</tr>
<tr>

</tr>
<tr>
<td>Raphaely</td>
<td>ST_CLERK</td>
</tr>
<tr>
<td>Taylor</td>
<td>SA_MAN</td>
</tr>
<tr>
<td>Whalen</td>
<td>AC_ACCOUNT</td>
</tr>
<tr>
<td>Whalen</td>
<td></td>
</tr>
</tbody>
</table>

### 7.144 NUMTODSINTERVAL

**Syntax**

```
NUMTODSINTERVAL ( n , 'interval_unit' )
```

**Purpose**

`NUMTODSINTERVAL` converts `n` to an INTERVAL `DAY TO SECOND` literal. The argument `n` can be any `NUMBER` value or an expression that can be implicitly converted to a `NUMBER` value. The argument `interval_unit` can be one of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type. The value for `interval_unit` specifies the unit of `n` and must resolve to one of the following string values:
• 'DAY'
• 'HOUR'
• 'MINUTE'
• 'SECOND'

interval_unit is case insensitive. Leading and trailing values within the parentheses are ignored. By default, the precision of the return is 9.

See Also:
Table 2-8 for more information on implicit conversion

Examples
The following example uses NUMTODSINTERVAL in a COUNT analytic function to calculate, for each employee, the number of employees hired by the same manager within the past 100 days from his or her hire date. Refer to "Analytic Functions " for more information on the syntax of the analytic functions.

```sql
SELECT manager_id, last_name, hire_date,
       COUNT(*) OVER (PARTITION BY manager_id ORDER BY hire_date
       RANGE NUMTODSINTERVAL(100, 'day') PRECEDING) AS t_count
FROM employees
ORDER BY last_name, hire_date;
```

<table>
<thead>
<tr>
<th>MANAGER_ID</th>
<th>LAST_NAME</th>
<th>HIRE_DATE</th>
<th>T_COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>149</td>
<td>Abel</td>
<td>11-MAY-04</td>

</tr>
<tr>
<td>100</td>
<td>Zlotkey</td>
<td>29-JAN-08</td>
<td>2</td>
</tr>
</tbody>
</table>

7.145 NUMTOYMINTERVAL

Syntax

```
NUMTOYMINTERVAL ( n , 'interval_unit' )
```

Purpose

NUMTOYMINTERVAL converts number n to an INTERVAL YEAR TO MONTH literal. The argument n can be any NUMBER value or an expression that can be implicitly converted to a NUMBER value. The argument interval_unit can be of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The value for interval_unit specifies the unit of n and must resolve to one of the following string values:
• 'YEAR'
• 'MONTH'

interval_unit is case insensitive. Leading and trailing values within the parentheses are ignored. By default, the precision of the return is 9.

**See Also:**
See Table 2-8 for more information on implicit conversion.

**Examples**
The following example uses NUMTOYMINTERVAL in a SUM analytic function to calculate, for each employee, the total salary of employees hired in the past one year from his or her hire date. Refer to "Analytic Functions" for more information on the syntax of the analytic functions.

```sql
SELECT last_name, hire_date, salary,
    SUM(salary) OVER (ORDER BY hire_date
    RANGE NUMTOYMINTERVAL(1,'year') PRECEDING) AS t_sal
FROM employees
ORDER BY last_name, hire_date;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>HIRE_DATE</th>
<th>SALARY</th>
<th>T_SAL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abel</td>
<td>11-MAY-04</td>
<td>11000</td>
<td>90300</td>
</tr>
<tr>
<td>Ande</td>
<td>24-MAR-08</td>
<td>6400</td>
<td>112500</td>
</tr>
<tr>
<td>Atkinson</td>
<td>30-OCT-05</td>
<td>2800</td>
<td>177000</td>
</tr>
<tr>
<td>Austin</td>
<td>25-JUN-05</td>
<td>4800</td>
<td>134700</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Walsh</td>
<td>24-APR-06</td>
<td>3100</td>
<td>186200</td>
</tr>
<tr>
<td>Weiss</td>
<td>18-JUL-04</td>
<td>8000</td>
<td>70900</td>
</tr>
<tr>
<td>Whalen</td>
<td>17-SEP-03</td>
<td>4400</td>
<td>54000</td>
</tr>
<tr>
<td>Zlotkey</td>
<td>29-JAN-08</td>
<td>10500</td>
<td>119000</td>
</tr>
</tbody>
</table>

**7.146 NVL**

**Syntax**

```
NVL ( expr1 , expr2 )
```

**Purpose**

NVL lets you replace null (returned as a blank) with a string in the results of a query. If `expr1` is null, then `NVL` returns `expr2`. If `expr1` is not null, then `NVL` returns `expr1`.

The arguments `expr1` and `expr2` can have any data type. If their data types are different, then Oracle Database implicitly converts one to the other. If they cannot be converted implicitly, then the database returns an error. The implicit conversion is implemented as follows:

- If `expr1` is character data, then Oracle Database converts `expr2` to the data type of `expr1` before comparing them and returns VARCHAR2 in the character set of `expr1`. 

• If `expr1` is numeric, then Oracle Database determines which argument has the highest numeric precedence, implicitly converts the other argument to that data type, and returns that data type.

**See Also:**
- Table 2-8 for more information on implicit conversion and "Numeric Precedence" for information on numeric precedence
- "COALESCE" and "CASE Expressions", which provide functionality similar to that of `NVL`
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of `NVL` when it is a character value

**Examples**

The following example returns a list of employee names and commissions, substituting "Not Applicable" if the employee receives no commission:

```
SELECT last_name, NVL(TO_CHAR(commission_pct), 'Not Applicable') commission
FROM employees
WHERE last_name LIKE 'B%'
ORDER BY last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>COMMISSION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baer</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Baida</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Banda</td>
<td>.1</td>
</tr>
<tr>
<td>Bates</td>
<td>.15</td>
</tr>
<tr>
<td>Bell</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Bernstein</td>
<td>.25</td>
</tr>
<tr>
<td>Bissot</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Bloom</td>
<td>.2</td>
</tr>
<tr>
<td>Bull</td>
<td>Not Applicable</td>
</tr>
</tbody>
</table>

**7.147 NVL2**

**Syntax**

```
NVL2(expr1, expr2, expr3)
```

**Purpose**

`NVL2` lets you determine the value returned by a query based on whether a specified expression is null or not null. If `expr1` is not null, then `NVL2` returns `expr2`. If `expr1` is null, then `NVL2` returns `expr3`.

The argument `expr1` can have any data type. The arguments `expr2` and `expr3` can have any data types except `LONG`.
If the data types of `expr2` and `expr3` are different, then Oracle Database implicitly converts one to the other. If they cannot be converted implicitly, then the database returns an error. If `expr2` is character or numeric data, then the implicit conversion is implemented as follows:

- If `expr2` is character data, then Oracle Database converts `expr3` to the data type of `expr2` before returning a value unless `expr3` is a null constant. In that case, a data type conversion is not necessary, and the database returns VARCHAR2 in the character set of `expr2`.
- If `expr2` is numeric data, then Oracle Database determines which argument has the highest numeric precedence, implicitly converts the other argument to that data type, and returns that data type.

**See Also:**
- Table 2-8 for more information on implicit conversion and "Numeric Precedence " for information on numeric precedence
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of `NVL2` when it is a character value

**Examples**

The following example shows whether the income of some employees is made up of salary plus commission, or just salary, depending on whether the `commission_pct` column of employees is null or not.

```sql
SELECT last_name, salary,
       NVL2(commission_pct, salary + (salary * commission_pct), salary) income
FROM employees
WHERE last_name like 'B%'
ORDER BY last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>INCOME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baer</td>
<td>10000</td>
<td>10000</td>
</tr>
<tr>
<td>Baida</td>
<td>2900</td>
<td>2900</td>
</tr>
<tr>
<td>Banda</td>
<td>6200</td>
<td>6820</td>
</tr>
<tr>
<td>Bates</td>
<td>7300</td>
<td>8395</td>
</tr>
<tr>
<td>Bell</td>
<td>4000</td>
<td>4000</td>
</tr>
<tr>
<td>Bernstein</td>
<td>9500</td>
<td>11875</td>
</tr>
<tr>
<td>Bissot</td>
<td>3300</td>
<td>3300</td>
</tr>
<tr>
<td>Bloom</td>
<td>10000</td>
<td>12000</td>
</tr>
<tr>
<td>Bull</td>
<td>4100</td>
<td>4100</td>
</tr>
</tbody>
</table>

**7.148 ORA_DM_PARTITION_NAME**

**Syntax**

```sql
ORA_DM_PARTITION_NAME (schema . model mining_attribute_clause)
```
mining_attribute_clause ::= 

Purpose

ORA_DM_PARTITION_NAME is a single row function that works along with other existing functions. This function returns the name of the partition associated with the input row. When ORA_DM_PARTITION_NAME is used on a non-partitioned model, the result is NULL.

The syntax of the ORA_DM_PARTITION_NAME function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

The mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. See mining_attribute_clause.

See Also:

- Oracle Data Mining User's Guide for information about scoring
- Oracle Data Mining Concepts for information about clustering

Note:

The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User's Guide.

Example

```
SELECT prediction(mymodel using *) pred, ora_dm_partition_name(mymodel USING *) pname FROM customers;
```
7.149 ORA_DST_AFFECTED

Syntax

```sql
ORA_DST_AFFECTED (datetime_expr)
```

Purpose

ORA_DST_AFFECTED is useful when you are changing the time zone data file for your database. The function takes as an argument a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values. The function returns 1 if the datetime value is affected by or will result in a "nonexisting time" or "duplicate time" error with the new time zone data. Otherwise, it returns 0.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the `DBMS_DST.BEGIN_PREPARE` and the `DBMS_DST.END_PREPARE` procedures or between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures.

See Also:

*Oracle Database Globalization Support Guide* for more information on time zone data files and on how Oracle Database handles daylight saving time, and *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_DST` package.

7.150 ORA_DST_CONVERT

Syntax

```sql
ORA_DST_CONVERT (datetime_expr, integer, integer)
```

Purpose

ORA_DST_CONVERT is useful when you are changing the time zone data file for your database. The function lets you specify error handling for a specified datetime expression.

- For `datetime_expr`, specify a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values.
• The optional second argument specifies handling of “duplicate time” errors. Specify 0 (false) to suppress the error by returning the source datetime value. This is the default. Specify 1 (true) to allow the database to return the duplicate time error.

• The optional third argument specifies handling of “nonexisting time” errors. Specify 0 (false) to suppress the error by returning the source datetime value. This is the default. Specify 1 (true) to allow the database to return the nonexisting time error.

If no error occurs, this function returns a value of the same data type as `datetime_expr` (a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values). The returned datetime value when interpreted with the new time zone file corresponds to `datetime_expr` interpreted with the old time zone file.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures.

**See Also:**

- *Oracle Database Globalization Support Guide* for more information on time zone data files and on how Oracle Database handles daylight saving time, and *
- *Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_DST` package

### 7.151 ORA_DST_ERROR

**Syntax**

```
ORA_DST_ERROR (datetime_expr)
```

**Purpose**

`ORA_DST_ERROR` is useful when you are changing the time zone data file for your database. The function takes as an argument a datetime expression that resolves to a `TIMESTAMP WITH TIME ZONE` value or a `VARRAY` object that contains `TIMESTAMP WITH TIME ZONE` values, and indicates whether the datetime value will result in an error with the new time zone data. The return values are:

- 0: the datetime value does not result in an error with the new time zone data.
- 1878: the datetime value results in a "nonexisting time" error.
- 1883: the datetime value results in a "duplicate time" error.

This function can be issued only when changing the time zone data file of the database and upgrading the timestamp with the time zone data, and only between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures or between the execution of the `DBMS_DST.BEGIN_UPGRADE` and the `DBMS_DST.END_UPGRADE` procedures.
### 7.152 ORA_HASH

**Syntax**

```
ORA_HASH(expr, max_bucket, seed_value)
```

**Purpose**

*ORA_HASH* is a function that computes a hash value for a given expression. This function is useful for operations such as analyzing a subset of data and generating a random sample.

- The *expr* argument determines the data for which you want Oracle Database to compute a hash value. There are no restrictions on the length of data represented by *expr*, which commonly resolves to a column name. The *expr* cannot be a LONG or LOB type. It cannot be a user-defined object type unless it is a nested table type. The hash value for nested table types does not depend on the order of elements in the collection. All other data types are supported for *expr*.

- The optional *max_bucket* argument determines the maximum bucket value returned by the hash function. You can specify any value between 0 and 4294967295. The default is 4294967295.

- The optional *seed_value* argument enables Oracle to produce many different results for the same set of data. Oracle applies the hash function to the combination of *expr* and *seed_value*. You can specify any value between 0 and 4294967295. The default is 0.

The function returns a *NUMBER* value.

**Examples**

The following example creates a hash value for each combination of customer ID and product ID in the *sh.sales* table, divides the hash values into a maximum of 100 buckets, and returns the sum of the *amount_sold* values in the first bucket (bucket 0). The third argument (5) provides a seed value for the hash function. You can obtain different hash results for the same query by changing the seed value.

```sql
SELECT SUM(amount_sold)
FROM sales
WHERE ORA_HASH(CONCAT(cust_id, prod_id), 99, 5) = 0;
```

SUM(AMOUNT_SOLD)
7.153 ORA_INVOKING_USER

Syntax

ORA_INVOKING_USER

Purpose

ORA_INVOKING_USER returns the name of the database user who invoked the current statement or view. This function takes into account the BEQUEATH property of intervening views referenced in the statement. If this function is invoked from within a definer’s rights context, then it returns the name of the owner of the definer’s rights object. If the invoking user is a Real Application Security user, then it returns user XS$NULL.

This function returns a VARCHAR2 value.

See Also:

- BEQUEATH clause of the CREATE VIEW statement
- Oracle Database 2 Day + Security Guide for more information on user XSSNULL
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of ORA_INVOKING_USER

Examples

The following example returns the name of the database user who invoked the statement:

SELECT ORA_INVOKING_USER FROM DUAL;

7.154 ORA_INVOKING_USERID

Syntax

ORA_INVOKING_USERID

---
Purpose

ORA_INVOKING_USERID returns the identifier of the database user who invoked the current statement or view. This function takes into account the BEQUEATH property of intervening views referenced in the statement.

This function returns a NUMBER value.

See Also:

- ORA_INVOKING_USER to learn how Oracle Database determines the database user who invoked the current statement or view
- BEQUEATH clause of the CREATE VIEW statement

Examples

The following example returns the identifier of the database user who invoked the statement:

```
SELECT ORA_INVOKING_USERID FROM DUAL;
```

7.155 PATH

Syntax

```
PATH ( correlation_integer )
```

Purpose

PATH is an ancillary function used only with the UNDER_PATH and EQUALS_PATH conditions. It returns the relative path that leads to the resource specified in the parent condition.

The correlation_integer can be any NUMBER integer and is used to correlate this ancillary function with its primary condition. Values less than 1 are treated as 1.

See Also:

- EQUALS_PATH Condition and UNDER_PATH Condition
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of PATH

Examples

Refer to the related function DEPTH for an example using both of these ancillary functions of the EQUALS_PATH and UNDER_PATH conditions.
### 7.156 PERCENT_RANK

**Aggregate Syntax**

\[ \text{percent\_rank\_aggregate ::= PERCENT_RANK ( expr ) WITHIN GROUP ( ORDER BY expr DESC ASC NULLS FIRST LAST , ) } \]

**Analytic Syntax**

\[ \text{percent\_rank\_analytic ::= PERCENT_RANK ( ) OVER ( query\_partition\_clause order\_by\_clause ) } \]

---

**Purpose**

`PERCENT_RANK` is similar to the `CUME_DIST` (cumulative distribution) function. The range of values returned by `PERCENT_RANK` is 0 to 1, inclusive. The first row in any set has a `PERCENT_RANK` of 0. The return value is `NUMBER`.

- As an aggregate function, `PERCENT_RANK` calculates, for a hypothetical row \( r \) identified by the arguments of the function and a corresponding sort specification, the rank of row \( r \) minus 1 divided by the number of rows in the aggregate group. This calculation is made as if the hypothetical row \( r \) were inserted into the group of rows over which Oracle Database is to aggregate.

  The arguments of the function identify a single hypothetical row within each aggregate group. Therefore, they must all evaluate to constant expressions within...
each aggregate group. The constant argument expressions and the expressions in the ORDER BY clause of the aggregate match by position. Therefore the number of arguments must be the same and their types must be compatible.

- As an analytic function, for a row \( r \), \( \text{PERCENT_RANK} \) calculates the rank of \( r \) minus 1, divided by 1 less than the number of rows being evaluated (the entire query result set or a partition).

### See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation \( \text{PERCENT_RANK} \) uses to compare character values for the ORDER BY clause.

#### Aggregate Example

The following example calculates the percent rank of a hypothetical employee in the sample table `hr.employees` with a salary of $15,500 and a commission of 5%:

```
SELECT PERCENT_RANK(15000, .05) WITHIN GROUP
    (ORDER BY salary, commission_pct) "Percent-Rank"
FROM employees;
```

```
Percent-Rank
------------
    .971962617
```

#### Analytic Example

The following example calculates, for each employee, the percent rank of the employee's salary within the department:

```
SELECT department_id, last_name, salary, PERCENT_RANK()
    OVER (PARTITION BY department_id ORDER BY salary DESC) AS pr
FROM employees
ORDER BY pr, salary, last_name;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>PR</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Whalen</td>
<td>4400</td>

<td>2200</td>
<td>.954545455</td>
</tr>
<tr>
<td>50</td>
<td>Olson</td>
<td>2100</td>
<td>1</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
7.157 PERCENTILE_CONT

Syntax

```
PERCENTILE_CONT ( expr ) WITHIN GROUP ( ORDER BY expr
DESC
ASC
)
OVER ( query_partition_clause )
```

See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions of the OVER clause

Purpose

PERCENTILE_CONT is an inverse distribution function that assumes a continuous distribution model. It takes a percentile value and a sort specification, and returns an interpolated value that would fall into that percentile value with respect to the sort specification. Nulls are ignored in the calculation.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

The first `expr` must evaluate to a numeric value between 0 and 1, because it is a percentile value. This `expr` must be constant within each aggregation group. The `ORDER BY` clause takes a single expression that must be a numeric or datetime value, as these are the types over which Oracle can perform interpolation.

The result of `PERCENTILE_CONT` is computed by linear interpolation between values after ordering them. Using the percentile value (P) and the number of rows (N) in the aggregation group, you can compute the row number you are interested in after ordering the rows with respect to the sort specification. This row number (RN) is computed according to the formula `RN = (1+(P*(N-1))`. The final result of the aggregate function is computed by linear interpolation between the values from rows at row numbers `CRN = CEILING(RN)` and `FRN = FLOOR(RN)`.

The final result will be:
If (CRN = FRN = RN) then the result is
   (value of expression from row at RN)
Otherwise the result is
   (CRN - RN) * (value of expression for row at FRN) +
   (RN - FRN) * (value of expression for row at CRN)

You can use the \texttt{PERCENTILE\_CONT} function as an analytic function. You can specify only the \texttt{query\_partitioning\_clause} in its \texttt{OVER} clause. It returns, for each row, the value that would fall into the specified percentile among a set of values within each partition.

The \texttt{MEDIAN} function is a specific case of \texttt{PERCENTILE\_CONT} where the percentile value defaults to 0.5. For more information, refer to \texttt{MEDIAN}.

\textbf{Note:}

Before processing a large amount of data with the \texttt{PERCENTILE\_CONT} function, consider using one of the following methods to obtain approximate results more quickly than exact results:

- Set the \texttt{APPROX\_FOR\_PERCENTILE} initialization parameter to \texttt{PERCENTILE\_CONT} or \texttt{ALL} before using the \texttt{PERCENTILE\_CONT} function. Refer to \texttt{Oracle Database Reference} for more information on this parameter.
- Use the \texttt{APPROX\_PERCENTILE} function instead of the \texttt{PERCENTILE\_CONT} function. Refer to \texttt{APPROX\_PERCENTILE}.

\section*{Aggregate Example}

The following example computes the median salary in each department:

\begin{verbatim}
SELECT department_id,
       PERCENTILE_CONT(0.5) WITHIN GROUP (ORDER BY salary DESC) "Median cont",
       PERCENTILE_DISC(0.5) WITHIN GROUP (ORDER BY salary DESC) "Median disc"
FROM employees
GROUP BY department_id
ORDER BY department_id;
\end{verbatim}

\begin{tabular}{|c|c|c|}
\hline
DEPARTMENT ID & Median cont & Median disc \\
\hline
10 & 4400 & 4400 \\
20 & 9500 & 13000 \\
30 & 2850 & 2900 \\
40 & 6500 & 6500 \\
50 & 3100 & 3100 \\
60 & 4800 & 4800 \\
70 & 10000 & 10000 \\
80 & 8900 & 9000 \\
90 & 17000 & 17000 \\
100 & 8000 & 8200 \\
110 & 10154 & 12008 \\
\hline
7000 & 7000 & 7000 \\
\hline
\end{tabular}

\texttt{PERCENTILE\_CONT} and \texttt{PERCENTILE\_DISC} may return different results. \texttt{PERCENTILE\_CONT} returns a computed result after doing linear interpolation. \texttt{PERCENTILE\_DISC} simply returns a value from the set of values that are aggregated over. When the percentile
value is 0.5, as in this example, PERCENTILE_CONT returns the average of the two middle values for groups with even number of elements, whereas PERCENTILE_DISC returns the value of the first one among the two middle values. For aggregate groups with an odd number of elements, both functions return the value of the middle element.

Analytic Example

In the following example, the median for Department 60 is 4800, which has a corresponding percentile (Percent_Rank) of 0.5. None of the salaries in Department 30 have a percentile of 0.5, so the median value must be interpolated between 2900 (percentile 0.4) and 2800 (percentile 0.6), which evaluates to 2850.

```
SELECT last_name, salary, department_id,
       PERCENTILE_CONT(0.5) WITHIN GROUP (ORDER BY salary DESC)
       OVER (PARTITION BY department_id) "Percentile_Cont",
       PERCENT_RANK()
       OVER (PARTITION BY department_id ORDER BY salary DESC) "Percent_Rank"
FROM employees
WHERE department_id IN (30, 60)
ORDER BY last_name, salary, department_id;
```

7.158 PERCENTILE_DISC

Syntax

```
PERCENTILE_DISC(expr) WITHIN GROUP (ORDER BY expr
ASC
DESC
)
OVER (query_partition_clause)
```

See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions of the OVER clause
Purpose

PERCENTILE_DISC is an inverse distribution function that assumes a discrete distribution model. It takes a percentile value and a sort specification and returns an element from the set. Nulls are ignored in the calculation.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

The first expr must evaluate to a numeric value between 0 and 1, because it is a percentile value. This expression must be constant within each aggregate group. The ORDER BY clause takes a single expression that can be of any type that can be sorted.

For a given percentile value P, PERCENTILE_DISC sorts the values of the expression in the ORDER BY clause and returns the value with the smallest CUME_DIST value (with respect to the same sort specification) that is greater than or equal to P.

Note:

Before processing a large amount of data with the PERCENTILE_DISC function, consider using one of the following methods to obtain approximate results more quickly than exact results:

- Set the APPROX_FOR_PERCENTILE initialization parameter to PERCENTILE_DISC or ALL before using the PERCENTILE_DISC function. Refer to Oracle Database Reference for more information on this parameter.
- Use the APPROX_PERCENTILE function instead of the PERCENTILE_DISC function. Refer to APPROX_PERCENTILE.

Aggregate Example

See aggregate example for PERCENTILE_CONT.

Analytic Example

The following example calculates the median discrete percentile of the salary of each employee in the sample table hr.employees:

```
SELECT last_name, salary, department_id,
       PERCENTILE_DISC(0.5) WITHIN GROUP (ORDER BY salary DESC)
          OVER (PARTITION BY department_id) "Percentile_Disc",
       CUME_DIST() OVER (PARTITION BY department_id
                      ORDER BY salary DESC) "Cume_Dist"
FROM employees
WHERE department_id in (30, 60)
```
ORDER BY last_name, salary, department_id;

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>DEPARTMENT_ID</th>
<th>Percentile_Disc</th>
<th>Cume_Dist</th>
</tr>
</thead>
<tbody>
<tr>
<td>Austin</td>
<td>4800</td>
<td>60</td>
<td>4800</td>
<td>.8</td>
</tr>
<tr>
<td>Baida</td>
<td>2900</td>
<td>30</td>
<td>2900</td>
<td>.5</td>
</tr>
<tr>
<td>Colmenares</td>
<td>2500</td>
<td>30</td>
<td>2900</td>
<td>1</td>
</tr>
<tr>
<td>Ernst</td>
<td>6000</td>
<td>60</td>
<td>4800</td>
<td>.4</td>
</tr>
<tr>
<td>Himuro</td>
<td>2600</td>
<td>30</td>
<td>2900</td>
<td>.833333333</td>
</tr>
<tr>
<td>Hunold</td>
<td>9000</td>
<td>60</td>
<td>4800</td>
<td>.2</td>
</tr>
<tr>
<td>Khoo</td>
<td>3100</td>
<td>30</td>
<td>2900</td>
<td>.333333333</td>
</tr>
<tr>
<td>Lorentz</td>
<td>4200</td>
<td>60</td>
<td>4800</td>
<td>1</td>
</tr>
<tr>
<td>Pataballa</td>
<td>4800</td>
<td>60</td>
<td>4800</td>
<td>.8</td>
</tr>
<tr>
<td>Raphaely</td>
<td>11000</td>
<td>30</td>
<td>2900</td>
<td>.166666667</td>
</tr>
<tr>
<td>Tobias</td>
<td>2800</td>
<td>30</td>
<td>2900</td>
<td>.666666667</td>
</tr>
</tbody>
</table>

The median value for Department 30 is 2900, which is the value whose corresponding percentile (Cume_Dist) is the smallest value greater than or equal to 0.5. The median value for Department 60 is 4800, which is the value whose corresponding percentile is the smallest value greater than or equal to 0.5.

7.159 POWER

Syntax

```
POWER(n2, n1)
```

Purpose

POWER returns \( n2 \) raised to the \( n1 \) power. The base \( n2 \) and the exponent \( n1 \) can be any numbers, but if \( n2 \) is negative, then \( n1 \) must be an integer.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If any argument is BINARY_FLOAT or BINARY_DOUBLE, then the function returns BINARY_DOUBLE. Otherwise, the function returns NUMBER.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns 3 squared:

```
SELECT POWER(3,2) "Raised"
FROM DUAL;

Raised
-------
9
```
7.160 POWERMULTISET

Syntax

```
POWERMULTISET ( expr )
```

Purpose

`POWERMULTISET` takes as input a nested table and returns a nested table of nested tables containing all nonempty subsets (called submultisets) of the input nested table.

- `expr` can be any expression that evaluates to a nested table.
- If `expr` resolves to null, then Oracle Database returns `NULL`.
- If `expr` resolves to a nested table that is empty, then Oracle returns an error.
- The element types of the nested table must be comparable. Refer to "Comparison Conditions" for information on the comparability of nonscalar types.

**Note:**

This function is not supported in PL/SQL.

Examples

First, create a data type that is a nested table of the `cust_address_tab_type` data type:

```
CREATE TYPE cust_address_tab_tab_typ AS TABLE OF cust_address_tab_typ;
/
```

Now, select the nested table column `cust_address_ntab` from the `customers_demo` table using the `POWERMULTISET` function:

```
SELECT CAST(POWERMULTISET(cust_address_ntab) AS cust_address_tab_tab_typ)
FROM customers_demo;
```

```
CAST(POWERMULTISET(CUST_ADDRESS_NTAB) AS CUST_ADDRESS_TAB_TAB_TYP)
(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
------------------------------------------------------------------
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
('514 W Superior St', '46901', 'Kokomo', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
('2515 Bloyd Ave', '46218', 'Indianapolis', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
('8768 N State Rd 37', '47404', 'Bloomington', 'IN', 'US')))
CUST_ADDRESS_TAB_TAB_TYP(CUST_ADDRESS_TAB_TYP(CUST_ADDRESS_TYP
('6445 Bay Harbor Ln', '46254', 'Indianapolis', 'IN', 'US')))
```
The preceding example requires the `customers_demo` table and a nested table column containing data. Refer to "Multiset Operators" to create this table and nested table columns.

### 7.161 POWERMULTISET_BY_CARDINALITY

#### Syntax

```
POWERMULTISET_BY_CARDINALITY(expr, cardinality)
```

#### Purpose

`POWERMULTISET_BY_CARDINALITY` takes as input a nested table and a cardinality and returns a nested table of nested tables containing all nonempty subsets (called submultisets) of the nested table of the specified cardinality.

- `expr` can be any expression that evaluates to a nested table.
- `cardinality` can be any positive integer.
- If `expr` resolves to null, then Oracle Database returns `NULL`.
- If `expr` resolves to a nested table that is empty, then Oracle returns an error.
- The element types of the nested table must be comparable. Refer to "Comparison Conditions" for information on the comparability of nonscalar types.

#### Note:

This function is not supported in PL/SQL.

#### Examples

First, create a data type that is a nested table of the `cust_address_tab_type` data type:

```
CREATE TYPE cust_address_tab_tab_typ
AS TABLE OF cust_address_tab_typ;
/
```

Next, duplicate the elements in all the nested table rows to increase the cardinality of the nested table rows to 2:

```
UPDATE customers_demo
SET cust_address_ntab = cust_address_ntab MULTISET UNION cust_address_ntab;
```

Now, select the nested table column `cust_address_ntab` from the `customers_demo` table using the `POWERMULTISET_BY_CARDINALITY` function:

```
SELECT CAST(POWERMULTISET_BY_CARDINALITY(cust_address_ntab, 2)
AS cust_address_tab_tab_typ)
FROM customers_demo;
```

```
CAST(POWERMULTISET_BY_CARDINALITY(CUST_ADDRESS_NTAB,2) AS CUST_ADDRESS_TAB_TAB_TYP)
(STREET_ADDRESS, POSTAL_CODE, CITY, STATE_PROVINCE, COUNTRY_ID)
```
The preceding example requires the `customers_demo` table and a nested table column containing data. Refer to "Multiset Operators" to create this table and nested table columns.

### 7.162 PREDICTION

**Syntax**

```
prediction ::= PREDICTION (grouping_hint schema . model cost_matrix_clause mining_attribute_clause )
```

**Analytic Syntax**

```
prediction_analytic ::= PREDICTION ( OF ANOMALY FOR expr cost_matrix_clause mining_attribute_clause ) OVER ( mining_analytic_clause )
```

**cost_matrix_clause ::=**

```
cost ::= COST MODEL AUTO (class_value, VALUES (cost_value, ))
```
**mining_attribute_clause**::= 

```
USING schema . table . expr AS alias ,
```

**mining_analytic_clause**::= 

```
query_partition_clause order_by_clause
```

---

**See Also:**

"Analytic Functions " for information on the syntax, semantics, and restrictions of `mining_analytic_clause`

---

**Purpose**

`PREDICTION` returns a prediction for each row in the selection. The data type of the returned prediction depends on whether the function performs Regression, Classification, or Anomaly Detection.

- **Regression**: Returns the expected target value for each row. The data type of the return value is the data type of the target.

- **Classification**: Returns the most probable target class (or lowest cost target class, if costs are specified) for each row. The data type of the return value is the data type of the target.

- **Anomaly Detection**: Returns 1 or 0 for each row. Typical rows are classified as 1. Rows that differ significantly from the rest of the data are classified as 0.

**cost_matrix_clause**

Costs are a biasing factor for minimizing the most harmful kinds of misclassifications. You can specify `cost_matrix_clause` for Classification or Anomaly Detection. Costs are not relevant for Regression. The `cost_matrix_clause` behaves as described for "PREDICTION_COST ".

**Syntax Choice**

`PREDICTION` can score data in one of two ways: It can apply a mining model object to the data, or it can dynamically score the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:
- **Syntax**: Use this syntax to score the data with a pre-defined model. Supply the name of a model that performs Classification, Regression, or Anomaly Detection.

- **Analytic Syntax**: Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses `mining_analytic_clause`, which specifies if the data should be partitioned for multiple model builds. The `mining_analytic_clause` supports a `query_partition_clause` and an `order_by_clause`. (See "analytic_clause::=".)
  - For Regression, specify `FOR expr`, where `expr` is an expression that identifies a target column that has a numeric data type.
  - For Classification, specify `FOR expr`, where `expr` is an expression that identifies a target column that has a character data type.
  - For Anomaly Detection, specify the keywords `OF ANOMALY`.

The syntax of the `PREDICTION` function can use an optional `GROUPING` hint when scoring a partitioned model. See GROUPING Hint.

`mining_attribute_clause`

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring.

- If you specify `USING *`, all the relevant attributes present in the input row are used.
- If you invoke the function with the analytic syntax, the `mining_attribute_clause` is used both for building the transient models and for scoring.
- If you invoke the function with a pre-defined model, the `mining_attribute_clause` should include all or some of the attributes that were used to create the model.

The following conditions apply:
- If `mining_attribute_clause` includes an attribute with the same name but a different data type from the one that was used to create the model, then the data type is converted to the type expected by the model.
- If you specify more attributes for scoring than were used to create the model, then the extra attributes are silently ignored.
- If you specify fewer attributes for scoring than were used to create the model, then scoring is performed on a best-effort basis.

---

**See Also:**

- *Oracle Data Mining User's Guide* for information about scoring.
- *Oracle Data Mining Concepts* for information about predictive data mining.
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `PREDICTION` when it is a character value.
Note:
The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User's Guide.

Example
In this example, the model dt_sh_clas_sample predicts the gender and age of customers who are most likely to use an affinity card (target = 1). The PREDICTION function takes into account the cost matrix associated with the model and uses marital status, education, and household size as predictors.

```sql
SELECT cust_gender, COUNT(*) AS cnt, ROUND(AVG(age)) AS avg_age
FROM mining_data_apply_v
WHERE PREDICTION(dt_sh_clas_sample COST MODEL
    USING cust_marital_status, education, household_size) = 1
GROUP BY cust_gender
ORDER BY cust_gender;
```

<table>
<thead>
<tr>
<th>CUST_GENDER</th>
<th>CNT</th>
<th>AVG_AGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>170</td>
<td>38</td>
</tr>
<tr>
<td>M</td>
<td>685</td>
<td>42</td>
</tr>
</tbody>
</table>

The cost matrix associated with the model dt_sh_clas_sample is stored in the table dt_sh_sample_costs. The cost matrix specifies that the misclassification of 1 is 8 times more costly than the misclassification of 0.

```sql
SQL> select * from dt_sh_sample_cost;
```

Analytic Example
In this example, dynamic regression is used to predict the age of customers who are likely to use an affinity card. The query returns the 3 customers whose predicted age is most different from the actual. The query includes information about the predictors that have the greatest influence on the prediction.

```sql
SELECT cust_id, age, pred_age, age-pred_age age_diff, pred_det
FROM (SELECT cust_id, age, pred_age, pred_det,
    RANK() OVER (ORDER BY ABS(age-pred_age) desc) rnk
FROM mining_data_apply_v)
WHERE rnk <= 3;
```

Chapter 7

PREDICTION_BOUNDS

7.163 PREDICTION_BOUNDS

Syntax

[PREDICTION_BOUNDS
(schema .
model
, confidence_level
, class_value
mining_attribute_clause )]
**Purpose**

`PREDICTION_BOUNDS` applies a Generalized Linear Model (GLM) to predict a class or a value for each row in the selection. The function returns the upper and lower bounds of each prediction in a varray of objects with fields `UPPER` and `LOWER`.

GLM can perform either regression or binary classification:

- The bounds for regression refer to the predicted target value. The data type of `UPPER` and `LOWER` is the data type of the target.
- The bounds for binary classification refer to the probability of either the predicted target class or the specified `class_value`. The data type of `UPPER` and `LOWER` is `BINARY_DOUBLE`.

If the model was built using ridge regression, or if the covariance matrix is found to be singular during the build, then `PREDICTION_BOUNDS` returns NULL for both bounds.

`confidence_level` is a number in the range (0,1). The default value is 0.95. You can specify `class_value` while leaving `confidence_level` at its default by specifying NULL for `confidence_level`.

The syntax of the `PREDICTION_BOUNDS` function can use an optional `GROUPING` hint when scoring a partitioned model. See `GROUPING Hint`.

**mining_attribute_clause**

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. This clause behaves as described for the `PREDICTION` function. (Note that the reference to analytic syntax does not apply.) See "`mining_attribute_clause::=`".

**See Also:**

- *Oracle Data Mining User's Guide* for information about scoring
- *Oracle Data Mining Concepts* for information about Generalized Linear Models
Example

The following example returns the distribution of customers whose ages are predicted with 98% confidence to be greater than 24 and less than 46.

```sql
SELECT count(cust_id) cust_count, cust_marital_status
FROM (SELECT cust_id, cust_marital_status
FROM mining_data_apply_v
WHERE PREDICTION_BOUNDS(glmr_sh_regr_sample,0.98 USING *).LOWER > 24 AND
  PREDICTION_BOUNDS(glmr_sh_regr_sample,0.98 USING *).UPPER < 46)
GROUP BY cust_marital_status;
```

### 7.164 PREDICTION_COST

**Syntax**

```sql
prediction_cost ::= 
```

**Analytic Syntax**

```sql
prediction_cost_analytic ::= 
```

---

**Note:**

The following example is excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in *Oracle Data Mining User's Guide*. 

---

**Chapter 7**

PREDICTION_COST
Purpose

`PREDICTION_COST` returns a cost for each row in the selection. The cost refers to the lowest cost class or to the specified `class`. The cost is returned as `BINARY_DOUBLE`.

`PREDICTION_COST` can perform classification or anomaly detection. For classification, the returned cost refers to a predicted target class. For anomaly detection, the returned cost refers to a classification of 1 (for typical rows) or 0 (for anomalous rows).

You can use `PREDICTION_COST` in conjunction with the `PREDICTION` function to obtain the prediction and the cost of the prediction.

`cost_matrix_clause`

Costs are a biasing factor for minimizing the most harmful kinds of misclassifications. For example, false positives might be considered more costly than false negatives.
Costs are specified in a cost matrix that can be associated with the model or defined inline in a VALUES clause. All classification algorithms can use costs to influence scoring.

Decision Tree is the only algorithm that can use costs to influence the model build. The cost matrix used to build a Decision Tree model is also the default scoring cost matrix for the model.

The following cost matrix table specifies that the misclassification of 1 is five times more costly than the misclassification of 0.

<table>
<thead>
<tr>
<th>ACTUAL_TARGET_VALUE</th>
<th>PREDICTED_TARGET_VALUE</th>
<th>COST</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>0</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1</td>
<td>0</td>
<td>5</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>0</td>
</tr>
</tbody>
</table>

In cost_matrix_clause:

- COST MODEL indicates that scoring should be performed by taking into account the scoring cost matrix associated with the model. If the cost matrix does not exist, then the function returns an error.
- COST MODEL AUTO indicates that the existence of a cost matrix is unknown. If a cost matrix exists, then the function uses it to return the lowest cost prediction. Otherwise the function returns the highest probability prediction.
- The VALUES clause specifies an inline cost matrix for class_value. For example, you could specify that the misclassification of 1 is five times more costly than the misclassification of 0 as follows:

  PREDICTION (nb_model COST (0,1) VALUES ((0, 1),(1, 5)) USING *)

If a model that has a scoring cost matrix is invoked with an inline cost matrix, then the inline costs are used.

See Also:

Oracle Data Mining User's Guide for more information about cost-sensitive prediction.

Syntax Choice

PREDICTION_COST can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.
- Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See "analytic_clause::=").
For classification, specify \texttt{FOR expr}, where \texttt{expr} is an expression that identifies a target column that has a character data type.

For anomaly detection, specify the keywords \texttt{OF ANOMALY}.

The syntax of the \texttt{PREDICTION\_COST} function can use an optional \texttt{GROUPING} hint when scoring a partitioned model. See \texttt{GROUPING Hint}.

\texttt{mining\_attribute\_clause}

\texttt{mining\_attribute\_clause} identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The \texttt{mining\_attribute\_clause} behaves as described for the \texttt{PREDICTION} function. (See "\texttt{mining\_attribute\_clause}::=".)

\end{tabular}
7.165 PREDICTION_DETAILS

Syntax

\[ \text{prediction_details} ::= \]

```
PREDICTIONDETAILS
  schema . model
  class_value
  topN DESC
  ASC
  ABS
  mining_attribute_clause
```

Analytic Syntax

\[ \text{prediction_details_analytic} ::= \]

```
PREDICTIONDETAILS
  OF ANOMALY
  FOR expr
  class_value
  topN DESC
  ASC
  ABS
  mining_attribute_clause
  OVER
  mining_analytic_clause
```

\[ \text{mining_attribute_clause} ::= \]

```
USING *
  schema . table . *
  expr
  AS alias
```

\[ \text{mining_analytic_clause} ::= \]

```
query_partition_clause
  order_by_clause
```
Purpose

PREDICTION_DETAILS returns prediction details for each row in the selection. The return value is an XML string that describes the attributes of the prediction.

For regression, the returned details refer to the predicted target value. For classification and anomaly detection, the returned details refer to the highest probability class or the specified class_value.

topN

If you specify a value for topN, the function returns the N attributes that have the most influence on the prediction (the score). If you do not specify topN, the function returns the 5 most influential attributes.

DESC, ASC, or ABS

The returned attributes are ordered by weight. The weight of an attribute expresses its positive or negative impact on the prediction. For regression, a positive weight indicates a higher value prediction; a negative weight indicates a lower value prediction. For classification and anomaly detection, a positive weight indicates a higher probability prediction; a negative weight indicates a lower probability prediction.

By default, PREDICTION_DETAILS returns the attributes with the highest positive weight (DESC). If you specify ASC, the attributes with the highest negative weight are returned. If you specify ABS, the attributes with the greatest weight, whether negative or positive, are returned. The results are ordered by absolute value from highest to lowest. Attributes with a zero weight are not included in the output.

Syntax Choice

PREDICTION_DETAILS can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a model that performs classification, regression, or anomaly detection.

- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See "analytic_clause::="."

  - For classification, specify FOR expr, where expr is an expression that identifies a target column that has a character data type.

  - For regression, specify FOR expr, where expr is an expression that identifies a target column that has a numeric data type.
For anomaly detection, specify the keywords OF ANOMALY.

The syntax of the PREDICTION_DETAILS function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See "mining_attribute_clause::=".)

See Also:

- Oracle Data Mining User's Guide for information about scoring.
- Oracle Data Mining Concepts for information about predictive data mining.

Note:

The following examples are excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User's Guide.

Example

This example uses the model svmr_sh_regr_sample to score the data. The query returns the three attributes that have the greatest influence on predicting a higher value for customer age.

```
SELECT PREDICTION_DETAILS(svmr_sh_regr_sample, null, 3 USING *) prediction_details
FROM mining_data_apply_v
WHERE cust_id = 100001;
```

Analytic Syntax

This example dynamically identifies customers whose age is not typical for the data. The query returns the attributes that predict or detract from a typical age.

```
SELECT cust_id, age, pred_age, age-pred_age age_diff, pred_det
FROM (SELECT cust_id, age, pred_age, pred_det,
       RANK() OVER (ORDER BY ABS(age-pred_age) DESC) rnk
       FROM (SELECT cust_id, age,
              PREDICTION(FOR age USING *) OVER () pred_age,
              PREDICTION_DETAILS(FOR age ABS USING *) OVER () pred_det
       FROM mining_data_apply_v
       WHERE cust_id = 100001)
       WHERE rnk = 1)
       ORDER BY age_diff
```

```
7.166 PREDICTION_PROBABILITY

Syntax

\[ \text{prediction}_\text{probability} ::= \]

Analytic Syntax

\[ \text{prediction}_\text{prob}\_\text{analytic} ::= \]

\[ \text{mining}_\text{attribute}_\text{clause} ::= \]

\[ \text{mining}_\text{analytic}_\text{clause} ::= \]

---

`rank="2"/>
<Attribute name="EDUCATION" actualValue="&lt; Bach." weight=".059"
rank="3"/>
<Attribute name="Y_Box_Games" actualValue="0" weight=".059"
rank="4"/>
<Attribute name="COUNTRY_NAME" actualValue="United States of
America" weight=".059" rank="5"/>
</Details>
Purpose

PREDICTION_PROBABILITY returns a probability for each row in the selection. The probability refers to the highest probability class or to the specified class. The data type of the returned probability is BINARY_DOUBLE.

PREDICTION_PROBABILITY can perform classification or anomaly detection. For classification, the returned probability refers to a predicted target class. For anomaly detection, the returned probability refers to a classification of 1 (for typical rows) or 0 (for anomalous rows).

You can use PREDICTION_PROBABILITY in conjunction with the PREDICTION function to obtain the prediction and the probability of the prediction.

Syntax Choice

PREDICTION_PROBABILITY can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- **Syntax** — Use the first syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.
- **Analytic Syntax** — Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See "analytic_clause::=").
  - For classification, specify FOR expr, where expr is an expression that identifies a target column that has a character data type.
  - For anomaly detection, specify the keywords OF ANOMALY.

The syntax of the PREDICTION_PROBABILITY function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.

mining_attribute_clause

mining_attribute_clause identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The mining_attribute_clause behaves as described for the PREDICTION function. (See "mining_attribute_clause::=".)
Example

The following example returns the 10 customers living in Italy who are most likely to use an affinity card.

```sql
SELECT cust_id FROM {
  SELECT cust_id
  FROM mining_data_apply_v
  WHERE country_name = 'Italy'
  ORDER BY PREDICTION_PROBABILITY(DT_SH_Clas_sample, 1 USING *)
  DESC, cust_id
  WHERE rownum < 11;
}

CUST_ID
--------
100081
100179
100185
100324
100344
100554
100662
100733
101250
101306
```

Analytic Example

This example identifies rows that are most atypical in the data in mining_data_one_class_v. Each type of marital status is considered separately so that the most anomalous rows per marital status group are returned.

The query returns three attributes that have the most influence on the determination of anomalous rows. The PARTITION BY clause causes separate models to be built and applied for each marital status. Because there is only one record with status Mabsent, no model is created for that partition (and no details are provided).

```sql
SELECT cust_id, cust_marital_status, rank_anom, anom_det FROM {
  SELECT cust_id, cust_marital_status, anom_det,
  rank() OVER (PARTITION BY CUST_MARITAL_STATUS
  ORDER BY ANOM_PROB DESC,cust_id) rank_anom FROM
```
(SELECT cust_id, cust_marital_status,
    PREDICTION_PROBABILITY(OF ANOMALY, 0 USING *)
OVER (PARTITION BY CUST_MARITAL_STATUS) anom_prob,
    PREDICTION_DETAILS(OF ANOMALY, 0, 3 USING *)
OVER (PARTITION BY CUST_MARITAL_STATUS) anom_det
FROM mining_data_one_class_v
WHERE rank_anom < 3 order by 2, 3;

CUST_ID  CUST_MARITAL_STATUS  RANK_ANOM  ANOM_DET

      </Details>

...
Analytic Syntax

prediction_set_analytic ::= 

See Also:

"Analytic Functions" for information on the syntax, semantics, and restrictions of mining_analytic_clause
Purpose

PREDICTION_SET returns a set of predictions with either probabilities or costs for each row in the selection. The return value is a varray of objects with field names PREDICTION_ID and PROBABILITY or COST. The prediction identifier is an Oracle NUMBER; the probability and cost fields are BINARY_DOUBLE.

PREDICTION_SET can perform classification or anomaly detection. For classification, the return value refers to a predicted target class. For anomaly detection, the return value refers to a classification of 1 (for typical rows) or 0 (for anomalous rows).

bestN and cutoff

You can specify bestN and cutoff to limit the number of predictions returned by the function. By default, both bestN and cutoff are null and all predictions are returned.

- bestN is the N predictions that are either the most probable or the least costly. If multiple predictions share the Nth probability or cost, then the function chooses one of them.
- cutoff is a value threshold. Only predictions with probability greater than or equal to cutoff, or with cost less than or equal to cutoff, are returned. To filter by cutoff only, specify NULL for bestN. If the function uses a cost_matrix_clause with COST MODEL AUTO, then cutoff is ignored.

You can specify bestN with cutoff to return up to the N most probable predictions that are greater than or equal to cutoff. If costs are used, specify bestN with cutoff to return up to the N least costly predictions that are less than or equal to cutoff.

cost_matrix_clause

You can specify cost_matrix_clause as a biasing factor for minimizing the most harmful kinds of misclassifications. cost_matrix_clause behaves as described for "PREDICTION_COST ".

Syntax Choice

PREDICTION_SET can score the data in one of two ways: It can apply a mining model object to the data, or it can dynamically mine the data by executing an analytic clause that builds and applies one or more transient mining models. Choose Syntax or Analytic Syntax:

- Syntax — Use the first syntax to score the data with a pre-defined model. Supply the name of a model that performs classification or anomaly detection.
- Analytic Syntax — Use the analytic syntax to score the data without a pre-defined model. The analytic syntax uses mining_analytic_clause, which specifies if the data should be partitioned for multiple model builds. The mining_analytic_clause supports a query_partition_clause and an order_by_clause. (See "analytic_clause::=".)
  - For classification, specify FOR expr, where expr is an expression that identifies a target column that has a character data type.
  - For anomaly detection, specify the keywords OF ANOMALY.

The syntax of the PREDICTION_SET function can use an optional GROUPING hint when scoring a partitioned model. See GROUPING Hint.
mining_attribute_clause

`mining_attribute_clause` identifies the column attributes to use as predictors for scoring. When the function is invoked with the analytic syntax, these predictors are also used for building the transient models. The `mining_attribute_clause` behaves as described for the `PREDICTION` function. (See "`mining_attribute_clause`::=".)

See Also:

- Oracle Data Mining User's Guide for information about scoring.
- Oracle Data Mining Concepts for information about predictive data mining.

Note:

The following example is excerpted from the Data Mining sample programs. For more information about the sample programs, see Appendix A in Oracle Data Mining User's Guide.

Example

This example lists the probability and cost that customers with ID less than 100006 will use an affinity card. This example has a binary target, but such a query is also useful for multiclass classification such as low, medium, and high.

```sql
SELECT T.cust_id, S.prediction, S.probability, S.cost
FROM (SELECT cust_id,
    PREDICTION_SET(dt_sh_clas_sample COST MODEL USING *) pset
    FROM mining_data_apply_v
    WHERE cust_id < 100006) T,
    TABLE(T.pset) S
ORDER BY cust_id, S.prediction;
```

7.168 PRESENTNNV

Syntax

```
PRESENTNNV (cell_reference, expr1, expr2)
```

Purpose

The PRESENTNNV function can be used only in the `model_clause` of the `SELECT` statement and then only on the right-hand side of a model rule. It returns `expr1` when `cell_reference` exists prior to the execution of the `model_clause` and is not null when `PRESENTNNV` is evaluated. Otherwise it returns `expr2`. This function differs from `NVL2` in that `NVL2` evaluates the data at the time it is executed, rather than evaluating the data as it was prior to the execution of the `model_clause`.

See Also:

- `model_clause` and "Model Expressions" for the syntax and semantics
- `NVL2` for comparison
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of `PRESENTNNV` when it is a character value

Examples

In the following example, if a row containing sales for the Mouse Pad for the year 2002 exists, and the sales value is not null, then the sales value remains unchanged. If the row exists and the sales value is null, then the sales value is set to 10. If the row does not exist, then the row is created with the sales value set to 10.

7.169 PRESENTV

Syntax

\[
\text{PRESENTV} ( \text{cell Reference}, \text{expr1}, \text{expr2})
\]

Purpose

The PRESENTV function can be used only within the model_clause of the SELECT statement and then only on the right-hand side of a model rule. It returns \( \text{expr1} \) when, prior to the execution of the model_clause, \( \text{cell Reference} \) exists. Otherwise it returns \( \text{expr2} \).

See Also:

- model_clause and "Model Expressions" for the syntax and semantics
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the return value of PRESENTV when it is a character value

Examples

In the following example, if a row containing sales for the Mouse Pad for the year 2000 exists, then the sales value for the Mouse Pad for the year 2001 is set to the sales value for the Mouse Pad for the year 2000. If the row does not exist, then a row is created with the sales value for the Mouse Pad for year 2000 set to 0.

16 rows selected.

The preceding example requires the view sales_view_ref. Refer to "The MODEL clause: Examples" to create this view.

### 7.170 PREVIOUS

#### Syntax

```sql
PREVIOUS(cell_reference)
```

#### Purpose

The PREVIOUS function can be used only in the model_clause of the SELECT statement and then only in the ITERATE ... [UNTIL] clause of the model_rules_clause. It returns the value of cell_reference at the beginning of each iteration.

**See Also:**

- `model_clause` and "Model Expressions" for the syntax and semantics
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of PREVIOUS when it is a character value
Examples

The following example repeats the rules, up to 1000 times, until the difference between the values of `cur_val` at the beginning and at the end of an iteration is less than one:

```
SELECT dim_col, cur_val, num_of_iterations
FROM (SELECT 1 AS dim_col, 10 AS cur_val FROM dual)
MODEL
  DIMENSION BY (dim_col)
  MEASURES (cur_val, 0 num_of_iterations)
  IGNORE NAV
  UNIQUE DIMENSION
  RULES ITERATE (1000) UNTIL (PREVIOUS(cur_val[1]) - cur_val[1] < 1)
  {
    cur_val[1] = cur_val[1]/2,
  };
```

```
DIM_COL   CUR_VAL   NUM_OF_ITERATIONS
---------- ---------- -----------------
1          .625                 4
```

7.171 RANK

Aggregate Syntax

```
rank_aggregate ::= 
```

```
RANK ( expr
, 
) WITHIN GROUP
( ORDER BY expr
DESC
ASC
NULLS
FIRST
LAST
,
)
```

Analytic Syntax

```
rank_analytic ::= 
```

```
RANK ( ) OVER (
query_partition_clause
order_by_clause
)
```

See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions
Purpose

RANK calculates the rank of a value in a group of values. The return type is NUMBER.

See Also:

Table 2-8 for more information on implicit conversion and "Numeric Precedence" for information on numeric precedence

Rows with equal values for the ranking criteria receive the same rank. Oracle Database then adds the number of tied rows to the tied rank to calculate the next rank. Therefore, the ranks may not be consecutive numbers. This function is useful for top-N and bottom-N reporting.

- As an aggregate function, RANK calculates the rank of a hypothetical row identified by the arguments of the function with respect to a given sort specification. The arguments of the function must all evaluate to constant expressions within each aggregate group, because they identify a single row within each group. The constant argument expressions and the expressions in the ORDER BY clause of the aggregate match by position. Therefore, the number of arguments must be the same and their types must be compatible.

- As an analytic function, RANK computes the rank of each row returned from a query with respect to the other rows returned by the query, based on the values of the value_exprs in the order_by_clause.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation RANK uses to compare character values for the ORDER BY clause

Aggregate Example

The following example calculates the rank of a hypothetical employee in the sample table hr.employees with a salary of $15,500 and a commission of 5%:

```
SELECT RANK(15500, .05) WITHIN GROUP
  (ORDER BY salary, commission_pct) "Rank"
FROM employees;
```

```
               Rank
----------
             105
```

Similarly, the following query returns the rank for a $15,500 salary among the employee salaries:

```
SELECT RANK(15500) WITHIN GROUP
  (ORDER BY salary DESC) "Rank of 15500"
FROM employees;
```
Analytic Example

The following statement ranks the employees in the sample hr schema in department 60 based on their salaries. Identical salary values receive the same rank and cause nonconsecutive ranks. Compare this example with the analytic example for DENSE_RANK.

```sql
SELECT department_id, last_name, salary,
       RANK() OVER (PARTITION BY department_id ORDER BY salary) RANK
FROM employees WHERE department_id = 60
ORDER BY RANK, last_name;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>60</td>
<td>Lorentz</td>
<td>4200</td>
<td>1</td>
</tr>
<tr>
<td>60</td>
<td>Austin</td>
<td>4800</td>
<td>2</td>
</tr>
<tr>
<td>60</td>
<td>Pataballa</td>
<td>4800</td>
<td>2</td>
</tr>
<tr>
<td>60</td>
<td>Ernst</td>
<td>6000</td>
<td>4</td>
</tr>
<tr>
<td>60</td>
<td>Hunold</td>
<td>9000</td>
<td>5</td>
</tr>
</tbody>
</table>

7.172 RATIO_TO_REPORT

Syntax

```sql
RATIO_TO_REPORT(expr) OVER(query_partition_clause)
```

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions, including valid forms of `expr`.

Purpose

RATIO_TO_REPORT is an analytic function. It computes the ratio of a value to the sum of a set of values. If `expr` evaluates to null, then the ratio-to-report value also evaluates to null.

The set of values is determined by the `query_partition_clause`. If you omit that clause, then the ratio-to-report is computed over all rows returned by the query.

You cannot nest analytic functions by using RATIO_TO_REPORT or any other analytic function for `expr`. However, you can use other built-in function expressions for `expr`. Refer to "About SQL Expressions" for information on valid forms of `expr`.

Examples

The following example calculates the ratio-to-report value of each purchasing clerk's salary to the total of all purchasing clerks' salaries:
SELECT last_name, salary, RATIO_TO_REPORT(salary) OVER () AS rr
FROM employees
WHERE job_id = 'PU_CLERK'
ORDER BY last_name, salary, rr;

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>RR</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baida</td>
<td>2900</td>
<td>.208633094</td>
</tr>
<tr>
<td>Colmenares</td>

</tr>
<tr>
<td>Himuro</td>
<td>2600</td>
<td>.18705036</td>
</tr>
<tr>
<td>Khoo</td>
<td>3100</td>
<td>.223021583</td>
</tr>
<tr>
<td>Tobias</td>
<td>2800</td>
<td>.201438849</td>
</tr>
</tbody>
</table>

7.173 RAWTOHEX

Syntax

RAWTOHEX (raw)

Purpose

RAWTOHEX converts raw to a character value containing its hexadecimal representation.

As a SQL built-in function, RAWTOHEX accepts an argument of any scalar data type other than LONG, LONG RAW, CLOB, NCLOB, BLOB, or BFILE. If the argument is of a data type other than RAW, then this function converts the argument value, which is represented using some number of data bytes, into a RAW value with the same number of data bytes. The data itself is not modified in any way, but the data type is recast to a RAW data type.

This function returns a VARCHAR2 value with the hexadecimal representation of bytes that make up the value of raw. Each byte is represented by two hexadecimal digits.

>Note:

RAWTOHEX functions differently when used as a PL/SQL built-in function. Refer to Oracle Database Development Guide for more information.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of RAWTOHEX.

Examples

The following hypothetical example returns the hexadecimal equivalent of a RAW column value:
SELECT RAWTOHEX(raw_column) "Graphics"
FROM graphics;

Graphics
--------
7D

See Also:
"RAW and LONG RAW Data Types" and HEXTORAW

7.174 RAWTONHEX

Syntax

RAWTONHEX ( raw )

Purpose

RAWTONHEX converts raw to a character value containing its hexadecimal representation. RAWTONHEX (raw) is equivalent to TO_NCHAR (RAWTOHEX (raw)). The value returned is always in the national character set.

Note:

RAWTONHEX functions differently when used as a PL/SQL built-in function. Refer to Oracle Database Development Guide for more information.

Examples

The following hypothetical example returns the hexadecimal equivalent of a RAW column value:

```
SELECT RAWTONHEX(raw_column),
       DUMP ( RAWTONHEX (raw_column) ) "DUMP"
FROM graphics;
```

RAWTONHEX(RA)           DUMP
----------------------- ------------------------------
7D                      Typ=1 Len=4: 0,55,0,68

7.175 REF

Syntax

REF ( correlation_variable )

Chapter 7
RAWTONHEX
7-272
Purpose

REF takes as its argument a correlation variable (table alias) associated with a row of an object table or an object view. A REF value is returned for the object instance that is bound to the variable or row.

Examples

The sample schema oe contains a type called cust_address_typ, described as follows:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>STREET_ADDRESS</td>
<td>VARCHAR2(40)</td>
</tr>
<tr>
<td>POSTAL_CODE</td>
<td>VARCHAR2(10)</td>
</tr>
<tr>
<td>CITY</td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>STATE_PROVINCE</td>
<td>VARCHAR2(10)</td>
</tr>
<tr>
<td>COUNTRY_ID</td>
<td>CHAR(2)</td>
</tr>
</tbody>
</table>

The following example creates a table based on the sample type oe.cust_address_typ, inserts a row into the table, and retrieves a REF value for the object instance of the type in the addresses table:

```
CREATE TABLE addresses OF cust_address_typ;

INSERT INTO addresses VALUES ('123 First Street', '4GF H1J', 'Our Town', 'Ourcounty', 'US');

SELECT REF(e) FROM addresses e;
```

REF(E)

```
00002802097CD1261E51925B60E0340800208254367CD1261E51905B60E034080020825436010101820000
```

See Also:

Oracle Database Object-Relational Developer's Guide for information on REFS

7.176 REFTOHEX

Syntax

```
REFTOHEX(expr)
```

Purpose

REFTOHEX converts argument expr to a character value containing its hexadecimal equivalent. expr must return a REF.
Examples

The sample schema `oe` contains a `warehouse_typ`. The following example builds on that type to illustrate how to convert the `REF` value of a column to a character value containing its hexadecimal equivalent:

```sql
CREATE TABLE warehouse_table OF warehouse_typ
  (PRIMARY KEY (warehouse_id));

CREATE TABLE location_table
  (location_number NUMBER, building REF warehouse_typ
   SCOPE IS warehouse_table);

INSERT INTO warehouse_table VALUES (1, 'Downtown', 99);
INSERT INTO location_table SELECT 10, REF(w) FROM warehouse_table w;
SELECT REFTOHEX(building) FROM location_table;

REFTOHEX(BUILDING)
0000220208859B5E9255C31760E034080020825436859B5E9255C21760E034080020825436
```

7.177 REGEXP_COUNT

Syntax

```
REGEXP_COUNT(source_char, pattern, position, match_param)
```

Purpose

REGEXP_COUNT complements the functionality of the REGEXP_INSTR function by returning the number of times a pattern occurs in a source string. The function evaluates strings using characters as defined by the input character set. It returns an integer indicating the number of occurrences of `pattern`. If no match is found, then the function returns 0.

- `source_char` is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.

- `pattern` is the regular expression. It is usually a text literal and can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. It can contain up to 512 bytes. If the data type of `pattern` is different from the data type of `source_char`, then Oracle Database converts `pattern` to the data type of `source_char`.

- `position` is a positive integer indicating the character of `source_char` where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of `source_char`. After finding the first occurrence of
pattern, the database searches for a second occurrence beginning with the first character following the first occurrence.

- **match_param** is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the condition.

The value of **match_param** can include one or more of the following characters:

- 'i' specifies case-insensitive matching, even if the determined collation of the condition is case-sensitive.
- 'c' specifies case-sensitive and accent-sensitive matching, even if the determined collation of the condition is case-insensitive or accent-insensitive.
- 'n' allows the period (.), which is the match-any-character character, to match the newline character. If you omit this parameter, then the period does not match the newline character.
- 'm' treats the source string as multiple lines. Oracle interprets the caret (^) and dollar sign ($) as the start and end, respectively, of any line anywhere in the source string, rather than only at the start or end of the entire source string. If you omit this parameter, then Oracle treats the source string as a single line.
- 'x' ignores whitespace characters. By default, whitespace characters match themselves.

If the value of **match_param** contains multiple contradictory characters, then Oracle uses the last character. For example, if you specify 'ic', then Oracle uses case-sensitive and accent-sensitive matching. If the value contains a character other than those shown above, then Oracle returns an error.

If you omit **match_param**, then:

- The default case and accent sensitivity are determined by the determined collation of the **REGEXP_COUNT** function.
- A period (.) does not match the newline character.
- The source string is treated as a single line.

### See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation **REGEXP_COUNT** uses to compare characters from **source_char** with characters from **pattern**.

### Examples

The following example shows that subexpressions parentheses in pattern are ignored:

```sql
SELECT REGEXP_COUNT('123123123123123', '(12)3', 1, 'i') REGEXP_COUNT
FROM DUAL;
```

REGEXP_COUNT
-------------
5
In the following example, the function begins to evaluate the source string at the third character, so skips over the first occurrence of pattern:

```sql
SELECT REGEXP_COUNT('123123123123', '123', 3, 'i') COUNT FROM DUAL;
```

```
COUNT ----------
3
```

**REGEXP_COUNT simple matching: Examples**

In the following example, `REGEXP_COUNT` validates the supplied string for the given pattern and returns the number of alphabetic letters:

```sql
select regexp_count('ABC123', '[A-Z]'), regexp_count('A1B2C3', '[A-Z]') from dual;
```

```
REGEXP_COUNT('ABC123','[A-Z]')  REGEXP_COUNT('A1B2C3','[A-Z]')
------------------------------- ------------------------------
3                    3
```

In the following example, `REGEXP_COUNT` validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number:

```sql
select regexp_count('ABC123', '[A-Z][0-9]'), regexp_count('A1B2C3', '[A-Z][0-9]') from dual;
```

```
REGEXP_COUNT('ABC123','[A-Z][0-9]')  REGEXP_COUNT('A1B2C3','[A-Z][0-9]')
----------------------------------- -----------------------------------
1                      3
```

In the following example, `REGEXP_COUNT` validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number only at the beginning of the string:

```sql
select regexp_count('ABC123', '[A-Z][0-9]'), regexp_count('A1B2C3', '[A-Z][0-9]') from dual;
```

```
REGEXP_COUNT('ABC123','^[A-Z][0-9]')  REGEXP_COUNT('A1B2C3','^[A-Z][0-9]')
------------------------------------ ------------------------------------
0                    1
```

In the following example, `REGEXP_COUNT` validates the supplied string for the given pattern and returns the number of alphabetic letters followed by two digits of number only contained within the string:

```sql
select regexp_count('ABC123', '[A-Z][0-9]{2}'), regexp_count('A1B2C3', '[A-Z][0-9]{2}') from dual;
```

```
REGEXP_COUNT('ABC123','[A-Z][0-9]{2}')  REGEXP_COUNT('A1B2C3','[A-Z][0-9]{2}')
-------------------------------------- --------------------------------------
1                        0
```

In the following example, `REGEXP_COUNT` validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number within the first two occurrences from the beginning of the string:

```sql
select regexp_count('ABC123', '([A-Z][0-9])2'), regexp_count('A1B2C3', '([A-Z][0-9])2') from dual;
```

```
REGEXP_COUNT('ABC123','([A-Z][0-9])2')  REGEXP_COUNT('A1B2C3','([A-Z][0-9])2')
```

Chapter 7

REGEXP_COUNT
REGEXP_COUNT advanced matching: Examples

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters:

```sql
select regexp_count('ABC123', '[A-Z]') Match_char_ABC_count, 
regexp_count('A1B2C3', '[A-Z]') Match_char_ABC_count from dual;
```

<table>
<thead>
<tr>
<th>MATCH_CHAR_ABC_COUNT</th>
<th>MATCH_CHAR_ABC_COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>3</td>
</tr>
</tbody>
</table>

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number:

```sql
select regexp_count('ABC123', '[A-Z][0-9]') Match_string_C1_count, 
regexp_count('A1B2C3', '[A-Z][0-9]') Match_strings_A1_B2_C3_count from dual;
```

<table>
<thead>
<tr>
<th>MATCH_STRING_C1_COUNT</th>
<th>MATCH_STRINGS_A1_B2_C3_COUNT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>3</td>
</tr>
</tbody>
</table>

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number only at the beginning of the string:

```sql
select regexp_count('ABC123A5', '^[A-Z][0-9]') Char_num_like_A1_at_start, 
regexp_count('A1B2C3', '^[A-Z][0-9]') Char_num_like_A1_at_start from dual;
```

<table>
<thead>
<tr>
<th>CHAR_NUM_LIKE_A1_AT_START</th>
<th>CHAR_NUM_LIKE_A1_AT_START</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by two digits of number only contained within the string:

```sql
select regexp_count('ABC123', '[A-Z][0-9]{2}') Char_num_like_A12_anywhere, 
regexp_count('A1B2C34', '[A-Z][0-9]{2}') Char_num_like_A12_anywhere from dual;
```

<table>
<thead>
<tr>
<th>CHAR_NUM_LIKE_A12_ANYWHERE</th>
<th>CHAR_NUM_LIKE_A12_ANYWHERE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

In the following example, REGEXP_COUNT validates the supplied string for the given pattern and returns the number of alphabetic letters followed by a single digit number within the first two occurrences from the beginning of the string:
select regexp_count('ABC12D3', '([A-Z][0-9]){2}') Char_num_within_2_places,
regexp_count('A1B2C3', '([A-Z][0-9]){2}') Char_num_within_2_places from dual;

<table>
<thead>
<tr>
<th>CHAR_NUM_WITHIN_2_PLACES</th>
<th>CHAR_NUM_WITHIN_2_PLACES</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

REGEXP_COUNT case-sensitive matching: Examples

The following statements create a table regexp_temp and insert values into it:

CREATE TABLE regexp_temp(empName varchar2(20));

INSERT INTO regexp_temp (empName) VALUES ('John Doe');
INSERT INTO regexp_temp (empName) VALUES ('Jane Doe');

In the following example, the statement queries the employee name column and searches for the lowercase of character ‘E’:

SELECT empName, REGEXP_COUNT(empName, 'e', 1, 'c') "CASE_SENSITIVE_E" From regexp_temp;

EMPNAME          CASE_SENSITIVE_E
-------------------- ----------------
John Doe                1
Jane Doe                2

In the following example, the statement queries the employee name column and searches for the lowercase of character ‘O’:

SELECT empName, REGEXP_COUNT(empName, 'o', 1, 'c') "CASE_SENSITIVE_O" From regexp_temp;

EMPNAME          CASE_SENSITIVE_O
-------------------- ----------------
John Doe                2
Jane Doe                1

In the following example, the statement queries the employee name column and searches for the lowercase or uppercase of character ‘E’:

SELECT empName, REGEXP_COUNT(empName, 'E', 1, 'i') "CASE_INSENSITIVE_E" From regexp_temp;

EMPNAME          CASE_INSENSITIVE_E
-------------------- ------------------
John Doe                  1
Jane Doe                  2

In the following example, the statement queries the employee name column and searches for the lowercase of string ‘DO’:
In the following example, the statement queries the employee name column and searches for the lowercase or uppercase of string ‘AN’:

```sql
SELECT empName, REGEXP_COUNT(empName, 'an', 1, 'c') "CASE_SENSITIVE_STRING" From regexp_temp;

<table>
<thead>
<tr>
<th>EMPNAME</th>
<th>CASE_SENSITIVE_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>John Doe</td>
<td>0</td>
</tr>
<tr>
<td>Jane Doe</td>
<td>1</td>
</tr>
</tbody>
</table>
```

---

### 7.178 REGEXP_INSTR

**Syntax**

```
REGEXP_INSTR(source_char, pattern, position, occurrence, return_opt, match_param, subexpr)
```

**Purpose**

REGEXP_INSTR extends the functionality of the INSTR function by letting you search a string for a regular expression pattern. The function evaluates strings using characters as defined by the input character set. It returns an integer indicating the beginning or ending position of the matched substring, depending on the value of the return_option argument. If no match is found, then the function returns 0.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

- **source_char** is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.
• **pattern** is the regular expression. It is usually a text literal and can be of any of the data types **CHAR**, **VARCHAR2**, **NCHAR**, or **NVARCHAR2**. It can contain up to 512 bytes. If the data type of **pattern** is different from the data type of **source_char**, then Oracle Database converts **pattern** to the data type of **source_char**. For a listing of the operators you can specify in **pattern**, refer to Oracle Regular Expression Support.

• **position** is a positive integer indicating the character of **source_char** where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of **source_char**.

• **occurrence** is a positive integer indicating which occurrence of **pattern** in **source_char** Oracle should search for. The default is 1, meaning that Oracle searches for the first occurrence of **pattern**. If **occurrence** is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of **pattern**, and so forth. This behavior is different from the **INSTR** function, which begins its search for the second occurrence at the second character of the first occurrence.

• **return_option** lets you specify what Oracle should return in relation to the occurrence:
  – If you specify 0, then Oracle returns the position of the first character of the occurrence. This is the default.
  – If you specify 1, then Oracle returns the position of the character following the occurrence.

• **match_param** is a character expression of the data type **VARCHAR2** or **CHAR** that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for **REGEXP_COUNT**. Refer to **REGEXP_COUNT** for detailed information.

• For a **pattern** with subexpressions, **subexpr** is an integer from 0 to 9 indicating which subexpression in **pattern** is the target of the function. The **subexpr** is a fragment of pattern enclosed in parentheses. Subexpressions can be nested. Subexpressions are numbered in order in which their left parentheses appear in pattern. For example, consider the following expression:

```
01234((abc)(de)f)ghi)45(678)
```

This expression has five subexpressions in the following order: "abcdefghi" followed by "abcdef", "abc", "de" and "678".

If **subexpr** is zero, then the position of the entire substring that matches the **pattern** is returned. If **subexpr** is greater than zero, then the position of the substring fragment that corresponds to subexpression number **subexpr** in the matched substring is returned. If **pattern** does not have at least **subexpr** subexpressions, the function returns zero. A null **subexpr** value returns NULL. The default value for **subexpr** is zero.
See Also:

- `INSTR` and `REGEXP_SUBSTR`
- `REGEXP_REPLACE` and `REGEXP_LIKE` Condition
- Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation `REGEXP_INSTR` uses to compare characters from `source_char` with characters from `pattern`

Examples

The following example examines the string, looking for occurrences of one or more non-blank characters. Oracle begins searching at the first character in the string and returns the starting position (default) of the sixth occurrence of one or more non-blank characters.

```sql
SELECT REGEXP_INSTR('500 Oracle Parkway, Redwood Shores, CA', '[^ ]+', 1, 6) "REGEXP_INSTR"
FROM DUAL;
```

```
REGEXP_INSTR
------------
    37
```

The following example examines the string, looking for occurrences of words beginning with `s`, `r`, or `p`, regardless of case, followed by any six alphabetic characters. Oracle begins searching at the third character in the string and returns the position in the string of the character following the second occurrence of a seven-letter word beginning with `s`, `r`, or `p`, regardless of case.

```sql
SELECT REGEXP_INSTR('500 Oracle Parkway, Redwood Shores, CA', '[s|r|p][[:alpha:]][{6}', 3, 2, 1, 'i') "REGEXP_INSTR"
FROM DUAL;
```

```
REGEXP_INSTR
------------
    28
```

The following examples use the `subexpr` argument to search for a particular subexpression in `pattern`. The first statement returns the position in the source string of the first character in the first subexpression, which is '123':

```sql
SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 1) "REGEXP_INSTR"
FROM DUAL;
```

```
REGEXP_INSTR
-------------
    1
```

The next statement returns the position in the source string of the first character in the second subexpression, which is '45678':

```sql
SELECT REGEXP_INSTR('1234567890', '(123)\(4(56)(78)\)', 1, 0, 'i', 1) "REGEXP_INSTR"
FROM DUAL;
```

```
REGEXP_INSTR
-------------
    1
```
SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 2) "REGEXP_INSTR" FROM DUAL;

REGEXP_INSTR
-------------------
    4

The next statement returns the position in the source string of the first character in the fourth subexpression, which is '78':

SELECT REGEXP_INSTR('1234567890', '(123)(4(56)(78))', 1, 1, 0, 'i', 4) "REGEXP_INSTR" FROM DUAL;

REGEXP_INSTR
-------------------
    7

**REGEXP_INSTR** pattern matching: Examples

The following statements create a table regexp_temp and insert values into it:

CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));

INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe');

In the following example, the statement queries the email column and searches for valid email addresses:

SELECT emailID, REGEXP_INSTR(emailID, '\w+@\w+(\..\w+)+') "IS_A_VALID_EMAIL" FROM regexp_temp;

EMAILID          IS_A_VALID_EMAIL
-------------------- ----------------
     johndoe@example.com            1
          example.com                0

In the following example, the statement queries the email column and returns the count of valid email addresses:

EMPNAME        Valid Email            FIELD_WITH_VALID_EMAIL
--------    -------------------    ----------------------
     John Doe    johndoe@example.com    1
     Jane Doe

7.179 REGEXP_REPLACE

Syntax

```
REGEXP_REPLACE ( source_char, pattern, replace_string, position, occurrence, match_param )
```

Purpose

REGEXP_REPLACE extends the functionality of the REPLACE function by letting you search a string for a regular expression pattern. By default, the function returns source_char with every occurrence of the regular expression pattern replaced with replace_string. The string returned is in the same character set as source_char. The function returns VARCHAR2 if the first argument is not a LOB and returns CLOB if the first argument is a LOB.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.

- **source_char** is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB or NCLOB.

- **pattern** is the regular expression. It is usually a text literal and can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. It can contain up to 512 bytes. If the data type of pattern is different from the data type of source_char, then Oracle Database converts pattern to the data type of source_char. For a listing of the operators you can specify in pattern, refer to Oracle Regular Expression Support.

- **replace_string** can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. If replace_string is a CLOB or NCLOB, then Oracle truncates replace_string to 32K. The replace_string can contain up to 500 backreferences to subexpressions in the form \n, where \n is a number from 1 to 9. If you want to include a backslash (\) in replace_string, then you must precede it with the escape character, which is also a backslash. For example, to replace \2 you would enter \\2. For more information on backreference expressions, refer to the notes to "Oracle Regular Expression Support", Table D-1.

- **position** is a positive integer indicating the character of source_char where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of source_char.

- **occurrence** is a nonnegative integer indicating the occurrence of the replace operation:
  - If you specify 0, then Oracle replaces all occurrences of the match.
If you specify a positive integer \( n \), then Oracle replaces the \( n \)th occurrence. If occurrence is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of pattern, and so forth. This behavior is different from the INSTR function, which begins its search for the second occurrence at the second character of the first occurrence.

- match_param is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for REGEXP_COUNT. Refer to REGEXP_COUNT for detailed information.

**See Also:**
- REPLACE
- REGEXP_INSTR, REGEXP_SUBSTR, and REGEXP_LIKE Condition
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation REGEXP_REPLACE uses to compare characters from source_char with characters from pattern, and for the collation derivation rules, which define the collation assigned to the character return value of this function

**Examples**

The following example examines phone_number, looking for the pattern xxx.xxx.xxx.x. Oracle reformats this pattern with \((xxx) xxx-xxxx\).

```sql
SELECT REGEXP_REPLACE(phone_number, '([^[:digit:]]{3}).([^[:digit:]]{3}).([^[:digit:]]{4})', '${1} \2-\3') "REGEXP_REPLACE"
FROM employees
ORDER BY "REGEXP_REPLACE";
```

<table>
<thead>
<tr>
<th>REGEXP_REPLACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>(515) 123-4444</td>
</tr>
<tr>
<td>(515) 123-4567</td>
</tr>
<tr>
<td>(515) 123-4568</td>
</tr>
<tr>
<td>(515) 123-4569</td>
</tr>
<tr>
<td>(515) 123-5555</td>
</tr>
<tr>
<td>...</td>
</tr>
</tbody>
</table>

The following example examines country_name. Oracle puts a space after each non-null character in the string.

```sql
SELECT REGEXP_REPLACE(country_name, '(.\)', ' \1 ') "REGEXP_REPLACE"
FROM countries;
```

<table>
<thead>
<tr>
<th>REGEXP_REPLACE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Argentina</td>
</tr>
<tr>
<td>Australia</td>
</tr>
</tbody>
</table>
The following example examines the string, looking for two or more spaces. Oracle replaces each occurrence of two or more spaces with a single space.

```
SELECT REGEXP_REPLACE('500   Oracle     Parkway,    Redwood  Shores, CA', '{ }{2,} ', '') "REGEXP_REPLACE"
FROM DUAL;
```

REGEXP_REPLACE
--------------------------------------
500 Oracle Parkway, Redwood Shores, CA

REGEXP_REPLACE: Examples

The following statements create a table `regexp_temp` and insert values into it:

```
CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));
INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe@example.com');
```

The following statement replaces the string ‘Jane’ with ‘John’:

```
SELECT empName, REGEXP_REPLACE (empName, 'Jane', 'John') "STRING_REPLACE" FROM regexp_temp;
```

EMPNAME        STRING_REPLACE
--------    --------------
John Doe    John Doe
Jane Doe    John Doe

The following statement replaces the string ‘John’ with ‘Jane’:

```
SELECT empName, REGEXP_REPLACE (empName, 'Jane', 'John') "STRING_REPLACE" FROM regexp_temp;
```

EMPNAME        STRING_REPLACE
--------    --------------
John Doe    Jane Doe
Jane Doe    Jane Doe

Live SQL:

View and run a related example on Oracle Live SQL at REGEXP_REPLACE - Pattern Matching

REGEXP_REPLACE: Examples
The following statement replaces all the numbers in a string:

```sql
WITH strings AS (
    SELECT 'abc123' s FROM dual union all
    SELECT '123abc' s FROM dual union all
    SELECT 'a1b2c3' s FROM dual
)
SELECT s "STRING", regexp_replace(s, '[0-9]', '') "MODIFIED_STRING"
FROM strings;
```

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>abc123</td>
<td>abc</td>
</tr>
<tr>
<td>123abc</td>
<td>abc</td>
</tr>
<tr>
<td>a1b2c3</td>
<td>abc</td>
</tr>
</tbody>
</table>

The following statement replaces the first numeric occurrence in a string:

```sql
WITH strings AS (
    SELECT 'abc123' s from DUAL union all
    SELECT '123abc' s from DUAL union all
    SELECT 'a1b2c3' s from DUAL
)
SELECT s "STRING", REGEXP_REPLACE(s, '[0-9]', '', 1, 1) "MODIFIED_STRING"
FROM strings;
```

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>abc123</td>
<td>abc23</td>
</tr>
<tr>
<td>123abc</td>
<td>23abc</td>
</tr>
<tr>
<td>a1b2c3</td>
<td>ab2c3</td>
</tr>
</tbody>
</table>

The following statement replaces the second numeric occurrence in a string:

```sql
WITH strings AS (
    SELECT 'abc123' s from DUAL union all
    SELECT '123abc' s from DUAL union all
    SELECT 'a1b2c3' s from DUAL
)
SELECT s "STRING", REGEXP_REPLACE(s, '[0-9]', '', 1, 2) "MODIFIED_STRING"
FROM strings;
```

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>abc123</td>
<td>abc13</td>
</tr>
<tr>
<td>123abc</td>
<td>13abc</td>
</tr>
<tr>
<td>a1b2c3</td>
<td>a1bc3</td>
</tr>
</tbody>
</table>
The following statement replaces multiple spaces in a string with a single space:

WITH strings AS (  
SELECT 'Hello  World' s FROM dual union all  
SELECT 'Hello       World' s FROM dual union all  
SELECT 'Hello,   World  !' s FROM dual  
)  
SELECT s "STRING", regexp_replace(s, ' {2,}', ' ') "MODIFIED_STRING"  
FROM strings;

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hello World</td>
<td>Hello World</td>
</tr>
<tr>
<td>Hello World</td>
<td>Hello World</td>
</tr>
<tr>
<td>Hello, World!</td>
<td>Hello, World!</td>
</tr>
</tbody>
</table>

The following statement converts camel case strings to a string containing lower case words separated by an underscore:

WITH strings as (  
SELECT 'AddressLine1' s FROM dual union all  
SELECT 'ZipCode' s FROM dual union all  
SELECT 'Country' s FROM dual  
)  
SELECT s "STRING", lower(regexp_replace(s, '([A-Z0-9])', '_\1', 2)) "MODIFIED_STRING"  
FROM strings;

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>AddressLine1</td>
<td>address_line_1</td>
</tr>
<tr>
<td>ZipCode</td>
<td>zip_code</td>
</tr>
<tr>
<td>Country</td>
<td>country</td>
</tr>
</tbody>
</table>

The following statement converts the format of a date:

WITH date_strings AS (  
SELECT '2015-01-01' d from dual union all  
SELECT '2000-12-31' d from dual union all  
SELECT '900-01-01' d from dual  
)  
SELECT d "STRING", regexp_replace(d, '([[:digit:]]{4})-([[:digit:]]{2})-([[:digit:]]{2})', '\3.\2.\1') "MODIFIED_STRING"  
FROM date_strings;

<table>
<thead>
<tr>
<th>STRING</th>
<th>MODIFIED_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-01-01</td>
<td>01.01.2015</td>
</tr>
<tr>
<td>900-01-01</td>
<td>01.01.900</td>
</tr>
</tbody>
</table>
The following statement replaces all the letters in a string with '1':

WITH strings as (
    SELECT 'NEW YORK' s FROM dual union all
    SELECT 'New York' s FROM dual union all
    SELECT 'new york' s FROM dual
)
SELECT s "STRING",
    regexp_replace(s, '[a-z]', '1', 1, 0, 'i') "CASE_INSENSITIVE",
    regexp_replace(s, '[a-z]', '1', 1, 0, 'c') "CASE_SENSITIVE",
    regexp_replace(s, '[a-zA-Z]', '1', 1, 0, 'c') "CASE_SENSITIVE_MATCHING"
FROM  strings;

<table>
<thead>
<tr>
<th>STRING</th>
<th>CASE_INSENSITIVE</th>
<th>CASE_SENSITIVE</th>
<th>CASE_SENSITIVE_MATCHING</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW YORK</td>
<td>111 1111</td>
<td>NEW YORK</td>
<td>111 1111</td>
</tr>
<tr>
<td>New York</td>
<td>111 1111</td>
<td>N11 Y1111</td>
<td>111 1111</td>
</tr>
<tr>
<td>new york</td>
<td>111 1111</td>
<td>111 1111</td>
<td>111 1111</td>
</tr>
</tbody>
</table>

**Live SQL:**

View and run a related example on Oracle Live SQL at `REGEXP_REPLACE`

### 7.180 REGEXP_SUBSTR

**Syntax**

```
REGEXP_SUBSTR ( source_char, pattern
, position
, occurrence
, match_param
subexpr
)
```

**Purpose**

`REGEXP_SUBSTR` extends the functionality of the `SUBSTR` function by letting you search a string for a regular expression pattern. It is also similar to `REGEXP_INSTR`, but instead of returning the position of the substring, it returns the substring itself. This function is useful if you need the contents of a match string but not its position in the source string. The function returns the string as `VARCHAR2` or `CLOB` data in the same character set as `source_char`.

This function complies with the POSIX regular expression standard and the Unicode Regular Expression Guidelines. For more information, refer to Oracle Regular Expression Support.
• *source_char* is a character expression that serves as the search value. It is commonly a character column and can be of any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB.

• *pattern* is the regular expression. It is usually a text literal and can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. It can contain up to 512 bytes. If the data type of *pattern* is different from the data type of *source_char*, then Oracle Database converts *pattern* to the data type of *source_char*. For a listing of the operators you can specify in *pattern*, refer to Oracle Regular Expression Support.

• *position* is a positive integer indicating the character of *source_char* where Oracle should begin the search. The default is 1, meaning that Oracle begins the search at the first character of *source_char*.

• *occurrence* is a positive integer indicating which occurrence of *pattern* in *source_char* Oracle should search for. The default is 1, meaning that Oracle searches for the first occurrence of *pattern*. If *occurrence* is greater than 1, then the database searches for the second occurrence beginning with the first character following the first occurrence of *pattern*, and so forth. This behavior is different from the SUBSTR function, which begins its search for the second occurrence at the second character of the first occurrence.

• *match_param* is a character expression of the data type VARCHAR2 or CHAR that lets you change the default matching behavior of the function. The behavior of this parameter is the same for this function as for REGEXP_COUNT. Refer to REGEXP_COUNT for detailed information.

• For a *pattern* with subexpressions, *subexpr* is a nonnegative integer from 0 to 9 indicating which subexpression in *pattern* is to be returned by the function. This parameter has the same semantics that it has for the REGEXP_INSTR function. Refer to REGEXP_INSTR for more information.

**See Also:**

• SUBSTR and REGEXP_INSTR
• REGEXP_REPLACE, and REGEXP_LIKE Condition
• Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation REGEXP_SUBSTR uses to compare characters from *source_char* with characters from *pattern*, and for the collation derivation rules, which define the collation assigned to the character return value of this function

**Examples**

The following example examines the string, looking for the first substring bounded by commas. Oracle Database searches for a comma followed by one or more occurrences of non-comma characters followed by a comma. Oracle returns the substring, including the leading and trailing commas.

```sql
SELECT REGEXP_SUBSTR('500 Oracle Parkway, Redwood Shores, CA',

Chapter 7
REGEXP_SUBSTR
7-289
```
The following example examines the string, looking for `http://` followed by a substring of one or more alphanumeric characters and optionally, a period (`.`). Oracle searches for a minimum of three and a maximum of four occurrences of this substring between `http://` and either a slash (`/`) or the end of the string.

```sql
SELECT REGEXP_SUBSTR('http://www.example.com/products', 'http://([[:alnum:]]+\.)?\{3,4\}(/)?') "REGEXP_SUBSTR"
FROM DUAL;
```

```
REGEXP_SUBSTR
----------------------
http://www.example.com/
```

The next two examples use the `subexpr` argument to return a specific subexpression of `pattern`. The first statement returns the first subexpression in `pattern`:

```sql
SELECT REGEXP_SUBSTR('1234567890', '(123)(4(56)(78))', 1, 1, 'i', 1) "REGEXP_SUBSTR" FROM DUAL;
```

```
REGEXP_SUBSTR
-------------------
123
```

The next statement returns the fourth subexpression in `pattern`:

```sql
SELECT REGEXP_SUBSTR('1234567890', '(123)(4(56)(78))', 1, 1, 'i', 4) "REGEXP_SUBSTR" FROM DUAL;
```

```
REGEXP_SUBSTR
-------------------
78
```

**REGEXP_SUBSTR pattern matching: Examples**

The following statements create a table `regexp_temp` and insert values into it:

```sql
CREATE TABLE regexp_temp(empName varchar2(20), emailID varchar2(20));

INSERT INTO regexp_temp (empName, emailID) VALUES ('John Doe', 'johndoe@example.com');
INSERT INTO regexp_temp (empName, emailID) VALUES ('Jane Doe', 'janedoe');
```

In the following example, the statement queries the email column and searches for valid email addresses:

```sql
SELECT empName, REGEXP_SUBSTR(emailID, '^[[:alnum:]]+@^[[:alnum:]]+\.[[:alnum:]]+$') "Valid Email" FROM regexp_temp;
```

```
EMPNAME  Valid Email
---------------
John Doe  johndoe@example.com
Jane Doe
```
In the following example, the statement queries the email column and returns the count of valid email addresses:

```
SELECT `empName`, REGEXP_SUBSTR(emailID, '^[[:alnum:]]+\@[[:alnum:]]+.\[[[:alnum:]]\]+') "Valid Email", REGEXP_INSTR(emailID, '\w+@\w+(\.[\w]+)\+') "FIELD_WITH_VALID_EMAIL"
FROM regexp_temp;
```

<table>
<thead>
<tr>
<th>EMPNAME</th>
<th>Valid Email</th>
<th>FIELD_WITH_VALID_EMAIL</th>
</tr>
</thead>
<tbody>
<tr>
<td>John</td>
<td><a href="mailto:johndoe@example.com">johndoe@example.com</a></td>
<td>1</td>
</tr>
<tr>
<td>Jane</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Live SQL:**

View and run related examples on Oracle Live SQL at `REGEXP_SUBSTR`

**pattern matching**

In the following example, numbers and alphabets are extracted from a string:

```
WITH strings AS (
    SELECT 'ABC123' str FROM DUAL UNION ALL
    SELECT 'A1B2C3' str FROM DUAL UNION ALL
    SELECT '123ABC' str FROM DUAL UNION ALL
    SELECT '1A2B3C' str FROM DUAL
)
SELECT REGEXP_SUBSTR(str, '[0-9]') First_Occurrence_of_Number,
    REGEXP_SUBSTR(str, '[0-9].*') Num_Followed_by_String,
    REGEXP_SUBSTR(str, '[A-Z][0-9]') Letter_Followed_by_String
FROM strings;
```

<table>
<thead>
<tr>
<th>FIRST_OCCURRENCE_OF_NUMB</th>
<th>NUM_FOLLOWED_BY_STRING</th>
<th>LETTER_FOLLOWED_BY_STRING</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>123</td>
<td>C1</td>
</tr>
<tr>
<td>1</td>
<td>1B2C3</td>
<td>A1</td>
</tr>
<tr>
<td>1</td>
<td>123ABC</td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>1A2B3C</td>
<td>A2</td>
</tr>
</tbody>
</table>

**Live SQL:**

View and run a related example on Oracle Live SQL at `REGEXP_SUBSTR`

**Extract Numbers and Alphabets**

In the following example, passenger names and flight information are extracted from a string:

```
WITH strings AS (
    SELECT 'LHRJFK/010315/JOHNDOE' str FROM DUAL UNION ALL
    SELECT 'CDGLAX/050515/JANEDOE' str FROM DUAL UNION ALL
    SELECT 'LAXCDG/220515/JOHNDOE' str FROM DUAL UNION ALL
    SELECT 'SFOJFK/010615/JANEDOE' str FROM DUAL
)
SELECT REGEXP_SUBSTR(str, '[A-Z]{6}') String_of_6_characters,
    REGEXP_SUBSTR(str, '[0-9]+') First_Matching_Numbers,
    REGEXP_SUBSTR(str, '[A-Z].*$') Letter_by_other_characters
FROM strings;
```

7-291
```sql
regexp_substr(str, '^[\A-Z].*$') Slash_letter_and_characters
FROM strings;
```

<table>
<thead>
<tr>
<th>STRING_OF_6_CHARACTERS</th>
<th>FIRST_MATCHING_NUMBERS</th>
<th>LETTER_BY_OTHER_CHARACTERS</th>
</tr>
</thead>
<tbody>
<tr>
<td>LHRJFK</td>
<td>010315</td>
<td>LHRJFK/010315/</td>
</tr>
<tr>
<td>JOHNOE</td>
<td>/JOHNOE</td>
<td></td>
</tr>
<tr>
<td>CDGLAX</td>
<td>050515</td>
<td>CDGLAX/050515/</td>
</tr>
<tr>
<td>JANEDOE</td>
<td>/JANEDOE</td>
<td></td>
</tr>
<tr>
<td>LAXCDG</td>
<td>220515</td>
<td>LAXCDG/220515/</td>
</tr>
<tr>
<td>JOHNOE</td>
<td>/JOHNOE</td>
<td></td>
</tr>
<tr>
<td>SFOJFK</td>
<td>010615</td>
<td>SFOJFK/010615/</td>
</tr>
<tr>
<td>JANEDOE</td>
<td>/JANEDOE</td>
<td></td>
</tr>
</tbody>
</table>

### 7.181 REGR_ (Linear Regression) Functions

The linear regression functions are:

- `REGR_SLOPE`
- `REGR_INTERCEPT`
- `REGR_COUNT`
- `REGR_R2`
- `REGR_AVGX`
- `REGR_AVGY`
- `REGR_SXX`
- `REGR_SYY`
- `REGR_SXY`
Syntax

linear_regr::=

\[
( \text{expr1}, \text{expr2} ) \quad \text{OVER ( analytic_clause )}
\]

Purpose

The linear regression functions fit an ordinary-least-squares regression line to a set of number pairs. You can use them as both aggregate and analytic functions.

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions

These functions take as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

See Also:

Table 2-8 for more information on implicit conversion and "Numeric Precedence" for information on numeric precedence
Oracle applies the function to the set of \((expr1, expr2)\) pairs after eliminating all pairs for which either \(expr1\) or \(expr2\) is null. Oracle computes all the regression functions simultaneously during a single pass through the data.

\(expr1\) is interpreted as a value of the dependent variable (a \(y\) value), and \(expr2\) is interpreted as a value of the independent variable (an \(x\) value).

- **REGR_SLOPE** returns the slope of the line. The return value is a numeric data type and can be null. After the elimination of null \((expr1, expr2)\) pairs, it makes the following computation:
  
  \[
  \frac{COVAR\_POP(expr1, expr2)}{VAR\_POP(expr2)}
  \]

- **REGR_INTERCEPT** returns the \(y\)-intercept of the regression line. The return value is a numeric data type and can be null. After the elimination of null \((expr1, expr2)\) pairs, it makes the following computation:
  
  \[
  AVG(expr1) - REGR\_SLOPE(expr1, expr2) \times AVG(expr2)
  \]

- **REGR_COUNT** returns an integer that is the number of non-null number pairs used to fit the regression line.

- **REGR_R2** returns the coefficient of determination (also called R-squared or goodness of fit) for the regression. The return value is a numeric data type and can be null. \(VAR\_POP(expr1)\) and \(VAR\_POP(expr2)\) are evaluated after the elimination of null pairs. The return values are:
  
  - NULL if \(VAR\_POP(expr2) = 0\)
  - 1 if \(VAR\_POP(expr1) = 0\) and \(VAR\_POP(expr2) \neq 0\)
  - \(POWER(CORR(expr1,expr),2)\) if \(VAR\_POP(expr1) > 0\) and \(VAR\_POP(expr2) \neq 0\)

All of the remaining regression functions return a numeric data type and can be null:

- **REGR_AVGX** evaluates the average of the independent variable \((expr2)\) of the regression line. It makes the following computation after the elimination of null \((expr1, expr2)\) pairs:
  
  \[
  AVG(expr2)
  \]

- **REGR_AVGY** evaluates the average of the dependent variable \((expr1)\) of the regression line. It makes the following computation after the elimination of null \((expr1, expr2)\) pairs:
  
  \[
  AVG(expr1)
  \]

**REGR_SXY, REGR_SXX, REGR_SYY** are auxiliary functions that are used to compute various diagnostic statistics.

- **REGR_SXX** makes the following computation after the elimination of null \((expr1, expr2)\) pairs:
  
  \[
  REGR\_COUNT(expr1, expr2) \times VAR\_POP(expr2)
  \]

- **REGR_SYY** makes the following computation after the elimination of null \((expr1, expr2)\) pairs:
  
  \[
  REGR\_COUNT(expr1, expr2) \times VAR\_POP(expr1)
  \]

- **REGR_SXY** makes the following computation after the elimination of null \((expr1, expr2)\) pairs:
The following examples are based on the sample tables `sh.sales` and `sh.products`.

General Linear Regression Example

The following example provides a comparison of the various linear regression functions used in their analytic form. The analytic form of these functions can be useful when you want to use regression statistics for calculations such as finding the salary predicted for each employee by the model. The sections that follow on the individual linear regression functions contain examples of the aggregate form of these functions.

```
SELECT job_id, employee_id ID, salary,
       REGR_SLOPE(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) slope,
       REGR_INTERCEPT(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) intcpt,
       REGR_R2(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) rsqr,
       REGR_COUNT(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) count,
       REGR_AVGX(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) avgx,
       REGR_AVGY(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) avgy
FROM employees
WHERE department_id in (50, 80)
ORDER BY job_id, employee_id;
```

//
```

REGR_SLOPE and REGR_INTERCEPT Examples

The following example calculates the slope and regression of the linear regression model for time employed (`SYSDATE - hire_date`) and salary using the sample table `hr.employees`. Results are grouped by `job_id`.

```
SELECT job_id, employee_id ID, salary,
       REGR_SLOPE(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) slope,
       REGR_INTERCEPT(SYSDATE-hire_date, salary)
       OVER (PARTITION BY job_id) intercept
FROM employees
WHERE department_id in (50, 80)
GROUP BY job_id
ORDER BY job_id;
```

```
JOB_ID     ID     SALARY SLOPE    INTERCEPT
---------- ----- ---------- ----- ------------
SA_MAN     145      14000 .355 -1707.035 2626.589
SA_MAN     146      13500 .355 -1707.035 2626.589
SA_MAN     147      12000 .355 -1707.035 2626.589
SA_MAN     148      11000 .355 -1707.035 2626.589
SA_MAN     149      10500 .355 -1707.035 2626.589

SA_REP     156      10000 .257  404.763 2561.244
//
```
SA_MAN   .355  -1707.030762
SA_REP    .257   404.767151
SH_CLERK  .745   159.015293
ST_CLERK  .904   134.409050
ST_MAN    .479   -570.077291

REGR_COUNT Examples

The following example calculates the count of by job_id for time employed (SYSDATE - hire_date) and salary using the sample table hr.employees. Results are grouped by job_id.

```
SELECT job_id,
REGR_COUNT(SYSDATE-hire_date, salary) count
FROM employees
WHERE department_id in (30, 50)
GROUP BY job_id
ORDER BY job_id, count;
```

<table>
<thead>
<tr>
<th>JOB_ID</th>

</tr>
<tr>
<td>ST_MAN</td>
<td>5</td>
</tr>
</tbody>
</table>

REGR_R2 Examples

The following example calculates the coefficient of determination the linear regression of time employed (SYSDATE - hire_date) and salary using the sample table hr.employees:

```
SELECT job_id,
REGR_R2(SYSDATE-hire_date, salary) Regr_R2
FROM employees
WHERE department_id in (80, 50)
GROUP BY job_id
ORDER BY job_id, Regr_R2;
```

<table>

REGR_AVGY and REGR_AVGX Examples

The following example calculates the average values for time employed (SYSDATE - hire_date) and salary using the sample table hr.employees. Results are grouped by job_id:

```
SELECT job_id,
REGR_AVGY(SYSDATE-hire_date, salary) avgy,
REGR_AVGX(SYSDATE-hire_date, salary) avgx
FROM employees
WHERE department_id in (30,50)
GROUP BY job_id
ORDER BY job_id, avgy, avgx;
```
REGR_SXY, REGR_SXX, and REGR_SYY Examples

The following example calculates three types of diagnostic statistics for the linear regression of time employed (SYSDATE - hire_date) and salary using the sample table hr.employees:

```sql
SELECT job_id, 
       REGR_SXY(SYSDATE-hire_date, salary) regr_sxy, 
       REGR_SXX(SYSDATE-hire_date, salary) regr_sxx, 
       REGR_SYY(SYSDATE-hire_date, salary) regr_syy 
FROM employees 
WHERE department_id in (80, 50) 
GROUP BY job_id 
ORDER BY job_id;
```

</tbody>
</table>

### 7.182 REMAINDER

**Syntax**

```sql
REMAINDER ( n2 , n1 )
```

**Purpose**

REMAINDER returns the remainder of n2 divided by n1.

This function takes as arguments any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. Oracle determines the argument with the highest numeric precedence, implicitly converts the remaining arguments to that data type, and returns that data type.

The MOD function is similar to REMAINDER except that it uses FLOOR in its formula, whereas REMAINDER uses ROUND. Refer to MOD.

**See Also:**

Table 2-8 for more information on implicit conversion and "Numeric Precedence" for information on numeric precedence.
• If \( n_1 = 0 \) or \( n_2 = \infty \), then Oracle returns
  
  – An error if the arguments are of type `NUMBER`
  
  – NaN if the arguments are `BINARY_FLOAT` or `BINARY_DOUBLE`.

• If \( n_1 \neq 0 \), then the remainder is \( n_2 - (n_1 \times N) \) where \( N \) is the integer nearest \( n_2/n_1 \). If \( n_2/n_1 \) equals \( \times.5 \), then \( N \) is the nearest even integer.

• If \( n_2 \) is a floating-point number, and if the remainder is 0, then the sign of the remainder is the sign of \( n_2 \). Remainders of 0 are unsigned for `NUMBER` values.

Examples

Using table `float_point_demo`, created for the `TO_BINARY_DOUBLE` "Examples", the following example divides two floating-point numbers and returns the remainder of that operation:

```sql
SELECT bin_float, bin_double, REMAINDER(bin_float, bin_double)
FROM float_point_demo;
```

<table>
<thead>
<tr>
<th>BIN_FLOAT</th>
<th>BIN_DOUBLE</th>
<th>REMAINDER(BIN_FLOAT, BIN_DOUBLE)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.235E+003</td>
<td>1.235E+003</td>
<td>5.859E-005</td>
</tr>
</tbody>
</table>

7.183 REPLACE

Syntax

```
REPLACE (char, search_string, replacement_string)
```

Purpose

`REPLACE` returns `char` with every occurrence of `search_string` replaced with `replacement_string`. If `replacement_string` is omitted or null, then all occurrences of `search_string` are removed. If `search_string` is null, then `char` is returned.

Both `search_string` and `replacement_string`, as well as `char`, can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, `NVARCHAR2`, `CLOB`, or `NCLOB`. The string returned is in the same character set as `char`. The function returns `VARCHAR2` if the first argument is not a LOB and returns `CLOB` if the first argument is a LOB.

`REPLACE` provides functionality related to that provided by the `TRANSLATE` function. `TRANSLATE` provides single-character, one-to-one substitution. `REPLACE` lets you substitute one string for another as well as to remove character strings.
See Also:

- TRANSLATE
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation REPLACE uses to compare characters from `char` with characters from `search_string`, and for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example replaces occurrences of `J` with `BL`:

```sql
SELECT REPLACE('JACK and JUE','J','BL') "Changes"
FROM DUAL;

Changes
--------------
BLACK and BLUE
```

7.184 ROUND (date)

Syntax

```
round_date ::= 
ROUND (date, fmt)
```

Purpose

`ROUND` returns `date` rounded to the unit specified by the format model `fmt`. This function is not sensitive to the `NLS_CALENDAR` session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type `DATE`, even if you specify a different datetime data type for `date`. If you omit `fmt`, then `date` is rounded to the nearest day. The `date` expression must resolve to a `DATE` value.

See Also:

"ROUND and TRUNC Date Functions" for the permitted format models to use in `fmt`

Examples

The following example rounds a date to the first day of the following year:

```sql
SELECT ROUND (TO_DATE ('27-OCT-00'), 'YEAR') "New Year"
FROM DUAL;
```
7.185 ROUND (number)

Syntax

round_number ::= 

ROUND ( n, integer )

Purpose

ROUND returns n rounded to integer places to the right of the decimal point. If you omit integer, then n is rounded to zero places. If integer is negative, then n is rounded off to the left of the decimal point.

n can be any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you omit integer, then the function returns the value ROUND(n, 0) in the same data type as the numeric data type of n. If you include integer, then the function returns NUMBER.

ROUND is implemented using the following rules:

1. If n is 0, then ROUND always returns 0 regardless of integer.
2. If n is negative, then ROUND(n, integer) returns -ROUND(-n, integer).
3. If n is positive, then

   \[ \text{ROUND}(n, \text{integer}) = \text{FLOOR}(n \times \text{POWER}(10, \text{integer}) + 0.5) \times \text{POWER}(10, -\text{integer}) \]

ROUND applied to a NUMBER value may give a slightly different result from ROUND applied to the same value expressed in floating-point. The different results arise from differences in internal representations of NUMBER and floating point values. The difference will be 1 in the rounded digit if a difference occurs.

See Also:

- Table 2-8 for more information on implicit conversion
- "Floating-Point Numbers " for more information on how Oracle Database handles BINARY_FLOAT and BINARY_DOUBLE values
- FLOOR and CEIL , TRUNC (number) and MOD for information on functions that perform related operations

Examples

The following example rounds a number to one decimal point:

SELECT ROUND(15.193,1) "Round" FROM DUAL;
The following example rounds a number one digit to the left of the decimal point:

```
SELECT ROUND(15.193,-1) "Round" FROM DUAL;
```

```
Round
-------
20
```

### 7.186 ROW_NUMBER

**Syntax**

```
ROW_NUMBER () OVER (query_partition_clause order_by_clause)
```

**Purpose**

ROW_NUMBER is an analytic function. It assigns a unique number to each row to which it is applied (either each row in the partition or each row returned by the query), in the ordered sequence of rows specified in the order_by_clause, beginning with 1.

By nesting a subquery using ROW_NUMBER inside a query that retrieves the ROW_NUMBER values for a specified range, you can find a precise subset of rows from the results of the inner query. This use of the function lets you implement top-N, bottom-N, and inner-N reporting. For consistent results, the query must ensure a deterministic sort order.

**Examples**

The following example finds the three highest paid employees in each department in the hr.employees table. Fewer than three rows are returned for departments with fewer than three employees.

```
SELECT department_id, first_name, last_name, salary
FROM
  (SELECT
       department_id, first_name, last_name, salary,
       ROW_NUMBER() OVER (PARTITION BY department_id ORDER BY salary desc) rn
  FROM employees
  )
WHERE rn <= 3
ORDER BY department_id, salary DESC, last_name;
```

The following example is a join query on the sh.sales table. It finds the sales amounts in 2000 of the five top-selling products in 1999 and compares the difference between
2000 and 1999. The ten top-selling products are calculated within each distribution channel.

```sql
SELECT sales_2000.channel_desc, sales_2000.prod_name,
       sales_2000.amt amt_2000,  top_5_prods_1999_year.amt amt_1999,
       sales_2000.amt  - top_5_prods_1999_year.amt amt_diff
FROM
/* The first subquery finds the 5 top-selling products per channel in year 1999. */
(SELECT channel_desc, prod_name, amt
 FROM
  (SELECT channel_desc, prod_name, sum(amount_sold) amt,
          ROW_NUMBER () OVER (PARTITION BY channel_desc
                         ORDER BY SUM(amount_sold) DESC) rn
   FROM sales, times, channels, products
   WHERE sales.time_id = times.time_id
     AND times.calendar_year = 1999
     AND channels.channel_id = sales.channel_id
     AND products.prod_id = sales.prod_id
   GROUP BY channel_desc, prod_name
  )
 WHERE rn <= 5
) top_5_prods_1999_year,
/* The next subquery finds sales per product and per channel in 2000. */
(SELECT channel_desc, prod_name, sum(amount_sold) amt
 FROM sales, times, channels, products
 WHERE sales.time_id = times.time_id
   AND times.calendar_year = 2000
   AND channels.channel_id = sales.channel_id
   AND products.prod_id = sales.prod_id
 GROUP BY channel_desc, prod_name
 ) sales_2000
WHERE sales_2000.channel_desc = top_5_prods_1999_year.channel_desc
AND sales_2000.prod_name = top_5_prods_1999_year.prod_name
ORDER BY sales_2000.channel_desc, sales_2000.prod_name
;
```

</table>

15 rows selected.
7.187 ROWIDTOCHAR

Syntax

```
ROWIDTOCHAR ( rowid )
```

Purpose

ROWIDTOCHAR converts a rowid value to VARCHAR2 data type. The result of this conversion is always 18 characters long.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of ROWIDTOCHAR

Examples

The following example converts a rowid value in the employees table to a character value. (Results vary for each build of the sample database.)

```
SELECT ROWID FROM employees
    WHERE ROWIDTOCHAR(ROWID) LIKE '%JAAB%'
ORDER BY ROWID;
```

<table>
<thead>
<tr>
<th>ROWID</th>
</tr>
</thead>
<tbody>
<tr>
<td>AAAFFIAAAAABSAAab</td>
</tr>
</tbody>
</table>

7.188 ROWIDTONCHAR

Syntax

```
ROWIDTONCHAR ( rowid )
```

Purpose

ROWIDTONCHAR converts a rowid value to NVARCHAR2 data type. The result of this conversion is always in the national character set and is 18 characters long.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of ROWIDTONCHAR
Examples

The following example converts a rowid value to an NVARCHAR2 string:

```sql
SELECT LENGTHB( ROWIDTONCHAR(ROWID) ) Length, ROWIDTONCHAR(ROWID)
FROM employees
ORDER BY length;
```

<table>
<thead>
<tr>
<th>Length</th>
<th>ROWIDTONCHAR(ROWID)</th>
</tr>
</thead>
<tbody>
<tr>
<td>36</td>
<td>AAAL52AFAAAAABSABD</td>
</tr>
<tr>
<td>36</td>
<td>AAAL52AFAAAAABSABV</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
</tbody>
</table>

7.189 RPAD

Syntax

```
RPAD(expr1, n, expr2)
```

Purpose

RPAD returns `expr1`, right-padded to length `n` characters with `expr2`, replicated as many times as necessary. This function is useful for formatting the output of a query.

Both `expr1` and `expr2` can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if `expr1` is a character data type, NVARCHAR2 if `expr1` is a national character data type, and a LOB if `expr1` is a LOB data type. The string returned is in the same character set as `expr1`. The argument `n` must be a NUMBER integer or a value that can be implicitly converted to a NUMBER integer.

`expr1` cannot be null. If you do not specify `expr2`, then it defaults to a single blank. If `expr1` is longer than `n`, then this function returns the portion of `expr1` that fits in `n`.

The argument `n` is the total length of the return value as it is displayed on your terminal screen. In most character sets, this is also the number of characters in the return value. However, in some multibyte character sets, the display length of a character string can differ from the number of characters in the string.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of RPAD

Examples

The following example creates a simple chart of salary amounts by padding a single space with asterisks:
SELECT last_name, RPAD(' ', salary/1000, '*') "Salary"
FROM employees
WHERE department_id = 80
ORDER BY last_name, "Salary";

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>Salary</th>

<tr>
<td>King</td>
<td>********</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
</tr>
</tbody>
</table>

### 7.190 RTRIM

#### Syntax

RTRIM(char, set)

#### Purpose

RTRIM removes from the right end of char all of the characters that appear in set. This function is useful for formatting the output of a query.

If you do not specify set, then it defaults to a single blank. RTRIM works similarly to LTRIM.

Both char and set can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The string returned is of VARCHAR2 data type if char is a character data type, NVARCHAR2 if char is a national character data type, and a LOB if char is a LOB data type.
See Also:

- LTRIM
- Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation RTRIM uses to compare characters from set with characters from char, and for the collation derivation rules, which define the collation assigned to the character return value of this function.

Examples

The following example trims all the right-most occurrences of less than sign (<), greater than sign (>), and equal sign (=) from a string:

```sql
SELECT RTRIM('<<<<<<<BROWNING>>>>>>>', '<>=') "RTRIM Example"
FROM DUAL;
```

```
RTRIM Example
--------------
<<<<<<<BROWNING
```

7.191 SCN_TO_TIMESTAMP

Syntax

```
SCN_TO_TIMESTAMP ( number )
```

Purpose

SCN_TO_TIMESTAMP takes as an argument a number that evaluates to a system change number (SCN), and returns the approximate timestamp associated with that SCN. The returned value is of TIMESTAMP data type. This function is useful any time you want to know the timestamp associated with an SCN. For example, it can be used in conjunction with the ORA_ROWSCN pseudocolumn to associate a timestamp with the most recent change to a row.

Notes:

- The usual precision of the result value is 3 seconds.
- The association between an SCN and a timestamp when the SCN is generated is remembered by the database for a limited period of time. This period is the maximum of the auto-tuned undo retention period, if the database runs in the Automatic Undo Management mode, and the retention times of all flashback archives in the database, but no less than 120 hours. The time for the association to become obsolete elapses only when the database is open. An error is returned if the SCN specified for the argument to SCN_TO_TIMESTAMP is too old.
See Also:
ORA_ROWSCN Pseudocolumn and TIMESTAMP_TO_SCN

Examples

The following example uses the ORA_ROWSCN pseudocolumn to determine the system change number of the last update to a row and uses SCN_TO_TIMESTAMP to convert that SCN to a timestamp:

```sql
SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN) FROM employees
   WHERE employee_id = 188;
```

You could use such a query to convert a system change number to a timestamp for use in an Oracle Flashback Query:

```sql
SELECT salary FROM employees WHERE employee_id = 188;
SALARY
--------
  3800

UPDATE employees SET salary = salary*10 WHERE employee_id = 188;
COMMIT;

SELECT salary FROM employees WHERE employee_id = 188;
SALARY
--------
  38000

SELECT SCN_TO_TIMESTAMP(ORA_ROWSCN) FROM employees
   WHERE employee_id = 188;
SCN_TO_TIMESTAMP(ORA_ROWSCN)
--------------------------------------------------------------
28-AUG-03 01.58.01.000000000 PM

FLASHBACK TABLE employees TO TIMESTAMP
   TO_TIMESTAMP('28-AUG-03 01.00.00.000000000 PM');

SELECT salary FROM employees WHERE employee_id = 188;
SALARY
--------
  3800
```

7.192 SESSIONTIMEZONE

Syntax

```sql
SESSIONTIMEZONE
```

Purpose

SESSIONTIMEZONE returns the time zone of the current session. The return type is a time zone offset (a character type in the format '[-+]TZH:TZM') or a time zone region
name, depending on how the user specified the session time zone value in the most recent `ALTER SESSION` statement.

**Note:**

The default client session time zone is an offset even if the client operating system uses a named time zone. If you want the default session time zone to use a named time zone, then set the `ORA_SDTZ` variable in the client environment to an Oracle time zone region name. Refer to *Oracle Database Globalization Support Guide* for more information on this variable.

**See Also:**

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `SESSIONTIMEZONE`.

### Examples

The following example returns the time zone of the current session:

```sql
SELECT SESSIONTIMEZONE FROM DUAL;
```

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>SESSION</td>
<td>------</td>
</tr>
<tr>
<td>-------</td>
<td>-08:00</td>
</tr>
</tbody>
</table>

### 7.193 SET

#### Syntax

```
SET ( nested_table )
```

#### Purpose

`SET` converts a nested table into a set by eliminating duplicates. The function returns a nested table whose elements are distinct from one another. The returned nested table is of the same type as the input nested table.

The element types of the nested table must be comparable. Refer to "Comparison Conditions" for information on the comparability of nonscalar types.

#### Examples

The following example selects from the `customers_demo` table the unique elements of the `cust_address_ntab` nested table column:

```sql
SELECT customer_id, SET(cust_address_ntab) address
FROM customers_demo
ORDER BY customer_id;
```
The preceding example requires the table `customers_demo` and a nested table column containing data. Refer to "Multiset Operators" to create this table and nested table column.

### 7.194 SIGN

#### Syntax

```
SIGN ( n )
```

#### Purpose

SIGN returns the sign of `n`. This function takes as an argument any numeric data type, or any nonnumeric data type that can be implicitly converted to `NUMBER`, and returns `NUMBER`. For value of `NUMBER` type, the sign is:

- `-1` if `n<0`
- `0` if `n=0`
- `1` if `n>0`

For binary floating-point numbers (`BINARY_FLOAT` and `BINARY_DOUBLE`), this function returns the sign bit of the number. The sign bit is:

- `-1` if `n<0`
- `1` if `n>=0` or `n=NaN`

#### Examples

The following example indicates that the argument of the function (-15) is `<0`:

```
SELECT SIGN(-15) "Sign" FROM DUAL;
```

<table>
<thead>
<tr>
<th>Sign</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
</tr>
</tbody>
</table>

### 7.195 SIN

#### Syntax

```
SIN ( n )
```

#### Examples

The following example indicates that the argument of the function (`-15`) is `<0`:

```
SELECT SIN(-15) "Sine" FROM DUAL;
```

<table>
<thead>
<tr>
<th>Sine</th>
</tr>
</thead>
<tbody>
<tr>
<td>-0.9589242746631905</td>
</tr>
</tbody>
</table>
Purpose

SIN returns the sine of \( n \) (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns the sine of 30 degrees:

```
SELECT SIN(30 * 3.14159265359/180)
"Sine of 30 degrees" FROM DUAL;
```

Sine of 30 degrees
------------------
          .5

7.196 SINH

Syntax

\[
\text{SINH}(n)
\]

Purpose

SINH returns the hyperbolic sine of \( n \).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns the hyperbolic sine of 1:

```
SELECT SINH(1) "Hyperbolic sine of 1" FROM DUAL;
```
7.197 SOUNDEX

Syntax

```
SOUNDEX(char)
```

Purpose

SOUNDEX returns a character string containing the phonetic representation of `char`. This function lets you compare words that are spelled differently, but sound alike in English.

The phonetic representation is defined in *The Art of Computer Programming*, Volume 3: Sorting and Searching, by Donald E. Knuth, as follows:

1. Retain the first letter of the string and remove all other occurrences of the following letters: a, e, h, i, o, u, w, y.
2. Assign numbers to the remaining letters (after the first) as follows:
   - b, f, p, v = 1
   - c, g, j, k, q, s, x, z = 2
   - d, t = 3
   - l = 4
   - m, n = 5
   - r = 6
3. If two or more letters with the same number were adjacent in the original name (before step 1), or adjacent except for any intervening h and w, then retain the first letter and omit rest of all the adjacent letters with same number.
4. Return the first four bytes padded with 0.

`char` can be of any of the data types CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The return value is the same data type as `char`.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also:

- "Data Type Comparison Rules " for more information.
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of SOUNDEX

Examples

The following example returns the employees whose last names are a phonetic representation of “Smyth”:

```sql
```
SELECT last_name, first_name  
FROM hr.employees  
WHERE SOUNDEX(last_name)  
  = SOUNDEX('SMYTHE')  
ORDER BY last_name, first_name;

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>FIRST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Smith</td>
<td>Lindsey</td>
</tr>
<tr>
<td>Smith</td>
<td>William</td>
</tr>
</tbody>
</table>

### 7.198 SQRT

#### Syntax

```
SQRT(n)
```

#### Purpose

SQRT returns the square root of \( n \).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

#### See Also:

[Table 2-8 for more information on implicit conversion](#)

- If \( n \) resolves to a \texttt{NUMBER}, then the value \( n \) cannot be negative. SQRT returns a real number.
- If \( n \) resolves to a binary floating-point number (\texttt{BINARY_FLOAT} or \texttt{BINARY_DOUBLE}):
  - If \( n \geq 0 \), then the result is positive.
  - If \( n = -0 \), then the result is -0.
  - If \( n < 0 \), then the result is NaN.

#### Examples

The following example returns the square root of 26:

```
SELECT SQRT(26) "Square root" FROM DUAL;
```

<table>
<thead>
<tr>
<th>Square root</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.09901951</td>
</tr>
</tbody>
</table>

---

7-312
7.199 STANDARD_HASH

Syntax

```
STANDARD_HASH(expr, 'method')
```

Purpose

STANDARD_HASH computes a hash value for a given expression using one of several hash algorithms that are defined and standardized by the National Institute of Standards and Technology. This function is useful for performing authentication and maintaining data integrity in security applications such as digital signatures, checksums, and fingerprinting.

You can use the STANDARD_HASH function to create an index on an extended data type column. Refer to "Creating an Index on an Extended Data Type Column" for more information.

- The `expr` argument determines the data for which you want Oracle Database to compute a hash value. There are no restrictions on the length of data represented by `expr`, which commonly resolves to a column name. The `expr` cannot be a `LONG` or LOB type. It cannot be a user-defined object type. All other data types are supported for `expr`.

- The optional `method` argument lets you specify the name of the hash algorithm to be used. Valid algorithms are SHA1, SHA256, SHA384, SHA512, and MD5. If you omit this argument, then SHA1 is used.

The function returns a RAW value.

Note:
The STANDARD_HASH function is not identical to the one used internally by Oracle Database for hash partitioning.

7.200 STATS_BINOMIAL_TEST

Syntax

```
STATS_BINOMIAL_TEST(expr1, expr2, p, 'TWO_SIDED_PROB', 'EXACT_PROB', 'ONE_SIDED_PROB_OR_MORE', 'ONE_SIDED_PROB_OR_LESS')
```

Chapter 7

STANDARD_HASH

7-313
Purpose

STATS_BINOMIAL_TEST is an exact probability test used for dichotomous variables, where only two possible values exist. It tests the difference between a sample proportion and a given proportion. The sample size in such tests is usually small.

This function takes three required arguments: expr1 is the sample being examined, expr2 contains the values for which the proportion is expected to be, and p is a proportion to test against. The optional fourth argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-3. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the fourth argument, then the default is 'TWO_SIDED_PROB'.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for STATS_BINOMIAL_TEST

Table 7-3  STATS_BINOMIAL Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'TWO_SIDED_PROB'</td>
<td>The probability that the given population proportion, p, could result in the observed proportion or a more extreme one.</td>
</tr>
<tr>
<td>'EXACT_PROB'</td>
<td>The probability that the given population proportion, p, could result in exactly the observed proportion.</td>
</tr>
<tr>
<td>'ONE_SIDED_PROB_OR_MORE'</td>
<td>The probability that the given population proportion, p, could result in the observed proportion or a larger one.</td>
</tr>
<tr>
<td>'ONE_SIDED_PROB_OR_LESS'</td>
<td>The probability that the given population proportion, p, could result in the observed proportion or a smaller one.</td>
</tr>
</tbody>
</table>

'EXACT_PROB' gives the probability of getting exactly proportion p. In cases where you want to test whether the proportion found in the sample is significantly different from a 50-50 split, p would normally be 0.50. If you want to test only whether the proportion is different, then use the return value 'TWO_SIDED_PROB'. If your test is whether the proportion is more than the value of expr2, then use the return value 'ONE_SIDED_PROB_OR_MORE'. If the test is to determine whether the proportion of expr2 is less, then use the return value 'ONE_SIDED_PROB_OR_LESS'.

STATS_BINOMIAL_TEST Example

The following example determines the probability that reality exactly matches the number of men observed under the assumption that 69% of the population is composed of men:

```
SELECT AVG(DECODE(cust_gender, 'M', 1, 0)) real_proportion,
       STATS_BINOMIAL_TEST (cust_gender, 'M', 0.68, 'EXACT_PROB') exact,
       STATS_BINOMIAL_TEST
```
(cust_gender, 'M', 0.68, 'ONE_SIDED_PROB_OR_LESS') prob_or_less
FROM sh.customers;

7.201 STATS_CROSSTAB

Syntax

\[
\text{STATS_CROSSTAB} (\text{expr1}, \text{expr2}, '\text{chisq_obs}\n\text{chisq_sig}\n\text{chisq_df}\n\text{phi_coefficient}\n\text{cramers_v}\n\text{cont_coefficient}\n\text{cohens_k}')
\]

Purpose

Crosstabulation (commonly called crosstab) is a method used to analyze two nominal variables. The STATS_CROSSTAB function takes two required arguments: expr1 and expr2 are the two variables being analyzed. The optional third argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-4. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'CHISQ_SIG'.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for STATS_CROSSTAB

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>

</table>
**STATS_CROSSTAB Example**

The following example determines the strength of the association between gender and income level:

```sql
SELECT STATS_CROSSTAB
    (cust_gender, cust_income_level, 'CHISQ_OBS') chi_squared,
STATS_CROSSTAB
    (cust_gender, cust_income_level, 'CHISQ_SIG') p_value,
STATS_CROSSTAB
    (cust_gender, cust_income_level, 'PHI_COEFFICIENT') phi_coefficient
FROM sh.customers;
```

<table>
<thead>
<tr>
<th>CHI_SQUARED</th>
<th>P_VALUE</th>
<th>PHI_COEFFICIENT</th>
</tr>
</thead>
<tbody>
<tr>
<td>251.690705</td>
<td>1.2364E-47</td>
<td>.067367056</td>
</tr>
</tbody>
</table>

### 7.202 STATS_F_TEST

**Syntax**

```sql
STATS_F_TEST ( expr1 , expr2
, 'STATISTIC
DF_NUM
DF_DEN
ONE_SIDED_SIG
' , expr3
' TWO_SIDED_SIG '
)
```

**Purpose**

`STATS_F_TEST` tests whether two variances are significantly different. The observed value of \( f \) is the ratio of one variance to the other, so values very different from 1 usually indicate significant differences.

This function takes two required arguments: `expr1` is the grouping or independent variable and `expr2` is the sample of values. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-5. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'TWO_SIDED_SIG'.

**See Also:**

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for `STATS_F_TEST`
### Table 7-5  STATS_F_TEST Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'STATISTIC'</td>
<td>The observed value of ( f )</td>
</tr>
<tr>
<td>'DF_NUM'</td>
<td>Degree of freedom for the numerator</td>
</tr>
<tr>
<td>'DF_DEN'</td>
<td>Degree of freedom for the denominator</td>
</tr>
<tr>
<td>'ONE_SIDED_SIG'</td>
<td>One-tailed significance of ( f )</td>
</tr>
<tr>
<td>'TWO_SIDED_SIG'</td>
<td>Two-tailed significance of ( f )</td>
</tr>
</tbody>
</table>

The one-tailed significance is always in relation to the upper tail. The final argument, \( expr3 \), indicates which of the two groups specified by \( expr1 \) is the high value or numerator (the value whose rejection region is the upper tail).

The observed value of \( f \) is the ratio of the variance of one group to the variance of the second group. The significance of the observed value of \( f \) is the probability that the variances are different just by chance—a number between 0 and 1. A small value for the significance indicates that the variances are significantly different. The degree of freedom for each of the variances is the number of observations in the sample minus 1.

#### STATS_F_TEST Example

The following example determines whether the variance in credit limit between men and women is significantly different. The results, a p_value not close to zero, and an f_statistic close to 1, indicate that the difference between credit limits for men and women are not significant.

```
SELECT VARIANCE(DECODE(cust_gender, 'M', cust_credit_limit, null)) var_men,
       VARIANCE(DECODE(cust_gender, 'F', cust_credit_limit, null)) var_women,
       STATS_F_TEST(cust_gender, cust_credit_limit, 'STATISTIC', 'F') f_statistic,
       STATS_F_TEST(cust_gender, cust_credit_limit) two_sided_p_value
FROM sh.customers;
```

<table>
<thead>
<tr>
<th>VAR_MEN</th>
<th>VAR_WOMEN</th>
<th>F_STATISTIC</th>
<th>TWO_SIDED_P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>12879896.7</td>
<td>13046865</td>
<td>1.01296348</td>
<td>.311928071</td>
</tr>
</tbody>
</table>

### 7.203 STATS_KS_TEST

#### Syntax

```
STATS_KS_TEST(expr1, expr2, 'STATISTIC', 'SIG')
```

#### Purpose

STATS_KS_TEST is a Kolmogorov-Smirnov function that compares two samples to test whether they are from the same population or from populations that have the same
distribution. It does not assume that the population from which the samples were taken is normally distributed.

This function takes two required arguments: \textit{expr1} classifies the data into the two samples and \textit{expr2} contains the values for each of the samples. If \textit{expr1} classifies the data into only one sample or into more than two samples, then an error is raised. The optional third argument lets you specify the meaning of the \texttt{NUMBER} value returned by this function, as shown in Table 7-6. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'SIG'.

![See Also:](Appendix C in \textit{Oracle Database Globalization Support Guide} for the collation determination rules for \texttt{STATS_KS_TEST})

Table 7-6 \texttt{STATS_KS_TEST} Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'STATISTIC'</td>
<td>Observed value of $D$</td>
</tr>
<tr>
<td>'SIG'</td>
<td>Significance of $D$</td>
</tr>
</tbody>
</table>

\textbf{STATS_KS_TEST Example}

Using the Kolmogorov Smirnov test, the following example determines whether the distribution of sales between men and women is due to chance:

```
SELECT stats_ks_test(cust_gender, amount_sold, 'STATISTIC') ks_statistic,
       stats_ks_test(cust_gender, amount_sold) p_value
FROM sh.customers c, sh.sales s
WHERE c.cust_id = s.cust_id;
```

<table>
<thead>
<tr>
<th>KS_STATISTIC</th>
<th>P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>.003841396</td>
<td>.004080006</td>
</tr>
</tbody>
</table>

7.204 \texttt{STATS_MODE}

\textbf{Syntax}

```
\texttt{STATS_MODE (expr)}
```

\textbf{Purpose}

\texttt{STATS_MODE} takes as its argument a set of values and returns the value that occurs with the greatest frequency. If more than one mode exists, then Oracle Database chooses one and returns only that one value.

To obtain multiple modes (if multiple modes exist), you must use a combination of other functions, as shown in the hypothetical query:
SELECT x FROM (SELECT x, COUNT(x) AS cnt1 FROM t GROUP BY x) WHERE cnt1 = (SELECT MAX(cnt2) FROM (SELECT COUNT(x) AS cnt2 FROM t GROUP BY x));

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules, which define the collation STATS_MODE uses to compare character values for expr, and for the collation derivation rules, which define the collation assigned to the return value of this function when it is a character value.

Examples

The following example returns the mode of salary per department in the hr.employees table:

```
SELECT department_id, STATS_MODE(salary) FROM employees GROUP BY department_id ORDER BY department_id, stats_mode(salary);
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>STATS_MODE(SALARY)</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>4400</td>
</tr>
<tr>
<td>20</td>
<td>6000</td>
</tr>
<tr>
<td>30</td>
<td>2500</td>
</tr>
<tr>
<td>40</td>
<td>6500</td>
</tr>
<tr>
<td>50</td>
<td>2500</td>
</tr>
<tr>
<td>60</td>
<td>4800</td>
</tr>
<tr>
<td>70</td>
<td>10000</td>
</tr>
<tr>
<td>80</td>
<td>9500</td>
</tr>
<tr>
<td>90</td>
<td>17000</td>
</tr>
<tr>
<td>100</td>
<td>6900</td>
</tr>
<tr>
<td>110</td>
<td>8300</td>
</tr>
</tbody>
</table>

If you need to retrieve all of the modes (in cases with multiple modes), you can do so using a combination of other functions, as shown in the next example:

```
SELECT commission_pct FROM
  (SELECT commission_pct, COUNT(commission_pct) AS cnt1 FROM employees GROUP BY commission_pct)
WHERE cnt1 = (SELECT MAX(cnt2) FROM
  (SELECT COUNT(commission_pct) AS cnt2 FROM employees GROUP BY commission_pct))
ORDER BY commission_pct;
```

<table>
<thead>
<tr>
<th>COMMISSION_PCT</th>
</tr>
</thead>
<tbody>
<tr>
<td>.2</td>
</tr>
<tr>
<td>.3</td>
</tr>
</tbody>
</table>
7.205 STATS_MW_TEST

Syntax

```
STATS_MW_TEST ( expr1 , expr2
, 'STATISTIC'
'U_STATISTIC'
'ONE_SIDED_SIG', expr3
'TWO_SIDED_SIG'
)
```

Purpose

A Mann Whitney test compares two independent samples to test the null hypothesis that two populations have the same distribution function against the alternative hypothesis that the two distribution functions are different.

The STATS_MW_TEST does not assume that the differences between the samples are normally distributed, as do the STATS_T_TEST_* functions. This function takes two required arguments: `expr1` classifies the data into groups and `expr2` contains the values for each of the groups. The optional third argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-7. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'TWO_SIDED_SIG'.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for STATS_MW_TEST

Table 7-7   STATS_MW_TEST Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'STATISTIC'</td>
<td>The observed value of Z</td>
</tr>
<tr>
<td>'U_STATISTIC'</td>
<td>The observed value of U</td>
</tr>
<tr>
<td>'ONE_SIDED_SIG'</td>
<td>One-tailed significance of Z</td>
</tr>
<tr>
<td>'TWO_SIDED_SIG'</td>
<td>Two-tailed significance of Z</td>
</tr>
</tbody>
</table>

The significance of the observed value of Z or U is the probability that the variances are different just by chance—a number between 0 and 1. A small value for the significance indicates that the variances are significantly different. The degree of freedom for each of the variances is the number of observations in the sample minus 1.
The one-tailed significance is always in relation to the upper tail. The final argument, `expr3`, indicates which of the two groups specified by `expr1` is the high value (the value whose rejection region is the upper tail).

`STATS_MW_TEST` computes the probability that the samples are from the same distribution by checking the differences in the sums of the ranks of the values. If the samples come from the same distribution, then the sums should be close in value.

**STATS_MW_TEST Example**

Using the Mann Whitney test, the following example determines whether the distribution of sales between men and women is due to chance:

```sql
SELECT STATS_MW_TEST
    (cust_gender, amount_sold, 'STATISTIC') z_statistic,
    STATS_MW_TEST
    (cust_gender, amount_sold, 'ONE_SIDED_SIG', 'F') one_sided_p_value
FROM sh.customers c, sh.sales s
WHERE c.cust_id = s.cust_id;
```

```
<table>
<thead>
<tr>
<th>Z_STATISTIC</th>
<th>ONE_SIDED_P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1.4011509</td>
<td>.080584471</td>
</tr>
</tbody>
</table>
```

7.206 **STATS_ONE_WAY_ANOVA**

**Syntax**

```
STATS_ONE_WAY_ANOVA(expr1, expr2, 'SUM_SQUARES_BETWEEN', 'SUM_SQUARES_WITHIN', 'DF_BETWEEN', 'DF_WITHIN', 'MEAN_SQUARES_BETWEEN', 'MEAN_SQUARES_WITHIN', 'F_RATIO', 'SIG')
```

**Purpose**

The one-way analysis of variance function (`STATS_ONE_WAY_ANOVA`) tests differences in means (for groups or variables) for statistical significance by comparing two different estimates of variance. One estimate is based on the variances within each group or category. This is known as the **mean squares within** or **mean square error**. The other estimate is based on the variances among the means of the groups. This is known as the **mean squares between**. If the means of the groups are significantly different, then the mean squares between will be larger than expected and will not match the mean squares within. If the mean squares of the groups are consistent, then the two variance estimates will be about the same.
STATS_ONE_WAY_ANOVA takes two required arguments: expr1 is an independent or grouping variable that divides the data into a set of groups and expr2 is a dependent variable (a numeric expression) containing the values corresponding to each member of a group. The optional third argument lets you specify the meaning of the NUMBER value returned by this function, as shown in Table 7-8. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'SIG'.

See Also:
Appendix C in Oracle Database Globalization Support Guide for the collation determination rules for STATS_ONE_WAY_ANOVA

Table 7-8  STATS_ONE_WAY_ANOVA Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'SUM_SQUARES_BETWEEN'</td>
<td>Sum of squares between groups</td>
</tr>
<tr>
<td>'SUM_SQUARES_WITHIN'</td>
<td>Sum of squares within groups</td>
</tr>

</tr>
<tr>
<td>'F_RATIO'</td>
<td>Ratio of the mean squares between to the mean squares within (MSB/MSW)</td>
</tr>
<tr>
<td>'SIG'</td>
<td>Significance</td>
</tr>
</tbody>
</table>

The significance of one-way analysis of variance is determined by obtaining the one-tailed significance of an f-test on the ratio of the mean squares between and the mean squares within. The f-test should use one-tailed significance, because the mean squares between can be only equal to or larger than the mean squares within. Therefore, the significance returned by STATS_ONE_WAY_ANOVA is the probability that the differences between the groups happened by chance—a number between 0 and 1. The smaller the number, the greater the significance of the difference between the groups. Refer to the STATS_F_TEST for information on performing an f-test.

**STATS_ONE_WAY_ANOVA Example**

The following example determines the significance of the differences in mean sales within an income level and differences in mean sales between income levels. The results, p_values close to zero, indicate that, for both men and women, the difference in the amount of goods sold across different income levels is significant.

```sql
SELECT cust_gender,
       STATS_ONE_WAY_ANOVA(cust_income_level, amount_sold, 'F_RATIO') f_ratio,
       STATS_ONE_WAY_ANOVA(cust_income_level, amount_sold, 'SIG') p_value
FROM sh.customers c, sh.sales s
WHERE c.cust_id = s.cust_id
GROUP BY cust_gender
```
ORDER BY cust_gender;

<table>
<thead>
<tr>
<th>C</th>
<th>F_RATIO</th>
<th>P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>F</td>
<td>5.59536943</td>
<td>4.7840E-09</td>
</tr>
<tr>
<td>M</td>
<td>9.2865001</td>
<td>6.7139E-17</td>
</tr>
</tbody>
</table>

7.207 STATS_T_TEST_*

The t-test functions are:

- **STATS_T_TEST_ONE**: A one-sample t-test
- **STATS_T_TEST_PAIRED**: A two-sample, paired t-test (also known as a crossed t-test)
- **STATS_T_TEST_INDEP**: A t-test of two independent groups with the same variance (pooled variances)
- **STATS_T_TEST_INDEPU**: A t-test of two independent groups with unequal variance (unpooled variances)

**Syntax**

```plaintext
stats_t_test::= 
```

**Purpose**

The t-test measures the significance of a difference of means. You can use it to compare the means of two groups or the means of one group with a constant. Each t-test function takes two expression arguments, although the second expression is optional for the one-sample function (**STATS_T_TEST_ONE**). Each t-test function takes an optional third argument, which lets you specify the meaning of the NUMBER value returned by the function, as shown in Table 7-9. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'TWO_SIDED_SIG'.

**See Also:**

Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules for the STATS_T_TEST_* functions.
Table 7-9  STATS_T_TEST_* Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'STATISTIC'</td>
<td>The observed value of ( t )</td>
</tr>
<tr>
<td>'DF'</td>
<td>Degree of freedom</td>
</tr>
<tr>
<td>'ONE_SIDED_SIG'</td>
<td>One-tailed significance of ( t )</td>
</tr>
<tr>
<td>'TWO_SIDED_SIG'</td>
<td>Two-tailed significance of ( t )</td>
</tr>
</tbody>
</table>

The two independent STATS_T_TEST_* functions can take a fourth argument (\( expr3 \)) if the third argument is specified as 'STATISTIC' or 'ONE_SIDED_SIG'. In this case, \( expr3 \) indicates which value of \( expr1 \) is the high value, or the value whose rejection region is the upper tail.

The significance of the observed value of \( t \) is the probability that the value of \( t \) would have been obtained by chance—a number between 0 and 1. The smaller the value, the more significant the difference between the means. One-sided significance is always respect to the upper tail. For one-sample and paired \( t \)-test, the high value is the first expression. For independent \( t \)-test, the high value is the one specified by \( expr3 \).

The degree of freedom depends on the type of \( t \)-test that resulted in the observed value of \( t \). For example, for a one-sample \( t \)-test (STATS_T_TEST_ONE), the degree of freedom is the number of observations in the sample minus 1.

7.207.1 STATS_T_TEST_ONE

In the STATS_T_TEST_ONE function, \( expr1 \) is the sample and \( expr2 \) is the constant mean against which the sample mean is compared. For this \( t \)-test only, \( expr2 \) is optional; the constant mean defaults to 0. This function obtains the value of \( t \) by dividing the difference between the sample mean and the known mean by the standard error of the mean (rather than the standard error of the difference of the means, as for STATS_T_TEST_PAIRED).

STATS_T_TEST_ONE Example

The following example determines the significance of the difference between the average list price and the constant value 60:

```sql
SELECT AVG(prod_list_price) group_mean,
       STATS_T_TEST_ONE(prod_list_price, 60, 'STATISTIC') t_observed,
       STATS_T_TEST_ONE(prod_list_price, 60) two_sided_p_value
FROM sh.products;
```

<table>
<thead>
<tr>
<th>GROUP_MEAN T_OBSERVED TWO_SIDED_P_VALUE</th>
</tr>
</thead>
<tbody>
<tr>
<td>139.545556 2.32107746 0.023158537</td>
</tr>
</tbody>
</table>

7.207.2 STATS_T_TEST_PAIRED

In the STATS_T_TEST_PAIRED function, \( expr1 \) and \( expr2 \) are the two samples whose means are being compared. This function obtains the value of \( t \) by dividing the difference between the sample means by the standard error of the difference of the means (rather than the standard error of the mean, as for STATS_T_TEST_ONE).
In the `STATS_T_TEST_INDEP` and `STATS_T_TEST_INDEPU` functions, `expr1` is the grouping column and `expr2` is the sample of values. The pooled variances version (`STATS_T_TEST_INDEP`) tests whether the means are the same or different for two distributions that have similar variances. The unpooled variances version (`STATS_T_TEST_INDEPU`) tests whether the means are the same or different even if the two distributions are known to have significantly different variances.

Before using these functions, it is advisable to determine whether the variances of the samples are significantly different. If they are, then the data may come from distributions with different shapes, and the difference of the means may not be very useful. You can perform an $f$-test to determine the difference of the variances. If they are not significantly different, use `STATS_T_TEST_INDEP`. If they are significantly different, use `STATS_T_TEST_INDEPU`. Refer to `STATS_F_TEST` for information on performing an $f$-test.

**STATS_T_TEST_INDEP Example**

The following example determines the significance of the difference between the average sales to men and women where the distributions are assumed to have similar (pooled) variances:

```sql
SELECT SUBSTR(cust_income_level, 1, 22) income_level,
       AVG(DECODE(cust_gender, 'M', amount_sold, null)) sold_to_men,
       AVG(DECODE(cust_gender, 'F', amount_sold, null)) sold_to_women,
       STATS_T_TEST_INDEP(cust_gender, amount_sold, 'STATISTIC', 'F') t_observed,
       STATS_T_TEST_INDEP(cust_gender, amount_sold) two_sided_p_value
FROM sh.customers c, sh.sales s
WHERE c.cust_id = s.cust_id
GROUP BY ROLLUP(cust_income_level)
ORDER BY income_level, sold_to_men, sold_to_women, t_observed;
```

```plaintext

7.208 STATS_WSR_TEST

Syntax

```
STATS_WSR_TEST(expr1, expr2)
```

Purpose

`STATS_WSR_TEST` is a Wilcoxon Signed Ranks test of paired samples to determine whether the median of the differences between the samples is significantly different from zero. The absolute values of the differences are ordered and assigned ranks. Then the null hypothesis states that the sum of the ranks of the positive differences is equal to the sum of the ranks of the negative differences.

This function takes two required arguments: `expr1` and `expr2` are the two samples being analyzed. The optional third argument lets you specify the meaning of the `NUMBER` value returned by this function, as shown in Table 7-10. For this argument, you can specify a text literal, or a bind variable or expression that evaluates to a constant character value. If you omit the third argument, then the default is 'TWO_SIDED_SIG'.

---

ORACLE

7-326
### Table 7-10  STATS_WSR_TEST_* Return Values

<table>
<thead>
<tr>
<th>Argument</th>
<th>Return Value Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>'STATISTIC'</td>
<td>The observed value of $Z$</td>
</tr>
<tr>
<td>'ONE_SIDED_SIG'</td>
<td>One-tailed significance of $Z$</td>
</tr>
<tr>
<td>'TWO_SIDED_SIG'</td>
<td>Two-tailed significance of $Z$</td>
</tr>
</tbody>
</table>

One-sided significance is always with respect to the upper tail. The high value (the value whose rejection region is the upper tail) is $\text{expr1}$.

## 7.209 STDDEV

### Syntax

```
STDDEV (DISTINCT ALL expr) OVER (analytic_clause)
```

### Purpose

$\text{STDDEV}$ returns the sample standard deviation of $\text{expr}$, a set of numbers. You can use it as both an aggregate and analytic function. It differs from $\text{STDDEV_SAMP}$ in that $\text{STDDEV}$ returns zero when it has only 1 row of input data, whereas $\text{STDDEV_SAMP}$ returns null.

Oracle Database calculates the standard deviation as the square root of the variance defined for the $\text{VARIANCE}$ aggregate function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

### See Also:

"Analytic Functions " for information on syntax, semantics, and restrictions

### See Also:

Table 2-8 for more information on implicit conversion

If you specify $\text{DISTINCT}$, then you can specify only the $\text{query_partition_clause}$ of the $\text{analytic_clause}$. The $\text{order_by_clause}$ and $\text{windowing_clause}$ are not allowed.
Aggregate Examples

The following example returns the standard deviation of the salaries in the sample hr.employees table:

```sql
SELECT STDDEV(salary) "Deviation"
FROM employees;
```

```
Deviation
---------
3909.36575
```

Analytic Examples

The query in the following example returns the cumulative standard deviation of the salaries in Department 80 in the sample table hr.employees, ordered by hire_date:

```sql
SELECT last_name, salary,
       STDDEV(salary) OVER (ORDER BY hire_date) "StdDev"
FROM employees
WHERE department_id = 30
ORDER BY last_name, salary, "StdDev";
```

```
LAST_NAME            SALARY     StdDev
------------------- ---------- ----------
Baida                2900        4035.26125
Colmenares           2500        3362.58829
Himuro              2600        3649.2465
Khoo                3100        5586.14357
Raphaely            11000       0
Tobias              2800        4650.0896
```

7.210 STDDEV_POP

Syntax

```
STDDEV_POP ( expr )
OVER ( analytic_clause )
```

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions
Purpose

STDDEV_POP computes the population standard deviation and returns the square root of the population variance. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

This function is the same as the square root of the VAR_POP function. When VAR_POP returns null, this function returns null.

See Also:

- "Aggregate Functions " and VAR_POP
- "About SQL Expressions " for information on valid forms of expr

Aggregate Example

The following example returns the population and sample standard deviations of the amount of sales in the sample table `sh.sales`:

```sql
SELECT STDDEV_POP(amount_sold) "Pop",
       STDDEV_SAMP(amount_sold) "Samp"
FROM sales;
```

<table>
<thead>
<tr>
<th>Pop</th>
<th>Samp</th>
</tr>
</thead>
<tbody>
<tr>
<td>896.355151</td>
<td>896.355592</td>
</tr>
</tbody>
</table>

Analytic Example

The following example returns the population standard deviations of salaries in the sample `hr.employees` table by department:

```sql
SELECT department_id, last_name, salary,
       STDDEV_POP(salary) OVER (PARTITION BY department_id) AS pop_std
FROM employees
ORDER BY department_id, last_name, salary, pop_std;
```

<table>
<thead>
<tr>
<th>DEPARTMENT_ID</th>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>POP_STD</th>
</tr>
</thead>
<tbody>

<td>Urman</td>
<td>7800</td>
<td>1644.18166</td>
</tr>
<tr>
<td>...</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
7.211 STDDEV_SAMP

Syntax

```
STDDEV_SAMP(expr)
OVER(analytic_clause)
```

See Also:

"Analytic Functions" for information on syntax, semantics, and restrictions

Purpose

STDDEV_SAMP computes the cumulative sample standard deviation and returns the square root of the sample variance. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:

Table 2-8 for more information on implicit conversion

This function is same as the square root of the VAR_SAMP function. When VAR_SAMP returns null, this function returns null.

See Also:

• "Aggregate Functions" and VAR_SAMP
• "About SQL Expressions" for information on valid forms of expr

Aggregate Example

Refer to the aggregate example for STDDEV_POP.

Analytic Example

The following example returns the sample standard deviation of salaries in the employees table by department:
SELECT department_id, last_name, hire_date, salary, 
STDDEV_SAMP(salary) OVER (PARTITION BY department_id 
ORDER BY hire_date 
ROWS BETWEEN UNBOUNDED PRECEDING AND CURRENT ROW) AS cum_sdev 
FROM employees 
ORDER BY department_id, last_name, hire_date, salary, cum_sdev;

<table>

7.212 SUBSTR

Syntax

substr::=

Purpose

The SUBSTR functions return a portion of char, beginning at character position, substring_length characters long. SUBSTR calculates lengths using characters as defined by the input character set. SUBSTRB uses bytes instead of characters. SUBSTRC uses Unicode complete characters. SUBSTR2 uses UCS2 code points. SUBSTR4 uses UCS4 code points.

- If position is 0, then it is treated as 1.
- If position is positive, then Oracle Database counts from the beginning of char to find the first character.
- If position is negative, then Oracle counts backward from the end of char.
- If substring_length is omitted, then Oracle returns all characters to the end of char. If substring_length is less than 1, then Oracle returns null.
char can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The exceptions are SUBSTRC, SUBSTR2, and SUBSTR4, which do not allow char to be a CLOB or NCLOB. Both position and substring_length must be of data type NUMBER, or any data type that can be implicitly converted to NUMBER, and must resolve to an integer. The return value is the same data type as char. Floating-point numbers passed as arguments to SUBSTR are automatically converted to integers.

See Also:

- Oracle Database Globalization Support Guide for more information about SUBSTR functions and length semantics in different locales
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of SUBSTR

Examples

The following example returns several specified substrings of "ABCDEFG":

```sql
SELECT SUBSTR('ABCDEFG', 3, 4) "Substring"
FROM DUAL;
```

**Substring**
---------
CDEF

```sql
SELECT SUBSTR('ABCDEFG', -5, 4) "Substring"
FROM DUAL;
```

**Substring**
---------
CDEF

Assume a double-byte database character set:

```sql
SELECT SUBSTRB('ABCDEFG', 5, 4.2) "Substring with bytes"
FROM DUAL;
```

**Substring with bytes**
---------------------
CD

7.213 SUM

Syntax
Purpose

SUM returns the sum of values of expr. You can use it as an aggregate or analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

If you specify DISTINCT, then you can specify only the query_partition_clause of the analytic_clause. The order_by_clause and windowing_clause are not allowed.

Aggregate Example

The following example calculates the sum of all salaries in the sample hr.employees table:

```
SELECT SUM(salary) "Total"
FROM employees;
```

```
Total
----------
691400
```

Analytic Example

The following example calculates, for each manager in the sample table hr.employees, a cumulative total of salaries of employees who answer to that manager that are equal to or less than the current salary. You can see that Raphaely and Cambrault have the same cumulative total. This is because Raphaely and Cambrault have the identical salaries, so Oracle Database adds together their salary values and applies the same cumulative total to both rows.

```
SELECT manager_id, last_name, salary,
       SUM(salary) OVER (PARTITION BY manager_id ORDER BY salary
                    RANGE UNBOUNDED PRECEDING) l_csum
FROM employees
```

### 7.214 SYS_CONNECT_BY_PATH

#### Syntax

```sql
SYS_CONNECT_BY_PATH(column, char)
```

#### Purpose

SYS_CONNECT_BY_PATH is valid only in hierarchical queries. It returns the path of a column value from root to node, with column values separated by `char` for each row returned by `CONNECT BY` condition.

Both `column` and `char` can be any of the data types `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`. The string returned is of `VARCHAR2` data type and is in the same character set as `column`.

#### See Also:

- "Hierarchical Queries" for more information about hierarchical queries and `CONNECT BY` conditions
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of `SYS_CONNECT_BY_PATH`

#### Examples

The following example returns the path of employee names from employee Kochhar to all employees of Kochhar (and their employees):
SELECT LPAD(' ', 2*level-1) || SYS_CONNECT_BY_PATH(last_name, '/') "Path"
FROM employees
START WITH last_name = 'Kochhar'
CONNECT BY PRIOR employee_id = manager_id;

Path

----------------------------------
/Kochhar/Greenberg/Chen
/Kochhar/Greenberg/Faviet
/Kochhar/Greenberg/Popp
/Kochhar/Greenberg/Sciarra
/Kochhar/Greenberg/Urman
/Kochhar/Higgins/Gietz
/Kochhar/Baer
/Kochhar/Greenberg
/Kochhar/Higgins
/Kochhar/Mavris
/Kochhar/Whalen
/Kochhar

7.215 SYS_CONTEXT

Syntax

```
SYS_CONTEXT ( 'namespace' , 'parameter' , length )
```

Purpose

SYS_CONTEXT returns the value of parameter associated with the context namespace at the current instant. You can use this function in both SQL and PL/SQL statements. SYS_CONTEXT must be executed locally.

For namespace and parameter, you can specify either a string or an expression that resolves to a string designating a namespace or an attribute. If you specify literal arguments for namespace and parameter, and you are using SYS_CONTEXT explicitly in a SQL statement—rather than in a PL/SQL function that in turn is mentioned in a SQL statement—then Oracle Database evaluates SYS_CONTEXT only once per SQL statement execution for each call site that invokes the SYS_CONTEXT function.

The context namespace must already have been created, and the associated parameter and its value must also have been set using the DBMS_SESSION.set_context procedure. The namespace must be a valid identifier. The parameter name can be any string. It is not case sensitive, but it cannot exceed 30 bytes in length.

The data type of the return value is VARCHAR2. The default maximum size of the return value is 256 bytes. You can override this default by specifying the optional length parameter, which must be a NUMBER or a value that can be implicitly converted to NUMBER. The valid range of values is 1 to 4000 bytes. If you specify an invalid value, then Oracle Database ignores it and uses the default.

Oracle provides the following built-in namespaces:

- **USERENV** - Describes the current session. The predefined parameters of namespace USERENV are listed in Table 7-11.
• **SYS_SESSION_ROLES** - Indicates whether a specified role is currently enabled for the session. Oracle Database evaluates the SYS_SESSION_ROLES context for the current user, and assumes the defining user's role when it evaluates SYS_SESSION_ROLES within a definer's rights procedure or function. Use invoker's rights, procedures or functions, and/or code based access control (CBAC) as an alternative.

**See Also:**

- *Oracle Database Security Guide* for information on using the application context feature in your application development
- *CREATE CONTEXT* for information on creating user-defined context namespaces
- *Oracle Database PL/SQL Packages and Types Reference* for information on the DBMS_SESSION.set_context procedure
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of SYS_CONTEXT

**Examples**

The following statement returns the name of the user who logged onto the database:

```sql
CONNECT OE
Enter password: password

SELECT SYS_CONTEXT ('USERENV', 'SESSION_USER')
FROM DUAL;
```

```
SYS_CONTEXT ('USERENV', 'SESSION_USER')
-----------------------
OE
```

The following example queries the SESSION_ROLES data dictionary view to show that RESOURCE is the only role currently enabled for the session. It then uses the SYS_CONTEXT function to show that the RESOURCE role is currently enabled for the session and the DBA role is not.

```sql
CONNECT OE
Enter password: password

SELECT role FROM session_roles;
```

```
ROLE
-------
RESOURCE
```

```sql
SELECT SYS_CONTEXT('SYS_SESSION_ROLES', 'RESOURCE')
FROM DUAL
```

```
SYS_CONTEXT('SYS_SESSION_ROLES', 'RESOURCE')
--------------------------------------
TRUE
```
SELECT SYS_CONTEXT('SYS_SESSION_ROLES', 'DBA')
FROM DUAL;

SYS_CONTEXT('SYS_SESSION_ROLES','DBA')
--------------------------------------
FALSE

Note:
For simplicity in demonstrating this feature, these examples do not perform the password management techniques that a deployed system normally uses. In a production environment, follow the Oracle Database password management guidelines, and disable any sample accounts. See Oracle Database Security Guide for password management guidelines and other security recommendations.

The following hypothetical example returns the group number that was set as the value for the attribute group_no in the PL/SQL package that was associated with the context hr_apps when hr_apps was created:

SELECT SYS_CONTEXT ('hr_apps', 'group_no') "User Group"
FROM DUAL;

<td>AUTHENTICATION_DATA</td>
<td>Data being used to authenticate the login user. For X.503 certificate authenticated sessions, this field returns the context of the certificate in HEX2 format. Note: You can change the return value of the AUTHENTICATION_DATA attribute using the length parameter of the syntax. Values of up to 4000 are accepted. This is the only attribute of USERENV for which Oracle Database implements such a change.</td>
</tr>
</tbody>
</table>
| AUTHENTICATION_METHOD | Returns the method of authentication. In the list that follows, the type of user is followed by the method returned:  
• Password-authenticated enterprise user, local database user, or user with the SYSDBA or SYSOPER administrative privilege using a password file; proxy with username using password: PASSWORD  
• Kerberos-authenticated enterprise user or external user (with no administrative privileges): KERBEROS  
• Kerberos-authenticated enterprise user (with administrative privileges): KERBEROS_GLOBAL  
• Kerberos-authenticated external user (with administrative privileges): KERBEROS_EXTERNAL  
• SSL-authenticated enterprise or external user (with no administrative privileges): SSL  
• SSL-authenticated enterprise user (with administrative privileges): SSL_GLOBAL  
• SSL-authenticated external user (with administrative privileges): SSL_EXTERNAL  
• Radius-authenticated external user: RADIUS  
• OS-authenticated external user or use with the SYSDBA or SYSOPER administrative privilege: OS  
• Proxy with certificate, DN, or username without using password: NONE  
• Background process (job queue slave process): JOB  
• Parallel Query Slave process: PQ_SLAVE  
For non-administrative connections, you can use IDENTIFICATION_TYPE to distinguish between external and enterprise users when the authentication method is PASSWORD, KERBEROS, or SSL. For administrative connections, AUTHENTICATION_METHOD is sufficient for the PASSWORD, SSL_EXTERNAL, and SSL_GLOBAL authentication methods. |
| BG_JOB_ID             | Job ID of the current session if it was established by an Oracle Database background process. Null if the session was not established by a background process. |
| CDB_NAME              | If queried while connected to a multitenant container database (CDB), returns the name of the CDB. Otherwise, returns null. |
| CLIENT_IDENTIFIER     | Returns an identifier that is set by the application through the DBMS_SESSION.SET_IDENTIFIER procedure, the OCI attribute OCI_ATTR_CLIENT_IDENTIFIER, or Oracle Dynamic Monitoring Service (DMS). This attribute is used by various database components to identify lightweight application users who authenticate as the same database user. |
| CLIENT_INFO           | Returns up to 64 bytes of user session information that can be stored by an application using the DBMS_APPLICATION_INFO package. |
| CLIENT_PROGRAM_NAME   | The name of the program used for the database session. |
### Table 7-11  (Cont.) Predefined Parameters of Namespace USERENV

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CON_ID</td>
<td>If queried while connected to a CDB, returns the current container ID. Otherwise, returns 0.</td>
</tr>
<tr>
<td>CON_NAME</td>
<td>If queried while connected to a CDB, returns the current container name. Otherwise, returns the name of the database as specified in the <code>DB_NAME</code> initialization parameter.</td>
</tr>
<tr>
<td>CURRENT BIND</td>
<td>The bind variables for fine-grained auditing. You can specify this attribute only inside the event handler for the fine-grained auditing feature.</td>
</tr>
<tr>
<td>CURRENT_EDITION_ID</td>
<td>The identifier of the current edition.</td>
</tr>
<tr>
<td>CURRENT_EDITION_NAME</td>
<td>The name of the current edition.</td>
</tr>
<tr>
<td>CURRENT_SCHEMA</td>
<td>The name of the currently active default schema. This value may change during the duration of a session through use of an <code>ALTER SESSION SET CURRENT_SCHEMA</code> statement. This may also change during the duration of a session to reflect the owner of any active definer's rights object. When used directly in the body of a view definition, this returns the default schema used when executing the cursor that is using the view; it does not respect views used in the cursor as being definer's rights.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Oracle recommends against issuing the SQL statement <code>ALTER SESSION SET CURRENT_SCHEMA</code> from within all types of stored PL/SQL units except logon triggers.</td>
</tr>
<tr>
<td>CURRENT_SCHEMAID</td>
<td>Identifier of the currently active default schema.</td>
</tr>
<tr>
<td>CURRENT_SQL</td>
<td><code>CURRENT_SQL</code> returns the first 4K bytes of the current SQL that triggered the fine-grained auditing event. The <code>CURRENT_SQLn</code> attributes return subsequent 4K-byte increments, where <code>n</code> can be an integer from 1 to 7, inclusive. <code>CURRENT_SQL1</code> returns bytes 4K to 8K; <code>CURRENT_SQL2</code> returns bytes 8K to 12K, and so forth. You can specify these attributes only inside the event handler for the fine-grained auditing feature.</td>
</tr>
<tr>
<td>CURRENT_SQL_LENGTH</td>
<td>The length of the current SQL statement that triggers fine-grained audit or row-level security (RLS) policy functions or event handlers. You can specify this attribute only inside the event handler for the fine-grained auditing feature.</td>
</tr>
<tr>
<td>CURRENT_USER</td>
<td>The name of the database user whose privileges are currently active. This may change during the duration of a database session as Real Application Security sessions are attached or detached, or to reflect the owner of any active definer's rights object. When no definer's rights object is active, CURRENT_USER returns the same value as <code>SESSION_USER</code>. When used directly in the body of a view definition, this returns the user that is executing the cursor that is using the view; it does not respect views used in the cursor as being definer's rights. For enterprise users, returns schema. If a Real Application Security user is currently active, returns user <code>XS$NULL</code>. <strong>See Also:</strong> Oracle Database 2 Day + Security Guide for more information on user <code>XS$NULL</code>.</td>
</tr>
<tr>
<td>CURRENT_USERID</td>
<td>The identifier of the database user whose privileges are currently active.</td>
</tr>
<tr>
<td>DATABASE_ROLE</td>
<td>The database role using the <code>SYS_CONTEXT</code> function with the <code>USERENV</code> namespace. The role is one of the following: PRIMARY, PHYSICAL STANDBY, LOGICAL STANDBY, SNAPSHOT STANDBY.</td>
</tr>
<tr>
<td>DB_DOMAIN</td>
<td>Domain of the database as specified in the <code>DB_DOMAIN</code> initialization parameter.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Return Value</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>DB_NAME</strong></td>
<td>Name of the database in the current context.</td>
</tr>
<tr>
<td><strong>DB_SUPPLEMENTAL_LOG_LEVEL</strong></td>
<td>If supplemental logging is enabled, returns a string containing the list of enabled supplemental logging levels. Possible values are: ALL_COLUMN, FOREIGN_KEY, MINIMAL, PRIMARY_KEY, PROCEDURAL, and UNIQUE_INDEX. If supplemental logging is not enabled, returns null.</td>
</tr>
<tr>
<td><strong>DB_UNIQUE_NAME</strong></td>
<td>Name of the database as specified in the DB_UNIQUE_NAME initialization parameter.</td>
</tr>
<tr>
<td><strong>DBLINK_INFO</strong></td>
<td>Returns the source of a database link session. Specifically, it returns a string of the form: &lt;br&gt;<strong>SOURCE_GLOBAL_NAME</strong>=dblink_src_global_name,  <strong>DBLINK_NAME</strong>=dblink_name, <strong>SOURCE_AUDIT_SESSIONID</strong>=dblink_src_audit_sessionid &lt;br&gt;where: &lt;br&gt;• <strong>dblink_src_global_name</strong> is the unique global name of the source database &lt;br&gt;• <strong>dblink_name</strong> is the name of the database link on the source database &lt;br&gt;• <strong>dblink_src_audit_sessionid</strong> is the audit session ID of the session on the source database that initiated the connection to the remote database using <strong>dblink_name</strong></td>
</tr>
<tr>
<td><strong>ENTRYID</strong></td>
<td>The current audit entry number. The audit entryid sequence is shared between fine-grained audit records and regular audit records. You cannot use this attribute in distributed SQL statements. The correct auditing entry identifier can be seen only through an audit handler for standard or fine-grained audit.</td>
</tr>
<tr>
<td><strong>ENTERPRISE_IDENTITY</strong></td>
<td>Returns the user's enterprise-wide identity:  &lt;br&gt;• For enterprise users: the Oracle Internet Directory DN.  &lt;br&gt;• For external users: the external identity (Kerberos principal name, Radius schema names, OS user name, Certificate DN).  &lt;br&gt;• For local users and SYSDBA/SYSOPER logins: NULL.  &lt;br&gt;The value of the attribute differs by proxy method:  &lt;br&gt;• For a proxy with DN: the Oracle Internet Directory DN of the client  &lt;br&gt;• For a proxy with certificate: the certificate DN of the client for external users; the Oracle Internet Directory DN for global users  &lt;br&gt;• For a proxy with username: the Oracle Internet Directory DN if the client is an enterprise users; NULL if the client is a local database user.</td>
</tr>
<tr>
<td><strong>FG_JOB_ID</strong></td>
<td>If queried from within a job that was created using the DBMS_JOB package:  &lt;br&gt;Returns the job ID of the current session if it was established by a client foreground process. Null if the session was not established by a foreground process.  &lt;br&gt;Otherwise: Returns 0.</td>
</tr>
<tr>
<td><strong>GLOBAL_CONTEXT_MEMORY</strong></td>
<td>Returns the number being used in the System Global Area by the globally accessed context.</td>
</tr>
<tr>
<td><strong>GLOBAL_UID</strong></td>
<td>Returns the global user ID from Oracle Internet Directory for Enterprise User Security (EUS) logins; returns null for all other logins.</td>
</tr>
<tr>
<td><strong>HOST</strong></td>
<td>Name of the host machine from which the client has connected.</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>• IDENTIFIED GLOBALLY: GLOBAL SHARED</td>
</tr>
<tr>
<td></td>
<td>• IDENTIFIED GLOBALLY AS DN: GLOBAL PRIVATE</td>
</tr>
<tr>
<td>INSTANCE</td>
<td>The instance identification number of the current instance.</td>
</tr>
<tr>
<td>INSTANCE_NAME</td>
<td>The name of the instance.</td>
</tr>
<tr>
<td>IPADDRESS</td>
<td>IP address of the machine from which the client is connected. If the client and server are on the same machine and the connection uses IPv6 addressing, then ::1 is returned.</td>
</tr>
<tr>
<td>IS_APPLY_SERVER</td>
<td>Returns TRUE if queried from within a SQL Apply server in a logical standby database. Otherwise, returns FALSE.</td>
</tr>
<tr>
<td>IS_DG_ROLLING_UPGRADE</td>
<td>Returns TRUE if a rolling upgrade of the database software in a Data Guard configuration, initiated by way of the DBMS_ROLLING package, is active. Otherwise, returns FALSE.</td>
</tr>
<tr>
<td>ISDBA</td>
<td>Returns TRUE if the user has been authenticated as having DBA privileges either through the operating system or through a password file.</td>
</tr>
<tr>
<td>LANG</td>
<td>The abbreviated name for the language, a shorter form than the existing 'LANGUAGE' parameter.</td>
</tr>
<tr>
<td>LANGUAGE</td>
<td>The language and territory currently used by your session, along with the database character set, in this form: language_territory.characterset</td>
</tr>
<tr>
<td>MODULE</td>
<td>The application name (module) set through the DBMS_APPLICATION_INFO package or OCI.</td>
</tr>
<tr>
<td>NETWORK_PROTOCOL</td>
<td>Network protocol being used for communication, as specified in the 'PROTOCOL=protocol' portion of the connect string.</td>
</tr>
<tr>
<td>NLS_CALENDAR</td>
<td>The current calendar of the current session.</td>
</tr>
<tr>
<td>NLS_CURRENCY</td>
<td>The currency of the current session.</td>
</tr>
<tr>
<td>NLS_DATE_FORMAT</td>
<td>The date format for the session.</td>
</tr>
<tr>
<td>NLS_DATE_LANGUAGE</td>
<td>The language used for expressing dates.</td>
</tr>
<tr>
<td>NLS_SORT</td>
<td>BINARY or the linguistic sort basis.</td>
</tr>
<tr>
<td>NLS_TERRITORY</td>
<td>The territory of the current session.</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>The full path name for the Oracle home directory.</td>
</tr>
<tr>
<td>OS_USER</td>
<td>Operating system user name of the client process that initiated the database session.</td>
</tr>
<tr>
<td>PLATFORM_SLASH</td>
<td>The slash character that is used as the file path delimiter for your platform.</td>
</tr>
<tr>
<td>POLICY_INVOKER</td>
<td>The invoker of row-level security (RLS) policy functions.</td>
</tr>
</tbody>
</table>
### Table 7-11  (Cont.) Predefined Parameters of Namespace USERENV

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROXY_ENTERPRISE_IDENTITY</td>
<td>Returns the Oracle Internet Directory DN when the proxy user is an enterprise user.</td>
</tr>
<tr>
<td>PROXY_USER</td>
<td>Name of the database user who opened the current session on behalf of SESSION_USER.</td>
</tr>
<tr>
<td>PROXY_USERID</td>
<td>Identifier of the database user who opened the current session on behalf of SESSION_USER.</td>
</tr>
<tr>
<td>SCHEDULER_JOB</td>
<td>Returns Y if the current session belongs to a foreground job or background job. Otherwise, returns N.</td>
</tr>
<tr>
<td>SERVER_HOST</td>
<td>The host name of the machine on which the instance is running.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>The name of the service to which a given session is connected.</td>
</tr>
<tr>
<td>SESSION_DEFAULT_COLLATION</td>
<td>The default collation for the session, which is set by the ALTER SESSION SET DEFAULT_COLLATION ... statement.</td>
</tr>
<tr>
<td>SESSION_EDITION_ID</td>
<td>The identifier of the session edition.</td>
</tr>
<tr>
<td>SESSION_EDITION_NAME</td>
<td>The name of the session edition.</td>
</tr>
<tr>
<td>SESSION_USER</td>
<td>The name of the session user (the user who logged on). This may change during the duration of a database session as Real Application Security sessions are attached or detached. For enterprise users, returns the schema. For other users, returns the database user name. If a Real Application Security session is currently attached to the database session, returns user XS$NULL. <strong>See Also:</strong> Oracle Database 2 Day + Security Guide for more information on user XS$NULL</td>
</tr>
<tr>
<td>SESSION_USERID</td>
<td>The identifier of the session user (the user who logged on).</td>
</tr>
<tr>
<td>SESSIONID</td>
<td>The auditing session identifier. You cannot use this attribute in distributed SQL statements.</td>
</tr>
<tr>
<td>SID</td>
<td>The session ID.</td>
</tr>
<tr>
<td>STATEMENTID</td>
<td>The auditing statement identifier. STATEMENTID represents the number of SQL statements audited in a given session. You cannot use this attribute in distributed SQL statements. The correct auditing statement identifier can be seen only through an audit handler for standard or fine-grained audit.</td>
</tr>
<tr>
<td>TERMINAL</td>
<td>The operating system identifier for the client of the current session. In distributed SQL statements, this attribute returns the identifier for your local session. In a distributed environment, this is supported only for remote SELECT statements, not for remote INSERT, UPDATE, or DELETE operations. (The return length of this parameter may vary by operating system.)</td>
</tr>
<tr>
<td>UNIFIED_AUDIT_SESSIONID</td>
<td>If queried while connected to a database that uses unified auditing or mixed mode auditing, returns the unified audit session ID. If queried while connected to a database that uses traditional auditing, returns null.</td>
</tr>
</tbody>
</table>
7.216 SYS_DBURIGEN

Syntax

```
SYS_DBURIGEN (column, attribute, rowid, 'text()')
```

Purpose

SYS_DBURIGen takes as its argument one or more columns or attributes, and optionally a rowid, and generates a URL of data type DBURIType to a particular column or row object. You can then use the URL to retrieve an XML document from the database.

All columns or attributes referenced must reside in the same table. They must perform the function of a primary key. They need not actually match the primary key of the table, but they must reference a unique value. If you specify multiple columns, then all but the final column identify the row in the database, and the last column specified identifies the column within the row.

By default the URL points to a formatted XML document. If you want the URL to point only to the text of the document, then specify the optional 'text()'.

Note:

In this XML context, the lowercase `text` is a keyword, not a syntactic placeholder.

If the table or view containing the columns or attributes does not have a schema specified in the context of the query, then Oracle Database interprets the table or view name as a public synonym.

See Also:

Oracle XML DB Developer's Guide for information on the DBURIType data type and XML documents in the database

Examples

The following example uses the SYS_DBURIGen function to generate a URL of data type DBURIType to the email column of the row in the sample table hr.employees where the employee_id = 206:

```
SELECT SYS_DBURIGEN(employee_id, email)
FROM employees
WHERE employee_id = 206;
```
7.217 SYS_EXTRACT_UTC

Syntax

```
SYS_EXTRACT_UTC (datetime_with_timezone)
```

Purpose

SYS_EXTRACT_UTC extracts the UTC (Coordinated Universal Time—formerly Greenwich Mean Time) from a datetime value with time zone offset or time zone region name. If a time zone is not specified, then the datetime is associated with the session time zone.

Examples

The following example extracts the UTC from a specified datetime:

```
SELECT SYS_EXTRACT_UTC(TIMESTAMP '2000-03-28 11:30:00.00 -08:00')
FROM DUAL;
```

```
28-MAR-00 07.30.00 PM
```

7.218 SYS_GUID

Syntax

```
SYS_GUID()
```

Purpose

SYS_GUID generates and returns a globally unique identifier (RAW value) made up of 16 bytes. On most platforms, the generated identifier consists of a host identifier, a process or thread identifier of the process or thread invoking the function, and a nonrepeating value (sequence of bytes) for that process or thread.

Examples

The following example adds a column to the sample table hr.locations, inserts unique identifiers into each row, and returns the 32-character hexadecimal representation of the 16-byte RAW value of the global unique identifier:

```
ALTER TABLE locations ADD (uid_col RAW(16));
UPDATE locations SET uid_col = SYS_GUID();
SELECT location_id, uid_col FROM locations
```
ORDER BY location_id, uid_col;

<table>
<thead>
<tr>
<th>LOCATION_ID</th>
<th>UID_COL</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000</td>
<td>09F686761827CF8AE040578CB20B7491</td>

</tr>
<tr>
<td>1300</td>
<td>09F68676182ACF8AE040578CB20B7491</td>
</tr>
<tr>
<td>1400</td>
<td>09F68676182BCF8AE040578CB20B7491</td>
</tr>
<tr>
<td>1500</td>
<td>09F68676182CCF8AE040578CB20B7491</td>
</tr>
</tbody>
</table>

## 7.219 SYS_OP_ZONE_ID

### Syntax

![Diagram of SYS_OP_ZONE_ID](image)

### Purpose

SYS_OP_ZONE_ID takes as its argument a rowid and returns a zone ID. The rowid identifies a row in a table. The zone ID identifies the set of contiguous disk blocks, called the zone, that contains the row. The function returns a NUMBER value.

The SYS_OP_ZONE_ID function is used when creating a zone map with the CREATE MATERIALIZED ZONEMAP statement. You must specify SYS_OP_ZONE_ID in the SELECT and GROUP BY clauses of the defining subquery of the zone map.

For rowid, specify the ROWID pseudocolumn of the fact table of the zone map.

Use schema and table to specify the schema and name of the fact table, or t_alias to specify the table alias for the fact table. The specification of these parameters depends on the FROM clause in the defining subquery of the zone map:

- If the FROM clause specifies a table alias for the fact table, then you must also specify the table alias (t_alias) in SYS_OP_ZONE_ID.
- If the FROM clause does not specify a table alias for the fact table, then use table to specify the name of the fact table. You can use the schema qualifier if the fact table is in a schema other than your own. If you omit schema, then the database assumes the fact table is in your own schema. If the FROM clause specifies only one table (the fact table) then you need not specify schema or table.

The optional scale parameter represents the scale of the zone map. It is not necessary to specify this parameter because, by default, SYS_OP_ZONE_ID uses the scale of the zone map being created. If you do specify scale, then it must match the scale of the zone map being created. Refer to the SCALE clause of CREATE MATERIALIZED ZONEMAP for information on specifying the scale of a zone map.
Examples

The following example uses the `SYS_OP_ZONE_ID` function when creating a basic zone map that tracks the column `time_id` of the fact table `sales`. The scale of the zone map is the default value of 10. Therefore, the `SYS_OP_ZONE_ID` function will default to a scale value of 10.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
AS
  SELECT SYS_OP_ZONE_ID(rowid), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid);
```

The following example is similar to the previous example, except that the scale of the zone map being created is specified as 8. Therefore, the `SYS_OP_ZONE_ID` function will default to a scale value of 8.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
SCALE 8
AS
  SELECT SYS_OP_ZONE_ID(rowid), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid);
```

The following example returns an error because the scale of the zone map being created is specified as 8, which does not match the `scale` argument of 12 specified in the `SYS_OP_ZONE_ID` function.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
SCALE 8
AS
  SELECT SYS_OP_ZONE_ID(rowid,12), MIN(time_id), MAX(time_id)
  FROM sales
  GROUP BY SYS_OP_ZONE_ID(rowid,12);
```

The following example creates a join zone map. The fact table is `sales` and the dimension tables are `products` and `customers`. Because the table alias `s` is specified for the fact table in the `FROM` clause, the table alias `s` is also specified in the `SYS_OP_ZONE_ID` function.

```
CREATE MATERIALIZED ZONEMAP sales_zmap
AS
  SELECT SYS_OP_ZONE_ID(s.rowid),
    MIN(prod_category), MAX(prod_category),
    MIN(country_id), MAX(country_id)
  FROM sales s, products p, customers c
  WHERE s.prod_id = p.prod_id(+)
    AND
    s.cust_id = c.cust_id(+)
  GROUP BY SYS_OP_ZONE_ID(s.rowid);
```
7.220 SYS_TYPEID

Syntax

```
SYS_TYPEID(object_type_value)
```

Purpose

SYS_TYPEID returns the typeid of the most specific type of the operand. This value is used primarily to identify the type-discriminant column underlying a substitutable column. For example, you can use the value returned by SYS_TYPEID to build an index on the type-discriminant column.

You can use this function only on object type operands. All final root object types—final types not belonging to a type hierarchy—have a null typeid. Oracle Database assigns to all types belonging to a type hierarchy a unique non-null typeid.

See Also:

*Oracle Database Object-Relational Developer's Guide* for more information on typeids

Examples

The following examples use the tables persons and books, which are created in "Substitutable Table and Column Examples". The first query returns the most specific types of the object instances stored in the persons table.

```
SELECT name, SYS_TYPEID(VALUE(p)) "Type_id" FROM persons p;
```

<table>
<thead>
<tr>
<th>NAME</th>
<th>Type_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bob</td>
<td>01</td>
</tr>
<tr>
<td>Joe</td>
<td>02</td>
</tr>
<tr>
<td>Tim</td>
<td>03</td>
</tr>
</tbody>
</table>

The next query returns the most specific types of authors stored in the table books:

```
SELECT b.title, b.author.name, SYS_TYPEID(author) "Type_ID" FROM books b;
```

<table>
<thead>
<tr>
<th>TITLE</th>
<th>AUTHOR_NAME</th>
<th>Type_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>An Autobiography</td>
<td>Bob</td>
<td>01</td>
</tr>
<tr>
<td>Business Rules</td>
<td>Joe</td>
<td>02</td>
</tr>
<tr>
<td>Mixing School and Work</td>
<td>Tim</td>
<td>03</td>
</tr>
</tbody>
</table>

You can use the SYS_TYPEID function to create an index on the type-discriminant column of a table. For an example, see "Indexing on Substitutable Columns: Examples".
7.221 SYS_XMLAGG

Syntax

SYS_XMLAGG(expr, fmt)

Purpose

SYS_XMLAgg aggregates all of the XML documents or fragments represented by expr and produces a single XML document. It adds a new enclosing element with a default name ROWSET. If you want to format the XML document differently, then specify fmt, which is an instance of the XMLFormat object.

See Also:

SYS_XMLGEN and “XML Format Model” for using the attributes of the XMLFormat type to format SYS_XMLAgg results

Examples

The following example uses the SYS_XMLGen function to generate an XML document for each row of the sample table employees where the employee’s last name begins with the letter R, and then aggregates all of the rows into a single XML document in the default enclosing element ROWSET:

```
SELECT SYS_XMLAGG(SYS_XMLGEN(last_name)) XMLAGG
FROM employees
WHERE last_name LIKE 'R%'
ORDER BY xmlagg;
```

```
<ROWSET>
<LAST_NAME>Rajs</LAST_NAME>
<LAST_NAME>Raphaely</LAST_NAME>
<LAST_NAME>Rogers</LAST_NAME>
<LAST_NAME>Russell</LAST_NAME>
</ROWSET>
```
7.222 SYS_XMLGEN

Note:
The SYS_XMLGen function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the SQL/XML generation functions instead. See Oracle XML DB Developer’s Guide for more information.

Syntax

SYS_XMLGEN ( expr
, fmt
)

Purpose
SYS_XMLGen takes an expression that evaluates to a particular row and column of the database, and returns an instance of type XMLType containing an XML document. The expr can be a scalar value, a user-defined type, or an XMLType instance.

- If expr is a scalar value, then the function returns an XML element containing the scalar value.
- If expr is a type, then the function maps the user-defined type attributes to XML elements.
- If expr is an XMLType instance, then the function encloses the document in an XML element whose default tag name is ROW.

By default the elements of the XML document match the elements of expr. For example, if expr resolves to a column name, then the enclosing XML element will be the same column name. If you want to format the XML document differently, then specify fmt, which is an instance of the XMLFormat object.

See Also:
"XML Format Model " for a description of the XMLFormat type and how to use its attributes to format SYS_XMLGen results

Examples
The following example retrieves the employee email ID from the sample table oe.employees where the employee_id value is 205, and generates an instance of an XMLType containing an XML document with an EMAIL element.

```
SELECT SYS_XMLGEN(email)
FROM employees
WHERE employee_id = 205;
```
7.223 SYSDATE

Syntax

```sql
SYSDATE
```

Purpose

SYSDATE returns the current date and time set for the operating system on which the database server resides. The data type of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The function requires no arguments. In distributed SQL statements, this function returns the date and time set for the operating system of your local database. You cannot use this function in the condition of a CHECK constraint.

**Note:**

The FIXED_DATE initialization parameter enables you to set a constant date and time that SYSDATE will always return instead of the current date and time. This parameter is useful primarily for testing. Refer to Oracle Database Reference for more information on the FIXED_DATE initialization parameter.

Examples

The following example returns the current operating system date and time:

```sql
SELECT TO_CHAR(SYSDATE, 'MM-DD-YYYY HH24:MI:SS') "NOW"
FROM DUAL;
```

```
NOW
-------------------
04-13-2001 09:45:51
```

7.224 SYSTIMESTAMP

Syntax

```sql
SYSTIMESTAMP
```

---

**ORACLE**

7-350
Purpose
SYSTIMESTAMP returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE.

Examples
The following example returns the system timestamp:

SELECT SYSTIMESTAMP FROM DUAL;

SYSTIMESTAMP
------------------------------------------------------------------
28-MAR-00 12.38.55.538741 PM -08:00

The following example shows how to explicitly specify fractional seconds:

SELECT TO_CHAR(SYSTIMESTAMP, 'SSSSS.FF') FROM DUAL;

TO_CHAR(SYSTIME
--------------
55615.449255

The following example returns the current timestamp in a specified time zone:

SELECT SYSTIMESTAMP AT TIME ZONE 'UTC' FROM DUAL;

SYSTIMESTAMPATTIMEZONE'UTC'
---------------------------------------------------------------------------
08-07-21 20:39:52,743557 UTC

The output format in this example depends on the NLS_TIMESTAMP_TZ_FORMAT for the session.

7.225 TAN

Syntax

\[ \text{TAN} \left( n \right) \]

Purpose
TAN returns the tangent of \( n \) (an angle expressed in radians).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:
Table 2-8 for more information on implicit conversion
Examples

The following example returns the tangent of 135 degrees:

```sql
SELECT TAN(135 * 3.14159265359/180)  
"Tangent of 135 degrees"  FROM DUAL;
```

```
Tangent of 135 degrees
----------------------
- 1
```

7.226 TANH

Syntax

```
TANH(n)
```

Purpose

TANH returns the hyperbolic tangent of \( n \).

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If the argument is BINARY_FLOAT, then the function returns BINARY_DOUBLE. Otherwise the function returns the same numeric data type as the argument.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following example returns the hyperbolic tangent of .5:

```sql
SELECT TANH(.5) "Hyperbolic tangent of .5"  FROM DUAL;
```

```
Hyperbolic tangent of .5
------------------------
.462117157
```

7.227 TIMESTAMP_TO_SCN

Syntax

```
TIMESTAMP_TO_SCN(t)
```
Purpose

TIMESTAMP_TO_SCN takes as an argument a timestamp value and returns the approximate system change number (SCN) associated with that timestamp. The returned value is of data type NUMBER. This function is useful any time you want to know the SCN associated with a particular timestamp.

Note:

The association between an SCN and a timestamp when the SCN is generated is remembered by the database for a limited period of time. This period is the maximum of the auto-tuned undo retention period, if the database runs in the Automatic Undo Management mode, and the retention times of all flashback archives in the database, but no less than 120 hours. The time for the association to become obsolete elapses only when the database is open. An error is returned if the timestamp specified for the argument to TIMESTAMP_TO_SCN is too old.

See Also:

SCN_TO_TIMESTAMP for information on converting SCNs to timestamp

Examples

The following example inserts a row into the oe.orders table and then uses TIMESTAMP_TO_SCN to determine the system change number of the insert operation. (The actual SCN returned will differ on each system.)

```
INSERT INTO orders (order_id, order_date, customer_id, order_total)
VALUES (5000, SYSTIMESTAMP, 188, 2345);
1 row created.

COMMIT;
Commit complete.

SELECT TIMESTAMP_TO_SCN(order_date) FROM orders
WHERE order_id = 5000;
TIMESTAMP_TO_SCN(ORDER_DATE)
----------------------------
574100
```

7.228 TO_APPROX_COUNT_DISTINCT

Syntax

```
    TO_APPROX_COUNT_DISTINCT [ (detail) ]
```

Chapter 7

TO_APPROX_COUNT_DISTINCT

7-353
Purpose

TO_APPROX_COUNT_DISTINCT takes as its input a detail containing information about an approximate distinct value count, and converts it to a NUMBER value.

For detail, specify a detail of type BLOB, which was created by the APPROX_COUNT_DISTINCT_DETAIL function or the APPROX_COUNT_DISTINCT_AGG function.

See Also:

- APPROX_COUNT_DISTINCT_DETAIL
- TO_APPROX_COUNT_DISTINCT

Examples

Refer to TO_APPROX_COUNT_DISTINCT: Examples for examples of using the TO_APPROX_COUNT_DISTINCT function in conjunction with the APPROX_COUNT_DISTINCT_DETAIL and APPROX_COUNT_DISTINCT_AGG functions.

7.229 TO_APPROX_PERCENTILE

Syntax

```
TO_APPROX_PERCENTILE ( detail , expr , ' datatype '
,
' DESC '
' ASC '
' ERROR_RATE '
' CONFIDENCE '
)
```

Purpose

TO_APPROX_PERCENTILE takes as its input a detail containing approximate percentile information, a percentile value, and a sort specification, and returns an approximate interpolated value that would fall into that percentile value with respect to the sort specification.

For detail, specify a detail of type BLOB, which was created by the APPROX_PERCENTILE_DETAIL function or the APPROX_PERCENTILE_AGG function.

For expr, specify a percentile value, which must evaluate to a numeric value between 0 and 1. If you specify the ERROR_RATE or CONFIDENCE clause, then the percentile value does not apply. In this case, for expr you must specify null or a numeric value between 0 and 1. However, the value will be ignored.

For datatype, specify the data type of the approximate percentile information in the detail. This is the data type of the expression supplied to the
APPROSS_PERCENTILE_DETAIL function that originated the detail. Valid data types are NUMBER, BINARY_FLOAT, BINARY_DOUBLE, DATE, TIMESTAMP, INTERVAL YEAR TO MONTH, and INTERVAL DAY TO SECOND.

DESC | ASC
Specify the sort specification for the interpolation. Specify DESC for a descending sort order, or ASC for an ascending sort order. ASC is the default.

ERROR_RATE | CONFIDENCE
These clauses let you determine the accuracy of the percentile evaluation of the detail. If you specify one of these clauses, then instead of returning the approximate interpolated value, the function returns a decimal value from 0 to 1, inclusive, which represents one of the following values:

- If you specify ERROR_RATE, then the return value represents the error rate of the percentile evaluation for the detail.
- If you specify CONFIDENCE, then the return value represents the confidence level for the error rate returned when you specify ERROR_RATE.

If you specify ERROR_RATE or CONFIDENCE, then the percentile value expr is ignored.

See Also:
- APPROX_PERCENTILE_DETAIL
- APPROX_PERCENTILE_AGG

Examples
Refer to APPROX_PERCENTILE_AGG: Examples for examples of using the TO_APPROX_PERCENTILE function in conjunction with the APPROX_PERCENTILE_DETAIL and APPROX_PERCENTILE_AGG functions.

7.230 TO_BINARY_DOUBLE

Syntax

```
TO_BINARY_DOUBLE ( expr
DEFAULT return_value ON CONVERSION ERROR
, fmt
, ' nlsparam '
)
```

Purpose

TO_BINARY_DOUBLE converts expr to a double-precision floating-point number.

- expr can be any expression that evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or
BINARY_DOUBLE, or null. If expr is BINARY_DOUBLE, then the function returns expr. If expr evaluates to null, then the function returns null. Otherwise, the function converts expr to a BINARY_DOUBLE value.

- The optional DEFAULT return_value ON CONVERSION ERROR clause allows you to specify the value returned by this function if an error occurs while converting expr to BINARY_DOUBLE. This clause has no effect if an error occurs while evaluating expr. The return_value can be an expression or a bind variable, and must evaluate to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, or null. The function converts return_value to BINARY_DOUBLE in the same way it converts expr to BINARY_DOUBLE. If return_value cannot be converted to BINARY_DOUBLE, then the function returns an error.

- The optional 'fmt' and 'nlsparam' arguments serve the same purpose as for the TO_NUMBER function. If you specify these arguments, then expr and return_value, if specified, must each be a character string or null. If either is a character string, then the function uses the fmt and nlsparam arguments to convert the character string to a BINARY_DOUBLE value.

If expr or return_value evaluate to the following character strings, then the function converts them as follows:

- The case-insensitive string 'INF' is converted to positive infinity.
- The case-insensitive string '-INF' is converted to negative identity.
- The case-insensitive string 'NaN' is converted to NaN (not a number).

You cannot use a floating-point number format element (F, f, D, or d) in a character string expr.

Conversions from character strings or NUMBER to BINARY_DOUBLE can be inexact, because the NUMBER and character types use decimal precision to represent the numeric value, and BINARY_DOUBLE uses binary precision.

Conversions from BINARY_FLOAT to BINARY_DOUBLE are exact.

See Also:

TO_CHAR (number) and "Floating-Point Numbers"

Examples

The examples that follow are based on a table with three columns, each with a different numeric data type:

```sql
CREATE TABLE float_point_demo
  (dec_num NUMBER(10,2), bin_double BINARY_DOUBLE, bin_float BINARY_FLOAT);

INSERT INTO float_point_demo
VALUES (1234.56,1234.56,1234.56);

SELECT * FROM float_point_demo;

DEC_NUM BIN_DOUBLE BIN_FLOAT
```

7-356
The following example converts a value of data type NUMBER to a value of data type BINARY_DOUBLE:

SELECT dec_num, TO_BINARY_DOUBLE(dec_num)
FROM float_point_demo;

<table>
<thead>
<tr>
<th>DEC_NUM TO_BINARY_DOUBLE (DEC_NUM)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1234.56</td>
</tr>
</tbody>
</table>

The following example compares extracted dump information from the dec_num and bin_double columns:

SELECT DUMP (dec_num) "Decimal",
    DUMP (bin_double) "Double"
FROM float_point_demo;

DecNum                      Double
---------------------------- ---------------------------
Typ=2 Len=4: 194,13,35,57   Typ=101 Len=8: 192,147,74,61,112,163,215,10

The following example returns the default value of 0 because the specified expression cannot be converted to a BINARY_DOUBLE value:

SELECT TO_BINARY_DOUBLE ('2oo' DEFAULT 0 ON CONVERSION ERROR) "Value"
FROM DUAL;

Value
---
0

7.231 TO_BINARY_FLOAT

Syntax

```
TO_BINARY_FLOAT ( expr
DEFAULT return_value ON CONVERSION ERROR
, fmt
, ' nlsparam '
)
```

Purpose

TO_BINARY_FLOAT converts *expr* to a single-precision floating-point number.

- *expr* can be any expression that evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, or null. If *expr* is BINARY_FLOAT, then the function returns *expr*. If *expr* evaluates to null, then the function returns null. Otherwise, the function converts *expr* to a BINARY_FLOAT value.
The optional `DEFAULT return_value ON CONVERSION ERROR` clause allows you to specify the value returned by this function if an error occurs while converting `expr` to `BINARY_FLOAT`. This clause has no effect if an error occurs while evaluating `expr`. The `return_value` can be an expression or a bind variable, and must evaluate to a character string of type `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2`, a numeric value of type `NUMBER`, `BINARY_FLOAT`, or `BINARY_DOUBLE`, or null. The function converts `return_value` to `BINARY_FLOAT` in the same way it converts `expr` to `BINARY_FLOAT`. If `return_value` cannot be converted to `BINARY_FLOAT`, then the function returns an error.

The optional `fmt` and `nlsparam` arguments serve the same purpose as for the `TO_NUMBER` function. If you specify these arguments, then `expr` and `return_value`, if specified, must each be a character string or null. If either is a character string, then the function uses the `fmt` and `nlsparam` arguments to convert the character string to a `BINARY_FLOAT` value.

If `expr` or `return_value` evaluate to the following character strings, then the function converts them as follows:

- The case-insensitive string `"INF"` is converted to positive infinity.
- The case-insensitive string `"-INF"` is converted to negative infinity.
- The case-insensitive string `"NaN"` is converted to `NaN` (not a number).

You cannot use a floating-point number format element (`F`, `f`, `D`, or `d`) in a character string `expr`.

Conversions from character strings or `NUMBER` to `BINARY_FLOAT` can be inexact, because the `NUMBER` and character types use decimal precision to represent the numeric value and `BINARY_FLOAT` uses binary precision.

Conversions from `BINARY_DOUBLE` to `BINARY_FLOAT` are inexact if the `BINARY_DOUBLE` value uses more bits of precision than supported by the `BINARY_FLOAT`.

### See Also:

- `TO_CHAR (number)` and "Floating-Point Numbers"

### Examples

Using table `float_point_demo` created for `TO_BINARY_DOUBLE`, the following example converts a value of data type `NUMBER` to a value of data type `BINARY_FLOAT`:

```sql
SELECT dec_num, TO_BINARY_FLOAT(dec_num)
FROM float_point_demo;
```

```
DEC_NUM TO_BINARY_FLOAT(DEC_NUM)
---------- ------------------------
1234.56   1.235E+003
```

The following example returns the default value of 0 because the specified expression cannot be converted to a `BINARY_FLOAT` value:

```sql
SELECT TO_BINARY_FLOAT('200' DEFAULT 0 ON CONVERSION ERROR) "Value"
FROM DUAL;
```
7.232 TO_BLOB (bfile)

Syntax

to_blob_bfile::= 

Purpose

TO_BLOB (bfile) converts a BFILE value to a BLOB value.

For mime_type, specify the MIME type to be set on the BLOB value returned by this function. If you omit mime_type, then a MIME type will not be set on the BLOB value.

Example

The following hypothetical example returns the BLOB of a BFILE column value media_col in table media_tab. It sets the MIME type to JPEG on the resulting BLOB.

```
SELECT TO_BLOB(media_col, 'JPEG') FROM media_tab;
```

7.233 TO_BLOB (raw)

Syntax

to_blob::= 

Purpose

TO_BLOB (raw) converts LONG RAW and RAW values to BLOB values.

From within a PL/SQL package, you can use TO_BLOB (raw) to convert RAW and BLOB values to BLOB.

Examples

The following hypothetical example returns the BLOB of a RAW column value:

```
SELECT TO_BLOB(raw_column) blob FROM raw_table;
```

BLOB
-----------------------
00AADD343CDBBD
### 7.234 TO_CHAR (bfile|blob)

**Syntax**

\[ \text{to_char_bfile_blob}::= \]

\[ \text{TO_CHAR (bfile|blob, csid)} \]

**Purpose**

TO_CHAR (bfile|blob) converts BFILE or BLOB data to the database character set. The value returned is always VARCHAR2. If the value returned is too large to fit into the VARCHAR2 data type, then the data is truncated.

For \( csid \), specify the character set ID of the BFILE or BLOB data. If the character set of the BFILE or BLOB data is the database character set, then you can specify a value of 0 for \( csid \), or omit \( csid \) altogether.

**See Also:**

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function.

**Example**

The following hypothetical example takes as its input a BFILE column \( \text{media\_col} \) in table \( \text{media\_tab} \), which uses the character set with ID 873. The example returns a VARCHAR2 value that uses the database character set.

\[ \text{SELECT TO_CHAR( media\_col, 873) FROM media\_tab; } \]

### 7.235 TO_CHAR (character)

**Syntax**

\[ \text{to_char_char}::= \]

\[ \text{TO_CHAR (nchar|clob|nclob)} \]

**Example**

The following hypothetical example takes as its input a BFILE column \( \text{media\_col} \) in table \( \text{media\_tab} \), which uses the character set with ID 873. The example returns a VARCHAR2 value that uses the database character set.

\[ \text{SELECT TO_CHAR( media\_col, 873) FROM media\_tab; } \]
Purpose

TO_CHAR (character) converts NCHAR, NVARCHAR2, CLOB, or NCLOB data to the database character set. The value returned is always VARCHAR2.

When you use this function to convert a character LOB into the database character set, if the LOB value to be converted is larger than the target type, then the database returns an error.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example interprets a simple string as character data:

```
SELECT TO_CHAR('01110') FROM DUAL;
```

```
TO_CH
-----
01110
```

Compare this example with the first example for TO_CHAR (number).

The following example converts some CLOB data from the pm.print_media table to the database character set:

```
SELECT TO_CHAR(ad_sourcetext) FROM print_media
WHERE product_id = 2268;
```

```
TO_CHAR(AD_SOURCETEXT)
--------------------------------------------------------------------
******************************
TIGER2 2268...Standard Hayes Compatible Modem
Product ID: 2268
The #1 selling modem in the universe! Tiger2's modem includes call management and Internet voicing. Make real-time full duplex phone calls at the same time you're online.
******************************
```

7.236 TO_CHAR (datetime)

Syntax

```
to_char_date ::= 
```

```
```

Chapter 7

TO_CHAR (datetime)
7-361
Purpose

TO_CHAR (datetime) converts a datetime or interval value of DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, INTERVAL DAY TO SECOND, or INTERVAL YEAR TO MONTH data type to a value of VARCHAR2 data type in the format specified by the date format fmt. If you omit fmt, then date is converted to a VARCHAR2 value as follows:

- DATE values are converted to values in the default date format.
- TIMESTAMP and TIMESTAMP WITH LOCAL TIME ZONE values are converted to values in the default timestamp format.
- TIMESTAMP WITH TIME ZONE values are converted to values in the default timestamp with time zone format.
- Interval values are converted to the numeric representation of the interval literal.

Refer to "Format Models " for information on datetime formats.

The 'nlsparam' argument specifies the language in which month and day names and abbreviations are returned. This argument can have this form:

'NLS_DATE_LANGUAGE = language'

If you omit 'nlsparam', then this function uses the default date language for your session.

See Also:

"Security Considerations for Data Conversion"

You can use this function in conjunction with any of the XML functions to generate a date in the database format rather than the XML Schema standard format.

See Also:

- Oracle XML DB Developer's Guide for information about formatting of XML dates and timestamps, including examples
- "XML Functions " for a listing of the XML functions
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example uses this table:

```sql
CREATE TABLE date_tab ( 
  ts_col TIMESTAMP, 
  tsltz_col TIMESTAMP WITH LOCAL TIME ZONE, 
  tstz_col TIMESTAMP WITH TIME ZONE);
```
The example shows the results of applying TO_CHAR to different TIMESTAMP data types. The result for a TIMESTAMP WITH LOCAL TIME ZONE column is sensitive to session time zone, whereas the results for the TIMESTAMP and TIMESTAMP WITH TIME ZONE columns are not sensitive to session time zone:

```
ALTER SESSION SET TIME_ZONE = '-8:00';
INSERT INTO date_tab VALUES ('1999-12-01 10:00:00',
                              '1999-12-01 10:00:00',
                              '1999-12-01 10:00:00');
INSERT INTO date_tab VALUES ('1999-12-02 10:00:00 -8:00',
                              '1999-12-02 10:00:00 -8:00',
                              '1999-12-02 10:00:00 -8:00');

SELECT TO_CHAR(ts_col, 'DD-MON-YYYY HH24:MI:SSxFF') AS ts_date,
       TO_CHAR(tstz_col, 'DD-MON-YYYY HH24:MI:SSxFF TZH:TZM') AS tstz_date
FROM date_tab
ORDER BY ts_date, tstz_date;
```

```
TS_DATE                         TSTZ_DATE
------------------------------ -------------------------------------
01-DEC-1999 10:00:00.000000    01-DEC-1999 10:00:00.000000 -08:00
02-DEC-1999 10:00:00.000000    02-DEC-1999 10:00:00.000000 -08:00
```

```
SELECT SESSIONTIMEZONE,
       TO_CHAR(tsltz_col, 'DD-MON-YYYY HH24:MI:SSxFF') AS tsltz
FROM date_tab
ORDER BY sessiontimezone, tsltz;
```

```
SESSIONTIM TSLTZ
---------- ------------------------------
-08:00     01-DEC-1999 10:00:00.000000
-08:00     02-DEC-1999 10:00:00.000000
```

```
ALTER SESSION SET TIME_ZONE = '-5:00';
SELECT TO_CHAR(ts_col, 'DD-MON-YYYY HH24:MI:SSxFF') AS ts_col,
       TO_CHAR(tstz_col, 'DD-MON-YYYY HH24:MI:SSxFF TZH:TZM') AS tstz_col
FROM date_tab
ORDER BY ts_col, tstz_col;
```

```
TS_COL                         TSTZ_COL
------------------------------ -------------------------------------
01-DEC-1999 10:00:00.000000    01-DEC-1999 10:00:00.000000 -08:00
02-DEC-1999 10:00:00.000000    02-DEC-1999 10:00:00.000000 -08:00
```

```
SELECT SESSIONTIMEZONE,
       TO_CHAR(tsltz_col, 'DD-MON-YYYY HH24:MI:SSxFF') AS tsltz_col
FROM date_tab
ORDER BY sessiontimezone, tsltz_col;
```

```
2    3    4
SESSIONTIM TSLTZ_COL
---------- ------------------------------
-05:00     01-DEC-1999 13:00:00.000000
-05:00     02-DEC-1999 13:00:00.000000
```

The following example converts an interval literal into a text literal:

```
SELECT TO_CHAR(INTERVAL '123-2' YEAR(3) TO MONTH) FROM DUAL;
```

TO_CHAR
7.237 TO_CHAR (number)

Syntax

to_char_number ::= 

Purpose

TO_CHAR (number) converts n to a value of VARCHAR2 data type, using the optional number format fmt. The value n can be of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. If you omit fmt, then n is converted to a VARCHAR2 value exactly long enough to hold its significant digits.

If n is negative, then the sign is applied after the format is applied. Thus TO_CHAR(-1, '9') returns -$1, rather than $-1.

Refer to "Format Models " for information on number formats.

The 'nlsparam' argument specifies these characters that are returned by number format elements:

- Decimal character
- Group separator
- Local currency symbol
- International currency symbol

This argument can have this form:

'NLS_NUMERIC_CHARACTERS = ''dg''
NLS_CURRENCY = ''text''
NLS_ISO_CURRENCY = territory ' 

The characters d and g represent the decimal character and group separator, respectively. They must be different single-byte characters. Within the quoted string, you must use two single quotation marks around the parameter values. Ten characters are available for the currency symbol.

If you omit 'nlsparam' or any one of the parameters, then this function uses the default parameter values for your session.
See Also:

- “Security Considerations for Data Conversion”
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following statement uses implicit conversion to combine a string and a number into a number:

```sql
SELECT TO_CHAR('01110' + 1) FROM DUAL;
```

```
TO_C
----
1111
```

Compare this example with the first example for TO_CHAR (character).

In the next example, the output is blank padded to the left of the currency symbol. In the optional number format fmt, L designates local currency symbol and MI designates a trailing minus sign. See Table 2-15 for a complete listing of number format elements.

The example shows the output in a session in which the session parameter NLS_TERRITORY is set to AMERICA.

```sql
SELECT TO_CHAR(-10000,'L99G999D99MI') "Amount"
FROM DUAL;
```

```
Amount
--------
$10,000.00-
```

In the next example, NLS_CURRENCY specifies the string to use as the local currency symbol for the L number format element. NLS_NUMERIC_CHARACTERS specifies comma as the character to use as the decimal separator for the D number format element and period as the character to use as the group separator for the G number format element. These characters are expected in many countries, for example in Germany.

```sql
SELECT TO_CHAR(-10000,'L99G999D99MI',
               'NLS_NUMERIC_CHARACTERS = ',',',
               NLS_CURRENCY = ''AusDollars'' ') "Amount"
FROM DUAL;
```

```
Amount
-------------------
AusDollars10.000,00-
```

In the next example, NLS_ISO_CURRENCY instructs the database to use the international currency symbol for the territory of POLAND for the C number format element:

```sql
SELECT TO_CHAR(-10000,'99G999D99C',
               'NLS_NUMERIC_CHARACTERS = ',',',
               NLS_ISO_CURRENCY=POLAND') "Amount"
FROM DUAL;
```

```
Amount
-------------------
AusDollars10.000,00-
```
7.238 TO_CLOB (bfile|blob)

Syntax

```sql
TO_CLOB (bfile|blob, csid, 'mime_type')
```

Purpose

TO_CLOB (bfile|blob) converts BFILE or BLOB data to the database character set and returns the data as a CLOB value.

For `csid`, specify the character set ID of the BFILE or BLOB data. If the character set of the BFILE or BLOB data is the database character set, then you can specify a value of 0 for `csid`, or omit `csid` altogether.

For `mime_type`, specify the MIME type to be set on the CLOB value returned by this function. If you omit `mime_type`, then a MIME type will not be set on the CLOB value.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function.

Example

The following hypothetical example returns the CLOB of a BFILE column value `docu` in table `media_tab`, which uses the character set with ID 873. It sets the MIME type to `text/xml` for the resulting CLOB.

```sql
SELECT TO_CLOB(docu, 873, 'text/xml') FROM media_tab;
```

7.239 TO_CLOB (character)

Syntax

```sql
TO_CLOB (lob_column, char)
```
Purpose

TO_CLOB (character) converts NCLOB values in a LOB column or other character strings to CLOB values. char can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. Oracle Database executes this function by converting the underlying LOB data from the national character set to the database character set.

From within a PL/SQL package, you can use the TO_CLOB (character) function to convert RAW, CHAR, VARCHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB values to CLOB or NCLOB values.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function.

Examples

The following statement converts NCLOB data from the sample pm.print_media table to CLOB and inserts it into a CLOB column, replacing existing data in that column.

```
UPDATE PRINT_MEDIA
SET AD_FINALTEXT = TO_CLOB (AD_FLTEXTN);
```

7.240 TO_DATE

Syntax

```sql
TO_DATE ( char
DEFAULT return_value ON CONVERSION ERROR
, fmt
, ' nlsparam '
)
```

Purpose

TO_DATE converts char to a value of DATE data type.

For char, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

Note:

This function does not convert data to any of the other datetime data types. For information on other datetime conversions, refer to TO_TIMESTAMP, TO_TIMESTAMP_TZ, TO_DSINTERVAL, and TO_YMINTERVAL.
The optional DEFAULT return_value ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting \texttt{char} to \texttt{DATE}. This clause has no effect if an error occurs while evaluating \texttt{char}. The return_value can be an expression or a bind variable, and it must evaluate to a character string of \texttt{CHAR}, \texttt{VARCHAR2}, \texttt{NCHAR}, or \texttt{NVARCHAR2} data type, or null. The function converts return_value to \texttt{DATE} using the same method it uses to convert \texttt{char} to \texttt{DATE}. If return_value cannot be converted to \texttt{DATE}, then the function returns an error.

The \texttt{fmt} is a datetime model format specifying the format of \texttt{char}. If you omit \texttt{fmt}, then \texttt{char} must be in the default date format. The default date format is determined implicitly by the \texttt{NLS_TERRITORY} initialization parameter or can be set explicitly by the \texttt{NLS_DATE_FORMAT} parameter. If \texttt{fmt} is J, for Julian, then \texttt{char} must be an integer.

\textbf{Caution:}

It is good practice \textit{always} to specify a format mask (\texttt{fmt}) with \texttt{TO_DATE}, as shown in the examples in the section that follows. When it is used without a format mask, the function is valid \textit{only} if \texttt{char} uses the same format as is determined by the \texttt{NLS_TERRITORY} or \texttt{NLS_DATE_FORMAT} parameters. Furthermore, the function may not be stable across databases unless the explicit format mask is specified to avoid dependencies.

The \texttt{\textquotesingle nlsparam\textquotesingle} argument specifies the language of the text string that is being converted to a date. This argument can have this form:

\texttt{\'NLS_DATE\_LANGUAGE = language\textquotesingle}

Do not use the \texttt{TO\_DATE} function with a \texttt{DATE} value for the \texttt{char} argument. The first two digits of the returned \texttt{DATE} value can differ from the original \texttt{char}, depending on \texttt{fmt} or the default date format.

This function does not support \texttt{CLOB} data directly. However, \texttt{CLOBs} can be passed in as arguments through implicit data conversion.

\textbf{See Also:}

"Datetime Format Models" and "Data Type Comparison Rules" for more information

\textbf{Examples}

The following example converts a character string into a date:

\begin{verbatim}
SELECT TO_DATE( 
    'January 15, 1989, 11:00 A.M.', 
    'Month dd, YYYY, HH:MI A.M.', 
    'NLS\_DATE\_LANGUAGE = American') 
FROM DUAL;
\end{verbatim}

\begin{verbatim}
TO\_DATE(' 
-------
15\~JAN\~89
\end{verbatim}
The value returned reflects the default date format if the NLS_TERRITORY parameter is set to 'AMERICA'. Different NLS_TERRITORY values result in different default date formats:

```
ALTER SESSION SET NLS_TERRITORY = 'KOREAN';

SELECT TO_DATE(  
    'January 15, 1989, 11:00 A.M.',  
    'Month dd, YYYY, HH:MI A.M.',  
    'NLS_DATE_LANGUAGE = American')  
FROM DUAL;

TO_DATE(  
--------
     89/01/15
)
```

The following example returns the default value because the specified expression cannot be converted to a DATE value, due to a misspelling of the month:

```
SELECT TO_DATE('February 15, 2016, 11:00 A.M.'  
    DEFAULT 'January 01, 2016 12:00 A.M.' ON CONVERSION ERROR,  
    'Month dd, YYYY, HH:MI A.M.') "Value"  
FROM DUAL;

Value  
--------
     01-JAN-16
```

### 7.241 TO_DSINTERVAL

**Syntax**

```
TO_DSINTERVAL [DEFAULT return_value ON CONVERSION ERROR] (sql_format
ds_iso_format)
```

**sql_format** ::=  

```
+– days hours : minutes : seconds . frac_secs
```
**Purpose**

**TO_DSINTERVAL** converts its argument to a value of INTERVAL DAY TO SECOND data type.

For the argument, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

**TO_DSINTERVAL** accepts argument in one of the two formats:

- SQL interval format compatible with the SQL standard (ISO/IEC 9075)
- ISO duration format compatible with the ISO 8601:2004 standard

In the SQL format, *days* is an integer between 0 and 999999999, *hours* is an integer between 0 and 23, and *minutes* and *seconds* are integers between 0 and 59. *frac_secs* is the fractional part of seconds between .0 and .999999999. One or more blanks separate days from hours. Additional blanks are allowed between format elements.

In the ISO format, *days*, *hours*, *minutes* and *seconds* are integers between 0 and 999999999. *frac_secs* is the fractional part of seconds between .0 and .999999999. No blanks are allowed in the value. If you specify T, then you must specify at least one of the *hours*, *minutes*, or *seconds* values.

The optional DEFAULT return_value ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting the argument to an INTERVAL DAY TO SECOND type. This clause has no effect if an error occurs while evaluating the argument. The return_value can be an expression or a bind variable, and it must evaluate to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. It can be in either the SQL format or ISO format, and need not be in the same format as the function argument. If return_value cannot be converted to an INTERVAL DAY TO SECOND type, then the function returns an error.
Examples

The following example uses the SQL format to select from the hr.employees table the employees who had worked for the company for at least 100 days on November 1, 2002:

```sql
SELECT employee_id, last_name FROM employees
WHERE hire_date + TO_DSINTERVAL('100 00:00:00')
<= DATE '2002-11-01'
ORDER BY employee_id;
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
<td>De Haan</td>
</tr>
<tr>
<td>203</td>
<td>Mavris</td>
</tr>
<tr>
<td>204</td>
<td>Baer</td>
</tr>
<tr>
<td>205</td>
<td>Higgins</td>
</tr>
<tr>
<td>206</td>
<td>Giet</td>
</tr>
</tbody>
</table>

The following example uses the ISO format to display the timestamp 100 days and 5 hours after the beginning of the year 2009:

```sql
SELECT TO_CHAR(TIMESTAMP '2009-01-01 00:00:00' + TO_DSINTERVAL('P100DT05H'),
               'YYYY-MM-DD HH24:MI:SS') "Time Stamp"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Time Stamp</th>
</tr>
</thead>
<tbody>
<tr>
<td>2009-04-11 05:00:00</td>
</tr>
</tbody>
</table>

The following example returns the default value because the specified expression cannot be converted to an INTERVAL DAY TO SECOND value:

```sql
SELECT TO_DSINTERVAL('10 1:02:10'
                      DEFAULT '10 8:00:00' ON CONVERSION ERROR) "Value"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>+0000000010 08:00:00.000000000</td>
</tr>
</tbody>
</table>

7.242 TO_LOB

Syntax

```sql
TO_LOB(long_column)
```

Purpose

TO_LOB converts LONG or LONG RAW values in the column long_column to LOB values. You can apply this function only to a LONG or LONG RAW column, and only in the select list of a subquery in an INSERT statement.

Before using this function, you must create a LOB column to receive the converted LONG values. To convert LONG values, create a CLOB column. To convert LONG RAW values, create a BLOB column.
You cannot use the TO_LOB function to convert a LONG column to a LOB column in the subquery of a CREATE TABLE ... AS SELECT statement if you are creating an index-organized table. Instead, create the index-organized table without the LONG column, and then use the TO_LOB function in an INSERT ... AS SELECT statement.

You cannot use this function within a PL/SQL package. Instead use the TO_CLOB (character) or TO_BLOB (raw) functions.

See Also:
- the modify_col_properties clause of ALTER TABLE for an alternative method of converting LONG columns to LOB
- INSERT for information on the subquery of an INSERT statement
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples
The following syntax shows how to use the TO_LOB function on your LONG data in a hypothetical table old_table:

```sql
CREATE TABLE new_table (col1, col2, ... lob_col CLOB);
INSERT INTO new_table (select o.col1, o.col2, ... TO_LOB(o.old_long_col)
    FROM old_table o;
```

7.243 TO_MULTI_BYTE

Syntax

```
TO_MULTI_BYTE(char)
```

Purpose

TO_MULTI_BYTE returns char with all of its single-byte characters converted to their corresponding multibyte characters. char can be of data type CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The value returned is in the same data type as char.

Any single-byte characters in char that have no multibyte equivalents appear in the output string as single-byte characters. This function is useful only if your database character set contains both single-byte and multibyte characters.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.
See Also:

- "Data Type Comparison Rules" for more information.
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of **TO_MULTI_BYTE**

Examples

The following example illustrates converting from a single byte `A` to a multibyte `A` in UTF8:

```sql
SELECT dump(TO_MULTI_BYTE('A')) FROM DUAL;
```

```
DUMP(TO_MULTI_BYTE('A'))
------------------------
Typ=1 Len=3: 239,188,161
```

7.244 **TO_NCHAR (character)**

Syntax

```
to_nchar_char ::= TO_NCHAR (char | clob | nclob)
```

Purpose

**TO_NCHAR (character)** converts a character string, `CHAR`, `VARCHAR2`, `CLOB`, or `NCLOB` value to the national character set. The value returned is always `NVARCHAR2`. This function is equivalent to the `TRANSLATE ... USING` function with a `USING` clause in the national character set.

See Also:

- "Data Conversion" and `TRANSLATE ... USING`
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example converts `VARCHAR2` data from the `oe.customers` table to the national character set:
SELECT TO_NCHAR(cust_last_name) FROM customers
WHERE customer_id=103;

TO_NCHAR(CUST_LAST_NAME)
--------------------------------------------------
Taylor

7.245 TO_NCHAR (datetime)

Syntax

\(to\_nchar\_date::=\)

```
TO_NCHAR(
    datetime
, interval
, fmt
, ' nlsparam '
)
```

Purpose

TO_NCHAR (datetime) converts a datetime or interval value of DATE, TIMESTAMP,
TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, INTERVAL MONTH TO YEAR,
or INTERVAL DAY TO SECOND data type from the database character set to the national
character set.

See Also:

- "Security Considerations for Data Conversion"
- Appendix C in Oracle Database Globalization Support Guide for the
collation derivation rules, which define the collation assigned to the
character return value of this function

Examples

The following example converts the order_date of all orders whose status is 9 to the
national character set:

```
SELECT TO_NCHAR(ORDER_DATE) AS order_date
FROM ORDERS
WHERE ORDER_STATUS > 9
ORDER BY order_date;
```

```
ORDER_DATE
--------------------------------------------------------------------------
06-DEC-99 02.22.34.225609 PM
13-SEP-99 10.19.00.654279 AM
14-SEP-99 09.53.40.223345 AM
26-JUN-00 10.19.43.190089 PM
27-JUN-00 09.53.32.335522 PM
```
7.246 TO_NCHAR (number)

Syntax

to_nchar_number::=

TO_NCHAR (n
, fmt
, ' nlsparam '
)

Purpose

TO_NCHAR (number) converts n to a string in the national character set. The value n can be of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The function returns a value of the same type as the argument. The optional fmt and 'nlsparam' corresponding to n can be of DATE, TIMESTAMP, TIMESTAMP WITH TIME ZONE, TIMESTAMP WITH LOCAL TIME ZONE, INTERVAL MONTH TO YEAR, or INTERVAL DAY TO SECOND data type.

See Also:

- “Security Considerations for Data Conversion”
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of this function

Examples

The following example converts the customer_id values from the sample table oe.orders to the national character set:

```sql
SELECT TO_NCHAR(customer_id) "NCHAR_Customer_ID"  FROM orders
WHERE order_status > 9
ORDER BY "NCHAR_Customer_ID";
```

<table>
<thead>
<tr>
<th>NCHAR_Customer_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
</tr>
<tr>
<td>103</td>
</tr>
<tr>
<td>148</td>
</tr>
<tr>
<td>148</td>
</tr>
<tr>
<td>149</td>
</tr>
</tbody>
</table>

7.247 TO_NCLOB

Syntax

TO_NCLOB (lob_column) char
Purpose

**TO_NCLOB** converts CLOB values in a LOB column or other character strings to NCLOB values. *char* can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. Oracle Database implements this function by converting the character set of *char* from the database character set to the national character set.

**See Also:**

Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of this function.

Examples

The following example inserts some character data into an NCLOB column of the *pm.print_media* table by first converting the data with the **TO_NCLOB** function:

```sql
INSERT INTO print_media (product_id, ad_id, ad_fltextn)
VALUES (3502, 31001,
        TO_NCLOB('Placeholder for new product description'));
```

### 7.248 TO_NUMBER

**Syntax**

```sql
TO_NUMBER(expr, DEFAULT return_value ON CONVERSION ERROR, fmt, 'nlsparam')
```

**Purpose**

**TO_NUMBER** converts *expr* to a value of NUMBER data type.

*expr* can be any expression that evaluates to a character string of type CHAR, VARCHAR2, NCHAR, or NVARCHAR2, a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE, or null. If *expr* is NUMBER, then the function returns *expr*. If *expr* evaluates to null, then the function returns null. Otherwise, the function converts *expr* to a NUMBER value.

- If you specify an *expr* of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, then you can optionally specify the format model *fmt*.
- If you specify an *expr* of BINARY_FLOAT or BINARY_DOUBLE data type, then you cannot specify a format model because a float can be interpreted only by its internal representation.

Refer to “Format Models” for information on number formats.
The 'nlsparam' argument in this function has the same purpose as it does in the TO_CHAR function for number conversions. Refer to TO_CHAR (number) for more information.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also:

"Data Type Comparison Rules " for more information.

Examples

The following examples convert character string data into a number:

```
UPDATE employees SET salary = salary +
    TO_NUMBER('100.00', '9G999D99')
WHERE last_name = 'Perkins';
```

```
SELECT TO_NUMBER('-AusDollars100','L9G999D99',
    ' NLS_NUMERIC_CHARACTERS = ''/.,''
    NLS_CURRENCY            = ''AusDollars''
) "Amount"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>-100</td>
</tr>
</tbody>
</table>

The following example returns the default value of 0 because the specified expression cannot be converted to a NUMBER value:

```
SELECT TO_NUMBER('2,00' DEFAULT 0 ON CONVERSION ERROR) "Value"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
</tbody>
</table>

### 7.249 TO_SINGLE_BYTE

**Syntax**

```
TO_SINGLE_BYTE(char)
```

**Purpose**

TO_SINGLE_BYTE returns char with all of its multibyte characters converted to their corresponding single-byte characters. char can be of data type CHAR, VARCHAR2, NCHAR, or NVARCHAR2. The value returned is in the same data type as char.
Any multibyte characters in `char` that have no single-byte equivalents appear in the output as multibyte characters. This function is useful only if your database character set contains both single-byte and multibyte characters.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

---

**See Also:**

- "Data Type Comparison Rules" for more information.
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `TO_SINGLE_BYTE`.

---

**Examples**

The following example illustrates going from a multibyte A in UTF8 to a single byte ASCII A:

```sql
SELECT TO_SINGLE_BYTE( CHR(15711393)) FROM DUAL;
```

```
T
-
A
```

---

**7.250 TO_TIMESTAMP**

**Syntax**

```
TO_TIMESTAMP(char DEFAULT return_value ON CONVERSION ERROR, fmt, 'nlsparam')
```

**Purpose**

`TO_TIMESTAMP` converts `char` to a value of `TIMESTAMP` data type.

For `char`, you can specify any expression that evaluates to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type.

The optional `DEFAULT return_value ON CONVERSION ERROR` clause allows you to specify the value this function returns if an error occurs while converting `char` to `TIMESTAMP`. This clause has no effect if an error occurs while evaluating `char`. The `return_value` can be an expression or a bind variable, and it must evaluate to a character string of `CHAR`, `VARCHAR2`, `NCHAR`, or `NVARCHAR2` data type, or null. The function converts `return_value` to `TIMESTAMP` using the same method it uses to convert `char` to
TIMESTAMP. If return_value cannot be converted to TIMESTAMP, then the function returns an error.

The optional fmt specifies the format of char. If you omit fmt, then char must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. The optional nlsparam argument has the same purpose in this function as in the TO_CHAR function for date conversion.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.

See Also:

"Data Type Comparison Rules" for more information.

Examples

The following example converts a character string to a timestamp. The character string is not in the default TIMESTAMP format, so the format mask must be specified:

```
SELECT TO_TIMESTAMP ('10-Sep-02 14:10:10.123000', 'DD-Mon-RR HH24:MI:SS.FF')
FROM DUAL;
```

```
TO_TIMESTAMP('10-SEP-02 14:10:10.123000', 'DD-Mon-RR HH24:MI:SS.FF')
---------------------------------------------------------------------------
10-SEP-02 02.10.10.123000000 PM
```

The following example returns the default value of NULL because the specified expression cannot be converted to a TIMESTAMP value, due to an invalid month specification:

```
SELECT TO_TIMESTAMP ('10-Sept-02 14:10:10.123000'
DEFAULT NULL ON CONVERSION ERROR,
'DD-Mon-RR HH24:MI:SS.FF',
'NLS_DATE_LANGUAGE = American') "Value"
FROM DUAL;
```

See Also:

NLS_TIMESTAMP_FORMAT initialization parameter for information on the default TIMESTAMP format and "Datetime Format Models" for information on specifying the format mask
7.251 TO_TIMESTAMP_TZ

Syntax

```
TO_TIMESTAMP_TZ(char DEFAULT return_value ON CONVERSION ERROR,
fmt 'nlsparam')
```

Purpose

TO_TIMESTAMP_TZ converts char to a value of TIMESTAMP WITH TIME ZONE data type.

For char, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

Note:

This function does not convert character strings to TIMESTAMP WITH LOCAL TIME ZONE. To do this, use a CAST function, as shown in CAST.

The optional DEFAULT return_value ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting char to TIMESTAMP WITH TIME ZONE. This clause has no effect if an error occurs while evaluating char. The return_value can be an expression or a bind variable, and it must evaluate to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or null. The function converts return_value to TIMESTAMP WITH TIME ZONE using the same method it uses to convert char to TIMESTAMP WITH TIME ZONE. If return_value cannot be converted to TIMESTAMP WITH TIME ZONE, then the function returns an error.

The optional fmt specifies the format of char. If you omit fmt, then char must be in the default format of the TIMESTAMP WITH TIME ZONE data type. The optional 'nlsparam' has the same purpose in this function as in the TO_CHAR function for date conversion.

Examples

The following example converts a character string to a value of TIMESTAMP WITH TIME ZONE:

```
SELECT TO_TIMESTAMP_TZ('1999-12-01 11:00:00 -8:00',
'YYYY-MM-DD HH:MI:SS TZH:TZM') FROM DUAL;

TO_TIMESTAMP_TZ('1999-12-01 11:00:00 -8:00', 'YYYY-MM-DD HH:MI:SS TZH:TZM')
--------------------------------------------------------------------
01-DEC-99 11.00.00.000000000 AM -08:00
```

The following example casts a null column in a UNION operation as TIMESTAMP WITH LOCAL TIME ZONE using the sample tables oe.order_items and oe.orders:
SELECT order_id, line_item_id,
       CAST(NULL AS TIMESTAMP WITH LOCAL TIME ZONE) order_date
FROM order_items
UNION
SELECT order_id, to_number(null), order_date
FROM orders;

ORDER_ID  LINE_ITEM_ID  ORDER_DATE
----------  ------------  -----------------------------------
   2354      1              
   2354      2              
   2354      3              
   2354      4              
   2354      5              
   2354      6              
   2354      7              
   2354      8              
   2354      9              
   2354     10              
   2354     11              
   2354     12              
   2354     13              
   2354  14-JUL-00 05.18.23.234567 PM
   2355      1              
   2355      2              

... 

The following example returns the default value of NULL because the specified expression cannot be converted to a TIMESTAMP WITH TIME ZONE value, due to an invalid month specification:

SELECT TO_TIMESTAMP_TZ('1999-13-01 11:00:00 -8:00'
CURRENT_DATE)
DEFAULT NULL ON CONVERSION ERROR,
'TYYYY-MM-DD HH:MI:SS TZH:TZM') "Value"
FROM DUAL;

7.252 TO_YMINTERVAL

Syntax

```
TO_YMINTERVAL ( 
+ years 
– months 
ym_iso_format
' DEFAULT return_value ON CONVERSION ERROR
) 
```

Chapter 7

TO_YMINTERVAL

7-381
Purpose

TO_YMINTERVAL converts its argument to a value of INTERVAL MONTH TO YEAR data type.

For the argument, you can specify any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type.

TO_YMINTERVAL accepts argument in one of the two formats:

- SQL interval format compatible with the SQL standard (ISO/IEC 9075)
- ISO duration format compatible with the ISO 8601:2004 standard

In the SQL format, years is an integer between 0 and 999999999, and months is an integer between 0 and 11. Additional blanks are allowed between format elements.

In the ISO format, years and months are integers between 0 and 999999999. Days, hours, minutes, seconds, and frac_secs are non-negative integers, and are ignored, if specified. No blanks are allowed in the value. If you specify T, then you must specify at least one of the hours, minutes, or seconds values.

The optional DEFAULT return_value ON CONVERSION ERROR clause allows you to specify the value this function returns if an error occurs while converting the argument to an INTERVAL MONTH TO YEAR type. This clause has no effect if an error occurs while evaluating the argument. The return_value can be an expression or a bind variable, and it must evaluate to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. It can be in either the SQL format or ISO format, and need not be in the same format as the function argument. If return_value cannot be converted to an INTERVAL MONTH TO YEAR type, then the function returns an error.

Examples

The following example calculates for each employee in the sample hr.employees table a date one year two months after the hire date:

```sql
SELECT hire_date, hire_date + TO_YMINTERVAL('01-02') "14 months"
FROM employees;
```

<table>
<thead>
<tr>
<th>HIRE_DATE</th>
<th>14 months</th>
</tr>
</thead>
<tbody>
<tr>
<td>17-JUN-03</td>
<td>17-AUG-04</td>
</tr>
<tr>
<td>21-SEP-05</td>
<td>21-NOV-06</td>
</tr>
<tr>
<td>13-JAN-01</td>
<td>13-MAR-02</td>
</tr>
<tr>
<td>20-MAY-08</td>
<td>20-JUL-09</td>
</tr>
<tr>
<td>21-MAY-07</td>
<td>21-JUL-08</td>
</tr>
<tr>
<td>. . .</td>
<td></td>
</tr>
</tbody>
</table>
The following example makes the same calculation using the ISO format:

```sql
SELECT hire_date, hire_date + TO_YMINTERVAL('P1Y2M') FROM employees;
```

The following example returns the default value because the specified expression cannot be converted to an INTERVAL MONTH TO YEAR value:

```sql
SELECT TO_YMINTERVAL('1x-02'
DEFAULT '00-00' ON CONVERSION ERROR) "Value"
FROM DUAL;
```

<table>
<thead>
<tr>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>+00000000-00</td>
</tr>
</tbody>
</table>

## 7.253 TRANSLATE

### Syntax

```sql
TRANSLATE (expr, from_string, to_string)
```

### Purpose

TRANSLATE returns `expr` with all occurrences of each character in `from_string` replaced by its corresponding character in `to_string`. Characters in `expr` that are not in `from_string` are not replaced. The argument `from_string` can contain more characters than `to_string`. In this case, the extra characters at the end of `from_string` have no corresponding characters in `to_string`. If these extra characters appear in `expr`, then they are removed from the return value.

If a character appears multiple times in `from_string`, then the `to_string` mapping corresponding to the first occurrence is used.

You cannot use an empty string for `to_string` to remove all characters in `from_string` from the return value. Oracle Database interprets the empty string as null, and if this function has a null argument, then it returns null. To remove all characters in `from_string`, concatenate another character to the beginning of `from_string` and specify this character as the `to_string`. For example, `TRANSLATE(expr,'x0123456789','x')` removes all digits from `expr`.

TRANSLATE provides functionality related to that provided by the REPLACE function. REPLACE lets you substitute a single string for another single string, as well as remove character strings. TRANSLATE lets you make several single-character, one-to-one substitutions in one operation.

This function does not support CLOB data directly. However, CLOBs can be passed in as arguments through implicit data conversion.
Examples

The following statement translates a book title into a string that could be used (for example) as a filename. The from_string contains four characters: a space, asterisk, slash, and apostrophe (with an extra apostrophe as the escape character). The to_string contains only three underscores. This leaves the fourth character in the from_string without a corresponding replacement, so apostrophes are dropped from the returned value.

```
SELECT TRANSLATE('SQL*Plus User''s Guide', ' */''', '___') FROM DUAL;
```

```
TRANSLATE('SQL*PLUSU
--------------------
SQL_Plus_Users_Guide
```

7.254 TRANSLATE ... USING

Syntax

```
TRANSLATE ( char USING
CHAR_CS
NCHAR_CS
)
```

Purpose

TRANSLATE ... USING converts char into the character set specified for conversions between the database character set and the national character set.

Note:

The TRANSLATE ... USING function is supported primarily for ANSI compatibility. Oracle recommends that you use the TO_CHAR and TO_NCHAR functions, as appropriate, for converting data to the database or national character set. TO_CHAR and TO_NCHAR can take as arguments a greater variety of data types than TRANSLATE ... USING, which accepts only character data.

The char argument is the expression to be converted.
• Specifying the USING CHAR_CS argument converts char into the database character set. The output data type is VARCHAR2.

• Specifying the USING NCHAR_CS argument converts char into the national character set. The output data type is NVARCHAR2.

This function is similar to the Oracle CONVERT function, but must be used instead of CONVERT if either the input or the output data type is being used as NCHAR or NVARCHAR2. If the input contains UCS2 code points or backslash characters (\), then use the UNISTR function.

See Also:

• CONVERT and UNISTR

• Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of TRANSLATE ... USING

Examples

The following statements use data from the sample table oe.product_descriptions to show the use of the TRANSLATE ... USING function:

```
CREATE TABLE translate_tab (char_col  VARCHAR2(100),
                           nchar_col NVARCHAR2(50));

INSERT INTO translate_tab
  SELECT NULL, translated_name
  FROM product_descriptions
  WHERE product_id = 3501;

SELECT * FROM translate_tab;

<table>
<thead>
<tr>
<th>CHAR_COL</th>
<th>NCHAR_COL</th>
</tr>
</thead>
<tbody>
<tr>
<td>. . .</td>
<td>. . .</td>
</tr>
<tr>
<td>C pre SPNIX4.0 - Sys</td>
<td>C pre SPNIX4.0 - Sys</td>
</tr>
<tr>
<td>C pro SPNIX4.0 - Sys</td>
<td>C pro SPNIX4.0 - Sys</td>
</tr>
<tr>
<td>C til SPNIX4.0 - Sys</td>
<td>C til SPNIX4.0 - Sys</td>
</tr>
</tbody>
</table>

UPDATE translate_tab
  SET char_col = TRANSLATE (nchar_col USING CHAR_CS);

SELECT * FROM translate_tab;

<table>
<thead>
<tr>
<th>CHAR_COL</th>
<th>NCHAR_COL</th>
</tr>
</thead>
<tbody>
<tr>
<td>. . .</td>
<td>. . .</td>
</tr>
<tr>
<td>C per a SPNIX4.0 - Sys</td>
<td>C per a SPNIX4.0 - Sys</td>
</tr>
<tr>
<td>C pro SPNIX4.0 - Sys</td>
<td>C pro SPNIX4.0 - Sys</td>
</tr>
<tr>
<td>C for SPNIX4.0 - Sys</td>
<td>C for SPNIX4.0 - Sys</td>
</tr>
<tr>
<td>C til SPNIX4.0 - Sys</td>
<td>C til SPNIX4.0 - Sys</td>
</tr>
</tbody>
</table>
```

7.255 TREAT

Syntax

TREAT ( expr AS REF schema . type )

Purpose

TREAT changes the declared type of an expression.

You must have the EXECUTE object privilege on type to use this function.

- expr and type must be user-defined object types, excluding top-level collections.
- type must be some supertype or subtype of the declared type of expr. If the most specific type of expr is type (or some subtype of type), then TREAT returns expr. If the most specific type of expr is not type (or some subtype of type), then TREAT returns NULL.
- You can specify REF only if the declared type of expr is a REF type.
- If the declared type of expr is a REF to a source type of expr, then type must be some subtype or supertype of the source type of expr. If the most specific type of DEREF(expr) is type (or a subtype of type), then TREAT returns expr. If the most specific type of DEREF(expr) is not type (or a subtype of type), then TREAT returns NULL.

See Also:

"Data Type Comparison Rules " for more information

Examples

The following statement uses the table oe.persons, which is created in "Substitutable Table and Column Examples". The example retrieves the salary attribute of all people in the persons table, the value being null for instances of people that are not employees.

SELECT name, TREAT(VALUE(p) AS employee_t).salary salary
FROM persons p;

<table>
<thead>
<tr>
<th>NAME</th>
<th>SALARY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bob</td>
<td></td>
</tr>
<tr>
<td>Joe</td>
<td>100000</td>
</tr>
<tr>
<td>Tim</td>
<td>1000</td>
</tr>
</tbody>
</table>

You can use the TREAT function to create an index on the subtype attributes of a substitutable column. For an example, see "Indexing on Substitutable Columns: Examples".
7.256 TRIM

Syntax

```
TRIM (LEADING trim_character FROM trim_source )
```

**Purpose**

TRIM enables you to trim leading or trailing characters (or both) from a character string. If `trim_character` or `trim_source` is a character literal, then you must enclose it in single quotation marks.

- If you specify `LEADING`, then Oracle Database removes any leading characters equal to `trim_character`.
- If you specify `TRAILING`, then Oracle removes any trailing characters equal to `trim_character`.
- If you specify `BOTH` or none of the three, then Oracle removes leading and trailing characters equal to `trim_character`.
- If you do not specify `trim_character`, then the default value is a blank space.
- If you specify only `trim_source`, then Oracle removes leading and trailing blank spaces.
- The function returns a value with data type `VARCHAR2`. The maximum length of the value is the length of `trim_source`.
- If either `trim_source` or `trim_character` is null, then the TRIM function returns null.

Both `trim_character` and `trim_source` can be `VARCHAR2` or any data type that can be implicitly converted to `VARCHAR2`. The string returned is a `VARCHAR2` (`NVARCHAR2`) data type if `trim_source` is a `CHAR` or `VARCHAR2` (`NCHAR` or `NVARCHAR2`) data type, and a `CLOB` if `trim_source` is a `CLOB` data type. The return string is in the same character set as `trim_source`.

See Also:

Appendix C in *Oracle Database Globalization Support Guide* for the collation determination rules, which define the collation TRIM uses to compare characters from `trim_character` with characters from `trim_source`, and for the collation derivation rules, which define the collation assigned to the character return value of this function.
Examples

This example trims leading zeros from the hire date of the employees in the hr schema:

```
SELECT employee_id,
       TO_CHAR(TRIM(LEADING 0 FROM hire_date))
FROM employees
WHERE department_id = 60
ORDER BY employee_id;
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>TO_CHAR(</th>
<th>A</th>
<th>T</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>103</td>
<td>20-MAY-08</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>104</td>
<td>21-MAY-07</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>105</td>
<td>25-JUN-05</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>106</td>
<td>5-FEB-06</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>107</td>
<td>7-FEB-07</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**7.257 TRUNC (date)**

**Syntax**

```
trunc_date::= 
```

**Purpose**

The TRUNC (date) function returns date with the time portion of the day truncated to the unit specified by the format model fmt. This function is not sensitive to the NLS_CALENDAR session parameter. It operates according to the rules of the Gregorian calendar. The value returned is always of data type DATE, even if you specify a different datet ime data type for date. If you omit fmt, then the default format model 'DD' is used and the value returned is date truncated to the day with a time of midnight. Refer to "ROUND and TRUNC Date Functions" for the permitted format models to use in fmt.

**Examples**

The following example truncates a date:

```
SELECT TRUNC(TO_DATE('27-OCT-92','DD-MON-YY'), 'YEAR')
  "New Year" FROM DUAL;
```

<table>
<thead>
<tr>
<th>New Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>01-JAN-92</td>
</tr>
</tbody>
</table>
7.258 TRUNC (number)

Syntax

\[
\text{trunc\_number} ::= \text{TRUNC}\ (n1, n2)
\]

Purpose

The TRUNC (number) function returns \( n1 \) truncated to \( n2 \) decimal places. If \( n2 \) is omitted, then \( n1 \) is truncated to 0 places. \( n2 \) can be negative to truncate (make zero) \( n2 \) digits left of the decimal point.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. If you omit \( n2 \), then the function returns the same data type as the numeric data type of the argument. If you include \( n2 \), then the function returns NUMBER.

See Also:

Table 2-8 for more information on implicit conversion

Examples

The following examples truncate numbers:

```sql
SELECT TRUNC(15.79,1) "Truncate" FROM DUAL;

   Truncate
----------
   15.7

SELECT TRUNC(15.79,-1) "Truncate" FROM DUAL;

   Truncate
----------
    10
```
TZ_OFFSET

Syntax

```
TZ_OFFSET(time_zone_name)

+HH:MM
```

Purpose

TZ_OFFSET returns the time zone offset corresponding to the argument based on the date the statement is executed. You can enter a valid time zone region name, a time zone offset from UTC (which simply returns itself), or the keyword SESSIONTIMEZONE or DBTIMEZONE. For a listing of valid values for time_zone_name, query the TZNAME column of the V$TIMEZONE_NAMES dynamic performance view.

**Note:**

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see Oracle Database Globalization Support Guide.

**See Also:**

- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of TZ_OFFSET

Examples

The following example returns the time zone offset of the US/Eastern time zone from UTC:

```
SELECT TZ_OFFSET('US/Eastern') FROM DUAL;
```

```
TZ_OFFS
-------
-04:00
```
7.260 UID

Syntax

\[ UID \]

Purpose

\[ UID \] returns an integer that uniquely identifies the session user (the user who logged on).

See Also:

USER to learn how Oracle Database determines the session user

Examples

The following example returns the UID of the session user:

\[
SELECT UID FROM DUAL;
\]

7.261 UNISTR

Syntax

\[ UNISTR \( \text{string} \) \]

Purpose

\[ UNISTR \] takes as its argument a text literal or an expression that resolves to character data and returns it in the national character set. The national character set of the database can be either AL16UTF16 or UTF8. \[ UNISTR \] provides support for Unicode string literals by letting you specify the Unicode encoding value of characters in the string. This is useful, for example, for inserting data into NCHAR columns.

The Unicode encoding value has the form `\xxxx` where `\xxxx` is the hexadecimal value of a character in UCS-2 encoding format. Supplementary characters are encoded as two code units, the first from the high-surrogates range (U+D800 to U+DBFF), and the second from the low-surrogates range (U+DC00 to U+DFFF). To include the backslash in the string itself, precede it with another backslash (`\\`).

For portability and data preservation, Oracle recommends that in the UNISTR string argument you specify only ASCII characters and the Unicode encoding values.
See Also:

- *Oracle Database Globalization Support Guide* for information on Unicode and national character sets
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of `UNISTR`

Examples

The following example passes both ASCII characters and Unicode encoding values to the `UNISTR` function, which returns the string in the national character set:

```
SELECT UNISTR('abc\00e5\00f1\00f6') FROM DUAL;
```

```
UNISTR
------
abcåñö
```

### 7.262 UPDATEXML

Note:

The `UPDATEXML` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use XQuery Update instead. See *Oracle XML DB Developer’s Guide* for more information.

Syntax

```
UPDATEXML ( XMLType_instance, XPath_string, value_expr
, namespace_string )
```

Purpose

`UPDATEXML` takes as arguments an `XMLType` instance and an XPath-value pair and returns an `XMLType` instance with the updated value. If `XPath_string` is an XML element, then the corresponding `value_expr` must be an `XMLType` instance. If `XPath_string` is an attribute or text node, then the `value_expr` can be any scalar data type. You can specify an absolute `XPath_string` with an initial slash or a relative `XPath_string` by omitting the initial slash. If you omit the initial slash, then the context of the relative path defaults to the root node.

The data types of the target of each `XPath_string` and its corresponding `value_expr` must match. The optional `namespace_string` must resolve to a `VARCHAR2` value that specifies a default mapping or namespace mapping for prefixes, which Oracle Database uses when evaluating the XPath expression(s).
If you update an XML element to null, then Oracle removes the attributes and children of the element, and the element becomes empty. If you update the text node of an element to null, Oracle removes the text value of the element, and the element itself remains but is empty.

In most cases, this function materializes an XML document in memory and updates the value. However, `UPDATEXML` is optimized for `UPDATE` statements on object-relational columns so that the function updates the value directly in the column. This optimization requires the following conditions:

- The `XMLType_instance` must be the same as the column in the `UPDATE ... SET` clause.
- The `XPath_string` must resolve to scalar content.

**Examples**

The following example updates to 4 the number of docks in the San Francisco warehouse in the sample schema `OE`, which has a `warehouse_spec` column of type `XMLType`:

```sql
SELECT warehouse_name,
       EXTRACT(warehouse_spec, '/Warehouse/Docks')
     "Number of Docks"
FROM warehouses
WHERE warehouse_name = 'San Francisco';
```

<table>
<thead>
<tr>
<th>WAREHOUSE_NAME</th>
<th>Number of Docks</th>
</tr>
</thead>
<tbody>
<tr>
<td>San Francisco</td>
<td>&lt;Docks&gt;1&lt;/Docks&gt;</td>
</tr>
</tbody>
</table>

```sql
UPDATE warehouses
SET warehouse_spec =
  UPDATEXML(warehouse_spec,
            '/Warehouse/Docks/text()',4)
WHERE warehouse_name = 'San Francisco';
```

1 row updated.

```sql
SELECT warehouse_name,
       EXTRACT(warehouse_spec, '/Warehouse/Docks')
     "Number of Docks"
FROM warehouses
WHERE warehouse_name = 'San Francisco';
```

<table>
<thead>
<tr>
<th>WAREHOUSE_NAME</th>
<th>Number of Docks</th>
</tr>
</thead>
<tbody>
<tr>
<td>San Francisco</td>
<td>&lt;Docks&gt;4&lt;/Docks&gt;</td>
</tr>
</tbody>
</table>

**7.263 UPPER**

**Syntax**

```
UPPER ( char )
```
Purpose

UPPER returns char, with all letters uppercase. char can be any of the data types CHAR, VARCHAR2, NCHAR, NVARCHAR2, CLOB, or NCLOB. The return value is the same data type as char. The database sets the case of the characters based on the binary mapping defined for the underlying character set. For linguistic-sensitive uppercase, refer to NLS_UPPER.

See Also:

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of UPPER.

Examples

The following example returns each employee's last name in uppercase:

```
SELECT UPPER(last_name) "Uppercase"
FROM employees;
```

7.264 USER

Syntax

```
USER
```

Purpose

USER returns the name of the session user (the user who logged on). This may change during the duration of a database session as Real Application Security sessions are attached or detached. For enterprise users, this function returns the schema. For other users, it returns the database user name. If a Real Application Security session is currently attached to the database session, then it returns user XS$NULL.

This function returns a VARCHAR2 value.

Oracle Database compares values of this function with blank-padded comparison semantics.

In a distributed SQL statement, the UID and USER functions together identify the user on your local database. You cannot use these functions in the condition of a CHECK constraint.
See Also:

- Oracle Database 2 Day + Security Guide for more information on user XS$NULL
- Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of USER

Examples

The following example returns the session user and the user's UID:

```sql
SELECT USER, UID FROM DUAL;
```

7.265 USERENV

Syntax

```
USERENV ( 'parameter' )
```

Purpose

Note:

USERENV is a legacy function that is retained for backward compatibility. Oracle recommends that you use the SYS_CONTEXT function with the built-in USERENV namespace for current functionality. See SYS_CONTEXT for more information.

USERENV returns information about the current session. This information can be useful for writing an application-specific audit trail table or for determining the language-specific characters currently used by your session. You cannot use USERENV in the condition of a CHECK constraint. Table 7-12 describes the values for the parameter argument.

All calls to USERENV return VARCHAR2 data except for calls with the SESSIONID, SID, and ENTRYID parameters, which return NUMBER.
Table 7-12 Parameters of the USERENV Function

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_INFO</td>
<td>CLIENT_INFO returns up to 64 bytes of user session information that can be stored by an application using the DBMS_APPLICATION_INFO package.</td>
</tr>
<tr>
<td></td>
<td><strong>Caution:</strong> Some commercial applications may be using this context value. Refer to the applicable documentation for those applications to determine what restrictions they may impose on use of this context area.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> Oracle Database Security Guide for more information on application context, CREATE CONTEXT, and SYS_CONTEXT.</td>
</tr>
<tr>
<td>ENTRYID</td>
<td>The current audit entry number. The audit entryid sequence is shared between fine-grained audit records and regular audit records. You cannot use this attribute in distributed SQL statements.</td>
</tr>
<tr>
<td>ISDBA</td>
<td>ISDBA returns 'TRUE' if the user has been authenticated as having DBA privileges either through the operating system or through a password file.</td>
</tr>
<tr>
<td>LANG</td>
<td>LANG returns the ISO abbreviation for the language name, a shorter form than the existing 'LANGUAGE' parameter.</td>
</tr>
<tr>
<td>LANGUAGE</td>
<td>LANGUAGE returns the language and territory used by the current session along with the database character set in this form:</td>
</tr>
<tr>
<td></td>
<td>language_territory.charset</td>
</tr>
<tr>
<td>SESSIONID</td>
<td>SESSIONID returns the auditing session identifier. You cannot specify this parameter in distributed SQL statements.</td>
</tr>
<tr>
<td>SID</td>
<td>SID returns the session ID.</td>
</tr>
<tr>
<td>TERMINAL</td>
<td>TERMINAL returns the operating system identifier for the terminal of the current session. In distributed SQL statements, this parameter returns the identifier for your local session. In a distributed environment, this parameter is supported only for remote SELECT statements, not for remote INSERT, UPDATE, or DELETE operations.</td>
</tr>
</tbody>
</table>

**See Also:**

Appendix C in Oracle Database Globalization Support Guide for the collation derivation rules, which define the collation assigned to the character return value of USERENV.

Examples

The following example returns the LANGUAGE parameter of the current session:

SELECT USERENV('LANGUAGE') "Language" FROM DUAL;

Language
-----------------------------------
AMERICAN_AMERICA.WEBISO8859P1
7.266 VALIDATE_CONVERSION

Syntax

```
VALIDATE_CONVERSION ( expr AS type_name
, fmt
, 'nlsparam'
)
```

Purpose

VALIDATE_CONVERSION determines whether expr can be converted to the specified data type. If expr can be successfully converted, then this function returns 1; otherwise, this function returns 0. If expr evaluates to null, then this function returns 1. If an error occurs while evaluating expr, then this function returns the error.

For expr, specify a SQL expression. The acceptable data types for expr, and the purpose of the optional fmt and nlsparam arguments, depend on the data type you specify for type_name.

For type_name, specify the data type to which you want to convert expr. You can specify the following data types:

- **BINARY_DOUBLE**
  If you specify BINARY_DOUBLE, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The optional fmt and nlsparam arguments serve the same purpose as for the TO_BINARY_DOUBLE function. Refer to TO_BINARY_DOUBLE for more information.

- **BINARY_FLOAT**
  If you specify BINARY_FLOAT, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The optional fmt and nlsparam arguments serve the same purpose as for the TO_BINARY_FLOAT function. Refer to TO_BINARY_FLOAT for more information.

- **DATE**
  If you specify DATE, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional fmt and nlsparam arguments serve the same purpose as for the TO_DATE function. Refer to TO_DATE for more information.

- **INTERVAL DAY TO SECOND**
  If you specify INTERVAL DAY TO SECOND, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, and must contain a value in either the SQL interval format or the ISO duration format. The optional fmt and nlsparam arguments do not apply for this data type. Refer to TO_DSINTERVAL for more information on the SQL interval format and the ISO duration format.

- **INTERVAL YEAR TO MONTH**
If you specify INTERVAL YEAR TO MONTH, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, and must contain a value in either the SQL interval format or the ISO duration format. The optional fmt and nlsparam arguments do not apply for this data type. Refer to TO_YMINTERVAL for more information on the SQL interval format and the ISO duration format.

- **NUMBER**

  If you specify NUMBER, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type, or a numeric value of type NUMBER, BINARY_FLOAT, or BINARY_DOUBLE. The optional fmt and nlsparam arguments serve the same purpose as for the TO_NUMBER function. Refer to TO_NUMBER for more information.

  If expr is a value of type NUMBER, then the VALIDATE_CONVERSION function verifies that expr is a legal numeric value. If expr is not a legal numeric value, then the function returns 0. This enables you to identify corrupt numeric values in your database.

- **TIMESTAMP**

  If you specify TIMESTAMP, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional fmt and nlsparam arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit fmt, then expr must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. Refer to TO_TIMESTAMP for more information.

- **TIMESTAMP WITH TIME ZONE**

  If you specify TIMESTAMP WITH TIME ZONE, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional fmt and nlsparam arguments serve the same purpose as for the TO_TIMESTAMP_TZ function. If you omit fmt, then expr must be in the default format of the TIMESTAMP WITH TIME ZONE data type, which is determined by the NLS_TIMESTAMP_TZ_FORMAT initialization parameter. Refer to TO_TIMESTAMP_TZ for more information.

- **TIMESTAMP WITH LOCAL TIME ZONE**

  If you specify TIMESTAMP, then expr can be any expression that evaluates to a character string of CHAR, VARCHAR2, NCHAR, or NVARCHAR2 data type. The optional fmt and nlsparam arguments serve the same purpose as for the TO_TIMESTAMP function. If you omit fmt, then expr must be in the default format of the TIMESTAMP data type, which is determined by the NLS_TIMESTAMP_FORMAT initialization parameter. Refer to TO_TIMESTAMP for more information.

Examples

In each of the following statements, the specified value can be successfully converted to the specified data type. Therefore, each of these statements returns a value of 1.

```
SELECT VALIDATE_CONVERSION(1000 AS BINARY_DOUBLE)
FROM DUAL;

SELECT VALIDATE_CONVERSION('1234.56' AS BINARY_FLOAT)
FROM DUAL;

SELECT VALIDATE_CONVERSION('July 20, 1969, 20:18' AS DATE,
FROM DUAL;
```
'Month dd, YYYY, HH24:MI', 'NLS_DATE_LANGUAGE = American')
FROM DUAL;

SELECT VALIDATE_CONVERSION('200 00:00:00' AS INTERVAL DAY TO SECOND)
FROM DUAL;

SELECT VALIDATE_CONVERSION('P1Y2M' AS INTERVAL YEAR TO MONTH)
FROM DUAL;

SELECT VALIDATE_CONVERSION('$100,00' AS NUMBER,
   '$999D99', 'NLS_NUMERIC_CHARACTERS = '',.''')
FROM DUAL;

SELECT VALIDATE_CONVERSION('29-Jan-02 17:24:00' AS TIMESTAMP,
   'DD-MON-YY HH24:MI:SS')
FROM DUAL;

SELECT VALIDATE_CONVERSION('1999-12-01 11:00:00 -8:00'
   AS TIMESTAMP WITH TIME ZONE, 'YYYY-MM-DD HH:MI:SS TZH:TZM')
FROM DUAL;

SELECT VALIDATE_CONVERSION('11-May-16 17:30:00'
   AS TIMESTAMP WITH LOCAL TIME ZONE, 'DD-MON-YY HH24:MI:SS')
FROM DUAL;

The following statement returns 0, because the specified value cannot be converted to
BINARY_FLOAT:

SELECT VALIDATE_CONVERSION('$29.99' AS BINARY_FLOAT)
FROM DUAL;

The following statement returns 1, because the specified number format model
enables the value to be converted to BINARY_FLOAT:

SELECT VALIDATE_CONVERSION('$29.99' AS BINARY_FLOAT, '$99D99')
FROM DUAL;

## 7.267 VALUE

### Syntax

```
VALUE ( correlation_variable )
```

### Purpose

VALUE takes as its argument a correlation variable (table alias) associated with a row of
an object table and returns object instances stored in the object table. The type of the
object instances is the same type as the object table.

### Examples

The following example uses the sample table oe.persons, which is created in
"Substitutable Table and Column Examples":

```
SELECT VALUE(p) FROM persons p;
```

```
VALUE(P) (NAME, SSN)
```
### 7.268 VAR_POP

**Syntax**

```sql
VAR_POP(expr) OVER (analytic_clause)
```

**Purpose**

VAR_POP returns the population variance of a set of numbers after discarding the nulls in this set. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

If the function is applied to an empty set, then it returns null. The function makes the following calculation:

\[
\text{SUM}((\text{expr} - (\text{SUM}(\text{expr}) / \text{COUNT}(\text{expr}))^2) / \text{COUNT}(\text{expr})
\]

**See Also:**

- "IS OF type Condition " for information on using IS OF type conditions with the VALUE function
- "Analytic Functions " for information on syntax, semantics, and restrictions
- "About SQL Expressions " for information on valid forms of \textit{expr} and "Aggregate Functions "

Aggregate Example
The following example returns the population variance of the salaries in the employees table:

```
SELECT VAR_POP(salary) FROM employees;
```

```
VAR_POP(SALARY)
-------------
15141964.9
```

Analytic Example
The following example calculates the cumulative population and sample variances in the sh.sales table of the monthly sales in 1998:

```
SELECT t.calendar_month_desc, 
    VAR_POP(SUM(s.amount_sold)) 
    OVER (ORDER BY t.calendar_month_desc) "Var_Pop", 
    VAR_SAMP(SUM(s.amount_sold)) 
    OVER (ORDER BY t.calendar_month_desc) "Var_Samp" 
FROM sales s, times t 
WHERE s.time_id = t.time_id AND t.calendar_year = 1998 
GROUP BY t.calendar_month_desc 
ORDER BY t.calendar_month_desc, "Var_Pop", "Var_Samp";
```

<table>

<td>4.3872E+10</td>
</tr>
</tbody>
</table>

7.269 VAR_SAMP
Syntax

```
VAR_SAMP
( expr )
OVER ( analytic_clause )
```

See Also:
"Analytic Functions " for information on syntax, semantics, and restrictions
Purpose

VAR_SAMP returns the sample variance of a set of numbers after discarding the nulls in this set. You can use it as both an aggregate and analytic function.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

See Also:
Table 2-8 for more information on implicit conversion

If the function is applied to an empty set, then it returns null. The function makes the following calculation:

\[
\frac{\left(\sum(expr - \frac{\sum(expr)}{\text{COUNT}(expr)})\right)^2}{\text{COUNT}(expr) - 1}
\]

This function is similar to VARIANCE, except that given an input set of one element, VARIANCE returns 0 and VAR_SAMP returns null.

See Also:
"About SQL Expressions" for information on valid forms of expr and "Aggregate Functions"

Aggregate Example

The following example returns the sample variance of the salaries in the sample employees table.

```sql
SELECT VAR_SAMP(salary) FROM employees;
```

```
VAR_SAMP(SALARY)
----------------
15284813.7
```

Analytic Example

Refer to the analytic example for VAR_POP.

7.270 VARIANCE

Syntax
Purpose

VARIANCE returns the variance of expr. You can use it as an aggregate or analytic function.

Oracle Database calculates the variance of expr as follows:

- 0 if the number of rows in expr = 1
- \text{VAR\_SAMP} if the number of rows in expr > 1

If you specify \text{DISTINCT}, then you can specify only the \text{query\_partition\_clause} of the \text{analytic\_clause}. The \text{order\_by\_clause} and \text{windowing\_clause} are not allowed.

This function takes as an argument any numeric data type or any nonnumeric data type that can be implicitly converted to a numeric data type. The function returns the same data type as the numeric data type of the argument.

Aggregate Example

The following example calculates the variance of all salaries in the sample employees table:

```sql
SELECT VARIANCE(salary) "Variance"
FROM employees;
```

<table>
<thead>
<tr>
<th>Variance</th>
</tr>
</thead>
<tbody>
<tr>
<td>15283140.5</td>
</tr>
</tbody>
</table>

Analytic Example

The following example returns the cumulative variance of salary values in Department 30 ordered by hire date.

```sql
SELECT last_name, salary, VARIANCE(salary)
OVER (ORDER BY hire_date) "Variance"
FROM employees
WHERE department_id = 30
ORDER BY last_name, salary, "Variance";
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>SALARY</th>
<th>Variance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baida</td>
<td>2900</td>
<td>16283333.3</td>
</tr>
<tr>
<td>Colmenares</td>
<td>2500</td>
<td>11307000</td>
</tr>
</tbody>
</table>
### 7.271 VSIZE

**Syntax**

```sql
VSIZE(expr)
```

**Purpose**

_VSIZE_ returns the number of bytes in the internal representation of `expr`. If `expr` is null, then this function returns null.

This function does not support _CLOB_ data directly. However, _CLOBs_ can be passed in as arguments through implicit data conversion.

**See Also:**

"Data Type Comparison Rules " for more information

**Examples**

The following example returns the number of bytes in the `last_name` column of the employees in department 10:

```sql
SELECT last_name, VSIZE(last_name) "BYTES"
FROM employees
WHERE department_id = 10
ORDER BY employee_id;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>BYTES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Whalen</td>
<td>6</td>
</tr>
</tbody>
</table>

### 7.272 WIDTH_BUCKET

**Syntax**

```sql
WIDTH_BUCKET(expr, min_value, max_value, num_buckets)
```

**Purpose**

_WIDTH_BUCKET_ lets you construct equiwidth histograms, in which the histogram range is divided into intervals that have identical size. (Compare this function with _NTILE_, which creates equiheight histograms.) Ideally each bucket is a closed-open interval of the real number line. For example, a bucket can be assigned to scores between 10.00 and
19.999 ... to indicate that 10 is included in the interval and 20 is excluded. This is sometimes denoted \([10, 20)\).

For a given expression, \(\text{WIDTH_BUCKET}\) returns the bucket number into which the value of this expression would fall after being evaluated.

- \(\text{expr}\) is the expression for which the histogram is being created. This expression must evaluate to a numeric or datetime value or to a value that can be implicitly converted to a numeric or datetime value. If \(\text{expr}\) evaluates to null, then the expression returns null.
- \(\text{min\_value}\) and \(\text{max\_value}\) are expressions that resolve to the end points of the acceptable range for \(\text{expr}\). Both of these expressions must also evaluate to numeric or datetime values, and neither can evaluate to null.
- \(\text{num\_buckets}\) is an expression that resolves to a constant indicating the number of buckets. This expression must evaluate to a positive integer.

See Also:

Table 2-8 for more information on implicit conversion

When needed, Oracle Database creates an underflow bucket numbered 0 and an overflow bucket numbered \(\text{num\_buckets} + 1\). These buckets handle values less than \(\text{min\_value}\) and more than \(\text{max\_value}\) and are helpful in checking the reasonableness of endpoints.

Examples

The following example creates a ten-bucket histogram on the \(\text{credit\_limit}\) column for customers in Switzerland in the sample table oe.customers and returns the bucket number ("Credit Group") for each customer. Customers with credit limits greater than or equal to the maximum value are assigned to the overflow bucket, 11:

```sql
SELECT customer_id, cust_last_name, credit_limit,
       \(\text{WIDTH_BUCKET}(\text{credit\_limit}, 100, 5000, 10)\) "Credit Group"
FROM customers WHERE nls_territory = 'SWITZERLAND'
ORDER BY "Credit Group", customer_id, cust_last_name, credit_limit;
```

<table>
<thead>
<tr>
<th>CUSTOMER_ID</th>
<th>CUST_LAST_NAME</th>
<th>CREDIT_LIMIT</th>
<th>Credit Group</th>
</tr>
</thead>
<tbody>

<td>2300</td>
<td>5</td>
</tr>
</tbody>
</table>
7.273 XMLAGG

Syntax

```sql
XMLAGG ( XMLType_instance
order_by_clause
)
```

Purpose

XMLAgg is an aggregate function. It takes a collection of XML fragments and returns an aggregated XML document. Any arguments that return null are dropped from the result.

XMLAgg is similar to SYS_XMLAgg except that XMLAgg returns a collection of nodes but it does not accept formatting using the XMLFormat object. Also, XMLAgg does not enclose the output in an element tag as does SYS_XMLAgg.

Within the order_by_clause, Oracle Database does not interpret number literals as column positions, as it does in other uses of this clause, but simply as number literals.

See Also:

XMLELEMENT and SYS_XMLAGG

Examples

The following example produces a Department element containing Employee elements with employee job ID and last name as the contents of the elements:

```sql
SELECT XMLELEMENT("Department",
   XMLAGG(XMLELEMENT("Employee",
   e.job_id||' '||e.last_name)
   ORDER BY last_name)
   as "Dept_list"
FROM employees e
WHERE e.department_id = 30;
```

Dept_list

```
<Department>
```

华丽助手
The result is a single row, because XMLAgg aggregates the rows. You can use the GROUP BY clause to group the returned set of rows into multiple groups:

```sql
SELECT XMLELEMENT("Department",
    XMLAGG(XMLELEMENT("Employee", e.job_id||' '||e.last_name)))
AS "Dept_list"
FROM employees e
GROUP BY e.department_id;
```

```
<Department>
  <Employee>AD_ASST Whalen</Employee>
</Department>

<Department>
  <Employee>MK_MAN Hartstein</Employee>
  <Employee>MK_REP Fay</Employee>
</Department>

<Department>
  <Employee>PU_MAN Raphaely</Employee>
  <Employee>PU_CLERK Khoo</Employee>
  <Employee>PU_CLERK Tobias</Employee>
  <Employee>PU_CLERK Baida</Employee>
  <Employee>PU_CLERK Colmenares</Employee>
  <Employee>PU_CLERK Himuro</Employee>
</Department>

...

7.274 XMLCAST

Syntax

```
XMLCAST ( value_expression AS datatype )
```

Purpose

XMLCast casts value_expression to the scalar SQL data type specified by datatype. The value_expression argument is a SQL expression that is evaluated. The datatype argument can be of data type NUMBER, VARCHAR2, CHAR, CLOB, BLOB, REF XMLTYPE, and any of the datetime data types.
### 7.275 XMLCDATA

#### Syntax

```
XMLCDATA(value_expr)
```

#### Purpose

`XMLCDATA` generates a CDATA section by evaluating `value_expr`. The `value_expr` must resolve to a string. The value returned by the function takes the following form:

```
<![CDATA[string]]>
```

If the resulting value is not a valid XML CDATA section, then the function returns an error. The following conditions apply to `XMLCDATA`:

- The `value_expr` cannot contain the substring `]]>`.  
- If `value_expr` evaluates to null, then the function returns null.

#### Examples

The following statement uses the `DUAL` table to illustrate the syntax of `XMLCDATA`:

```sql
SELECT XMLELEMENT("PurchaseOrder",
    XMLAttributes(dummy as "pono"),
    XMLCDATA('<!DOCTYPE po_dom_group [ 
        <!ELEMENT po_dom_group(student_name)*>
        <!ELEMENT po_purch_name (#PCDATA)>
        <!ATTLIST po_name po_no ID #REQUIRED>
        <!ATTLIST po_name trust_1 IDREF #IMPLIED>
        <!ATTLIST po_name trust_2 IDREF #IMPLIED>
    ]]>')) "XMLCDATA" FROM DUAL;
```

```xml
<PurchaseOrder pono="X"><![CDATA[
<!DOCTYPE po_dom_group [ 
```

---

**See Also:**

- *Oracle XML DB Developer's Guide* for more information on uses for this function and examples
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the return value of `XMLCAST` when it is a character value.
7.276 XMLCOLATTVAL

Syntax

XMLCOLATTVAL ( value_expr
AS
c_alias
EVALNAME value_expr
,
)

Purpose

XMLColAttVal creates an XML fragment and then expands the resulting XML so that each XML fragment has the name column with the attribute name.

You can use the AS clause to change the value of the name attribute to something other than the column name. You can do this by specifying c_alias, which is a string literal, or by specifying EVALNAME value_expr. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the alias. The alias can be up to 4000 characters if the initialization parameter MAX_STRING_SIZE = STANDARD, and 32767 characters if MAX_STRING_SIZE = EXTENDED. See "Extended Data Types" for more information.

You must specify a value for value_expr. If value_expr is null, then no element is returned.

Restriction on XMLColAttVal

You cannot specify an object type column for value_expr.

Examples

The following example creates an Emp element for a subset of employees, with nested employee_id, last_name, and salary elements as the contents of Emp. Each nested element is named column and has a name attribute with the column name as the attribute value:

```
SELECT XMLELEMENT("Emp",
   XMLCOLATTVAL(e.employee_id, e.last_name, e.salary)) "Emp Element"
FROM employees e
WHERE employee_id = 204;
```

```
Emp Element

<Emp>
   <column name="EMPLOYEE_ID">204</column>
   <column name="LAST_NAME">Baer</column>
</Emp>
```
Refer to the example for XMLFOREST to compare the output of these two functions.

### 7.277 XMLCOMMENT

**Syntax**

```
XMLCOMMENT ( value_expr )
```

**Purpose**

XMLComment generates an XML comment using an evaluated result of value_expr. The value_expr must resolve to a string. It cannot contain two consecutive dashes (hyphens). The value returned by the function takes the following form:

```
<!--string-->
```

If value_expr resolves to null, then the function returns null.

**See Also:**

*Oracle XML DB Developer’s Guide* for more information on this function

**Examples**

The following example uses the DUAL table to illustrate the XMLComment syntax:

```
SELECT XMLCOMMENT('OrderAnalysisComp imported, reconfigured, disassembled')
AS "XMLCOMMENT" FROM DUAL;
```

```
<!--OrderAnalysisComp imported, reconfigured, disassembled-->
```

### 7.278 XMLCONCAT

**Syntax**

```
XMLCONCAT ( XMLType_instance
,
)
```

**Purpose**

XMLConcat takes as input a series of XMLType instances, concatenates the series of elements for each row, and returns the concatenated series. XMLConcat is the inverse of XMLSequence.
Null expressions are dropped from the result. If all the value expressions are null, then the function returns null.

See Also:
XMLSEQUENCE

Examples

The following example creates XML elements for the first and last names of a subset of employees, and then concatenates and returns those elements:

```
SELECT XMLCONCAT(XMLELEMENT("First", e.first_name),
               XMLELEMENT("Last", e.last_name)) AS "Result"
FROM employees e
WHERE e.employee_id > 202;
```

Result

```
<First>Susan</First>
<Last>Mavris</Last>

<First>Hermann</First>
<Last>Baer</Last>

<First>Shelley</First>
<Last>Higgins</Last>

<First>William</First>
<Last>Gietz</Last>
```

4 rows selected.

---

7.279 XMLDIFF

Syntax

```
XMLDiff (XMLType_document, XMLType_document, integer, string)
```

Purpose

The `XMLDiff` function is the SQL interface for the Xmdiff C API. This function compares two XML documents and captures the differences in XML conforming to an Xdiff schema. The diff document is returned as an XMLType document.

- For the first two arguments, specify the names of two XMLType documents.
- For the `integer`, specify a number representing the hashLevel for a C function `XmlDiff`. If you do not want hashing, set this argument to 0 or omit it entirely. If you
do not want hashing, but you want to specify flags, then you must set this argument to 0.

- For string, specify the flags that control the behavior of the function. These flags are specified by one or more names separated by semicolon. The names are the same as the names of constants for.XmlDiff function.

See Also:

Oracle XML Developer's Kit Programmer's Guide for more information on using this function, including examples, and Oracle Database XML C API Reference for information on the XML APIs for C

Examples

The following example compares two XML documents and returns the difference as an XMLType document:

```sql
SELECT XMLDIFF(
    XMLTYPE('<?xml version="1.0"?>
    <bk:book xmlns:bk="http://example.com">
      <bk:tr>
        <bk:td>
          <bk:chapter>
            Chapter 1.
          </bk:chapter>
        </bk:td>
        <bk:td>
          <bk:chapter>
            Chapter 2.
          </bk:chapter>
        </bk:td>
      </bk:tr>
    </bk:book>'),
    XMLTYPE('<?xml version="1.0"?>
    <bk:book xmlns:bk="http://example.com">
      <bk:tr>
        <bk:td>
          <bk:chapter>
            Chapter 1.
          </bk:chapter>
        </bk:td>
      </bk:tr>
    </bk:book>'))
FROM DUAL;
```
7.280 XMLELEMENT

Syntax

XMLElement takes an element name for identifier or evaluates an element name for EVALNAME value_expr, an optional collection of attributes for the element, and arguments that make up the content of the element. It returns an instance of type XMLType. XMLElement is similar to SYS_XMLGen except that XMLElement can include attributes in the XML returned, but it does not accept formatting using the XMLFormat object.

The XMLElement function is typically nested to produce an XML document with a nested structure, as in the example in the following section.

For an explanation of the ENTITYESCAPING and NONENTITYESCAPING keywords, refer to Oracle XML DB Developer's Guide.

You must specify a value for Oracle Database to use an the enclosing tag. You can do this by specifying identifier, which is a string literal, or by specifying EVALNAME value_expr. In the latter case, the value expression is evaluated and the result, which
must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter \texttt{MAX\_STRING\_SIZE = STANDARD}, and 32767 characters if \texttt{MAX\_STRING\_SIZE = EXTENDED}.

The objects that make up the element content follow the \texttt{XMLATTRIBUTES} keyword. In the \texttt{XML\_attributes\_clause}, if the \texttt{value\_expr} is null, then no attribute is created for that value expression. The type of \texttt{value\_expr} cannot be an object type or collection. If you specify an alias for \texttt{value\_expr} using the \texttt{AS} clause, then the \texttt{c\_alias} or the evaluated value expression (\texttt{EVALNAME value\_expr}) can be up to 4000 characters if the initialization parameter \texttt{MAX\_STRING\_SIZE = STANDARD}, and 32767 characters if \texttt{MAX\_STRING\_SIZE = EXTENDED}.

For the optional \texttt{value\_expr} that follows the \texttt{XML\_attributes\_clause} in the diagram:

- If \texttt{value\_expr} is a scalar expression, then you can omit the \texttt{AS} clause, and Oracle uses the column name as the element name.
- If \texttt{value\_expr} is an object type or collection, then the \texttt{AS} clause is mandatory, and Oracle uses the specified \texttt{c\_alias} as the enclosing tag.
- If \texttt{value\_expr} is null, then no element is created for that value expression.

See Also:

- "Extended Data Types" for more information on \texttt{MAX\_STRING\_SIZE}
- \texttt{SYS\_XMLGEN}

Examples

The following example produces an \texttt{Emp} element for a series of employees, with nested elements that provide the employee’s name and hire date:

```sql
SELECT XMLEMENT("Emp", XMLEMENT("Name",
    e.job_id||' '||e.last_name),
    XMLEMENT("Hiredate", e.hire_date) as "Result"
FROM employees e WHERE employee_id > 200;
```

Result

```
<Emp>
  <Name>MK\_MAN Hartstein</Name>
  <Hiredate>2004-02-17</Hiredate>
</Emp>

<Emp>
  <Name>MK\_REP Fay</Name>
  <Hiredate>2005-08-17</Hiredate>
</Emp>

<Emp>
```

See Also:

- "Extended Data Types" for more information on \texttt{MAX\_STRING\_SIZE}
- \texttt{SYS\_XMLGEN}
The following similar example uses the `XMLElement` function with the `XML_attributes_clause` to create nested XML elements with attribute values for the top-level element:

```sql
SELECT XMLELEMENT("Emp",
    XMLATTRIBUTES(e.employee_id AS "ID", e.last_name),
    XMLELEMENT("Dept", e.department_id),
    XMLELEMENT("Salary", e.salary)) AS "Emp Element"
FROM employees e
WHERE e.employee_id = 206;
```

```
Emp Element
---------------------------------------------------------------
<Emp EMPLOYEE_ID="206" LAST_NAME="Higgins">
<Dept DEPARTMENT_ID="110" Dept_name="Accounting"/>
<salary>12008</salary>
<Hiredate>2002-06-07</Hiredate>
</Emp>
```

Notice that the `AS` identifier clause was not specified for the `last_name` column. As a result, the XML returned uses the column name `last_name` as the default.

Finally, the next example uses a subquery within the `XML_attributes_clause` to retrieve information from another table into the attributes of an element:

```sql
SELECT XMLELEMENT("Emp", XMLATTRIBUTES(e.employee_id, e.last_name),
    XMLELEMENT("Dept", XMLATTRIBUTES(e.department_id,
        (SELECT d.department_name FROM departments d
            WHERE d.department_id = e.department_id) as "Dept_name")),
    XMLELEMENT("salary", e.salary),
    XMLELEMENT("Hiredate", e.hire_date)) AS "Emp Element"
FROM employees e
WHERE employee_id = 205;
```

```
Emp Element
---------------------------------------------------------------
<Emp EMPLOYEE_ID="205" LAST_NAME="Higgins">
<Dept DEPARTMENT_ID="110" Dept_name="Accounting"/>
<salary>12008</salary>
<Hiredate>2002-06-07</Hiredate>
</Emp>
```
7.281 XMLEXISTS

Syntax

\[
\text{XMLEXISTS}( \text{XQuery}\_\text{string} , \text{XML}_{-}\text{passing}\_\text{clause})
\]

\text{XML}_{-}\text{passing}\_\text{clause}::= \\
\text{PASSING} \text{BY VALUE} \text{expr} \text{AS}\ identifier \]

Purpose

\text{XMLEXISTS} checks whether a given XQuery expression returns a nonempty XQuery sequence. If so, the function returns TRUE; otherwise, it returns FALSE. The argument \text{XQuery}\_\text{string} is a literal string, but it can contain XQuery variables that you bind using the \text{XML}_{-}\text{passing}\_\text{clause}.

The \text{expr} in the \text{XML}_{-}\text{passing}\_\text{clause} is an expression returning an XMLType or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one \text{expr} in the \text{PASSING} clause without an identifier. The result of evaluating each \text{expr} is bound to the corresponding identifier in the \text{XQuery}\_\text{string}. If any \text{expr} that is not followed by an AS clause, then the result of evaluating that expression is used as the context item for evaluating the \text{XQuery}\_\text{string}. If \text{expr} is a relational column, then its declared collation is ignored by Oracle XML DB.

See Also:

Oracle XML DB Developer's Guide for more information on uses for this function and examples

7.282 XMLFOREST

Syntax

\[
\text{XMLFOREST}( \text{value}\_\text{expr} \text{AS}\ c\_\text{alias})
\]

See Also:

Oracle XML DB Developer's Guide for more information on uses for this function and examples
XMLForest converts each of its argument parameters to XML, and then returns an XML fragment that is the concatenation of these converted arguments.

- If `value_expr` is a scalar expression, then you can omit the `AS` clause, and Oracle Database uses the column name as the element name.
- If `value_expr` is an object type or collection, then the `AS` clause is mandatory, and Oracle uses the specified expression as the enclosing tag.

You can do this by specifying `c_alias`, which is a string literal, or by specifying `EVALNAME value_expr`. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`. See “Extended Data Types” for more information.

- If `value_expr` is null, then no element is created for that `value_expr`.

Examples

The following example creates an `Emp` element for a subset of employees, with nested `employee_id`, `last_name`, and `salary` elements as the contents of `Emp`:

```sql
SELECT XMLELEMENT("Emp",
    XMLFOREST(e.employee_id, e.last_name, e.salary))
"Emp Element"
FROM employees e WHERE employee_id = 204;
```

Emp Element

```
<Employee_ID>204</Employee_ID>
<Last_Name>Baer</Last_Name>
<Salary>10000</Salary>
</Emp>
```

Refer to the example for `XMLCOLATTVAL` to compare the output of these two functions.

7.283 XMLISVALID

Syntax

```
XMLISVALID ( XMLType_instance
, XMLSchema_URL
, element
)
```

Purpose

`XMLISVALID` checks whether the input `XMLType_instance` conforms to the relevant XML schema. It does not change the validation status recorded for `XMLType_instance`. 
If the input XML document is determined to be valid, then XMLISVALID returns 1; otherwise, it returns 0. If you provide XMLSchema_URL as an argument, then that is used to check conformance. Otherwise, the XML schema specified by the XML document is used to check conformance.

- **XMLType_instance** is the XMLType instance to be validated.
- **XMLSchema_URL** is the URL of the XML schema against which to check conformance.
- **element** is the element of the specified schema against which to check conformance. Use this if you have an XML schema that defines more than one top level element, and you want to check conformance against a specific one of those elements.

### See Also:

*Oracle XML DB Developer’s Guide* for information on the use of this function, including examples

---

## 7.284 XMLPARSE

### Syntax

```
XMLPARSE (
  DOCUMENT
  CONTENT
  value_expr
  WELLFORMED
)
```

### Purpose

XMLParse parses and generates an XML instance from the evaluated result of `value_expr`. The `value_expr` must resolve to a string. If `value_expr` resolves to null, then the function returns null.

- If you specify DOCUMENT, then `value_expr` must resolve to a singly rooted XML document.
- If you specify CONTENT, then `value_expr` must resolve to a valid XML value.
- When you specify WELLFORMED, you are guaranteeing that `value_expr` resolves to a well-formed XML document, so the database does not perform validity checks to ensure that the input is well formed.

### See Also:

*Oracle XML DB Developer’s Guide* for more information on this function

### Examples

The following example uses the DUAL table to illustrate the syntax of XMLParse:
SELECT XMLPARSE(CONTENT '124 <purchaseOrder poNo="12435"> 
  <customerName> Acme Enterprises</customerName> 
  <itemNo>32987457</itemNo> 
  </purchaseOrder>' 
WELLFORMED) AS PO FROM DUAL;

PO
---
124 <purchaseOrder poNo="12435"> 
  <customerName> Acme Enterprises</customerName> 
  <itemNo>32987457</itemNo> 
  </purchaseOrder>

7.285 XMLPATCH

Syntax

```
XMLPatch (XMLType_document, XMLType_document)
```

Purpose

The `XMLPatch` function is the SQL interface for the `XmlPatch` C API. This function patches an XML document with the changes specified. A patched `XMLType` document is returned.

- For the first argument, specify the name of the input `XMLType` document.
- For the second argument, specify the `XMLType` document containing the changes to be applied to the first document. The changes should conform to the Xdiff XML schema. You can supply the XML output from the Oracle XML Developer's Kit Java method `diff()`.

See Also:

- *Oracle XML Developer's Kit Programmer's Guide* for more information on using this function, including examples, and *Oracle Database XML C API Reference* for information on the XML APIs for C.

Examples

The following example patches an `XMLType` document with the changes specified in another `XMLType` and returns a patched `XMLType` document:

SELECT XMLPATCH(
XMLTYPE('<?xml version="1.0"?>
<bk:book xmlns:bk="http://example.com">
  <bk:tr>
    <bk:td>
      <bk:chapter>
        Chapter 1.
      </bk:chapter>
    </bk:td>
  </bk:tr>
</bk:book>')
XMLTYPE('...
<bk:tr>
  <bk:td>
    <bk:chapter>
      Chapter 1.
    </bk:chapter>
  </bk:td>
</bk:tr>'))
Chapter 7
XMLPI

7.286 XMLPI

Syntax

```
XMLPI(NAME identifier, value_expr)
```

Purpose

XMLPI generates an XML processing instruction using `identifier` and optionally the evaluated result of `value_expr`. A processing instruction is commonly used to provide to an application information that is associated with all or part of an XML document. The application uses the processing instruction to determine how best to process the XML document.

You must specify a value for Oracle Database to use an the enclosing tag. You can do this by specifying `identifier`, which is a string literal, or by specifying `EVALNAME value_expr`. In the latter case, the value expression is evaluated and the result, which must be a string literal, is used as the identifier. The identifier does not have to be a column name or column reference. It cannot be an expression or null. It can be up to 4000 characters if the initialization parameter `MAX_STRING_SIZE = STANDARD`, and 32767 characters if `MAX_STRING_SIZE = EXTENDED`. See "Extended Data Types" for more information.

The optional `value_expr` must resolve to a string. If you omit the optional `value_expr`, then a zero-length string is the default. The value returned by the function takes this form:

```
<?identifier string?>
```

XMLPI is subject to the following restrictions:

- The `identifier` must be a valid target for a processing instruction.
You cannot specify xml in any case combination for identifier.

The identifier cannot contain the consecutive characters ?>.

See Also:
Oracle XML DB Developer's Guide for more information on this function

Examples

The following statement uses the DUAL table to illustrate the use of the XMLPI syntax:

```
SELECT XMLPI(NAME "Order analysisComp", 'imported, reconfigured, disassembled')
AS "XMLPI" FROM DUAL;
```

```
XMLPI
<?Order analysisComp imported, reconfigured, disassembled?>
```

7.287 XMLQUERY

Syntax

```
XMLQUERY
( XQuery_string
XML_passing_clause
RETURNING CONTENT
NULL ON EMPTY
)
```

XML_passing_clause ::= 

```
PASSING
BY VALUE
expr
AS identifier
```

Purpose

XMLQUERY lets you query XML data in SQL statements. It takes an XQuery expression as a string literal, an optional context item, and other bind variables and returns the result of evaluating the XQuery expression using these input values.

- XQuery_string is a complete XQuery expression, including prolog.
- The expr in the XML_passing_clause is an expression returning an XMLType or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one expr in the PASSING clause without an identifier. The result of evaluating each expr is bound to the corresponding identifier in the XQuery_string. If any expr that is not followed by an AS clause, then the result of evaluating that expression is used as the context item for
evaluating the XQuery_string. If expr is a relational column, then its declared collation is ignored by Oracle XML DB.

- **RETURNING CONTENT** indicates that the result from the XQuery evaluation is either an XML 1.0 document or a document fragment conforming to the XML 1.0 semantics.
- If the result set is empty, then the function returns the SQL NULL value. The NULL ON EMPTY keywords are implemented by default and are shown for semantic clarity.

### See Also:

*Oracle XML DB Developer's Guide* for more information on this function

### Examples

The following statement specifies the warehouse_spec column of the oe.warehouses table in the XML_passing_clause as a context item. The statement returns specific information about the warehouses with area greater than 50K.

```
SELECT warehouse_name, 
       EXTRACTVALUE(warehouse_spec, '/Warehouse/Area'), 
       XMLQuery('for $i in /Warehouse 
                   where $i/Area > 50000 
                   return <Details> 
                       <Docks num="{$i/Docks}"/> 
                       <Rail> 
                           if ($i/RailAccess = "Y") then "true" else "false" 
                       </Rail> 
                   </Details>') 
       XMLSERIALIZE(warehouse_spec RETURNING CONTENT) 
FROM warehouses;
```

<table>
<thead>
<tr>
<th>WAREHOUSE_ID</th>
<th>Area</th>
<th>Big_warehouses</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>25000</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>50000</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>85700</td>
<td>&lt;Details&gt;&lt;Docks&gt;&lt;/Docks&gt;&lt;Rail&gt;false&lt;/Rail&gt;&lt;/Details&gt;</td>
</tr>
<tr>
<td>4</td>
<td>103000</td>
<td>&lt;Details&gt;&lt;Docks num=&quot;3&quot;&gt;&lt;/Docks&gt;&lt;Rail&gt;true&lt;/Rail&gt;&lt;/Details&gt;</td>
</tr>
</tbody>
</table>

### 7.288 XMLROOT

**Note:**

The XMLROOT function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you instead use the SQL/XML function XMLSERIALIZE with a version number. See *Oracle XML DB Developer's Guide* for more information on the XMLSERIALIZE function.
Syntax

```sql
XMLROOT ( value_expr, VERSION value_expr, NO VALUE, STANDALONE YES NO NO VALUE )
```

Purpose

`XMLROOT` lets you create a new XML value by providing version and standalone properties in the XML root information (prolog) of an existing XML value. If the `value_expr` already has a prolog, then the database returns an error. If the input is null, then the function returns null.

The value returned takes the following form:

```xml
<?xml version = "version" [ STANDALONE = "[yes | no]" ]?>
```

- The first `value_expr` specifies the XML value for which you are providing prolog information.
- In the `VERSION` clause, `value_expr` must resolve to a string representing a valid XML version. If you specify `NO VALUE` for `VERSION`, then the version defaults to 1.0.
- If you omit the optional `STANDALONE` clause, or if you specify it with `NO VALUE`, then the standalone property is absent from the value returned by the function.

Examples

The following statement uses the `DUAL` table to illustrate the syntax of `XMLROOT`:

```sql
SELECT XMLROOT ( XMLType('<poid>143598</poid>'), VERSION '1.0', STANDALONE YES )
AS "XMLROOT" FROM DUAL;
```

```
XMLROOT
--------------------------------------------------
<?xml version="1.0" standalone="yes"?>
<poid>143598</poid>
```

Note:

The `XMLSEQUENCE` function is deprecated. It is still supported for backward compatibility. However, Oracle recommends that you use the `XMLTABLE` function instead. See `XMLTABLE` for more information.
Syntax

```xml
XMLSEQUENCE
XMLType_instance sys_refcursor_instance, fmt
```

Purpose

XMLSequence has two forms:

- The first form takes as input an XMLType instance and returns a varray of the top-level nodes in the XMLType. This form is effectively superseded by the SQL/XML standard function XMLTable, which provides for more readable SQL code. Prior to Oracle Database 10g Release 2, XMLSequence was used with SQL function TABLE to do some of what can now be done better with the XMLTable function.

- The second form takes as input a REF_CURSOR instance, with an optional instance of the XML_FORMAT object, and returns as an XMLSequence type an XML document for each row of the cursor.

Because XMLSequence returns a collection of XMLType, you can use this function in a TABLE clause to unnest the collection values into multiple rows, which can in turn be further processed in the SQL query.

See Also:

Oracle XML DB Developer’s Guide for more information on this function, and XMLTABLE

Examples

The following example shows how XMLSequence divides up an XML document with multiple elements into VARRAY single-element documents. In this example, the TABLE keyword instructs Oracle Database to consider the collection a table value that can be used in the FROM clause of the subquery:

```sql
SELECT EXTRACT(warehouse_spec, '/Warehouse') as "Warehouse"
FROM warehouses WHERE warehouse_name = 'San Francisco';
```

Warehouse

```
<Warehouse>
  <Building>Rented</Building>
  <Area>50000</Area>
  <Docks>1</Docks>
  <DockType>Side load</DockType>
  <WaterAccess>Y</WaterAccess>
  <RailAccess>N</RailAccess>
  <Parking>Lot</Parking>
  <VClearance>12 ft</VClearance>
</Warehouse>
```

1 row selected.
SELECT VALUE(p)
FROM warehouses w,
    TABLE(XMLSEQUENCE(EXTRACT(warehouse_spec, '/Warehouse/*'))) p
WHERE w.warehouse_name = 'San Francisco';

8 rows selected.

### 7.290 XMLHttpRequest

**Syntax**

```
XMLSERIALIZE
  ( DOCUMENT
   CONTENT
   value_expr
   AS datatype
   ENCODING xml_encoding_spec
   VERSION string_literal
   NO INDENT
   INDENT SIZE = number
   HIDE
   SHOW
   DEFAULTS
  )
```

**Purpose**

XMLSerialize creates a string or LOB containing the contents of value_expr.

- If you specify DOCUMENT, then the value_expr must be a valid XML document.
- If you specify CONTENT, then the value_expr need not be a singly rooted XML document. However it must be valid XML content.
- The datatype specified can be a string type (VARCHAR2 or VARCHAR, but not NVARCHAR2), BLOB, or CLOB. The default is CLOB.
- If datatype is BLOB, then you can specify the ENCODING clause to use the specified encoding in the prolog. The xml_encoding_spec is an XML encoding declaration (encoding="...").
- If datatype is BLOB, then you can specify the VERSION clause to use the version you provide as string_literal in the XML declaration (<?xml version="..." ...?>).
- Specify NO INDENT to strip all insignificant whitespace from the output. Specify INDENT SIZE = N, where N is a whole number, for output that is pretty-printed.
using a relative indentation of $N$ spaces. If $N$ is 0, then pretty-printing inserts a newline character after each element, placing each element on a line by itself, but omitting all other insignificant whitespace in the output. If INDENT is present without a SIZE specification, then 2-space indenting is used. If you omit this clause, then the behavior (pretty-printing or not) is indeterminate.

- **HIDE DEFAULTS** and **SHOW DEFAULTS** apply only to XML schema-based data. If you specify SHOW DEFAULTS and the input data is missing any optional elements or attributes for which the XML schema defines default values, then those elements or attributes are included in the output with their default values. If you specify HIDE DEFAULTS, then no such elements or attributes are included in the output. HIDE DEFAULTS is the default behavior.

See Also:

- *Oracle XML DB Developer's Guide* for more information on this function
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to the character return value of XMLSERIALIZE

Examples

The following statement uses the DUAL table to illustrate the syntax of XMLSerialize:

```sql
SELECT XMLSERIALIZE(CONTENT XMLTYPE('<Owner>Grandco</Owner>')) AS xmlserialize_doc
FROM DUAL;
```

<table>
<thead>
<tr>
<th>XMLSERIALIZE_DOC</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;Owner&gt;Grandco&lt;/Owner&gt;</td>
</tr>
</tbody>
</table>

### 7.291 XMLTABLE

**Syntax**

```sql
XMLTABLE XMLnamespaces_clause XQuery_string XMLTABLE_options
```

**XMLnamespaces_clause::=**

```sql
XMLNAMESPACES string AS identifier DEFAULT string
```

Chapter 7

XMLTABLE

7-426
Note:
You can specify at most one DEFAULT string clause.

XMLTable maps the result of an XQuery evaluation into relational rows and columns. You can query the result returned by the function as a virtual relational table using SQL.

- The XMLNAMESPACES clause contains a set of XML namespace declarations. These declarations are referenced by the XQuery expression (the evaluated XQuery_string), which computes the row, and by the XPath expression in the PATH clause of XML_table_column, which computes the columns for the entire XMLTable function. If you want to use qualified names in the PATH expressions of the COLUMNS clause, then you need to specify the XMLNAMESPACES clause.
- XQuery_string is a literal string. It is a complete XQuery expression and can include prolog declarations. The value of XQuery_string serves as input to the XMLTable function; it is this XQuery result that is decomposed and stored as relational data.
• The expr in the XML_passing_clause is an expression returning an XMLType or an instance of a SQL scalar data type that is used as the context for evaluating the XQuery expression. You can specify only one expr in the PASSING clause without an identifier. The result of evaluating each expr is bound to the corresponding identifier in the XQuery_string. If any expr that is not followed by an AS clause, then the result of evaluating that expression is used as the context item for evaluating the XQuery_string. This clause supports only passing by value, not passing by reference. Therefore, the BY VALUE keywords are optional and are provided for semantic clarity.

• The optional RETURNING SEQUENCE BY REF clause causes the result of the XQuery evaluation to be returned by reference. This allows you to refer to any part of the source data in the XML_table_column clause.

If you omit this clause, then the result of the XQuery evaluation is returned by value. That is, a copy of the targeted nodes is returned instead of a reference to the actual nodes. In this case, you cannot refer to any data that is not in the returned copy in the XML_table_column clause. In particular, you cannot refer to data that precedes the targeted nodes in the source data.

• The optional COLUMNS clause defines the columns of the virtual table to be created by XMLTable.
  – If you omit the COLUMNS clause, then XMLTable returns a row with a single XMLType pseudocolumn named COLUMN_VALUE.
  – FOR ORDINALITY specifies that column is to be a column of generated row numbers. There must be at most one FOR ORDINALITY clause. It is created as a NUMBER column.
  – For each resulting column except the FOR ORDINALITY column, you must specify the column data type, which can be XMLType or any other data type.

If the column data type is XMLType, then specify the XMLTYPE clause. If you specify the optional (SEQUENCE) BY REF clause, then a reference to the source data targeted by the PATH expression is returned as the column content. Otherwise, column contains a copy of that targeted data.

Returning the XMLType data by reference lets you specify other columns whose paths target nodes in the source data that are outside those targeted by the PATH expression for column.

If the column data type is any other data type, then specify datatype.

– The optional PATH clause specifies that the portion of the XQuery result that is addressed by XQuery expression string is to be used as the column content.

If you omit PATH, then the XQuery expression column is assumed. For example:

XMLTable(... COLUMNS xyz)

is equivalent to

XMLTable(... COLUMNS xyz PATH 'XYZ')

You can use different PATH clauses to split the XQuery result into different virtual-table columns.
– The optional DEFAULT clause specifies the value to use when the PATH expression results in an empty sequence. Its expr is an XQuery expression that is evaluated to produce the default value.

**See Also:**

- *Oracle XML DB Developer's Guide* for more information on the XMLTable function, including additional examples, and on XQuery in general
- Appendix C in *Oracle Database Globalization Support Guide* for the collation derivation rules, which define the collation assigned to each character data type column in the table generated by XMLTABLE

**Examples**

The following example converts the result of applying the XQuery '/Warehouse' to each value in the warehouse_spec column of the warehouses table into a virtual relational table with columns Water and Rail:

```sql
SELECT warehouse_name warehouse,
       warehouse2."Water", warehouse2."Rail"
FROM warehouses,
     XMLTABLE('/Warehouse'
               PASSING warehouses.warehouse_spec
               COLUMNS
               "Water" varchar2(6) PATH 'WaterAccess',
               "Rail" varchar2(6) PATH 'RailAccess')
     warehouse2;
```

<table>
<thead>
<tr>
<th>WAREHOUSE</th>
<th>Water</th>
<th>Rail</th>
</tr>
</thead>
<tbody>
<tr>
<td>Southlake, Texas</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>San Francisco</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>New Jersey</td>
<td>N</td>
<td>N</td>
</tr>
<tr>
<td>Seattle, Washington</td>
<td>N</td>
<td>Y</td>
</tr>
</tbody>
</table>

### 7.292 XMLTRANSFORM

**Syntax**

\[
\text{XMLTRANSFORM}(\text{XMLType\_instance},\text{XMLType\_instance},\text{string})
\]

**Purpose**

XMLTransform takes as arguments an XMLType instance and an XSL style sheet, which is itself a form of XMLType instance. It applies the style sheet to the instance and returns an XMLType.

This function is useful for organizing data according to a style sheet as you are retrieving it from the database.
Examples

The `XMLTransform` function requires the existence of an XSL style sheet. Here is an example of a very simple style sheet that alphabetizes elements within a node:

```sql
CREATE TABLE xsl_tab (col1 XMLTYPE);
INSERT INTO xsl_tab VALUES
(xmltype.createxml(''<?xml version="1.0"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform" >
<xsl:output encoding="utf-8"/>
<!-- alphabetizes an xml tree -->
<xsl:template match=""">
<xsl:copy>
<xsl:apply-templates select="*|text()">
<xsl:sort select="name(.)" data-type="text" order="ascending"/>
</xsl:apply-templates>
</xsl:copy>
</xsl:template>
</xsl:stylesheet>' ));
1 row created.
```

The next example uses the `xsl Tab` XSL style sheet to alphabetize the elements in one `warehouse_spec` of the sample table `oe.warehouses`:

```sql
SELECT XMLTRANSFORM(w.warehouse_spec, x.col1).GetClobVal()
FROM warehouses w, xsl_tab x
WHERE w.warehouse_name = 'San Francisco';
```

7.293 ROUND and TRUNC Date Functions

Table 7-13 lists the format models you can use with the `ROUND` and `TRUNC` date functions and the units to which they round and truncate dates. The default model, 'DD', returns the date rounded or truncated to the day with a time of midnight.
Table 7-13  Date Format Models for the ROUND and TRUNC Date Functions

<table>
<thead>
<tr>
<th>Format Model</th>
<th>Rounding or Truncating Unit</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>One greater than the first two digits of a four-digit year</td>
</tr>
<tr>
<td>SCC</td>
<td></td>
</tr>
<tr>
<td>YYYY</td>
<td>Year (rounds up on July 1)</td>
</tr>
<tr>
<td>YYY</td>
<td>Year containing the calendar week, as defined by the ISO 8601 standard</td>
</tr>
<tr>
<td>YEAR</td>
<td></td>
</tr>
<tr>
<td>SYEAR</td>
<td></td>
</tr>
<tr>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>YYY</td>
<td></td>
</tr>
<tr>
<td>YY</td>
<td></td>
</tr>
<tr>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>IYYYY</td>
<td>Quarter (rounds up on the sixteenth day of the second month of the quarter)</td>
</tr>
<tr>
<td>IY</td>
<td>Month (rounds up on the sixteenth day)</td>
</tr>
<tr>
<td>IY</td>
<td></td>
</tr>
<tr>
<td>I</td>
<td></td>
</tr>
<tr>
<td>Q</td>
<td></td>
</tr>
<tr>
<td>MONTH</td>
<td></td>
</tr>
<tr>
<td>MON</td>
<td>Same day of the week as the first day of the year</td>
</tr>
<tr>
<td>MM</td>
<td></td>
</tr>
<tr>
<td>RM</td>
<td></td>
</tr>
<tr>
<td>WW</td>
<td>Same day of the week as the first day of the calendar week as defined by the ISO 8601 standard, which is Monday</td>
</tr>
<tr>
<td>IW</td>
<td>Same day of the week as the first day of the month</td>
</tr>
<tr>
<td>W</td>
<td>Day</td>
</tr>
<tr>
<td>DDD</td>
<td>Starting day of the week</td>
</tr>
<tr>
<td>DD</td>
<td></td>
</tr>
<tr>
<td>J</td>
<td></td>
</tr>
<tr>
<td>DAY</td>
<td>Hour</td>
</tr>
<tr>
<td>DY</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>Minute</td>
</tr>
<tr>
<td>HH</td>
<td></td>
</tr>
<tr>
<td>HH12</td>
<td></td>
</tr>
<tr>
<td>HH24</td>
<td></td>
</tr>
<tr>
<td>MI</td>
<td></td>
</tr>
</tbody>
</table>

The starting day of the week used by the format models DAY, DY, and D is specified implicitly by the initialization parameter NLS_TERRITORY.
7.294 About User-Defined Functions

You can write user-defined functions in PL/SQL, Java, or C to provide functionality that is not available in SQL or SQL built-in functions. User-defined functions can appear in a SQL statement wherever an expression can occur.

For example, user-defined functions can be used in the following:

- The select list of a `SELECT` statement
- The condition of a `WHERE` clause
- `CONNECT BY`, `START WITH`, `ORDER BY`, and `GROUP BY` clauses
- The `VALUES` clause of an `INSERT` statement
- The `SET` clause of an `UPDATE` statement

**Note:**

Oracle SQL does not support calling of functions with Boolean parameters or returns. Therefore, if your user-defined functions will be called from SQL statements, you must design them to return numbers (0 or 1) or character strings ("TRUE" or "FALSE").

`user_defined_function`::=

The optional expression list must match attributes of the function, package, or operator.

**Restriction on User-defined Functions**

The `DISTINCT` and `ALL` keywords are valid only with a user-defined aggregate function.
7.294.1 Prerequisites

User-defined functions must be created as top-level functions or declared with a package specification before they can be named within a SQL statement.

To use a user function in a SQL expression, you must own or have EXECUTE privilege on the user function. To query a view defined with a user function, you must have the READ or SELECT privilege on the view. No separate EXECUTE privileges are needed to select from the view.

7.294.2 Name Precedence

Within a SQL statement, the names of database columns take precedence over the names of functions with no parameters. For example, if the Human Resources manager creates the following two objects in the hr schema:

```
CREATE TABLE new_emps (new_sal NUMBER, ...);
CREATE FUNCTION new_sal RETURN NUMBER IS BEGIN ... END;
```

then in the following two statements, the reference to `new_sal` refers to the column `new_emps.new_sal`:

```
SELECT new_sal FROM new_emps;
SELECT new_emps.new_sal FROM new_emps;
```

To access the function `new_sal`, you would enter:

```
SELECT hr.new_sal FROM new_emps;
```

Here are some sample calls to user functions that are allowed in SQL expressions:

```
circle_area (radius)
payroll.tax_rate (empno)
hr.employees.tax_rate (dependent, empno)|remote
```

**Example**

To call the `tax_rate` user function from schema `hr`, execute it against the `ss_no` and `sal` columns in `tax_table`, specify the following:
SELECT hr.tax_rate (ss_no, sal)
    INTO income_tax
    FROM tax_table WHERE ss_no = tax_id;

The INTO clause is PL/SQL that lets you place the results into the variable income_tax.

7.294.2.1 Naming Conventions

If only one of the optional schema or package names is given, then the first identifier can be either a schema name or a package name. For example, to determine whether PAYROLL in the reference PAYROLL.TAX_RATE is a schema or package name, Oracle Database proceeds as follows:

1. Check for the PAYROLL package in the current schema.
2. If a PAYROLL package is not found, then look for a schema name PAYROLL that contains a top-level TAX_RATE function. If no such function is found, then return an error.
3. If the PAYROLL package is found in the current schema, then look for a TAX_RATE function in the PAYROLL package. If no such function is found, then return an error.

You can also refer to a stored top-level function using any synonym that you have defined for it.
This chapter describes some SQL data definition clauses that appear in multiple SQL statements.

This chapter contains these sections:

- allocate_extent_clause
- constraint
- deallocate_unused_clause
- file_specification
- logging_clause
- parallel_clause
- physical_attributes_clause
- size_clause
- storage_clause

### 8.1 allocate_extent_clause

**Purpose**

Use the `allocate_extent_clause` clause to explicitly allocate a new extent for a database object.

Explicitly allocating an extent with this clause does not change the values of the `NEXT` and `PCTINCREASE` storage parameters, so does not affect the size of the next extent to be allocated implicitly by Oracle Database. Refer to `storage_clause` for information about the `NEXT` and `PCTINCREASE` storage parameters.

You can allocate an extent in the following SQL statements:

- `ALTER CLUSTER` (see ALTER CLUSTER)
- `ALTER INDEX`: to allocate an extent to the index, an index partition, or an index subpartition (see ALTER INDEX)
- `ALTER MATERIALIZED VIEW`: to allocate an extent to the materialized view, one of its partitions or subpartitions, or the overflow segment of an index-organized materialized view (see ALTER MATERIALIZED VIEW)
- `ALTER MATERIALIZED VIEW LOG` (see ALTER MATERIALIZED VIEW LOG)
- `ALTER TABLE`: to allocate an extent to the table, a table partition, a table subpartition, the mapping table of an index-organized table, the overflow segment of an index-organized table, or a LOB storage segment (see ALTER TABLE)
Syntax

\textit{allocate\_extent\_clause} ::= 

\begin{align*}
&\text{ALLOCATE} \\
&\quad \text{EXTENT} \\
&\quad ( \\
&\quad\quad \text{SIZE} \ 	ext{size\_clause} \\
&\quad\quad \text{DATAFILE} \ ' \ 	ext{filename}' \\
&\quad\quad \text{INSTANCE} \ 	ext{integer} \\
&\quad )
\end{align*}

(size\_clause ::= )

Semantics

This section describes the parameters of the \textit{allocate\_extent\_clause}. For additional information, refer to the SQL statement in which you set or reset these parameters for a particular database object.

You cannot specify the \textit{allocate\_extent\_clause} and the \textit{deallocate\_unused\_clause} in the same statement.

\textbf{SIZE}

Specify the size of the extent in bytes. The value of \textit{integer} can be 0 through 2147483647. To specify a larger extent size, use an integer within this range with \textit{K}, \textit{M}, \textit{G}, or \textit{T} to specify the extent size in kilobytes, megabytes, gigabytes, or terabytes.

For a table, index, materialized view, or materialized view log, if you omit \textit{SIZE}, then Oracle Database determines the size based on the values of the storage parameters of the object. However, for a cluster, Oracle does not evaluate the cluster's storage parameters, so you must specify \textit{SIZE} if you do not want Oracle to use a default value.

\textbf{DATAFILE ‘filename’}

Specify one of the data files in the tablespace of the table, cluster, index, materialized view, or materialized view log to contain the new extent. If you omit \textit{DATAFILE}, then Oracle chooses the data file.

\textbf{INSTANCE integer}

Use this parameter only if you are using Oracle Real Application Clusters.

Specifying \textit{INSTANCE integer} makes the new extent available to the freelist group associated with the specified instance. If the instance number exceeds the maximum number of freelist groups, then Oracle divides the specified number by the maximum number and uses the remainder to identify the freelist group to be used. An instance is identified by the value of its initialization parameter \textit{INSTANCE\_NUMBER}.

If you omit this parameter, then the space is allocated to the table, cluster, index, materialized view, or materialized view log but is not drawn from any particular freelist group. Instead, Oracle uses the master freelist and allocates space as needed.
8.2 constraint

Purpose

Use a **constraint** to define an **integrity constraint**—a rule that restricts the values in a database. Oracle Database lets you create six types of constraints and lets you declare them in two ways.

The six types of integrity constraint are described briefly here and more fully in "Semantics":

- **A NOT NULL constraint** prohibits a database value from being null.
- **A unique constraint** prohibits multiple rows from having the same value in the same column or combination of columns but allows some values to be null.
- **A primary key constraint** combines a NOT NULL constraint and a unique constraint in a single declaration. It prohibits multiple rows from having the same value in the same column or combination of columns and prohibits values from being null.
- **A foreign key constraint** requires values in one table to match values in another table.
- **A check constraint** requires a value in the database to comply with a specified condition.
- **A REF column** by definition references an object in another object type or in a relational table. A REF constraint lets you further describe the relationship between the REF column and the object it references.

You can define constraints syntactically in two ways:

- As part of the definition of an individual column or attribute. This is called **inline** specification.
- As part of the table definition. This is called **out-of-line** specification.

**NOT NULL** constraints must be declared inline. All other constraints can be declared either inline or out of line.

Constraint clauses can appear in the following statements:

- **CREATE TABLE** (see CREATE TABLE)
- **ALTER TABLE** (see ALTER TABLE)
- **CREATE VIEW** (see CREATE VIEW)
- **ALTER VIEW** (see ALTER VIEW)

View Constraints
Oracle Database does not enforce view constraints. However, you can enforce constraints on views through constraints on base tables.

You can specify only unique, primary key, and foreign key constraints on views, and they are supported only in `DISABLE NOVALIDATE` mode. You cannot define view constraints on attributes of an object column.

**External Table Constraints**

You can specify only `NOT NULL`, unique, primary key, and foreign key constraints on external tables. Unique, primary key, and foreign key constraints are supported only in `RELY DISABLE` mode.

**Prerequisites**

You must have the privileges necessary to issue the statement in which you are defining the constraint.

To create a foreign key constraint, in addition, the parent table or view must be in your own schema or you must have the `REFERENCES` privilege on the columns of the referenced key in the parent table or view.

**Syntax**

```
constraint ::=

XMLIndex_clause
```

**global_partitioned_index::=, local_partitioned_index::=**—part of CREATE INDEX,

**index_attributes::=**. The INDEXTYPE IS ... clause is not valid when defining a constraint.)
Semantics

This section describes the semantics of \textit{constraint}. For additional information, refer to the SQL statement in which you define or redefine a constraint for a table or view.

Oracle Database does not support constraints on columns or attributes whose type is a user-defined object, nested table, VARRAY, REF, or LOB, with two exceptions:

- NOT NULL constraints are supported for a column or attribute whose type is user-defined object, VARRAY, REF, or LOB.
- NOT NULL, foreign key, and REF constraints are supported on a column of type REF.

\textbf{CONSTRAINT} \textit{constraint\_name}

Specify a name for the constraint. The name must satisfy the requirements listed in "Database Object Naming Rules". If you omit this identifier, then Oracle Database generates a name with the form \texttt{SYS\_Cn}. Oracle stores the name and the definition of
the integrity constraint in the USER_, ALL_, and DBA_CONSTRAINTS data dictionary views
(in the CONSTRAINT_NAME and SEARCH_CONDITION columns, respectively).

See Also:

Oracle Database Reference for information on the data dictionary views

NOT NULL Constraints

A NOT NULL constraint prohibits a column from containing nulls. The NULL keyword by
itself does not actually define an integrity constraint, but you can specify it to explicitly
permit a column to contain nulls. You must define NOT NULL and NULL using inline
specification. If you specify neither NOT NULL nor NULL, then the default is NULL.

NOT NULL constraints are the only constraints you can specify inline on XMLType and
VARRAY columns.

To satisfy a NOT NULL constraint, every row in the table must contain a value for the
column.

Note:

Oracle Database does not index table rows in which all key columns are null
except in the case of bitmap indexes. Therefore, if you want an index on all
rows of a table, then you must either specify NOT NULL constraints for at least
one of the index key columns or create a bitmap index.

Restrictions on NOT NULL Constraints

NOT NULL constraints are subject to the following restrictions:

• You cannot specify NULL or NOT NULL in a view constraint.

• You cannot specify NULL or NOT NULL for an attribute of an object. Instead, use a
  CHECK constraint with the IS [NOT] NULL condition.

Unique Constraints

A unique constraint designates a column as a unique key. A composite unique key
designates a combination of columns as the unique key. When you define a unique
constraint inline, you need only the UNIQUE keyword. When you define a unique
constraint out of line, you must also specify one or more columns. You must define a
composite unique key out of line.

To satisfy a unique constraint, no two rows in the table can have the same value for
the unique key. However, the unique key made up of a single column can contain
nulls. To satisfy a composite unique key, no two rows in the table or view can have the
same combination of values in the key columns. Any row that contains nulls in all key
columns automatically satisfies the constraint. However, two rows that contain nulls for
one or more key columns and the same combination of values for the other key
columns violate the constraint.
Unique constraints are sensitive to declared collations of their key columns. See Collation Sensitivity of Constraints for more details.

When you specify a unique constraint on one or more columns, Oracle implicitly creates an index on the unique key. If you are defining uniqueness for purposes of query performance, then Oracle recommends that you instead create the unique index explicitly using a CREATE UNIQUE INDEX statement. You can also use the CREATE UNIQUE INDEX statement to create a unique function-based index that defines a conditional unique constraint. See "Using a Function-based Index to Define Conditional Uniqueness: Example" for more information.

When you specify an enabled unique constraint on an extended data type column, you may receive a "maximum key length exceeded" error when Oracle tries to create the index to enforce uniqueness for the enabled constraint. See "Creating an Index on an Extended Data Type Column" for information on how to work around this issue.

Restrictions on Unique Constraints

Unique constraints are subject to the following restrictions:

1. None of the columns in the unique key can be of LOB, LONG, LONG RAW, VARRAY, NESTED TABLE, OBJECT, REF, TIMESTAMP WITH TIME ZONE, or user-defined type. However, the unique key can contain a column of TIMESTAMP WITH LOCAL TIME ZONE.

2. A composite unique key cannot have more than 32 columns.

3. You cannot designate the same column or combination of columns as both a primary key and a unique key.

4. You cannot specify a unique key when creating a subview in an inheritance hierarchy. The unique key can be specified only for the top-level (root) view.

5. When you specify a unique constraint for an external table, you must specify the RELY and DISABLE constraint states. See External Table Constraints for more information.

See Also:
"Unique Key Example" and Composite Unique Key Example

Primary Key Constraints

A primary key constraint designates a column as the primary key of a table or view. A composite primary key designates a combination of columns as the primary key. When you define a primary key constraint inline, you need only the PRIMARY KEY keywords. When you define a primary key constraint out of line, you must also specify one or more columns. You must define a composite primary key out of line.

To satisfy a primary key constraint:

1. No primary key value can appear in more than one row in the table.

2. No column that is part of the primary key can contain a null.

When you create a primary key constraint:
• Oracle Database uses an existing index if it contains a unique set of values before enforcing the primary key constraint. The existing index can be defined as unique or nonunique. When a DML operation is performed, the primary key constraint is enforced using this existing index.

• If no existing index can be used, then Oracle Database generates a unique index.

When you drop a primary key constraint:
• If the primary key was created using an existing index, then the index is not dropped.
• If the primary key was created using a system-generated index, then the index is dropped.

When you designate an extended data type column as an enabled primary key, you may receive a "maximum key length exceeded" error when Oracle tries to create the index to enforce uniqueness for the enabled constraint. See "Creating an Index on an Extended Data Type Column" for information on how to work around this issue.

Primary key constraints are sensitive to declared collations of their key columns. See Collation Sensitivity of Constraints for more details.

Restrictions on Primary Key Constraints

Primary constraints are subject to the following restrictions:
• A table or view can have only one primary key.
• None of the columns in the primary key can be LOB, LONG, LONG RAW, VARRAY, NESTED TABLE, BFILE, REF, TIMESTAMP WITH TIME ZONE, or user-defined type. However, the primary key can contain a column of TIMESTAMP WITH LOCAL TIME ZONE.
• The size of the primary key cannot exceed approximately one database block.
• A composite primary key cannot have more than 32 columns.
• You cannot designate the same column or combination of columns as both a primary key and a unique key.
• You cannot specify a primary key when creating a subview in an inheritance hierarchy. The primary key can be specified only for the top-level (root) view.
• When you specify a primary key constraint for an external table, you must specify the RELY and DISABLE constraint states. See External Table Constraints for more information.

"Primary Key Example" and "Composite Primary Key Example"

Foreign Key Constraints

A foreign key constraint (also called a referential integrity constraint) designates a column as the foreign key and establishes a relationship between that foreign key and a specified primary or unique key, called the referenced key. A composite foreign key designates a combination of columns as the foreign key.
The table or view containing the foreign key is called the child object, and the table or view containing the referenced key is called the parent object. The foreign key and the referenced key can be in the same table or view. In this case, the parent and child tables are the same. If you identify only the parent table or view and omit the column name, then the foreign key automatically references the primary key of the parent table or view. The corresponding column or columns of the foreign key and the referenced key must match in order, data types, and declared collations.

Foreign key constraints are sensitive to declared collations of the referenced primary or unique key columns. See Collation Sensitivity of Constraints for more details.

You can define a foreign key constraint on a single key column either inline or out of line. You must specify a composite foreign key and a foreign key on an attribute out of line.

To satisfy a composite foreign key constraint, the composite foreign key must refer to a composite unique key or a composite primary key in the parent table or view, or the value of at least one of the columns of the foreign key must be null.

You can designate the same column or combination of columns as both a foreign key and a primary or unique key. You can also designate the same column or combination of columns as both a foreign key and a cluster key.

You can define multiple foreign keys in a table or view. Also, a single column can be part of more than one foreign key.

**Restrictions on Foreign Key Constraints**

Foreign key constraints are subject to the following restrictions:

- None of the columns in the foreign key can be of LOB, LONG, LONG RAW, VARRAY, NESTED TABLE, BFILE, REF, TIMESTAMP WITH TIME ZONE, or user-defined type. However, the primary key can contain a column of TIMESTAMP WITH LOCAL TIME ZONE.

- The referenced unique or primary key constraint on the parent table or view must already be defined.

- A composite foreign key cannot have more than 32 columns.

- The child and parent tables must be on the same database. To enable referential integrity constraints across nodes of a distributed database, you must use database triggers. See CREATE TRIGGER.

- If either the child or parent object is a view, then the constraint is subject to all restrictions on view constraints. See "View Constraints".

- You cannot define a foreign key constraint in a CREATE TABLE statement that contains an AS subquery clause. Instead, you must create the table without the constraint and then add it later with an ALTER TABLE statement.

- When a table has a foreign key, and the parent of the foreign key is an index-organized table, a session that updates a row that contains the foreign key can hang when another session is updating a non-key column in the parent table.

- When you specify a foreign key constraint for an external table, you must specify the RELY and DISABLE constraint states. See External Table Constraints for more information.
Foreign key constraints use the `references_clause` syntax. When you specify a foreign key constraint inline, you need only the `references_clause`. When you specify a foreign key constraint out of line, you must also specify the `FOREIGN KEY` keywords and one or more columns.

**ON DELETE Clause**

The `ON DELETE` clause lets you determine how Oracle Database automatically maintains referential integrity if you remove a referenced primary or unique key value. If you omit this clause, then Oracle does not allow you to delete referenced key values in the parent table that have dependent rows in the child table.

- Specify `CASCADE` if you want Oracle to remove dependent foreign key values.
- Specify `SET NULL` if you want Oracle to convert dependent foreign key values to `NULL`. You cannot specify this clause for a virtual column, because the values in a virtual column cannot be updated directly. Rather, the values from which the virtual column are derived must be updated.

**Restriction on ON DELETE**

You cannot specify this clause for a view constraint.

A **check constraint** lets you specify a condition that each row in the table must satisfy. To satisfy the constraint, each row in the table must make the condition either `TRUE` or unknown (due to a null). When Oracle evaluates a check constraint condition for a particular row, any column names in the condition refer to the column values in that row.

The syntax for inline and out-of-line specification of check constraints is the same. However, inline specification can refer only to the column (or the attributes of the column if it is an object column) currently being defined, whereas out-of-line specification can refer to multiple columns or attributes.

Oracle does not verify that conditions of check constraints are not mutually exclusive. Therefore, if you create multiple check constraints for a column, design them carefully.
so their purposes do not conflict. Do not assume any particular order of evaluation of the conditions.

If the condition of a check constraint depends on NLS parameters, such as NLS_DATE_FORMAT, Oracle evaluates the condition using the database values of the parameters, not the session values. You can find the database values of the NLS parameters in the data dictionary view NLS_DATABASE_PARAMETERS. These values are associated with a database by the DDL statement CREATE DATABASE and never change afterwards.

See Also:

- Conditions for additional information and syntax
- “Check Constraint Examples” and “Attribute-Level Constraints Example”

Restrictions on Check Constraints

Check constraints are subject to the following restrictions:

- You cannot specify a check constraint for a view. However, you can define the view using the WITH CHECK OPTION clause, which is equivalent to specifying a check constraint for the view.
- The condition of a check constraint can refer to any column in the table, but it cannot refer to columns of other tables.
- Conditions of check constraints cannot contain the following constructs:
  - Subqueries and scalar subquery expressions
  - Calls to the functions that are not deterministic (CURRENT_DATE, CURRENT_TIMESTAMP, DBTIMEZONE, LOCALTIMESTAMP, SESSIONTIMEZONE, SYSDATE, SYSTIMESTAMP, UID, USER, and USERENV)
  - Calls to user-defined functions
  - Dereferencing of REF columns (for example, using the DEREF function)
  - Nested table columns or attributes
  - The pseudocolumns CURRVAL, NEXTVAL, LEVEL, or ROWNUM
  - Date constants that are not fully specified
  - You cannot specify a check constraint for an external table.

REF Constraints

REF constraints let you describe the relationship between a column of type REF and the object it references.

ref_constraint

REF constraints use the ref_constraint syntax. You define a REF constraint either inline or out of line. Out-of-line specification requires you to specify the REF column or attribute you are further describing.

- For ref_column, specify the name of a REF column of an object or relational table.
• For ref_attribute, specify an embedded REF attribute within an object column of a relational table.

Both inline and out-of-line specification let you define a scope constraint, a rowid constraint, or a referential integrity constraint on a REF column.

If the scope table or referenced table of the REF column has a primary-key-based object identifier, then the REF column is a user-defined REF column.

See Also:

• Oracle Database Object-Relational Developer's Guide for more information on REF data types
• "Foreign Key Constraints", and "REF Constraint Examples"

SCOPE REF Constraints

In a table with a REF column, each REF value in the column can conceivably reference a row in a different object table. The SCOPE clause restricts the scope of references to a single table, scope_table. The values in the REF column or attribute point to objects in scope_table, in which object instances of the same type as the REF column are stored.

Specify the SCOPE clause to restrict the scope of references in the REF column to a single table. For you to specify this clause, scope_table must be in your own schema, or you must have the READ or SELECT privilege on scope_table, or you must have the READ ANY TABLE or SELECT ANY TABLE system privilege. You can specify only one scope table for each REF column.

Restrictions on Scope Constraints

Scope constraints are subject to the following restrictions:

• You cannot add a scope constraint to an existing column unless the table is empty.
• You cannot specify a scope constraint for the REF elements of a VARRAY column.
• You must specify this clause if you specify AS subquery and the subquery returns user-defined REF data types.
• You cannot subsequently drop a scope constraint from a REF column.
• You cannot specify a scope constraint for an external table.

Rowid REF Constraints

Specify WITH ROWID to store the rowid along with the REF value in ref_column or ref_attribute. Storing the rowid with the REF value can improve the performance of dereferencing operations, but will also use more space. Default storage of REF values is without rowids.
Restrictions on Rowid Constraints

Rowid constraints are subject to the following restrictions:

- You cannot define a rowid constraint for the `REF` elements of a `VARRAY` column.
- You cannot subsequently drop a rowid constraint from a `REF` column.
- If the `REF` column or attribute is scoped, then this clause is ignored and the rowid is not stored with the `REF` value.
- You cannot specify a rowid constraint for an external table.

Referential Integrity Constraints on REF Columns

The `references_clause` of the `ref_constraint` syntax lets you define a foreign key constraint on the `REF` column. This clause also implicitly restricts the scope of the `REF` column or attribute to the referenced table. However, whereas a foreign key constraint on a non-`REF` column references an actual column in the parent table, a foreign key constraint on a `REF` column references the implicit object identifier column of the parent table.

If you do not specify a constraint name, then Oracle generates a system name for the constraint of the form `SYS_Cn`.

If you add a referential integrity constraint to an existing `REF` column that is already scoped, then the referenced table must be the same as the scope table of the `REF` column. If you later drop the referential integrity constraint, then the `REF` column will remain scoped to the referenced table.

As is the case for foreign key constraints on other types of columns, you can use the `references_clause` alone for inline declaration. For out-of-line declaration you must also specify the `FOREIGN KEY` keywords plus one or more `REF` columns or attributes.

Restrictions on Foreign Key Constraints on REF Columns

Foreign key constraints on `REF` columns have the following additional restrictions:

- Oracle implicitly adds a scope constraint when you add a referential integrity constraint to an existing unscoped `REF` column. Therefore, all the restrictions that apply for scope constraints also apply in this case.
- You cannot specify a column after the object name in the `references_clause`.
Collation Sensitivity of Constraints

Starting with Oracle Database 12c Release 2 (12.2), primary key, unique, and foreign key constraints are sensitive to declared collations of their key columns. A primary or unique key character column value from a new or updated row is compared with values in existing rows using the declared collation of the key column. For example, if the declared collation of the key column is the case-insensitive collation BINARY_CI, a new or updated row may be rejected if the new key column value differs from some existing key value only by case. The collation BINARY_CI treats character values differing only by case as equal.

A foreign key character column value is compared to parent primary or unique key column values using the declared collation of the parent key column. For example, if the declared collation of the key column is the case-insensitive collation BINARY_CI, a new or updated child row may be accepted even if there is no identical parent key value for the corresponding foreign key value, provided there exists a value differing only by case.

The declared collation of a foreign key column must be the same as the collation of the corresponding parent key column.

Columns in a composite key of a constraint may have different declared collations.

When the declared collation of a key column of a constraint is a pseudo-collation, the constraint uses a corresponding variant of the collation BINARY. Pseudo-collations cannot be used directly to compare values for a constraint, because constraints are static and cannot depend on session NLS parameters on which the pseudo-collations depend. Therefore:

- The pseudo-collations USING_NLS_COMP, USING_NLS_SORT, and USING_NLS_SORT_CS use the collation BINARY.
- The pseudo-collation USING_NLS_COMP_CI uses the collation BINARY_CI.
- The pseudo-collation USING_NLS_COMP_AI uses the collation BINARY_AI.

When the effective collation used by a primary or unique key column is not BINARY, Oracle creates a hidden virtual column for this column. The expression of the virtual column calculates collation keys for character values of the original key column. The primary key or unique constraint is internally created on the virtual column instead of the original column. The virtual column is visible in the data dictionary views of the *_TAB_COLS family. For each of these hidden virtual columns, the COLLATED_COLUMN_ID of the *_TAB_COLS views contains the internal sequence number pointing to the corresponding original key column. The hidden virtual columns count to the 1000-column limit of a table.

Specifying Constraint State

As part of constraint definition, you can specify how and when Oracle should enforce the constraint.

constraint_state

You can use constraint_state with both inline and out-of-line specification. Except for the clauses DEFERRABLE and INITIALLY, that may be specified in any order, you must specify the rest of the component clauses in the order shown, and each clause only once.

DEFERRABLE Clause

The DEFERRABLE and NOT DEFERRABLE parameters indicate whether or not, in subsequent transactions, constraint checking can be deferred until the end of the transaction using the SET CONSTRAINT[S] statement. If you omit this clause, then the default is NOT DEFERRABLE.

- Specify NOT DEFERRABLE to indicate that in subsequent transactions you cannot use the SET CONSTRAINT[S] clause to defer checking of this constraint until the transaction is committed. The checking of a NOT DEFERRABLE constraint can never be deferred to the end of the transaction.

  If you declare a new constraint NOT DEFERRABLE, then it must be valid at the time the CREATE TABLE or ALTER TABLE statement is committed or the statement will fail.

- Specify DEFERRABLE to indicate that in subsequent transactions you can use the SET CONSTRAINT[S] clause to defer checking of this constraint until a COMMIT statement is submitted. If the constraint check fails, then the database returns an error and the transaction is not committed. This setting in effect lets you disable the constraint temporarily while making changes to the database that might violate the constraint until all the changes are complete.

  Note:

  The optimizer does not consider indexes on deferrable constraints as usable.

You cannot alter the deferrability of a constraint. Whether you specify either of these parameters, or make the constraint NOT DEFERRABLE implicitly by specifying neither of them, you cannot specify this clause in an ALTER TABLE statement. You must drop the constraint and re-create it.
Restriction on [NOT] DEFERRABLE

You cannot specify either of these parameters for a view constraint.

INITIALLY Clause

The INITIALY clause establishes the default checking behavior for constraints that are DEFERRABLE. The INITIALY setting can be overridden by a SET CONSTRAINT(s) statement in a subsequent transaction.

- Specify INITIALY IMMEDIATE to indicate that Oracle should check this constraint at the end of each subsequent SQL statement. If you do not specify INITIALY at all, then the default is INITIALY IMMEDIATE.

  If you declare a new constraint INITIALY IMMEDIATE, then it must be valid at the time the CREATE TABLE or ALTER TABLE statement is committed or the statement will fail.

- Specify INITIALY DEFERRED to indicate that Oracle should check this constraint at the end of subsequent transactions.

This clause is not valid if you have declared the constraint to be NOT DEFERRABLE, because a NOT DEFERRABLE constraint is automatically INITIALY IMMEDIATE and cannot ever be INITIALY DEFERRED.

RELY Clause

The RELY and NORELY parameters specify whether a constraint in NOVALIDATE mode is to be taken into account for query rewrite. Specify RELY to activate a constraint in NOVALIDATE mode for query rewrite in an unenforced query rewrite integrity mode. The constraint is in NOVALIDATE mode, so Oracle does not enforce it. The default is NORELY.

Unenforced constraints are generally useful only with materialized views and query rewrite. Depending on the QUERY_REWRITE_INTEGRITY mode, query rewrite can use only constraints that are in VALIDATE mode, or that are in NOVALIDATE mode with the RELY parameter set, to determine join information.

Restriction on the RELY Clause

You cannot set a nondeferrable NOT NULL constraint to RELY.
Using Indexes to Enforce Constraints

When defining the state of a unique or primary key constraint, you can specify an index for Oracle to use to enforce the constraint, or you can instruct Oracle to create the index used to enforce the constraint.

**using_index_clause**

You can specify the `using_index_clause` only when enabling unique or primary key constraints. You can specify the clauses of the `using_index_clause` in any order, but you can specify each clause only once.

- If you specify `schema.index`, then Oracle attempts to enforce the constraint using the specified index. If Oracle cannot find the index or cannot use the index to enforce the constraint, then Oracle returns an error.
- If you specify the `create_index_statement`, then Oracle attempts to create the index and use it to enforce the constraint. If Oracle cannot create the index or cannot use the index to enforce the constraint, then Oracle returns an error.
- If you neither specify an existing index nor create a new index, then Oracle creates the index. In this case:
  - The index receives the same name as the constraint.
  - If table is partitioned, then you can specify a locally or globally partitioned index for the unique or primary key constraint.

**Restrictions on the using_index_clause**

The following restrictions apply to the `using_index_clause`:

- You cannot specify this clause for a view constraint.
- You cannot specify this clause for a NOT NULL, foreign key, or check constraint.
- You cannot specify an index (`schema.index`) or create an index (`create_index_statement`) when enabling the primary key of an index-organized table.
- You cannot specify the `parallel_clause` of `index_attributes`.
- The `INDEXTYPE IS ...` clause of `index_properties` is not valid in the definition of a constraint.

- "Explicit Index Control Example"

**ENABLE Clause**

Specify `ENABLE` if you want the constraint to be applied to the data in the table.

If you enable a unique or primary key constraint, and if no index exists on the key, then Oracle Database creates a unique index. Unless you specify `KEEP INDEX` when subsequently disabling the constraint, this index is dropped and the database rebuilds the index every time the constraint is reenabled.

You can also avoid rebuilding the index and eliminate redundant indexes by creating new primary key and unique constraints initially disabled. Then create (or use existing) nonunique indexes to enforce the constraint. Oracle does not drop a nonunique index when the constraint is disabled, so subsequent `ENABLE` operations are facilitated.

- `ENABLE VALIDATE` specifies that all old and new data also complies with the constraint. An enabled validated constraint guarantees that all data is and will continue to be valid.

  If any row in the table violates the integrity constraint, then the constraint remains disabled and Oracle returns an error. If all rows comply with the constraint, then Oracle enables the constraint. Subsequently, if new data violates the constraint, then Oracle does not execute the statement and returns an error indicating the integrity constraint violation.

  If you place a primary key constraint in `ENABLE VALIDATE` mode, then the validation process will verify that the primary key columns contain no nulls. To avoid this overhead, mark each column in the primary key `NOT NULL` before entering data into the column and before enabling the primary key constraint of the table.

- `ENABLE NOVALIDATE` ensures that all new DML operations on the constrained data comply with the constraint. This clause does not ensure that existing data in the table complies with the constraint.

  If you specify neither `VALIDATE` nor `NOVALIDATE`, then the default is `VALIDATE`.

  If you change the state of any single constraint from `ENABLE NOVALIDATE` to `ENABLE VALIDATE`, then the operation can be performed in parallel, and does not block reads, writes, or other DDL operations.

**Restriction on the ENABLE Clause**

You cannot enable a foreign key that references a disabled unique or primary key.
DISABLE Clause

Specify **DISABLE** to disable the integrity constraint. Disabled integrity constraints appear in the data dictionary along with enabled constraints. If you do not specify this clause when creating a constraint, then Oracle automatically enables the constraint.

- **DISABLE VALIDATE** disables the constraint and drops the index on the constraint, but keeps the constraint valid. This feature is most useful in data warehousing situations, because it lets you load large amounts of data while also saving space by not having an index. This setting lets you load data from a nonpartitioned table into a partitioned table using the `exchange_partition_subpart` clause of the `ALTER TABLE` statement or using SQL*Loader. All other modifications to the table (inserts, updates, and deletes) by other SQL statements are disallowed.

---

**See Also:**

*Oracle Database Data Warehousing Guide* for more information on using this setting

- **DISABLE NOVALIDATE** signifies that Oracle makes no effort to maintain the constraint (because it is disabled) and cannot guarantee that the constraint is true (because it is not being validated).

You cannot drop a table whose primary key is being referenced by a foreign key even if the foreign key constraint is in **DISABLE NOVALIDATE** state. Further, the optimizer can use constraints in **DISABLE NOVALIDATE** state.

---

**See Also:**

*Oracle Database SQL Tuning Guide* for information on when to use this setting

If you specify neither **VALIDATE** nor **NOVALIDATE**, then the default is **NOVALIDATE**.

If you disable a unique or primary key constraint that is using a unique index, then Oracle drops the unique index. Refer to the `CREATE TABLE enable_disable_clause` for additional notes and restrictions.

VALIDATE | NOVALIDATE

The behavior of **VALIDATE** and **NOVALIDATE** depends on whether the constraint is enabled or disabled, either explicitly or by default.

**Note on Foreign Key Constraints in NOVALIDATE Mode**

When a foreign key constraint is in **NOVALIDATE** mode, if existing data in the table does not comply with the constraint and the `QUERY_REWRITE_INTEGRITY` parameter is not set to **ENFORCED**, then the optimizer may use join elimination during queries on the table. In this case, a query may return table rows with noncompliant foreign key values even if the query contains a join condition that should filter out those rows.
Handling Constraint Exceptions

When defining the state of a constraint, you can specify a table into which Oracle places the rowids of all rows violating the constraint.

`exceptions_clause`

Use the `exceptions_clause` syntax to define exception handling. If you omit `schema`, then Oracle assumes the exceptions table is in your own schema. If you omit this clause altogether, then Oracle assumes that the table is named `EXCEPTIONS`. The `EXCEPTIONS` table or the table you specify must exist on your local database.

You can create the `EXCEPTIONS` table using one of these scripts:

- `UTLEXCPT.SQL` uses physical rowids. Therefore it can accommodate rows from conventional tables but not from index-organized tables. (See the Note that follows.)
- `UTLEXPT1.SQL` uses universal rowids, so it can accommodate rows from both conventional and index-organized tables.

If you create your own exceptions table, then it must follow the format prescribed by one of these two scripts.

If you are collecting exceptions from index-organized tables based on primary keys (rather than universal rowids), then you must create a separate exceptions table for each index-organized table to accommodate its primary-key storage. You create multiple exceptions tables with different names by modifying and resubmitting the script.

Restrictions on the `exceptions_clause`

The following restrictions apply to the `exceptions_clause`:

- You cannot specify this clause for a view constraint.
- You cannot specify this clause in a `CREATE TABLE` statement, because no rowids exist until after the successful completion of the statement.

See Also:

- The `DBMS_IOT` package in *Oracle Database PL/SQL Packages and Types Reference* for information on the SQL scripts

View Constraints

Oracle does not enforce view constraints. However, operations on views are subject to the integrity constraints defined on the underlying base tables. This means that you can enforce constraints on views through constraints on base tables.

Notes on View Constraints

View constraints are a subset of table constraints and are subject to the following restrictions:
You can specify only unique, primary key, and foreign key constraints on views. However, you can define the view using the WITH CHECK OPTION clause, which is equivalent to specifying a check constraint for the view.

View constraints are supported only in DISABLE NOVALIDATE mode. You cannot specify any other mode. You must specify the keyword DISABLE when you declare the view constraint. You need not specify NOVALIDATE explicitly, as it is the default.

The RELY and NORELY parameters are optional. View constraints, because they are unenforced, are usually specified with the RELY parameter to make them more useful. The RELY or NORELY keyword must precede the DISABLE keyword.

Because view constraints are not enforced directly, you cannot specify INITIALLY DEFERRED or DEFERRABLE.

You cannot specify the using_index_clause, the exceptions_clause clause, or the ON DELETE clause of the references_clause.

You cannot define view constraints on attributes of an object column.

External Table Constraints

Starting with Oracle Database 12c Release 2 (12.2), you can specify NOT NULL, unique, primary key, and foreign key constraints on external tables.

NOT NULL constraints on external tables are enforced and prohibit columns from containing nulls.

Unique, primary key, and foreign key constraints are supported on external tables only in RELY DISABLE mode. You must specify the keywords RELY and DISABLE when you create these constraints. These constraints are declarative and are not enforced. They can increase query performance and reduce resource consumption because more optimizer transformations can be taken into account. In order for the optimizer to utilize these RELY DISABLE constraints, the QUERY_REWRITE_INTEGRITY initialization parameter must be set to either trusted or stale_tolerated.

Examples

Unique Key Example

The following statement is a variation of the statement that created the sample table sh.promotions. It defines inline and implicitly enables a unique key on the promo_id column (other constraints are not shown):

```sql
CREATE TABLE promotions_var1
( promo_id NUMBER(6) CONSTRAINT promo_id_u  UNIQUE,
  promo_name VARCHAR2(20),
  promo_category VARCHAR2(15),
  promo_cost NUMBER(10,2),
  promo_begin_date DATE,
  promo_end_date   DATE
) ;
```

The constraint promo_id_u identifies the promo_id column as a unique key. This constraint ensures that no two promotions in the table have the same ID. However, the constraint does allow promotions without identifiers.

Alternatively, you can define and enable this constraint out of line:
CREATE TABLE promotions_var2
  ( promo_id         NUMBER(6)
    , promo_name       VARCHAR2(20)
    , promo_category   VARCHAR2(15)
    , promo_cost       NUMBER(10,2)
    , promo_begin_date DATE
    , promo_end_date   DATE
    , CONSTRAINT promo_id_u UNIQUE (promo_id)
  ) USING INDEX PCTFREE 20
  TABLESPACE stocks
  STORAGE (INITIAL 8M) );

The preceding statement also contains the using_index_clause, which specifies storage characteristics for the index that Oracle creates to enable the constraint.

Composite Unique Key Example

The following statement defines and enables a composite unique key on the combination of the warehouse_id and warehouse_name columns of the oe.warehouses table:

ALTER TABLE warehouses
  ADD CONSTRAINT wh_unq UNIQUE (warehouse_id, warehouse_name)
  USING INDEX PCTFREE 5
  EXCEPTIONS INTO wrong_id;

The wh_unq constraint ensures that the same combination of warehouse_id and warehouse_name values does not appear in the table more than once.

The ADD CONSTRAINT clause also specifies other properties of the constraint:

- The USING INDEX clause specifies storage characteristics for the index Oracle creates to enable the constraint.
- The EXCEPTIONS INTO clause causes Oracle to write to the wrong_id table information about any rows currently in the warehouses table that violate the constraint. If the wrong_id exceptions table does not already exist, then this statement will fail.

Primary Key Example

The following statement is a variation of the statement that created the sample table hr.locations. It creates the locations_demo table and defines and enables a primary key on the location_id column (other constraints from the hr.locations table are omitted):

CREATE TABLE locations_demo
  ( location_id    NUMBER(4) CONSTRAINT loc_id_pk PRIMARY KEY
    , street_address VARCHAR2(40)
    , postal_code    VARCHAR2(12)
    , city           VARCHAR2(30)
    , state_province VARCHAR2(25)
    , country_id     CHAR(2)
  ) ;

The loc_id_pk constraint, specified inline, identifies the location_id column as the primary key of the locations_demo table. This constraint ensures that no two locations in the table have the same location number and that no location identifier is NULL.

Alternatively, you can define and enable this constraint out of line:
CREATE TABLE locations_demo
( location_id NUMBER(4)
, street_address VARCHAR2(40)
, postal_code VARCHAR2(12)
, city VARCHAR2(30)
, state_province VARCHAR2(25)
, country_id CHAR(2)
, CONSTRAINT loc_id_pk PRIMARY KEY (location_id));

NOT NULL Example

The following statement alters the locations_demo table (created in "Primary Key Example") to define and enable a NOT NULL constraint on the country_id column:

ALTER TABLE locations_demo
MODIFY (country_id CONSTRAINT country_nn NOT NULL);

The constraint country_nn ensures that no location in the table has a null country_id.

Composite Primary Key Example

The following statement defines a composite primary key on the combination of the prod_id and cust_id columns of the sample table sh.sales:

ALTER TABLE sales
ADD CONSTRAINT sales_pk PRIMARY KEY (prod_id, cust_id) DISABLE;

This constraint identifies the combination of the prod_id and cust_id columns as the primary key of the sales table. The constraint ensures that no two rows in the table have the same combination of values for the prod_id column and cust_id columns.

The constraint clause (PRIMARY KEY) also specifies the following properties of the constraint:

- The constraint definition does not include a constraint name, so Oracle generates a name for the constraint.
- The DISABLE clause causes Oracle to define the constraint but not enable it.

Foreign Key Constraint Example

The following statement creates the dept_20 table and defines and enables a foreign key on the department_id column that references the primary key on the department_id column of the departments table:

CREATE TABLE dept_20
(employee_id NUMBER(4),
last_name VARCHAR2(10),
job_id VARCHAR2(9),
manager_id NUMBER(4),
hire_date DATE,
salary NUMBER(7,2),
commission_pct NUMBER(7,2),
department_id CONSTRAINT fk_deptno
REFERENCES departments(department_id) );

The constraint fk_deptno ensures that all departments given for employees in the dept_20 table are present in the departments table. However, employees can have null department numbers, meaning they are not assigned to any department. To ensure that all employees are assigned to a department, you could create a NOT NULL
constraint on the department_id column in the dept_20 table in addition to the REFERENCES constraint.

Before you define and enable this constraint, you must define and enable a constraint that designates the department_id column of the departments table as a primary or unique key.

The foreign key constraint definition does not use the FOREIGN KEY clause, because the constraint is defined inline. The data type of the department_id column is not needed, because Oracle automatically assigns to this column the data type of the referenced key.

The constraint definition identifies both the parent table and the columns of the referenced key. Because the referenced key is the primary key of the parent table, the referenced key column names are optional.

Alternatively, you can define this foreign key constraint out of line:

```sql
CREATE TABLE dept_20
(
  employee_id     NUMBER(4),
  last_name       VARCHAR2(10),
  job_id          VARCHAR2(9),
  manager_id      NUMBER(4),
  hire_date       DATE,
  salary          NUMBER(7,2),
  commission_pct  NUMBER(7,2),
  department_id,
  CONSTRAINT fk_deptno
    FOREIGN KEY (department_id)
    REFERENCES departments(department_id) );
```

The foreign key definitions in both variations of this statement omit the ON DELETE clause, causing Oracle to prevent the deletion of a department if any employee works in that department.

ON DELETE Example

This statement creates the dept_20 table, defines and enables two referential integrity constraints, and uses the ON DELETE clause:

```sql
CREATE TABLE dept_20
(
  employee_id     NUMBER(4) PRIMARY KEY,
  last_name       VARCHAR2(10),
  job_id          VARCHAR2(9),
  manager_id      NUMBER(4) CONSTRAINT fk_mgr
    REFERENCES employees ON DELETE SET NULL,
  hire_date       DATE,
  salary          NUMBER(7,2),
  commission_pct  NUMBER(7,2),
  department_id   NUMBER(2)   CONSTRAINT fk_deptno
    REFERENCES departments(department_id)
    ON DELETE CASCADE );
```

Because of the first ON DELETE clause, if manager number 2332 is deleted from the employees table, then Oracle sets to null the value of manager_id for all employees in the dept_20 table who previously had manager 2332.

Because of the second ON DELETE clause, Oracle cascades any deletion of a department_id value in the departments table to the department_id values of its dependent rows of the dept_20 table. For example, if Department 20 is deleted from
the departments table, then Oracle deletes all of the employees in Department 20 from the dept_20 table.

Composite Foreign Key Constraint Example

The following statement defines and enables a foreign key on the combination of the employee_id and hire_date columns of the dept_20 table:

```
ALTER TABLE dept_20
  ADD CONSTRAINT fk_empid_hiredate
  FOREIGN KEY (employee_id, hire_date)
  REFERENCES hr.job_history(employee_id, start_date)
  EXCEPTIONS INTO wrong_emp;
```

The constraint fk_empid_hiredate ensures that all the employees in the dept_20 table have employee_id and hire_date combinations that exist in the employees table. Before you define and enable this constraint, you must define and enable a constraint that designates the combination of the employee_id and hire_date columns of the employees table as a primary or unique key.

The EXCEPTIONS INTO clause causes Oracle to write information to the wrong_emp table about any rows in the dept_20 table that violate the constraint. If the wrong_emp exceptions table does not already exist, then this statement will fail.

Check Constraint Examples

The following statement creates a divisions table and defines a check constraint in each column of the table:

```
CREATE TABLE divisions
  (div_no    NUMBER  CONSTRAINT check_divno
   CHECK (div_no BETWEEN 10 AND 99)
   DISABLE,
  div_name  VARCHAR2(9)  CONSTRAINT check_divname
   CHECK (div_name = UPPER(div_name))
   DISABLE,
  office    VARCHAR2(10)  CONSTRAINT check_office
   CHECK (office IN ('DALLAS','BOSTON','PARIS','TOKYO'))
   DISABLE);
```

Each constraint restricts the values of the column in which it is defined:

- check_divno ensures that no division numbers are less than 10 or greater than 99.
- check_divname ensures that all division names are in uppercase.
- check_office restricts office locations to Dallas, Boston, Paris, or Tokyo.

Because each CONSTRAINT clause contains the DISABLE clause, Oracle only defines the constraints and does not enable them.

The following statement creates the dept_20 table, defining out of line and implicitly enabling a check constraint:

```
CREATE TABLE dept_20
  (employee_id     NUMBER(4) PRIMARY KEY,
  last_name       VARCHAR2(10),
  job_id          VARCHAR2(9),
  manager_id      NUMBER(4),
  salary          NUMBER(7,2),
  commission_pct  NUMBER(7,2),
```

This constraint uses an inequality condition to limit an employee's total commission, the product of salary and commission_pct, to $5000:

- If an employee has non-null values for both salary and commission, then the product of these values must not exceed $5000 to satisfy the constraint.
- If an employee has a null salary or commission, then the result of the condition is unknown and the employee automatically satisfies the constraint.

Because the constraint clause in this example does not supply a constraint name, Oracle generates a name for the constraint.

The following statement defines and enables a primary key constraint, two foreign key constraints, a NOT NULL constraint, and two check constraints:

```sql
CREATE TABLE order_detail
  (CONSTRAINT pk_od PRIMARY KEY (order_id, part_no),
   order_id    NUMBER
   CONSTRAINT fk_oid
                   REFERENCES oe.orders(order_id),
   part_no     NUMBER
   CONSTRAINT fk_pno
                   REFERENCES oe.product_information(product_id),
   quantity    NUMBER
   CONSTRAINT nn_qty NOT NULL
   CONSTRAINT check_qty CHECK (quantity > 0),
   cost        NUMBER
   CONSTRAINT check_cost CHECK (cost > 0) );
```

The constraints enable the following rules on table data:

- **pk_od** identifies the combination of the order_id and part_no columns as the primary key of the table. To satisfy this constraint, no two rows in the table can contain the same combination of values in the order_id and the part_no columns, and no row in the table can have a null in either the order_id or the part_no column.

- **fk_oid** identifies the order_id column as a foreign key that references the order_id column in the orders table in the sample schema oe. All new values added to the column order_detail.order_id must already appear in the column oe.orders.order_id.

- **fk_pno** identifies the product_id column as a foreign key that references the product_id column in the product_information table owned by oe. All new values added to the column order_detail.product_id must already appear in the column oe.product_information.product_id.

- **nn_qty** forbids nulls in the quantity column.

- **check_qty** ensures that values in the quantity column are always greater than zero.

- **check_cost** ensures the values in the cost column are always greater than zero.

This example also illustrates the following points about constraint clauses and column definitions:
Out-of-line constraint definition can appear before or after the column definitions. In this example, the out-of-line definition of the `pk_od` constraint precedes the column definitions.

A column definition can contain multiple inline constraint definitions. In this example, the definition of the `quantity` column contains the definitions of both the `nn_qty` and `check_qty` constraints.

A table can have multiple `CHECK` constraints. Multiple `CHECK` constraints, each with a simple condition enforcing a single business rule, are preferable to a single `CHECK` constraint with a complicated condition enforcing multiple business rules. When a constraint is violated, Oracle returns an error identifying the constraint. Such an error more precisely identifies the violated business rule if the identified constraint enables a single business rule.

Case-Insensitive Constraints Example

The following statements create two tables in a parent-child relationship. The parent table is a product description table and the child table is a product component description table. Unique constraints are defined to assure that product and description values are unambiguous. For illustrative purposes, the product and component ID are case-insensitive character values. (In real-world applications, primary key IDs are usually numeric or case-normalized.)

```sql
CREATE TABLE products
( product_id VARCHAR2(20) COLLATE BINARY_CI
  CONSTRAINT product_pk PRIMARY KEY,
  description VARCHAR2(1000) COLLATE BINARY_CI
  CONSTRAINT product_description_unq UNIQUE)
;
CREATE TABLE product_components
( component_id VARCHAR2(40) COLLATE BINARY_CI
  CONSTRAINT product_component_pk PRIMARY KEY,
  product_id CONSTRAINT product_component_fk REFERENCES products(product_id),
  description VARCHAR2(1000) COLLATE BINARY_CI
  CONSTRAINT product_component_descr_unq UNIQUE)
;
```

Note that if you do not specify the data type or the collation for a foreign key column, then they are inherited from the parent key column.

The following statements add a product and its components into the tables:

```sql
INSERT INTO products(product_id, description)
  VALUES('BICY0001', 'Men''s bicycle, fr 21", wh 24", gear 3x7');
INSERT INTO product_components(component_id, product_id, description)
  VALUES('BICY0001_FRAME01', 'BICY0001', 'Aluminium frame 21"');
INSERT INTO product_components(component_id, product_id, description)
  VALUES('BICY0001_WHEEL01', 'bicy0001', 'Wheels 24"');
INSERT INTO product_components(component_id, product_id, description)
  VALUES('BICY0001_GEAR01', 'Bicy0001', 'Front derailleur 3 chainrings');
INSERT INTO product_components(component_id, product_id, description)
  VALUES('BICY0001_GEAR02', 'BiCy0001', 'Rear derailleur 7 chainrings');
```

Note the different case of the product ID in different component rows. Because the primary key on the product ID is declared as case-insensitive, all possible letter case combinations of the same ID are considered equal.
The following statement demonstrates that it is not possible to enter another product with the same description differing only by case. It fails with the error ORA-00001: unique constraint (schema.PRODUCT_DESCRIPTION_UNQ) violated.

```
INSERT INTO products(product_id, description)
VALUES('BICY0002', 'MEN''S BICYCLE, fr 21", wh 24", gear 3x7');
```

Similarly, the following statement demonstrates that the primary key constraint of the product table is case-insensitive and does not allow values differing only by case. It fails with the error ORA-00001: unique constraint (schema.PRODUCT_PK) violated.

```
INSERT INTO products(component_id, product_id, description)
VALUES('bicy0001', 'Women''s bicycle, fr 21", wh 24", gear 2x6');
```

The following statement demonstrates that it is not possible to enter another component with the same description differing only by case. It fails with the error ORA-00001: unique constraint (schema.PRODUCT_COMPONENT_DESCR_UNQ) violated.

```
INSERT INTO product_components(component_id, product_id, description)
VALUES('BICY0001_gear03', 'BiCy0001', 'REAR DERAILLEUR 7 CHAINRINGS');
```

### Attribute-Level Constraints Example

The following example guarantees that a value exists for both the `first_name` and `last_name` attributes of the `name` column in the `students` table:

```
CREATE TYPE person_name AS OBJECT
  (first_name VARCHAR2(30), last_name VARCHAR2(30));
/
CREATE TABLE students (name person_name, age INTEGER,
  CHECK (name.first_name IS NOT NULL AND
         name.last_name IS NOT NULL));
```

### REF Constraint Examples

The following example creates a duplicate of the sample schema object type `cust_address_typ`, and then creates a table containing a `REF` column with a `SCOPE` constraint:

```
CREATE TYPE cust_address_typ_new AS OBJECT
  ( street_address VARCHAR2(40)
  , postal_code VARCHAR2(10)
  , city VARCHAR2(30)
  , state_province VARCHAR2(10)
  , country_id CHAR(2)
  );
/
CREATE TABLE address_table OF cust_address_typ_new;
CREATE TABLE customer_addresses (add_id NUMBER,
  address REF cust_address_typ_new
  SCOPE IS address_table);
```

The following example creates the same table but with a referential integrity constraint on the `REF` column that references the object identifier column of the parent table:

```
CREATE TABLE customer_addresses (add_id NUMBER,
  address REF cust_address_typ REFERENCES address_table);
```
The following example uses the type department_typ and the table departments_obj_t, created in "Creating Object Tables: Examples". A table with a scoped REF is then created.

```sql
CREATE TABLE employees_obj
  ( e_name   VARCHAR2(100),
    e_number NUMBER,
    e_dept   REF department_typ SCOPE IS departments_obj_t );
```

The following statement creates a table with a REF column which has a referential integrity constraint defined on it:

```sql
CREATE TABLE employees_obj
  ( e_name   VARCHAR2(100),
    e_number NUMBER,
    e_dept   REF department_typ REFERENCES departments_obj_t );
```

**Explicit Index Control Example**

The following statement shows another way to create a unique (or primary key) constraint that gives you explicit control over the index (or indexes) Oracle uses to enforce the constraint:

```sql
CREATE TABLE promotions_var3
  ( promo_id         NUMBER(6),
    promo_name       VARCHAR2(20),
    promo_category   VARCHAR2(15),
    promo_cost       NUMBER(10,2),
    promo_begin_date DATE,
    promo_end_date   DATE,
    CONSTRAINT promo_id_u UNIQUE (promo_id, promo_cost)
      USING INDEX (CREATE UNIQUE INDEX promo_ix1
        ON promotions_var3 (promo_id, promo_cost))
    , CONSTRAINT promo_id_u2 UNIQUE (promo_cost, promo_id)
      USING INDEX promo_ix1);
```

This example also shows that you can create an index for one constraint and use that index to create and enable another constraint in the same statement.

**DEFERRABLE Constraint Examples**

The following statement creates table games with a NOT DEFERRABLE INITIALLY IMMEDIATE constraint check (by default) on the scores column:

```sql
CREATE TABLE games (scores NUMBER CHECK (scores >= 0));
```

To define a unique constraint on a column as INITIALLY DEFERRED DEFERRABLE, issue the following statement:

```sql
CREATE TABLE games
  (scores NUMBER, CONSTRAINT unq_num UNIQUE (scores)
    INITIALLY DEFERRED DEFERRABLE);
```

### 8.3 deallocate_unused_clause

**Purpose**

Use the `deallocate_unused_clause` to explicitly deallocate unused space at the end of a database object segment and make the space available for other segments in the tablespace.
You can deallocate unused space using the following statements:

- **ALTER CLUSTER** (see ALTER CLUSTER)
- **ALTER INDEX**: to deallocate unused space from the index, an index partition, or an index subpartition (see ALTER INDEX)
- **ALTER MATERIALIZED VIEW**: to deallocate unused space from the overflow segment of an index-organized materialized view (see ALTER MATERIALIZED VIEW)
- **ALTER TABLE**: to deallocate unused space from the table, a table partition, a table subpartition, the mapping table of an index-organized table, the overflow segment of an index-organized table, or a LOB storage segment (see ALTER TABLE)

**Syntax**

```
deallocate_unused_clause ::=  
  DEALLOCATE UNUSED KEEP size_clause
```

**Semantics**

This section describes the semantics of the `dallocate_unused_clause`. For additional information, refer to the SQL statement in which you set or reset this clause for a particular database object.

You cannot specify both the deallocate_unused_clause and the allocate_extent_clause in the same statement.

Oracle Database frees only unused space above the high water mark (the point beyond which database blocks have not yet been formatted to receive data). Oracle deallocates unused space beginning from the end of the object and moving toward the beginning of the object to the high water mark.

If an extent is completely contained in the deallocation, then the whole extent is freed for reuse. If an extent is partially contained in the deallocation, then the used part up to the high water mark becomes the extent, and the remaining unused space is freed for reuse.

Oracle credits the amount of the released space to the user quota for the tablespace in which the deallocation occurs.

The exact amount of space freed depends on the values of the INITIAL, MINEXTENTS, and NEXT storage parameters. Refer to the storage_clause for a description of these parameters.

**KEEP integer**

Specify the number of bytes above the high water mark that the segment of the database object is to have after deallocation.

- If you omit KEEP and the high water mark is above the size of INITIAL and MINEXTENTS, then all unused space above the high water mark is freed. When the high water mark is less than the size of INITIAL or MINEXTENTS, then all unused space above MINEXTENTS is freed.
• If you specify **KEEP**, then the specified amount of space is kept and the remaining space is freed. When the remaining number of extents is less than **MINEXTENTS**, then Oracle adjusts **MINEXTENTS** to the new number of extents. If the initial extent becomes smaller than **INITIAL**, then Oracle adjusts **INITIAL** to the new size.

• In either case, Oracle sets the value of the **NEXT** storage parameter to the size of the last extent that was deallocated.

### 8.4 file_specification

**Purpose**

Use one of the *file_specification* forms to specify a file as a data file or temp file, or to specify a group of one or more files as a redo log file group. If you are storing your files in Oracle Automatic Storage Management (Oracle ASM) disk groups, then you can further specify the file as a disk group file.

A *file_specification* can appear in the following statements:

- CREATE CONTROLFILE (see CREATE CONTROLFILE)
- CREATE DATABASE (see CREATE DATABASE)
- ALTER DATABASE (see ALTER DATABASE)
- CREATE TABLESPACE (see CREATE TABLESPACE)
- ALTER TABLESPACE (see ALTER TABLESPACE)
- ALTER DISKGROUP (see ALTER DISKGROUP)

**Prerequisites**

You must have the privileges necessary to issue the statement in which the file specification appears.

**Syntax**

```
file_specification ::=  
```

```
datafile_tempfile_spec ::=  
```

```
filename
ASM_filename
SIZE size_clause
REUSE autoextend_clause
```

```
(size_clause ::=  
```

```
```

**Chapter 8**

**file_specification**

  maxsize_clause
```

**size_clause::=**

**maxsize_clause::=**

```
MAXSIZE
  UNLIMITED
  size_clause
```

Semantics

This section describes the semantics of *file_specification*. For additional information, refer to the SQL statement in which you specify a data file, temp file, redo log file, or Oracle ASM disk group or disk group file.

**datafile_tempfile_spec**

Use this clause to specify the attributes of data files and temp files if your database storage is in a file system or in Oracle ASM disk groups.

**redo_log_file_spec**

Use this clause to specify the attributes of redo log files if your database storage is in a file system or in Oracle ASM disk groups.

**filename**

Use *filename* for files stored in a file system. The *filename* can specify either a new file or an existing file. For a new file:

- If you are *not* using Oracle Managed Files, then you must specify both *filename* and the SIZE clause or the statement fails. When you specify a filename without a size, Oracle attempts to reuse an existing file and returns an error if the file does not exist.
- If you are using Oracle Managed Files, then *filename* is optional, as are the remaining clauses of the specification. In this case, Oracle Database creates a unique name for the file and saves it in the directory specified by one of the following initialization parameters:
  - The DB_RECOVERY_FILE_DEST (for logfiles and control files)
  - The DB_CREATE_FILE_DEST initialization parameter (for any type of file)
  - The DB_CREATE_ONLINE_LOG_DEST_n initialization parameter, which takes precedence over DB_CREATE_FILE_DEST and DB_RECOVERY_FILE_DEST for log files.
For an existing file, specify the name of either a data file, temp file, or a redo log file member. The filename can contain only single-byte characters from 7-bit ASCII or EBCDIC character sets. Multibyte characters are not valid.

The filename can include a path prefix. If you do not specify such a path prefix, then the database adds the path prefix for the default storage location, which is platform dependent.

A redo log file group can have one or more members (copies). Each filename must be fully specified according to the conventions for your operating system.

The way the database interprets filename also depends on whether you specify it with the SIZE and REUSE clauses.

- If you specify filename only, or with the REUSE clause but without the SIZE clause, then the file must already exist.
- If you specify filename with SIZE but without REUSE, then the file must be a new file.
- If you specify filename with both SIZE and REUSE, then the file can be either new or existing. If the file exists, then it is reused with the new size. If it does not exist, then the database ignores the REUSE keyword and creates a new file of the specified size.

ASM filename

Use a form of ASM filename for files stored in Oracle ASM disk groups. You can create or refer to data files, temp files, and redo log files with this syntax.

All forms of ASM filename begin with the plus sign (+) followed by the name of the disk group. You can determine the names of all Oracle ASM disk groups by querying the V$ASM_DISKGROUP view.

See Also:

Oracle Automatic Storage Management Administrator's Guide for information on using Oracle ASM

fully qualified file name

When you create a file in an Oracle ASM disk group, the file receives a system-generated fully qualified Oracle ASM filename. You can use this form only when referring to an existing Oracle ASM file. Therefore, if you are using this form during file creation, you must also specify REUSE.
• *db_name* is the value of the *DB_UNIQUE_NAME* initialization parameter. This name is equivalent to the name of the database on which the file resides, but the parameter distinguishes between primary and standby databases, if both exist.

• *file_type* and *file_type_tag* indicate the type of database file. Table 8-1 lists all of the file types and their corresponding Oracle ASM tags.

• *filenumber* and *incarnation_number* are system-generated identifiers to guarantee uniqueness.

You can determine the fully qualified names of Oracle ASM files by querying the dynamic performance view appropriate for the file type (for example *V$DATAFILE* for data files, *V$CONTROLFILE* for control files, and so on). You can also obtain the *filenumber* and *incarnation_number* portions of the fully qualified names by querying the *V$ASM_FILE* view.

</tr>
</tbody>
</table>

**numeric_file_name**

A numeric Oracle ASM filename is similar to a fully qualified filename except that it uses only the unique `filename.incarnation_number` string. You can use this form only to refer to an existing file. Therefore, if you are using this form during file creation, you must also specify `REUSE`.

**incomplete_file_name**

Incomplete Oracle ASM filenames are used during file creation only. If you specify the disk group name alone, then Oracle ASM uses the appropriate default template for the file type. For example, if you are creating a data file in a `CREATE TABLESPACE` statement, Oracle ASM uses the default `DATAFILE` template to create an Oracle ASM data file. If you specify the disk group name with a template, then Oracle ASM uses the specified template to create the file. In both cases, Oracle ASM also creates a fully qualified filename.

**template_name**

A template is a named collection of attributes. You can create templates and apply them to files in a disk group. You can determine the names of all Oracle ASM template names by querying the `V$ASM_TEMPLATE` data dictionary view. Refer to `diskgroup_template_clauses` for instructions on creating Oracle ASM templates.

You can specify `template` only during file creation. It appears in the incomplete and alias name forms of the `ASM_filename` diagram:

- If you specify `template` immediately after the disk group name, then Oracle ASM uses the specified template to create the file, and gives the file a fully qualified filename.
- If you specify `template` after specifying an alias, then Oracle ASM uses the specified template to create the file, gives the file a fully qualified filename, and also creates the alias so that you can subsequently use it to refer to the file. If the alias you specify refers to an existing file, then Oracle ASM ignores the template specification unless you also specify `REUSE`.

**See Also:**

`diskgroup_template_clauses` for information about the default templates.
**alias_file_name**

An alias is a user-friendly name for an Oracle ASM file. You can use alias filenames during file creation or reference. You can specify a template with an alias, but only during file creation. To determine the alias names for Oracle ASM files, query the V$ASM_ALIAS data dictionary view.

If you are specifying an alias during file creation, then refer to **diskgroup_directory_clauses** and **diskgroup_alias_clauses** for instructions on specifying the full alias name.

**SIZE Clause**

Specify the size of the file in bytes. Use K, M, G, or T to specify the size in kilobytes, megabytes, gigabytes, or terabytes.

- For undo tablespaces, you must specify the **SIZE** clause for each data file. For other tablespaces, you can omit this parameter if the file already exists, or if you are creating an Oracle Managed File.
- If you omit this clause when creating an Oracle Managed File, then Oracle creates a 100M file.
- The size of a tablespace must be one block greater than the sum of the sizes of the objects contained in it.

**See Also:**

*Oracle Database Administrator's Guide* for information on automatic undo management and undo tablespaces and "Adding a Log File: Example"

**BLOCKSIZE Clause**

Specify **BLOCKSIZE** to override the operating system-dependent sector size. If you omit this clause, then the database uses the operating system-dependent sector size as the block size.

When you add a redo log file to a 512-byte sector disk or to a 4KB sector disk with 512-byte emulation, the blocksize of the new file must be the original platform base block size or 4KB.

- If the redo log file is being added to a 512-byte sector disk, then you must specify 512 or 1024 (or 1K) as the block size, depending on your platform.
- If the redo log file is being added to a 4KB sector disk (native), then you must specify either 4096 or 4K as the block size.
- If the redo log file is being added to a 4KB sector disk with 512-byte emulation, then you can specify either 512, 1024 (or 1K), or 4096 (or 4K) as the block size, depending on your platform.

All logs within a log group must have the same block size. Two log groups created on separate disks can have different block sizes. However, the mixed configuration introduces overhead at every log switch. Oracle recommends that you create all log files with the same block size.
This clause is useful when the 4K sector size is in use, but you want to optimize disk space use rather than performance. In such a case you can override the operating system sector size by specifying `BLOCKSIZE 512` or, for HP-UX, `BLOCKSIZE 1024`.

See Also:

"Adding a Log File: Example"

REUSE

Specify `REUSE` to allow Oracle to reuse an existing file.

- If the file already exists, then Oracle reuses the filename and applies the new size (if you specify `SIZE`) or retains the original size.
- If the file does not exist, then Oracle ignores this clause and creates the file.

Restriction on the REUSE Clause

You cannot specify `REUSE` unless you have specified `filename`.

Whenever Oracle uses an existing file, the previous contents of the file are lost.

See Also:

"Adding a Data File: Example" and "Adding a Log File: Example"

autoextend_clause

The `autoextend_clause` is valid for data files and temp files but not for redo log files. Use this clause to enable or disable the automatic extension of a new or existing data file or temp file. If you omit this clause, then:

- For Oracle Managed Files:
  - If you specify `SIZE`, then Oracle Database creates a file of the specified size with `AUTOEXTEND` disabled.
  - If you do not specify `SIZE`, then the database creates a 100M file with `AUTOEXTEND` enabled. When autoextension is required, the database extends the file by its original size or 100MB, whichever is smaller. You can override this default behavior by specifying the `NEXT` clause.
- For user-managed files, with or without `SIZE` specified, Oracle creates a file with `AUTOEXTEND` disabled.

ON

Specify `ON` to enable autoextend.

OFF

Specify `OFF` to turn off autoextend if is turned on. When you turn off autoextend, the values of `NEXT` and `MAXSIZE` are set to zero. If you turn autoextend back on in a subsequent statement, then you must reset these values.
NEXT
Use the NEXT clause to specify the size in bytes of the next increment of disk space to be allocated automatically when more extents are required. The default is the size of one data block.

MAXSIZE
Use the MAXSIZE clause to specify the maximum disk space allowed for automatic extension of the data file.

UNLIMITED
Use the UNLIMITED clause if you do not want to limit the disk space that Oracle can allocate to the data file or temp file.

Restriction on the autoextend_clause
You cannot specify this clause as part of the datafile_tempfile_spec in a CREATE CONTROLFILE statement or in an ALTER DATABASE CREATE DATAFILE clause.

Examples

Specifying a Log File: Example
The following statement creates a database named payable that has two redo log file groups, each with two members, and one data file:

```sql
CREATE DATABASE payable
    LOGFILE GROUP 1 ('diska:log1.log', 'diskb:log1.log') SIZE 50K,
    GROUP 2 ('diska:log2.log', 'diskb:log2.log') SIZE 50K
    DATAFILE 'diskc:dbone.dbf' SIZE 30M;
```

The first file specification in the LOGFILE clause specifies a redo log file group with the GROUP value 1. This group has members named 'diska:log1.log' and 'diskb:log1.log', each 50 kilobytes in size.

The second file specification in the LOGFILE clause specifies a redo log file group with the GROUP value 2. This group has members named 'diska:log2.log' and 'diskb:log2.log', also 50 kilobytes in size.

The file specification in the DATAFILE clause specifies a data file named 'diskc:dbone.dbf', 30 megabytes in size.

Each file specification specifies a value for the SIZE parameter and omits the REUSE clause, so none of these files can already exist. Oracle must create them.

Adding a Log File: Example
The following statement adds another redo log file group with two members to the payable database:

```sql
ALTER DATABASE payable
    ADD LOGFILE GROUP 3 ('diska:log3.log', 'diskb:log3.log')
    SIZE 50K REUSE;
```

The file specification in the ADD LOGFILE clause specifies a new redo log file group with the GROUP value 3. This new group has members named 'diska:log3.log' and 'diskb:log3.log', each 50 kilobytes in size. Because the file specification specifies the REUSE clause, each member can (but need not) already exist.
The following statement adds a logfile group 5 with member log files on migration target disks 4k_disk_a and 4k_disk_b. After executing this statement, you can switch existing log files on disks with 512-byte block size to logs with 4K block size using the switch_logfile_clause.

```
ALTER DATABASE ADD LOGFILE GROUP 5
    ('4k_disk_a:log5.log', '4k_disk_b:log5.log')
    SIZE 100M BLOCKSIZE 4096 REUSE;
```

### Specifying a Data File: Example

The following statement creates a tablespace named stocks that has three data files:

```
CREATE TABLESPACE stocks
    DATAFILE 'stock1.dbf' SIZE 10M,
            'stock2.dbf' SIZE 10M,
            'stock3.dbf' SIZE 10M;
```

The file specifications for the data files specify files named 'diskc:stock1.dbf', 'diskc:stock2.dbf', and 'diskc:stock3.dbf'.

### Adding a Data File: Example

The following statement alters the stocks tablespace and adds a new data file:

```
ALTER TABLESPACE stocks
    ADD DATAFILE 'stock4.dbf' SIZE 10M REUSE;
```

The file specification specifies a data file named 'stock4.dbf'. If the filename does not exist, then Oracle simply ignores the REUSE keyword.

### Using a Fully Qualified Oracle ASM Data File Name: Example

When using Oracle ASM, the following syntax shows how to use the fully_qualified_file_name clause to bring online a data file in a hypothetical database, testdb:

```
ALTER DATABASE testdb
    DATAFILE '+dgroup_01/testdb/datafile/system.261.1' ONLINE;
```

---

### 8.5 logging_clause

#### Purpose

The `logging_clause` lets you specify whether certain DML operations will be logged in the redo log file (LOGGING) or not (NOLOGGING).

You can specify the `logging_clause` in the following statements:

- CREATE TABLE and ALTER TABLE: for logging of the table, a table partition, a LOB segment, or the overflow segment of an index-organized table (see CREATE TABLE and ALTER TABLE).
Note:
Logging specified for a LOB column can differ from logging set at the table level. If you specify LOGGING at the table level and NOLOGGING for a LOB column, then DML changes to the base table row are logged, but DML changes to the LOB data are not logged.

- **CREATE INDEX and ALTER INDEX**: for logging of the index or an index partition (see CREATE INDEX and ALTER INDEX).
- **CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW**: for logging of the materialized view, one of its partitions, or a LOB segment (see CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW).
- **CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG**: for logging of the materialized view log or one of its partitions (see CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG).
- **CREATE TABLESPACE and ALTER TABLESPACE**: to set or modify the default logging characteristics for all objects created in the tablespace (see CREATE TABLESPACE and ALTER TABLESPACE).
- **CREATE PLUGGABLE DATABASE and ALTER PLUGGABLE DATABASE**: to set or modify the default logging characteristics for all tablespaces created in the pluggable database (PDB) (see CREATE PLUGGABLE DATABASE and ALTER PLUGGABLE DATABASE).

You can also specify LOGGING or NOLOGGING for the following operations:
- Rebuilding an index (using CREATE INDEX ... REBUILD)
- Moving a table (using ALTER TABLE ... MOVE)

**Syntax**

```
logging_clause ::= 
```

**Semantics**

This section describes the semantics of the `logging_clause`. For additional information, refer to the SQL statement in which you set or reset logging characteristics for a particular database object.

- If you specify LOGGING, then the creation of a database object, as well as subsequent inserts into the object, will be logged in the redo log file.
- If you specify NOLOGGING, then the creation of a database object, as well as subsequent conventional inserts, will be logged in the redo log file. Direct-path inserts will not be logged.
- For a **nonpartitioned object**, the value specified for this clause is the actual physical attribute of the segment associated with the object.

- For **partitioned objects**, the value specified for this clause is the default physical attribute of the segments associated with all partitions specified in the `CREATE` statement (and in subsequent `ALTER ... ADD PARTITION` statements), unless you specify the logging attribute in the `PARTITION` description.

- For SecureFiles LOBs, the **NOLOGGING** setting is converted internally to `FILESYSTEM_LIKE_LOGGING`.

- **CACHE NOLOGGING** is not allowed for BasicFiles LOBs.

- The `FILESYSTEM_LIKE_LOGGING` clause is valid only for logging of SecureFiles LOB segments. You cannot specify this setting for BasicFiles LOBs. Specify this setting if you want to log only metadata changes. This setting is similar to the metadata journaling of file systems, which reduces mean time to recovery from failures. The `LOGGING` setting, for SecureFiles LOBs, is similar to the data journaling of file systems. Both the `LOGGING` and `FILESYSTEM_LIKE_LOGGING` settings provide a complete transactional file system by way of SecureFiles.

**Note:**

For LOB segments, with the `NOLOGGING` and `FILESYSTEM_LIKE_LOGGING` settings it is possible for data to be changed on disk during a backup operation, resulting in an inconsistent backup. To avoid this situation, ensure that changes to LOB segments are saved in the redo log file by setting `LOGGING` for LOB storage. Alternatively, change the database to `FORCE LOGGING` mode so that changes to all LOB segments are saved in the redo.

If the object for which you are specifying the logging attributes resides in a database or tablespace in force logging mode, then Oracle Database ignores any `NOLOGGING` setting until the database or tablespace is taken out of force logging mode.

If the database is running in `ARCHIVELOG` mode, then media recovery from a backup made before the `LOGGING` operation re-creates the object. However, media recovery from a backup made before the `NOLOGGING` operation does not re-create the object.

The size of a redo log generated for an operation in `NOLOGGING` mode is significantly smaller than the log generated in `LOGGING` mode.

In `NOLOGGING` mode, data is modified with minimal logging (to mark new extents `INVALID` and to record dictionary changes). When applied during media recovery, the extent invalidation records mark a range of blocks as logically corrupt, because the redo data is not fully logged. Therefore, if you cannot afford to lose the database object, then you should take a backup after the `NOLOGGING` operation.

`NOLOGGING` is supported in only a subset of the locations that support `LOGGING`. Only the following operations support the `NOLOGGING` mode:

**DML:**

- Direct-path `INSERT` (serial or parallel) resulting either from an `INSERT` or a `MERGE` statement. `NOLOGGING` is not applicable to any `UPDATE` operations resulting from the `MERGE` statement.
• Direct Loader (SQL*Loader)

**DDL:**

- **CREATE TABLE ... AS SELECT** (In NOLOGGING mode, the creation of the table will be logged, but direct-path inserts will not be logged.)
- **CREATE TABLE ... LOB_storage_clause ... LOB_parameters ... CACHE | NOCACHE | CACHE READS**
- **ALTER TABLE ... LOB_storage_clause ... LOB_parameters ... CACHE | NOCACHE | CACHE READS** (to specify logging of newly created LOB columns)
- **ALTER TABLE ... modify_LOB_storage_clause ... modify_LOB_parameters ... CACHE | NOCACHE | CACHE READS** (to change logging of existing LOB columns)
- **ALTER TABLE ... MOVE**
- **ALTER TABLE ... (all partition operations that involve data movement)**
  - **ALTER TABLE ... ADD PARTITION** (hash partition only)
  - **ALTER TABLE ... MERGE PARTITIONS**
  - **ALTER TABLE ... SPLIT PARTITION**
  - **ALTER TABLE ... MOVE PARTITION**
  - **ALTER TABLE ... MODIFY PARTITION ... ADD SUBPARTITION**
  - **ALTER TABLE ... MODIFY PARTITION ... COALESCE SUBPARTITION**
- **CREATE INDEX**
- **ALTER INDEX ... REBUILD**
- **ALTER INDEX ... REBUILD [SUB]PARTITION**
- **ALTER INDEX ... SPLIT PARTITION**

For **objects other than LOBs**, if you omit this clause, then the logging attribute of the object defaults to the logging attribute of the tablespace in which it resides.

For **LOBs**, if you omit this clause, then:

- If you specify **CACHE**, then **LOGGING** is used (because you cannot have **CACHE NOLOGGING**).
- If you specify **NOCACHE** or **CACHE READS**, then the logging attribute defaults to the logging attribute of the tablespace in which it resides.

**NOLOGGING** does not apply to LOBs that are stored internally (in the table with row data). If you specify **NOLOGGING** for LOBs with values less than 4000 bytes and you have not disabled **STORAGE IN ROW**, then Oracle ignores the **NOLOGGING** specification and treats the LOB data the same as other table data.

### 8.6 parallel_clause

**Purpose**

The **parallel_clause** lets you parallelize the creation of a database object and set the default degree of parallelism for subsequent queries of and DML operations on the object.
You can specify the `parallel_clause` in the following statements:

- **CREATE TABLE**: to set parallelism for the table (see CREATE TABLE).
- **ALTER TABLE** (see ALTER TABLE):
  - To change parallelism for the table
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a table partition
- **CREATE CLUSTER and ALTER CLUSTER**: to set or alter parallelism for a cluster (see CREATE CLUSTER and ALTER CLUSTER).
- **CREATE INDEX**: to set parallelism for the index (see CREATE INDEX).
- **ALTER INDEX** (see ALTER INDEX):
  - To change parallelism for the index
  - To parallelize the rebuilding of the index or the splitting of an index partition
- **CREATE MATERIALIZED VIEW**: to set parallelism for the materialized view (see CREATE MATERIALIZED VIEW).
- **ALTER MATERIALIZED VIEW** (see ALTER MATERIALIZED VIEW):
  - To change parallelism for the materialized view
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a materialized view partition
  - To parallelize the operations of adding or moving materialized view subpartitions
- **CREATE MATERIALIZED VIEW LOG**: to set parallelism for the materialized view log (see CREATE MATERIALIZED VIEW LOG).
- **ALTER MATERIALIZED VIEW LOG** (see ALTER MATERIALIZED VIEW LOG):
  - To change parallelism for the materialized view log
  - To parallelize the operations of adding, coalescing, exchanging, merging, splitting, truncating, dropping, or moving a materialized view log partition
- **ALTER DATABASE ... RECOVER**: to recover the database (see ALTER DATABASE).
- **ALTER DATABASE ... standby_database_clauses**: to parallelize operations on the standby database (see ALTER DATABASE).

---

**See Also:**

*Oracle Database PL/SQL Packages and Types Reference* for information on the `DBMS_PARALLEL_EXECUTE` package, which provides methods to apply table changes in chunks of rows. Changes to each chunk are independently committed when there are no errors.
Syntax

\[ \textit{parallel\_clause} ::= \]

\[ \begin{array}{c}
\text{NOPARALLEL} \\
\text{PARALLEL} \quad \text{integer}
\end{array} \]

Semantics

This section describes the semantics of the \textit{parallel\_clause}. For additional information, refer to the SQL statement in which you set or reset parallelism for a particular database object or operation.

\begin{itemize}
  \item \textbf{Note:}
  
  The syntax of the \textit{parallel\_clause} supersedes syntax appearing in earlier releases of Oracle. The superseded syntax is still supported for backward compatibility, but may result in slightly different behavior from that documented.
\end{itemize}

The database interprets the \textit{parallel\_clause} based on the setting of the \texttt{PARALLEL\_DEGREE\_POLICY} initialization parameter. When that parameter is set to \texttt{AUTO}, the \textit{parallel\_clause} is ignored entirely, and the optimizer determines the best degree of parallelism for all statements. When \texttt{PARALLEL\_DEGREE\_POLICY} is set to either \texttt{MANUAL} or \texttt{LIMITED}, the \textit{parallel\_clause} is interpreted as follows:

\begin{itemize}
  \item \textbf{NOPARALLEL}
  
  Specify \texttt{NOPARALLEL} for serial execution. This is the default.

  \item \textbf{PARALLEL}
  
  Specify \texttt{PARALLEL} for parallel execution.
  
  \begin{itemize}
    \item If \texttt{PARALLEL\_DEGREE\_POLICY} is set to \texttt{MANUAL}, then the optimizer calculates a degree of parallelism equal to the number of CPUs available on all participating instances times the value of the \texttt{PARALLEL\_THREADS\_PER\_CPU} initialization parameter.
    \item If \texttt{PARALLEL\_DEGREE\_POLICY} is set to \texttt{LIMITED}, then the optimizer determines the best degree of parallelism.
  \end{itemize}

  \item \textbf{PARALLEL} \quad \texttt{integer}
  
  Specification of \texttt{integer} indicates the degree of parallelism, which is the number of parallel threads used in the parallel operation. Each parallel thread may use one or two parallel execution servers.
\end{itemize}

\begin{itemize}
  \item \textbf{Notes on the parallel\_clause}
  
  The following notes apply to the \textit{parallel\_clause}:
\end{itemize}
- Parallelism is disabled for DML operations on tables on which you have defined a trigger or referential integrity constraint.
- Parallelism is not supported for UPDATE or DELETE operations on index-organized tables.
- When you specify the parallel_clause during creation of a table, if the table contains any columns of LOB or user-defined object type, then subsequent INSERT, UPDATE, DELETE or MERGE operations that modify the LOB or object type column are executed serially without notification. Subsequent queries, however, will be executed in parallel.
- A parallel hint overrides the effect of the parallel_clause.
- DML statements and CREATE TABLE ... AS SELECT statements that reference remote objects can run in parallel. However, the remote object must really be on a remote database. The reference cannot loop back to an object on the local database, for example, by way of a synonym on the remote database pointing back to an object on the local database.
- DML operations on tables with LOB columns can be parallelized. However, intrapartition parallelism is not supported.

Oracle Database VLDB and Partitioning Guide for more information on parallelized operations, and "Creating a Table: Parallelism Examples"

8.7 physical_attributes_clause

Purpose

The physical_attributes_clause lets you specify the value of the PCTFREE, PCTUSED, and INITRANS parameters and the storage characteristics of a table, cluster, index, or materialized view.

You can specify the physical_attributes_clause in the following statements:

- CREATE CLUSTER and ALTER CLUSTER: to set or change the physical attributes of the cluster and all tables in the cluster (see CREATE CLUSTER and ALTER CLUSTER).
- CREATE TABLE: to set the physical attributes of the table, a table partition, the OIDINDEX of an object table, or the overflow segment of an index-organized table (see CREATE TABLE).
- ALTER TABLE: to change the physical attributes of the table, the default physical attributes of future table partitions, or the physical attributes of existing table partitions (see ALTER TABLE). The following restrictions apply:
  - You cannot specify physical attributes for a temporary table.
  - You cannot specify physical attributes for a clustered table. Tables in a cluster inherit the physical attributes of the cluster.
- CREATE INDEX: to set the physical attributes of an index or index partition (see CREATE INDEX).
• **ALTER INDEX**: to change the physical attributes of the index, the default physical attributes of future index partitions, or the physical attributes of existing index partitions (see ALTER INDEX).

• **CREATE MATERIALIZED VIEW**: to set the physical attributes of the materialized view, one of its partitions, or the index Oracle Database generates to maintain the materialized view (see CREATE MATERIALIZED VIEW).

• **ALTER MATERIALIZED VIEW**: to change the physical attributes of the materialized view, the default physical attributes of future partitions, the physical attributes of an existing partition, or the index Oracle creates to maintain the materialized view (see ALTER MATERIALIZED VIEW).

• **CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG**: to set or change the physical attributes of the materialized view log (see CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG).

**Syntax**

\[
\text{physical_attributes_clause} ::= \\
\]

\[
\text{PCTFREE integer} \\
\text{PCTUSED integer} \\
\text{INITRANS integer} \\
\text{storage_clause} \\
\sigma (storage_clause ::= )
\]

**Semantics**

This section describes the parameters of the `physical_attributes_clause`. For additional information, refer to the SQL statement in which you set or reset these parameters for a particular database object.

**PCTFREE integer**

Specify a whole number representing the percentage of space in each data block of the database object reserved for future updates to rows of the object. The value of PCTFREE must be a value from 0 to 99. A value of 0 means that the entire block can be filled by inserts of new rows. The default value is 10. This value reserves 10% of each block for updates to existing rows and allows inserts of new rows to fill a maximum of 90% of each block.

**Restriction on the PCTFREE Clause**

When altering an index, you can specify this parameter only in the `modify_index_default_attrs` clause and the `split_index_partition_clause`.
**PCTUSED integer**

Specify a whole number representing the minimum percentage of used space that Oracle maintains for each data block of the database object. **PCTUSED** is specified as a positive integer from 0 to 99 and defaults to 40.

**PCTUSED** has the same function in the statements that create and alter tables, partitions, clusters, materialized views, materialized view logs, and zone maps.

**PCTUSED** is not a valid table storage characteristic for an index-organized table.

The sum of **PCTFREE** and **PCTUSED** must be equal to or less than 100. You can use **PCTFREE** and **PCTUSED** together to utilize space within a database object more efficiently. See "How PCTFREE and PCTUSED Work Together".

**Restrictions on the PCTUSED Clause**

The **PCTUSED** parameter is subject to the following restrictions:

- You cannot specify this parameter for an index or for the index segment of an index-organized table.
- This parameter is not useful and is ignored for objects with automatic segment-space management.

**See Also:**

*Oracle Database Performance Tuning Guide* for information on the performance effects of different values of **PCTUSED** and **PCTFREE** and *CREATE TABLESPACE segment_management_clause* for information on automatic segment-space management.

**How PCTFREE and PCTUSED Work Together**

In a newly allocated data block, the space available for inserts is the block size minus the sum of the block overhead and free space (**PCTFREE**). Updates to existing data can use any available space in the block. Therefore, updates can reduce the available space of a block to less than **PCTFREE**.

After a data block is filled to the limit determined by **PCTFREE**, Oracle Database considers the block unavailable for the insertion of new rows until the percentage of that block falls beneath the parameter **PCTUSED**. Until this value is achieved, Oracle Database uses the free space of the data block only for updates to rows already contained in the data block. A block becomes a candidate for row insertion when its used space falls below **PCTUSED**.

**See Also:**

*FREELISTS* for information on how **PCTUSED** and **PCTFREE** work with freelist segment space management.

**INITRANS integer**
Specify the initial number of concurrent transaction entries allocated within each data block allocated to the database object. This value can range from 1 to 255 and defaults to 1, with the following exceptions:

- The default INITSANS value for a cluster is 2 or the default INITSANS value of the tablespace in which the cluster resides, whichever is greater.
- The default value for an index is 2.

In general, you should not change the INITSANS value from its default.

Each transaction that updates a block requires a transaction entry in the block. This parameter ensures that a minimum number of concurrent transactions can update the block and helps avoid the overhead of dynamically allocating a transaction entry.

The INITSANS parameter serves the same purpose in the statements that create and alter tables, partitions, clusters, indexes, materialized views, and materialized view logs.

**MAXTRANS Parameter**

In earlier releases, the MAXTRANS parameter determined the maximum number of concurrent update transactions allowed for each data block in the segment. This parameter has been deprecated. Oracle now automatically allows up to 255 concurrent update transactions for any data block, depending on the available space in the block.

Existing objects for which a value of MAXTRANS has already been set retain that setting. However, if you attempt to change the value for MAXTRANS, Oracle ignores the new specification and substitutes the value 255 without returning an error.

**storage_clause**

The storage_clause lets you specify storage characteristics for the table, object table OIDINDEX, partition, LOB data segment, or index-organized table overflow data segment. This clause has performance ramifications for large tables. Storage should be allocated to minimize dynamic allocation of additional space. Refer to the storage_clause for more information.

### 8.8 size_clause

**Purpose**

The size_clause lets you specify a number of bytes, kilobytes (K), megabytes (M), gigabytes (G), terabytes (T), petabytes (P), or exabytes (E) in any statement that lets you establish amounts of disk or memory space.
Syntax

```plaintext
size_clause ::= integer
```

Semantics

Use the `size_clause` to specify a number or multiple of bytes. If you do not specify any of the multiple abbreviations, then the `integer` is interpreted as bytes.

**Note:**
Not all multiples of bytes are appropriate in all cases, and context-sensitive limitations may apply. In the latter case, Oracle issues an error message.

### 8.9 storage_clause

**Purpose**

The `storage_clause` lets you specify how Oracle Database should store a permanent database object. Storage parameters for temporary segments always use the default storage parameters for the associated tablespace. Storage parameters affect both how long it takes to access data stored in the database and how efficiently space in the database is used.

**See Also:**

`Oracle Automatic Storage Management Administrator’s Guide` for a discussion of the effects of the storage parameters

When you create a cluster, index, materialized view, materialized view log, rollback segment, table, LOB, varray, nested table, or partition, you can specify values for the storage parameters for the segments allocated to these objects. If you omit any storage parameter, then Oracle uses the value of that parameter specified for the tablespace in which the object resides. If no value was specified for the tablespace, then the database uses default values.
The specification of storage parameters for objects in locally managed tablespaces is supported for backward compatibility. If you are using locally managed tablespaces, then you can omit these storage parameter when creating objects in those tablespaces.

When you alter a cluster, index, materialized view, materialized view log, rollback segment, table, varray, nested table, or partition, you can change the values of storage parameters. The new values affect only future extent allocations.

The `storage_clause` is part of the `physical_attributes_clause`, so you can specify this clause in any of the statements where you can specify the physical attributes clause (see `physical_attributes_clause`). In addition, you can specify the `storage_clause` in the following statements:

- **CREATE CLUSTER and ALTER CLUSTER**: to set or change the storage characteristics of the **cluster and all tables in the cluster** (see `CREATE CLUSTER` and `ALTER CLUSTER`).

- **CREATE INDEX and ALTER INDEX**: to set or change the storage characteristics of an index segment created for a **table index or index partition** or an index segment created for an index used to enforce a primary key or unique constraint (see `CREATE INDEX` and `ALTER INDEX`).

- **The ENABLE ... USING INDEX clause of CREATE TABLE or ALTER TABLE**: to set or change the storage characteristics of an **index created by the system to enforce a primary key or unique constraint**.

- **CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW**: to set or change the storage characteristics of a **materialized view, one of its partitions, or the index Oracle generates to maintain the materialized view** (see `CREATE MATERIALIZED VIEW` and `ALTER MATERIALIZED VIEW`).

- **CREATE MATERIALIZED VIEW LOG and ALTER MATERIALIZED VIEW LOG**: to set or change the storage characteristics of the **materialized view log** (see `CREATE MATERIALIZED VIEW LOG` and `ALTER MATERIALIZED VIEW LOG`).

- **CREATE ROLLBACK SEGMENT and ALTER ROLLBACK SEGMENT**: to set or change the storage characteristics of a **rollback segment** (see `CREATE ROLLBACK SEGMENT` and `ALTER ROLLBACK SEGMENT`).

- **CREATE TABLE and ALTER TABLE**: to set the storage characteristics of a **LOB or varray data segment** of the nonclustered table or one of its partitions or subpartitions, or the **storage table of a nested table** (see `CREATE TABLE` and `ALTER TABLE`).

- **CREATE TABLESPACE and ALTER TABLESPACE**: to set or change the default storage characteristics for **objects created in the tablespace** (see `CREATE TABLESPACE` and `ALTER TABLESPACE`). Changes to tablespace storage parameters affect only new objects created in the tablespace or new extents allocated for a segment.

- **constraint**: to specify storage for the **index (and its partitions, if it is a partitioned index) used to enforce the constraint** (see `constraint`).
Prerequisites

To change the value of a STORAGE parameter, you must have the privileges necessary to use the appropriate CREATE or ALTER statement.

Syntax

```
storage_clause::=
```

```
(MAXSIZE
UNLIMITED
size_clause
(size_clause::=)
```

```
maxsize_clause::=
```

```
(size_clause::=)
```
Semantics

This section describes the parameters of the `storage_clause`. For additional information, refer to the SQL statement in which you set or reset these storage parameters for a particular database object.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>The <code>storage_clause</code> is interpreted differently for locally managed tablespaces. For locally managed tablespaces, Oracle Database uses <code>INITIAL</code>, <code>NEXT</code>, <code>PCTINCREASE</code>, and <code>MINEXTENTS</code> to compute how many extents are allocated when the object is first created. After object creation, these parameters are ignored. For more information, see <code>CREATE TABLESPACE</code></td>
</tr>
</tbody>
</table>

| See Also: |
| "Specifying Table Storage Attributes: Example"

**INITIAL**

Specify the size of the first extent of the object. Oracle allocates space for this extent when you create the schema object. Refer to `size_clause` for information on that clause.

In locally managed tablespaces, Oracle uses the value of `INITIAL`, in conjunction with the type of local management—`AUTOALLOCATE` or `UNIFORM`—and the values of `MINEXTENTS`, `NEXT` and `PCTINCREASE`, to determine the initial size of the segment.

- With `AUTOALLOCATE` extent management, Oracle uses the `INITIAL` setting to optimize the number of extents allocated. Extents of 64K, 1M, 8M, and 64M can be allocated. During segment creation, the system chooses the greatest of these four sizes that is equal to or smaller than `INITIAL`, and allocates as many extents of that size as are needed to reach the `INITIAL` setting. For example, if you set `INITIAL` to 4M, then the database creates four 1M extents.

- For `UNIFORM` extent management, the number of extents is determined from initial segment size and the uniform extent size specified at tablespace creation time. For example, in a uniform locally managed tablespace with 1M extents, if you specify an `INITIAL` value of 5M, then Oracle creates five 1M extents.

Consider this comparison: With `AUTOALLOCATE`, if you set `INITIAL` to 72K, then the initial segment size will be 128K (greater than `INITIAL`). The database cannot allocate an extent smaller than 64K, so it must allocate two 64K extents. If you set `INITIAL` to 72K with a `UNIFORM` extent size of 24K, then the database will allocate three 24K extents to equal 72K.

In dictionary managed tablespaces, the default initial extent size is 5 blocks, and all subsequent extents are rounded to 5 blocks. If `MINIMUM EXTENT` was specified at tablespace creation time, then the extent sizes are rounded to the value of `MINIMUM EXTENT`.

**Restriction on INITIAL**
You cannot specify INITIAL in an ALTER statement.

**NEXT**

Specify in bytes the size of the next extent to be allocated to the object. Refer to size_clause for information on that clause.

In locally managed tablespaces, any user-supplied value for NEXT is ignored and the size of NEXT is determined by Oracle if the tablespace is set for autoallocate extent management. In UNIFORM tablespaces, the size of NEXT is the uniform extent size specified at tablespace creation time.

In dictionary-managed tablespaces, the default value is the size of 5 data blocks. The minimum value is the size of 1 data block. The maximum value depends on your operating system. Oracle rounds values up to the next multiple of the data block size for values less than 5 data blocks. For values greater than 5 data blocks, Oracle rounds up to a value that minimizes fragmentation.

**PCTINCREASE**

In locally managed tablespaces, Oracle Database uses the value of PCTINCREASE during segment creation to determine the initial segment size and ignores this parameter during subsequent space allocation.

In dictionary-managed tablespaces, specify the percent by which the third and subsequent extents grow over the preceding extent. The default value is 50, meaning that each subsequent extent is 50% larger than the preceding extent. The minimum value is 0, meaning all extents after the first are the same size. The maximum value depends on your operating system. Oracle rounds the calculated size of each new extent to the nearest multiple of the data block size. If you change the value of the PCTINCREASE parameter by specifying it in an ALTER statement, then Oracle calculates the size of the next extent using this new value and the size of the most recently allocated extent.

**Restriction on PCTINCREASE**

You cannot specify PCTINCREASE for rollback segments. Rollback segments always have a PCTINCREASE value of 0.

**MINEXTENTS**

In locally managed tablespaces, Oracle Database uses the value of MINEXTENTS in conjunction with PCTINCREASE, INITIAL and NEXT to determine the initial segment size.

In dictionary-managed tablespaces, specify the total number of extents to allocate when the object is created. The default and minimum value is 1, meaning that Oracle allocates only the initial extent, except for rollback segments, for which the default and minimum value is 2. The maximum value depends on your operating system.
• In a locally managed tablespace, `MINEXTENTS` is used to compute the initial amount of space allocated, which is equal to `INITIAL * MINEXTENTS`. Thereafter this value is set to 1, which is reflected in the `DBA_SEGMENTS` view.

• In a dictionary-managed tablespace, `MINEXTENTS` is simply the minimum number of extents that must be allocated to the segment.

If the `MINEXTENTS` value is greater than 1, then Oracle calculates the size of subsequent extents based on the values of the `INITIAL`, `NEXT`, and `PCTINCREASE` storage parameters.

When changing the value of `MINEXTENTS` by specifying it in an `ALTER` statement, you can reduce the value from its current value, but you cannot increase it. Resetting `MINEXTENTS` to a smaller value might be useful, for example, before a `TRUNCATE ... DROP STORAGE` statement, if you want to ensure that the segment will maintain a minimum number of extents after the `TRUNCATE` operation.

Restrictions on `MINEXTENTS`

The `MINEXTENTS` storage parameter is subject to the following restrictions:

• `MINEXTENTS` is not applicable at the tablespace level.

• You cannot change the value of `MINEXTENTS` in an `ALTER` statement or for an object that resides in a locally managed tablespace.

`MAXEXTENTS`

This storage parameter is valid only for objects in dictionary-managed tablespaces. Specify the total number of extents, including the first, that Oracle can allocate for the object. The minimum value is 1 except for rollback segments, which always have a minimum of 2. The default value depends on your data block size.

Restriction on `MAXEXTENTS`

`MAXEXTENTS` is ignored for objects residing in a locally managed tablespace, unless the value of `ALLOCATION_TYPE` is `USER` for the tablespace in the `DBA_TABLESPACES` data dictionary view.

---

**See Also:**

Oracle Database Reference for more information on the `DBA_TABLESPACES` data dictionary view

---

**UNLIMITED**

Specify `UNLIMITED` if you want extents to be allocated automatically as needed. Oracle recommends this setting as a way to minimize fragmentation.

Do not use this clause for rollback segments. Doing so allows the possibility that long-running rogue DML transactions will continue to create new extents until a disk is full.
A rollback segment that you create without specifying the \texttt{storage\_clause} has the same storage parameters as the tablespace in which the rollback segment is created. Thus, if you create a tablespace with \texttt{MAXEXTENTS UNLIMITED}, then the rollback segment will have this same default.

\textbf{MAXSIZE}

The \texttt{MAXSIZE} clause lets you specify the maximum size of the storage element. For LOB storage, \texttt{MAXSIZE} has the following effects

- If you specify \texttt{RETENTION MAX} in \texttt{LOB\_parameters}, then the LOB segment increases to the specified size before any space can be reclaimed from undo space.
- If you specify \texttt{RETENTION AUTO, MIN, or NONE} in \texttt{LOB\_parameters}, then the specified size is a hard limit on the LOB segment size and has no bearing on undo retention.

\textbf{UNLIMITED}

Use the \texttt{UNLIMITED} clause if you do not want to limit the disk space of the storage element. This clause is not compatible with a specification of \texttt{RETENTION MAX} in \texttt{LOB\_parameters}. If you specify both, then the database uses \texttt{RETENTION AUTO} and \texttt{MAXSIZE UNLIMITED}.

\textbf{FREELISTS}

In tablespaces with manual segment-space management, Oracle Database uses the \texttt{FREELISTS} storage parameter to improve performance of space management in OLTP systems by increasing the number of insert points in the segment. In tablespaces with automatic segment-space management, this parameter is ignored, because the database adapts to varying workload.

In tablespaces with manual segment-space management, for objects other than tablespaces and rollback segments, specify the number of free lists for each of the free list groups for the table, partition, cluster, or index. The default and minimum value for this parameter is 1, meaning that each free list group contains one free list. The maximum value of this parameter depends on the data block size. If you specify a \texttt{FREELISTS} value that is too large, then Oracle returns an error indicating the maximum value.

This clause is not valid or useful if you have specified the \texttt{SECUREFILE} parameter of \texttt{LOB\_parameters}. If you specify both the \texttt{SECUREFILE} parameter and \texttt{FREELISTS}, then the database silently ignores the \texttt{FREELISTS} specification.

\textbf{Restriction on FREELISTS}

You can specify \texttt{FREELISTS} in the \texttt{storage\_clause} of any statement except when creating or altering a tablespace or rollback segment.

\textbf{FREELIST GROUPS}

In tablespaces with manual segment-space management, Oracle Database uses the value of this storage parameter to statically partition the segment free space in an Oracle Real Application Clusters environment. This partitioning improves the performance of space allocation and deallocation by avoiding inter instance transfer of
segment metadata. In tablespaces with automatic segment-space management, this parameter is ignored, because Oracle dynamically adapts to inter instance workload.

In tablespaces with manual segment-space management, specify the number of groups of free lists for the database object you are creating. The default and minimum value for this parameter is 1. Oracle uses the instance number of Oracle Real Application Clusters (Oracle RAC) instances to map each instance to one free list group.

Each free list group uses one database block. Therefore:

- If you do not specify a large enough value for **INITIAL** to cover the minimum value plus one data block for each free list group, then Oracle increases the value of **INITIAL** the necessary amount.
- If you are creating an object in a uniform locally managed tablespace, and the extent size is not large enough to accommodate the number of freelist groups, then the create operation will fail.

This clause is not valid or useful if you have specified the **SECUREFILE** parameter of **LOB_parameters**. If you specify both the **SECUREFILE** parameter and **FREELIST GROUPS**, then the database silently ignores the **FREELIST GROUPS** specification.

**Restriction on FREELIST GROUPS**

You can specify the **FREELIST GROUPS** parameter only in **CREATE TABLE**, **CREATE CLUSTER**, **CREATE MATERIALIZED VIEW**, **CREATE MATERIALIZED VIEW LOG**, and **CREATE INDEX** statements.

**OPTIMAL**

The **OPTIMAL** keyword is relevant only to rollback segments. It specifies an optimal size in bytes for a rollback segment. Refer to **size_clause** for information on that clause.

Oracle tries to maintain this size for the rollback segment by dynamically deallocating extents when their data is no longer needed for active transactions. Oracle deallocates as many extents as possible without reducing the total size of the rollback segment below the **OPTIMAL** value.

The value of **OPTIMAL** cannot be less than the space initially allocated by the **MINEXTENTS**, **INITIAL**, **NEXT**, and **PCTINCREASE** parameters. The maximum value depends on your operating system. Oracle rounds values up to the next multiple of the data block size.

**NULL**

Specify **NULL** for no optimal size for the rollback segment, meaning that Oracle never deallocates the extents of the rollback segment. This is the default behavior.

**BUFFER_POOL**

The **BUFFER_POOL** clause lets you specify a default buffer pool or cache for a schema object. All blocks for the object are stored in the specified cache.

- If you define a buffer pool for a partitioned table or index, then the partitions inherit the buffer pool from the table or index definition unless overridden by a partition-level definition.
- For an index-organized table, you can specify a buffer pool separately for the index segment and the overflow segment.
Restrictions on the BUFFER_POOL Parameter

BUFFER_POOL is subject to the following restrictions:

- You cannot specify this clause for a cluster table. However, you can specify it for a cluster.
- You cannot specify this clause for a tablespace or a rollback segment.

KEEP

Specify KEEP to put blocks from the segment into the KEEP buffer pool. Maintaining an appropriately sized KEEP buffer pool lets Oracle retain the schema object in memory to avoid I/O operations. KEEP takes precedence over any NOCACHE clause you specify for a table, cluster, materialized view, or materialized view log.

RECYCLE

Specify RECYCLE to put blocks from the segment into the RECYCLE pool. An appropriately sized RECYCLE pool reduces the number of objects whose default pool is the RECYCLE pool from taking up unnecessary cache space.

DEFAULT

Specify DEFAULT to indicate the default buffer pool. This is the default for objects not assigned to KEEP or RECYCLE.

FLASH_CACHE

The FLASH_CACHE clause lets you override the automatic buffer cache policy and specify how specific schema objects are cached in flash memory. To use this clause, Database Smart Flash Cache (flash cache) must be configured on your system. The flash cache is an extension of the database buffer cache that is stored on a flash disk, a storage device that uses flash memory. Because flash memory is faster than magnetic disks, the database can improve performance by caching buffers in the flash cache instead of reading from magnetic disk.

KEEP

Specify KEEP if you want the schema object buffers to remain cached in the flash cache as long as the flash cache is large enough.

NONE

Specify NONE to ensure that the schema object buffers are never cached in the flash cache. This allows you to reserve the flash cache space for more frequently accessed objects.

DEFAULT

Specify DEFAULT if you want the schema object buffers to be written to the flash cache when they are aged out of main memory, and then be aged out of the flash cache with

See Also:

Oracle Database Performance Tuning Guide for more information about using multiple buffer pools
the standard buffer cache replacement algorithm. This is the default if flash cache is configured and you do not specify KEEP or NONE.

Note:

Database Smart Flash Cache is available only in Solaris and Oracle Linux.

See Also:

- *Oracle Database Concepts* for more information about Database Smart Flash Cache
- *Oracle Database Administrator's Guide* to learn how to configure Database Smart Flash Cache

**ENCRIPT**

This clause is valid only when you are creating a tablespace. Specify ENCRIPT to encrypt the entire tablespace. You must also specify the ENCRYPTION clause in the CREATE TABLESPACE statement.

Note:

The ENCRIPT clause is supported for backward compatibility. However, beginning with Oracle Database 12c Release 2 (12.2), you can instead specify ENCRIPT in the `tablespace_encryption_clause`. Refer to the `tablespace_encryption_clause` of CREATE TABLESPACE for more information.

Example

Live SQL:

View and run a related example on Oracle Live SQL at *Specifying Table Storage Attributes*.

**Specifying Table Storage Attributes: Example**

The following statement creates a table and provides storage parameter values:

```sql
CREATE TABLE divisions

( div_no NUMBER(2),
  div_name VARCHAR2(14),
  location VARCHAR2(13) )
STORAGE ( INITIAL 8M MAXSIZE 1G );
```
Oracle allocates space for the table based on the `STORAGE` parameter values as follows:

- The `INITIAL` value is 8M, so the size of the first extent is 8 megabytes.
- The `MAXSIZE` value is 1G, so the maximum size of the storage element is 1 gigabyte.
This chapter describes SQL queries and subqueries.

This chapter contains these sections:

- About Queries and Subqueries
- Creating Simple Queries
- Hierarchical Queries
- The UNION [ALL], INTERSECT, MINUS Operators
- Sorting Query Results
- Joins
- Using Subqueries
- Unnesting of Nested Subqueries
- Selecting from the DUAL Table
- Distributed Queries

9.1 About Queries and Subqueries

A query is an operation that retrieves data from one or more tables or views. In this reference, a top-level SELECT statement is called a query, and a query nested within another SQL statement is called a subquery.

This section describes some types of queries and subqueries and how to use them. The top level of the syntax is shown in this chapter. Refer to SELECT for the full syntax of all the clauses and the semantics of this statement.

\[
\text{select} ::= \\
\]

\[
\text{subquery} ::= \\
\]

\[
\text{query\_block} ::= \\
\]

\[
\text{subquery} ::= \\
\]

\[
\text{UNION} \\
\text{INTERSECT} \\
\text{MINUS} \\
\text{order\_by\_clause} \\
\text{row\_limiting\_clause} \\
\]

\[
\text{for\_update\_clause} \\
\]

\[
\text{for\_update\_clause} \\
\]

\[
\text{for\_update\_clause} \\
\]
9.2 Creating Simple Queries

The list of expressions that appears after the `SELECT` keyword and before the `FROM` clause is called the select list. Within the select list, you specify one or more columns in the set of rows you want Oracle Database to return from one or more tables, views, or materialized views. The number of columns, as well as their data type and length, are determined by the elements of the select list.

If two or more tables have some column names in common, then you must qualify column names with names of tables. Otherwise, fully qualified column names are optional. However, it is always a good idea to qualify table and column references explicitly. Oracle often does less work with fully qualified table and column names.

You can use a column alias, `c_alias`, to label the immediately preceding expression in the select list so that the column is displayed with a new heading. The alias effectively renames the select list item for the duration of the query. The alias can be used in the `ORDER BY` clause, but not other clauses in the query.

You can use comments in a `SELECT` statement to pass instructions, or hints, to the Oracle Database optimizer. The optimizer uses hints to choose an execution plan for the statement. Refer to "Hints" for more information on hints.

9.3 Hierarchical Queries

If a table contains hierarchical data, then you can select rows in a hierarchical order using the hierarchical query clause:
**condition** can be any condition as described in [Conditions](#).

**START WITH** specifies the root row(s) of the hierarchy.

**CONNECT BY** specifies the relationship between parent rows and child rows of the hierarchy.

- The **NOCYCLE** parameter instructs Oracle Database to return rows from a query even if a **CONNECT BY** loop exists in the data. Use this parameter along with the **CONNECT_BY_ISCYCLE** pseudocolumn to see which rows contain the loop. Refer to [CONNECT_BY_ISCYCLE Pseudocolumn](#) for more information.

- In a hierarchical query, one expression in **condition** must be qualified with the **PRIOR** operator to refer to the parent row. For example,

  ```sql
  ... PRIOR expr = expr
  or
  ... expr = PRIOR expr
  ```

  If the **CONNECT BY** condition is compound, then only one condition requires the **PRIOR** operator, although you can have multiple **PRIOR** conditions. For example:

  ```sql
  CONNECT BY last_name != 'King' AND PRIOR employee_id = manager_id ...
  CONNECT BY PRIOR employee_id = manager_id and
  PRIOR account_mgr_id = customer_id ...
  ```

  **PRIOR** is a unary operator and has the same precedence as the unary + and - arithmetic operators. It evaluates the immediately following expression for the parent row of the current row in a hierarchical query.

  **PRIOR** is most commonly used when comparing column values with the equality operator. (The **PRIOR** keyword can be on either side of the operator.) **PRIOR** causes Oracle to use the value of the parent row in the column. Operators other than the equal sign (=) are theoretically possible in **CONNECT BY** clauses. However, the conditions created by these other operators can result in an infinite loop through the possible combinations. In this case Oracle detects the loop at run time and returns an error.

  Both the **CONNECT BY** condition and the **PRIOR** expression can take the form of an uncorrelated subquery. However, **CURRVAL** and **NEXTVAL** are not valid **PRIOR** expressions, so the **PRIOR** expression cannot refer to a sequence.

  You can further refine a hierarchical query by using the **CONNECT_BY_ROOT** operator to qualify a column in the select list. This operator extends the functionality of the **CONNECT BY [PRIOR]** condition of hierarchical queries by returning not only the immediate parent row but all ancestor rows in the hierarchy.

**See Also:**

[CONNECT_BY_ROOT](#) for more information about this operator and "Hierarchical Query Examples"

Oracle processes hierarchical queries as follows:

- A join, if present, is evaluated first, whether the join is specified in the **FROM** clause or with **WHERE** clause predicates.
• The `CONNECT BY` condition is evaluated.
• Any remaining `WHERE` clause predicates are evaluated.

Oracle then uses the information from these evaluations to form the hierarchy using the following steps:

1. Oracle selects the root row(s) of the hierarchy—those rows that satisfy the `START` with condition.
2. Oracle selects the child rows of each root row. Each child row must satisfy the condition of the `CONNECT BY` condition with respect to one of the root rows.
3. Oracle selects successive generations of child rows. Oracle first selects the children of the rows returned in step 2, and then the children of those children, and so on. Oracle always selects children by evaluating the `CONNECT BY` condition with respect to a current parent row.
4. If the query contains a `WHERE` clause without a join, then Oracle eliminates all rows from the hierarchy that do not satisfy the condition of the `WHERE` clause. Oracle evaluates this condition for each row individually, rather than removing all the children of a row that does not satisfy the condition.
5. Oracle returns the rows in the order shown in Figure 9-1. In the diagram, children appear below their parents. For an explanation of hierarchical trees, see Figure 3-1.

Figure 9-1  Hierarchical Queries

To find the children of a parent row, Oracle evaluates the `PRIOR` expression of the `CONNECT BY` condition for the parent row and the other expression for each row in the table. Rows for which the condition is true are the children of the parent. The `CONNECT BY` condition can contain other conditions to further filter the rows selected by the query.

If the `CONNECT BY` condition results in a loop in the hierarchy, then Oracle returns an error. A loop occurs if one row is both the parent (or grandparent or direct ancestor) and a child (or a grandchild or a direct descendent) of another row.
9.3.1 Hierarchical Query Examples

CONNECT BY Example
The following hierarchical query uses the CONNECT BY clause to define the relationship
between employees and managers:

```
SELECT employee_id, last_name, manager_id
FROM employees
CONNECT BY PRIOR employee_id = manager_id;
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>MANAGER_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>100</td>
</tr>
<tr>
<td>108</td>
<td>Greenberg</td>
<td>101</td>
</tr>
<tr>
<td>109</td>
<td>Faviot</td>
<td>108</td>
</tr>
<tr>
<td>110</td>
<td>Chen</td>
<td>108</td>
</tr>
<tr>
<td>111</td>
<td>Sciarra</td>
<td>108</td>
</tr>
<tr>
<td>112</td>
<td>Urman</td>
<td>108</td>
</tr>
<tr>
<td>113</td>
<td>Popp</td>
<td>108</td>
</tr>
<tr>
<td>200</td>
<td>Whalen</td>
<td>101</td>
</tr>
<tr>
<td>203</td>
<td>Mavris</td>
<td>101</td>
</tr>
<tr>
<td>204</td>
<td>Baer</td>
<td>101</td>
</tr>
</tbody>
</table>

. . .

LEVEL Example
The next example is similar to the preceding example, but uses the LEVEL
pseudocolumn to show parent and child rows:

```
SELECT employee_id, last_name, manager_id, LEVEL
FROM employees
CONNECT BY PRIOR employee_id = manager_id;
```

<table>
<thead>
<tr>
<th>EMPLOYEE_ID</th>
<th>LAST_NAME</th>
<th>MANAGER_ID</th>
<th>LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>101</td>
<td>Kochhar</td>
<td>100</td>
<td>1</td>
</tr>
<tr>
<td>108</td>
<td>Greenberg</td>
<td>101</td>
<td>2</td>
</tr>
<tr>
<td>109</td>
<td>Faviot</td>
<td>108</td>
<td>3</td>
</tr>
<tr>
<td>110</td>
<td>Chen</td>
<td>108</td>
<td>3</td>
</tr>
<tr>
<td>111</td>
<td>Sciarra</td>
<td>108</td>
<td>3</td>
</tr>
<tr>
<td>112</td>
<td>Urman</td>
<td>108</td>
<td>3</td>
</tr>
<tr>
<td>113</td>
<td>Popp</td>
<td>108</td>
<td>3</td>
</tr>
<tr>
<td>200</td>
<td>Whalen</td>
<td>101</td>
<td>2</td>
</tr>
<tr>
<td>203</td>
<td>Mavris</td>
<td>101</td>
<td>2</td>
</tr>
<tr>
<td>204</td>
<td>Baer</td>
<td>101</td>
<td>2</td>
</tr>
<tr>
<td>205</td>
<td>Higgins</td>
<td>101</td>
<td>2</td>
</tr>
<tr>
<td>206</td>
<td>Gietz</td>
<td>205</td>
<td>3</td>
</tr>
<tr>
<td>102</td>
<td>De Haan</td>
<td>100</td>
<td>1</td>
</tr>
</tbody>
</table>

...
START WITH Examples

The next example adds a START WITH clause to specify a root row for the hierarchy and an ORDER BY clause using the SIBLINGS keyword to preserve ordering within the hierarchy:

```sql
SELECT last_name, employee_id, manager_id, LEVEL
FROM employees
  START WITH employee_id = 100
  CONNECT BY PRIOR employee_id = manager_id
  ORDER SIBLINGS BY last_name;
```

<table>
<thead>
<tr>
<th>LAST_NAME</th>
<th>EMPLOYEE_ID</th>
<th>MANAGER_ID</th>
<th>LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>King</td>
<td>100</td>
<td></td>
<td>1</td>
</tr>
<tr>
<td>Cambrault</td>
<td>148</td>
<td>100</td>
<td>2</td>
</tr>
<tr>
<td>Bates</td>
<td>172</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>Bloom</td>
<td>169</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>Fox</td>
<td>170</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>Kumar</td>
<td>173</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>Ozer</td>
<td>168</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>Smith</td>
<td>171</td>
<td>148</td>
<td>3</td>
</tr>
<tr>
<td>De Haan</td>
<td>102</td>
<td>100</td>
<td>2</td>
</tr>
<tr>
<td>Hunold</td>
<td>103</td>
<td>102</td>
<td>3</td>
</tr>
<tr>
<td>Austin</td>
<td>105</td>
<td>103</td>
<td>4</td>
</tr>
<tr>
<td>Ernst</td>
<td>104</td>
<td>103</td>
<td>4</td>
</tr>
<tr>
<td>Lorentz</td>
<td>107</td>
<td>103</td>
<td>4</td>
</tr>
<tr>
<td>Pataballa</td>
<td>106</td>
<td>103</td>
<td>4</td>
</tr>
<tr>
<td>Errazuriz</td>
<td>147</td>
<td>100</td>
<td>2</td>
</tr>
<tr>
<td>Ande</td>
<td>166</td>
<td>147</td>
<td>3</td>
</tr>
<tr>
<td>Banda</td>
<td>167</td>
<td>147</td>
<td>3</td>
</tr>
</tbody>
</table>
...  

In the hr.employees table, the employee Steven King is the head of the company and has no manager. Among his employees is John Russell, who is the manager of department 80. If you update the employees table to set Russell as King's manager, you create a loop in the data:

```sql
UPDATE employees SET manager_id = 145
  WHERE employee_id = 100;
```

```sql
SELECT last_name "Employee",
    LEVEL, SYS_CONNECT_BY_PATH(last_name, '/') "Path"
FROM employees
WHERE level <= 3 AND department_id = 80
  START WITH last_name = 'King'
  CONNECT BY PRIOR employee_id = manager_id AND LEVEL <= 4;
```

ERROR:
ORA-01436: CONNECT BY loop in user data

The NOCYCLE parameter in the CONNECT BY condition causes Oracle to return the rows in spite of the loop. The CONNECT_BY_ISCYCLE pseudocolumn shows you which rows contain the cycle:

```sql
SELECT last_name "Employee", CONNECT_BY_ISCYCLE "Cycle",
    LEVEL, SYS_CONNECT_BY_PATH(last_name, '/') "Path"
FROM employees
WHERE level <= 3 AND department_id = 80
  START WITH last_name = 'King'
  CONNECT BY PRIOR employee_id = manager_id AND LEVEL <= 4;
```
CONNECT BY NOCYCLE PRIOR employee_id = manager_id AND LEVEL <= 4
ORDER BY "Employee", "Cycle", LEVEL, "Path";

<table>
<thead>
<tr>
<th>Employee</th>
<th>Cycle</th>
<th>LEVEL</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abel</td>
<td>0</td>
<td>3</td>
<td>/King/Zlotkey/Abel</td>
</tr>
<tr>
<td>Ande</td>
<td>0</td>
<td>3</td>
<td>/King/Errazuriz/Ande</td>
</tr>
<tr>
<td>Banda</td>
<td>0</td>
<td>3</td>
<td>/King/Errazuriz/Banda</td>
</tr>
<tr>
<td>Bates</td>
<td>0</td>
<td>3</td>
<td>/King/Cambrault/Bates</td>
</tr>
<tr>
<td>Bernstein</td>
<td>0</td>
<td>3</td>
<td>/King/Russell/Bernstein</td>
</tr>
<tr>
<td>Bloom</td>
<td>0</td>
<td>3</td>
<td>/King/Cambrault/Bloom</td>
</tr>
<tr>
<td>Cambrault</td>
<td>0</td>
<td>2</td>
<td>/King/Cambrault</td>
</tr>
<tr>
<td>Cambrault</td>
<td>0</td>
<td>3</td>
<td>/King/Russell/Cambrault</td>
</tr>
<tr>
<td>Doran</td>
<td>0</td>
<td>3</td>
<td>/King/Partners/Doran</td>
</tr>
<tr>
<td>Errazuriz</td>
<td>0</td>
<td>2</td>
<td>/King/Errazuriz</td>
</tr>
<tr>
<td>Fox</td>
<td>0</td>
<td>3</td>
<td>/King/Cambrault/Fox</td>
</tr>
</tbody>
</table>

CONNECT_BY_ISLEAF Example

The following statement shows how you can use a hierarchical query to turn the values in a column into a comma-delimited list:

```sql
SELECT LTRIM(SYS_CONNECT_BY_PATH (warehouse_id,','),',') FROM
(SELECT ROWNUM r, warehouse_id FROM warehouses)
WHERE CONNECT_BY_ISLEAF = 1
START WITH r = 1
CONNECT BY r = PRIOR r + 1
ORDER BY warehouse_id;
```

LTRIM(SYS_CONNECT_BY_PATH(WAREHOUSE_ID,','),',')

```
1,2,3,4,5,6,7,8,9
```

CONNECT_BY_ROOT Examples

The following example returns the last name of each employee in department 110, each manager at the highest level above that employee in the hierarchy, the number of levels between manager and employee, and the path between the two:

```sql
SELECT last_name "Employee", CONNECT_BY_ROOT last_name "Manager", LEVEL-1 "Pathlen", SYS_CONNECT_BY_PATH(last_name, '/') "Path"
FROM employees
WHERE LEVEL > 1 and department_id = 110
CONNECT BY PRIOR employee_id = manager_id
ORDER BY "Employee", "Manager", "Pathlen", "Path";
```

<table>
<thead>
<tr>
<th>Employee</th>
<th>Manager</th>
<th>Pathlen</th>
<th>Path</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gietz</td>
<td>Higgins</td>
<td>1</td>
<td>/Higgins/Gietz</td>
</tr>
<tr>
<td>Gietz</td>
<td>King</td>
<td>3</td>
<td>/King/Kochhar/Gietz</td>
</tr>
<tr>
<td>Gietz</td>
<td>Kochhar</td>
<td>2</td>
<td>/Kochhar/Gietz</td>
</tr>
<tr>
<td>Higgins</td>
<td>King</td>
<td>2</td>
<td>/King/Kochhar/Higgins</td>
</tr>
<tr>
<td>Higgins</td>
<td>Kochhar</td>
<td>1</td>
<td>/Kochhar/Higgins</td>
</tr>
</tbody>
</table>

The following example uses a GROUP BY clause to return the total salary of each employee in department 110 and all employees above that employee in the hierarchy:

```sql
SELECT name, SUM(salary) "Total_Salary" FROM
(SELECT CONNECT_BY_ROOT last_name as name, Salary
FROM employees
GROUP BY name)
```

Chapter 9
Hierarchical Queries

9-7
WHERE department_id = 110
CONNECT BY PRIOR employee_id = manager_id)
GROUP BY name
ORDER BY name, "Total_Salary";

<table>
<thead>
<tr>
<th>NAME</th>
<th>Total_Salary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gietz</td>
<td>8300</td>
</tr>
<tr>
<td>Higgins</td>
<td>20300</td>
</tr>
<tr>
<td>King</td>
<td>20300</td>
</tr>
<tr>
<td>Kochhar</td>
<td>20300</td>
</tr>
</tbody>
</table>

- **LEVEL Pseudocolumn** and **CONNECT_BY_ISCYCLE Pseudocolumn** for a discussion of how these pseudocolumns operate in a hierarchical query
- **SYS_CONNECT_BY_PATH** for information on retrieving the path of column values from root to node
- **order_by_clause** for more information on the SIBLINGS keyword of ORDER BY clauses
- **subquery factoring clause**, which supports recursive subquery factoring (recursive WITH) and lets you query hierarchical data. This feature is more powerful than CONNECT BY in that it provides depth-first search and breadth-first search, and supports multiple recursive branches.

9.4 The UNION [ALL], INTERSECT, MINUS Operators

You can combine multiple queries using the set operators **UNION**, **UNION ALL**, **INTERSECT**, and **MINUS**. All set operators have equal precedence. If a SQL statement contains multiple set operators, then Oracle Database evaluates them from the left to right unless parentheses explicitly specify another order.

The corresponding expressions in the select lists of the component queries of a compound query must match in number and must be in the same data type group (such as numeric or character).

If component queries select character data, then the data type of the return values are determined as follows:

- If both queries select values of data type **CHAR** of equal length, then the returned values have data type **CHAR** of that length. If the queries select values of **CHAR** with different lengths, then the returned value is **VARCHAR2** with the length of the larger **CHAR** value.
- If either or both of the queries select values of data type **VARCHAR2**, then the returned values have data type **VARCHAR2**.

If component queries select numeric data, then the data type of the return values is determined by numeric precedence:
• If any query selects values of type **BINARY_DOUBLE**, then the returned values have data type **BINARY_DOUBLE**.

• If no query selects values of type **BINARY_DOUBLE** but any query selects values of type **BINARY_FLOAT**, then the returned values have data type **BINARY_FLOAT**.

• If all queries select values of type **NUMBER**, then the returned values have data type **NUMBER**.

In queries using set operators, Oracle does not perform implicit conversion across data type groups. Therefore, if the corresponding expressions of component queries resolve to both character data and numeric data, Oracle returns an error.

### See Also:

- Table 2-8 for more information on implicit conversion and "Numeric Precedence" for information on numeric precedence

### Examples

The following query is valid:

```sql
SELECT 3 FROM DUAL
INTERSECT
SELECT 3f FROM DUAL;
```

This is implicitly converted to the following compound query:

```sql
SELECT TO_BINARY_FLOAT(3) FROM DUAL
INTERSECT
SELECT 3f FROM DUAL;
```

The following query returns an error:

```sql
SELECT '3' FROM DUAL
INTERSECT
SELECT 3f FROM DUAL;
```

### Restrictions on the Set Operators

The set operators are subject to the following restrictions:

- The set operators are not valid on columns of type **BLOB**, **CLOB**, **BFILE**, **VARRAY**, or nested table.

- The **UNION**, **INTERSECT**, and **MINUS** operators are not valid on **LONG** columns.

- If the select list preceding the set operator contains an expression, then you must provide a column alias for the expression in order to refer to it in the **order_by_clause**.

- You cannot also specify the **for_update_clause** with the set operators.

- You cannot specify the **order_by_clause** in the **subquery** of these operators.

- You cannot use these operators in **SELECT** statements containing **TABLE** collection expressions.
Note:

To comply with emerging SQL standards, a future release of Oracle will give the `INTERSECT` operator greater precedence than the other set operators. Therefore, you should use parentheses to specify order of evaluation in queries that use the `INTERSECT` operator with other set operators.

**UNION Example**

The following statement combines the results of two queries with the `UNION` operator, which eliminates duplicate selected rows. This statement shows that you must match data type (using the `TO_CHAR` function) when columns do not exist in one or the other table:

```sql
SELECT location_id, department_name "Department",
       TO_CHAR(NULL) "Warehouse" FROM departments
UNION
SELECT location_id, TO_CHAR(NULL) "Department", warehouse_name
       FROM warehouses;
```

<table>
<thead>
<tr>
<th>LOCATION_ID</th>
<th>Department</th>
<th>Warehouse</th>
</tr>
</thead>
<tbody>
<tr>
<td>1400</td>
<td>IT</td>
<td></td>
</tr>
<tr>
<td>1400</td>
<td></td>
<td>Southlake, Texas</td>
</tr>
<tr>
<td>1500</td>
<td>Shipping</td>
<td></td>
</tr>
<tr>
<td>1500</td>
<td></td>
<td>San Francisco</td>
</tr>
<tr>
<td>1600</td>
<td></td>
<td>New Jersey</td>
</tr>
<tr>
<td>1700</td>
<td>Accounting</td>
<td></td>
</tr>
<tr>
<td>1700</td>
<td>Administration</td>
<td></td>
</tr>
<tr>
<td>1700</td>
<td>Benefits</td>
<td></td>
</tr>
<tr>
<td>1700</td>
<td>Construction</td>
<td></td>
</tr>
<tr>
<td>1700</td>
<td>Contracting</td>
<td></td>
</tr>
<tr>
<td>1700</td>
<td>Control And Credit</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**UNION ALL Example**

The `UNION` operator returns only distinct rows that appear in either result, while the `UNION ALL` operator returns all rows. The `UNION ALL` operator does not eliminate duplicate selected rows:

```sql
SELECT product_id FROM order_items
UNION ALL
SELECT product_id FROM inventories
ORDER BY product_id;
```

```sql
SELECT location_id FROM locations
UNION ALL
SELECT location_id FROM departments
ORDER BY location_id;
```

A `location_id` value that appears multiple times in either or both queries (such as '1700') is returned only once by the `UNION` operator, but multiple times by the `UNION ALL` operator.
INTERSECT Example

The following statement combines the results with the `INTERSECT` operator, which returns only those unique rows returned by both queries:

```sql
SELECT product_id FROM inventories
INTERSECT
SELECT product_id FROM order_items
ORDER BY product_id;
```

MINUS Example

The following statement combines results with the `MINUS` operator, which returns only unique rows returned by the first query but not by the second:

```sql
SELECT product_id FROM inventories
MINUS
SELECT product_id FROM order_items
ORDER BY product_id;
```

9.5 Sorting Query Results

Use the `ORDER BY` clause to order the rows selected by a query. Sorting by position is useful in the following cases:

- To order by a lengthy select list expression, you can specify its position in the `ORDER BY` clause rather than duplicate the entire expression.
- For compound queries containing set operators `UNION`, `INTERSECT`, `MINUS`, or `UNION ALL`, the `ORDER BY` clause must specify positions or aliases rather than explicit expressions. Also, the `ORDER BY` clause can appear only in the last component query. The `ORDER BY` clause orders all rows returned by the entire compound query.

The mechanism by which Oracle Database sorts character values for the `ORDER BY` clause, also known as the collation, is specified by the `NLS_SORT` session parameter. If this parameter is not set, then its default is derived from the `NLS_LANGUAGE` session parameter. You can change the collation dynamically using the `ALTER SESSION SET` `NLS_SORT` statement. You can also apply a specific collation by including the character expressions to be sorted as arguments to the `NLSSORT` function, with the collation specified in the second parameter.

When character values are compared linguistically for the `ORDER BY` clause, they are first transformed to collation keys and then compared like `RAW` values. The collation keys are generated either explicitly as specified in `NLSSORT` or implicitly using the same method that `NLSSORT` uses. Both explicitly and implicitly generated collation keys are subject to the same restrictions that are described in "`NLSSORT`". As a result of these restrictions, two values may compare as linguistically equal if they do not differ in the prefix that was used to produce the collation key, even if they differ in the rest of the value.
9.6 Joins

A join is a query that combines rows from two or more tables, views, or materialized views. Oracle Database performs a join whenever multiple tables appear in the FROM clause of the query. The select list of the query can select any columns from any of these tables. If any two of these tables have a column name in common, then you must qualify all references to these columns throughout the query with table names to avoid ambiguity.

9.6.1 Join Conditions

Most join queries contain at least one join condition, either in the FROM clause or in the WHERE clause. The join condition compares two columns, each from a different table. To execute a join, Oracle Database combines pairs of rows, each containing one row from each table, for which the join condition evaluates to TRUE. The columns in the join conditions need not also appear in the select list.

To execute a join of three or more tables, Oracle first joins two of the tables based on the join conditions comparing their columns and then joins the result to another table based on join conditions containing columns of the joined tables and the new table. Oracle continues this process until all tables are joined into the result. The optimizer determines the order in which Oracle joins tables based on the join conditions, indexes on the tables, and, any available statistics for the tables.

A WHERE clause that contains a join condition can also contain other conditions that refer to columns of only one table. These conditions can further restrict the rows returned by the join query.

Note:

You cannot specify LOB columns in the WHERE clause if the WHERE clause contains the join condition. The use of LOBs in WHERE clauses is also subject to other restrictions. See Oracle Database SecureFiles and Large Objects Developer's Guide for more information.

9.6.2 Equijoins

An equijoin is a join with a join condition containing an equality operator. An equijoin combines rows that have equivalent values for the specified columns. Depending on the internal algorithm the optimizer chooses to execute the join, the total size of the columns in the equijoin condition in a single table may be limited to the size of a data block minus some overhead. The size of a data block is specified by the initialization parameter DB_BLOCK_SIZE.
9.6.3 Band Joins

A band join is a special type of nonequijoin in which key values in one data set must fall within the specified range ("band") of the second data set. The same table can serve as both the first and second data sets.

See Also:
- Database SQL Tuning Guide for more information on band joins
- USE_BAND Hint
- NO_USE_BAND Hint

9.6.4 Self Joins

A self join is a join of a table to itself. This table appears twice in the FROM clause and is followed by table aliases that qualify column names in the join condition. To perform a self join, Oracle Database combines and returns rows of the table that satisfy the join condition.

See Also:
- "Using Self Joins: Example"

9.6.5 Cartesian Products

If two tables in a join query have no join condition, then Oracle Database returns their Cartesian product. Oracle combines each row of one table with each row of the other. A Cartesian product always generates many rows and is rarely useful. For example, the Cartesian product of two tables, each with 100 rows, has 10,000 rows. Always include a join condition unless you specifically need a Cartesian product. If a query joins three or more tables and you do not specify a join condition for a specific pair, then the optimizer may choose a join order that avoids producing an intermediate Cartesian product.

9.6.6 Inner Joins

An inner join (sometimes called a simple join) is a join of two or more tables that returns only those rows that satisfy the join condition.
9.6.7 Outer Joins

An **outer join** extends the result of a simple join. An outer join returns all rows that satisfy the join condition and also returns some or all of those rows from one table for which no rows from the other satisfy the join condition.

- To write a query that performs an outer join of tables A and B and returns all rows from A (a **left outer join**), use the `LEFT [OUTER] JOIN` syntax in the `FROM` clause, or apply the outer join operator (+) to all columns of B in the join condition in the `WHERE` clause. For all rows in A that have no matching rows in B, Oracle Database returns null for any select list expressions containing columns of B.

- To write a query that performs an outer join of tables A and B and returns all rows from B (a **right outer join**), use the `RIGHT [OUTER] JOIN` syntax in the `FROM` clause, or apply the outer join operator (+) to all columns of A in the join condition in the `WHERE` clause. For all rows in B that have no matching rows in A, Oracle returns null for any select list expressions containing columns of A.

- To write a query that performs an outer join and returns all rows from A and B, extended with nulls if they do not satisfy the join condition (a **full outer join**), use the `FULL [OUTER] JOIN` syntax in the `FROM` clause.

You cannot compare a column with a subquery in the `WHERE` clause of any outer join, regardless which form you specify.

You can use outer joins to fill gaps in sparse data. Such a join is called a **partitioned outer join** and is formed using the `query_partition_clause` of the `join_clause` syntax. Sparse data is data that does not have rows for all possible values of a dimension such as time or department. For example, tables of sales data typically do not have rows for products that had no sales on a given date. Filling data gaps is useful in situations where data sparsity complicates analytic computation or where some data might be missed if the sparse data is queried directly.

---

**See Also:**

- `join_clause` for more information about using outer joins to fill gaps in sparse data
- `Oracle Database Data Warehousing Guide` for a complete discussion of group outer joins and filling gaps in sparse data

Oracle recommends that you use the `FROM clause OUTER JOIN syntax` rather than the Oracle join operator. Outer join queries that use the Oracle join operator (+) are subject to the following rules and restrictions, which do not apply to the `FROM clause OUTER JOIN syntax`:

- You cannot specify the (+) operator in a query block that also contains `FROM clause join syntax`.

- The (+) operator can appear only in the `WHERE` clause or, in the context of left-correlation (when specifying the `TABLE clause`) in the `FROM` clause, and can be applied only to a column of a table or view.
• If A and B are joined by multiple join conditions, then you must use the (+) operator in all of these conditions. If you do not, then Oracle Database will return only the rows resulting from a simple join, but without a warning or error to advise you that you do not have the results of an outer join.

• The (+) operator does not produce an outer join if you specify one table in the outer query and the other table in an inner query.

• You cannot use the (+) operator to outer-join a table to itself, although self joins are valid. For example, the following statement is not valid:

```
-- The following statement is not valid:
SELECT employee_id, manager_id
FROM employees
WHERE employees.manager_id(+) = employees.employee_id;
```

However, the following self join is valid:

```
SELECT e1.employee_id, e1.manager_id, e2.employee_id
FROM employees e1, employees e2
WHERE e1.manager_id(+) = e2.employee_id
ORDER BY e1.employee_id, e1.manager_id, e2.employee_id;
```

• The (+) operator can be applied only to a column, not to an arbitrary expression. However, an arbitrary expression can contain one or more columns marked with the (+) operator.

• A WHERE condition containing the (+) operator cannot be combined with another condition using the OR logical operator.

• A WHERE condition cannot use the IN comparison condition to compare a column marked with the (+) operator with an expression.

If the WHERE clause contains a condition that compares a column from table B with a constant, then the (+) operator must be applied to the column so that Oracle returns the rows from table A for which it has generated nulls for this column. Otherwise Oracle returns only the results of a simple join.

In previous releases of Oracle Database, in a query that performed outer joins of more than two pairs of tables, a single table could be the null-generated table for only one other table. Beginning with Oracle Database 12c, a single table can be the null-generated table for multiple tables. For example, the following statement is allowed in Oracle Database 12c:

```
SELECT * FROM A, B, D
WHERE A.c1 = B.c2(+) and D.c3 = B.c4(+);
```

In this example, B, the null-generated table, is outer-joined to two tables, A and D. Refer to SELECT for the syntax for an outer join.

### 9.6.8 Antijoins

An antijoin returns rows from the left side of the predicate for which there are no corresponding rows on the right side of the predicate. It returns rows that fail to match (NOT IN) the subquery on the right side.
9.6.9 Semijoins

A semijoin returns rows that match an `EXISTS` subquery without duplicating rows from the left side of the predicate when multiple rows on the right side satisfy the criteria of the subquery.

Semijoin and antijoin transformation cannot be done if the subquery is on an `OR` branch of the `WHERE` clause.

9.7 Using Subqueries

A subquery answers multiple-part questions. For example, to determine who works in Taylor's department, you can first use a subquery to determine the department in which Taylor works. You can then answer the original question with the parent `SELECT` statement. A subquery in the `FROM` clause of a `SELECT` statement is also called an inline view. You can nest any number of subqueries in an inline view. A subquery in the `WHERE` clause of a `SELECT` statement is also called a nested subquery. You can nest up to 255 levels of subqueries in the a nested subquery.

A subquery can contain another subquery. Oracle Database imposes no limit on the number of subquery levels in the `FROM` clause of the top-level query. You can nest up to 255 levels of subqueries in the `WHERE` clause.

If columns in a subquery have the same name as columns in the containing statement, then you must prefix any reference to the column of the table from the containing statement with the table name or alias. To make your statements easier to read, always qualify the columns in a subquery with the name or alias of the table, view, or materialized view.

Oracle performs a correlated subquery when a nested subquery references a column from a table referred to a parent statement one or more levels above the subquery or nested subquery. The parent statement can be a `SELECT`, `UPDATE`, or `DELETE` statement in which the subquery is nested. A correlated subquery conceptually is evaluated once for each row processed by the parent statement. However, the optimizer may choose to rewrite the query as a join or use some other technique to formulate a query that is semantically equivalent. Oracle resolves unqualified columns in the subquery by looking in the tables named in the subquery and then in the tables named in the parent statement.

A correlated subquery answers a multiple-part question whose answer depends on the value in each row processed by the parent statement. For example, you can use a correlated subquery to determine which employees earn more than the average...
salaries for their departments. In this case, the correlated subquery specifically computes the average salary for each department.

**See Also:**
"Using Correlated Subqueries: Examples"

Use subqueries for the following purposes:

- To define the set of rows to be inserted into the target table of an `INSERT` or `CREATE TABLE` statement
- To define the set of rows to be included in a view or materialized view in a `CREATE VIEW` or `CREATE MATERIALIZED VIEW` statement
- To define one or more values to be assigned to existing rows in an `UPDATE` statement
- To provide values for conditions in a `WHERE` clause, `HAVING` clause, or `START WITH` clause of `SELECT`, `UPDATE`, and `DELETE` statements
- To define a table to be operated on by a containing query

You do this by placing the subquery in the `FROM` clause of the containing query as you would a table name. You may use subqueries in place of tables in this way as well in `INSERT`, `UPDATE`, and `DELETE` statements.

Subqueries so used can employ correlation variables, both defined within the subquery itself and those defined in query blocks containing the subquery. Refer to `table_collection_expression` for more information.

Scalar subqueries, which return a single column value from a single row, are a valid form of expression. You can use scalar subquery expressions in most of the places where `expr` is called for in syntax. Refer to "Scalar Subquery Expressions " for more information.

## 9.8 Unnesting of Nested Subqueries

Subqueries are nested when they appear in the `WHERE` clause of the parent statement. When Oracle Database evaluates a statement with a nested subquery, it must evaluate the subquery portion multiple times and may overlook some efficient access paths or joins.

**Subquery unnesting** unnests and merges the body of the subquery into the body of the statement that contains it, allowing the optimizer to consider them together when evaluating access paths and joins. The optimizer can unnest most subqueries, with some exceptions. Those exceptions include hierarchical subqueries and subqueries that contain a `ROWNUM` pseudocolumn, one of the set operators, a nested aggregate function, or a correlated reference to a query block that is not the immediate outer query block of the subquery.

Assuming no restrictions exist, the optimizer automatically unnests some (but not all) of the following nested subqueries:

- Uncorrelated `IN` subqueries
• IN and EXISTS correlated subqueries, as long as they do not contain aggregate functions or a GROUP BY clause

You can enable extended subquery unnesting by instructing the optimizer to unnest additional types of subqueries:

• You can unnest an uncorrelated NOT IN subquery by specifying the HASH_AJ or MERGE_AJ hint in the subquery.

• You can unnest other subqueries by specifying the UNNEST hint in the subquery.

See Also:

“Hints” for information on hints

9.9 Selecting from the DUAL Table

DUAL is a table automatically created by Oracle Database along with the data dictionary. DUAL is in the schema of the user SYS but is accessible by the name DUAL to all users. It has one column, DUMMY, defined to be VARCHAR2 (1), and contains one row with a value X. Selecting from the DUAL table is useful for computing a constant expression with the SELECT statement. Because DUAL has only one row, the constant is returned only once. Alternatively, you can select a constant, pseudocolumn, or expression from any table, but the value will be returned as many times as there are rows in the table. Refer to "About SQL Functions" for many examples of selecting a constant value from DUAL.

Note:

Beginning with Oracle Database 10g Release 1, logical I/O is not performed on the DUAL table when computing an expression that does not include the DUMMY column. This optimization is listed as FAST DUAL in the execution plan. If you SELECT the DUMMY column from DUAL, then this optimization does not take place and logical I/O occurs.

9.10 Distributed Queries

The Oracle distributed database management system architecture lets you access data in remote databases using Oracle Net and an Oracle Database server. You can identify a remote table, view, or materialized view by appending @dblink to the end of its name. The dblink must be a complete or partial name for a database link to the database containing the remote table, view, or materialized view.

See Also:

References to Objects in Remote Databases for more information on referring to database links
Restrictions on Distributed Queries

Distributed queries are currently subject to the restriction that all tables locked by a `FOR UPDATE` clause and all tables with `LONG` columns selected by the query must be located on the same database. In addition, Oracle Database currently does not support distributed queries that select user-defined types or object `REF` data types on remote tables.
This chapter lists the various types of SQL statements and then describes the first set (in alphabetical order) of SQL statements. The remaining SQL statements appear in alphabetical order in the subsequent chapters.

This chapter contains the following sections:

• Types of SQL Statements
• How the SQL Statement Chapters are Organized
• ADMINISTER KEY MANAGEMENT
• ALTER ANALYTIC VIEW
• ALTER ATTRIBUTE DIMENSION
• ALTER AUDIT POLICY (Unified Auditing)
• ALTER CLUSTER
• ALTER DATABASE
• ALTER DATABASE LINK
• ALTER DIMENSION
• ALTER DISKGROUP
• ALTER FLASHBACK ARCHIVE
• ALTER FUNCTION
• ALTER HIERARCHY
• ALTER INDEX
• ALTER INDEXTYPE
• ALTER INMEMORY JOIN GROUP
• ALTER JAVA

10.1 Types of SQL Statements

The lists in the following sections provide a functional summary of SQL statements and are divided into these categories:

• Data Definition Language (DDL) Statements
• Data Manipulation Language (DML) Statements
• Transaction Control Statements
• Session Control Statements
• System Control Statement
10.1.1 Data Definition Language (DDL) Statements

Data definition language (DDL) statements let you to perform these tasks:

- Create, alter, and drop schema objects
- Grant and revoke privileges and roles
- Analyze information on a table, index, or cluster
- Establish auditing options
- Add comments to the data dictionary

The `CREATE`, `ALTER`, and `DROP` commands require exclusive access to the specified object. For example, an `ALTER TABLE` statement fails if another user has an open transaction on the specified table.

The `GRANT`, `REVOKE`, `ANALYZE`, `AUDIT`, and `COMMENT` commands do not require exclusive access to the specified object. For example, you can analyze a table while other users are updating the table.

Oracle Database implicitly commits the current transaction before and after every DDL statement.

A DDL statement is either blocking or nonblocking, and both types of DDL statements require exclusive locks on internal structures.

---

**See Also:**

Oracle Database Development Guide to learn about the difference between blocking and nonblocking DDL

Many DDL statements may cause Oracle Database to recompile or reauthorize schema objects. For information on how Oracle Database recompiles and reauthorizes schema objects and the circumstances under which a DDL statement would cause this, see Oracle Database Concepts.

DDL statements are supported by PL/SQL with the use of the DBMS_SQL package.

---

**See Also:**

Oracle Database PL/SQL Packages and Types Reference for more information about this package

The DDL statements are:

`ALTER ...` (All statements beginning with `ALTER`, except `ALTER SESSION` and `ALTER SYSTEM`—see "Session Control Statements" and "System Control Statement")

`ANALYZE`

`ASSOCIATE STATISTICS`
10.1.2 Data Manipulation Language (DML) Statements

Data manipulation language (DML) statements access and manipulate data in existing schema objects. These statements do not implicitly commit the current transaction. The data manipulation language statements are:

- CALL
- DELETE
- EXPLAIN PLAN
- INSERT
- LOCK TABLE
- MERGE
- SELECT
- UPDATE

The SELECT statement is a limited form of DML statement in that it can only access data in the database. It cannot manipulate data stored in the database, although it can manipulate the accessed data before returning the results of the query.

The SELECT statement is supported in PL/SQL only when executed dynamically. However, you can use the similar PL/SQL statement SELECT INTO in PL/SQL code, and you do not have to execute it dynamically. The CALL and EXPLAIN PLAN statements are supported in PL/SQL only when executed dynamically. All other DML statements are fully supported in PL/SQL.

10.1.3 Transaction Control Statements

Transaction control statements manage changes made by DML statements. The transaction control statements are:

- COMMIT
- ROLLBACK
- SAVEPOINT
- SET TRANSACTION
- SET CONSTRAINT

All transaction control statements, except certain forms of the COMMIT and ROLLBACK commands, are supported in PL/SQL. For information on the restrictions, see COMMIT and ROLLBACK.
10.1.4 Session Control Statements

Session control statements dynamically manage the properties of a user session. These statements do not implicitly commit the current transaction.

PL/SQL does not support session control statements. The session control statements are:

\[
\text{ALTER SESSION} \\
\text{SET ROLE}
\]

10.1.5 System Control Statement

The single system control statement, ALTER SYSTEM, dynamically manages the properties of an Oracle Database instance. This statement does not implicitly commit the current transaction and is not supported in PL/SQL.

10.1.6 Embedded SQL Statements

Embedded SQL statements place DDL, DML, and transaction control statements within a procedural language program. Embedded SQL is supported by the Oracle precompilers and is documented in the following books:

- Pro*COBOL Programmer's Guide
- Pro*C/C++ Programmer's Guide

10.2 How the SQL Statement Chapters are Organized

All SQL statements in this book are organized into the following sections:

**Syntax**

The syntax diagrams show the keywords and parameters that make up the statement.

**Note:**

Not all keywords and parameters are valid in all circumstances. Be sure to refer to the "Semantics" section of each statement and clause to learn about any restrictions on the syntax.

**Purpose**

The "Purpose" section describes the basic uses of the statement.

**Prerequisites**

The "Prerequisites" section lists privileges you must have and steps that you must take before using the statement. In addition to the prerequisites listed, most statements also require that the database be opened by your instance, unless otherwise noted.
10.3 ADMINISTER KEY MANAGEMENT

Purpose
The ADMINISTER KEY MANAGEMENT statement provides a unified key management interface for Transparent Data Encryption. Use this statement to:

- Manage software and hardware keystores
- Manage encryption keys
- Manage secrets

Prerequisites
You must have the ADMINISTER KEY MANAGEMENT or SYSKM system privilege.

To specify the CONTAINER clause, you must be connected to a multitenant container database (CDB). To specify CONTAINER = ALL, the current container must be the root and you must have the commonly granted ADMINISTER KEY MANAGEMENT or SYSKM privilege.

Syntax

```
administer_key_management ::= 
```

```
(keystore_management_clauses ::=, key_management_clauses ::=,
  secret_management_clauses ::=)
```
keystore_management_clauses::=

(create_keystore::=, open_keystore::=, close_keystore::=, backup_keystore::=, alter_keystore_password::=, merge_into_new_keystore::=, merge_intoExisting_keystore::=)

create_keystore::=

CREATE KEYSTORE 'keystore_location' LOCAL AUTO_LOGIN KEYSTORE FROM KEYSTORE 'keystore_location' IDENTIFIED BY keystore_password

FORCE KEYSTORE
IDENTIFIED BY
EXTERNAL STORE
keystore_password
WITH BACKUP
USING 'backup_identifier'

Semantics

keystore_management_clauses

Use these clauses to perform the following keystore management operations:

- Create a software keystore
- Open and close a software keystore or a hardware keystore
- Back up a password-based software keystore
- Change the password of a password-based software keystore
- Merge two existing software keystores into a new password-based software keystore
• Merge one existing software keystore into an existing password-based software keystore

`create_keystore`

This clause lets you create the following types of software keystores: password-based software keystores and auto-login software keystores. To issue this clause in a multitenant environment, you must be connected to the root.

**CREATE KEYSTORE**

Specify this clause to create a password-based software keystore.

- For `keystore_location`, specify the full path name of the software keystore directory. The keystore will be created in this directory in a file named `ewallet.p12`. Refer to *Oracle Database Advanced Security Guide* to learn how to determine the software keystore directory for your system.
- Use the `IDENTIFIED BY` clause to set the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

**CREATE [ LOCAL ] AUTO_LOGIN KEYSTORE**

Specify this clause to create an auto-login software keystore. An auto-login software keystore is created from an existing password-based software keystore. The auto-login keystore has a system-generated password. It is stored in a PKCS#12-based file named `cwallet.sso` in the same directory as the password-based software keystore.

- By default, Oracle creates an auto-login keystore, which can be opened from computers other than the computer on which the keystore resides. If you specify the `LOCAL` keyword, then Oracle Database creates a local auto-login keystore, which can be opened only from the computer on which the keystore resides.
- For `keystore_location`, specify the full path name of the directory in which the existing password-based software keystore resides. The password-based software keystore can be open or closed.
- Use the `IDENTIFIED BY` clause to specify the password for the existing password-based software keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

**Restriction on Creating Keystores**

You can create at most one password-based software keystore and one auto-login software keystore, either local or not, in any single directory.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on creating software keystores

`open_keystore`

This clause lets you open a password-based software keystore or a hardware keystore.
Note:

You do not need to use this clause to open auto-login and local auto-login software keystores because they are opened automatically when they are required—that is, when the master encryption key is accessed.

- The `FORCE KEYSTORE` clause is useful when opening a keystore in a PDB. It ensures that the CDB root keystore is open before opening the PDB keystore. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- Use the `IDENTIFIED BY` clause to specify the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.
- The `CONTAINER` clause applies when you are connected to a CDB.
  - If the current container is a pluggable database (PDB), then specify `CONTAINER = CURRENT` to open the keystore in the PDB. The keystore must be open in the root before you open it in the PDB.
  - If the current container is the root, then specify `CONTAINER = CURRENT` to open the keystore in the root, or specify `CONTAINER = ALL` to open the keystore in the root and in all PDBs.
  - If you omit this clause, then `CONTAINER = CURRENT` is the default.

See Also:

*Oracle Database Advanced Security Guide* for more information on opening password-based software keystores and hardware keystores

**close_keystore**

This clause lets you close a password-based software keystore, an auto-login software keystore, or a hardware keystore. Closing a keystore disables all encryption and decryption operations. Any attempt to encrypt or decrypt data or access encrypted data results in an error.

- To close a password-based software keystore or a hardware keystore, specify the `IDENTIFIED BY` clause. Refer to "Notes on Specifying Keystore Passwords" for more information.
- To close an auto-login keystore, do not specify the `IDENTIFIED BY` clause. Before you close an auto-login keystore, check the `WALLET_TYPE` column of the `V$ENCRYPTION_WALLET` view. If it returns `AUTOLOGIN`, then you can close the keystore. Otherwise, if you attempt to close the keystore, then an error occurs.
- The `CONTAINER` clause applies when you are connected to a CDB.
  - If the current container is a PDB, then specify `CONTAINER = CURRENT` to close the keystore in the PDB.
  - If the current container is the root, then the `CONTAINER = CURRENT` and `CONTAINER = ALL` clauses have the same effect; both clauses close the keystore in the root and in all PDBs.
If you omit this clause, then CONTAINER = CURRENT is the default.

See Also:
Oracle Database Advanced Security Guide for more information on closing keystores

backup_keystore

This clause lets you back up a password-based software keystore. The keystore must be open.

• By default, Oracle Database creates a backup file with a name of the form ewallet_timestamp.p12, where timestamp is the file creation timestamp in UTC format. The optional USING 'backup_identifier' clause lets you specify a backup identifier which is added to the backup file name. For example, if you specify a backup identifier of 'Backup1', then Oracle Database creates a backup file with a name of the form ewallet_timestamp_Backup1.p12.

• The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• Use the IDENTIFIED BY clause to specify the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

• The optional TO 'keystore_location' clause lets you specify the directory in which the backup file is created. If you omit this clause, then the backup is created in the same directory as the keystore that you are backing up.

See Also:
Oracle Database Advanced Security Guide for more information on backing up password-based software keystores

alter_keystore_password

This clause lets you change the password for a password-based software keystore. The keystore must be open.

• The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• For old_keystore_password, specify the old password for the keystore. For new_keystore_password, specify the new password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

• The optional WITH BACKUP clause instructs the database to create a backup of the keystore before changing the password. Refer to "Notes on the WITH BACKUP Clause" for more information.
merge_into_new_keystore

This clause lets you merge two software keystores into a new keystore. The keys and attributes in the two constituent keystores are added to the new keystore. The constituent keystores can be password-based or auto-login (including local auto-login) software keystores; they can be open or closed. The new keystore is a password-based software keystore. It is in a closed state when the merge completes. Any or none of the keystores specified in this clause can be the keystore configured for use by the database.

- For **keystore1_location**, specify the full path name of the directory in which the first keystore resides.
- Specify **IDENTIFIED BY keystore1_password** only if the first keystore is a password-based software keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.
- For **keystore2_location**, specify the full path name of the directory in which the second keystore resides.
- Specify **IDENTIFIED BY keystore2_password** only if the second keystore is a password-based software keystore.
- For **keystore3_location**, specify the full path name of the directory in which the new keystore is created.
- For **keystore3_password**, specify the password for the new keystore.

merge_into_existing_keystore

This clause lets you merge a software keystore into another existing software keystore. The keys and attributes in the keystore from which you merge are added to the keystore into which you merge. The keystore from which you merge can be a password-based or auto-login (including local auto-login) software keystore; it can be open or closed. The keystore into which you merge must be a password-based software keystore. It can be open or closed when the merge begins. However, it will be in a closed state when the merge completes. Either or neither of the keystores specified in this clause can be the keystore configured for use by the database.

- For **keystore1_location**, specify the full path name of the directory in which the keystore from which you merge resides.
- Specify **IDENTIFIED BY keystore1_password** only if the keystore from which you merge is a password-based software keystore.
key_management_clauses

Use these clauses to perform the following key management operations:

- Create and activate a master encryption key
- Set the tag for an encryption key
- Export encryption keys from a keystore into a file
- Import encryption keys from a file into a keystore
- Migrate from a password-based software keystore to a hardware keystore
- Migrate from a hardware keystore to a password-based software keystore

set_key

This clause creates a new master encryption key and activates it. You can use this clause to create the first master encryption key in a keystore or to rotate (change) the master encryption key. If a master encryption key is active when you use this clause, then it is deactivated before the new master encryption key is activated. The keystore that contains the key can be a password-based software keystore or a hardware keystore. The keystore must be open.

- The ENCRYPTION keyword is optional and is provided for semantic clarity.
- Specify the optional USING TAG clause to associate a tag to the new master encryption key. Refer to "Notes on the USING TAG Clause" for more information.
- If you specify the USING ALGORITHM clause, then the database creates a master encryption key that conforms to the specified encryption algorithm. For encrypt_algorithm, you can specify AES256, ARIA256, GOST256, or SEED128. To specify this clause, the COMPATIBLE initialization parameter must be set to 12.2 or higher. If you omit this clause, then the default is AES256.

The ARIA, SEED, and GOST algorithms are country-specific national and government standards for encryption and hashing. See Oracle Database Security Guide for more information.

- The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
• Use the IDENTIFIED BY clause to specify the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

• Specify the WITH BACKUP clause, and optionally the USING 'backup_identifier' clause, to create a backup of the keystore before the new master encryption key is created. Refer to "Notes on the WITH BACKUP Clause" for more information.

• The CONTAINER clause applies when you are connected to a CDB.
  
  If the current container is a PDB, then specify CONTAINER = CURRENT to create and activate a new master encryption key in the PDB. A master encryption key must exist in the root before you create a master encryption key in the PDB.

  If the current container is the root, then specify CONTAINER = CURRENT to create and activate a new master encryption key in the root, or specify CONTAINER = ALL to create and activate new master encryption keys in the root and in all PDBs.

  If you omit this clause, then CONTAINER = CURRENT is the default.

See Also:

Oracle Database Advanced Security Guide for more information on creating and activating a master encryption key

create_key

This clause lets you create a master encryption key for later use. You can subsequently activate the key by using the use_key clause. The keystore that contains the key can be a password-based software keystore or a hardware keystore. The keystore must be open.

• The ENCRYPTION keyword is optional and is provided for semantic clarity.

• Specify the optional USING TAG clause to associate a tag to the encryption key. Refer to "Notes on the USING TAG Clause" for more information.

• If you specify the USING ALGORITHM clause, then the database creates a master encryption key that conforms to the specified encryption algorithm. For encrypt_algorithm, you can specify AES256, ARIA256, GOST256, or SEED128. To specify this clause, the COMPATIBLE initialization parameter must be set to 12.2 or higher. If you omit this clause, then the default is AES256.

  The ARIA, SEED, and GOST algorithms are country-specific national and government standards for encryption and hashing. See Oracle Database Security Guide for more information.

• The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• Use the IDENTIFIED BY clause to specify the password for the keystore in which the key will be created. Refer to "Notes on Specifying Keystore Passwords" for more information.

• Specify the WITH BACKUP clause, and optionally the USING 'backup_identifier' clause, to create a backup of the keystore before the key is created. Refer to "Notes on the WITH BACKUP Clause" for more information.

• The CONTAINER clause applies when you are connected to a CDB.
If the current container is a PDB, then specify `CONTAINER = CURRENT` to create a master encryption key in the PDB. A master encryption key must exist in the root before you create a master encryption key in the PDB.

If the current container is the root, then specify `CONTAINER = CURRENT` to create a master encryption key in the root, or specify `CONTAINER = ALL` to create master encryption keys in the root and in all PDBs.

If you omit this clause, then `CONTAINER = CURRENT` is the default.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on creating a master encryption key for later use.

**use_key**

This clause lets you activate a master encryption key that has already been created. If a master encryption key is active when you use this clause, then it is deactivated before the new master encryption key is activated. The keystore that contains the key can be a password-based software keystore or a hardware keystore. The keystore must be open.

- The `ENCRYPTION` keyword is optional and is provided for semantic clarity.
- For `key_id`, specify the identifier of the key that you want to activate. You can find the key identifier by querying the `KEY_ID` column of the `V$ENCRYPTION_KEY` view.
- Specify the optional `USING` `TAG` clause to associate a tag to the encryption key. Refer to "Notes on the USING TAG Clause" for more information.
- The `FORCE KEYSTORE` clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- Use the `IDENTIFIED BY` clause to specify the password for the keystore that contains the key. Refer to "Notes on Specifying Keystore Passwords" for more information.
- Specify the `WITH` `BACKUP` clause, and optionally the `USING` `backup_identifier` clause, to create a backup of the keystore before the key is activated. Refer to "Notes on the WITH BACKUP Clause" for more information.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on activating a master encryption key.

**set_key_tag**

This clause lets you set the tag for the specified encryption key. The tag is an optional, user-defined descriptor for the key. If the key has no tag, then use this clause to create a tag. If the key already has a tag, then use this clause to replace the tag. You can view encryption key tags by querying the `TAG` column of the `V$ENCRYPTION_KEY` view. The keystore must be open.
• For tag, specify an alphanumeric string. Enclose tag in single quotation marks.

• For key_id, specify the identifier of the encryption key. You can find the key identifier by querying the KEY_ID column of the V$ENCRYPTION_KEYS view.

• The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• Use the IDENTIFIED BY clause to specify the password for the keystore that contains the key. Refer to “Notes on Specifying Keystore Passwords” for more information.

• Specify the WITH BACKUP clause, and optionally the USING 'backup_identifier' clause, to create a backup of the keystore before you set the key tag. Refer to "Notes on the WITH BACKUP Clause" for more information.

See Also:
Oracle Database Advanced Security Guide for more information on setting a key tag

export_keys
Use this clause to export one or more encryption keys from a password-based software keystore into a file. The keystore must be open. Each encryption key is exported together with its key identifier and key attributes. The exported keys are protected in the file with a password (secret). You can subsequently import one or more of the keys into a password-based software keystore by using the import_keys clause.

• The ENCRYPTION keyword is optional and is provided for semantic clarity.

• Specify secret to set the password (secret) that protects the keys in the file. The secret is an alphanumeric string. You can optionally enclose the secret in double quotation marks. Quoted and nonquoted secrets are case sensitive.

• For filename, specify the full path name of the file to which the keys are to be exported. Enclose filename in single quotation marks.

• The FORCE KEYSTORE clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• Use the IDENTIFIED BY clause to specify the password for the keystore that contains the keys you want to export. Refer to "Notes on the WITH BACKUP Clause" for more information.

• Use the WITH IDENTIFIER IN clause to specify one or more encryption keys that you would like to export using one of the following methods:
  – Use key_id to specify the identifier of the encryption key you would like to export. You can specify more than one key_id in a comma-separated list. You can find key identifiers by querying the KEY_ID column of the V$ENCRYPTION_KEYS view.
  – Use subquery to specify a query that returns a list of key identifiers for the encryption keys you would like to export. For example, the following subquery returns the key identifiers for all encryption keys in the database whose tags begin with the string mytag:
SELECT KEY_ID FROM V$ENCRYPTION_KEYS WHERE TAG LIKE 'mytag%'

Be aware that Oracle Database executes subquery within the current user's rights and not with definer's rights.

– If you omit the WITH IDENTIFIER IN clause, then all encryption keys in the database are exported.

**Restriction on the WITH IDENTIFIER IN Clause**

In a multitenant environment, you cannot specify WITH IDENTIFIER IN when exporting keys from a PDB. This ensures that all of the keys in the PDB are exported, along with metadata about the active encryption key. If you subsequently clone the PDB, or unplug and plug in the PDB, then you can use the export file to import the keys into the cloned or newly plugged-in PDB and preserve information about the active encryption key.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on exporting encryption keys

**import_keys**

Use this clause to import one or more encryption keys from a file into a password-based software keystore. The keystore must be open. Each encryption key is imported together with its key identifier and key attributes. The keys must have been previously exported to the file by using the `export_keys` clause. You cannot re-import keys that have already been imported into the keystore.

- The `ENCRYPTION` keyword is optional and is provided for semantic clarity.
- For `secret`, specify the password (secret) that protects the keys in the file. The secret is an alphanumeric string. You can optionally enclose the secret in double quotation marks. Quoted and nonquoted secrets are case sensitive.
- For `filename`, specify the full path name of the file from which the keys are to be imported. Enclose `filename` in single quotation marks.
- The `FORCE KEYSTORE` clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- Use the `IDENTIFIED BY` clause to specify the password for the keystore into which you want to import the keys. Refer to "Notes on the WITH BACKUP Clause" for more information.
- Specify the `WITH BACKUP` clause, and optionally the `USING 'backup_identifier'` clause, to create a backup of the keystore before the keys are imported. Refer to "Notes on the WITH BACKUP Clause" for more information.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on importing encryption keys
**migrate_key**

Use this clause to migrate from a password-based software keystore to a hardware keystore. This clause decrypts existing table encryption keys and tablespace encryption keys with the master encryption key in the software keystore and then re-encrypts them with the newly created master encryption key in the hardware keystore.

**Note:**

The use of this clause is only one step in a series of steps for migrating from a password-based software keystore to a hardware keystore. Refer to *Oracle Database Advanced Security Guide* for the complete set of steps before you use this clause.

- The ENCRYPTION keyword is optional and is provided for semantic clarity.
- For `HSM_auth_string`, specify the hardware keystore password. Refer to "Notes on Specifying Keystore Passwords" for more information.
- The FORCE KEYSTORE clause enables this operation even if the keystores are closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- For `software_keystore_password`, specify the password-based software keystore password. Refer to "Notes on Specifying Keystore Passwords" for more information.
- Specify the WITH BACKUP clause, and optionally the USING 'backup_identifier' clause, to create a backup of the keystore before the migration occurs. Refer to "Notes on the WITH BACKUP Clause" for more information.

**reverse_migrate_key**

Use this clause to migrate from a hardware keystore to a password-based software keystore. This clause decrypts existing table encryption keys and tablespace encryption keys with the master encryption key in the hardware keystore and then re-encrypts them with the newly created master encryption key in the password-based software keystore.

**Note:**

The use of this clause is only one step in a series of steps for migrating from a hardware keystore to a password-based software keystore. Refer to *Oracle Database Advanced Security Guide* for the complete set of steps before you use this clause.

- The ENCRYPTION keyword is optional and is provided for semantic clarity.
- For `software_keystore_password`, specify the password-based software keystore password. Refer to "Notes on Specifying Keystore Passwords" for more information.
- The `FORCE KEYSTORE` clause enables this operation even if the keystores are closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- For `HSM_auth_string`, specify the hardware keystore password. Refer to "Notes on Specifying Keystore Passwords" for more information.

**secret_management_clauses**

Use these clauses to add, update, and delete secrets in a password-based software keystores or a hardware keystore.

**See Also:**

*Oracle Database Advanced Security Guide* for more information on adding, updating, and deleting secrets

**add_update_secret**

This clause lets you add a secret to a keystore or update an existing secret in a keystore. The keystore must be open.

- Specify `ADD` to add a secret to a keystore.
- Specify `UPDATE` to update an existing secret in a keystore.
- For `secret`, specify the secret to be added or updated. The secret is an alphanumeric string. Enclose the secret in single quotation marks.
- For `client_identifier`, specify an alphanumeric string used to identify the secret. Enclose `client_identifier` in single quotation marks. This value is case-sensitive. You can enter any of the following fixed values:
  - `TDE_WALLET` if the keystore was configured as `FILE`
  - `OKV_WALLET` if the keystore is for an Oracle Key Vault HSM
  - `HSM_WALLET` if the keystore is for a third-party HSM
- Specify the optional `USING TAG` clause to associate a tag to `secret`. The `tag` is an optional, user-defined descriptor for the secret. Enclose the tag in single quotation marks. You can view secret tags by querying the `SECRET_TAG` column of the `V$CLIENT_SECRETS` view.
- The `FORCE KEYSTORE` clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.
- Use the `IDENTIFIED BY` clause to specify the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.
- Specify the `WITH BACKUP` clause, and optionally the `USING 'backup_identifier'` clause, to create a backup of the keystore before adding or updating the secret in a password-based software keystore. Refer to "Notes on the WITH BACKUP Clause" for more information.

**delete_secret**

This clause lets you delete a secret from a keystore. The keystore must be open.
• For `client_identifier`, specify an alphanumeric string used to identify the secret. Enclose `client_identifier` in single quotation marks. You can view client identifiers by querying the `CLIENT` column of the `V$CLIENT_SECRETS` view.

• The `FORCE KEYSTORE` clause enables this operation even if the keystore is closed. Refer to "Notes on the FORCE KEYSTORE Clause" for more information.

• Use the `IDENTIFIED BY` clause to specify the password for the keystore. Refer to "Notes on Specifying Keystore Passwords" for more information.

• Specify the `WITH BACKUP` clause, and optionally the `USING 'backup_identifier'` clause, to create a backup of the keystore before deleting the secret from a password-based software keystore. Refer to "Notes on the WITH BACKUP Clause" for more information.

Notes on the USING TAG Clause

Many `ADMINISTER KEY MANAGEMENT` operations include the `USING TAG` clause, which lets you associate a tag to an encryption key. The `tag` is an optional, user-defined descriptor for the key. It is a character string enclosed in single quotation marks.

You can view encryption key tags by querying the `TAG` column of the `V$ENCRYPTION_KEYS` view.

Notes on the FORCE KEYSTORE Clause

The `FORCE KEYSTORE` clause enables a keystore operation even if the keystore is closed. The behavior of this clause depends on whether you are connected to a non-CDB, a CDB root, or a PDB:

• When you are connected to a non-CDB:
  – If the password-based software or hardware keystore is closed, then the database opens the password-based software or hardware keystore while the operation is performed and leaves it open, and then updates the auto-login keystore, if one exists, with the new information.
  – If the auto-login keystore is open, then the database opens the password-based software or hardware keystore temporarily while the operation is performed and updates the auto-login keystore with the new information, without switching out the auto-login keystore.
  – If the password-based software or hardware keystore is open, then the `FORCE KEYSTORE` clause is not necessary and has no effect.

• When you are connected to the CDB root:
  – To perform an operation on the CDB root keystore (`CONTAINER=CURRENT`), the CDB root keystore must be open. Therefore, the behavior described for a non-CDB applies to the CDB root.
  – To perform an operation on the CDB root keystore and all PDB keystores (`CONTAINER=ALL`), the CDB root keystore and all PDB keystores must be open. Therefore, the behavior described for a non-CDB applies to the CDB root and each PDB.

• When you are connected to a PDB:
  – To perform an operation on a PDB keystore, the CDB root keystore and the keystore for that PDB must be open. Therefore, the behavior described for a non-CDB applies to the CDB root and that PDB.

Notes on Specifying Keystore Passwords
Specify keystore passwords as follows:

- For a password-based software keystore, specify the password as a character string. You can optionally enclose the password in double quotation marks. Quoted and nonquoted passwords are case sensitive. Keystore passwords adhere to the same rules as database user passwords. Refer to the `BY password` clause of `CREATE USER` for the complete details.

- For a hardware keystore, specify the password as a string of the form "user_id:password" where:
  - `user_id` is the user ID created for the database using the HSM management interface
  - `password` is the password created for the user ID using the HSM management interface

  Enclose the `user_id:password` string in double quotation marks (" ") and separate `user_id` and `password` with a colon (:).

- If you specify `EXTERNAL STORE`, then the database uses the keystore password stored in the external store to perform the operation. This feature enables you to store the password in a separate location where it can be centrally managed and accessed. To use this functionality, you must first set the `EXTERNAL_KEYSTORE_CREDENTIAL_LOCATION` initialization parameter to a location where the keystore password will be stored. Refer to the Oracle Database Advanced Security Guide for more information on configuring an external store for a keystore password.

Notes on the WITH BACKUP Clause

Many ADMINISTER KEY MANAGEMENT operations include the WITH BACKUP clause. This clause applies only to password-based software keystores. It indicates that the keystore must be backed up before the operation is performed. Therefore, you must either specify the WITH BACKUP clause when performing the operation, or issue the ADMINISTER KEY MANAGEMENT `backup_clause` statement immediately before performing the operation.

When you specify the WITH BACKUP clause, Oracle Database creates a backup file with a name of the form `ewallet_timestamp.p12`, where `timestamp` is the file creation timestamp in UTC format. The backup file is created in the same directory as the keystore you are backing up.

The optional USING 'backup_identifier' clause lets you specify a backup identifier, which is added to the backup file name. For example, if you specify a backup identifier of 'Backup1', then Oracle Database creates a backup file with a name of the form `ewallet_timestamp_Backup1.p12`.

Examples

Creating a Keystore: Examples

The following statement creates a password-based software keystore in directory `/etc/ORACLE/WALLETS/orcl`:

```sql
ADMINISTER KEY MANAGEMENT
  CREATE KEYSTORE '/etc/ORACLE/WALLETS/orcl'
  IDENTIFIED BY password;
```
The following statement creates an auto-login software keystore from the keystore created in the previous statement:

```
ADMINISTER KEY MANAGEMENT
CREATE AUTO_LOGIN KEYSTORE FROM KEYSTORE '/etc/ORACLE/WALLETS/orcl'
IDENTIFIED BY password;
```

Opening a Keystore: Examples

The following statement opens a password-based software keystore:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE OPEN
IDENTIFIED BY password;
```

If you are connected to a CDB, then the following statement opens a password-based software keystore in the current container:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE OPEN
IDENTIFIED BY password
CONTAINER = CURRENT;
```

The following statement opens a hardware keystore:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE OPEN
IDENTIFIED BY "user_id:password";
```

The following statement opens a keystore whose password is stored in the external store:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE OPEN
IDENTIFIED BY EXTERNAL STORE;
```

Closing a Keystore: Examples

The following statement closes a password-based software keystore:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE CLOSE
IDENTIFIED BY password;
```

The following statement closes an auto-login software keystore:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE CLOSE;
```

The following statement closes a hardware keystore:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE CLOSE
IDENTIFIED BY "user_id:password";
```

The following statement closes a keystore whose password is stored in the external store:

```
ADMINISTER KEY MANAGEMENT
SET KEYSTORE CLOSE
IDENTIFIED BY EXTERNAL STORE;
```
Backing Up a Keystore: Example

The following statement creates a backup of a password-based software keystore. The backup is stored in directory /etc/ORACLE/KEYSTORE/DB1 and the backup file name contains the tag hr.emp_keystore.

```
ADMINISTER KEY MANAGEMENT
  BACKUP KEYSTORE USING 'hr.emp_keystore'
  IDENTIFIED BY password
  TO '/etc/ORACLE/KEYSTORE/DB1/';
```

Changing a Keystore Password: Example

The following statement changes the password for a password-based software keystore. It also creates a backup of the keystore, with the tag pwd_change, before changing the password.

```
ADMINISTER KEY MANAGEMENT
  ALTER KEYSTORE PASSWORD IDENTIFIED BY old_password
  SET new_password WITH BACKUP USING 'pwd_change';
```

Merging Two Keystores Into a New Keystore: Example

The following statement merges an auto-login software keystore with a password-based software keystore to create a new password-based software keystore at a new location:

```
ADMINISTER KEY MANAGEMENT
  MERGE KEYSTORE '/etc/ORACLE/KEYSTORE/DB1'
  AND KEYSTORE '/etc/ORACLE/KEYSTORE/DB2'
  IDENTIFIED BY existing_keystore_password
  INTO NEW KEYSTORE '/etc/ORACLE/KEYSTORE/DB3'
  IDENTIFIED BY new_keystore_password;
```

Merging a Keystore Into an Existing Keystore: Example

The following statement merges an auto-login software keystore into a password-based software keystore. It also creates a backup of the password-based software keystore before performing the merge.

```
ADMINISTER KEY MANAGEMENT
  MERGE KEYSTORE '/etc/ORACLE/KEYSTORE/DB1'
  INTO EXISTING KEYSTORE '/etc/ORACLE/KEYSTORE/DB2'
  IDENTIFIED BY existing_keystore_password
  WITH BACKUP;
```

Creating and Activating a Master Encryption Key: Examples

The following statement creates and activates a master encryption key in a password-based software keystore. It encrypts the key using the SEED128 algorithm. It also creates a backup of the keystore before creating the new master encryption key.

```
ADMINISTER KEY MANAGEMENT
  SET KEY USING ALGORITHM 'SEED128'
  IDENTIFIED BY password
  WITH BACKUP;
```

The following statement creates a master encryption key in a password-based software keystore, but does not activate the key. It also creates a backup of the keystore before creating the new master encryption key.

```
ADMINISTER KEY MANAGEMENT
  SET KEY USING ALGORITHM 'SEED128'
  IDENTIFIED BY password
  WITH BACKUP;
```
ADMINISTER KEY MANAGEMENT
CREATE KEY USING TAG 'mykey1'
IDENTIFIED BY password
WITH BACKUP;

The following query displays the key identifier for the master encryption key that was created in the previous statement:

```sql
SELECT TAG, KEY_ID
FROM V$ENCRYPTION_KEYS
WHERE TAG = 'mykey1';
```

<table>
<thead>
<tr>
<th>TAG</th>
<th>KEY_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>mykey1</td>
<td>ARgEtzPxpE/Nv8WdPu8JJJUAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA</td>
</tr>
</tbody>
</table>

The following statement activates the master encryption key that was queried in the previous statement. It also creates a backup of the keystore before activating the new master encryption key.

```sql
ADMINISTER KEY MANAGEMENT
USE KEY 'ARgEtzPxpE/Nv8WdPu8JJJUAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA'
IDENTIFIED BY password
WITH BACKUP;
```

**Setting a Key Tag: Example**

This example assumes that the keystore is closed. The following statement temporarily opens the keystore and changes the tag to `mykey2` for the master encryption key that was activated in the previous example. It also creates a backup of the keystore before changing the tag.

```sql
ADMINISTER KEY MANAGEMENT
SET TAG 'mykey2' FOR 'ARgEtzPxpE/Nv8WdPu8JJJUAAAAAAAAAAAAAAAAAAAAAAAAAAAAAA'
FORCE KEYSTORE
IDENTIFIED BY password
WITH BACKUP;
```

**Exporting Keys: Examples**

The following statement exports two master encryption keys from a password-based software keystore to file `/etc/TDE/export.exp`. The statement encrypts the master encryption keys in the file using the secret `my_secret`. The identifiers of the master encryption keys to be exported are provided as a comma-separated list.

```sql
ADMINISTER KEY MANAGEMENT
EXPORT KEYS WITH SECRET "my_secret"
TO `/etc/TDE/export.exp'
IDENTIFIED BY password
WITH IDENTIFIER IN 'AdoxnJ0uH08cv7xkz83ovwsAAAAAAAAAAAAAAAAAAAAAAAAAAAA',
'AW5z3CoyKE/yv3cNT5CWXUAAAAAAAAAAAAAAAAAAAAAAAAAAAA';
```

The following statement exports master encryption keys from a password-based software keystore to file `/etc/TDE/export.exp`. Only the keys whose tags are `mytag1` or `mytag2` are exported. The master encryption keys in the file are encrypted using the secret `my_secret`. The key identifiers are found by querying the `V$ENCRYPTION_KEYS` view.

```sql
ADMINISTER KEY MANAGEMENT
EXPORT KEYS WITH SECRET "my_secret"
TO '/etc/TDE/export.exp'
```
IDENTIFIED BY password
WITH IDENTIFIER IN
(SELECT KEY_ID FROM V$ENCRYPTION_KEYS WHERE TAG IN ('mytag1', 'mytag2'));

The following statement exports all master encryption keys of the database to
file /etc/TDE/export.exp. The master encryption keys in the file are encrypted using
the secret my_secret.

ADMINISTER KEY MANAGEMENT
EXPORT KEYS WITH SECRET "my_secret"
TO '/etc/TDE/export.exp'
IDENTIFIED BY password;

In a multitenant environment, the following statements exports all master encryption
keys of the PDB salespdb, along with metadata, to file /etc/TDE/salespdb.exp. The
master encryption keys in the file are encrypted using the secret my_secret. If the PDB
is subsequently cloned, or unplugged and plugged back in, then the export file created
by this statement can be used to import the keys into the cloned or newly plugged-in
PDB.

ALTER SESSION SET CONTAINER = salespdb;
ADMINISTER KEY MANAGEMENT
EXPORT KEYS WITH SECRET "my_secret"
TO '/etc/TDE/salespdb.exp'
IDENTIFIED BY password;

Importing Keys: Example

The following statement imports the master encryption keys, encrypted with secret
my_secret, from file /etc/TDE/export.exp to a password-based software keystore. It
also creates a backup of the password-based software keystore before importing the
keys.

ADMINISTER KEY MANAGEMENT
IMPORT KEYS WITH SECRET "my_secret"
FROM '/etc/TDE/export.exp'
IDENTIFIED BY password
WITH BACKUP;

Migrating a Keystore: Example

The following statement migrates from a password-based software keystore to a
hardware keystore. It also creates a backup of the password-based software keystore
before performing the migration.

ADMINISTER KEY MANAGEMENT
SET ENCRYPTION KEY IDENTIFIED BY "user_id:password"
MIGRATE USING software_keystore_password
WITH BACKUP;

Reverse Migrating a Keystore: Example

The following statement reverse migrates from a hardware keystore to a password-
based software keystore:

ADMINISTER KEY MANAGEMENT
SET ENCRYPTION KEY IDENTIFIED BY software_keystore_password
REVERSE MIGRATE USING "user_id:password";

Adding a Secret to a Keystore: Examples
The following statement adds secret secret1, with the tag My first secret, for client client1 to a password-based software keystore. It also creates a backup of the password-based software keystore before adding the secret.

ADMINISTER KEY MANAGEMENT
ADD SECRET 'secret1' FOR CLIENT 'client1'
USING TAG 'My first secret'
IDENTIFIED BY password
WITH BACKUP;

The following statement adds a similar secret to a hardware keystore:

ADMINISTER KEY MANAGEMENT
ADD SECRET 'secret2' FOR CLIENT 'client2'
USING TAG 'My second secret'
IDENTIFIED BY "user_id:password";

**Updating a Secret in a Keystore: Examples**

The following statement updates the secret that was created in the previous example in a password-based software keystore. It also creates a backup of the password-based software keystore before updating the secret.

ADMINISTER KEY MANAGEMENT
UPDATE SECRET 'secret1' FOR CLIENT 'client1'
USING TAG 'New Tag 1'
IDENTIFIED BY password
WITH BACKUP;

The following statement updates the secret that was created in the previous example in a hardware keystore:

ADMINISTER KEY MANAGEMENT
UPDATE SECRET 'secret2' FOR CLIENT 'client2'
USING TAG 'New Tag 2'
IDENTIFIED BY "user_id:password";

**Deleting a Secret from a Keystore: Examples**

The following statement deletes the secret that was updated in the previous example from a password-based software keystore. It also creates a backup of the password-based software keystore before deleting the secret.

ADMINISTER KEY MANAGEMENT
DELETE SECRET FOR CLIENT 'client1'
IDENTIFIED BY password
WITH BACKUP;

The following statement deletes the secret that was updated in the previous example from a hardware keystore:

ADMINISTER KEY MANAGEMENT
DELETE SECRET FOR CLIENT 'client2'
IDENTIFIED BY "user_id:password";
10.4 ALTER ANALYTIC VIEW

Purpose

Use the ALTER ANALYTIC VIEW statement to rename or compile an analytic view. For other alterations, use CREATE OR REPLACE ANALYTIC VIEW.

Prerequisites

To alter an analytic view in your own schema, you must have the ALTER ANALYTIC VIEW system privilege. To alter an analytic view in another user’s schema, you must have the ALTER ANY ANALYTIC VIEW system privilege or ALTER ANY TABLE granted on the analytic view.

Syntax

```
ALTER ANALYTIC VIEW
schema .
analytic_view_name
RENAME TO new_av_name
COMPILE
;
```

Semantics

```
schema
```

Specify the schema in which the analytic view exists. If you do not specify a schema, then Oracle Database looks for the analytic view in your own schema.

```
analytic_view_name
```

Specify the name of the analytic view.

```
RENAME TO
```

Specify RENAME TO to change the name of the analytic view. For `new_av_name`, specify a new name for the analytic view.

```
COMPILE
```

Specify COMPILE to compile the analytic view.

Example

The following statement changes the name of an analytic view:

```
ALTER ANALYTIC VIEW sales_av RENAME TO mysales_av;
```
10.5 ALTER ATTRIBUTE DIMENSION

Purpose

Use the ALTER ATTRIBUTE DIMENSION statement to rename or compile an attribute dimension. For other alterations, use CREATE OR REPLACE ATTRIBUTE DIMENSION.

Prerequisites

To alter an attribute dimension in your own schema, you must have the ALTER ATTRIBUTE DIMENSION system privilege. To alter an attribute dimension in another user’s schema, you must have the ALTER ANY ATTRIBUTE DIMENSION system privilege or have been granted ALTER on the attribute dimension directly.

Syntax

```
alter_attribute_dimension ::= 

ALTER ATTRIBUTE DIMENSION
schema .
attr_dim_name
RENAME TO new_attr_dim_name
COMPILE
;
```

Semantics

```
schema

Specify the schema in which the attribute dimension exists. If you do not specify a schema, then Oracle Database looks for the attribute dimension in your own schema.

attr_dim_name

Specify the name of the attribute dimension.

RENAME TO

Specify RENAME TO to change the name of the attribute dimension. For new_attr_dim_name, specify a new name for the attribute dimension.

COMPILE

Specify COMPILE to compile the attribute dimension.
```

Example

The following statement changes the name of an attribute dimension:

```
ALTER ATTRIBUTE DIMENSION product_attr_dim RENAME TO my_product_attr_dim;
```
10.6 ALTER AUDIT POLICY (Unified Auditing)

This section describes the ALTER AUDIT POLICY statement for **unified auditing**. This type of auditing is new beginning with Oracle Database 12c and provides a full set of enhanced auditing features. Refer to *Oracle Database Security Guide* for more information on unified auditing.

**Purpose**

Use the ALTER AUDIT POLICY statement to modify a unified audit policy.

<table>
<thead>
<tr>
<th>See Also:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• CREATE AUDIT POLICY (Unified Auditing)</td>
</tr>
<tr>
<td>• DROP AUDIT POLICY (Unified Auditing)</td>
</tr>
<tr>
<td>• AUDIT (Unified Auditing)</td>
</tr>
<tr>
<td>• NOAUDIT (Unified Auditing)</td>
</tr>
</tbody>
</table>

**Prerequisites**

You must have the AUDIT SYSTEM system privilege or the AUDIT_ADMIN role.

If you are connected to a multitenant container database (CDB), then to modify a common unified audit policy, the current container must be the root and you must have the commonly granted AUDIT SYSTEM privilege or the AUDIT_ADMIN common role. To modify a local unified audit policy, the current container must be the container in which the audit policy was created and you must have the commonly granted AUDIT SYSTEM privilege or the AUDIT_ADMIN common role, or you must have the locally granted AUDIT SYSTEM privilege or the AUDIT_ADMIN local role in the container.
Syntax

```
alter_audit_policy ::= 
```

Note:
If you specify the `ADD` or `DROP` clause, then you must specify at least one of the clauses `privilege_audit_clause`, `action_audit_clause`, or `role_audit_clause`.

```
(privilege_audit_clause ::=, action_audit_clause ::=, role_audit_clause ::=)
```

```
privilege_audit_clause ::= 
```

```
PRIVILEGES system_privilege
```

```
action_audit_clause ::= 
```

```
standard_actions component_actions
```

**standard_actions::=**

```
ACTIONS
    object_action
        ALL
    ON
        DIRECTORY directory_name
        MINING MODEL
            schema
        object_name
    MINING
        object_name
    system_action
        ALL
```

**component_actions::=**

```
ACTIONS COMPONENT
    component_action
        DATAPUMP
        DIRECT_LOAD
        OLS
        XS
```

**role_audit_clause::=**

```
ROLES
    role
```

**Semantics**

**policy**

Specify the name of the unified audit policy to be modified. The policy must have been created using the `CREATE AUDIT POLICY` statement. You can find descriptions of all unified audit policies by querying the `AUDIT_UNIFIED_POLICIES` view.

**See Also:**

- `CREATE AUDIT POLICY` (Unified Auditing)
- `Oracle Database Reference` for more information on the `AUDIT_UNIFIED_POLICIES` view
ADD | DROP
Use the ADD clause to add privileges to be audited to policy.
Use the DROP clause to remove privileges to be audited from policy.
Refer to privilege_audit_clause, action_audit_clause, and role_audit_clause of CREATE AUDIT POLICY for the full semantics of these clauses.

CONDITION
Use this clause to drop, add, or replace the audit condition for policy.
Specify DROP to drop the audit condition from policy.
Specify 'audit_condition'... to add or replace the audit condition for policy.
Refer to audit_condition, EVALUATE PER STATEMENT, EVALUATE PER SESSION, and EVALUATE PER INSTANCE of CREATE AUDIT POLICY for the full semantics of these clauses.

Examples
The following examples modify unified audit policies that were created in the CREATE AUDIT POLICY "Examples".

Adding Privileges, Actions, and Roles to a Unified Audit Policy: Examples
The following statement adds the system privileges CREATE ANY TABLE and DROP ANY TABLE to unified audit policy dml_pol:
ALTER AUDIT POLICY dml_pol
   ADD PRIVILEGES CREATE ANY TABLE, DROP ANY TABLE;

The following statement adds the system actions CREATE JAVA, ALTER JAVA, and DROP JAVA to unified audit policy java_pol:
ALTER AUDIT POLICY java_pol
   ADD ACTIONS CREATE JAVA, ALTER JAVA, DROP JAVA;

The following statement adds the role dba to unified audit policy table_pol:
ALTER AUDIT POLICY table_pol
   ADD ROLES dba;

The following statement adds multiple system privileges, actions, and roles to unified audit policy security_pol:
ALTER AUDIT POLICY security_pol
   ADD PRIVILEGES CREATE ANY LIBRARY, DROP ANY LIBRARY
   ACTIONS DELETE on hr.employees,
       INSERT on hr.employees,
       UPDATE on hr.employees,
       ALL on hr.departments
   ROLES dba, connect;

Dropping Privileges, Actions, and Roles from a Unified Audit Policy: Examples
The following statement drops the system privilege CREATE ANY TABLE from unified audit policy table_pol:
ALTER AUDIT POLICY table_pol
   DROP PRIVILEGES CREATE ANY TABLE;

The following statement drops the INSERT and UPDATE actions on hr.employees from unified audit policy dml_pol:

ALTER AUDIT POLICY dml_pol
   DROP ACTIONS INSERT on hr.employees,
       UPDATE on hr.employees;

The following statement drops the role java_deploy from unified audit policy java_pol:

ALTER AUDIT POLICY java_pol
   DROP ROLES java_deploy;

The following statement drops a system privilege, an action, and a role from unified audit policy hr_admin_pol:

ALTER AUDIT POLICY hr_admin_pol
   DROP PRIVILEGES CREATE ANY TABLE
       ACTIONS LOCK TABLE
       ROLES audit_viewer;

Adding and Dropping Actions for a Unified Audit Policy: Example

The following statement adds EXPORT actions for Oracle Data Pump to unified audit policy dp_actions_pol and drops IMPORT actions for Oracle Data Pump:

ALTER AUDIT POLICY dp_actions_pol
   ADD ACTIONS COMPONENT = datapump EXPORT
   DROP ACTIONS COMPONENT = datapump IMPORT;

Dropping the Audit Condition from a Unified Audit Policy: Example

The following statement drops the audit condition from unified audit policy order_updates_pol:

ALTER AUDIT POLICY order_updates_pol
   CONDITION DROP;

Modifying the Audit Condition for a Unified Audit Policy: Example

The following statement modifies the audit condition for unified audit policy emp_updates_pol so that the policy is enforced only when the auditable statement is issued by a user whose UID is 102:

ALTER AUDIT POLICY emp_updates_pol
   CONDITION 'UID = 102'
   EVALUATE PER STATEMENT;

10.7 ALTER CLUSTER

Purpose

Use the ALTER CLUSTER statement to redefine storage and parallelism characteristics of a cluster.

**Note:**
You cannot use this statement to change the number or the name of columns in the cluster key, and you cannot change the tablespace in which the cluster is stored.

**See Also:**
CREATE CLUSTER for information on creating a cluster, DROP CLUSTER and DROP TABLE for information on removing tables from a cluster, and CREATE TABLE ... physical_properties for information on adding a table to a cluster

**Prerequisites**
The cluster must be in your own schema or you must have the ALTER ANY CLUSTER system privilege.

**Syntax**

`alter_cluster::=`

```
ALTER CLUSTER
   schema .
   cluster
   physical_attributes_clause
   SIZE size_clause
   MODIFY PARTITION partition
   allocate_extent Clause
   deallocate_unused_clause
   CACHE
   NOCACHE
   parallel_clause
;```

```
(physical_attributes_clause::,
 size_clause::=,
 MODIFY PARTITION,
 allocate_extent_clause::=,
 deallocate_unused_clause::=,
 parallel_clause::=)
```

`physical_attributes_clause::=`

```
PCTFREE integer
PCTUSED integer
INITRANS integer
storage_clause
```
(storage_clause::=)

allocate_extent_clause::=

ALLOCATE EXTENT
(SIZE size_clause
DATAFILE 'filename'
INSTANCE integer)

(size_clause::=)

deallocate_unused_clause::=

DEALLOCATE UNUSED
KEEP size_clause

(size_clause::=)

parallel_clause::=

NOPARALLEL
PARALLEL integer

Semantics

schema
Specify the schema containing the cluster. If you omit schema, then Oracle Database assumes the cluster is in your own schema.

cluster
Specify the name of the cluster to be altered.

physical_attributes_clause
Use this clause to change the values of the PCTUSED, PCTFREE, and INITRANS parameters of the cluster.

Use the STORAGE clause to change the storage characteristics of the cluster.
Restriction on Physical Attributes

You cannot change the values of the storage parameters INITIAL and MINEXTENTS for a cluster.

SIZE

(integer)

Use the SIZE clause to specify the number of cluster keys that will be stored in data blocks allocated to the cluster.

Restriction on SIZE

You can change the SIZE parameter only for an indexed cluster, not for a hash cluster.

See Also:

CREATE CLUSTER for a description of the SIZE parameter and "Modifying a Cluster: Example"

MODIFY PARTITION

Specify MODIFY PARTITION partition allocate_extent_clause to explicitly allocate a new extent for a cluster partition. This operation is valid only for range-partitioned hash clusters. For partition, specify the cluster partition name.

allocate_extent_clause

Specify allocate_extent_clause to explicitly allocate a new extent for a cluster. This operation is valid only for indexed clusters and nonpartitioned hash clusters.

When you explicitly allocate an extent with the allocate_extent_clause, Oracle Database does not evaluate the storage parameters of the cluster and determine a new size for the next extent to be allocated (as it does when you create a table). Therefore, specify SIZE if you do not want Oracle Database to use a default value.

See Also:

allocate_extent_clause for a full description of this clause
**deallocate_used_clause**

Use the `deallocate_unused_clause` to explicitly deallocate unused space at the end of the cluster and make the freed space available for other segments.

**See Also:**

- `deallocate_unused_clause` for a full description of this clause and
  "Deallocating Unused Space: Example"

**parallel_clause**

Specify the `parallel_clause` to change the default degree of parallelism for queries on the cluster.

**See Also:**

- `parallel_clause` in the documentation on `CREATE TABLE` for complete information on this clause

**Examples**

The following examples modify the clusters that were created in the `CREATE CLUSTER "Examples"`

**Modifying a Cluster: Example**

The next statement alters the `personnel` cluster:

```
ALTER CLUSTER personnel
    SIZE 1024 CACHE;
```

Oracle Database allocates 1024 bytes for each cluster key value and enables the cache attribute. Assuming a data block size of 2 kilobytes, future data blocks within this cluster contain 2 cluster keys in each data block, or 2 kilobytes divided by 1024 bytes.

**Deallocating Unused Space: Example**

The following statement deallocates unused space from the `language` cluster, keeping 30 kilobytes of unused space for future use:

```
ALTER CLUSTER language
    DEALLOCATE UNUSED KEEP 30 K;
```
10.8 ALTER DATABASE

Purpose

Use the ALTER DATABASE statement to modify, maintain, or recover an existing database.

See Also:

- Oracle Database Backup and Recovery User’s Guide for examples of performing media recovery
- Oracle Data Guard Concepts and Administration for additional information on using the ALTER DATABASE statement to maintain standby databases
- CREATE DATABASE for information on creating a database

Prerequisites

You must have the ALTER DATABASE system privilege.

To specify the startup clauses, you must also be connected AS SYSDBA, AS SYSOPER, AS SYSBACKUP, or AS SYSDG.

To specify the general_recovery clause, you must also have the SYSDBA or SYSBACKUP system privilege.

To specify the DEFAULT EDITION clause, you must also have the USE object privilege WITH GRANT OPTION on the specified edition.

If you are connected to a multitenant container database (CDB):

- To modify the entire CDB, the current container must be the root and you must have the commonly granted ALTER DATABASE privilege.
- To modify a container, it must be the current container and you must have the ALTER DATABASE privilege, either granted commonly or granted locally in the container.

See Also:

"Notes on Using ALTER DATABASE in a CDB" to determine which clauses of ALTER DATABASE modify the entire CDB and which clauses modify only a container

Semantics

Notes on Using ALTER DATABASE in a CDB

When you issue the ALTER DATABASE statement while connected to a CDB, the behavior of the statement depends on the current container and the clause(s) you specify.

If the current container is the root, then ALTER DATABASE statements with the following clauses modify the entire CDB. In order to specify these clauses, you must have the commonly granted ALTER DATABASE privilege:

- startup_clauses
- recovery_clauses

**Note:** A subset of the recovery_clauses are supported to back up and recover an individual pluggable database (PDB). In order to specify these clauses, you must have the ALTER DATABASE privilege, either granted commonly or granted locally in the PDB. Refer to "Notes on Using the recovery_clauses in a CDB" for more information.

- logfile_clauses
- controlfile_clauses
- standby_database_clauses
- instance_clauses
- security_clause
• **RENAME GLOBAL_NAME TO**
• **ENABLE BLOCK CHANGE TRACKING**
• **DISABLE BLOCK CHANGE TRACKING**
• **undo_mode_clause**

If the current container is the root, then *ALTER DATABASE* statements with the following clauses modify only the root. In order to specify these clauses, you must have the *ALTER DATABASE* privilege, either granted commonly or granted locally in the root:

• **database_file_clauses**
• **DEFAULT EDITION**
• **DEFAULT TABLESPACE**

If the current container is the root, then *ALTER DATABASE* statements with the following clauses modify the root and set default values for the PDBs. In order to specify these clauses, you must have the commonly granted *ALTER DATABASE* privilege:

• **DEFAULT [ LOCAL ] TEMPORARY TABLESPACE**
• **flashback_mode_clause**
• **SET DEFAULT ( BIGFILE | SMALLFILE ) TABLESPACE**
• **set_time_zone_clause**

If the current container is a PDB, then *ALTER DATABASE* statements modify that PDB. In this case, you can issue only *ALTER DATABASE* clauses that are also supported by the *ALTER PLUGGABLE DATABASE* statement. This functionality is provided to maintain backward compatibility for applications that have been migrated to a CDB environment. The exception is modifying PDB storage limits, for which you must use the *pdb_storage_clause* of *ALTER PLUGGABLE DATABASE*. Refer to the documentation on *ALTER PLUGGABLE DATABASE* for complete information on these clauses.

**database**

Specify the name of the database to be altered. If you omit *database*, then Oracle Database alters the database identified by the value of the initialization parameter *DB_NAME*. You can alter only the database whose control files are specified by the initialization parameter *CONTROL_FILES*. The database identifier is not related to the Oracle Net database specification.

**startup clauses**

The *startup clauses* let you mount and open the database so that it is accessible to users.

**MOUNT Clause**

Use the *MOUNT* clause to mount the database. Do not use this clause when the database is already mounted.

**MOUNT STANDBY DATABASE**

You can specify *MOUNT STANDBY DATABASE* to mount a physical standby database. The keywords *STANDBY DATABASE* are optional, because Oracle Database determines automatically whether the database to be mounted is a primary or standby database.
As soon as this statement executes, the standby instance can receive redo data from the primary instance.

See Also:

*Oracle Data Guard Concepts and Administration* for more information on standby databases

MOUNT CLONE DATABASE

Specify `MOUNT CLONE DATABASE` to mount the clone database.

OPEN Clause

Use the `OPEN` clause to make the database available for normal use. You must mount the database before you can open it.

If you specify only `OPEN` without any other keywords, then the default is `OPEN READ WRITE NORESETLOGS` on a primary database, logical standby database, or snapshot standby database and `OPEN READ ONLY` on a physical standby database.

OPEN READ WRITE

Specify `OPEN READ WRITE` to open the database in read/write mode, allowing users to generate redo logs. This is the default if you are opening a primary database. You cannot specify this clause for a physical standby database.

See Also:

"READ ONLY / READ WRITE: Example"

RESETLOGS | NORESETLOGS

This clause determines whether Oracle Database resets the current log sequence number to 1, archives any unarchived logs (including the current log), and discards any redo information that was not applied during recovery, ensuring that it will never be applied. Oracle Database uses `NORESETLOGS` automatically except in the following specific situations, which require a setting for this clause:

- You must specify `RESETLOGS`:
  - After performing incomplete media recovery or media recovery using a backup control file
  - After a previous `OPEN RESETLOGS` operation that did not complete
  - After a `FLASHBACK DATABASE` operation
- If a created control file is mounted, then you must specify `RESETLOGS` if the online logs are lost, or you must specify `NORESETLOGS` if they are not lost.

UPGRADE | DOWNGRADE

Use these `OPEN` clause parameters only if you are upgrading or downgrading a database. This clause instructs Oracle Database to modify system parameters
dynamically as required for upgrade and downgrade, respectively. You can achieve the same result using the SQL*Plus STARTUP UPGRADE or STARTUP DOWNGRADE command.

When you use the UPGRADE or DOWNGRADE parameters for a CDB, the root container is opened in the specified mode, but all other containers are opened in READ WRITE mode.

---

**See Also:**
- Oracle Database Upgrade Guide for information on the steps required to upgrade or downgrade a database from one release to another
- SQL*Plus User’s Guide and Reference for information on the SQL*Plus STARTUP command

---

**OPEN READ ONLY**

Specify OPEN READ ONLY to restrict users to read-only transactions, preventing them from generating redo logs. This setting is the default when you are opening a physical standby database, so that the physical standby database is available for queries even while archive logs are being copied from the primary database site.

**Restrictions on Opening a Database**

The following restrictions apply to opening a database:

- You cannot open a database in READ ONLY mode if it is currently opened in READ WRITE mode by another instance.
- You cannot open a database in READ ONLY mode if it requires recovery.
- You cannot take tablespaces offline while the database is open in READ ONLY mode. However, you can take data files offline and online, and you can recover offline data files and tablespace while the database is open in READ ONLY mode.

---

**See Also:**
- Oracle Data Guard Concepts and Administration for additional information about opening a physical standby database

---

**recovery_clauses**

The recovery_clauses include post-backup operations. For all of these clauses, Oracle Database recovers the database using any incarnations of data files and log files that are known to the current control file.
Notes on Using the recovery_clauses in a CDB

When the current container is the root, you can specify all of the recovery_clauses to back up and recover the entire CDB.

When the current container is a PDB, you can specify the following subclauses of the recovery_clauses to back up and recover the PDB:

- BEGIN BACKUP
- END BACKUP
- full_database_recovery: You can specify only the DATABASE keyword
- partial_database_recovery
- The LOGFILE and CONTINUE clauses of general_recovery

You can also specify the preceding subclauses using the pdb_recovery_clauses of ALTER PLUGGABLE DATABASE. Refer to the syntax diagram pdb_recovery_clauses of ALTER PLUGGABLE DATABASE.

general_recovery

The general_recovery clause lets you control media recovery for the database or standby database or for specified tablespaces or files. You can use this clause when your instance has the database mounted, open or closed, and the files involved are not in use.

Note:

Parallelism is enabled by default during full or partial database recovery and logfile recovery. The database computes the degree of parallelism. You can disable parallelism of these operations by specifying NOPARALLEL, or specify a degree of parallelism with PARALLEL integer, as shown in the respective syntax diagrams.

Restrictions on General Database Recovery

General recovery is subject to the following restrictions:

- You can recover the entire database only when the database is closed.
- Your instance must have the database mounted in exclusive mode.
- You can recover tablespaces or data files when the database is open or closed, if the tablespaces or data files to be recovered are offline.
- You cannot perform media recovery if you are connected to Oracle Database through the shared server architecture.
AUTOMATIC

Specify AUTOMATIC if you want Oracle Database to automatically generate the name of the next archived redo log file needed to continue the recovery operation. If the LOG_ARCHIVE_DEST_n parameters are defined, then Oracle Database scans those that are valid and enabled for the first local destination. It uses that destination in conjunction with LOG_ARCHIVE_FORMAT to generate the target redo log filename. If the LOG_ARCHIVE_DEST_n parameters are not defined, then Oracle Database uses the value of the LOG_ARCHIVE_DEST parameter instead.

If the resulting file is found, then Oracle Database applies the redo contained in that file. If the file is not found, then Oracle Database prompts you for a filename, displaying the generated filename as a suggestion.

If you specify neither AUTOMATIC nor LOGFILE, then Oracle Database prompts you for a filename, displaying the generated filename as a suggestion. You can then accept the generated filename or replace it with a fully qualified filename. If you know that the archived filename differs from what Oracle Database would generate, then you can save time by using the LOGFILE clause.

FROM 'location'

Specify FROM 'location' to indicate the location from which the archived redo log file group is read. The value of location must be a fully specified file location following the conventions of your operating system. If you omit this parameter, then Oracle Database assumes that the archived redo log file group is in the location specified by the initialization parameter LOG_ARCHIVE_DEST or LOG_ARCHIVE_DEST_1.

full_database_recovery

The full_database_recovery clause lets you recover an entire database.

DATABASE

Specify the DATABASE clause to recover the entire database. This is the default. You can use this clause only when the database is closed.

STANDBY DATABASE

Specify the STANDBY DATABASE clause to manually recover a physical standby database using the control file and archived redo log files copied from the primary database. The standby database must be mounted but not open.

This clause recovers only online data files.

- Use the UNTIL clause to specify the duration of the recovery operation.
  - CANCEL indicates cancel-based recovery. This clause recovers the database until you issue the ALTER DATABASE statement with the RECOVER CANCEL clause.
– **TIME** indicates time-based recovery. This parameter recovers the database to the time specified by the date. The date must be a character literal in the format `'YYYY-MM-DD:HH24:MI:SS'`.

– **CHANGE** indicates change-based recovery. This parameter recovers the database to a transaction-consistent state immediately before the system change number specified by integer.

– **CONSISTENT** recovers the database until all online files are brought to a consistent SCN point so that the database can be open in read only mode. This clause requires the controlfile to be a backup controlfile.

  • Specify using `USING BACKUP CONTROLFILE` if you want to use a backup control file instead of the current control file.

  • Specify the `SNAPSHOT TIME` clause to recover the database with a storage snapshot using Storage Snapshot Optimization. This clause can be used in cases where the database was not placed in backup mode when the storage snapshot was created.

  – `date` must be a character literal in the format `'YYYY-MM-DD:HH24:MI:SS'`. It must represent a time that is immediately after the snapshot was completed. If you specify the `UNTIL TIME` clause, then `SNAPSHOT TIME date` must be earlier than `UNTIL TIME date`.

**See Also:**

*Oracle Database Backup and Recovery User’s Guide* for more information on recovery using Storage Snapshot Optimization

**partial_database_recovery**

The `partial_database_recovery` clause lets you recover individual tablespaces and data files.

**TABLESPACE**

Specify the `TABLESPACE` clause to recover only the specified tablespaces. You can use this clause if the database is open or closed, provided the tablespaces to be recovered are offline.

**See Also:**

**DATAFILE**

Specify the `DATAFILE` clause to recover the specified data files. You can use this clause when the database is open or closed, provided the data files to be recovered are offline.

You can identify the data file by name or by number. If you identify it by number, then `filenumber` is an integer representing the number found in the `FILE#` column of the
V$DATAFILE dynamic performance view or in the FILE_ID column of the
DBA_DATA_FILES data dictionary view.

**STANDBY {TABLESPACE | DATAFILE}**

In earlier releases, you could specify STANDBY TABLESPACE or STANDBY DATAFILE to
recover older backups of a specific tablespace or a specific data file on the standby to
be consistent with the rest of the standby database. These two clauses are now
desupported. Instead, to recover the standby database to a consistent point, but no
further, use the statement ALTER DATABASE RECOVER MANAGED STANDBY DATABASE UNTIL
CONSISTENT.

**LOGFILE**

Specify the LOGFILE 'filename' to continue media recovery by applying the specified
redo log file.

**TEST**

Use the TEST clause to conduct a trial recovery. A trial recovery is useful if a normal
recovery procedure has encountered some problem. It lets you look ahead into the
redo stream to detect possible additional problems. The trial recovery applies redo in a
way similar to normal recovery, but it does not write changes to disk, and it rolls back
its changes at the end of the trial recovery.

You can use this clause only if you have restored a backup taken since the last
RESETLOGS operation. Otherwise, Oracle Database returns an error.

**ALLOW ... CORRUPTION**

The ALLOW integer CORRUPTION clause lets you specify, in the event of logfile
corruption, the number of corrupt blocks that can be tolerated while allowing recovery
to proceed.

**CONTINUE**

Specify CONTINUE to continue multi-instance recovery after it has been interrupted to
disable a thread.

Specify CONTINUE DEFAULT to continue recovery using the redo log file that Oracle
Database would automatically generate if no other logfile were specified. This clause
is equivalent to specifying AUTOMATIC, except that Oracle Database does not prompt
for a filename.

**CANCEL**

Specify CANCEL to terminate cancel-based recovery.
**managed_standby_recovery**

Use the `managed_standby_recovery` clause to start and stop Redo Apply on a physical standby database. Redo Apply keeps the standby database transactionally consistent with the primary database by continuously applying redo received from the primary database.

A primary database transmits its redo data to standby sites. As the redo data is written to redo log files at the physical standby site, the log files become available for use by Redo Apply. You can use the `managed_standby_recovery` clause when your standby instance has the database mounted or is opened read-only.

**Note:**

Beginning with Oracle Database 12c, **real-time apply** is enabled by default during Redo Apply. Real-time apply recovers redo from the standby redo log files as soon as they are written, without requiring them to be archived first at the physical standby database. You can disable real-time apply with the `USING ARCHIVED LOGFILE` clause. Refer to:

- *Oracle Data Guard Concepts and Administration* for more information on real-time apply
- *USING ARCHIVED LOGFILE Clause*

**Note:**

Parallelism is enabled by default during Redo Apply. The database computes the degree of parallelism. You can disable parallelism of these operations by specifying `NOPARALLEL`, or specify a degree of parallelism with `PARALLEL integer`, as shown in the respective syntax diagrams.

**Restrictions on Managed Standby Recovery**

The same restrictions listed under `general_recovery` apply to this clause.

**See Also:**

*Oracle Data Guard Concepts and Administration* for more information on the use of this clause

**USING ARCHIVED LOGFILE Clause**

Specify `USING ARCHIVED LOGFILE` to start Redo Apply without enabling real-time apply.

**DISCONNECT**
Specify **DISCONNECT** to indicate that Redo Apply should be performed in the background, leaving the current session available for other tasks. The **FROM SESSION** keywords are optional and are provided for semantic clarity.

**NODELAY**

The **NODELAY** clause overrides the **DELAY** attribute on the **LOG_ARCHIVE_DEST_n** parameter on the primary database. If you do not specify the **NODELAY** clause, then application of the archived redo log file is delayed according to the **DELAY** attribute of the **LOG_ARCHIVE_DEST_n** setting (if any). If the **DELAY** attribute was not specified on that parameter, then the archived redo log file is applied immediately to the standby database.

If you specify real-time apply with the **USING CURRENT LOGFILE** clause, then any **DELAY** value specified for the **LOG_ARCHIVE_DEST_n** parameter at the primary for this standby is ignored, and **NODELAY** is the default.

**UNTIL CHANGE Clause**

Use this clause to instruct Redo Apply to recover redo data up to, but not including, the specified system change number.

**UNTIL CONSISTENT**

Use this clause to recover the standby database to a consistent SCN point so that the standby database can be opened in read only mode.

**USING Instances**

This clause is applicable only for Oracle Real Application Clusters (Oracle RAC) or Oracle RAC One Node databases and allows you to start apply processes on multiple instances of the standby that are started in the same mode (**MOUNTED** or **READ ONLY**) as the instance on which the command is executed. Specify **USING INSTANCES ALL** to perform Redo Apply on all instances in an Oracle RAC standby database started in the same mode. Specify **USING INSTANCES integer** to perform Redo Apply on the specified number of instances that are started in the same mode. For **integer**, specify an integer value from 1 to the number of instances in the standby database. The database chooses the instances on which to perform Redo Apply; you cannot specify particular instances. For example, if you specify 4 instances from an instance that is **MOUNTED** and only 3 instances of the standby are running in the **MOUNTED** mode, then Redo Apply will only be started on 3 instances. If you omit the **USING INSTANCES** clause, then Oracle Database performs Redo Apply only on the instance where the command was executed.

**FINISH**

Specify **FINISH** to complete applying all available redo data in preparation for a failover.

Use the **FINISH** clause only in the event of the failure of the primary database. This clause overrides any specified delay intervals and applies all available redo immediately. After the **FINISH** command completes, this database can no longer run in the standby database role, and it must be converted to a primary database by issuing the **ALTER DATABASE COMMIT TO SWITCHOVER TO PRIMARY** statement.

**CANCEL**

Specify **CANCEL** to stop Redo Apply immediately. Control is returned as soon as Redo Apply stops.
TO LOGICAL STANDBY Clause

Use this clause to convert a physical standby database into a logical standby database.

_db_name

Specify a database name to identify the new logical standby database. If you are using a server parameter file (spfile) at the time you issue this statement, then the database will update the file with appropriate information about the new logical standby database. If you are not using an spfile, then the database issues a message reminding you to set the name of the _DB_NAME_ parameter after shutting down the database. In addition, you must invoke the _DBMS_LOGSTDBY.BUILD_ PL/SQL procedure on the primary database before using this clause on the standby database.

See Also:
Oracle Database PL/SQL Packages and Types Reference for information about the _DBMS_LOGSTDBY.BUILD_ procedure

KEEP IDENTITY

Use this clause if you want to use the rolling upgrade feature provided by a logical standby and also revert to the original configuration of a primary database and a physical standby. A logical standby database created using this clause provides only limited support for switchover and failover. Therefore, do not use this clause create a general-purpose logical standby database.

See Also:
Oracle Data Guard Concepts and Administration for more information on rolling upgrade

Deprecated Managed Standby Recovery Clauses

The following clauses appeared in the syntax of earlier releases. They have been deprecated and are no longer needed. Oracle recommends that you do not use these clauses.

FINISH FORCE, FINISH WAIT, FINISH NOWAIT

These optional forms of the _FINISH_ clause are deprecated. Their semantics are presented here for backward compatibility:

- **FORCE** terminates inactive redo transport sessions that would otherwise prevent _FINISH_ processing from beginning.
- **NOWAIT** returns control to the foreground process before the recovery completes
- **WAIT** (the default) returns control to the foreground process after recovery completes
When specified, these clauses are ignored. Terminal recovery now runs in the foreground and always terminates all redo transport sessions. Therefore control is not returned to the user until recovery completes.

**CANCEL IMMEDIATE, CANCEL WAIT, CANCEL NOWAIT**

These optional forms of the `CANCEL` clause are deprecated. Their semantics are presented here for backward compatibility:

- Include the `IMMEDIATE` keyword to stop Redo Apply before completely applying the current redo log file. Session control returns when Redo Apply actually stops.
- Include the `NOWAIT` keyword to return session control without waiting for the `CANCEL` operation to complete.

When specified, these clauses are ignored. Redo Apply is now always cancelled immediately and control returns to the session only after the operation completes.

**USING CURRENT LOGFILE Clause**

The `USING CURRENT LOGFILE` clause is deprecated. It invokes real-time apply during Redo Apply. However, this is now the default behavior and this clause is no longer useful.

**BACKUP Clauses**

Use these clauses to move all the data files in the database into or out of online backup mode (also called hot backup mode).

**BEGIN BACKUP Clause**

Specify `BEGIN BACKUP` to move all data files in the database into online backup mode. The database must be mounted and open, and media recovery must be enabled (the database must be in `ARCHIVELOG` mode).

While the database is in online backup mode, you cannot shut down the instance normally, begin backup of an individual tablespace, or take any tablespace offline or make it read only.

This clause has no effect on data files that are in offline or on read-only tablespaces.

**END BACKUP Clause**

Specify `END BACKUP` to take out of online backup mode any data files in the database currently in online backup mode. The database must be mounted (either open or closed) when you perform this operation.

After a system failure, instance failure, or `SHUTDOWN ABORT` operation, Oracle Database does not know whether the files in online backup mode match the files at the time the system crashed. If you know the files are consistent, then you can take either individual data files or all data files out of online backup mode. Doing so avoids media recovery of the files upon startup.
To take an individual data file out of online backup mode, use the \texttt{ALTER DATABASE DATAFILE \ldots END BACKUP} statement. See \texttt{database_file_clauses}.

To take all data files in a tablespace out of online backup mode, use an \texttt{ALTER TABLESPACE \ldots END BACKUP} statement.

\texttt{database_file_clauses}

The \texttt{database_file_clauses} let you modify data files and temp files. You can use any of the following clauses when your instance has the database mounted, open or closed, and the files involved are not in use. The exception is the \texttt{move_datafile_clause}, which allows you to move a data file that is in use.

\textbf{RENAME FILE Clause}

Use the \texttt{RENAME FILE} clause to rename data files, temp files, or redo log file members. You must create each filename using the conventions for filenames on your operating system before specifying this clause.

- To use this clause for a data file or temp file, the database must be mounted. The database can also be open, but the data file or temp file being renamed must be offline. In addition, you must first rename the file on the file system to the new name.
- To use this clause for logfiles, the database must be mounted but not open.
- If you have enabled block change tracking, then you can use this clause to rename the block change tracking file. The database must be mounted but not open when you rename the block change tracking file.

This clause renames only files in the control file. It does not actually rename them on your operating system. The operating system files continue to exist, but Oracle Database no longer uses them.

\textbf{See Also:}

- \textit{Oracle Database Backup and Recovery User's Guide} for information on recovery of data files and temp files
- “Renaming a Log File Member: Example” and “Manipulating Temp Files: Example”

\textbf{create_datafile_clause}

Use the \texttt{CREATE DATAFILE clause} to create a new empty data file in place of an old one. You can use this clause to re-create a data file that was lost with no backup. The filename or filenumber must identify a file that is or was once part of the database. If you identify the file by number, then filenumber is an integer representing the number found in the FILE# column of the \texttt{V$DATAFILE} dynamic performance view or in the FILE_ID column of the \texttt{DBA_DATA_FILES} data dictionary view.

- Specify \texttt{AS NEW} to create an Oracle-managed data file with a system-generated filename, the same size as the file being replaced, in the default file system location for data files.
- Specify \texttt{AS file_specification} to assign a file name (and optional size) to the new data file. Use the \texttt{datafile_tempfile_spec} form of \texttt{file_specification} (see
file_specification) to list regular data files and temp files in an operating system file system or to list Oracle Automatic Storage Management (Oracle ASM) disk group files.

If the original file (filename or filenumber) is an existing Oracle-managed data file, then Oracle Database attempts to delete the original file after creating the new file. If the original file is an existing user-managed data file, then Oracle Database does not attempt to delete the original file.

If you omit the AS clause entirely, then Oracle Database creates the new file with the same name and size as the file specified by filename or filenumber.

During recovery, all archived redo logs written to since the original data file was created must be applied to the new, empty version of the lost data file.

Oracle Database creates the new file in the same state as the old file when it was created. You must perform media recovery on the new file to return it to the state of the old file at the time it was lost.

Restrictions on Creating New Data Files

The creation of new data files is subject to the following restrictions:

- You cannot create a new file based on the first data file of the SYSTEM tablespace.
- You cannot specify the autoextend_clause of datafile_tempfile_spec in this CREATE DATAFILE clause.

See Also:

- "DATAFILE Clause" of CREATE DATABASE for information on the result of this clause if you do not specify a name for the new data file
- file_specification for a full description of the file specification (datafile_tempfile_spec) and "Creating a New Data File: Example"

alter_datafile_clause

The DATAFILE clause lets you manipulate a file that you identify by name or by number. If you identify it by number, then filenumber is an integer representing the number found in the FILE# column of the V$DATAFILE dynamic performance view or in the FILE_ID column of the DBA_DATA_FILES data dictionary view. The DATAFILE clauses affect your database files as follows:

ONLINE

Specify ONLINE to bring the data file online.

OFFLINE

Specify OFFLINE to take the data file offline. If the database is open, then you must perform media recovery on the data file before bringing it back online, because a checkpoint is not performed on the data file before it is taken offline.

FOR DROP
If the database is in **NOARCHIVELOG** mode, then you must specify **FOR DROP** clause to take a data file offline. However, this clause does not remove the data file from the database. To do that, you must use an operating system command or drop the tablespace in which the data file resides. Until you do so, the data file remains in the data dictionary with the status **RECOVER** or **OFFLINE**.

If the database is in **ARCHIVELOG** mode, then Oracle Database ignores the **FOR DROP** clause.

**RESIZE**

Specify **RESIZE** if you want Oracle Database to attempt to increase or decrease the size of the data file to the specified absolute size in bytes. There is no default, so you must specify a size.

If sufficient disk space is not available for the increased size, or if the file contains data beyond the specified decreased size, then Oracle Database returns an error.

---

**See Also:**

"Resizing a Data File: Example"

---

**END BACKUP**

Specify **END BACKUP** to take the data file out of online backup mode. The **END BACKUP** clause is described more fully at the top level of the syntax of **ALTER DATABASE**. See "**END BACKUP Clause**".

**ENCRYPT | DECRYPT**

Use these clauses to perform offline encryption or decryption of the data file using Transparent Data Encryption (TDE). In any given tablespace, either all data files must be encrypted or all data files must be unencrypted.

Before issuing either of these clauses, the database must be mounted. The database can also be open, but the tablespace that contains the data file being encrypted or decrypted must be offline. The TDE master key must be loaded into database memory.

- Specify **ENCRYPT** to encrypt an unencrypted data file. The data file is encrypted using the AES128 algorithm.
- Specify **DECRYPT** to decrypt a data file. The data file must have been previously encrypted with the **ALTER DATABASE DATAFILE ... ENCRYPT** statement.

**Restrictions on Encrypting and Decrypting Data Files**

The following restrictions apply to the **ENCRYPT** and **DECRYPT** clauses:

- You cannot encrypt or decrypt a temporary data file of a temporary tablespace. Instead, you must drop the temporary tablespace and recreate it as an encrypted tablescape.
- Oracle recommends against encrypting the data files of an undo tablespace. Doing so prevents the keystore from being closed, which prevents the database from functioning. Furthermore, this practice is unnecessary because all undo
records that are associated with an encrypted tablespace are already automatically encrypted in the undo tablespace.

**Note:**

The use of the `ENCRYPT` or `DECRYPT` clause is only one step in a series of steps for performing offline encryption or decryption of a data file. Refer to *Oracle Database Advanced Security Guide* for the complete set of steps before you use either of these clauses.

**alter_tempfile_clause**

Use the `TEMPFILE` clause to resize your temporary data file or specify the `autoextend_clause`, with the same effect as for a permanent data file. The database must be open. You can identify the temp file by name or by number. If you identify it by number, then `filenumber` is an integer representing the number found in the `FILE#` column of the `V$TEMPFILE` dynamic performance view.

**Note:**

On some operating systems, Oracle does not allocate space for a temp file until the temp file blocks are actually accessed. This delay in space allocation results in faster creation and resizing of temp files, but it requires that sufficient disk space is available when the temp files are later used. To avoid potential problems, before you create or resize a temp file, ensure that the available disk space exceeds the size of the new temp file or the increased size of a resized temp file. The excess space should allow for anticipated increases in disk space use by unrelated operations as well. Then proceed with the creation or resizing operation.

**DROP**

Specify `DROP` to drop `tempfile` from the database. The tablespace remains.

If you specify `INCLUDING DATAFILES`, then Oracle Database also deletes the associated operating system files and writes a message to the alert log for each such deleted file.

You can achieve the same result using an `ALTER TABLESPACE ... DROP TEMPFILE` statement. Refer to the *ALTER TABLESPACE DROP Clause* for more information.

**move_datafile_clause**

Use the `MOVE DATAFILE` clause to move an online data file to a new location. The database can be open and accessing the data file when you perform this operation. The database creates a copy of the data file when it is performing this operation. Ensure that there is adequate disk space for the original data file and the copy before using this clause.

You can specify the original data file using the `file_name`, `ASM_filename`, or `file_number`. Refer to *ASM_filename* for information on ASM file names. If you identify the file by number, then `file_number` is an integer representing the number found in
the FILE# column of the V$DATAFILE dynamic performance view or in the FILE_ID column of the DBA_DATA_FILES data dictionary view.

Use the TO clause to specify the new file_name or ASM_filename. If you are using Oracle Managed Files, then you can omit the TO clause. In this case, Oracle Database creates a unique name for the data file and saves it in the directory specified by the DB_CREATE_FILE_DEST initialization parameter.

If you specify REUSE, then the new data file is created even if it already exists.

If you specify KEEP, then the original data file will be kept after the MOVE DATAFILE operation. You cannot specify KEEP if the original data file is an Oracle Managed File. You can specify KEEP if the new data file is an Oracle Managed File.

**autoextend_clause**

Use the autoextend_clause to enable or disable the automatic extension of a new or existing data file or temp file. Refer to file_specification for information about this clause.

**logfile_clauses**

The logfile clauses let you add, drop, or modify log files.

**ARCHIVELOG**

Specify ARCHIVELOG if you want the contents of a redo log file group to be archived before the group can be reused. This mode prepares for the possibility of media recovery. Use this clause only after shutting down your instance normally, or immediately with no errors, and then restarting it and mounting the database.

**MANUAL**

Specify MANUAL to indicate that Oracle Database should create redo log files, but the archiving of the redo log files is controlled entirely by the user. This clause is provided for backward compatibility, for example for users who archive directly to tape. If you specify MANUAL, then:

- Oracle Database does not archive redo log files when a log switch occurs. You must handle this manually.
- You cannot have specified a standby database as an archivelog destinations. As a result, the database cannot be in MAXIMUM PROTECTION or MAXIMUM AVAILABILITY standby protection mode.

If you omit this clause, then Oracle Database automatically archives the redo log files to the destination specified in the LOG_ARCHIVE_DEST_n initialization parameters.

**NOARCHIVELOG**

Specify NOARCHIVELOG if you do not want the contents of a redo log file group to be archived so that the group can be reused. This mode does not prepare for recovery after media failure. Use this clause only if your instance has the database mounted but not open.

**[NO] FORCE LOGGING**

Use this clause to put the database into or take the database out of FORCE LOGGING mode. The database must be mounted or open.
In **FORCE LOGGING** mode, Oracle Database logs all changes in the database except changes in temporary tablespaces and temporary segments. This setting takes precedence over and is independent of any **NOLOGGING** or **FORCE LOGGING** settings you specify for individual tablespaces and any **NOLOGGING** settings you specify for individual database objects.

If you specify **FORCE LOGGING**, then Oracle Database waits for all ongoing unlogged operations to finish.

---

**See Also:**

*Oracle Database Administrator's Guide* for information on when to use **FORCE LOGGING** mode.

---

**RENAME FILE Clause**

This clause has the same function for logfiles that it has for data files and temp files. See “**RENAME FILE Clause**”.

**CLEAR LOGFILE Clause**

Use the **CLEAR LOGFILE** clause to reinitialize an online redo log, optionally without archiving the redo log. **CLEAR LOGFILE** is similar to adding and dropping a redo log, except that the statement may be issued even if there are only two logs for the thread and may be issued for the current redo log of a closed thread.

For a standby database, if the **STANDBY_FILE_MANAGEMENT** initialization parameter is set to **AUTO**, and if any of the log files are Oracle Managed Files, Oracle Database will create as many Oracle-managed log files as are in the control file. The log file members will reside in the current default log file destination.

- You must specify **UNARCHIVED** if you want to reuse a redo log that was not archived.

---

**Note:**

Specifying **UNARCHIVED** makes backups unusable if the redo log is needed for recovery.

- You must specify **UNRECOVERABLE DATAFILE** if you have taken the data file offline with the database in **ARCHIVELOG** mode (that is, you specified **ALTER DATABASE ... DATAFILE OFFLINE** without the **DROP** keyword), and if the unarchived log to be cleared is needed to recover the data file before bringing it back online. In this case, you must drop the data file and the entire tablespace once the **CLEAR LOGFILE** statement completes.

Do not use **CLEAR LOGFILE** to clear a log needed for media recovery. If it is necessary to clear a log containing redo after the database checkpoint, then you must first perform incomplete media recovery. The current redo log of an open thread can be cleared. The current log of a closed thread can be cleared by switching logs in the closed thread.
If the `CLEAR LOGFILE` statement is interrupted by a system or instance failure, then the database may hang. In this case, reissue the statement after the database is restarted. If the failure occurred because of I/O errors accessing one member of a log group, then that member can be dropped and other members added.

**See Also:**

"Clearing a Log File: Example"

### add_logfile_clauses

Use these clauses to add redo log file groups to the database and to add new members to existing redo log file groups.

**ADD LOGFILE Clause**

Use the `ADD LOGFILE` clause to add one or more redo log file groups to the online redo log or standby redo log.

**See Also:**

- "LOGFILE Clause" of `CREATE DATABASE` for information on the result of this clause for Oracle Managed Files if you do not specify a name for the new log file group
- "Adding Redo Log File Groups: Examples"
- *Oracle Data Guard Concepts and Administration* for more information on standby redo logs

**STANDBY**

Use the `STANDBY` clause to add a redo log file group to the standby redo log. If you do not specify this clause, then a log file group is added to the online redo log.

**INSTANCE**

The `INSTANCE` clause is applicable only for Oracle Real Application Clusters (Oracle RAC) or Oracle RAC One Node databases. Specify the name of the instance for which you want to add a redo log file group. The instance name is a string of up to 80 characters. Oracle Database automatically uses the thread that is mapped to the specified instance. If no thread is mapped to the specified instance, then Oracle Database automatically acquires an available unmapped thread and assigns it to that instance. If you do not specify this clause, then Oracle Database executes the command as if you had specified the current instance. If the specified instance has no current thread mapping and there are no available unmapped threads, then Oracle Database returns an error.

**THREAD**

When adding a redo log file group to the standby redo log, use the `THREAD` clause to assign the log file group to a specific primary database redo thread. Query the
V$INSTANCE view on the primary database to determine which redo threads have been opened, and specify one of these thread numbers.

You can also use the THREAD clause to assign a log file group to a specific redo thread when adding the log file group to the online redo log. This usage has been deprecated. The INSTANCE clause achieves the same purpose and is easier to use.

GROUP

The GROUP clause uniquely identifies the redo log file group among all groups in all threads and can range from 1 to the value specified for MAXLOGFILES in the CREATE DATABASE statement. You cannot add multiple redo log file groups having the same GROUP value. If you omit this parameter, then Oracle Database generates its value automatically. You can examine the GROUP value for a redo log file group through the dynamic performance view V$LOG.

redo_log_file_spec

Each redo_log_file_spec specifies a redo log file group containing one or more members (copies). If you do not specify a filename for the new log file, then Oracle Database creates Oracle Managed Files according to the rules described in the "LOGFILE Clause" of CREATE DATABASE.

See Also:

- file_specification
- Oracle Database Reference for information on dynamic performance views

ADD LOGFILE MEMBER Clause

Use the ADD LOGFILE MEMBER clause to add new members to existing redo log file groups. Each new member is specified by 'filename'. If the file already exists, then it must be the same size as the other group members and you must specify REUSE. If the file does not exist, then Oracle Database creates a file of the correct size. You cannot add a member to a group if all of the members of the group have been lost through media failure.

STANDBY

You must specify STANDBY when adding a member to a standby redo log file group. Otherwise, Oracle Database returns an error.

You can use the logfile_descriptor clause to specify an existing redo log file group in one of two ways:

GROUP integer

Specify the value of the GROUP parameter that identifies the redo log file group.

filename(s)

List all members of the redo log file group. You must fully specify each filename according to the conventions of your operating system.
drop_logfile_clauses

Use these clauses to drop redo log file groups or redo log file members.

DROP LOGFILE Clause

Use the DROP LOGFILE clause to drop all members of a redo log file group. If you use this clause to drop Oracle Managed Files, then Oracle Database also removes all log file members from disk. Specify a redo log file group as indicated for the ADD LOGFILE MEMBER clause.

- To drop the current log file group, you must first issue an ALTER SYSTEM SWITCH LOGFILE statement.
- You cannot drop a redo log file group if it needs archiving.
- You cannot drop a redo log file group if doing so would cause the redo thread to contain less than two redo log file groups.

DROP LOGFILE MEMBER Clause

Use the DROP LOGFILE MEMBER clause to drop one or more redo log file members. Each 'filename' must fully specify a member using the conventions for filenames on your operating system.

- To drop a log file in the current log, you must first issue an ALTER SYSTEM SWITCH LOGFILE statement. Refer to ALTER SYSTEM for more information.
- You cannot use this clause to drop all members of a redo log file group that contains valid data. To perform that operation, use the DROP LOGFILE clause.

switch_logfile_clause

This clause is useful when you are migrating the database to disks with a different block size that the block size of the current database. Use this clause to switch logfiles to a different block size for all externally enabled threads, including both open and
closed threads. If you are migrating the database to use 4KB sector disks, then you must specify 4096 for integer. If you are unmigrating the database back to using 512B sector disks, then you must specify 512 for integer.

This clause is an extension of the existing ALTER SYSTEM SWITCH LOGFILE statement. That statement switches logs for a single thread. This clause switches logfiles for all externally enabled threads, including both open and closed threads.

Before using this clause, you must already have created at least two redo log groups with the same target block size on the migration target disk.

See Also:
Oracle Database Administrator's Guide for more information on migrating the database to disks with a different block size, and "Adding a Log File: Example"

supplemental_db_logging

Use these clauses to instruct Oracle Database to add or stop adding supplemental data into the log stream.

**ADD SUPPLEMENTAL LOG Clause**

Specify **ADD SUPPLEMENTAL LOG DATA** to enable minimal supplemental logging. Specify **ADD SUPPLEMENTAL LOG supplemental_id_key_clause** to enable column data logging in addition to minimal supplemental logging. Specify **ADD SUPPLEMENTAL LOG supplemental_plsql_clause** to enable supplemental logging of PL/SQL calls. Oracle Database does not enable either minimal supplemental logging or supplemental logging by default.

Minimal supplemental logging ensures that LogMiner (and any products building on LogMiner technology) will have sufficient information to support chained rows and various storage arrangements such as cluster tables.

If the redo generated on one database is to be the source of changes (to be mined and applied) at another database, as is the case with logical standby, then the affected rows need to be identified using column data (as opposed to rowids). In this case, you should specify the **supplemental_id_key_clause**.

You can query the appropriate columns in the **V$DATABASE** view to determine whether any supplemental logging has already been enabled.

You can use this clause when the database is open. However, Oracle Database will invalidate all DML cursors in the cursor cache, which will have an effect on performance until the cache is repopulated.

If you use this clause in a CDB, then the current container must be the root and the operation will be performed on the entire CDB.

For a full discussion of the **supplemental_id_clause**, refer to **supplemental_id_key_clause** in the documentation on CREATE TABLE.
DROP SUPPLEMENTAL LOG Clause

Use this clause to stop supplemental logging.

- Specify `DROP SUPPLEMENTAL LOG DATA` to instruct Oracle Database to stop placing minimal additional log information into the redo log stream whenever an update operation occurs. If Oracle Database is doing column data supplemental logging specified with the `supplemental_id_key_clause`, then you must first stop the column data supplemental logging with the `DROP SUPPLEMENTAL LOG supplemental_id_key_clause` and then specify this clause.

- Specify `DROP SUPPLEMENTAL LOG supplemental_id_key_clause` to drop some or all of the system-generated supplemental log groups. You must specify the `supplemental_id_key_clause` if the supplemental log groups you want to drop were added using that clause.

- Specify `DROP SUPPLEMENTAL LOG supplemental_plsql_clause disable supplemental logging of PL/SQL calls`.

If you use this clause in a CDB, then the current container must be the root and the operation will be performed on the entire CDB.

controlfile_clauses

The `controlfile_clauses` let you create or back up a control file.

CREATE CONTROLFILE Clause

The `CREATE CONTROLFILE` clause lets you create a control file.

- Specify `PHYSICAL STANDBY` to create a control file to be used to maintain a physical database. This is the default if you specify `STANDBY` and do not specify `PHYSICAL` or `LOGICAL`.

- Specify `LOGICAL STANDBY` to create a control file to be used to maintain a logical database.

- Specify `FAR SYNC INSTANCE` to create a control file to be used to maintain a Data Guard far sync instance.
If the file already exists, then you must specify **REUSE**. In an Oracle RAC environment, the control file must be on shared storage.

---

**See Also:**

*Oracle Data Guard Concepts and Administration* for more information on creating control files

---

### BACKUP CONTROLFILE Clause

Use the `BACKUP CONTROLFILE` clause to back up the current control file. The database must be open or mounted when you specify this clause.

**TO 'filename'**

Use this clause to specify a binary backup of the control file. You must fully specify the `filename` using the conventions for your operating system. If the specified file already exists, then you must specify **REUSE**. In an Oracle RAC environment, `filename` must be on shared storage.

A binary backup contains information that is not captured if you specify **TO TRACE**, such as the archived log history, offline range for read-only and offline tablespaces, and backup sets and copies (if you use RMAN). If the `COMPATIBLE` initialization parameter is 10.2 or higher, binary control file backups include temp file entries.

**TO TRACE**

Specify **TO TRACE** if you want Oracle Database to write SQL statements to a trace file rather than making a physical backup of the control file. You can use SQL statements written to the trace file to start up the database, re-create the control file, and recover and open the database appropriately, based on the created control file. If you issue an **ALTER DATABASE BACKUP CONTROLFILE TO TRACE** statement while block change tracking is enabled, then the resulting trace file will contain a command to reenable block change tracking.

This statement issues an implicit **ALTER DATABASE REGISTER LOGFILE** statement, which creates incarnation records if the archived log files reside in the current archivelog destinations.

The trace file will also include **ALTER DATABASE REGISTER LOGFILE** statements for existing logfiles that reside in the current archivelog destinations. This will implicitly create database incarnation records for the branches of redo to which the logfiles apply.

You can copy the statements from the trace file into a script file, edit the statements as necessary, and use the script if all copies of the control file are lost (or to change the size of the control file).

- Specify **AS filename** if you want Oracle Database to place the trace output into a file called `filename` rather than into the standard trace file.
- Specify **REUSE** to allow Oracle Database to overwrite any existing file called `filename`. 

• **RESETLOGS** indicates that the SQL statement written to the trace file for starting the database is `ALTER DATABASE OPEN RESETLOGS`. This setting is valid only if the online logs are unavailable.

• **NORESETLOGS** indicates that the SQL statement written to the trace file for starting the database is `ALTER DATABASE OPEN NORESETLOGS`. This setting is valid only if all the online logs are available.

If you cannot predict the future state of the online logs, then specify neither **RESETLOGS** nor **NORESETLOGS**. In this case, Oracle Database puts both versions of the script into the trace file, and you can choose which version is appropriate when the script becomes necessary.

The trace files are stored in a subdirectory determined by the **DIAGNOSTIC_DEST** initialization parameter. You can find the name and location of the trace file to which the `CREATE CONTROLFILE` statements were written by looking in the alert log. You can also find the directory for trace files by querying the `NAME` and `VALUE` columns of the `V$DIAG_INFO` dynamic performance view.

**See Also:**

*Oracle Database Administrator's Guide* for information on viewing the alert log

---

**standby_database_clauses**

Use these clauses to activate the standby database or to specify whether it is in protected or unprotected mode.

**See Also:**

*Oracle Data Guard Concepts and Administration* for descriptions of the physical and logical standby database and for information on maintaining and using standby databases

---

**activate_standby_db_clause**

Use the **ACTIVATE STANDBY DATABASE** clause to convert a standby database into a primary database.

**Note:**

Before using this command, refer to *Oracle Data Guard Concepts and Administration* for important usage information.

---

**PHYSICAL**

Specify **PHYSICAL** to activate a physical standby database. This is the default.
LOGICAL

Specify LOGICAL to activate a logical standby database. If you have more than one logical standby database, then you should first ensure that the same log data is available on all the standby systems.

FINISH APPLY

This clause applies only to logical standby databases. Use it to initiate terminal apply, which is the application of any remaining redo to bring the logical standby database to the same state as the primary database. When terminal apply is complete, the database completes the switchover from logical standby to primary database.

If you require immediate restoration of the database in spite of data loss, then omit this clause. The database will execute the switchover from logical standby to primary database immediately without terminal apply.

maximize_standby_db_clause

Use this clause to specify the level of protection for the data in your database environment. You specify this clause from the primary database.

Note:

The PROTECTED and UNPROTECTED keywords have been replaced for clarity but are still supported. PROTECTED is equivalent to TO MAXIMIZE PROTECTION. UNPROTECTED is equivalent to TO MAXIMIZE PERFORMANCE.

TO MAXIMIZE PROTECTION

This setting establishes maximum protection mode and offers the highest level of data protection. A transaction does not commit until all data needed to recover that transaction has been written to at least one physical standby database that is configured to use the SYNC log transport mode. If the primary database is unable to write the redo records to at least one such standby database, then the primary database is shut down. This mode guarantees zero data loss, but it has the greatest potential impact on the performance and availability of the primary database.

Restriction on Establishing Maximum Protection Mode

You can specify TO MAXIMIZE PROTECTION on an open database only if the current data protection mode is MAXIMUM AVAILABILITY and there is at least one synchronized standby database.

TO MAXIMIZE AVAILABILITY

This setting establishes maximum availability mode and offers the next highest level of data protection. A transaction does not commit until all data needed to recover that transaction has been written to at least one physical or logical standby database that is configured to use the SYNC log transport mode. Unlike maximum protection mode, the primary database does not shut down if it is unable to write the redo records to at least one such standby database. Instead, the protection is lowered to maximum performance mode until the fault has been corrected and the standby database has caught up with the primary database. This mode guarantees zero data loss unless the primary database fails while in maximum performance mode. Maximum availability
mode provides the highest level of data protection that is possible without affecting the availability of the primary database.

**TO MAXIMIZE PERFORMANCE**

This setting establishes maximum performance mode and is the default setting. A transaction commits before the data needed to recover that transaction has been written to a standby database. Therefore, some transactions may be lost if the primary database fails and you are unable to recover the redo records from the primary database. This mode provides the highest level of data protection that is possible without affecting the performance of the primary database.

To determine the current mode of the database, query the PROTECTION_MODE column of the V$DATABASE dynamic performance view.

See Also:

*Oracle Data Guard Concepts and Administration* for full information on using these standby database settings

**register_logfile_clause**

Specify the REGISTER LOGFILE clause from the standby database to manually register log files from the failed primary. Use the redo_log_file_spec form of file_specification (see file_specification) to list regular redo log files in an operating system file system or to list Oracle ASM disk group redo log files.

When a log file is from an unknown incarnation, the REGISTER LOGFILE clause causes an incarnation record to be added to the V$DATABASE_INCARNATION view. If the newly registered log file belongs to an incarnation having a higher RESETLOGS_TIME than the current RECOVERY_TARGET_INCARNATION#, then the REGISTER LOGFILE clause also causes RECOVERY_TARGET_INCARNATION# to be changed to correspond to the newly added incarnation record.

**OR REPLACE**

Specify OR REPLACE to allow an existing archivelog entry in the standby database to be updated, for example, when its location or file specification changes. The system change numbers of the entries must match exactly, and the original entry must have been created by the managed standby log transmittal mechanism.

**FOR logminer_session_name**

This clause is useful in a Streams environment. It lets you register the log file with one specified LogMiner session.

**switchover_clause**

Caution:

Before using this command, refer to *Oracle Data Guard Concepts and Administration* for complete usage information.
Use this clause to perform a switchover to a physical standby database. Specify this clause from the primary database. For `target_db_name`, specify the `DB_UNIQUE_NAME` of the standby database.

**VERIFY**

Use this clause to verify that a physical standby database is ready for a switchover. Specify this clause from the primary database. For `target_db_name`, specify the `DB_UNIQUE_NAME` of the standby database. If the standby database is ready for a switchover, then the "Database Altered" message is returned. Otherwise, an error message that will assist you in preparing the standby database for a switchover is returned.

**FORCE**

Use this clause if a previous switchover command failed and created a configuration with no primary database. Specify this clause from the physical standby database that you want to convert to the primary database. For `target_db_name`, specify the `DB_UNIQUE_NAME` of the database that you want to convert to the primary database.

**failover_clause**

⚠️ **Caution:**

Before using this command, refer to *Oracle Data Guard Concepts and Administration* for complete usage information.

Use this clause to perform a failover to a physical standby database. Specify this clause from the standby database. For `target_db_name`, specify the `DB_UNIQUE_NAME` of the standby database.

**FORCE**

This clause has meaning only when the failover target is serviced by a Data Guard far sync instance. Use this clause when a previous failover command failed and the reason for the failure cannot be resolved. It instructs the failover to ignore any failures encountered when interacting with the Data Guard far sync instance and proceed with the failover, if at all possible.

**commit_switchover_clause**

Use this clause to perform database role transitions in a Data Guard configuration.

⚠️ **Caution:**

Before using this command, refer to *Oracle Data Guard Concepts and Administration* for complete usage information.

**PREPARE TO SWITCHOVER**

This clause prepares a primary database to become a logical standby database or a logical standby database to become a primary database.
• Specify `PREPARE TO SWITCHOVER TO LOGICAL STANDBY` on a **primary database**.

• Specify `PREPARE TO SWITCHOVER TO PRIMARY DATABASE` on a **logical standby database**.

**COMMIT TO SWITCHOVER**

This clause switches a **primary database** to a **standby database role** or switches a **standby database** to the **primary database role**.

• Specify `COMMIT TO SWITCHOVER TO PHYSICAL STANDBY` or `COMMIT TO SWITCHOVER TO LOGICAL STANDBY` on a **primary database**.

• Specify `COMMIT TO SWITCHOVER TO PRIMARY DATABASE` on a **standby database**.

**PHYSICAL**

This clause is always optional. Use of this clause with the `COMMIT TO SWITCHOVER TO PRIMARY` clause has been deprecated.

**LOGICAL**

This clause is specified with the `PREPARE TO SWITCHOVER` or `COMMIT TO SWITCHOVER` clauses when switching a **primary database** to the **logical standby database role**. Use of this clause with the `COMMIT TO SWITCHOVER TO PRIMARY` clause has been deprecated.

**WITH SESSION SHUTDOWN**

This clause causes all database sessions to be closed and uncommitted transactions to be rolled back before performing a database role transition.

**WITHOUT SESSION SHUTDOWN**

This clause prevents a requested role transition from occurring if there are any database sessions. This is the default.

**WAIT**

Specify this clause to wait for a role transition to complete before returning control to the user.

**NOWAIT**

Specify this clause to return control to the user without waiting for a role transition to complete. This is the default.

**CANCEL**

Specify this clause to reverse the effect of a previously specified `PREPARE TO SWITCHOVER` statement.

---

**See Also:**

*Oracle Data Guard Concepts and Administration* for full information on switchover between primary and standby databases.
**start_standby_clause**

Specify the `START LOGICAL STANDBY APPLY` clause to begin applying redo logs to a logical standby database. This clause enables primary key, unique index, and unique constraint supplemental logging as well as PL/SQL call logging.

- Specify `IMMEDIATE` to apply redo data from the current standby redo log file.
- Specify `NODELAY` if you want Oracle Database to ignore a delay for this apply. This is useful if the primary database is no longer present, which would otherwise require a PL/SQL call to be made.
- Specify `INITIAL` the first time you apply the logs to the standby database.
- The `NEW PRIMARY` clause is needed in two situations:
  - On a failover to a logical standby, specify this clause on a logical standby not participating in the failover operation, and on the old primary database after it has been reinstated as a logical standby database.
  - During a rolling upgrade using a logical standby database (which uses an unprepared switchover operation), specify this clause after the original primary database has been upgraded to the new database software.
- Specify `SKIP FAILED [TRANSACTION]` to skip the last transaction in the events table and restart the apply.
- Specify `FINISH` to force the standby redo log file information into archived logs. If the primary database becomes disabled, then you can then apply the data in the redo log files.

**stop_standby_clause**

Use this clause to stop the log apply services. This clause applies only to logical standby databases, not to physical standby databases. Use the `STOP` clause to stop the apply in an orderly fashion.

**convert_database_clause**

Use this clause to convert a database from one form to another.

- Specify `CONVERT TO PHYSICAL STANDBY` to convert a primary database, a logical standby database, or a snapshot standby database into a physical standby database.
  
  Perform these steps before specifying this clause:
  - On an Oracle Real Application Clusters (Oracle RAC) database, shut down all but one instance.
  - Ensure that the database is mounted, but not open.
  
  The database is dismounted after conversion and must be restarted.
- Specify `CONVERT TO SNAPSHOT STANDBY` to convert a physical standby database into a snapshot standby database.
  
  Ensure that redo apply is stopped before specifying this clause.
Note:
A snapshot standby database must be opened at least once in read/write mode before it can be converted into a physical standby database.

See Also:
Oracle Data Guard Concepts and Administration for more information about standby databases

default_settings_clauses
Use these clauses to modify the default settings of the database.

DEFAULT EDITION Clause
Use this clause to designate the specified edition as the default edition for the database. The specified edition must already have been created and must be USABLE. The change takes place immediately and is visible to all nodes in an Oracle RAC environment. New database sessions automatically start out in the specified edition. The new setting persists across database shutdown and startup.

When you designate an edition as the database default edition, all users can use the edition, as though the USE object privilege were granted on the specified edition to the role PUBLIC.

You can determine the current default edition of the database with the following query:

```
SELECT PROPERTY_VALUE FROM DATABASE_PROPERTIES
WHERE PROPERTY_NAME = 'DEFAULT_EDITION';
```

See Also:
CREATE EDITION for more information on editions and Oracle Database PL/SQL Language Reference for information on how editions are designated as USABLE

CHARACTER SET, NATIONAL CHARACTER SET
You can no longer change the database character set or the national character set using the ALTER DATABASE statement. Refer to Oracle Database Globalization Support Guide for information on database character set migration.

SET DEFAULT TABLESPACE Clause
Use this clause to specify or change the default type of subsequently created tablespaces. Specify BIGFILE or SMALLFILE to indicate whether the tablespaces should be bigfile or smallfile tablespaces.

• A bigfile tablespace contains only one data file or temp file, which can contain up to approximately 4 billion \(2^{32}\) blocks. The maximum size of the single data file or
temp file is 128 terabytes (TB) for a tablespace with 32K blocks and 32TB for a tablespace with 8K blocks.

- A **smallfile tablespace** is a traditional Oracle tablespace, which can contain 1022 data files or temp files, each of which can contain up to approximately 4 million \(2^{22}\) blocks.

**See Also:**

- *Oracle Database Administrator's Guide* for more information about bigfile tablespaces
- "Setting the Default Type of Tablespaces: Example"

### DEFAULT TABLESPACE Clause

Specify this clause to establish or change the default permanent tablespace of the database. The tablespace you specify must already have been created. After this operation completes, Oracle Database automatically reassigns to the new default tablespace all non-SYSTEM users. All objects subsequently created by those users will by default be stored in the new default tablespace. If you are replacing a previously specified default tablespace, then you can move the previously created objects from the old to the new default tablespace, and then drop the old default tablespace if you want to.

### DEFAULT [LOCAL] TEMPORARY TABLESPACE Clause

Specify this clause to change the default shared temporary tablespace of the database to a new tablespace or tablespace group, or to change the default local temporary tablespace to a new tablespace.

- Specify `tablespace` to indicate the new default temporary tablespace for the database. After this operation completes, Oracle Database automatically reassigns to the new default temporary tablespace all users who had been assigned to the old default temporary tablespace. You can then drop the old default temporary tablespace if you want to. Specify `DEFAULT TEMPORARY TABLESPACE` to change the default shared temporary tablespace. Specify `DEFAULT LOCAL TEMPORARY TABLESPACE` to change the default local temporary tablespace.

- Specify `tablespace_group_name` to indicate that all tablespaces in the tablespace group specified by `tablespace_group_name` are now default shared temporary tablespaces for the database. After this operation completes, users who have not been explicitly assigned a default temporary tablespace can create temporary segments in any of the tablespaces that are part of `tablespace_group_name`. You cannot drop an old default temporary tablespace if it is part of the default temporary tablespace group. Local temporary tablespaces cannot be part of a tablespace group.

To learn the name of the current default temporary tablespace or default temporary tablespace group, query the `TEMPORARY_TABLESPACE` column of the `ALL_`, `DBA_`, or `USER_USERS` data dictionary views.

### Restrictions on Default Temporary Tablespaces

Default temporary tablespaces are subject to the following restrictions:
The tablespace you assign or reassign as the default temporary tablespace must have a standard block size.

If the system tablespace is locally managed, then the tablespace you specify as the default temporary tablespace must also be locally managed.

See Also:

- Oracle Database Administrator's Guide for information on tablespace groups
- "Changing the Default Temporary Tablespace: Examples"

instance_clauses

In an Oracle Real Application Clusters environment, specify ENABLE INSTANCE to enable the thread that is mapped to the specified database instance. The thread must have at least two redo log file groups, and the database must be open.

Specify DISABLE INSTANCE to disable the thread that is mapped to the specified database instance. The name of the instance is a string of up to 80 characters. If no thread is currently mapped to the specified instance, then Oracle Database returns an error. The database must be open, but you cannot disable a thread if an instance using it has the database mounted.

See Also:

Oracle Real Application Clusters Administration and Deployment Guide for more information on enabling and disabling instances

RENAME GLOBAL_NAME Clause

Specify RENAME GLOBAL_NAME to change the global name of the database. The database must be open. The database is the new database name and can be as long as eight bytes. The optional domain specifies where the database is effectively located in the network hierarchy. If you specify a domain name, then the components of the domain name must be legal identifiers. See “Database Object Naming Rules” for information on valid identifiers.

Note:

Renaming your database does not change global references to your database from existing database links, synonyms, and stored procedures and functions on remote databases. Changing such references is the responsibility of the administrator of the remote databases.
BLOCK CHANGE TRACKING Clauses

The block change tracking feature causes Oracle Database to keep track of the physical locations of all database updates on both the primary database and any physical standby database. You must enable block change tracking on each database for which you want tracking to be performed. The tracking information is maintained in a separate file called the block change tracking file. If you are using Oracle Managed Files, then Oracle Database automatically creates the block change tracking file in the location specified by DB_CREATE_FILE_DEST. If you are not using Oracle Managed Files, then you must specify the change tracking filename. Oracle Database uses change tracking data for some internal tasks, such as increasing the performance of incremental backups. You can enable or disable block change tracking with the database either open or mounted, in either archivelog or NOARCHIVELOG mode.

ENABLE BLOCK CHANGE TRACKING

This clause enables block change tracking and causes Oracle Database to create a block change tracking file.

- Specify USING FILE 'filename' if you want to name the block change tracking file instead of letting Oracle Database generate a name for it. You must specify this clause if you are not using Oracle Managed Files.
- Specify REUSE to allow Oracle Database to overwrite an existing block change tracking file of the same name.

DISABLE BLOCK CHANGE TRACKING

Specify this clause if you want Oracle Database to stop tracking changes and delete the existing block change tracking file.

[NO] FORCE FULL DATABASE CACHING

Use this clause to enable or disable the force full database caching mode. In contrast to the default mode, which is automatic, the force full database caching mode considers the entire database, including NOCACHE LOBs, as eligible for caching in the buffer cache.

The database must be mounted but not open. In an Oracle RAC environment, the database must be mounted but not open in the current instance and unmounted in all other instances.
• Specify **FORCE FULL DATABASE CACHING** to enable the force full database caching mode.

• Specify **NO FORCE FULL DATABASE CACHING** to disable the force full database caching mode. This is the default mode.

You can determine whether the force full database caching mode is enabled by querying the **FORCE_FULL_DB_CACHING** column of the **V$DATABASE** dynamic performance view.

**CONTAINERS DEFAULT TARGET**

Use this clause to specify the default container for DML statements in a CDB. You must be connect to the CDB root.

• For **container_name**, specify the name of the default container. The default container can be any container in the CDB, including the CDB root, a PDB, an application root, or an application PDB. You can specify only one default container.

• If you specify **NONE**, then the default container is the CDB root. This is the default.

When a DML statement is issued in a CDB root without specifying containers in the **WHERE** clause, the DML statement affects the default container for the CDB.

**flashback_mode_clause**

Use this clause to put the database in or take the database out of **FLASHBACK** mode. You can specify this clause only if the database is in **ARCHIVELOG** mode and you have already prepared a fast recovery area for the database. You can specify this clause when the database is mounted or open. This clause cannot be specified on a physical standby database if redo apply is active.

**FLASHBACK ON**

Use this clause to put the database in **FLASHBACK** mode. When the database is in **FLASHBACK** mode, Oracle Database automatically creates and manages Flashback
Database logs in the fast recovery area. Users with SYSDBA system privilege can then issue aFLASHBACK DATABASEstatement.

**FLASHBACK OFF**

Use this clause to take the database out ofFLASHBACK mode. Oracle Database stops logging Flashback data and deletes all existing Flashback Database logs. Any attempt to issue aFLASHBACK DATABASEwill fail with an error.

**undo_mode_clause**

This clause is valid only when you are connected to a CDB. It lets you change the undo mode for the CDB. The CDB must be inOPEN UPGRADE mode.

- SpecifyLOCAL UNDO ON to change the CDB to use local undo mode.
- SpecifyLOCAL UNDO OFF to change the CDB to use shared undo mode.

> **See Also:**

- CREATE DATABASEundo_mode_clauses for the full semantics of this clause
- Oracle Database Administrator’s Guidefor the complete steps for configuring a CDB to use local undo mode or shared undo mode

**set_time_zone_clause**

This clause has the same semantics inCREATE DATABASE andALTER DATABASEstatements. When used in withALTER DATABASE, this clause resets the time zone of the database. To determine the time zone of the database, query the built-in functionDBTIMEZONE. After setting or changing the time zone with this clause, you must restart the database for the new time zone to take effect.

Oracle Database normalizes all newTIMESTAMP WITH LOCAL TIME ZONE data to the time zone of the database when the data is stored on disk. Oracle Database does not automatically update existing data in the database to the new time zone. Therefore, you cannot reset the database time zone if there is anyTIMESTAMP WITH LOCAL TIME ZONE data in the database. You must first delete or export theTIMESTAMP WITH LOCAL TIME ZONE data and then reset the database time zone. For this reason, Oracle does not encourage you to change the time zone of a database that contains data.

For a full description of this clause, refer to**set_time_zone_clause** in the documentation onCREATE DATABASE.

**security_clause**

Use thesecurity_clauses (GUARD) to protect data in the database from being changed. You can override this setting for a current session using theALTER SESSION DISABLE GUARD statement. Refer to**ALTER SESSION** for more information.

**ALL**

SpecifyALL to prevent all users other thanSYSfrom making any changes to the database.
STANDBY

Specify STANDBY to prevent all users other than SYS from making changes to any database object being maintained by logical standby. This setting is useful if you want report operations to be able to modify data as long as it is not being replicated by logical standby.

See Also:
Oracle Data Guard Concepts and Administration for information on logical standby

NONE

Specify NONE if you want normal security for all data in the database.

Note:
Oracle strongly recommends that you not use this setting on a logical standby database.

Examples

READ ONLY / READ WRITE: Example

The following statement opens the database in read-only mode:

```
ALTER DATABASE OPEN READ ONLY;
```

The following statement opens the database in read/write mode and clears the online redo logs:

```
ALTER DATABASE OPEN READ WRITE RESETLOGS;
```

Using Parallel Recovery Processes: Example

The following statement performs tablespace recovery using parallel recovery processes:

```
ALTER DATABASE
  RECOVER TABLESPACE tbs_03
  PARALLEL;
```

Adding Redo Log File Groups: Examples

The following statement adds a redo log file group with two members and identifies it with a GROUP parameter value of 3:

```
ALTER DATABASE
  ADD LOGFILE GROUP 3
  ("diska:log3.log",
   "diskb:log3.log") SIZE 50K;
```
The following statement adds a redo log file group containing two members to thread 5 (in a Real Application Clusters environment) and assigns it a GROUP parameter value of 4:

```sql
ALTER DATABASE
  ADD LOGFILE THREAD 5 GROUP 4
  ('diska:log4.log',
   'diskb:log4:log');
```

Adding Redo Log File Group Members: Example

The following statement adds a member to the redo log file group added in the previous example:

```sql
ALTER DATABASE
  ADD LOGFILE MEMBER 'diskc:log3.log'
  TO GROUP 3;
```

Dropping Log File Members: Example

The following statement drops one redo log file member added in the previous example:

```sql
ALTER DATABASE
  DROP LOGFILE MEMBER 'diskb:log3.log';
```

The following statement drops all members of the redo log file group 3:

```sql
ALTER DATABASE DROP LOGFILE GROUP 3;
```

Renaming a Log File Member: Example

The following statement renames a redo log file member:

```sql
ALTER DATABASE
  RENAME FILE 'diskc:log3.log' TO 'diskb:log3.log';
```

The preceding statement only changes the member of the redo log group from one file to another. The statement does not actually change the name of the file `diskc:log3.log` to `diskb:log3.log`. Before issuing this statement, you must change the name of the file through your operating system.

Setting the Default Type of Tablespaces: Example

The following statement specifies that subsequently created tablespaces be created as bigfile tablespaces by default:

```sql
ALTER DATABASE
  SET DEFAULT BIGFILE TABLESPACE;
```

Changing the Default Temporary Tablespace: Examples

The following statement makes the `tbs_05` tablespace (created in "Creating a Temporary Tablespace: Example") the default temporary tablespace of the database. This statement either establishes a default temporary tablespace if none was specified at create time, or replaces an existing default temporary tablespace with `tbs_05`:

```sql
ALTER DATABASE
  DEFAULT TEMPORARY TABLESPACE tbs_05;
```

Alternatively, a group of tablespaces can be defined as the default temporary tablespace by using a tablespace group. The following statement makes the
tablespaces in the tablespace group tbs_group_01 (created in "Adding a Temporary Tablespace to a Tablespace Group: Example") the default temporary tablespaces of the database:

```
ALTER DATABASE
  DEFAULT TEMPORARY TABLESPACE tbs_grp_01;
```

### Creating a New Data File: Example

The following statement creates a new data file tbs_f04.dbf based on the file tbs_f03.dbf. Before creating the new data file, you must take the existing data file (or the tablespace in which it resides) offline.

```
ALTER DATABASE
  CREATE DATAFILE 'tbs_f03.dbf'
  AS 'tbs_f04.dbf';
```

### Manipulating Temp Files: Example

The following takes offline the temp file temp02.dbf created in Adding and Dropping Data Files and Temp Files: Examples and then renames the temp file:

```
ALTER DATABASE TEMPFILE 'temp02.dbf' OFFLINE;
ALTER DATABASE RENAME FILE 'temp02.dbf' TO 'temp03.dbf';
```

The statement renaming the temp file requires that you first create the file temp03.dbf on the operating system.

### Changing the Global Database Name: Example

The following statement changes the global name of the database and includes both the database name and domain:

```
ALTER DATABASE
  RENAME GLOBAL_NAME TO demo.world.example.com;
```

### Enabling and Disabling Block Change Tracking: Examples

The following statement enables block change tracking and causes Oracle Database to create a block change tracking file named tracking_file and overwrite the file if it already exists:

```
ALTER DATABASE
  ENABLE BLOCK CHANGE TRACKING
  USING FILE 'tracking_file' REUSE;
```

The following statement disables block change tracking and deletes the existing block change tracking file:

```
ALTER DATABASE
  DISABLE BLOCK CHANGE TRACKING;
```

### Resizing a Data File: Example

The following statement attempts to change the size of data file diskb:tbs_f5.dbf:

```
ALTER DATABASE
  DATAFILE 'diskb:tbs_f5.dbf' RESIZE 10 M;
```

### Clearing a Log File: Example
The following statement clears a log file:

```
ALTER DATABASE
  CLEAR LOGFILE 'diskc:log3.log';
```

**Database Recovery: Examples**

The following statement performs complete recovery of the entire database, letting Oracle Database generate the name of the next archived redo log file needed:

```
ALTER DATABASE
  RECOVER AUTOMATIC DATABASE;
```

The following statement explicitly names a redo log file for Oracle Database to apply:

```
ALTER DATABASE
  RECOVER LOGFILE 'diskc:log3.log';
```

The following statement performs time-based recovery of the database:

```
ALTER DATABASE
  RECOVER AUTOMATIC UNTIL TIME '2001-10-27:14:00:00';
```

Oracle Database recovers the database until 2:00 p.m. on October 27, 2001.

For an example of recovering a tablespace, see "Using Parallel Recovery Processes: Example".

## 10.9 ALTER DATABASE LINK

### Purpose

Use the `ALTER DATABASE LINK` statement to modify a fixed-user database link when the password of the connection or authentication user changes.

#### Note:

- You cannot use this statement to change the connection or authentication user associated with the database link. To change the user, you must re-create the database link.
- You cannot use this statement to change the password of a connection or authentication user. You must use the `ALTER USER` statement for this purpose, and then alter the database link with the `ALTER DATABASE LINK` statement.
- This statement is valid only for fixed-user database links, not for connected-user or current user database links. See `CREATE DATABASE LINK` for more information on these two types of database links.

### Prerequisites

To alter a private database link, you must have the `ALTER DATABASE LINK` system privilege. To alter a public database link, you must have the `ALTER PUBLIC DATABASE LINK` system privilege.
Syntax

\texttt{alter\_database\_link::=}

\begin{align*}
\text{ALTER} & \quad \text{SHARED} & \quad \text{PUBLIC} & \quad \text{DATABASE} & \quad \text{LINK} & \quad \text{dblink\_name} \\
\quad \text{CONNECT} & \quad \text{TO} & \quad \text{user} & \quad \text{IDENTIFIED} & \quad \text{BY} & \quad \text{password} & \quad \text{dblink\_authentication}
\end{align*}

\textit{dblink\_authentication}

\begin{align*}
\quad \text{AUTHENTICATED} & \quad \text{BY} & \quad \text{user} & \quad \text{IDENTIFIED} & \quad \text{BY} & \quad \text{password}
\end{align*}

Semantics

The \texttt{ALTER DATABASE LINK} statement is intended only to update fixed-user database links with the current passwords of connection and authentication users. Therefore, any clauses valid in a \texttt{CREATE DATABASE LINK} statement that do not appear in the syntax diagram above are not valid in an \texttt{ALTER DATABASE LINK} statement. The semantics of all of the clauses permitted in this statement are the same as the semantics for those clauses in \texttt{CREATE DATABASE LINK}. Refer to \texttt{CREATE DATABASE LINK} for this information.

Examples

The following statements show the valid variations of the \texttt{ALTER DATABASE LINK} statement:

\begin{verbatim}
ALTER DATABASE LINK private_link
   CONNECT TO hr IDENTIFIED BY hr_new_password;

ALTER PUBLIC DATABASE LINK public_link
   CONNECT TO scott IDENTIFIED BY scott_new_password;

ALTER SHARED PUBLIC DATABASE LINK shared_pub_link
   CONNECT TO scott IDENTIFIED BY scott_new_password
   AUTHENTICATED BY hr IDENTIFIED BY hr_new_password;

ALTER SHARED DATABASE LINK shared_pub_link
   CONNECT TO scott IDENTIFIED BY scott_new_password;
\end{verbatim}

\subsection*{10.10 ALTER DIMENSION}

Purpose

Use the \texttt{ALTER DIMENSION} statement to change the hierarchical relationships or dimension attributes of a dimension.
Prerequisites

The dimension must be in your schema or you must have the `ALTER ANY DIMENSION` system privilege to use this statement.

A dimension is always altered under the rights of the owner.

Syntax

```
alter_dimension ::= 
```

```
( level_clause ::=, hierarchy_clause ::=, attribute_clause ::=, 
  extended_attribute_clause ::= )
```

```
level_clause ::= 
```

```
( level_table . level_column )
```

```
SKIP WHEN NULL
```
hierarchy_clause::= 

HIERARCHY hierarchy ( child_level CHILD OF parent_level
dimension_join_clause
)

(dimension_join_clause::=)

dimension_join_clause::=

JOIN KEY child_key_column
( child_key_column
,
)
REFERENCES parent_level

attribute_clause::= 

ATTRIBUTE level DETERMINES dependent_column
( dependent_column
,
)

extended_attribute_clause::= 

ATTRIBUTE attribute LEVEL level DETERMINES dependent_column
( dependent_column
,
)

Semantics

The following keywords, parameters, and clauses have meaning unique to ALTER DIMENSION. Keywords, parameters, and clauses that do not appear here have the same functionality that they have in the CREATE DIMENSION statement. Refer to CREATE DIMENSION for more information.

schema

Specify the schema of the dimension you want to modify. If you do not specify schema, then Oracle Database assumes the dimension is in your own schema.
**dimension**

Specify the name of the dimension. This dimension must already exist.

**ADD**

The ADD clauses let you add a level, hierarchy, or attribute to the dimension. Adding one of these elements does not invalidate any existing materialized view.

Oracle Database processes ADD LEVEL clauses prior to any other ADD clauses.

**DROP**

The DROP clauses let you drop a level, hierarchy, or attribute from the dimension. Any level, hierarchy, or attribute you specify must already exist.

Within one attribute, you can drop one or more level-to-column relationships associated with one level.

**Restriction on DROP**

If any attributes or hierarchies reference a level, then you cannot drop the level until you either drop all the referencing attributes and hierarchies or specify CASCADE.

**CASCADE**

Specify CASCADE if you want Oracle Database to drop any attributes or hierarchies that reference the level, along with the level itself.

**RESTRICT**

Specify RESTRICT if you want to prevent Oracle Database from dropping a level that is referenced by any attributes or hierarchies. This is the default.

**COMPILE**

Specify COMPILE to explicitly recompile an invalidated dimension. Oracle Database automatically compiles a dimension when you issue an ADD clause or DROP clause. However, if you alter an object referenced by the dimension (for example, if you drop and then re-create a table referenced in the dimension), Oracle Database invalidates, and you must recompile it explicitly.

**Examples**

**Modifying a Dimension: Examples**

The following examples modify the customers_dim dimension in the sample schema sh:

```
ALTER DIMENSION customers_dim
  DROP ATTRIBUTE country;

ALTER DIMENSION customers_dim
  ADD LEVEL zone IS customers.cust_postal_code
  ADD ATTRIBUTE zone DETERMINES (cust_city);
```
10.11 ALTER DISKGROUP

**Note:**

This SQL statement is valid only if you are using Oracle ASM and you have started an Oracle ASM instance. You must issue this statement from within the Oracle ASM instance, not from a normal database instance. For information on starting an Oracle ASM instance, refer to *Oracle Automatic Storage Management Administrator's Guide*.

**Purpose**

The `ALTER DISKGROUP` statement lets you perform a number of operations on a disk group or on the disks in a disk group.

**See Also:**

- `CREATE DISKGROUP` for information on creating disk groups
- *Oracle Automatic Storage Management Administrator's Guide* for information on Oracle ASM and using disk groups to simplify database administration

**Prerequisites**

You must have an Oracle ASM instance started from which you issue this statement. The disk group to be modified must be mounted.

You can issue all `ALTER DISKGROUP` clauses if you have the `SYSASM` system privilege.

You can issue specific clauses as follows:

- The `SYSOPER` privilege permits the following subset of the `ALTER DISKGROUP` operations: `diskgroup_availability`, `rebalance_diskgroup_clause`, `check_diskgroup_clause` (without the `REPAIR` option).
- If you are connected as `SYSDBA`, you have limited privileges to use this statement. The following operations are always granted to users connected as `SYSDBA`:
  - `ALTER DISKGROUP ... ADD DIRECTORY`
  - `ALTER DISKGROUP ... ADD/ALTER/DROP TEMPLATE` *(nonsystem templates only)*
  - `ALTER DISKGROUP ... ADD USERGROUP`
  - `SELECT`
  - `SHOW PARAMETER`

Table 10-1 shows additional privileges granted to users connected as `SYSDBA` under the conditions shown:
Table 10-1  Conditional Diskgroup Privileges for SYSDBA

Semantics

diskgroup_name

Specify the name of the disk group you want to modify. To determine the names of existing disk groups, query the V$ASM_DISKGROUP dynamic performance view.

add_disk_clause

Use this clause to add one or more disks to the disk group and specify attributes for the newly added disk. Oracle ASM automatically rebalances the disk group as part of this operation.

You cannot use this clause to change the failure group of a disk. Instead you must drop the disk from the disk group and then add the disk back into the disk group as part of the new failure group.

To determine the names of the disks already in this disk group, query the V$ASM_DISK dynamic performance view.

QUORUM | REGULAR

The semantics of these keyword are the same as the semantics in a CREATE DISKGROUP statement. See QUORUM | REGULAR for more information on these keywords.

You cannot change this qualifier for an existing disk or disk group. Therefore, you cannot specify in this clause a keyword different from the keyword that was specified when the disk group was created.

See Also:

Oracle Automatic Storage Management Administrator's Guide for more information about the use of these keywords

FAILGROUP Clause

Use this clause to assign the newly added disk to a failure group. If you omit this clause and you are adding the disk to a normal or high redundancy disk group, then Oracle Database automatically adds the newly added disk to its own failure group. The implicit name of the failure group is the same as the operating system independent disk name (see "NAME Clause").

You cannot specify this clause if you are creating an external redundancy disk group.
qualified\_disk\_clause

This clause has the same semantics in CREATE\ DISKGROUP and ALTER DISKGROUP statements. For complete information on this clause, refer to qualified\_disk\_clause in the documentation on CREATE DISKGROUP.

drop\_disk\_clause

Use this clause to drop one or more disks from the disk group.

DROP DISK

The DROP DISK clause lets you drop one or more disks from the disk group and automatically rebalance the disk group. When you drop a disk, Oracle ASM relocates all the data from the disk and clears the disk header so that it no longer is part of the disk group. The disk header is not cleared if you specify the FORCE keyword.

Specify disk\_name as shown in the NAME column of the V\$ASM\_DISK dynamic performance view.

If a disk to be dropped is a quorum disk or belongs to a quorum failure group, then you must specify QUORUM in order to drop the disk. See QUORUM | REGULAR.

DROP DISKS IN FAILGROUP

The DROP DISKS IN FAILGROUP clause lets you drop all the disks in the specified failure group. The behavior is otherwise the same as that for the DROP DISK clause.

If the specified failure group is a quorum failure group, then you must specify the QUORUM keyword in order to drop the disks. See QUORUM | REGULAR.

FORCE | NOFORCE

These keywords let you specify when the disk is considered to be no longer part of the disk group. The default and recommended setting is NOFORCE.

• When you specify NOFORCE, Oracle ASM reallocates all of the extents of the disk to other disks and then expels the disk from the disk group and rebalances the disk group.

Note:

DROP DISK ... NOFORCE returns control to the user before the disk can be safely reused or removed from the system. To ensure that the drop disk operation has completed, query the V\$ASM\_DISK view to verify that HEADER\_STATUS has the value FORMER. Do not attempt to remove or reuse a disk if STATE has the value DROPPING. Query the V\$ASM\_OPERATION view for approximate information on how long it will take to complete the rebalance resulting from dropping the disk. If you also specify REBALANCE ... WAIT (see rebalance\_diskgroup\_clause), then the statement will not return until the rebalance operation is complete and the disk has been cleared. However, you should always verify that the HEADER\_STATUS column of V\$ASM\_DISK is FORMER, because of the unlikely event the rebalance operations fails.
When you specify FORCE, Oracle Database expels the disk from the disk group immediately. It then reconstructs the data from the redundant copies on other disks, reallocates the data to other disks, and rebalances the disk group.

The FORCE clause can be useful, for example, if Oracle ASM can no longer read the disk to be dropped. However, it is more time consuming than a NOFORCE drop, and it can leave portions of a file with reduced protection. You cannot specify FORCE for an external redundancy disk group at all, because in the absence of redundant data on the disk, Oracle ASM must read the data from the disk before it can be dropped.

The rebalance operation invoked when a disk is dropped is time consuming, whether or not you specify FORCE or NOFORCE. You can monitor the progress by querying the V$ASM_OPERATION dynamic performance view. Refer to rebalance_diskgroup_clause for more information on rebalance operations.

resize_disk_clause
Use this clause to specify a new size for every disk in a disk group. This clause lets you override the size returned by the operating system or the size you specified previously for the disks.

SIZE
Specify the new size in kilobytes, megabytes, gigabytes, or terabytes. You cannot specify a size greater than the capacity of the disk. If you specify a size smaller than the disk capacity, then you limit the amount of disk space Oracle ASM will use. If you omit this clause, then Oracle ASM attempts programatically to determine the size of the disks.

replace_disk_clause
Use this clause to replace one or more disks in the disk group. This clause allows you to replace disks with a single operation, which is more efficient than dropping and adding each disk.

For disk_name, specify the name of the disk you want to replace. This name is assigned to the replacement disk. You can view disk names by querying the NAME column of the V$ASM_DISK dynamic performance view.

For path_name, specify the full path name for the replacement disk.

FORCE
Specify FORCE if you want Oracle ASM to add the replacement disk to the disk group even if the replacement disk is already a member of a disk group.

Note:
Using FORCE in this way may destroy existing disk groups.

NOFORCE
Specify NOFORCE if you want Oracle ASM to return an error if the replacement disk is already a member of a disk group. NOFORCE is the default.
POWER

The POWER clause has the same semantics here as for a manual rebalancing of a disk
group, except that the power value cannot be set to 0. See POWER.

WAIT | NOWAIT

The WAIT and NOWAIT keywords have the same semantics here as for a manual
rebalancing of a disk group. See WAIT | NOWAIT.

rename_disk_clause

Use this clause to rename one or more disks in the disk group. The disk group must
be in the MOUNT RESTRICTED state and all disks in the disk group must be online.

RENAME DISK

Specify this clause to rename one or more disks. For each disk, specify the
old_disk_name and new_disk_name. If new_disk_name already exists, then this
operation fails.

RENAME DISKS ALL

Specify this clause to rename all disks in the disk group to a name of the form
diskgroupname_####, where #### is the disk number. Disk names that are already in
the diskgroupname_#### format are not changed.

disk_online_clause

Use this clause to bring one or more disks online and rebalance the disk group.

ONLINE DISK

The ONLINE DISK clause lets you bring one or more specified disks online and
rebalance the disk group.

Specify disk_name as shown in the NAME column of the V$ASM_DISK dynamic
performance view.

The QUORUM and REGULAR keywords have the same semantics here as they have when
adding a disk to a disk group. See QUORUM | REGULAR.

ONLINE DISKS IN FAILGROUP

The ONLINE DISKS IN FAILGROUP clause lets you bring all disks in the specified failure
group online and rebalance the disk group.

If the specified failure group is a quorum failure group, then you must specify the
QUORUM keyword in order to bring the disks online. See QUORUM | REGULAR.

ALL

The ALL clause lets you bring all disks in the disk group online and rebalance the disk
group.

POWER

The POWER clause has the same semantics here as for a manual rebalancing of a disk
group. See POWER.

WAIT | NOWAIT
The WAIT and NOWAIT keywords have the same semantics here as for a manual rebalancing of a disk group. See WAIT | NOWAIT.

**disk_offline_clause**

Use the disk_offline_clause to take one or more disks offline. This clause fails if the redundancy level of the disk group would be violated by taking the specified disks offline.

**OFFLINE DISK**

The OFFLINE DISK clause lets you take one or more specified disks offline.

Specify disk_name as shown in the NAME column of the V$ASM_DISK dynamic performance view.

The QUORUM and REGULAR keywords have the same semantics here as they have when adding a disk to a disk group. See QUORUM | REGULAR.

**OFFLINE DISKS IN FAILGROUP**

The OFFLINE DISKS IN FAILGROUP clause lets you take all disks in the specified failure group offline.

If the specified failure group is a quorum failure group, then you must specify the QUORUM keyword in order to take the disks offline. See QUORUM | REGULAR.

**timeout_clause**

By default, Oracle ASM drops a disk shortly after it is taken offline. You can delay this operation by specifying the timeout_clause, which gives you the opportunity to repair the disk and bring it back online. You can specify the timeout value in units of minute or hour. If you omit the unit, then the default is hour.

You can change the timeout period by specifying this clause multiple times. Each time you specify it, Oracle ASM measures the time from the most recent previous disk_offline_clause while the disk group is mounted. To learn how much time remains before Oracle ASM will drop an offline disk, query the REPAIR_TIMER column of V$ASM_DISK.

This clause overrides any previous setting of the disk_repair_time attribute. Refer to Table 13-2 for more information about disk group attributes.

**See Also:**

Oracle Automatic Storage Management Administrator's Guide for more information about taking Oracle ASM disks online and offline

**rebalance_diskgroup_clause**

Use this clause to manually rebalance the disk group. During a rebalance operation, Oracle ASM redistributes data files evenly across all drives. This clause is rarely necessary, because Oracle ASM allocates files evenly and automatically rebalances disk groups when the storage configuration changes. However, it is useful if you want to perform a controlled rebalance operation. It allows you to include or exclude certain
phases of a rebalance operation, pause and restart a rebalance operation, and adjust the power of a rebalance operation.

**WITH | WITHOUT**

A rebalance operation consists of the following phases: RESTORE (includes the RESYNC, RESILVER, or REBUILD phases), BALANCE, PREPARE, and COMPACT.

You can use the **WITH** or **WITHOUT** clause to instruct Oracle ASM to include or exclude specific phases of a rebalance operation. For example, if you have time constraints, you can include only the **RESTORE** phase. Or, if you are using flash storage disk groups or disk groups with flash cache, you can exclude the **COMPACT** phase, which is not beneficial for such disk groups.

- Use the **WITH** clause to include only the specified phases of a rebalance operation. You can specify any of phases RESTORE, BALANCE, PREPARE, and COMPACT. It is acceptable, but not necessary, to specify **RESTORE**, because the **RESTORE** phase always occurs.

- Use the **WITHOUT** clause to exclude the specified phases of a rebalance operation. You can specify any of the phases BALANCE, PREPARE, and COMPACT. You cannot specify **RESTORE**, because the **RESTORE** phase must always occur.

The order in which you specify multiple phases in the **WITH** or **WITHOUT** clause does not matter. Oracle ASM will perform the phases of the rebalance operation in the proper order. You cannot specify the RESYNC, RESILVER, or REBUILD phases; they are part of the **RESTORE** phase.

If you omit the **WITH** and **WITHOUT** clauses, then Oracle ASM performs all phases of the rebalance operation.

You can monitor the progress of the rebalance operation by querying the **V$ASM_OPERATION** dynamic performance view.

See *Oracle Automatic Storage Management Administrator’s Guide* for more information on the phases of a rebalance operation.

### POWER

This clause lets you specify the power, or speed, of the rebalance operation. It also lets you stop the rebalance operation.

For **integer**, specify a value from 0 to 1024:

- A value of 1 through 1024 specifies the power at which Oracle ASM is to perform the rebalance operation, with 1 representing the lowest possible power and 1024 representing the highest possible power.

- A value of 0 stops an active rebalance operation. No further rebalancing will occur until the start of another manual or automatic rebalance operation on the disk group, and at that time the rebalance operation will start from the beginning. If you would like to have the option of later resuming the rebalance operation from where it left off, then instead stop the rebalance operation by specifying **MODIFY POWER 0**. See the clause **MODIFY POWER** for more information.

If you omit the **POWER** clause, then the default power is determined as follows:

- For flex disk groups, Oracle ASM rebalances each file group according the value of its **POWER_LIMIT** property. If the **POWER_LIMIT** property is not set for a file group,
then Oracle ASM uses the value of the `ASM_POWER_LIMIT` initialization parameter for the file group.

- For all other types of disk groups, if you omit the `POWER` clause, then Oracle ASM rebalances the disk group according to the value of the `ASM_POWER_LIMIT` initialization parameter.

**WAIT | NOWAIT**

Use this clause to specify when, in the course of the rebalance operation, control should be returned to the user.

- Specify `WAIT` if you want control returned to the user after the rebalance operation has finished. You can explicitly terminate a rebalance operation running in `WAIT` mode, although doing so does not undo any completed disk add, drop, or resize operations in the same statement.
- Specify `NOWAIT` if you want control returned to the user immediately after the statement is issued. This is the default.

**MODIFY POWER**

Use this clause to pause, resume, or change the power of an active rebalance operation.

You can specify `integer` as follows:

- Specify 0 to pause the rebalance operation. When you pause a rebalance operation in this manner, you can subsequently resume the operation from the phase where it left off by issuing an `ALTER DISKGROUP ... MODIFY POWER ...` statement. If you subsequently start a manual rebalance operation on the disk group using the clause `POWER`, or an automatic rebalance operation for the disk group occurs, then the rebalance operation will start at the beginning.
- Specify 1 through 1024 to specify the power of the rebalance operation, with 1 representing the lowest possible power and 1024 representing the highest possible power. If a rebalance operation is running, then Oracle ASM changes the power without interrupting the operation. If a rebalance operation was previously paused with the `MODIFY POWER 0` clause, then the rebalance operation resumes at the specified power.
- Omit `integer` to specify the default power. If a rebalance operation is running, then Oracle ASM changes the power to the default power without interrupting the operation. If a rebalance operation was previously paused with the `MODIFY POWER 0` clause, then the rebalance operation resumes at the default power. Refer to the clause `POWER` for information on how the default power is determined.

---

**See Also:**

- *Oracle Database Reference* for more information on the `ASM_POWER_LIMIT` initialization parameter and the `V$ASM_OPERATION` dynamic performance view
- *Rebalancing a Disk Group: Example*
The `check_diskgroup_clause` lets you verify the internal consistency of Oracle ASM disk group metadata. The disk group must be mounted. Oracle ASM displays summary errors and writes the details of the detected errors in the alert log.

The `CHECK` keyword performs the following operations:

- Checks the consistency of the disk.
- Cross checks all the file extent maps and allocation tables for consistency.
- Checks that the alias metadata directory and file directory are linked correctly.
- Checks that the alias directory tree is linked correctly.
- Checks that Oracle ASM metadata directories do not have unreachable allocated blocks.

**REPAIR | NOREPAIR**

This clause lets you instruct Oracle ASM whether or not to attempt to repair any errors found during the consistency check. The default is `NOREPAIR`. The `NOREPAIR` setting is useful if you want to be alerted to any inconsistencies but do not want Oracle ASM to take any automatic action to resolve them.

**Deprecated Clauses**

In earlier releases, you could specify `CHECK` for `ALL`, `DISK`, `DISKS IN FAILGROUP`, or `FILE`. Those clauses have been deprecated as they are no longer needed. If you specify them, then their behavior is the same as in earlier releases and a message is added to the alert log. However, Oracle recommends that you do not introduce these clauses into your new code, as they are scheduled for desupport. The deprecated clauses are these:

- `ALL` checks all disks and files in the disk group.
- `DISK` checks one or more specified disks in the disk group.
- `DISKS IN FAILGROUP` checks all disks in a specified failure group.
- `FILE` checks one or more specified files in the disk group. You must use one of the reference forms of the filename. Refer to `ASM_filename` for information on the reference forms of Oracle ASM filenames.

**diskgroup_template_clauses**

A template is a named collection of attributes. When you create a disk group, Oracle ASM associates a set of initial system default templates with that disk group. The attributes defined by the template are applied to all files in the disk group. Table 10-2 lists the system default templates and the attributes they apply to the various file types. The `diskgroup_template_clauses` described following the table let you change the template attributes and create new templates.

You cannot use this clause to change the attributes of a disk group file after it has been created. Instead, you must use Recovery Manager (RMAN) to copy the file into a new file with the new attributes.

</tbody>
</table>

**ADD TEMPLATE**

Use this clause to add one or more named templates to a disk group. To determine the names of existing templates, query the `V$ASM_TEMPLATE` dynamic performance view.

**MODIFY TEMPLATE**

Use this clause to modify the attributes of a system default or user-defined disk group template. Only the specified attributes are altered. Unspecified properties retain their current values.
**Note:**

In earlier releases, the keywords `ALTER TEMPLATE` were used instead of `MODIFY TEMPLATE`. The `ALTER` keyword is still supported for backward compatibility, but is replaced with `MODIFY` for consistency with other Oracle SQL.

**template_name**

Specify the name of the template to be added or modified. The maximum length of a template name is 30 characters. The name must satisfy the requirements listed in "Database Object Naming Rules".

**redundancy_clause**

Specify the redundancy level of the newly added or modified template:

- **MIRROR**: Files to which this template are applied are protected by mirroring their data blocks. In normal redundancy disk groups, each primary extent has one mirror extent (2-way mirroring). For high redundancy disk groups, each primary extent has two mirror extents (3-way mirroring). You cannot specify `MIRROR` for templates in external redundancy disk groups.

- **HIGH**: Files to which this template are applied are protected by mirroring their data blocks. Each primary extent has two mirror extents (3-way mirroring) for both normal redundancy and high redundancy disk groups. You cannot specify `HIGH` for templates in external redundancy disk groups.

- **UNPROTECTED**: Files to which this template are applied are not protected by Automated Storage Management from media failures. Disks taken offline, either through system action or by user command, can cause loss of unprotected files. `UNPROTECTED` is the only valid setting for external redundancy disk groups. `UNPROTECTED` may not be specified for templates in high redundancy disk groups. Oracle discourages the use of unprotected files in high and normal redundancy disk groups.

If you omit this clause, then the value defaults to `MIRROR` for a normal redundancy disk group, `HIGH` for a high redundancy disk group, and `UNPROTECTED` for an external redundancy disk group.

**striping_clause**

Specify how the files to which this template are applied will be striped:

- **FINE**: Files to which this template are applied are striped every 128KB. This striping mode is not valid for an Oracle ASM spfile.

- **COARSE**: Files to which this template are applied are striped every 1MB. This is the default value.

**disk_region_clause**

This clause lets you determine the Intelligent Data Placement attribute of the disk group file. Specify the region of the disk in which you want Oracle ASM to allocate extents for the file:
• **HOT**: Extents are allocated in the region of the disk furthest away from the spindle. These outer tracks on the disk are longer than inner tracks, and so have more sectors and increased throughput.
• **COLD**: Extents are allocated in the region of the disk closest to the spindle.  
• **MIRRORHOT** and **MIRRORCOLD**: Specify the region desired for the mirrored datablocks of the file.

If no space is available in the desired disk region, then Oracle ASM allocates extents in the other region but initiates a rebalance to adjust the size of the region.

---

**See Also:**

*Oracle Automatic Storage Management Administrator's Guide* for more information on Intelligent Data Placement

---

### DROP TEMPLATE

Use this clause to drop one or more templates from the disk group. You can use this clause to drop only user-defined templates, not system default templates.

*diskgroup_directory_clauses*

Before you can create alias names for Oracle ASM filenames (see *diskgroup_alias_clauses*), you must specify the full directory structure in which the alias name will reside. The *diskgroup_directory_clauses* let you create and manipulate such a directory structure.

### ADD DIRECTORY

Use this clause to create a new directory path for hierarchically named aliases. Use a slash (/) to separate components of the directory. Each directory component can be up to 48 bytes in length and must not contain the slash character. You cannot use a space for the first or last character of any component. The total length of the directory path cannot exceed 256 bytes minus the length of any alias name you intend to create in this directory (see *diskgroup_alias_clauses*).

### DROP DIRECTORY

Use this clause to drop a directory for hierarchically named aliases. Oracle ASM will not drop the directory if it contains any alias definitions unless you also specify **FORCE**. This clause is not valid for dropping directories created as part of a system alias. Such directories are labeled with the value **Y** in the **SYSTEM_CREATED** column of the **V$ASM_ALIAS** dynamic performance view.

### RENAME DIRECTORY

Use this clause to change the name of a directory for hierarchically named aliases. This clause is not valid for renaming directories created as part of a system alias. Such directories are labeled with the value **Y** in the **SYSTEM_CREATED** column of the **V$ASM_ALIAS** dynamic performance view.

### diskgroup_alias_clauses

When an Oracle ASM file is created, either implicitly or by user specification, Oracle ASM assigns to the file a fully qualified name ending in a dotted pair of numbers (see...
file specification). The diskgroup_alias_clauses let you create more user-friendly alias names for the Oracle ASM filenames. You cannot specify an alias name that ends in a dotted pair of numbers, as this format is indistinguishable from an Oracle ASM filename.

Before specifying this clause, you must first create the directory structure appropriate for your naming conventions (see diskgroup_directory_clauses). The total length of the alias name, including the directory prefix, is limited to 256 bytes. Alias names are case insensitive but case retentive.

ADD ALIAS

Use this clause to create an alias name for an Oracle ASM filename. The alias_name consists of the full directory path and the alias itself. To determine the names of existing Oracle ASM aliases, query the V$ASM_ALIAS dynamic performance view. Refer to ASM_filename for information on Oracle ASM filenames.

DROP ALIAS

Use this clause to remove an alias name from the disk group directory. Each alias name consists of the full directory path and the alias itself. The underlying file to which the alias refers remains unchanged.

RENAME ALIAS

Use this clause to change the name of an existing alias. The alias_name consists of the full directory path and the alias itself.

Restriction on Dropping and Renaming Aliases

You cannot drop or rename a system-generated alias. To determine whether an alias was system generated, query the SYSTEM_CREATED column of the V$ASM_ALIAS dynamic performance view.

diskgroup_volume_clauses

Use these clauses to manipulate logical Oracle ASM Dynamic Volume Manager (Oracle ADVM) volumes corresponding to physical volume devices. To use these clauses, Oracle ASM must be started and the disk group being modified must be mounted.

See Also:

Oracle Automatic Storage Management Administrator's Guide for more information about disk group volumes, including examples

add_volume_clause

Use this clause to add a volume to the disk group.

For asm_volume, specify the name of the volume. The name can contain only alphanumeric characters and the first character must be alphabetic. The maximum length of the name is platform dependent. Refer to Oracle Automatic Storage Management Administrator's Guide for more information.

For size_clause, specify the size of the Oracle ADVM volume. The Oracle ASM instance determines whether sufficient space exists to create the volume. If sufficient
space does not exist, then the Oracle ASM instance returns an error. If sufficient space does exist, then all nodes in the cluster with an Oracle ASM instance running and the disk group mounted are notified of the addition. Oracle ASM creates and enables on those nodes a volume device that can be used to create and mount file systems.

The following optional settings are also available:

- In the `redundancy_clause`, specify the redundancy level of the Oracle ADVM volume. You can specify this clause only when creating a volume in a normal redundancy disk group. You can specify the following volume redundancy levels:
  - `MIRROR`: 2-way mirroring of the volume. This is the default.
  - `HIGH`: 3-way mirroring of the volume.
  - `UNPROTECTED`: No mirroring of the volume.

You cannot specify the `redundancy_clause` when creating a volume in a high redundancy disk group or an external redundancy disk group. If you do so, then an error will result. In high redundancy disk groups, Oracle Database automatically sets the volume redundancy to `HIGH` (3-way mirroring). In external redundancy disk groups, Oracle Database automatically sets the volume redundancy to `UNPROTECTED` (no mirroring).

- In the `STRIPE_WIDTH` clause, specify a stripe width for the Oracle ADVM volume. The valid range is from 4KB to 1MB, at intervals of the power of 2. The default value is 128K.

- In the `STRIPE_COLUMNS` clause, specify the number of stripes in a stripe set of the Oracle ADVM volume. The valid range is 1 to 8. The default is 4. If `STRIPE_COLUMNS` is set to 1, then striping becomes disabled. In this case, the stripe width is the extent size of the volume. This volume extent size is 64 times the allocation unit (AU) size of the disk group.

- In the `disk_region_clause` clause, specify the Intelligent Data Placement attribute of both the primary and nonprimary mirror of the disk group volume. The default for both is `COLD`. See `disk_region_clause` for details on this clause.

modify_volume_clause

Use this clause to modify the characteristics of an existing Oracle ADVM volume. You must specify at least one of the following clauses:

- In the `disk_region_clause` clause, specify the Intelligent Data Placement attribute of both the primary and nonprimary mirror of the disk group volume. The default for the primary mirror is `COLD`. The default for mirror and high redundancy is `HOT`. See `disk_region_clause` for details on this clause.

- In the `MOUNTPATH` clause, specify the mountpath name associated with the volume. The `mountpath_name` can be up to 1024 characters.

- In the `USAGE` clause, specify the usage name associated with the volume. The `usage_name` can be up to 30 characters.

RESIZE VOLUME Clause

Use this clause to change the size of an existing Oracle ADVM volume. In an Oracle ASM cluster, the new size is propagated to all nodes. If an Oracle Automatic Storage Management File System (ACFS) exists on the volume, then you must use the `acfsutil size` command instead of the `ALTER DISKGROUP` statement.
**DROP VOLUME Clause**

Use this clause to remove the Oracle ASM file that is the storage container for an existing Oracle ADVM volume. In an Oracle ASM cluster, all nodes with an Oracle ASM instance running and with this disk group open are notified of the drop operation, which results in removal of the volume device. If the volume file is open, then this clause returns an error.

**diskgroup_attributes**

Use this clause to specify attributes for the disk group. Table 13-2 lists the attributes you can set with this clause. Refer to the CREATE_DISKGROUP "ATTRIBUTE Clause " for information on the behavior of this clause.

**modify_diskgroup_file**

Use this clause to modify the Intelligent Data Placement attributes of an existing disk group file. When you modify the Intelligent Data Placement for a file, this action will apply to new extensions of the file, but existing file contents are not affected until a rebalance operation. To apply the new Intelligent Data Placement policy for existing file contents, you can manually initiate a rebalance. A rebalance operation uses the last specified policy for the file extents.

**drop_diskgroup_file_clause**

Use this clause to drop a file from the disk group. Oracle ASM also drops all aliases associated with the file being dropped. You must use one of the reference forms of the filename. Most Oracle ASM files do not need to be manually deleted because, as Oracle Managed Files, they are removed automatically when they are no longer needed. Refer to ASM_filename for information on the reference forms of Oracle ASM filenames.

You cannot drop a disk group file if it is the spfile that was used to start up the current instance or any instance in the Oracle ASM cluster.

**convert_redundancy_clause**

You can use this clause to convert a NORMAL REDUNDANCY or HIGH REDUNDANCY disk group to a FLEX REDUNDANCY disk group. The disk group must have at least three failure
groups before you start the conversion, and must be in the MOUNT RESTRICTED state for the duration of the conversion.

usergroup_clauses

Use these clauses to add a user group to the disk group, remove a user group from the disk group, or to add a member to or drop a member from an existing user group.

See Also:

Oracle Automatic Storage Management Administrator’s Guide for detailed information about user groups and members, including examples

ADD USERGROUP

Use this clause to add a user group to the disk group. You must have SYSASM or SYSDBA privilege to create a user group. The maximum length of a user group name is 63 bytes. If you specify the user name, then it must be in the OS password file and its length cannot exceed 32 characters.

MODIFY USERGROUP

Use these clauses to add a member to or drop a member from an existing user group. You must be an Oracle ASM administrator (with SYSASM privilege) or the creator (with SYSDBA privilege) of the user group to use these clauses. The user name must be an existing user in the OS password file.

DROP USERGROUP

Use this clause to drop an existing user group from the disk group. You must be an Oracle ASM administrator (with SYSASM privilege) or the creator (with SYSDBA privilege) of the user group to use this clause. Dropping a user group may leave a disk group file without a valid user group. In this case, you can update the disk group file manually to add a new, valid group using the file_permissions_clause.

user_clauses

Use these clauses to add a user to, drop a user from, or replace a user in a disk group.

Note:

When administering users with SQL*Plus, the users must be existing operating system users and their user names must have corresponding operating system user IDs. However, only users in the same cluster as the Oracle ASM instance can be validated.

ADD USER

Use this clause to add one or more operating system (OS) users to an Oracle ASM disk group and give those users access privileges on the disk group. A user name must be an existing user in the OS password file and its length cannot exceed 32.
characters. If a specified user already exists in the disk group, as shown by V$ASM_USER, then the command records an error and continues to add other users, if any have been specified. This command is seldom needed, because the OS user running the database instance is added to a disk group automatically when the instance accesses the disk group. However, this clause is useful when adding users that are not associated with a particular database instance.

**DROP USER**

Use this clause to drop one or more users from the disk group. If a specified user is not in the disk group, then this clause records an error and continues to drop other users, if any are specified. If the user owns any files, then you must specify the CASCADE keyword, which drops the user and all the user's files. If any files owned by the user are open, then DROP USER CASCADE fails with an error.

To delete a user without deleting the files owned by that user, change the owner of each of these files to another user and then issue an ALTER DISKGROUP ... DROP USER statement on the user. Alternatively, you can issue an ALTER DISKGROUP ... REPLACE USER statement to replace the user you want to drop with a user that currently does not exist in the disk group. This operation has the side effect of making the new user the owner of files that were previously owned by the dropped user.

**REPLACE USER**

Use this clause to replace old_user with new_user in the disk group. All files that are currently owned by old_user will become owned by new_user, and old_user will be dropped from the disk group. old_user must exist in the disk group and new_user must not exist in the disk group.

**file_permissions_clause**

Use this clause to change the permission settings of a disk group file. The three classes of permissions are owner, user group, and other. You must be the file owner or the Oracle ASM administrator to use this clause.

If you change the permission settings of an open file, then the operation currently running on the file will complete using the old permission settings. The new permission settings will take effect when re-authentication is required.

**file_owner_clause**

Use this clause to set the owner or user group for a specified file. You must be the Oracle ASM administrator to change the owner of the file. You must be the owner of the file or the Oracle ASM administrator to change the user group of a file. In addition, to change the associated user group of a file, the specified user group must already exist in the disk group, and the owner of the file must be a member of that user group.

If you use this clause on an open file, then the following conditions apply:

- If you change the owner or user group of an open file, then the operation currently running on the file will complete using the old owner or user group. The new owner or user group will take effect when re-authentication is required.
- If you change the owner of an open file, then the new owner of the file cannot be dropped from the disk group until the instance has been restarted. In an Oracle ASM cluster, the new owner of the file cannot be dropped until all instances in the cluster have been restarted.
If you change the owner of an open file, then the old owner cannot be dropped while the file is still open, even after the ownership of the file has changed.

**scrub_clause**

Use this clause to scrub a disk group. The scrub operation checks for logical data corruptions and repairs the corruptions automatically in normal and high redundancy disks groups.

- Use the `FILE` clause to scrub the specified Oracle ASM file in the disk group. You must use one of the reference forms of the `ASM_filename`. Refer to `ASM_filename` for information on the reference forms of Oracle ASM filenames.
- Use the `DISK` clause to scrub the specified disk in the disk group.
- If you do not specify `FILE` or `DISK`, then all files and disks in the disk group are scrubbed.

**REPAIR | NOREPAIR**

Specify `REPAIR` to attempt to repair any errors found during the logical data corruption check. Specify `NOREPAIR` to be alerted of any corruptions; Oracle ASM will not take any action to resolve them. The default is `NOREPAIR`.

**POWER**

Use the `POWER` clause to specify the power level of the scrub operation. Valid values are `AUTO`, `LOW`, `HIGH`, and `MAX`. If you omit this clause, then the power level defaults to `AUTO` and the power adjusts to the optimum level for the system.

**WAIT | NOWAIT**

Specify `WAIT` to allow the scrub operation to complete before returning control to the user. Specify `NOWAIT` to add the operation to the scrubbing queue and return control to the user immediately. The default is `NOWAIT`.

**FORCE | NOFORCE**

Specify `FORCE` to process the command even if the system I/O load is high or scrubbing has been disabled at the system level. Specify `NOFORCE` to process the command normally. The default is `NOFORCE`.

You can monitor the progress of the scrub operation by querying the `V$ASM_OPERATION` dynamic performance view.

**See Also:**

- Oracle Automatic Storage Management Administrator’s Guide for more information on scrubbing disk groups and “Scrubbing a Disk Group: Example”

**quotagroup_clauses**

Use these clauses to add a quota group to the disk group, modify a quota group, move a file group into a quota group, or drop a quota group.
A quota group is a collection of file groups. A file group is a container for all files of a database within one disk group. A quota group has a specified quota limit, which is the maximum amount of storage space that its file groups can collectively use. Therefore, a quota group enables you to define the quota limit for a group of databases within a disk group. The sum of the quota limits for all quota groups in a disk group can exceed the storage capacity of the disk group.

Each disk group contains a default quota group named GENERIC. If you create a file group and do not specify its quota group, then the file group belongs to the GENERIC quota group. Oracle ASM automatically creates the GENERIC quota group when you create a disk group with the compatible.asm attribute set to 12.2 or higher, or when you set compatible.asm to 12.2 or higher for an existing disk group. Initially, the quota limit for GENERIC is UNLIMITED. You can subsequently modify this quota limit with the MODIFY QUOTAGROUP clause.

**ADD QUOTAGROUP**

Use this clause to create a quota group and add it to the disk group. For *quotagroup_name*, specify the name of the new quota group.

The SET clause allows you to set the quota limit for the quota group.

- For *property_name*, specify QUOTA.
- For *property_value*, specify one of the following clauses:
  - Specify *size_clause* to set a number of bytes for the quota limit. The minimum value you can specify is 1 byte. You can specify a value that is greater than the storage size of the disk group. In this case, storage use is limited by the current size of the disk group. However, if you subsequently increase the storage space for the disk group to a size that exceeds the quota limit, then the quota limit will be enforced. Refer to *size_clause* for the syntax and semantics of this clause. Note that specifying 0 bytes is equivalent to specifying UNLIMITED.
  - Specify UNLIMITED if you do not want to set a quota limit. In this case, storage use is limited by the storage size of the disk group.

If you omit the SET clause, then the default is SET QUOTA=UNLIMITED.

**MODIFY QUOTAGROUP**

Use this clause to modify the quota limit for a quota group. For *quotagroup_name*, specify the name of the quota group you want to modify. You can modify the quota limit for any quota group, including the GENERIC quota group. The SET clause has the same semantics here as for the ADD QUOTAGROUP clause. The quota limit can be set below the amount of space currently used by the quota group. This action prevents any additional space from being allocated for files described by file groups associated with this quota group.

**MOVE FILEGROUP**

Use this clause to move a file group from one quota group to another. For *filegroup_name*, specify the file group you want to move. For *quotagroup_name*, specify the name of the destination quota group. If the move operation causes the amount of used storage space in the destination quota group to exceed the quota limit, then the operation succeeds, but no new storage allocations can take place in the file groups within the quota group. This capability enables you to stop any files described by a specific file group from allocating additional space.
DROP QUOTAGROUP

Use this clause to drop a quota group from the disk group. For *quotagroup_name*, specify the quota group you want to drop. The quota group must not contain any file groups. You cannot drop the quota group GENERIC.

See Also:

*Automatic Storage Management Administrator's Guide* for more information on quota groups

**filegroup_clauses**

The *filegroup_clauses* are valid only for flex disk groups. Use these clauses to create a file group, modify a file group, move a file into a file group, or drop a file group. A file group is a container for all files of a database within one disk group. A file group must belong to a quota group.

Each disk group has a default file group with FILEGROUP_NUMBER = 0.

**add_filegroup_clause**

Use this clause to create a file group.

For *filegroup_name*, specify the name of the new file group. The maximum length of a file group name is 127 characters. The name must satisfy the requirements listed in "Database Object Naming Rules", with the following addition: File group names are not case sensitive, even if you specify them with quotation marks. They are always stored internally as uppercase. File group names must be unique within a disk group.

- Use the DATABASE clause to specify the database (non-CDB, CDB, or PDB) with which the file group is associated.
- Use the CLUSTER clause to specify the cluster with which the file group is associated.
- Use the VOLUME clause to specify the volume with which the file group is associated.

You cannot associate more than one file group in the same disk group with the same database, cluster, or volume. If the database, cluster, or volume does not exist at the time of file group creation, then the file group will be automatically associated with it when it is subsequently created. Database, cluster, and volume names must satisfy the requirements listed in "Database Object Naming Rules".

The SET clause allows you to set properties for the file group. If you do not specify the SET clause for a property, then the default value is assigned. You can specify the file_type for any property for which a file type applies. If you do not specify file_type for such a property, then the property applies to all file types. For complete information on file group properties and their default values, see *Oracle Automatic Storage Management Administrator's Guide*.

**modify_filegroup_clause**

Use this clause to modify file group properties. For *filegroup_name*, specify the name of the file group you want to modify. You can modify properties for any file group,
including the default file group. Any that you do not specify with this clause remain unchanged. The SET clause has the same semantics here as for the add_filegroup_clause.

move_to_filegroup_clause

Use this clause to move a file to a file group. If the file is currently associated with a different file group, then it is disassociated from that file group. The target file group must have enough space available to contain the file. You must be the owner of the file and the target file group.

drop_filegroup_clause

Use this clause to drop a file group from a quota group. For filegroup_name, specify the name of the file group you want to drop. The file group must be empty, or you must specify the CASCADE keyword. If you specify CASCADE, then the files in the file group are dropped.

See Also:

Automatic Storage Management Administrator's Guide for more information on file groups

undrop_disk_clause

Use this clause to cancel the drop of disks from the disk group. You can cancel the pending drop of all the disks in one or more disk groups (by specifying diskgroup_name) or of all the disks in all disk groups (by specifying ALL).

This clause is not relevant for disks that have already been completely dropped from the disk group or for disk groups that have been completely dropped. This clause results in a long-running operation. You can see the status of the operation by querying the V$ASM_OPERATION dynamic performance view.

See Also:

V$ASM_OPERATION for more information on the details of long-running Oracle ASM operations

diskgroup_availability

Use this clause to make one or more disk groups available or unavailable to the database instances running on the same node as the Oracle ASM instance. This clause does not affect the status of the disk group on other nodes in a cluster.

MOUNT

Specify MOUNT to mount the disk groups in the local Oracle ASM instance. Specify ALL MOUNT to mount all disk groups specified in the ASM_DISKGROUPS initialization parameter. File operations can only be performed when a disk group is mounted. If Oracle ASM is running in a cluster or a standalone server managed by Oracle Grid
Infrastructure for Independent Servers (Oracle Restart), then the MOUNT clause automatically brings the corresponding resource online.

**Note:**

Starting with Oracle Database 12c, Oracle Grid Infrastructure for Independent Servers (Oracle Restart) is deprecated and is subject to desupport in future releases. Oracle continues to provide Oracle Automatic Storage Management (Oracle ASM) as part of the Oracle Grid Infrastructure installation for Standalone and Cluster deployments.

## RESTRICTED | NORMAL

Use these clauses to determine the manner in which the disk groups are mounted.

- In the RESTRICTED mode, the disk group is mounted in single-instance exclusive mode. No other Oracle ASM instance in the same cluster can mount that disk group. In this mode the disk group is not usable by any Oracle ASM client.

- In the NORMAL mode, the disk group is mounted in shared mode, so that other Oracle ASM instances and clients can access the disk group. This is the default.

## FORCE | NOFORCE

Use these clauses to determine the circumstances under which the disk groups are mounted.

- In the FORCE mode, Oracle ASM attempts to mount the disk group even if it cannot discover all of the devices that belong to the disk group. This setting is useful if some of the disks in a normal or high redundancy disk group became unavailable while the disk group was dismounted. When MOUNT FORCE succeeds, Oracle ASM takes the missing disks offline.

  If Oracle ASM discovers all of the disks in the disk group, then MOUNT FORCE fails. Therefore, use the MOUNT FORCE setting only if some disks are unavailable. Otherwise, use NOFORCE.

  In normal- and high-redundancy disk groups, disks from one failure group can be unavailable and MOUNT FORCE will succeed. Also in high-redundancy disk groups, two disks in two different failure groups can be unavailable and MOUNT FORCE will succeed. Any other combination of unavailable disks causes the operation to fail, because Oracle ASM cannot guarantee that a valid copy of all user data or metadata exists on the available disks.

- In the NOFORCE mode, Oracle ASM does not attempt to mount the disk group unless it can discover all the member disks. This is the default.

**See Also:**

ASM_DISKGROUPS for more information about adding disk group names to the initialization parameter file

## DISMOUNT
Specify DISMOUNT to dismount the specified disk groups. Oracle ASM returns an error if any file in the disk group is open unless you also specify FORCE. Specify ALL DISMOUNT to dismount all currently mounted disk groups. File operations can only be performed when a disk group is mounted. If Oracle ASM is running in a cluster or a standalone server managed by Oracle Grid Infrastructure for Independent Servers (Oracle Restart), then the DISMOUNT clause automatically takes the corresponding resource offline.

**Note:**
Starting with Oracle Database 12c, Oracle Grid Infrastructure for Independent Servers (Oracle Restart) is deprecated and is subject to desupport in future releases. Oracle continues to provide Oracle Automatic Storage Management (Oracle ASM) as part of the Oracle Grid Infrastructure installation for Standalone and Cluster deployments.

**FORCE**
Specify FORCE if you want Oracle ASM to dismount the disk groups even if some files in the disk group are open.

**enable_disable_volume**
Use this clause to enable or disable one or more volumes in the disk group.

- For each volume you enable, Oracle ASM creates a volume device file on the local node that can be used to create or mount the file system.
- For each volume you disable, Oracle ASM deletes the device file on the local node. If the volume file is open on the local node, then the DISABLE clause returns an error.

Use the ALL keyword to enable or disable all volumes in the disk group. If you specify ALTER DISKGROUP ALL ..., then you must use the ALL keyword in this clause as well.

**See Also:**
*Oracle Automatic Storage Management Administrator's Guide* for more information about disk group volumes

**Examples**
The following examples require a disk group called dgroup_01. They assume that ASM_DISKSTRING is set to /devices/disks/*. In addition, they assume the Oracle user has read/write permission to /devices/disks/d100. Refer to "Creating a Diskgroup: Example" to create dgroup_01.

**Adding a Disk to a Disk Group: Example**
To add a disk, d100, to a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
ADD DISK '/devices/disks/d100';
```
Dropping a Disk from a Disk Group: Example
To drop a disk, dgroup_01_0000, from a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  DROP DISK dgroup_01_0000;
```

Undropping a Disk from a Disk Group: Example
To cancel the drop of disks from a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  UNDROP DISKS;
```

Resizing a Disk Group: Example
To resize every disk in a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  RESIZE ALL
  SIZE 36G;
```

Rebalancing a Disk Group: Example
To manually rebalance a disk group, dgroup_01, and permit Oracle ASM to execute the rebalance as fast as possible, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  REBALANCE POWER 11 WAIT;
```

The **WAIT** keyword causes the database to wait for the disk group to be rebalanced before returning control to the user.

Verifying the Internal Consistency of Disk Group Metadata: Example
To verify the internal consistency of Oracle ASM disk group metadata and instruct Oracle ASM to repair any errors found, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  CHECK ALL
  REPAIR;
```

Adding a Named Template to a Disk Group: Example
To add a named template, template_01 to a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  ADD TEMPLATE template_01
  ATTRIBUTES (UNPROTECTED COARSE);
```

Changing the Attributes of a Disk Group Template: Example
To modify the attributes of a system default or user-defined disk group template, template_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  MODIFY TEMPLATE template_01
  ATTRIBUTES (FINE);
```
Dropping a User-Defined Template from a Disk Group: Example

To drop a user-defined template, template_01, from a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  DROP TEMPLATE template_01;
```

Creating a Directory Path for Hierarchically Named Aliases: Example

To specify the directory structure in which alias names will reside, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  ADD DIRECTORY '+dgroup_01/alias_dir';
```

Creating an Alias Name for an Oracle ASM Filename: Example

To create a user alias by specifying the numeric Oracle ASM filename, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  ADD ALIAS '+dgroup_01/alias_dir/datafile.dbf'
    FOR '+dgroup_01.261.1';
```

Scrubbing a Disk Group: Example

To scrub a disk group, dgroup_01, issue the following statement. This statement attempts to repair any errors found during the logical data corruption check and allows the scrub operation to complete before returning control to the user.

```
ALTER DISKGROUP dgroup_01
  SCRUB REPAIR WAIT;
```

Dismounting a Disk Group: Example

To dismount a disk group, dgroup_01, issue the following statement. This statement dismounts the disk group even if one or more files are active:

```
ALTER DISKGROUP dgroup_01
  DISMOUNT FORCE;
```

Mounting a Disk Group: Example

To mount a disk group, dgroup_01, issue the following statement:

```
ALTER DISKGROUP dgroup_01
  MOUNT;
```

10.12 ALTER FLASHBACK ARCHIVE

**Purpose**

Use the ALTER FLASHBACK ARCHIVE statement for these operations:

- Designate a flashback data archive as the default flashback data archive for the system
- Add a tablespace for use by the flashback data archive
- Change the quota of a tablespace used by the flashback data archive
• Remove a tablespace from use by the flashback data archive
• Change the retention period of the flashback data archive
• Purge the flashback data archive of old data that is no longer needed

See Also:
Oracle Database Development Guide and CREATE FLASHBACK ARCHIVE for more information on using flashback data archives

Prerequisites
You must have the FLASHBACK ARCHIVE ADMINISTER system privilege to alter a flashback data archive in any way. You must also have appropriate privileges on the affected tablespaces to add, modify, or remove a flashback data archive tablespace.

Syntax

\[
\text{alter\_flashback\_archive::=} \\
\text{\texttt{ALTER FLASHBACK ARCHIVE}} \\
\text{SET DEFAULT} \\
\text{ADD TABLESPACE \texttt{tablespace}} \\
\text{MODIFY TABLESPACE \texttt{tablespace}} \\
\text{REMOVE TABLESPACE \texttt{tablespace\_name}} \\
\text{MODIFY RETENTION \texttt{flashback\_archive\_retention}} \\
\text{PURGE \texttt{ALL} BEFORE SCN \texttt{expr} TIMESTAMP \texttt{expr}} \\
\text{NO OPTIMIZE DATA} \\
\]

\[
\text{flashback\_archive\_quota::=} \\
\text{QUOTA integer M G T P E} \\
\]
**flashback_archive_retention ::=**

Semantics

**flashback_archive**

Specify the name of an existing flashback data archive.

**SET DEFAULT**

You must be logged in as SYSDBA to specify this clause. Use this clause to designate this flashback data archive as the default flashback data archive for the system. When a CREATE TABLE or ALTER TABLE statement specifies the **flashback_archive_clause** without specifying a flashback data archive name, the database uses the default flashback data archive to store data from that table.

This statement overrides any previous designation of a different flashback data archive as the default.

**See Also:**

The CREATE TABLE **flashback_archive_clause** for more information

**ADD TABLESPACE**

Use this clause to add a tablespace to the flashback data archive. You can use the **flashback_archive_quota** clause to specify the amount of space that can be used by the flashback data archive in the new tablespace. If you omit that clause, then the flashback data archive has unlimited space in the newly added tablespace.

**MODIFY TABLESPACE**

Use this clause to change the tablespace quota of a tablespace already used by the flashback data archive.

**REMOVE TABLESPACE**

Use this clause to remove a tablespace from use by the flashback data archive. You cannot remove the last remaining tablespace used by the flashback data archive.

If the tablespace to be removed contains any data within the retention period of the flashback archive, then that data will be dropped as well. Therefore, you should move your data to another tablespace before removing the tablespace with this clause.

**MODIFY RETENTION**

Use this clause to change the retention period of the flashback data archive.
PURGE

Use this clause to purge data from the flashback data archive.

- Specify `PURGE ALL` to remove all data from the flashback data archive. This historical information can be retrieved using a flashback query only if the SCN or timestamp specified in the flashback query is within the undo retention duration.
- Specify `PURGE BEFORE SCN` to remove all data from the flashback data archive before the specified system change number.
- Specify `PURGE BEFORE TIMESTAMP` to remove all data from the flashback data archive before the specified timestamp.

[NO] OPTIMIZE DATA

This clause has the same semantics as the [NO] OPTIMIZE DATA clause of `CREATE FLASHBACK ARCHIVE`.

See Also:

- `CREATE FLASHBACK ARCHIVE` for information on creating flashback data archives and for some simple examples of using flashback data archives

10.13 ALTER FUNCTION

Purpose

Functions are defined using PL/SQL. Therefore, this section provides some general information but refers to `Oracle Database PL/SQL Language Reference` for details of syntax and semantics.

Use the `ALTER FUNCTION` statement to recompile an invalid standalone stored function. Explicit recompilation eliminates the need for implicit run-time recompilation and prevents associated run-time compilation errors and performance overhead.

This statement does not change the declaration or definition of an existing function. To redeclare or redefine a function, use the `CREATE FUNCTION` statement with the `OR REPLACE` clause. See `CREATE FUNCTION`.

Prerequisites

The function must be in your own schema or you must have `ALTER ANY PROCEDURE` system privilege.

Syntax

```
alter_function ::=  
```
Semantics

schema

Specify the schema containing the function. If you omit `schema`, then Oracle Database assumes the function is in your own schema.

function_name

Specify the name of the function to be recompiled.

function_compile_clause

See Oracle Database PL/SQL Language Reference for the syntax and semantics of this clause and for complete information on creating and compiling functions.

EDITIONABLE | NONEDITIONABLE

Use these clauses to specify whether the function becomes an editioned or noneditioned object if editioning is later enabled for the schema object type `FUNCTION` in `schema`. The default is EDITIONABLE. For information about altering editioned and noneditioned objects, see Oracle Database Development Guide.

10.14 ALTER HIERARCHY

Purpose

Use the ALTER HIERARCHY statement to rename or compile a hierarchy. For other alterations, use CREATE OR REPLACE HIERARCHY.

Prerequisites

To alter a hierarchy in your own schema, you must have the ALTER HIERARCHY system privilege. To alter a hierarchy in another user's schema, you must have the ALTER ANY HIERARCHY system privilege or have been granted ALTER directly on the hierarchy.

Syntax

```
alter_hierarchy ::= 
```

Semantics

schema

Specify the schema in which the hierarchy exists. If you do not specify a schema, then Oracle Database looks for the hierarchy in your own schema.
**hierarchy_name**
Specify the name of the hierarchy.

**RENAME TO**
Specify RENAME TO to change the name of the hierarchy.

**COMPILE**
Specify COMPILE to compile the hierarchy.

**new_hier_name**
Specify a new name for the hierarchy.

**Example**
The following statement changes the name of a hierarchy:

```
ALTER HIERARCHY product_hier RENAME TO myproduct_hier;
```

### 10.15 ALTER INDEX

**Purpose**
Use the ALTER INDEX statement to change or rebuild an existing index.

<table>
<thead>
<tr>
<th>See Also:</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE INDEX for information on creating an index</td>
</tr>
</tbody>
</table>

**Prerequisites**
The index must be in your own schema or you must have the ALTER ANY INDEX system privilege.

To execute the MONITORING USAGE clause, the index must be in your own schema.

To modify a domain index, you must have EXECUTE object privilege on the indextype of the index.

Object privileges are granted on the parent index, not on individual index partitions or subpartitions.

You must have tablespace quota to modify, rebuild, or split an index partition or to modify or rebuild an index subpartition.
Syntax

\[\textit{alter\_index}::=\]

\[
\begin{align*}
\text{deallocate\_unused\_clause} & \quad \text{allocate\_extent\_clause} \\
\text{shrink\_clause} & \quad \text{parallel\_clause} \\

modify_index_subpartition::=

Allocate extent clause
Deallocate unused clause

(allocate_extent_clause::=, deallocate_unused_clause::=)

Semantics

schema

Specify the schema containing the index. If you omit schema, then Oracle Database assumes the index is in your own schema.

index

Specify the name of the index to be altered.

Restrictions on Modifying Indexes

The modification of indexes is subject to the following restrictions:

- If index is a domain index, then you can specify only the PARAMETERS clause, the RENAME clause, the rebuild_clause (with or without the PARAMETERS clause), the parallel_clause, or the UNUSABLE clause. No other clauses are valid.
- You cannot alter or rename a domain index that is marked LOADING or FAILED. If an index is marked FAILED, then the only clause you can specify is REBUILD.

See Also:

*Oracle Database Data Cartridge Developer's Guide* for information on the LOADING and FAILED states of domain indexes

deallocate_unused_clause

Use the deallocate_unused_clause to explicitly deallocate unused space at the end of the index and make the freed space available for other segments in the tablespace.

If index is range-partitioned or hash-partitioned, then Oracle Database deallocates unused space from each index partition. If index is a local index on a composite-partitioned table, then Oracle Database deallocates unused space from each index subpartition.

Restrictions on Dealloacting Space

Deallocation of space is subject to the following restrictions:
You cannot specify this clause for an index on a temporary table.

You cannot specify this clause and also specify the `rebuild_clause`.

Refer to `deallocate_unused_clause` for a full description of this clause.

**KEEP integer**

The `KEEP` clause lets you specify the number of bytes above the high water mark that the index will have after deallocation. If the number of remaining extents is less than `MINEXTENTS`, then `MINEXTENTS` is set to the current number of extents. If the initial extent becomes smaller than `INITIAL`, then `INITIAL` is set to the value of the current initial extent. If you omit `KEEP`, then all unused space is freed.

Refer to `ALTER TABLE` for a complete description of this clause.

**allocate_extent_clause**

The `allocate_extent_clause` lets you explicitly allocate a new extent for the index. For a local index on a hash-partitioned table, Oracle Database allocates a new extent for each partition of the index.

**Restriction on Allocating Extents**

You cannot specify this clause for an index on a temporary table or for a range-partitioned or composite-partitioned index.

Refer to `allocate_extent_clause` for a full description of this clause.

**shrink_clause**

Use this clause to compact the index segments. Specifying `ALTER INDEX ... SHRINK SPACE COMPACT` is equivalent to specifying `ALTER INDEX ... COALESCE`.

For complete information on this clause, refer to `shrink_clause` in the documentation on `CREATE TABLE`.

**Restriction on Shrinking Index Segments**

You cannot specify this clause for a bitmap join index or for a function-based index.

**parallel_clause**

Use the `PARALLEL` clause to change the default degree of parallelism for queries and DML on the index.

**Restriction on Parallelizing Indexes**

You cannot specify this clause for an index on a temporary table.

For complete information on this clause, refer to `parallel_clause` in the documentation on `CREATE TABLE`.

🔗 See Also:

“Enabling Parallel Queries: Example”
**physical_attributes_clause**

Use the `physical_attributes_clause` to change the values of parameters for a nonpartitioned index, all partitions and subpartitions of a partitioned index, a specified partition, or all subpartitions of a specified partition.

**See Also:**
- the physical attributes parameters in `CREATE TABLE`
- “Modifying Real Index Attributes: Example” and “Changing MAXEXTENTS: Example”

**Restrictions on Index Physical Attributes**

Index physical attributes are subject to the following restrictions:

- You cannot specify this clause for an index on a temporary table.
- You cannot specify the `PCTUSED` parameter at all when altering an index.
- You can specify the `PCTFREE` parameter only as part of the `rebuild_clause`, the `modify_index_default_attrs` clause, or the `split_index_partition` clause.

**storage_clause**

Use the `storage_clause` to change the storage parameters for a nonpartitioned index, index partition, or all partitions of a partitioned index, or default values of these parameters for a partitioned index. Refer to `storage_clause` for complete information on this clause.

**logging_clause**

Use the `logging_clause` to change the logging attribute of the index. If you also specify the `REBUILD` clause, then this new setting affects the rebuild operation. If you specify a different value for logging in the `REBUILD` clause, then Oracle Database uses the last logging value specified as the logging attribute of the index and of the rebuild operation.

An index segment can have logging attributes different from those of the base table and different from those of other index segments for the same base table.

**Restriction on Index Logging**

You cannot specify this clause for an index on a temporary table.

**See Also:**
- `logging_clause` for a full description of this clause
- *Oracle Database VLDB and Partitioning Guide* for more information about parallel DML
**partial_index_clause**

Use the `partial_index_clause` to change the index to a full index or a partial index. Specify `INDEXING FULL` to change the index to a full index. Specify `INDEXING PARTIAL` to change the index to a partial index. This clause is valid only for indexes on partitioned tables. Refer to the `partial_index_clause` of `CREATE INDEX` for the full semantics of this clause.

**RECOVERABLE | UNRECOVERABLE**

These keywords are deprecated and have been replaced with `LOGGING` and `NOLOGGING`, respectively. Although `RECOVERABLE` and `UNRECOVERABLE` are supported for backward compatibility, Oracle strongly recommends that you use the `LOGGING` and `NOLOGGING` keywords.

`RECOVERABLE` is not a valid keyword for creating partitioned tables or LOB storage characteristics. `UNRECOVERABLE` is not a valid keyword for creating partitioned or index-organized tables. Also, it can be specified only with the `AS subquery clause of CREATE INDEX`.

**rebuild_clause**

Use the `rebuild_clause` to re-create an existing index or one of its partitions or subpartitions. If index is marked `UNUSABLE`, then a successful rebuild will mark it `USABLE`. For a function-based index, this clause also enables the index. If the function on which the index is based does not exist, then the rebuild statement will fail.

---

**Note:**

When you rebuild the secondary index of an index-organized table, Oracle Database preserves the primary key columns contained in the logical rowid when the index was created. Therefore, if the index was created with the `COMPATIBLE` initialization parameter set to less than 10.0.0, the rebuilt index will contain the index key and any of the primary key columns of the table that are not also in the index key. If the index was created with the `COMPATIBLE` initialization parameter set to 10.0.0 or greater, then the rebuilt index will contain the index key and all the primary key columns of the table, including those also in the index key.

**Restrictions on Rebuilding Indexes**

The rebuilding of indexes is subject to the following restrictions:

- You cannot rebuild an index on a temporary table.
- You cannot rebuild a bitmap index that is marked `INVALID`. Instead, you must drop and then re-create it.
- You cannot rebuild an entire partitioned index. You must rebuild each partition or subpartition, as described for the `PARTITION` clause.
- You cannot specify the `deallocate_unused_clause` in the same statement as the `rebuild_clause`.

---
• You cannot change the value of the PCTFREE parameter for the index as a whole (ALTER INDEX) or for a partition (ALTER INDEX ... MODIFY PARTITION). You can specify PCTFREE in all other forms of the ALTER INDEX statement.

• For a domain index:
  – You can specify only the PARAMETERS clause (either for the index or for a partition of the index) or the parallel_clause. No other rebuild clauses are valid.
  – You can rebuild an index only if the index is not marked IN_PROGRESS.
  – You can rebuild an index partition only if the index is not marked IN_PROGRESS or FAILED and the partition is not marked IN_PROGRESS.

• You cannot rebuild a local index, but you can rebuild a partition of a local index (ALTER INDEX ... REBUILD PARTITION).

• For a local index on a hash partition or subpartition, the only parameter you can specify is TABLESPACE.

• You cannot rebuild an online index that is used to enforce a deferrable unique constraint.

PARTITION Clause

Use the PARTITION clause to rebuild one partition of an index. You can also use this clause to move an index partition to another tablespace or to change a create-time physical attribute.

The storage of partitioned database entities in tablespaces of different block sizes is subject to several restrictions. Refer to Oracle Database VLDB and Partitioning Guide for a discussion of these restrictions.

Restriction on Rebuilding Partitions

You cannot specify this clause for a local index on a composite-partitioned table. Instead, use the REBUILD SUBPARTITION clause.

SUBPARTITION Clause

Use the SUBPARTITION clause to rebuild one subpartition of an index. You can also use this clause to move an index subpartition to another tablespace. If you do not specify TABLESPACE, then the subpartition is rebuilt in the same tablespace.

The storage of partitioned database entities in tablespaces of different block sizes is subject to several restrictions. Refer to Oracle Database VLDB and Partitioning Guide for a discussion of these restrictions.

Restriction on Modifying Index Subpartitions
The only parameters you can specify for a subpartition are TABLESPACE, ONLINE, and the parallel_clause.

REVERSE | NOREVERSE
Indicate whether the bytes of the index block are stored in reverse order:
- REVERSE stores the bytes of the index block in reverse order and excludes the rowid when the index is rebuilt.
- NOREVERSE stores the bytes of the index block without reversing the order when the index is rebuilt. Rebuilding a REVERSE index without the NOREVERSE keyword produces a rebuilt, reverse-keyed index.

Restrictions on Reverse Indexes
Reverse indexes are subject to the following restrictions:
- You cannot reverse a bitmap index or an index-organized table.
- You cannot specify REVERSE or NOREVERSE for a partition or subpartition.

parallel_clause
Use the parallel_clause to parallelize the rebuilding of the index and to change the degree of parallelism for the index itself. All subsequent operations on the index will be executed with the degree of parallelism specified by this clause, unless overridden by a subsequent data definition language (DDL) statement with the parallel_clause. The following exceptions apply:
- If ALTER SESSION DISABLE PARALLEL DDL was specified before rebuilding the index, then the index will be rebuilt serially and the degree of parallelism for the index will be changed to 1.
- If ALTER SESSION FORCE PARALLEL DDL was specified before rebuilding the index, then the index will be rebuilt in parallel and the degree of parallelism for the index will be changed to the value that was specified in the ALTER SESSION statement, or DEFAULT if no value was specified.

TABLESPACE Clause
Specify the tablespace where the rebuilt index, index partition, or index subpartition will be stored. The default is the default tablespace where the index or partition resided before you rebuilt it.
index_compression

Use the `index_compression` clauses to enable or disable index compression for the index. Specify the `prefix_compression` clause to enable or disable prefix compression for the index. Specify the `advanced_index_compression` clause to enable or disable advanced index compression for the index.

The `index_compression` clauses have the same semantics for `CREATE INDEX` and `ALTER INDEX`. For full information on these clauses, refer to `index_compression` in the documentation on `CREATE INDEX`.

ONLINE Clause

Specify `ONLINE` to allow DML operations on the table or partition during rebuilding of the index.

Restrictions on Online Indexes

Online indexes are subject to the following restrictions:

- Parallel DML is not supported during online index building. If you specify `ONLINE` and subsequently issue parallel DML statements, then Oracle Database returns an error.
- You cannot specify `ONLINE` for a bitmap join index or a cluster index.
- For a nonunique secondary index on an index-organized table, the number of index key columns plus the number of primary key columns that are included in the logical rowid in the index-organized table cannot exceed 32. The logical rowid excludes columns that are part of the index key.

logging_clause

Specify whether the `ALTER INDEX ... REBUILD` operation will be logged.

Refer to the `logging_clause` for a full description of this clause.

PARAMETERS Clause

This clause is valid only for domain indexes in a top-level `ALTER INDEX` statement and in the `rebuild_clause`. This clause specifies the parameter string that is passed uninterpreted to the appropriate ODCI indextype routine.

The maximum length of the parameter string is 1000 characters.

If you are altering or rebuilding an entire index, then the string must refer to index-level parameters. If you are rebuilding a partition of the index, then the string must refer to partition-level parameters.

If `index` is marked `UNUSABLE`, then modifying the parameters alone does not make it `USABLE`. You must also rebuild the `UNUSABLE` index to make it usable.

If you have installed Oracle Text, then you can rebuild your Oracle Text domain indexes using parameters specific to that product. For more information on those parameters, refer to Oracle Text Reference.

Restriction on the PARAMETERS Clause
You can modify index partitions only if *index* is not marked `IN_PROGRESS` or `FAILED`, no index partitions are marked `IN_PROGRESS`, and the partition being modified is not marked `FAILED`.

### See Also:
- *Oracle Database Data Cartridge Developer's Guide* for more information on indextype routines for domain indexes
- `CREATE INDEX` for more information on domain indexes

### XMLIndex_parameters_clause

This clause is valid only for XMLIndex indexes. This clause specifies the parameter string that defines the XMLIndex implementation.

The maximum length of the parameter string is 1000 characters.

If you are altering or rebuilding an entire index, then the string must refer to index-level parameters. If you are rebuilding a partition of the index, then the string must refer to partition-level parameters.

If *index* is marked `UNUSABLE`, then modifying the parameters alone does not make it `USABLE`. You must also rebuild the `UNUSABLE` index to make it usable.

### See Also:
- *Oracle XML DB Developer's Guide* for more information on XMLIndex, including the syntax and semantics of the `XMLIndex_parameters_clause`

### Restriction on the XMLIndex_parameters_clause

You can modify index partitions only if *index* is not marked `IN_PROGRESS` or `FAILED`, no index partitions are marked `IN_PROGRESS`, and the partition being modified is not marked `FAILED`.

#### { DEFERRED | IMMEDIATE } INVALIDATION

This clause lets you control when the database invalidates dependent cursors while rebuilding an index or while marking an index `UNUSABLE`.

- If you specify `DEFERRED INVALIDATION`, then the database avoids or defers invalidating dependent cursors, when possible.
- If you specify `IMMEDIATE INVALIDATION`, then the database immediately invalidates dependent cursors, as it did in Oracle Database 12c Release 1 (12.1) and prior releases. This is the default.

If you omit this clause, then the value of the `CURSOR INVALIDATION` initialization parameter determines when cursors are invalidated.
See Also:

• Oracle Database SQL Tuning Guide for more information on cursor invalidation
• Oracle Database Reference for more information in the CURSOR_INVALIDATION initialization parameter

COMPILE Clause

Use this clause to recompile an invalid index explicitly. For domain indexes, this clause is useful when the underlying indextype has been altered to support system-managed domain indexes, so that the existing domain index has been marked INVALID. In this situation, this ALTER INDEX statement migrates the domain index from a user-managed domain index to a system-managed domain index. For all types of indexes, this clause is useful when an index has been marked INVALID by an ALTER TABLE statement. In this situation, this ALTER INDEX statement revalidates the index without rebuilding it.

See Also:

The CREATE INDEXTYPE storage_table_clause and Oracle Database Data Cartridge Developer’s Guide for information on creating system-managed domain indexes

ENABLE Clause

ENABLE applies only to a function-based index that has been disabled, either by an ALTER INDEX ... DISABLE statement, or because a user-defined function used by the index was dropped or replaced. This clause enables such an index if these conditions are true:

• The function is currently valid.
• The signature of the current function matches the signature of the function when the index was created.
• The function is currently marked as DETERMINISTIC.

Restrictions on Enabling Function-based Indexes

The ENABLE clause is subject to the following restrictions:

• You cannot specify any other clauses of ALTER INDEX in the same statement with ENABLE.
• You cannot specify this clause for an index on a temporary table. Instead, you must drop and recreate the index. You can retrieve the creation DDL for the index using the DBMS_METADATA package.

DISABLE Clause

DISABLE applies only to a function-based index. This clause lets you disable the use of a function-based index. You might want to do so, for example, while working on the
body of the function. Afterward you can either rebuild the index or specify another ALTER INDEX statement with the ENABLE keyword.

**USABLE | UNUSABLE**

Specify UNUSABLE to mark the index or index partition(s) or index subpartition(s) UNUSABLE. The space allocated for an index or index partition or subpartition is freed immediately when the object is marked UNUSABLE. An unusable index must be rebuilt, or dropped and re-created, before it can be used. While one partition is marked UNUSABLE, the other partitions of the index are still valid. You can execute statements that require the index if the statements do not access the unusable partition. You can also split or rename the unusable partition before rebuilding it. Refer to CREATE INDEX ... USABLE | UNUSABLE for more information.

**ONLINE**

Specify ONLINE to indicate that DML operations on the table or partition will be allowed while marking the index UNUSABLE. If you specify this clause, then the database will not drop the index segments.

**Restrictions on Marking Indexes Unusable**

The following restrictions apply to marking indexes unusable:

- You cannot specify UNUSABLE for an index on a temporary table.
- When a global index is marked UNUSABLE during a partition maintenance operation, the database does not drop the unusable index segments.

**VISIBLE | INVISIBLE**

Use this clause to specify whether the index is visible or invisible to the optimizer. Refer to "VISIBLE | INVISIBLE" in CREATE INDEX for a full description of this clause.

**RENAME Clause**

Use this clause to rename an index. The new_index_name is a single identifier and does not include the schema name.

**Restriction on Renaming Indexes**

For a domain index, neither index nor any partitions of index can be marked IN_PROGRESS or FAILED.

**COALESCE Clause**

Specify COALESCE to instruct Oracle Database to merge the contents of index blocks where possible to free blocks for reuse.

**CLEANUP**

Specify CLEANUP to remove orphaned index entries for records that were previously dropped or truncated by a table partition maintenance operation.

---

**See Also:**

"Renaming an Index: Example"
To determine whether an index contains orphaned index entries, you can query the `ORPHANED_ENTRIES` column of the `USER_INDEXES`, `DBA_INDEXES`, and `ALL_INDEXES` data dictionary views. Refer to Oracle Database Reference for more information.

**parallel_clause**

Use the `parallel_clause` to specify whether to parallelize the coalesce operation.

For complete information on this clause, refer to `parallel_clause` in the documentation on `CREATE TABLE`.

**Restrictions on Coalescing Index Blocks**

Coalescing of index blocks is subject to the following restrictions:

- You cannot specify this clause for an index on a temporary table.
- Do not specify this clause for the primary key index of an index-organized table. Instead use the `COALESCE` clause of `ALTER TABLE`.

### See Also:

- Oracle Database Administrator's Guide for more information on space management and coalescing indexes
- `COALESCE` Clause for information on coalescing the space of an index-organized table
- `shrink_clause` for an alternative method of compacting index segments

**MONITORING USAGE | NOMONITORING USAGE**

Use this clause to determine whether Oracle Database should monitor index use.

- Specify `MONITORING USAGE` to begin monitoring the index. Oracle Database first clears existing information on index use, and then monitors the index for use until a subsequent `ALTER INDEX ... NOMONITORING USAGE` statement is executed.
- To terminate monitoring of the index, specify `NOMONITORING USAGE`.

To see whether the index has been used since this `ALTER INDEX ... NOMONITORING USAGE` statement was issued, query the `USED` column of the `USER_OBJECT_USAGE` data dictionary view.

### See Also:

Oracle Database Reference for information on the `USER_OBJECT_USAGE` data dictionary view

**UPDATE BLOCK REFERENCES Clause**

The `UPDATE BLOCK REFERENCES` clause is valid only for normal and domain indexes on index-organized tables. Specify this clause to update all the stale guess data block addresses stored as part of the index row with the correct database address for the corresponding block identified by the primary key.
For a domain index, Oracle Database executes the `ODCIIndexAlter` routine with the `alter_option` parameter set to `AlterIndexUpdBlockRefs`. This routine enables the cartridge code to update the stale guess data block addresses in the index.

**Restriction on UPDATE BLOCK REFERENCES**

You cannot combine this clause with any other clause of `ALTER INDEX`.

*alter_index_partitioning*

The partitioning clauses of the `ALTER INDEX` statement are valid only for partitioned indexes.

The storage of partitioned database entities in tablespaces of different block sizes is subject to several restrictions. Refer to *Oracle Database VLDB and Partitioning Guide* for a discussion of these restrictions.

**Restrictions on Modifying Index Partitions**

Modifying index partitions is subject to the following restrictions:

- You cannot specify any of these clauses for an index on a temporary table.
- You can combine several operations on the base index into one `ALTER INDEX` statement (except `RENAME` and `REBUILD`), but you cannot combine partition operations with other partition operations or with operations on the base index.

*modify_index_default_attrs*

Specify new values for the default attributes of a partitioned index.

**Restriction on Modifying Partition Default Attributes**

The only attribute you can specify for a hash-partitioned global index or for an index on a hash-partitioned table is `TABLESPACE`.

**TABLESPACE**

Specify the default tablespace for new partitions of an index or subpartitions of an index partition.

*logging_clause*

Specify the default logging attribute of a partitioned index or an index partition.

Refer to *logging_clause* for a full description of this clause.

**FOR PARTITION**

Use the `FOR PARTITION` clause to specify the default attributes for the subpartitions of a partition of a local index on a composite-partitioned table.

**Restriction on FOR PARTITION**

You cannot specify `FOR PARTITION` for a list partition.

---

*See Also:*

"Modifying Default Attributes: Example"
**add_hash_index_partition**

Use this clause to add a partition to a global hash-partitioned index. Oracle Database adds hash partitions and populates them with index entries rehashed from an existing hash partition of the index, as determined by the hash function. If you omit the partition name, then Oracle Database assigns a name of the form `SYS_Pn`. If you omit the TABLESPACE clause, then Oracle Database places the partition in the tablespace specified for the index. If no tablespace is specified for the index, then Oracle Database places the partition in the default tablespace of the user, if one has been specified, or in the system default tablespace.

**modify_index_partition**

Use the `modify_index_partition` clause to modify the real physical attributes, logging attribute, or storage characteristics of index partition `partition` or its subpartitions. For a hash-partitioned global index, the only subclause of this clause you can specify is UNUSABLE.

**COALESCE**

Specify this clause to merge the contents of index partition blocks where possible to free blocks for reuse.

**CLEANUP**

Specify CLEANUP to remove orphaned index entries for records that were previously dropped or truncated by a table partition maintenance operation.

To determine whether an index partition contains orphaned index entries, you can query the `ORPHANED_ENTRIES` column of the `USER_INDEXES`, `DBA_INDEXES`, `ALL_INDEXES` data dictionary views. Refer to Oracle Database Reference for more information.

**UPDATE BLOCK REFERENCES**

The `UPDATE BLOCK REFERENCES` clause is valid only for normal indexes on index-organized tables. Use this clause to update all stale guess data block addresses stored in the secondary index partition.

**Restrictions on UPDATE BLOCK REFERENCES**

This clause is subject to the following restrictions:

- You cannot specify the `physical_attributes_clause` for an index on a hash-partitioned table.
- You cannot specify `UPDATE BLOCK REFERENCES` with any other clause in `ALTER INDEX`.

**Note:**

If the index is a local index on a composite-partitioned table, then the changes you specify here will override any attributes specified earlier for the subpartitions of index, as well as establish default values of attributes for future subpartitions of that partition. To change the default attributes of the partition without overriding the attributes of subpartitions, use `ALTER TABLE ... MODIFY DEFAULT ATTRIBUTES FOR PARTITION`. 
UNUSABLE Clause

This clause has the same function for index partitions that it has for the index as a whole. Refer to "USABLE | UNUSABLE".

index_compression

This clause is relevant for composite-partitioned indexes. Use this clause to change the compression attribute for the partition and every subpartition in that partition. Oracle Database marks each index subpartition in the partition UNUSABLE and you must then rebuild these subpartitions. Prefix compression must already have been specified for the index before you can specify the prefix_compression clause for a partition, or advanced index compression must have already been specified for the index before you can specify the advanced_index_compression clause for a partition. You can specify this clause only at the partition level. You cannot change the compression attribute for an individual subpartition.

You can use this clause for noncomposite index partitions. However, it is more efficient to use the rebuild_clause for noncomposite partitions, which lets you rebuild and set the compression attribute in one step.

rename_index_partition

Use the rename_index_partition clauses to rename index partition or subpartition to new_name.

Restrictions on Renaming Index Partitions

Renaming index partitions is subject to the following restrictions:

- You cannot rename the subpartition of a list partition.
- For a partition of a domain index, index cannot be marked IN_PROGRESS or FAILED, none of the partitions can be marked IN_PROGRESS, and the partition you are renaming cannot be marked FAILED.

See Also:

"Renaming an Index Partition: Example"

drop_index_partition

Use the drop_index_partition clause to remove a partition and the data in it from a partitioned global index. When you drop a partition of a global index, Oracle Database marks the next index partition UNUSABLE. You cannot drop the highest partition of a global index.
See Also:
"Dropping an Index Partition: Example"

**split_index_partition**

Use the `split_index_partition` clause to split a partition of a global range-partitioned index into two partitions, adding a new partition to the index. This clause is not valid for hash-partitioned global indexes. Instead, use the `add_hash_index_partition` clause.

Splitting a partition marked **UNUSABLE** results in two partitions, both marked **UNUSABLE**. You must rebuild the partitions before you can use them.

Splitting a partition marked **USABLE** results in two partitions populated with index data. Both new partitions are marked **USABLE**.

**AT Clause**

Specify the new noninclusive upper bound for `split_partition_1`. The `value_list` must evaluate to less than the presplit partition bound for `partition_name_old` and greater than the partition bound for the next lowest partition (if there is one).

**INTO Clause**

Specify (optionally) the name and physical attributes of each of the two partitions resulting from the split.

---

See Also:
"Splitting a Partition: Example"

**coalesce_index_partition**

This clause is valid only for hash-partitioned global indexes. Oracle Database reduces by one the number of index partitions. Oracle Database selects the partition to coalesce based on the requirements of the hash function. Use this clause if you want to distribute index entries of a selected partition into one of the remaining partitions and then remove the selected partition.

**modify_index_subpartition**

Use the `modify_index_subpartition` clause to mark **UNUSABLE** or allocate or deallocate storage for a subpartition of a local index on a composite-partitioned table. All other attributes of such a subpartition are inherited from partition-level default attributes.

**Examples**

**Storing Index Blocks in Reverse Order: Example**

The following statement rebuilds index `ord_customer_ix` (created in "Creating an Index: Example") so that the bytes of the index block are stored in reverse order:

```sql
ALTER INDEX ord_customer_ix REBUILD REVERSE;
```
Rebuilding an Index in Parallel: Example

The following statement causes the index to be rebuilt from the existing index by using parallel execution processes to scan the old and to build the new index:

```
ALTER INDEX ord_customer_ix REBUILD PARALLEL;
```

Modifying Real Index Attributes: Example

The following statement alters the `oe.cust_lname_ix` index so that future data blocks within this index use 5 initial transaction entries:

```
ALTER INDEX oe.cust_lname_ix
  INITRANS 5;
```

If the `oe.cust_lname_ix` index were partitioned, then this statement would also alter the default attributes of future partitions of the index. Partitions added in the future would then use 5 initial transaction entries and an incremental extent of 100K.

Enabling Parallel Queries: Example

The following statement sets the parallel attributes for index `upper_ix` (created in "Creating a Function-Based Index: Example") so that scans on the index will be parallelized:

```
ALTER INDEX upper_ix PARALLEL;
```

Renaming an Index: Example

The following statement renames an index:

```
ALTER INDEX upper_ix RENAME TO upper_name_ix;
```

Marking an Index Unusable: Examples

The following statements use the `cost_ix` index, which was created in "Creating a Range-Partitioned Global Index: Example". Partition `p1` of that index was dropped in "Dropping an Index Partition: Example". The first statement marks index partition `p2` as unusable:

```
ALTER INDEX cost_ix
  MODIFY PARTITION p2 UNUSABLE;
```

The next statement marks the entire index `cost_ix` as unusable:

```
ALTER INDEX cost_ix UNUSABLE;
```

Rebuilding Unusable Index Partitions: Example

The following statements rebuild partitions `p2` and `p3` of the `cost_ix` index, making the index once more usable: The rebuilding of partition `p3` will not be logged:

```
ALTER INDEX cost_ix
  REBUILD PARTITION p2;
ALTER INDEX cost_ix
  REBUILD PARTITION p3 NOLOGGING;
```

Changing MAXEXTENTS: Example

The following statement changes the maximum number of extents for partition `p3` and changes the logging attribute:
/* This example will fail if the tablespace in which partition p3 resides is locally managed. */
ALTER INDEX cost_ix MODIFY PARTITION p3
   STORAGE(MAXEXTENTS 30) LOGGING;

Renaming an Index Partition: Example
The following statement renames an index partition of the cost_ix index (created in "Creating a Range-Partitioned Global Index: Example"):
ALTER INDEX cost_ix
   RENAME PARTITION p3 TO p3_Q3;

Splitting a Partition: Example
The following statement splits partition p2 of index cost_ix (created in "Creating a Range-Partitioned Global Index: Example") into p2a and p2b:
ALTER INDEX cost_ix
   SPLIT PARTITION p2 AT (1500)
   INTO ( PARTITION p2a TABLESPACE tbs_01 LOGGING,
          PARTITION p2b TABLESPACE tbs_02);

Dropping an Index Partition: Example
The following statement drops index partition p1 from the cost_ix index:
ALTER INDEX cost_ix
   DROP PARTITION p1;

Modifying Default Attributes: Example
The following statement alters the default attributes of local partitioned index prod_idx, which was created in "Creating an Index on a Hash-Partitioned Table: Example". Partitions added in the future will use 5 initial transaction entries:
ALTER INDEX prod_idx
   MODIFY DEFAULT ATTRIBUTES INITRANS 5;

### 10.16 ALTER INDEXTYPE

#### Purpose
Use the ALTER INDEXTYPE statement to add or drop an operator of the indextype or to modify the implementation type or change the properties of the indextype.

#### Prerequisites
The indextype must be in your own schema or you must have the ALTER ANY INDEXTYPE system privilege.

To add a new operator, you must have the EXECUTE object privilege on the operator.

To change the implementation type, you must have the EXECUTE object privilege on the new implementation type.
Syntax

\[
\text{alter\_indextype::=}
\]

\[
\text{ALTER INDEXTYPE schema \cdot indextype ADD DROP schema \cdot operator (parameter_types), using\_type\_clause COMPILE WITH LOCAL RANGE PARTITION storage\_table\_clause ;}
\]

\[
(\text{using\_type\_clause::=, storage\_table\_clause})
\]

\[
\text{using\_type\_clause::=}
\]

\[
\text{USING schema \cdot implementation\_type array\_DML\_clause}
\]

\[
(array\_DML\_clause)
\]

\[
\text{array\_DML\_clause}
\]

\[
\text{WITH WITHOUT ARRAY DML (schema \cdot type, schema \cdot varray\_type)}
\]

\[
\text{storage\_table\_clause}
\]

\[
\text{WITH SYSTEM USER MANAGED STORAGE TABLES}
\]
Semantics

**schema**
Specify the name of the schema in which the indextype resides. If you omit *schema*, then Oracle Database assumes the indextype is in your own schema.

**indextype**
Specify the name of the indextype to be modified.

**ADD | DROP**
Use the *ADD* or *DROP* clause to add or drop an operator.

No special privilege needed to drop.

- For *schema*, specify the schema containing the operator. If you omit *schema*, then Oracle assumes the operator is in your own schema.
- For *operator*, specify the name of the operator supported by the indextype.
  All the operators listed in this clause must be valid operators.
- For *parameter_type*, list the types of parameters to the operator.

**using_type_clause**
The *USING* clause lets you specify a new type to provide the implementation for the indextype.

**array_DML_clause**
Use this clause to modify the indextype to support the array interface for the ODCIIndexInsert method.

**type and varray_type**
If the data type of the column to be indexed is a user-defined object type, then you must specify this clause to identify the varray *varray_type* that Oracle should use to hold column values of *type*. If the indextype supports a list of types, then you can specify a corresponding list of varray types. If you omit *schema* for either *type* or *varray_type*, then Oracle assumes the type is in your own schema.

If the data type of the column to be indexed is a built-in system type, then any varray type specified for the indextype takes precedence over the ODCI types defined by the system.

**COMPILE**
Use this clause to recompile the indextype explicitly. This clause is required only after some upgrade operations, because Oracle Database normally recompiles the indextype automatically.

**storage_table_clause**
This clause has the same behavior when altering an indextype that it has when you are creating an indextype. Refer to the *CREATE INDEXTYPE storage_table_clause* for more information.
WITH LOCAL PARTITION

This clause has the same behavior when altering an indextype that it has when you create an indextype. Refer to the CREATE INDEXTYPE clause WITH LOCAL PARTITION for more information.

Examples

Altering an Indextype: Example

The following example compiles the position_indextype indextype created in "Creating an Indextype: Example".

```
ALTER INDEXTYPE position_indextype Compile;
```

10.17 ALTER INMEMORY JOIN GROUP

Purpose

Use the ALTER INMEMORY JOIN GROUP statement to add a table column to a join group or remove a table column from a join group.

See Also:

- CREATE INMEMORY JOIN GROUP and DROP INMEMORY JOIN GROUP
- Oracle Database In-Memory Guide for more information on join groups

Prerequisites

If the join group is not in your own schema, or if the column you want to add to or remove from the join group is in a table that is not in your own schema, then you must have the ALTER ANY TABLE system privilege.

Syntax

```
alter_inmemory_join_group ::= 
```

```sql
ALTER INMEMORY JOIN GROUP 
```

```sql
ADD | REMOVE 
```

```sql
( 
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```

```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
```
Semantics

schema
Specify the schema containing the join group. If you omit schema, then the database assumes the join group is in your own schema.

join_group
Specify the name of the join group to be modified.

You can view existing join groups by querying the DBA_JOINGROUPS or USER_JOINGROUPS data dictionary view. Refer to Oracle Database Reference for more information on these views.

ADD
Specify ADD to add a table column to the join group. A join group can contain a maximum of 255 columns.

REMOVE
Specify REMOVE to remove a table column from the join group. A join group must contain at least 2 columns.

schema
Specify the schema of the table that contains the column to be added to or removed from the join group. If you omit schema, then Oracle Database assumes the table is in your own schema.

table
Specify the name of the table that contains the column to be added to or removed from the join group.

column
Specify the name of the column to be added to or removed from the join group.

Examples

The following example adds a column to the prod_id1 join group created in Examples in the documentation on CREATE INMEMORY JOIN GROUP:

```
ALTER INMEMORY JOIN GROUP prod_id1
  ADD(product_descriptions(product_id));
```

The following example removes a column from the prod_id1 join group:

```
ALTER INMEMORY JOIN GROUP prod_id1
  REMOVE(product_descriptions(product_id));
```
10.18 ALTER JAVA

Purpose

Use the ALTER JAVA statement to force the resolution of a Java class schema object or compilation of a Java source schema object. (You cannot call the methods of a Java class before all its external references to Java names are associated with other classes.)

See Also:

Oracle Database Java Developer’s Guide for more information on resolving Java classes and compiling Java sources

Prerequisites

The Java source or class must be in your own schema, or you must have the ALTER ANY PROCEDURE system privilege. You must also have the EXECUTE object privilege on Java classes.

Syntax

alter_java ::=
Semantics

JAVA SOURCE

Use **ALTER JAVA SOURCE** to compile a Java source schema object.

JAVA CLASS

Use **ALTER JAVA CLASS** to resolve a Java class schema object.

**object_name**

Specify a previously created Java class or source schema object. Use double quotation marks to preserve lower- or mixed-case names.

RESOLVER

The **RESOLVER** clause lets you specify how schemas are searched for referenced fully specified Java names, using the mapping pairs specified when the Java class or source was created.

**See Also:**

CREATE JAVA and "Resolving a Java Class: Example"

RESOLVE | COMPILE

**RESOLVE** and **COMPILE** are synonymous keywords. They let you specify that Oracle Database should attempt to resolve the primary Java class schema object.

- When applied to a class, resolution of referenced names to other class schema objects occurs.
- When applied to a source, source compilation occurs.

**invoker_rights_clause**

The **invoker_rights_clause** lets you specify whether the methods of the class execute with the privileges and in the schema of the user who defined it or with the privileges and in the schema of **CURRENT_USER**.

This clause also determines how Oracle Database resolves external names in queries, DML operations, and dynamic SQL statements in the member functions and procedures of the type.

**AUTHID CURRENT_USER**

Specify **CURRENT_USER** if you want the methods of the class to execute with the privileges of **CURRENT_USER**. This clause is the default and creates an **invoker-rights class**.

This clause also specifies that external names in queries, DML operations, and dynamic SQL statements resolve in the schema of **CURRENT_USER**. External names in all other statements resolve in the schema in which the methods reside.

**AUTHID DEFINER**
Specify `DEFINER` if you want the methods of the class to execute with the privileges of the user who defined the class.

This clause also specifies that external names resolve in the schema where the methods reside.

**See Also:**

*Oracle Database PL/SQL Language Reference* for information on how `CURRENT_USER` is determined

**Examples**

**Resolving a Java Class: Example**

The following statement forces the resolution of a Java class:

```sql
ALTER JAVA CLASS "Agent"
    RESOLVER ("/usr/bin/bfile_dir/*" pm)(* public)
    RESOLVE;
```
11

SQL Statements: ALTER LIBRARY to ALTER SESSION

This chapter contains the following SQL statements:

• ALTER LIBRARY
• ALTER LOCKDOWN PROFILE
• ALTER MATERIALIZED VIEW
• ALTER MATERIALIZED VIEW LOG
• ALTER MATERIALIZED ZONEMAP
• ALTER OPERATOR
• ALTER OUTLINE
• ALTER PACKAGE
• ALTER PLUGGABLE DATABASE
• ALTER PROCEDURE
• ALTER PROFILE
• ALTER RESOURCE COST
• ALTER ROLE
• ALTER ROLLBACK SEGMENT
• ALTER SEQUENCE
• ALTER SESSION

11.1 ALTER LIBRARY

Purpose

The ALTER LIBRARY statement explicitly recompiles a library. Explicit recompilation eliminates the need for implicit run-time recompilation and prevents associated run-time compilation errors and performance overhead.

Note:

This statement does not change the declaration or definition of an existing library. To redeclare or redefine a library, use the "CREATE LIBRARY" with the OR REPLACE clause.
Prerequisites

If the library is in the **SYS** schema, you must be connected as **SYSDBA**. Otherwise, the library must be in your own schema or you must have the **ALTER ANY LIBRARY** system privilege.

Syntax

```
alter_library::=
```

```
ALTER LIBRARY
schema .
library_name
library_compile_clause
EDITIONABLE
NONEDITIONABLE
```

(`library_compile_clause`: See *Oracle Database PL/SQL Language Reference* for the syntax of this clause.)

Semantics

**schema**

Specify the schema containing the library. If you omit `schema`, then Oracle Database assumes the procedure is in your own schema.

**library_name**

Specify the name of the library to be recompiled.

**library_compile_clause**

See *Oracle Database PL/SQL Language Reference* for the syntax and semantics of this clause and for complete information on creating and compiling libraries.

**EDITIONABLE | NONEDITIONABLE**

Use these clauses to specify whether the library becomes an editioned or noneditioned object if editioning is later enabled for the schema object type **LIBRARY** in `schema`. The default is **EDITIONABLE**. For information about altering editioned and noneditioned objects, see *Oracle Database Development Guide*.

### 11.2 ALTER LOCKDOWN PROFILE

Purpose

Use the **ALTER LOCKDOWN PROFILE** statement to alter a PDB lockdown profile. You can use PDB lockdown profiles in a multitenant environment to restrict user operations in pluggable databases (PDBs).

Immediately after you create a lockdown profile with the **CREATE LOCKDOWN PROFILE** statement, all user operations are enabled for the profile. You can then use the **ALTER LOCKDOWN PROFILE** statement to disable certain user operations for the profile. When a lockdown profile is applied to a CDB, application container, or PDB, users cannot
perform the operations that are the disabled for the profile. If you later would like to reenable some of the disabled user operations, you can use the **ALTER LOCKDOWN PROFILE** statement to do so.

The **ALTER LOCKDOWN PROFILE** statement allows you to disable or enable:

- User operations associated with certain database features (using the `lockdown_features` clause)
- User operations associated with certain database options (using the `lockdown_options` clause)
- The issuance of certain SQL statements (using the `lockdown_statements` clause)

### See Also:

- **CREATE LOCKDOWN PROFILE** and **DROP LOCKDOWN PROFILE**
- *Oracle Database Security Guide* for more information on PDB lockdown profiles

**Prerequisites**

The **ALTER LOCKDOWN PROFILE** statement is valid only in a CDB. The current container must be the CDB root and you must have the **ALTER LOCKDOWN PROFILE** system privilege, either granted commonly or granted locally in the CDB root.

**Syntax**

```sql
alter_lockdown_profile::=  

ALTER LOCKDOWN PROFILE profile_name
  lockdown_features
  lockdown_options
  lockdown_statements

lockdown_features::=  

DISABLE | ENABLE FEATURE = ( 'feature' , )
  ALL EXCEPT = ( 'feature' , )
```

---

**Chapter 11**

**ALTER LOCKDOWN PROFILE**

11-3
**lockdown_options::=**

```
DISABLE
ENABLE
OPTION

EXCEPT = ( 'option'
,
)
ALL
```

**lockdown_statements::=**

```
DISABLE
ENABLE
STATEMENT

EXCEPT = ( 'SQL_statement'
,
)
ALL
```

**statement_clauses::=**

```
CLAUSE

EXCEPT = ( 'clause'
,
)
ALL
```

**clause_options::=**

```
OPTION

EXCEPT = ( 'clause_option'

clause_option_pattern
)
```

---

**Chapter 11**

**ALTER LOCKDOWN PROFILE**

11-4
Semantics

profile_name

Specify the name of the PDB lockdown profile to be altered.

You can find the names of existing PDB lockdown profiles by querying the DBA_LOCKDOWN_PROFILES data dictionary view.

lockdown_features

This clause lets you disable or enable user operations associated with certain database features.

- Specify **DISABLE** to disable user operations for the specified features. Users will be restricted from performing these operations in any PDB to which the profile applies.
- Specify **ENABLE** to enable user operations for the specified features. Users will be allowed to perform these operations in any PDB to which the profile applies.
- Use **feature** to specify the features whose operations you want to disable or enable. Table 11-1 lists the features you can specify and describes the operations associated with each feature. The table also indicates a feature bundle for each feature. For **feature**, you can specify a feature bundle name to disable or enable user operations for all features in that bundle, or you can specify an individual feature name. You can specify feature bundle names and feature names in any combination of uppercase and lowercase letters.
- Use **ALL** to specify all features listed in the table.
- Use **ALL EXCEPT** to specify all features listed in the table except the specified features.

If you omit this clause, then the default is **ENABLE ALL**.

Table 11-1  PDB Lockdown Profile Features

<table>
<thead>
<tr>
<th>Feature Bundle</th>
<th>Feature</th>
<th>Operations</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWR_ACCESS</td>
<td>AWR_ACCESS</td>
<td>The PDB taking manual and automatic Automatic Workload Repository (AWR) snapshots</td>
</tr>
<tr>
<td>Feature Bundle</td>
<td>Feature</td>
<td>Operations</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>COMMON_SCHEMA_ACCESS</td>
<td>COMMON_USER_LOCAL_SCHEMA_ACCESS</td>
<td>A common user invoking an invoker's rights code unit or accessing a BEQUEATH CURRENT_USER view owned by any local user in the PDB</td>
</tr>
</tbody>
</table>
| COMMON_SCHEMA_ACCESS      | LOCAL_USER_COMMON_SCHEMA_ACCESS              | • A local user with an ANY system privilege (for example, CREATE ANY TABLE) creating or accessing objects in a common user's schema for which the privilege applies. **Note:** Disabling the LOCAL_USER_COMMON_SCHEMA_ACCESS feature does not prevent a local user with the SYSDBA privilege or specific object privileges from creating or accessing objects in a common user's schema. Therefore, Oracle recommends against granting such privileges to local users.  
• A local user with the BECOME USER system privilege becoming a common user  
• A local user altering a common user by issuing an ALTER USER statement  
• A local user using a common user for proxy connections |
| COMMON_SCHEMA_ACCESS      | SECURITY_POLICIES                           | Creation of certain security policies by a local user on a common object, including:  
• Data Redaction  
• Fine Grained Auditing (FGA)  
• Real Application Security (RAS)  
• Virtual Private Database (VPD) |
| CONNECTIONS               | COMMON_USER_CONNECT                         | A common user connecting to the PDB directly. If this feature is disabled, then in order to connect to the PDB, a common user must first connect to the CDB root and then switch to the desired PDB using the ALTER SESSION SET CONTAINER statement. |
| CONNECTIONS               | LOCAL(SYSOPER_RESTRICTED_MODE CONNECT)      | A local user with the SYSOPER privilege connecting to a PDB that is open in RESTRICTED mode |
| CTX_LOGGING               | CTX_LOGGING                                  | Use logging in Oracle Text PL/SQL procedures such as CTX_OUTPUT.START_LOG and CTX_OUTPUT.START_QUERY_LOG |
| JAVA                      | JAVA                                         | Java as a whole. If this feature is disabled, then all options and features of the database that depend on Java will be disabled. |
Table 11-1  (Cont.) PDB Lockdown Profile Features

<table>

</tbody>
</table>
lockdown_options

This clause lets you disable or enable user operations associate with certain database options.

- Specify DISABLE to disable user operations for the specified options. Users will be restricted from performing these operations in any PDB to which the profile applies.
- Specify ENABLE to enable user operations for the specified options. Users will be allowed to perform these operations in any PDB to which the profile applies.
- For option, you can specify the following database options in any combination of uppercase and lowercase letters:
  - DATABASE QUEUING – Represents user operations associated with the Oracle Database Advanced Queuing option
  - PARTITIONING – Represents user operations associated with the Oracle Partitioning option
- Use ALL to specify all options in the preceding list.
- Use ALL EXCEPT to specify all options in the preceding list except the specified options.

If you omit this clause, then the default is ENABLE OPTION ALL.

lockdown_statements

This clause lets you disable or enable the issuance of certain SQL statements.

- Specify DISABLE to disable the issuance of the specified SQL statements. Users will be restricted from issuing these statements in any PDB to which the profile applies.
- Specify ENABLE to enable the issuance of the specified SQL statements. Users will be allowed to issue these statements in any PDB to which the profile applies.
- For SQL_statement, you can specify the following statements in any combination of uppercase and lowercase letters:
  - ALTER DATABASE
  - ALTER PLUGGABLE DATABASE
  - ALTER SESSION
  - ALTER SYSTEM
- Use ALL to specify all statements in the preceding list.
- Use ALL EXCEPT to specify all statements in the preceding list except the specified statements.

If you omit this clause, then the default is ENABLE STATEMENT ALL.

statement_clauses

This clause lets you disable or enable specific clauses of the specified SQL statement.
• Use clause to specify the SQL keywords that form the clause you want to disable or enable. You can specify a clause in any combination of uppercase and lowercase letters.

• Use ALL to specify all clauses for the SQL statement.

• Use ALL EXCEPT to specify all clauses for the SQL statement except the specified clauses.

For clause, you must specify at least enough keywords to unambiguously identify a single clause for the SQL statement. The following are some examples of how to specify clause for the ALTER SYSTEM statement:

• To specify the archive_log_clause:=, specify ARCHIVE. This is sufficient because no other ALTER SYSTEM clause begins with the keyword ARCHIVE. Alternatively, you can specify ARCHIVE LOG for semantic clarity, but the LOG keyword is unnecessary.

• To specify either of the rolling_migration_clauses:=, you must specify START ROLLING MIGRATION or STOP ROLLING MIGRATION in order to distinguish these clauses from the similarly named rolling_patch_clauses:= START ROLLING PATCH and STOP ROLLING PATCH.

• You cannot specify the single keyword FLUSH, because several ALTER SYSTEM clauses begin with this keyword. You must instead specify each clause separately, such as FLUSH SHARED_POOL or FLUSH GLOBAL CONTEXT.

There is no need to specify optional keywords within a clause, because they have no effect. For example:

• The archive_log_clause:= has an optional INSTANCE keyword. However, you cannot enable or disable only ARCHIVE LOG clauses that contain the INSTANCE keyword. Specifying ARCHIVE LOG INSTANCE is equivalent to specifying ARCHIVE or ARCHIVE LOG.

There is no need to specify parameter values within a clause, because they have no effect. For example:

• The shutdown_dispatcher_clause:= requires you to specify a dispatcher_name. However, you cannot enable or disable SHUTDOWN clauses that contain a specific dispatcher name. Specifying SHUTDOWN dispatcher1 is equivalent to specifying SHUTDOWN.

See Also:

ALTER DATABASE, ALTER PLUGGABLE DATABASE, ALTER SESSION, and ALTER SYSTEM for complete information on the clauses for these statements

clause_options

This clause is valid only when you specify one of the following for lockdown_statements and statement_clauses:

{ DISABLE | ENABLE } STATEMENT = ('ALTER SESSION') CLAUSE = ('SET')
{ DISABLE | ENABLE } STATEMENT = ('ALTER SYSTEM') CLAUSE = ('SET')
This clause lets you disable or enable the setting or modification of specific options with the `ALTER SESSION SET` or `ALTER SYSTEM SET` statements.

- Use `clause_option` to specify the option you want to disable or enable.
- Use `clause_option_pattern` to specify a pattern that matches multiple options. Within the pattern, specify a percent sign (%) to match zero or more characters in an option name. For example, specifying `QUERY_REWRITE_%` is equivalent to specifying both the `QUERY_REWRITE_ENABLED` and `QUERY_REWRITE_INTEGRITY` options.
- You can specify `clause_option` and `clause_option_pattern` in any combination of uppercase and lowercase letters.
- Use `ALL` to specify all options.
- Use `ALL EXCEPT` to specify all options except the specified options.

### See Also:

The `alter_session_set_clause` clause of `ALTER SESSION` and the `alter_system_set_clause` clause of `ALTER SYSTEM` for complete information on the options you can specify for these statements.

### Option Values

This clause is valid only when you specify one of the following for `lockdown_statements`, `statement_clauses`, and `clause_options`:

```sql
DISABLE STATEMENT = ('ALTER SESSION') CLAUSE = ('SET') OPTION = clause_option
DISABLE STATEMENT = ('ALTER SYSTEM') CLAUSE = ('SET') OPTION = clause_option
```

This clause lets you specify a default value for an option when disabling the setting of that option. For options that take numeric values, this clause also lets you restrict users from setting an option to certain values.

- The `VALUE` clause lets you specify a default `option_value` for `clause_option`, which will go into effect for any PDB to which the profile applies after you close and reopen the PDB. If `clause_option` accepts multiple default values, then you can specify more than one `option_value` in a comma-separated list. The purpose of using this clause is to simultaneously set a default value for an option and restrict users from setting or modifying the value.
- The `MINVALUE` clause lets you restricts users from setting the value of `clause_option` to a value less than `option_value`. You can specify this clause only for options that take a numeric value.
- The `MAXVALUE` clause lets you restricts users from setting the value of `clause_option` to a value greater than `option_value`. You can specify this clause only for options that take a numeric value.
- You can specify both the `MINVALUE` and `MAXVALUE` clauses together to restrict users from setting the value of `clause_options` to any value less than `MINVALUE` or greater than `MAXVALUE`. 
MINVALUE and MAXVALUE settings take effect immediately when the lockdown profile is assigned to a PDB; you need not close and reopen the PDB.

See Also:
Oracle Database Reference for complete information on the values allowed for the various options

Examples
The following statement creates PDB lockdown profile hr_prof:

```
CREATE LOCKDOWN PROFILE hr_prof;
```

The remaining examples in this section alter hr_prof.

Disabling Features for PDB Lockdown Profiles: Examples
The following statement disables all features in the feature bundle NETWORK_ACCESS:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE FEATURE = ('NETWORK_ACCESS');
```

The following statement disables the LOB_FILE_ACCESS and TRACE_VIEW_ACCESS features:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE FEATURE = ('LOB_FILE_ACCESS', 'TRACE_VIEW_ACCESS');
```

The following statement disables all features except the COMMON_USER_LOCAL_SCHEMA_ACCESS and LOCAL_USER_COMMON_SCHEMA_ACCESS features:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE FEATURE ALL EXCEPT = ('COMMON_USER_LOCAL_SCHEMA_ACCESS',
  'LOCAL_USER_COMMON_SCHEMA_ACCESS');
```

The following statement disables all features:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE FEATURE ALL;
```

Enabling Features for PDB Lockdown Profiles: Examples
The following statement enables the UTL_HTTP and UTL_SMTP features, as well as all features in the feature bundle OS_ACCESS:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE FEATURE = ('UTL_HTTP', 'UTL_SMTP', 'OS_ACCESS');
```
The following statement enables all features except the `AQ_PROTOCOLS` and `CTX_PROTOCOLS` features:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE FEATURE ALL EXCEPT = ('AQ_PROTOCOLS', 'CTX_PROTOCOLS');
```

The following statement enables all features:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE FEATURE ALL;
```

**Disabling Options for PDB Lockdown Profiles: Examples**

The following statement disables user operations associated with the Oracle Database Advanced Queuing option:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE OPTION = ('DATABASE QUEUING');
```

The following statement disables user operations associated with the Oracle Partitioning option:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE OPTION = ('PARTITIONING');
```

**Enabling Options for PDB Lockdown Profiles: Examples**

The following statement enables user operations associated with the Oracle Database Advanced Queuing option:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE OPTION = ('DATABASE QUEUING');
```

The following statement enables user operations associated both with the Oracle Database Advanced Queuing option and the Oracle Partitioning option:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE OPTION ALL;
```

**Disabling SQL Statements for PBB Lockdown Profiles: Examples**

The following statement disables the `ALTER DATABASE` statement:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER DATABASE');
```
The following statement disables the `ALTER SYSTEM SUSPEND` and `ALTER SYSTEM RESUME` statements:

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SYSTEM')
  CLAUSE = ('SUSPEND', 'RESUME');
```

The following statement disables all clauses of the `ALTER PLUGGABLE DATABASE` statement, except `DEFAULT TABLESPACE` and `DEFAULT TEMPORARY TABLESPACE`:

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER PLUGGABLE DATABASE')
  CLAUSE ALL EXCEPT = ('DEFAULT TABLESPACE', 'DEFAULT TEMPORARY TABLESPACE');
```

The following statement disables using the `ALTER SESSION` statement to set or modify `COMMIT_WAIT` or `CURSOR_SHARING`:

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SESSION')
  CLAUSE = ('SET')
  OPTION = ('COMMIT_WAIT', 'CURSOR_SHARING');
```

The following statement disables using the `ALTER SYSTEM` statement to set or modify the value of `PDB_FILE_NAME_CONVERT`. It also sets the default value for `PDB_FILE_NAME_CONVERT` to 'cdb1_pdb0', 'cdb1_pdb1'. This default value will take effect the next time the PDB is closed and reopened.

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SYSTEM')
  CLAUSE = ('SET')
  OPTION = ('PDB_FILE_NAME_CONVERT')
  VALUE = ('cdb1_pdb0', 'cdb1_pdb1');
```

The following statement disables using the `ALTER SYSTEM` statement to set or modify the value of `CPU_COUNT` to a value less than 8:

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SYSTEM')
  CLAUSE = ('SET')
  OPTION = ('CPU_COUNT')
  MINVALUE = '8';
```

The following statement disables using the `ALTER SYSTEM` statement to set or modify the value of `CPU_COUNT` to a value greater than 2:

```sql
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SYSTEM')
  CLAUSE = ('SET')
  OPTION = ('CPU_COUNT')
  MAXVALUE = '2';
```
The following statement disables using the `ALTER SYSTEM` statement to set or modify the value of `CPU_COUNT` to a value less than 2 or greater than 6:

```
ALTER LOCKDOWN PROFILE hr_prof
  DISABLE STATEMENT = ('ALTER SYSTEM')
  CLAUSE = ('SET')
  OPTION = ('CPU_COUNT')
  MINVALUE = '2'
  MAXVALUE = '6';
```

### Enabling SQL Statements for PBB Lockdown Profiles: Examples

The following statement enables all statements except `ALTER DATABASE`:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE STATEMENT ALL EXCEPT = ('ALTER DATABASE');
```

The following statement enables the `ALTER DATABASE MOUNT` and `ALTER DATABASE OPEN` statements:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE STATEMENT = ('ALTER DATABASE')
  CLAUSE = ('MOUNT', 'OPEN');
```

The following statement enables all clauses of the `ALTER PLUGGABLE DATABASE` statement, except `DEFAULT TABLESPACE` and `DEFAULT TEMPORARY TABLESPACE`:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE STATEMENT = ('ALTER PLUGGABLE DATABASE')
  CLAUSE ALL EXCEPT = ('DEFAULT TABLESPACE', 'DEFAULT TEMPORARY TABLESPACE');
```

The following statement enables using the `ALTER SESSION` statement to set or modify `COMMIT_WAIT` or `CURSOR_SHARING`:

```
ALTER LOCKDOWN PROFILE hr_prof
  ENABLE STATEMENT = ('ALTER SESSION')
  CLAUSE = ('SET')
  OPTION = ('COMMIT_WAIT', 'CURSOR_SHARING');
```

### 11.3 ALTER MATERIALIZED VIEW

**Purpose**

A materialized view is a database object that contains the results of a query. The `FROM` clause of the query can name tables, views, and other materialized views. Collectively these source objects are called master tables (a replication term) or detail tables (a data warehousing term). This reference uses the term master tables for consistency. The databases containing the master tables are called the master databases.
Use the `ALTER MATERIALIZED VIEW` statement to modify an existing materialized view in one or more of the following ways:

- To change its storage characteristics
- To change its refresh method, mode, or time
- To alter its structure so that it is a different type of materialized view
- To enable or disable query rewrite

**Note:**

The keyword `SNAPSHOT` is supported in place of `MATERIALIZED VIEW` for backward compatibility.

**See Also:**

- `CREATE MATERIALIZED VIEW` for more information on creating materialized views
- *Oracle Database Administrator’s Guide* for information on materialized views in a replication environment
- *Oracle Database Data Warehousing Guide* for information on materialized views in a data warehousing environment

**Prerequisites**

The materialized view must be in your own schema, or you must have the `ALTER ANY MATERIALIZED VIEW` system privilege.

To enable a materialized view for query rewrite:

- If all of the master tables in the materialized view are in your schema, then you must have the `QUERY REWRITE` privilege.
- If any of the master tables are in another schema, then you must have the `GLOBAL QUERY REWRITE` privilege.
- If the materialized view is in another user's schema, then both you and the owner of that schema must have the appropriate `QUERY REWRITE` privilege, as described in the preceding two items. In addition, the owner of the materialized view must have `SELECT` access to any master tables that the materialized view owner does not own.

To specify an edition in the `evaluation_edition_clause` or the `unusable_editions_clause`, you must have the `USE` privilege on the edition.
Syntax

\texttt{alter\_materialized\_view::=}

\begin{itemize}

Chapter 11
ALTER MATERIALIZED VIEW

11-23
You cannot specify only \texttt{QUERY REWRITE}. You must specify at least one of the following: \texttt{ENABLE}, \texttt{DISABLE}, or a subclause of the 
\texttt{unusable
ditions_clause}.
### usable_editions_clause

```
UNUSABLE BEFORE CURRENT EDITION
UNUSABLE BEGINNING WITH CURRENT EDITION
NULL EDITION
```

### Semantics

**schema**

Specify the schema containing the materialized view. If you omit `schema`, then Oracle Database assumes the materialized view is in your own schema.

**materialized_view**

Specify the name of the materialized view to be altered.

**physical_attributes_clause**

Specify new values for the `PCTFREE`, `PCTUSED`, and `INITRANS` parameters (or, when used in the `USING INDEX` clause, for the `INITRANS` parameter only) and the storage characteristics for the materialized view. Refer to `ALTER TABLE` for information on the `PCTFREE`, `PCTUSED`, and `INITRANS` parameters and to `storage_clause` for information about storage characteristics.

**modify_mv_column_clause**

Use this clause to encrypt or decrypt this column of the materialized view. Refer to the `CREATE TABLE` clause `encryption_spec` for information on this clause.

**table_compression**

Use the `table_compression` clause to instruct Oracle Database whether to compress data segments to reduce disk and memory use. Refer to the `table_compression` clause of `CREATE TABLE` for the full semantics of this clause.

**inmemory_table_clause**

Use the `inmemory_table_clause` to enable or disable the materialized view or its columns for the In-Memory Column Store (IM column store), or to change the In-Memory attributes for the materialized view or its columns. This clause has the same semantics here as it has for the `ALTER TABLE` statement. Refer to the `inmemory_table_clause` of `ALTER TABLE` for the full semantics of this clause.

**LOB_storage_clause**

The `LOB_storage_clause` lets you specify the storage characteristics of a new LOB. LOB storage behaves for materialized views exactly as it does for tables. Refer to the
**LOB_storage_clause** (in `CREATE TABLE`) for information on the LOB storage parameters.

**modify_LOB_storage_clause**

The `modify_LOB_storage_clause` lets you modify the physical attributes of the LOB attribute `LOB_item` or the LOB object attribute. Modification of LOB storage behaves for materialized views exactly as it does for tables.

**See Also:**

The `modify_LOB_storage_clause` of `ALTER TABLE` for information on the LOB storage parameters that can be modified.

**alter_table_partitioning**

The syntax and general functioning of the partitioning clauses for materialized views is the same as for partitioned tables. Refer to `alter_table_partitioning` in the documentation on `ALTER TABLE`.

**Restriction on Altering Materialized View Partitions**

You cannot specify the `LOB_storage_clause` or `modify_LOB_storage_clause` within any of the `partitioning_clauses`.

**Note:**

If you want to keep the contents of the materialized view synchronized with those of the master table, then Oracle recommends that you manually perform a complete refresh of all materialized views dependent on the table after dropping or truncating a table partition.

**MODIFY PARTITION UNUSABLE LOCAL INDEXES**

Use this clause to mark `UNUSABLE` all the local index partitions associated with `partition`.

**MODIFY PARTITION REBUILD UNUSABLE LOCAL INDEXES**

Use this clause to rebuild the unusable local index partitions associated with `partition`.

**parallel_clause**

The `parallel_clause` lets you change the default degree of parallelism for the materialized view.

For complete information on this clause, refer to `parallel_clause` in the documentation on `CREATE TABLE`. 
logging_clause

Specify or change the logging characteristics of the materialized view. Refer to the logging_clause for a full description of this clause.

allocate_extent_clause

The allocate_extent_clause lets you explicitly allocate a new extent for the materialized view. Refer to the allocate_extent_clause for a full description of this clause.

deallocate_unused_clause

Use the deallocate_unused_clause to explicitly deallocate unused space at the end of the materialized view and make the freed space available for other segments. Refer to the deallocate_unused_clause for a full description of this clause.

shrink_clause

Use this clause to compact the materialized view segments. For complete information on this clause, refer to shrink_clause in the documentation on CREATE TABLE.

CACHE | NOCACHE

For data that will be accessed frequently, CACHE specifies that the blocks retrieved for this table are placed at the most recently used end of the LRU list in the buffer cache when a full table scan is performed. This attribute is useful for small lookup tables. NOCACHE specifies that the blocks are placed at the least recently used end of the LRU list. Refer to “CACHE | NOCACHE | CACHE READS” in the documentation on CREATE TABLE for more information about this clause.

alter_iot_clauses

Use the alter_iot_clauses to change the characteristics of an index-organized materialized view. The keywords and parameters of the components of the alter_iot_clauses have the same semantics as in ALTER TABLE, with the restrictions that follow.

Restrictions on Altering Index-Organized Materialized Views

You cannot specify the mapping_table_clause or the prefix_compression clause of the index_org_table_clause.

See Also:

index_org_table_clause of CREATE MATERIALIZED VIEW for information on creating an index-organized materialized view

USING INDEX Clause

Use this clause to change the value of INITRANS and STORAGE parameters for the index Oracle Database uses to maintain the materialized view data.

Restriction on the USING INDEX clause
You cannot specify the PCTUSED or PCTFREE parameters in this clause.

**MODIFY scoped_table_ref_constraint**

Use the MODIFY scoped_table_ref_constraint clause to rescope a REF column or attribute to a new table or to an alias for a new column.

**Restrictions on Rescoping REF Columns**

You can rescope only one REF column or attribute in each ALTER MATERIALIZED VIEW statement, and this must be the only clause in this statement.

**alter_mv_refresh**

Use the alter_mv_refresh clause to change the default method and mode and the default times for automatic refreshes. If the contents of the master tables of a materialized view are modified, then the data in the materialized view must be updated to make the materialized view accurately reflect the data currently in its master table(s). This clause lets you schedule the times and specify the method and mode for Oracle Database to refresh the materialized view.

---

**See Also:**

- This clause only sets the default refresh options. For instructions on actually implementing the refresh, refer to Oracle Database Administrator’s Guide and Oracle Database Data Warehousing Guide.
- Oracle Database Data Warehousing Guide to learn how to use refresh statistics to monitor the performance of materialized view refresh operations

**FAST Clause**

Specify FAST for the fast refresh method, which performs the refresh according to the changes that have occurred to the master tables. The changes are stored either in the materialized view log associated with the master table (for conventional DML changes) or in the direct loader log (for direct-path INSERT operations).

For both conventional DML changes and for direct-path INSERT operations, other conditions may restrict the eligibility of a materialized view for fast refresh.

When you change the refresh method to FAST in an ALTER MATERIALIZED VIEW statement, Oracle Database does not perform this verification. If the materialized view is not eligible for fast refresh, then Oracle Database returns an error when you attempt to refresh this view.
### COMPLETE Clause

Specify `COMPLETE` for the complete refresh method, which is implemented by executing the defining query of the materialized view. If you specify a complete refresh, then Oracle Database performs a complete refresh even if a fast refresh is possible.

### FORCE Clause

Specify `FORCE` if, when a refresh occurs, you want Oracle Database to perform a fast refresh if one is possible or a complete refresh otherwise.

### ON COMMIT Clause

Specify `ON COMMIT` if you want a refresh to occur whenever Oracle Database commits a transaction that operates on a master table of the materialized view.

You cannot specify both `ON COMMIT` and `ON DEMAND`. If you specify `ON COMMIT`, then you cannot also specify `START WITH` or `NEXT`.

### Restriction on ON COMMIT

This clause is supported only for materialized join views and single-table materialized aggregate views.

### ON DEMAND Clause

Specify `ON DEMAND` if you want the materialized view to be refreshed on demand by calling one of the three `DBMS_MVIEW` refresh procedures. If you omit both `ON COMMIT` and `ON DEMAND`, then `ON DEMAND` is the default.

You cannot specify both `ON COMMIT` and `ON DEMAND`. `START WITH` and `NEXT` take precedence over `ON DEMAND`. Therefore, in most circumstances it is not meaningful to specify `ON DEMAND` when you have specified `START WITH` or `NEXT`.

---

**See Also:**
- *Oracle Database Administrator's Guide* for restrictions on fast refresh in replication environments
- *Oracle Database Data Warehousing Guide* for restrictions on fast refresh in data warehouse environments
- “Automatic Refresh: Examples”
START WITH Clause

Specify `START WITH date` to indicate a date for the first automatic refresh time.

NEXT Clause

Specify `NEXT` to indicate a date expression for calculating the interval between automatic refreshes.

Both the `START WITH` and `NEXT` values must evaluate to a time in the future. If you omit the `START WITH` value, then Oracle Database determines the first automatic refresh time by evaluating the `NEXT` expression with respect to the creation time of the materialized view. If you specify a `START WITH` value but omit the `NEXT` value, then Oracle Database refreshes the materialized view only once. If you omit both the `START WITH` and `NEXT` values, or if you omit the `alter_mv_refresh` entirely, then Oracle Database does not automatically refresh the materialized view.

WITH PRIMARY KEY Clause

Specify `WITH PRIMARY KEY` to change a rowid materialized view to a primary key materialized view. Primary key materialized views allow materialized view master tables to be reorganized without affecting the ability of the materialized view to continue to fast refresh.

For you to specify this clause, the master table must contain an enabled primary key constraint and must have defined on it a materialized view log that logs primary key information.

USING ROLLBACK SEGMENT Clause

This clause is not valid if your database is in automatic undo mode, because in that mode Oracle Database uses undo tablespaces instead of rollback segments. Oracle strongly recommends that you use automatic undo mode. This clause is supported for backward compatibility with replication environments containing older versions of Oracle Database that still use rollback segments.

For complete information on this clause, refer to `CREATE MATERIALIZED VIEW ... "USING ROLLBACK SEGMENT Clause"`. 
USING ... CONSTRAINTS Clause

This clause has the same semantics in CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW statements. For complete information, refer to "USING ... CONSTRAINTS Clause" in the documentation on CREATE MATERIALIZED VIEW.

evaluation_edition_clause

Use this clause to change the evaluation edition for the materialized view. This clause has the same semantics in CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW statements. For complete information on this clause, refer to evaluation_edition_clause in the documentation on CREATE MATERIALIZED VIEW.

Notes on Changing the Evaluation Edition of a Materialized View

The following notes apply when changing the evaluation edition of a materialized view:

- If you change the evaluation edition of a refresh-on-commit materialized view, then Oracle Database performs a complete refresh of the materialized view unless you specify CONSIDER FRESH.
- If you change the evaluation edition of a refresh-on-demand materialized view, then Oracle Database sets the staleness state of the materialized view to STALE unless you specify CONSIDER FRESH.
- For both refresh-on-commit and refresh-on-demand materialized views: If you change the evaluation edition and specify CONSIDER FRESH, then Oracle Database does not update the staleness state of the materialized view and does not rebuild the materialized view. Therefore, you can specify CONSIDER FRESH to indicate that, although the evaluation edition has changed, there is no difference in the results that subquery will produce. If the materialized view is stale and in need of either a fast refresh or a complete refresh before this statement is issued, then the state will not be changed and the materialized view may contain bad data.

{ ENABLE | DISABLE } ON QUERY COMPUTATION

This clause lets you control whether the materialized view is a real-time materialized view or a regular materialized view.

- Specify ENABLE ON QUERY COMPUTATION to convert a regular materialized view into a real-time materialized view by enabling on-query computation.
- Specify DISABLE ON QUERY COMPUTATION to convert a real-time materialized view into a regular materialized view by disabling on-query computation.

This clause has the same semantics in CREATE MATERIALIZED VIEW and ALTER MATERIALIZED VIEW statements. For complete information on this clause, refer to { ENABLE | DISABLE } ON QUERY COMPUTATION in the documentation on CREATE MATERIALIZED VIEW.

alter_query_rewrite_clause

Use this clause to specify whether the materialized view is eligible to be used for query rewrite.

ENABLE Clause

Specify ENABLE to enable the materialized view for query rewrite. If you currently specify, or previously specified, the unusable_editions_clause for the materialized view, then it is not enabled for query rewrite in the unusable editions.
Restrictions on Enabling Materialized Views

Enabling materialized views is subject to the following restrictions:

- If the materialized view is in an invalid or unusable state, then it is not eligible for query rewrite in spite of the `ENABLE` mode.
- You cannot enable query rewrite if the materialized view was created totally or in part from a view.
- You can enable query rewrite only if all user-defined functions in the materialized view are `DETERMINISTIC`.

See Also:
- `CREATE FUNCTION`

- You can enable query rewrite only if expressions in the statement are repeatable. For example, you cannot include `CURRENT_TIME` or `USER`.

See Also:
- `Oracle Database Data Warehousing Guide` for more information on query rewrite

DISABLE Clause

Specify `DISABLE` if you do not want the materialized view to be eligible for use by query rewrite. If a materialized view is in the invalid state, then it is not eligible for use by query rewrite, whether or not it is disabled. However, a disabled materialized view can be refreshed.

`unusable_editions_clause`

Use this clause to specify the editions in which the materialized view is not eligible for query rewrite. This clause has the same semantics in `CREATE MATERIALIZED VIEW` and `ALTER MATERIALIZED VIEW` statements. For complete information on this clause, refer to `unusable_editions_clause` in the documentation on `CREATE MATERIALIZED VIEW`.

Cursors that use the materialized view for query rewrite and were compiled in an edition that is made unusable will be invalidated.

See Also:
- "Enabling Query Rewrite: Example"
- `Oracle Database Data Warehousing Guide` to learn how to use refresh statistics to monitor the performance of materialized view refresh operations
### COMPIL

Specify `COMPILE` to explicitly revalidate a materialized view. If an object upon which the materialized view depends is dropped or altered, then the materialized view remains accessible, but it is invalid for query rewrite. You can use this clause to explicitly revalidate the materialized view to make it eligible for query rewrite.

If the materialized view fails to revalidate, then it cannot be refreshed or used for query rewrite.

#### See Also:

"Compiling a Materialized View: Example"

### CONSIDER FRESH

This clause lets you manage the staleness state of a materialized view after changes have been made to its master tables. `CONSIDER FRESH` directs Oracle Database to consider the materialized view fresh and therefore eligible for query rewrite in the TRUSTED or STALE_TOLERATED modes.

#### Caution:

The `CONSIDER FRESH` clause also directs Oracle Database to no longer apply any rows in a materialized view log or Partition Change Tracking changes to the materialized view prior to the issuance of the `CONSIDER FRESH` clause. In other words, the pending changes will be ignored and deleted, not applied to the materialized view. This may result in the materialized view containing more or less data than the base table.

Because Oracle Database cannot guarantee the freshness of the materialized view, query rewrite in ENFORCED mode is not supported. This clause also sets the staleness state of the materialized view to UNKNOWN. The staleness state is displayed in the STALENESS column of the ALL_MVIEWS, DBA_MVIEWS, and USER_MVIEWS data dictionary views.

A materialized view is stale if changes have been made to the contents of any of its master tables. This clause directs Oracle Database to assume that the materialized view is fresh and that no such changes have been made. Therefore, actual updates to those tables pending refresh are purged with respect to the materialized view.

#### See Also:

- *Oracle Database Data Warehousing Guide* for more information on query rewrite and the implications of performing partition maintenance operations on master tables
- “CONSIDER FRESH: Example"
Examples

Automatic Refresh: Examples

The following statement changes the default refresh method for the sales_by_month_by_state materialized view (created in "Creating Materialized Aggregate Views: Example") to FAST:

```
ALTER MATERIALIZED VIEW sales_by_month_by_state REFRESH FAST;
```

The next automatic refresh of the materialized view will be a fast refresh provided it is a simple materialized view and its master table has a materialized view log that was created before the materialized view was created or last refreshed.

Because the `REFRESH` clause does not specify `START WITH` or `NEXT` values, Oracle Database will use the refresh intervals established by the `REFRESH` clause when the sales_by_month_by_state materialized view was created or last altered.

The following statement establishes a new interval between automatic refreshes for the sales_by_month_by_state materialized view:

```
ALTER MATERIALIZED VIEW sales_by_month_by_state REFRESH NEXT SYSDATE+7;
```

Because the `REFRESH` clause does not specify a `START WITH` value, the next automatic refresh occurs at the time established by the `START WITH` and `NEXT` values specified when the sales_by_month_by_state materialized view was created or last altered.

At the time of the next automatic refresh, Oracle Database refreshes the materialized view, evaluates the `NEXT` expression `SYSDATE+7` to determine the next automatic refresh time, and continues to refresh the materialized view automatically once a week. Because the `REFRESH` clause does not explicitly specify a refresh method, Oracle Database continues to use the refresh method specified by the `REFRESH` clause of the CREATE MATERIALIZED VIEW or most recent ALTER MATERIALIZED VIEW statement.

CONSIDER FRESH: Example

The following statement instructs Oracle Database that materialized view sales_by_month_by_state should be considered fresh. This statement allows sales_by_month_by_state to be eligible for query rewrite in TRUSTED mode even after you have performed partition maintenance operations on the master tables of sales_by_month_by_state:

```
ALTER MATERIALIZED VIEW sales_by_month_by_state CONSIDER FRESH;
```

As a result of the preceding statement, any partition maintenance operations that were done to the base table since the last refresh of the materialized view will not be applied to the materialized view. For example, the add, drop, or change of data in a partition in the base table will not be reflected in the materialized view if `CONSIDER FRESH` is used before the next refresh of the materialized view. Refer to `CONSIDER FRESH` for more information.
Complete Refresh: Example

The following statement specifies a new refresh method, a new NEXT refresh time, and a new interval between automatic refreshes of the emp_data materialized view (created in "Periodic Refresh of Materialized Views: Example"):

```sql
ALTER MATERIALIZED VIEW emp_data
  REFRESH COMPLETE
  START WITH TRUNC(SYSDATE+1) + 9/24
  NEXT SYSDATE+7;
```

The START WITH value establishes the next automatic refresh for the materialized view to be 9:00 a.m. tomorrow. At that point, Oracle Database performs a complete refresh of the materialized view, evaluates the NEXT expression, and subsequently refreshes the materialized view every week.

Enabling Query Rewrite: Example

The following statement enables query rewrite on the materialized view emp_data and implicitly revalidates it:

```sql
ALTER MATERIALIZED VIEW emp_data
  ENABLE QUERY REWRITE;
```

Primary Key Materialized View: Example

The following statement changes the rowid materialized view order_data (created in "Creating Rowid Materialized Views: Example") to a primary key materialized view. This example requires that you have already defined a materialized view log with a primary key on order_data.

```sql
ALTER MATERIALIZED VIEW order_data
  REFRESH WITH PRIMARY KEY;
```

Compiling a Materialized View: Example

The following statement revalidates the materialized view store_mv:

```sql
ALTER MATERIALIZED VIEW store_mv
  COMPILE;
```

11.4 ALTER MATERIALIZED VIEW LOG

Purpose

A materialized view log is a table associated with the master table of a materialized view. Use the ALTER MATERIALIZED VIEW LOG statement to alter the storage characteristics or type of an existing materialized view log.
**Note:**

The keyword `SNAPSHOT` is supported in place of `MATERIALIZED VIEW` for backward compatibility.

**See Also:**

- `CREATE MATERIALIZED VIEW LOG` for information on creating a materialized view log
- `ALTER MATERIALIZED VIEW` for more information on materialized views, including refreshing them
- `CREATE MATERIALIZED VIEW` for a description of the various types of materialized views

**Prerequisites**

You must be the owner of the master table, or you must have the `READ` or `SELECT` privilege on the master table and the `ALTER` privilege on the materialized view log.

**See Also:**

`Oracle Database Administrator's Guide` for detailed information about the prerequisites for `ALTER MATERIALIZED VIEW LOG`

Semantics

FORCE

If you specify FORCE and any items specified with the ADD clause have already been specified for the materialized view log, then Oracle Database does not return an error, but silently ignores the existing elements and adds to the materialized view log any items that do not already exist in the log. Likewise, if you specify INCLUDING NEW VALUES and that attribute has already been specified for the materialized view log, Oracle Database ignores the redundancy and does not return an error.

schema

Specify the schema containing the master table. If you omit schema, then Oracle Database assumes the materialized view log is in your own schema.

table

Specify the name of the master table associated with the materialized view log to be altered.
physical_attributes_clause

The physical_attributes_clause lets you change the value of the PCTFREE, PCTUSED, and INITRANS parameters and the storage characteristics for the materialized view log, the partition, the overflow data segment, or the default characteristics of a partitioned materialized view log.

Restriction on Materialized View Log Physical Attributes

You cannot use the storage_clause to modify extent parameters if the materialized view log resides in a locally managed tablespace. Refer to CREATE TABLE for a description of these parameters.

add_mv_log_column_clause

When you add a column to the master table of the materialized view log, the database does not automatically add a column to the materialized view log. Therefore, use this clause to add a column to the materialized view log. Oracle Database will encrypt the newly added column if the corresponding column of the master table is encrypted.

alter_table_partitioning

The syntax and general functioning of the partitioning clauses is the same as described for the ALTER TABLE statement. Refer to alter_table_partitioning in the documentation on ALTER TABLE.

Restrictions on Altering Materialized View Log Partitions

Altering materialized view log partitions is subject to the following restrictions:

• You cannot use the LOB_storage_clause or modify_LOB_storage_clause when modifying partitions of a materialized view log.

• If you attempt to drop, truncate, or exchange a materialized view log partition, then Oracle Database raises an error.

parallel_clause

The parallel_clause lets you specify whether parallel operations will be supported for the materialized view log.

For complete information on this clause, refer to parallel_clause in the documentation on CREATE TABLE.

logging_clause

Specify the logging attribute of the materialized view log. Refer to the logging_clause for a full description of this clause.

allocate_extent_clause

Use the allocate_extent_clause to explicitly allocate a new extent for the materialized view log. Refer to allocate_extent_clause for a full description of this clause.
shrink_clause

Use this clause to compact the materialized view log segments. For complete information on this clause, refer to shrink_clause in the documentation on CREATE TABLE.

move_mv_log_clause

Use the MOVE clause to move the materialized view log table to a different tablespace, to change other segment or storage attributes of the materialized view log, or to change the parallelism of the materialized view log.

Restriction on Moving Materialized View Logs

The ENCRYPT clause of the storage_clause of segment_attributes is not valid for materialized view logs.

CACHE | NOCACHE Clause

For data that will be accessed frequently, CACHE specifies that the blocks retrieved for this log are placed at the most recently used end of the LRU list in the buffer cache when a full table scan is performed. This attribute is useful for small lookup tables. NOCACHE specifies that the blocks are placed at the least recently used end of the LRU list. Refer to "CACHE | NOCACHE | CACHE READS" in the documentation on CREATE TABLE for more information about this clause.

mv_log_augmentation

Use the ADD clause to augment the materialized view log so that it records the primary key values, rowid values, object ID values, or a sequence when rows in the materialized view master table are changed. This clause can also be used to record additional columns.

To stop recording any of this information, you must first drop the materialized view log and then re-create it. Dropping the materialized view log and then re-creating it forces a complete refresh for each of the existing materialized views that depend on the master table on its next refresh.

Restriction on Augmenting Materialized View Logs

You can specify only one PRIMARY KEY, one ROWID, one OBJECT ID, one SEQUENCE, and each column in the column list once for each materialized view log. You can specify only a single occurrence of PRIMARY KEY, ROWID, OBJECT ID, SEQUENCE, and column list within this ALTER statement. Also, if any of these values was specified at create time (either implicitly or explicitly), you cannot specify that value in this ALTER statement unless you use the FORCE option.

OBJECT ID

Specify OBJECT ID if you want the appropriate object identifier of all rows that are changed to be recorded in the materialized view log.

Restriction on the OBJECT ID clause

You can specify OBJECT ID only for logs on object tables, and you cannot specify it for storage tables.

PRIMARY KEY
Specify **PRIMARY KEY** if you want the primary key values of all rows that are changed to be recorded in the materialized view log.

**ROWID**

Specify **ROWID** if you want the rowid values of all rows that are changed to be recorded in the materialized view log.

**SEQUENCE**

Specify **SEQUENCE** to indicate that a sequence value providing additional ordering information should be recorded in the materialized view log.

**column**

Specify the additional columns whose values you want to be recorded in the materialized view log for all rows that are changed. Typically these columns are filter columns (non-primary-key columns referenced by subquery materialized views) and join columns (non-primary-key columns that define a join in the **WHERE** clause of the subquery).

---

**See Also:**

- **CREATE MATERIALIZED VIEW** for details on explicit and implicit inclusion of materialized view log values
- *Oracle Database Administrator's Guide* for more information about filter columns and join columns
- "Rowid Materialized View Log: Example"

---

**NEW VALUES Clause**

The **NEW VALUES** clause lets you specify whether Oracle Database saves both old and new values for update DML operations in the materialized view log. The value you set in this clause applies to all columns in the log, not only to columns you may have added in this **ALTER MATERIALIZED VIEW LOG** statement.

**INCLUDING**

Specify **INCLUDING** to save both new and old values in the log. If this log is for a table on which you have a single-table materialized aggregate view, and if you want the materialized view to be eligible for fast refresh, then you must specify **INCLUDING**.

**EXCLUDING**

Specify **EXCLUDING** to disable the recording of new values in the log. You can use this clause to avoid the overhead of recording new values.

If you have a fast-refreshable single-table materialized aggregate view defined on this table, then do not specify **EXCLUDING NEW VALUES** unless you first change the refresh mode of the materialized view to something other than **FAST**.
mv_log_purge_clause

Use this clause alter the purge attributes of the materialized view log in the following ways:

- Change the purge from IMMEDIATE SYNCHRONOUS to IMMEDIATE ASYNCHRONOUS or from IMMEDIATE ASYNCHRONOUS to IMMEDIATE SYNCHRONOUS
- Change the purge from IMMEDIATE to scheduled or from scheduled to IMMEDIATE
- Specify a new start time and a new next time and interval

If you are altering purge from scheduled to IMMEDIATE, then the scheduled purged job associated with that materialized view log is dropped. If you are altering purge from IMMEDIATE to scheduled, then a purge job is created with the attributes provided. If you are altering scheduled purge attributes, then only those attributes specified will be changed in the scheduler purge job.

You must specify FORCE if you are altering log purge to its current state (that is, you are not making any change), unless you are changing scheduled purge attributes.

To learn whether the purge time or interval has already been set for this materialized view log, query the *_MVIEW_LOGS data dictionary views. See the CREATE MATERIALIZED VIEW LOG clause mv_log_purge_clause for the full semantics of this clause.

for_refresh_clause

Use this clause to change the refresh method for which the materialized view log will be used.

FOR SYNCHRONOUS REFRESH

Specify this clause to change from fast refresh to synchronous refresh, or complete refresh to synchronous refresh. A staging log will be created.

If you are changing from fast refresh, then ensure that the following conditions are satisfied before using this clause:

- All changes in the materialized view log have been consumed.
- Any refresh-on-demand materialized views associated with the master table have been refreshed.
- Any refresh-on-commit materialized views associated with the master table have been converted to refresh-on-demand materialized views.

After you use this clause, you cannot perform DML operations directly on the master table. You must use the procedures in the DBMS_SYNC_REFRESH package to prepare and execute change data operations.

FOR FAST REFRESH

Specify this clause to change from synchronous refresh to fast refresh, or complete refresh to fast refresh. A materialized view log will be created.
If you are changing from synchronous refresh to fast refresh, then ensure that all changes in the staging log have been consumed before using this clause.

After you use this clause, you can perform DML operations directly on the master table.

See the `CREATE MATERIALIZED VIEW LOG` clause for the full semantics of this clause.

Examples

**Rowid Materialized View Log: Example**

The following statement alters an existing primary key materialized view log to also record rowid information:

```sql
ALTER MATERIALIZED VIEW LOG ON order_items ADD ROWID;
```

**Materialized View Log EXCLUDING NEW VALUES: Example**

The following statement alters the materialized view log on `hr.employees` by adding a filter column and excluding new values. Any materialized aggregate views that use this log will no longer be fast refreshable. However, if fast refresh is no longer needed, this action avoids the overhead of recording new values:

```sql
ALTER MATERIALIZED VIEW LOG ON employees
  ADD (commission_pct)
  EXCLUDING NEW VALUES;
```

11.5 ALTER MATERIALIZED ZONEMAP

**Purpose**

Use the `ALTER MATERIALIZED ZONEMAP` statement to modify an existing zone map in one of the following ways:

- To change its attributes
- To change its default refresh method and mode
- To enable or disable its use for pruning
- To compile it, rebuild it, or make it unusable

**See Also:**

- `CREATE MATERIALIZED ZONEMAP` for information on creating zone maps
- `Oracle Database Data Warehousing Guide` for more information on zone maps

**Prerequisites**

The zone map must be in your own schema or you must have the `ALTER ANY MATERIALIZED VIEW` system privilege.
The user who owns the schema containing the zone map must have access to any base tables of the zone map that reside outside of that schema, either through a `READ` or `SELECT` object privilege on each of the tables, or through the `READ ANY TABLE` or `SELECT ANY TABLE` system privilege.

Syntax

```
ALTER MATERIALIZED ZONEMAP
```

```
ALTER MATERIALIZED ZONEMAP
```

```
alter_zonemap_attributes::=
```

```
alter_zonemap_attributes
```

```
zonemap_refresh_clause::=
```

```
zonemap_refresh_clause
```

Note:

When specifying the `zonemap_refresh_clause`, you must specify at least one clause after the `REFRESH` keyword.
Semantics

**schema**

Specify the schema containing the zone map. If you omit *schema*, then Oracle Database assumes the zone map is in your own schema.

**zonemap_name**

Specify the name of the zone map to be altered.

**alter_zonemap_attributes**

Use this clause to modify the following attributes for the zone map: PCTFREE, PCTUSED, and CACHE or NOCACHE. These attributes have the same semantics for *ALTER MATERIALIZED ZONEMAP* and *CREATE MATERIALIZED ZONEMAP*. For complete information on these attributes, refer to PCTFREE, PCTUSED, and CACHE | NOCACHE in the documentation on CREATE MATERIALIZED ZONEMAP.

**zonemap_refresh_clause**

Use this clause to modify the default refresh method and mode for the zone map. This clause has the same semantics for *ALTER MATERIALIZED ZONEMAP* and *CREATE MATERIALIZED ZONEMAP*. For complete information on this clause, refer to *zonemap_refresh_clause* in the documentation on CREATE MATERIALIZED ZONEMAP.

**ENABLE | DISABLE PRUNING**

Use this clause to enable or disable use of the zone map for pruning. This clause has the same semantics for *ALTER MATERIALIZED ZONEMAP* and *CREATE MATERIALIZED ZONEMAP*. For complete information on this clause, refer to ENABLE | DISABLE PRUNING in the documentation on CREATE MATERIALIZED ZONEMAP.

**COMPILE**

This clause lets you explicitly compile the zone map. This operation validates the zone map after a DDL operation changes the structure of one or more of its base tables. It is usually not necessary to issue this clause because Oracle database automatically compiles a zone map that requires compilation before using it. However, if you would like to explicitly compile a zone map, then you can use this clause to do so.

The result of compiling a zone map depends on whether a base table is changed in a way that affects the zone map. For example, if a column is added to a base table, then the zone map will be valid after compilation because the change does not affect the zone map. However, if a column that is included in the defining subquery of the zone map is dropped from a base table, then the zone map will be invalid after compilation.

You can determine if a zone map requires compilation by querying the COMPILE_STATE column of the ALL_, DBA_, and USER_ZONEMAPS data dictionary views. If the value of the column is NEEDS_COMPILE, then the zone map requires compilation.

**REBUILD**

This clause lets you explicitly rebuild the zone map. This operation refreshes the data in the zone map. This clause is useful in the following situations:
• You can use this clause to refresh the data for a refresh-on-demand zone map. Refer to the ON DEMAND clause in the documentation on CREATE MATERIALIZED ZONEMAP for more information.

• You must issue this clause after an EXCHANGE PARTITION operation on one of the base tables of a zone map, regardless of the default refresh mode of the zone map.

• If a zone map is marked unusable, then you must issue this clause to mark it usable. You can determine if a zone map is marked unusable by querying the UNUSABLE column of the ALL_, DBA_, and USER_ZONEMAPS data dictionary views.

UNUSABLE

Specify this clause to make the zone map unusable. Subsequent queries will not use the zone map and the database will no longer maintain the zone map. You can make the zone map usable again by issuing an ALTER MATERIALIZED ZONEMAP ... REBUILD statement.

Examples

Modifying Zone Map Attributes: Example

The following statement modifies the PCTFREE and PCTUSED attributes of zone map sales_zmap, and modifies the zone map so that it does not use caching:

```
ALTER MATERIALIZED ZONEMAP sales_zmap
  PCTFREE 20 PCTUSED 50 NOCACHE;
```

Modifying the Default Refresh Method and Mode for a Zone Map: Example

The following statement changes the default refresh method to FAST and the default refresh mode to ON COMMIT for zone map sales_zmap:

```
ALTER MATERIALIZED ZONEMAP sales_zmap
  REFRESH FAST ON COMMIT;
```

Disabling Use of a Zone Map for Pruning: Example

The following statement disables use of zone map sales_zmap for pruning:

```
ALTER MATERIALIZED ZONEMAP sales_zmap
  DISABLE PRUNING;
```

Compiling a Zone Map: Example

The following statement compiles zone map sales_zmap:

```
ALTER MATERIALIZED ZONEMAP sales_zmap
  COMPILE;
```

Rebuilding a Zone Map: Example

The following statement rebuilds zone map sales_zmap:

```
ALTER MATERIALIZED ZONEMAP sales_zmap
  REBUILD;
```

Making a Zone Map Unusable: Example

The following statement makes zone map sales_zmap unusable:
11.6 ALTER OPERATOR

Purpose

Use the ALTER OPERATOR statement to add bindings to, drop bindings from, or compile an existing operator.

See Also:

CREATE OPERATOR

Prerequisites

The operator must already have been created by a previous CREATE OPERATOR statement. The operator must be in your own schema or you must have the ALTER ANY OPERATOR system privilege. You must have the EXECUTE object privilege on the operators and functions referenced in the ALTER OPERATOR statement.

Syntax

\[ \textit{alter\_operator}::= \]

\[ \text{ALTER}\ \text{OPERATOR}\ \text{schema} . \text{operator}\ \text{add\_binding\_clause}\ \text{drop\_binding\_clause}\ \text{COMPILE}; \]

\[ (\text{add\_binding\_clause}::=, \text{drop\_binding\_clause}::=) \]

\[ \text{add\_binding\_clause}::= \]

\[ \text{ADD}\ \text{BINDING}\ \text{parameter\_type}\ \text{RETURN}\ \text{return\_type}; \]

\[ \text{implementation\_clause}, \text{using\_function\_clause}\]

\[ (\text{implementation\_clause}::=, \text{using\_function\_clause}::=) \]
implementation_clause ::= 

(context_clause::=)

context_clause ::= 

using_function_clause ::= 

(drop_binding_clause::=)

Semantics

schema
Specify the schema containing the operator. If you omit this clause, then Oracle Database assumes the operator is in your own schema.

operator
Specify the name of the operator to be altered.
**add_binding_clause**

Use this clause to add an operator binding and specify its parameter data types and return type. The signature must be different from the signature of any existing binding for this operator.

If a binding of an operator is associated with an indextype and you add another binding to the operator, then Oracle Database does not automatically associate the new binding with the indextype. If you want to make such an association, then you must issue an explicit `ALTER INDEXTYPE ... ADD OPERATOR` statement.

**implementation_clause**

This clause has the same semantics in `CREATE OPERATOR` and `ALTER OPERATOR` statements. For full information, refer to `implementation_clause` in the documentation on `CREATE OPERATOR`.

**context_clause**

This clause has the same semantics in `CREATE OPERATOR` and `ALTER OPERATOR` statements. For full information, refer to `context_clause` in the documentation on `CREATE OPERATOR`.

**using_function_clause**

This clause has the same semantics in `CREATE OPERATOR` and `ALTER OPERATOR` statements. For full information, refer to `using_function_clause` in the documentation on `CREATE OPERATOR`.

**drop_binding_clause**

Use this clause to specify the list of parameter data types of the binding you want to drop from the operator. You must specify `FORCE` if the binding has any dependent objects, such as an indextype or an ancillary operator binding. If you specify `FORCE`, then Oracle Database marks `INVALID` all objects that are dependent on the binding. The dependent objects are revalidated the next time they are referenced in a DDL or DML statement or a query.

You cannot use this clause to drop the only binding associated with this operator. Instead you must use the `DROP OPERATOR` statement. Refer to `DROP OPERATOR` for more information.

**COMPILE**

Specify `COMPILE` to cause Oracle Database to recompile the operator.

**Examples**

**Compiling a User-defined Operator: Example**

The following example compiles the operator `eq_op` (which was created in "Creating User-Defined Operators: Example"):

```
ALTER OPERATOR eq_op COMPILE;
```
11.7 ALTER OUTLINE

Purpose

Note:

Stored outlines are deprecated. They are still supported for backward compatibility. However, Oracle recommends that you use SQL plan management instead. SQL plan management creates SQL plan baselines, which offer superior SQL performance stability compared with stored outlines.

You can migrate existing stored outlines to SQL plan baselines by using the MIGRATE_STORED_OUTLINE function of the DBMS_SPM package or Enterprise Manager Cloud Control. When the migration is complete, the stored outlines are marked as migrated and can be removed. You can drop all migrated stored outlines on your system by using the DROP_MIGRATED_STORED_OUTLINE function of the DBMS_SPM package.

See Also: Oracle Database SQL Tuning Guide for more information about SQL plan management and Oracle Database PL/SQL Packages and Types Reference for information about the DBMS_SPM package.

Use the ALTER OUTLINE statement to rename a stored outline, reassign it to a different category, or regenerate it by compiling the outline's SQL statement and replacing the old outline data with the outline created under current conditions.

See Also: CREATE OUTLINE for information on creating an outline.

Prerequisites

To modify an outline, you must have the ALTER ANY OUTLINE system privilege.

Syntax

```
alteroutline ::=  
```

```
Semantics

PUBLIC | PRIVATE

Specify PUBLIC if you want to modify the public version of this outline. This is the default.

Specify PRIVATE if you want to modify an outline that is private to the current session and whose data is stored in the current parsing schema.

outline

Specify the name of the outline to be modified.

REBUILD

Specify REBUILD to regenerate the execution plan for outline using current conditions.

See Also:

"Rebuilding an Outline: Example"

RENAME TO Clause

Use the RENAME TO clause to specify an outline name to replace outline.

CHANGE CATEGORY TO Clause

Use the CHANGE CATEGORY TO clause to specify the name of the category into which the outline will be moved.

ENABLE | DISABLE

Use this clause to selectively enable or disable this outline. Outlines are enabled by default. The DISABLE keyword lets you disable one outline without affecting the use of other outlines.

Examples

Rebuilding an Outline: Example

The following statement regenerates a stored outline called salaries by compiling the text of the outline and replacing the old outline data with the outline created under current conditions.

ALTER OUTLINE salaries REBUILD;

11.8 ALTER PACKAGE

Purpose

Packages are defined using PL/SQL. Therefore, this section provides some general information but refers to Oracle Database PL/SQL Language Reference for details of syntax and semantics.
Use the `ALTER PACKAGE` statement to explicitly recompile a package specification, body, or both. Explicit recompilation eliminates the need for implicit run-time recompilation and prevents associated run-time compilation errors and performance overhead.

Because all objects in a package are stored as a unit, the `ALTER PACKAGE` statement recompiles all package objects together. You cannot use the `ALTER PROCEDURE` statement or `ALTER FUNCTION` statement to recompile individually a procedure or function that is part of a package.

**Note:**
This statement does not change the declaration or definition of an existing package. To redeclare or redefine a package, use the `CREATE PACKAGE` or the `CREATE PACKAGE BODY` statement with the `OR REPLACE` clause.

Prerequisites
For you to modify a package, the package must be in your own schema or you must have `ALTER ANY PROCEDURE` system privilege.

Syntax

```
alter_package ::= 
```

(See `Oracle Database PL/SQL Language Reference` for the syntax of this clause.)

Semantics

**schema**
Specify the schema containing the package. If you omit `schema`, then Oracle Database assumes the package is in your own schema.

**package_name**
Specify the name of the package to be recompiled.

**package_compile_clause**
See `Oracle Database PL/SQL Language Reference` for the syntax and semantics of this clause and for complete information on creating and compiling packages.

**EDITIONABLE | NONEDITIONABLE**
Use these clauses to specify whether the package becomes an editioned or noneditioned object if editioning is later enabled for the schema object type `PACKAGE` in
ALTER PLUGGABLE DATABASE

Purpose

Use the ALTER PLUGGABLE DATABASE statement to modify a pluggable database (PDB). The PDB can be a traditional PDB, an application container, or an application PDB. This statement enables you to perform the following tasks:

- Unplug a PDB from a multitenant container database (CDB) (using the `pdb_unplug_clause`)
- Modify the settings of a PDB (using the `pdb_settings_clauses`)
- Bring PDB data files online or take them offline (using the `pdb_datafile_clause`)
- Back up and recover a PDB (using the `pdb_recovery_clauses`)
- Modify the state of a PDB (using the `pdb_change_state` clause)
- Modify the state of multiple PDBs within a CDB (using the `pdb_change_state_from_root` clause)
- Perform operations on applications in an application container (using the `application_clauses`)

Note:

You can perform all ALTER PLUGGABLE DATABASE tasks by connecting to a PDB and running the corresponding ALTER DATABASE statement. This functionality is provided to maintain backward compatibility for applications that have been migrated to a CDB environment. The exception is modifying PDB storage limits, for which you must use the `pdb_storage_clause` of ALTER PLUGGABLE DATABASE.

See Also:

CREATE PLUGGABLE DATABASE for information on creating PDBs

Prerequisites

You must be connected to a CDB.

To specify the `pdb_unplug_clause`, the current container must be the root or the application root, you must be authenticated as SYSDBA or SYSOPER, and the SYSDBA or SYSOPER privilege must be either granted to you commonly, or granted to you locally in the root and locally in the PDB you want to unplug.

To specify the `pdb_settings_clauses`, the current container must be the PDB whose settings you want to modify and you must have the ALTER DATABASE privilege, either...
granted commonly or granted locally in the PDB. To specify the `pdb_logging_clauses` or the `rename global_name` clause, you must also have the `restricted session` privilege, either granted commonly or granted locally in the PDB being renamed, and the PDB must be in `read write restricted` mode.

To specify the `pdb_datafile_clause`, the current container must be the PDB whose datafiles you want to bring online or take offline and you must have the `alter database` privilege, either granted commonly or granted locally in the PDB.

To specify the `pdb_recovery_clauses`, the current container must be the PDB you want to back up or recover and you must have the `alter database` privilege, either granted commonly or granted locally in the PDB.

To specify the `pdb_change_state` clause, the current container must be the PDB whose state you want to change and you must be authenticated as `sysbackup`, `sysdba`, `sysdg`, or `sysoper`.

To specify the `pdb_change_state_from_root` clause, the current container must be the root or the application root, you must be authenticated as `sysbackup`, `sysdba`, `sysdg`, or `sysoper`, and the `sysbackup`, `sysdba`, `sysdg`, or `sysoper` privilege must be either granted to you commonly, or granted to you locally in the root or application root, and locally in the PDB(s) whose state(s) you want to change.

To specify the `application_clauses`, the current container must be an application container, you must be authenticated as `sysbackup` or `sysdba`, and the `sysbackup` or `sysdba` privilege must be either granted to you commonly, or granted to you locally in the application root and locally in the application PDB(s) in which you want to perform application operations.

Semantics

**pdb_unplug_clause**

This clause lets you unplug a PDB from a CDB. When you unplug a PDB, Oracle stores information about the PDB in a file on your operating system. You can subsequently use this file to plug the PDB into a CDB.

For `pdb_name`, specify the name of the PDB you want to unplug. The PDB must be closed—that is, the open mode must be **MOUNTED**. In an Oracle Real Application Clusters (Oracle RAC) environment, the PDB must be closed in all Oracle RAC instances.

For `filename`, specify the full path name of the operating system file in which to store information about the PDB. The file name that you specify determines the type of information stored and how it is stored.

- If you specify a file name that ends with the extension .xml, then Oracle creates an XML file containing metadata about the PDB. You can then copy the XML file and the PDB’s data files to a new location and specify the XML file name when plugging the PDB into a CDB. In this case, you must copy the PDB’s data files separately.
- If you specify a file name that ends with the extension .pdb, then Oracle creates a .pdb archive file. This is a compressed file that includes an XML file containing metadata about the PDB, as well as the PDB’s data files. You can then copy this single archive file to a new location and specify the archive file name when plugging the PDB into a CDB. This eliminates having to copy the PDB’s data files separately. When you use a .pdb archive file when plugging in a PDB, this file is
extracted when you plug in the PDB, and the PDB’s files are placed in the same
directory as the .pdb archive file.

After a PDB is unplugged, it remains in the CDB with an open mode of MOUNTED and a
status of UNPLUGGED. The only operation you can perform on an unplugged PDB is
DROP PLUGGABLE DATABASE, which will remove it from the CDB. You must drop the PDB
before you can plug it into the same CDB or another CDB.

See Also:

- Oracle Database Administrator’s Guide for more information on
  unplugging a PDB
- The create_pdb_from_xml clause of CREATE PLUGGABLE DATABASE for
  information on plugging a PDB into a CDB

**pdb_settings_clauses**

These clauses lets you modify various settings for a PDB.

**pdb_name**

You can optionally use pdb_name to specify the name of the PDB whose settings you
want to modify.

**DEFAULT EDITION Clause**

Use this clause to designate the specified edition as the default edition for the PDB.
For the full semantics of this clause, refer to "DEFAULT EDITION Clause" in the ALTER
DATABASE documentation.

**SET DEFAULT TABLESPACE Clause**

Use this clause to specify or change the default type of tablespaces subsequently
created in the PDB. For the full semantics of this clause, refer to "SET DEFAULT
TABLESPACE Clause" in the ALTER DATABASE documentation.

**DEFAULT TABLESPACE Clause**

Use this clause to establish or change the default permanent tablespace of the PDB.
For the full semantics of this clause, refer to "DEFAULT TABLESPACE Clause" in the ALTER
DATABASE documentation.

**DEFAULT TEMPORARY TABLESPACE Clause**

Use this clause to change the default temporary tablespace of the PDB to a new
tablespace or tablespace group. For the full semantics of this clause, refer to
"DEFAULT [LOCAL] TEMPORARY TABLESPACE Clause" in the ALTER DATABASE
documentation.

**RENAME GLOBAL_NAME TO Clause**

Use this clause to change the global name of the PDB. The new global name must be
unique within the CDB. For an Oracle Real Application Clusters (Oracle RAC)
database, the PDB must be open in READ WRITE RESTRICTED mode on the current
instance only. The PDB must be closed on all other instances. For the full semantics of this clause, refer to "RENAME GLOBAL_NAME Clause" in the ALTER DATABASE documentation.

**Note:**

When you change the global name of a PDB, be sure to change the PLUGGABLE DATABASE property for database services that are used to connect to the PDB.

*set_time_zone_clauses*

Use this clause to modify the time zone setting for the PDB. For the full semantics of this clause, refer to *set_time_zone_clause* in the ALTER DATABASE documentation.

*database_file_clauses*

Use this clause to modify data files and temp files for the PDB. For the full semantics of this clause, refer to *database_file_clauses* in the ALTER DATABASE documentation.

*supplemental_db_logging*

Use these clauses to instruct Oracle Database to add or stop adding supplemental data into the log stream for the PDB.

- Specify the `ADD SUPPLEMENTAL LOG` clause to add supplemental data into the log stream for the PDB. In order to issue this clause, supplemental logging must have been enabled for the CDB root with the ALTER DATABASE ... ADD SUPPLEMENTAL LOG ... statement. The level of supplemental logging that you specify for the PDB does not need to match that of the CDB root. That is, you can specify any of the clauses `DATA`, `supplemental_id_key_clause`, or `supplemental_plsql_clause` for the PDB, regardless of which clause was specified when enabling supplemental logging for the CDB root.

- Specify the `DROP SUPPLEMENTAL LOG` clause to stop adding supplemental data into the log stream for the PDB.

For the full semantics of this clause, refer to *supplemental_db_logging* in the ALTER DATABASE documentation.

*pdb_storage_clause*

Use this clause to modify the storage limits for a PDB.

This clause has the same semantics as the `pdb_storage_clause` in the CREATE PLUGGABLE DATABASE documentation, with the following additions:

- If you specify `MAXSIZE size_clause`, then the value you specify for `size_clause` must be greater than or equal to the combined size of the existing tablespaces belonging to the PDB. Otherwise, an error occurs.

- If you specify `MAX_AUDIT_SIZE size_clause`, then the value you specify for `size_clause` must be greater than or equal to the amount of storage used by the existing unified audit OS spillover (.bin format) files in the PDB. Otherwise, an error occurs.
If you specify `MAX_DIAG_SIZE size_clause`, then the value you specify for `size_clause` must be greater than or equal to the amount of storage for diagnostics in the Automatic Diagnostic Repository (ADR) that is currently used by the PDB. Otherwise an error occurs.

**pdb_logging_clauses**

Use these clauses to set or change the logging characteristics of the PDB.

**logging_clause**

Use this clause to change the default logging attribute for tablespaces subsequently created within the PDB. This clause has the same semantics as the `logging_clause` in the `CREATE PLUGGABLE DATABASE` documentation.

**pdb_force_logging_clause**

Use this clause to place a PDB into force logging or force nologging mode or take a PDB out of force logging or force nologging mode.

Force logging mode instructs the database to log all changes in the PDB, except changes in temporary tablespaces and temporary segments. Force nologging mode instructs the database to not log any changes in the PDB.

CDB-wide force logging mode takes precedence over PDB-level force nologging mode. PDB-level force logging mode and force nologging mode take precedence over and are independent of any |LOGGING, NOLOGGING, or FORCE LOGGING| settings you specify for individual tablespaces in the PDB and any |LOGGING or NOLOGGING| settings you specify for individual database objects in the PDB.

- Specify `ENABLE FORCE LOGGING` to place the PDB in force logging mode. If the PDB is currently in force nologging mode, then specifying this clause results in an error. You must first specify `DISABLE FORCE NOLOGGING`.
- Specify `DISABLE FORCE LOGGING` to take the PDB out of force logging mode. If the PDB is not currently in force logging mode, then specifying this clause results in an error.
- Specify `ENABLE FORCE NOLOGGING` to place the PDB in force nologging mode. If the PDB is currently in force logging mode, then specifying this clause results in an error. You must first specify `DISABLE FORCE LOGGING`.
- Specify `DISABLE FORCE NOLOGGING` to take the PDB out of force nologging mode. If the PDB is not currently in force nologging mode, then specifying this clause results in an error.

This clause does not change the default |LOGGING or NOLOGGING| mode of the PDB specified by the `logging_clause`.

**pdb_refresh_mode_clause**

This clause lets you change the refresh mode of a PDB. You can specify this clause only for a refreshable PDB, that is, a PDB whose current refresh mode is `MANUAL` or `EVERY number MINUTES`. You can switch a PDB from manual refresh to automatic refresh, or from automatic refresh to manual refresh. You can also use this clause to change the number of minutes between automatic refreshes. You can switch a PDB from manual or automatic refresh to no refresh, but you cannot enable manual or automatic refresh for a PDB that is not refreshable. For the complete semantics of this
clause, refer to the pdb_refresh_mode_clause in the documentation on CREATE PLUGGABLE DATABASE.

REFRESH
Specify this clause to perform a manual refresh of a refreshable PDB, that is, a PDB whose current refresh mode is MANUAL or EVERY number MINUTES. The PDB must be closed. For more information on refreshable PDBs, refer to the pdb_refresh_mode_clause in the documentation on CREATE PLUGGABLE DATABASE.

SET CONTAINER_MAP
Use this clause to specify the CONTAINER_MAP database property for an application container. The current container must be the application root. The map_object is of the form [schema.]table. For schema, specify the schema containing table. If you omit schema, then the database assumed that the table is in your own schema. For table, specify a range-, list-, or hash-partitioned table.

CONTAINERS DEFAULT TARGET
Use this clause to specify the default container for DML statements in an application container. You must be connect to the application root.

- For container_name, specify the name of the default container. The default container can be any container in the application container, including the application root or an application PDB. You can specify only one default container.
- If you specify NONE, then the default container is the CDB root. This is the default.

When a DML statement is issued in the application root without specifying containers in the WHERE clause, the DML statement affects the default container for the application container.

pdb_datafile_clause
This clause lets you bring data files associated with a PDB online or take them offline. The PDB must be closed when you issue this clause.

- For pdb_name, specify the name of the PDB. If the current container is the PDB, then you can omit pdb_name.
- The DATAFILE clauses let you specify the data files you want to bring online or take offline. Use filename or filenumber to identify specific data files by name or by number. You can view data file names and numbers by querying the NAME and FILE# columns of the V$DATAFILE dynamic performance view. Use ALL to specify all datafiles associated with the PDB.
- Specify ONLINE to bring the data files online or OFFLINE to take the data files offline.

pdb_recovery_clauses
Use the pdb_recovery_clauses to back up and recover a PDB.

pdb_name
You can optionally use pdb_name to specify the name of the PDB you want to back up or recover.

pdb_general_recovery
This clause lets you control media recovery for the PDB or standby database or for specified tablespaces or files. The `pdb_general_recovery` clause has the same semantics as the `general_recovery` clause of `ALTER DATABASE`. Refer to the `general_recovery` clause of `ALTER DATABASE` for more information.

**BACKUP Clauses**

Use these clauses to move all of the data files in the PDB into or out of online backup mode (also called hot backup mode). These clauses have the same semantics in `ALTER PLUGGABLE DATABASE` and `ALTER DATABASE`. Refer to the "BACKUP Clauses" of `ALTER DATABASE` for more information.

**RECOVERY Clauses**

Use these clauses to enable or disable a PDB for recovery. The PDB must be closed—that is, the open mode must be `MOUNTED`.

- Specify `ENABLE RECOVERY` to bring all data files that belong to a PDB online and enable the PDB for recovery.
- Specify `DISABLE RECOVERY` to take all data files that belong to a PDB offline and disable the PDB for recovery.

---

*pdb_change_state*

This clause enables you to change the state, or open mode, of a PDB. Table 11-2 lists the open modes of a PDB.

- Specify the `pdb_open` clause to change the open mode to `READ WRITE`, `READ ONLY`, or `MIGRATE`.
- Specify the `pdb_close` clause to change the open mode to `MOUNTED`.

### Table 11-2   PDB Open Modes

<table>
<thead>
<tr>
<th>Open Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>READ WRITE</td>
<td>A PDB in open read/write mode allows queries and user transactions to proceed and allows users to generate redo logs.</td>
</tr>
<tr>
<td>READ ONLY</td>
<td>A PDB in open read-only mode allows queries but does not allow user changes.</td>
</tr>
<tr>
<td>MIGRATE</td>
<td>When a PDB is in open migrate mode, you can run database upgrade scripts on the PDB.</td>
</tr>
<tr>
<td>MOUNTED</td>
<td>When a PDB is in mounted mode, it behaves like a non-CDB in mounted mode. It does not allow changes to any objects, and it is accessible only to database administrators. It cannot read from or write to data files. Information about the PDB is removed from memory caches. Cold backups of the PDB are possible.</td>
</tr>
</tbody>
</table>

---

See Also:

*Oracle Data Guard Concepts and Administration* for more information on the **RECOVERY clauses**
You can view the open mode of a PDB by querying the \texttt{OPEN\_MODE} column of the \texttt{V$PDBS} view.

\textbf{See Also:}

\textit{Oracle Database Administrator's Guide} for a complete description of PDB open modes

\texttt{pdb\_name}

You can optionally use \texttt{pdb\_name} to specify the name of the PDB whose open mode you want to change.

\texttt{pdb\_open}

This clause lets you change the open mode of a PDB to \texttt{READ\_WRITE}, \texttt{READ\_ONLY}, or \texttt{MIGRATE}. When you specify this clause, the PDB must be in \texttt{MOUNTED} mode unless you specify the \texttt{FORCE} keyword.

If you do not specify \texttt{READ\_WRITE} or \texttt{READ\_ONLY}, then the default is \texttt{READ\_WRITE}. The exception is when the PDB belongs to a CDB that is used as a physical standby database, in which case the default is \texttt{READ\_ONLY}.

\textbf{READ\_WRITE}

Specify this clause to change the open mode to \texttt{READ\_WRITE}.

\textbf{READ\_ONLY}

Specify this clause to change the open mode to \texttt{READ\_ONLY}.

\textbf{[READ\_WRITE] UPGRADE}

Specify this clause to change the open mode to \texttt{MIGRATE}. The \texttt{READ\_WRITE} keywords are optional and are provided for semantic clarity.

\textbf{RESTRICTED}

If you specify the optional \texttt{RESTRICTED} keyword, then the PDB is accessible only to users with the \texttt{RESTRICTED\_SESSION} privilege in the PDB.

If the PDB is in \texttt{READ\_WRITE} or \texttt{READ\_ONLY} mode, and you specify the \texttt{RESTRICTED} and \texttt{FORCE} keywords while changing the open mode, then all sessions connected to the PDB that do not have the \texttt{RESTRICTED\_SESSION} privilege in the PDB are terminated, and their transactions are rolled back.

\textbf{FORCE}

Specify this keyword to change the open mode of a PDB from \texttt{READ\_WRITE} to \texttt{READ\_ONLY}, or from \texttt{READ\_ONLY} to \texttt{READ\_WRITE}. The \texttt{FORCE} keyword allows users to remain connected to the PDB while the open mode is changed.

When you specify \texttt{FORCE} to change the open mode of a PDB from \texttt{READ\_WRITE} to \texttt{READ\_ONLY}, any \texttt{READ\_WRITE} transaction that is open when you change the open mode will not be allowed to perform any more DML operations or to \texttt{COMMIT}.

\textbf{Restriction on FORCE}
You cannot specify the `force` keyword if the PDB is currently in `migrate` mode, and you cannot specify the `force` keyword to change a currently open PDB to `migrate` mode.

**RESETLOGS**

Specify this clause to create a new PDB incarnation and open the PDB in `read write` mode after point-in-time recovery of the PDB.

---

**instances_clause**

In an Oracle Real Application Clusters environment, use this clause to modify the state of the PDB in the specified Oracle RAC instances. If you omit this clause, then the state of the PDB is modified only in the current instance.

- Use `instance_name` to specify one or more instance names, in a comma-separated list enclosed in parenthesis. This modifies the state of the PDB only in those instances.
- Specify `ALL` to modify the state of the PDB in all instances.
- Specify `ALL EXCEPT` to modify the state of the PDB in all instances except the specified instances.

If the PDB is already open in one or more instances, then you can open it in additional instances, but it must be opened in the same mode as in the instances in which it is already open.

**pdb_close**

This clause lets you change the open mode of a PDB to `mounted`. When you specify this clause, the PDB must be in `read write`, `read only`, or `migrate` mode. This clause is the PDB equivalent of the SQL*Plus `shutdown` command.

**IMMEDIATE**

If you specify the optional `IMMEDIATE` keyword, then this clause is the PDB equivalent of the SQL*Plus `shutdown` command with the immediate mode. Otherwise, the PDB is shut down with the normal mode.

---

**See Also:**

*Oracle Database Backup and Recovery User's Guide* for more information on performing point-in-time recovery of CDBs and PDBs

---

**instances_clause**

In an Oracle Real Application Clusters environment, use this clause to modify the state of the PDB in the specified Oracle RAC instances. You can close a PDB in some
instances and leave it open in others. Refer to the instances_clause for the full semantics of this clause.

relocate_clause

In an Oracle Real Application Clusters environment, use this clause to instruct the database to reopen the PDB on a different Oracle RAC instance.

- Specify RELOCATE to reopen the PDB on a different instance that is selected by Oracle Database.
- Specify RELOCATE TO 'instance_name' to reopen the PDB in the specified instance.
- Specify NORELOCATE to close the PDB in the current instance. This is the default.

pdb_save_or_discard_state

Use this clause to instruct the database to save or discard the open mode of the PDB when the CDB restarts.

- If you specify SAVE, then the PDB's open mode after the CDB restarts will be identical to its open mode just before the CDB restarted.
- If you specify DISCARD, then the PDB's open mode after the CDB restarts will be MOUNTED. This is the default.

instances_clause

In an Oracle Real Application Clusters environment, use this clause to instruct the database to save or discard the open mode of the PDB in the specified Oracle RAC instances. If you omit this clause, then the database applies the SAVE or DISCARD setting only to the PDB in the current instance.

- Use instance_name to specify one or more instance names, in a comma-separated list enclosed in parenthesis. This applies the SAVE or DISCARD setting to the PDB only in those instances.
- Specify ALL to apply the SAVE or DISCARD setting to the PDB in all instances.
- Specify ALL EXCEPT to apply the SAVE or DISCARD setting to the PDB in all instances except the specified instances.

pdb_change_state_from_root

This clause enables you to modify the state of one or more PDBs.

- Specify the pdb_name for one or more PDBs whose state you want to modify.
- Specify ALL to modify the state of all PDBs in the CDB.
- Specify ALL EXCEPT to modify the state of all PDBs in the CDB except those specified by using pdb_name.

If a PDB is already in the specified state, then the PDB's state is unchanged and no error is returned. If the state of a PDB cannot be changed, then an error occurs only for that PDB.

Refer to pdb_open and pdb_close for the full semantics of these clauses.
application_clauses

The APPLICATION clauses allow you to perform the following operations in an application container:

- Install, patch, upgrade, and uninstall applications
- Register application versions and patch numbers
- Keep applications in sync between the application root and application PDBs

See Also:

Oracle Database Administrator's Guide for more information on administering application containers

Specifying Application Names

Most of the application_clauses require you to specify an application name. The maximum length of an application name is 30 bytes. The name must satisfy the requirements listed in "Database Object Naming Rules". The application name must be unique within an application container.

Specifying Application Versions

Several of the application_clauses require you to specify an application version. The application version can be up to 30 bytes in length and can contain alphanumeric characters, punctuations marks, and spaces. The application version is case-sensitive and must be enclosed in single quotation marks.

Specifying Comments

Several of the application_clauses allow you to specify a comment to associate with an application install, patch, or upgrade operation. For comment, enter a character string enclosed in single quotation marks.

INSTALL Clauses

Use the INSTALL clauses when installing an application in an application container. The current container must be the application root, not an application PDB.

- Specify the BEGIN INSTALL clause before you start installing the application.
  - Use app_name to assign a name to the application.
  - Use app_version to assign a version to the application.
  - The optional COMMENT clause allows you to enter a comment to be associated with the application version created by this installation.
- Specify the END INSTALL clause after you have finished installing the application.
  - You must specify the same app_name that you specified for the corresponding BEGIN INSTALL clause.
  - You need not specify app_version, but if you do, then you must specify the same version that you specified for the corresponding BEGIN INSTALL clause.

PATCH Clauses
Use the PATCH clauses when patching an application in an application container. The current container must be the application root, not an application PDB.

- Specify the BEGIN PATCH clause before you start patching the application.
  - For app_name, specify the name of the application you want to patch.
  - For number, specify the patch number.
  - The optional MINIMUM VERSION clause allows you to specify the minimum version at which the application must be before the patch can be applied. For app_version, specify the minimum application version. If the current application version is lower than the minimum application version, then an error occurs. If you omit this clause, then the minimum version is the current application version.
  - The optional COMMENT clause allows you to enter a comment to be associated with the patch.
- Specify the END PATCH clause after you finish patching the application.
  - You must specify the same app_name that you specified for the corresponding BEGIN PATCH clause.
  - You need not specify number, but if you do, then you must specify the same value that you specified for the corresponding BEGIN PATCH clause.

UPGRADE Clauses

Use the UPGRADE clauses when upgrading an application in an application container. The current container must be the application root, not an application PDB.

- Specify the BEGIN UPGRADE clause before you start upgrading the application.
  - For app_name, specify the name of the application you want to upgrade.
  - For start_app_version, specify the version from which you are upgrading the application. If this version does not match the current application version, then an error occurs.
  - For end_app_version, specify the version to which you are upgrading the application.
  - The optional COMMENT clause allows you to enter a comment to be associated with the upgrade.
- Specify the END UPGRADE clause after you finish upgrading the application.
  - You must specify the same app_name that you specified for the corresponding BEGIN UPGRADE clause.
  - You need not specify TO end_app_version, but if you do, then you must specify the same version that you specified for the corresponding BEGIN UPGRADE clause.

UNINSTALL Clauses

Use the UNINSTALL clauses when uninstalling an application from an application container. The current container must be the application root, not an application PDB.

- Specify the BEGIN UNINSTALL clause before you start uninstalling the application.
  - For app_name, specify the name of the application you want to uninstall.
• Specify the END UNINSTALL clause after you have finished uninstalling the application.
  – You must specify the same app_name that you specified for the corresponding BEGIN UNINSTALL clause.

SET PATCH

Use the SET PATCH clause to register the patch number of an application that is already installed in an application container. This clause allows you to assign a patch number to an application that was not patched using the PATCH clauses. This is useful if the application was migrated from a PDB in an earlier Oracle Database release, when the PATCH clauses were not available. The current container can be the application root or an application PDB.

• For app_name, specify the name of an existing application.
• Use number to assign a patch number to the existing application.

SET VERSION

Use the SET VERSION clause to register the version of an application that is already installed in an application container. This clause allows you to assign a name and a version to an application that was not installed using the INSTALL clauses. This is useful if the application was migrated from a PDB in an earlier Oracle Database release, when the INSTALL clauses were not available. The current container can be the application root or an application PDB.

• Use app_name to assign a name to the existing application.
• Use app_version to assign a version to the existing application.

SET COMPATIBILITY VERSION

Use the SET COMPATIBILITY VERSION clause to set the compatibility version for an application.

The compatibility version of an application is the earliest version of the application possible for the application PDBs that belong to the application container. The current container must be the application root, not an application PDB.

Note:

You cannot plug in an application PDB that uses an application version earlier than the compatibility setting of the application container.

• Use app_name to specify the name of the application.
• Use app_version to specify the compatibility version for the application.
• If you specify CURRENT, then the compatibility version is set to the version of the application in the application root.

The compatibility version is enforced when the compatibility version is set and when an application PDB is created. If there are application root clones that resulted from application upgrades, then all application root clones that correspond to versions earlier than the compatibility version are implicitly dropped.

SYNC TO
You can synchronize an application to a particular version or a patch number. There are two variations:

1. `SYNC TO app_version`
2. `SYNC TO PATCH patch_number`

**Example**

Assume that you perform the following operations on application `salesapp`:

1. Install version 1.0
2. Patch 101
3. Upgrade to version 2.0
4. Patch 102
5. Upgrade to 3.0

```
ALTER PLUGGABLE DATABASE APPLICATION salesapp SYNC TO 2.0 replays all statements up to and including 'Upgrade to version 2.0'.
```

```
ALTER PLUGGABLE DATABASE APPLICATION salesapp SYNC TO PATCH 102 replays all statements up to and including 'Patch 102'.
```

**SYNC**

Use the `SYNC` clause to sync an application in an application PDB to the version and patch level of the same application in the application root. This is useful after changes have been made to the application in the application root. The current container must be an application PDB.

- For `app_name`, specify the name of an application that exists in the application root. The application may or may not exist in the application PDB.

**ALL SYNC**

Use the `ALL SYNC` clause to sync all applications in an application PDB with all applications in the application root. This clause is useful if you have recently added the application PDB to the CDB and would like to sync its applications with the application container. The current container must be an application PDB.

**Examples**

**Unplugging a PDB from a CDB: Example**

The following statement unplugs PDB `pdb1` and stores metadata for the PDB into XML file `/oracle/data/pdb1.xml`:

```
ALTER PLUGGABLE DATABASE pdb1
    UNPLUG INTO '/oracle/data/pdb1.xml';
```

**Modifying the Settings of a PDB: Example**

The following statement changes the limit for the amount of storage used by all tablespaces in PDB `pdb2` to 500M:

```
ALTER PLUGGABLE DATABASE pdb2
    STORAGE (MAXSIZE 500M);
```

**Taking the Data Files of a PDB Offline: Example**
The following statement takes the data files associated with PDB pdb3 offline:

```
ALTER PLUGGABLE DATABASE pdb3
  DATAFILE ALL OFFLINE;
```

### Changing the State of a PDB: Examples

**Assume that PDB pdb4 is closed—that is, its open mode is MOUNTED. The following statement opens pdb4 with open mode READ ONLY:**

```
ALTER PLUGGABLE DATABASE pdb4
  OPEN READ ONLY;
```

**The following statement uses the FORCE keyword to change the open mode of pdb4 from READ ONLY to READ WRITE:**

```
ALTER PLUGGABLE DATABASE pdb4
  OPEN READ WRITE FORCE;
```

**The following statement closes PDB pdb4:**

```
ALTER PLUGGABLE DATABASE pdb4
  CLOSE;
```

**The following statement opens PDB pdb4 with open mode READ ONLY. Because the RESTRICTED keyword is specified, the PDB is accessible only to users with the RESTRICTED SESSION privilege in the PDB:**

```
ALTER PLUGGABLE DATABASE pdb4
  OPEN READ ONLY RESTRICTED;
```

**Assume that PDB pdb5 is closed—that is, its open mode is MOUNTED. In an Oracle Real Application Clusters environment, the following statement opens PDB pdb5 with open mode READ WRITE in instances ORCLDB_1 and ORCLDB_2:**

```
ALTER PLUGGABLE DATABASE pdb5
  OPEN READ WRITE INSTANCES = ('ORCLDB_1', 'ORCLDB_2');
```

**In an Oracle Real Application Clusters environment, the following statement closes PDB pdb6 in the current instance and instructs the database to reopen pdb6 in instance ORCLDB_3:**

```
ALTER PLUGGABLE DATABASE pdb6
  CLOSE RELOCATE TO 'ORCLDB_3';
```

### Changing the State of All PDBs in a CDB: Example

**Assume that the current container is the root. The following statement opens all PDBs in the CDB with open mode READ ONLY:**

```
ALTER PLUGGABLE DATABASE ALL
  OPEN READ ONLY;
```
11.10 ALTER PROCEDURE

Purpose

Packages are defined using PL/SQL. Therefore, this section provides some general information but refers to Oracle Database PL/SQL Language Reference for details of syntax and semantics.

Use the ALTER PROCEDURE statement to explicitly recompile a standalone stored procedure. Explicit recompilation eliminates the need for implicit run-time recompilation and prevents associated run-time compilation errors and performance overhead.

To recompile a procedure that is part of a package, recompile the entire package using the ALTER PACKAGE statement (see ALTER PACKAGE).

Note:
This statement does not change the declaration or definition of an existing procedure. To redefine or redefine a procedure, use the CREATE PROCEDURE statement with the OR REPLACE clause (see CREATE PROCEDURE).

The ALTER PROCEDURE statement is quite similar to the ALTER FUNCTION statement. Refer to ALTER FUNCTION for more information.

Prerequisites

The procedure must be in your own schema or you must have ALTER ANY PROCEDURE system privilege.

Syntax

\texttt{alter\_procedure::=} \hfill (procedure\_compile\_clause: See Oracle Database PL/SQL Language Reference for the syntax of this clause.)

Semantics

\texttt{schema}

Specify the schema containing the procedure. If you omit \texttt{schema}, then Oracle Database assumes the procedure is in your own schema.
**procedure_name**

Specify the name of the procedure to be recompiled.

**procedure_compile_clause**

See Oracle Database PL/SQL Language Reference for the syntax and semantics of this clause and for complete information on creating and compiling procedures.

**EDITIONABLE | NONEDITIONABLE**

Use these clauses to specify whether the procedure becomes an editioned or noneditioned object if editioning is later enabled for the schema object type PROCEDURE in schema. The default is EDITIONABLE. For information about altering editioned and noneditioned objects, see Oracle Database Development Guide.

### 11.11 ALTER PROFILE

**Purpose**

Use the `ALTER PROFILE` statement to add, modify, or remove a resource limit or password management parameter in a profile.

Changes made to a profile with an `ALTER PROFILE` statement affect users only in their subsequent sessions, not in their current sessions.

**See Also:**

CREATE PROFILE for information on creating a profile

**Prerequisites**

You must have the ALTER PROFILE system privilege.

To specify the CONTAINER clause, you must be connected to a multitenant container database (CDB). To specify CONTAINER = ALL, the current container must be the root. To specify CONTAINER = CURRENT, the current container must be a pluggable database (PDB).

**Syntax**

```
ALTER PROFILE profile LIMIT
(resource_parameters, password_parameters)
CONTAINER =
CURRENT
ALL
```

(resource_parameters::=, password_parameters::=)
resource_parameters ::=  

```
SESSIONS_PER_USER  CPU_PER_SESSION  CPU_PER_CALL  CONNECT_TIME  IDLE_TIME  
LOGICAL_READS_PER_SESSION  LOGICAL_READS_PER_CALL  COMPOSITE_LIMIT
```

(size_clause ::= )

password_parameters ::=  

```
FAILED_LOGIN_ATTEMPTS  PASSWORD_LIFE_TIME  
PASSWORD_REUSE_TIME  PASSWORD_REUSE_MAX  PASSWORD_LOCK_TIME  
PASSWORD_GRACE_TIME  INACTIVE_ACCOUNT_TIME
```

```
expr  expr
```

```
expr
```

```
expr
```

```
expr
```

```
expr
```

```
expr
```

```
expr
```

```
expr
```

Semantics  
The keywords, parameters, and clauses in the ALTER PROFILE statement all have the same meaning as in the CREATE PROFILE statement.  
You cannot remove a limit from the DEFAULT profile.
Refer to CREATE PROFILE and to the examples in the next section for more information.

Examples

Making a Password Unavailable: Example

The following statement makes the password of the new_profile profile (created in "Creating a Profile: Example") unavailable for reuse for 90 days:

```sql
ALTER PROFILE new_profile
    LIMIT PASSWORD_REUSE_TIME 90
    PASSWORD_REUSE_MAX UNLIMITED;
```

Setting Default Password Values: Example

The following statement defaults the PASSWORD_REUSE_TIME value of the app_user profile (created in "Setting Profile Resource Limits: Example") to its defined value in the DEFAULT profile:

```sql
ALTER PROFILE app_user
    LIMIT PASSWORD_REUSE_TIME DEFAULT
    PASSWORD_REUSE_MAX UNLIMITED;
```

Limiting Login Attempts and Password Lock Time: Example

The following statement alters profile app_user with FAILED_LOGIN_ATTEMPTS set to 5 and PASSWORD_LOCK_TIME set to 1:

```sql
ALTER PROFILE app_user LIMIT
    FAILED_LOGIN_ATTEMPTS 5
    PASSWORD_LOCK_TIME 1;
```

This statement causes any user account to which the app_user profile is assigned to become locked for one day after five consecutive unsuccessful login attempts.

Changing Password Lifetime and Grace Period: Example

The following statement modifies the profile app_user2 PASSWORD_LIFE_TIME to 90 days and PASSWORD_GRACE_TIME to 5 days:

```sql
ALTER PROFILE app_user2 LIMIT
    PASSWORD_LIFE_TIME 90
    PASSWORD_GRACE_TIME 5;
```

Limiting Account Inactivity: Example

The following statement modifies the profile app_user2 INACTIVE_ACCOUNT_TIME to 30 consecutive days:

```sql
ALTER PROFILE app_user2 LIMIT
    INACTIVE_ACCOUNT_TIME 30;
```

If the account has already been inactive for a certain number of days, then those days count toward the new 30 day limit.

Limiting Concurrent Sessions: Example

This statement defines a new limit of 5 concurrent sessions for the app_user profile:

```sql
ALTER PROFILE app_user LIMIT SESSIONS_PER_USER 5;
```
If the `app_user` profile does not currently define a limit for `SESSIONS_PER_USER`, then the preceding statement adds the limit of 5 to the profile. If the profile already defines a limit, then the preceding statement redefines it to 5. Any user assigned the `app_user` profile is subsequently limited to 5 concurrent sessions.

**Removing Profile Limits: Example**

This statement removes the `IDLE_TIME` limit from the `app_user` profile:

```sql
ALTER PROFILE app_user LIMIT IDLE_TIME DEFAULT;
```

Any user assigned the `app_user` profile is subject in their subsequent sessions to the `IDLE_TIME` limit defined in the `DEFAULT` profile.

**Limiting Profile Idle Time: Example**

This statement defines a limit of 2 minutes of idle time for the `DEFAULT` profile:

```sql
ALTER PROFILE default LIMIT IDLE_TIME 2;
```

This `IDLE_TIME` limit applies to these users:

- Users who are not explicitly assigned any profile
- Users who are explicitly assigned a profile that does not define an `IDLE_TIME` limit

This statement defines unlimited idle time for the `app_user2` profile:

```sql
ALTER PROFILE app_user2 LIMIT IDLE_TIME UNLIMITED;
```

Any user assigned the `app_user2` profile is subsequently permitted unlimited idle time.

### 11.12 ALTER RESOURCE COST

**Purpose**

Use the `ALTER RESOURCE COST` statement to specify or change the formula by which Oracle Database calculates the total resource cost used in a session.

Although Oracle Database monitors the use of other resources, only the four resources shown in the syntax can contribute to the total resource cost for a session.

This statement lets you apply weights to the four resources. Oracle Database then applies the weights to the value of these resources that were specified for a profile to establish a formula for calculating total resource cost. You can limit this cost for a session with the `COMPOSITE_LIMIT` parameter of the `CREATE PROFILE` statement. If the resource cost of a session exceeds the limit, then Oracle Database aborts the session and returns an error. If you use the `ALTER RESOURCE COST` statement to change the weight assigned to each resource, then Oracle Database uses these new weights to calculate the total resource cost for all current and subsequent sessions.

See Also:

- `CREATE PROFILE` for information on all resources and on establishing resource limits
Prerequisites
You must have the ALTER RESOURCE COST system privilege.

Syntax

```
alter_resource_cost ::= 
```

Semantics
Oracle Database calculates the total resource cost by first multiplying the amount of each resource used in the session by the weight of the resource, and then summing the products for all four resources. For any session, this cost is limited by the value of the COMPOSITE_LIMIT parameter in the user's profile. Both the products and the total cost are expressed in units called service units.

CPU_PER_SESSION
Use this keyword to apply a weight to the CPU_PER_SESSION resource.

CONNECT_TIME
Use this keyword to apply a weight to the CONNECT_TIME resource.

LOGICAL_READS_PER_SESSION
Use this clause to apply a weight to the LOGICAL_READS_PER_SESSION resource. Logical reads include blocks read from both memory and disk.

PRIVATE_SGA
Use this clause to apply a weight to the PRIVATE_SGA resource. This limit applies only if you are using shared server architecture and allocating private space in the SGA for your session.

integer
Specify the weight of each resource. The weight that you assign to each resource determines how much the use of that resource contributes to the total resource cost. If you do not assign a weight to a resource, then the weight defaults to 0, and use of the resource subsequently does not contribute to the cost. The weights you assign apply to all subsequent sessions in the database.

Examples

Altering Resource Costs: Examples
The following statement assigns weights to the resources \texttt{CPU\_PER\_SESSION} and \texttt{CONNECT\_TIME}:

\begin{verbatim}
ALTER RESOURCE COST
    CPU\_PER\_SESSION 100
    CONNECT\_TIME 1;
\end{verbatim}

The weights establish this cost formula for a session:

\begin{equation}
\text{cost} = (100 \times \text{CPU\_PER\_SESSION}) + (1 \times \text{CONNECT\_TIME})
\end{equation}

In this example, the values of \texttt{CPU\_PER\_SESSION} and \texttt{CONNECT\_TIME} are either values in the \texttt{DEFAULT} profile or in the profile of the user of the session.

Because the preceding statement assigns no weight to the resources \texttt{LOGICAL\_READS\_PER\_SESSION} and \texttt{PRIVATE\_SGA}, these resources do not appear in the formula.

If a user is assigned a profile with a \texttt{COMPOSITE\_LIMIT} value of 500, then a session exceeds this limit whenever \texttt{cost} exceeds 500. For example, a session using 0.04 seconds of CPU time and 101 minutes of elapsed time exceeds the limit. A session using 0.0301 seconds of CPU time and 200 minutes of elapsed time also exceeds the limit.

You can subsequently change the weights with another \texttt{ALTER RESOURCE} statement:

\begin{verbatim}
ALTER RESOURCE COST
    LOGICAL\_READS\_PER\_SESSION 2
    CONNECT\_TIME 0;
\end{verbatim}

These new weights establish a new cost formula:

\begin{equation}
\text{cost} = (100 \times \text{CPU\_PER\_SESSION}) + (2 \times \text{LOGICAL\_READ\_PER\_SECOND})
\end{equation}

where the values of \texttt{CPU\_PER\_SESSION} and \texttt{LOGICAL\_READ\_PER\_SECOND} are either the values in the \texttt{DEFAULT} profile or in the profile of the user of this session.

This \texttt{ALTER RESOURCE COST} statement changes the formula in these ways:

- The statement omits a weight for the \texttt{CPU\_PER\_SESSION} resource. That resource was already assigned a weight, so the resource remains in the formula with its original weight.
- The statement assigns a weight to the \texttt{LOGICAL\_READ\_PER\_SESSION} resource, so this resource now appears in the formula.
- The statement assigns a weight of 0 to the \texttt{CONNECT\_TIME} resource, so this resource no longer appears in the formula.
- The statement omits a weight for the \texttt{PRIVATE\_SGA} resource. That resource was not already assigned a weight, so the resource still does not appear in the formula.

### 11.13 ALTER ROLE

**Purpose**

Use the \texttt{ALTER ROLE} statement to change the authorization needed to enable a role.
Prerequisites

You must either have been granted the role with the **ADMIN OPTION** or have **ALTER ANY ROLE** system privilege.

Before you alter a role to **IDENTIFIED GLOBALLY**, you must:

- Revoke all grants of roles identified externally to the role and
- Revoke the grant of the role from all users, roles, and **PUBLIC**.

The one exception to this rule is that you should not revoke the role from the user who is currently altering the role.

To specify the **CONTAINER** clause, you must be connected to a multitenant container database (CDB). To specify **CONTAINER = ALL**, the current container must be the root. To specify **CONTAINER = CURRENT**, the current container must be a pluggable database (PDB).

Syntax

```
alter_role ::= 
```
If you change a role identified by password to an application role (with the USING package clause), then password information associated with the role is lost. Oracle Database will use the new authentication mechanism the next time the role is to be enabled.

If you have the ALTER ANY ROLE system privilege and you change a role that is IDENTIFIED GLOBALLY to IDENTIFIED BY password, IDENTIFIED EXTERNALLY, or NOT IDENTIFIED, then Oracle Database grants you the altered role with the ADMIN OPTION, as it would have if you had created the role identified nonglobally.

For more information, refer to CREATE ROLE and to the examples that follow.

Examples

Changing Role Identification: Example

The following statement changes the role warehouse_user (created in "Creating a Role: Example") to NOT IDENTIFIED:

```
ALTER ROLE warehouse_user NOT IDENTIFIED;
```

Changing a Role Password: Example

This statement changes the password on the dw_manager role (created in "Creating a Role: Example") to data:

```
ALTER ROLE dw_manager IDENTIFIED BY data;
```

Users granted the dw_manager role must subsequently use the new password data to enable the role.

Application Roles: Example

The following example changes the dw_manager role to an application role using the hr.admin package:

```
ALTER ROLE dw_manager IDENTIFIED USING hr.admin;
```

11.14 ALTER ROLLBACK SEGMENT

Note:

Oracle strongly recommends that you run your database in automatic undo management mode instead of using rollback segments. Do not use rollback segments unless you must do so for compatibility with earlier versions of Oracle Database. Refer to Oracle Database Administrator’s Guide for information on automatic undo management.

Purpose

Use the ALTER ROLLBACK SEGMENT statement to bring a rollback segment online or offline, change its storage characteristics, or shrink it to an optimal or specified size.

This section assumes that your database is running in rollback undo mode (the UNDO_MANAGEMENT initialization parameter is set to MANUAL or not set at all). If your
database is running in automatic undo mode (the UNDO_MANAGEMENT initialization parameter is set to AUTO, which is the default), then user-created rollback segments are irrelevant.

See Also:
- CREATE ROLLBACK SEGMENT for information on creating a rollback segment
- Oracle Database Reference for information on the UNDO_MANAGEMENT parameter

Prerequisites
You must have the ALTER ROLLBACK SEGMENT system privilege.

Syntax

```sql
alter_rollback_segment ::= ALTER ROLLBACK SEGMENT rollback_segment
                         ONLINE
                         OFFLINE
                         storage_clause
                         SHRINK TO size_clause;
```

Semantics

`rollback_segment`
Specify the name of an existing rollback segment.

`ONLINE`
Specify ONLINE to bring the rollback segment online. When you create a rollback segment, it is initially offline and not available for transactions. This clause brings the rollback segment online, making it available for transactions by your instance. You can also bring a rollback segment online when you start your instance with the initialization parameter ROLLBACK_SEGMENTS.

See Also:
"Bringing a Rollback Segment Online: Example"
Specify **OFFLINE** to take the rollback segment offline.

- If the rollback segment does not contain any information needed to roll back an active transaction, then Oracle Database takes it offline immediately.
- If the rollback segment does contain information for active transactions, then the database makes the rollback segment unavailable for future transactions and takes it offline after all the active transactions are committed or rolled back.

When the rollback segment is offline, it can be brought online by any instance.

To see whether a rollback segment is online or offline, query the **STATUS** column of the data dictionary view `DBA_ROLLBACK_SEGS`. Online rollback segments have a value of `IN_USE`. Offline rollback segments have a value of `AVAILABLE`.

### Restriction on Taking Rollback Segments Offline

You cannot take the `SYSTEM` rollback segment offline.

### storage_clause

Use the **storage_clause** to change the storage characteristics of the rollback segment.

### Restrictions on Rollback Segment Storage

You cannot change the value of the `INITIAL` parameter. If the rollback segment is in a locally managed tablespace, then the only storage parameter you can change is `OPTIMAL`. If the rollback segment is in a dictionary-managed tablespace, then the only storage parameters you can change are `NEXT`, `MINEXTENTS`, `MAXEXTENTS` and `OPTIMAL`.

---

**See Also:**

*storage_clause* for syntax and additional information

### SHRINK Clause

Specify **SHRINK** if you want Oracle Database to attempt to shrink the rollback segment to an optimal or specified size. The success and amount of shrinkage depend on the available free space in the rollback segment and how active transactions are holding space in the rollback segment.

If you do not specify **TO size_clause**, then the size defaults to the `OPTIMAL` value of the `storage_clause` of the `CREATE ROLLBACK SEGMENT` statement that created the rollback segment. If `OPTIMAL` was not specified, then the size defaults to the `MINEXTENTS` value of the `storage_clause` of the `CREATE ROLLBACK SEGMENT` statement.

Regardless of whether you specify **TO size_clause**:

- The value to which Oracle Database shrinks the rollback segment is valid for the execution of the statement. Thereafter, the size reverts to the `OPTIMAL` value of the `CREATE ROLLBACK SEGMENT` statement.
- The rollback segment cannot shrink to less than two extents.
To determine the actual size of a rollback segment after attempting to shrink it, query the `BYTES`, `BLOCKS`, and `EXTENTS` columns of the `DBA_SEGMENTS` view.

**Restriction on Shrinking Rollback Segments**

In an Oracle Real Application Clusters environment, you can shrink only rollback segments that are online to your instance.

See Also:

- `size_clause` for information on that clause, and "Resizing a Rollback Segment: Example"

**Examples**

The following examples use the `rbs_one` rollback segment, which was created in "Creating a Rollback Segment: Example".

**Bringing a Rollback Segment Online: Example**

This statement brings the rollback segment `rbs_one` online:

```
ALTER ROLLBACK SEGMENT rbs_one ONLINE;
```

**Resizing a Rollback Segment: Example**

This statement shrinks the rollback segment `rbs_one`:

```
ALTER ROLLBACK SEGMENT rbs_one
    SHrink TO 100M;
```

### 11.15 ALTER SEQUENCE

**Purpose**

Use the `ALTER SEQUENCE` statement to change the increment, minimum and maximum values, cached numbers, and behavior of an existing sequence. This statement affects only future sequence numbers.

See Also:

- `CREATE SEQUENCE` for additional information on sequences

**Prerequisites**

The sequence must be in your own schema, or you must have the `ALTER` object privilege on the sequence, or you must have the `ALTER ANY SEQUENCE` system privilege.
Syntax

\[ alter\_sequence ::= \]

Semantics

The keywords and parameters in this statement serve the same purposes they serve when you create a sequence.

- To restart the sequence at a different number, you must drop and re-create it.
- If you change the `INCREMENT BY` value before the first invocation of `NEXTVAL`, then some sequence numbers will be skipped. Therefore, if you want to retain the original `START WITH` value, you must drop the sequence and re-create it with the original `START WITH` value and the new `INCREMENT BY` value.
- If you alter the sequence by specifying the `KEEP` or `NOKEEP` clause between runtime and failover of a request, then the original value of `NEXTVAL` is not retained during replay for Application Continuity for that request.
- Oracle Database performs some validations. For example, a new `MAXVALUE` cannot be imposed that is less than the current sequence number.

See Also:

- `CREATE SEQUENCE` for information on creating a sequence and
- `DROP SEQUENCE` for information on dropping and re-creating a sequence
Examples

Modifying a Sequence: Examples

This statement sets a new maximum value for the `customers_seq` sequence, which was created in "Creating a Sequence: Example":

```
ALTER SEQUENCE customers_seq
  MAXVALUE 1500;
```

This statement turns on `CYCLE` and `CACHE` for the `customers_seq` sequence:

```
ALTER SEQUENCE customers_seq
  CYCLE
  CACHE 5;
```

11.16 ALTER SESSION

Purpose

Use the `ALTER SESSION` statement to set or modify any of the conditions or parameters that affect your connection to the database. The statement stays in effect until you disconnect from the database.

Prerequisites

To enable and disable the SQL trace facility, you must have `ALTER SESSION` system privilege.

To enable or disable resumable space allocation, you must have the `RESUMABLE` system privilege.

You do not need any privileges to perform the other operations of this statement unless otherwise indicated.
Syntax

\textit{alter\_session::=}

\begin{itemize}
  \item \text{ADVISE}
  \item \text{COMMIT}
  \item \text{ROLLBACK}
  \item \text{NOTHING}
  \item \text{CLOSE}
  \item \text{DATABASE}
  \item \text{LINK}
  \item \text{@blink}
  \item \text{ENABLE}
  \item \text{DISABLE}
  \item \text{GUARD}
  \item \text{ENABLE}
  \item \text{DISABLE}
  \item \text{PARALLEL}
  \item \text{FORCE}
  \item \text{DML}
  \item \text{DDL}
  \item \text{QUERY}
  \item \text{PARALLEL}
  \item \text{integer}
  \item \text{TIMEOUT}
  \item \text{integer}
  \item \text{NAME}
  \item \text{string}
  \item \text{ENABLE}
  \item \text{DISABLE}
  \item \text{RESUMABLE}
  \item \text{RESUMABLE}
  \item \text{SHARD}
  \item \text{DDL}
  \item \text{SYNC}
  \item \text{WITH}
  \item \text{PRIMARY}
\end{itemize}

\textit{alter\_session\_set\_clause::=}

\begin{itemize}
  \item \text{SET}
  \item \text{parameter\_name} = \text{parameter\_value}
  \item \text{EDITION} = \text{edition\_name}
  \item \text{CONTAINER} = \text{container\_name}
  \item \text{SERVICE} = \text{service\_name}
  \item \text{ROW ARCHIVAL VISIBILITY} = \text{ACTIVE}
  \item \text{ACTIVE}
  \item \text{COLLATION} = \text{collation\_name}
  \item \text{NONE}
\end{itemize}
Semantics

ADVISE Clause

The ADVISE clause sends advice to a remote database to force a distributed transaction. The advice appears in the ADVICE column of the DBA_2PC_PENDING view on the remote database (the values are 'c' for COMMIT, 'r' for ROLLBACK, and ' ' for NOTHING). If the transaction becomes in doubt, then the administrator of that database can use this advice to decide whether to commit or roll back the transaction.

You can send different advice to different remote databases by issuing multiple ALTER SESSION statements with the ADVISE clause in a single transaction. Each such statement sends advice to the databases referenced in the following statements in the transaction until another such statement is issued.

See Also:

"Forcing a Distributed Transaction: Example"

CLOSE DATABASE LINK Clause

Specify CLOSE DATABASE LINK to close the database link dblink. When you issue a statement that uses a database link, Oracle Database creates a session for you on the remote database using that link. The connection remains open until you end your local session or until the number of database links for your session exceeds the value of the initialization parameter OPEN_LINKS. If you want to reduce the network overhead associated with keeping the link open, then use this clause to close the link explicitly if you do not plan to use it again in your session.

See Also:

Closing a Database Link: Example

ENABLE | DISABLE COMMIT IN PROCEDURE

Procedures and stored functions written in PL/SQL can issue COMMIT and ROLLBACK statements. If your application would be disrupted by a COMMIT or ROLLBACK statement not issued directly by the application itself, then specify DISABLE COMMIT IN PROCEDURE clause to prevent procedures and stored functions called during your session from issuing these statements.

You can subsequently allow procedures and stored functions to issue COMMIT and ROLLBACK statements in your session by issuing the ENABLE COMMIT IN PROCEDURE.

Some applications automatically prohibit COMMIT and ROLLBACK statements in procedures and stored functions. Refer to your application documentation for more information.
ENABLE | DISABLE GUARD

The security_clause of ALTER DATABASE lets you prevent anyone other than the SYS user from making any changes to data or database objects on the primary or standby database. This clause lets you override that setting for the current session.

See Also:
security_clause for more information on the GUARD setting

PARALLEL DML | DDL | QUERY

The PARALLEL parameter determines whether all subsequent DML, DDL, or query statements in the session will be considered for parallel execution. This clause enables you to override the degree of parallelism of tables during the current session without changing the tables themselves. Uncommitted transactions must either be committed or rolled back prior to executing this clause for DML.

See Also:
"Enabling Parallel DML: Example"

ENABLE Clause

Specify ENABLE to execute subsequent statements in the session in parallel. This is the default for DDL and query statements.

• DML: DML statements are executed in parallel mode if a parallel hint or a parallel clause is specified.
• DDL: DDL statements are executed in parallel mode if a parallel clause is specified.
• QUERY: Queries are executed in parallel mode if a parallel hint or a parallel clause is specified.

Restriction on the ENABLE clause

You cannot specify the optional PARALLEL integer with ENABLE.

DISABLE Clause

Specify DISABLE to execute subsequent statements in the session serially. This is the default for DML statements.

• DML: DML statements are executed serially.
• DDL: DDL statements are executed serially.
• QUERY: Queries are executed serially.

Restriction on the DISABLE clause

You cannot specify the optional PARALLEL integer with DISABLE.

FORCE Clause
**FORCE** forces parallel execution of subsequent statements in the session. If no parallel clause or hint is specified, then a default degree of parallelism is used. This clause overrides any `parallel_clause` specified in subsequent statements in the session but is overridden by a parallel hint.

- **DML**: Provided no parallel DML restrictions are violated, subsequent DML statements in the session are executed with the default degree of parallelism, unless a degree is specified in this clause.

- **DDL**: Subsequent DDL statements in the session are executed with the default degree of parallelism, unless a degree is specified in this clause. Resulting database objects will have associated with them the prevailing degree of parallelism.

  Specifying **FORCE DDL** automatically causes all tables created in this session to be created with a default level of parallelism. The effect is the same as if you had specified the `parallel_clause` (with the default degree) in the `CREATE TABLE` statement.

- **QUERY**: Subsequent queries are executed with the default degree of parallelism, unless a degree is specified in this clause.

**PARALLEL integer**

Specify an integer to explicitly specify a degree of parallelism:

- **For** **FORCE DDL**, the degree overrides any parallel clause in subsequent DDL statements.

- **For** **FORCE DML** and **QUERY**, the degree overrides the degree currently stored for the table in the data dictionary.

- A degree specified in a statement through a hint will override the degree being forced.

The following types of DML operations are not parallelized regardless of this clause:

- Operations on cluster tables
- Operations with embedded functions that either write or read database or package states
- Operations on tables with triggers that could fire
- Operations on tables or schema objects containing object types, or LONG or LOB data types

**RESUMABLE Clauses**

These clauses let you enable and disable resumable space allocation. This feature allows an operation to be suspended in the event of an out-of-space error condition and to resume automatically from the point of interruption when the error condition is fixed.
Note:

Resumable space allocation is fully supported for operations on locally managed tablespaces. Some restrictions apply if you are using dictionary-managed tablespaces. For information on these restrictions, refer to Oracle Database Administrator's Guide.

ENABLE RESUMABLE

This clause enables resumable space allocation for the session.

TIMEOUT

TIMEOUT lets you specify (in seconds) the time during which an operation can remain suspended while waiting for the error condition to be fixed. If the error condition is not fixed within the TIMEOUT period, then Oracle Database aborts the suspended operation.

NAME

NAME lets you specify a user-defined text string to help users identify the statements issued during the session while the session is in resumable mode. Oracle Database inserts the text string into the USER_RESUMABLE and DBA_RESUMABLE data dictionary views. If you do not specify NAME, then Oracle Database inserts the default string 'User username(userid), Session sessionid, Instance instanceid'.

See Also:

Oracle Database Reference for information on the data dictionary views

DISABLE RESUMABLE

This clause disables resumable space allocation for the session.

SHARD DDL Clauses

These clauses are valid only if you are connected to a sharded database. They let you control whether DDLs issued in the session are issued against the shard catalog database and all shards, or against only the shard catalog database.

- If you specify ENABLE SHARD DDL, then DDLs issued in the session are issued against the shard catalog database and all shards. This mode is the default for the SDB user—a user that exists in the shard catalog database and in all shards.

- If you specify DISABLE SHARD DDL, then DDLs issued in the session are issued against only the shard catalog database. This mode is the default for a local user—a user that exists only in the shard catalog database.

SYNC WITH PRIMARY

Use this clause to synchronize redo apply on a physical standby database with the primary database. An ALTER SESSION statement with this clause blocks until redo apply has applied all redo data received by the standby at the time the statement is issued.
This clause returns an error, and synchronization does not occur, if the redo transport state for the standby database is not `SYNCHRONIZED` or if redo apply is not active.

### See Also:

*Oracle Data Guard Concepts and Administration* for more information on this session parameter

---

**alter_session_set_clause**

Use the `alter_session_set_clause` to set initialization parameter values or to set an edition for the current session.

### Initialization Parameters

You can set two types of parameters using this clause:

- Initialization parameters that are dynamic in the scope of the `ALTER SESSION` statement (listed in "Initialization Parameters and ALTER SESSION")
- Session parameters (listed in "Session Parameters and ALTER SESSION")

You can set values for multiple parameters in the same `alter_session_set_clause`.

#### EDITION

Specify `EDITION = edition` to set the specified edition as the edition in the database session. You must have the `USE` object privilege on `edition`, `edition` must already have been created, and it must be `USABLE`.

When this statement is successful, the database discards PL/SQL package state corresponding to editionable packages but retains package state corresponding to packages that are not editionable.

You can also set the edition for the current session at startup with the `EDITION` parameter of the SQL*Plus `CONNECT` command. However, you cannot specify an `ALTER SESSION SET EDITION` statement in a recursive SQL or PL/SQL block.

You can determine the edition in use by the current session with the following query:

```sql
SELECT SYS_CONTEXT('USERENV', 'CURRENT_EDITION_NAME') FROM DUAL;
```

### See Also:

*CREATE EDITION* for more information on editions and *Oracle Database PL/SQL Language Reference* for information on how editions are designated as `USABLE`

---

**CONTAINER**

Use this clause in a multitenant container database (CDB) to switch to the container specified by `container_name`. 
To use this clause, you must be a common user with the `SET CONTAINER` privilege, either granted commonly or granted locally in `container_name`.

For `container_name`, specify one of the following:

- `CDB$ROOT` to switch to the root
- `PDB$SEED` to switch to the seed
- A pluggable database (PDB) name to switch to that PDB. You can view the names of the PDBs in a CDB by querying the `DBA_PDBS` view.

You can determine the container to which the current session is connected by using the SQL*Plus `SHOW CON_NAME` command or with the following SQL query:

```
SELECT SYS_CONTEXT('USERENV', 'CON_NAME') FROM DUAL;
```

**SERVICE**

By default, when you switch to a container, the session uses the default service for the container. Specify the `SERVICE` clause to use a different service for the container. For `service_name`, specify the name of the service you want to use.

**See Also:**

- *Oracle Database Administrator's Guide* for more information on switching to a container

**ROW ARCHIVAL VISIBILITY**

Use this clause to configure row archival visibility for the session. This clause lets you implement In-Database Archiving, which allows you to designate table rows as active or archived. You can then perform queries on only the active rows within the table.

- If you specify `ACTIVE`, then the database will consider only active rows when performing queries on tables that are enabled for row archival. This is the default.
- If you specify `ALL`, then the database will consider all rows when performing queries on tables that are enabled for row archival.

This clause has no effect on queries on tables that are not enabled for row archival.

**See Also:**

- The `CREATE TABLE ROW ARCHIVAL` clause to learn how to enable a new table for row archival
- The `ALTER TABLE [NO] ROW ARCHIVAL` clause to learn how to enable or disable an existing table for row archival
- *Oracle Database VLDB and Partitioning Guide* for more information on In-Database Archiving
DEFAULT_COLLATION

Use this clause to set the default collation for the session.

- **Use** `collation_name` **to specify** the default collation for the session. You can specify the name of any valid named collation or pseudo-collation. This collation becomes the *effective schema default collation*. This collation is assigned to tables, views, and materialized views that are subsequently created in any schema for the duration of the session. The default collation for the session does not get propagated to any remote sessions connected to the current session using DB links.

- If you specify `NONE`, then there is no default collation for the session. In this case, the default collation for a particular schema becomes the *effective schema default collation* for that schema. That default collation is assigned to tables, views, and materialized views that are subsequently created in the schema for the duration of the session.

In either of the preceding cases, you can override the effective schema default collation and assign a default collation to a particular table, materialized view, or view by specifying the **DEFAULT COLLATION clause** of the **CREATE** or **ALTER** statement for the table, materialized view, or view.

The effective schema default collation also affects the DDL statements **CREATE FUNCTION**, **CREATE PACKAGE**, **CREATE PROCEDURE**, **CREATE TRIGGER**, and **CREATE TYPE**. Refer to *Oracle Database PL/SQL Language Reference* for more details on these statements.

You can query the default collation for a session with the following statement:

```
SELECT SYS_CONTEXT('USERENV', 'SESSION_DEFAULT_COLLATION') FROM DUAL;
```

You can specify the **SET DEFAULT_COLLATION clause** only if the **COMPATIBLE** initialization parameter is set to 12.2 or greater, and the **MAX_STRING_SIZE** initialization parameter is set to **EXTENDED**.

---

**See Also:**

The **DEFAULT COLLATION Clause** clause of **CREATE USER** for more information on the default collation of a schema.
Note:
The effective schema default collation for a session should not be confused with the session parameter \texttt{NLS\_SORT}. The effective schema default collation is used by DDL statements to decide the default data-bound collation of tables, views, and materialized views when they are created. The session parameter \texttt{NLS\_SORT} points to a named collation that is used when Oracle executes a query, a DML statement, or PL/SQL code containing a SQL operation whose determined collation is a pseudo-collation, such as \texttt{USING\_NLS\_COMP} or \texttt{USING\_NLS\_SORT}. Refer to \textit{Oracle Database Globalization Support Guide} for more information.

11.16.1 Initialization Parameters and \texttt{ALTER SESSION} 

Some initialization parameter are dynamic in the scope of \texttt{ALTER SESSION}. When you set these parameters using \texttt{ALTER SESSION}, the value you set persists only for the duration of the current session. To determine whether a parameter can be altered using an \texttt{ALTER SESSION} statement, query the \texttt{ISSES\_MODIFIABLE} column of the \texttt{V\_PARAMETER} dynamic performance view.

Note:
Before changing the values of initialization parameters, refer to their full description in \textit{Oracle Database Reference}.

A number of parameters that can be set using \texttt{ALTER SESSION} are not initialization parameters. You can set them only with \texttt{ALTER SESSION}, not in an initialization parameter file. Those session parameters are described in "Session Parameters and \texttt{ALTER SESSION}".

11.16.2 Session Parameters and \texttt{ALTER SESSION} 

The following parameters are session parameters only, not initialization parameters:

\texttt{CONSTRAINT[S]}

\texttt{Syntax:}
\begin{verbatim}
CONSTRAINT[S] = \{ IMMEDIATE | DEFERRED | DEFAULT \}
\end{verbatim}

The \texttt{CONSTRAINT[S]} parameter determines when conditions specified by a deferrable constraint are enforced.

- \texttt{IMMEDIATE} indicates that the conditions specified by the deferrable constraint are checked immediately after each DML statement. This setting is equivalent to issuing the \texttt{SET CONSTRAINTS ALL IMMEDIATE} statement at the beginning of each transaction in your session.
- \texttt{DEFERRED} indicates that the conditions specified by the deferrable constraint are checked when the transaction is committed. This setting is equivalent to issuing...
the `SET CONSTRAINTS ALL DEFERRED` statement at the beginning of each transaction in your session.

- `DEFAULT` restores all constraints at the beginning of each transaction to their initial state of `DEFERRED` or `IMMEDIATE`.

**CURRENT_SCHEMA**

**Syntax:**

```sql
CURRENT_SCHEMA = schema
```

The `CURRENT_SCHEMA` parameter changes the current schema of the session to the specified schema. Subsequent unqualified references to schema objects during the session will resolve to objects in the specified schema. The setting persists for the duration of the session or until you issue another `ALTER SESSION SET CURRENT_SCHEMA` statement.

This setting offers a convenient way to perform operations on objects in a schema other than that of the current user without having to qualify the objects with the schema name. This setting changes the current schema, but it does not change the session user or the current user, nor does it give the session user any additional system or object privileges for the session.

**ERROR_ON_OVERLAP_TIME**

**Syntax:**

```sql
ERROR_ON_OVERLAP_TIME = { TRUE | FALSE }
```

The `ERROR_ON_OVERLAP_TIME` parameter determines how Oracle Database should handle an ambiguous boundary datetime value—a case in which it is not clear whether the datetime is in standard or daylight saving time.

- Specify `TRUE` to return an error for the ambiguous overlap timestamp.
- Specify `FALSE` to default the ambiguous overlap timestamp to the standard time. This is the default.

Refer to "Support for Daylight Saving Times" for more information on boundary datetime values.

**FLAGGER**

**Syntax:**

```sql
FLAGGER = { ENTRY | OFF }
```

The `FLAGGER` parameter specifies FIPS flagging (as specified in Federal Information Processing Standard 127-2), which causes an error message to be generated when a SQL statement issued is an extension of the Entry Level of SQL-92 (officially, ANSI X3.135-1992, a standard that is now superseded by SQL:2016). `FLAGGER` is a session parameter only, not an initialization parameter.

After flagging is set in a session, a subsequent `ALTER SESSION SET FLAGGER` statement will work, but generates the message, ORA-00097. This allows FIPS flagging to be altered without disconnecting the session. `OFF` turns off flagging.
INSTANCE

Syntax:

INSTANCE = integer

Setting the INSTANCE parameter lets you access another instance as if you were connected to your own instance. INSTANCE is a session parameter only, not an initialization parameter. In an Oracle Real Application Clusters (Oracle RAC) environment, each Oracle RAC instance retains static or dynamic ownership of disk space for optimal DML performance based on the setting of this parameter.

ISOLATION_LEVEL

Syntax:

ISOLATION_LEVEL = {SERIALIZABLE | READ COMMITTED}

The ISOLATION_LEVEL parameter specifies how transactions containing database modifications are handled. ISOLATION_LEVEL is a session parameter only, not an initialization parameter.

- SERIALIZABLE indicates that transactions in the session use the serializable transaction isolation mode as specified in the SQL standard. If a serializable transaction attempts to execute a DML statement that updates rows currently being updated by another uncommitted transaction at the start of the serializable transaction, then the DML statement fails. A serializable transaction can see its own updates.

- READ COMMITTED indicates that transactions in the session will use the default Oracle Database transaction behavior. If the transaction contains DML that requires row locks held by another transaction, then the DML statement will wait until the row locks are released.

Note:

Serializable transactions do not work with deferred segment creation or interval partitioning. Trying to insert data into an empty table with no segment created, or into a partition of an interval partitioned table that does not yet have a segment, causes an error.

STANDBY_MAX_DATA_DELAY

Syntax:

STANDBY_MAX_DATA_DELAY = { integer | NONE }
In an Active Data Guard environment, this session parameter can be used to specify a session-specific apply lag tolerance, measured in seconds, for queries issued by non-administrative users to a physical standby database that is in real-time query mode. This capability allows queries to be safely offloaded from the primary database to a physical standby database, because it is possible to detect if the standby database has become unacceptably stale.

If `STANDBY_MAX_DATA_DELAY` is set to the default value of `NONE`, queries issued to a physical standby database will be executed regardless of the apply lag on that database.

If `STANDBY_MAX_DATA_DELAY` is set to a nonzero value, a query issued to a physical standby database will be executed only if the apply lag is less than or equal to `STANDBY_MAX_DATA_DELAY`. Otherwise, an ORA-3172 error is returned to alert the client that the apply lag is too large.

If `STANDBY_MAX_DATA_DELAY` is set to 0, a query issued to a physical standby database is guaranteed to return the exact same result as if the query were issued on the primary database, unless the standby database is lagging behind the primary database, in which case an ORA-3172 error is returned.

### See Also:

Oracle Data Guard Concepts and Administration for more information on Active Data Guard and using this session parameter

#### TIME_ZONE

**Syntax:**

```sql
TIME_ZONE = '[+ | -] hh:mi'
LOCAL
DBTIMEZONE
'time_zone_region'
```

The `TIME_ZONE` parameter specifies the default local time zone offset or region name for the current SQL session. `TIME_ZONE` is a session parameter only, not an initialization parameter. To determine the time zone of the current session, query the built-in function `SESSIONTIMEZONE` (see `SESSIONTIMEZONE`).

- Specify a format mask (`'[+|-%]hh:mm'`) indicating the hours and minutes before or after UTC (Coordinated Universal Time—formerly Greenwich Mean Time). The valid range for `hh:mm` is -12:00 to +14:00.
- Specify `LOCAL` to set the default local time zone offset of the current SQL session to the original default local time zone offset that was established when the current SQL session was started.
- Specify `DBTIMEZONE` to set the current session time zone to match the value set for the database time zone. If you specify this setting, then the `DBTIMEZONE` function will return the database time zone as a UTC offset or a time zone region, depending on how the database time zone has been set.
- Specify a valid `time_zone_region`. To see a listing of valid time zone region names, query the `TZNAME` column of the `V$TIMEZONE_NAMES` dynamic performance
view. If you specify this setting, then the SESSIONTIMEZONE function will return the region name.

**Note:**

Time zone region names are needed by the daylight saving feature. These names are stored in two types of time zone files: one large and one small. One of these files is the default file, depending on your environment and the release of Oracle Database you are using. For more information regarding time zone files and names, see *Oracle Database Globalization Support Guide*.

**See Also:**

*Oracle Database Globalization Support Guide* for a complete listing of the time zone region names in both files.

**Note:**

You can also set the default client session time zone using the ORA_SDTZ environment variable. Refer to *Oracle Database Globalization Support Guide* for more information on this variable.

### USE_PRIVATE_OUTLINES

**Syntax:**

`USE_PRIVATE_OUTLINES = { TRUE | FALSE | category_name }`

The `USE_PRIVATE_OUTLINES` parameter lets you control the use of private outlines. When this parameter is enabled and an outlined SQL statement is issued, the optimizer retrieves the outline from the session private area rather than the public area used when `USE_STORED_OUTLINES` is enabled. If no outline exists in the session private area, then the optimizer will not use an outline to compile the statement. `USE_PRIVATE_OUTLINES` is not an initialization parameter.

- **TRUE** causes the optimizer to use private outlines stored in the **DEFAULT** category when compiling requests.
- **FALSE** specifies that the optimizer should not use stored private outlines. This is the default. If `USE_STORED_OUTLINES` is enabled, then the optimizer will use stored public outlines.
- **category_name** causes the optimizer to use outlines stored in the **category_name** category when compiling requests.

**Restriction on USE_PRIVATE_OUTLINES**

You cannot enable this parameter if `USE_STORED_OUTLINES` is enabled.
USE_STORED_OUTLINES

**Note:**
Stored outlines are deprecated. They are still supported for backward compatibility. However, Oracle recommends that you use SQL plan management instead. Refer to Oracle Database SQL Tuning Guide for more information about SQL plan management.

Syntax:
USE_STORED_OUTLINES = { TRUE | FALSE | category_name }

The USE_STORED_OUTLINES parameter determines whether the optimizer will use stored public outlines to generate execution plans. USE_STORED_OUTLINES is not an initialization parameter.

- **TRUE** causes the optimizer to use outlines stored in the DEFAULT category when compiling requests.
- **FALSE** specifies that the optimizer should not use stored outlines. This is the default.
- **category_name** causes the optimizer to use outlines stored in the category_name category when compiling requests.

Restriction on USED_STORED_OUTLINES
You cannot enable this parameter if USE_PRIVATE_OUTLINES is enabled.

Examples

**Enabling Parallel DML: Example**

Issue the following statement to enable parallel DML mode for the current session:

```
ALTER SESSION ENABLE PARALLEL DML;
```

**Forcing a Distributed Transaction: Example**

The following transaction inserts an employee record into the employees table on the database identified by the database link `remote` and deletes an employee record from the employees table on the database identified by `local`:

```
ALTER SESSION
   ADVISE COMMIT;

INSERT INTO employees@remote
   VALUES (8002, 'Juan', 'Fernandez', 'juanf@example.com', NULL,
   TO_DATE('04-OCT-1992', 'DD-MON-YYYY'), 'SA_CLERK', 3000,
   NULL, 121, 20);

ALTER SESSION
   ADVISE ROLLBACK;

DELETE FROM employees@local
   WHERE employee_id = 8002;
```
This transaction has two \texttt{ALTER SESSION} statements with the \texttt{ADVISE} clause. If the transaction becomes in doubt, then \texttt{remote} is sent the advice '\texttt{COMMIT}’ by virtue of the first \texttt{ALTER SESSION} statement and \texttt{local} is sent the advice ‘\texttt{ROLLBACK}’ by virtue of the second statement.

\textbf{Closing a Database Link: Example}

This statement updates the \texttt{jobs} table on the \texttt{local} database using a database link, commits the transaction, and explicitly closes the database link:

\begin{verbatim}
UPDATE jobs@local SET min_salary = 3000
  WHERE job_id = 'SH_CLERK';

COMMIT;

ALTER SESSION
  CLOSE DATABASE LINK local;
\end{verbatim}

\textbf{Changing the Date Format Dynamically: Example}

The following statement dynamically changes the default date format for your session to 'YYYY MM DD-HH24:MI:SS':

\begin{verbatim}
ALTER SESSION
  SET NLS_DATE_FORMAT = 'YYYY MM DD HH24:MI:SS';
\end{verbatim}

Oracle Database uses the new default date format:

\begin{verbatim}
SELECT TO_CHAR(SYSDATE) Today
  FROM DUAL;
\end{verbatim}

\begin{verbatim}
TODAY
-------------------
2001 04 12 12:30:38
\end{verbatim}

\textbf{Changing the Date Language Dynamically: Example}

The following statement changes the language for date format elements to French:

\begin{verbatim}
ALTER SESSION
  SET NLS_DATE_LANGUAGE = French;
\end{verbatim}

\begin{verbatim}
SELECT TO_CHAR(SYSDATE, 'Day DD Month YYYY') Today
  FROM DUAL;
\end{verbatim}

\begin{verbatim}
TODAY
---------------------------
Jeudi    12 Avril     2001
\end{verbatim}

\textbf{Changing the ISO Currency: Example}

The following statement dynamically changes the ISO currency symbol to the ISO currency symbol for the territory America:

\begin{verbatim}
ALTER SESSION
  SET NLS_ISO_CURRENCY = America;
\end{verbatim}

\begin{verbatim}
SELECT TO_CHAR( SUM(salary), 'C999G999D99') Total
  FROM employees;
\end{verbatim}
TOTAL
------------------
USD694,900.00

Changing the Decimal Character and Group Separator: Example

The following statement dynamically changes the decimal character to comma (,) and the group separator to period (.):

```
ALTER SESSION SET NLS_NUMERIC_CHARACTERS = ',.' ;
```

Oracle Database returns these new characters when you use their number format elements:

```
ALTER SESSION SET NLS_CURRENCY = 'FF';

SELECT TO_CHAR( SUM(salary), 'L999G999D99') Total FROM employees;
```

TOTAL
------------------
FF694.900,00

Changing the NLS Currency: Example

The following statement dynamically changes the local currency symbol to 'DM':

```
ALTER SESSION
    SET NLS_CURRENCY = 'DM';

SELECT TO_CHAR( SUM(salary), 'L999G999D99') Total FROM employees;
```

TOTAL
------------------
DM694.900,00

Changing the NLS Language: Example

The following statement dynamically changes to French the language in which error messages are displayed:

```
ALTER SESSION
    SET NLS_LANGUAGE = FRENCH;

Session modifiée.

SELECT * FROM DMP;

ORA-00942: Table ou vue inexistante
```

Changing the Linguistic Sort Sequence: Example

The following statement dynamically changes the linguistic sort sequence to Spanish:

```
ALTER SESSION
    SET NLS_SORT = XSpanish;
```

Oracle Database sorts character values based on their position in the Spanish linguistic sort sequence.

Enabling Query Rewrite: Example
This statement enables query rewrite in the current session for all materialized views that have not been explicitly disabled:

```sql
ALTER SESSION
    SET QUERY_REWRITE_ENABLED = TRUE;
```
This chapter contains the following SQL statements:

- ALTER SYNONYM
- ALTER SYSTEM
- ALTER TABLE
- ALTER TABLESPACE
- ALTER TABLESPACE SET
- ALTER TRIGGER
- ALTER TYPE
- ALTER USER
- ALTER VIEW
- ANALYZE
- ASSOCIATE STATISTICS
- AUDIT (Traditional Auditing)
- AUDIT (Unified Auditing)
- CALL
- COMMENT

12.1 ALTER SYNONYM

Purpose

Use the ALTER SYNONYM statement to modify an existing synonym.

Prerequisites

To modify a private synonym in another user's schema, you must have the CREATE ANY SYNONYM and DROP ANY SYNONYM system privileges.

To modify a public synonym, you must have the CREATE PUBLIC SYNONYM and DROP PUBLIC SYNONYM system privileges.
Syntax

\textit{alter\_synonym}::=\texttt{PUBLIC}\texttt{\textbackslash{}\textbackslash{}SYNONYM}.\textit{schema}.\textit{synonym}\texttt{EDITIONABLE}\texttt{NONSEDITIONABLE}\texttt{COMPILE}.

Semantics

\section*{PUBLIC}

Specify \texttt{PUBLIC} if \textit{synonym} is a public synonym. You cannot use this clause to change a public synonym to a private synonym, or vice versa.

\section*{schema}

Specify the schema containing the synonym. If you omit \textit{schema}, then Oracle Database assumes the synonym is in your own schema.

\section*{synonym}

Specify the name of the synonym to be altered.

\section*{EDITIONABLE | NONEDITIONABLE}

Use these clauses to specify whether the synonym becomes an editioned or noneditioned object if editioning is later enabled for the schema object type \textit{SYNONYM} in \textit{schema}. The default is \texttt{EDITIONABLE}. For information about altering editioned and noneditioned objects, see \textit{Oracle Database Development Guide}.

\section*{Restriction on EDITIONABLE | NONEDITIONABLE}

You cannot specify these clauses for a public synonym because editioning is always enabled for the object type \textit{SYNONYM} in the \texttt{PUBLIC} schema.

\section*{COMPILE}

Use this clause to compile \textit{synonym}. A synonym places a dependency on its target object and becomes invalid if the target object is changed or dropped. When you compile an invalid synonym, it becomes valid again.

\begin{quote}
\begin{em}
\textbf{Note:} You can determine if a synonym is valid or invalid by querying the \texttt{STATUS} column of the \texttt{ALL\_}, \texttt{DBA\_}, and \texttt{USER\_OBJECTS} data dictionary views.
\end{em}
\end{quote}

Examples

The following examples modify synonyms that were created in the \texttt{CREATE SYNONYM "Examples"}.
The following statement compiles synonym **offices**:

```
ALTER SYNONYM offices COMPILE;
```

The following statement compiles public synonym **emp_table**:

```
ALTER PUBLIC SYNONYM emp_table COMPILE;
```

The following statement causes synonym **offices** to remain a noneditioned object if editioning is later enabled for schema object type **SYNONYM** in the schema that contains the synonym **offices**:

```
ALTER SYNONYM offices NONEDITIONABLE;
```

### 12.2 ALTER SYSTEM

#### Purpose

Use the `ALTER SYSTEM` statement to dynamically alter your Oracle Database instance. The settings stay in effect as long as the database is mounted.

When you use the `ALTER SYSTEM` statement in a multitenant container database (CDB), you can specify some clauses to alter the CDB as a whole and other clauses to alter a specific pluggable database (PDB).

#### See Also:

*Oracle Database Administrator's Guide* for complete information on using the `ALTER SYSTEM` statement in a CDB

#### Prerequisites

To specify the `RELOCATE CLIENT` clause, you must be authenticated as `SYSASM`.

To specify all other clauses, you must have the `ALTER SYSTEM` system privilege.

If you are connected to a CDB:

- To alter the CDB as a whole, the current container must be the root and you must have the commonly granted `ALTER SYSTEM` privilege.
- To alter a PDB, the current container must be the PDB and you must have the `ALTER SYSTEM` privilege, either granted commonly or granted locally in the PDB.
Syntax

\texttt{alter\_system::=}

\begin{verbatim}

archive_log_clause

The archive_log_clause manually archives redo log files or enables or disables automatic archiving. To use this clause, your instance must have the database mounted. The database can be either open or closed unless otherwise noted.

INSTANCE Clause

This clause is relevant only if you are using Oracle Real Application Clusters (Oracle RAC). Specify the name of the instance for which you want the redo log file group to be archived. The instance name is a string of up to 80 characters. Oracle Database automatically determines the thread that is mapped to the specified instance and archives the corresponding redo log file group. If no thread is mapped to the specified instance, then Oracle Database returns an error.

SEQUENCE Clause

Specify SEQUENCE to manually archive the online redo log file group identified by the log sequence number integer in the specified thread. If you omit the THREAD parameter, then Oracle Database archives the specified group from the thread assigned to your instance.

CHANGE Clause

Specify CHANGE to manually archive the online redo log file group containing the redo log entry with the system change number (SCN) specified by integer in the specified thread. If the SCN is in the current redo log file group, then Oracle Database performs a log switch. If you omit the THREAD parameter, then Oracle Database archives the groups containing this SCN from all enabled threads.

You can use this clause only when your instance has the database open.

CURRENT Clause

Specify CURRENT to manually archive the current redo log file group of the specified thread, forcing a log switch. If you omit the THREAD parameter, then Oracle Database archives all redo log file groups from all enabled threads, including logs previous to current logs. You can specify CURRENT only when the database is open.

NOSWITCH

Specify NOSWITCH if you want to manually archive the current redo log file group without forcing a log switch. This setting is used primarily with standby databases to prevent data divergence when the primary database shuts down. Divergence implies the possibility of data loss in case of primary database failure.

You can use the NOSWITCH clause only when your instance has the database mounted but not open. If the database is open, then this operation closes the database automatically. You must then manually shut down the database before you can reopen it.

GROUP Clause

Specify GROUP to manually archive the online redo log file group with the GROUP value specified by integer. You can determine the GROUP value for a redo log file group by querying the dynamic performance view V$LOG. If you specify both the THREAD and
GROUP parameters, then the specified redo log file group must be in the specified thread.

**LOGFILE Clause**

Specify `LOGFILE` to manually archive the online redo log file group containing the redo log file member identified by `filename`. If you specify both the `THREAD` and `LOGFILE` parameters, then the specified redo log file group must be in the specified thread.

If the database was mounted with a backup control file, then specify `USING BACKUP CONTROLFILE` to permit archiving of all online logfiles, including the current logfile.

**Restriction on the LOGFILE clause**

You must archive redo log file groups in the order in which they are filled. If you specify a redo log file group for archiving with the `LOGFILE` parameter, and earlier redo log file groups are not yet archived, then Oracle Database returns an error.

**NEXT Clause**

Specify `NEXT` to manually archive the next online redo log file group from the specified thread that is full but has not yet been archived. If you omit the `THREAD` parameter, then Oracle Database archives the earliest unarchived redo log file group from any enabled thread.

**ALL Clause**

Specify `ALL` to manually archive all online redo log file groups from the specified thread that are full but have not been archived. If you omit the `THREAD` parameter, then Oracle Database archives all full unarchived redo log file groups from all enabled threads.

**TO location Clause**

Specify `TO 'location'` to indicate the primary location to which the redo log file groups are archived. The value of this parameter must be a fully specified file location following the conventions of your operating system. If you omit this parameter, then Oracle Database archives the redo log file group to the location specified by the initialization parameters `LOG_ARCHIVE_DEST` or `LOG_ARCHIVE_DEST_n`.

**checkpoint_clause**

Specify `CHECKPOINT` to explicitly force Oracle Database to perform a checkpoint, ensuring that all changes made by committed transactions are written to data files on disk. You can specify this clause only when your instance has the database open. Oracle Database does not return control to you until the checkpoint is complete.

**GLOBAL**

In an Oracle Real Application Clusters (Oracle RAC) environment, this setting causes Oracle Database to perform a checkpoint for all instances that have opened the database. This is the default.

**LOCAL**

In an Oracle RAC environment, this setting causes Oracle Database to perform a checkpoint only for the thread of redo log file groups for the instance from which you issue the statement.
check_datafiles_clause

In a distributed database system, such as an Oracle RAC environment, this clause updates an instance’s SGA from the database control file to reflect information on all online data files.

- Specify GLOBAL to perform this synchronization for all instances that have opened the database. This is the default.
- Specify LOCAL to perform this synchronization only for the local instance.

Your instance should have the database open.

distributed_recoavirus clauses

The DISTRIBUTED RECOVERY clause lets you enable or disable distributed recovery. To use this clause, your instance must have the database open.

ENABLE

Specify ENABLE to enable distributed recovery. In a single-process environment, you must use this clause to initiate distributed recovery.

You may need to issue the ENABLE DISTRIBUTED RECOVERY statement more than once to recover an in-doubt transaction if the remote node involved in the transaction is not accessible. In-doubt transactions appear in the data dictionary view DBA_2PC_PENDING.

DISABLE

Specify DISABLE to disable distributed recovery.

FLUSH SHARED_POOL Clause

The FLUSH SHARED_POOL clause lets you clear data from the shared pool in the system global area (SGA). The shared pool stores:

- Cached data dictionary information and
- Shared SQL and PL/SQL areas for SQL statements, stored procedures, functions, packages, and triggers.

This statement does not clear global application context information, nor does it clear shared SQL and PL/SQL areas for items that are currently being executed. You can use this clause regardless of whether your instance has the database dismounted or mounted, open or closed.
See Also:
"Clearing the Shared Pool: Example"

**FLUSH GLOBAL CONTEXT Clause**

The **FLUSH GLOBAL CONTEXT** clause lets you flush all global application context information from the shared pool in the system global area (SGA). You can use this clause regardless of whether your instance has the database dismounted or mounted, open or closed.

**FLUSH BUFFER_CACHE Clause**

The **FLUSH BUFFER_CACHE** clause lets you clear all data from the buffer cache in the system global area (SGA), including the **KEEP**, **RECYCLE**, and **DEFAULT** buffer pools.

**Note:**

This clause is intended for use only on a test database. Do not use this clause on a production database, because as a result of this statement, subsequent queries will have no hits, only misses.

This clause is useful if you need to measure the performance of rewritten queries or a suite of queries from identical starting points.

**FLUSH FLASH_CACHE Clause**

Use the **FLUSH FLASH_CACHE** clause to flush the Database Smart Flash Cache. This clause can be useful if you need to measure the performance of rewritten queries or a suite of queries from identical starting points, or if there might be corruption in the cache.

**FLUSH REDO Clause**

Use the **FLUSH REDO** clause to flush redo data from a primary database to a standby database and to optionally wait for the flushed redo data to be applied to a physical or logical standby database.

This clause can allow a failover to be performed on the target standby database without data loss, even if the primary database is not in a zero data loss data protection mode, provided that all redo data that has been generated by the primary database can be flushed to the standby database.

The **FLUSH REDO** clause must be issued on a mounted, but not open, primary database.

**target_db_name**

For **target_db_name**, specify the **DB_UNIQUE_NAME** of the standby database that is to receive the redo data flushed from the primary database.

The value of the **LOG_ARCHIVE_DEST_n** database initialization parameter that corresponds to the target standby database must contain the **DB_UNIQUE_NAME**
attribute, and the value of that attribute must match the `DB_UNIQUE_NAME` of the target standby database.

**NO CONFIRM APPLY**

If you specify this clause, then the `ALTER SYSTEM` statement will not complete until the standby database has received all of the flushed redo data. You must specify this clause if the target standby database is a snapshot standby database.

**CONFIRM APPLY**

If you specify this clause, then the `ALTER SYSTEM` statement will not complete until the target standby database has received and applied all flushed redo data. This is the default behavior unless you specify `NO CONFIRM APPLY`. You cannot specify this clause if the target standby database is a snapshot standby database.

---

**See Also:**

*Oracle Data Guard Concepts and Administration* for more information about the `FLUSH REDO` clause and failovers

---

**end_session_clauses**

The `end_session_clauses` give you several ways to end the current session.

**DISCONNECT SESSION Clause**

Use the `DISCONNECT SESSION` clause to disconnect the current session by destroying the dedicated server process (or virtual circuit if the connection was made by way of a Shared Server). To use this clause, your instance must have the database open. You must identify the session with both of the following values from the `V$SESSION` view:

- For `integer1`, specify the value of the `SID` column.
- For `integer2`, specify the value of the `SERIAL#` column.

If system parameters are appropriately configured, then application failover will take effect.

- The `POST_TRANSACTION` setting allows ongoing transactions to complete before the session is disconnected. If the session has no ongoing transactions, then this clause has the same effect described for `KILL SESSION`.
- The `IMMEDIATE` setting disconnects the session and recovers the entire session state immediately, without waiting for ongoing transactions to complete.
  - If you also specify `POST_TRANSACTION` and the session has ongoing transactions, then the `IMMEDIATE` keyword is ignored.
  - If you do not specify `POST_TRANSACTION`, or you specify `POST_TRANSACTION` but the session has no ongoing transactions, then this clause has the same effect as described for `KILL SESSION IMMEDIATE`.  

**KILL SESSION Clause**

The **KILL SESSION** clause lets you mark a session as terminated, roll back ongoing transactions, release all session locks, and partially recover session resources. To use this clause, your instance must have the database open. Your session and the session to be terminated must be on the same instance unless you specify `integer3`. You must identify the session with the following values from the `V$SESSION` view:

- For `integer1`, specify the value of the `SID` column.
- For `integer2`, specify the value of the `SERIAL#` column.
- For the optional `integer3`, specify the ID of the instance where the target session to be killed exists. You can find the instance ID by querying the GV$ tables.

If the session is performing some activity that must be completed, such as waiting for a reply from a remote database or rolling back a transaction, then Oracle Database waits for this activity to complete, marks the session as terminated, and then returns control to you. If the waiting lasts a minute, then Oracle Database marks the session to be terminated and returns control to you with a message that the session is marked to be terminated. The `PMON` background process then marks the session as terminated when the activity is complete.

Whether or not the session has an ongoing transaction, Oracle Database does not recover the entire session state until the session user issues a request to the session and receives a message that the session has been terminated.

**IMMEDIATE**

Specify **IMMEDIATE** to instruct Oracle Database to roll back ongoing transactions, release all session locks, recover the entire session state, and return control to you immediately.

**NOREPLAY**

This clause is valid if you are using Application Continuity. When connected to a service with Application Continuity enabled (that is, `FAILOVER_TYPE = TRANSACTION`), the session is recovered after the session fails or is killed. If you do not want to recover a session after it is terminated, then specify **NOREPLAY**.

**SWITCH LOGFILE Clause**

The **SWITCH LOGFILE** clause lets you explicitly force Oracle Database to begin writing to a new redo log file group, regardless of whether the files in the current redo log file group are full. When you force a log switch, Oracle Database begins to perform a
checkpoint but returns control to you immediately rather than when the checkpoint is complete. To use this clause, your instance must have the database open.

See Also:
"Forcing a Log Switch: Example"

SUSPEND | RESUME

The SUSPEND clause lets you suspend all I/O (data file, control file, and file header) as well as queries, in all instances, enabling you to make copies of the database without having to handle ongoing transactions.

Restrictions on SUSPEND and RESUME

SUSPEND and RESUME are subject to the following restrictions:

• Do not use this clause unless you have put the database tablespaces in hot backup mode.
• Do not terminate the session that issued the ALTER SYSTEM SUSPEND statement. An attempt to reconnect while the system is suspended may fail because of recursive SQL that is running during the SYS login.
• If you start a new instance while the system is suspended, then that new instance will not be suspended.

The RESUME clause lets you make the database available once again for queries and I/O.

quiesce_clauses

Use the QUIESCE RESTRICTED and UNQUIESCE clauses to put the database in and take it out of the quiesced state. This state enables database administrators to perform administrative operations that cannot be safely performed in the presence of concurrent transactions, queries, or PL/SQL operations.

Note:
The QUIESCE RESTRICTED clause is valid only if the Database Resource Manager is installed and only if the Resource Manager has been on continuously since database startup in any instances that have opened the database.

If multiple QUIESCE RESTRICTED or UNQUIESCE statements issue at the same time from different sessions or instances, then all but one will receive an error.

QUIESCE RESTRICTED

Specify QUIESCE RESTRICTED to put the database in the quiesced state. For all instances with the database open, this clause has the following effect:

• Oracle Database instructs the Database Resource Manager in all instances to prevent all inactive sessions (other than SYS and SYSTEM) from becoming active.
No user other than **SYS** and **SYSTEM** can start a new transaction, a new query, a new fetch, or a new PL/SQL operation.

- Oracle Database waits for all existing transactions in all instances that were initiated by a user other than **SYS** or **SYSTEM** to finish (either commit or abort). Oracle Database also waits for all running queries, fetches, and PL/SQL procedures in all instances that were initiated by users other than **SYS** or **SYSTEM** and that are not inside transactions to finish. If a query is carried out by multiple successive OCI fetches, then Oracle Database does not wait for all fetches to finish. It waits for the current fetch to finish and then blocks the next fetch. Oracle Database also waits for all sessions (other than those of **SYS** or **SYSTEM**) that hold any shared resources (such as enqueues) to release those resources. After all these operations finish, Oracle Database places the database into quiesced state and finishes executing the `QUIESCE RESTRICTED` statement.

- If an instance is running in shared server mode, then Oracle Database instructs the Database Resource Manager to block logins (other than **SYS** or **SYSTEM**) on that instance. If an instance is running in non-shared-server mode, then Oracle Database does not impose any restrictions on user logins in that instance.

During the quiesced state, you cannot change the Resource Manager plan in any instance.

**UNQUIESCE**

Specify **UNQUIESCE** to take the database out of quiesced state. Doing so permits transactions, queries, fetches, and PL/SQL procedures that were initiated by users other than **SYS** or **SYSTEM** to be undertaken once again. The **UNQUIESCE** statement does not have to originate in the same session that issued the **QUIESCE RESTRICTED** statement.

**rolling_migration_clauses**

Use these clauses in a clustered Oracle Automatic Storage Management (Oracle ASM) environment to migrate one node at a time to a different Oracle ASM version without affecting the overall availability of the Oracle ASM cluster or the database clusters using Oracle ASM for storage.

**START ROLLING MIGRATION**

When starting rolling upgrade, for **ASM_version**, you must specify the following string:

'\<version_num>, <release_num>, <update_num>,<port_release_num>,<port_update_num>'

**ASM_version** must be equal to or greater than 11.1.0.0.0. The surrounding single quotation marks are required. Oracle ASM first verifies that the current release is compatible for migration to the specified release, and then goes into limited functionality mode. Oracle ASM then determines whether any rebalance operations are under way anywhere in the cluster. If there are any such operations, then the statement fails and must be reissued after the rebalance operations are complete.

Rolling upgrade mode is a cluster-wide In-Memory persistent state. The cluster continues to be in this state until there is at least one Oracle ASM instance running in the cluster. Any new instance joining the cluster switches to migration mode immediately upon startup. If all the instances in the cluster terminate, then subsequent startup of any Oracle ASM instance will not be in rolling upgrade mode until you reissue this statement to restart rolling upgrade of the Oracle ASM instances.

**STOP ROLLING MIGRATION**
Use this clause to stop rolling upgrade and bring the cluster back into normal operation. Specify this clause only after all instances in the cluster have migrated to the same software version. The statement will fail if the cluster is not in rolling upgrade mode.

When you specify this clause, the Oracle ASM instance validates that all the members of the cluster are at the same software version, takes the instance out of rolling upgrade mode, and returns to full functionality of the Oracle ASM cluster. If any rebalance operations are pending because disks have gone offline, then those operations are restarted if the ASM\_POWER\_LIMIT parameter would not be violated by such a restart.

See Also:
Oracle Automatic Storage Management Administrator’s Guide for more information about rolling upgrade

rolling_patch_clauses

Use these clauses in a clustered Oracle Automatic Storage Management (Oracle ASM) environment to update one node at a time to the latest patch level without affecting the overall availability of the Oracle ASM cluster or the database clusters using Oracle ASM for storage.

START ROLLING PATCH

Use this clause to start the rolling patch operation. Oracle ASM first verifies that all live nodes in the cluster are at the same version, and then goes into rolling patch mode, which is a cluster-wide In-Memory persistent state. The cluster continues to be in this state until all live nodes have been patched to the latest patch level.

Any nodes that are down during this operation are not patched. This does not affect the success of the rolling patch operation. However, you must patch these nodes before they are started. Otherwise, they will not be allowed to join the cluster.

STOP ROLLING PATCH

use this clause to stop the rolling patch operation and bring the cluster back into normal operation. Specify this clause only after all live nodes in the cluster have been patched to the latest patch level. The statement will fail if the cluster is not in rolling patch mode.

When you specify this clause, the Oracle ASM instance validates that all members of the cluster are at the same patch level, takes the instance out of rolling patch mode, and returns full functionality of the Oracle ASM cluster. If any members of the cluster are not at the latest patch level, then this operation fails and the cluster goes into limited functionality mode.

The following queries display information about rolling patches. In order to run these queries, you must be connected to the Oracle ASM instance in the Grid home, and the Grid Infrastructure home must be configured with the Oracle Clusterware option for an Oracle RAC environment.

• You can determine whether a cluster is in rolling patch mode with the following query:
SELECT SYS_CONTEXT('SYS_CLUSTER_PROPERTIES', 'CLUSTER_STATE') FROM DUAL;

- You can determine the patch level of a cluster with the following query:
  SELECT SYS_CONTEXT('SYS_CLUSTER_PROPERTIES', 'CURRENT_PATCHLVL') FROM DUAL;

- You can display a list of patches applied on the Oracle ASM instance, by querying the V$PATCHES dynamic performance view. Refer to Oracle Database Reference for more information.

See Also:
Oracle Automatic Storage Management Administrator's Guide for more information about rolling patches

security clauses

The security clauses let you control access to the instance. They also allow you to enable or disable access to the encrypted data in the instance.

RESTRICTED SESSION

The RESTRICTED SESSION clause lets you restrict logon to Oracle Database. You can use this clause regardless of whether your instance has the database dismounted or mounted, open or closed.

- Specify ENABLE to allow only users with RESTRICTED SESSION system privilege to log on to Oracle Database. Existing sessions are not terminated.
  
  This clause applies only to the current instance. Therefore, in an Oracle RAC environment, authorized users without the RESTRICTED SESSION system privilege can still access the database by way of other instances.

- Specify DISABLE to reverse the effect of the ENABLE RESTRICTED SESSION clause, allowing all users with CREATE SESSION system privilege to log on to Oracle Database. This is the default.

See Also:
"Restricting Sessions: Example"

SET ENCRYPTION WALLET Clause

Use this clause to manage database access to the Transparent Data Encryption (TDE) master encryption key. The TDE master encryption key is stored in an external security module, which can be an encryption wallet or Hardware Security Module (HSM).

Although this statement begins with the keyword ALTER, an ALTER SYSTEM SET ENCRYPTION WALLET statement is not a DDL clause. However, you cannot roll back such a statement.
Although this clause begins with the `SET` keyword, do not confuse it with the `alter_system_set_clause`, which allows you to use the `SET` keyword to set the value of initialization parameters. `ENCRYPTION WALLET` is not an initialization parameter.

**OPEN**

When you specify this clause, the database uses the specified password to open the wallet and load the TDE master key into database memory for the duration of the instance, or establish a connection to the HSM in order to send the encrypted table and tablespace keys to the HSM and receive them back decrypted.

- Specify `wallet_password` to retrieve the master encryption key from the encryption wallet. If the wallet is not available or is already open, then the database returns an error. The double quotation marks around `wallet_password` are required.

- Specify `HSM_auth_string` to make the HSM accessible. `HSM_auth_string` is of the form "user_id:password" where:
  - `user_id` is the user ID created for the database using the HSM management interface
  - `password` is the password created for the user ID using the HSM management interface

  The double quotation marks around `HSM_auth_string` are required

**CLOSE**

Use this clause to disable encryption and decryption in your database. The `wallet_password` is required to close an encryption wallet. `HSM_auth_string` is required to disable access to the HSM. Refer to `OPEN` for details on specifying `HSM_auth_string`.

A password is not required to close an auto-open wallet when only an auto-open wallet is present. The password is required to close an auto-open wallet when both an auto-open wallet and an encryption wallet are open. In this case, using `CLOSE` with a password will close the auto-open wallet and the encryption wallet.

---

**See Also:**

*Oracle Real Application Clusters Administration and Deployment Guide* for information on setting encryption wallets in an Oracle Real Application Clusters (Oracle RAC) environment

---

**set_encryption_key**

Use this clause to generate a new TDE master encryption key, if none exists. If there are existing master keys in the HSM or keystore, then this clause rekeys the existing table and tablespace keys, that is, it decrypts all table and tablespace keys with the old master key and reencrypts them with the new master key.

An `ALTER SYSTEM SET ENCRYPTION KEY` statement is a DDL statement and will automatically commit any pending transactions in the schema.

Although this clause begins with the `SET` keyword, do not confuse it with the `alter_system_set_clause`, which allows you to use the `SET` keyword to set the value of initialization parameters. `ENCRYPTION KEY` is not an initialization parameter.
IDENTIFIED BY `wallet_password`

This clause loads the TDE master encryption key from the encryption wallet into memory for access to encrypted data.

- The `certificate_id` is required if you are using PKI asymmetric key pairs as master encryption keys. Specify the integer that identifies the certificate. You can find this value by querying the `CERT_ID` column of the `V$WALLET` dynamic performance view. Do not specify `certificate_id` if you are using symmetric keys, which are the default.
- For `wallet_password`, specify the password used to connect to the security module.

If you specify an invalid `certificate_id` or `wallet_password`, then the database returns an error. The double quotation marks around `certificate_id` and `wallet_password` are required.

**Restriction on IDENTIFIED BY `wallet_password`**

PKI-based master keys, including unified master encryption keys, can only be used with TDE column encryption and an Oracle Wallet, not with HSM.

**Note:**

The use of PKI encryption with Transparent Data Encryption is deprecated. To configure Transparent Data Encryption, use the `ADMINISTER KEY MANAGEMENT` statement. See *Oracle Database Advanced Security Guide* for more information.

IDENTIFIED BY `HSM_auth_string`

This clause creates a master encryption key that will be stored inside the HSM. The master encryption key is used to encrypt or decrypt table keys inside the HSM.

`HSM_auth_string` is of the form "`user_id:password`" where:

- `user_id` is the user ID created for the database using the HSM management interface
- `password` is the password created for the user ID using the HSM management interface

The double quotation marks around `HSM_auth_string` are required.

If you are already using Transparent Data Encryption with an Oracle Wallet and you would like to migrate to an HSM, then specify the `MIGRATE USING wallet_password` clause. This decrypts the existing table and tablespace keys, and then reencrypts them with the newly created, HSM-based, master encryption key. Note that the wallet is still in use after you migrate to an HSM, because it may contain master encryption keys that were used for export files, RMAN backups, or encrypted data in temporary or undo tablespaces or redo log files. After migrating, perform one of the following steps:

- Change the wallet password to the `HSM_auth_string` using Oracle Wallet Manager or the `orapki` command-line tool.
• Create a local auto-open wallet from the encryption wallet and either rename the encryption wallet, or move it out of the directory specified in ENCRYPTION_WALLET_LOCATION in sqlnet.ora. Do not delete the encryption wallet and do not forget the wallet password.

See Also:

• Oracle Database Advanced Security Guide for more information on using Transparent Data Encryption
• The description of the CREATE TABLE "encryption_spec" for information on using that feature to encrypt table columns
• "Establishing a Wallet and Encryption Key: Examples"

shutdown_dispatcher_clause

The SHUTDOWN clause is relevant only if your system is using the shared server architecture of Oracle Database. It shuts down a dispatcher identified by dispatcher_name.

Note:

Do not confuse this clause with the SQL*Plus command SHUTDOWN, which is used to shut down the entire database.

The dispatcher_name must be a string of the form 'Dxxx', where xxx indicates the number of the dispatcher. For a listing of dispatcher names, query the NAME column of the V$DISPATCHER dynamic performance view.

• If you specify IMMEDIATE, then the dispatcher stops accepting new connections immediately and Oracle Database terminates all existing connections through that dispatcher. After all sessions are cleaned up, the dispatcher process shuts down.
• If you do not specify IMMEDIATE, then the dispatcher stops accepting new connections immediately but waits for all its users to disconnect and for all its database links to terminate. Then it shuts down.

REGISTER Clause

Specify REGISTER to instruct the PMON background process to register the instance with the listeners immediately. If you do not specify this clause, then registration of the instance does not occur until the next time PMON executes the discovery routine. As a result, clients may not be able to access the services for as long as 60 seconds after the listener is started.
**See Also:**

*Oracle Database Concepts* and *Oracle Database Net Services Administrator's Guide* for information on the `PMON` background process and listeners.

### alter_system_set_clause

This clause allows you to change parameter values. The `set_parameter_clause` allows you to change the value of a specified initialization parameter. The `USE_STORED_OUTLINES` and `GLOBAL_TOPIC_ENABLED` clauses allow you to change the value of those system parameters.

### set_parameter_clause

You can change the value of many initialization parameters for the current instance, whether you have started the database with a traditional plain-text parameter file (pfile) or with a server parameter file (spfile). *Oracle Database Reference* indicates these parameters in the "Modifiable" category of each parameter description. If you are using a pfile, then the change will persist only for the duration of the instance. However, if you have started the database with an spfile, then you can change the value of the parameter in the spfile itself, so that the new value will occur in subsequent instances.

Oracle Database Reference documents all initialization parameters in full. The parameters fall into three categories:

- **Basic parameters**: Database administrators should be familiar with and consider the setting for all of the basic parameters.
- **Functional categories**: *Oracle Database Reference* also lists the initialization parameters by their functional category.
- **Alphabetical listing**: The Table of Contents of *Oracle Database Reference* contains all initialization parameters in alphabetical order.

The ability to change initialization parameter values depends on whether you have started up the database with a traditional plain-text initialization parameter file (pfile) or with a server parameter file (spfile). To determine whether you can change the value of a particular parameter, query the `ISSYS_MODIFIABLE` column of the `V$PARAMETER` dynamic performance view.

When setting a parameter value, you can specify additional settings as follows:

#### COMMENT

The `COMMENT` clause lets you associate a comment string with this change in the value of the parameter. The comment string cannot contain control characters or a line break. If you also specify `SPFILE`, then this comment will appear in the parameter file to indicate the most recent change made to this parameter.

#### DEFERRED

The `DEFERRED` keyword sets or modifies the value of the parameter for future sessions that connect to the database. Current sessions retain the old value.

You must specify `DEFERRED` if the value of the `ISSYS_MODIFIABLE` column of `V$PARAMETER` for this parameter is `DEFERRED`. If the value of that column is `IMMEDIATE`,
then the `DEFERRED` keyword in this clause is optional. If the value of that column is `FALSE`, then you cannot specify `DEFERRED` in this `ALTER SYSTEM` statement.

---

**CONTAINER**

You can specify the `CONTAINER` clause when you set a parameter value in a CDB. A CDB uses an inheritance model for initialization parameters in which PDBs inherit initialization parameter values from the root. In this case, inheritance means that the value of a particular parameter in the root applies to a particular PDB.

A PDB can override the root's setting for some parameters, which means that a PDB has an inheritance property for each initialization parameter that is either true or false. The inheritance property is true for a parameter when the PDB inherits the root's value for the parameter. The inheritance property is false for a parameter when the PDB does not inherit the root's value for the parameter.

The inheritance property for some parameters must be true. For other parameters, you can change the inheritance property by running the `ALTER SYSTEM SET` statement to set the parameter when the current container is the PDB. If `ISPDB_MODIFIABLE` is `TRUE` for an initialization parameter in the `V$SYSTEM_PARAMETER` view, then the inheritance property can be false for the parameter.

- If you specify `CONTAINER = ALL`, then the parameter setting applies to all containers in the CDB, including the root and all of the PDBs. The current container must be the root.
  
  Specifying `ALL` sets the inheritance property to true for the parameter in all PDBs.

- If you specify `CONTAINER = CURRENT`, then the parameter setting applies only to the current container. When the current container is the root, the parameter setting applies to the root and to any PDB with an inheritance property of true for the parameter.

If you omit this clause, then `CONTAINER = CURRENT` is the default.

---

**SCOPE**

The `SCOPE` clause lets you specify when the change takes effect. The behavior of this clause depends on whether you are connected to a non-CDB, a CDB root, or a PDB.

When you issue the `ALTER SYSTEM` statement while connected to a non-CDB or a CDB root, the scope depends on whether you started up the database using a traditional plain-text parameter file (pfile) or server parameter file (spfile).
• **MEMORY** indicates that the change is made in memory, takes effect immediately, and persists until the database is shut down. If you started up the database using a parameter file (pfile), then this is the only scope you can specify.

• **SPFILE** indicates that the change is made in the server parameter file. The new setting takes effect when the database is next shut down and started up again. You must specify SPFILE when changing the value of a static parameter that is described as not modifiable in *Oracle Database Reference*.

• **BOTH** indicates that the change is made in memory and in the server parameter file. The new setting takes effect immediately and persists after the database is shut down and started up again.

If a server parameter file was used to start up the database, then **BOTH** is the default. If a parameter file was used to start up the database, then **MEMORY** is the default, as well as the only scope you can specify.
