<td>When you specify this transform, Data Pump uses the contents of the string as the IM clause for all objects being imported that have an IM clause in their DDL. This transform is useful when you want to override the IM clause for an object in the dump file.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>Note:</strong> The INMEMORY_CLAUSE transform is available only in Oracle Database 12c Release (12.1.0.2) or higher.</td>
</tr>
</tbody>
</table>
### Table 45-19 (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| LOB_STORAGE      | TEXT     | TABLE       | Specifies the storage type to use for LOB segments. The options are as follows:  
  - **SECUREFILE** - LOB storage is returned as **SECUREFILE**  
  - **BASICFILE** - LOB storage is returned as **BASICFILE**  
  - **DEFAULT** - The keyword (SECUREFILE or BASICFILE) is omitted in the LOB STORE AS clause.  
  - **NO_CHANGE** - LOB segments are created with the same storage they had in the source database. This is the default. Specifying this transform changes the LOB storage for all tables in the job, including tables that provide storage for materialized views. |
| OID              | NUMBER   | TYPE        | If zero, inhibits the assignment of the exported OID during type or table creation. Instead, a new OID will be assigned. Use of this transform on Object Tables will cause breakage in REF columns that point to the table. Defaults to 1.                                                                                                    |
| PCTSPACE         | NUMBER   | TABLE, INDEX, TABLESPACE | Specifies a percentage multiplier used to alter extent allocations and data file sizes. Used to shrink large tablespaces for testing purposes. Defaults to 100.                                                                                                                      |
| SEGMENT_ATTRIBUTES | NUMBER   | TABLE, INDEX | If nonzero (TRUE), emit storage segment parameters. Defaults to 1.                                                                                                                                                                                                                                                                      |
| SEGMENT_CREATION | NUMBER   | TABLE       | If nonzero (TRUE), the SQL SEGMENT CREATION clause is added to the CREATE TABLE statement. That is, the CREATE TABLE statement will explicitly say either SEGMENT CREATION DEFERRED or SEGMENT CREATION IMMEDIATE. If the value is FALSE, then the SEGMENT CREATION clause is omitted from the CREATE TABLE statement. Set this parameter to FALSE to use the default segment creation attributes for the table(s) being loaded. Defaults to nonzero (TRUE). |
| STORAGE          | NUMBER   | TABLE       | If nonzero (TRUE), emit storage clause. (Ignored if SEGMENT_ATTRIBUTES is zero.) Defaults to nonzero (TRUE).                                                                                                                                                                                                                       |
Table 45-19  (Cont.) Transforms Provided by the METADATA_TRANSFORM Procedure

<table>
<thead>
<tr>
<th>Name</th>
<th>Datatype</th>
<th>Object Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_COMPRESSION_CLAUSE</td>
<td>TEXT</td>
<td>TABLE</td>
<td>Specifies a table compression clause (for example, COMPRESS BASIC) to use when the table is created. Specify NONE to omit the table compression clause. The table will have the default compression for the tablespace. Specifying this transform changes the compression type for all tables in the job, including tables that provide storage for materialized views.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_ARGVAL. This message can indicate any of the following:
  - The mode is transportable, which doesn't support transforms.
  - The job's mode does not include the specified object_type.
  - The transform has already been specified for the specified value and object_type.
- INVALID_OPERATION. Transforms are only supported for SQL_FILE and Import operations. The job's operation was Export which does not support the use of metadata transforms.
- INVALID_STATE. The user called METADATA_TRANSFORM after the job had started (that is, the job was not in the defining state).
- INCONSISTENT_ARGS. There was no value supplied or it was of the wrong datatype for the transform.
- PRIVILEGE_ERROR. A nonprivileged user attempted to do a REMAP_SCHEMA to a different user's schema or a REMAP_DATAFILE.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The METADATA_TRANSFORM procedure is only supported for Import and SQL_FILE operations. It enables you to apply commonly desired, predefined transformations to the definition of objects as part of the transfer. If you need transforms that are not supported within this procedure, you should do a preliminary SQL_FILE operation to produce a SQL script corresponding to the dump file set. By editing the DDL directly and then executing it, you can produce any transformations that you need.
- Transforms for the DataPump API are a subset of the transforms implemented by the DBMS_METADATA.SET_TRANSFORM_PARAMETER API. Multiple transforms can be defined for a single job. However, each transform defined must be unique according its
parameters. That is, two transforms cannot specify conflicting or redundant transformations.

45.5.12 OPEN Function

This function is used to declare a new job using the Data Pump API.

The handle that is returned is used as a parameter for calls to all other procedures (but not to the ATTACH function).

Syntax

```sql
DBMS_DATAPUMP.OPEN (
    operation    IN VARCHAR2,
    job_mode         IN VARCHAR2,
    remote_link  IN VARCHAR2 DEFAULT NULL,
    job_name     IN VARCHAR2 DEFAULT NULL,
    version      IN VARCHAR2 DEFAULT 'COMPATIBLE')
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>operation</td>
<td>The type of operation to be performed. Table 45-21 contains descriptions of valid operation types.</td>
</tr>
<tr>
<td>job_mode</td>
<td>The scope of the operation to be performed. Table 45-22 contains descriptions of valid modes. Specifying NULL generates an error.</td>
</tr>
<tr>
<td>remote_link</td>
<td>If the value of this parameter is non-null, it provides the name of a database link to the remote database that will be the source of data and metadata for the current job.</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job. The name is limited to 128 characters; it will be truncated if more than 128 characters are used. It may consist of printable characters and spaces. It is implicitly qualified by the schema of the user executing the OPEN function and must be unique to that schema (that is, there cannot be other Data Pump jobs using the same name). The name is used to identify the job both within the API and with other database components such as identifying the job in the DBA_RESUMABLE view if the job becomes suspended through lack of resources. If no name is supplied, a system generated name will be provided for the job in the following format: &quot;SYS_&lt;Operation&gt;_&lt;<em>Mode&gt;</em>%N&quot;. The default job name is formed where %N expands to a two-digit incrementing integer starting at '01' (for example, &quot;SYS_IMPORT_FULL_03&quot;). The name supplied for the job will also be used to name the master table and other resources associated with the job.</td>
</tr>
</tbody>
</table>
Table 45-20  (Cont.) OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>version</td>
<td>The version of database objects to be extracted. This option is only valid for Export, network Import, and SQL_FILE operations. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows:</td>
</tr>
<tr>
<td></td>
<td>• COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</td>
</tr>
<tr>
<td></td>
<td>• LATEST - the version of the metadata corresponds to the database version.</td>
</tr>
<tr>
<td></td>
<td>• A specific database version, for example, ‘11.0.0’.</td>
</tr>
<tr>
<td></td>
<td>Specify a value of 12 to allow all existing database features, components, and options to be exported from Oracle Database 11g release 2 (11.2.0.3) or later into an Oracle Database 12c Release 1 (12.1) (either a multitenant container database (CDB) or a non-CDB).</td>
</tr>
</tbody>
</table>

Table 45-21 describes the valid operation types for the OPEN function.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPORT</td>
<td>Saves data and metadata to a dump file set or obtains an estimate of the size of the data for an operation.</td>
</tr>
<tr>
<td>IMPORT</td>
<td>Restores data and metadata from a dump file set or across a database link.</td>
</tr>
<tr>
<td>SQL_FILE</td>
<td>Displays the metadata within a dump file set, or from across a network link, as a SQL script. The location of the SQL script is specified through the ADD_FILE procedure.</td>
</tr>
</tbody>
</table>

Table 45-22 describes the valid modes for the OPEN function.

Table 45-22  Valid Modes for the OPEN Function

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FULL</td>
<td>Operates on the full database or full dump file set except for Oracle Database internal schemas. (Some tables from Oracle Database internal schemas may be registered to be exported and imported in full operations in order to provide consistent metadata during import.)</td>
</tr>
<tr>
<td></td>
<td>The TRANSPORTABLE parameter can be set to ALWAYS during a full database export in order to move data via transportable tablespaces rather than in the Data Pump dump file.</td>
</tr>
<tr>
<td>SCHEMA</td>
<td>Operates on a set of selected schemas. Defaults to the schema of the current user. All objects in the selected schemas are processed. In SCHEMA mode, you cannot specify Oracle-internal schemas (for example, SYS, XDB, ORDSYS, MDSYS, CTXSYS, ORDDPLUGINS, or LBACSYS).</td>
</tr>
</tbody>
</table>
Table 45-22  (Cont.) Valid Modes for the OPEN Function

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE</td>
<td>Operates on a set of selected tables. Defaults to all of the tables in the current user's schema. Only tables and their dependent objects are processed.</td>
</tr>
<tr>
<td>TABLESPACE</td>
<td>Operates on a set of selected tablespaces. No defaulting is performed. Tables that have storage in the specified tablespaces are processed in the same manner as in Table mode.</td>
</tr>
<tr>
<td>TRANSPORTABLE</td>
<td>Operates on metadata for tables (and their dependent objects) within a set of selected tablespaces to perform a transportable tablespace export/import.</td>
</tr>
</tbody>
</table>

Return Values

- An opaque handle for the job. This handle is used as input to the following procedures: ADD_FILE, CREATE_JOB_VIEW, DATA_FILTER, DETACH, GET_STATUS, LOG_ENTRY, LOG_ERROR, METADATA_FILTER, METADATA_REMAP, METADATA.Transform, SET_PARALLEL, SET_PARAMETER, START_JOB, STOP_JOB, and WAIT_FOR_JOB

Exceptions

- INVALID_ARGVAL. An invalid operation or mode was specified. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- JOB_EXISTS. A table already exists with the specified job name.
- PRIVILEGE_ERROR. The user does not have the necessary privileges or roles to use the specified mode.
- INTERNAL_ERROR. The job was created under the wrong schema or the master table was of the wrong format.
- SUCCESS_WITH_INFO. The function succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- When the job is created, a master table is created for the job under the caller's schema within the caller's default tablespace. A handle referencing the job is returned that attaches the current session to the job. Once attached, the handle remains valid until either an explicit or implicit detach occurs. The handle is only valid in the caller's session. Other handles can be attached to the same job from a different session by using the ATTACH function.
- If the call to the OPEN function fails, call the GET_STATUS procedure with a null handle to retrieve additional information about the failure.
45.5.13 SET_PARALLEL Procedure

This procedure adjusts the degree of parallelism within a job.

Syntax

```
DBMS_DATAPUMP.SET_PARALLEL(
    handle  IN NUMBER,
    degree  IN NUMBER);
```

Parameters

Table 45-23  SET_PARALLEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>degree</td>
<td>The maximum number of worker processes that can be used for the job. You use this parameter to adjust the amount of resources used for a job.</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_HANDLE. The specified handle is not attached to a Data Pump job.
- INVALID_OPERATION. The SET_PARALLEL procedure is only valid for export and import operations.
- INVALID_ARGVAL. An invalid value was supplied for an input parameter.
- SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
- NO_SUCH_JOB. The specified job does not exist.

Usage Notes

- The SET_PARALLEL procedure is only available in the Enterprise Edition of the Oracle database.
- The SET_PARALLEL procedure can be executed by any session attached to a job. The job must be in one of the following states: Defining, Idling, or Executing.
- The effect of decreasing the degree of parallelism may be delayed because ongoing work needs to find an orderly completion point before SET_PARALLEL can take effect.
- Decreasing the parallelism will not result in fewer worker processes associated with the job. It will only decrease the number of worker processes that will be executing at any given time.
- Increasing the parallelism will take effect immediately if there is work that can be performed in parallel.
- The degree of parallelism requested by a user may be decreased based upon settings in the resource manager or through limitations introduced by the PROCESSES or SESSIONS initialization parameters in the init.ora file.
• To parallelize an Export job to a degree of \( n \), the user should supply \( n \) files in the dump file set or specify a substitution variable in a file specification. Otherwise, some of the worker processes will be idle while waiting for files.

• SQL_FILE operations always operate with a degree of 1. Jobs running in the Transportable mode always operate with a degree of 1.

45.5.14 SET_PARAMETER Procedures

This procedure is used to specify job-processing options.

Syntax

DBMS_DATAPUMP.SET_PARAMETER(
    handle       IN NUMBER,
    name         IN VARCHAR2,
    value        IN VARCHAR2);

DBMS_DATAPUMP.SET_PARAMETER (  
    handle      IN NUMBER,  
    name        IN VARCHAR2,  
    value       IN NUMBER);

Parameters

Table 45-24  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to the OPEN function.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the parameter. Table 45-25 describes the valid parameter names.</td>
</tr>
<tr>
<td>value</td>
<td>The value for the specified parameter</td>
</tr>
</tbody>
</table>

Table 45-25 describes the valid options for the name parameter of the SET_PARAMETER procedure.

Table 45-25  Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_COMMAND</td>
<td>TEXT</td>
<td>All</td>
<td>An opaque string used to describe the current operation from the client's perspective. The command-line procedures will use this string to store the original command used to invoke the job.</td>
</tr>
</tbody>
</table>
### Table 45-25  (Cont.) Valid Options for the *name* Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>COMPRESSION</strong></td>
<td>TEXT</td>
<td>Export</td>
<td>Allows you to trade off the size of the dump file set versus the time it takes to perform export and import operations. The <strong>DATA_ONLY</strong> option compresses only user data in the dump file set. The <strong>METADATA_ONLY</strong> option compresses only metadata in the dump file set. The <strong>ALL</strong> option compresses both user data and metadata. The <strong>NONE</strong> option stores the dump file set in an uncompressed format. The <strong>METADATA_ONLY</strong> and <strong>NONE</strong> options require a job version of 10.2 or later. All other options require a job version of 11.1 or later. <strong>Default=METADATA_ONLY</strong></td>
</tr>
</tbody>
</table>
| **COMPRESSION_ALGOR**| TEXT     | Export               | Indicates the compression algorithm is to be used when compressing dump file data. The choices are as follows:  
  - **BASIC**—Offers a good combination of compression ratios and speed; the algorithm used is the same as in previous versions of Oracle Data Pump.  
  - **LOW**—Least impact on backup throughput and suited for environments where CPU resources are the limiting factor.  
  - **MEDIUM**—Recommended for most environments. This option, like the **BASIC** option, provides a good combination of compression ratios and speed, but it uses a different algorithm than **BASIC**.  
  - **HIGH**—Best suited for exports over slower networks where the limiting factor is network speed.  
To use this feature, the **COMPATIBLE** initialization parameter must be set to at least 12.0.0. This feature requires that the Oracle Advanced Compression option be enabled. |
| **DATA_ACCESS_METHOD**| TEXT     | Export and Import    | Allows you to specify an alternative method to unload data if the default method does not work for some reason. The choices are **AUTOMATIC**, **DIRECT_PATH**, or **EXTERNAL_TABLE**. Oracle recommends that you use the default option (**AUTOMATIC**) whenever possible because it allows Data Pump to automatically select the most efficient method. |
Table 45-25  (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATA_OPTIONS</td>
<td>Number</td>
<td>Export and Import</td>
<td>A bitmask to supply special options for processing the job. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_SKID$$_CONST$$_ERR</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_XML$$TYPE$$_CLOB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_DISAB$$L$$_APPEND$$_HINT</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_GRP$$ PART$$_TAB</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_TRUST$$_EXIST$$_TB$$_PAR</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• KU$$_DATAOPT$$_CONT$$LOAD$$_ON$$_FMT$$_ERR</td>
</tr>
</tbody>
</table>

Export supports the value KU$$_DATAOPT$$_XML$$TYPE$$_CLOB. This option stores compressed XML$$Type$$ columns in the dump file in CLOB format rather than as XML documents.

**Note:** XML$$Type$$ stored as CLOB is deprecated as of Oracle Database 12c Release 1 (12.1).

Import supports the value KU$$_DATAOPT$$_SKID$$_CONST$$_ERR. This option specifies that if constraint violations occur while data is being imported into user tables, the rows that cause the violations will be rejected and the load will continue. If this option is not set, a constraint error will abort the loading of the entire partition (or table for unpartitioned tables). Setting this option may affect performance, especially for pre-existing tables with unique indexes or constraints.

Import also supports the value KU$$_DATAOPT$$_DISAB$$L$$_APPEND$$_HINT. This option prevents the append hint from being applied to the data load. Disabling the APPEND hint can be useful if there is a small set of data objects to load that already exist in the database and some other application may be concurrently accessing one or more of the data objects.

Data Pump Export supports the value KU$$_DATAOPT$$_GRP$$ PART$$_TAB. This option tells Data Pump to unload all table data in one operation rather than unload each table partition as a separate operation. As a result, the definition of the table will not matter at import time because Import will see one partition of data that will be loaded into the entire table.

Data Pump Import supports the value KU$$_DATAOPT$$_TRUST$$_EXIST$$_TB$$_PAR. This option tells Data Pump to load partition data in parallel into existing tables.

Use of the DATA_OPTIONS parameter requires that the version on the OPEN function be set to 11.1 or later.

Default=0

Data Pump Import supports the value KU$$_DATAOPT$$_CONT$$LOAD$$_ON$$_FMT$$_ERR. This option tells Data Pump to skip forward to the start of the next granule if a stream format error is encountered while loading table data. Most stream format errors are caused by corrupt dump files. This value can be used if Data Pump encounters a stream format error and the original export database is not available to export the table data again. If Data Pump skips over data, not all data...
### Table 45-25  (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPTION</td>
<td>TEXT</td>
<td>Export</td>
<td>from the source database is imported potentially skipping hundreds or thousands of rows. Specifies what to encrypt in the dump file set, as follows: ALL enables encryption for all data and metadata in the export operation. DATA_ONLY specifies that only data is written to the dump file set in encrypted format. ENCRYPTED_COLUMNS_ONLY specifies that only encrypted columns are written to the dump file set in encrypted format. METADATA_ONLY specifies that only metadata is written to the dump file set in encrypted format. NONE specifies that no data is written to the dump file set in encrypted format. This parameter requires a job version of 11.1 or later. The default value depends upon the combination of encryption-related parameters that are used. To enable encryption, either ENCRYPTION or ENCRYPTION_PASSWORD or both, must be specified. If only ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to ALL. If neither ENCRYPTION nor ENCRYPTION_PASSWORD is specified, then ENCRYPTION defaults to NONE. To specify ALL, DATA_ONLY, or METADATA_ONLY, the COMPATIBLE initialization parameter must be set to at least 11.1. NOTE: If the data being exported includes SecureFiles that you want to be encrypted, then you must specify ENCRYPTION=ALL to encrypt the entire dump file set. Encryption of the entire dump file set is the only way to achieve encryption security for SecureFiles during a Data Pump export operation.</td>
</tr>
<tr>
<td>ENCRYPTION_ALGORITHM</td>
<td>TEXT</td>
<td>Export</td>
<td>Identifies which cryptographic algorithm should be used to perform encryption. Possible values are AES128, AES192, and AES256. The ENCRYPTION_ALGORITHM parameter requires that you also specify either ENCRYPTION or ENCRYPTION_PASSWORD; otherwise an error is returned. See Oracle Database Advanced Security Guide for information about encryption algorithms. This parameter requires a job version of 11.1 or later. Default=AES128</td>
</tr>
</tbody>
</table>
Table 45-25  (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ENCRYPTION_MODE</td>
<td>TEXT</td>
<td>Export</td>
<td>Identifies the types of security used for encryption and decryption. The values are as follows: PASSWORD requires that you provide a password when creating encrypted dump file sets. You will need to provide the same password when you import the dump file set. PASSWORD mode requires that you also specify the ENCRYPTION_PASSWORD parameter. The PASSWORD mode is best suited for cases in which the dump file set will be imported into a different or remote database, but which must remain secure in transit. TRANSPARENT allows an encrypted dump file set to be created without any intervention from a database administrator (DBA), provided the required Oracle Encryption Wallet is available. Therefore, the ENCRYPTION_PASSWORD parameter is not required, and will in fact, cause an error if it is used in TRANSPARENT mode. This encryption mode is best suited for cases in which the dump file set will be imported into the same database from which it was exported. DUAL creates a dump file set that can later be imported using either the Oracle Encryption Wallet or the password that was specified with the ENCRYPTION_PASSWORD parameter. DUAL mode is best suited for cases in which the dump file set will be imported on-site using the Oracle Encryption Wallet, but which may also need to be imported offsite where the Oracle Encryption Wallet is not available. When you use the ENCRYPTION_MODE parameter, you must also use either the ENCRYPTION or ENCRYPTION_PASSWORD parameter. Otherwise, an error is returned. To use DUAL or TRANSPARENT mode, the COMPATIBLE initialization parameter must be set to at least 11.1. The default mode depends on which other encryption-related parameters are used. If only ENCRYPTION is specified, then the default mode is TRANSPARENT. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is open, then the default is DUAL. If ENCRYPTION_PASSWORD is specified and the Oracle Encryption Wallet is closed, then the default is PASSWORD.</td>
</tr>
<tr>
<td>ENCRYPTION_PASSWORD</td>
<td>TEXT</td>
<td>Export and Import</td>
<td>For export operations, this parameter is required if ENCRYPTION_MODE is set to either PASSWORD or DUAL. It is also required for transportable export/import operations (job mode=FULL and TRANSPORTABLE=ALWAYS) when the database includes either encrypted tablespaces or tables with encrypted columns.</td>
</tr>
</tbody>
</table>

### Table 45-25 (Cont.) Valid Options for the name Parameter in the SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Datatype</th>
<th>Supported Operations</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSPORTABLE</td>
<td>TEXT</td>
<td>Export (and network import or full-mode import)</td>
<td>This option is for export operations done in table mode, and also for full-mode imports and network imports. It allows the data to be moved using transportable tablespaces. In table-mode storage segments in the moved tablespaces that are not associated with the parent schemas (tables) will be reclaimed at import time. If individual partitions are selected in a table-mode job, only the tablespaces referenced by those partitions will be moved. During import, the moved partitions can only be reconstituted as tables by using the PARTITION_OPTIONS=DEPARTITION parameter. Use of the TRANSPORTABLE parameter prohibits the subsequent import of the dump file into a database at a lower version or using different character sets. Additionally, the data files may need to be converted if the target database is on a different platform. In table-mode, the TRANSPORTABLE parameter is not allowed if a network link is supplied on the OPEN call. The possible values for this parameter are as follows: ALWAYS - data is always moved by moving data files. This option is valid only for table mode and full mode. NEVER - data files are never used for copying user data This parameter requires a job version of 11.1 or later This parameter requires a job version of 12.1 or later when the job mode is FULL. Default=NEVER</td>
</tr>
<tr>
<td>TTS_FULL_CHECK</td>
<td>NUMBER</td>
<td>Export</td>
<td>If nonzero, verifies that a transportable tablespace set has no dependencies (specifically, IN pointers) on objects outside the set, and vice versa. Only valid for Transportable mode Exports. Default=0</td>
</tr>
<tr>
<td>USER_METADATA</td>
<td>NUMBER</td>
<td>Export and network Import</td>
<td>For schema-mode operations, specifies that the metadata to re-create the users’ schemas (for example, privilege grants to the exported schemas) should also be part of the operation if set to nonzero. Users must be privileged to explicitly set this parameter. The USER_METADATA parameter cannot be used in Table, Tablespace, or Transportable Tablespace mode. Default=1 if user has DATAPUMP_EXP_FULL_DATABASE role; 0 otherwise.</td>
</tr>
</tbody>
</table>

**Exceptions**

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_ARGVAL.** This exception could be due to any of the following causes:
  - An invalid name was supplied for an input parameter
  - The wrong datatype was used for value
  - A value was not supplied
– The supplied value was not allowed for the specified parameter name
– A flashback parameter had been established after a different flashback parameter had already been established
– A parameter was specified that did not support duplicate definitions
  • INVALID_OPERATION. The operation specified is invalid in this context.
  • INVALID_STATE. The specified job is not in the Defining state.
  • INCONSISTENT_ARGS. Either the specified parameter is not supported for the current operation type or it is not supported for the current mode.
  • PRIVILEGE_ERROR. The user does not have the DATAPUMP_EXP_FULL_DATABASE or DATAPUMP_IMP_FULL_DATABASE role required for the specified parameter.
  • SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS procedure.
  • NO_SUCH_JOB. The specified job does not exist.

Usage Notes
  • The SET_PARAMETER procedure is used to specify optional features for the current job. See Table 45-25 for a list of supported options.

45.5.15 START_JOB Procedure

This procedure begins or resumes job execution.

Syntax

```sql
DBMS_DATAPUMP.START_JOB (  
  handle       IN NUMBER,  
  skip_current IN NUMBER DEFAULT 0,  
  abort_step   IN NUMBER DEFAULT 0,  
  cluster_ok   IN NUMBER DEFAULT 1,  
  service_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function.</td>
</tr>
<tr>
<td>skip_current</td>
<td>If nonzero, causes actions that were ‘in progress’ on a previous execution of the job to be skipped when the job restarts. The skip will only be honored for Import jobs. This mechanism allows the user to skip actions that trigger fatal bugs and cause the premature termination of a job. Multiple actions can be skipped on a restart. The log file will identify which actions are skipped. If a domain index was being processed, all pieces of the domain index are skipped even if the error occurred in only a subcomponent of the domain index. A description of the actions skipped is entered into the log file. <code>skip_current</code> is ignored for the initial <code>START_JOB</code> in a job. If zero, no data or metadata is lost upon a restart.</td>
</tr>
</tbody>
</table>
Table 45-26  (Cont.) START_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abort_step</td>
<td>Value must be 0. Inserting values other than 0 into this argument will have unintended consequences.</td>
</tr>
<tr>
<td>cluster_ok</td>
<td>If = 0, all workers are started on the current instance. Otherwise, workers are started on instances usable by the job.</td>
</tr>
<tr>
<td>service_name</td>
<td>If specified, indicates a service name used to constrain the job to specific instances or to a specific resource group.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID_STATE.** The causes of this exception can be any of the following:
  - No files have been defined for an Export, non-network Import, or SQL_FILE job
  - An ADD_FILE procedure has not been called to define the output for a SQL_FILE job
  - A TABLESPACE_DATAFILE parameter has not been defined for a Transportable Import job
  - A TABLESPACE_EXPR metadata filter has not been defined for a Transportable or Tablespace mode Export or Network job
  - The dump file set on an Import or SQL_FILE job was either incomplete or missing a master table specification
- **INVALID_OPERATION.** Unable to restore master table from a dump file set.
- **INTERNAL_ERROR.** An inconsistency was detected when the job was started. Additional information may be available through the GET_STATUS procedure.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- When this procedure is called to request that the corresponding job be started or restarted, the state of the job is changed from either the Defining or Idling state to the Executing state.
- If the SET_PARALLEL procedure was not called prior to the START_JOB procedure, the initial level of parallelism used in the job will be 1. If SET_PARALLEL was called prior to the job starting, the degree specified by the last SET_PARALLEL call determines the parallelism for the job. On restarts, the parallelism is determined by the previous parallel setting for the job, unless it is overridden by another SET_PARALLEL call.
- To restart a stopped job, an ATTACH function must be performed prior to executing the START_JOB procedure.
45.5.16 STOP_JOB Procedure

This procedure terminates a job, but optionally, preserves the state of the job.

Syntax

```sql
DBMS_DATAPUMP.STOP_JOB (
  handle      IN NUMBER,
  immediate   IN NUMBER DEFAULT 0,
  keep_master IN NUMBER DEFAULT NULL,
  delay       IN NUMBER DEFAULT 60);
```

Parameters

**Table 45-27  STOP_JOB Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of a job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.</td>
</tr>
<tr>
<td>immediate</td>
<td>If nonzero, the worker processes are aborted immediately. This halts the job quickly, but parts of the job will have to be rerun if the job is ever restarted. If zero, the worker processes are allowed to complete their current work item (either metadata or table data) before they are terminated. The job is placed in a Stop Pending state while the workers finish their current work.</td>
</tr>
<tr>
<td>keep_master</td>
<td>If nonzero, the master table is retained when the job is stopped. If zero, the master table is dropped when the job is stopped. If the master table is dropped, the job will not be restartable. If the master table is dropped during an export job, the created dump files are deleted.</td>
</tr>
<tr>
<td>delay</td>
<td>The number of seconds to wait until other attached sessions are forcibly detached. The delay allows other sessions attached to the job to be notified that a stop has been performed. The job keeps running until either all clients have detached or the delay has been satisfied. If no delay is specified, then the default delay is 60 seconds. If a shorter delay is used, clients might not be able to retrieve the final messages for the job through the GET_STATUS procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- **INVALID_HANDLE.** The specified handle is not attached to a Data Pump job.
- **INVALID STATE.** The job is already in the process of being stopped or completed.
- **SUCCESS_WITH_INFO.** The procedure succeeded, but further information is available through the GET_STATUS procedure.
- **NO_SUCH_JOB.** The specified job does not exist.

Usage Notes

- This procedure is used to request that the corresponding job stop executing.
- The termination of a job that is in an Executing state may take several minutes to complete in an orderly fashion.
- For jobs in the Defining, Idling, or Completing states, this procedure is functionally equivalent to the DETACH procedure.
• Once a job is stopped, it can be restarted using the ATTACH function and START_JOB procedures, provided the master table and the dump file set are left intact.

• If the KEEP_MASTER parameter is not specified, and the job is in the Defining state or has a mode of Transportable, the master table is dropped. Otherwise, the master table is retained.

45.5.17 WAIT_FOR_JOB Procedure

This procedure runs a job until it either completes normally or stops for some other reason.

Syntax

DBMS_DATAPUMP.WAIT_FOR_JOB ( handle IN NUMBER, job_state OUT VARCHAR2);

Parameters

Table 45-28 WAIT_FOR_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle of the job. The current session must have previously attached to the handle through a call to either the OPEN or ATTACH function. At the end of the procedure, the user is detached from the handle.</td>
</tr>
<tr>
<td>job_state</td>
<td>The state of the job when it has stopped executing; either STOPPED or COMPLETED.</td>
</tr>
</tbody>
</table>

Exceptions

• SUCCESS_WITH_INFO. The procedure succeeded, but further information is available through the GET_STATUS API.

• INVALID_HANDLE. The job handle is no longer valid.

Usage Notes

This procedure provides the simplest mechanism for waiting for the completion of a Data Pump job. The job should be started before calling WAIT_FOR_JOB. When WAIT_FOR_JOB returns, the job will no longer be executing. If the job completed normally, the final status will be COMPLETED. If the job stopped executing because of a STOP_JOB request or an internal error, the final status will be STOPPED.
The `DBMS_DB_VERSION` package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

### See Also:

*Oracle Database PL/SQL Language Reference* regarding conditional compilation

This package contains the following topics:

- Overview
- Constants
- Examples

#### 46.1 DBMS_DB_VERSION Overview

The `DBMS_DB_VERSION` package specifies the Oracle version numbers and other information useful for simple conditional compilation selections based on Oracle versions.

The package for the Oracle Database 12c Release 2 version is shown below.

```plsql
PACKAGE DBMS_DB_VERSION IS
  VERSION CONSTANT PLS_INTEGER := 12; -- RDBMS version number
  RELEASE CONSTANT PLS_INTEGER := 2;  -- RDBMS release number
  ver_le_9_1    CONSTANT BOOLEAN := FALSE;
  ver_le_9_2    CONSTANT BOOLEAN := FALSE;
  ver_le_9      CONSTANT BOOLEAN := FALSE;
  ver_le_10_1   CONSTANT BOOLEAN := FALSE;
  ver_le_10_2   CONSTANT BOOLEAN := FALSE;
  ver_le_10     CONSTANT BOOLEAN := FALSE;
  ver_le_11_1   CONSTANT BOOLEAN := FALSE;
  ver_le_11_2   CONSTANT BOOLEAN := FALSE;
  ver_le_11     CONSTANT BOOLEAN := FALSE;
  ver_le_12_1   CONSTANT BOOLEAN := FALSE;
  ver_le_12_2   CONSTANT BOOLEAN := TRUE;
  ver_le_12     CONSTANT BOOLEAN := TRUE;
END DBMS_DB_VERSION;
```

The boolean constants follow a naming convention. Each constant gives a name for a boolean expression. For example:

- `VER_LE_9_1` represents version \( \leq 9 \) and release \( \leq 1 \)
- `VER_LE_10_2` represents version \( \leq 10 \) and release \( \leq 2 \)
• **VER_LE_10** represents version <= 10

A typical usage of these boolean constants is:

```sql
$IF DBMS_DB_VERSION.VER_LE_10 $THEN
    version 10 and earlier code
$ELSIF DBMS_DB_VERSION.VER_LE_11 $THEN
    version 11 code
$ELSE
    version 12 and later code
$END
```

This code structure will protect any reference to the code for version 12. It also prevents the controlling package constant `DBMS_DB_VERSION.VER_LE_11` from being referenced when the program is compiled under version 10. A similar observation applies to version 11. This scheme works even though the static constant `VER_LE_11` is not defined in version 10 database because conditional compilation protects the `$ELSIF` from evaluation if `DBMS_DB_VERSION.VER_LE_10` is TRUE.

### 46.2 DBMS_DB_VERSION Constants

The `DBMS_DB_VERSION` package contains different constants for different Oracle Database releases.

The Oracle Database 12c Release 2 version of the `DBMS_DB_VERSION` package uses the constants shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VERSION</td>
<td>PLS_INTEGER</td>
<td>12</td>
<td>Current version</td>
</tr>
<tr>
<td>RELEASE</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Current release</td>
</tr>
<tr>
<td>VER_LE_9</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;= 9</td>
</tr>
<tr>
<td>VER_LE_9_1</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;= 9 and release &lt;= 1</td>
</tr>
<tr>
<td>VER_LE_9_2</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;= 9 and release &lt;= 2</td>
</tr>
<tr>
<td>VER_LE_10</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;= 10</td>
</tr>
<tr>
<td>VER_LE_10_1</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;=10 and release &lt;= 1</td>
</tr>
<tr>
<td>VER_LE_10_2</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;=10 and release &lt;= 2</td>
</tr>
<tr>
<td>VER_LE_11</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version &lt;= 11</td>
</tr>
<tr>
<td>VER_LE_11_1</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version&lt;=11 and release &lt;= 1</td>
</tr>
<tr>
<td>VER_LE_11_2</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version&lt;=11 and release &lt;= 2</td>
</tr>
<tr>
<td>VER_LE_12_1</td>
<td>BOOLEAN</td>
<td>FALSE</td>
<td>Version&lt;=12 and release &lt;= 1</td>
</tr>
<tr>
<td>VER_LE_12_2</td>
<td>BOOLEAN</td>
<td>TRUE</td>
<td>Version&lt;=12 and release &lt;= 2</td>
</tr>
<tr>
<td>VER_LE_12</td>
<td>BOOLEAN</td>
<td>TRUE</td>
<td>Version &lt;=12</td>
</tr>
</tbody>
</table>
This example uses conditional compilation to guard new features.

The DBMS_DBCOMP package performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases. It contains one procedure, DBCOMP, which can be executed at any time. (It does not require that the DB_LOST_WRITE_PROTECT initialization parameter be enabled.)

This chapter contains the following sections:

- Using DBMS_DBCOMP
- DBMS_DBCOMP Security Model
- DBCOMP Procedure

Related Topics
- Oracle Data Guard Concepts and Administration

47.1 Using DBMS_DBCOMP

The DBMS_DBCOMP.DBCOMP procedure assumes that there is one primary database and one or more physical standby databases. The databases should be at least mounted before block comparison.

**Note:**

Logical standby databases, far sync instances, and cascaded standbys cannot be the target database for the DBMS_DBCOMP.DBCOMP procedure.

While this procedure is running, you can monitor progress of the compare operation by querying the V$SESSION_LONGOPS view. For example:

```sql
SQL> SELECT target_desc, sofar, totalwork FROM V$SESSION_LONGOPS WHERE opname = 'BlockCompare';
```

The output might look as follows:

<table>
<thead>
<tr>
<th>TARGET_DESC</th>
<th>SO FAR</th>
<th>TOTALWORK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compared Blocks</td>
<td>23914</td>
<td>340639</td>
</tr>
<tr>
<td>Lost Writes</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>

The results can be interpreted as follows:

- The Compared Blocks value is the number of blocks that were scanned (including those that did not use compare callback functions). The number is the sum of all slaves (that is, each slave is responsible for a connection between primary and standby). For example, if there are two slaves and each slave has compared 1000 blocks, then the value of SOFAR should be 2000.
The Lost Writes value is the number of lost writes found at both the primary and the standby. Also, it is the sum of all slaves. For Lost Writes, the value of SOFAR should be always equal to the value of TOTALWORK.

- The value of SOFAR should be always less than or equal to the value of TOTALWORK.
- When the block compare slave processes finish, the value of SOFAR should be equal to the value of TOTALWORK.

47.2 DBMS_DBCOMP Security Model

The DBMS_DBCOMP package runs with invoker’s rights and requires the SYSDBA or SYSDG or SYSBACKUP privilege.

47.3 Summary of the DBMS_DBCOMP Subprogram

The DBMS_DBCOMP package contains one procedure, DBCOMP.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>DBCOMP procedure</strong></td>
<td>The DBMS_DBCOMP.DBCOMP procedure performs block comparison to detect lost writes or database inconsistencies between a primary database and one or more physical standby databases. The DBCOMP procedure can be executed on the primary or on the physical standby while the databases are mounted or open.</td>
</tr>
</tbody>
</table>

47.3.1 DBCOMP Procedure

Use DBCOMP procedure to compare blocks on a primary database and one or more physical standby databases.

**Syntax**

```sql
DBMS_DBCOMP.DBCOMP (    datafile IN varchar2,    outputfile IN varchar2,    block_dump IN boolean);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datafile</td>
<td>This can be a data file name or a data file number. Specify ‘ALL’ to compare all data files.</td>
</tr>
<tr>
<td>outputfile</td>
<td>This value is used as a prefix in the name of the output file. By default, output files are placed in the dbs/ directory, but the output file argument can contain a relative directory path or an absolute directory path. See Usage Notes for descriptions of the information contained in the output file.</td>
</tr>
</tbody>
</table>
Parameter | Description
---|---
block_dump | This is a Boolean parameter to specify whether block content should be dumped into output files if a pair of blocks of primary and standby databases is not identical. This parameter does not guarantee that all different block pairs are dumped. The default value is FALSE.

Usage Notes

- The output file contains the following columns:
  - **ID**: The block type. For instance, type 02 is undo block type, and 06 is KTB-managed data block type.
  - **TOTAL**: The total number of blocks in the specific block type.
  - **CORR**: The number of corrupted blocks.
  - **SKIPPED**: The number of block pairs that are skipped (ignored) without comparison, such as direct loaded blocks, RMAN optimized blocks, and flashback optimized blocks.
  - **DIFFV**: The number of blocks that have different version numbers between primary and standby.
  - **SAMEV**: The number of block pairs that have the same version number between primary and standby.
  - **SAMEV&C**: The number of block pairs that have the same version and the same checksum.
  - **ENCERR**: The number of block pairs that have encryption related errors (usually because the Wallet is not open).
  - **LWLOC**: The number of lost writes on the local database.
  - **LWRMT**: The number of lost writes on the remote databases.
  - **DIFFPAIR**: The number of block pairs that have the same version but different checksum, and which the block compare callback function has concluded are different.

Example 47-1 Example

The following is an example of using the `DBMS_DBCOMP.DBCOMP` procedure.

```sql
declare
    Datafile_Name_or_Number varchar2(1000);
    Output_File varchar2(1000);
begin
    dbms_output.enable(1000000);
    Datafile_Name_or_Number:= 'all' ;
    Output_File:='BlockCompareAll_';
    sys.dbms_dbcomp.DBCOMP(Datafile_Name_or_Number, Output_File, true);
end;
```
The *DBMS_DBFS_CONTENT* package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

This chapter contains the following topics:

### 48.1 DBMS_DBFS_CONTENT Overview

The *DBMS_DBFS_CONTENT* package provides an interface that connects the Oracle database to the DBFS client-side.

In the server, the *DBMS_DBFS_CONTENT* package is backed by the *DBMS_DBFS_CONTENT_SPI* package, which includes descriptions but not actual implementations of DBFS stores.

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide for a description of *DBMS_DBFS_CONTENT* and the DBFS architecture
- Oracle Database SecureFiles and Large Objects Developer's Guide for conceptual information about the *DBMS_DBFS_CONTENT* package

### 48.2 DBMS_DBFS_CONTENT Security Model

The *DBMS_DBFS_CONTENT* package runs under *AUTHID CURRENT_USER*. 
48.3 DBMS_DBFS_CONTENT Constants

The DBMS_DBFS_CONTENT package uses various types of constants.

These are shown in the following tables:

- Table 48-1
- Table 48-2
- Table 48-3
- Table 48-4
- Table 48-5
- Table 48-6
- Table 48-7
- Table 48-8
- Table 48-9
- Table 48-10

Path Name Constants and Types

The following constants are useful for declaring paths and item names. Paths are limited to 1024 characters and item names are limited to 256 characters.

Table 48-1  DBMS_DBFS_CONTENT Constants - Path Names

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME_MAX</td>
<td>PLS_INTEGER</td>
<td>256</td>
<td>Maximum length of an absolute path name visible to clients</td>
</tr>
<tr>
<td>NAME_T</td>
<td>VARCHAR2(256)</td>
<td>NAME_MAX</td>
<td>Portable alias for string that can represent component names</td>
</tr>
<tr>
<td>PATH_MAX</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Maximum length of any individual component of an absolute path name visible to clients</td>
</tr>
<tr>
<td>PATH_T</td>
<td>VARCHAR2(1024)</td>
<td>PATH_MAX</td>
<td>Portable alias for string that can represent path names</td>
</tr>
</tbody>
</table>

ContentID Constants

Stores may expose to the user a unique identifier that represents a particular path item in the store. These identifiers are limited to 128 characters.
Table 48-2  DBMS_DBFS_CONTENT Constants - ContentID

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTENT_ID_MAX</td>
<td>PLS_INTEGER</td>
<td>128</td>
<td>Maximum length of a store-specific provider-generated contentID that identifies a file-type content item</td>
</tr>
<tr>
<td>CONTENT_ID_T</td>
<td>RAW(128)</td>
<td>CONTENT_ID_MAX</td>
<td>Portable alias for raw buffers that can represent contentID values</td>
</tr>
</tbody>
</table>

Path Properties Constants

Every path name in a store is associated with a set of properties. Each property is identified by a string “name”, has a string “value” (which might be NULL if unset or undefined or unsupported by a specific store implementation) and a value “typecode” (a numeric discriminant for the actual type of value held in the “value” string.)

Table 48-3  DBMS_DBFS_CONTENT Constants - Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROPNAME_MAX</td>
<td>PLS_INTEGER</td>
<td>32</td>
<td>Maximum length of a property name</td>
</tr>
<tr>
<td>PROPNAME_T</td>
<td>VARCHAR2(32)</td>
<td>PROPNAME_MAX</td>
<td>Portable alias for string that can represent property names</td>
</tr>
<tr>
<td>PROPVAL_MAX</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Maximum length of the string value of a property</td>
</tr>
<tr>
<td>PROPVAL_T</td>
<td>VARCHAR2(1024)</td>
<td>PATH_MAX</td>
<td>Portable alias for string that can represent property values</td>
</tr>
</tbody>
</table>

Path Name Type Constants

Path items in a store have a item type associated with them. These types represent the kind of entry the item represents in the store.

Table 48-4  DBMS_DBFS_CONTENT Constants - Path Name Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_FILE</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>A regular file storing content (a logically linear sequence of bytes accessed as a BLOB</td>
</tr>
<tr>
<td>TYPE_DIRECTORY</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>A container of other path name types, including file types</td>
</tr>
</tbody>
</table>
Table 48-4  (Cont.) DBMS_DBFS_CONTENT Constants - Path Name Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE_LINK</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>A symbolic link (that is, an uninterpreted string value associated with a path name). Since symbolic links may represent path names that fall outside the scope of any given store (or even the entire aggregation of stores managed by the DBMS_DBFS_CONTENT interface), or may not even represent path names, clients must be careful in creating symbolic links, and stores must be careful in trying to resolve these links internally.</td>
</tr>
<tr>
<td>TYPE_REFERENCE</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>A hard link which is always a valid path name alias to content.</td>
</tr>
</tbody>
</table>

Store Feature Constants

The DBFS content API allows different store providers (and different stores) to describe themselves through a feature set (a bitmask indicating which features they support and which ones they do not).

Table 48-5  DBMS_DBFS_CONTENT Constants - Store Features

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_FOLDERS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Set if the store supports folders (or directories) as part of hierarchical path names.</td>
</tr>
<tr>
<td>FEATURE_FOIAT</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Set if implicit folder operations within the store (performed as part of a client-requested operation) runs inside autonomous transactions. In general, the use of autonomous transactions is a compromise between (a) simplicity in the implementation and client-controlled transaction scope for all operations, at the cost of greatly reduced concurrency (FEATURE_FOIAT not set), versus (b) more complex implementation and smaller client-controlled transaction scope, at the benefit of greatly increased concurrency (FEATURE_FOIAT set).</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------</td>
<td>-------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FEATURE_NOWAIT</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>Set if the store allows <code>nowait</code> gets of path elements. The default behavior is to wait for row locks; if <code>nowait</code> gets are implemented, the get operation raises an ORA-54 exception if the path element is already locked by another transaction.</td>
</tr>
<tr>
<td>FEATURE_ACLS</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>Set if the store supports Access Control Lists (ACLs) and internal authorization or checking based on these ACLs. ACLs are standard properties but a store may do nothing more than store and retrieve the ACLs without interpreting them in any way.</td>
</tr>
<tr>
<td>FEATURE_LINKS</td>
<td>PLS_INTEGER</td>
<td>16</td>
<td>Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself.</td>
</tr>
<tr>
<td>FEATURE_LINK_DEREF</td>
<td>PLS_INTEGER</td>
<td>32</td>
<td>Set if the store supports symbolic links, and if certain types of symbolic links (specifically non-absolute path names) can be internally resolved by the store itself.</td>
</tr>
<tr>
<td>FEATURE_REFERENCES</td>
<td>PLS_INTEGER</td>
<td>64</td>
<td>Set if the store supports hard links.</td>
</tr>
<tr>
<td>FEATURE_LOCKING</td>
<td>PLS_INTEGER</td>
<td>128</td>
<td>Set if the store supports user-level locks (read-only, write-only, read-write) that can be applied on various items of the store, and if the store uses these lock settings to control various types of access to the locked items. User-level locks are orthogonal to transaction locks and persist beyond the scope of any specific transaction, session, or connection — this implies that the store itself may not be able to clean up after dangling locks, and client-applications need to perform any garbage collection.</td>
</tr>
<tr>
<td>FEATURE_LOCK_HIERARCHY</td>
<td>PLS_INTEGER</td>
<td>256</td>
<td>Set if the store allows a user-lock to control access to the entire sub-tree under the locked path name.</td>
</tr>
<tr>
<td>FEATURE_LOCK_CONVERT</td>
<td>PLS_INTEGER</td>
<td>512</td>
<td>Set if the store supports upgrade or downgrade of locks from one mode to another.</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-----------------</td>
<td>-------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FEATURE_VERSIONING</td>
<td>PLS_INTEGER</td>
<td>1024</td>
<td>Set if the store supports at least a linear versioning and version management. Different versions of the same path name are identified by monotonic version numbers, with a version-nonqualified path name representing the latest version.</td>
</tr>
<tr>
<td>FEATURE_VERSION_PATH</td>
<td>PLS_INTEGER</td>
<td>2048</td>
<td>Set if the store supports a hierarchical namespace for different versions of a path name.</td>
</tr>
<tr>
<td>FEATURE_SOFT_DELETES</td>
<td>PLS_INTEGER</td>
<td>4096</td>
<td>Set if the store supports a &quot;soft-delete&quot;, that is, the ability to delete a path name and make it invisible to normal operations, but retain the ability to restore the path name later (as long as it has not been overwritten by a new create operation). The store also supports purging soft-deleted path names (making them truly deleted), and navigation modes that show soft-deleted items.</td>
</tr>
<tr>
<td>FEATURE_HASHING</td>
<td>PLS_INTEGER</td>
<td>8192</td>
<td>Set if the store automatically computes and maintains some type of a secure hash of the contents of a path name (typically a TYPE_FILE path).</td>
</tr>
<tr>
<td>FEATURE_HASH_LOOKUP</td>
<td>PLS_INTEGER</td>
<td>16384</td>
<td>Set if the store allows &quot;content-based addressing&quot;, that is, the ability to locate a content item based, not on its path name, but on its content hash.</td>
</tr>
</tbody>
</table>
### Table 48-5  (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
</table>
| FEATURE_FILTERING    | PLS_INTEGER  | 32768  | Set if the store allows clients to pass a filter function (a PL/SQL function conforming to the signature below) that returns a logical boolean indicating if a given store item satisfies a selection predicate. Stores that support filtering may be able to more efficiently perform item listing, directory navigation, and deletions by embedding the filtering logic inside their implementation. If filtering is not supported, clients can retrieve more items than necessary and perform the filtering checks themselves, albeit less efficiently. A filter predicate is a function with the following signature:  

```sql
function filterFunction(
    path        IN   VARCHAR2,
    store_name  IN   VARCHAR2,
    opcode      IN   INTEGER,
    item_type   IN   INTEGER,
    properties  IN   DBMS_DBFS_CONTENT_PROPERTIES_T,
    content     IN   BLOB)  
RETURN  INTEGER;
```

Any PL/SQL function conforming to this signature can examine the contents and properties of a store item, and determine if the item satisfies the selection criterion for the current operation. Any nonzero return value results in the DBMS_DBFS_CONTENT interface processing the item as part of the current operation; a return value that is zero or NULL results in the item being skipped from processing. |
| FEATURE_SEARCHING    | PLS_INTEGER  | 65536  | Set if the store allows clients to pass a text-search filter query to locate type_file path names based on their content. Stores that support searching may use indexes to accelerate such searches; otherwise, clients need to build their own indexes, or else search a potentially larger set of items to locate the ones of interest for the current search. |
| FEATURE_ASOF         | PLS_INTEGER  | 131072 | Set if the store allows clients to use a flashback timestamp in query operations (non-mutating GETPATH Procedures and LIST Function). |

---

Chapter 48  
DBMS_DBFS_CONTENT Constants  
48-7
Table 48-5  (Cont.) DBMS_DBFS_CONTENT Constants - Store Features

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FEATURE_PROVIDER_PROPS</td>
<td>PLS_INTEGER</td>
<td>262144</td>
<td>Set if the store allows per-operation properties (that control the behavior of the store with regard to the current operation, as opposed to properties associated with individual items).</td>
</tr>
<tr>
<td>FEATURE_SNAPSHOTS</td>
<td>PLS_INTEGER</td>
<td>524288</td>
<td>Set if the store allows the use of named, read-only snapshots of its contents. It is up to the provider to implement snapshots using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between snapshots and its parent content view.</td>
</tr>
<tr>
<td>FEATURE_CLONES</td>
<td>PLS_INTEGER</td>
<td>1048576</td>
<td>Set if the store allows the use of named, writable clones of its contents. It is up to the provider to implement clones using any suitable means (including creating immediate copies of the content, or using copy-on-write) and managing dependencies between clones and its parent content view.</td>
</tr>
<tr>
<td>FEATURE_LOCATOR</td>
<td>PLS_INTEGER</td>
<td>2097152</td>
<td>Set if the store allows direct access to file contents through a LOB locator. Stores that internally manipulate the file contents, perhaps by shredding or reassembling them in separate pieces, performing other transformations, and so on, cannot transparently give out a LOB locator to clients. The file contents of these stores should be accessed using the buffer-based interfaces.</td>
</tr>
<tr>
<td>FEATURE_CONTENT_ID</td>
<td>PLS_INTEGER</td>
<td>4194304</td>
<td>Set if the store allows a “pathless”, contentID-based access to files (there is no notion of a directory, link, or reference in this model)</td>
</tr>
<tr>
<td>FEATURE_LAZY_PATH</td>
<td>PLS_INTEGER</td>
<td>8388608</td>
<td>Set if the store allows a lazy binding of a path name to file content elements that are otherwise identified by a contentID; this feature makes sense only in conjunction with FEATURE_CONTENT_ID</td>
</tr>
</tbody>
</table>

Lock Type Constants

Stores that support locking should implement 3 types of locks: LOCK_READ_ONLY, LOCK_WRITE_ONLY, and LOCK_READ_WRITE.
Table 48-6  DBMS_DBFS_CONTENT Constants - Lock Types

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCK_READ_ONLY</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Locks as read-only</td>
</tr>
<tr>
<td>LOCK_WRITE_ONLY</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Locks as write-only</td>
</tr>
<tr>
<td>LOCK_READ_WRITE</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>Locks as read-write</td>
</tr>
</tbody>
</table>

Standard Property Constants

Standard properties are well-defined, mandatory properties associated with all content path names that all stores should support (in the manner described by the content interface), with some exceptions. For example, a read-only store need not implement a modification_time or creation_time.

All standard properties informally use the STD namespace, which clients and stores should avoid using.

Table 48-7  DBMS_DBFS_CONTENT Constants - Standard Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STD_ACCESS_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:access_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time of last access of a path name's contents</td>
</tr>
<tr>
<td>STD_ACL</td>
<td>VARCHAR2(32)</td>
<td>'std:acl'</td>
<td>TYPECODE_VARCHAR2: The access control list (in standard ACL syntax) associated with the path name</td>
</tr>
<tr>
<td>STD_CANONICAL_PATH</td>
<td>VARCHAR2(32)</td>
<td>'std:canonical_path'</td>
<td>TYPECODE_VARCHAR2: The canonical store-specific path name of an item.</td>
</tr>
<tr>
<td>STD_CHANGE_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:change_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time of last change to the metadata of a path name</td>
</tr>
<tr>
<td>STD_CHILDREN</td>
<td>VARCHAR2(32)</td>
<td>'std:children'</td>
<td>TYPECODE_NUMBER: The number of child directories/folders a directory/folder path has (this property should be available in providers that support the FEATURE_FOLDERS feature)</td>
</tr>
<tr>
<td>STD_CONTENT_TYPE</td>
<td>VARCHAR2(32)</td>
<td>'std:content_type'</td>
<td>TYPECODE_NUMBER: The client-supplied mime-type(s) (in standard RFC syntax) describing the (typically type_file) path name. The content type is not necessarily interpreted by the store.</td>
</tr>
<tr>
<td>STD_CREATION_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:creation_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time at which the item was created (once set, this value never changes for the lifetime of the path name)</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------</td>
<td>------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STD_DELETED</td>
<td>VARCHAR2(32)</td>
<td>'std:deleted'</td>
<td>TYPECODE_NUMBER as a BOOLEAN: Set to a nonzero number if the path name has been soft-deleted but not yet purged.</td>
</tr>
<tr>
<td>STD_GUID</td>
<td>VARCHAR2(32)</td>
<td>'std:guid'</td>
<td>TYPECODE_NUMBER: A store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.</td>
</tr>
<tr>
<td>STD_LENGTH</td>
<td>VARCHAR2(32)</td>
<td>'std:length'</td>
<td>TYPECODE_NUMBER: The length of the content (BLOB) of a TYPE_FILE/TYPE_REFERENCE path, or the length of the referent of a TYPE_LINK symbolic link. Directories do not have a well-defined length and stores are free to set this property to zero, NULL, or any other value.</td>
</tr>
<tr>
<td>STD_MODIFICATION_TIME</td>
<td>VARCHAR2(32)</td>
<td>'std:modification_time'</td>
<td>TYPECODE_TIMESTAMP in UTC: The time of last change to the data associated with a path name. Change to the content of a TYPE_FILE/TYPE_REFERENCE path, the referent of the TYPE_LINK path, and addition or deletion of immediate children in a TYPE_DIRECTORY path, all constitute data changes.</td>
</tr>
<tr>
<td>STD_OWNER</td>
<td>VARCHAR2(32)</td>
<td>'std:owner'</td>
<td>TYPECODE_VARCHAR2: A client-supplied (or implicit) owner name for the path name. The owner name may be used (along with the current &quot;principal&quot;) for access checks by stores that support ACLs, locking, or both.</td>
</tr>
</tbody>
</table>
| STD_PARENT_GUID     | VARCHAR2(32)       | 'std:parent_guid'      | TYPECODE_NUMBER: A store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given (store-name, store-specific-path name) has a stable and unique GUID for its lifetime.  
STD_PARENT_GUID(path name) == STD_GUID(parent(path name))
### Table 48-7  (Cont.) DBMS_DBFS_CONTENT Constants - Standard Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STD_REFERENT</td>
<td>VARCHAR2(32)</td>
<td>'std:referent'</td>
<td>TYPECODE VARCHAR2: The content of the symbolic link of a TYPE_LINK path; NULL otherwise. As mentioned, the STD_REFERENT can be an arbitrary string and must not necessarily be interpreted as path name by clients (or such interpretation should be done with great care).</td>
</tr>
</tbody>
</table>

### Optional Property Constants

Optional properties are well-defined properties (not mandatory) associated with all content path names that all stores are free to support (but only in the manner described by the DBFS content API).

All optional properties informally use the opt: namespace, which clients and stores should avoid using.

### Table 48-8  DBMS_DBFS_CONTENT Constants - Optional Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPT_HASH_TYPE</td>
<td>VARCHAR2(32)</td>
<td>'opt:hash_type'</td>
<td>TYPECODE NUMBER: The type of hash provided in the opt_hash_value property; see DBMS_CRYPTO for possible options.</td>
</tr>
<tr>
<td>OPT_HASH_VALUE</td>
<td>VARCHAR2(32)</td>
<td>'opt:hash_value'</td>
<td>TYPECODE NUMBER: The hash value of type OPT_HASH_TYPE describing the content of the path name.</td>
</tr>
<tr>
<td>OPT_LOCK_COUNT</td>
<td>VARCHAR2(32)</td>
<td>'opt:lock_count'</td>
<td>TYPECODE NUMBER: The number of (compatible) locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers (with repeats so that lock counts can be correctly maintained).</td>
</tr>
<tr>
<td>OPT_LOCK_DATA</td>
<td>VARCHAR2(32)</td>
<td>'opt:lock_data'</td>
<td>TYPECODE NUMBER: The client-supplied user-data associated with a user-lock, uninterpreted by the store.</td>
</tr>
<tr>
<td>OPT_LOCKER</td>
<td>VARCHAR2(32)</td>
<td>'opt:locker'</td>
<td>TYPECODE NUMBER: One or more implicit or client-specified principals that applied a user-lock on a path name.</td>
</tr>
</tbody>
</table>
Table 48-8  (Cont.) DBMS_DBFS_CONTENT Constants - Optional Properties

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPT_LOCK_STATUS</td>
<td>VARCHAR2(32)</td>
<td>'opt:lock_status'</td>
<td>TYPECODE_NUMBER: One of the LOCK_READ_ONLY, LOCK_WRITE_ONLY, LOCK_READ_WRITE values describing the type of lock currently applied on a path name.</td>
</tr>
<tr>
<td>OPT_VERSION</td>
<td>VARCHAR2(32)</td>
<td>'opt:version'</td>
<td>TYPECODE_NUMBER: A sequence number for linear versioning of a path name.</td>
</tr>
<tr>
<td>OPT_VERSION_PATH</td>
<td>VARCHAR2(32)</td>
<td>'opt:version_path'</td>
<td>TYPECODE_NUMBER: A version-path name for hierarchical versioning of a path name.</td>
</tr>
<tr>
<td>OPT_CONTENT_ID</td>
<td>VARCHAR2(32)</td>
<td>'opt:content_id'</td>
<td>TYPECODE_NUMBER: A provider-generated store-specific unique contentID in the form of a string for a file content element (that may optionally not be associated with a path; see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH).</td>
</tr>
</tbody>
</table>

Property Access Flag Constants

Content interface methods to get or set properties can use combinations of property access flags to fetch properties from different name spaces in a single interface call.

Table 48-9  DBMS_DBFS_CONTENT Constants - Property Access Flags

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROP_NONE</td>
<td>PLS_INTEGER</td>
<td>0</td>
<td>None: used when the client is not interested in any properties, and is invoking the content access method for other reasons (path name existence or lockability validation, data access, and so on)</td>
</tr>
<tr>
<td>PROP_STD</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Mandatory: used when the client is interested in the standard properties; all standard properties are retrieved if this flag is specified.</td>
</tr>
<tr>
<td>PROP_OPT</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Optional: used when the client is interested in the optional properties; all optional properties are retrieved if this flag is specified.</td>
</tr>
<tr>
<td>PROP_USR</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>User-defined: used when the client is interested in the user-defined properties; all user-defined properties are retrieved if this flag is specified.</td>
</tr>
</tbody>
</table>
Table 48-9  (Cont.) DBMS_DBFS_CONTENT Constants - Property Access Flags

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROP_ALL</td>
<td>PLS_INTEGER</td>
<td>PROP_STD + PROP_OPT + PROP_USR</td>
<td>All: an alias for the combination of all standard, optional, and user-defined properties</td>
</tr>
<tr>
<td>PROP_DATA</td>
<td>PLS_INTEGER</td>
<td>8</td>
<td>Content: used when the client is interested only in data access, and does not care about properties</td>
</tr>
<tr>
<td>PROP_SPC</td>
<td>PLS_INTEGER</td>
<td>16</td>
<td>Specific: used when the client is interested in a mix-and-match of different subsets of various property name spaces; the names of the specific properties to fetch are passed into the content interface method call as arguments, and only these property values are fetched and returned to the client. This is useful in cases where there are a very large number of properties potentially accessible, but the client is interested in only a small number of them (and knows the names of these &quot;interesting&quot; properties beforehand). PROP_SPC is applicable only to the various GETPATH operations. Other operations that specify properties ignore PROP_SPC specifications.</td>
</tr>
</tbody>
</table>

Operation Code Constants

All of the operations in the DBFS content API are represented as abstract opcodes.

Clients can use these opcodes to directly and explicitly by invoking the CHECKACCESS Function to verify if a particular operation can be invoked by a given principal on a particular path name.

Table 48-10  DBMS_DBFS_CONTENT Constants - Operation Codes

<table>
<thead>

<td>A mutating operation was invoked on a read-only mount or store</td>
</tr>
</tbody>
</table>

48.5 DBMS_DBFS_CONTENT Operational Notes

This topic lists operational notes for DBMS_DBFS_CONTENT implementation, path names, and other operations.

- Implementation
- Path Names
- Other DBMS_DBFS_CONTENT Operations

Implementation

Since the interconnection of the DBMS_DBFS_CONTENT interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit INIT or FINI methods to indicate when the DBMS_DBFS_CONTENT interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are “stateless” in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

Path Names

All path names used in the provider SPI are store-qualified in pair form (store_name, pathname) where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see FEATURE_CONTENT_ID in Table 48-5) also support a form of addressing that is not based on path names. Content items are identified by an explicit store name, a NULL path name, and possibly a contentID specified as a parameter or by way of the OPT_CONTENT_ID (see Table 48-8) property.
Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

This table lists other operations and provides links to related discussions.

**48.6 DBMS_DBFS_CONTENT Data Structures**

The DBMS_DBFS_CONTENT package defines RECORD types and TABLE types.

**RECORD Types**

- FEATURE_T Record Type
- MOUNT_T Record Type
- PATH_ITEM_T Record Type
- PROP_ITEM_T Record Type
- PROPERTY_T Record Type
- STORE_T Record Type

**TABLE Types**

- FEATURES_T Table Type
- MOUNTS_T Table Type
- PATH_ITEMS_T Table Type
- PROP_ITEMS_T Table Type
- PROPERTIES_T Table Type
- STORES_T Table Type
Usage Notes

There is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTY_T` and `PROPERTY_T` — the former is a SQL object type that describes the full property tuple, while the latter is a PL/SQL record type that describes only the property value component.

Likewise, there is an approximate correspondence between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` — the former is a SQL nested table type, while the latter is a PL/SQL hash table type.

Dynamic SQL calling conventions force the use of SQL types, but PL/SQL code may be implemented more conveniently in terms of the hash-table types.

The `DBMS_DBFS_CONTENT` interface provides convenient utility functions to convert between `DBMS_DBFS_CONTENT_PROPERTIES_T` and `PROPERTIES_T` (see `propertiesT2H` and `propertiesH2T`).

Clients can query the `DBMS_DBFS_CONTENT` interface for the list of available stores, determine which store is to handle access to a given path name, and determine the feature set for the store.

48.6.1 DBMS_DBFS_CONTENT FEATURE_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE feature_t IS RECORD (  
  feature_name    VARCHAR2(32),  
  feature_mask    INTEGER,  
  feature_state   VARCHAR2(3));
```

Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature_name</td>
<td>Name of feature</td>
</tr>
<tr>
<td>feature_mask</td>
<td>Value used to mask off all other bits other than this feature in the feature value</td>
</tr>
<tr>
<td>feature_state</td>
<td>‘YES’ or ‘NO’ depending on whether the feature is supported on this store</td>
</tr>
</tbody>
</table>

48.6.2 DBMS_DBFS_CONTENT MOUNT_T Record Type

This type describes a store mount point and its properties.

Syntax

```
TYPE mount_t IS RECORD (  
  store_name          VARCHAR2(32),  
  store_id            NUMBER,  
  provider_name       VARCHAR2(32),  
  provider_pkg        VARCHAR2(32),
);```
Fields

</tr>
<tr>
<td></td>
<td>DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
</tbody>
</table>

48.6.3 DBMS_DBFS_CONTENT PATH_ITEM_T Record Type

A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

Syntax

```
TYPE path_item_t IS RECORD (  
    store                    NAME_T,
    mount                    NAME_T,
    pathname                 PATH_T,
    pathtype                 VARCHAR2(32),
    filedata                 BLOB,
    std_access_time          TIMESTAMP,
    std_acl                  VARCHAR2(1024),
    std_change_time          TIMESTAMP,
    std_children             NUMBER,
    std_content_type         VARCHAR2(1024),
    std_creation_time        TIMESTAMP,
    std_deleted              INTEGER,
    std_guid                 INTEGER,
    std_modification_time    TIMESTAMP,
    std_owner                VARCHAR2(32),
    std_parent_guid          INTEGER,
    std_referent             VARCHAR2(1024),
    opt_hash_type            VARCHAR2(32),
    opt_hash_value           VARCHAR2(128),
    opt_lock_count           INTEGER,
    opt_lock_data            VARCHAR2(128),
    opt_locker               VARCHAR2(128),
);```
### Fields

#### Table 48-15  PATH_ITEM_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>Name of store</td>
</tr>
<tr>
<td>mount</td>
<td>Location at which instance of store is mounted</td>
</tr>
<tr>
<td>pathname</td>
<td>Name of path to item</td>
</tr>
<tr>
<td>pathtype</td>
<td>Type of object path (see Table 48-4)</td>
</tr>
<tr>
<td>filedatal</td>
<td>BLOB locator that can be used to access data in the path item</td>
</tr>
<tr>
<td>std_access_time</td>
<td>Time of last access of a pathname's contents</td>
</tr>
<tr>
<td>std_acl</td>
<td>Access Control List (in standard ACL syntax)</td>
</tr>
<tr>
<td>std_change_time</td>
<td>Time of last change to the metadata of a path name</td>
</tr>
<tr>
<td>std_children</td>
<td>Number of child directories or folders a directory or folder path (this property should be available in providers that support the feature_folders feature).</td>
</tr>
<tr>
<td>std_content_type</td>
<td>One or more client-supplied mime-types (in standard RFC syntax) describing the path name which is typically of type_file. The content type s not necessarily interpreted by the store.</td>
</tr>
<tr>
<td>std_creation_time</td>
<td>Time at which the item was created. Once set, this value remains the same for the lifetime of the path name.</td>
</tr>
<tr>
<td>std_deleted</td>
<td>Set to a nonzero number if the path name has been soft-deleted but not yet purged (see Table 48-5)</td>
</tr>
<tr>
<td>std_guid</td>
<td>Store-specific unique identifier for a path name. Clients must not depend on the GUID being unique across different stores, but a given store-name, store-specific-pathname has a stable and unique GUID for its lifetime.</td>
</tr>
<tr>
<td>std_modification_time</td>
<td>Time of last change to the data associated with a path name. Changes to the content of a type_file or type_reference path, the referent of the type_link path, and addition or deletion of immediate children in a type_directory path, all constitute data changes.</td>
</tr>
<tr>
<td>std_owner</td>
<td>Client-supplied (or implicit) owner name for the path name</td>
</tr>
<tr>
<td>std_parent_guid</td>
<td>Store-specific unique identifier for the parent of a path name. Clients must not depend on the GUID being unique across different stores, but a given store-name, store-specific-pathname has a stable and unique GUID for its lifetime.</td>
</tr>
<tr>
<td>std_parent_guid(pathname) == std_guid(parent(pathname))</td>
<td></td>
</tr>
<tr>
<td>std_reffert</td>
<td>Content of the symbolic link of a type_link path, otherwise NULL. As mentioned before, the std_reffert can be an arbitrary string and must not necessarily be interpreted as pathname by clients (or such interpretation should be done with great care).</td>
</tr>
<tr>
<td>opt_hash_type</td>
<td>Type of hash provided in the opt_hash_value property (see DBMS_CRYPTO for possible options)</td>
</tr>
</tbody>
</table>
Table 48-15  (Cont.) PATH_ITEM_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opt_hash_value</td>
<td>Hash value of type opt_hash_type describing the content of the path name</td>
</tr>
<tr>
<td>opt_lock_count</td>
<td>Number of compatible locks placed on a path name. If different principals are allowed to place compatible (read) locks on a path, the opt_locker must specify all lockers with repeats so that lock counts can be correctly maintained.</td>
</tr>
<tr>
<td>opt_lock_data</td>
<td>Client-supplied user-data associated with a user-lock, uninterpreted by the store</td>
</tr>
<tr>
<td>opt_locker</td>
<td>One or more implicit or client-specified principals that applied a user-lock on a path name</td>
</tr>
<tr>
<td>opt_lock_status</td>
<td>One of the lock_read_only, lock_write_only, lock_read_write values describing the type of lock currently applied on a path name</td>
</tr>
<tr>
<td>opt_version</td>
<td>Sequence number for linear versioning of a path name</td>
</tr>
<tr>
<td>opt_version_path</td>
<td>Version path name for hierarchical versioning of a path name</td>
</tr>
<tr>
<td>opt_content_id</td>
<td>Stringified provider-generated store-specific unique contentID for a file element (that may optionally not be associated with a path (see FEATURE_CONTENT_ID and FEATURE_LAZY_PATH in Table 48-5))</td>
</tr>
</tbody>
</table>

48.6.4 DBMS_DBFS_CONTENT PROP_ITEM_T Record Type

A PROP_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all user-defined properties associated with it, expanded out into individual (name, value, type) tuples.

Syntax

```sql
TYPE prop_item_t IS RECORD (  
  store               NAME_T,  
  mount                    NAME_T,  
  pathname                 PATH_T,  
  property_name            PROPNAME_T,  
  property_value           PROPVAL_T,  
  property_type            INTEGER);  
```

Fields

Table 48-16  PROP_ITEM_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store</td>
<td>Name of store</td>
</tr>
<tr>
<td>mount</td>
<td>Location at which instance of store is mounted</td>
</tr>
<tr>
<td>pathname</td>
<td>Name of path to item</td>
</tr>
<tr>
<td>property_name</td>
<td>Name of the property</td>
</tr>
<tr>
<td>property_value</td>
<td>Value of the property</td>
</tr>
</tbody>
</table>
48.6.5 PROPERTY_T Record Type

This type describes a single \((value, typecode)\) property value tuple; the property name is implied.

See PROPERTIES_T Table Type for more information.

Syntax

```
TYPE property_t  IS RECORD (
    propvalue  PROPVAL_T,
    typecode   INTEGER);
```

Fields

Table 48-17    PROPERTY_T Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propvalue</td>
<td>Value of property</td>
</tr>
<tr>
<td>typecode</td>
<td>Typecode</td>
</tr>
</tbody>
</table>

48.6.6 DBMS_DBFS_CONTENT STORE_T Record Type

This type describes a store registered with and managed by the DBMS_DBFS_CONTENT interface.

Syntax

```
TYPE store_t IS RECORD (
    store_name          VARCHAR2(32),
    store_id            NUMBER,
    provider_name       VARCHAR2(32),
    provider_pkg        VARCHAR2(32),
    provider_id         NUMBER,
    provider_version    VARCHAR2(32),
    store_features      INTEGER,
    store_guid          NUMBER);
```

<td>Unique identifier for the content store</td>
</tr>
<tr>
<td>provider_version</td>
<td>Version number for the content store</td>
</tr>
<tr>
<td>respos_features</td>
<td>Features supported by this content store</td>
</tr>
<tr>
<td>store_guid</td>
<td>Unique ID for this instance of the store</td>
</tr>
</tbody>
</table>

48.6.7 DBMS_DBFS_CONTENT FEATURES_T Table Type

A table type of FEATURE_T Record Type.

Syntax

```
TYPE features_t IS TABLE OF feature_t;
```

Related Topics

- **DBMS_DBFS_CONTENT FEATURE_T Record Type**
  This type describes a store mount point and its properties.

48.6.8 MOUNTS_T Table Type

A table type of MOUNT_T Record Type.

Syntax

```
TYPE mounts_t IS TABLE OF mount_t;
```

Related Topics

- **DBMS_DBFS_CONTENT MOUNT_T Record Type**
  This type describes a store mount point and its properties.

48.6.9 DBMS_DBFS_CONTENT PATH_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type

Syntax

```
TYPE path_items_t IS TABLE OF path_item_t;
```

Related Topics

- **DBMS_DBFS_CONTENT PATH_ITEM_T Record Type**
  A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.
48.6.10 DBMS_DBFS_CONTENT PROP_ITEMS_T Table Type

A table type of PATH_ITEM_T Record Type.

Syntax

```
TYPE prop_items_t IS TABLE OF prop_item_t;
```

Related Topics

- DBMS_DBFS_CONTENT PATH_ITEM_T Record Type

A PATH_ITEM_T is a tuple describing a (store, mount) qualified path in a store, with all standard and optional properties associated with it.

48.6.11 DBMS_DBFS_CONTENT PROPERTIES_T Table Type

This is a name-indexed hash table of property tuples. The implicit hash-table association between the index and the value allows the client to build up the full DBMS_DBFS_CONTENT_PROPERTY_T tuples for a PROPERTIES_T.

Syntax

```
TYPE properties_t IS TABLE OF property_t INDEX BY propname_t;
```

48.6.12 STORES_T Table Type

This type describes a store registered with and managed by the DBMS_DBFSCONTENT interface.

Syntax

```
TYPE stores_t IS TABLE OF store_t;
```

48.7 Summary of DBMS_DBFS_CONTENT Subprograms

This table lists and describes the subprograms used in the DBMS_DBFS_CONTENT Package.

**Table 48-19  DBMS_DBFS_CONTENT Package Subprograms**

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECKACCESS Function</td>
<td>Reports if the user (principal) can perform the specified operation on the given path</td>
</tr>
<tr>
<td>CHECKSPI Functions and Procedures</td>
<td>Checks if a user-provided package implements all of the DBMS_DBFS_CONTENT_SPI subprograms with the proper signatures, and reports on the conformance.</td>
</tr>
<tr>
<td>CREATEDIRECTORY Procedures</td>
<td>Creates a directory</td>
</tr>
<tr>
<td>CREATEFILE Procedures</td>
<td>Creates a file</td>
</tr>
<tr>
<td>CREATELINK Procedures</td>

</tbody>
</table>

48.7.1 CHECKACCESS Function

This function reports if the user (principal) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If CHECKACCESS returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```sql
DBMS_DBFS_CONTENT.CHECKACCESS (  
  path           IN     VARCHAR2,  
  pathtype       IN     INTEGER,  
  operation      IN     VARCHAR2,  
  principal      IN     VARCHAR2,  
  store_name     IN     VARCHAR2 DEFAULT NULL)  
RETURN  BOOLEAN;
```

Parameters

Table 48-20  CHECKACCESS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to check for access</td>
</tr>
<tr>
<td>pathtype</td>
<td>Type of object path represents (see Table 48-4)</td>
</tr>
<tr>
<td>operation</td>
<td>Operation to be checked (see Table 48-8)</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.
48.7.2 CHECKSPI Functions and Procedures

Given the name of a putative DBMS_DBFS_CONTENT_SPI conforming package, this function or procedure checks whether the package implements all of the provider subprograms with the proper signatures, and reports on the conformance.

Syntax

\[
\text{DBMS\_DBFS\_CONTENT\_CHECKSPI (}
\text{package\_name IN VARCHAR2)
\text{RETURN CLOB;}
\]

\[
\text{DBMS\_DBFS\_CONTENT\_CHECKSPI (}
\text{schema\_name IN VARCHAR2,}
\text{package\_name IN VARCHAR2)
\text{return clob;}
\]

\[
\text{DBMS\_DBFS\_CONTENT\_CHECKSPI (}
\text{package\_name IN VARCHAR2,}
\text{chk IN OUT NOCOPY CLOB;}
\]

\[
\text{DBMS\_DBFS\_CONTENT\_CHECKSPI (}
\text{schema\_name in VARCHAR2,}
\text{package\_name in VARCHAR2,}
\text{chk in out nocopy CLOB;}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>package_name</td>
<td>Name of package</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>chk</td>
<td>CLOB that contains the evaluation results</td>
</tr>
</tbody>
</table>

Usage Notes

- The functional form returns a cached temporary LOB of session duration with the results of the analysis. The caller is expected to manage the lifetime of this LOB, as needed.

- The procedural form generates the results of the analysis into the \( \text{chk} \) LOB parameter; if the value passed in is null, the results are written to the foreground trace file provided that DBMS_DBFS_CONTENT interface tracing is enabled. If neither tracing is enabled nor a valid LOB passed in, the checker does not provide any useful indication of the analysis (other than raise exceptions if it encounters a serious error).

- If \( \text{schema}\_\text{name} \) is null, standard name resolution rules (current schema, private synonym, public synonym) are used to try and locate a suitable package to analyze.
48.7.3 CREATEDIRECTORY Procedures

This procedure creates a directory.

Syntax

DBMS_DBFS_CONTENT.CREATEDIRECTORY (  
    path IN VARCHAR2,  
    properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,  
    prop_flags IN INTEGER DEFAULT PROP_STD,  
    recurse IN BOOLEAN DEFAULT FALSE,  
    store_name IN VARCHAR2 DEFAULT NULL,  
    principal IN VARCHAR2 DEFAULT NULL);  

Parameters

Table 48-22   CREATEDIRECTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see Table 48-9), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively; otherwise, recursively create the directories above the given directory</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.4 CREATEFILE Procedures

This procedure creates a file.

Syntax

DBMS_DBFS_CONTENT.CREATEFILE (  
    path IN VARCHAR2,  
    properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,  
    content IN OUT NOCOPY BLOB,  
    prop_flags IN INTEGER DEFAULT (PROP_STD + PROP_DATA),  
    store_name IN VARCHAR2 DEFAULT NULL,  
    principal IN VARCHAR2 DEFAULT NULL);
CREATEFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data with which to populate the file (optional)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.5 CREATELINK Procedures

This procedure creates a new link element srcPath with the value of dstPath. The value of dstPath is not validated or interpreted in any way by this procedure. This is analogous to a UNIX file system symbolic link.

Syntax

```
DBMS_DBFS_CONTENT.CREATEFILE (
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   PROPERTIES_T,
    content     IN OUT NOCOPY   BLOB,
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD + PROP_DATA),
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```
Parameters

Table 48-24  CREATELINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcPath</td>
<td>File system entry to create.</td>
</tr>
<tr>
<td>dstPath</td>
<td>Value to associate with srcPath.</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned depending, or both, on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.6 CREATEREFERENCE Procedures

This procedure creates a physical link, srcPath, to an already existing file system element, dstPath (such as file or directory). The resulting entry shares the same metadata structures as the value of the dstPath parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

Syntax

DBMS_DBFS_CONTENT.CREATEREFERENCE (  
  srcPath    IN               VARCHAR2,  
  dstPath    IN               VARCHAR2,  
  properties IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
  prop_flags IN               INTEGER     DEFAULT PROP_STD,  
  store_name IN               VARCHAR2    DEFAULT NULL,  
  principal  IN               VARCHAR2    DEFAULT NULL);  

Parameters

Table 48-25  CREATEREFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcPath</td>
<td>File system entry to create.</td>
</tr>
<tr>
<td>dstPath</td>
<td>Path that is the reference to srcPath.</td>
</tr>
</tbody>
</table>
Table 48-25  (Cont.) CREATREFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.7 DECODEFEATURES Function

Given a feature bit set integer value, this function returns a FEATURES_T table of the feature bits as FEATURE_T records.

Syntax

```sql
DBMS_DBFS_CONTENT.DECODEFEATURES (featureSet IN INTEGER)
RETURN FEATURES_T DETERMINISTIC PIPELINED;
```

Parameters

Table 48-26  DECODEFEATURES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>featureSet</td>
<td>Feature set</td>
</tr>
</tbody>
</table>

Return Values

FEATURES_T Table Type

48.7.8 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

```sql
DBMS_DBFS_CONTENT.DELETECONTENT (store_name IN VARCHAR2 DEFAULT NULL,
contentID IN RAW,
filter IN VARCHAR2 DEFAULT NULL,
soft_delete IN BOOLEAN DEFAULT NULL,
principal IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 48-27 DELETECONTENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>contentID</td>
<td>Unique identifier for the file to be deleted</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see Oracle Database SecureFiles and Large Objects Developer's Guide, Deletion Operations).</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.9 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If `recurse` is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

```sql
DBMS_DBFS_CONTENT.DELETEDIRECTORY ( path           IN     VARCHAR2,
                                   filter         IN     VARCHAR2    DEFAULT NULL,
                                   soft_delete    IN     BOOLEAN     DEFAULT NULL,
                                   recurse        IN     BOOLEAN     DEFAULT FALSE,
                                   store_name     IN     VARCHAR2    DEFAULT NULL,
                                   principal      IN     VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48-28 DELETEDIRECTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see Oracle Database SecureFiles and Large Objects Developer's Guide, Deletion Operations.</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>
48.7.10 DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```sql
DBMS_DBFS_CONTENT.DELETEFILE (  
  path IN VARCHAR2,
  filter IN VARCHAR2 DEFAULT NULL,
  soft_delete IN BOOLEAN DEFAULT NULL,
  store_name IN VARCHAR2 DEFAULT NULL,
  principal IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-29  DELETEFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete (see Oracle Database SecureFiles and Large Objects Developer's Guide, Deletion Operations).</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

48.7.11 FEATURENAME Function

Given a feature bit, this function returns a VARCHAR2 of that feature's name.

Syntax

```sql
DBMS_DBFS_CONTENT.FEATURENAME (  
  featureBit IN INTEGER)  
RETURN VARCHAR2 DETERMINISTIC;
```

Parameters

Table 48-30  FEATURENAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>featureBit</td>
<td>Bit representation of the feature (see Table 48-5)</td>
</tr>
</tbody>
</table>

Return Values

Name of the feature
48.7.12 FLUSHSTATS Function

This procedure flushes DBMS_DBFS_CONTENT statistics to disk.

Syntax

DBMS_DBFS_CONTENT.FLUSHSTATS;

48.7.13 GETDEFAULTACL Procedure

This procedure returns the ACL parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

DBMS_DBFS_CONTENT.GETDEFAULTACL (*
    acl    OUT NOCOPY     VARCHAR2);

Parameters

Table 48-31  GETDEFAULTACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>

48.7.14 GETDEFAULTASOF Procedure

This procedure returns the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

DBMS_DBFS_CONTENT.GETDEFAULTASOF (*
    asof    OUT NOCOPY     TIMESTAMP);

Parameters

Table 48-32  GETDEFAULTASOF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>
48.7.15 GETDEFAULTCONTEXT Procedure

This procedure returns the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```sql
DBMS_DBFS_CONTENT.GETDEFAULTCONTEXT (    principal OUT NOCOPY VARCHAR2,
    owner OUT NOCOPY VARCHAR2,
    acl OUT NOCOPY VARCHAR2,
    asof OUT NOCOPY TIMESTAMP);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>asof</td>
<td>The “as of” timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>

48.7.16 GETDEFAULTOWNER Procedure

This procedure returns the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.GETDEFAULTOWNER (    principal IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>
48.7.17 GETDEFAULTPRINCIPAL Procedure

This procedure returns the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

DBMS_DBFS_CONTENT.GETDEFAULTPRINCIPAL (principal OUT NOCOPY VARCHAR2);

Parameters

Table 48-35 GETDEFAULTPRINCIPAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.18 GETFEATURESBYMOUNT Function

This function returns features of a store by mount point.

Syntax

DBMS_DBFS_CONTENT.GETFEATURESBYMOUNT (store_mount IN VARCHAR2) RETURN INTEGER;

Parameters

Table 48-36 GETFEATURESBYMOUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Mount point</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

48.7.19 GETFEATURESBYNAME Function

This function returns features of a store by store name.

Syntax

DBMS_DBFS_CONTENT.GETFEATURESBYNAME (store_name IN VARCHAR2) RETURN INTEGER;
Parameters

Table 48-37  GETFEATURESBYNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

48.7.20 GETFEATURESBYPATH Function

This function returns features of a store by path.

Syntax

```sql
DBMS_DBFS_CONTENT.GETFEATURESBYPATH (  
    path       IN      PATH_T  
) RETURN INTEGER;
```

Parameters

Table 48-38  GETFEATURESBYPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>PATH_T</td>
</tr>
</tbody>
</table>

Return Values

A bit mask of supported features (see FEATURES_T Table Type)

48.7.21 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using prop_flags) that specific properties be returned. File path names can be read either by specifying a BLOB locator using the prop_data bitmask in prop_flags (see Table 48-9) or by passing one or more RAW buffers.

When forUpdate is 0, this procedure also accepts a valid asof timestamp parameter as part of ctx that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

Syntax

```sql
DBMS_DBFS_CONTENT.GETPATH (  
    path        IN              VARCHAR2,  
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
    content     OUT    NOCOPY   BLOB,  
    item_type   OUT             INTEGER,  
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD +  
                                 PROP_OPT +  
                                 PROP_HIST +  
                                 PROP_CONTENT +  
                                 PROP_METADATA),
) RETURN INTEGER;
```
Chapter 48

Summary of DBMS_DBFS_CONTENT Subprograms

DBMS_DBFS_CONTENT.GETPATH (path IN VARCHAR2,
properties IN OUT NOCOPY PROPERTIES_T,
content OUT NOCOPY BLOB,
item_type OUT INTEGER,
prop_flags IN INTEGER DEFAULT (PROP_STD + PROP_OPT + PROP_DATA),
asof IN TIMESTAMP DEFAULT NULL,
forUpdate IN BOOLEAN DEFAULT FALSE,
deref IN BOOLEAN DEFAULT FALSE,
store_name IN VARCHAR2 DEFAULT NULL,
principal IN VARCHAR2 DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (path IN VARCHAR2,
properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
amount IN OUT NUMBER,
offset IN NUMBER,
buffers OUT NOCOPY RAW,
prop_flags IN INTEGER DEFAULT (PROP_STD + PROP_OPT + PROP_DATA),
asof IN TIMESTAMP DEFAULT NULL,
store_name IN VARCHAR2 DEFAULT NULL,
principal IN VARCHAR2 DEFAULT NULL);

DBMS_DBFS_CONTENT.GETPATH (path IN VARCHAR2,
properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
amount IN OUT NUMBER,
offset IN NUMBER,
buffers OUT NOCOPY DBMS_DBFS_CONTENT_RAW_T,
prop_flags IN INTEGER DEFAULT (PROP_STD + PROP_OPT + PROP_DATA),
asof IN TIMESTAMP DEFAULT NULL,
store_name IN VARCHAR2 DEFAULT NULL,
principal IN VARCHAR2 DEFAULT NULL);
Parameters

Table 48-39  GETPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see Table 48-4)</td>
</tr>
<tr>
<td>amount</td>
<td>On input, number of bytes to be read. On output, number of bytes read</td>
</tr>
<tr>
<td>offset</td>
<td>Byte offset from which to begin reading</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>buffers</td>
<td>Buffers to which to write</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>forUpdate</td>
<td>Specifies that a lock should be taken to signify exclusive write access to the path item</td>
</tr>
<tr>
<td>deref</td>
<td>If nonzero, attempts to resolve the given path item to actual data provided it is a reference</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.22 GETPATHBYMOUNTID Function

If the underlying GUID is found in the underlying store, this function returns the full absolute path name.

Syntax

```
DBMS_DBFS_CONTENT.GETPATHBYMOUNTID ( store_mount IN VARCHAR2,
```
### GETPATHBYSMOUNTID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Mount point in which the path item with guid resides</td>
</tr>
<tr>
<td>guid</td>
<td>Unique ID for the path item</td>
</tr>
</tbody>
</table>

#### Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

#### Return Values

Path of the path item represented by GUID in store_mount

### 48.7.23 GETPATHBYSSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

#### Syntax

```sql
DBMS_DBFS_CONTENT.GETPATHBYSSTOREID (
    store_name IN VARCHAR2,
    guid IN INTEGER)
RETURN VARCHAR2;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>guid</td>
<td>Unique ID representing the desired path item</td>
</tr>
</tbody>
</table>

#### Usage Notes

If the GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

#### Return Values

Store-qualified path name represented by the GUID
48.7.24 GETPATHNOWAIT Procedures

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See FEATURE_NOWAIT in Table 48-5 for more information.

Syntax

```sql
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    content     OUT    NOCOPY   BLOB,
    item_type   OUT             INTEGER,
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                      PROP_OPT +
                                      PROP_DATA),
    deref       IN              BOOLEAN     DEFAULT FALSE,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

```sql
DBMS_DBFS_CONTENT.GETPATHNOWAIT (
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   PROPERTIES_T,
    content     OUT    NOCOPY   BLOB,
    item_type   OUT             INTEGER,
    prop_flags  IN              INTEGER     DEFAULT (PROP_STD +
                                      PROP_OPT +
                                      PROP_DATA),
    deref       IN              BOOLEAN     DEFAULT FALSE,
    store_name  IN              VARCHAR2    DEFAULT NULL,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

### 48.7.25 GETSTOREBYMOUNT Function

This function returns a store by way of its name.

**Syntax**

```sql
DBMS_DBFS_CONTENT.GETSTOREBYMOUNT (
    store_mount       IN      VARCHAR2)
RETURN STORE_T;
```

**Parameters**

Table 48-43  GETSTOREBYMOUNT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Location at which the store instance is mounted</td>
</tr>
</tbody>
</table>

**Return Values**

STORE_T Record Type

### 48.7.26 GETSTOREBYNAME Function

This function returns a store by way of its name.

**Syntax**

```sql
DBMS_DBFS_CONTENT.GETSTOREBYNAME (
    store_name       IN      VARCHAR2)
RETURN STORE_T;
```

**Parameters**

Table 48-44  GETSTOREBYNAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

**Return Values**

STORE_T Record Type
48.7.27 GETSTOREBYPATH Function

This function returns a store by way of its path.

Syntax

```
DBMS_DBFS_CONTENT.GETSTOREBYPATH (
    path       IN      PATH_T
) RETURN STORE_T;
```

Parameters

Table 48-45  GETSTOREBYPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>PATH_T</td>
</tr>
</tbody>
</table>

Return Values

STORE_T Record Type

48.7.28 GETSTATS Procedure

This procedure returns information about DBMS_DBFS_CONTENT statistics collection.

Syntax

```
DBMS_DBFS_CONTENT.GETSTATS (
    enabled         OUT    BOOLEAN,
    flush_time      OUT    INTEGER,
    flush_count     OUT    INTEGER);
```

Parameters

Table 48-46  GETSTATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Whether statistics collection is enabled</td>
</tr>
<tr>
<td>flush_time</td>
<td>How often to flush the statistics to disk in centiseconds</td>
</tr>
<tr>
<td>flush_count</td>
<td>Number of operations to allow between statistics flushes</td>
</tr>
</tbody>
</table>

48.7.29 GETTRACE Function

This function returns whether DBMS_DBFS_CONTENT tracing is turned on or not.

Syntax

```
DBMS_DBFS_CONTENT.GETTRACE
    RETURN INTEGER.
```
Return Values
Returns zero if tracing is off, non-zero if tracing is on.

48.7.30 GETVERSION Function
This function marks each version of the DBMS_DBFS_CONTENT interface.

Syntax
DBMS_DBFS_CONTENT.GETVERSION (  
    RETURN VARCHAR2;
)

Return Values
A string enumerating the version of the DBMS_DBFS_CONTENT interface in standard naming convention: string: a.b.c corresponding to major, minor, and patch components.

48.7.31 ISPATHLOCKED Procedure
This procedure checks if any user-level locks are applied on a given path.

Syntax
DBMS_DBFS_CONTENT.ISPATHLOCKED (  
    path IN VARCHAR2,  
    who IN VARCHAR2,  
    lock_type IN OUT INTEGER,  
    store_name IN VARCHAR2 DEFAULT NULL,  
    principal IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>lock_type</td>
<td>One of the available lock types (see Table 48-6)</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.32 LIST Function
This function lists the path items in the specified path meeting the specified filter and other criteria.

Syntax
DBMS_DBFS_CONTENT.LIST (  
    path IN VARCHAR2,  
    filter IN VARCHAR2 DEFAULT NULL,  
    recurse IN INTEGER DEFAULT 0,  
)
asof IN TIMESTAMP DEFAULT NULL,
store_name IN VARCHAR2 DEFAULT NULL,
principal IN VARCHAR2 DEFAULT NULL)
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;

Parameters

Table 48-48  LIST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to directories</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of repository</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

Return Values

DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type

48.7.33 LISTALLPROPERTIES Function

This function returns a table of all properties for all path items in all mounts.

Syntax

DBMS_DBFS_CONTENT.LISTALLPROPERTIES
RETURN PROP_ITEMS_T PIPELINED;

Return Values

PROP_ITEMS_T Table Type

48.7.34 LISTALLCONTENT Function

This function lists all path items in all mounts.

Syntax

DBMS_DBFS_CONTENT.LISTALLCONTENT
RETURN PATH_ITEMS_T PIPELINED;

Return Values

PATH_ITEMS_T Table Type
48.7.35 LISTMOUNTS Function

This function lists all available mount points, their backing stores, and the store features.

Syntax

```
DBMS_DBFS_CONTENT.LISTMOUNTS
    RETURN MOUNTS_T PIPELINED;
```

Return Values

MOUNTS_T Table Type

Usage Notes

A single mount results in a single returned row, with its store_mount field of the returned records set to NULL.

48.7.36 LISTSTORES Function

This function lists all available stores and their features.

Syntax

```
DBMS_DBFS_CONTENT.LISTSTORES
    RETURN STORES_T PIPELINED;
```

Return Values

STORES_T Table Type

Usage Notes

The store_mount field of the returned records is set to NULL (since mount-points are separate from stores themselves).

48.7.37 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```
DBMS_DBFS_CONTENT.LOCKPATH ( path IN VARCHAR2, who IN VARCHAR2, lock_type IN INTEGER, waitForRowLock IN INTEGER DEFAULT 1, store_name IN VARCHAR2 DEFAULT NULL, principal IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 48-49  LOCKPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>lock_type</td>
<td>One of the available lock types (see Table 48-6)</td>
</tr>
<tr>
<td>waitForRowLock</td>
<td>Determines if a row is locked by a transaction or not</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.38 MOUNTSTORE Procedure

This procedure mounts a previously registered store and binds it to the mount point.

Syntax

```sql
DBMS_DBFS_CONTENT.MOUNTSTORE (  
    store_mount in VARCHAR2 DEFAULT NULL,  
    singleton in BOOLEAN DEFAULT FALSE,  
    principal in VARCHAR2 DEFAULT NULL,  
    owner in VARCHAR2 DEFAULT NULL,  
    acl in VARCHAR2 DEFAULT NULL,  
    asof in TIMESTAMP DEFAULT NULL,  
    read_only in BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48-50  MOUNTSTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_mount</td>
<td>Path name to use to mount this store</td>
</tr>
<tr>
<td>singleton</td>
<td>Whether the mount is a single backend store on the system</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
<tr>
<td>read_only</td>
<td>Whether the mount is read-only</td>
</tr>
</tbody>
</table>
48.7.39 NORMALIZEPATH Functions

This function converts a store-specific or full-absolute path name into normalized form.

It does the following:

• verifies that the path name is absolute, and so starts with "/"
• collapses multiple consecutive "/" into a single "/"
• strips trailing "/"
• breaks up a store-specific normalized path name into 2 components - parent pathname, trailing component name
• breaks up a full-absolute normalized path name into 3 components - store name, parent pathname, trailing component name

Syntax

DBMS_DBFS_CONTENT.NORMALIZEPATH (path IN VARCHAR2, parent OUT NOCOPY VARCHAR2, tpath OUT NOCOPY VARCHAR2) RETURN VARCHAR2;

DBMS_DBFS_CONTENT.NORMALIZEPATH (path IN VARCHAR2, store_name OUT NOCOPY VARCHAR2, parent OUT NOCOPY VARCHAR2, tpath OUT NOCOPY VARCHAR2) RETURN VARCHAR2;

Parameters

Table 48-51 NORMALIZEPATH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>parent</td>
<td>Parent path name</td>
</tr>
<tr>
<td>tpath</td>
<td>Name of trailing path item</td>
</tr>
</tbody>
</table>

Return Values

The completely normalized store-specific or full-absolute path name
48.7.40 PROPANY Functions

This function provides constructors that take one of a variety of types and return a PROPERTY_T.

Syntax

```sql
DBMS_DBFS_CONTENT.PROPANY (val IN NUMBER) RETURN PROPERTY_T;
```

```sql
DBMS_DBFS_CONTENT.PROPANY (val IN VARCHAR2) RETURN PROPERTY_T;
```

```sql
DBMS_DBFS_CONTENT.PROPANY (val IN TIMESTAMP) RETURN PROPERTY_T;
```

```sql
DBMS_DBFS_CONTENT.PROPANY (val IN RAW) RETURN PROPERTY_T;
```

Parameters

Table 48-52 PROPANY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Value</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Record Type

48.7.41 PROPERTIESH2T Function

This function converts a PROPERTY_T hash to a DBMS_DBFSCONTENT_PROPERTIES_T table.

Syntax

```sql
DBMS_DBFSCONTENT.PROPERTIESH2T (pprops IN PROPERTIES_T) RETURN DBMS_DBFSCONTENT_PROPERTIES_T;
```

Parameters

Table 48-53 PROPERTIESH2T Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sprops</td>
<td>A PROPERTIES_T hash</td>
</tr>
</tbody>
</table>

Return Values

DBMS_DBFSCONTENT_PROPERTIES_T Table Type
48.7.42 PROPERTIEST2H Function

This function converts a DBMS_DBFS_CONTENT_PROPERTIES_T table to a PROPERTY_T hash.

Syntax

```sql
DBMS_DBFS_CONTENT.PROPERTIEST2H (sprops IN DBMS_DBFS_CONTENT_PROPERTIES_T) RETURN properties_t;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sprops</td>
<td>A DBMS_DBFS_CONTENT_PROPERTIES_T table</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Table Type

48.7.43 PROPNUMBER Function

This function is a constructor that takes a number and returns a PROPERTY_T.

Syntax

```sql
DBMS_DBFS_CONTENT.PROPNUMBER (val IN NUMBER) RETURN PROPERTY_T;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Value</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Record Type

48.7.44 PROPRAW Function

This function is a constructor that takes a RAW and returns a PROPERTY_T.

Syntax

```sql
DBMS_DBFS_CONTENT.PROPRAW (val IN RAW) RETURN PROPERTY_T;
```
Parameters

Table 48-56   PROPREW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Value</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Record Type

48.7.45 PROPTIMESTAMP Function

This function is a constructor that takes a \texttt{TIMESTAMP} and returns a \texttt{PROPERTY_T}.

Syntax

\begin{verbatim}
DBMS_DBFS_CONTENT.PROPTIMESTAMP (  
    val IN TIMESTAMP)  
RETURN PROPERTY_T;
\end{verbatim}

Parameters

Table 48-57   PROPTIMESTAMP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Value</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Record Type

48.7.46 PROPVARCHAR2 Function

This function is a constructor that takes a \texttt{VARCHAR2} and returns a \texttt{PROPERTY_T}.

Syntax

\begin{verbatim}
DBMS_DBFS_CONTENT.PROPVARCHAR2 (  
    val IN VARCHAR2)  
RETURN PROPERTY_T;
\end{verbatim}

Parameters

Table 48-58   PROPNUMBER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Value</td>
</tr>
</tbody>
</table>

Return Values

PROPERTY_T Record Type
48.7.47 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

Syntax

```sql
DBMS_DBFS_CONTENT.PURGEALL (  
    path           IN      VARCHAR2,  
    filter         IN      VARCHAR2    DEFAULT NULL,  
    store_name     IN      VARCHAR2    DEFAULT NULL,  
    principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48-59  PURGEALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied based on specified criteria</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.48 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

Syntax

```sql
DBMS_DBFS_CONTENT.PURGEPATH (  
    path           IN      VARCHAR2,  
    filter         IN      VARCHAR2    DEFAULT NULL,  
    store_name     IN      VARCHAR2    DEFAULT NULL,  
    principal      IN      VARCHAR2    DEFAULT NULL);
```

Parameters

Table 48-60  PURGEPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
48.7.49 PUTPATH Procedures

This procedure creates a new path item.

Syntax

DBMS_DBFS_CONTENT.PUTPATH (  
  path        IN              VARCHAR2,  
  properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
  content     IN OUT NOCOPY   BLOB,  
  item_type   OUT             INTEGER,  
  prop_flags  IN              INTEGER     DEFAULT (PROP_STD +  
                                          PROP_OPT +  
                                          PROP_DATA),  
  store_name  IN              VARCHAR2    DEFAULT NULL,  
  principal   IN              VARCHAR2    DEFAULT NULL);  

DBMS_DBFS_CONTENT.PUTPATH (  
  path        IN              VARCHAR2,  
  properties  IN OUT NOCOPY   PROPERTIES_T,  
  content     IN OUT NOCOPY   BLOB,  
  item_type   OUT             INTEGER,  
  prop_flags  IN              INTEGER     DEFAULT (PROP_STD +  
                                          PROP_OPT +  
                                          PROP_DATA),  
  store_name  IN              VARCHAR2    DEFAULT NULL,  
  principal   IN              VARCHAR2    DEFAULT NULL);  

DBMS_DBFS_CONTENT.PUTPATH (  
  path        IN              VARCHAR2,  
  properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
  amount      IN              NUMBER,  
  offset      IN              NUMBER,  
  buffer      IN              RAW,  
  prop_flags  IN              INTEGER     DEFAULT (PROP_STD +  
                                          PROP_OPT),  
  store_name  IN              VARCHAR2    DEFAULT NULL,  
  principal   IN              VARCHAR2    DEFAULT NULL);  

DBMS_DBFS_CONTENT.PUTPATH (  
  path        IN              VARCHAR2,  
  properties  IN OUT NOCOPY   PROPERTIES_T,  
  amount      IN              NUMBER,  
  offset      IN              NUMBER,

48.7.50 REGISTERSTORE Procedure

This procedure registers a new store backed by a provider that uses a store provider (conforming to the DBMS_DBFS_CONTENT_SPI package signature).

This method is to be used primarily by store providers after they have created a new store.

Syntax

DBMS_DBFS_CONTENT.REGISTERSTORE (  
  store_name          IN      VARCHAR2,  
  provider_name       IN      VARCHAR2,  
  provider_package    IN      VARCHAR2);
Parameters

Table 48-62  REGISTERSTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store, must be unique</td>
</tr>
<tr>
<td>provider_name</td>
<td>Name of provider</td>
</tr>
<tr>
<td>provider_package</td>
<td>Store provider</td>
</tr>
</tbody>
</table>

48.7.51 RENAMEPATH Procedures

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note:

See Oracle Database SecureFiles and Large Objects Developer’s Guide for Rename and Move operations

Syntax

```sql
DBMS_DBFS_CONTENT.RENAMEPATH (    oldPath     IN              VARCHAR2,    newPath     IN              VARCHAR2,    properties  IN OUT NOCOPY   DBMS=DBFS_CONTENT_PROPERTIES_T,    store_name  IN              VARCHAR2    DEFAULT NULL,    principal   IN              VARCHAR2    DEFAULT NULL);    DBMS_DBFS_CONTENT.RENAMEPATH (    oldPath     IN              VARCHAR2,    newPath     IN              VARCHAR2,    properties  IN OUT NOCOPY   PROPERTIES_T,    store_name  IN              VARCHAR2    DEFAULT NULL,    principal   IN              VARCHAR2    DEFAULT NULL);```

Parameters

Table 48-63  RENAMEPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldPath</td>
<td>Name of path prior to renaming</td>
</tr>
<tr>
<td>newPath</td>
<td>Name of path after renaming</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store, must be unique</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
48.7.52 RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

```sql
DBMS_DBFS_CONTENT.RESTOREALL (
    path IN VARCHAR2,
    filter IN VARCHAR2 DEFAULT NULL,
    store_name IN VARCHAR2 DEFAULT NULL,
    principal IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-64  RESTOREALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.53 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

```sql
DBMS_DBFS_CONTENT.RESTOREPATH (
    path IN VARCHAR2,
    filter IN VARCHAR2 DEFAULT NULL,
    store_name IN VARCHAR2 DEFAULT NULL,
    principal IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 48-65  RESTOREPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>
48.7.54 SETDEFAULTACL Procedure

This procedure sets the ACL parameter of the default context.

This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.SETDEFAULTACL (    acl IN VARCHAR2);
```

Parameters

Table 48-66   SETDEFAULTACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>

Usage Notes

- **NULL** by default, this parameter be can be cleared by setting it to **NULL**.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

48.7.55 SETDEFAULTASOF Procedure

This procedure sets the "as of" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.SETDEFAULTASOF (    asof IN TIMESTAMP);
```

Parameters

Table 48-67   SETDEFAULTASOF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>

Usage Notes

- **NULL** by default, this parameter be can be cleared by setting it to **NULL**.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.
48.7.56 SETDEFAULTCONTEXT Procedure

This procedure sets the default context. The information contained in the context can be inserted explicitly by way of arguments to the various method calls, allowing for fine-grained control over individual operations.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTCONTEXT {
    principal    IN     VARCHAR2,
    owner        IN     VARCHAR2,
    acl          IN     VARCHAR2,
    asof         IN     TIMESTAMP);
```

Parameters

Table 48-68  SETDEFAULTCONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>acl</td>
<td>ACL for all new elements created (implicitly or explicitly) by the current operation</td>
</tr>
<tr>
<td>asof</td>
<td>The &quot;as of&quot; timestamp at which the underlying read-only operation (or its read-only sub-components) executes</td>
</tr>
</tbody>
</table>

Usage Notes

- All of the context parameters are NULL by default, and be can be cleared by setting them to NULL.
- The context parameters, once set, remain as defaults for the duration of the session, and are inherited by all operations for which the defaults are not explicitly overridden.

48.7.57 SETDEFAULTOWNER Procedure

This procedure sets the "owner" parameter of the default context. This information can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```
DBMS_DBFS_CONTENT.SETDEFAULTOWNER {
    principal    IN     VARCHAR2);
```
Parameters

Table 48-69  SETDEFAULTOWNER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner for new elements created (implicitly or explicitly) by the current operation</td>
</tr>
</tbody>
</table>

Usage Notes

- **NULL** by default, this parameter be can be cleared by setting it to **NULL**.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

48.7.58 SETDEFAULTPRINCIPAL Procedure

This procedure sets the "principal" parameter of the default context. This information contained can be inserted explicitly by way of argument into other method calls, allowing for a more fine-grained control.

Syntax

```sql
DBMS_DBFS_CONTENT.SETDEFAULTPRINCIPAL (principal IN VARCHAR2);
```

Parameters

Table 48-70  SETDEFAULTPRINCIPAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

Usage Notes

- **NULL** by default, this parameter be can be cleared by setting it to **NULL**.
- The parameters, once set, remain as a default for the duration of the session, and is inherited by all operations for which the default is not explicitly overridden.

48.7.59 SETPATH Procedures

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.
Syntax

```sql
DBMS_DBFS_CONTENT.SETPATH (
    store_name  IN              VARCHAR2,
    contentID   IN              RAW,
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

```sql
DBMS_DBFS_CONTENT.SETPATH (
    store_name  IN              VARCHAR2,
    contentID   IN              RAW,
    path        IN              VARCHAR2,
    properties  IN OUT NOCOPY   PROPERTIES_T,
    principal   IN              VARCHAR2    DEFAULT NULL);
```

Parameters

**Table 48-71  SETPATH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of the store</td>
</tr>
<tr>
<td>contentID</td>
<td>Unique identifier for the item to be associated</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path item</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

48.7.60 SETSTATS Procedure

This procedure enables and disables statistics collection.

The client can optionally control the flush settings by specifying non-NULL values for the time, count or both parameters.

**Syntax**

```sql
DBMS_DBFS_CONTENT.SETSTATS (
    enable          IN    BOOLEAN,
    flush_time      IN    INTEGER,
    flush_count     IN    INTEGER);
```
Parameters

Table 48-72  SETSTATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>If TRUE, enable statistics collection. If FALSE, disable statistics collection.</td>
</tr>
<tr>
<td>flush_time</td>
<td>How often to flush the statistics to disk in centiseconds</td>
</tr>
<tr>
<td>flush_count</td>
<td>Number of operations to allow between statistics flushes</td>
</tr>
</tbody>
</table>

Usage Notes

The SETSTATS Procedure buffers statistics in-memory for a maximum of flush_time centiseconds or a maximum of flush_count operations (whichever limit is reached first), or both, at which time the buffers are implicitly flushed to disk.

48.7.61 SETTRACE Procedure

This procedure sets the DBMS_DBFS_CONTENT tracing severity to the given level, 0 being "off".

Syntax

```sql
DBMS_DBFS_CONTENT.SETTRACE
    trclvl     IN         INTEGER);
```

Parameters

Table 48-73  SETTRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trclvl</td>
<td>Level of the tracing, higher values implying more tracing</td>
</tr>
</tbody>
</table>

48.7.62 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores (and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on).

Syntax

```sql
DBMS_DBFS_CONTENT.SPACEUSAGE (|
    path          IN        VARCHAR2,
    blksize       OUT       INTEGER,
    tbytes        OUT       INTEGER,
    fbytes        OUT       INTEGER,
    nfile         OUT       INTEGER,
    ndir          OUT       INTEGER,
    nlink         OUT       INTEGER,
    nref          OUT       INTEGER,
    store_name    IN        VARCHAR2 DEFAULT NULL);
```
Parameters

Table 48-74  SPACEUSAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>blksize</td>
<td>Natural tablespace blocksize that holds the store. If multiple</td>
</tr>
<tr>
<td></td>
<td>tablespaces with different block sizes are used, any valid</td>
</tr>
<tr>
<td></td>
<td>blocksize is acceptable.</td>
</tr>
<tr>
<td>tbytes</td>
<td>Total size of the store in bytes computed over all segments that</td>
</tr>
<tr>
<td></td>
<td>comprise the store</td>
</tr>
<tr>
<td>fbytes</td>
<td>Free or unused size of the store in bytes computed over all</td>
</tr>
<tr>
<td></td>
<td>segments that comprise the store</td>
</tr>
<tr>
<td>nfile</td>
<td>Number of currently available files in the store</td>
</tr>
<tr>
<td>ndir</td>
<td>Number of currently available directories in the store</td>
</tr>
<tr>
<td>nlink</td>
<td>Number of currently available links in the store</td>
</tr>
<tr>
<td>nref</td>
<td>Number of currently available references in the store</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between "free" space and "used" space.

48.7.63 TRACE Procedure

This procedure outputs tracing to the current foreground trace file.

Syntax

```sql
DBMS_DBFS_CONTENT.TRACE
  sev         IN              INTEGER,
  msg0        IN              VARCHAR2,
  msg1        IN              VARCHAR DEFAULT '',
  msg2        IN              VARCHAR DEFAULT '',
  msg3        IN              VARCHAR DEFAULT '',
  msg4        IN              VARCHAR DEFAULT '',
  msg5        IN              VARCHAR DEFAULT '',
  msg6        IN              VARCHAR DEFAULT '',
  msg7        IN              VARCHAR DEFAULT '',
  msg8        IN              VARCHAR DEFAULT '',
  msg9        IN              VARCHAR DEFAULT '',
  msg10       IN              VARCHAR DEFAULT '';
```
Parameters

Table 48-75  TRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sev</td>
<td>Severity at which trace message is output</td>
</tr>
<tr>
<td>msg*</td>
<td>One or more message strings to be output. If more than one message is specified, all are output.</td>
</tr>
</tbody>
</table>

Usage Notes

- Trace information is written to the foreground trace file, with varying levels of detail as specified by the trace level arguments.
- The global trace level consists of 2 components: "severity" and "detail". These can be thought of as additive bitmasks. The "severity" allows the separation of top level as compared to low-level tracing of different components, and allows the amount of tracing to be increased as needed. There are no semantics associated with different levels, and users are free to set trace at any severity they choose, although a good rule of thumb would use severity "1" for top level API entry and exit traces, "2" for internal operations, and "3" or greater for very low-level traces.
- The "detail" controls how much additional information: timestamps, short-stack, etc. is dumped along with each trace record.

48.7.64 TRACEENABLED Function

This function determines if the current trace "severity" set by the SETTRACE Procedure is at least as high as the given trace level.

Syntax

```sql
DBMS_DBFS_CONTENT.TRACEENABLED(
    sev IN INTEGER)
RETURN INTEGER;
```

Parameters

Table 48-76  TRACEENABLED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sev</td>
<td>Severity at which trace message is output</td>
</tr>
</tbody>
</table>

Return Values

Returns 0 if the requested severity level is lower than the currently set trace severity level; 1 otherwise.
Related Topics

- **SETTRACE Procedure**
  This procedure sets the `DBMS_DBFS_CONTENT` tracing severity to the given level, 0 being "off".

### 48.7.65 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

**Syntax**

```sql
DBMS_DBFS_CONTENT.UNLOCKPATH ( path IN VARCHAR2,
                                who IN VARCHAR2,
                                waitForRowLock IN INTEGER DEFAULT 1,
                                store_name IN VARCHAR2 DEFAULT NULL,
                                principal IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>waitForRowLock</td>
<td>Determines if a row is locked by a transaction or not</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>principal</td>
<td>Agent (principal) invoking the current operation</td>
</tr>
</tbody>
</table>

**Related Topics**

- **LOCKPATH Procedure**
  This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

### 48.7.66 UNMOUNTSTORE Procedure

This procedure unmounts a registered store, either by name or by mount point.

**Syntax**

```sql
DBMS_DBFS_CONTENT.UNMOUNTSTORE ( store_name IN VARCHAR2 DEFAULT NULL,
                                 store_mount IN VARCHAR2 DEFAULT NULL,
                                 ignore_unknown IN BOOLEAN DEFAULT FALSE);
```
Parameters

Table 48-78  UNMOUNTSTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>store_mount</td>
<td>Location at which the store instance is mounted</td>
</tr>
<tr>
<td>ignore_unknown</td>
<td>If TRUE, attempts to unregister unknown stores will not raise an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for further information on unmounting a previously unmounted store

48.7.67 UNREGISTERSTORE Procedure

This procedure unregisters a previously registered store (invalidating all mount points associated with it).

Syntax

```sql
DBMS_DBFS_CONTENT.UNREGISTERSTORE (  
    store_name          IN      VARCHAR2,  
    ignore_unknown      IN      BOOLEAN DEFAULT FALSE);
```

Parameters

Table 48-79  UNREGISTERSTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>ignore_unknown</td>
<td>If TRUE, attempts to unregister unknown stores will not raise an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

- Once unregistered all access to the store (and its mount points) are not guaranteed to work
- If the *ignore_unknown* argument is TRUE, attempts to unregister unknown stores do not raise an exception.
DBMS_DBFS_CONTENT_SPI

The DBMS_DBFS_CONTENT_SPI package is a specification for DBMS_DBFS_CONTENT store providers, which must be implemented. Application designers can create PL/SQL packages conforming to this specification to extend DBMS_DBFS_CONTENT to use custom store providers.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Summary of DBMS_DBFS_CONTENT_SPI Subprograms

Related Topics

- DBMS_DBFS_CONTENT
  The DBMS_DBFS_CONTENT package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide

49.1 ODBMS_DBFS_CONTENT_SPI Overview

The DBMS_DBFS_CONTENT_SPI package describes an internal contract between the implementation of the DBMS_DBFSCONTENT interface and individual store providers, and whichever package contains their code.

Since PL/SQL does not allow a compile-time, declarative type-conformation between package signatures, store providers should informally conform to the SPI, which is to say, they should implement the SPI by means of a package that contains all of the methods specified in package DBMS_DBFS_CONTENT_SPI, with the same method signatures and semantics.

Obviously, these provider packages can implement other methods and expose other interfaces, however, these interfaces are not to be used by the DBMS_DBFS_CONTENT interface itself.

Since the provider SPI is merely a contract specification, there is no package body for DBMS_DBFS_CONTENT_SPI, and it is not possible to actually invoke any methods using this package.

The SPI references various elements (constants, types, exceptions) defined by the DBMS_DBFS_CONTENT interface.
Additionally, there is an almost one-to-one correspondence between the client API exported by the `DBMS_DBFS_CONTENT` interface and the provider interface that the `DBMS_DBFS_CONTENT` interface itself expects to work against.

The main distinction in the method naming conventions is that all path name references are always store-qualified. That is, the notion of mount-points and full-absolute path names have been normalized and converted to store-qualified path names by the `DBMS_DBFS_CONTENT` interface before it invokes any of the provider SPI methods.

Since the interconnection of the `DBMS_DBFSCONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, and the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

**Related Topics**

- `DBMS_DBFS_CONTENT`
  The `DBMS_DBFS_CONTENT` package provides an interface comprising a file system-like abstraction backed by one or more Store Providers.

### 49.2 DBMS_DBFS_CONTENT_SPI Security Model

Implementations of the `DBMS_DBFS_CONTENT_SPI` package should be created as `AUTHID CURRENT_USER`.

### 49.3 DBMS_DBFS_CONTENT_SPI Operational Notes

This topic lists operational notes for `DBMS_DBFS_CONTENT_SPI` implementation, path names, and other operations.

- **Implementation**
- **Path Names**
- **Other DBMS_DBFS_CONTENT Operations**

**Implementation**

Since the interconnection of the `DBMS_DBFS_CONTENT` interface and the provider SPI is a 1-to-many pluggable architecture, the interface uses dynamic SQL to invoke methods in the provider SPI, this can lead to runtime errors.

There are no explicit `INIT` or `FINI` methods to indicate when the `DBMS_DBFS_CONTENT` interface plugs or unplugs a particular provider SPI. Provider SPIs must be willing to auto-initialize themselves at any SPI entry-point.

All operations performed by a store provider are "stateless" in that they are complete operations unto themselves. If state is necessary to be maintained for some reason, then the state must be maintained in data structures such as auxiliary tables that can be queried as needed.

**Path Names**

All path names used in the provider SPI are store-qualified in pair form `(store_name, pathname)` where the path name is rooted within the store namespace.

Stores and their providers that support contentID-based access (see `FEATURE_CONTENT_ID` in Table 48-5) also support a form of addressing that is not based...
on path names. Content items are identified by an explicit store name, a **null** path name, and possibly a contentID specified as a parameter or by way of the **opt_content_id** (see Table 48-8) property.

Not all operations are supported with contentID-based access, and applications should depend only on the simplest create or delete functionality being available.

**Other DBMS_DBFS_CONTENT Operations**

This table lists other operations and provides links to related discussions.

**Table 49-1 Other DBMS_DBFS_CONTENT Operations**

<tr>
<td>SETPATH Procedure</td>
<td>Assigns a path name to a path item represented by contentID</td>
</tr>
<tr>
<td>SPACEUSAGE Procedure</td>
<td>Queries file system space usage statistics</td>
</tr>
<tr>
<td>UNLOCKPATH Procedure</td>
<td>Unlocks path items that were previously locked with the LOCKPATH Procedure</td>
</tr>
</tbody>
</table>

49.4.1 CHECKACCESS Function

This function reports if the user (principal) can perform the specified operation on the given path. This enables verifying the validity of an operation without attempting to perform the operation. If CHECKACCESS returns 0, then the subprogram invoked to implement that operation should fail with an error.

Syntax

```
DBMS_DBFS_CONTENT_SPI.CHECKACCESS (  
  store_name IN VARCHAR2 DEFAULT NULL,  
  path IN VARCHAR2,  
  pathtype IN INTEGER,  
  operation IN VARCHAR2,  
  
  ...)
```

Chapter 49

Summary of DBMS_DBFS_CONTENT_SPI Subprograms
principal IN VARCHAR2)
RETURN INTEGER;

Parameters

Table 49-3  CHECKACCESS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to check for access</td>
</tr>
<tr>
<td>path_type</td>
<td>Type of object path represents (see Table 48-4)</td>
</tr>
<tr>
<td>operation</td>
<td>Operation to be checked (see Table 48-8)</td>
</tr>
<tr>
<td>principal</td>
<td>File system user for whom the access check is made</td>
</tr>
</tbody>
</table>

Usage Notes

Whether or not the user invokes this function, a store that supports access control internally performs these checks to guarantee security.

49.4.2 CREATEDIRECTORY Procedure

This procedure creates a directory.

Syntax

DBMS_DBFS_CONTENT_SPI.CREATEDIRECTORY (  
  store_name IN VARCHAR2,  
  path IN VARCHAR2,  
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,  
  prop_flags IN INTEGER,  
  recurse IN INTEGER,  
  ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);  

Parameters

Table 49-4  CREATEDIRECTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting PROP_SPC (see Table 48-9), and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively; otherwise, recursively create the directories above the given directory</td>
</tr>
</tbody>
</table>
Table 49-4  (Cont.) CREATEDIRECTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context with which to create the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.3 CREATEFILE Procedure

This procedure creates a file.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.CREATEFILE (  
    store_name    IN              VARCHAR2,  
    path          IN              VARCHAR2,  
    properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,  
    content       IN OUT NOCOPY   BLOB,  
    prop_flags    IN              INTEGER,  
    ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

**Parameters**

Table 49-5  CREATEFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned or both depending, or both on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data with which to populate the file (optional)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to create the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.4 CREATELINK Procedure

This procedure creates a physical link to an already existing file system element (such as file or directory). The resulting entry shares the same metadata structures as the value of the srcPath parameter, and so is similar to incrementing a reference count on the file system element. This is analogous to a UNIX file system hard link.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.CREATELINK (  
    store_name    IN              VARCHAR2,  
    srcPath       IN              VARCHAR2,
);
dstPath       IN              VARCHAR2,
properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
prop_flags    IN              INTEGER,
ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);

Parameters

Table 49-6  CREATELINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>srcPath</td>
<td>File system entry with which to link</td>
</tr>
<tr>
<td>dstPath</td>
<td>Path of the new link element to be created</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to create the link (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.5 CREATEREFERENCE Procedure

This procedure creates a new reference to the source file system element (such as a file, or directory). The resulting reference points to the source element but does not directly share metadata with the source element. This is analogous to a UNIX file system symbolic link.

Syntax

DBMS_DBFS_CONTENT_SPI.CREATEREFERENCE (srcPath IN VARCHAR2,
dstPath IN VARCHAR2,
properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
prop_flags IN INTEGER,
store_name IN VARCHAR2,
ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);

Parameters

Table 49-7  CREATEREFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>srcPath</td>
<td>File system entry with which to link</td>
</tr>
<tr>
<td>dstPath</td>
<td>Path of the new link element to be created</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set, returned, or both, depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
</tbody>
</table>
Table 49-7  (Cont.) CREATREFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to create the reference (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.6 DELETECONTENT Procedure

This procedure deletes the file specified by the given contentID.

Syntax

\[
\text{DBMS_DBFS_CONTENT_SPI.DELETECONTENT} (\text{store_name IN VARCHAR2, contentID IN RAW, filter IN VARCHAR2, soft_delete IN INTEGER, ctx IN DBMS_DBFS_CONTENT_CONTEXT_T};
\]

Parameters

Table 49-8  DELETECONTENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>contentID</td>
<td>Unique identifier for the file to be deleted</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see Oracle Database SecureFiles and Large Objects Developer's Guide, Deletion Operations.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.7 DELETEDIRECTORY Procedure

This procedure deletes a directory.

If \text{recurse} is nonzero, it recursively deletes all elements of the directory. A filter, if supplied, determines which elements of the directory are deleted.

Syntax

\[
\text{DBMS_DBFS_CONTENT_SPI.DELETEDIRECTORY} (\text{store_name IN VARCHAR2, path IN VARCHAR2, filter IN VARCHAR2, soft_delete IN INTEGER,}
\]

Parameters

Table 49-9  DELETEDIRECTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to the directory</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see Oracle Database SecureFiles and Large Objects Developer’s Guide, Deletion Operations.</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively delete the directories and files below the given directory.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to delete the directory (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.8 DELETEFILE Procedure

This procedure deletes the specified file.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.DELETEFILE ( 
    store_name     IN     VARCHAR2,
    path           IN     VARCHAR2,
    filter         IN     VARCHAR2,
    soft_delete    IN     BOOLEAN,
    ctx            IN     DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49-10  DELETEFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to the file</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>soft_delete</td>
<td>If 0, execute a hard (permanent) delete. For any value other than 0, perform a soft delete see Oracle Database SecureFiles and Large Objects Developer’s Guide, Deletion Operations.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to delete the file (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>
49.4.9 GETFEATURES Function

This function returns the features of a store.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.GETFEATURES (    
    store_name  IN    VARCHAR2)    
RETURN  INTEGER;
```

Parameters

Table 49-11  GETFEATURES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

```sql
DBMS_DBFS_CONTENT.FEATURE_* features supported by the Store Provider
```

49.4.10 GETPATH Procedures

This procedure returns existing path items (such as files and directories). This includes both data and metadata (properties).

The client can request (using `prop_flags`) that specific properties be returned. File path names can be read either by specifying a `BLOB` locator using the `prop_data` bitmask in `prop_flags` (see Table 48-9) or by passing one or more `RAW` buffers.

When `forUpdate` is 0, this procedure also accepts a valid "as of" timestamp parameter as part of `ctx` that can be used by stores to implement "as of" style flashback queries. Mutating versions of the GETPATH Procedures do not support these modes of operation.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.GETPATH (    
    store_name  IN    VARCHAR2,    
    path        IN    VARCHAR2,    
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,    
    content     OUT    NOCOPY   BLOB,    
    item_type   OUT             INTEGER,    
    prop_flags  IN              INTEGER,    
    forUpdate   IN              INTEGER,    
    deref       IN              INTEGER,    
    ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

```sql
DBMS_DBFS_CONTENT_SPI.GETPATH (    
    store_name  IN    VARCHAR2,    
    path        IN    VARCHAR2,    
    properties  IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,    
    amount      IN OUT          NUMBER,    
    offset      IN              NUMBER,    
    buffer      OUT    NOCOPY   RAW,    
    prop_flags  IN              INTEGER,    
    ctx         IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```
Parameters

Table 49-12 GETPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see Table 48-4)</td>
</tr>
<tr>
<td>amount</td>
<td>On input, number of bytes to be read. On output, number of bytes read</td>
</tr>
<tr>
<td>offset</td>
<td>Byte offset from which to begin reading</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>buffers</td>
<td>Buffers to which to write</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set, returned, or both. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>forUpdate</td>
<td>Specifies that a lock should be taken to signify exclusive write access to the path item</td>
</tr>
<tr>
<td>deref</td>
<td>If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.11 GETPATHBYSTOREID Function

If the underlying GUID is found in the underlying store, this function returns the store-qualified path name.

Syntax

DBMS_DBFS_CONTENT_SPI.GETPATHBYSTOREID (  
  store_name IN VARCHAR2,  
  guid IN VARCHAR2)  
RETURN VARCHAR2;
Parameters

Table 49-13 GETPATHBystoreID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>guid</td>
<td>Unique ID representing the desired path item</td>
</tr>
</tbody>
</table>

Return Values

Store-qualified path name represented by the GUID

Usage Notes

If the STD_GUID is unknown, a NULL value is returned. Clients are expected to handle this as appropriate.

49.4.12 GETPATHNOWAIT Procedure

This procedure implies that the operation is for an update, and, if implemented, allows providers to return an exception (ORA-00054) rather than wait for row locks.

See FEATURE_NOWAIT in Table 48-5 for more information.

Syntax

DBMS_DBFS_CONTENT_SPI.GETPATHNOWAIT {
    store_name IN VARCHAR2, 
    path IN VARCHAR2, 
    properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T, 
    content OUT NOCOPY BLOB, 
    item_type OUT INTEGER, 
    prop_flags IN INTEGER, 
    deref IN INTEGER, 
    ctx IN DBMS_DBFS_CONTENT_CONTEXT_T)
}

Parameters

Table 49-14 GETPATHNOWAIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be returned depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see Table 48-4)</td>
</tr>
</tbody>
</table>
Table 49-14  (Cont.) GETPATHNOWAIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prop_flags</td>
<td>Determines which properties are returned. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>deref</td>
<td>If nonzero, attempts to resolve the given path item to actual data provided it is a reference (symbolic link)</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.13 GETSTOREID Function

This function returns the ID of a store.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.GETSTOREID (store_name IN VARCHAR2) RETURN NUMERO;
```

Parameters

Table 49-15  GETSTOREID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

ID of the Store

Usage Notes

A store ID identifies a provider-specific store, across registrations and mounts, but independent of changes to the store contents. For this reason, changes to the store table or tables should be reflected in the store ID, but re-initialization of the same store table or tables should preserve the store ID.

49.4.14 GETVERSION Function

This function returns the version associated with a store.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.GETVERSION (store_name IN VARCHAR2) RETURN VARCHAR2;
```
Parameters

Table 49-16  GETVERSION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Return Values

A "version" (either specific to a provider package, or to an individual store) based on a standard \textit{a.b.c} naming convention (for \textit{major}, \textit{minor}, and \textit{patch} components)

49.4.15 ISPATHLOCKED Procedure

This procedure checks if any user-level locks are applied on a given path.

Syntax

```sql
DBMS_DBFS_CONTENT.ISPATHLOCKED ( 
    store_name IN VARCHAR2,
    path IN VARCHAR2,
    who IN VARCHAR2,
    lock_type IN OUT INTEGER,
    ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49-17  ISPATHLOCKED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Path name of items to be locked</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>lock_type</td>
<td>One of the available lock types (see Table 48-6)</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.16 LIST Function

This function lists the contents of a directory path name.

The invoker of the subprogram has the option to investigate recursively into sub-directories, to make soft-deleted items visible, to use a flashback "as of" a specified timestamp, and to filter items within the store based on list predicates.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.LIST ( 
    store_name IN VARCHAR2,
    path IN VARCHAR2,
    filter IN VARCHAR2,
    recurse IN INTEGER,
```
Parameters

Table 49-18 LIST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of repository</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to directories</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively list the contents of directories and files below the given directory.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

Return Values

Path items found that match the path, filter and criteria for executing recursively (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)

Usage Notes

This function returns only list items; the client is expected to explicitly use one of the GETPATH Procedures to access the properties or content associated with an item.

49.4.17 LOCKPATH Procedure

This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.LOCKPATH (  
    store_name IN VARCHAR2,  
    path IN VARCHAR2,  
    who IN VARCHAR2,  
    lock_type IN INTEGER,  
    waitForRowLock IN INTEGER,  
    ctx IN DBMS_DBFS_CONTENT_CONTEXT_T)
```

Parameters

Table 49-19 LOCKPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Path name of items to be locked</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>lock_type</td>
<td>One of the available lock types (see Table 48-6)</td>
</tr>
<tr>
<td>waitForRowLock</td>
<td>Determines if a row is locked by a transaction or not</td>
</tr>
</tbody>
</table>
### Table 49-19 (Cont.) LOCKPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

**Usage Notes**

- It is the responsibility of the store and its providers (assuming it supports user-defined lock checking) to ensure that lock and unlock operations are performed in a consistent manner.
- The status of locked items is available by means of various optional properties (see OPT_LOCK in Table 48-8).

#### 49.4.18 PURGEALL Procedure

This procedure purges all soft-deleted entries matching the path and optional filter criteria.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.PURGEALL (  
    store_name     IN      VARCHAR2,  
    path           IN      VARCHAR2,  
    filter         IN      VARCHAR2,  
    ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to file items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied based on specified criteria</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

#### 49.4.19 PURGEPATH Procedure

This procedure purges any soft-deleted versions of the given path item.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.PURGEPATH (  
    path           IN      VARCHAR2,  
    filter         IN      VARCHAR2,  
    store_name     IN      VARCHAR2,  
    ctx            IN      DBMS_DBFS_CONTENT_CONTEXT_T);
```
49.4.20 PUTPATH Procedures

This procedure creates a new path item.

Syntax

```sql
DBMS_DBFS_CONTENT_SPI.PUTPATH (    
    store_name    IN              VARCHAR2,
    path          IN              VARCHAR2,
    properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    content       IN OUT NOCOPY   BLOB,
    item_type     OUT             INTEGER,
    prop_flags    IN              INTEGER,
    ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (    
    store_name    IN              VARCHAR2,
    path          IN              VARCHAR2,
    properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    amount        IN              NUMBER,
    offset        IN              NUMBER,
    buffer        IN              RAW,
    prop_flags    IN              INTEGER,
    ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);

DBMS_DBFS_CONTENT_SPI.PUTPATH (    
    store_name    IN              VARCHAR2,
    path          IN              VARCHAR2,
    properties    IN OUT NOCOPY   DBMS_DBFS_CONTENT_PROPERTIES_T,
    written       OUT             NUMBER,
    offset        IN              NUMBER,
    buffers       IN              DBMS_DBFS_CONTENT_RAW_T,
    prop_flags    IN              INTEGER,
    ctx           IN              DBMS_DBFS_CONTENT_CONTEXT_T);
```

Parameters

Table 49-22  PUTPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Path name of item to be put</td>
</tr>
<tr>
<td>prop_flags</td>
<td>INTEGER</td>
</tr>
</tbody>
</table>

Chapter 49  
Summary of DBMS_DBFS_CONTENT_SPI Subprograms
Table 49-22  (Cont.) PUTPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>content</td>
<td>BLOB holding data which populates the file (optional)</td>
</tr>
<tr>
<td>item_type</td>
<td>Type of the path item specified (see Table 48-4)</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to be read</td>
</tr>
<tr>
<td>written</td>
<td>Number of bytes written</td>
</tr>
<tr>
<td>offset</td>
<td>Byte offset from which to begin reading</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer to which to write</td>
</tr>
<tr>
<td>buffers</td>
<td>Buffers to which to write</td>
</tr>
<tr>
<td>prop_flags</td>
<td>Determines which properties are set. Default is PROP_STD. Specify properties to be returned by setting prop_spec, and providing an instance of the DBMS_DBFS_CONTENT_PROPERTIES_T Table Type with properties whose values are of interest.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

Usage Notes

- All path names allow their metadata (properties) to be read and modified. On completion of the call, the client can access specific properties using prop_flags (see Table 48-9).
- On completion of the call, the client can request a new BLOB locator that can be used to continue data access using the prop_data bitmask in prop_flags (see Table 48-9).
- Files can also be written without using BLOB locators, by explicitly specifying logical offsets or buffer-amounts, and a suitably sized buffer.

49.4.21 RENAMEPATH Procedure

This procedure renames or moves a path. This operation can be performed across directory hierarchies and mount-points as long as it is within the same store.

Note:

See Oracle Database SecureFiles and Large Objects Developer's Guide for further information on Rename and Move operations.

Syntax

```
DBMS_DBFS_CONTENT_SPI.RENAMEPATH ( 
    store_name IN VARCHAR2, 
    oldPath IN VARCHAR2, 
    newPath IN VARCHAR2,
) 
```
properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);

Parameters

Table 49-23  RENAMEPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store, must be unique</td>
</tr>
<tr>
<td>oldPath</td>
<td>Name of path prior to renaming</td>
</tr>
<tr>
<td>newPath</td>
<td>Name of path after renaming</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.22 RESTOREALL Procedure

This procedure restores all soft-deleted path items meeting the path and optional filter criteria.

Syntax

DBMS_DBFS_CONTENT_SPI.RESTOREALL (  
  store_name IN VARCHAR2,  
  path IN VARCHAR2,  
  filter IN VARCHAR2,  
  ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);  

Parameters

Table 49-24  RESTOREALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.23 RESTOREPATH Procedure

This procedure restores all soft-deleted path items that match the given path and optional filter criteria.

Syntax

DBMS_DBFS_CONTENT_SPI.RESTOREPATH (  
  store_name IN VARCHAR2,  
  path IN VARCHAR2,  
  properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
  ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);
filter IN VARCHAR2,
ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);

Parameters

Table 49-25  RESTOREPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.24 SEARCH Function

This function searches for path items matching the given path and filter criteria.

Syntax

```
DBMS_DBFS_CONTENT_SPI.SEARCH (  
  store_name IN VARCHAR2,  
  path IN VARCHAR2,  
  filter IN VARCHAR2,  
  recurse IN INTEGER,  
  ctx IN DBMS_DBFS_CONTENT_CONTEXT_T)  
RETURN DBMS_DBFS_CONTENT_LIST_ITEMS_T PIPELINED;
```

Parameters

Table 49-26  LIST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to the path items</td>
</tr>
<tr>
<td>filter</td>
<td>A filter, if any, to be applied</td>
</tr>
<tr>
<td>recurse</td>
<td>If 0, do not execute recursively. Otherwise, recursively search the contents of directories and files below the given directory.</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

Return Values

Path items matching the given path and filter criteria (see DBMS_DBFS_CONTENT_LIST_ITEMS_T Table Type)
49.4.25 SETPATH Procedure

This procedure assigns a path name to a path item represented by contentID.

Stores and their providers that support contentID-based access and lazy path name binding also support the SETPATH Procedure that associates an existing contentID with a new path.

**Note:**

See Oracle Database SecureFiles and Large Objects Developer's Guide for further information on Rename and Move operations.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.SETPATH (
    store_name IN VARCHAR2,
    contentID IN RAW,
    path IN VARCHAR2,
    properties IN OUT NOCOPY DBMS_DBFS_CONTENT_PROPERTIES_T,
    ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);
```

**Parameters**

**Table 49-27 SETPATH Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of the store</td>
</tr>
<tr>
<td>contentID</td>
<td>Unique identifier for the item to be associated</td>
</tr>
<tr>
<td>path</td>
<td>Name of path to path item</td>
</tr>
<tr>
<td>properties</td>
<td>One or more properties and their values to be set depending on prop_flags (see DBMS_DBFS_CONTENT_PROPERTIES_T Table Type)</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

49.4.26 SPACEUSAGE Procedure

This procedure queries file system space usage statistics.

Providers are expected to support this subprogram for their stores and to make a best effort determination of space usage, especially if the store consists of multiple tables, indexes, LOBs, and so on.

**Syntax**

```sql
DBMS_DBFS_CONTENT_SPI.SPACEUSAGE (
    store_name IN VARCHAR2,
    blksize OUT INTEGER,
    tbytes OUT INTEGER,
    fbytes OUT INTEGER,
    ...);
### Parameters

#### Table 49-28 SPACEUSAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>blksize</td>
<td>Natural tablespace blocksize that holds the store. If multiple tablesspaces with different blocksizes are used, any valid blocksize is acceptable.</td>
</tr>
<tr>
<td>tbytes</td>
<td>Total size of the store in bytes computed over all segments that comprise the store</td>
</tr>
<tr>
<td>fbytes</td>
<td>Free or unused size of the store in bytes computed over all segments that comprise the store</td>
</tr>
<tr>
<td>nfile</td>
<td>Number of currently available files in the store</td>
</tr>
<tr>
<td>ndir</td>
<td>Number of currently available directories in the store</td>
</tr>
<tr>
<td>nlink</td>
<td>Number of currently available links in the store</td>
</tr>
<tr>
<td>nref</td>
<td>Number of currently available references in the store</td>
</tr>
</tbody>
</table>

#### Usage Notes

- A space usage query on the top-level root directory returns a combined summary of the space usage of all available distinct stores under it (if the same store is mounted multiple times, it is still counted only once).
- Since database objects are dynamically expandable, it is not easy to estimate the division between “free” space and “used” space.

### 49.4.27 UNLOCKPATH Procedure

This procedure unlocks path items that were previously locked with the LOCKPATH Procedure.

#### Syntax

```sql
DBMS_DBFS_CONTENT_SPI.UNLOCKPATH (  
    store_name IN VARCHAR2,  
    path IN VARCHAR2,  
    who IN VARCHAR2,  
    waitForRowLock IN INTEGER,  
    ctx IN DBMS_DBFS_CONTENT_CONTEXT_T);
```

#### Parameters

#### Table 49-29 UNLOCKPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>
### Table 49-29  (Cont.) UNLOCKPATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Name of path to the path items</td>
</tr>
<tr>
<td>who</td>
<td>Transaction identifier that has locked the path</td>
</tr>
<tr>
<td>waitForRowLock</td>
<td>Determines if a row is locked by a transaction or not</td>
</tr>
<tr>
<td>ctx</td>
<td>Context with which to access the path items (see DBMS_DBFS_CONTENT_CONTEXT_T Object Type)</td>
</tr>
</tbody>
</table>

### Related Topics
- **LOCKPATH Procedure**
  This procedure applies user-level locks to the given valid path name (subject to store feature support), and optionally associates user-data with the lock.
DBMS_DBFS_HS

The Oracle Database File System Hierarchical Store is implemented in the DBMS_DBFS_HS package. This package provides users the ability to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management for their database tables.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Summary of DBMS_DBFS_HS Subprograms

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide

50.1 DBMS_DBFS_HS Overview

The DBMS_DBFS_HS package is a service provider underneath the DBMS_DBFS_CONTENT package that enables use of tape or Amazon S3 Web service as storage for data.

The data on tape or Amazon S3 Web service is part of the Oracle Database and can be accessed through all standard interfaces, but only through the database. The package allows users to use tape or Amazon S3 Web service as a storage tier when doing Information Lifecycle Management of their content.

The package initially stores all content files in level-1 cache. As the level-1 cache fills up, content files are moved to level-2 cache and then to an external storage device using bulk writes.

50.2 DBMS_DBFS_HS Security Model

The DBMS_DBFS_HS package runs with invoker's rights.

50.3 DBMS_DBFS_HS Constants

The DBMS_DBFS_HS package uses the constants shown in the tables in this topic.
Table 50-1  DBMS_DBFS_HS Constants - Used by the CREATESTORE Procedure

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STORETYPE_TAPE</td>
<td>VARCHAR2(50)</td>
<td>'HS_TAPE'</td>
<td>Use tape as a storage tier</td>
</tr>
<tr>
<td>STORETYPE_AMAZONS</td>
<td>VARCHAR2(50)</td>
<td>'HS_S3'</td>
<td>Use Amazon S3 Web service as a storage tier</td>
</tr>
</tbody>
</table>

Table 50-2  DBMS_DBFS_HS Constants - Used by the SETSTOREPROPERTY Procedure and the GETSTOREPROPERTY Function

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROPNAME_BUCKET</td>
<td>VARCHAR2(50)</td>
<td>'BUCKET'</td>
<td>Specifies the AWS bucket to be used as a storage tier by the Hierarchical Store. Restrictions on bucket name are: 1) Bucket names can only contain lowercase letters, numbers, periods (.) and dashes(-). Note that underscores (_) are invalid. 2) Bucket names must start with a number or letter. 3) Bucket names cannot be in an IP address style (192.168.5.4). 4) Bucket names must be between 3 and 63 characters long. 5) Bucket names should not end with a dash. 6) Dashes cannot appear next to periods. For example, my-.bucket.com is invalid.</td>
</tr>
<tr>
<td>PROPNAME_CACHESIZE</td>
<td>VARCHAR2(50)</td>
<td>'CACHE_SIZE'</td>
<td>Specifies the cumulative cache size used for the Hierarchical Store. This property is set by the CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure. It cannot be modified by the SETSTOREPROPERTY Procedure, though its value can be queried by the GETSTOREPROPERTY Function.</td>
</tr>
<tr>
<td>PROPNAME_COMPRESS_LEVEL</td>
<td>VARCHAR2(50)</td>
<td>'COMPRESSION_LEVEL'</td>
<td>Use to enable compression of files stored in the DBFS hierarchical store. It specifies the compression level to be used for compressing the files</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------</td>
<td>------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROPNAME_ENABLECLEANUPONDELETE</td>
<td>VARCHAR2(50)</td>
<td>'ENABLE_CLEANUP_ON_DELETE'</td>
<td>If this property is set to 'TRUE', whenever the user invokes the DELETEFILE Procedure in the DBMS_DBFS_CONTENT interface on a file residing in the DBMS_DBFS_HS store, the DBMS_DBFS_HS removes the file on the external storage that contains this user file, provided that the file has no other useful data. By default, the property is set to 'TRUE' for STORETYPE_AMAZONS3 and 'FALSE' for STORETYPE_TAPE.</td>
</tr>
<tr>
<td>PROPNAME_HTTP_PROXY</td>
<td>VARCHAR2(50)</td>
<td>'HTTP_PROXY'</td>
<td>Specifies the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service.</td>
</tr>
<tr>
<td>PROPNAME_LICENSE_ID</td>
<td>VARCHAR2(50)</td>
<td>'LICENSE_ID'</td>
<td>Specifies the license ID associated with the library libosbws11.so.</td>
</tr>
<tr>
<td>PROPNAME_LOBCACHE_QUOTA</td>
<td>VARCHAR2(50)</td>
<td>'LOBCACHE_QUOTA'</td>
<td>Specifies fraction of the cache_size which is allocated for level 1 cache. The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache. This property cannot be modified by the SETSTOREPROPERTY Procedure though its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.</td>
</tr>
<tr>
<td>PROPNAME_MEDIAPOOL</td>
<td>VARCHAR2(50)</td>
<td>'MEDIA_POOL'</td>
<td>Specifies the media pool number to use for storing the content</td>
</tr>
<tr>
<td>PROPVAL_COMPLVL_NONE</td>
<td>VARCHAR2(50)</td>
<td>'NONE'</td>
<td>Indicates no compression</td>
</tr>
<tr>
<td>PROPVAL_COMPLVL_LOW</td>
<td>VARCHAR2(50)</td>
<td>'LOW'</td>
<td>Use to set the compression level to LOW. This is expected to have the best performance while still providing a good compression ratio.</td>
</tr>
<tr>
<td>PROPVAL_COMPLVL_MEDIUM</td>
<td>VARCHAR2(50)</td>
<td>'MEDIUM'</td>
<td>Use to set the compression level to MEDIUM. This compression level is expected to provide better compression ratio than LOW but the time required for compression will be higher than compression level LOW.</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------</td>
<td>----------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROPVAL_COMPLVL_HIGH</td>
<td>VARCHAR2(50)</td>
<td>'HIGH'</td>
<td>Use to set the compression level to HIGH. This compression level is expected to provide the best compression ratio but compression time will in general be highest among the 3 compression levels.</td>
</tr>
<tr>
<td>PROPNAME_OPTTARBA_LL_SIZE</td>
<td>VARCHAR2(50)</td>
<td>'OPTIMAL_TARBA_LL_SIZE'</td>
<td>Specifies optimal_tarball_size as the maximum possible size of an archive file. Multiple content files are bundled together into one archive file and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. This property cannot be modified by the SETSTOREPROPERTY Procedure though its value can be queried by the GETSTOREPROPERTY Function. Its value is set by CREATESTORE Procedure and can be modified by the RECONFIGCACHE Procedure.</td>
</tr>
<tr>
<td>PROPNAME_READCHUNK_SIZE</td>
<td>VARCHAR2(50)</td>
<td>'READ_CHUNK_SIZE'</td>
<td>Specifies the size used by the SBT protocol to transfer data from tape or S3. This chunk is allocated in memory per transaction for retrieval of content files from an archive store, so the value of this property should be conservative. The default size of 1MB is typically good for most users.</td>
</tr>
<tr>
<td>PROPNAME_S3HOST</td>
<td>VARCHAR2(50)</td>
<td>'S3_HOST'</td>
<td>Specifies the host name of the Amazon S3 storage service. It must be s3.amazonaws.com.</td>
</tr>
<tr>
<td>PROPNAME_SBT_LIBRARY</td>
<td>VARCHAR2(50)</td>
<td>'SBT_LIBRARY'</td>
<td>Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbwsll.so and is available in rdbms/lib directory.</td>
</tr>
<tr>
<td>PROPNAME_STREAMABLE</td>
<td>VARCHAR2(50)</td>
<td>'STREAMABLE'</td>
<td>Indicates whether buffer-based PUT or GET should be done on this store. Valid values for are TRUE and FALSE. The default value of this property is TRUE.</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------</td>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PROPNAME_WALLET</td>
<td>VARCHAR2(50)</td>
<td>'WALLET'</td>
<td>The value of this property should be of the form:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>LOCATION=file:filename</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>CREDENTIAL_ALIAS=access/secret_alias</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>PROXY_AUTH_ALIAS=proxyusername/password alias</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Defines the Oracle Wallet which contains the credentials of the Amazon S3 account associated with the store under consideration.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>LOCATION: The directory path that contains the Oracle wallet. The format is file:directory-path</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The format of wallet_path in Windows is, for example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>file:c:\WINNT\Profiles\username\WALLETS</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>In UNIX or Linux it is, for example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>file:/home/username/wallets</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>When the package is executed in the Oracle database server, the wallet is accessed from the database server.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>PASSWORD: Defines the wallet password. If auto-login is enabled in wallet (this can be changed using the OWM utility), this parameter does not have to be specified. By default, the mkstore utility enables auto-login.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>CREDENTIAL_ALIAS: Defines the credential alias for ACCESS_KEY and SECRET_KEY</td>
</tr>
<tr>
<td>PROPNAME_WRITECHU</td>
<td>VARCHAR2(50)</td>
<td>'WRITE_CHUNK_SIZE'</td>
<td>Specifies the size used by the SBT protocol to transfer data to tape or S3.</td>
</tr>
<tr>
<td>NKSIZ</td>
<td></td>
<td></td>
<td>This chunk is allocated in memory per transaction for PUT of Content Files to an archive store so the value should be conservative.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The default size of 1MB is typically good for most users.</td>
</tr>
</tbody>
</table>

<td>Procedure or function returned an error</td>
</tr>
</tbody>
</table>

50.4 DBMS_DBFS_HS Operational Notes

When the DBMS_DBFS_HS package is executed in the Oracle database server, the wallet is accessed from the database server.

50.5 Summary of DBMS_DBFS_HS Subprograms

This table lists and describes the subprograms in the DBMS_DBFS_HS package.

Table 50-5  DBMS_DBFS_HS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEANUPUNUSEDBACKUPFILES</td>
<td>Removes files created on the external storage device that hold no currently used data</td>
</tr>
<tr>
<td>CREATEBUCKET Procedure</td>
<td>Creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data</td>
</tr>
<tr>
<td>CREATESTORE Procedure</td>
<td>Creates a new hierarchical store</td>
</tr>
<tr>
<td>DEREGSTORECOMMAND Function</td>
<td>Removes a command that had been previously associated with a store through the RECONFIGCACHE Procedure</td>
</tr>
<tr>
<td>DROPSTORE Procedure</td>
<td>Deletes a previously created hierarchical store</td>
</tr>
<tr>
<td>FLUSHCACHE Procedure</td>
<td>Flushes (writes out) dirty contents from the level-1 cache.</td>
</tr>
<tr>
<td>GETSTOREPROPERTY Function</td>
<td>Retrieves the values of a property of a store</td>
</tr>
</tbody>
</table>
Table 50-5  (Cont.) DBMS_DBFS_HS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RECONFIGCACHE Procedure</td>
<td>Reconfigures the parameters of the database cache used by the store</td>
</tr>
<tr>
<td>REGISTERSTORECOMMAND Procedure</td>
<td>Registers commands for a store with the Hierarchical Store to be sent to the Media Manager for the external storage device associated with the store</td>
</tr>
<tr>
<td>SENDCOMMAND Procedures</td>
<td>Sends a command to be executed on the external storage device's Media Manager</td>
</tr>
<tr>
<td>SETSTOREPROPERTY Procedure</td>
<td>Stores properties of a store in the database</td>
</tr>
<tr>
<td>STOREPUSH Procedure</td>
<td>Pushes locally staged data to the remote storage</td>
</tr>
</tbody>
</table>

50.5.1 CLEANUPUNUSEDBACKUPFILES Procedure

This procedure removes files created on the external storage device that hold no currently used data in them.

Syntax

```
DBMS_DBFS_HS.CLEANUPUNUSEDBACKUPFILES (store_name IN VARCHAR2);
```

Parameters

Table 50-6  CLEANUPUNUSEDBACKUPFILES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

- The action of removing files from external storage device can not be rolled back.
- This method can be executed periodically to clear space on the external storage device. Asynchronously deleting content from the external storage device is useful because it has minimal impact on the OLTP performance. The periodic scheduling can be accomplished using the DBMS_SCHEDULER package.

50.5.2 CREATEBUCKET Procedure

This procedure creates an AWS bucket, associated with a store of type STORETYPE_AMAZONS3 into which the Hierarchical Store can then move data.

Syntax

```
DBMS_DBFS_HS.CREATESUBJECT (store_name IN VARCHAR2);
```
Parameters

Table 50-7  CREATEBUCKET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

- The `PROPNAME_BUCKET` property of the store should be set before this subprogram is called.
- Once this procedure has successfully created a bucket in Amazon S3, the bucket can only be deleted using out-of-band methods, such as logging-in to S3 and deleting data (directories, files, and other items) for the bucket.

50.5.3 CREATESTORE Procedure

This procedure creates a new hierarchical store `store_name` of type `STORE_TYPE` (STORETYPE_TAPE or STORETYPE_AMAZONS3) in schema `schema_name` (defaulting to the current schema) under the ownership of the invoking session user.

Syntax

```sql
DBMS_DBFS_HS.CREATESTORE  (  
    store_name              IN     VARCHAR2,
    store_type              IN     VARCHAR2,
    tbl_name                IN     VARCHAR2,
    tbs_name                IN     VARCHAR2,
    cache_size              IN     NUMBER,
    lob_cache_quota         IN     NUMBER DEFAULT NULL,
    optimal_tarball_size    IN     NUMBER DEFAULT NULL,
    schema_name             IN     VARCHAR2 DEFAULT NULL);
```

Parameters

Table 50-8  CREATESTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>store_type</td>
<td>STORETYPE_TAPE or STORETYPE_AMAZONS3</td>
</tr>
<tr>
<td>tbl_name</td>
<td>Table for store entries</td>
</tr>
<tr>
<td>tbs_name</td>
<td>Tablespace for the store</td>
</tr>
<tr>
<td>cache_size</td>
<td>Amount of space used by the store to cache content in given tablespace</td>
</tr>
<tr>
<td>lob_cache_quota</td>
<td>Fraction of the cache_size which is allocated for level 1 cache.</td>
</tr>
<tr>
<td></td>
<td>The default value of this parameter is NULL which means that 0.8 (= 80%) of the cache_size is used for level 1 cache.</td>
</tr>
</tbody>
</table>
Table 50-8  (Cont.) CREATESTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>optimal_tarball_size</td>
<td>Maximum possible size of the archive file. Multiple content files are bundled together into one archive file, and then the archive file is transferred to tape or Amazon S3. This is because creating one file on tape or Amazon S3 for every content file in the store is a prohibitively expensive operation. The value of is set by default to 10GB for tape and to 100MB for Amazon S3.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema for the store</td>
</tr>
</tbody>
</table>

Usage Notes

CREATESTORE() sets certain properties of the store to default values. The user can use the methods SETSTOREPROPERTY() and RECONFIGCACHE() to appropriately change the property values and to set other properties of the store.

- Store names must be unique for an owner. The same store names can be used for different stores owned by different owners.
- Once a table space has been specified to store the store’s content in a database, it cannot be changed later.
- This subprogram will execute like a DDL statement, performing an automatic COMMIT before and after execution.
- Stores using DBMS_DBFS_HS must not use singleton mount. This means that the singleton parameter should be FALSE and the store_mount parameter should have a non-NULL value in a call to the DBMS_DBFS_CONTENT.MOUNTSTORE procedure.

50.5.4 DEREGSTORECOMMAND Function

This procedure removes a command that had been previously associated with a store through the REGISTERSTORECOMMAND Procedure.

Syntax

```sql
DBMS_DBFS_HS.DEREGSTORECOMMAND (
    store_name  IN    VARCHAR2,
    message     IN    VARCHAR2);
```

Parameters

Table 50-9  DEREGSTORECOMMAND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>message</td>
<td>Message to be deregistered</td>
</tr>
</tbody>
</table>
Usage Notes

If this subprogram successfully executes, its actions cannot be rolled back by the user. If the user wants to restore the previous state, the user must call the REGISTERSTORECOMMAND Procedure.

Related Topics

- **REGISTERSTORECOMMAND Procedure**
  This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

### 50.5.5 DROPSTORE Procedure

This procedure deletes a previously created hierarchical store specified by name and owned by the invoking session user.

**Syntax**

```sql
DBMS_DBFS_HS.DROPSTORE ( 
    store_name   IN     VARCHAR2,
    opt_flags    IN     INTEGER DEFAULT 0);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store owned by the invoking session user</td>
</tr>
<tr>
<td>opt_flags</td>
<td>User can specify optional flags. If DISABLE_CLEANUPBACKUPFILES is specified as one of the optional flags, the call to the CLEANUPUNUSEDBACKUPFILES Procedure is not issued. By default, when this flag is not set, the procedure implicitly cleans-up all unused backup files.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The procedure executes like a DDL in that it auto-commits before and after its execution.

- If CLEANUPBACKUPFILES is disabled during the procedure, the user must resort to out-of-band techniques to cleanup unused backup files. No further invocations of CLEANUPBACKUPFILES for a dropped store are possible through hierarchical store.

- This subprogram will un-register the store from DBMS_DBFS_CONTENT package. All files in the given store are deleted from the store (Tape or Amazon S3 Web service). The database table holding the store’s entries in the database, is also dropped by this subprogram.
50.5.6 FLUSHCACHE Procedure

This procedure flushes out dirty contents from level-1 cache, which can be locked, to level-2 cache, thereby freeing-up space in level 1 cache.

Syntax

```sql
DBMS_DBFS_HS.FLUSHCACHE (
  store_name  IN     VARCHAR2);
```

Parameters

Table 50-11 FLUSHCACHE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

50.5.7 GETSTOREPROPERTY Function

This function retrieves the values of a property.

Syntax

```sql
DBMS_DBFS_HS.GETSTOREPROPERTY  (
  store_name      IN     VARCHAR2,
  property_name   IN     VARCHAR2,
  noexcp          IN     BOOLEAN DEFAULT FALSE) RETURN VARCHAR2;
```

Parameters

Table 50-12 GETSTOREPROPERTY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>property_name</td>
<td>Name of property</td>
</tr>
<tr>
<td>noexcp</td>
<td>If set to FALSE, raises an exception if the property does not exist in the database. If noexcp is set to TRUE, returns NULL if the property does not exist.</td>
</tr>
</tbody>
</table>

Return Values

The values of a property.

Usage Notes

The specified store must already have been created.
50.5.8 RECONFIGCACHE Procedure

This procedure reconfigures the parameters of the database cache being used by the store.

Syntax

```sql
DBMS_DBFS_HS.RECONFIGCACHE (  
    store_name    IN    VARCHAR2,
    cache_size    IN    NUMBER DEFAULT NULL,
    lobcache_quota IN    NUMBER DEFAULT NULL,
    optimal_tarball_size IN    NUMBER DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>cache_size</td>
<td>Cumulative cache size used for the Hierarchical Store</td>
</tr>
<tr>
<td>lobcache_quota</td>
<td>Fraction of the cache size that are assigned to level 1 cache</td>
</tr>
<tr>
<td>optimal_tarball_size</td>
<td>Maximum possible size of an archive file. Since creating one file for every content file in the store is a prohibitively expensive operation, multiple content files are bundled together into one archive file for transfer to tape or Amazon S3.</td>
</tr>
</tbody>
</table>

Usage Notes

- The specified store must already have been created before reconfiguration.
- The Hierarchical Store uses a level 1 cache and a level 2 cache. The level 1 cache subsumes most of the working set and the level 2 cache is used to perform bulk writes to the backend device.
- If any of the last 3 parameters is NULL, its value specified during store creation is used. If the parameter was NULL when the call to the CREATESTORE Procedure was issued, the DBMS_DBFS_HS package assigns a default value.
  
The DBMS_DBFS_HS package optimistically tries to allocate more than 1 tarball's worth of size for level 2 cache to facilitate concurrency, though a minimum of 1 tarball size is necessary for level 2 cache.
  
The values for cumulative cache size and LOB cache quota decide allocation of space for the two caches. If values are not provided, a user might see an INSUFFICIENT_CACHE exception. In that case, it is better to revise the cache parameters in order to have a working store.
- If this subprogram successfully executes, its actions cannot be rolled back by the user. In that case, the user should call RECONFIGCACHE again with new or modified parameters.
50.5.9 REGISTERSTORECOMMAND Procedure

This procedure registers commands for a store with the Hierarchical Store. These commands are sent to the Media Manager for the external storage device associated with the store.

Syntax

```sql
DBMS_DBFS_HS.REGISTERSTORECOMMAND (    store_name      IN     VARCHAR2,    message         IN     VARCHAR2,    flags           IN     NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>message</td>
<td>Message to be sent to the Media Manager of the external store</td>
</tr>
<tr>
<td>flags</td>
<td>Valid values:</td>
</tr>
<tr>
<td></td>
<td>• BEFORE_PUT CONSTANT NUMBER := 1;</td>
</tr>
<tr>
<td></td>
<td>• BEFORE_GET CONSTANT NUMBER := 2;</td>
</tr>
</tbody>
</table>

Usage Notes

- These commands are sent before the next read or write of content. When the Hierarchical Store wants to push (or get) data to (or from) the storage device, it begins a session (to communicate with the device). After beginning the session, it sends all registered commands for the to the relevant device before writing (or getting) any data.

- If this method successfully executes, its actions cannot be rolled back by the user. To restore the previous state the user must call the DEREGSTORECOMMAND Function.

50.5.10 SENDCOMMAND Procedure

This procedure sends a command to be executed on the external storage device's Media Manager.

Syntax

```sql
DBMS_DBFS_HS.SENDCOMMAND (    store_name    IN       VARCHAR2,    message       IN       VARCHAR2);
```
Parameters

Table 50-15  SENDCOMMAND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>message</td>
<td>Message string to be executed</td>
</tr>
</tbody>
</table>

50.5.11 SETSTOREPROPERTY Procedure

This procedure stores properties of a store in the database as name-value pairs.

Syntax

```sql
DBMS_DBFS_HS.SETSTOREPROPERTY (  
    store_name    IN     VARCHAR2,
    property_name IN     VARCHAR2,
    property_value IN     VARCHAR2);
```

Parameters

Table 50-16  SETSTOREPROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>property_name</td>
<td>For a store using Tape device, there are three properties whose values must be set by the user, and four properties that have default values. Stores of type STORETYPE_AMAZONS3 have properties with default values. The various options for both types of stores are detailed under property_value.</td>
</tr>
</tbody>
</table>
### Table 50-16 (Cont.) SETSTOREPROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>property_value</td>
<td>Stores using a Tape Device</td>
</tr>
<tr>
<td></td>
<td>The values for the following properties must be set by the user:</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_SBTLIBRARY - This should point to the shared library used by RMAN to communicate with the external tape device. It is usually named libobk.so.</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_MEDIAPPOOOL - Media pool number for storing content</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_CACHE_SIZE - Amount of space, in bytes, used for the cache of this store</td>
</tr>
<tr>
<td></td>
<td>The following properties, which have default values assigned to them when a store is created, benefit from tuning:</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_READCHUNKSIZE and PROPNMSE_WRITECHUNKSIZE - These are the sizes used by the SBT protocol to transfer data to and from the tapes. These chunks are allocated in memory per transaction, so the values should be conservative. The default size is 1MB.</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_STREAMABLE - Indicates whether DBFS_LINKS can perform read operations (for example SELECT or DBMS_LOB.READ) directly from the store, or if the data must be copied back into the database before it can be read</td>
</tr>
<tr>
<td></td>
<td>• PROPNMSE_ENABLECLEANUPONDELETE - Indicates if DBMS_DBFS_HS should delete unused files on the external storage. Valid values for this property are 'FALSE' for STORETYPE_TAPE.</td>
</tr>
</tbody>
</table>
|                    | • PROPNMSE_COMPRESSLEVEL - Describes how files written to Tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MEDIUM or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.
Table 50-16  (Cont.) SETSTOREPROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(cont) property_value</td>
<td>Stores of type STORETYPE_AMAZONS3</td>
</tr>
<tr>
<td></td>
<td>It is mandatory that the following properties have assigned values, and default values are provided:</td>
</tr>
<tr>
<td></td>
<td>• PROPNAME_SBTLIBRARY - Specifies the path of the shared library used by RMAN to communicate with Amazon S3. It is named libosbws11.so and is available in rdbms/lib directory.</td>
</tr>
<tr>
<td></td>
<td>• PROPNAME_S3HOST - Defines the HOST name of the Amazon S3 storage service. It must be s3.amazonaws.com.</td>
</tr>
<tr>
<td></td>
<td>• PROPNAME_BUCKET - Defines the AWS bucket used as a storage tier by the Hierarchical Store. Restrictions on bucket names are:</td>
</tr>
<tr>
<td></td>
<td>-- Bucket names can only contain lowercase letters, numbers, periods (.) and dashes (-). Use of an underscore (_) is invalid.</td>
</tr>
<tr>
<td></td>
<td>-- Bucket names must start with a number or letter</td>
</tr>
<tr>
<td></td>
<td>-- Bucket names cannot be in an IP address style (&quot;192.168.5.4&quot;)</td>
</tr>
<tr>
<td></td>
<td>-- Bucket names must be between 3 and 63 characters in length</td>
</tr>
<tr>
<td></td>
<td>-- Bucket names should not end with a dash</td>
</tr>
<tr>
<td></td>
<td>-- Dashes cannot appear next to periods. For example, &quot;my-.bucket.com&quot; is invalid.</td>
</tr>
<tr>
<td></td>
<td>• PROPNAME_LICENSEID - Specifies the license ID associated with the library libosbws11.so.</td>
</tr>
<tr>
<td></td>
<td>• PROPNAME_WALLET - Has the form: 'LOCATION=file:&lt;filename&gt; CREDENTIAL_ALIAS=&lt;access/secret_alias&gt; PROXY_AUTH_ALIAS=&lt;proxyusername/password_alias&gt;'</td>
</tr>
<tr>
<td></td>
<td>-- LOCATION - Directory path that contains the Oracle wallet. The format is file:directory-path. See Examples for variations in format.</td>
</tr>
<tr>
<td></td>
<td>-- PASSWORD - Defines the wallet password. If auto-login is enabled in the wallet (this can be changed using the user's own utility), and does not have to be specified. By default, the mkstore utility enables auto-login.</td>
</tr>
<tr>
<td></td>
<td>-- CREDENTIAL_ALIAS - Defines the credential alias for ACCESS_KEY and SECRET_KEY</td>
</tr>
<tr>
<td></td>
<td>-- PROXY_AUTH_ALIAS - Defines authentication credentials for the proxy server, if applicable.</td>
</tr>
</tbody>
</table>
### Table 50-16 (Cont.) SETSTOREPROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(property_value (contd.)</td>
<td>The following properties are optional:</td>
</tr>
<tr>
<td>• PROPNAME_HTTPPROXY</td>
<td>Defines the DNS name of the HTTP proxy, if any, that is needed to access the Amazon S3 storage service.</td>
</tr>
<tr>
<td>• PROPNAME_STREAMABLE</td>
<td>Indicates whether buffer-based PUT or GET operation should be done on this store. Valid values for this property are TRUE (default) and FALSE.</td>
</tr>
<tr>
<td>• PROPNAME_ENABLECLEANUPONDELETE</td>
<td>Indicates if DBMS_DBFS_HS should delete unused files on the external storage device. Default values for this property are FALSE for STORETYPE_TAPE and TRUE for STORETYPE_AMAZONS3.</td>
</tr>
<tr>
<td>• PROPNAME_COMPRESSLEVEL</td>
<td>Describes how files written to tape should be compressed. It can be set to PROPVAL_COMPLVL_NONE, PROPVAL_COMPLVL_LOW, PROPVAL_COMPLVL_MIDLEM, or PROPVAL_COMPLVL_HIGH. By default it is set to PROPVAL_COMPLVL_NONE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The specified store must already have been created.
- If this subprogram successfully executes, its actions cannot be rolled back by the user.
- The same property can be set multiple times to the same or different values using this subprogram.
- Regarding PROPNAME_ENABLECLEANUPONDELETE behavior, a job is created for each store by the DBMS_DBFS_HS to remove the unused files from the external storage. By default, the job is enabled for STORETYPE_AMAZONS3 and is disabled for STORETYPE_TAPE. If the ENABLECLEANUPONDELETE property is set to TRUE, the job is enabled; if the property is set to FALSE, the job is disabled. If enabled, the job runs at an interval of one hour by default. The DBMS_SCHEDULER package can be used to modify the schedule. The name of the job can be obtained by querying USER_DBFS_HS_FIXED_PROPERTIES for prop_name = 'DELJOB_NAME'.

**Examples**

**Format**

The format of wallet_path in Windows is, for example:

```
file:ct\WINNT\Profiles<username>\WALLETS
```

The format of wallet_path in UNIX or Linux is, for example:

```
file:/home/username/wallets
```
50.5.12 STOREPUSH Procedure

This procedure pushes locally staged data to the remote storage.

Syntax

```sql
DBMS_DBFS_HS.STOREPUSH (
    store_name   IN        VARCHAR2,
    path         IN        VARCHAR2 DEFAULT NULL);
```

Parameters

Table 50-17  STOREPUSH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store whose content the client writes from local cache to the external store</td>
</tr>
<tr>
<td>path</td>
<td>A non-mount qualified (without mount point) path within the store. By default, its value is NULL which corresponds to the root path of the store.</td>
</tr>
</tbody>
</table>

Usage Notes

- The Hierarchical Store caches the content files locally in database tables. When enough content is amassed in the cache to make it efficient to write to the external storage device (or the cache is completely filled), the Hierarchical Store creates a tarball out of the local content and writes these tarballs as files on the external device. The size of the tarball created by the Hierarchical Store is controlled by the store property `PROPNAME_OPTTARBALLSIZE`.

- When the amount of free space in the cache is such that the caching of a content file will push the space used above `cache_size`, the Hierarchical Store will internally call `STOREPUSH`. The `STOREPUSH` Procedure creates tarball(s) out of the existing dirty or modified content files in the cache and writes them out to the external device. A `STOREPUSH` call is not guaranteed to write all the dirty content from local cache to the external storage, since some files may be locked by other sessions.

- `STOREPUSH` has a built-in ability feature allowing it to automatically resume operation. If a `STOREPUSH` call is interrupted (say by a network outage) after it has transferred some tarballs to the external device, it can be restarted after the outage and will then resume transferring data from the point it was interrupted. In other words, work done before the outage is not lost. `STOREPUSH` can safely be restarted and the effect is such as if the outage never occurred.

- If this method successfully executes, its actions cannot be rolled back by the user.

- By default, when `path` is NULL, all files in the store are candidates for `STOREPUSH`. If `path` has a valid input value, all files which are under the namespace of given path are written from the local cache to the external store. If a given path is an existing file, it is pushed out again to the remote store.
The `DBMS_DBFS_SFS` package provides an interface to operate a SecureFile-based store (SFS) for the content interface described in the `DBMS_DBFS_CONTENT` package.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_DBFS_SFS Subprograms

See Also:

Oracle Database SecureFiles and Large Objects Developer’s Guide

### 51.1 DBMS_DBFS_SFS Overview

The `DBMS_DBFS_SFS` package is a sample implementation of a package that implements and extends the `DBMS_DBFS_CONTENT_SPI` interface. It provides a POSIX-compliant file system stored in the RDBMS.

### 51.2 DBMS_DBFS_SFS Security Model

The `DBMS_DBFS_SFS` package runs with `AUTHID CURRENT_USER`.

### 51.3 DBMS_DBFS_SFS Constants

The `DBMS_DBFS_SFS` package uses the constants shown in the following tables.

- Table 51-1
- Table 51-2
- Table 51-3
- Table 51-4

**Table 51-1  DBMS_DBFS_SFS Constants - Compression Levels**

<td>INITFS Procedure</td>
<td>Initializes a POSIX file system store</td>
</tr>
</tbody>
</table>

51.4.1 CREATEFILESYSTEM Procedure

This procedure creates a file system store.

Syntax

```sql
DBMS_DBFS_SFS.CREATEFILESYSTEM (  
    store_name IN VARCHAR2,
    schema_name IN VARCHAR2 DEFAULT NULL,
    tbl_name IN VARCHAR2 DEFAULT NULL,
    tbl_tbs IN VARCHAR2 DEFAULT NULL,
    lob_tbs IN VARCHAR2 DEFAULT NULL,
    use_bf IN BOOLEAN DEFAULT FALSE,
    properties IN DBMS_DBFS_CONTENT_PROPERTIES_T DEFAULT NULL,
    create_only IN BOOLEAN FALSE,
    use_objects IN BOOLEAN DEFAULT FALSE,
    with_grants IN BOOLEAN DEFAULT FALSE,
    do_dedup IN BOOLEAN DEFAULT FALSE,
    do_compress IN BOOLEAN DEFAULT FALSE,
    compression IN VARCHAR2 DEFAULT COMPRESSION_DEFAULT,
    do_encrypt IN BOOLEAN DEFAULT FALSE,
    encryption IN VARCHAR2 DEFAULT ENCRYPTION_DEFAULT,
    do_partition IN BOOLEAN DEFAULT FALSE,
    npartitions IN NUMBER DEFAULT DEFAULT_PARTITIONS,
    partition_key IN NUMBER DEFAULT PARTITION_BY_ITEM,
    partition_guidi IN BOOLEAN DEFAULT FALSE,
    partition_pathi IN BOOLEAN DEFAULT FALSE,
    partition_prop IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 51-6  CREATEFILESYSTEM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema for the store, defaulting to the current schema</td>
</tr>
<tr>
<td>tbl_name</td>
<td>Table for store entries. If not specified, an internally generated name is used.</td>
</tr>
<tr>
<td>tbl_tbs</td>
<td>Tablespace for the store, defaulting to the schema's default tablespace</td>
</tr>
<tr>
<td>lob_tbs</td>
<td>Tablespace in which to create the LOB segment. It defaults to the user's default tablespace.</td>
</tr>
<tr>
<td>use_bf</td>
<td>If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.</td>
</tr>
<tr>
<td>properties</td>
<td>Table of (name, value, typecode) tuples used to configure the store properties. Currently no such properties are defined or used.</td>
</tr>
</tbody>
</table>
### Table 51-6  (Cont.) CREATEFILESYSTEM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_only</td>
<td>If TRUE, the file system is created, but not registered with the current user</td>
</tr>
<tr>
<td>use_objects</td>
<td>If TRUE, a single base-table with an object-type column (using a nested table) is created to backup the new file system. Otherwise, a pair of (parent, child) tables is used to backup the file system. In both cases, the object type nested table or the child table is used only for user-defined properties.</td>
</tr>
<tr>
<td>with_grants</td>
<td>If TRUE, DML and query access permissions are granted to the DBFS_ROLE as part of creating the file system. Otherwise, explicit grants (or existing permissions) are required to access the file system.</td>
</tr>
<tr>
<td>do_dedup</td>
<td>If TRUE, do deduplication the underlying SecureFile column</td>

</tr>
<tr>
<td>partition_key</td>
<td>How to partition the table: by item name, by path name, or by GUID (see Table 51-4).</td>
</tr>
<tr>
<td>partition_guidi</td>
<td>If TRUE, build an index on GUID</td>
</tr>
<tr>
<td>partition_pathi</td>
<td>If TRUE, build an index on path name</td>
</tr>
<tr>
<td>partition_prop</td>
<td>If TRUE, partition the properties table</td>
</tr>
</tbody>
</table>

### Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.

#### 51.4.2 CREATESTORE Procedure

This procedure creates a new DBFS SFS store owned by the invoking session user.

### Syntax

```sql
DBMS_DBFS_SFS.CREATESSTORE (  
  store_name IN VARCHAR2,  
  tbl_name IN VARCHAR2 DEFAULT NULL,  
  tbs_name in VARCHAR2 DEFAULT NULL,  
  use_bf in BOOLEAN DEFAULT FALSE,  
  stgopts in VARCHAR2 DEFAULT '');
```
Parameters

Table 51-7  CREATESTORE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
<tr>
<td>store_type</td>
<td>STORETYPE_TAPE or STORETYPE_AMAZONS3</td>
</tr>
<tr>
<td>tbl_name</td>
<td>Placeholder for the store content cached in database</td>
</tr>
<tr>
<td>tbs_name</td>
<td>Named tablespace</td>
</tr>
<tr>
<td>use_bf</td>
<td>If TRUE, a BasicFile LOB is used; otherwise a SecureFile LOB is used.</td>
</tr>
<tr>
<td>stgopt</td>
<td>Currently non-operational, reserved for future use</td>
</tr>
</tbody>
</table>

51.4.3 DROPFILESYSTEM Procedures

This procedure drops the DBFS SFS store, purging all dictionary information associated with the store, and dropping the underlying file system table.

Syntax

```sql
DBMS_DBFS_SFS.DROPFILESYSTEM  (
    schema_name    IN      VARCHAR2 DEFAULT NULL,
    tbl_name       IN      INTEGER);

DBMS_DBFS_SFS.DROPFILESYSTEM  (
    store_name     IN      VARCHAR2);
```

Parameters

Table 51-8  DROPFILESYSTEM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>tbl_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>store_name</td>
<td>Name of store path</td>
</tr>
</tbody>
</table>

Usage Notes

- If the specified store table is registered by the current user, it will be unregistered from the content interface described in the DBMS_DBFS_CONTENT package and the POSIX metadata tables.
- Subsequent to unregistration, an attempt will be made to store table(s). This operation may fail if other users are currently using this store table.
- The user attempting a drop of the tables underlying the store must actually have the privileges to complete the drop operation (either as the owner of the tables, or as a sufficiently privileged user for cross-schema operations).
- The procedure executes like a DDL in that it auto-commits before and after its execution.
51.4.4 INITFS Procedure

This procedure initialize a POSIX file system store. The table associated with the POSIX file system store `store_name` is truncated and reinitialized with a single "root" directory entry.

Syntax

```sql
DBMS_DBFS_SFS.INITFS (
    store_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>store_name</td>
<td>Name of store</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure executes like a DDL in that it auto-commits before and after its execution.
This package provides access to some SQL data definition language (DDL) statements from stored procedures. It also provides special administration operations that are not available as Data Definition Language statements (DDLs).

This chapter contains the following topics:

- Deprecated Subprograms
- Security Model
- Operational Notes
- Summary of DBMS_DDL Subprograms

### 52.1 DBMS_DDL Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with release Oracle Database 10g:

- ALTER_COMPILE Procedure

### 52.2 DBMS_DDL Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

### 52.3 DBMS_DDL Operational Notes

The ALTER_COMPILE procedure commits the current transaction, performs the operation, and then commits again.

### 52.4 Summary of DBMS_DDL Subprograms

This table lists the DBMS_DDL subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_COMPILE Procedure</td>
<td>Compiles the PL/SQL object</td>
</tr>
<tr>
<td>ALTER_TABLE_NOT_REFERENCEABLE</td>
<td>Reorganizes object tables</td>
</tr>
<tr>
<td>Procedure</td>
<td></td>
</tr>
<tr>
<td>ALTER_TABLE_REFERENCEABLE Procedure</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 52-1  (Cont.) DBMS_DDL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_WRAPPED Procedures</td>
<td>Takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body, generates a CREATE OR REPLACE statement with the PL/SQL source text obfuscated and executes the generated statement</td>
</tr>
<tr>
<td>IS_TRIGGER_FIRE_ONCE Function</td>
<td>Returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, returns FALSE</td>
</tr>
<tr>
<td>SET_TRIGGER_FIRING_PROPERTY Procedures</td>
<td>Sets the specified DML or DDL trigger's firing property</td>
</tr>
<tr>
<td>WRAP Functions</td>
<td>Takes as input a CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated</td>
</tr>
</tbody>
</table>

52.4.1 ALTER_COMPILE Procedure

This procedure is equivalent to the SQL statement: `ALTER PROCEDURE FUNCTION PACKAGE [<schema>.] <name> COMPILE [BODY]`

Note:
This procedure is deprecated in Oracle Database 10g Release 2 (10.2) While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the DDL equivalent in a dynamic SQL statement.

Syntax

```sql
DBMS_DDL.ALTER_COMPILE (
    type VARCHAR2,
    schema VARCHAR2,
    name VARCHAR2,
    reuse_settings BOOLEAN := FALSE);
```

Parameters

Table 52-2  ALTER_COMPILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Must be either PROCEDURE, FUNCTION, PACKAGE, PACKAGE BODY or TRIGGER</td>
</tr>
<tr>
<td>schema</td>
<td>Schema name</td>
</tr>
<tr>
<td></td>
<td>If NULL, then use current schema (case-sensitive)</td>
</tr>
</tbody>
</table>
Table 52-2  (Cont.) ALTER_COMPILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object (case-sensitive)</td>
</tr>
<tr>
<td>reuse_settings</td>
<td>Indicates whether the session settings in the objects should be reused, or</td>
</tr>
<tr>
<td></td>
<td>whether the current session settings should be adopted instead</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000:</td>
<td>Insufficient privileges or object does not exist</td>
</tr>
<tr>
<td>ORA-20001:</td>
<td>Remote object, cannot compile</td>
</tr>
<tr>
<td>ORA-20002:</td>
<td>Bad value for object type: should be either PACKAGE, PACKAGE BODY, PROCEDURE,</td>
</tr>
<tr>
<td></td>
<td>FUNCTION, or TRIGGER</td>
</tr>
</tbody>
</table>

52.4.2 ALTER_TABLE_NOT_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes not the default referenceable table for the schema `affected_schema`.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>].<table_name> NOT REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_NOT_REFERENCEABLE (  
  table_name        IN           VARCHAR2,  
  table_schema      IN  DEFAULT  NULL,  
  affected_schema   IN  DEFAULT  NULL);
```

Parameters

Table 52-4  ALTER_TABLE_NOT_REFERENCEABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case</td>
</tr>
<tr>
<td></td>
<td>sensitive.</td>
</tr>
<tr>
<td>table_schema</td>
<td>Name of the schema owning the table to be altered. If NULL then the current</td>
</tr>
<tr>
<td></td>
<td>schema is used. Case sensitive.</td>
</tr>
<tr>
<td>affected_schema</td>
<td>Name of the schema affected by this alteration. If NULL then the current</td>
</tr>
<tr>
<td></td>
<td>schema is used. Case sensitive.</td>
</tr>
</tbody>
</table>
Usage Notes

This procedure simply reverts for the affected schema to the default table referenceable for PUBLIC; that is, it simply undoes the previous ALTER TABLE REFERENCEABLE call for this specific schema. The affected schema must a particular schema (cannot be PUBLIC).

The user that executes this procedure must own the table (that is, the schema is the same as the user), and the affected schema must be the same as the user.

If the user executing this procedure has ALTER ANY TABLE and SELECT ANY TABLE and DROP ANY TABLE privileges, the user doesn't have to own the table and the affected schema can be any valid schema.

52.4.3 ALTER_TABLE_REFERENCEABLE Procedure

This procedure alters the given object table `table_schema.table_name` so it becomes the referenceable table for the given schema `affected_schema`.

This is equivalent to SQL:

```
ALTER TABLE [<table_schema>.]table_name REFERENCEABLE FOR <affected_schema>
```

which is currently not supported or available as a DDL statement.

Syntax

```
DBMS_DDL.ALTER_TABLE_REFERENCEABLE
    table_name IN VARCHAR2,
    table_schema IN DEFAULT NULL,
    affected_schema IN DEFAULT NULL);
```

Parameters

Table 52-5 ALTER_TABLE_REFERENCEABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to be altered. Cannot be a synonym. Must not be NULL. Case sensitive.</td>
</tr>
<tr>
<td>table_schema</td>
<td>Name of the schema owning the table to be altered. If NULL then the current schema is used. Case sensitive.</td>
</tr>
<tr>
<td>affected_schema</td>
<td>Name of the schema affected by this alteration. If NULL then the current schema is used. Case sensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

When you create an object table, it automatically becomes referenceable, unless you use the `OID AS` clause when creating the table. The `OID AS` clause makes it possible for you to create an object table and to assign to the new table the same EOID as another object table of the same type. After you create a new table using the `OID AS` clause, you end up with two object table with the same EOID; the new table is not referenceable, the original one is. All references that used to point to the objects in the original table still reference the same objects in the same original table.
If you execute this procedure on the new table, it makes the new table the
referenceable table replacing the original one; thus, those references now point to the
objects in the new table instead of the original table.

52.4.4 CREATE_WRAPPED Procedures

The procedure takes as input a single CREATE OR REPLACE statement that specifies
creation of a PL/SQL package specification, package body, function, procedure, type
specification or type body. It then generates a CREATE OR REPLACE statement with the
PL/SQL source text obfuscated and executes the generated statement. In effect, this
procedure bundles together the operations of wrapping the text and creating the
PL/SQL unit.

See Also:
WRAP Functions

This procedure has 3 overloads. Each of the three functions provides better
performance than using a combination of individual WRAP Functions and
DBMS_SQL.PARSE (or EXECUTE IMMEDIATE) calls. The different functionality of each form of
syntax is presented with the definition.

Syntax
Is a shortcut for EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl):

```
DBMS_DDL.CREATE_WRAPPED {
    ddl     VARCHAR2);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED{
    ddl     DBMS_SQL.VARCHAR2A,
    lb      PLS_INTEGER,
    ub      PLS_INTEGER);
```

Is a shortcut for DBMS_SQL.PARSE(cursor, SYS.DBMS_DDL.WRAP (input, lb, ub)):

```
DBMS_DDL.CREATE_WRAPPED{
    ddl     DBMS_SQL.VARCHAR2S,
    lb      PLS_INTEGER,
    ub      PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl</td>
<td>A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body</td>
</tr>
<tr>
<td>lb</td>
<td>Lower bound for indices in the string table that specify the CREATE OR REPLACE statement</td>
</tr>
</tbody>
</table>
Table 52-6  (Cont.) CREATE_WRAPPED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ub</td>
<td>Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.</td>
</tr>
</tbody>
</table>

Usage Notes

- The CREATE OR REPLACE statement is executed with the privileges of the user invoking DBMS_DDL.CREATE_WRAPPED.
- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name SYS.DBMS_DDL to avoid the possibility that the name DBMS_DDL is captured by a locally-defined unit or by redefining the DBMS_DDL public synonym.
- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a entire SQL*Plus file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL’s dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus “/” termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

Exceptions

ORA-24230: If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.

Examples

```declare
  dd1 VARCHAR2(32767);
begin
  dd1 := GENERATE_PACKAGE(...);
  SYS.DBMS_DDL.CREATE_WRAPPED(dd1); -- Instead of EXECUTE IMMEDIATE dd1
end;
```

52.4.5 IS_TRIGGER_FIRE_ONCE Function

This function returns TRUE if the specified DML or DDL trigger is set to fire once. Otherwise, it returns FALSE.

A fire once trigger fires in a user session but does not fire in the following cases:

- For changes made by a Streams apply process
- For changes made by executing one or more Streams apply errors using the EXECUTE_ERROR or EXECUTE_ALL_ERRORS procedure in the DBMS.Apply.ADM package
- For changes made by a Logical Standby apply process
**Note:**

Only DML and DDL triggers can be fire once. All other types of triggers always fire.

**See Also:**

"SET_TRIGGER_FIRING_PROPERTY Procedures"

**Syntax**

```sql
DBMS_DDL.IS_TRIGGER_FIRE_ONCE
    trig_owner IN VARCHAR2,
    trig_name IN VARCHAR2)
RETURN BOOLEAN;
```

**Parameters**

**Table 52-7 IS_TRIGGER_FIRE_ONCE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trig_owner</td>
<td>Schema of trigger</td>
</tr>
<tr>
<td>trig_name</td>
<td>Name of trigger</td>
</tr>
</tbody>
</table>

**52.4.6 SET_TRIGGER_FIRING_PROPERTY Procedures**

This procedure sets the specified DML or DDL trigger's firing property whether or not the property is set for the trigger.

Use this procedure to control a DML or DDL trigger's firing property for changes:

- Applied by a Streams apply process
- Made by executing one or more Streams apply errors using the `EXECUTE_ERROR` or `EXECUTE_ALL_ERRORS` procedure in the `DBMS_APPLY_ADM` package.
- Applied by a Logical Standby apply process

**Syntax**

```sql
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (  
    trig_owner IN VARCHAR2,  
    trig_name IN VARCHAR2,  
    fire_once IN BOOLEAN);
```

```sql
DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY (  
    trig_owner IN VARCHAR2,  
    trig_name IN VARCHAR2,  
    property IN INTEGER,  
    setting IN BOOLEAN);
```
Parameters

Table 52-8  SET_TRIGGER_FIRING_PROPERTY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trig_owner</td>
<td>Schema of the trigger to set</td>
</tr>
<tr>
<td>trig_name</td>
<td>Name of the trigger to set</td>
</tr>
</tbody>
</table>
| fire_once       | • If TRUE, the trigger is set to fire once. By default, the fire_once parameter is set to TRUE for DML and DDL triggers.  
                    • If FALSE, the trigger is set to always fire unless apply_server_only property is set to TRUE, which overrides fire_once property setting. |
| property        | • DBMS_DDL.fire_once to set the fire_once property of the trigger          |
|                 | • DBMS_DDL.apply_server_only to indicate whether trigger fires only in the context of SQL apply processes maintaining a logical standby database or Streams apply processes |
| setting         | Value of property being set                                                |

Usage Notes

DML triggers created on a table have their fire-once property set to TRUE. In this case, the triggers only fire when the table is modified by an user process, and they are automatically disabled inside Oracle processes maintaining either a logical standby database (SQL Apply) or Oracle processes doing replication (Streams Apply) processes, and thus do not fire when a SQL Apply or a Streams Apply process modifies the table. There are two ways for a user to fire a trigger as a result of SQL Apply or a Streams Apply process making a change to a maintained table: (a) setting the fire-once property of a trigger to FALSE, which allows it fire both in the context of a user process or a SQL or Streams Apply process, or (b) by setting the apply-server-only property to TRUE and thus making the trigger fire only in the context of a SQL Apply or a Streams Apply process and not in the context of a user process.

• FIRE_ONCE=TRUE, APPLY_SERVER_ONLY=FALSE
  This is the default property setting for a DML trigger. The trigger only fires when user process modifies the base table.

• FIRE_ONCE=TRUE OR FALSE, APPLY_SERVER_ONLY=TRUE
  The trigger only fires when SQL Apply or Streams Apply process modifies the base table. The trigger does not fire when a user process modifies the base table. Thus the apply-server-only property overrides the fire-once property of a trigger.
52.4.7 WRAP Functions

This function takes as input a single CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body and returns a CREATE OR REPLACE statement where the text of the PL/SQL unit has been obfuscated.

The function has 3 overloads to allow for the different ways in which DDL statements can be generated dynamically and presented to DBMS_SQL or EXECUTE IMMEDIATE. The different functionality of each form of syntax is presented with the definition.

Syntax

Provides basic functionality:

```sql
DBMS_DDL.WRAP(
    dd1     VARCHAR2)
RETURN VARCHAR2;
```

Provides the same functionality as the first form, but allows for larger inputs. This function is intended to be used with the PARSE Procedures in the DBMS_SQL package and its argument list follows the convention of DBMS_SQL.PARSE:

```sql
DBMS_DDL.WRAP(
    dd1     DBMS_SQL.VARCHAR2S,
    lb      PLS_INTEGER,
    ub      PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2S;
```
Provides the same functionality as the second form and is provided for compatibility with multiple forms of the PARSE Procedures in the DBMS_SQL package:

```plsql
DBMS_DDL.WRAP(
    ddl     DBMS_SQL.VARCHAR2A,
    lb      PLS_INTEGER,
    ub      PLS_INTEGER)
RETURN DBMS_SQL.VARCHAR2A;
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ddl</code></td>
<td>A CREATE OR REPLACE statement that specifies creation of a PL/SQL package specification, package body, function, procedure, type specification or type body.</td>
</tr>
<tr>
<td><code>lb</code></td>
<td>Lower bound for indices in the string table that specify the CREATE OR REPLACE statement.</td>
</tr>
<tr>
<td><code>ub</code></td>
<td>Upper bound for indices in the string table that specify the CREATE OR REPLACE statement.</td>
</tr>
</tbody>
</table>

### Return Values

A CREATE OR REPLACE statement with the text obfuscated. In the case of the second and third form, the return value is a table of strings that need to be concatenated in order to construct the CREATE OR REPLACE string containing obfuscated source text.

### Usage Notes

- Any PL/SQL code that attempts to call these interfaces should use the fully qualified package name `SYS.DBMS_DDL` to avoid the possibility that the name `DBMS_DDL` is captured by a locally-defined unit or by redefining the `DBMS_DDL` public synonym.

- Each invocation of any accepts only a single PL/SQL unit. By contrast, the PL/SQL wrap utility accepts a full SQL file and obfuscates the PL/SQL units within the file leaving all other text as-is. These interfaces are intended to be used in conjunction with or as a replacement for PL/SQL’s dynamic SQL interfaces (EXECUTE IMMEDIATE and DBMS_SQL.PARSE). Since these dynamic SQL interfaces only accept a single unit at a time (and do not understand the SQL*Plus ”/” termination character), both the CREATE_WRAPPED Procedures and the WRAP Functions require input to be a single unit.

### Exceptions

ORA-24230: **If the input is not a CREATE OR REPLACE statement specifying a PL/SQL unit, exception DBMS_DDL.MALFORMED_WRAP_INPUT is raised.**

### Examples

```plsql
DECLARE
    ddl VARCHAR2(32767);
BEGIN
    ddl := GENERATE_PACKAGE(...);
    EXECUTE IMMEDIATE SYS.DBMS_DDL.WRAP(ddl); -- Instead of EXECUTE IMMEDIATE ddl
END;
```
53

DBMS_DEBUG

DBMS_DEBUG is deprecated. Use DBMS_DEBUG_JDWP instead.

See DBMS_DEBUG_JDWP for more information.

DBMS_DEBUG is a PL/SQL interface to the PL/SQL debugger layer, Probe, in the Oracle server.

This package is primarily intended to implement server-side debuggers and it provides a way to debug server-side PL/SQL program units.

Note:

The term program unit refers to a PL/SQL program of any type (procedure, function, package, package body, trigger, anonymous block, object type, or object type body).

This chapter contains the following topics:

• Overview
• Constants
• Variables
• Exceptions
• Operational Notes
• Data Structures
• Summary of DBMS_DEBUG Subprograms

53.1 DBMS_DEBUG Overview

To debug server-side code, you must have two database sessions: one session to run the code in debug mode (the target session), and a second session to supervise the target session (the debug session).

The target session becomes available for debugging by making initializing calls with DBMS_DEBUG. This marks the session so that the PL/SQL interpreter runs in debug mode and generates debug events. As debug events are generated, they are posted from the session. In most cases, debug events require return notification: the interpreter pauses awaiting a reply.

Meanwhile, the debug session must also initialize itself using DBMS_DEBUG. This tells it which target session to supervise. The debug session may then call entry points in DBMS_DEBUG to read events that were posted from the target session and to communicate with the target session.
The following subprograms are run in the target session (the session that is to be debugged):

- **SYNCHRONIZE Function**
- **DEBUG_ON Procedure**
- **DEBUG_OFF Procedure**

**DBMS_DEBUG** does not provide an interface to the PL/SQL compiler, but it does depend on debug information optionally generated by the compiler. Without debug information, it is not possible to examine or modify the values of parameters or variables.

### 53.2 DBMS_DEBUG Constants

A breakpoint status may have the following value: `breakpoint_status_unused`—breakpoint is not in use.

Otherwise, the status is a mask of the following values:

- `breakpoint_status_active`—a line breakpoint
- `breakpoint_status_disabled`—breakpoint is currently disabled
- `breakpoint_status_remote`—a shadow breakpoint (a local representation of a remote breakpoint)

### 53.3 DBMS_DEBUG Variables

The **DBMS_DEBUG** uses the variables shown in the following table.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default_timeout</td>
<td>The timeout value (used by both sessions). The smallest possible timeout is 1 second. If this value is set to 0, then a large value (3600) is used.</td>
</tr>
</tbody>
</table>

### 53.4 DBMS_DEBUG Exceptions

These values are returned by the various functions called in the debug session (**SYNCHRONIZE**, **CONTINUE**, **SET_BREAKPOINT**, and so on). If PL/SQL exceptions worked across client/server and server/server boundaries, then these would all be exceptions rather than error codes.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Normal termination</td>
</tr>
</tbody>
</table>

Statuses returned by **GET_VALUE** and **SET_VALUE**: 
### Table 53-3  DBMS_DEBUG Exceptions Returned by GET_VALUE and SET_VALUE

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_bogus_frame</td>
<td>No such entrypoint on the stack</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>Program was compiled without debug symbols</td>
</tr>
<tr>
<td>error_no_such_object</td>
<td>No such variable or parameter</td>
</tr>
<tr>
<td>error_unknown_type</td>
<td>Debug information is unreadable</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>Returned by GET_VALUE if the object is a table, but no index was provided</td>
</tr>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_illegal_value</td>
<td>Constraint violation</td>
</tr>
<tr>
<td>error_illegal_null</td>
<td>Constraint violation</td>
</tr>
<tr>
<td>error_value_malformed</td>
<td>Unable to decipher the given value</td>
</tr>
<tr>
<td>error_other</td>
<td>Some other error</td>
</tr>
<tr>
<td>error_name_incomplete</td>
<td>Name did not resolve to a scalar</td>
</tr>
</tbody>
</table>

**Statuses returned by the breakpoint functions:**

### Table 53-5  Statuses Returned by the Breakpoint Functions

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot enable or disable an unused breakpoint</td>
</tr>
<tr>
<td>error_bad_handle</td>
<td>Unable to set breakpoint in given program (nonexistent or security violation)</td>
</tr>
</tbody>
</table>

**General error codes (returned by many of the DBMS_DEBUG subprograms):**

### Table 53-6  DBMS_DEBUG Subprograms Error Codes

<table>
<thead>
<tr>

### 53.5 DBMS_DEBUG Operational Notes

There are two ways to ensure that debug information is generated: through a session switch, or through individual recompilation.

To set the session switch, enter the following statement:

```
ALTER SESSION SET PLSQL_DEBUG = true;
```

This instructs the compiler to generate debug information for the remainder of the session. It does not recompile any existing PL/SQL.

To generate debug information for existing PL/SQL code, use one of the following statements (the second recompiles a package or type body):

```
ALTER [PROCEDURE | FUNCTION | PACKAGE | TRIGGER | TYPE] <name> COMPILE DEBUG;
ALTER [PACKAGE | TYPE] <name> COMPILE DEBUG BODY;
```

Figure 53-1 and Figure 53-2 illustrate the flow of operations in the session to be debugged and in the debugging session.
Initialize session for debugging, and generate/specify unique debugID.  
`DBMS_DEBUG.initialize()`

Start debugging  
`DBMS_DEBUG.debug_on()`

Execute PL/SQL programs

Stop debugging  
`DBMS_DEBUG.debug_off()`

Chapter 53  
DBMS_DEBUG Operational Notes  
53-5
Figure 53-2  Debug Session

Input: debugID from target session
- Initialize DBMS_DEBUG.attach_session()

Manipulate breakpoints
- DBMS_DEBUG.set_breakpoint()
- DBMS_DEBUG.delete_breakpoint()
- DBMS_DEBUG.disable_breakpoint()
- DBMS_DEBUG.enable_breakpoint()
- DBMS_DEBUG.show_breakpoints()

Read first event from target session
- DBMS_DEBUG.synchronize()

Show stack
- DBMS_DEBUG.print_backtrace()

Get/set values
- DBMS_DEBUG.get_value()
- DBMS_DEBUG.set_value()

Show source
- DBMS_DEBUG.show_source()
Control of the Interpreter

The interpreter pauses execution at the following times:

1. At startup of the interpreter so any deferred breakpoints may be installed prior to execution.
2. At any line containing an enabled breakpoint.
3. At any line where an interesting event occurs. The set of interesting events is specified by the flags passed to DBMS_DEBUG.CONTINUE in the breakflags parameter.
Session Termination

There is no event for session termination. Therefore, it is the responsibility of the debug session to check and make sure that the target session has not ended. A call to DBMS_DEBUG.SYNCHRONIZE after the target session has ended causes the debug session to hang until it times out.

Deferred Operations

The diagram suggests that it is possible to set breakpoints prior to having a target session. This is true. In this case, Probe caches the breakpoint request and transmits it to the target session at first synchronization. However, if a breakpoint request is deferred in this fashion, then:

- SET_BREAKPOINT does not set the breakpoint number (it can be obtained later from SHOW_BREAKPOINTS if necessary).
- SET_BREAKPOINT does not validate the breakpoint request. If the requested source line does not exist, then an error silently occurs at synchronization, and no breakpoint is set.

Diagnostic Output

To debug Probe, there are diagnostics parameters to some of the calls in DBMS_DEBUG. These parameters specify whether to place diagnostic output in the RDBMS tracefile. If output to the RDBMS tracefile is disabled, these parameters have no effect.

Common Debug Session Sections

- Common Section
- Target Session
- Debug Session Section

Common Section

The following subprograms may be called in either the target or the debug session:

- PROBE_VERSION Procedure
- SELF_CHECK Procedure
- SET_TIMEOUT Function

Target Session

The following subprograms may be called only in the target session:

- INITIALIZE Function
- DEBUG_ON Procedure
- SET_TIMEOUT_BEHAVIOUR Procedure
- GET_TIMEOUT_BEHAVIOUR Function

Debug Session Section

The following subprograms should be run in the debug session only:

- ATTACH_SESSION Procedure
- SYNCHRONIZE Function
OER Breakpoints

Exceptions that are declared in PL/SQL programs are known as user-defined exceptions. In addition, there are Oracle Errors (OERs) that are returned from the Oracle kernel. To tie the two mechanisms together, PL/SQL provides the `exception_init` pragma that turns a user-defined exception into an OER, so that a PL/SQL handler may be used for it, and so that the PL/SQL engine can return OERs to the Oracle kernel. As of the current release, the only information available about an OER is its number. If two user-defined exceptions are `exception_init`d to the same OER, they are indistinguishable.

Namespaces

Program units on the server reside in different namespaces. When setting a breakpoint, specify the desired namespace.

1. `Namespace_cursor` contains cursors (anonymous blocks).
2. `Namespace_pgkspec_or_toplevel` contains:
   - Package specifications.
• Procedures and functions that are not nested inside other packages, procedures, or functions.

• Object types.

3. Namespace_pkg_body contains package bodies and type bodies.

**Libunit Types**

These values are used to disambiguate among objects in a given namespace. These constants are used in `PROGRAM_INFO` when Probe is giving a stack backtrace.

• `LibunitType_cursor`
• `LibunitType_procedure`
• `LibunitType_function`
• `LibunitType_package`
• `LibunitType_package_body`
• `LibunitType_trigger`
• `LibunitType_Unknown`

**Breakflags**

These are values to use for the `breakflags` parameter to `CONTINUE`, in order to tell Probe what events are of interest to the client. These flags may be combined.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>break_next_line</code></td>
<td>Break at next source line (step over calls)</td>
</tr>
<tr>
<td><code>break_any_call</code></td>
<td>Break at next source line (step into calls)</td>
</tr>
<tr>
<td><code>break_any_return</code></td>
<td>Break after returning from current entrypoint (skip over any entrypoints called from the current routine)</td>
</tr>
<tr>
<td><code>break_return</code></td>
<td>Break the next time an entrypoint gets ready to return. (This includes entrypoints called from the current one. If interpreter is running Proc1, which calls Proc2, then <code>break_return</code> stops at the end of Proc2.)</td>
</tr>
<tr>
<td><code>break_exception</code></td>
<td>Break when an exception is raised</td>
</tr>
<tr>
<td><code>break_handler</code></td>
<td>Break when an exception handler is executed</td>
</tr>
<tr>
<td><code>abort_execution</code></td>
<td>Stop execution and force an 'exit' event as soon as <code>DBMS_DEBUG.CONTINUE</code> is called.</td>
</tr>
</tbody>
</table>

**Information Flags**

These are flags which may be passed as the `info_requested` parameter to `SYNCHRONIZE`, `CONTINUE`, and `GET_RUNTIME_INFO`.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>info_getStackDepth</code></td>
<td>Get the current depth of the stack</td>

</tbody>
</table>

### 53.6 DBMS_DEBUG Data Structures

The `DBMS_DEBUG` package defines **RECORD types and TABLE types**.

**RECORD Types**

- `BREAKPOINT_INFO` Record Type
- `PROGRAM_INFO` Record Type
- `RUNTIME_INFO` Record Type

**TABLE Types**

- `BACKTRACE_TABLE` Table Type
- `BREAKPOINT_TABLE` Table Type
- `INDEX_TABLE` Table Type
- `VC2_TABLE` Table Type
53.6.1 BREAKPOINT_INFO Record Type

This type gives information about a breakpoint, such as its current status and the program unit in which it was placed.

Syntax

```
TYPE breakpoint_info IS RECORD (
  name        VARCHAR2(30),
  owner       VARCHAR2(30),
  dblink      VARCHAR2(30),
  line#       BINARY_INTEGER,
  libunittype BINARY_INTEGER,
  status      BINARY_INTEGER);
```

Fields

Table 53-9  BREAKPOINT_INFO Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the program unit</td>
</tr>
<tr>
<td>owner</td>
<td>Owner of the program unit</td>
</tr>
<tr>
<td>dblink</td>
<td>Database link, if remote</td>
</tr>
<tr>
<td>line#</td>
<td>Line number</td>
</tr>
<tr>
<td>libunittype</td>
<td>NULL, unless this is a nested procedure or function</td>
</tr>
<tr>
<td>status</td>
<td>See Constants for values of breakpoint_status_*</td>
</tr>
</tbody>
</table>

53.6.2 PROGRAM_INFO Record Type

The PROGRAM_INFO record type of the DBMS_DEBG package specifies a program location. It is a line number in a program unit.

This is used for stack backtraces and for setting and examining breakpoints. The read-only fields are currently ignored by Probe for breakpoint operations. They are set by Probe only for stack backtraces.

Syntax

```
TYPE program_info IS RECORD(
  -- The following fields are used when setting a breakpoint
  namespace        BINARY_INTEGER,
  name             VARCHAR2(30),
  owner            VARCHAR2(30),
  dblink           VARCHAR2(30),
  line#            BINARY_INTEGER,
  libunittype      BINARY_INTEGER,
  -- Read-only fields (set by Probe when doing a stack backtrace)
  entrypointname   VARCHAR2(30));
```
Fields

Table 53-10  PROGRAM_INFO Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>See DBMS_DEBUG Operational Notes for more information about namespaces.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the program unit</td>
</tr>
<tr>
<td>owner</td>
<td>Owner of the program unit</td>
</tr>
<tr>
<td>dblink</td>
<td>Database link, if remote</td>
</tr>
<tr>
<td>line#</td>
<td>Line number</td>
</tr>
<tr>
<td>libunittype</td>
<td>A read-only field, NULL, unless this is a nested procedure or function</td>
</tr>
<tr>
<td>entrypointname</td>
<td>A read-only field, to disambiguate among objects that share the same namespace (for example, procedure and package specifications).</td>
</tr>
</tbody>
</table>

See DBMS_DEBUG Operational Notes for more information about the libunit types.

53.6.3 RUNTIME_INFO Record Type

This type gives context information about the running program.

Syntax

```sql
TYPE runtime_info IS RECORD(
  line#            BINARY_INTEGER,
  terminated       binary_integer,
  breakpoint       binary_integer,
  stackdepth       BINARY_INTEGER,
  interpreterdepth BINARY_INTEGER,
  reason           BINARY_INTEGER,
  program          program_info);
```

Fields

Table 53-11  RUNTIME_INFO Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line#</td>
<td>Duplicate of program.line#</td>
</tr>
<tr>
<td>terminated</td>
<td>Whether the program has terminated</td>
</tr>
<tr>
<td>breakpoint</td>
<td>Breakpoint number</td>
</tr>
<tr>
<td>stackdepth</td>
<td>Number of frames on the stack</td>
</tr>
<tr>
<td>interpreterdepth</td>
<td>[A reserved field]</td>
</tr>
<tr>
<td>reason</td>
<td>Reason for suspension</td>
</tr>
<tr>
<td>program</td>
<td>Source location</td>
</tr>
</tbody>
</table>
53.6.4 BACKTRACE_TABLE Table Type

This type is used by PRINT_BACKTRACE.

Syntax

TYPE backtrace_table IS TABLE OF program_info INDEX BY BINARY_INTEGER;

53.6.5 BREAKPOINT_TABLE Table Type

This type is used by SHOW_BREAKPOINTS.

Syntax

TYPE breakpoint_table IS TABLE OF breakpoint_info INDEX BY BINARY_INTEGER;

53.6.6 INDEX_TABLE Table Type

This type is used by GET_INDEXES to return the available indexes for an indexed table.

Syntax

TYPE index_table IS table of BINARY_INTEGER INDEX BY BINARY_INTEGER;

53.6.7 VC2_TABLE Table Type

This type is used by SHOW_SOURCE.

Syntax

TYPE vc2_table IS TABLE OF VARCHAR2(90) INDEX BY BINARY_INTEGER;

53.7 Summary of DBMS_DEBUG Subprograms

This table lists the DBMS_DEBUG subprograms in alphabetical order and briefly describes them.

Table 53-12  DBMS_DEBUG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTACH_SESSION Procedure</td>
<td>Notifies the debug session about the target debugID</td>
</tr>
<tr>

<tr>
<td>SET_OER_BREAKPOINT Function</td>
<td>Sets an OER breakpoint</td>
</tr>
<tr>
<td>SET_TIMEOUT Function</td>
<td>Sets the timeout value</td>
</tr>
<tr>
<td>SET_TIMEOUT_BEHAVIOR Procedure</td>
<td>Tells Probe what to do with the target session when a timeout occurs</td>
</tr>
<tr>
<td>SET_VALUE Function</td>
<td>Sets a value in the currently-running program</td>
</tr>
<tr>
<td>SHOW_BREAKPOINTS Procedures</td>
<td>Returns a listing of the current breakpoints</td>
</tr>
<tr>
<td>SHOW_FRAME_SOURCE Procedure</td>
<td>Fetches the frame source</td>
</tr>
<tr>
<td>SHOW_SOURCE Procedures</td>
<td>Fetches program source</td>
</tr>
<tr>
<td>SYNCHRONIZE Function</td>
<td>Waits for program to start running</td>
</tr>
<tr>
<td>TARGET_PROGRAM_RUNNING Procedure</td>
<td>Returns TRUE if the target session is currently executing a stored procedure, or FALSE if it is not</td>
</tr>
</tbody>
</table>
53.7.1 ATTACH_SESSION Procedure

This procedure notifies the debug session about the target program.

Syntax

```
DBMS_DEBUG.ATTACH_SESSION (  
    debug_session_id  IN VARCHAR2,  
    diagnostics       IN BINARY_INTEGER := 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug_session_id</td>
<td>Debug ID from a call to INITIALIZE in target session</td>
</tr>
<tr>
<td>diagnostics</td>
<td>Generate diagnostic output if nonzero</td>
</tr>
</tbody>
</table>

53.7.2 CONTINUE Function

This function passes the given breakflags (a mask of the events that are of interest) to Probe in the target process. It tells Probe to continue execution of the target process, and it waits until the target process runs to completion or signals an event.

If `info_requested` is not NULL, then calls `GET_RUNTIME_INFO`.

Syntax

```
DBMS_DEBUG.CONTINUE (  
    run_info       IN OUT runtime_info,  
    breakflags     IN     BINARY_INTEGER,  
    info_requested IN     BINARY_INTEGER := NULL)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_info</td>
<td>Information about the state of the program</td>
</tr>
<tr>
<td>breakflags</td>
<td>Mask of events that are of interest (see the discussion about break flags under DBMS_DEBUG Operational Notes)</td>
</tr>
<tr>
<td>info_requested</td>
<td>Which information should be returned in <code>run_info</code> when the program stops (see the discussion of information flags under DBMS_DEBUG Operational Notes)</td>
</tr>
</tbody>
</table>
Return Values

Table 53-15  CONTINUE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_timeout</td>
<td>Timed out before the program started running</td>
</tr>
<tr>
<td>error_communication</td>
<td>Other communication error</td>
</tr>
</tbody>
</table>

53.7.3 DEBUG_OFF Procedure

This procedure notifies the target session that debugging should no longer take place in that session. It is not necessary to call this function before ending the session.

⚠️ WARNING:
There must be a debug session waiting if immediate is TRUE.

Syntax

```
DBMS_DEBUG.DEBUG_OFF;
```

Usage Notes

The server does not handle this entrypoint specially. Therefore, it attempts to debug this entrypoint.

53.7.4 DEBUG_ON Procedure

This procedure marks the target session so that all PL/SQL is run in debug mode. This must be done before any debugging can take place.

Syntax

```
DBMS_DEBUG.DEBUG_ON (
    no_client_side_plsql_engine BOOLEAN := TRUE,
    immediate                   BOOLEAN := FALSE);
```

Parameters

Table 53-16  DEBUG_ON Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_client_side_plsql_engine</td>
<td>Should be left to its default value unless the debugging session is taking place from a client-side PL/SQL engine</td>
</tr>
<tr>
<td>immediate</td>
<td>If this is TRUE, then the interpreter immediately switches itself into debug-mode, instead of continuing in regular mode for the duration of the call.</td>
</tr>
</tbody>
</table>
53.7.5 DELETE_BREAKPOINT Function

This function deletes a breakpoint.

Syntax

```sql
DBMS_DEBUG.DELETE_BREAKPOINT (
    breakpoint IN BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint exists</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot delete an unused breakpoint</td>
</tr>
<tr>
<td>error_stale_breakpt</td>
<td>The program unit was redefined since the breakpoint was set</td>
</tr>
</tbody>
</table>

53.7.6 DELETE_OER_BREAKPOINT Function

This function deletes an OER breakpoint.

Syntax

```sql
DBMS_DEBUG.DELETE_OER_BREAKPOINT (
    oer IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (positive 4-byte number) to delete</td>
</tr>
</tbody>
</table>
53.7.7 DETACH_SESSION Procedure

This procedure stops debugging the target program.

This procedure may be called at any time, but it does not notify the target session that the debug session is detaching itself, and it does not terminate execution of the target session. Therefore, care should be taken to ensure that the target session does not hang itself.

Syntax

```
DBMS_DEBUG.DETACH_SESSION;
```

53.7.8 DISABLE_BREAKPOINT Function

This function makes an existing breakpoint inactive but leaves it in place.

Syntax

```
DBMS_DEBUG.DISABLE_BREAKPOINT (breakpoint IN BINARY_INTEGER) RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT</td>
</tr>
</tbody>
</table>

Return Values

<table>
<thead>
<tr>
<th>Returns</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td></td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint exists</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot disable an unused breakpoint</td>
</tr>
</tbody>
</table>

53.7.9 ENABLE_BREAKPOINT Function

This function is the reverse of disabling. This enables a previously disabled breakpoint.

Syntax

```
DBMS_DEBUG.ENABLE_BREAKPOINT (breakpoint IN BINARY_INTEGER) RETURN BINARY_INTEGER;
```
Parameters

Table 53-22  ENABLE_BREAKPOINT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>breakpoint</td>
<td>Breakpoint number from a previous call to SET_BREAKPOINT</td>
</tr>
</tbody>
</table>

Return Values

Table 53-23  ENABLE_BREAKPOINT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>Success</td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such breakpoint exists</td>
</tr>
<tr>
<td>error_idle_breakpt</td>
<td>Cannot enable an unused breakpoint</td>
</tr>
</tbody>
</table>

53.7.10 EXECUTE Procedure

This procedure executes SQL or PL/SQL code in the target session. The target session is assumed to be waiting at a breakpoint (or other event). The call to DBMS_DEBUG.EXECUTE occurs in the debug session, which then asks the target session to execute the code.

Syntax

```sql
DBMS_DEBUG.EXECUTE (
    what         IN VARCHAR2,
    frame#       IN BINARY_INTEGER,
    bind_results IN BINARY_INTEGER,
    results      IN OUT NOCOPY dbms_debug_vc2coll,
    errm         IN OUT NOCOPY VARCHAR2);
```

Parameters

Table 53-24  EXECUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>what</td>
<td>SQL or PL/SQL source to execute</td>
</tr>
<tr>
<td>frame#</td>
<td>The context in which to execute the code. Only -1 (global context) is supported at this time.</td>
</tr>
<tr>
<td>bind_results</td>
<td>Whether the source wants to bind to results in order to return values from the target session: 0 = No 1 = Yes</td>
</tr>
<tr>
<td>results</td>
<td>Collection in which to place results, if bind_results is not 0</td>
</tr>
<tr>
<td>errm</td>
<td>Error message, if an error occurred; otherwise, NULL</td>
</tr>
</tbody>
</table>
Examples

Example 1

This example executes a SQL statement. It returns no results.

```sql
DECLARE
    coll sys.dbms_debug_vc2coll; -- results (unused)
    ermm VARCHAR2(100);
BEGIN
    dbms_debug.execute('insert into emp(ename,empno,deptno) ' ||
        'values(''LJE'', 1, 1)',
        -1, 0, coll, ermm);
END;
```

Example 2

This example executes a PL/SQL block, and it returns no results. The block is an autonomous transaction, which means that the value inserted into the table becomes visible in the debug session.

```sql
DECLARE
    coll sys.dbms_debug_vc2coll;
    ermm VARCHAR2(100);
BEGIN
    dbms_debug.execute('DECLARE PRAGMA autonomous_transaction; ' ||
        'BEGIN ' ||
        '   insert into emp(ename, empno, deptno) ' ||
        'values(''LJE'', 1, 1); ' ||
        '   COMMIT; ' ||
        'END;',
        -1, 0, coll, ermm);
END;
```

Example 3

This example executes a PL/SQL block, and it returns some results.

```sql
DECLARE
    coll sys.dbms_debug_vc2coll;
    ermm VARCHAR2(100);
BEGIN
    dbms_debug.execute('DECLARE ' ||
        '   pp SYS.dbms_debug_vc2coll := SYS.dbms_debug_vc2coll(); ' ||
        '   x  PLS_INTEGER; ' ||
        '   i  PLS_INTEGER := 1; ' ||
        'BEGIN ' ||
        '   SELECT COUNT(*) INTO x FROM emp; ' ||
        '   pp.EXTEND(x * 6); ' ||
        '   FOR c IN (SELECT * FROM emp) LOOP ' ||
        '      pp(i) := ''Ename: '' || c.ename; i := i+1; ' ||
        '      pp(i) := ''Empno: '' || c.empno; i := i+1; ' ||
        '      pp(i) := ''Job:   '' || c.job;   i := i+1; ' ||
        '      pp(i) := ''Mgr:   '' || c.mgr;   i := i+1; ' ||
        '      pp(i) := ''Sal:   '' || c.sal;   i := i+1; ' ||
        '      pp(i) := null;                   i := i+1; ' ||
        '   END LOOP; ' ||
        '   :i := pp; ' ||
        'END;',
        -1, 0, coll, ermm);
```
53.7.11 GET_INDEXES Function

Given a name of a variable or parameter, this function returns the set of its indexes, if it is an indexed table. An error is returned if it is not an indexed table.

Syntax

```
DBMS_DEBUG.GET_INDEXES ( 
  varname   IN  VARCHAR2, 
  frame#    IN  BINARY_INTEGER, 
  handle    IN  program_info, 
  entries   OUT index_table) 
RETURN BINARY_INTEGER;
```

Parameters

**Table 53-25  GET_INDEXES Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>varname</td>
<td>Name of the variable to get index information about</td>
</tr>
<tr>
<td>frame#</td>
<td>Number of frame in which the variable or parameter resides; NULL for a package variable</td>
</tr>
<tr>
<td>handle</td>
<td>Package description, if object is a package variable</td>
</tr>
<tr>
<td>entries</td>
<td>1-based table of the indexes: if non-NULL, then entries(1) contains the first index of the table, entries(2) contains the second index, and so on.</td>
</tr>
</tbody>
</table>

Return Values

**Table 53-26  GET_INDEXES Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_object</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- The package does not exist</td>
</tr>
<tr>
<td></td>
<td>- The package is not instantiated</td>
</tr>
<tr>
<td></td>
<td>- The user does not have privileges to debug the package</td>
</tr>
<tr>
<td></td>
<td>- The object does not exist in the package</td>
</tr>
</tbody>
</table>
53.7.12 GET_MORE_SOURCE Procedure

When the source does not fit in the buffer provided by the SHOW_SOURCE Procedure version which produced a formatted buffer, this procedure provides additional source.

Syntax

DBMS_DEBUG.GET_MORE_SOURCE (  
    buffer          IN OUT VARCHAR2,  
    buflen          IN BINARY_INTEGER,  
    piece#          IN BINARY_INTEGER);  

Parameters

Table 53-27  GET_MORE_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>The buffer</td>
</tr>
<tr>
<td>buflen</td>
<td>The length of the buffer</td>
</tr>
<tr>
<td>piece#</td>
<td>A value between 2 and the value returned in the parameter pieces from the call to the relevant version of the SHOW_SOURCE Procedures</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure should be called only after the version of SHOW_SOURCE that returns a formatted buffer.

Related Topics

- SHOW_SOURCE Procedures
  The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

53.7.13 GET_LINE_MAP Function

This function finds line and entrypoint information about a program so that a debugger can determine the source lines at which it is possible to place breakpoints.

Syntax

DBMS_DEBUG.GET_LINE_MAP (  
    program            IN   program_info,  
    maxline            OUT  BINARY_INTEGER,  
    number_of_entry_points OUT  BINARY_INTEGER,  
    linemap            OUT  RAW)  
RETURN BINARY_INTEGER;
Parameters

Table 53-28  GET_LINE_MAP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program</td>
<td>A top-level program unit (procedure / package / function / package body, and so on). Its Namespace, Name, and Owner fields must be initialized, the remaining fields are ignored.</td>
</tr>
<tr>
<td>maxline</td>
<td>The largest source code line number in 'program'</td>
</tr>
<tr>
<td>number_of_entry_points</td>
<td>The number of subprograms in 'program'</td>
</tr>
<tr>
<td>linemap</td>
<td>A bitmap representing the executable lines of 'program'. If line number N is executable, bit number N MOD 8 will be set to 1 at linemap position N / 8. The length of returned linemap is either maxline divided by 8 (plus one if maxline MOD 8 is not zero) or 32767 in the unlikely case of maxline being larger than 32767 * 8.</td>
</tr>
</tbody>
</table>

Return Values

Table 53-29  GET_LINE_MAP Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>The program unit exists, but has no debug info</td>
</tr>
<tr>
<td>error_bad_handle</td>
<td>No such program unit exists</td>
</tr>
</tbody>
</table>

53.7.14 GET_RUNTIME_INFO Function

This function returns information about the current program. It is only needed if the info_requested parameter to SYNCHRONIZE or CONTINUE was set to 0.

Note:

This is currently only used by client-side PL/SQL.

Syntax

```
DBMS_DEBUG.GET_RUNTIME_INFO (  
  info_requested  IN  BINARY_INTEGER,  
  run_info        OUT runtime_info)  
RETURN BINARY_INTEGER;
```
Parameters

Table 53-30  GET_RUNTIME_INFO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>info_requested</td>
<td>Which information should be returned in run_info when the program stops (see DBMS_DEBUG Operational Notes for information about information flags)</td>
</tr>
<tr>
<td>run_info</td>
<td>Information about the state of the program</td>
</tr>
</tbody>
</table>

53.7.15 GET_TIMEOUT_BEHAVIOUR Function

This procedure returns the current timeout behavior. This call is made in the target session.

Syntax

```sql
DBMS_DEBUG.GET_TIMEOUT_BEHAVIOUR
RETURN BINARY_INTEGER;
```

Parameters

Table 53-31  GET_TIMEOUT_BEHAVIOUR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (a 4-byte positive number)</td>
</tr>
</tbody>
</table>

Return Values

Table 53-32  GET_TIMEOUT_BEHAVIOUR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
</tbody>
</table>

Information Flags

```sql
info_getOerInfo CONSTANT PLS_INTEGER:= 32;
```

Usage Notes

Less functionality is supported on OER breakpoints than on code breakpoints. In particular, note that:

- No "breakpoint number" is returned - the number of the OER is used instead. Thus it is impossible to set duplicate breakpoints on a given OER (it is a no-op).
- It is not possible to disable an OER breakpoint (although clients are free to simulate this by deleting it).
- OER breakpoints are deleted using `delete_oer_breakpoint`. 

53.7.16 GET_VALUE Function

This function gets a value from the currently-running program. There are two overloaded GET_VALUE functions.

Syntax

```sql
DBMS_DEBUG.GET_VALUE (    variable_name  IN  VARCHAR2,
   frame#         IN  BINARY_INTEGER,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```

Parameters

Table 53-33  GET_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of the variable or parameter</td>
</tr>
<tr>
<td>frame#</td>
<td>Frame in which it lives; 0 means the current procedure</td>
</tr>
<tr>
<td>scalar_value</td>
<td>Value</td>
</tr>
<tr>
<td>format</td>
<td>Optional date format to use, if meaningful</td>
</tr>
</tbody>
</table>

Return Values

Table 53-34  GET_VALUE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
<tr>
<td>error_bogus_frame</td>
<td>Frame does not exist</td>
</tr>
<tr>
<td>error_no_debug_info</td>
<td>Entrypoint has no debug information</td>
</tr>
<tr>
<td>error_no_such_object</td>
<td>variable_name does not exist in frame#</td>
</tr>
<tr>
<td>error_unknown_type</td>
<td>The type information in the debug information is illegible</td>
</tr>
<tr>
<td>error_nullvalue</td>
<td>Value is NULL</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>The object is a table, but no index was provided</td>
</tr>
</tbody>
</table>

This form of GET_VALUE is for fetching package variables. Instead of a frame#, it takes a handle, which describes the package containing the variable.

Syntax

```sql
DBMS_DEBUG.GET_VALUE (    variable_name  IN  VARCHAR2,
   handle         IN  program_info,
   scalar_value   OUT VARCHAR2,
   format         IN  VARCHAR2 := NULL)
RETURN BINARY_INTEGER;
```
Parameters

Table 53-35  GET_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_name</td>
<td>Name of the variable or parameter</td>
</tr>
<tr>
<td>handle</td>
<td>Description of the package containing the variable</td>
</tr>
<tr>
<td>scalar_value</td>
<td>Value</td>
</tr>
<tr>
<td>format</td>
<td>Optional date format to use, if meaningful</td>
</tr>
</tbody>
</table>

Return Values

Table 53-36  GET_VALUE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_no_such_object</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- Package does not exist</td>
</tr>
<tr>
<td></td>
<td>- Package is not instantiated</td>
</tr>
<tr>
<td></td>
<td>- User does not have privileges to debug the package</td>
</tr>
<tr>
<td></td>
<td>- Object does not exist in the package</td>
</tr>
<tr>
<td>error_indexed_table</td>
<td>The object is a table, but no index was provided</td>
</tr>
</tbody>
</table>

Examples

This example illustrates how to get the value with a given package `PACK` in schema `SCOTT`, containing variable `VAR`:

```sql
DECLARE
    handle     dbms_debug.program_info;
    resultbuf  VARCHAR2(500);
    retval     BINARY_INTEGER;
BEGIN
    handle.Owner     := 'SCOTT';
    handle.Name      := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.get_value('VAR', handle, resultbuf, NULL);
END;
```

53.7.17 INITIALIZE Function

This function initializes the target session for debugging.

Syntax

```sql
DBMS_DEBUG.INITIALIZE ( 
    debug_session_id IN VARCHAR2       := NULL,
    diagnostics       IN BINARY_INTEGER := 0)
RETURN VARCHAR2;
```
Parameters

Table 53-37  INITIALIZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug_session_id</td>
<td>Name of session ID. If NULL, then a unique ID is generated.</td>
</tr>
<tr>
<td>diagnostics</td>
<td>Indicates whether to dump diagnostic output to the tracefile:</td>
</tr>
<tr>
<td></td>
<td>0 = (default) no diagnostics</td>
</tr>
<tr>
<td></td>
<td>1 = print diagnostics</td>
</tr>
</tbody>
</table>

Return Values

The newly-registered debug session ID (debugID)

Usage Notes

You cannot use DBMS_DEBUG and the JDWP-based debugging interface simultaneously. This call will either fail with an ORA-30677 error if the session is currently being debugged with the JDWP-based debugging interface or, if the call succeeds, any further use of the JDWP-based interface to debug this session will be disallowed.

Calls to DBMS_DEBUG will succeed only if either the caller or the specified debug role carries the DEBUG CONNECT SESSION privilege. Failing that, an ORA-1031 error will be raised. Other exceptions are also possible if a debug role is specified but the password does not match, or if the calling user has not been granted the role, or the role is application-enabled and this call does not originate from within the role-enabling package.

The CREATE ANY PROCEDURE privilege does not affect the visibility of routines through the debugger. A privilege DEBUG for each object has been introduced with a corresponding DEBUG ANY PROCEDURE variant. These are required in order to see routines owned by users other than the session's login user.

Authentication of the debug role and the check for DEBUG CONNECT SESSION privilege will be done in the context of the caller to this routine. If the caller is a definer's rights routine or has been called from one, only privileges granted to the defining user, the debug role, or PUBLIC will be used to check for DEBUG CONNECT SESSION. If this call is from within a definer's rights routine, the debug role, if specified, must be one that has been granted to that definer, but it need not also have been granted to the session login user or be enabled in the calling session at the time the call is made.

The checks made by the debugger after this call is made looking for the DEBUG privilege on individual procedures will be done in the context of the session's login user, the roles that were enabled at session level at the moment this call was made (even if those roles were not available within a definer's rights environment of the call), and the debug role.
53.7.18 PING Procedure

This procedure pings the target session to prevent it from timing out. Use this procedure when execution is suspended in the target session, for example at a breakpoint.

If the timeoutBehaviour is set to retry_on_timeout then this procedure is not necessary.

Syntax

DBMS_DEBUG.PING;

Exceptions

Oracle will display the no_target_program exception if there is no target program or if the target session is not currently waiting for input from the debug session.

Usage Notes

Timeout options for the target session are registered with the target session by calling set_timeoutBehaviour:

- retry_on_timeout - Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.
- continue_on_timeout - Continue execution, using same event flags.
- nodebug_on_timeout - Turn debug-mode OFF (in other words, call debug_off) and then continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.
- abort_on_timeout - Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.

retry_on_timeout CONSTANT BINARY_INTEGER:= 0;
continue_on_timeout CONSTANT BINARY_INTEGER:= 1;
nodebug_on_timeout CONSTANT BINARY_INTEGER:= 2;
abort_on_timeout CONSTANT BINARY_INTEGER:= 3;

53.7.19 PRINT_BACKTRACE Procedure

This procedure prints a backtrace listing of the current execution stack. This should only be called if a program is currently running.

There are two overloaded PRINT_BACKTRACE procedures.

Syntax

DBMS_DEBUG.PRINT_BACKTRACE (listing IN OUT VARCHAR2);

DBMS_DEBUG.PRINT_BACKTRACE (backtrace OUT backtrace_table);
Parameters

Table 53-38 PRINT_BACKTRACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listing</td>
<td>A formatted character buffer with embedded newlines</td>
</tr>
<tr>
<td>backtrace</td>
<td>1-based indexed table of backtrace entries. The currently-running procedure is the last entry in the table (that is, the frame numbering is the same as that used by GET_VALUE). Entry 1 is the oldest procedure on the stack.</td>
</tr>
</tbody>
</table>

53.7.20 PRINT_INSTANTIATIONS Procedure

This procedure returns a list of the packages that have been instantiated in the current session.

Syntax

```sql
DBMS_DEBUG.PRINT_INSTANTIATIONS (
    pkgs   IN OUT NOCOPY backtrace_table,
    flags  IN BINARY_INTEGER);
```

Parameters

Table 53-39 PRINT_INSTANTIATIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pkgs</td>
<td>The instantiated packages</td>
</tr>
<tr>
<td>flags</td>
<td>Bitmask of options:</td>
</tr>
<tr>
<td></td>
<td>• 1 - show specs</td>
</tr>
<tr>
<td></td>
<td>• 2 - show bodies</td>
</tr>
<tr>
<td></td>
<td>• 4 - show local instantiations</td>
</tr>
<tr>
<td></td>
<td>• 8 - show remote instantiations (NYI)</td>
</tr>
<tr>
<td></td>
<td>• 16 - do a fast job. The routine does not test whether debug information exists or whether the libunit is shrink-wrapped.</td>
</tr>
</tbody>
</table>

Exceptions

- no_target_program - target session is not currently executing

Usage Notes

On return, `pkgs` contains a `program_info` for each instantiation. The valid fields are: Namespace, Name, Owner, and LibunitType.

In addition, `Line#` contains a bitmask of:

- 1 - the libunit contains debug info
- 2 - the libunit is shrink-wrapped
53.7.21 PROBE_VERSION Procedure

This procedure returns the version number of DBMS_DEBUG on the server.

Syntax

\[
\text{DBMS_DEBUG.PROBE_VERSION (}
\begin{align*}
\text{major } & \text{out BINARY_INTEGER}, \\
\text{minor } & \text{out BINARY_INTEGER}; \\
\end{align*}
\]

Parameters

Table 53-40  PROBE_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version number</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version number: increments as functionality is added</td>
</tr>
</tbody>
</table>

53.7.22 SELF_CHECK Procedure

This procedure performs an internal consistency check. SELF_CHECK also runs a communications test to ensure that the Probe processes are able to communicate.

If SELF_CHECK does not return successfully, then an incorrect version of DBMS_DEBUG was probably installed on this server. The solution is to install the correct version (pbload.sql loads DBMS_DEBUG and the other relevant packages).

Syntax

\[
\text{DBMS_DEBUG.SELF_CHECK (}
\begin{align*}
\text{timeout IN binary_integer := 60);} \\
\end{align*}
\]

Parameters

Table 53-41  SELF_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout to use for the communication test. Default is 60 seconds.</td>
</tr>
</tbody>
</table>

Exceptions

Table 53-42  SELF_CHECK Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OER-6516</td>
<td>Probe version is inconsistent</td>
</tr>
<tr>
<td>pipe_creation_failure</td>
<td>Could not create a pipe</td>
</tr>
<tr>
<td>pipe_send_failure</td>
<td>Could not write data to the pipe</td>
</tr>
<tr>
<td>pipe_receive_failure</td>
<td>Could not read data from the pipe</td>
</tr>
</tbody>
</table>
### Table 53-42 (Cont.) SELF_CHECK Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipe_datatype_mismatch</td>
<td>Datatype in the pipe was wrong</td>
</tr>
<tr>
<td>pipe_data_error</td>
<td>Data got garbled in the pipe</td>
</tr>
</tbody>
</table>

All of these exceptions are fatal. They indicate a serious problem with Probe that prevents it from working correctly.

### 53.7.23 SET_BREAKPOINT Function

This function sets a breakpoint in a program unit, which persists for the current session.

Execution pauses if the target program reaches the breakpoint.

**Syntax**

```sql
DBMS_DEBUG.SET_BREAKPOINT (
    program     IN  program_info,
    line#       IN  BINARY_INTEGER,
    breakpoint# OUT BINARY_INTEGER,
    fuzzy       IN  BINARY_INTEGER := 0,
    iterations  IN  BINARY_INTEGER := 0
) RETURN BINARY_INTEGER;
```

**Parameters**

### Table 53-43 SET_BREAKPOINT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program</td>
<td>Information about the program unit in which the breakpoint is to be set. (In version 2.1 and later, the namespace, name, owner, and dblink may be set to NULL, in which case the breakpoint is placed in the currently-running program unit.)</td>
</tr>
<tr>
<td>line#</td>
<td>Line at which the breakpoint is to be set</td>
</tr>
<tr>
<td>breakpoint#</td>
<td>On successful completion, contains the unique breakpoint number by which to refer to the breakpoint</td>
</tr>
<tr>
<td>fuzzy</td>
<td>Only applicable if there is no executable code at the specified line:</td>
</tr>
<tr>
<td>iterations</td>
<td>Number of times to wait before signalling this breakpoint</td>
</tr>
</tbody>
</table>
Return Values

**Note:**
The fuzzy and iterations parameters are not yet implemented

### Table 53-44  SET_BREAKPOINT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
<tr>
<td>errorillegal_line</td>
<td>Cannot set a breakpoint at that line</td>
</tr>
<tr>
<td>errorbad_handle</td>
<td>No such program unit exists</td>
</tr>
</tbody>
</table>

### 53.7.24 SET_OER_BREAKPOINT Function

This function sets an OER breakpoint.

**Syntax**

```sql
DBMS_DEBUG.SET_OER_BREAKPOINT (
    oer  IN PLS_INTEGER)
RETURN PLS_INTEGER;
```

**Parameters**

### Table 53-45  SET_OER_BREAKPOINT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oer</td>
<td>The OER (positive 4-byte number) to set</td>
</tr>
</tbody>
</table>

### Return Values

### Table 53-46  SET_OER_BREAKPOINT Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
<tr>
<td>error_no_such_breakpt</td>
<td>No such OER breakpoint exists</td>
</tr>
</tbody>
</table>

### 53.7.25 SET_TIMEOUT Function

This function sets the timeout value and returns the new timeout value.

**Syntax**

```sql
DBMS_DEBUG.SET_TIMEOUT (
    timeout BINARY_INTEGER)
RETURN BINARY_INTEGER;
```
Parameters

Table 53-47  SET_TIMEOUT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout to use for communication between the target and debug sessions</td>
</tr>
</tbody>
</table>

53.7.26 SET_TIMEOUT_BEHAVIOUR Procedure

This procedure tells Probe what to do with the target session when a timeout occurs. This call is made in the target session.

Syntax

```sql
DBMS_DEBUG.SET_TIMEOUT_BEHAVIOUR (  
    behaviour IN PLS_INTEGER);
```

Parameters

Table 53-48  SET_TIMEOUT_BEHAVIOUR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>behaviour - One of the following: retry_on_timeout</td>
<td>Retry. Timeout has no effect. This is like setting the timeout to an infinitely large value.</td>
</tr>
<tr>
<td>continue_on_timeout</td>
<td>Continue execution, using same event flags</td>
</tr>
<tr>
<td>nodebug_on_timeout</td>
<td>Turn debug-mode OFF (in other words, call debug_off) and continue execution. No more events will be generated by this target session unless it is re-initialized by calling debug_on.</td>
</tr>
<tr>
<td>abort_on_timeout</td>
<td>Continue execution, using the abort_execution flag, which should cause the program to terminate immediately. The session remains in debug-mode.</td>
</tr>
</tbody>
</table>

Exceptions

unimplemented - the requested behavior is not recognized

Usage Notes

The default behavior (if this procedure is not called) is continue_on_timeout, since it allows a debugger client to reestablish control (at the next event) but does not cause the target session to hang indefinitely.
53.7.27 SET_VALUE Function

This function sets a value in the currently-running program. There are two overloaded SET_VALUE functions.

Syntax

DBMS_DEBUG.SET_VALUE (  
  frame#               IN binary_integer,  
  assignment_statement IN varchar2)  
RETURN BINARY_INTEGER;

DBMS_DEBUG.SET_VALUE (  
  handle               IN program_info,  
  assignment_statement IN VARCHAR2)  
RETURN BINARY_INTEGER;

Parameters

Table 53-49  SET_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>frame#</td>
<td>Frame in which the value is to be set; 0 means the currently executing frame.</td>
</tr>
<tr>
<td>handle</td>
<td>Description of the package containing the variable</td>
</tr>
<tr>
<td>assignment_statement</td>
<td>An assignment statement (which must be legal PL/SQL) to run in order to set the value. For example, 'x := 3;'. Only scalar values are supported in this release. The right side of the assignment statement must be a scalar.</td>
</tr>
</tbody>
</table>

Return Values

Table 53-50  SET_VALUE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>-</td>
</tr>
<tr>
<td>error_illegal_value</td>
<td>Not possible to set it to that value</td>
</tr>
<tr>
<td>errorillegal_null</td>
<td>Cannot set to NULL because object type specifies it as 'not NULL'</td>
</tr>
<tr>
<td>error_value_malformed</td>
<td>Value is not a scalar</td>
</tr>
<tr>
<td>error_name_incomplete</td>
<td>The assignment statement does not resolve to a scalar. For example, 'x := 3;'; if x is a record.</td>
</tr>
<tr>
<td>error_no_such_object</td>
<td>One of the following:</td>
</tr>
<tr>
<td></td>
<td>- Package does not exist</td>
</tr>
<tr>
<td></td>
<td>- Package is not instantiated</td>
</tr>
<tr>
<td></td>
<td>- User does not have privileges to debug the package</td>
</tr>
<tr>
<td></td>
<td>- Object does not exist in the package</td>
</tr>
</tbody>
</table>
Usage Notes

In some cases, the PL/SQL compiler uses temporaries to access package variables, and does not guarantee to update such temporaries. It is possible, although unlikely, that modification to a package variable using SET_VALUE might not take effect for a line or two.

Examples

To set the value of SCOTT.PACK.var to 6:

```
DECLARE
    handle  dbms_debug.program_info;
    retval  BINARY_INTEGER;
BEGIN
    handle.Owner     := 'SCOTT';
    handle.Name      := 'PACK';
    handle.namespace := dbms_debug.namespace_pkgspec_or_toplevel;
    retval           := dbms_debug.set_value(handle, 'var := 6;');
END;
```

53.7.28 SHOW_BREAKPOINTS Procedures

There are two overloaded procedures that return a listing of the current breakpoints. There are three overloaded SHOW_BREAKPOINTS procedures.

Syntax

```
DBMS_DEBUG.SHOW_BREAKPOINTS  (  
    listing    IN OUT VARCHAR2);

DBMS_DEBUG.SHOW_BREAKPOINTS  (  
    listing    OUT breakpoint_table);

DBMS_DEBUG.SHOW_BREAKPOINTS  (  
    code_breakpoints  OUT breakpoint_table,
    oer_breakpoints   OUT oer_table);
```

Parameters

Table 53-51  SHOW_BREAKPOINTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>listing</td>
<td>A formatted buffer (including newlines) of the breakpoints. Indexed table of breakpoint entries. The breakpoint number is indicated by the index into the table. Breakpoint numbers start at 1 and are reused when deleted.</td>
</tr>
<tr>
<td>code_breakpoints</td>
<td>The indexed table of breakpoint entries, indexed by breakpoint number</td>
</tr>
<tr>
<td>oer_breakpoints</td>
<td>The indexed table of OER breakpoints, indexed by OER</td>
</tr>
</tbody>
</table>
53.7.29 SHOW_FRAME_SOURCE Procedure

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```sql
DBMS_DEBUG.SHOW_FRAME_SOURCE (
    first_line  IN            BINARY_INTEGER,
    last_line   IN            BINARY_INTEGER,
    source      IN OUT NOCOPY vc2_table,
    frame_num   IN            BINARY_INTEGER);
```

Parameters

Table 53-52   SHOW_FRAME_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_line</td>
<td>Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)</td>
</tr>
<tr>
<td>last_line</td>
<td>Line number of last line to fetch. No lines are fetched past the end of the program.</td>
</tr>
<tr>
<td>source</td>
<td>The resulting table, which may be indexed by line#</td>
</tr>
<tr>
<td>frame_num</td>
<td>1-based frame number</td>
</tr>
</tbody>
</table>

Usage Notes

- You use this function only when backtrace shows an anonymous unit is executing at a given frame position and you need to view the source in order to set a breakpoint.
- If frame number is top of the stack and it’s an anonymous block then SHOW_SOURCE can also be used.
- If it’s a stored PL/SQL package/function/procedure then use SQL as described in the Usage Notes to SHOW_SOURCE Procedures.

53.7.30 SHOW_SOURCE Procedures

The procedure gets the source code. There are two overloaded SHOW_SOURCE procedures.

Syntax

```sql
DBMS_DEBUG.SHOW_SOURCE (
    first_line IN            BINARY_INTEGER,
    last_line  IN            BINARY_INTEGER,
    source     OUT  vc2_table);
```

```sql
DBMS_DEBUG.SHOW_SOURCE (
    first_line  IN            BINARY_INTEGER,
    last_line   IN            BINARY_INTEGER,
    window      IN            BINARY_INTEGER,
    print_arrow IN            BINARY_INTEGER,
    buffer      IN OUT VARCHAR2,
```

Chapter 53
Summary of DBMS_DEBUG Subprograms
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>first_line</td>
<td>Line number of first line to fetch (PL/SQL programs always start at line 1 and have no holes)</td>
</tr>
<tr>
<td>last_line</td>
<td>Line number of last line to fetch. No lines are fetched past the end of the program.</td>
</tr>
<tr>
<td>source</td>
<td>The resulting table, which may be indexed by line#</td>
</tr>
<tr>
<td>window</td>
<td>'Window' of lines (the number of lines around the current source line)</td>
</tr>
<tr>
<td>print_arrow</td>
<td>Nonzero means to print an arrow before the current line</td>
</tr>
<tr>
<td>buffer</td>
<td>Buffer in which to place the source listing</td>
</tr>
<tr>
<td>buflen</td>
<td>Length of buffer</td>
</tr>
<tr>
<td>pieces</td>
<td>Set to nonzero if not all the source could be placed into the given buffer</td>
</tr>
</tbody>
</table>

Return Values

An indexed table of source-lines. The source lines are stored starting at first_line. If any error occurs, then the table is empty.

Usage Notes

The best way to get the source code (for a program that is being run) is to use SQL. For example:

```sql
DECLARE
    info DBMS_DEBUG.runtime_info;
BEGIN
    -- call DBMS_DEBUG.SYNCHRONIZE, CONTINUE,
    -- or GET_RUNTIME_INFO to fill in 'info'
    SELECT text INTO <buffer> FROM all_source
    WHERE owner = info.Program.Owner
    AND name  = info.Program.Name
    AND line  = info.Line#;
END;
```

However, this does not work for nonpersistent programs (for example, anonymous blocks and trigger invocation blocks). For nonpersistent programs, call `SHOW_SOURCE`. There are two flavors: one returns an indexed table of source lines, and the other returns a packed (and formatted) buffer.

The second overloading of `SHOW_SOURCE` returns the source in a formatted buffer, complete with line-numbers. It is faster than the indexed table version, but it does not guarantee to fetch all the source.

If the source does not fit in bufferlength (buflen), then additional pieces can be retrieved using the `GET_MORE_SOURCE` procedure (pieces returns the number of additional pieces that need to be retrieved).
53.7.31 SYNCHRONIZE Function

This function waits until the target program signals an event. If `info_requested` is not `NULL`, then it calls `GET_RUNTIME_INFO`.

**Syntax**

```sql
DBMS_DEBUG.SYNCHRONIZE (  
    run_info OUT runtime_info,  
    info_requested IN   BINARY_INTEGER := NULL)  
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_info</td>
<td>Structure in which to write information about the program. By default, this includes information about what program is running and at which line execution has paused.</td>
</tr>
<tr>
<td>info_requested</td>
<td>Optional bit-field in which to request information other than the default (which is <code>info_getStackDepth + info_getLineInfo</code>). 0 means that no information is requested at all (see <code>DBMS_DEBUG Operational Notes</code> for more about information flags).</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>A successful completion</td>
</tr>
<tr>
<td>error_timeout</td>
<td>Timed out before the program started execution</td>
</tr>
<tr>
<td>error_communication</td>
<td>Other communication error</td>
</tr>
</tbody>
</table>

53.7.32 TARGET_PROGRAM_RUNNING Procedure

This procedure returns `TRUE` if the target session is currently executing a stored procedure, or `FALSE` if it is not.

**Syntax**

```sql
DBMS_DEBUG.TARGET_PROGRAM_RUNNING  
RETURN BOOLEAN;
```
54

DBMS_DEBUG_JDWP

The DBMS_DEBUG_JDWP provides the interface to initiate and control the debugging of PL/SQL stored procedures and Java stored procedures over Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- DBMS_DEBUG_JDWP Overview
- DBMS_DEBUG_JDWP Security Model
- Summary of DBMS_DEBUG_JDWP Subprograms

54.1 DBMS_DEBUG_JDWP Overview

Oracle supports the debugging of PL/SQL stored procedures and Java stored procedures over JDWP. Using the DBMS_DEBUG_JDWP package, you can:

- Retrieve the session ID of the current session and serial number
- Connect a database session to a debugger over JDWP
- Set the NLS parameters to change the formats in which PL/SQL program values are represented over JDWP

54.2 DBMS_DEBUG_JDWP Security Model

The debugging user invoking a DBMS_DEBUG_JDWP subprogram requires a privilege to connect the target database session to the debugger.

Table 54-1  System Privileges

<table>
<thead>
<tr>
<th>System Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG CONNECT SESSION</td>
<td>Allows a user to connect his current session to a debugger</td>
</tr>
<tr>
<td>DEBUG CONNECT ANY</td>
<td>Allows a user to connect a session by any logon user to a debugger</td>
</tr>
</tbody>
</table>

In addition, the user can also be granted the following user privilege to debug another user's session.

Table 54-2  User Privileges

<table>
<thead>
<tr>
<th>User Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEBUG CONNECT ON USER &lt;user&gt;</td>
<td>Allows a user to connect any of the specified user's logon sessions to a debugger to debug another user's session or his own</td>
</tr>
</tbody>
</table>
54.3 Summary DBMS_DEBUG_JDWP Subprograms

This table lists the DBMS_DEBUG_JDWP subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECT_TCP Procedure</td>
<td>Connects the specified session to the debugger waiting at host:port</td>
</tr>
<tr>
<td>CURRENT_SESSION_ID Function</td>
<td>Gets the current session's session ID</td>
</tr>
<tr>
<td>CURRENT_SESSION_SERIAL Function</td>
<td>Gets the current session's session serial number</td>
</tr>
<tr>
<td>DISCONNECT Procedure</td>
<td>Disconnects the specified session from any debugger with which it is connected</td>
</tr>
<tr>
<td>GET_NLS_PARAMETER Function</td>
<td>Gets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP</td>
</tr>
<tr>
<td>PROCESS_CONNECT_STRING Procedure</td>
<td>Connects a session to a debugger without having to directly modify an application's code</td>
</tr>
<tr>
<td>SET_NLS_PARAMETER Procedure</td>
<td>Sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP</td>
</tr>
</tbody>
</table>

54.3.1 CONNECT_TCP Procedure

This procedure connects the specified session to the debugger waiting at host:port.

Syntax

```sql
DBMS_DEBUG_JDWP.CONNECT_TCP(
    host    IN VARCHAR2,
    port    IN VARCHAR2,
    session_id    IN PLS_INTEGER := NULL,
    session_serial    IN PLS_INTEGER := NULL,
    debug_role    IN VARCHAR2 := NULL,
    debug_role_pwd    IN VARCHAR2 := NULL,
    option_flags    IN PLS_INTEGER := 0,
    extensions_cmd_set    IN PLS_INTEGER := 128);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host name the debugger is waiting at</td>
</tr>
</tbody>
</table>
Table 54-4  (Cont.) CONNECT_TCP Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>The port number the debugger is waiting at</td>
</tr>
<tr>
<td>session_id</td>
<td>Session ID</td>
</tr>
<tr>
<td>session_serial</td>
<td>Session number</td>
</tr>
<tr>
<td>debug_role</td>
<td>Debug role</td>
</tr>
<tr>
<td>debug_role_pwd</td>
<td>Debug password</td>
</tr>
<tr>
<td>option_flags</td>
<td>Values:</td>
</tr>
<tr>
<td></td>
<td>• 1: Does not suspend the program until the next client/server request begins. This can be used to hide the startup sequence from end users, who may only want to see their own code</td>
</tr>
</tbody>
</table>
|                   | • 2: Forces the connection even if the session appears to be connected to a debugger. This should best only be specified after some human-interaction confirmation step has occurred; i.e., if an attempt without this option raised ORA-30677, then if the user confirms, retry with this bit set. 
These may be added together to select multiple option choices. |
| extensions_cmd_set| The ID of the Oracle JDWP extension command set                             |

Exceptions

Table 54-5  CONNECT_TCP Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-00022</td>
<td>Invalid session ID</td>
</tr>
<tr>
<td>ORA-01031</td>
<td>Insufficient privilege</td>
</tr>
<tr>
<td>ORA-30677</td>
<td>Session is already connected to a debugger</td>
</tr>
<tr>
<td>ORA-30681</td>
<td>Improper value for argument EXTENSIONS_CMD_SET</td>
</tr>
<tr>
<td>ORA-30682</td>
<td>Improper value for argument OPTION_FLAGS</td>
</tr>
<tr>
<td>ORA-30683</td>
<td>Failure establishing connection to debugger</td>
</tr>
</tbody>
</table>

Usage Notes

- To connect the current session to a debugger, you can pass NULL to both the session_id and session_serial parameters.
- To connect a different session, you need to find out its ID and serial. These are available in the v$plsql_debuggable_sessions view. The Instance Manager option of Oracle Enterprise Manager is one example of a user interface that displays these values to users. You can also find the values of these for your own session using...
The **CURRENT_SESSION_ID Function** and **CURRENT_SESSION_SERIAL Function**.

- The `debug_role` and `debug_role_pwd` arguments allow the user to name any role as the "debug role", which will be available to privilege checking when checking for permissions to connect the session and when checking permissions available on objects within the debugged session. Both the role and its password are passed here as strings and not as identifiers, so double quotes should not be used but case matters. If the original role name wasn't double-quoted, it should be specified here in upper case.

- An **ORA-30677** indicates that the requested session is already being debugged. It is suggested in this case that the user be asked to confirm that (s)he desires to steal the session from the existing connection, and then either an explicit disconnect call or the use of the `connect_force_connect` option bit can be used to allow the connection to succeed on a second attempt. Note that using the `connect_force_connect` bit will avoid the session being allowed to run freely if it is currently suspended through the debugger - in other words, this bit lets you steal a session from one debugger to another without actually disturbing the state of the session.

### 54.3.2 CURRENT_SESSION_ID Function

This function gets the current session's session ID

**Syntax**

```sql
DBMS_DEBUG_JDWP.CURRENT_SESSION_ID
RETURN PLS_INTEGER;
```

### 54.3.3 CURRENT_SESSION_SERIAL Function

This function gets the current session's session number.

**Syntax**

```sql
DBMS_DEBUG_JDWP.CURRENT_SESSION_SERIAL
RETURN PLS_INTEGER;
```

### 54.3.4 DISCONNECT Procedure

This procedure disconnects the specified session from any debugger with which it is connected.

**Syntax**

```sql
DBMS_DEBUG_JDWP.DISCONNECT(
    session_id   IN  PLS_INTEGER := NULL,
    session_serial   IN  PLS_INTEGER := NULL);
```
Parameters

Table 54-6  DISCONNECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Session ID</td>
</tr>
<tr>
<td>session_serial</td>
<td>Session number</td>
</tr>
</tbody>
</table>

Usage Notes

• If the session to disconnect is the current session, the session will be allowed to run freely after disconnecting the debugger. Otherwise, the session will be terminated.

• The same rights are required for this call as for connect, except when disconnecting the current session and the effective user at the time of the call is the same as the login user of the session where no privilege is required.

54.3.5 GET_NLS_PARAMETER Function

This function gets the value of the specified NLS parameter affecting the format in which the NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings, as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

Syntax

```sql
DBMS_DEBUG_JDWP.GET_NLS_PARAMETER(
    name   IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 54-7  GET_NLS_PARAMETER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specified NLS parameter</td>
</tr>
</tbody>
</table>

Usage Notes

• When any variable value is read or assigned through JDWP, or when either GET_NLS_PARAMETER Function or SET_NLS_PARAMETER Procedure is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS_LANGUAGE, NLS_TERRITORY, NLSCALENDAR, NLS_DATE_LANGUAGE, NLS_NUMERIC_CHARACTERS, NLS_TIMESTAMP_FORMAT, NLS_TIMESTAMP_TZ_FORMAT, NLS_TIME_FORMAT and NLS_TIME_TZ_FORMAT values. These private copies may be read using this GET_NLS_PARAMETER Function call and changed using the following call to the SET_NLS_PARAMETER Procedure.
• Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the `ALTER SESSION` statement will have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the `SET_NLS_PARAMETER Procedure`. By the same token, changes made to the debugger's private copy of the NLS parameters using `SET_NLS_PARAMETER Procedure` will have no effect on the debugged program itself.

• Date values are always formatted for JDWP use using the `NLS_TIMESTAMP_FORMAT`. The default format for `DATE (NLS_DATE_FORMAT)` used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.

54.3.6 PROCESS_CONNECT_STRING Procedure

This procedure connects a session to a debugger in two ways, so that you do not have to directly modify the application code.

The two ways are:

• Using the `ORA_DEBUG_JDWP` environment variable, when running an OCI program

• Setting a web browser cookie called `OWA_DEBUG_<dad>`, when running an application through the PL/SQL Web Gateway

Syntax

```sql
DBMS_DEBUG_JDWP.PROCESS_CONNECT_STRING (
    connect_string          IN  VARCHAR2,
    connect_string_type     IN  PLS_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>connect_string</td>
<td>The <code>ORA_DEBUG_JDWP</code> environment variable or <code>OWA_DEBUG_&lt;dad&gt;</code> cookie value that contains the JDWP connection information such as the host and port number of the debugger to connect to</td>
</tr>
<tr>
<td>connect_string_type</td>
<td>Can have the following two values:</td>
</tr>
<tr>
<td></td>
<td>• 1 if the connect string value is retrieved from the <code>ORA_DEBUG_JDWP</code> environment</td>
</tr>
<tr>
<td></td>
<td>• 2 if the value is from the <code>OWA_DEBUG_&lt;dad&gt;</code> cookie</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-00022</td>
<td>Invalid session ID</td>
</tr>
<tr>
<td>ORA-01031</td>
<td>Insufficient privilege</td>
</tr>
</tbody>
</table>
Table 54-9  (Cont.) PROCESS_CONNECT_STRING Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-30677</td>
<td>Session is already connected to a debugger</td>
</tr>
<tr>
<td>ORA-30681</td>
<td>Improper value for argument</td>
</tr>
<tr>
<td></td>
<td>EXTENSIONS_CMD_SET</td>
</tr>
<tr>
<td>ORA-30682</td>
<td>Improper value for argument</td>
</tr>
<tr>
<td></td>
<td>OPTION_FLAGS</td>
</tr>
<tr>
<td>ORA-30683</td>
<td>Failure establishing connection to debugger</td>
</tr>
<tr>
<td>ORA-30689</td>
<td>Improper value for environment variable</td>
</tr>
<tr>
<td></td>
<td>ORA_DEBUG_JDWP</td>
</tr>
</tbody>
</table>

54.3.7 SET_NLS_PARAMETER Procedure

This function sets the value of the specified NLS parameter affecting the format in which NUMBER, DATE, TIME (WITH TIME ZONE) and TIMESTAMP (WITH TIME ZONE) runtime values of PL/SQL programs are converted to strings as they are presented through JDWP.

These values are private to the current session, but further are private to the debugger mechanisms, separate from the values used to convert values within the debugged program itself.

Syntax

```sql
DBMS_DEBUG_JDWP.SET_NLS_PARAMETER(
    name IN VARCHAR2,
    value IN VARCHAR2);
```

Parameters

Table 54-10  SET_NLS_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specified NLS parameter</td>
</tr>
<tr>
<td>value</td>
<td>Value of specified NLS parameter</td>
</tr>
</tbody>
</table>

Usage Notes

- When any variable value is read or assigned through JDWP, or when either `GET_NLS_PARAMETER` Function or `SET_NLS_PARAMETER` Procedure is first invoked in a session, the debugger mechanisms make a private copy of the then-current NLS_LANGUAGE, NLS_TERRITORY, NLSCALENDAR, NLS_DATE_LANGUAGE, NLS_NUMERIC_CHARACTERS, NLS_TIMESTAMP_FORMAT, NLS_TIMESTAMP_TZ_FORMAT, NLS_TIME_FORMAT and NLS_TIME_TZ_FORMAT values. These private copies may be read by calling the `GET_NLS_PARAMETER` Function and changed using the following call to the `SET_NLS_PARAMETER` Procedure.

- Once the debugger's private copy of the NLS parameters is established, changes made to the NLS parameters in the current session using the `ALTER SESSION` statement will have no effect on the formatting of values as seen through JDWP. To modify the NLS parameters used for JDWP, one must use the
SET_NLS_PARAMETER Procedure. By the same token, changes made to the debugger's private copy of the NLS parameters using SET_NLS_PARAMETER Procedure will have no effect on the debugged program itself.

- Date values are always formatted for JDWP use using the NLS_TIMESTAMP_FORMAT. The default format for DATE (NLS_DATE_FORMAT) used in a session most often does not show the time information that is in fact present in the value, and for debugging purposes it seems beneficial to always display that information.
The **DBMS_DEBUG_JDWP_CUSTOM** package provides database users a means to perform custom handling of a debug connection request of a database session to a debugger using the Java Debug Wire Protocol (JDWP).

This chapter contains the following topics:

- **DBMS_DEBUG_JDWP_CUSTOM Overview**
- **DBMS_DEBUG_JDWP_CUSTOM Security Model**
- **Summary of DBMS_DEBUG_JDWP_CUSTOM Subprograms**

### 55.1 DBMS_DEBUG_JDWP_CUSTOM Overview

The **DBMS_DEBUG_JDWP_CUSTOM** package is invoked when you attempt to connect your database session to a debugger, using the Java Debug Wire Protocol (JDWP). Before connecting to the database, you must set the `ORA_DEBUG_JDWP` environment variable in your client-side OCI application. Defining this package in your schema enables you to perform custom actions before connecting your database session to the debugger.

### 55.2 DBMS_DEBUG_JDWP_CUSTOM Security Model

This default implementation of the **DBMS_DEBUG_JDWP_CUSTOM** package does not perform any additional security checks and only invokes the **DBMS_DEBUG_JDWP** package for making the debug connection. When the **DBMS_DEBUG_JDWP** package is invoked, it checks for the necessary `DEBUG CONNECT` system or user privilege before making the connection.

A database user who wants to perform additional custom security checks, must perform the following steps to override this default implementation:

- Define the **DBMS_DEBUG_JDWPCUSTOM** package in the user’s own schema.
- Implement the check before invoking the **DBMS_DEBUG_JDWP** package in the user’s local copy of the package.
55.3 Summary DBMS_DEBUG_JDWP_CUSTOM Subprograms

This table summarizes the DBMS_DEBUG_JDWP_CUSTOM subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECT_DEBUGGER</td>
<td>This procedure is invoked to handle the debug connection request of the current database session to the debugger.</td>
</tr>
</tbody>
</table>

55.3.1 CONNECT_DEBUGGER Procedure

This procedure is invoked to handle the debug connection request of the current database session to the debugger.

Syntax

```sql
PROCEDURE CONNECT_DEBUGGER
(  HOST                VARCHAR2,
  PORT                VARCHAR2,
  DEBUG_ROLE          VARCHAR2 := NULL,
  DEBUG_ROLE_PWD      VARCHAR2 := NULL,
  OPTION_FLAGS        PLS_INTEGER := 0,
  EXTENSIONS_CMD_SET  PLS_INTEGER := 128
)
```

Parameters

The preceding parameters are for the default implementation of the procedure for handling the debug connection request. A user, who wants to customize the handling of the request, must override this default implementation of the DBMS_DEBUG_JDWP_CUSTOM package procedure by defining the package (specification and body) with a procedure of the same name in the user's own schema. The user may customize the number and names of the arguments, but must have the same name for the package and the procedure, namely, DBMS_DEBUG_JDWP_CUSTOM and CONNECT_DEBUGGER respectively. The user's customized version of the package may contain overloaded versions of the CONNECT_DEBUGGER procedure with different arguments. All of the arguments to the custom package procedure must either be of VARCHAR2 type or of types that PL/SQL can implicitly convert from VARCHAR2.

For example, if a user wants to disallow debugging outside business hours, while applying optional NLS settings to the program values displayed during debugging, then the user can define a custom implementation of the package in the user's schema in the following way:

```sql
CREATE OR REPLACE PACKAGE DBMS_DEBUG_JDWP_CUSTOM AUTHID CURRENT_USER IS
  PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
                               PORT VARCHAR2,
                               NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
                               ...
  )
```

Chapter 55

Summary DBMS_DEBUG_JDWP_CUSTOM Subprograms
CREATE OR REPLACE PACKAGE BODY DBMS_DEBUG_JDWP_CUSTOM IS

PROCEDURE CONNECT_DEBUGGER(HOST VARCHAR2,
    PORT VARCHAR2,
    NLS_LANGUAGE VARCHAR2 DEFAULT NULL,
    NLS_TERRITORY VARCHAR2 DEFAULT NULL) IS
BEGIN
    SELECT EXTRACT(HOUR FROM LOCALTIMESTAMP) INTO HOUR FROM DUAL;
    IF (HOUR < 9 OR HOUR > 5) THEN
        RAISE_APPLICATION_ERROR(-20000,
            'Debug connection disallowed outside business hours');
    ELSE
        IF (NLS_LANGUAGE IS NOT NULL) THEN
            DBMS_DEBUG_JDWP.SET_NLS_PARAMETER('NLS_LANGUAGE', NLS_LANGUAGE);
        END IF;
        IF (NLS_TERRITORY IS NOT NULL) THEN
            DBMS_DEBUG_JDWP.SET_NLS_PARAMETER('NLS_TERRITORY', NLS_TERRITORY);
        END IF;
        DBMS_DEBUG_JDWP.CONNECT_TCP(HOST, PORT);
    END IF;
END;
/

Before executing the client application for passing arguments to the procedure parameters, the user must set the ORA_DEBUG_JDWP environment variable as follows:

> setenv ORA_DEBUG_JDWP "host=123.45.67.89;port=4000;nls_language=american"
> myapp -user hr/hr
...
You can use the `DBMS_DESCRIBE` package to get information about a PL/SQL object. When you specify an object name, `DBMS_DESCRIBE` returns a set of indexed tables with the results. Full name translation is performed and security checking is also checked on the final object.

This chapter contains the following topics:

- Overview
- Security Model
- Types
- Exceptions
- Examples
- Summary of `DBMS_DESCRIBE` Subprograms

### 56.1 DBMS_DESCRIBE Overview

This package provides the same functionality as the Oracle Call Interface `OCIDescribeAny` call.

**See Also:**

*Oracle Call Interface Programmer’s Guide*

### 56.2 DBMS_DESCRIBE Security Model

This package is available to `PUBLIC` and performs its own security checking based on the schema object being described.

### 56.3 DBMS_DESCRIBE Types

The `DBMS_DESCRIBE` package declares two PL/SQL table types, which are used to hold data returned by `DESCRIBE_PROCEDURE` in its `OUT` parameters.

The types are:

```Plsql
TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(30)
   INDEX BY BINARY_INTEGER;

TYPE NUMBER_TABLE IS TABLE OF NUMBER
   INDEX BY BINARY_INTEGER;
```
56.4 DBMS_DESCRIBE Exceptions

DBMS_DESCRIBE can raise application errors in the range -20000 to -20004.

Table 56-1  DBMS_DESCRIBE Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>

</tbody>
</table>

56.5 DBMS_DESCRIBE Examples

One use of the DESCRIBE_PROCEDURE procedure is as an external service interface.

For example, consider a client that provides an OBJECT_NAME of SCOTT.ACCOUNT_UPDATE, where ACCOUNT_UPDATE is an overloaded function with specification:

TABLE account (acct_no NUMBER, person_id NUMBER, balance NUMBER(7,2))
TABLE person (person_id number(4), person_nm varchar2(10))

CREATE OR REPLACE PACKAGE ACCOUNT_PKG is
FUNCTION ACCOUNT_UPDATE (acct_no NUMBER,
    person      person%rowtype,
    amounts     DBMS_DESCRIBE.NUMBER_TABLE,
    trans_date  DATE)
return       account.balance%type;

FUNCTION ACCOUNT_UPDATE (acct_no     NUMBER,
    person       person%rowtype,
    amounts      DBMS_DESCRIBE.NUMBER_TABLE,
    trans_no     NUMBER)
return       account.balance%type;
END;

This procedure might look similar to the following output:

<table>
<thead>
<tr>
<th>overload position</th>
<th>argument level</th>
<th>datatype</th>
<th>length</th>
<th>prec</th>
<th>scale</th>
<th>rad</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0</td>
<td>2</td>
<td>22</td>
<td>7</td>
<td>2</td>
<td>10</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>ACCNT_NO</td>
<td>0</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>PERSON</td>
<td>0</td>
<td>250</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>PERSON_ID</td>
<td>1</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>2</td>
<td>PERSON_NM</td>
<td>1</td>
<td>1</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3</td>
<td>AMOUNTS</td>
<td>0</td>
<td>251</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
<td>TRANS_DATE</td>
<td>0</td>
<td>12</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>0</td>
<td>TRANS_DATE</td>
<td>0</td>
<td>12</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>1</td>
<td>ACCNT_NO</td>
<td>0</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>PERSON</td>
<td>0</td>
<td>2</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>3</td>
<td>AMOUNTS</td>
<td>0</td>
<td>251</td>
<td>22</td>
<td>4</td>
</tr>
</tbody>
</table>
The following PL/SQL procedure has as its parameters all of the PL/SQL datatypes:

```sql
CREATE OR REPLACE PROCEDURE p1 (
    pvc2    IN     VARCHAR2,
    pvc     OUT    VARCHAR,
    pstr    IN OUT STRING,
    plong   IN     LONG,
    prowid  IN     ROWID,
    pchara  IN     CHARACTER,
    pchar   IN     CHAR,
    praw    IN     RAW,
    plraw   IN     LONG RAW,
    pbinint IN     BINARY_INTEGER,
    pplsint IN     PLS_INTEGER,
    pbool   IN     BOOLEAN,
    pnat    IN     NATURAL,
    ppos    IN     POSITIVE,
    pposn   IN     POSITIVEN,
    pnatn   IN     NATURALN,
    pnum    IN     NUMBER,
    pintqr  IN     INTEGER,
    pint    IN     INT,
    psmall  IN     SMALLINT,
    pdec    IN     DECIMAL,
    preal   IN     REAL,
    pfloat  IN     FLOAT,
    pnumber IN     NUMERIC,
    pdp     IN     DOUBLE PRECISION,
    pdate   IN     DATE,
    pmls    IN     MLSLABEL) AS
BEGIN
    NULL;
END;

If you describe this procedure using the following:

```sql
CREATE OR REPLACE PACKAGE describe_it AS
    PROCEDURE desc_proc (name VARCHAR2);
END describe_it;
CREATE OR REPLACE PACKAGE BODY describe_it AS
    PROCEDURE prt_value (val VARCHAR2, isize INTEGER) IS
        n INTEGER;
    BEGIN
        n := isize - LENGTHB(val);
        IF n < 0 THEN
            n := 0;
        END IF;
        DBMS_OUTPUT.PUT(val);
        FOR i in 1..n LOOP
            DBMS_OUTPUT.PUT(' ');
        END LOOP;
    END prt_value;
END describe_it;
```
PROCEDURE desc_proc (name VARCHAR2) IS

overload     DBMS_DESCRIBE.NUMBER_TABLE;
position     DBMS_DESCRIBE.NUMBER_TABLE;
c_level      DBMS_DESCRIBE.NUMBER_TABLE;
arg_name     DBMS_DESCRIBE.VARCHAR2_TABLE;

def_val      DBMS_DESCRIBE.NUMBER_TABLE;
p_mode       DBMS_DESCRIBE.NUMBER_TABLE;
length       DBMS_DESCRIBE.NUMBER_TABLE;
precision    DBMS_DESCRIBE.NUMBER_TABLE;
scale        DBMS_DESCRIBE.NUMBER_TABLE;
radix        DBMS_DESCRIBE.NUMBER_TABLE;
spare        DBMS_DESCRIBE.NUMBER_TABLE;
idx          INTEGER := 0;

BEGIN

DBMS_DESCRIBE.DESCRIBE_PROCEDURE(
    name,
    null,
    null,
    overload,
    position,
    c_level,
    arg_name,
    dty,
    def_val,
    p_mode,
    length,
    precision,
    scale,
    radix,
    spare);

DBMS_OUTPUT.PUT_LINE('Position    Name        DTY  Mode');
LOOP
    idx := idx + 1;
    prt_value(TO_CHAR(position(idx)), 12);
    prt_value(arg_name(idx), 12);
    prt_value(TO_CHAR(dty(idx)), 5);
    prt_value(TO_CHAR(p_mode(idx)), 5);
    DBMS_OUTPUT.NEW_LINE;
END LOOP;

EXCEPTION
    WHEN NO_DATA_FOUND THEN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.NEW_LINE;

END desc_proc;
END describe_it;

Then the results list all the numeric codes for the PL/SQL datatypes:

<table>
<thead>
<tr>

</tbody>
</table>
56.6 Summary of DBMS_DESCRIBE Subprograms

The DBMS_DESCRIBE package includes the DESCRIBE_PROCEDURE procedure.

Table 56-2 DBMS_DESCRIBE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCRIBE_PROCEDURE Procedure</td>
<td>Provides a brief description of a PL/SQL stored procedure</td>
</tr>
</tbody>
</table>

56.6.1 DESCRIBE_PROCEDURE Procedure

The procedure DESCRIBE_PROCEDURE provides a brief description of a PL/SQL stored procedure.

It takes the name of a stored procedure and returns information about each parameter of that procedure.

Syntax

DBMS_DESCRIBE.DESCRIPTION_PROCEDURE(
    object_name       IN  VARCHAR2,
    reserved1         IN  VARCHAR2,
    reserved2         IN  VARCHAR2,
    overload          OUT NUMBER_TABLE,
    position          OUT NUMBER_TABLE,
    level             OUT NUMBER_TABLE,
    argument_name     OUT VARCHAR2_TABLE,
    datatype          OUT NUMBER_TABLE,
    default_value     OUT NUMBER_TABLE,
    in_out            OUT NUMBER_TABLE,
    length            OUT NUMBER_TABLE,
    precision         OUT NUMBER_TABLE,
    scale             OUT NUMBER_TABLE,
    radix             OUT NUMBER_TABLE,
)
Parameters

</tr>
</tbody>
</table>
Return Values

All values from DESCRIBE_PROCEDURE are returned in its OUT parameters. The datatypes for these are PL/SQL tables, to accommodate a variable number of parameters.
The DBMS_DG package allows applications to notify the primary database or the fast-start failover target database in an Oracle Data Guard broker environment to initiate a fast-start failover when the application encounters a condition that warrants a failover.

This chapter contains the following topics:

• Using DBMS_DG
• Security Model
• Summary of the DBMS_DG Subprogram

See Also:

Oracle Data Guard Broker

57.1 Using DBMS_DG

There are conditions detectable by applications running outside of the Oracle database that may warrant the Oracle Data Guard broker to perform a fast-start failover. Because the range of possible conditions is virtually unlimited, it is left to the applications to determine which conditions warrant a fast-start failover.

When such conditions occur, the application calls the DBMS_DG.INITIATE_FS_FAILOVER procedure to alert either the primary or fast-start failover target standby database that the application wants a fast-start failover to occur immediately. The database on which the procedure was called then notifies the observer, which immediately initiates a fast-start failover as long as the standby database is in a valid fast-start failover state ("observed" and either "synchronized" or "within lag") to accept a failover. If the configuration is not in a valid fast-start failover state, the INITIATE_FS_FAILOVER subprogram returns an ORA error message (it will not signal an exception) to inform the calling application that a fast-start failover could not be performed.

Note:

If you are working in a multitenant container database (CDB), then functions within DBMS_DG are only executed at the root level. Ensure you are connected at the root level, not at the individual pluggable database (PDB) level.

57.2 DBMS_DG Security Model

The DBMS_DG package runs with invoker's rights and requires the SYSDBA privilege.
57.3 Summary of the DBMS_DG Subprogram

The **DBMS_DG** package contains one subprogram, the **INITIATE_FS_FAILOVER** procedure.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIATE_FS_FAILOVER Procedure</td>
<td>Enables an application to notify either the primary or fast-start failover target standby database that a fast-start failover is necessary when the application encounters conditions that warrant a failover. This procedure can only be called while connected to a primary database or a fast-start failover standby database.</td>
</tr>
</tbody>
</table>

### 57.3.1 INITIATE_FS_FAILOVER Procedure

Use this procedure to specify a condition string that, when encountered by an application, allows the application to request that a fast-start failover be invoked.

**Syntax**

```sql
DBMS_DG.INITIATE_FS_FAILOVER (
    condstr          IN VARCHAR2)
RETURN BINARY_INTEGER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>condstr</td>
<td>Specifies the condition string for which a fast-start failover should be requested. If no condition string argument is supplied, the default string of “Application Failover Requested” will be logged in the broker log file and in the database alert log of the database on which the procedure was called.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- This procedure returns a binary integer.
- Query the **V$FS_FAILOVER_STATS** view to see the time of the last fast-start failover and the reason it was performed.
- This procedure can only be called while connected to a primary database or a fast-start failover standby database.
Errors

Table 57-3 INITIATE_FS_FAILOVER Procedure Errors

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-00000: normal, successful completion</td>
<td>The request to initiate a fast-start failover has been posted to the observer.</td>
</tr>
<tr>
<td>ORA-16646: fast-start failover is disabled</td>
<td>Either a broker configuration does not exist or fast-start failover has not been enabled.</td>
</tr>
<tr>
<td>ORA-16666: unable to initiate fast-start failover on a bystander standby database</td>
<td>DBMS_DG.INITIATE_FS_FAILOVER was invoked on a bystander standby database. That is, it was not invoked on the primary or on the fast-start failover target standby database.</td>
</tr>
<tr>
<td>ORA-16817: unsynchronized fast-start failover configuration</td>
<td>DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum available fast-start failover configuration when the configuration was not synchronized.</td>
</tr>
<tr>
<td>ORA-16819: fast-start failover observer not started</td>
<td>DBMS_DG.INITIATE_FS_FAILOVER was invoked but an observer had not yet been started.</td>
</tr>
<tr>
<td>ORA-16820: fast-start failover observer is no longer observing this database</td>
<td>DBMS_DG.INITIATE_FS_FAILOVER was invoked but the configuration detects that the observer may not be running.</td>
</tr>
<tr>
<td>ORA-16829: lagging fast-start failover configuration</td>
<td>DBMS_DG.INITIATE_FS_FAILOVER was invoked in a maximum performance fast-start failover configuration when the configuration was not in the user-specified redo lag limit.</td>
</tr>
</tbody>
</table>

Example

In this example, the program attempts to initiate a fast-start failover when fast-start failover is disabled. To use this example, connect as user SYS with SYSDBA privileges.

```sql
set serveroutput on
declare
status integer;
begin
status := dbms_dg.initiate_fs_failover('Failover Requested');
dbms_output.put_line('Fast-Start Failover is disabled: Expected status = ORA-16646');
dbms_output.put_line('Actual Status = ORA-' || status);
end;/
exit;
```
DBMS_DIMENSION enables you to verify dimension relationships and provides an alternative to the Enterprise Manager Dimension Wizard for displaying a dimension definition.

See Also:
Oracle Database Data Warehousing Guide for detailed conceptual and usage information about the DBMS_DIMENSION package

This chapter contains the following topics:

- Security Model
- Summary of DBMS_DIMENSION Subprograms

58.1 DBMS_DIMENSION Security Model

Security on this package can be controlled by granting EXECUTE to selected users or roles.

A user can validate or describe all the dimensions in his own schema. To validate or describe a dimension in another schema, you must have either an object privilege on the dimension or one of the following system privileges: CREATE ANY DIMENSION, ALTER ANY DIMENSION, and DROP ANY DIMENSION.

58.2 Summary of DBMS_DIMENSION Subprograms

This table lists the DBMS_DIMENSION subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Table 58-1 DBMS_DIMENSION Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subprogram</td>
</tr>
<tr>
<td>-------------</td>
</tr>
<tr>
<td>DESCRIBE_DIMENSION Procedure</td>
</tr>
<tr>
<td>VALIDATE_DIMENSION Procedure</td>
</tr>
</tbody>
</table>
58.2.1 DESCRIBE_DIMENSION Procedure

This procedure displays the definition of the dimension, including dimension name, levels, hierarchies, and attributes. It displays the output using the DBMS_OUTPUT package.

Syntax

```
DBMS_DIMENSION.DESCRIBE_DIMENSION (
    dimension  IN VARCHAR2);
```

Parameters

Table 58-2  DESCRIBE_DIMENSION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>The owner and name of the dimension in the format of owner.name.</td>
</tr>
</tbody>
</table>

58.2.2 VALIDATE_DIMENSION Procedure

This procedure verifies that the relationships specified in a dimension are valid. The rowid for any row that is found to be invalid will be stored in the table DIMENSION_EXCEPTIONS in the user's schema.

Syntax

```
DBMS_DIMENSION.VALIDATE_DIMENSION (
    dimension               IN VARCHAR2,
    incremental             IN BOOLEAN := TRUE,
    check_nulls             IN BOOLEAN := FALSE,
    statement_id            IN VARCHAR2 := NULL );
```

Parameters

Table 58-3  VALIDATE_DIMENSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>The owner and name of the dimension in the format of owner.name.</td>
</tr>
<tr>
<td>incremental</td>
<td>If TRUE, check only the new rows for tables of this dimension. If FALSE, check all the rows.</td>
</tr>
<tr>
<td>check_nulls</td>
<td>If TRUE, then all level columns are verified to be non-null. If FALSE, this check is omitted. Specify FALSE when non-NULLness is guaranteed by other means, such as NOT NULL constraints.</td>
</tr>
<tr>
<td>statement_id</td>
<td>A client-supplied unique identifier to associate output rows with specific invocations of the procedure.</td>
</tr>
</tbody>
</table>
DBMS_DISTRIBUTED_TRUST_ADMIN procedures maintain the Trusted Servers List. Use these procedures to define whether a server is trusted. If a database is not trusted, Oracle refuses current user database links from the database.

This chapter contains the following topics:

- Overview
- Security Model
- Examples
- Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

### 59.1 DBMS_DISTRIBUTED_TRUST_ADMIN Overview

Oracle uses local Trusted Servers Lists, along with enterprise domain membership lists stored in the enterprise LDAP directory service, to determine if another database is trusted. The LDAP directory service entries are managed with the Enterprise Security Manager Tool in Oracle Enterprise Manager.

Oracle considers another database to be “trusted” if it meets the following criteria:

1. It is in the same enterprise domain in the directory service as the local database.
2. The enterprise domain is marked as trusted in the directory service.
3. It is not listed as untrusted in the local Trusted Servers List. Current user database links will only be accepted from another database if both databases involved trust each other.

You can list a database server locally in the Trusted Servers List regardless of what is listed in the directory service. However, if you list a database that is not in the same domain as the local database, or if that domain is untrusted, the entry will have no effect.

This functionality is part of the Enterprise User Security feature of the Oracle Advanced Security Option.

### 59.2 DBMS_DISTRIBUTED_TRUST_ADMIN Security Model

To execute DBMS_DISTRIBUTED_TRUST_ADMIN, the EXECUTE_CATALOG_ROLE role must be granted to the DBA. To select from the view TRUSTED_SERVERS, the SELECT_CATALOG_ROLE role must be granted to the DBA.

It is important to know whether all servers are trusted or not trusted. Trusting a particular server with the ALLOW_SERVER procedure does not have any effect if the database already trusts all databases, or if that database is already trusted. Similarly, denying a particular server with the DENY_SERVER procedure does not have any effect if
the database already does not trust any database or if that database is already untrusted.

The procedures `DENY_ALL` and `ALLOW_ALL` delete all entries (in other words, server names) that are explicitly allowed or denied using the `ALLOW_SERVER` procedure or `DENY_SERVER` procedure respectively.

### 59.3 DBMS_DISTRIBUTED_TRUST_ADMIN Examples

If you have not yet used the package `DBMS_DISTRIBUTED_TRUST_ADMIN` to change the trust listing, by default you trust all databases in the same enterprise domain if that domain it listed as trusted in the directory service:

```sql
SELECT * FROM TRUSTED_SERVERS;
```

```
<table>
<thead>
<tr>
<th>TRUST</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusted</td>
<td>All</td>
</tr>
</tbody>
</table>
```

Because all servers are currently trusted, you can execute the `DENY_SERVER` Procedure and specify that a particular server is not trusted:

```sql
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER ('SALES.US.AMERICAS.ACME_AUTO.COM');
```

```
**PL/SQL procedure successfully completed.**
```

```sql
SELECT * FROM TRUSTED_SERVERS;
```

```
<table>
<thead>
<tr>
<th>TRUST</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untrusted</td>
<td>SALES.US.AMERICAS.ACME_AUTO.COM</td>
</tr>
</tbody>
</table>
```

By executing the `DENY_ALL` Procedure, you can choose to not trust any database server:

```sql
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;
```

```
**PL/SQL procedure successfully completed.**
```

```sql
SELECT * FROM TRUSTED_SERVERS;
```

```
<table>
<thead>
<tr>
<th>TRUST</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Untrusted</td>
<td>All</td>
</tr>
</tbody>
</table>
```

The `ALLOW_SERVER` Procedure can be used to specify that one particular database is to be trusted:

```sql
EXECUTE DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER ('SALES.US.AMERICAS.ACME_AUTO.COM');
```

```
**PL/SQL procedure successfully completed.**
```

```sql
SELECT * FROM TRUSTED_SERVERS;
```

```
<table>
<thead>
<tr>
<th>TRUST</th>
<th>NAME</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trusted</td>
<td>SALES.US.AMERICAS.ACME_AUTO.COM</td>
</tr>
</tbody>
</table>
```
59.4 Summary of DBMS_DISTRIBUTED_TRUST_ADMIN Subprograms

This table lists and briefly describes the DBMS_DISTRIBUTED_TRUST_ADMIN subprograms.

Table 59-1  DBMS_DISTRIBUTED_TRUST_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW_ALL Procedure</td>
<td>Empties the list and inserts a row indicating that all servers should be trusted</td>
</tr>
<tr>
<td>ALLOW_SERVER</td>
<td>Enables a specific server to be allowed access even though deny all is indicated in the list</td>
</tr>
<tr>
<td>DENY_ALL Procedure</td>
<td>Empties the list and inserts a row indicating that all servers should be untrusted</td>
</tr>
<tr>
<td>DENY_SERVER</td>
<td>Enables a specific server to be denied access even though allow all is indicated in the list</td>
</tr>
</tbody>
</table>

59.4.1 ALLOW_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers that are members of a trusted domain in an enterprise directory service and that are in the same domain are allowed access.

The view TRUSTED_SERVERS will show "TRUSTED ALL" indicating that the database trusts all servers that are currently trusted by the enterprise directory service.

Syntax

DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_ALL;

Usage Notes

ALLOW_ALL only applies to servers listed as trusted in the enterprise directory service and in the same enterprise domain.

59.4.2 ALLOW_SERVER Procedure

This procedure ensures that the specified server is considered trusted (even if you have previously specified "deny all").

Syntax

DBMS_DISTRIBUTED_TRUST_ADMIN.ALLOW_SERVER (server IN VARCHAR2);
Parameters

Table 59-2  ALLOW_SERVER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Unique, fully-qualified name of the server to be trusted.</td>
</tr>
</tbody>
</table>

Usage Notes

If the Trusted Servers List contains the entry "deny all", then this procedure adds a specification indicating that a specific database (for example, DBx) is to be trusted.

If the Trusted Servers List contains the entry "allow all", and if there is no "deny DBx" entry in the list, then executing this procedure causes no change.

If the Trusted Servers List contains the entry "allow all", and if there is a "deny DBx" entry in the list, then that entry is deleted.

59.4.3 DENY_ALL Procedure

This procedure empties the Trusted Servers List and specifies that all servers are denied access.

The view TRUSTED_SERVERS will show "UNTRUSTED ALL" indicating that no servers are currently trusted.

Syntax

DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_ALL;

59.4.4 DENY_SERVER Procedure

This procedure ensures that the specified server is considered untrusted (even if you have previously specified allow all).

Syntax

DBMS_DISTRIBUTED_TRUST_ADMIN.DENY_SERVER (server IN VARCHAR2);

Parameters

Table 59-3  DENY_SERVER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>server</td>
<td>Unique, fully-qualified name of the server to be untrusted.</td>
</tr>
</tbody>
</table>

Usage Notes

If the Trusted Servers List contains the entry allow all, then this procedure adds an entry indicating that the specified database (for example, DBx) is not to be trusted.
If the Trusted Servers List contains the entry "deny all", and if there is no "allow DBx" entry in the list, then this procedure causes no change.

If the Trusted Servers List contains the entry "deny all", and if there is an "allow DBx" entry, then this procedure causes that entry to be deleted.
60

DBMS_DNFS

The DBMS_DNFS package provides an interface to assist in creating a database using files in the backup set.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_DNFS Subprograms

See Also:
Oracle Database Administrator's Guide

60.1 DBMS_DNFS Security Model

This package has to be executed by users with SYSDBA privileges.

60.2 Summary of DBMS_DNFS Subprograms

The DBMS_DNFS package includes the CLONEDB_RENAMEFILE procedure.

Table 60-1  DBMS_DNFS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLONEDB_RENAMEFILE</td>
<td>Renames datafiles that were pointing to the backup set to the actual file name in cloned database.</td>
</tr>
</tbody>
</table>

60.2.1 CLONEDB_RENAMEFILE Procedure

This procedure is used to rename datafiles that were pointing to the backup set to the actual file name in cloned database.

The srcfile is the file name that represents the data file in the backup image copy or a read-only storage snapshot. The destfile destination file path must point to a NFS volume where cloneDB datafiles will be created. When the procedure is run successfully, the control file record is updated with the new datafile name.

Syntax

```
DBMS_DNFS.CLONEDB_RENAMEFILE (  
    srcfile      IN     VARCHAR2,  
    destfile     IN     VARCHAR2);  
```
### Parameters

**Table 60-2   CLONEDB_RENAMEFILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srcfile</td>
<td>Source datafile name in the control file</td>
</tr>
<tr>
<td>destfile</td>
<td>New datafile name</td>
</tr>
</tbody>
</table>
61

DBMS_DST

The DBMS_DST package provides an interface to apply the Daylight Saving Time (DST) patch to the Timestamp with Time Zone datatype.

This chapter contains the following topics:

• Overview
• Security Model
• Views
• Summary of DBMS_DST Subprograms

See Also:
• Oracle Database Globalization Support Guide
• Oracle Database Reference

61.1 DBMS_DST Overview

The transition period during which Daylight Saving Time comes into effect, or stops being in effect, has the potential for problems, such as data loss, when handling timestamps with time zone data. The DBMS_DST package enables working with these transitions in the context of a set of rules.

61.2 DBMS_DST Security Model

The DBMS_DST package is an invoker's rights package.

See Also:
Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

The execute privilege on the package is granted to the EXECUTE_CATALOG_ROLE role. This role is normally granted to selected users to allow EXECUTE privileges for packages and procedures in the data dictionary.

The user that invokes the package must have the following privileges:

• CREATE ANY TABLE
• ALTER ANY TABLE
• DROP ANY TABLE
• SELECT ANY TABLE
• LOCK ANY TABLE
• ALTER ANY INDEX
• ALTER ANY TRIGGER
• UPDATE ANY TABLE
• EXECUTE ANY TYPE

61.3 DBMS_DST Views

The DBMS_DST package uses views to display table information.

These views are shown in the following table. They are further described in the Oracle Database Reference:

<table>
<thead>
<tr>
<th>View</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBA_TSTZ_TABLES</td>
<td>Displays information about all tables in the database, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes. Its columns are the same as those in ALL_TSTZ_TABLES.</td>
</tr>
<tr>
<td>USER_TSTZ_TABLES</td>
<td>Displays information about the tables owned by the current user, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes. Its columns (except for OWNER) are the same as those in ALL_TSTZ_TABLES.</td>
</tr>
<tr>
<td>ALL_TSTZ_TABLES</td>
<td>Displays information about the tables accessible to the current user, which have columns defined on TIMESTAMP WITH TIME ZONE datatypes or object types containing attributes of TIMESTAMP WITH TIME ZONE datatypes.</td>
</tr>
</tbody>
</table>

61.4 Summary of DBMS_DST Subprograms

This table lists and describes the DBMS_DST package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_PREPARE Procedure</td>
<td>Starts a prepare window</td>
</tr>
<tr>
<td>BEGIN_UPGRADE Procedure</td>
<td>Starts an upgrade window</td>
</tr>
<tr>
<td>CREATE_AFFECTED_TABLE</td>
<td>Creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure</td>
</tr>
<tr>
<td>CREATE_ERROR_TABLE Procedure</td>
<td>Creates a log error table</td>
</tr>
</tbody>
</table>
### Table 61-2  (Cont.) DBMS_DST Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TRIGGER_TABLE Procedure</td>
<td>Creates a table that is used to record active triggers disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process</td>
</tr>
<tr>
<td>END_PREPARE Procedure</td>
<td>Ends a prepare window</td>
</tr>
<tr>
<td>END_UPGRADE Procedure</td>
<td>Ends an upgrade window</td>
</tr>
<tr>
<td>FIND_AFFECTED_TABLES Procedure</td>
<td>Finds all the tables that have affected TSTZ data due to the new timezone version</td>
</tr>
<tr>
<td>UPGRADE_DATABASE Procedure</td>
<td>Upgrades all tables in the database that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type</td>
</tr>
<tr>
<td>UPGRADE_SCHEMA Procedure</td>
<td>Upgrades tables in a specified list of schemas that has one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type</td>
</tr>
<tr>
<td>UPGRADE_TABLE Procedure</td>
<td>Upgrades a specified list of tables that has one or more columns defined on the TSTZ type or an ADT containing the TSTZ type</td>
</tr>
</tbody>
</table>

### 61.4.1 BEGIN_PREPARE Procedure

This procedure starts a prepare window. Once a prepare window is started successfully, the database property 'DST_UPGRADE_STATE' is set to 'PREPARE', and the database property 'SECONDARY_TT_VERSION' is set to a new timezone version.

The prepare window lets a DBA investigate data affected by the upgrade, and so judge when it is optimal to perform the upgrade. The prepare window can overlap normal database operation.

**Syntax**

```sql
DBMS_DST.BEGIN_PREPARE (new_version IN BINARY_INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_version</td>
<td>New timezone version to which the database is to be prepared to upgrade</td>
</tr>
</tbody>
</table>

### 61.4.2 BEGIN_UPGRADE Procedure

This procedure starts an upgrade window.

When an upgraded window is started successfully, the TSTZ data in the dictionary tables is upgraded to reflect the new timezone version, and the database property 'DST_UPGRADE_STATE' is set to 'UPGRADE'. Once BEGIN_UPGRADE has been performed successfully, the user must re-start the database. After a successful restart, the
**database property** 'PRIMARY_TT_VERSION' is the new timezone version, and 'SECONDARY_TT_VERSION' is the old timezone version.

The procedure operates atomically, and upgrades all or none of the dictionary tables and the database properties. It must be called in the database in **OPEN MIGRATE** mode.

**Syntax**

```sql
DBMS_DST.BEGIN_UPGRADE (
    new_version                IN  BINARY_INTEGER,
    error_on_overlap_time      IN  BOOLEAN := FALSE,
    error_on_nonexisting_time  IN  BOOLEAN := FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_version</td>
<td>New timezone version to which the database is to be upgraded</td>
</tr>
<tr>
<td>error_on_overlap_time</td>
<td>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is FALSE. For more information about boundary cases, see Oracle Database SQL Language Reference.</td>
</tr>
<tr>
<td>error_on_nonexisting_time</td>
<td>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default value is FALSE.</td>
</tr>
</tbody>
</table>

### 61.4.3 CREATE_AFFECTED_TABLE Procedure

This procedure creates a table that has the schema shown in the comments for the FIND_AFFECTED_TABLES Procedure.

**Syntax**

```sql
DBMS_DST.CREATE_AFFECTED_TABLE (
    table_name      IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table created</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedures takes a `table_name` without schema qualification, creating a table within the current user schema.

**Related Topics**

- **FIND_AFFECTED_TABLES Procedure**
  This procedure finds all the tables which have affected TSTZ data due to the new timezone version.
61.4.4 CREATE_ERROR_TABLE Procedure

This procedure creates a log error table.

The table has the following schema:

```sql
CREATE TABLE dst$error_table(
    table_owner     VARCHAR2(30),
    table_name      VARCHAR2(30),
    column_name     VARCHAR2(4000),
    rid             ROWID,
    error_number    NUMBER)
```

Syntax

```sql
DBMS_DST.CREATE_ERROR_TABLE (
    table_name  IN  VARCHAR2);
```

Parameters

**Table 61-6  CREATE_ERROR_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table created</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.
- The error number is found when upgrading time zone file and timestamp with time zone data. For more information about error handling when upgrading time zone file and timestamp with time zone data, see Oracle Database Globalization Support Guide

61.4.5 CREATE_TRIGGER_TABLE Procedure

This procedure creates a table to record active triggers that are disabled before performing upgrade on the table, having not been enabled due to fatal failure during the upgrading process.

The table that has the following schema.

```sql
CREATE TABLE dst_trigger_table (
    trigger_owner  VARCHAR2(30),
    trigger_name   VARCHAR2(30));
```

Syntax

```sql
DBMS_DST.CREATE_TRIGGER_TABLE (
    table_name  IN  VARCHAR2);
```
Parameters

Table 61-7    CREATE_TRIGGER_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of table to be created</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure takes a `table_name` without schema qualification, creating a table within the current user schema.

61.4.6 END_PREPARE Procedure

This procedure ends a prepare window.

Syntax

```
DBMS_DST.BEGIN_Prepare;
```

61.4.7 END_UPGRADE Procedure

This procedure ends an upgrade window. An upgraded window is ended if all the affected user tables have been upgraded. Otherwise, the `OUT` parameter `num_of_failures` indicates how many tables have not been converted.

Syntax

```
DBMS_DST.END_UPGRADE (    
    num_of_failures OUT  BINARY_INTEGER);
```

Parameters

Table 61-8    END_UPGRADE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_of_failures</td>
<td>Number of tables that fail to complete</td>
</tr>
</tbody>
</table>

61.4.8 FIND_AFFECTED_TABLES Procedure

This procedure finds all the tables which have affected TSTZ data due to the new timezone version.

This procedure can only be invoked during a prepare window. The tables which have affected TSTZ data are recorded into a table indicated by parameter `affected_tables`. If semantic errors must be logged, they are recorded into a table indicated by parameter `log_errors_table`.

Syntax

```
DBMS_DST.FIND_AFFECTED_TABLES (    
    affected_tables IN   VARCHAR2 := 'sys.dst$affected_tables',
);```
log_errors                  IN  BOOLEAN := FALSE,
log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table',
parallel                    IN  BOOLEAN := FALSE);

Parameters

Table 61-9  FIND_AFFECTED_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>affected_tables</td>
<td>Name of table with the following schema:</td>
</tr>
<tr>
<td></td>
<td>CREATE TABLE dst$affected_tables (</td>
</tr>
<tr>
<td></td>
<td>table_owner VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>table_name VARCHAR2(30),</td>
</tr>
<tr>
<td></td>
<td>column_name VARCHAR2(4000),</td>
</tr>
<tr>
<td></td>
<td>row_count NUMBER,</td>
</tr>
<tr>
<td></td>
<td>error_count NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The table can be created with the CREATE_AFFECTED_TABLE Procedure.</td>

<tr>
<td></td>
<td>rid ROWID,</td>
</tr>
<tr>
<td></td>
<td>error_number NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending</td>
</tr>
<tr>
<td></td>
<td>rows, and the error_number column records the corresponding</td>
</tr>
<tr>
<td></td>
<td>error number.</td>
</tr>
<tr>
<td>parallel</td>
<td>Boolean flag indicating whether to find the affected tables using</td>
</tr>
<tr>
<td></td>
<td>parallel queries or serial queries. The default is FALSE.</td>
</tr>
</tbody>
</table>

61.4.9 UPGRADE_DATABASE Procedure

This procedure upgrades all tables in the database, which have one or more columns defined on the TSTZ type or an ADT containing the TSTZ type.

This procedure can only be invoked after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that, a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

DBMS_DST.UPGRADE_DATABASE  (  
num_of_failures             OUT BINARY_INTEGER,  
upgrade_data                IN  BOOLEAN := TRUE,  
parallel                    IN  BOOLEAN := FALSE,  
continue_after_errors       IN  BOOLEAN := TRUE,
log_errors                  IN  BOOLEAN := FALSE,
log_errors_table            IN  VARCHAR2 =: 'sys.dst$error_table' ,
error_on_overlap_time       IN  BOOLEAN := FALSE,
error_on_nonexisting_time   IN  BOOLEAN := FALSE,
log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');

Parameters

Table 61-10  UPGRADE_DATABASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_of_failures</td>
<td>Number of tables that fail to complete</td>
</tr>
<tr>
<td>upgrade_data</td>
<td>Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or to leave it unconverted (FALSE). The default is TRUE.</td>
</tr>
<tr>
<td>parallel</td>
<td>Boolean flag indicating whether to convert tables using PDML (Parallel DML) or Serial DML. The default is FALSE.</td>
</tr>
<tr>
<td>continue_after_errors</td>
<td>Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.</td>
</tr>
<tr>
<td>log_errors</td>
<td>Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, errors are logged to the log_errors_table. The default is FALSE.</td>
</tr>
<tr>
<td>log_errors_table</td>
<td>Table name with the following schema:</td>
</tr>
<tr>
<td></td>
<td>CREATE TABLE dst$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The table can be created with the CREATE_ERROR_TABLE Procedure. The rid column records the rowids of the offending rows, and the error_number column records the corresponding error number.</td>
</tr>
<tr>
<td>error_on_overlap_time</td>
<td>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.</td>
</tr>
<tr>
<td>error_on_nonexisting_time</td>
<td>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.</td>
</tr>
<tr>
<td>log_triggers_table</td>
<td>Table to log triggers which are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade</td>
</tr>
</tbody>
</table>
61.4.10 UPGRADE_SCHEMA Procedure

This procedure upgrades tables in a specified list of schemas that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

This procedure can be invoked only after an upgrade window has been started. Each table is upgraded in an atomic transaction. Note that a base table and its materialized view log table are upgraded in an atomic transaction.

Syntax

```
DBMS_DST.UPGRADE_SCHEMA (
    num_of_failures             OUT BINARY_INTEGER,
    schema_list                 IN  VARCHAR2,
    upgrade_data                IN  BOOLEAN := TRUE,
    parallel                    IN  BOOLEAN := FALSE,
    continue_after_errors       IN  BOOLEAN := TRUE,
    log_errors                  IN  BOOLEAN := FALSE,
    log_errors_table            IN  VARCHAR2 := 'sys.dst$error_table',
    error_on_overlap_time       IN  BOOLEAN := FALSE,
    error_on_nonexisting_time   IN  BOOLEAN := FALSE,
    log_triggers_table          IN  VARCHAR2 := 'sys.dst$trigger_table');
```

Parameters

<td>Table to log triggers that are disabled before upgrade, having not been</td>
</tr>
<tr>
<td></td>
<td>enabled due to a fatal failure when performing an upgrade.</td>
</tr>
</tbody>
</table>

61.4.11 UPGRADE_TABLE Procedure

This procedure upgrades a specified list of tables that have one or more columns defined on the TSTZ type, or an ADT containing the TSTZ type.

Syntax

```sql
DBMS_DST.UPGRADE_TABLE ( |
   num_of_failures OUT BINARY_INTEGER, |
   table_list IN VARCHAR2, |
   upgrade_data IN BOOLEAN := TRUE, |
   parallel IN BOOLEAN := FALSE, |
   continue_after_errors IN BOOLEAN := TRUE, |
   log_errors IN BOOLEAN := FALSE, |
   log_errors_table IN VARCHAR2 := 'sys.$error_table', |
   error_on_overlap_time IN BOOLEAN := FALSE, |
   error_on_nonexisting_time IN BOOLEAN := FALSE, |
   log_triggers_table IN VARCHAR2 := 'sys.$trigger_table', |
   atomic_upgrade IN BOOLEAN := FALSE);
```

Parameters

Table 61-12  UPGRADE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_of_failures</td>
<td>Number of tables that fail to complete</td>
</tr>
<tr>
<td>table_list</td>
<td>Table name list (comma separated strings)</td>
</tr>
</tbody>
</table>
### Table 61-12  (Cont.) UPGRADE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upgrade_data</td>
<td>Boolean flag indicating whether to convert TSTZ data using the new Time Zone patch File (TRUE), or leave unconverted (FALSE). The default is TRUE.</td>
</tr>
<tr>
<td>parallel</td>
<td>Boolean flag indicating whether to convert tables using PDML (Parallel DML), or Serial DML. The default is FALSE.</td>
</tr>
<tr>
<td>continue_after_errors</td>
<td>Boolean flag indicating whether to continue after upgrade fails on the current table. The default is TRUE.</td>
</tr>
<tr>
<td>log_errors</td>
<td>Boolean flag indicating whether to log errors during upgrade. If FALSE, no error is logged into the log_errors_table after aborting conversion of the current table. If TRUE, the error is logged to the log_errors_table. The default is FALSE.</td>
</tr>
<tr>
<td>log_errors_table</td>
<td>Table name with the following schema:</td>
</tr>
<tr>
<td></td>
<td>CREATE TABLE dst$error_table (table_owner VARCHAR2(30), table_name VARCHAR2(30), column_name VARCHAR2(4000), rid ROWID, error_number NUMBER)</td>
</tr>
<tr>
<td></td>
<td>The table can be created with the CREATE_ERROR_TABLE Procedure. The rid parameter records the rowids of the offending rows and the corresponding error number.</td>
</tr>
<tr>
<td>error_on_overlap_time</td>
<td>Boolean flag indicating whether to report errors on the 'overlap' time semantic conversion error. The default is TRUE.</td>
</tr>
<tr>
<td>error_on_nonexisting_time</td>
<td>Boolean flag indicating whether to report errors on the 'non-existing' time semantic conversion error. The default is TRUE.</td>
</tr>
<tr>
<td>log_triggers_table</td>
<td>Table to log triggers that are disabled before upgrade, having not been enabled due to a fatal failure when performing an upgrade.</td>
</tr>
<tr>
<td>atomic_upgrade</td>
<td>Boolean flag indicating whether to convert the listed tables atomically (in a single transaction). If FALSE, each table is converted in its own transaction. The default is FALSE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure can only be invoked after an upgrade window has been started. The table list has to satisfy the following partial ordering:

1. If a base table has a materialized view log table, the log table must be the next item in the list.
2. If the container table for a materialized view appears in the list, the materialized view's 'non-upgraded' base tables and log tables must appear in the table list and before the container table.

A base table and its materialized view log table need to be upgraded in an atomic transaction by specifying `atomic_upgrade` to `TRUE`. 
62

DBMS_EDITIONS_UTILITIES

The DBMS_EDITIONS_UTILITIES package provides helper functions for edition-related operations.

The chapter contains the following topics:

• Overview
• Security Model
• Exceptions
• Summary of DBMS_EDITIONS_UTILITIES Subprograms

62.1 DBMS_EDITIONS_UTILITIES Overview

The DBMS_EDITIONS_UTILITIES package implements an interface which provides helper functions for edition-related operations.

62.2 DBMS_EDITIONS_UTILITIES Security Model

This package is owned by SYS with execute access granted to PUBLIC. It runs with invoker’s rights, that is, with the security profile of the caller.

62.3 DBMS_EDITIONS_UTILITIES Exceptions

The table in this topic lists exception messages created by DBMS_EDITIONS_UTILITIES.

Table 62-1  DBMS_EDITIONS_UTILITIES Error Messages

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-38817</td>
<td>Insufficient privileges</td>
</tr>
<tr>
<td>ORA-942</td>
<td>Missing table</td>
</tr>
</tbody>
</table>

62.4 Summary of DBMS_EDITIONS_UTILITIES Subprograms

This table lists and describes the DBMS_EDITIONS_UTILITIES package subprograms.
<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAN_UNUSABLE_EDITIONS Procedure</td>
<td>Drops covered objects in unusable editions, and drops empty unusable editions if possible.</td>
</tr>
<tr>
<td>SET_EDITIONING_VIEWS_READ_ONLY Procedure</td>
<td>Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE.</td>
</tr>
<tr>
<td>SET_NULL_COLUMN_VALUES_TO_EXPR Procedure</td>
<td>For use only during an edition-based redefinition (EBR) exercise.</td>
</tr>
</tbody>
</table>

### 62.4.1 CLEAN_UNUSABLE_EDITIONS Procedure

Drops all covered objects in any unusable editions and drops empty unusable editions.

The `CLEAN_UNUSABLE_EDITIONS` procedure executes immediately and in its entirety.

**Syntax**

```
DBMS_EDITIONS_UTILITIES.CLEAN_UNUSABLE_EDITIONS ( );
```

**Usage Notes**

The `COMPATIBLE` parameter must be set to 12.2.0 or higher for this procedure to execute.

**See Also:**

- *Oracle Database SQL Language Reference* for information about `DROP EDITION`
- *Oracle Database Development Guide* for more information about using edition-based redefinition

### 62.4.2 SET_EDITIONING_VIEWS_READ_ONLY Procedure

Given the schema name and table name, this procedure sets the corresponding editioning views in all editions to READ ONLY or READ/WRITE.

**Syntax**

```
DBMS_EDITIONS_UTILITIES.SET_EDITIONING_VIEWS_READ_ONLY ( table_name IN VARCHAR2,
owner      IN VARCHAR2 DEFAULT NULL,
read_only  IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 62-3  SET_EDITIONING_VIEWS_READ_ONLY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Base table of the editioning views</td>
</tr>
<tr>
<td>owner</td>
<td>Base table schema. The default (or NULL) is the current schema.</td>
</tr>
<tr>
<td>read_only</td>
<td>TRUE to set the views to read-only; FALSE (or NULL) sets the views to READ/WRITE. Default is TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

The user must have the following privileges:

- Owner of the table, or have the ALTER ANY TABLE system privileges
- USE object privilege on all the editions for which the views are defined

62.4.3 SET_NULL_COLUMN_VALUES_TO_EXPR Procedure

This procedure replaces NULL values in a replacement column with the value of an expression.

The expression evaluation cost is deferred to future updates and queries. The procedure is intended for use only during an edition-based redefinition (EBR) exercise.

See Also:

- Oracle Database Development Guide regarding transforming pre- to post-upgrade representation

Syntax

```sql
DBMS_EDITIONS_UTILITIES.SET_NULL_COLUMN_VALUES_TO_EXPR;
  table_name    IN  VARCHAR2,
  column_name   IN  VARCHAR2,
  expression    IN  VARCHAR2);
```

Parameters

Table 62-4  SET_NULL_COLUMN_VALUES_TO_EXPR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>A potentially schema-qualified table name</td>
</tr>
<tr>
<td>column_name</td>
<td>Name of the column to be updated</td>
</tr>
<tr>
<td>expression</td>
<td>An expression composed of columns in the same table, constants, and SQL functions</td>
</tr>
</tbody>
</table>
63 DBMS_EPG

The DBMS_EPG package implements the embedded PL/SQL gateway that enables a Web browser to invoke a PL/SQL stored procedure through an HTTP listener.

This chapter contains the following topics:

- Overview
- Security Model
- Exceptions
- Data Structures
  - VARCHAR2_TABLE Table Type
- Subprogram Groups
- Summary of DBMS_EPG Subprograms

63.1 DBMS_EPG Overview

The DBMS_EPG package is a platform on which PL/SQL users develop and deploy PL/SQL Web applications. The embedded PL/SQL gateway is an embedded version of the gateway that runs in the XML database HTTP server in the Oracle database. It provides the core features of mod_plsql in the database but does not require the Oracle HTTP server powered by Apache.

In order to make a PL/SQL application accessible from a browser by way of HTTP, a Database Access Descriptor (DAD) must be created and mapped to a virtual path. A DAD is a set of configuration values used for database access and the virtual path mapping makes the application accessible under a virtual path of the XML DB HTTP Server. A DAD is represented as a servlet in XML DB HTTP Server.

63.2 DBMS_EPG Security Model

The XDBADMIN role is required to invoke the configuration interface. It may invoked by the database user "XDB".

The authorization interface can be invoked by any user.

63.3 DBMS_EPG Exceptions

The table in this topic lists the exceptions raised by the DBMS_EPG package.
Table 63-1  DBMS_EPG Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DAD_NOT_FOUND</td>
<td>20000</td>
<td>Database Access Descriptor (DAD) %s not found. Ensure that the name of the DAD is correct and that it exists.</td>
</tr>
</tbody>
</table>

63.4 DBMS_EPG Data Structures

The DBMS_EPG package defines a TABLE type.

VARCHAR2_TABLE Table Type

This type is used by the procedures GET_ALL_GLOBAL_ATTRIBUTES, GET_ALL_DAD_ATTRIBUTES, GET_ALL_DAD_MAPPINGS, and GET_DAD_LIST to return lists of attribute names, attribute values, virtual paths, and database access descriptors (DAD).

TYPE VARCHAR2_TABLE IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;

63.5 DBMS_EPG Subprogram Groups

The DBMS_EPG consists of two interfaces: configuration subprograms and authorization subprograms.

- Configuration Subprograms
- Authorization Subprograms

63.5.1 DBMS_EPG Configuration Subprograms

The Configuration subprogram group contain the subprogram interfaces to examine and modify the global and database access descriptor (DAD) specific settings of the embedded PL/SQL gateway.

Table 63-2  Configuration Subprogram Group

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_DAD Procedure</td>
<td>Creates a new DAD</td>
</tr>
<tr>
<td>DELETE_DAD_ATTRIBUTE Procedure</td>
<td>Deletes a DAD attribute</td>
</tr>
<tr>
<td>DELETE_GLOBAL_ATTRIBUTE Procedure</td>
<td>Deletes a global attribute</td>
</tr>
<tr>
<td>DROP_DAD Procedure</td>
<td>Drops a DAD</td>
</tr>
<tr>
<td>GET_ALL_DAD_ATTRIBUTES Procedure</td>
<td>Retrieves all the attributes of a DAD.</td>
</tr>
<tr>
<td>GET_ALL_DAD_MAPPINGS Procedure</td>
<td>Retrieves all virtual paths to which the specified DAD is mapped.</td>
</tr>
<tr>
<td>GET_ALL_GLOBAL_ATTRIBUTES Procedure</td>
<td>Retrieves all global attributes and values</td>
</tr>
<tr>
<td>GET_DAD_ATTRIBUTE Function</td>
<td>Retrieves the value of a DAD attribute</td>
</tr>
</tbody>
</table>
Table 63-2  (Cont.) Configuration Subprogram Group

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_DAD_LIST Procedure</td>
<td>Retrieves a list of all DADs for an Embedded Gateway instance.</td>
</tr>
<tr>
<td>GET_GLOBAL_ATTRIBUTE Function</td>
<td>Retrieves the value of a global attribute</td>
</tr>
<tr>
<td>MAP_DAD Procedure</td>
<td>Maps a DAD to the specified virtual path.</td>
</tr>
<tr>
<td>SET_DAD_ATTRIBUTE Procedure</td>
<td>Sets the value for a DAD</td>
</tr>
<tr>
<td>SET_GLOBAL_ATTRIBUTE Procedure</td>
<td>Sets the value of a DAD</td>
</tr>
<tr>
<td>UNMAP_DAD Procedure</td>
<td>Unmaps a DAD from the specified virtual path</td>
</tr>
</tbody>
</table>

63.5.2 DBMS_EPG Authorization Subprograms

The Authorization subprogram group contains the subprogram interfaces to authorize and deauthorize the use of a database user's privileges by the embedded PL/SQL gateway through a specific database access descriptor (DAD)

Table 63-3  Authorization Subprogram Group

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHORIZE_DAD Procedure</td>
<td>Authorizes a DAD to invoke procedures and access document tables with a database user's privileges</td>
</tr>
<tr>
<td>DEAUTHORIZE_DAD Procedure</td>
<td>Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges</td>
</tr>
</tbody>
</table>

63.6 Summary of DBMS_EPG Subprograms

This table lists the DBMS_ALERT subprograms and briefly describes them.

Table 63-4  DBMS_EPG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTHORIZE_DAD Procedure</td>
<td>authorizes a DAD to invoke procedures and access document tables with a database user's privileges</td>
</tr>
<tr>
<td>CREATE_DAD Procedure</td>
<td>Creates a new DAD</td>
</tr>
<tr>
<td>DEAUTHORIZE_DAD Procedure</td>
<td>Deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user's privileges</td>
</tr>
<tr>
<td>DELETE_DAD_ATTRIBUTE Procedure</td>
<td>Deletes a DAD attribute</td>
</tr>
<tr>
<td>DELETE_GLOBAL_ATTRIBUTE Procedure</td>
<td>Deletes a global attribute</td>
</tr>
<tr>
<td>DROP_DAD Procedure</td>
<td>Drops a DAD</td>
</tr>
<tr>
<td>GET_ALL_DAD_ATTRIBUTES Procedure</td>
<td>Retrieves all the attributes of a DAD.</td>
</tr>
</tbody>
</table>
Table 63-4  (Cont.) DBMS_EPG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_ALL_DAD_MAPPINGS Procedure</td>
<td>Retrieves all virtual paths to which the specified DAD is mapped.</td>
</tr>
<tr>
<td>GET_ALL_GLOBAL_ATTRIBUTES Procedure</td>
<td>Retrieves all global attributes and values</td>
</tr>
<tr>
<td>GET_DAD_ATTRIBUTE Function</td>
<td>Retrieves the value of a DAD attribute</td>
</tr>
<tr>
<td>GET_DAD_LIST Procedure</td>
<td>Retrieves a list of all DADs for an Embedded Gateway instance.</td>
</tr>
<tr>
<td>GET_GLOBAL_ATTRIBUTE Function</td>
<td>Retrieves the value of a global attribute</td>
</tr>
<tr>
<td>MAP_DAD Procedure</td>
<td>Maps a DAD to the specified virtual path</td>
</tr>
<tr>
<td>SET_DAD_ATTRIBUTE Procedure</td>
<td>Sets the value for a DAD</td>
</tr>
<tr>
<td>SET_GLOBAL_ATTRIBUTE Procedure</td>
<td>Sets the value of a global attribute</td>
</tr>
<tr>
<td>UNMAP_DAD Procedure</td>
<td>Unmaps a DAD from the specified virtual path</td>
</tr>
</tbody>
</table>

63.6.1 AUTHORIZE_DAD Procedure

This procedure authorizes a DAD to invoke procedures and access document tables with a database user's privileges. The invoker can always authorize the use of her/his own privileges.

See Also:

Authorization Subprograms for other subprograms in this group

Syntax

DBMS_EPG.AU ThORIZE_DAD (  
dad_name  IN  VARCHAR2,  
path     IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 63-5   AUTHORIZE_DAD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD to create</td>
</tr>
<tr>
<td>user</td>
<td>The user whose privileges to deauthorize. If use, the invoker is assumed.</td>
</tr>
</tbody>
</table>

Usage Notes

- To authorize the use of another user's privileges, the invoker must have the ALTER USER system privilege.
• The DAD must exist but its “database-username” DAD attribute does not have to be set to user to authorize.
• Multiple users can authorize the same DAD and it is up to the DAD’s “database-username” setting to decide which user’s privileges to use.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

DBMS_EPG.AUTHORIZE_DAD('HR');

63.6.2 CREATE_DAD Procedure

This procedure creates a new DAD.

| See Also: |
| Configuration Subprograms for other subprograms in this group |

Syntax

DBMS_EPG.CREATE_DAD (  
dad_name  IN  VARCHAR2,  
path      IN  VARCHAR2 DEFAULT NULL);  

Parameters

<p>| Table 63-6 CREATE_DAD Procedure Parameters |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD to create</td>
</tr>
<tr>
<td>path</td>
<td>The virtual path to which to map the DAD</td>
</tr>
</tbody>
</table>

63.6.3 DEAUTHORIZE_DAD Procedure

This procedure deauthorizes a DAD with regard to invoking procedures and accessing document tables with a database user’s privileges. The invoker can always deauthorize the use of his own privileges.

| See Also: |
| Authorization Subprograms for other subprograms in this group |
Syntax

DBMS_EPG.DEAUTHORIZE_DAD {
    dad_name  IN  VARCHAR2,
    path      IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 63-7  DEAUTHORIZE_DAD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD for which to deauthorize use</td>
</tr>
<tr>
<td>user</td>
<td>The user whose privileges to deauthorize. If use, the invoker is assumed.</td>
</tr>
</tbody>
</table>

Usage Notes

To deauthorize the use of another user’s privileges, the invoker must have the ALTER USER system privilege.

Exceptions

Raises an error if the DAD or user does not exist, or the invoker does not have the needed system privilege.

Examples

DBMS_EPG.DEAUTHORIZE_DAD('HR');

63.6.4 DELETE_DAD_ATTRIBUTE Procedure

This procedure deletes a DAD attribute.

See Also:

Configuration Subprograms for other subprograms in this group

Syntax

DBMS_EPG.DELETE_DAD_ATTRIBUTE {
    dad_name    IN  VARCHAR2,
    attr_name   IN  VARCHAR2;

Parameters

Table 63-8  DELETE_DAD_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD for which to delete a DAD attribute</td>
</tr>
<tr>
<td>attr_name</td>
<td>The name of the DAD attribute to delete</td>
</tr>
</tbody>
</table>
Exceptions
Raises an error if DAD does not exist

63.6.5 DELETE_GLOBAL_ATTRIBUTE Procedure
This procedure deletes a global attribute.

See Also:
Configuration Subprograms for other subprograms in this group

Syntax

```sql
DBMS_EPG.DELETE_GLOBAL_ATTRIBUTE (
    attr_name     IN  VARCHAR2);
```

Parameters

Table 63-9  DELETE_GLOBAL_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_name</td>
<td>The global attribute to delete</td>
</tr>
</tbody>
</table>

63.6.6 DROP_DAD Procedure
This procedure drops a DAD. All the virtual-path mappings of the DAD will be dropped also.

See Also:
Configuration Subprograms for other subprograms in this group

Syntax

```sql
DBMS_EPG.DROP_DAD (  
    dadname  IN  VARCHAR2);
```

Parameters

Table 63-10  DROP_DAD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The DAD to drop</td>
</tr>
</tbody>
</table>
Exceptions

 Raises an error if the DAD does not exist.

63.6.7 GET_ALL_DAD_ATTRIBUTES Procedure

This procedure retrieves all the attributes of a DAD. The outputs are 2 correlated index-by tables of the name/value pairs.

See Also:
Configuration Subprograms for other subprograms in this group

Syntax

```sql
DBMS_EPG.GET_ALL_DAD_ATTRIBUTES (
    dad_name      IN          VARCHAR2,
    attr_names    OUT NOCOPY  VARCHAR2_TABLE,
    attr_values   OUT NOCOPY  VARCHAR2_TABLE);
```

Parameters

Table 63-11  GET_ALL_DAD_ATTRIBUTES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD</td>
</tr>
<tr>
<td>attr_names</td>
<td>The attribute names</td>
</tr>
<tr>
<td>attr_values</td>
<td>The attribute values</td>
</tr>
</tbody>
</table>

Exceptions

 Raises an error if DAD does not exist.

Usage Notes

If the DAD has no attributes set, then `attr_names` and `attr_values` will be set to empty arrays.

63.6.8 GET_ALL_DAD_MAPPINGS Procedure

This procedure retrieves all the virtual paths to which the specified DAD is mapped.

See Also:
Configuration Subprograms for other subprograms in this group
### Syntax

DBMS_EPG.GET_ALL_DAD_MAPPINGS (  
dad_name  IN  VARCHAR2,  
paths  OUT NOCOPY  VARCHAR2_TABLE);

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD</td>
</tr>
<tr>
<td>paths</td>
<td>The virtual paths to which the DAD is mapped</td>
</tr>
</tbody>
</table>

### Exceptions

Raises an error if DAD does not exist.

### Usage Notes

If the DAD is not mapped to any virtual path, paths will be set to empty arrays.

#### 63.6.9 GET_ALL_GLOBAL_ATTRIBUTES Procedure

This procedure retrieves all global attributes and values. The outputs are 2 correlated index-by tables of the name/value pairs.

### Syntax

DBMS_EPG.GET_ALL_GLOBAL_ATTRIBUTES (  
attr_names     OUT   NOCOPY  VARCHAR2_TABLE,  
attr_values    OUT   NOCOPY  VARCHAR2_TABLE);

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_names</td>
<td>The global attribute names</td>
</tr>
<tr>
<td>attr_values</td>
<td>The values of the global attributes</td>
</tr>
</tbody>
</table>

### Usage Notes

If the gateway instance has no global attributes set, then attr_names and attr_values will be set to empty arrays.
63.6.10 GET_DAD_ATTRIBUTE Function

This procedure retrieves the value of a DAD attribute.

```sql
DBMS_EPG.GET_DAD_ATTRIBUTE (
    dad_name    IN  VARCHAR2,
    attr_name   IN  VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 63-14  GET_DAD_ATTRIBUTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD for which to delete an attribute</td>
</tr>
<tr>
<td>attr_name</td>
<td>The name of the attribute to delete</td>
</tr>
</tbody>
</table>

Return values

Returns the DAD attribute value. Returns NULL if attribute is unknown or has not been set.

Exceptions

Raises an error if DAD does not exist.

63.6.11 GET_DAD_LIST Procedure

This procedure retrieves a list of all DADs for an Embedded Gateway instance.

```sql
DBMS_EPG.GET_DAD_LIST (
    dad_names   OUT NOCOPY VARCHAR2_TABLE);
```
**Parameters**

**Table 63-15  GET_DAD_LIST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_names</td>
<td>The list of all DADs</td>
</tr>
</tbody>
</table>

**Usage Notes**

If no DADs exist then `dad_names` will be set to an empty array.

### 63.6.12 GET_GLOBAL_ATTRIBUTE Function

This function retrieves the value of a global attribute.

**See Also:**
Configuration Subprograms for other subprograms in this group

**Syntax**

```sql
DBMS_EPG.GET_GLOBAL_ATTRIBUTE (   attr_name  IN  VARCHAR2)   RETURN VARCHAR2;
```

**Parameters**

**Table 63-16  GET_GLOBAL_ATTRIBUTE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_name</td>
<td>The global attribute to retrieve</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the global attribute value. Returns `NULL` if attribute has not been set or is not a valid attribute.

### 63.6.13 MAP_DAD Procedure

This procedure maps a DAD to the specified virtual path. If the virtual path exists already, the old virtual-path mapping will be overridden.

**See Also:**
Configuration Subprograms for other subprograms in this group
Syntax

DBMS_EPG.MAP_DAD (  
    dad_name  IN  VARCHAR2,  
    path      IN  VARCHAR2);

Parameters

Table 63-17  MAP_DAD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD to map</td>
</tr>
<tr>
<td>path</td>
<td>The virtual path to map</td>
</tr>
</tbody>
</table>

Exceptions

Raises and error if the DAD does not exist.

63.6.14 SET_DAD_ATTRIBUTE Procedure

This procedure sets the value for a DAD.

See Also:

Configuration Subprograms for other subprograms in this group

Syntax

DBMS_EPG.SET_DAD_ATTRIBUTE (  
    dad_name    IN  VARCHAR2,  
    attr_name   IN  VARCHAR2,  
    attr_value  IN  VARCHAR2);

Parameters

Table 63-18  SET_DAD_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD for which to set the attribute</td>
</tr>
<tr>
<td>attr_name</td>
<td>The name of the attribute to set</td>
</tr>
<tr>
<td>attr_value</td>
<td>The attribute value to set</td>
</tr>
</tbody>
</table>
### Table 63-19  Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

<td>No</td>
<td>String</td>
</tr>
<tr>
<td>PlsqlSessionCookieName</td>
<td>session-cookie-name</td>
<td>No</td>
<td>String</td>
</tr>
</tbody>
</table>
Table 63-19  (Cont.) Mapping Between mod_plsql and Embedded PL/SQL Gateway DAD Attributes

<table>
<thead>
<tr>
<th>mod_plsql DAD Attribute</th>
<th>Embedded PL/SQL Gateway DAD Attribute</th>
<th>Allows Multiple Occurrences</th>
<th>Legal Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlsqlSessionStateManagement</td>
<td>session-state-management</td>
<td>No</td>
<td>Enumeration of StatelessWithResetPackageState, StatelessWithFastResetPackageState, StatelessWithPreservePackageState</td>
</tr>
<tr>
<td>PlsqlTransferMode</td>
<td>transfer-mode</td>
<td>No</td>
<td>Enumeration of Char, Raw</td>
</tr>
<tr>
<td>PlsqlUploadAsLongRaw</td>
<td>upload-as-long-raw</td>
<td>No</td>
<td>String</td>
</tr>
</tbody>
</table>

Exceptions

Raises an error if DAD does not exist or the attribute is unknown.

Usage Notes

- If attr_name attribute has been set before, then the old value will be overwritten with the new attr_value argument.
- The embedded gateway assumes default values when the attributes are not set. The default values of the DAD attributes should be sufficient for most users of the embedded gateway. mod_plsql users should note the following
  - The PlsqlDatabasePassword attribute is not needed.
  - The PlsqlDatabaseConnectString attribute is not needed because the embedded gateway does not support logon to external databases.

Examples

```sql
DBMS_EPG.SET_DAD_ATTRIBUTE('HR', 'default-page', 'HRApp.home');
```

63.6.15 SET_GLOBAL_ATTRIBUTE Procedure

This procedure sets the value of a global attribute.

See Also:

Configuration Subprograms for other subprograms in this group
Syntax

```
DBMS_EPG.SET_GLOBAL_ATTRIBUTE (  
    attr_name    IN VARCHAR2,  
    attr_value   IN VARCHAR2);
```

Parameters

Table 63-20  SET_GLOBAL_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attr_name</td>
<td>The global attribute to set</td>
</tr>
<tr>
<td>attr_value</td>
<td>The attribute value to set</td>
</tr>
</tbody>
</table>

Table 63-21  Mapping Between mod_plsql and Embedded PL/SQL Gateway Global Attributes

<table>
<thead>
<tr>
<th>mod_plsql Global Attribute</th>
<th>Embedded PL/SQL Gateway Global Attribute</th>
<th>Allows Multiple Occurrences</th>
<th>Legal Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>PlsqlLogLevel</td>
<td>log-level</td>
<td>No</td>
<td>Unsigned integer</td>
</tr>
<tr>
<td>PlsqlMaxParameters</td>
<td>max-parameters</td>
<td>No</td>
<td>Unsigned integer</td>
</tr>
</tbody>
</table>

Usage Notes

- The attribute name is case sensitive. The value may or may not be case-sensitive depending on the attribute.
- If `attr_name` attribute has been set before, then the old value will be overwritten with the new `attr_value` argument.

Exceptions

Raises an error if the attribute is unknown.

Examples

```
dbms_epg.set_global_attribute('max-parameters', '100');
```

63.6.16 UNMAP_DAD Procedure

This procedure unmaps a DAD from the specified virtual path. If path is `NULL`, the procedure removes all virtual-path mappings for the DAD but keeps the DAD.

See Also:

- Configuration Subprograms for other subprograms in this group
Syntax

```
DBMS_EPG.UNMAP_DAD (
    dad_name IN VARCHAR2,
    path IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 63-22  UNMAP_DAD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dad_name</td>
<td>The name of the DAD to unmap</td>
</tr>
<tr>
<td>path</td>
<td>The virtual path to unmap</td>
</tr>
</tbody>
</table>

Usage Notes

Raises and error if the DAD does not exist.
The **DBMS_ERRLOG** package provides a procedure that enables you to create an error logging table so that DML operations can continue after encountering errors rather than abort and roll back. This enables you to save time and system resources.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_ERRLOG Subprograms

### See Also:

For more information regarding how to use **DBMS_ERRLOG** and its subprograms, see the [Oracle Database SQL Language Reference](https://docs.oracle.com/en/database/oracle/oracle-database/19/sqlrf/) for the `error_logging_clause` syntax.

## 64.1 DBMS_DIMENSION Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles. The `EXECUTE` privilege is granted publicly. However, to create an error logging table, you need `SELECT` access on the base table or view, the `CREATE TABLE` privilege, as well as tablespace quota for the target tablespace.

## 64.2 Summary of DBMS_ERRLOG Subprograms

The **DBMS_ERRLOG** package includes the `CREATE_ERROR_LOG` procedure subprogram.

### 64.2.1 CREATE_ERROR_LOG Procedure

This procedure creates the error logging table needed to use the DML error logging capability.

*`LONG`, `CLOB`, `BLOB`, `BFILE`, and `ADT` datatypes are not supported in the columns.*
Syntax

DBMS_ERRLOG.CREATE_ERROR_LOG (
    dml_table_name            IN VARCHAR2,
    err_log_table_name        IN VARCHAR2 := NULL,
    err_log_table_owner       IN VARCHAR2 := NULL,
    err_log_table_space       IN VARCHAR2 := NULL,
    skip_unsupported          IN BOOLEAN := FALSE);

Parameters

Table 64-2  CREATE_ERROR_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dml_table_name</td>
<td>The name of the DML table to base the error logging table on. The name can be fully qualified (for example, emp, scott.emp,&quot;EMP&quot;,&quot;SCOTT&quot;,&quot;EMP&quot;). If a name component is enclosed in double quotes, it will not be upper cased.</td>
</tr>
<tr>
<td>err_log_table_name</td>
<td>The name of the error logging table you will create. The default is the first 25 characters in the name of the DML table prefixed with 'ERR$_'. Examples are the following: dml_table_name: 'EMP', err_log_table_name: 'ERR$_EMP' dml_table_name: '&quot;Emp2&quot;', err_log_table_name: 'ERR$_Emp2'</td>
</tr>
<tr>
<td>err_log_table_owner</td>
<td>The name of the owner of the error logging table. You can specify the owner in dml_table_name. Otherwise, the schema of the current connected user is used.</td>
</tr>
<tr>
<td>err_log_table_space</td>
<td>The tablespace the error logging table will be created in. If not specified, the default tablespace for the user owning the DML error logging table will be used.</td>
</tr>
<tr>
<td>skip_unsupported</td>
<td>When set to TRUE, column types that are not supported by error logging will be skipped over and not added to the error logging table. When set to FALSE, an unsupported column type will cause the procedure to terminate. The default is FALSE.</td>
</tr>
</tbody>
</table>

Examples

First, create an error log table for the channels table in the SH schema, using the default name generation.

Then, see all columns of the table channels:

```sql
SQL> DESC channels
Name                                      Null?       Type
---------------------------            -------     -----  
CHANNEL_ID                             NOT NULL    CHAR(1)
CHANNEL_DESC                           NOT NULL    VARCHAR2(20)
CHANNEL_CLASS                                      VARCHAR2(20)
```

Finally, see all columns of the generated error log table. Note the mandatory control columns that are created by the package:

```sql
SQL> DESC ERR$_CHANNELS
Name                           Null?       Type
---------------------------            -------     -----  
```

64-2
<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA_ERR_NUMBER$</td>
<td>NUMBER</td>
</tr>
<tr>
<td>ORA_ERR_MESGS</td>
<td>VARCHAR2 (2000)</td>
</tr>
<tr>
<td>ORA_ERR_ROWID$</td>
<td>ROWID</td>
</tr>
<tr>
<td>ORA_ERR_OPTYP$</td>
<td>VARCHAR2 (2)</td>
</tr>
<tr>
<td>ORA_ERR_TAGS</td>
<td>VARCHAR2 (2000)</td>
</tr>
<tr>
<td>CHANNEL_ID</td>
<td>VARCHAR2 (4000)</td>
</tr>
<tr>
<td>CHANNEL_DESC</td>
<td>VARCHAR2 (4000)</td>
</tr>
<tr>
<td>CHANNEL_CLASS</td>
<td>VARCHAR2 (4000)</td>
</tr>
</tbody>
</table>

See *Oracle Database Administrator's Guide* for more information regarding control columns.
The `DBMS_FGA` package provides fine-grained security functions.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Summary of DBMS_FGA Subprograms

### 65.1 DBMS_FGA Security Model

You must have the `AUDIT_ADMIN` role or the `EXECUTE` privilege on the `DBMS_FGA` package to create audit policies. `DBMS_FGA` is an invoker rights package.

To analyze and audit data, you must have the `AUDIT_VIEWER` role. Because the audit function can potentially capture all user environment and application context values, policy administration should be executable by privileged users only. The policy event handler module is executed with the module owner’s privilege.

### 65.2 DBMS_FGA Operational Notes

This package is available for only cost-based optimization. The rule-based optimizer may generate unnecessary audit records since audit monitoring can occur before row filtering.

For both the rule-based optimizer and the cost-based optimizer, you can query the `SQL_TEXT` and `SQL_BINDS` columns of the `UNIFIED_AUDIT_TRAIL` view to analyze the SQL text and corresponding bind variables that are issued.

### 65.3 Summary of DBMS_FGA Subprograms

This table lists the `DBMS_FGA` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ADD_POLICY Procedure</code></td>
<td>Creates an audit policy using the supplied predicate as the audit condition</td>
</tr>
<tr>
<td><code>DISABLE_POLICY Procedure</code></td>
<td>Disables an audit policy</td>
</tr>
<tr>
<td><code>DROP_POLICY Procedure</code></td>
<td>Drops an audit policy</td>
</tr>
<tr>
<td><code>ENABLE_POLICY Procedure</code></td>
<td>Enables an audit policy</td>
</tr>
</tbody>
</table>
65.3.1 ADD_POLICY Procedure

This procedure creates an audit policy using the supplied predicate as the audit condition.

Syntax

```sql
DBMS_FGA.ADD_POLICY(
    object_schema IN VARCHAR2 DEFAULT NULL,
    object_name IN VARCHAR2,
    policy_name IN VARCHAR2,
    audit_condition IN VARCHAR2 DEFAULT NULL,
    audit_column IN VARCHAR2 DEFAULT NULL,
    handler_schema IN VARCHAR2 DEFAULT NULL,
    handler_module IN VARCHAR2 DEFAULT NULL,
    enable IN BOOLEAN DEFAULT TRUE,
    statement_types IN VARCHAR2 DEFAULT SELECT,
    audit_trail IN BINARY_INTEGER DEFAULT NULL,
    audit_column_opts IN BINARY_INTEGER DEFAULT ANY_COLUMNS,
    policy_owner IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema of the object to be audited. If NULL, the current schema is assumed.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object to be audited</td>
</tr>
<tr>
<td>policy_name</td>
<td>Unique name of the policy. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.</td>
</tr>
<tr>
<td>audit_condition</td>
<td>A condition in a row that indicates a monitoring condition. NULL is allowed and acts as TRUE.</td>
</tr>
<tr>
<td>audit_column</td>
<td>Columns to be checked for access. These can include OLS hidden columns or object type columns. The default, NULL, causes audit if any column is accessed or affected.</td>
</tr>
<tr>
<td>handler_schema</td>
<td>Schema that contains the event handler. The default, NULL, causes the current schema to be used.</td>
</tr>
<tr>
<td>handler_module</td>
<td>Function name of the event handler; includes the package name if necessary. This function is invoked only after the first row that matches the audit condition in the query is processed. If the procedure fails with an exception, the user SQL statement will fail as well.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the policy if TRUE, which is the default</td>
</tr>
<tr>
<td>statement_types</td>
<td>SQL statement types to which this policy is applicable: INSERT, UPDATE, DELETE, or SELECT only</td>
</tr>
<tr>
<td>audit_trail</td>
<td>In an environment that has not yet migrated to unified auditing, the destination (DB or XML) of fine-grained audit records. Also specifies whether to populate the LSQLTEXT and LSQLBIND columns in the FGA_LOG$ system table.</td>
</tr>
</tbody>
</table>
Table 65-2  (Cont.) ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>audit_column_opts</td>
<td>Establishes whether a statement is audited when the query references any column specified in the audit_column parameter or only when all such columns are referenced.</td>
</tr>
<tr>
<td>policy_owner</td>
<td>User who owns the fine-grained auditing policy. However, this setting is not a user-supplied argument. The Oracle Data Pump client uses this setting internally to recreate the fine-grained audit policies appropriately.</td>
</tr>
</tbody>
</table>

Usage Notes

- A table or view can have a maximum of 256 fine-grained audit policies applied to it.
- If object_schema is not specified, the current schema is assumed.
- An FGA policy should not be applied to out-of-line columns such as LOB columns.
- Each audit policy is applied to the query individually. However, at most one audit record may be generated for each policy, no matter how many rows being returned satisfy that policy's audit_condition. In other words, whenever any number of rows being returned satisfy an audit condition defined on the table, a single audit record will be generated for each such policy.
- If a table with an FGA policy defined on it receives a Fast Path insert or a vectored update, the hint is automatically disabled before any such operations. Disabling the hint allows auditing to occur according to the policy's terms. (One example of a Fast Path insert is the statement INSERT-WITH-APPEND-hint.)
- The audit_condition must be a boolean expression that can be evaluated using the values in the row being inserted, updated, or deleted. The expression can also use functions, such as the USER or SYS_CONTEXT functions. The expression must not combine conditions using operators such as AND and OR. audit_condition can be NULL (or omitted), which is interpreted as TRUE, but it cannot contain the following elements:
  - Subqueries or sequences
  - The following attributes of the USERENV namespace when accessed using the SYS_CONTEXT function:
    * CURRENT_SQL
    * CURRENT_SQL_LENGTH
    * CURRENT_BIND
  - Any use of the pseudo columns LEVEL, PRIOR, or ROWNUM.

Specifying an audit condition of “1=1” to force auditing of all specified statements ("statement_types") affecting the specified column ("audit_column") is no longer needed to achieve this purpose. A NULL value for audit_condition causes audit to happen even if no rows are processed, so that all actions on a table with this policy are audited.
- The audit_condition is evaluated using the privileges of the user who creates the policy.
For the audit_condition setting, do not include functions, which execute the auditable statement on the same base table, in the audit_condition setting. For example, suppose you create a function that executes an INSERT statement on the HR.EMPLOYEES table. The policy audit_condition contains this function and it is for INSERT statements (as set by the statement_types parameter). When the policy is used, the function executes recursively until the system has run out of memory. This can raise the error ORA-1000: maximum open cursors exceeded or ORA-00036: maximum number of recursive SQL levels (50) exceeded.

Do not issue the DBMS_FGA.ENABLE_POLICY or DBMS_FGA.DISABLE_POLICY statement from a policy function in a condition.

The audit function (handler_module) is an alerting mechanism for the administrator. The required interface for such a function is as follows:

```
PROCEDURE fname ( object_schema VARCHAR2, object_name VARCHAR2, policy_name VARCHAR2 ) AS ...;
```

where fname is the name of the procedure, object_schema is the name of the schema of the table audited, object_name is the name of the table to be audited, and policy_name is the name of the policy being enforced. The audit function will be executed with the function owner's privilege.

If you have migrated to unified auditing, then omit the audit_trail parameter because the audit records will automatically be written to the unified audit trail.

Be aware that sensitive data, such as credit card information, can be recorded in clear text.

The audit_trail parameter, if used, specifies both where the fine-grained audit trail will be written and whether it is to include the query's SQL Text and SQL Bind variable information (typically in columns named LSQLTEXT and LSQLBIND):

- If audit_trail includes XML, then fine-grained audit records are written to XML-format operating system files stored in the directory specified by an AUDIT_FILE_DEST statement in SQL. (The default AUDIT_FILE_DEST is $ORACLE_BASE/admin/$DB_UNIQUE_NAME/adump on Unix-based systems, and $ORACLE_BASE\admin\$DB_UNIQUE_NAME\adump on Windows systems.)

- If audit_trail includes DB instead, then the audit records are written to the SYS.FGA_LOG$ table in the database. However, for read-only databases, Oracle Database writes the fine-grained audit records to XML files, regardless of the audit_trail settings.

- If audit_trail includes EXTENDED, then the query's SQL Text and SQL Bind variable information are included in the audit trail.

For example:

* Setting audit_trail to DBMS_FGA.DB sends the audit trail to the SYS.FGA_LOG$ table in the database and omits SQL Text and SQL Bind.

* Setting audit_trail to DBMS_FGA.DB + DBMS_FGA.EXTENDED sends the audit trail to the SYS.FGA_LOG$ table in the database and includes SQL Text and SQL Bind.

* Setting audit_trail to DBMS_FGA.XML writes the audit trail in XML files sent to the operating system and omits SQL Text and SQL Bind.

* Setting audit_trail to DBMS_FGA.XML + DBMS_FGA.EXTENDED writes the audit trail in XML files sent to the operating system and includes SQL Text and SQL Bind.
The audit_trail parameter appears in the ALL_AUDIT_POLICIES view.

- You can change the operating system destination using the following command:
  `ALTER SYSTEM SET AUDIT_FILE_DEST = New Directory DEFERRED`

- On many platforms, XML audit files are named `process_name_processId.xml`, for example, `ora_2111.xml`. Alternatively, on Windows, the XML audit files are named `process_name_ThreadId.xml` (or `process_name_ProcessId.xml` if the process is not running as a thread).

- The audit_column_opts parameter establishes whether a statement is audited
  - when the query references any column specified in the audit_column parameter (`audit_column_opts = DBMS_FGA.ANY_COLUMNS`), or
  - only when all such columns are referenced (`audit_column_opts = DBMS_FGA.ALL_COLUMNS`).

  The default is `DBMS_FGA.ANY_COLUMNS`.

The ALL_AUDIT_POLICIES view also shows audit_column_opts.

- When `audit_column_opts` is set to `DBMS_FGA.ALL_COLUMNS`, a SQL statement is audited only when all the columns mentioned in `audit_column` have been explicitly referenced in the statement. And these columns must be referenced in the same SQL-statement or in the sub-select.

  All these columns must refer to a single table/view or alias.

  If a SQL statement selects the columns from different table aliases, the statement will not be audited.

- Every XML audit record contains the elements `AUDIT_TYPE` and `EXTENDED_TIMESTAMP`, with the latter printed in UTC zone (with no timezone information). Values retrieved using `V$XML_AUDIT_TRAIL` view are converted to session timezone and printed.

- For `SQL_TEXT` and `SQL_BIND` element values (CLOB type columns), the dynamic view shows only the first 4000 characters. The underlying XML file may have more than 4000 characters for such `SQL_TEXT` and `SQL_BIND` values.

- For large numbers of XML audit files, querying `V$XML_AUDIT_TRAIL` is faster when they are loaded into a database table using SQL*Loader or a similar tool. XML audit files are larger than the equivalent written to OS files when `AUDIT_TRAIL=OS`.

- Error handling is the same as when `AUDIT_TRAIL=OS`. If any error occurs in writing an audit record to disk, including the directory identified by `AUDIT_FILE_DEST` being full, the auditing operation fails. An alert message is logged.

- The policy event handler module will be executed with the module owner's privilege.

- Do not create recursive fine-grained audit handlers. For example, suppose you create a handler that executes an `INSERT` statement on the `HR.EMPLOYEES` table. The policy that is associated with this handler is for `INSERT` statements (as set by the `statement_types` parameter). When the policy is used, the handler executes recursively until the system has run out of memory. This can raise the error `ORA-1000: maximum open cursors exceeded` or `ORA-00036: maximum number of recursive SQL levels (50) exceeded`. See also Oracle Database Security Guide with regard to Creating a Fine-Grained Audit Policy.

- The fine-grained audit handler module should not have explicit `COMMIT`, `ROLLBACK`, and `DDL` statements mentioned in it.
The values for the `audit_trail` parameter (XML and XML+EXTENDED) cause fine-grained auditing records to be written to operating system files in XML format. A dynamic view, `V$XML_AUDIT_TRAIL`, makes such audit records from XML files available to DBAs through SQL query, providing enhanced usability. Querying this view causes all XML files (all files with an `.xml` extension) in the `AUDIT_FILE_DEST` directory to be parsed and presented in relational table format.

Audit records stored in operating system files can be more secure than database-stored audit records because access can require file permissions that DBAs do not have. Operating system storage for audit records also offers higher availability, since such records remain available even if the database is temporarily inaccessible.

The `DBA_COMMON_AUDIT_TRAIL` view includes the contents of the `V$XML_AUDIT_TRAIL` dynamic view for standard and fine-grained audit records.

Note that the `V$XML_AUDIT_TRAIL` view is populated only if unified auditing is not enabled. If you have enabled unified auditing, then you can query the `UNIFIED_AUDIT_TRAIL` data dictionary view for the audit trail records.

---

**See Also:**

*Oracle Database Security Guide* for an example of creating an email alert handler for a fine-grained audit policy

---

### Examples

```sql
DBMS_FGA.ADD_POLICY (object_schema      =>  'scott',
                      object_name        =>  'emp',
                      policy_name        =>  'mypolicy1',
                      audit_condition    =>  'sal < 100',
                      audit_column       =>  'comm,sal',
                      handler_schema     =>   NULL,
                      handler_module     =>   NULL,
                      enable             =>   TRUE,
                      statement_types    =>  'INSERT, UPDATE',
                      audit_column_opts  =>   DBMS_FGA.ANY_COLUMNS,
                      policy_owner       =>  'sec_admin');
```

### 65.3.2 DISABLE_POLICY Procedure

This procedure disables an audit policy.

**Syntax**

```sql
DBMS_FGA.DISABLE_POLICY(
    object_schema IN VARCHAR2,
    object_name   IN VARCHAR2,
    policy_name   IN VARCHAR2);
```
Parameters

Table 65-3  DISABLE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema of the object to be audited. If NULL, the current schema is assumed.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object to be audited</td>
</tr>
<tr>
<td>policy_name</td>
<td>Unique name of the policy</td>
</tr>
</tbody>
</table>

The default value for object_schema is NULL. If NULL, the current schema is assumed.

Examples

DBMS_FGA.DISABLE_POLICY {
  object_schema => 'scott',
  object_name   => 'emp',
  policy_name   => 'mypolicy1'};

65.3.3 DROP_POLICY Procedure

This procedure drops an audit policy.

Syntax

DBMS_FGA.DROP_POLICY(
  object_schema IN VARCHAR2,
  object_name  IN VARCHAR2,
  policy_name  IN VARCHAR2);

Parameters

Table 65-4  DROP_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema of the object to be audited. If NULL, the current schema is assumed.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object to be audited</td>
</tr>
<tr>
<td>policy_name</td>
<td>Unique name of the policy</td>
</tr>
</tbody>
</table>

Usage Notes

The DBMS_FGA procedures cause current DML transactions, if any, to commit before the operation unless they are inside a DDL event trigger. With DDL transactions, the DBMS_FGA procedures are part of the DDL transaction. The default value for object_schema is NULL. If NULL, the current schema is assumed.
Note:
Oracle Database automatically drops the audit policy if you remove the object specified in the `object_name` parameter of the `DBMS_FGA.ADD_POLICY` procedure, or if you drop the user who created the audit policy.

Examples

```sql
DBMS_FGA.DROP_POLICY (
  object_schema   =>  'scott',
  object_name     =>  'emp',
  policy_name     =>  'mypolicy1');
```

65.3.4 ENABLE_POLICY Procedure

This procedure enables an audit policy.

Syntax

```sql
DBMS_FGA.ENABLE_POLICY(
  object_schema  IN  VARCHAR2,
  object_name    IN  VARCHAR2,
  policy_name    IN  VARCHAR2,
  enable         IN  BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema of the object to be audited. If NULL, the current schema is assumed.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object to be audited</td>
</tr>
<tr>
<td>policy_name</td>
<td>Unique name of the policy</td>
</tr>
<tr>
<td>enable</td>
<td>Defaults to TRUE to enable the policy</td>
</tr>
</tbody>
</table>

Examples

```sql
DBMS_FGA.ENABLE_POLICY (
  object_schema   =>  'scott',
  object_name     =>  'emp',
  policy_name     =>  'mypolicy1',
  enable          =>  TRUE);
```
The DBMS_FILE_GROUP package, one of a set of Oracle Streams packages, provides administrative interfaces for managing file groups, file group versions, and files. A file group repository is a collection of all of the file groups in a database and can contain multiple versions of a particular file group. You can use this package to create and manage file group repositories.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Examples
- Summary of DBMS_FILE_GROUP Subprograms

### 66.1 DBMS_FILE_GROUP Overview

It is helpful to understand terminology before using the DBMS_FILE_GROUP package.

The following terms pertain to the DBMS_FILE_GROUP package:

**File**

A file is a reference to a file stored on hard disk. A file is composed of a file name, a directory object, and a file type. The directory object references the directory in which the file is stored on hard disk. For example, a file might have the following components:

- The file name is `expdat.dmp`.
- The directory object that contains the file is `db_files`.
- The file type is `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

**Version**

A version is a collection of related files. For example, a version might consist of a set of data files and a Data Pump export dump file generated by a Data Pump transportable tablespace export. Only one Data Pump export dump file is allowed in a version.

**File Group**

A file group is a collection of versions. A file group can logically group a set of versions. For example, a file group named `financial_quarters` can keep track of quarterly financial data by logically grouping versions of files related to a tablespace set. The tablespaces containing the data can be exported at the end of each quarter and versioned under names such as `Q1FY04`, `Q2FY04`, and so on.
66.2 DBMS_FILE_GROUP Security Model

There are two ways to define control on the DBMS_FILE_GROUP package.

- Granting `EXECUTE` on this package to selected users or roles.
- Granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

66.3 DBMS_FILE_GROUP Constants

The `DBMS_FILE_GROUP` package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, `DBMS_FILE_GROUP.EXPORT_DUMP_FILE`.

The following table lists the parameters and enumerated constants.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_type</td>
<td><code>DATAFILE</code></td>
<td><code>VARCHAR2(30)</code></td>
<td><code>DATAFILE</code> is a datafile for a database. This constant can be specified as 'DATAFILE'.</td>
</tr>
<tr>
<td>new_file_type</td>
<td><code>EXPORT_DUMP_FILE</code></td>
<td></td>
<td><code>EXPORT_DUMP_FILE</code> is a Data Pump export dump file. This constant can be specified as 'DUMPSET'.</td>
</tr>
<tr>
<td></td>
<td><code>DATAPUMP_LOG_FILE</code></td>
<td></td>
<td><code>DATAPUMP_LOG_FILE</code> is a Data Pump export log file. This constant can be specified as 'DATAPUMPLOG'.</td>
</tr>
<tr>
<td>max_versions</td>
<td><code>INFINITE</code></td>
<td><code>NUMBER</code></td>
<td>INFINITE specifies no limit. The max_versions or retention_days can increase without reaching a limit.</td>
</tr>
<tr>
<td>retention_days</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 66-1  (Cont.) DBMS_FILE_GROUP Parameters with Enumerated Constants

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td></td>
<td>BINARY_INTEGER</td>
<td><strong>READ_ANY_FILE_GROUP</strong> grants the privilege to view information about any file group in any schema in the data dictionary. <strong>MANAGE_ANY_FILE_GROUP</strong> grants the privilege to create, manage, and drop any file group in any schema. <strong>MANAGE_FILE_GROUP</strong> grants the privilege to create, manage, and drop file groups in the user's schema. <strong>READ_ON_FILE_GROUP</strong> grants the privilege to view information about a specific file group in the data dictionary. <strong>MANAGE_ON_FILE_GROUP</strong> grants the privilege to manage a specific file group in a schema other than the user's schema.</td>
</tr>
</tbody>
</table>

66.4 DBMS_FILE_GROUP Examples

DBMS_FILE_GROUP examples are in another book. *Oracle Streams Concepts and Administration* includes an example of a business that sells books and music over the internet. The business runs weekly reports on the sales data in the `inst1.example.com` database and stores these reports in two HTML files on a computer file system. The `book_sales.htm` file contains the report for book sales, and the `music_sales.htm` file contains the report for music sales.

The business wants to store these weekly reports in a file group repository at the `inst2.example.com` remote database. Every week, the two reports are generated on the `inst1.example.com` database, transferred to the computer system running the `inst2.example.com` database, and added to the repository as a file group version. The file group repository stores all of the file group versions that contain the reports for each week.

66.5 Summary of DBMS_FILE_GROUP Subprograms

This table lists the DBMS_FILE_GROUP subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_FILE Procedure</td>
<td>Adds a file to a version of a file group</td>
</tr>
<tr>
<td>ALTER_FILE Procedure</td>
<td>Alters a file in a version of a file group</td>
</tr>
<tr>
<td>ALTER_FILE_GROUP Procedure</td>
<td>Alters a file group</td>
</tr>
</tbody>
</table>
### Table 66-2  (Cont.) DBMS_FILE_GROUP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_VERSION Procedure</td>
<td>Alters a version of a file group</td>
</tr>
<tr>
<td>CREATE_FILE_GROUP Procedure</td>
<td>Creates a file group</td>
</tr>
<tr>
<td>CREATE_VERSION Procedure</td>
<td>Creates a version of a file group</td>
</tr>
<tr>
<td>DROP_FILE_GROUP Procedure</td>
<td>Drops a file group</td>
</tr>
<tr>
<td>DROP_VERSION Procedure</td>
<td>Drops a version of a file group</td>
</tr>
<tr>
<td>GRANT_OBJECT_PRIVILEGE Procedure</td>
<td>Grants object privileges on a file group to a user</td>
</tr>
<tr>
<td>GRANT_SYSTEM_PRIVILEGE Procedure</td>
<td>Grants system privileges for file group operations to a user</td>
</tr>
<tr>
<td>PURGE_FILE_GROUP Procedure</td>
<td>Purges a file group using the file group's retention policy</td>
</tr>
<tr>
<td>REMOVE_FILE Procedure</td>
<td>Removes a file from a version of a file group</td>
</tr>
<tr>
<td>REVOKE_OBJECT_PRIVILEGE Procedure</td>
<td>Revokes object privileges on a file group from a user</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE Procedure</td>
<td>Revokes system privileges for file group operations from a user</td>
</tr>
</tbody>
</table>

**Note:**
All subprograms commit unless specified otherwise.

### 66.5.1 ADD_FILE Procedure

This procedure adds a file to a version of a file group.

**See Also:**
An example that uses this procedure for a file group repository in *Oracle Streams Concepts and Administration*

**Syntax**

```sql
DBMS_FILE_GROUP.ADD_FILE(
    file_group_name  IN  VARCHAR2,
    file_name        IN  VARCHAR2,
    file_type        IN  VARCHAR2  DEFAULT NULL,
    file_directory   IN  VARCHAR2  DEFAULT NULL,
    version_name     IN  VARCHAR2  DEFAULT NULL,
    comments         IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 66-3  ADD_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group that contains the version, specified as [schema_name.]{file_group_name}. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file being added to the version. Each file name in a version must be unique.</td>
</tr>
<tr>
<td>file_type</td>
<td>The file type. The following are reserved file types:</td>
</tr>
<tr>
<td></td>
<td>• If the file is a datafile, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DATAFILE'</td>
</tr>
<tr>
<td></td>
<td>• If the file is a Data Pump export dump file, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DUMPSET'</td>
</tr>
<tr>
<td></td>
<td>Data Pump metadata is populated when a Data Pump export dump file is imported.</td>
</tr>
<tr>
<td></td>
<td>• If the file is a Data Pump export log file, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DATAPUMPLOG'</td>
</tr>
<tr>
<td></td>
<td>If the file type is not one of the reserved file types, then either enter a text description of the file type, or specify NULL to omit a file type description.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot; for more information about the reserved file types.</td>
</tr>
<tr>
<td>file_directory</td>
<td>The name of the directory object that corresponds to the directory containing the file.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the default directory object for the version.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no default directory object exists for the version, then the procedure uses the default directory object for the file group.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no default directory object exists for the version or file group, then the procedure raises an error.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version to which the file is added.</td>
</tr>
<tr>
<td></td>
<td>If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is added to version 1 of the file group.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
<tr>
<td>comments</td>
<td>Comments about the file being added</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure with either DBMS_FILE_GROUP.EXPORT_DUMP_FILE or 'DUMPSET' specified for the file_type parameter, a user must meet the following requirements:

• Have the appropriate privileges to import the Data Pump export dump file
• Have READ privilege on the directory object that contains the Data Pump export dump file
66.5.2 ALTER_FILE Procedure

This procedure alters a file in a version of a file group.

Syntax

```sql
DBMS_FILE_GROUP.ALTER_FILE(
    file_group_name     IN  VARCHAR2,
    file_name           IN  VARCHAR2,
    version_name        IN  VARCHAR2  DEFAULT NULL,
    new_file_name       IN  VARCHAR2  DEFAULT NULL,
    new_file_directory  IN  VARCHAR2  DEFAULT NULL,
    new_file_type       IN  VARCHAR2  DEFAULT NULL,
    remove_file_type    IN  VARCHAR2  DEFAULT 'N',
    new_comments        IN  VARCHAR2  DEFAULT NULL,
    remove_comments     IN  VARCHAR2  DEFAULT 'N');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group that contains the version, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file being altered in the version</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version that contains the file being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file in version 1 of the file group is altered. If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
<tr>
<td>new_file_name</td>
<td>The new name of the file if the file name is being changed. Each file name in a version must be unique. If NULL, then the procedure does not change the file name.</td>
</tr>
<tr>
<td>new_file_directory</td>
<td>The new name of the directory object that corresponds to the directory containing the file, if the directory object is being changed.</td>
</tr>
<tr>
<td>new_file_type</td>
<td></td>
</tr>
<tr>
<td>remove_file_type</td>
<td></td>
</tr>
<tr>
<td>new_comments</td>
<td></td>
</tr>
<tr>
<td>remove_comments</td>
<td></td>
</tr>
</tbody>
</table>

Note: When a non-NULL new file name is specified, this procedure changes the metadata for the file name in the data dictionary, but it does not change the file name on the hard disk.

Note: When a non-NULL new directory is specified, this procedure changes the metadata for the file directory in the data dictionary, but it does not change the file directory on the hard disk.
### Table 66-4  (Cont.) ALTER_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_file_type</td>
<td>The file type. The following are reserved file types:</td>
</tr>
<tr>
<td></td>
<td>• If the file is a datafile, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DATAFILE'</td>
</tr>
<tr>
<td></td>
<td>• If the file is a Data Pump export dump file, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DUMPSET'</td>
</tr>
<tr>
<td></td>
<td>• If the file is a Data Pump export log file, then enter the following:</td>
</tr>
<tr>
<td></td>
<td>'DATAPUMPLOG'</td>
</tr>
<tr>
<td></td>
<td>If the file type is not one of the reserved file types, then enter a text</td>
</tr>
<tr>
<td></td>
<td>description of the file type.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not change the file type.</td>
</tr>
<tr>
<td></td>
<td><strong>See Also:</strong> &quot;Constants&quot; for more information about the reserved file</td>
</tr>
<tr>
<td></td>
<td>types.</td>
</tr>
<tr>
<td>remove_file_type</td>
<td>If Y, then the procedure removes the file type. If Y and the</td>
</tr>
<tr>
<td></td>
<td>new_file_type parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If N, then the procedure does not remove the file type.</td>
</tr>
<tr>
<td>new_comments</td>
<td>New comments about the file being altered. If non-NULL, then the</td>
</tr>
<tr>
<td></td>
<td>procedure replaces the existing comments with the specified comments.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure does not change the existing comments.</td>
</tr>
<tr>
<td>remove_comments</td>
<td>If Y, then the procedure removes the comments for the file. If Y and the</td>
</tr>
<tr>
<td></td>
<td>new_comments parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td></td>
<td>If N, then the procedure does not change the existing comments.</td>
</tr>
</tbody>
</table>

#### Usage Notes

If the file type is changed to `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is populated. If the file type is changed from `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET', then Data Pump metadata for the file is purged.

To run this procedure with `DBMS_FILE_GROUP.EXPORT_DUMP_FILE` or 'DUMPSET' specified for the `new_file_type` parameter, a user must meet the following requirements:

- Have the appropriate privileges to import the Data Pump export dump file
- Have `READ` privilege on the directory object that contains the Data Pump export dump file

**See Also:**

*Oracle Database Utilities* for more information about Data Pump privileges
66.5.3 ALTER_FILE_GROUP Procedure

This procedure alters a file group.

Syntax

```
DBMS_FILE_GROUP.ALTER_FILE_GROUP(
    file_group_name           IN  VARCHAR2,
    keep_files                IN  VARCHAR2  DEFAULT NULL,
    min_versions              IN  NUMBER    DEFAULT NULL,
    max_versions              IN  NUMBER    DEFAULT NULL,
    retention_days            IN  NUMBER    DEFAULT NULL,
    new_default_directory     IN  VARCHAR2  DEFAULT NULL,
    remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
    new_comments              IN  VARCHAR2  DEFAULT NULL,
    remove_comments           IN  VARCHAR2  DEFAULT 'N');
```

Parameters

Table 66-5   ALTER_FILE_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group being altered, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>keep_files</td>
<td>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. If NULL, then this parameter is not changed.</td>
</tr>
<tr>
<td>min_versions</td>
<td>The minimum number of versions to retain. The specified value must be greater than or equal to 1. If NULL, then the procedure does not change the min_versions setting for the file group.</td>
</tr>
<tr>
<td>max_versions</td>
<td>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions. If NULL, then the procedure does not change the max_versions setting for the file group.</td>
</tr>
</tbody>
</table>
Table 66-5  (Cont.) ALTER_FILE_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retention_days</td>
<td>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist. If NULL, then the procedure does not change the retention_days setting for the file group.</td>
</tr>
<tr>
<td>new_default_directory</td>
<td>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version. If NULL, then the procedure does not change the default directory.</td>
</tr>
<tr>
<td>remove_default_directory</td>
<td>If Y, then the procedure removes the default directory for the file group. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory for the file group.</td>
</tr>
<tr>
<td>new_comments</td>
<td>Comments about the file group. If non-NULL, then the new comments replace the existing comments for the file group. If NULL, then the procedure does not change the existing comments.</td>
</tr>
<tr>
<td>remove_comments</td>
<td>If Y, then the comments for the file group are removed. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not change the comments for the file group.</td>
</tr>
</tbody>
</table>

Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.
66.5.4 ALTER_VERSION Procedure

This procedure alters a version of a file group.

Syntax

DBMS_FILE_GROUP.ALTER_VERSION(
  file_group_name           IN  VARCHAR2,
  version_name              IN  VARCHAR2  DEFAULT NULL,
  new_version_name          IN  VARCHAR2  DEFAULT NULL,
  remove_version_name       IN  VARCHAR2  DEFAULT 'N',
  new_default_directory     IN  VARCHAR2  DEFAULT NULL,
  remove_default_directory  IN  VARCHAR2  DEFAULT 'N',
  new_comments              IN  VARCHAR2  DEFAULT NULL,
  remove_comments           IN  VARCHAR2  DEFAULT 'N')

Parameters

Table 66-6  ALTER_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group that contains the version, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version being altered. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then version 1 of the file group is altered. If '*' is specified, then the procedure alters all versions, and the new_version_name parameter must be NULL. If NULL, then the procedure uses the version with the latest creation time for the file group.</td>
</tr>
<tr>
<td>new_version_name</td>
<td>The new name of the version. Do not specify a schema. The specified version name cannot be a positive integer or an asterisk ('*'). If NULL, then the procedure does not change the version name.</td>
</tr>
<tr>
<td>remove_version_name</td>
<td>If Y, then the procedure removes the version name. If the version name is removed, then the version number must be used to manage the version. If Y and the new_version_name parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the version name.</td>
</tr>
<tr>
<td>new_default_directory</td>
<td>The default directory object used when files are added to a version if no directory is specified when the files are added. If NULL, then the procedure does not change the default directory.</td>
</tr>
</tbody>
</table>
### Table 66-6  (Cont.) ALTER_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_default_directory</td>
<td>If Y, then the procedure removes the default directory. If Y and the new_default_directory parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the default directory.</td>
</tr>
<tr>
<td>new_comments</td>
<td>Comments about the version. If non-NULL, then the new comments replace the existing comments for the version. If NULL, then the procedure does not change the comments.</td>
</tr>
<tr>
<td>remove_comments</td>
<td>If Y, then the procedure removes the comments for the version. If Y and the new_comments parameter is set to a non-NULL value, then the procedure raises an error. If N, then the procedure does not remove the comments for the version.</td>
</tr>
</tbody>
</table>

### 66.5.5 CREATE_FILE_GROUP Procedure

This procedure creates a file group.

#### Syntax

```sql
DBMS_FILE_GROUP.CREATE_FILE_GROUP(
    file_group_name    IN  VARCHAR2,
    keep_files         IN  VARCHAR2  DEFAULT 'Y',
    min_versions       IN  NUMBER    DEFAULT 2,
    max_versions       IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
    retention_days     IN  NUMBER    DEFAULT DBMS_FILE_GROUP.INFINITE,
    default_directory  IN  VARCHAR2  DEFAULT NULL,
    comments           IN  VARCHAR2  DEFAULT NULL);
```

#### Parameters

**file_group_name**

The name of the file group, specified as `{schema_name}.{file_group_name}. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.
### Table 66-7  (Cont.) CREATE_FILE_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keep_files</td>
<td>If Y, then the files in the file group are retained on hard disk if the file group or a version of the file group is dropped or purged. If N, then the files in the file group are deleted from hard disk if the file group or a version of the file group is dropped or purged. <strong>Note:</strong> If the file group is dropped because of a DROP USER CASCADE statement, then the setting of this parameter determines whether the files are dropped from the hard disk.</td>
</tr>
<tr>
<td>min_versions</td>
<td>The minimum number of versions to retain. The specified value must be greater than or equal to 1.</td>
</tr>
<tr>
<td>max_versions</td>
<td>The maximum number of versions to retain. The specified value must be greater than or equal to the value specified for min_versions. When the number of versions exceeds the specified max_versions, the oldest version is purged. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of versions.</td>
</tr>
<tr>
<td>retention_days</td>
<td>The maximum number of days to retain a version. The specified value must be greater than or equal to 0 (zero). When the age of a version exceeds the specified retention_days and there are more versions than the number specified in min_versions, the version is purged. The age of a version is calculated by subtracting the creation time from the current time. A decimal value can specify a fraction of a day. For example, 1.25 specifies one day and six hours. Specify DBMS_FILE_GROUP.INFINITE for no limit to the number of days a version can exist.</td>
</tr>
<tr>
<td>default_directory</td>
<td>The default directory object used when files are added to a file group if no directory is specified when the files are added, and no default directory object is specified for the version.</td>
</tr>
<tr>
<td>comments</td>
<td>Comments about the file group being created.</td>
</tr>
</tbody>
</table>

### Usage Notes

If min_versions is set to 1, then the only version of the file group can be purged when a new version is added. If the addition of the new version is not complete when the existing version is purged, then there can be a period of time when no version of the file group is available. Therefore, set min_versions to at least 2 if a version of the file group must be available at all times.

### 66.5.6 CREATE_VERSION Procedure

This procedure creates a version of a file group.

This procedure automatically runs the PURGE_FILE_GROUP procedure. Therefore, versions can be purged based on the file group's retention policy.

This procedure is overloaded. One version of the procedure contains the OUT parameter version_out, and the other does not.
See Also:

- PURGE_FILE_GROUP Procedure
- An example that uses this procedure for a file group repository in Oracle Streams Concepts and Administration

Syntax

DBMS_FILE_GROUP.CREATE_VERSION(
    file_group_name    IN  VARCHAR2,
    version_name       IN  VARCHAR2 DEFAULT NULL,
    default_directory  IN  VARCHAR2 DEFAULT NULL,
    comments           IN  VARCHAR2 DEFAULT NULL);

DBMS_FILE_GROUP.CREATE_VERSION(
    file_group_name    IN   VARCHAR2,
    version_name       IN   VARCHAR2 DEFAULT NULL,
    default_directory  IN   VARCHAR2 DEFAULT NULL,
    comments           IN   VARCHAR2 DEFAULT NULL,
    version_out        OUT  VARCHAR2);

Parameters

Table 66-8  CREATE_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group to which the new version is added, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version being created. Do not specify a schema. The specified version name cannot be a positive integer because, when a version is created, a version number is generated automatically. The specified version name cannot be an asterisk (‘*’).</td>
</tr>
<tr>
<td>default_directory</td>
<td>The default directory object used when files are added to a version if no directory is specified when the files are added.</td>
</tr>
<tr>
<td>comments</td>
<td>Comments about the version being created</td>
</tr>
<tr>
<td>version_out</td>
<td>If the version_name parameter is set to a non-NULL value, then this parameter contains the specified version name. If the version_name parameter is set to NULL, then this parameter contains the generated version number.</td>
</tr>
</tbody>
</table>
66.5.7 DROP_FILE_GROUP Procedure

This procedure drops a file group.

Syntax

DBMS_FILE_GROUP.DROP_FILE_GROUP(
    file_group_name  IN  VARCHAR2,
    keep_files       IN  VARCHAR2  DEFAULT NULL);

Parameters

Table 66-9  DROP_FILE_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group being dropped, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>keep_files</td>
<td>If Y, then the procedure retains the files in the file group on hard disk. If n, then the procedure deletes the files in the file group from hard disk. If NULL, then the procedure uses the default keep files property of the file group.</td>
</tr>
</tbody>
</table>

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

66.5.8 DROP_VERSION Procedure

This procedure drops a version of a file group.

Syntax

DBMS_FILE_GROUP.DROP_VERSION(
    file_group_name  IN  VARCHAR2,
    version_name     IN  VARCHAR2 DEFAULT NULL,
    keep_files       IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 66-10  DROP_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group that contains the version, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
</tbody>
</table>
Table 66-10  (Cont.) DROP_VERSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version_name</td>
<td>The name of the version being dropped.</td>
</tr>
<tr>
<td></td>
<td>If a positive integer is specified as a VARCHAR2 value, then the integer is</td>
</tr>
<tr>
<td></td>
<td>interpreted as a version number. For example, if '1' is specified, then</td>
</tr>
<tr>
<td></td>
<td>version 1 of the file group is dropped.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the version with the oldest creation time</td>
</tr>
<tr>
<td></td>
<td>for the file group.</td>
</tr>
<tr>
<td></td>
<td>If '*', then the procedure drops all versions.</td>
</tr>
<tr>
<td>keep_files</td>
<td>If 'Y', then the procedure retains the files in the version on hard disk.</td>
</tr>
<tr>
<td></td>
<td>If 'N', then the procedure deletes the files in the version from hard disk.</td>
</tr>
<tr>
<td></td>
<td>If NULL, then the procedure uses the default keep files property of the file</td>
</tr>
<tr>
<td></td>
<td>group.</td>
</tr>
</tbody>
</table>

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

66.5.9 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants object privileges on a file group to a user.

Syntax

DBMS_FILE_GROUP.GRANT_OBJECT_PRIVILEGE(
    object_name   IN  VARCHAR2,
    privilege     IN  BINARY_INTEGER,
    grantee       IN  VARCHAR2,
    grant_option  IN  BOOLEAN DEFAULT FALSE);

Parameters

<td>grantee</td>
<td>The name of the user or role for which the privilege is granted. The</td>
</tr>
<tr>
<td></td>
<td>specified user cannot be the owner of the object.</td>
</tr>
<tr>
<td>grant_option</td>
<td>If TRUE, then the specified user granted the specified privilege can grant</td>
</tr>
<tr>
<td></td>
<td>this privilege to others.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then the specified user granted the specified privilege cannot</td>
</tr>
<tr>
<td></td>
<td>grant this privilege to others.</td>
</tr>
</tbody>
</table>
Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

66.5.10 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grants system privileges for file group operations to a user.

**Note:**

When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to FALSE, you give the user access to that type of object in all schemas, except the SYS schema. By default, the initialization parameter `O7_DICTIONARY_ACCESSIBILITY` is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the `O7_DICTIONARY_ACCESSIBILITY` initialization parameter to TRUE. Then privileges granted on "ANY" object allows access to any schema, including SYS. Set the `O7_DICTIONARY_ACCESSIBILITY` initialization parameter with caution.

Syntax

```
DBMS_FILE_GROUP.GRANT_SYSTEM_PRIVILEGE(
    privilege     IN  BINARY_INTEGER,
    grantee       IN  VARCHAR2,
    grant_option  IN  BOOLEAN  DEFAULT FALSE);
```

Parameters

**Table 66-12**  GRANT_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The constant that specifies the privilege. See &quot;Constants&quot; for valid privileges.</td>
</tr>
<tr>
<td>grantee</td>
<td>The name of the user or role for which the privilege is granted. The user who runs the procedure cannot be specified.</td>
</tr>
<tr>
<td>grant_option</td>
<td>If TRUE, then the specified user granted the specified privilege can grant this privilege to others. If FALSE, then the specified user granted the specified privilege cannot grant this privilege to others.</td>
</tr>
</tbody>
</table>
66.5.11 PURGE_FILE_GROUP Procedure

This procedure purges a file group using the file group's retention policy.

A file group's retention policy is determined by its settings for the max_versions, min_versions, and retention_days parameters. The following versions of a file group are removed when a file group is purged:

- All versions greater than the max_versions setting for the file group when versions are ordered in descending order by creation time. Therefore, the older versions are purged before the newer versions.
- All versions older than the retention_days setting for the file group unless purging a version would cause the number of versions to drop below the min_versions setting for the file group.

A job named SYS.FGR$AUTOPURGE_JOB automatically purges all file groups in a database periodically according to the job's schedule. You can adjust this job's schedule using the DBMS_SCHEDULER package. Alternatively, you can create a job that runs the PURGE_FILE_GROUP procedure periodically.

Syntax

DBMS_FILE_GROUP.PURGE_FILE_GROUP(
    file_group_name  IN  VARCHAR2);

Parameter

Table 66-13  PURGE_FILE_GROUP Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default. If NULL and this procedure is run by SYS user, then the procedure purges all file groups.</td>
</tr>
</tbody>
</table>

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files. Files are deleted when a version is purged and the keep_files parameter is set to N for the version's file group.

66.5.12 REMOVE_FILE Procedure

This procedure removes a file from a version of a file group.

Syntax

DBMS_FILE_GROUP.REMOVE_FILE(
    file_group_name  IN  VARCHAR2,
    file_name        IN  VARCHAR2,
version_name IN VARCHAR2 DEFAULT NULL,
keep_file IN VARCHAR2 DEFAULT NULL);

Parameters

Table 66-14  REMOVE_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_group_name</td>
<td>The name of the file group that contains the version, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file being removed from the version</td>
</tr>
<tr>
<td>version_name</td>
<td>The name of the version from which the file is removed. If a positive integer is specified as a VARCHAR2 value, then the integer is interpreted as a version number. For example, if '1' is specified, then the file is removed from version 1 of the file group. If NULL, then the procedure uses the version with the latest creation time for the file group. If '***', then the procedure removes the file from all versions.</td>
</tr>
<tr>
<td>keep_file</td>
<td>If Y, then the procedure retains the file on hard disk. If N, then the procedure deletes the file from hard disk. If NULL, then the procedure uses the default keep files property of the file group.</td>
</tr>
</tbody>
</table>

Usage Notes

If this procedure deletes files on hard disk, then the user who runs the procedure must have WRITE privilege on the directory object that contains the files.

66.5.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes object privileges on a file group from a user.

Syntax

DBMS_FILE_GROUP.REVOKE_OBJECT_PRIVILEGE(
    object_name IN VARCHAR2,
    privilege IN BINARY_INTEGER,
    revokee IN VARCHAR2);

Parameters

Table 66-15  REVOKE_OBJECT_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the file group on which the privilege is revoked, specified as [schema_name.]file_group_name. For example, if the schema is hq_dba and the file group name is sales_tbs, then specify hq_dba.sales_tbs. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>privilege</td>
<td>The constant that specifies the privilege. See &quot;Constants&quot; for valid privileges.</td>
</tr>
</tbody>
</table>
66.5.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes system privileges for file group operations from a user.

Syntax

```sql
DBMS_FILE_GROUP.REVOKE_SYSTEM_PRIVILEGE(
    privilege  IN  BINARY_INTEGER,
    revokee    IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The constant that specifies the privilege. See &quot;Constants&quot; for valid privileges.</td>
</tr>
<tr>
<td>revokee</td>
<td>The name of the user or role from which the privilege is revoked. The user who runs the procedure cannot be specified.</td>
</tr>
</tbody>
</table>
The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

This chapter contains the following topics:

• Overview
• Security Model
• Operating Notes
• Summary of DBMS_FILE_TRANSFER Subprograms

See Also:

• Oracle Database Administrator’s Guide for instructions about using file transfer
• Oracle Streams Concepts and Administration for applications of file transfer.

67.1 DBMS_FILE_TRANSFER Overview

The DBMS_FILE_TRANSFER package provides procedures to copy a binary file within a database or to transfer a binary file between databases.

The destination database converts each block when it receives a file from a platform with different endianness. Datafiles can be imported after they are moved to the destination database as part of a transportable operation without RMAN conversion. Both GET and PUT operations will converted the file across platform difference at the destination. However, COPY is a local operation and therefore no conversion is required.

67.2 DBMS_FILE_TRANSFER Security Model

The DBMS_FILE_TRANSFER package must be created under SYS (CONNECT INTERNAL). Operations provided by this package are performed under the current calling user, not the package owner (SYS).

To use this interface the following users must have the following privileges:

• The current user at the local database must have READ privilege on the directory object specified in the source_directory_object parameter.

• The connected user at the destination database must have WRITE privilege to the directory object specified in the destination_directory_object parameter.
67.3 DBMS_FILE_TRANSFER Operational Notes

DBMS_FILE_TRANSFER supports online backup. You should therefore be careful in copying or transferring a file that is being modified by the database because this can result in an inconsistent file, and require recovery. To guarantee consistency, bring files offline when the database is in use.

If you want to use DBMS_FILE_TRANSFER for performing backups, note that you are implementing self-managed backups, and should therefore put the files in hot backup mode.

67.4 Summary of DBMS_FILE_TRANSFER Subprograms

This table lists the DBMS_FILE_TRANSFER subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COPY_FILE Procedure</td>
<td>Reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.</td>
</tr>
<tr>
<td>GET_FILE Procedure</td>
<td>Contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM.</td>
</tr>
<tr>
<td>PUT_FILE Procedure</td>
<td>Reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system</td>
</tr>
</tbody>
</table>

67.4.1 COPY_FILE Procedure

This procedure reads a file from a source directory and creates a copy of it in a destination directory. The source and destination directories can both be in a local file system, or both be in an Automatic Storage Management (ASM) disk group, or between local file system and ASM with copying in either direction.

You can copy any type of file to and from a local file system. However, you can copy only database files (such as datafiles, tempfiles, controlfiles, and so on) to and from an ASM disk group.

The destination file is not closed until the procedure completes successfully.

Syntax

```sql
DBMS_FILE_TRANSFER.COPY_FILE(
    source_directory_object       IN  VARCHAR2,
    source_file_name              IN  VARCHAR2,
    destination_directory_object  IN  VARCHAR2,
    destination_file_name         IN  VARCHAR2);
```
Parameters

Table 67-2  COPY_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object that designates the source directory. The directory object must already exist. (You create directory objects with the CREATE DIRECTORY command).</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file to copy. This file must exist in the source directory.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object that designates the destination directory. The directory object must already exist. If the destination is ASM, the directory object must designate either a disk group name (for example, +diskgroup1) or a directory created for alias names. In the case of a directory, the full path to the directory must be specified (for example: +diskgroup1/dbs/control).</td>
</tr>
</tbody>
</table>
| destination_file_name      | The name to assign to the file in the destination directory. A file with the same name must not exist in the destination directory. If the destination is ASM:  
  • The file is given a fully qualified ASM filename and created in the appropriate directory (depending on the database name and file type)  
  • The file type tag assigned to the file is COPY_FILE  
  • The value of the destination_file_name argument becomes the file’s alias name in the designated destination directory  
  The file name can be followed by an ASM template name in parentheses. The file is then given the attributes specified by the template. |

Usage Notes

To run this procedure successfully, the current user must have the following privileges:

• **READ** privilege on the directory object specified in the source_directory_object parameter

• **WRITE** privilege on directory object specified in the destination_directory_object parameter

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

• The size of the copied file must be a multiple of 512 bytes.

• The size of the copied file must be less than or equal to two terabytes.

The source_file_name parameter must specify a file that is in the directory specified by the source_directory_object parameter before running the procedure, and the destination_file_name parameter must specify the new name of the file in the new
location specified in the destination_directory_object parameter. Relative paths and symbolic links are not allowed in the directory objects for the source_directory_object and destination_directory_object parameters.

Transferring the file is not transactional. To monitor the progress of a long file copy, query the V$SESSION_LONGOPS dynamic performance view.

Examples

SQL> create directory DGROUP as '+diskgroup1/dbs/backup';
Directory created.

SQL> BEGIN
  2    DBMS_FILE_TRANSFER.COPY_FILE('SOURCEDIR','t_xdbtmp.f', 'DGROUP',
  3          't_xdbtmp.f');
  4  END;
  5 /
PL/SQL procedure successfully completed.

SQL> EXIT
$ASMCMD
ASMCMD> ls
DISKGROUP1/
ASMCMD> cd diskgroup1/dbs/backup
ASMCMD> ls
  t_xdbtmp.f => +DISKGROUP1/ORCL/TEMPFILE/COPY_FILE.267.546546525

67.4.2 GET_FILE Procedure

This procedure contacts a remote database to read a remote file and then creates a copy of the file in the local file system or ASM. The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

DBMS_FILE_TRANSFER.GET_FILE
  source_directory_object      IN  VARCHAR2,
  source_file_name             IN  VARCHAR2,
  source_database              IN  VARCHAR2,
  destination_directory_object IN  VARCHAR2,
  destination_file_name        IN  VARCHAR2);
Parameters

Table 67-3  GET_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object from which the file is copied at the source site. This directory object must exist at the source site.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file that is copied in the remote file system. This file must exist in the remote file system in the directory associated with the source directory object.</td>
</tr>
<tr>
<td>source_database</td>
<td>The name of a database link to the remote database where the file is located.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object into which the file is placed at the destination site. This directory object must exist in the local file system.</td>
</tr>
<tr>
<td>destination_file_name</td>
<td>The name of the file copied to the local file system. A file with the same name must not exist in the destination directory in the local file system.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure successfully, the following users must have the following privileges:

- The connected user at the source database must have read privilege on the directory object specified in the source_directory_object parameter.
- The current user at the local database must have write privilege on the directory object specified in the destination_directory_object parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

- The size of the copied file must be a multiple of 512 bytes.
- The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the V$SESSION_LONGOPS dynamic performance view.

Examples

```sql
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE DIRECTORY DSK_FILES AS ''^t_work'' ;
GRANT WRITE ON DIRECTORY dsk_files TO "user";

-- assumes that dbs2 link has been created and we are connected to the instance.
-- dbs2 could be a loopback or point to another instance.
BEGIN
  -- asm file to an os file
```

Chapter 67
Summary of DBMS_FILE_TRANSFER Subprograms
-- get an asm file from dbs1.asm/a1 to dbs2.^t_work^/oa5.dat
DBMS_FILE_TRANSFER.GET_FILE ( 'df', 'a1', 'dbs1', 'dsk_files', 'oa5.dat');

-- os file to an os file
-- get an os file from dbs1.^t_work^/a2.dat to dbs2.^t_work^/a2back.dat
DBMS_FILE_TRANSFER.GET_FILE ( 'dsk_files', 'a2.dat', 'dbs1', 'dsk_files',
'a2back.dat');

END ;
/

67.4.3 PUT_FILE Procedure

This procedure reads a local file or ASM and contacts a remote database to create a copy of the file in the remote file system.

The file that is copied is the source file, and the new file that results from the copy is the destination file. The destination file is not closed until the procedure completes successfully.

Syntax

DBMS_FILE_TRANSFER.PUT_FILE(
  source_directory_object       IN  VARCHAR2,
  source_file_name              IN  VARCHAR2,
  destination_directory_object  IN  VARCHAR2,
  destination_file_name         IN  VARCHAR2,
  destination_database          IN  VARCHAR2);

Parameters

Table 67-4  PUT_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_directory_object</td>
<td>The directory object from which the file is copied at the local source site. This directory object must exist at the source site.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The name of the file that is copied from the local file system. This file must exist in the local file system in the directory associated with the source directory object.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object into which the file is placed at the destination site. This directory object must exist in the remote file system.</td>
</tr>
<tr>
<td>destination_file_name</td>
<td>The name of the file placed in the remote file system. A file with the same name must not exist in the destination directory in the remote file system.</td>
</tr>
<tr>
<td>destination_database</td>
<td>The name of a database link to the remote database to which the file is copied.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure successfully, the following users must have the following privileges:
• The current user at the local database must have read privilege on the directory object specified in the \texttt{source_directory_object} parameter.

• The connected user at the destination database must have write privilege to the directory object specified in the \texttt{destination_directory_object} parameter.

This procedure converts directory object parameters to uppercase unless they are surrounded by double quotation marks, but this procedure does not convert file names to uppercase.

Also, the copied file must meet the following requirements:

• The size of the copied file must be a multiple of 512 bytes.

• The size of the copied file must be less than or equal to two terabytes.

Transferring the file is not transactional. To monitor the progress of a long file transfer, query the \texttt{V$SESSION_LONGOPS} dynamic performance view.

\textbf{Examples}

\begin{verbatim}
CREATE OR REPLACE DIRECTORY df AS '+datafile' ;
GRANT WRITE ON DIRECTORY df TO "user";
CREATE OR REPLACE DIRECTORY ft1 AS '+datafile/ft1' ;
GRANT READ,WRITE ON DIRECTORY ft1 TO "user";
CREATE OR REPLACE DIRECTORY ft1_1 AS '+datafile/ft1/ft1_1' ;

CONNECT user;
Enter password:

-- - put a1.dat to a4.dat (using dbs2 dblink)
-- - level 2 sub dir to parent dir
-- - user has read privs on ft1_1 at dbs1 and write on df in dbs2
BEGIN
  DBMS_FILE_TRANSFER.PUT_FILE ( 'ft1_1' , 'a2.dat' , 'df' , 'a4.dat' , 'dbs2' ) ;
END ;
\end{verbatim}
Using **DBMS_FLASHBACK**, you can flash back to a version of the database at a specified time or a specified system change number (SCN).

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Types**
- **Exceptions**
- **Operational Notes**
- **Examples**
- **Summary of DBMS_FLASHBACK Subprograms**

**See Also:**

For detailed information about **DBMS_FLASHBACK**:

- *Oracle Database Development Guide*
- *Oracle Database SQL Language Reference*.

### 68.1 DBMS_FLASHBACK Overview

**DBMS_FLASHBACK** provides an interface for the user to view the database at a particular time in the past, with the additional capacity provided by transaction back out features that allow for selective removal of the effects of individual transactions. This is different from a flashback database which moves the database back in time.

When **DBMS_FLASHBACK** is enabled, the user session uses the Flashback version of the database, and applications can execute against the Flashback version of the database.

You may want to use **DBMS_FLASHBACK** for the following reasons:

- **Self-service repair**: If you accidentally delete rows from a table, you can recover the deleted rows.
- **Packaged applications such as email and voicemail**: You can use Flashback to restore deleted email by re-inserting the deleted message into the current message box.
- **Decision support system (DSS) and online analytical processing (OLAP) applications**: You can perform data analysis or data modeling to track seasonal demand.
68.2 DBMS_FLASHBACK Security Model

To use the DBMS_FLASHBACK package, you must have the EXECUTE privilege on it.

68.3 DBMS_FLASHBACK Types

The following table describes the types used by DBMS_FLASHBACK.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TXNAME_ARRAY</td>
<td>Creates a VARRAY for holding Transaction Names or Identifiers (XIDs)</td>
</tr>
</tbody>
</table>

68.4 DBMS_FLASHBACK Exceptions

DBMS_FLASHBACK creates the following error messages.

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-08180</td>
<td>Time specified is too old</td>
</tr>
<tr>
<td>ORA-08181</td>
<td>Invalid system change number specified</td>
</tr>
<tr>
<td>ORA-08182</td>
<td>User cannot begin read-only or serializable transactions in Flashback mode</td>
</tr>
<tr>
<td>ORA-08183</td>
<td>User cannot enable Flashback within an uncommitted transaction</td>
</tr>
<tr>
<td>ORA-08184</td>
<td>User cannot enable Flashback within another Flashback session</td>
</tr>
<tr>
<td>ORA-08185</td>
<td>SYS cannot enable Flashback mode</td>
</tr>
</tbody>
</table>

68.5 DBMS_FLASHBACK Operational Notes

DBMS_FLASHBACK is automatically turned off when the session ends, either by disconnection or by starting another connection.

PL/SQL cursors opened in Flashback mode return rows as of the flashback time or SCN. Different concurrent sessions (connections) in the database can perform Flashback to different wall-clock times or SCNs. DML and DDL operations and distributed operations are not allowed while a session is running in Flashback mode.

You can use PL/SQL cursors opened before disabling Flashback to perform DML.

Under Automatic Undo Management (AUM) mode, you can use retention control to control how far back in time to go for the version of the database you need. If you need to perform a Flashback over a 24-hour period, the DBA must set the undo_retention parameter to 24 hours. This way, the system retains enough undo information to regenerate the older versions of the data.

You can set the RETENTION GUARANTEE clause for the undo tablespace to ensure that unexpired undo is not discarded. UNDO_RETENTION is not in itself a guarantee because, if
the system is under space pressure, unexpired undo may be overwritten with freshly generated undo. In such cases, RETENTION GUARANTEE prevents this. For more information, see the Oracle Database Administrator's Guide.

In a Flashback-enabled session, SYSDATE is not affected; it continues to provide the current time.

=DBMS_FLASHBACK= can be used within logon triggers to enable Flashback without changing the application code.

68.6 DBMS_FLASHBACK Examples

The following example illustrates how Flashback can be used when the deletion of a senior employee triggers the deletion of all the personnel reporting to him. Using the Flashback feature, you can recover and re-insert the missing employees.

```sql
DROP TABLE employee;
DROP TABLE keep_scn;
REM -- Keep_scn is a temporary table to store scns that we are interested in
CREATE TABLE keep_scn (scn number);
SET ECHO ON
CREATE TABLE employee
  (employee_no   number(5) PRIMARY KEY,
   employee_name varchar2(20),
   employee_mgr  number(5)
    CONSTRAINT mgr_fkey REFERENCES EMPLOYEE ON DELETE CASCADE,
   salary        number,
   hiredate      date)
REM -- Populate the company with employees
INSERT INTO employee VALUES (1, 'John Doe', null, 1000000, '5-jul-81');
INSERT INTO employee VALUES (10, 'Joe Johnson', 1, 500000, '12-aug-84');
INSERT INTO employee VALUES (20, 'Susie Tiger', 10, 250000, '13-dec-90');
INSERT INTO employee VALUES (100, 'Scott Tiger', 20, 200000, '3-feb-86');
INSERT INTO employee VALUES (200, 'Charles Smith', 100, 150000, '22-mar-88');
INSERT INTO employee VALUES (210, 'Jane Johnson', 100, 100000, '11-apr-87');
INSERT INTO employee VALUES (220, 'Nancy Doe', 100, 100000, '18-sep-93');
INSERT INTO employee VALUES (300, 'Gary Smith', 210, 75000, '4-nov-96');
INSERT INTO employee VALUES (310, 'Bob Smith', 210, 65000, '3-may-95');
COMMIT;
REM -- Show the entire org
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;
REM -- Sleep for a short time (approximately 10 to 20 seconds) to avoid querying close to table creation
EXECUTE DBMS_LOCK.SLEEP(10);
REM -- Store this snapshot for later access through Flashback
DECLARE
I NUMBER;
BEGIN

```
I := DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER;
INSERT INTO keep_scn VALUES (I);
COMMIT;
END;
/

REM -- Scott decides to retire but the transaction is done incorrectly
DELETE FROM EMPLOYEE WHERE employee_name = 'Scott Tiger';
COMMIT;

REM -- notice that all of scott's employees are gone
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM EMPLOYEE
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no = 1
ORDER BY LEVEL;

REM -- Flashback to see Scott's organization
DECLARE
  restore_scn number;
BEGIN
  SELECT  scn INTO restore_scn FROM keep_scn;
  DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (restore_scn);
END;
/

REM -- Show Scott's org.
SELECT lpad(' ', 2*(level-1)) || employee_name Name
FROM employee
CONNECT BY PRIOR employee_no = employee_mgr
START WITH employee_no =
  (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger')
ORDER BY LEVEL;

REM -- Restore scott's organization.
DECLARE
  scotts_emp NUMBER;
  scotts_mgr NUMBER;
  CURSOR c1 IS
    SELECT employee_no, employee_name, employee_mgr, salary, hiredate
    FROM employee
    CONNECT BY PRIOR employee_no = employee_mgr
    START WITH employee_no =
      (SELECT employee_no FROM employee WHERE employee_name = 'Scott Tiger');
  c1_rec c1 % ROWTYPE;
BEGIN
  SELECT employee_no, employee_mgr INTO scotts_emp, scotts_mgr FROM employee
  WHERE employee_name = 'Scott Tiger';
  /* Open c1 in flashback mode */
  OPEN c1;
  /* Disable Flashback */
  DBMS_FLASHBACK.DISABLE;
  LOOP
    FETCH c1 INTO c1_rec;
    EXIT WHEN c1%NOTFOUND;
    /*
      Note that all the DML operations inside the loop are performed
      with Flashback disabled
    */
    IF (c1_rec.employee_mgr = scotts_emp) then
      INSERT INTO employee VALUES (c1_rec.employee_no,
cl_rec.employee_name,  
scotts_mgr, 
cl_rec.salary,  
cl_rec.hiredate);
ELSE
  IF (cl_rec.employee_no != scotts_emp) THEN
    INSERT INTO employee VALUES (cl_rec.employee_no, 
    cl_rec.employee_name, 
    cl_rec.employee_mgr, 
    cl_rec.salary,

ORDER BY LEVEL;

68.7 Summary of DBMS_FLASHBACK Subprograms

This table lists the DBMS_FLASHBACK subprograms and briefly describes them.

Table 68-3   DBMS_FLASHBACK Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure</td>
<td>Disables the Flashback mode for the entire session</td>
</tr>
<tr>
<td>ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure</td>
<td>Enables Flashback for the entire session. Takes an SCN as an Oracle number and sets the session snapshot to the specified number. Inside the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN</td>
</tr>
<tr>
<td>ENABLE_AT_TIME Procedure</td>
<td>Enables Flashback for the entire session. The snapshot time is set to the SCN that most closely matches the time specified in query_time</td>
</tr>
<tr>
<td>GET_SYSTEM_CHANGE_NUMBER Function</td>
<td>Returns the current SCN as an Oracle number. You can use the SCN to store specific snapshots</td>
</tr>
<tr>
<td>TRANSACTION_BACKOUT Procedures</td>
<td>Provides the mechanism to back out a transaction</td>
</tr>
</tbody>
</table>

68.7.1 DISABLE Procedure

This procedure disables the Flashback mode for the entire session.

Syntax

DBMS_FLASHBACK.DISABLE;

Examples

The following example queries the salary of an employee, Joe, on August 30, 2000:
EXECUTE dbms_flashback.enable_at_time('30-AUG-2000');
SELECT salary FROM emp where name = 'Joe'
EXECUTE dbms_flashback.disable;

68.7.2 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure

This procedure takes an SCN as an input parameter and sets the session snapshot to the specified number.

In the Flashback mode, all queries return data consistent as of the specified wall-clock time or SCN. It enables Flashback for the entire session.

Syntax

DBMS_FLASHBACK.ENABLE_AT_SYSTEM_CHANGE_NUMBER (
    query_scn IN NUMBER);

Parameters

Table 68-4 ENABLE_AT_SYSTEM_CHANGE_NUMBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_scn</td>
<td>The system change number (SCN), a version number for the database that is incremented on every transaction commit.</td>
</tr>
</tbody>
</table>

68.7.3 ENABLE_AT_TIME Procedure

This procedure enables Flashback for the entire session.

The snapshot time is set to the SCN that most closely matches the time specified in query_time. It enables Flashback for the entire session.

Syntax

DBMS_FLASHBACK.ENABLE_AT_TIME (query_time IN TIMESTAMP);
Parameters

Table 68-5 ENABLE_AT_TIME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>query_time</td>
<td>This is an input parameter of type TIMESTAMP. A time stamp can be specified in the following ways:</td>
</tr>
<tr>
<td></td>
<td>• Using the TIMESTAMP constructor</td>
</tr>
<tr>
<td></td>
<td>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TIMESTAMP '2001-01-09 12:31:00').</td>
</tr>
<tr>
<td></td>
<td>Use the Globalization Support (NLS) format and supply a string. The format depends on the Globalization Support settings.</td>
</tr>
<tr>
<td></td>
<td>• Using the TO_TIMESTAMP function:</td>
</tr>
<tr>
<td></td>
<td>EXECUTE DBMS_FLASHBACK.ENABLE_AT_TIME(TO_TIMESTAMP('12-02-2001 14:35:00', 'DD-MM-YYYY HH24:MI:SS'))</td>
</tr>
<tr>
<td></td>
<td>You provide the format you want to use. This example shows the TO_TIMESTAMP function for February 12, 2001, 2:35 PM.</td>
</tr>
<tr>
<td></td>
<td>• If the time is omitted from query time, it defaults to the beginning of the day, that is, 12:00 A.M.</td>
</tr>
<tr>
<td></td>
<td>• Note that if the query time contains a time zone, the time zone information is truncated.</td>
</tr>
</tbody>
</table>

68.7.4 GET_SYSTEM_CHANGE_NUMBER Function

This function returns the current SCN as an Oracle number datatype. You can obtain the current change number and store it for later use. This helps you retain specific snapshots.

Syntax

```sql
DBMS_FLASHBACK.GET_SYSTEM_CHANGE_NUMBER
RETURN NUMBER;
```

68.7.5 TRANSACTION_BACKOUT Procedures

This procedure provides a mechanism to back out a set of transactions. The user can call these procedures with either transaction names or transaction identifiers (XIDS).

The procedure analyzes the transactional dependencies, perform DMLs and generates an extensive report on the operation performed by the subprogram. This procedure does not commit the DMLs performed as part of transaction back out. However it holds all the required locks on rows and tables in the right form, so that no other dependencies can enter the system. To make the changes permanent you must explicitly commit the transaction.

A report is generated in the system tables DBA_FLASHBACK_TRANSACTION_STATE and DBA_FLASHBACK_TRANSACTION_REPORT.
Syntax

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns NUMBER,
xids XID_ARRAY,
options NUMBER default NOCASCADE,
timeHint TIMESTAMP default MINTIME);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns NUMBER,
xids XID_ARRAY,
options NUMBER default NOCASCADE,
scnHint TIMESTAMP default 0);

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns NUMBER,
txnnames TXNAME_ARRAY,
options NUMBER default NOCASCADE,
timehint TIMESTAMP MINTIME );

DBMS_FLASHBACK.TRANSACTION_BACKOUT
numtxns NUMBER,
txnNames TXNAME_ARRAY,
options NUMBER default NOCASCADE,
scnHint NUMBER 0);

Parameters

Table 68-6 TRANSACTION_BACKOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>numtxns</td>
<td>Number of transactions passed as input</td>
</tr>
<tr>
<td>xids</td>
<td>List of transaction IDs in the form of an array</td>
</tr>
<tr>
<td>txnnames</td>
<td>List of transaction names in the form of an array</td>
</tr>
<tr>
<td>options</td>
<td>Back out dependent transactions:</td>
</tr>
<tr>
<td></td>
<td>• NOCASCADE - No dependency is expected. If a dependency is found, this raises an error, with the first dependent transaction provided in the report.</td>
</tr>
<tr>
<td></td>
<td>• NOCASCADE_FORCE - The user forcibly backs out the given transactions without considering the dependent transactions. The RDBMS executes the UNDO SQL for the given transactions in reverse order of their commit times. If no constraints break, and the result is satisfactory, the user can either COMMIT the changes or else ROLL BACK.</td>
</tr>
<tr>
<td></td>
<td>• NONCONFLICT_ONLY - This option lets the user back out the changes to the nonconflicting rows of the given transactions. Note that a transaction dependency can happen due to a row conflict through either WAW or primary/unique key constraints. If the user chooses to back out only the nonconflicting rows, this does not cause any problem with database consistency, although transaction atomicity is lost. As this is a recovery operation, the user can correct the data.</td>
</tr>
<tr>
<td></td>
<td>• CASCADE - This completely removes the given transactions including their dependents in a post order fashion (reverse order of commit times).</td>
</tr>
</tbody>
</table>
Table 68-6  (Cont.) TRANSACTION_BACKOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timehint</td>
<td>Time hint on the start of the transaction</td>
</tr>
<tr>
<td>scnhint</td>
<td>SCN hint on the start of the transaction</td>
</tr>
</tbody>
</table>

Usage Notes

_for Note:_

For information about restrictions in using TRANSACTION_BACKOUT, see "Using Flashback Transaction" in the Oracle Database Development Guide.

- If transaction name is used, a time hint must be provided. The time hint should be a time before the start of all the given transactions to back out.
- If the SCN hint is provided, it must be before the start of the earliest transaction in the specified input set, or this raises an error and terminates. If it is not provided and the transaction has committed within undo retention, the database system is able to determine the start time.
The `DBMS_FLASHBACK_ARCHIVE` package contains procedures for performing various flashback tasks.

These include:

- Disassociation and reassociation of a Flashback Data Archive (FDA) enabled table from/with its underlying FDA
- Tamper-proofing the tables of an application
- Importing of user history

**Caution:**

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

- Enabling and disabling of session-level support for valid-time

**See Also:**

*Oracle Database Development Guide* for more information about "Using Flashback Data Archive (Oracle Temporal)"

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

### 69.1 DBMS_FLASHBACK_ARCHIVE Overview

Flashback Data Archive (FDA) provides strict protection on the internal history tables that it creates and maintains for users.

The read-only semantics prohibit users, including a DBA, from doing updates, deletes, and inserts on the Flashback Data Archive internal history tables. Users are also prevented from issuing any DDL statements on these tables. This strict security enforcement helps meet the requirements of applications in regulatory/compliance environments. Flashback Data Archive supports most common DDL statements, including those that alter the table definition or incur data movement. However, some
DDL statements are not supported on Flashback Data Archive-enabled tables. Since most application schemas are modified during application software upgrades, the ability to perform DDL operations on tracked tables is critical.

To support schema evolution during application upgrades and other table maintenance tasks that require use of DDL statements not supported by Flashback Data Archive, the `DBMS_FLASHBACK_ARCHIVE` package provides a set of simple-to-use PL/SQL procedures:

- To disassociate a Flashback Data Archive enabled base table from the underlying FDA
- To reassociate a temporarily disassociated base table with its underlying FDA

After a user has disassociated the base table from its FDA, it's possible to issue any DDL statements on the base table or the history tables in the FDA. Having finished with the schema changes, the user can then reassociate the base table with its FDA so that Flashback Data Archive protection is in operation and automatic tracking and archiving is resumed.

### 69.2 DBMS_FLASHBACK_ARCHIVE Security Model

Users need the `FLASHBACK_ARCHIVE_ADMINISTER` privilege to import user-generated history, to set context level, and to tamper-proof tables. After a table is disassociated, users can perform DDL and DML statements on the table if they have the necessary privileges. Enabling and disabling session-level Valid Time Temporal flashback needs no additional privileges.

### 69.3 DBMS_FLASHBACK_ARCHIVE Constants

The `DBMS_FLASHBACK_ARCHIVE` package uses the constants shown in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODROP</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Do not drop temporary history table</td>
</tr>
<tr>
<td>NOCOMMIT</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Do not commit transaction</td>
</tr>
<tr>
<td>NODELETE</td>
<td>BINARY_INTEGER</td>
<td>4</td>
<td>Do not delete data in history table</td>
</tr>
</tbody>
</table>

### 69.4 Summary of DBMS_FLASHBACK_ARCHIVE Subprograms

This table lists the `DBMS_FLASHBACK_ARCHIVE` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_TABLE_TO_APPLICATION Procedure</td>
<td>Takes an application name and adds a table to the application as a security table</td>
</tr>
</tbody>
</table>
Table 69-2  (Cont.) DBMS_FLASHBACK_ARCHIVE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_TEMP_HISTORY_TABLE Procedure</td>
<td>Creates a table called TEMP_HISTORY with the correct definition in schema.</td>
</tr>
<tr>
<td>DISABLE_APPLICATION Procedure</td>
<td>Takes an application name and marks a table in it as a security table.</td>
</tr>
<tr>
<td>DISABLE_ASOF_VALID_TIME Procedure</td>
<td>Disables session level valid-time flashback.</td>
</tr>
<tr>
<td>DISASSOCIATE_FBA Procedure</td>
<td>Disassociates the given table from the flashback data archive.</td>
</tr>
<tr>
<td>DROP_APPLICATION Procedure</td>
<td>Takes an application name and removes it from the list of applications.</td>
</tr>
<tr>
<td>ENABLE_APPLICATION Procedure</td>
<td>Takes an application name and enables Flashback Data Archive on all the security tables for this application.</td>
</tr>
<tr>
<td>ENABLE_AT_VALID_TIME Procedure</td>
<td>Enables session level valid time flashback.</td>
</tr>
<tr>
<td>EXTEND_MAPPINGS Procedure</td>
<td>Extends time mappings to times in the past.</td>
</tr>
<tr>
<td>GET_SYS_CONTEXT Function</td>
<td>Gets the context previously selected by the SET_CONTEXT_LEVEL Procedure.</td>
</tr>
<tr>
<td>IMPORT_HISTORY Procedure</td>
<td>Imports history from a table called TEMP_HISTORY in the given schema.</td>
</tr>
<tr>
<td>LOCK_DOWN_APPLICATION Procedure</td>
<td>Takes an application name and makes all the security tables read-only. The group called SYSTEM cannot be locked.</td>
</tr>
<tr>
<td>PURGE_CONTEXT Procedure</td>
<td>Purges the context to be saved selected by the SET_CONTEXT_LEVEL Procedure.</td>
</tr>
<tr>
<td>REASSOCIATE_FBA Procedure</td>
<td>Reassociates the given table with the flashback data archive.</td>
</tr>
<tr>
<td>REGISTER_APPLICATION Procedure</td>
<td>Takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening.</td>
</tr>
<tr>
<td>REMOVE_TABLE_FROM_APPLICATION Procedure</td>
<td>Takes an application name and marks a table in it as no longer being a security table.</td>
</tr>
<tr>
<td>SET_CONTEXT_LEVEL Procedure</td>
<td>Defines how much of the user context is to be saved.</td>
</tr>
</tbody>
</table>

69.4.1 ADD_TABLE_TO_APPLICATION Procedure

This procedure takes an application name and adds a table to the application as a security table. If the application is enabled for Flashback Data Archive, then this table will also be enabled for Flashback Data Archive.

**Syntax**

```sql
DBMS_FLASHBACK_ARCHIVE.ADD_TABLE_TO_APPLICATION (application_name           IN   VARCHAR2, table_name                 IN   VARCHAR2, schema_name                IN   VARCHAR2 := NULL);
```
Parameters

Table 69-3 ADD_TABLE_TO_APPLICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application for which a table has been added as a security table</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to add as a security table for the given application</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema containing the desired table. If no schema name is specified, the current schema is used.</td>
</tr>
</tbody>
</table>

69.4.2 CREATE_TEMP_HISTORY_TABLE Procedure

This procedure creates a table called TEMP_HISTORY with the correct definition in schema.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.CREATE_TEMP_HISTORY_TABLE (
  owner_name1      IN   VARCHAR2,
  table_name1      IN   VARCHAR2);
```

Parameters

Table 69-4 CREATE_TEMP_HISTORY_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name1</td>
<td>Schema of the Flashback Data Archive-enabled table</td>
</tr>
<tr>
<td>table_name1</td>
<td>Name of the Flashback Data Archive-enabled table</td>
</tr>
</tbody>
</table>

69.4.3 DISABLE_APPLICATION Procedure

This procedure takes an application name and disables Flashback Data Archive on all of its security tables.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.DISABLE_APPLICATION (
  application_name           IN   VARCHAR2);
```

Parameters

Table 69-5 DISABLE_APPLICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application whose security tables will be disabled for Flashback Data Archive</td>
</tr>
</tbody>
</table>
### 69.4.4 DISABLE_ASOF_VALID_TIME Procedure

This procedure disables session level valid-time flashback.

**Syntax**

```
DBMS_FLASHBACK_ARCHIVE.DISABLE_ASOF_VALID_TIME;
```

### 69.4.5 DISASSOCIATE_FBA Procedure

This procedure disassociates the given table from the flashback data archive.

**Syntax**

```
DBMS_FLASHBACK_ARCHIVE.DISASSOCIATE_FBA (
    owner_name     IN    VARCHAR2,
    table_name     IN    VARCHAR2);
```

**Parameters**

**Table 69-6** DISASSOCIATE_FBA Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Schema of the Flashback Data Archive enabled base table</td>
<td></td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the Flashback Data Archive enabled base table</td>
<td></td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 69-7** DISASSOCIATE_FBA Procedure Exceptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-55602</td>
<td>User table is not enabled for Flashback Data Archive</td>
<td></td>
</tr>
<tr>
<td>ORA-55634</td>
<td>Cannot acquire the lock on the table for disassociation</td>
<td></td>
</tr>
</tbody>
</table>

### 69.4.6 DROP_APPLICATION Procedure

This procedure takes an application name and removes it from the list of applications. As part of this procedure, Flashback Data Archive will be disabled on all security-enabled tables and all history data will be lost. The group called SYSTEM cannot be dropped.

**Syntax**

```
DBMS_FLASHBACK_ARCHIVE.DROP_APPLICATION (
    application_name IN VARCHAR2);
```
**Parameters**

**Table 69-8  DROP_APPLICATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application for which a table has been added as a security table</td>
</tr>
</tbody>
</table>

**69.4.7 ENABLEAPPLICATION Procedure**

This procedure takes an application name and enables Flashback Data Archive on all the security tables for this application. Once an application is enabled, every change to an FDA enabled table will be tracked.

**Syntax**

```sql
DBMS_FLASHBACK_ARCHIVE.ENABLE_APPLICATION (application_name IN VARCHAR2);
```

**Parameters**

**Table 69-9  ENABLEAPPLICATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application for which to enable Flashback Data Archive on all its security tables</td>
</tr>
</tbody>
</table>

**69.4.8 ENABLE_AT_VALID_TIME Procedure**

This procedure enables session level valid time flashback.

**Syntax**

```sql
DBMS_FLASHBACK_ARCHIVE.ENABLE_AT_VALID_TIME (level IN VARCHAR2, query_time IN TIMESTAMP DEFAULT SYSTIMESTAMP);
```

**Parameters**

**Table 69-10  ENABLE_AT_VALID_TIME Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| level         | Options:  
| query_time    | Used only if level is ASOF. Data which is valid at this query_time will only be shown. |
69.4.9 EXTEND_MAPPINGS Procedure

This procedure extends time mappings to times in the past.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.EXTEND_MAPPINGS;
```

69.4.10 GET_SYS_CONTEXT Function

This function gets the context previously selected by the SET_CONTEXT_LEVEL Procedure.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.GET_SYS_CONTEXT (
    xid            IN   RAW,
    namespace      IN   VARCHAR2,
    parameter      IN   VARCHAR2)
RETURN VARCHAR2;
```

Parameters

Table 69-11  GET_SYS_CONTEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xid</td>
<td>Transaction identifier is an opaque handle to a transaction obtained from the versions query</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace</td>
</tr>
<tr>
<td>parameter</td>
<td>If undefined, the subprogram returns NULL</td>
</tr>
</tbody>
</table>

Related Topics

- **SET_CONTEXT_LEVEL Procedure**
  This procedure defines how much of the user context is to be saved.

69.4.11 IMPORT_HISTORY Procedure

This procedure is called after invoking the CREATE_TEMP_HISTORY_TABLE procedure, and after the TEMP_HISTORY table is populated with user-generated history data

**Caution:**

Importing user-generated history can lead to inaccurate, or unreliable results. This procedure should only be used after consulting with Oracle Support.

Syntax

```
DBMS_FLASHBACK_ARCHIVE.IMPORT_HISTORY (
    owner_name1         IN   VARCHAR2,
```
Table 69-12  IMPORT_HISTORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name1</td>
<td>Schema of the Flashback Data Archive-enabled table</td>
</tr>
<tr>
<td>table_name1</td>
<td>Name of the Flashback Data Archive-enabled table</td>
</tr>
<tr>
<td>temp_history_name</td>
<td>Optional temporary history table from which we import history data</td>
</tr>
<tr>
<td>options</td>
<td>One (or a combination) of constants (NODROP, NOCOMMIT, and NODELETE) to specify if we want to drop, commit changes of, or truncate the temporary history table</td>
</tr>
</tbody>
</table>

Usage Notes

The database function TIMESTAMP_TO_SCN can be used to convert times to SCN when populating the temporary history table.

Related Topics

- CREATE_TEMP_HISTORY_TABLE Procedure
  This procedure creates a table called TEMP_HISTORY with the correct definition in schema.

69.4.12 LOCK_DOWN_APPLICATION Procedure

This procedure takes an application name and makes all the security tables read-only. The group called SYSTEM cannot be locked.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.LOCK_DOWN_APPLICATION (application_name IN VARCHAR2);
```

Parameters

Table 69-13  LOCK_DOWN_APPLICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application for which a table has been added as a security table</td>
</tr>
</tbody>
</table>
69.4.13 PURGE_CONTEXT Procedure

This procedure purges the context to be saved selected by the SET_CONTEXT_LEVEL Procedure.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.PURGE_CONTEXT;
```

Related Topics

- SET_CONTEXT_LEVEL Procedure
  This procedure defines how much of the user context is to be saved.

69.4.14 REASSOCIATE_FBA Procedure

This procedure reassociates the given table with the flashback data archive.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.REASSOCIATE_FBA (
    owner_name      VARCHAR2,
    table_name      VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Schema of the Flashback Data Archive enabled base table</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the Flashback Data Archive enabled base table</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-55602</td>
<td>User table is not enabled for Flashback Data Archive</td>
</tr>
<tr>
<td>ORA-55636</td>
<td>Table definition validation failed</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure will signal an error if the base table and the history table do not have identical data definitions. For example, when columns are added or table is split, the resulting base table and history table need to have the same schema.
- The FDA internal history table schema has some row versions metadata columns. The procedure will signal an error if any metadata column is dropped by users.
69.4.15 REGISTER_APPLICATION Procedure

This procedure takes an application name and optionally a Flashback Data Archive, and registers an application for database hardening.

When database hardening is enabled, then all the security tables for that application are enabled for Flashback Data Archive using the given Flashback Data Archive. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.

See Also:
Using Flashback Data Archive in Oracle Database Development Guide regarding database hardening

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.REGISTER_APPLICATION (  
  application_name           IN   VARCHAR2,
  flashback_archive_name     IN    VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_name</td>
<td>Name of the application which is being registered. The application SYSTEM is already registered when the package is created and is populated with list of tables needed for database hardening.</td>
</tr>
<tr>
<td>flashback_archive_name</td>
<td>Name of the Flashback Data Archive in which the historical data for the security tables for given application is stored. If no Flashback Data Archive is specified, the default Flashback Data Archive is used.</td>
</tr>
</tbody>
</table>

69.4.16 REMOVE_TABLE_FROM_APPLICATION Procedure

This procedure takes an application name and marks a table in it as no longer being a security table.

If the application is already enabled for Flashback Data Archive, Flashback Data Archive will be disabled for this table.

Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.REMOVE_TABLE_TO_APPLICATION (  
  application_name           IN   VARCHAR2,
  table_name                 IN   VARCHAR2,
  schema_name                IN   VARCHAR2 := NULL);
```
### 69.4.17 SET_CONTEXT_LEVEL Procedure

This procedure defines how much of the user context is to be saved.

#### Syntax

```sql
DBMS_FLASHBACK_ARCHIVE.SET_CONTEXT_LEVEL (level VARCHAR2);
```

#### Parameters

**Table 69-18  SET_CONTEXT_LEVEL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>Depending on how much of the user context needs to be saved:</td>
</tr>
<tr>
<td></td>
<td>- ALL - the entire SYS_CONTEXT</td>
</tr>
<tr>
<td></td>
<td>- TYPICAL - the user ID, global user ID and the hostname</td>
</tr>
<tr>
<td></td>
<td>- NONE - nothing</td>
</tr>
</tbody>
</table>
The DBMS_FREQUENT_ITEMSET package enables frequent itemset counting. The two functions are identical except in the input cursor format difference.

This chapter contains the following topics:

- Summary of DBMS_FREQUENT_ITEMSET Subprograms

### 70.1 Summary of DBMS_FREQUENT_ITEMSET Subprograms

The DBMS_FREQUENT_ITEMSET package includes the `FI_HORIZONTAL` function and `FI_TRANSACTIONAL` function subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>FI_HORIZONTAL</code> Function</td>
<td>Counts all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded</td>
</tr>
<tr>
<td><code>FI_TRANSACTIONAL</code></td>
<td>Function</td>
</tr>
<tr>
<td></td>
<td>Counts all frequent itemsets given a cursor for input data which is in 'TRANSACTIONAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded</td>
</tr>
</tbody>
</table>

### 70.1.1 FI_HORIZONTAL Function

The purpose of this table function is to count all frequent itemsets given a cursor for input data which is in 'HORIZONTAL' row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total transactions counted.

In 'HORIZONTAL' row format, each row contains all of the item ids for a single transaction. Since all of the items come together, no transaction id is necessary.

The benefit of this table function is that if an application already has data in horizontal format, the database can skip the step of transforming rows that are in transactional format into horizontal format.

**Syntax**

```sql
DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
  tranx_cursor IN SYSREFCURSOR,
  support_threshold IN NUMBER,
  itemset_length_min IN NUMBER,
  itemset_length_max IN NUMBER,
)
```
including_items IN SYS_REFCURSOR DEFAULT NULL,
excluding_items IN SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support NUMBER,
  length NUMBER,
  total_tranx NUMBER);

Parameters

Table 70-2  FI_HORIZONTAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tranx_cursor</td>
<td>The cursor parameter that the user will supply when calling the function. There is no limit on the number of returning columns. Each column of cursor represents an item. All columns of the cursor must be of the same datatype. The item id must be number or character type (for example, VARCHAR2(n)).</td>
</tr>
<tr>
<td>support_threshold</td>
<td>A fraction number of total transaction count. An itemset is termed “frequent” if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.</td>
</tr>
<tr>
<td>itemset_length_min</td>
<td>The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.</td>
</tr>
<tr>
<td>itemset_length_max</td>
<td>The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.</td>
</tr>
<tr>
<td>including_items</td>
<td>A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that are returned. The default is NULL.</td>
</tr>
<tr>
<td>excluding_items</td>
<td>A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that are returned. The default is NULL.</td>
</tr>
</tbody>
</table>

Return Values

Table 70-3  FI_HORIZONTAL Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>support</td>
<td>The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.</td>
</tr>
<tr>
<td>itemset</td>
<td>A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.</td>
</tr>
<tr>
<td>length</td>
<td>Number of items in a frequent itemset. This will be returned as a NUMBER.</td>
</tr>
<tr>
<td>total_tranx</td>
<td>The total transaction count. This will be returned as a NUMBER.</td>
</tr>
</tbody>
</table>

Example

Suppose you have a table horiz_table_in.
and the data in horiz_table_in looks as follows:

('apple', 'banana', NULL, NULL, NULL)
('apple', 'milk', 'banana', NULL, NULL)
('orange', NULL, NULL, NULL, NULL)

Suppose you want to find out what combinations of items is frequent with a given support threshold of 30%, requiring itemset containing at least one of ('apple', 'banana', 'orange'), but excluding any of ('milk') in any itemset. You use the following query:

CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT)itemset, support, length, total_tranx
FROM table(DBMS_FREQUENT_ITEMSET.FI_HORIZONTAL(
  CURSOR(SELECT iid1, iid2, iid3, iid4, iid5
          FROM horiz_table_in),
  0.3,
  2,
  5,
  CURSOR(SELECT * FROM table(FI_VARCHAR_NT
          ('apple', 'banana', 'orange'))),
  CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk')));

70.1.2 FI_TRANSACTIONAL Function

This procedure counts all frequent itemsets given a cursor for input data which is in "TRANSACTIONAL" row format, support threshold, minimum itemset length, maximum itemset length, items to be included, items to be excluded. The result will be a table of rows in form of itemset, support, length, total number of transactions.

In "TRANSACTIONAL" row format, each transaction is spread across multiple rows. All the rows of a given transaction have the same transaction id, and each row has a different item id. Combining all of the item ids which share a given transaction id results in a single transaction.

Syntax

DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL (
  tranx_cursor IN SYS_REFCURSOR,
  support_threshold IN NUMBER,
  itemset_length_min IN NUMBER,
  itemset_length_max IN NUMBER,
  including_items IN SYS_REFCURSOR DEFAULT NULL,
  excluding_items IN SYS_REFCURSOR DEFAULT NULL)
RETURN TABLE OF ROW (
  itemset [Nested Table of Item Type DERIVED FROM tranx_cursor],
  support NUMBER,
  length NUMBER,
  total_tranx NUMBER);
Parameters

Table 70-4  FI.TRANSACTIONAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tranx_cursor</td>
<td>The cursor parameter that the user will supply when calling the function. It should return two columns in its returning row, the first column being the transaction id, the second column being the item id. The item id must be number or character type (for example, VARCHAR2(n)).</td>
</tr>
<tr>
<td>support_threshold</td>
<td>A fraction number of total transaction count. An itemset is termed &quot;frequent&quot; if [the number of transactions it occurs in] divided by [the total number of transactions] exceed the fraction. The parameter must be a NUMBER.</td>
</tr>
<tr>
<td>itemset_length_min</td>
<td>The minimum length for interested frequent itemset. The parameter must be a NUMBER between 1 and 20, inclusive.</td>
</tr>
<tr>
<td>itemset_length_max</td>
<td>The maximum length for interested frequent itemset. This parameter must be a NUMBER between 1 and 20, inclusive, and must not be less than itemset_length_min.</td>
</tr>
<tr>
<td>including_items</td>
<td>A cursor from which a list of items can be fetched. At least one item from the list must appear in frequent itemsets that will be returned. The default is NULL.</td>
</tr>
<tr>
<td>excluding_items</td>
<td>A cursor from which a list of items can be fetched. No item from the list can appear in frequent itemsets that will returned. The default is NULL.</td>
</tr>
</tbody>
</table>

Return Values

Table 70-5  FI.TRANSACTIONAL Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>support</td>
<td>The number of transactions in which a frequent itemset occurs. This will be returned as a NUMBER.</td>
</tr>
<tr>
<td>itemset</td>
<td>A collection of items which is computed as frequent itemset. This will be returned as a nested table of item type which is the item column type of the input cursor.</td>
</tr>
<tr>
<td>length</td>
<td>Number of items in a frequent itemset. This will be returned as a NUMBER.</td>
</tr>
<tr>
<td>total_tranx</td>
<td>The total transaction count. This will be returned as a NUMBER, and will be the same for all returned rows, similar to a reporting aggregate.</td>
</tr>
</tbody>
</table>

Usage Notes

Applications must predefine a nested table type of the input item type and cast the output itemset into this predefined nested table type before further processing, such as loading into a table.

Examples

Suppose that the input table tranx_table_in looks as follows:
(1, 'apple')
(1, 'banana')
(2, 'apple')
(2, 'milk')
(2, 'banana')
(3, 'orange')

and the user is trying to find itemsets that satisfy a support-threshold of 60% and have
the itemset-length greater than 1 (namely, (apple, banana)).

The output of this function would contain the following output row:

itemset=('apple','banana'), support=2, length=2, total_tranz=3

You need to create a nested table of item type before you submit a query to perform
the frequent itemset counting. In this example, since item is of VARCHAR2(30), you must
create a nested table of VARCHAR2(30):

CREATE TYPE fi_varchar_nt AS TABLE OF VARCHAR2(30);
SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranz
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
  cursor(SELECT tid, iid FROM tranx_table_in),
  0.6,
  2,
  5,
  NULL,
  NULL));

Here is another example to illustrate how to include certain items and exclude certain
items in the counting.

SELECT CAST(itemset as FI_VARCHAR_NT) itemset, support, length, total_tranz
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
  CURSOR(SELECT tid, iid FROM tranx_table_in),
  0.6,
  2,
  5,
  CURSOR(SELECT * FROM table(FI_VARCHAR_NT('apple','banana','orange'))),
  CURSOR(SELECT * FROM table(FI_VARCHAR_NT('milk'))));

Using the including/excluding items parameter, you are able to further optimize the
execution by ignoring itemsets that are not expected by application.

You can also use transactional output through collection unnesting:

SELECT
  bt.setid, nt.*
FROM
  $(SELECT cast(Itemset as FI_VARCHAR_NT) itemset, rownum setid
  FROM table(
    DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
      CURSOR(SELECT tid, iid FROM tranx_table_in),
      0.6, 2, 5,
      NULL, NULL))) bt,
  table(bt.itemset) nt;

If you want to use an insert statement to load frequent itemsets into a nested table, it is
better to use the NESTED_TABLE_FAST_INSERT hint for performance:

CREATE TABLE fq_nt (coll FI_VARCHAR_NT) NESTED TABLE coll STORE AS
coll_nest;
INSERT /*+ NESTED_TABLE_FAST_INSERT */ INTO fq_nt
SELECT cast(itemset as FI_VARCHAR_NT)
FROM table(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
    cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
    NULL, NULL));

Note that if you want to use the package inside a PL/SQL cursor, you must cast the
return type of the table function:

CREATE TYPE fi_res AS OBJECT (
    itemset      FI_VARCHAR_NT,
    support      NUMBER,
    length       NUMBER,
    total_tranx  NUMBER
);
/
CREATE TYPE fi_coll AS TABLE OF fi_res;
/

DECLARE
    cursor freqC is
        SELECT Itemset
        FROM table(
            CAST(DBMS_FREQUENT_ITEMSET.FI_TRANSACTIONAL(
                cursor(SELECT tid, iid FROM tranx_table_in), 0.6, 2, 5,
                NULL, NULL) AS fi_coll))
        coll_nt  FI_VARCHAR_NT;
        num_rows int;
        num_itms int;
BEGIN
    num_rows := 0;
    num_itms := 0;
    OPEN freqC;
    LOOP
        FETCH freqC INTO coll_nt;
        EXIT WHEN freqC%NOTFOUND;
        num_rows := num_rows + 1;
        num_itms := num_itms + coll_nt.count;
    END LOOP;
    CLOSE freqC;
    DBMS_OUTPUT.PUT_LINE('Totally ' || num_rows || ' rows ' || num_itms || ' items were produced.');
END;
71

DBMS_FS

The DBMS_FS package for performing operations on an Oracle file system (make, mount, unmount and destroy operations) in an Oracle database.

This chapter contains the following topics:

• DBMS_FS Overview
• DBMS_FS Security Model
• Summary of DBMS_FS Subprograms

71.1 DBMS_FS Overview

The DBMS_FS package contains Oracle file system (OFS) procedures that you can use to create, mount, unmount, and destroy an Oracle file system.

The DBMS_FS package enables applications to access database objects from a universal client such as an NFS server. This feature interfaces with Oracle SecureFiles to provide the file system access.

See Also:
Oracle Database SecureFiles and Large Objects Developer’s Guide for a detailed description of managing an NFS server in Oracle Database

71.2 DBMS_FS Security Model

You must have the SYSDBA administrative privilege to use the DBMS_FS package.

The operations that you perform using the DBMS_FS package are equivalent to the file system operations that are performed in an operating system by the root user. Access to the individual file system that is created and mounted by this package is enforced using Access Control Lists (ACLs) and the permissions on the mounted directories to the operating system user.

71.3 Summary of DBMS_FS Subprograms

This table lists the DBMS_FS subprograms and briefly describes them.

Table 71-1    DBMS_FS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESTROY_ORACLE_FS Procedure</td>
<td>Destroys an Oracle file system, using the fstype and of name fsname</td>
</tr>
</tbody>
</table>
Table 71-1  (Cont.) DBMS_FS Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAKE.ORACLE_FS Procedure</td>
<td>Creates a file system of type specified by fstype and of name fsname</td>
</tr>
<tr>
<td>MOUNT.ORACLE_FS Procedure</td>
<td>Mounts an Oracle file system on the specified mount point</td>
</tr>
<tr>
<td>UNMOUNT.ORACLE_FS Procedure</td>
<td>Unmounts an Oracle file system on the specified mount point</td>
</tr>
</tbody>
</table>

71.3.1 DESTROY_ORACLE_FS Procedure

This procedure destroys an Oracle file system and then frees the resources that were associated with it.

Syntax

```
DBMS_FS.DESTROY_ORACLE_FS (
    fstype   IN VARCHAR2,
    fsname   IN VARCHAR2);
```

Parameters

Table 71-2  DBMS_FS Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fstype</td>
<td>File system type. Valid options are:</td>
</tr>
<tr>
<td></td>
<td>• DBFS (database file system)</td>
</tr>
<tr>
<td></td>
<td>• OFS (Oracle file system)</td>
</tr>
<tr>
<td>fsname</td>
<td>Name of the file system</td>
</tr>
</tbody>
</table>

Usage Notes

- You can find information about the currently mounted file systems by querying the V$OFSMOUNT dynamic view.
- For more information about the file system types, see the fstype description in MAKE.ORACLE_FS Procedure.
- Before you run the DBMS_FS.DESTROY_ORACLE_FS procedure, you must unmount the file system by using the DBMS_FS.UNMOUNT_ORACLE_FS procedure.
- After you run DBMS_FS.DESTROY_ORACLE_FS, Oracle Database destroys the file system and frees the associated resources.

Example

This example shows how to destroy an OFS file system:

```
BEGIN
    DBMS_FS.DESTROY_ORACLE_FS (
        fstype => 'ofs',
        fsname => 'dbfs_fs1');
```

71.3.2 MAKE_ORACLE_FS Procedure

This procedure creates a new file system of type OFS, on top of an existing Oracle tablespace or other database object.

Syntax

```sql
DBMS_FS.MAKE_ORACLE_FS (
    fstype      IN VARCHAR2,
    fsname      IN VARCHAR2,
    fsoptions   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fstype</td>
<td>File system type. Enter ofs to create an Oracle file system.</td>
</tr>
<tr>
<td>fsname</td>
<td>Name of the file system. Enter a string no longer than 256 characters, using alphanumeric characters.</td>
</tr>
<tr>
<td>fsoptions</td>
<td>Specify an existing tablespace to use for the Oracle file system, using the following format: &quot;tablespace=tablespace_name&quot;</td>
</tr>
</tbody>
</table>

Usage Notes

- If you want to create a database file system (DBFS), then you must run the `dbfs_create_filesystem.sql` script, which in turn calls the `dbfs_create_filesystem_advanced.sql` script. By default, this script is in the `$ORACLE_HOME/rdbms/admin` directory. When you run this script, provide the name of an existing tablespace and a name for the file system that will be stored in the database. The size of the file system will be the same as the table size. For example, to create a file system in the `dbfs_ts` tablespace, in the file system `dbfs_tab`:

  ```sql
  @/$ORACLE_HOME/rdbms/admin/dbfs_create_filesystem.sql dbfs_ts dbfs_tab
  ```

  After you run this script, you can use the other procedures in the `DBMS_FS` package to mount, unmount, and destroy the file system.

- Running the `DBMS_FS.MAKE_ORACLE_FS` procedure on the database instance is equivalent to running the `mkfs` command by root in an operating system.

- The tablespace that you specified in the `fsoptions` parameter must already exist before you execute the `DBMS_FS.MAKE_ORACLE_FS` procedure. To find existing tablespaces, query the `DBA_TABLESPACES` data dictionary view.

- The size of the file system is the same size as this tablespace.
Example

This example shows how to create an OFS file system:

BEGIN
    DBMS_FS.MAKE_ORACLE_FS (
        fstype => 'ofs',
        fsname => 'ofs_fs1',
        mount_options => 'TABLESPACE=ofs_fs1_tbspc');
END;
/

71.3.3 MOUNT_ORACLE_FS Procedure

This procedure mounts an Oracle file system on the specified mount point.

Syntax

DBMS_FS.MOUNT_ORACLE_FS (
    fstype           IN VARCHAR2,
    fsname           IN VARCHAR2,
    mount_point      IN VARCHAR2,
    mount_options    IN VARCHAR2);

Parameters

Table 71-4  MOUNT_ORACLE_FS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fstype</td>
<td>File system type. Valid options are:</td>
</tr>
<tr>
<td></td>
<td>- DBFS (database file system)</td>
</tr>
<tr>
<td></td>
<td>- OFS (Oracle file system)</td>
</tr>
<tr>
<td>fsname</td>
<td>Name of the file system. Enter a string no longer than 256 characters, using alphanumeric characters.</td>
</tr>
<tr>
<td>mount_point</td>
<td>Local directory where the file system should be mounted. This directory must already exist. Enter an absolute path. The maximum number of mount points that you can create is 64.</td>
</tr>
<tr>
<td>mount_options</td>
<td>Comma-separated mount options, listed in Table 71-5.</td>
</tr>
</tbody>
</table>

Usage Notes

Table 71-5  Supported Mount Options for the MOUNT_ORACLE_FS procedure

<table>
<thead>
<tr>
<th>Mount Option</th>
<th>Usage Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default_permissions</td>
<td>Enables permission check and restrict access based on file mode. This option is useful with the allow_other mount option.</td>
</tr>
</tbody>
</table>
Table 71-5  (Cont.) Supported Mount Options for the MOUNT_ORACLE_FS procedure

<table>
<thead>
<tr>
<th>Mount Option</th>
<th>Usage Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_other</td>
<td>Allows other users apart from the operating system user that did the mount can access the files. This will be used in conjunction with permission checks in determining the file access. This option requires setting the user_allow_other parameter in the /etc/fuse.conf configuration file on Linux.</td>
</tr>
<tr>
<td>max_read</td>
<td>Maximum size of the read operation. No maximum size is set by default.</td>
</tr>
<tr>
<td>max_write</td>
<td>Maximum write size in a single request. The default is 128K.</td>
</tr>
<tr>
<td>direct_io</td>
<td>Indicates to the operating system kernel not use file system cache.</td>
</tr>
<tr>
<td>noperpersist</td>
<td>Does not store the mount options for use in next instance startup.</td>
</tr>
<tr>
<td>persist</td>
<td>Stores the mount entry persistently so that on subsequent instance startup it will be automatically mounted again.</td>
</tr>
<tr>
<td>ro</td>
<td>Mounts the file system in read-only mode. Files cannot be modified.</td>
</tr>
<tr>
<td>rw</td>
<td>Mounts the file system as read-write. This is the default.</td>
</tr>
<tr>
<td>nosuid</td>
<td>Specifies that the file system cannot contain set userid files.</td>
</tr>
<tr>
<td>suid</td>
<td>Specifies that the file system can contain set userid files. This is the default.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure makes the files system visible in the local database instance.
- For more information about the file system types, see the fstype description in MAKE_ORACLE_FS Procedure.
- You can find information about currently mounted file systems by querying the V$OFSMOUNT dynamic view.
- Run the DBMS_FS.MOUNT_ORACLE_FS procedure on a file system that has already been created with DBMS_FS.MAKE_ORACLE_FS in the local computer node where the Oracle database instance is running. You cannot run this procedure on file systems that were created outside of Oracle Database.

Example

BEGIN
DBMS_FS.MOUNT_ORACLE_FS (  
    fstype      => 'dbfs',  
    fsname      => 'dbfs_fs1',  
    mount_point => '/oracle/dbfs/testfs',  
    mount_options => 'default_permissions, allow_other, persist');
END;

71.3.4 UNMOUNT_ORACLE_FS Procedure

This procedure unmounts an Oracle file system on the specified mount point.

Syntax

```sql
DBMS_FS.UNMOUNT_ORACLE_FS (  
    fsname        IN VARCHAR2,  
    mount_point   IN VARCHAR2,  
    unmount_options IN VARCHAR2);
```

Table 71-6  UNMOUNT_ORACLE_FS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fsname</td>
<td>Name of the file system</td>
</tr>
<tr>
<td>mount_point</td>
<td>Local directory where the file system had been mounted. Enter an absolute path.</td>
</tr>
<tr>
<td>unmount_options</td>
<td>Optionally, enter force to unmount the file system forcibly. This setting prevents new requests from being sent to the file system. All pending requests on the file system are either completed or cancelled. If you omit this setting, then attempts to unmount a busy file system cause an EBUSY error.</td>
</tr>
</tbody>
</table>

Usage Notes

- Before you unmount the file system, ensure that all applications that use this file system are shut down. Also ensure that no processes reference the mounting file system.
- You can find information about the currently mounted file systems by querying the V$OFSMOUNT dynamic view.
- For more information about the file system types, see the fstype description in MAKE_ORACLE_FS Procedure.
- When an Oracle instance is shut down in normal immediate mode, then all the mounted file systems are automatically unmounted.
- If a file system is mounted from the operating system level with the persist option of the `mount` command, it is automatically mounted again when the database instance starts. If this file system is unmounted by executing `DBMS_FS.UNMOUNT_ORACLE_FS`, then it is not automatically mounted when the database instance starts.
- If you perform a `SHUTDOWN ABORT`, then the file system may still show as mounted but not accessible. In this case, you must unmount the system manually by calling `unmount` command at the operating system level or `fusermount` procedure on Linux systems.
- You can export the local mount point of an Oracle file system to point to the remote system, and then NFS mount the file system from the remote system by using the operating system `mount` command. The `DBMS_FS.MOUNT_ORACLE_FS` procedure is similar to `mount` commands that are used for other local file systems.
• For better security, Oracle recommends that you use access control lists (ACLs) and Kerberos to control access to sensitive data.

• Do not attempt to unmount the file system from the operating system level. Doing so can leave the Oracle Database-created file system internal tables in an inconsistent state.

Example

BEGIN
    DBMS_FS.UNMOUNT_ORACLE_FS (
        fsname => 'dbfs_fs1',
        mount_point => '/oracle/dbfs/testfs',
        mount_options => 'force');
END;
The `DBMS_GOLDENGATE_ADM` package provides subprograms to configure and manage Oracle GoldenGate conflict detection and resolution.

This chapter contains the following topics:
- Using `DBMS_GOLDENGATE_ADM`
- Summary of `DBMS_GOLDENGATE_ADM` Subprograms

### 72.1 Using `DBMS_GOLDENGATE_ADM`

This section contains topics which relate to using the `DBMS_GOLDENGATE_ADM` package.
- `DBMS_GOLDENGATE_ADM` Overview
- `DBMS_GOLDENGATE_ADM` Security Model

#### 72.1.1 `DBMS_GOLDENGATE_ADM` Overview

The `DBMS_GOLDENGATE_ADM` package provides interfaces to configure automatic conflict detection and resolution in an Oracle GoldenGate configuration that replicates tables between Oracle databases.

When more than one replica of a table allows changes to the table, a conflict can occur when a change is made to the same row in two different databases at nearly the same time. Oracle GoldenGate replicates changes using row logical change records (LCRs). It detects a conflict by comparing the old values in the row LCR with the current values of the corresponding table row identified by the key columns. If any column value does not match, then there is a conflict. After a conflict is detected, Oracle GoldenGate can resolve the conflict by overwriting values in the row with some values from the row LCR, ignoring the values in the row LCR, or computing a delta to update the row values.

XStream inbound servers and outbound servers can be used in an XStream configuration in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

---

**Note:**

Using XStream requires purchasing a license for the Oracle GoldenGate product.
72.1.2 DBMS_GOLDENGATE_ADM Security Model

Security on this package can be controlled either by granting EXECUTE on this package to selected users or roles or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

An Oracle GoldenGate administrator must be configured at each Oracle database in the table's replication environment, and Oracle GoldenGate must be configured to replicate the table at each Oracle database. You can configure an Oracle GoldenGate administrator using the GRANT_ADMIN_PRIVILEGE procedure in the DBMS_GOLDENGATE_ADM package.

See Also:
• The Oracle GoldenGate documentation for more information about Oracle GoldenGate replication and configuring an Oracle GoldenGate administrator.

72.2 Summary of DBMS_GOLDENGATE_ADM Subprograms

</tr>
<tr>
<td>REMOVE_AUTO_CDR_DELTA_RES Procedure</td>
<td>Removes Oracle GoldenGate automatic conflict detection and delta resolution for the column</td>
</tr>
</tbody>
</table>

髻 Note:

All procedures commit unless specified otherwise.

72.2.1 ADD_AUTO_CDR Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and resolution for a table.

The conflict detection and resolution configured by this procedure is based on the timestamp of the changes. The procedure adds one or more hidden columns of TIMESTAMP type to the table, and each hidden column is counted against the limit of 1,000 columns for each table.

The procedure automatically places the columns in the table into a default column group and into an unconditional supplemental log group, excluding nonscalar columns. To create column groups that include a subset of the columns in the table, use the ADD_AUTO_CDR_COLUMN_GROUP procedure in this package.

Syntax

```sql
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR(
    schema_name             IN VARCHAR2,
    table_name              IN VARCHAR2,
    resolution_granularity  IN VARCHAR2 DEFAULT 'ROW',
    existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    tombstone_deletes       IN BOOLEAN DEFAULT TRUE,
    fetchcols               IN BOOLEAN DEFAULT TRUE,
    record_conflicts        IN BOOLEAN DEFAULT FALSE,
    use_custom_handlers     IN BINARY_INTEGER DEFAULT 0);
```
Parameters

<tr>
<td>use_custom_handlers</td>
<td>0, the default, indicates that automatic conflict handlers are used. 1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the SET_DML_HANDLER procedure in the DBMS_APPLY_ADM package.</td>
</tr>
</tbody>
</table>

---

72.2.2 ADD_AUTO_CDR_COLUMN_GROUP Procedure

This procedure adds a column group to a table that is configured for Oracle GoldenGate automatic conflict detection and resolution.

For a table that has been configured for timestamp conflict detection and resolution, this procedure adds a column group that includes a specified subset of columns in the table. Any columns in the table that are not part of a column group remain in the default column group for the table.

When you add a column group to a table, conflict detection and resolution is performed on the columns in the column group separately from the other columns in the table. Column groups enable different databases to update different columns in the same row at nearly the same time without causing a conflict.
For example, a replicated table that contains employee information might have a salary column and a bonus column as well as other columns that identify the employee and a location column for the employees office number. Assume that one department in the company updates its database to change the employee's salary while another department updates its database to change the employee's location. If the salary and bonus columns are in a column group, these changes are applied to the replicated table in each database without requiring conflict resolution.

The procedure automatically places the columns in the column group into an unconditional supplemental log group, excluding nonscalar columns.

Before this procedure can be run on a table, the `DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR` procedure must be run in the table with `ROW` specified for the `resolution_granularity` parameter.

**Syntax**

```sql
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_COLUMN_GROUP(
    schema_name             IN VARCHAR2,
    table_name              IN VARCHAR2,
    column_list             IN VARCHAR2,
    column_group_name       IN VARCHAR2 DEFAULT NULL,
    existing_data_timestamp IN TIMESTAMP WITH TIME ZONE DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>schema_name</code></td>
<td>The name of the table’s schema.</td>
</tr>
<tr>
<td><code>table_name</code></td>
<td>The name of the table.</td>
</tr>
<tr>
<td><code>column_list</code></td>
<td>Group of columns for which the conflict detection and resolution is configured. Specify the columns in a comma-separated list. The same column cannot be in more than one column group. Also, the same column cannot be in a column group and specified in a delta resolution.</td>
</tr>
<tr>
<td><code>column_group_name</code></td>
<td>The name of the column group. If NULL, the column group name is system generated.</td>
</tr>
<tr>
<td><code>existing_data_timestamp</code></td>
<td>The time value for the added <code>TIMESTAMP</code> columns for existing table data.</td>
</tr>
</tbody>
</table>

### 72.2.3 ADD_AUTO_CDR_DELTA_RES Procedure

This procedure configures Oracle GoldenGate automatic conflict detection and delta resolution for the column.

The resolution method does not depend on a timestamp or an extra resolution column. With delta conflict resolution, the conflict is resolved by adding the difference between the new and old values in the LCR to the value in the table. For example, if a bank balance is updated at two sites concurrently, then the converged value accounts for all debits and credits. This resolution method is generally used for financial data such as an account balance.
The procedure automatically places the column into an unconditional supplemental log group.

Before this procedure can be run on a table, the `DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR` procedure must be run in the table with `ROW` specified for the `resolution_granularity` parameter.

**Syntax**

```sql
DBMS_GOLDENGATE_ADM.ADD_AUTO_CDR_DELTA_RES(
    schema_name IN VARCHAR2,
    table_name  IN VARCHAR2,
    column_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the table's schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column.</td>
</tr>
</tbody>
</table>

The specified column must be a `NUMBER` or `FLOAT` data type column. The same column cannot be in a column group.

### 72.2.4 ALTER_AUTO_CDR Procedure

This procedure alters the Oracle GoldenGate automatic conflict detection and resolution for a table.

**Syntax**

```sql
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR(
    schema_name             IN VARCHAR2,
    table_name              IN VARCHAR2,
    tombstone_deletes       IN BOOLEAN DEFAULT NULL,
    fetchcols               IN BOOLEAN DEFAULT NULL,
    record_conflicts        IN BOOLEAN DEFAULT NULL,
    use_custom_handlers     IN BINARY_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the table's schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>tombstone_deletes</td>
<td></td>
</tr>
<tr>
<td>fetchcols</td>
<td></td>
</tr>
<tr>
<td>record_conflicts</td>
<td></td>
</tr>
<tr>
<td>use_custom_handlers</td>
<td></td>
</tr>
</tbody>
</table>
Table 72-5  (Cont.) ALTER_AUTO_CDR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| tombstone_deletes | TRUE tracks deleted rows in a tombstone table. Tracking deleted rows might be required to detect and resolve some conflicts, but tracking deleted rows requires additional database resources.  
FALSE does not track deleted rows in a tombstone table.  
NULL retains the current setting for the parameter. |
| fetchcols       | TRUE fetches the value of nonscalar columns during conflict detection and resolution.  
FALSE does not fetch the value of nonscalar columns during conflict detection and resolution.  
NULL retains the current setting for the parameter. |
| record_conflicts | TRUE records the conflict.  
FALSE does not record the conflict.  
NULL retains the current setting for the parameter. |
| use_custom_handlers | 0 indicates that automatic conflict handlers are used.  
1 indicates that automatic conflict handlers are not used and that a custom error handler must be specified using the SET_DML_HANDLER procedure in the DBMS_APPLY_ADM package.  
NULL, the default, retains the current setting for the parameter. |

72.2.5 ALTER_AUTO_CDR_COLUMN_GROUP Procedure

This procedure alters a column group for Oracle GoldenGate automatic conflict detection and resolution.

Syntax

```
DBMS_GOLDENGATE_ADM.ALTER_AUTO_CDR_COLUMN_GROUP(
    schema_name        IN VARCHAR2,
    table_name         IN VARCHAR2,
    column_group_name  IN VARCHAR2,
    add_column_list    IN VARCHAR2,
    remove_column_list IN VARCHAR2);
```

Parameters

Table 72-6  ALTER_AUTO_CDR_COLUMN_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the table’s schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table.</td>
</tr>
<tr>
<td>column_group_name</td>
<td>The name of the column group.</td>
</tr>
<tr>
<td>add_column_list</td>
<td>A comma-separated list of columns to add to the column group.</td>
</tr>
</tbody>
</table>
Table 72-6  (Cont.) ALTER_AUTO_CDR_COLUMN_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_column_list</td>
<td>A comma-separated list of columns to remove from the column group.</td>
</tr>
</tbody>
</table>

72.2.6 DELETE_PROCREP_EXCLUSION_OBJ Procedure

This procedure deletes a database object from the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

⚠️ **Caution:**

Run the `DELETE_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

Syntax

```sql
DBMS_GOLDENGATE_ADM.DELETE_PROCREP_EXCLUSION_OBJ(
    package_owner     IN VARCHAR2 DEFAULT NULL,
    package_name      IN VARCHAR2 DEFAULT NULL,
    object_owner      IN VARCHAR2 DEFAULT NULL,
    object_name       IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 72-7  DELETE_PROCREP_EXCLUSION_OBJ Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>package_owner</td>
<td>The owner of the package.</td>
</tr>
<tr>
<td>package_name</td>
<td>The name of the package.</td>
</tr>
<tr>
<td>object_owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>
72.2.7 GG_PROCEDURE_REPLICATION_ON Function

This function returns 1 if Oracle GoldenGate procedural replication is enabled and returns 0 if it is disabled.

Syntax

```sql
DBMS_STREAMS.GG_PROCEDURE_REPLICATION_ON
RETURN NUMBER;
```

72.2.8 INSERT_PROCREP_EXCLUSION_OBJ Procedure

This procedure inserts a database object into the exclusion list for Oracle GoldenGate procedural replication.

When a database object is on the exclusion list for Oracle GoldenGate procedural replication, execution of subprogram in the package is not replicated if the subprogram operates on the excluded object. For example, if `hr.employees` is an excluded database object for the `DBMS_REDEFINITION` package, then an execution of the `DBMS_REDEFINITION.START_REDEF_TABLE` procedure on the `hr.employees` table is not replicated.

⚠️ **Caution:**

Run the `INSERT_PROCREP_EXCLUSION_OBJ` procedure only under the direction of Oracle Support.

Syntax

```sql
DBMS_GOLDENGATE_ADM.INSERT_PROCREP_EXCLUSION_OBJ(
    package_owner     IN VARCHAR2 DEFAULT NULL,
    package_name      IN VARCHAR2 DEFAULT NULL,
    object_owner      IN VARCHAR2 DEFAULT NULL,
    object_name       IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>package_owner</td>
<td>The owner of the package.</td>
</tr>
<tr>
<td>package_name</td>
<td>The name of the package.</td>
</tr>
<tr>
<td>object_owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>
72.2.9 PURGE_TOMBSTONES Procedure

This procedure purges rows that were deleted before the specified timestamp from the tombstone table.

Syntax

```
DBMS_GOLDENGATE_ADM.PURGE_TOMBSTONES(
    purge_timestamp IN TIMESTAMP WITH TIME ZONE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge_timestamp</td>
<td>The timestamp before which records are purged.</td>
</tr>
</tbody>
</table>

72.2.10 REMOVE_AUTO_CDR Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and resolution for a table.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR(
    schema_name             IN VARCHAR2,
    table_name              IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the table’s schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table.</td>
</tr>
</tbody>
</table>

72.2.11 REMOVE_AUTO_CDR_COLUMN_GROUP Procedure

This procedure removes a column group that was configured for Oracle GoldenGate automatic conflict detection and resolution.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_COLUMN_GROUP(
    schema_name             IN VARCHAR2,
    table_name              IN VARCHAR2,
    column_group_name       IN VARCHAR2);
```
72.2.12 REMOVE_AUTO_CDR_DELTA_RES Procedure

This procedure removes Oracle GoldenGate automatic conflict detection and delta resolution for the column.

Syntax

```
DBMS_GOLDENGATE_ADM.REMOVE_AUTO_CDR_DELTA_RES(
    schema_name IN VARCHAR2,
    table_name  IN VARCHAR2,
    column_name IN VARCHAR2);
```

Parameters

<td>The name of the column.</td>
</tr>
</tbody>
</table>
The DBMS_GOLDENGATE_AUTH package provides subprograms for granting privileges to and revoking privileges from GoldenGate administrators.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_GOLDENGATE_AUTH Subprograms

See Also:
- GRANT_ADMIN_PRIVILEGE Procedure in the DBMS_XSTREAM_AUTH package

73.1 DBMS_GOLDENGATE_AUTH Overview

This package provides subprograms for granting privileges to GoldenGate administrators and revoking privileges from GoldenGate administrators. A GoldenGate administrator manages an integrated GoldenGate and XStream Out configuration.

GoldenGate administrators can be used in a multitenant container database (CDB). A CDB is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs).

See Also:
- GRANT_ADMIN_PRIVILEGE Procedure in the DBMS_XSTREAM_AUTH package
- Oracle Database XStream Guide
- Oracle Database Concepts for more information about CDBs and PDBs

73.2 DBMS_GOLDENGATE_AUTH Security Model

Security on this package can be controlled by granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

The user executing the subprograms in the DBMS_GOLDENGATE_AUTH package must have SYSDBA administrative privilege, and the user must exercise the privilege using AS SYSDBA at connect time.
If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

To ensure that the user who runs the subprograms in this package has the necessary privileges, connect as an administrative user who can create users, grant privileges, and create tablespaces when using this package.

## 73.3 Summary of DBMS_GOLDENGATE_AUTH Subprograms

The DBMS_XSTREAM_AUTH package includes the `GRANT_ADMIN_PRIVILEGE` procedure and `REVOKE_ADMIN_PRIVILEGE` procedure subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANT_ADMIN_PRIVILEGE Procedure</strong></td>
<td>Either grants the privileges needed by a user to be a GoldenGate administrator directly, or generates a script that grants these privileges</td>
</tr>
<tr>
<td><strong>REVOKE_ADMIN_PRIVILEGE Procedure</strong></td>
<td>Either revokes GoldenGate administrator privileges from a user directly, or generates a script that revokes these privileges</td>
</tr>
</tbody>
</table>

### 73.3.1 GRANT_ADMIN_PRIVILEGE Procedure

This procedure grants the privileges needed by a user to be a GoldenGate administrator.

### Syntax

```
DBMS_GOLDENGATE_AUTH.GRANT_ADMIN_PRIVILEGE(
    grantee                   IN  VARCHAR2,
    privilege_type            IN  VARCHAR2  DEFAULT '***',
    grant_select_privileges   IN  BOOLEAN  DEFAULT TRUE,
    do_grants                 IN  BOOLEAN  DEFAULT TRUE,
    file_name                 IN  VARCHAR2  DEFAULT NULL,
    directory_name            IN  VARCHAR2  DEFAULT NULL
)
```
grant_optional_privileges IN VARCHAR2 DEFAULT NULL,
container IN VARCHAR2 DEFAULT 'CURRENT');

Parameters

</thead>
<tbody>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
</tbody>
</table>
| grant_optional_privileges | A comma-separated list of optional privileges to grant to the grantee. You can specify the following roles and privileges:  
  - XDBADMIN  
  - DV_XSTREAM_ADMIN  
  - DV_GOLDENGATE_ADMIN  
  - EXEMPT_ACCESS_POLICY  
  - EXEMPT_REDACTION_POLICY |
| container            | If CURRENT, then grants privileges to the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB.  
If ALL, then grants privileges to the grantee in all containers in the CDB and all PDBs created after the procedure is invoked. To specify ALL, the procedure must be invoked in the root by a common user.  
If a container name, then grants privileges to the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root.  
**Note:** This parameter only applies to CDBs. |

Usage Notes

The user who runs the procedure must be an administrative user who can grant privileges to other users.

Specifically, the procedure grants the following privileges to the specified user:

- The **RESTRICTED SESSION** system privilege
- **EXECUTE** on the following packages:
  - DBMS_APPLY_ADM
  - DBMS_AQ
  - DBMS_AQADM
  - DBMS_AQIN
  - DBMS_AQELM
  - DBMS_CAPTURE_ADM
  - DBMS_FLASHBACK
  - DBMS_LOCK
• Privileges to enqueue messages into and dequeue messages from any queue
• Privileges to manage any queue
• Privileges to create, alter, and execute any of the following types of objects in the user's own schema and in other schemas:
  – Evaluation contexts
  – Rule sets
  – Rules
In addition, the grantee can grant these privileges to other users.
• SELECT_CATALOG_ROLE
• SELECT or READ privilege on data dictionary views related to GoldenGate and Oracle Streams
• The ability to allow a remote GoldenGate administrator to perform administrative actions through a database link by connecting to the grantee
  This ability is enabled by running the GRANT_REMOTE_ADMIN_ACCESS procedure in this package.

Note:
This procedure grants only the privileges necessary to configure and administer a GoldenGate environment. You can grant additional privileges to the grantee if necessary.

See Also:
GRANT_ADMIN_PRIVILEGE Procedure in the DBMS_XSTREAM_AUTH package
73.3.2 REVOKE_ADMIN_PRIVILEGE Procedure

This procedure revokes GoldenGate administrator privileges from a user.

Syntax

```sql
DBMS_GOLDENGATE_AUTH.REVOKE_ADMIN_PRIVILEGE(
  grantee                     IN  VARCHAR2,
  privilege_type              IN  VARCHAR2  DEFAULT '*',
  revoke_select_privileges    IN  BOOLEAN   DEFAULT FALSE,
  do_revokes                  IN  BOOLEAN   DEFAULT TRUE,
  file_name                   IN  VARCHAR2  DEFAULT NULL,
  directory_name              IN  VARCHAR2  DEFAULT NULL,
  revoke_optional_privileges  IN  VARCHAR2  DEFAULT NULL,
  container                   IN  VARCHAR2  DEFAULT 'CURRENT');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee</td>
<td>The user from whom privileges are revoked</td>
</tr>
<tr>
<td>privilege_type</td>
<td>Specify one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• CAPTURE</td>
</tr>
<tr>
<td></td>
<td>Specifying CAPTURE revokes the minimum privileges required by the user to</td>
</tr>
<tr>
<td></td>
<td>administer Oracle GoldenGate integrated extract.</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>SELECT_CATALOG_ROLE enables the user to select from the data dictionary.</td>
</tr>
</tbody>
</table>
Table 73-3 (Cont.) REVOKE_ADMIN_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>do_revokes</td>
<td>If TRUE, then the procedure revokes the privileges from the specified user directly, and removes the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. If the user does not have a record in this data dictionary view, then the procedure does not remove a record from the view, and no error is raised. If TRUE and any of the revoke statements fails, then the procedure raises an error. A revoke statement fails if the user is not granted the privilege that is being revoked. If FALSE, then the procedure does not revoke the privileges from the specified user directly, and does not remove the user from the DBA_XSTREAM_ADMINISTRATOR data dictionary view. You specify FALSE when the procedure is generating a file that you will run later. If you specify FALSE and either the file_name or directory_name parameter is NULL, then the procedure does not raise an error.</td>
</tr>
<tr>
<td>file_name</td>
<td>The name of the file generated by this procedure. The file contains all of the statements that revoke the privileges. If a file with the specified file name exists in the specified directory name, then the revoke statements are appended to the existing file. If NULL, then the procedure does not generate a file.</td>
</tr>
<tr>
<td>directory_name</td>
<td>The directory into which the generated file is placed. The specified directory must be a directory object created using the SQL statement CREATE DIRECTORY. If you specify a directory, then the user who invokes the procedure must have the WRITE privilege on the directory object. If the file_name parameter is NULL, then this parameter is ignored, and the procedure does not generate a file. If NULL and the file_name parameter is non-NULL, then the procedure raises an error.</td>
</tr>
<tr>
<td>revoke_optional_privileges</td>
<td>A comma-separated list of optional privileges to revoke from the grantee, such as the DV_XSTREAM_ADMIN and DV_GOLDENGATE_ADMIN privileges</td>
</tr>
<tr>
<td>container</td>
<td>If CURRENT, then revokes privileges from the grantee only in the container where the procedure is invoked. CURRENT can be specified while connected to the root or to a PDB. If ALL, then revokes privileges from the grantee in all containers in the CDB. To specify ALL, the procedure must be invoked in the root. If a container name, then revokes privileges from the grantee only in the specified container. To specify root, use CDB$ROOT while connected to the root. To specify a PDB, the procedure must be invoked in the root. Note: This parameter only applies to CDBs.</td>
</tr>
</tbody>
</table>

Usage Notes

The user who runs this procedure must be an administrative user who can revoke privileges from other users. Specifically, this procedure revokes the privileges granted by running the GRANT_ADMIN_PRIVILEGE procedure in this package.
See Also:

"GRANT_ADMIN_PRIVILEGE Procedure"
The DBMS_HADOOP package provides a PL/SQL procedure called CREATE_EXTDDL_FOR_HIVE(), that creates an Oracle external table for a given hive table.

Big Data SQL needs to be correctly set up for DBMS_HADOOP to work.

This chapter contains the following topics:
- DBMS_HADOOP Overview
- DBMS_HADOOP Security Model
- Summary of DBMS_HADOOP Subprograms

### 74.1 DBMS_HADOOP Overview

The DBMS_HADOOP package provides two procedures for creating an Oracle external table and for synchronizing the Oracle external table partitions.

These procedures are:
- CREATE_EXTDDL_FOR_HIVE() — creates an Oracle external table for a given hive table
- SYNCHRONIZE_PARTITIONS_FOR_HIVE() — helps to synchronize the Oracle external table partitions with those in the corresponding hive table

### 74.2 DBMS_HADOOP Security Model

Users must have ALTER privileges on the table for modifying external table parameters. In addition the ALTER privileges, users must have READ privileges for the directory object that contains the external data source and WRITE privileges for the directory objects containing bad, log, and discard files.

Similar privileges are applicable to the partitioned external tables.

### 74.3 Summary of DBMS_HADOOP Subprograms

DBMS_HADOOP includes the CREATE_EXTDDL_FOR_HIVE procedure and SYNC_PARTITIONS_FOR_HIVE procedure subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_EXTDDL_FOR_HIVE Procedure</td>
<td>Given a hive table name, creates a text of DDL that can be executed to create an external table corresponding to the hive table</td>
</tr>
<tr>
<td>SYNC_PARTITIONS_FOR_HIVE Procedure</td>
<td>Synchronizes the existing partitioning definition of a hive table in Oracle catalog</td>
</tr>
</tbody>
</table>
74.3.1 CREATE_EXTDDL_FOR_HIVE Procedure

This procedure creates an Oracle external table for a given hive table.

Syntax

```sql
DBMS_HADOOP.CREATE_EXTDDL_FOR_HIVE (  
  cluster_id         IN  VARCHAR2,  
  db_name            IN  VARCHAR2 := NULL,  
  hive_table_name    IN  VARCHAR2,  
  hive_partition     IN  BOOLEAN,  
  table_name         IN  VARCHAR2 := NULL,  
  perform_DDL        IN  BOOLEAN := FALSE,  
  text_of_DDL        OUT CLOB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cluster_id</td>
<td>Hadoop cluster ID</td>
</tr>
<tr>
<td>hive_db_name</td>
<td>Database where the hive table is located</td>
</tr>
<tr>
<td>hive_table_name</td>
<td>Name of the hive table</td>
</tr>
<tr>
<td>hive_partition</td>
<td>If this argument is TRUE and if the original hive table is partitioned, the corresponding Oracle external table will also be partitioned using the same partition key(s). If the original hive table is not partitioned, hive_partition=TRUE has no effect. If hive_partition=FALSE, the corresponding Oracle external table will not be partitioned even if the original hive table is partitioned.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the Oracle external table</td>
</tr>
<tr>
<td>perform_DDL</td>
<td>If this argument is TRUE, the external table will be automatically created. Otherwise, only the textual representation of the DDL statement will be generated and returned in text_of_DDL.</td>
</tr>
<tr>
<td>text_of_DDL</td>
<td>If the argument perform_DDL is FALSE, only the textual representation of the DDL statement will be generated and returned in text_of_DDL.</td>
</tr>
</tbody>
</table>

74.3.2 SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure

This procedure synchronizes the Oracle external table partitions with those in the corresponding hive table.

Syntax

```sql
DBMS_HADOOP.SYNCHRONIZE_PARTITIONS_FOR_HIVE (  
  table_name     IN  VARCHAR2,  
  table_owner    IN  VARCHAR2);
```
### Parameters

Table 74-3  SYNCHRONIZE_PARTITIONS_FOR_HIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Oracle external table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Schema name</td>
</tr>
</tbody>
</table>

DBMS_HANG_MANAGER

The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.

This chapter contains the following topics:

• DBMS_HANG_MANAGER Overview
• DBMS_HANG_MANAGER Security Model
• DBMS_HANG_MANAGER Constants
• DBMS_HANG_MANAGER Exceptions
• Summary of DBMS_HANG_MANAGER Subprograms

75.1 DBMS_HANG_MANAGER Overview

The DBMS_HANG_MANAGER package provides a method of changing some Hang Manager configuration parameters.

Hang Manager is always enabled on all databases, Automatic Storage Management (ASM) disk groups, and single instance systems (when not using Oracle RAC). Hang resolution is enabled on all instances by default except for single instance systems (when not using Oracle RAC) where it is disabled and cannot be enabled at this time.

Note:
The 
DBMS_HANG_MANAGER
package is intended for use by database administrators (DBA) only. It is not intended for use by application developers.

75.2 DBMS_HANG_MANAGER Security Model

DBMS_HANG_MANAGER can only be run as the 
SYS
user.

75.3 DBMS_HANG_MANAGER Constants

The table in this topic lists DBMS_HANG_MANAGER package constants.

Table 75-1  DBMS_HANG_MANAGER Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RESOLUTION_SCOPE</td>
<td>VARCHAR2</td>
<td>resolution scope</td>
<td>Resolution scope parameter name</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------</td>
<td>----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SENSITIVITY</td>
<td>VARCHAR2</td>
<td>sensitivity</td>
<td>Sensitivity parameter name</td>
</tr>
<tr>
<td>BASE_FILE_SIZE_LIMIT</td>
<td>VARCHAR2</td>
<td>base file size limit</td>
<td>Base file size limit parameter name. The default value of this parameter is 100 MB.</td>
</tr>
<tr>
<td>BASE_FILE_SET_COUNT</td>
<td>VARCHAR2</td>
<td>base file set count</td>
<td>Base file set count parameter name. The default value is 5 trace files in the circular trace file set.</td>
</tr>
<tr>
<td>LWS_FILE_SIZE_LIMIT</td>
<td>VARCHAR2</td>
<td>long waiting session file size limit</td>
<td>Long waiting session file size limit parameter name. The default value of this parameter is 100 MB.</td>
</tr>
<tr>
<td>LWS_FILE_SET_COUNT</td>
<td>VARCHAR2</td>
<td>long waiting session set count</td>
<td>Long waiting session set count parameter name. The default value is 5 trace files in the circular trace file set.</td>
</tr>
<tr>
<td>RESOLUTION_SCOPE_PROCESS</td>
<td>VARCHAR2</td>
<td>PROCESS</td>
<td>Enables only session and/or process termination</td>
</tr>
<tr>
<td>RESOLUTION_SCOPE_INSTANCE</td>
<td>VARCHAR2</td>
<td>INSTANCE</td>
<td>Enables session, process, and instance termination. The latter is used in specific scenarios. The default value is INSTANCE.</td>
</tr>
<tr>
<td>SENSITIVITY_NORMAL</td>
<td>VARCHAR2</td>
<td>NORMAL</td>
<td>Sets various Hang Manager intervals to their default values. The default value is NORMAL.</td>
</tr>
<tr>
<td>SENSITIVITY_HIGH</td>
<td>VARCHAR2</td>
<td>HIGH</td>
<td>Sets the various Hang Manager intervals to half of their default values</td>
</tr>
</tbody>
</table>
75.4 DBMS_HANG_MANAGER Exceptions

The table in this topic lists the exceptions raised by the DBMS_HANG_MANAGER package.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERRNUM_INPUT_ERROR</td>
<td>-32706</td>
<td>Invalid user input</td>
</tr>
<tr>
<td>ERRNUM_INTERNAL_ERROR</td>
<td>-32707</td>
<td>Database experienced an error setting a parameter</td>
</tr>
<tr>
<td>ERRNUM_UNSUPPORTED_ERROR</td>
<td>-32708</td>
<td>Operation is not supported on this instance type</td>
</tr>
</tbody>
</table>

75.5 Summary of DBMS_HANG_MANAGER Subprograms

The DBMS_HANG_MANAGER package includes the SET procedure subprogram.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET Procedure</td>
<td>Sets the specified parameter to the specified value</td>
</tr>
</tbody>
</table>

75.5.1 SET Procedure

This procedure sets the specified parameters to specified values.

Syntax

```sql
DBMS_HANG_MANAGER.SET (  
    pname   IN  VARCHAR2,  
    pvalue  IN  VARCHAR2);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Contains the parameter name that needs to be modified</td>
</tr>
<tr>
<td>pvalue</td>
<td>Contains the new value for the parameter name specified in <code>pname</code></td>
</tr>
</tbody>
</table>
The **DBMS_HEAT_MAP** package provides an interface to externalize heatmaps at various levels of storage including block, extent, segment, object and tablespace. A second set of subprograms externalize the heatmaps materialized by the background for top N tablespaces.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_HEAT_MAP Subprograms

### See Also:

- Heat Map in *Oracle Database VLDB and Partitioning Guide*
- **DBMS_ILM**
- **DBMS_ILM_ADMIN**

#### 76.1 DBMS_HEAT_MAP Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

The Heat Map tracks modification times at the block level, and multiple access statistics at the segment level. Objects in the **SYSTEM** and **SYSAUX** tablespaces are not tracked. **DBMS_HEAT_MAP** gives you access to the Heat Map statistics at various levels - block, extent, segment, object, and tablespace.

#### 76.2 DBMS_HEAT_MAP Security Model

The execution privilege is granted to **PUBLIC**. Procedures in this package run under the caller security. The user must have **ANALYZE** privilege on the object.

#### 76.3 Summary of DBMS_HEAT_MAP Subprograms

This table lists and briefly describes the **DBMS_HEAT_MAP** package subprograms.
### Table 76-1 DBMS_HEAT_MAP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOCK_HEAT_MAP Function</td>
<td>Returns last modification time for each block in a table segment</td>
</tr>
<tr>
<td>EXTENT_HEAT_MAP Function</td>
<td>Returns the extent level Heat Map statistics for a table segment</td>
</tr>
<tr>
<td>OBJECT_HEAT_MAP Function</td>
<td>Returns the minimum, maximum and average access times for all the segments belonging to the object</td>
</tr>
<tr>
<td>SEGMENT_HEAT_MAP Procedure</td>
<td>Returns the heatmap attributes for the given segment</td>
</tr>
<tr>
<td>TABLESPACE_HEAT_MAP Function</td>
<td>Returns the minimum, maximum and average access times for all the segments in the tablespace</td>
</tr>
</tbody>
</table>

#### 76.3.1 BLOCK_HEAT_MAP Function

This table function returns the last modification time for each block in a table segment. It returns no information for segment types that are not data.

**Syntax**

```sql
DBMS_HEAT_MAP.BLOCK_HEAT_MAP (  
    owner             IN VARCHAR2,  
    segment_name      IN VARCHAR2,  
    partition_name    IN VARCHAR2 DEFAULT NULL,  
    sort_columnid     IN NUMBER DEFAULT NULL,  
    sort_order        IN VARCHAR2 DEFAULT NULL)
RETURN hm_bls_row PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name.</td>
</tr>
<tr>
<td>sort_columnid</td>
<td>ID of the column on which to sort the output. Valid values 1..9. Invalid values are ignored.</td>
</tr>
<tr>
<td>sort_order</td>
<td>Defaults to NULL. Possible values: ASC, DESC</td>
</tr>
</tbody>
</table>

Return Values

Table 76-3  BLOCK_HEAT_MAP Function Return Values (Output Parameters)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the non-partitioned table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace containing the segment</td>
</tr>
<tr>
<td>file_id</td>
<td>Absolute file number of the block in the segment</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number of the block in the segment</td>
</tr>
<tr>
<td>block_id</td>
<td>Block number of the block</td>
</tr>
<tr>
<td>write time</td>
<td>Last modification time of the block</td>
</tr>
</tbody>
</table>

76.3.2 EXTENT_HEAT_MAP Function

This table function returns the extent level Heat Map statistics for a table segment. It returns no information for segment types that are not data. Aggregates at extent level, including minimum modification time and maximum modification time, are included.

Syntax

```
DBMS_HEAT_MAP.EXTENT_HEAT_MAP (  
    owner IN VARCHAR2,  
    segment_name IN VARCHAR2,  
    partition_name IN VARCHAR2 DEFAULT NULL,  
RETURN hm_els_row PIPELINED;
```

Parameters

Table 76-4  EXTENT_HEAT_MAP Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Table name of a non-partitioned table or (sub)partition of partitioned table. Returns no rows when table name is specified for a partitioned table.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Defaults to NULL. For a partitioned table, specify the partition or subpartition segment name.</td>
</tr>
</tbody>
</table>

Return Values

Table 76-5  EXTENT_HEAT_MAP Function Return Values (Output Parameters)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the non-partitioned table</td>
</tr>
</tbody>
</table>
### Table 76-5 (Cont.) EXTENT_HEAT_MAP Function Return Values (Output Parameters)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace containing the segment</td>
</tr>
<tr>
<td>file_id</td>
<td>Absolute file number of the block in the segment</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number of the block in the segment</td>
</tr>
<tr>
<td>block_id</td>
<td>Block number of the block</td>
</tr>
<tr>
<td>blocks</td>
<td>Number of blocks in the extent</td>
</tr>
<tr>
<td>bytes</td>
<td>Number of bytes in the extent</td>
</tr>
<tr>
<td>min_writetime</td>
<td>Minimum of last modification time of the block</td>
</tr>
<tr>
<td>max_writetime</td>
<td>Maximum of last modification time of the block</td>
</tr>
<tr>
<td>avg_writetime</td>
<td>Average of last modification time of the block</td>
</tr>
</tbody>
</table>

#### 76.3.3 OBJECT_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments belonging to the object.

The object must be a table. The table function raises an error if called on object tables other than table.

**Syntax**

```sql
DBMS_HEAT_MAP.OBJECT_HEAT_MAP (
    object_owner    IN VARCHAR2,
    object_name     IN VARCHAR2)
RETURN hm_object_table PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>Tablespace containing the segment</td>
</tr>
<tr>
<td>object_name</td>
<td>Segment header relative file number</td>
</tr>
</tbody>
</table>

**Return Values**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_name</td>
<td>Name of the top level segment</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace</td>
</tr>
</tbody>
</table>
Table 76-7  (Cont.) OBJECT_HEAT_MAP Function Return Values (Output Parameters)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_type</td>
<td>Type of segment as in DBA_SEGMENTS.SEGMENT_TYPE</td>
</tr>
<tr>
<td>segment_size</td>
<td>Segment size in bytes</td>
</tr>
<tr>
<td>min_writetime</td>
<td>Oldest write time for the segment</td>
</tr>
<tr>
<td>max_writetime</td>
<td>Latest write time for the segment</td>
</tr>
<tr>
<td>avg_writetime</td>
<td>Average write time for the segment</td>
</tr>
<tr>
<td>min_readtime</td>
<td>Oldest read time for the segment</td>
</tr>
<tr>
<td>max_readtime</td>
<td>Latest read time for the segment</td>
</tr>
<tr>
<td>avg_readtime</td>
<td>Average read time for the segment</td>
</tr>
<tr>
<td>min_lookuptime</td>
<td>Oldest index lookup time for the segment</td>
</tr>
<tr>
<td>max_lookuptime</td>
<td>Latest index lookup time for the segment</td>
</tr>
<tr>
<td>avg_lookuptime</td>
<td>Average index lookup time for the segment</td>
</tr>
<tr>
<td>min_ftstime</td>
<td>Oldest full table scan time for the segment</td>
</tr>
<tr>
<td>max_ftstime</td>
<td>Latest full table scan time for the segment</td>
</tr>
<tr>
<td>avg_ftstime</td>
<td>Average full table scan time for the segment</td>
</tr>
</tbody>
</table>

76.3.4 SEGMENT_HEAT_MAP Procedure

This procedure returns the heatmap attributes for the given segment.

Syntax

```
DBMS_HEAT_MAP.SEGMENT_HEAT_MAP (  
  tablespace_id       IN  NUMBER,  
  header_file        IN  NUMBER,  
  header_block       IN  NUMBER,  
  segment_objd       IN  NUMBER,  
  min_writetime      OUT DATE,  
  max_writetime      OUT DATE,  
  avg_writetime      OUT DATE,  
  min_readtime       OUT DATE,  
  max_readtime       OUT DATE,  
  avg_readtime       OUT DATE,  
  min_lookuptime     OUT DATE,  
  max_lookuptime     OUT DATE,  
  avg_lookuptime     OUT DATE,  
  min_ftstime        OUT DATE,  
  max_ftstime        OUT DATE,  
  avg_ftstime        OUT DATE);  
```

Parameters

Table 76-8  SEGMENT_HEAT_MAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_id</td>
<td>Tablespace containing the segment</td>

</tr>
<tr>
<td>avg_ftstime</td>
<td>Average full table scan time for the segment</td>
</tr>
</tbody>
</table>

76.3.5 TABLESPACE_HEAT_MAP Function

This table function returns the minimum, maximum and average access times for all the segments in the tablespace.

Syntax

```sql
DBMS_HEAT_MAP.TABLESPACE_HEAT_MAP(
    tablespace_name IN VARCHAR2)
RETURN hm_tablespace_table PIPELINED;
```

Parameters

Table 76-10  TABLESPACE_HEAT_MAP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace</td>

</tr>
</tbody>
</table>
DBMS_HIERARCHY

DBMS_HIERARCHY contains subprograms for validating the data in tables used by hierarchies and analytic views.

This chapter contains the following topics:

• DBMS_HIERARCHY Overview
• DBMS_HIERARCHY Security Model
• Summary of DBMS_HIERARCHY Subprograms

77.1 DBMS_HIERARCHY Overview

The DBMS_HIERARCHY package contains functions for validating that the contents of a database table are suitable for use by an analytic view or a hierarchy, a function for verifying the success of the validation, and a procedure for creating a table for logging validation operations.

Note:

Names specified by parameters of the DBMS_HIERARCHY subprograms are case-sensitive.

For information about using analytic views, see Oracle Database Data Warehousing Guide.

77.2 DBMS_HIERARCHY Security Model

Summarizes security considerations for the validation of analytic view and hierarchy objects.

All procedures in this package validate that the current user has the necessary privileges on the specified objects and return an error if those privileges are not found.

Note:

To ensure that the user has enough tablespace to log validation operations, do one of the following:

• GRANT UNLIMITED TABLESPACE TO username;
• ALTER USERNAME username QUOTA size ON tablespace_name;

The following system privileges are required to use this package:
To validate objects in the user’s own schema:

- CREATE TABLE privilege for CREATE_VALIDATE_LOG_TABLE or to have VALIDATE_ANALYTIC_VIEW or VALIDATE_HIERARCHY automatically create a table
- SELECT privilege on the tables or views used by the analytic view or hierarchy
- INSERT privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

To validate objects in different schemas:

- CREATE ANY TABLE privilege for CREATE_VALIDATE_LOG_TABLE or to have the VALIDATE_ANALYTIC_VIEW or VALIDATE_HIERARCHY automatically create a table
- INSERT ANY TABLE privilege on the tables used by the attribute dimensions of the hierarchy or the fact table used by the analytic view

77.3 Summary of DBMS_HIERARCHY Subprograms

This table lists the DBMS_HIERARCHY subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_VALIDATE_LOG_TABLE Procedure</td>
<td>Creates a table that you can use for logging messages generated by the VALIDATE_HIERARCHY and VALIDATE_ANALYTIC_VIEW functions.</td>
</tr>
<tr>
<td>VALIDATE_ANALYTIC_VIEW Function</td>
<td>Validates that the data in a table is suitable for use by an analytic view.</td>
</tr>
<tr>
<td>VALIDATE_CHECK_SUCCESS Function</td>
<td>Indicates whether a prior call to VALIDATE_HIERARCHY or VALIDATE_ANALYTIC_VIEW was successful or produced validation errors.</td>
</tr>
<tr>
<td>VALIDATE_HIERARCHY Function</td>
<td>Validates that the data in a table is suitable for use by a hierarchy.</td>
</tr>
</tbody>
</table>

77.3.1 CREATE_VALIDATE_LOG_TABLE Procedure

This procedure creates a table that you can use for logging messages generated by the VALIDATE_ANALYTIC_VIEW or VALIDATE_HIERARCHY function, which validate data used by an analytic view or hierarchy.

The table that this procedure creates has the following structure.

<table>
<thead>
<tr>
<th>NAME</th>
<th>NULL?</th>
<th>DATATYPE</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG_NUMBER</td>
<td>NOT NULL</td>
<td>NUMBER</td>
</tr>
<tr>
<td>ACTION_ORDER</td>
<td>NOT NULL</td>
<td>NUMBER</td>
</tr>
<tr>
<td>OBJECT_OWNER</td>
<td>NOT NULL</td>
<td>VARCHAR2(128 BYTE)</td>
</tr>
<tr>
<td>OBJECT_NAME</td>
<td>NOT NULL</td>
<td>VARCHAR2(128 BYTE)</td>
</tr>
<tr>
<td>ACTION</td>
<td>NOT NULL</td>
<td>VARCHAR2(10 BYTE)</td>
</tr>
<tr>
<td>TIME</td>
<td>NOT NULL</td>
<td>TIMESTAMP (6)</td>
</tr>
<tr>
<td>ERROR_NUMBER</td>
<td>NUMBER</td>
<td></td>
</tr>
<tr>
<td>ERROR_MESSAGE</td>
<td>VARCHAR2 (4000)</td>
<td></td>
</tr>
</tbody>
</table>
Syntax

```sql
DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
    table_name        IN  VARCHAR2,
    owner_name        IN  VARCHAR2         DEFAULT NULL
    IGNORE_IF_EXISTS  IN  PL/SQL BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to create.</td>
</tr>
<tr>
<td>owner_name</td>
<td>The name of the schema in which to create the table. If owner_name is NULL, then the table is created in the current user's schema.</td>
</tr>
<tr>
<td>IGNORE_IF_EXISTS</td>
<td>A Boolean that indicates whether to create the table if a table by the same name exists. If you specify a table, it must have the same structure as the table that this procedure creates.</td>
</tr>
</tbody>
</table>

Examples

Example 77-1 Creating a Validation Log Table

BEGIN
    DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE (
        'VAL_AV_HIERARCHY_LOG',
        'AV_USER',
        FALSE
    );
END;
/

77.3.2 VALIDATE_ANALYTIC_VIEW Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definition of an analytic view.

Syntax

```sql
DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW (
    analytic_view_name         IN VARCHAR2   DEFAULT NULL,
    analytic_view_owner_name   IN VARCHAR2   DEFAULT NULL,
    log_table_name             IN VARCHAR2   DEFAULT NULL,
    log_table_owner_name       IN VARCHAR2   DEFAULT NULL
) RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>analytic_view_name</td>
<td>The name of the analytic view to validate.</td>
</tr>
<tr>
<td>analytic_view_owner_name</td>
<td>The name of the owner of the schema that contains the analytic view.</td>
</tr>
<tr>
<td>log_table_name</td>
<td>The name of the validation log table in which to put the results of the validation operation.</td>
</tr>
</tbody>
</table>
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_table_owner_name</td>
<td>The name of the owner of the schema in which the validation log table exists or in which to create the table.</td>
</tr>
</tbody>
</table>

### Returns

The number of the entry in the validation log table for the validation results.

### Usage Notes

If the `log_table_name` parameter is `NULL`, then the `VALIDATE_ANALYTIC_VIEW` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_ANALYTIC_VIEW` function verifies that the following conditions are true for each attribute dimension the analytic view is dimensioned by:

- The key values found in the fact table for the attribute dimension must exist in the star schema dimension table for that attribute dimension.
- The referenced attribute values for the attribute dimension must be unique across all rows of the star schema dimension table for that dimension.

Also, for every hierarchy in the analytic view, the function verifies that the following conditions are true:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is `non-NULL`.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be `non-NULL`. This verifies that the alternate level key is determined by the level key.
- For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

### Examples

#### Example 77-2  Validating an Analytic View

```sql
DECLARE
    log_num NUMBER;
    obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN
    log_num := DBMS_HIERARCHY.VALIDATE_ANALYTIC_VIEW(obj_name);
```
77.3.3 VALIDATE_CHECK_SUCCESS Function

This function indicates whether a prior call to VALIDATE_HIERARCHY or VALIDATE_ANALYTIC_VIEW was successful or produced validation errors.

Syntax

```sql
DBMS_HIERARCHY.VALIDATE_CHECK_SUCCESS (
    TOPOBJ_NAME           IN  VARCHAR2,
    TOPOBJ_OWNER          IN  VARCHAR2,
    LOG_NUMBER            IN  VARCHAR2,
    LOG_TABLE_NAME        IN  VARCHAR2,
    LOG_TABLE_OWNER_NAME  IN  VARCHAR2
) RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TOPOBJ_NAME</td>
<td>The name of the hierarchy or analytic view.</td>
</tr>
<tr>
<td>TOPOBJ_OWNER</td>
<td>The owner of the hierarchy or analytic view.</td>
</tr>
<tr>
<td>LOG_NUMBER</td>
<td>The number of the log entry.</td>
</tr>
<tr>
<td>LOG_TABLE_NAME</td>
<td>The name of the log table.</td>
</tr>
<tr>
<td>LOG_TABLE_OWNER_NAME</td>
<td>The name of the schema in which the table exits.</td>
</tr>
</tbody>
</table>

Returns

A VARCHAR2 that is SUCCESS if no errors occurred or ERROR if errors did occur.

Examples

**Example 77-3  Using VALIDATE_CHECK_SUCCESS**

This example finds out whether the prior call to VALIDATE_ANALYTIC_VIEW encountered errors.

```sql
DECLARE
    log_num NUMBER;
    succ VARCHAR2(7);
    obj_name VARCHAR2(8) := 'SALES_AV';
BEGIN
    log_num := dbms_hierarchy.validate_analytic_view(obj_name);
    succ := dbms_hierarchy.validate_check_success(
        topobj_name => obj_name, log_number => log_num);
    IF (succ != 'SUCCESS') THEN
        RAISE_APPLICATION_ERROR(
            num => -20000,
            msg => 'Validate failed!');
    END IF;
END;
/```

77.3.4 VALIDATE_HIERARCHY Function

This function validates that the data in a table or view conforms to the logical constraints inherent in the definitions of an attribute dimension that uses the table or view and a hierarchy that uses the attribute dimension.

Syntax

```sql
DBMS_HIERARCHY.VALIDATE_HIERARCHY (  
hier_name                IN VARCHAR2,  
hier_owner_name          IN VARCHAR2 DEFAULT NULL,  
log_table_name           IN VARCHAR2 DEFAULT NULL,  
log_table_owner_name     IN VARCHAR2 DEFAULT NULL)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hier_name</td>
<td>The name of the hierarchy to validate.</td>
</tr>
<tr>
<td>hier_owner_name</td>
<td>The name of the owner of the schema that contains the hierarchy.</td>
</tr>
<tr>
<td>log_table_name</td>
<td>The name of the validation log table in which to put the results of the validation operation.</td>
</tr>
<tr>
<td>log_table_owner_name</td>
<td>The name of the owner of the schema in which the validation log table exists or in which to create the table.</td>
</tr>
</tbody>
</table>

Returns

The number of the entry in the validation log table for the validation results.

Usage Notes

If the `log_table_name` parameter is NULL, then the `VALIDATE_HIERARCHY` function creates a validation log table. The name of the table it creates is `DBMS_HIERARCHY_LOG`.

When the validation operation begins, a row is inserted into the log table with the action of `START`. When the operation completes, a row is inserted into the log table with the action of `END`. When an error is detected, a row is inserted into the log table with the action of `ERROR`, and the associated `error_number` and `error_message` columns are populated. All rows inserted into the validation log table include a log number and the time of the insert.

The `VALIDATE_HIERARCHY` function verifies that the following conditions are true for the hierarchy:

- The primary key of a level determines a unique value for each attribute of the level.
- For each row of the table or view used by the attribute dimension of the hierarchy, the value for every level key column (including alternate keys) of a `NOT NULL` level is non-NULL.
- For each row of the table or view, either all level key columns and alternate key columns of a `SKIP WHEN NULL` level must be `NULL` or they must all be non-NULL. This verifies that the alternate level key is determined by the level key.
For each group of rows that have the same alternate key column values for a level, the key column values must have the same column values. This verifies that the level key is determined by the alternate level key, which is required for an alternate key.

Examples

Example 77-4  Validating a Hierarchy and Specifying a Table Name

This example validates the PRODUCT_HIER hierarchy and specifies that the results be inserted in the table named VAL_AV_HIERARCHY_LOG. The owner of the hierarchy and of the schema that contains the table is AV_USER.

-- Create a log table.
BEGIN
DBMS_HIERARCHY.CREATE_VALIDATE_LOG_TABLE ('VAL_AV_HIERARCHY_LOG', 'AV_USER', FALSE);
END;
/

-- Validate the hierarchy.
DECLARE
log_num NUMBER;
obj_name VARCHAR2(12) := 'PRODUCT_HIER';
table_name VARCHAR2(28) := 'VAL_AV_HIERARCHY_LOG';
BEGIN
log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name, 'AV_USER', table_name);
END;
/

Query the log table.

SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
FROM AV_USER.VAL_AV_HIERARCHY_LOG
WHERE OBJECT_NAME = 'PRODUCT_HIER';

LOG_NUMBER ACTION OBJECT_NAME            ERROR_NUMBER ERROR_MESSAGE
---------- ------ ------------------- ------------ --------------
1 START PRODUCT_HIER
1 END   PRODUCT_HIER

Example 77-5  Validating a Hierarchy Without Specifying a Table Name

This example shows that if you do not specify a validation log table, then the VALIDATE_HIERARCHY function creates one named DBMS_HIERARCHY_LOG.

DECLARE
log_num NUMBER;
obj_name VARCHAR2(12) := 'PRODUCT_HIER';
BEGIN
log_num := DBMS_HIERARCHY.VALIDATE_HIERARCHY(obj_name);
END;

Query the log table.

SELECT LOG_NUMBER, ACTION, OBJECT_NAME, ERROR_NUMBER, ERROR_MESSAGE
FROM DBMS_HIERARCHY_LOG
WHERE OBJECT_NAME = 'PRODUCT_HIER';
<table>
<thead>
<tr>
<th>LOG_NUMBER</th>
<th>ACTION</th>
<th>OBJECT_NAME</th>
<th>ERROR_NUMBER</th>
<th>ERROR_MESSAGE</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>START</td>
<td>PRODUCT_HIER</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>END</td>
<td>PRODUCT_HIER</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
DBMS_HM

This package contains constants and procedure declarations for health check management. Health Monitor provides facilities to run a check store and retrieve the reports through DBMS_HM package.

This chapter contains the following topics:

- Security Model
- Summary of DBMS_HM Subprograms

See Also:
Oracle Database Administrator's Guide for more information about "Health Monitor"

78.1 DBMS_HM Security Model

Users must have EXECUTE privilege to run the procedures of DBMS_HM package.

78.2 Summary of DBMS_HM Subprograms

This table lists the DBMS_CONNECTION_POOL subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_RUN_REPORT Function</td>
<td>Returns the report for the specified checker run</td>
</tr>
<tr>
<td>RUN_CHECK Procedure</td>
<td>Runs the specified checker with the given arguments</td>
</tr>
</tbody>
</table>

78.2.1 GET_RUN_REPORT Function

This function returns the report for the specified checker run.

Syntax

```
DBMS_HM.GET_RUN_REPORT (       
  run_name IN VARCHAR2,      
  type    IN VARCHAR2 := 'TEXT',    
  level   IN VARCHAR2 := 'BASIC',) 
RETURN CLOB;
```
Parameters

Table 78-2  GET_RUN_REPORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_name</td>
<td>Name of the check's run</td>
</tr>
<tr>
<td>type</td>
<td>Report format type. Possible values are 'HTML', 'XML' and 'TEXT'. Default report type is 'TEXT'.</td>
</tr>
<tr>
<td>level</td>
<td>Details of report, possible value are 'BASIC' and 'DETAIL'. Caution: Currently only 'BASIC' level is supported.</td>
</tr>
</tbody>
</table>

78.2.2 RUN_CHECK Procedure

This procedure runs the specified checker with the specified arguments.

You can specify a name for the run, the inputs needed and maximum time-out for the run. The run report will be maintained persistently in the database.

Syntax

```sql
DBMS_HM.RUN_CHECK (  
    check_name     IN  VARCHAR2,  
    run_name       IN  VARCHAR2 := NULL,  
    timeout        IN  NUMBER := NULL,  
    input_params   IN  VARCHAR2 := NULL);
```

Parameters

Table 78-3  RUN_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>check_name</td>
<td>Name of the check to be invoked. Check names and their parameters can be accessed from the V$HM_CHECK and V$HM_CHECK_PARAM views. Users can run all checks which are not internal in nature: SELECT name FROM V$HM_CHECK WHERE INTERNAL_CHECK = 'N' retrieves the list of checks that can be run manually by users.</td>
</tr>
<tr>
<td>run_name</td>
<td>Name with which external users can uniquely identify this check's run. If NULL value is passed, then HM creates a unique name and associates with this check's run.</td>
</tr>
<tr>
<td>timeout</td>
<td>Maximum amount of time (in units of seconds), this checker run is allowed to run. HM will interrupt the run, if it the specified time elapses for the run. If NULL value is passed, HM doesn't impose any timeout limits on the run.</td>
</tr>
</tbody>
</table>
Table 78-3  (Cont.) RUN_CHECK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| input_params| Input string: which consists of name, value pairs delimited by a special character ';'. Example: ('Data Block Integrity Check' invocation may take following type of input parameters. 'BLC_DF_NUM=1;BLC_BL_NUM=23456')

Input parameters BLC_DF_NUM and BLC_BL_NUM have values '1' and '23456' respectively.

Every check will have well defined set of inputs associated with it. These Input parameters, their types, default values and descriptions can be obtained using V$HM_CHECK_PARAM view.

Example: The following query gets the list of parameters, their default values and descriptions for a 'Data Block Integrity Check'

```
SELECT a.* FROM v$hm_check_param a, v$hm_check b
WHERE a.check_id = b.id
AND b.name = 'Data Block Integrity Check';
```
DBMS_HPROF

The DBMS_HPROF package provides an interface for profiling the execution of PL/SQL applications. It provides services for collecting the hierarchical profiler data, analyzing the raw profiler output and profiling information generation.

This chapter contains the following topic:

- Summary of DBMS_HPROF Subprograms

See Also:

Oracle Database Development Guide for more information about the "PL/SQL Hierarchical Profiler"

79.1 Summary of DBMS_HPROF Subprograms

This table lists and briefly describes the DBMS_HPROF package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANALYZE Function</td>
<td>Analyzes the raw profiler output and produces hierarchical profiler information in database tables.</td>
</tr>
<tr>
<td>CREATE_TABLES</td>
<td>Creates the hierarchical profiler database tables and data structures in the user’s session.</td>
</tr>
<tr>
<td>START_PROFILING</td>
<td>Starts hierarchical profiler data collection in the user’s session.</td>
</tr>
<tr>
<td>STOP_PROFILING</td>
<td>Stops profiler data collection in the user’s session.</td>
</tr>
</tbody>
</table>

79.1.1 ANALYZE Function

This function analyzes the raw profiler output and produces hierarchical profiler information in database tables or generates out-of-the-box HTML reports.

Syntax

```
DBMS_HPROF.ANALYZE (
  trace_id IN NUMBER,
  summary_mode IN BOOLEAN DEFAULT FALSE,
  trace IN VARCHAR2 DEFAULT NULL,
  skip IN PLS_INTEGER DEFAULT 0,
  collect IN PLS_INTEGER DEFAULT NULL,
  run_comment IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```
DBMS_HPROF.ANALYZE (  
  trace_id         IN NUMBER,  
  report_clob      OUT CLOB,  
  trace            IN VARCHAR2 DEFAULT NULL,  
  skip             IN PLS_INTEGER DEFAULT 0,  
  collect          IN PLS_INTEGER DEFAULT NULL);  

Parameters

Table 79-2  ANALYZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trace_id</td>
<td>The trace_id of the raw profiler data entry in the raw profiler data table.</td>
</tr>
<tr>
<td>summary_mode</td>
<td>By default (that is, when summary_mode is FALSE), a detailed analysis is done.</td>
</tr>
<tr>
<td></td>
<td>When summary_mode is TRUE, only top-level summary information is generated into the database table.</td>
</tr>
<tr>
<td>report_clob</td>
<td>The analyzed HTML report.</td>
</tr>
<tr>
<td>trace</td>
<td>Analyzes only the subtrees rooted at the specified trace entry.</td>
</tr>
<tr>
<td></td>
<td>By default (when trace is NULL), the analysis/reporting is generated for the entire run.</td>
</tr>
<tr>
<td></td>
<td>The trace entry must be specified in a special quoted qualified format. For example, &quot;HR&quot;.&quot;PKG&quot;.&quot;FOO&quot; or &quot;&quot;&quot;.&quot;.&quot;_plsql_vm&quot;.&quot;.</td>
</tr>
<tr>
<td></td>
<td>If multiple overloads exist for the specified name, all of them will be analyzed.</td>
</tr>
<tr>
<td>skip</td>
<td>Used only when trace is specified. Analyze only the subtrees rooted at the specified trace, but ignore the first skip invocations to trace.</td>
</tr>
<tr>
<td></td>
<td>The default value for skip is 0.</td>
</tr>
<tr>
<td>collect</td>
<td>Used only when trace is specified. Analyze collect number of invocations of traces (starting from skip+1'th invocation).</td>
</tr>
<tr>
<td></td>
<td>By default, only 1 invocation is collected.</td>
</tr>
<tr>
<td>run_comment</td>
<td>User-provided comment for this run.</td>
</tr>
</tbody>
</table>

Return Values

A unique run identifier for this run of the analyzer. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.

Usage Notes

- Use the DBMS_HPROF.CREATE_TABLES subprogram to create the hierarchical profiler database tables and other data structures required for persistently storing the results of analyzing the raw profiler data.
- Calling the DBMS_HPROF.CREATE_TABLES with default value (FALSE) will raise error if table already exists.
- Use DBMS_HPROF.CREATE_TABLES(TRUE) to drop any previously created hierarchical profiler tables.
• Use the `DBMS_HPROF.CREATE_TABLES` to drop any previously created hierarchical profiler tables. By default, `force_it` is `FALSE`; therefore, to drop any previously created hierarchical profiler tables you must set the value of `force_it` to `TRUE`.

• If `trace_id` entry is `NULL`, error is raised.

• If `trace_id` entry in the raw profiler data table does not exist, error is raised.

• If raw data of the `trace_id` entry in the raw profiler data table is `NULL` or is zero size, error is raised.

Examples

The following snippet installs the hierarchical profiler tables in HR schema.

```sql
connect HR/HR;
```

The following example analyzes and generates HTML CLOB report from a raw profiler data table.

```sql
DECLARE
    reportclob clob;
    trace_id number;
BEGIN
    -- create raw profiler data and analysis tables
    -- force_it =>TRUE will dropped the tables if table exists
    DBMS_HPROF.CREATE_TABLES(force_it =>TRUE);

    -- Start profiling
    -- Write raw profiler data in raw profiler data table
    trace_id := DBMS_HPROF.START_PROFILING;

    -- Run procedure to be profiled
    test;

    -- Stop profiling
    DBMS_HPROF.STOP_PROFILING;

    -- analyzes trace_id entry in raw profiler data table and produce
    -- analyzed HTML report in reportclob
    DBMS_HPROF.ANALYZE(trace_id, reportclob);
END;
/
```

79.1.2 CREATE_TABLES Procedure

Creates the hierarchical profiler database tables and data structures in the user's session.

Syntax

```sql
DBMS_HPROF.CREATE_TABLES (force_it IN BOOLEAN DEFAULT FALSE);
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force_it</td>
<td>If FALSE and DBMS_HPROF tables are present, then an HPROF error is raised. If TRUE, then the procedure creates tables. If the tables already exist, then they are dropped and new tables are created.</td>
</tr>
</tbody>
</table>

**Note:**

Users need not use the `dbmshtab.sql` script located in the `rdbms/admin` directory to create the hierarchical profiler database tables and data structures anymore.

The `dbmshtab.sql` script is deprecated starting in Oracle Database 18c.

### 79.1.3 START_PROFILING Procedure

This procedure starts hierarchical profiler data collection in the user's session.

**Syntax**

```sql
DBMS_HPROF.START_PROFILING(
    max_depth     IN PLS_INTEGER DEFAULT NULL,
    sqlmonitor    IN BOOLEAN DEFAULT TRUE,
    run_comment   IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_depth</td>
<td>By default (that is, when max_depth value is NULL) profile information is gathered for all functions irrespective of their call depth. When a non-NULL value is specified for max_depth, the profiler collects data only for functions up to a call depth level of max_depth.</td>
</tr>
<tr>
<td>sqlmonitor</td>
<td>Generates a real-time monitoring report for a profiler run when the profiler run ends. The default value is TRUE.</td>
</tr>
<tr>
<td>run_comment</td>
<td>User provided comment for the profiler data collection run.</td>
</tr>
</tbody>
</table>

**Return Values**

Unique run identifier for this profiler run. This can then be used to look up the results corresponding to this run from the hierarchical profiler tables.
Usage Notes

- Even though the profiler does not individually track functions at depth greater than `max_depth`, the time spent in such functions is charged to the ancestor function at depth `max_depth`.
- Raw profiler data is generated in the raw profiler data table with an unique `trace_id`.
- The unique `trace_id` is used to manage the raw profiler output stored in the raw profiler data table.

79.1.4 STOP_PROFILING Procedure

This procedure stops profiler data collection in the user's session. This subprogram also has the side effect of flushing data collected so far in the session, and it signals the end of a run. When the `STOP_PROFILING` procedure returns CLOB, it contains the Real-Time Monitoring report for the profiler run.

Syntax

```
DBMS_HPROF.STOP_PROFILING;
```

DBMS_HPROF.STOP_PROFILING
  RETURN CLOB;

Examples

Profiling with raw profiler data table

```
DECLARE
  analyze_runid number;
  trace_id number;
BEGIN
  -- create raw profiler data and analysis tables
  -- call create_tables with force_it =>FALSE (default) when
  -- raw profiler data and analysis tables do not exist already
  DBMS_HPROF.CREATE_TABLES;
  -- Start profiling
  -- Write raw profiler data in raw profiler data table
  trace_id := DBMS_HPROF.START_PROFILING;
  -- Run the procedure to be profiled
  test;
  -- Stop profiling
  DBMS_HPROF.STOP_PROFILING;
  -- analyzes trace_id entry in raw profiler data table and writes
  -- hierarchical profiler information in hprof’s analysis tables
  analyze_runid := DBMS_HPROF.ANALYZE(trace_id);
END;
/
```
80

DBMS_HS_PARALLEL

The DBMS_HS_PARALLEL PL/SQL package enables parallel processing for heterogeneous targets access. This package is designed to improve performance when retrieving data from a large foreign table.

This chapter discusses the following topics:

- Using DBMS_HS_PARALLEL
- Summary of DBMS_HS_PARALLEL Subprograms

80.1 Using the DBMS_HS_PARALLEL Subprogram

DBMS_HS_PARALLEL is compiled with the authorization ID of CURRENT_USER, which uses invoker's rights. In other words, all procedures in this package are executed with the privileges of the calling user.

80.2 Summary of DBMS_HS_PARALLEL Subprograms

This table lists the DBMS_HS_PARALLEL subprograms in alphabetic order and briefly describes them.

Table 80-1  DBMS_HS_PARALLEL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_OR_REPLACE_VIEW</td>
<td>Creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.</td>
</tr>
<tr>
<td>CREATE_TABLE_TEMPLATE</td>
<td>Writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.</td>
</tr>
<tr>
<td>DROP_VIEW</td>
<td>Drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.</td>
</tr>
<tr>
<td>LOAD_TABLE</td>
<td>Loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.</td>
</tr>
</tbody>
</table>

80.2.1 CREATE_OR_REPLACE_VIEW Procedure

This procedure creates (or replaces) a read-only view to be referenced for retrieving the data from a remote table in parallel.

Syntax

CREATE_OR_REPLACE_VIEW (remote_table, database_link, oracle_view, parallel_degree)
Parameters

Table 80-2  CREATE_OR_REPLACE_VIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_table</td>
<td>The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.</td>
</tr>
<tr>
<td>database_link</td>
<td>The remote database link name. The call can only be applied to a heterogeneous services database link.</td>
</tr>
<tr>
<td>oracle_view</td>
<td>The name of the Oracle view. It is specified as [schema_name.]oracle_view_name. The default schema name is the current user. If the oracle_view parameter is not specified, the remote table name will be used as the view name.</td>
</tr>
<tr>
<td>parallel_degree</td>
<td>The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.</td>
</tr>
</tbody>
</table>

Usage Notes

- The specified Oracle view is created and future reference of this view utilizes internal database objects for parallel retrieval of remote non-Oracle table data. If the Oracle view already exists, the following Oracle error message is raised:

  ORA-00955: name is already used by an existing object

- This view is created as a read-only view. If you attempt to insert and update the view, the following Oracle error message is raised:

  ORA-01733: virtual column not allowed here

- If the remote table or the database link does not exist, one of the following Oracle error messages is raised:

  ORA-00942: table or view does not exist
  or
  ORA-02019: connection description for remote database not found

- You need the CREATE VIEW, CREATE TABLE, CREATE TYPE, CREATE PACKAGE, and CREATE FUNCTION privileges to execute the CREATE_OR_REPLACE_VIEW procedure.

- If you encounter either of the following Oracle error messages, increase the PROCESSES and SESSIONS parameter in the Oracle initialization parameter file:

  ORA-12801: error signaled in parallel query server P003
  or
  ORA-00018: maximum number of session exceeded

- Because the CREATE_OR_REPLACE_VIEW procedure creates some internal objects, use the DROP_VIEW procedure to drop the view and the internal objects. The SQL DROP VIEW statement only drops the view and not the internal objects.
80.2.2 CREATE_TABLE_TEMPLATE Procedure

This procedure writes out a CREATE TABLE template based on information gathered from the remote table. You can use the information to add any optimal Oracle CREATE TABLE clauses.

Syntax

CREATE_TABLE_TEMPLATE (remote_table, database_link, oracle_table, create_table_template_string)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_table</td>
<td>The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name.</td>
</tr>
<tr>
<td>database_link</td>
<td>The remote database link name. The call can only be applied to a heterogeneous services database link.</td>
</tr>
<tr>
<td>oracle_table</td>
<td>The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.</td>
</tr>
<tr>
<td>create_table_template_string</td>
<td>Contains the Oracle CREATE TABLE SQL template when the procedure is returned.</td>
</tr>
</tbody>
</table>

80.2.3 DROP_VIEW Procedure

This procedure drops the view and internal objects created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not already been created by the CREATE_OR_REPLACE_VIEW procedure, an error message is returned.

Syntax

DROP_VIEW (oracle_view)

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle_view</td>
<td>The name of the Oracle view created by the CREATE_OR_REPLACE_VIEW procedure. If the view has not been created by the CREATE_OR_REPLACE_VIEW procedure, an error is returned.</td>
</tr>
</tbody>
</table>
80.2.4 LOAD_TABLE Procedure

This procedure loads the data from a remote table to a local Oracle table in parallel. If the local Oracle table does not already exist, it is created automatically.

Syntax

LOAD_TABLE (remote_table, database_link, oracle_table, truncate, parallel_degree, row_count)

Parameters

Table 80-5  LOAD_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote_table</td>
<td>The name of the remote database table. It is specified as [remote_schema_name.]remote_table_name</td>
</tr>
<tr>
<td>database_link</td>
<td>The remote database link name. The call can only be applied to a heterogeneous services database link.</td>
</tr>
<tr>
<td>oracle_table</td>
<td>The name of the local Oracle table the data will be loaded into. It is specified as [schema_name.]oracle_table_name. The default schema name is the current user. If the oracle_table parameter is not specified, the remote table name will be used as the local Oracle name.</td>
</tr>
<tr>
<td>truncate</td>
<td>Determines whether the Oracle table is truncated before the data is loaded. The value is either TRUE or FALSE. The default value is TRUE which means the Oracle table is truncated first. When set to FALSE, the Oracle table will not be truncated before the data is loaded.</td>
</tr>
<tr>
<td>parallel_degree</td>
<td>The number of parallel processes for the operation is computed based on the range-partition number if applicable, or the number of CPUs. The range of values is 2 to 16.</td>
</tr>
<tr>
<td>row_count</td>
<td>Contains the number of rows just added with the load table operation.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure only loads the remote table data into Oracle local table. It does not create a key, index, constraints or any other dependencies such as triggers. It is recommended that you create these dependencies after the table data is loaded as performance will improve greatly. You will need to decide whether to create the dependencies before or after the data is loaded based on your knowledge of the remote table data and dependencies.
- If the local table does not exist, the LOAD_TABLE procedure creates a simple (non-partitioned) local table based on the exact column matching of the remote table after which the data is inserted into the local table.
- If the remote table or the database link does not exist, an error message is returned.
• If the local table is incompatible with the remote table, an error message is returned.

• You need the `CREATE TABLE`, `CREATE TYPE`, `CREATE PACKAGE`, and `CREATE FUNCTION` privileges to execute the `LOAD_TABLE` procedure.

• If you encounter either of the following Oracle error messages, increase the `PROCESSES` and `SESSIONS` parameter in Oracle initialization parameter file:

  ORA-12801: error signaled in parallel query server P003
  or
  ORA-00018: maximum number of session exceeded

• One of the following is required for parallel processing:
  – The remote table is range partitioned.
  – Histogram information for a numeric column is available.
  – There is a numeric index or primary key.

• To drop the local table, use the `DROP TABLE` SQL statement.
The `DBMS_HS_PASSTHROUGH` PL/SQL package allows you to send a statement directly to a non-Oracle system without being interpreted by the Oracle server. This can be useful if the non-Oracle system allows operations in statements for which there is no equivalent in Oracle.

This chapter discusses the following topics:

- **DBMS_HS_PASSTHROUGH Overview**
- **DBMS_HS_PASSTHROUGH Operational Notes**
- **Summary of DBMS_HS_PASSTHROUGH Subprograms**

### See Also:

*Oracle Database Heterogeneous Connectivity User's Guide* for more information about this package

#### 81.1 DBMS_HS_PASSTHROUGH Overview

You can execute passthrough SQL statements directly at the non-Oracle system using the PL/SQL package `DBMS_HS_PASSTHROUGH`. Any statement executed with this package is executed in the same transaction as standard SQL statements.

### See Also:

*Oracle Database Heterogeneous Connectivity User's Guide* for information about this package

#### 81.2 DBMS_HS_PASSTHROUGH Operational Notes

The `DBMS_HS_PASSTHROUGH` package is a virtual package. It conceptually resides at the non-Oracle system. In reality, however, calls to this package are intercepted by Heterogeneous Services and mapped to one or more Heterogeneous Services calls. The driver, in turn, maps these Heterogeneous Services calls to the API of the non-Oracle system. The client application should invoke the procedures in the package through a database link in exactly the same way as it would invoke a non-Oracle system stored procedure. The special processing done by Heterogeneous Services is transparent to the user.
81.3 Summary of DBMS_HS_PASSTHROUGH Subprograms

This table lists the DBMS_HS_PASSTHROUGH subprograms and briefly describes them.

Table 81-1  DBMS_HS_PASSTHROUGH Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BIND_INOUT_VARIABLE Procedure</td>
<td>Binds IN OUT bind variables</td>
</tr>
<tr>
<td>BIND_INOUT_VARIABLE_RAW Procedure</td>
<td>Binds IN OUT bind variables of datatype RAW</td>

</table>

81.3.1 BIND_INOUT_VARIABLE Procedure

This procedure binds IN OUT bind variables.

Syntax

```sql
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE (c IN BINARY_INTEGER NOT NULL,
p IN BINARY_INTEGER NULL,
v OUT <dty>,
n IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.
Pragmas

Purity level defined: WNDS, RNDS

Parameters

Table 81-2  BIND_INOUT_VARIABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>This value is used for two purposes: - To provide the IN value before the SQL statement is run. - To determine the size of the out value.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports &quot;named binds&quot; instead of positional binds. Passing the position is still required.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>
<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28553</td>
<td>The position of the bind variable is out of range.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>

81.3.2 BIND_INOUT_VARIABLE_RAW Procedure

This procedure binds IN OUT bind variables of datatype RAW.

Syntax

```sql
DBMS_HS_PASSTHROUGH.BIND_INOUT_VARIABLE_RAW (  
c IN BINARY_INTEGER NOT NULL,  
p IN BINARY_INTEGER NOT NULL,
```
v IN OUT RAW,
n IN VARCHAR2);

Pragmas

Purity level defined: WNDS, RNDS

Parameters

Table 81-4  BIND_INOUT_VARIABLE_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
</tbody>
</table>
| v         | This value is used for two purposes: 
- To provide the IN value before the SQL statement is run. 
- To determine the size of the out value. |
| n         | (Optional) Name the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports "named binds" instead of positional binds. Passing the position is still required. |

Exceptions

Table 81-5  BIND_INOUT_VARIABLE_RAW Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>
<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28553</td>
<td>The position of the bind variable is out of range.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>

81.3.3 BIND_OUT_VARIABLE Procedure

This procedure binds an OUT variable with a PL/SQL program variable.

Syntax

DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE (  
  c       IN  BINARY_INTEGER NOT NULL,  
  p       IN  BINARY_INTEGER NULL,  
  v       OUT <dty>,  
  n       IN  VARCHAR2);  

<dty> is either DATE, NUMBER, or VARCHAR2.
Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 81-6  BIND_OUT_VARIABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Variable in which the OUT bind variable stores its value. The package remembers only the “size” of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports “named binds” instead of positional binds. Passing the position is still required.</td>
</tr>
</tbody>
</table>

Exceptions

<tr>
<td>ora-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.4 BIND_OUT_VARIABLE_RAW Procedure

This procedure binds an OUT variable of datatype RAW with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_OUT_VARIABLE_RAW (c     IN  BINARY_INTEGER NOT NULL,
p     IN  BINARY_INTEGER NOT NULL,
v     OUT RAW,
n     IN  VARCHAR2);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 81-8  BIND_OUT_VARIABLE_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Variable in which the OUT bind variable stores its value. The package remembers only the &quot;size&quot; of the variable. After the SQL statement is run, you can use GET_VALUE to retrieve the value of the OUT parameter. The size of the retrieved value should not exceed the size of the parameter that was passed using BIND_OUT_VARIABLE_RAW.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. (Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports &quot;named binds&quot; instead of positional binds. Passing the position is still required.</td>
</tr>
</tbody>
</table>

Exceptions

<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28553</td>
<td>The position of the bind variable is out of range.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.5 BIND_VARIABLE Procedure

This procedure binds an IN variable positionally with a PL/SQL program variable.

Syntax

```
DBMS_HS_PASSTHROUGH.BIND_VARIABLE (  
c IN BINARY_INTEGER NOT NULL,  
p IN BINARY_INTEGER NOT NULL,  
v IN <dty>,  
n IN VARCHAR2);
```

<dty> is either DATE, NUMBER, or VARCHAR2.

See Also:
To bind RAW variables use BIND_VARIABLE_RAW Procedure.

Pragmas

Purity level defined: WNDS, RNDS

Parameters

Table 81-10  BIND_VARIABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Value that must be passed to the bind variable name.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports &quot;named binds&quot; instead of positional binds. Passing the position is still required.</td>

</tr>
</tbody>
</table>

81.3.6 BIND_VARIABLE_RAW Procedure

This procedure binds IN variables of type RAW.

Syntax

```sql
DBMS_HS_PASSTHROUGH.BIND_VARIABLE_RAW (  
c  IN BINARY_INTEGER NOT NULL,  
p  IN BINARY_INTEGER NOT NULL,  
v  IN RAW,  
n  IN VARCHAR2);
```

Pragmas

Purity level defined : WDNS, RNS

Parameters

Table 81-12 BIND_VARIABLE_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Value that must be passed to the bind variable.</td>
</tr>
<tr>
<td>n</td>
<td>(Optional) Name of the bind variable. For example, in SELECT * FROM emp WHERE ename=:ename, the position of the bind variable :ename is 1, the name is :ename. This parameter can be used if the non-Oracle system supports &quot;named binds&quot; instead of positional binds. Passing the position is still required.</td>
</tr>
</tbody>
</table>

Exceptions

<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28553</td>
<td>The position of the bind variable is out of range.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.7 CLOSE_CURSOR Procedure

This function closes the cursor and releases associated memory after the SQL statement has been run at the non-Oracle system. If the cursor was not open, then the operation is a "no operation".

Syntax

```sql
DBMS_HS_PASSTHROUGH.CLOSE_CURSOR (  
    c IN BINARY_INTEGER NOT NULL);
```

Pragmas

Purity level defined : WNDS, RNDS

Parameters

<table>
<thead>
<tr>
<th>Table 81-14</th>
<th>CLOSE_CURSOR Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>c</td>
<td>Cursor to be released.</td>

<th>CLOSE_CURSOR Procedure Exceptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exception</td>
<td>Description</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>

81.3.8 EXECUTE_IMMEDIATE Procedure

This function runs a SQL statement immediately. Any valid SQL command except `SELECT` can be run immediately.

The statement must not contain any bind variables. The statement is passed in as a `VARCHAR2` in the argument. Internally the SQL statement is run using the `PASSTHROUGH` SQL protocol sequence of `OPEN_CURSOR`, `PARSE`, `EXECUTE_NON_QUERY`, `CLOSE_CURSOR`.

Syntax

```sql
DBMS_HS_PASSTHROUGH.EXECUTE_IMMEDIATE (  
    s IN VARCHAR2 NOT NULL)  
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Table 81-16</th>
<th>EXECUTE_IMMEDIATE Procedure Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>s</td>
<td>VARCHAR2 variable with the statement to be executed immediately.</td>
</tr>
</tbody>
</table>
Return Values
The number of rows affected by the execution of the SQL statement.

Exceptions

Table 81-17  EXECUTE_IMMEDIATE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28551</td>
<td>SQL statement is invalid.</td>
</tr>
<tr>
<td>ORA-28554</td>
<td>Max open cursors.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>

81.3.9 EXECUTE_NON_QUERY Function

This function runs a SQL statement. The SQL statement cannot be a SELECT statement. A cursor has to be open and the SQL statement has to be parsed before the SQL statement can be run.

Syntax

```
DBMS_HS_PASSTHROUGH.EXECUTE_NON_QUERY (  
    c IN BINARY_INTEGER NOT NULL)  
RETURN BINARY_INTEGER;
```

Parameters

Table 81-18  EXECUTE_NON_QUERY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
</tbody>
</table>

Return Values
The number of rows affected by the SQL statement in the non-Oracle system

Exceptions

Table 81-19  EXECUTE_NON_QUERY Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>
<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.10 FETCH_ROW Function

This function fetches rows from a result set.

The result set is defined with a SQL SELECT statement. When there are no more rows to be fetched, the exception NO_DATA_FOUND is raised. Before the rows can be fetched, a cursor has to be opened, and the SQL statement has to be parsed.

Syntax

```sql
DBMS_HS_PASSTHROUGH.FETCH_ROW (  
    c   IN BINARY_INTEGER NOT NULL,  
    f   IN BOOLEAN)  
RETURN BINARY_INTEGER;
```

Pragmas

Purity level defined : WNDS

Parameters

Table 81-20  FETCH_ROW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>first</td>
<td>(Optional) Reexecutes SELECT statement. Possible values:</td>
</tr>
<tr>
<td></td>
<td>- TRUE: reexecute SELECT statement.</td>
</tr>
<tr>
<td></td>
<td>- FALSE: fetch the next row, or if run for the first time, then execute and fetch rows (default).</td>
</tr>
</tbody>
</table>

Return Values

The returns the number of rows fetched. The function returns "0" if the last row was already fetched.

Exceptions

Table 81-21  FETCH_ROW Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>
<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.11 GET_VALUE Procedure

This procedure has two purposes: it retrieves the select list items of `SELECT` statements after a row has been fetched, and it retrieves the `OUT` bind values, after the SQL statement has been run.

**Syntax**

```
DBMS_HS_PASSTHROUGH.GET_VALUE (c IN BINARY_INTEGER NOT NULL, p IN BINARY_INTEGER NOT NULL, v OUT <dty>);
```

<dty> is either `DATE`, `NUMBER`, or `VARCHAR2`.

**See Also:**

For retrieving values of datatype `RAW`, see `GET_VALUE_RAW Procedure`.

**Pragmas**

Purity level defined: WNS

**Parameters**

**Table 81-22  GET_VALUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines <code>OPEN_CURSOR</code> and <code>PARSE</code> respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable or select list item in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Variable in which the <code>OUT</code> bind variable or select list item stores its value.</td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 81-23  GET_VALUE Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-1403</td>
<td>Returns <code>NO_DATA_FOUND</code> exception when running the <code>GET_VALUE</code> after the last row was fetched (that is, <code>FETCH_ROW</code> returned &quot;0&quot;).</td>
</tr>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>
<td>Procedure is not run in right order. (Did you first open the cursor and parse the SQL statement?)</td>
</tr>
<tr>
<td>ORA-28553</td>
<td>The position of the bind variable is out of range.</td>
</tr>
<tr>
<td>ORA-28555</td>
<td>A NULL value was passed for a NOT NULL parameter.</td>
</tr>
</tbody>
</table>
81.3.12 GET_VALUE_RAW Procedure

This procedure is similar to GET_VALUE, but for datatype RAW.

Syntax

```sql
DBMS_HS_PASSTHROUGH.GET_VALUE_RAW (  
    c    IN  BINARY_INTEGER NOT NULL,  
    p    IN  BINARY_INTEGER NOT NULL,  
    v    OUT RAW);
```

Pragmas

Purity level defined: WNDS

Parameters

Table 81-24 GET_VALUE_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened and parsed, using the routines OPEN_CURSOR and PARSE respectively.</td>
</tr>
<tr>
<td>p</td>
<td>Position of the bind variable or select list item in the SQL statement: Starts at 1.</td>
</tr>
<tr>
<td>v</td>
<td>Variable in which the OUT bind variable or select list item stores its value.</td>
</tr>
</tbody>
</table>

Exceptions

Table 81-25 GET_VALUE_RAW Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-1403</td>
<td>Returns NO_DATA_FOUND exception when running the GET_VALUE after the last row was fetched (that is, FETCH_ROW returned &quot;0&quot;).</td>
</tr>
<tr>
<td>ORA-28550</td>
<td>The cursor passed is invalid.</td>
</tr>
<tr>
<td>ORA-28552</td>

</table>

81.3.13 OPEN_CURSOR Function

This function opens a cursor for running a passthrough SQL statement at the non-Oracle system. This function must be called for any type of SQL statement.

The function returns a cursor, which must be used in subsequent calls. This call allocates memory. To deallocate the associated memory, call the procedure CLOSE_CURSOR.
Syntax

DBMS_HS_PASSTHROUGH.OPEN_CURSOR
    RETURN BINARY_INTEGER;

Pragmas

Purity level defined : WNDS, RNDS

Return Values

The cursor to be used on subsequent procedure and function calls.

Exceptions

Table 81-26  OPEN_CURSOR Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-28554</td>
<td>Maximum number of open cursor has been exceeded. Increase Heterogeneous Services' OPEN_CURSORS initialization parameter.</td>
</tr>
</tbody>
</table>

81.3.14 PARSE Procedure

This procedure parses an SQL statement at a non-Oracle system.

Syntax

DBMS_HS_PASSTHROUGH.PARSE (  
    c       IN  BINARY_INTEGER NOT NULL,  
    stmt    IN  VARCHAR2 NOT NULL);  

Pragmas

Purity level defined : WNDS, RNDS

Parameters

Table 81-27  PARSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor associated with the passthrough SQL statement. Cursor must be opened using function OPEN_CURSOR.</td>
</tr>

The **DBMS_ILM** package provides an interface for implementing Information Lifecycle Management (ILM) strategies using Automatic Data Optimization (ADO) policies.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Exceptions**
- **Summary of DBMS_ILM Subprograms**

**See Also:**

- *Oracle Database VLDB and Partitioning Guide* for information about managing Automatic Data Optimization (ADO) with this package
- **DBMS_ILM_ADMIN**
- **DBMS_HEAT_MAP**

### 82.1 DBMS_ILM Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database. The **DBMS_ILM** package supports immediate evaluation or execution of ADO related tasks. The package supports the following two ways for scheduling ADO actions.

- A database user schedules immediate ADO policy execution on a set of objects.
- A database user views the results of evaluation of ADO policies on a set of objects. The user then adds or deletes objects to this set and reviews the results of ADO policy evaluation again. The user repeats this step to determine the set of objects for ADO execution. The user can then schedule ADO actions for immediate execution on this set of objects.

The following procedures support the two usage modes. Before describing the procedures, we introduce the notion of an ADO task as an entity that helps to track a particular evaluation or (an evaluation and execution) of ADO policies. A particular ADO task could be in one of the following states.

- Inactive
- Active
82.2 DBMS_ILM Security Model

The DBMS_ILM package runs under invoker's rights.

82.3 DBMS_ILM Constants

The table in this topic lists the constants used by the DBMS_ILM package.

<table>
<thead>
<tr>
<th>Table 82-1</th>
<th>DBMS_ILM Constants</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>Value</td>
</tr>
<tr>
<td>ILM_ALL_POLICIES</td>
<td>'ALL POLICIES'</td>
</tr>
<tr>
<td>ILM_EXECUTION_OFFLINE</td>
<td>1</td>
</tr>
<tr>
<td>ILM_EXECUTION_ONLINE</td>
<td>2</td>
</tr>
<tr>
<td>SCOPE_DATABASE</td>
<td>1</td>
</tr>
<tr>
<td>SCOPE_SCHEMA</td>
<td>2</td>
</tr>
<tr>
<td>SCHEDULE_IMMEDIATE</td>
<td>1</td>
</tr>
<tr>
<td>ARCHIVE_STATE_ACTIVE</td>
<td>'0'</td>
</tr>
<tr>
<td>ARCHIVE_STATE_ARCHIVED</td>
<td>'1'</td>
</tr>
</tbody>
</table>

82.4 DBMS_ILM Exceptions

The table in this topic lists the exceptions raised by the DBMS_ILM package.

<table>
<thead>
<tr>

<td>38329</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGES</td>
<td>38330</td>
</tr>
</tbody>
</table>
82.5 Summary of DBMS_ILM Subprograms

This table lists and describes the DBMS_ILM package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_TO_ILM Procedure</td>
<td>Adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object.</td>
</tr>
<tr>
<td>ARCHIVESTATENAME Function</td>
<td>Returns the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table.</td>
</tr>
<tr>
<td>EXECUTE_ILM Procedure</td>
<td>Executes an ADO task.</td>
</tr>
<tr>
<td>EXECUTE_ILM_TASK Procedure</td>
<td>Executes an ADO task that has been evaluated previously.</td>
</tr>
<tr>
<td>PREVIEW_ILM Procedure</td>
<td>Evaluates all ADO policies in the scope specified by means of an argument.</td>
</tr>
<tr>
<td>REMOVE_FROM_ILM Procedure</td>
<td>Removes the object specified through the argument from a particular ADO task.</td>
</tr>
<tr>
<td>STOP_ILM Procedure</td>
<td>Stops ADO-related jobs created for a particular ADO task.</td>
</tr>
</tbody>
</table>

82.5.1 ADD_TO_ILM Procedure

This procedure adds the object specified through the argument to a particular ADO task and evaluates the ADO policies on this object.

The procedure can only be executed on an ADO task in an inactive state. The results of the ADO policy evaluation on this object can be viewed using the appropriate views depending on role and access (USER_ILMTASKS or DBA_ILMTASKS, USER_ILM_EVALUATIONDETAILS or DBA_ILM_EVALUATIONDETAILS, USER_ILM_RESULTS or DBA_ILM_RESULTS).

Syntax

```sql
DBMS_ILM.ADD_TO_ILM (    task_id       IN   NUMBER,    owner           IN   VARCHAR2,    object_name     IN   VARCHAR2,    subobject_name  IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Identifies a particular ADO task</td>
</tr>
<tr>
<td>owner</td>
<td>Owner of the object</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object</td>
</tr>
<tr>
<td>subobject_name</td>
<td>Name of the subobject (partition name in the case of partitioned tables)</td>
</tr>
</tbody>
</table>
82.5.2 ARCHIVESTATENAME Function

This function returns the value of the ORA_ARCHIVE_STATE column of a row-archival enabled table.

Syntax

```sql
DBMS_ILM.ARCHIVESTATENAME (
    value      IN  VARCHAR2
) RETURN VARCHAR2;
```

Parameters

Table 82-5  ARCHIVESTATENAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value for which the archive state name is to be returned</td>
</tr>
</tbody>
</table>

Usage Notes

Returns ARCHIVE_STATE_ACTIVE for 0, ARCHIVE_STATE_ARCHIVED for others

See Also:

"Using In-Database Archiving" in Oracle Database VLDB and Partitioning Guide

82.5.3 EXECUTE_ILM Procedure

This procedure executes an ADO task.

There are two overloads to this procedure. The first overload executes an ADO task for a set of objects without having evaluated them previously. The second overload executes ADO policies for a specific object.

Syntax

```sql
DBMS_ILM.EXECUTE_ILM (
    task_id             OUT    NUMBER,
    ilm_scope           IN     NUMBER DEFAULT SCOPE_SCHEMA,
    execution_mode      IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```

```sql
DBMS_ILM.EXECUTE_ILM (
    owner               IN     VARCHAR2,
    object_name         IN     VARCHAR2,
    task_id             OUT    NUMBER,
    subobject_name      IN     VARCHAR2 DEFAULT NULL,
    policy_name         IN     VARCHAR2 DEFAULT ILM_ALL_POLICIES,
    execution_mode      IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE);
```
Parameters

Table 82-6  EXECUTE_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Identifies a particular ADO task</td>
</tr>
<tr>
<td>ilm_scope</td>
<td>Determines the set of objects considered for ADO execution. The default is to consider only the objects in the schema.</td>
</tr>
<tr>
<td>execution_mode</td>
<td>Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE)</td>
</tr>
<tr>
<td>owner</td>
<td>Owner of the object</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object</td>
</tr>
<tr>
<td>subobject_name</td>
<td>Name of the subobject (partition name in the case of partitioned tables)</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the ADO policy to be evaluated on the object. The package constant ILM_ALL_POLICIES should be used if all ADO policies on an object should be evaluated.</td>
</tr>
</tbody>
</table>

Usage Notes

- The EXECUTE_ILM procedure can be used by users who want more control of when ADO is performed, and who do not want to wait until the next maintenance window.
- The procedure executes like a DDL in that it auto commits before and after the ADO task and related jobs are created.

82.5.4 EXECUTE_ILM_TASK Procedure

This procedure executes an ADO task that has been evaluated previously and moves it to an active state.

Syntax

```sql
DBMS_ILM.EXECUTE_ILM_TASK ( 
  task_id             IN     NUMBER, 
  execution_mode      IN     NUMBER DEFAULT ILM_EXECUTION_ONLINE),
  execution_schedule  IN     NUMBER DEFAULT SCHEDULE_IMMEDIATE);
```

Parameters

Table 82-7  EXECUTE_ILM_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Identifies a particular ADO task</td>
</tr>
<tr>
<td>execution_mode</td>
<td>Whether the ADO task be executed online (ILM_EXECUTION_ONLINE) or offline (ILM_EXECUTION_OFFLINE)</td>
</tr>
<tr>
<td>execution_schedule</td>
<td>Identifies when the ADO task should be executed. Currently, the only choice available is immediate scheduling of ADO jobs</td>
</tr>
</tbody>
</table>
82.5.5 PREVIEW_ILM Procedure

This procedure evaluates the ADO policies on the objects specified using the ILM_SCOPE argument.

It returns a number as task_id which identifies a particular ADO task. This can be used to view the results of the policy evaluation in the appropriate views depending on role and access (USER_ILMTASKS or DBA_ILMTASKS, USER_ILMEVALUATIONDETAILS or DBA_ILMEVALUATIONDETAILS, USER_ILMRESULTS or DBA_ILMRESULTS).

The PREVIEW_ILM procedure leaves the ADO task in an inactive state. Once you have previewed the results, you can add or delete objects to this task.

Syntax

DBMS_ILM.PREVIEW_ILM (  
  task_id OUT NUMBER,  
  ilm_scope IN NUMBER DEFAULT SCOPE_SCHEMA);

Parameters

Table 82-8    PREVIEW_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Identifies a particular ADO task</td>
</tr>
<tr>
<td>ilm_scope</td>
<td>Identifies the scope of execution. Should be either SCOPE_DATABASE or SCOPE_SCHEMA as described in Constants</td>
</tr>
</tbody>
</table>

82.5.6 REMOVE_FROM_ILM Procedure

This procedure removes the object specified through the argument from a particular ADO task.

The procedure can only be executed on an ADO task in an inactive state.

Syntax

DBMS_ILM.REMOVE_FROM_ILM (  
  task_id IN NUMBER,  
  owner IN VARCHAR2,  
  object_name IN VARCHAR2,  
  subobject_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 82-9    REMOVE_FROM_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Identifies a particular ADO task</td>
</tr>
<tr>
<td>owner</td>
<td>Owner of the object</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object</td>
</tr>
</tbody>
</table>
Table 82-9  (Cont.) REMOVE_FROM_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subobject_name</td>
<td>Name of the subobject (partition name in the case of partitioned tables)</td>
</tr>
</tbody>
</table>

82.5.7 STOP_ILM Procedure

This procedure terminates ILM ADO jobs associated to a particular task Id or job name.

Syntax

```sql
DBMS_ILM.STOP_ILM (  
    task_id               IN         NUMBER,  
    p_drop_running_jobs   IN         BOOLEAN  DEFAULT FALSE),  
    p_jobname             IN         VARCHAR2 DEFAULT NULL);
```

Parameters

Table 82-10  STOP_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_id</td>
<td>Number that uniquely identifies a particular ADO task</td>
</tr>
<tr>
<td>p_drop_running_jobs</td>
<td>Determines whether running jobs are dropped</td>
</tr>
<tr>
<td>p_jobname</td>
<td>Name of job to be terminated</td>
</tr>
</tbody>
</table>
The DBMS_ILM_ADMIN package provides an interface to customize Automatic Data Optimization (ADO) policy execution. In combination with partitioning and compression, ADO policies can be used to help implement an Information Lifecycle Management (ILM) strategy.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Summary of DBMS_ILM_ADMIN Subprograms

See Also:

- Oracle Database VLDB and Partitioning Guide for information about managing Automatic Data Optimization (ADO) with this package
- DBMS_ILM
- DBMS_HEAT_MAP

83.1 DBMS_ILM_ADMIN Overview

To implement your ILM strategy, you can use Heat Map in Oracle Database to track data access and modification. You can also use Automatic Data Optimization (ADO) to automate the compression and movement of data between different tiers of storage within the database.

83.2 DBMS_ILM_ADMIN Security Model

This package runs under definer's rights. The user requires DBA privileges.

83.3 DBMS_ILM_ADMIN Constants

The table in this topic describes constants used by the DBMS_ILM_ADMIN package.

The value column refers to the numeric or character value that the constants resolve to.
Table 83-1  DBMS_ILM_ADMIN Constants

<table>
<thead>
<tr>

<td>Turns on all background ILM scheduling</td>
</tr>
<tr>
<td>SET_HEAT_MAP_ALL Procedure</td>
<td>Updates or inserts heat map rows for all tables</td>
</tr>
<tr>
<td>SET_HEAT_MAP_START Procedure</td>
<td>Sets the start date for collecting heat map data</td>
</tr>
<tr>
<td>SET_HEAT_MAP_TABLE Procedure</td>
<td>Updates or inserts a row for the specified table or segment</td>
</tr>
</tbody>
</table>
83.4.1 CLEAR_HEAT_MAP_ALL Procedure

This procedure deletes all rows in HEAT_MAP_STAT$ except the dummy row.

Syntax

DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_ALL;

83.4.2 CLEAR_HEAT_MAP_TABLE Procedure

This procedure clears all or some statistics for the heat map table, deleting rows for a given table or segment which match a given pattern, or all such rows.

Syntax

DBMS_ILM_ADMIN.CLEAR_HEAT_MAP_TABLE (owner                   IN  VARCHAR2,
                                          tablename               IN  VARCHAR2,
                                          partition               IN  VARCHAR2 default '','
                                          access_date             IN  DATE DEFAULT NULL,
                                          segment_access_summary  IN  NUMBER DEFAULT NULL); Parameters

Table 83-4  CLEAR_HEAT_MAP_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Table owner</td>
</tr>
<tr>
<td>tablename</td>
<td>Table name</td>
</tr>
<tr>
<td>partition</td>
<td>Name of the subobject, defaults to NULL</td>
</tr>
<tr>
<td>access_date</td>
<td>Date for the entry in HEAT_MAP_STAT$ to be removed</td>
</tr>
<tr>
<td>segment_access_summary</td>
<td>Summary of segment access constants indicating access operations performed on the segment</td>
</tr>
</tbody>
</table>

83.4.3 CUSTOMIZE_ILM Procedure

This procedure customizes environment for ILM execution by specifying the values for ILM execution related parameters. These values take effect for the next background scheduling.

Syntax

DBMS_ILM_ADMIN.CUSTOMIZE_ILM (parameter            IN       NUMBER,
                              value                IN       NUMBER);
Parameters

Table 83-5  CUSTOMIZE_ILM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>One of the parameter constants defined in DBMS_ILM_ADMIN package</td>
</tr>
<tr>
<td>value</td>
<td>Value of parameter</td>
</tr>
</tbody>
</table>

83.4.4 DISABLE_ILM Procedure

This procedure turns off all background ILM scheduling.

Syntax

DBMS_ILM_ADMIN.DISABLE_ILM;

83.4.5 ENABLE_ILM Procedure

This procedure turns on all background ILM scheduling.

Syntax

DBMS_ILM_ADMIN.ENABLE_ILM;

83.4.6 SET_HEAT_MAP_ALL Procedure

This procedure sets an HTTP request header. The request header is sent to the Web server as soon as it is set.

Syntax

DBMS_ILM_ADMIN.SET_HEAT_MAP_ALL  (
    access_date            IN DATE,
    segment_access_summary IN NUMBER);

Parameters

Table 83-6  SET_HEAT_MAP_ALL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>access_date</td>
<td>Date for the entry in HEAT_MAP_STAT$ to be added</td>
</tr>
<tr>
<td>segment_access_summary</td>
<td>Summary of segment access constants indicating access operations performed on the segment</td>
</tr>
</tbody>
</table>
83.4.7 SET_HEAT_MAP_START Procedure

This procedure sets the start date for collecting heat map data.

Syntax

```sql
DBMS_ILM_ADMIN.SET_HEAT_MAP_START  (
    start_date  IN   DATE);
```

Parameters

Table 83-7  SET_HEAT_MAP_START Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_date</td>
<td>Indicates the new date from which all statistics are valid</td>
</tr>
</tbody>
</table>

83.4.8 SET_HEAT_MAP_TABLE Procedure

This procedure updates or inserts a row for the specified table or segment.

Syntax

```sql
DBMS_ILM_ADMIN.SET_HEAT_MAP_TABLE  (
    owner                  IN VARCHAR2,
    tablename              IN VARCHAR2,
    partition              IN VARCHAR2 DEFAULT '',
    access_date            IN DATE DEFAULT NULL,
    segment_access_summary IN NUMBER DEFAULT NULL);
```

Parameters

Table 83-8  SET_HEAT_MAP_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Table owner</td>
</tr>
<tr>

</table>
The DBMS_INMEMORY package provides an interface for In-Memory Column Store (IM column store) functionality.

This chapter contains the following topics:

- DBMS_INMEMORY Overview
- DBMS_INMEMORY Security Model
- Summary of DBMS_INMEMORY Subprograms

### 84.1 DBMS_INMEMORY Overview

This package contains procedures for populating and repopulating the IM column store, and for dropping IM expressions from a specified table.

#### IM Population and Repopulation

In-Memory population (population) occurs when the database reads existing row-format data from disk, transforms it into columnar format, and then stores it in the IM column store. Only objects with the `INMEMORY` attribute are eligible for population.

Population, which transforms existing data on disk into columnar format, is different from repopulation, which loads new data into the IM column store. Repopulation occurs automatically after their columnar data undergo significant DML activity.

When an object has the `INMEMORY` attribute and a priority other than `NONE`, the database gradually populates the object in the IM column store according to an internal priority queue. Objects with priority of `NONE` are populated only when they undergo a full scan. The `DBMS_INMEMORY.POPULATE` procedure forces immediate population of an object. Similarly, `DBMS_INMEMORY.REPOPULATE` procedure forces immediate repopulation of an object.

See Also:

*Oracle Database In-Memory Guide* to learn more about IM population

#### IM Expressions

IM expressions populate frequently evaluated query expressions in the IM column store for subsequent reuse. An IM expression is materialized as a hidden virtual column, prefixed with the string `SYS_IME`, and is accessed in the same way as a non-virtual column.

When you use `DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS`, the database adds the 20 hottest expressions to their respective tables as `SYS_IME` columns and applies the default `INMEMORY` column compression clause. If any `SYS_IME` columns that were added...
during a previous invocation are no longer in the latest expression list, then the database changes their attribute to \texttt{NO INMEMORY}.

The maximum number of \texttt{SYS\_IME} columns for a table, regardless of whether the attribute is \texttt{INMEMORY} or \texttt{NO INMEMORY}, is 50. After the 50 expression limit is reached for a table, the database will not add new \texttt{SYS\_IME} columns. To make space for new expressions, you must manually drop \texttt{SYS\_IME} columns with the \texttt{DBMS\_INMEMORY.IME\_DROP\_EXPRESSIONS} or \texttt{DBMS\_INMEMORY\_ADMIN.IME\_DROP\_ALL\_EXPRESSIONS} procedures.

\\textit{Oracle Database In-Memory Guide} to learn more about IM expressions

\section*{84.2 DBMS\_INMEMORY Security Model}

The DBMS\_INMEMORY package subprograms execute with invoker's rights.

The \texttt{POPULATE} and \texttt{REPOPULATE} procedures require the invoking user to have \texttt{SELECT} privileges on the specified object. For \texttt{IME\_DROP\_EXPRESSIONS}, the invoking user must have \texttt{ALTER TABLE} privileges on the specified table.

\section*{84.3 Summary of DBMS\_INMEMORY Subprograms}

This table lists and briefly describes the DBMS\_INMEMORY package subprograms.

\begin{table}[h]
\centering
\begin{tabular}{|c|l|}
\hline
\textbf{Subprogram} & \textbf{Description} \\
\hline
\texttt{IME\_DROP\_EXPRESSIONS Procedure} & Drops a specified set of \texttt{SYS\_IME} virtual columns from a table \\
\texttt{POPULATE Procedure} & Forces population of the specified table \\
\texttt{REPOPULATE Procedure} & Forces repopulation of the specified table \\
\texttt{SEGMENT\_DEALLOCATE\_VERSIONS Procedure} & Deallocates non-current IMCUs in the IM column store \\
\hline
\end{tabular}
\caption{DBMS\_INMEMORY Package Subprograms}
\end{table}

\subsection*{84.3.1 IME\_DROP\_EXPRESSIONS Procedure}

This procedure drops a specified set of \texttt{SYS\_IME} virtual columns from a table.

\textbf{Syntax}

\begin{verbatim}
DBMS\_INMEMORY.IME\_DROP\_EXPRESSIONS(
    schema_name IN VARCHAR2,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2 DEFAULT NULL);
\end{verbatim}
Parameters

Table 84-2 IME_DROP_EXPRESSIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that contains the In-Memory table</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the In-Memory table that contains the SYS_IME columns</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the SYS_IME column. By default this value is null, which specifies all SYS_IME columns in this table.</td>
</tr>
</tbody>
</table>

Usage Notes

Typical reasons for dropping SYS_IME columns are space and performance. The maximum number of SYS_IME columns for a table, regardless of whether the attribute is INMEMORY or NO INMEMORY, is 50. After the 50-expression limit is reached for a table, the database will not add new SYS_IME columns. To make space for new expressions, you must manually drop SYS_IME columns with the DBMS_INMEMORY.IME_DROP_EXPRESSIONS or DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS procedures.

To drop a specified SYS_IME column or all SYS_IME columns in the requested table, use DBMS_INMEMORY.IME_DROP_EXPRESSIONS. To populate these segments again, either invoke the DBMS_INMEMORY.POPULATE procedure, or perform a full table scan.

84.3.2 POPULATE Procedure

This procedure forces population of the specified table, partition, or subpartition into the IM column store.

Syntax

```
DBMS_INMEMORY.POPULATE(
    schema_name    IN   VARCHAR2,
    table_name     IN   VARCHAR2,
    subobject_name IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 84-3 POPULATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>subobject_name</td>
<td>Partition or subpartition</td>
</tr>
</tbody>
</table>
84.3.3 REPOPULATE Procedure

This procedure forces repopulation of a table, partition, or subpartition that is currently populated in the IM column store.

Syntax

```sql
DBMS_INMEMORY.REPOPULATE(
    schema_name      IN    VARCHAR2,
    table_name       IN    VARCHAR2,
    subobject_name   IN    VARCHAR2 DEFAULT NULL,
    force            IN    BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema that owns the object.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table requiring repopulation.</td>
</tr>
<tr>
<td>subobject_name</td>
<td>Name of the partition or subpartition. If null, then repopulate the entire table.</td>
</tr>
<tr>
<td>force</td>
<td>Whether to repopulate all IMCUs in the segment, just as in initial population.</td>
</tr>
</tbody>
</table>

The following values are possible for the `force` parameter:

- **FALSE** — The database repopulates only IMCUs containing modified rows. This is the default.
- **TRUE** — The database drops the segment, and then rebuilds it. The database increments the statistics and performs all other tasks related to initial population.

For example, IMCU 1 contains rows 1 to 500,000, and IMCU 2 contains rows 500,001 to 1,000,000. A statement modifies row 600,000. When `force` is `FALSE`, the database only repopulates IMCU 2. When `force` is `TRUE`, the database repopulates both IMCUs.

Consider further that the `INMEMORY_VIRTUAL_COLUMNS` initialization parameter is set to `ENABLE`, and an application creates a new virtual column. When `force` is `FALSE`, the database only repopulates IMCU 2 with the new column. When `force` is `TRUE`, the database repopulates both IMCUs with the new column.

84.3.4 SEGMENT_DEALLOCATE_VERSIONS Procedure

This procedure deallocates non-current IMCUs in the IM column store.

Syntax

```sql
DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS(
    SCHEMA_NAME    IN    VARCHAR2,
    TABLE_NAME     IN    VARCHAR2,
    PARTITION_NAME IN    VARCHAR2 DEFAULT NULL,
    SPCPRESSURE    IN    BOOLEAN DEFAULT FALSE);
```
Parameters

Table 84-5 SEGMENT_DEALLOCATE_VERSIONS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema that owns the object.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table requiring repopulation.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition or subpartition. If null, then repopulate the entire</td>
</tr>
<tr>
<td></td>
<td>table.</td>
</tr>
<tr>
<td>spcpressure</td>
<td>Whether to force deallocation of non-current IMCUs (TRUE), or wait for the</td>
</tr>
<tr>
<td></td>
<td>database to deallocate them automatically. By default, the database</td>
</tr>
<tr>
<td></td>
<td>deallocates non-current IMCUs every two minutes.</td>
</tr>
</tbody>
</table>

Usage Notes

During repopulation, the IM column store maintains both the current IMCU and non-current IMCU. This mechanism, which is called double buffering, ensures that queries do not decrease performance because an IMCU is unavailable during repopulation. After repopulation completes, the IM column store retains the non-current IMCU for a short time (2 minutes by default) to optimize queries with older SCNs. Typically, the default behavior is sufficient. However, you can force deallocation of non-current IMCUs by using the SEGMENT_DEALLOCATE_VERSIONS procedure.

Example

The following program forces deallocation of non-current IMCUs for the products table:

```
BEGIN
    DBMS_INMEMORY.SEGMENT_DEALLOCATE_VERSIONS(
        schema_name => 'SH',
        table_name  => 'PRODUCTS',
        spcpressure => TRUE );
END;
```

Oracle Database In-Memory Guide to learn more about Oracle Database In-Memory features

85.1 DBMS_INMEMORY_ADMIN Overview

This package provides interfaces for managing In-Memory Expressions (IM expressions) and the In-Memory FastStart (IM FastStart) area.

IM Expressions

Analytic queries often contain complex expressions or calculations that consume significant CPU and memory during execution. Use `IME_CAPTURE_EXPRESSIONS` to identify these frequently used (“hot”) expressions and `IME_POPULATE_EXPRESSIONS` to populate them in the IM column store. By using IM expressions, the database avoids repeated computations and improves performance.

The database represents IM expressions as system-generated virtual columns. The name of an IM virtual column begins with `SYS_IME`. You can also use `DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS` and `DBMS_INMEMORY.IME_DROP_EXPRESSIONS` to remove existing `SYS_IME` columns.

The `DBA_IM_EXPRESSIONS` view shows the `SYS_IME` columns that have the `INMEMORY` attribute. After using the `IME_CAPTURE_EXPRESSIONS` procedure, you can query this view to see the hot expressions added to different tables in the database.

See Also:
Oracle Database In-Memory Guide to learn more about IM expressions
IM FastStart Area

The IM FastStart area stores data that optimizes the population of the IM column store when the database restarts. Because the database reads columnar data directly from persistent storage without needing to compress or format it, population is faster when a database instance restarts.

When you enable IM FastStart for the IM column store, you must specify an ASSM tablespace for the IM FastStart area. The tablespace stores the data in a SecureFiles LOB named SYSDBIMFS_LOGSEG$. The SYSAUX tablespace stores the metadata. When data is populated or repopulated in the IM column store, the database automatically writes the data to the IM FastStart area. You cannot manually force a write. If you specify an object as NO INMEMORY, then the database removes it from the IM FastStart area.

When the IM FastStart area is under space pressure, the database automatically drops the oldest 15% of segments and continues saving columnar data. If space is unavailable, then the database stops writing to the IM FastStart area.

See Also:

Oracle Database In-Memory Guide to learn more about IM expressions

Automatic In-Memory

Automatic In-Memory uses access tracking, column statistics, and other relevant statistics to manage objects in the IM column store. If the IM column store is full, and if other more frequently accessed segments would benefit from population in the IM column store, then the IM column store evicts inactive segments. If the IM column store is configured to hold all INMEMORY segments, however, then Automatic In-Memory takes no action.

By default, Automatic In-Memory checks usage statistics for the past 31 days. You can change the current setting by supplying the AIM_STATWINDOW_DAYS parameter to DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER.

See Also:

Oracle Database In-Memory Guide to learn more about Automatic In-Memory

85.2 DBMS_INMEMORY_ADMIN Security Model

This package requires administrator privileges. Package subprograms execute with invoker's rights.
85.3 DBMS_INMEMORY_ADMIN Operational Notes

It is possible for a DBMS_INMEMORY_ADMIN FastStart operation to fail or be interrupted. In a failure or interruption scenario, the following rules determine which subprograms you can use:

- If `FASTSTART_ENABLE` does not succeed, then the only permitted operation is re-executing `FASTSTART_ENABLE`.
- If `FASTSTART_MIGRATE_STORAGE` does not succeed, then the only permitted operation is re-executing `FASTSTART_MIGRATE_STORAGE`.
- If `FASTSTART_DISABLE` does not succeed, then all DBMS_INMEMORY_ADMIN operations are permitted.

85.4 Summary of DBMS_INMEMORY_ADMIN Subprograms

This table lists the DBMS_INMEMORY_ADMIN subprograms and briefly describes them.

Table 85-1 DBMS_INMEMORY_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AIM_GET_PARAMETER Procedure</td>
<td>This procedure obtains the current values for parameters that control Automatic In-Memory.</td>
</tr>

</tbody>
</table>
Table 85-1 (Cont.) DBMS_INMEMORY_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IME_POPULATE_EXPRESSIONS Procedure</td>
<td>This procedure forces the population of expressions captured in the latest invocation of DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS.</td>
</tr>
</tbody>
</table>

85.4.1 AIM_GET_PARAMETER Procedure

This procedure obtains the current values for parameters that control Automatic In-Memory.

Syntax

```
DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(
  parameter   IN    NUMBER,
  value       OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is AIM_STATWINDOW_DAYS, which specifies the number of days in the sliding statistics window. Automatic In-Memory uses this duration to filter statistics for INMEMORY objects as part of its algorithms. For example, if the duration is set to 7 days, then Automatic In-Memory considers only statistics of the past 7 days for its algorithms. The default is 31.</td>
</tr>
<tr>
<td>value</td>
<td>Specifies the value assigned to AIM_STATWINDOW_DAYS.</td>
</tr>
</tbody>
</table>

Example 85-1 Getting the Number of Days in the Statistics Window

The following code prints the number of days in the statistics window to the screen:

```
VARIABLE b_statwin NUMBER
BEGIN
  DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, :b_statwin);
END;
/
PRINT b_statwin
```

Sample output appears below:

```
B_STATWIN
---------
14
```
85.4.2 AIM_SET_PARAMETER Procedure

The procedure customizes the execution environment of Automatic In-Memory.

Syntax

```
DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(
    parameter   IN    NUMBER,
    value       IN    NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Specifies a predefined constant that controls Automatic In-Memory. The only valid constant is AIM_STATWINDOW_DAYS, which specifies the number of days in the sliding statistics window. The default is 31.</td>
</tr>
<tr>
<td>value</td>
<td>Assigns the value assigned to AIM_STATWINDOW_DAYS.</td>
</tr>
</tbody>
</table>

Example 85-2 Setting the Number of Days in the Statistics Window

The following example gets the current number of days in the window, sets it to 14, and then prints the value to the screen:

```
VARIABLE b_statwin NUMBER
BEGIN
    DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, :b_statwin);
END;
/

PRINT b_statwin

BEGIN
    DBMS_INMEMORY_ADMIN.AIM_SET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, 14);
END;
/

BEGIN
    DBMS_INMEMORY_ADMIN.AIM_GET_PARAMETER(DBMS_INMEMORY_ADMIN.AIM_STATWINDOW_DAYS, :b_statwin);
END;
/

PRINT b_statwin

Sample output appears below:
85.4.3 FASTSTART_DISABLE Procedure

This procedure disables the In-Memory FastStart (IM FastStart) feature.

Syntax

```sql
DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE();
```

Security Model

Administrator privileges are required to execute this procedure.

Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature, and performs the following operations:
   - Cleans the IM FastStart area
   - Deletes IM FastStart metadata stored in the SYSAUX tablespace
   - Releases the IM FastStart tablespace (but does not delete it)

This procedure does not interrupt or affect any concurrent IM column store operations.

Examples

The following PL/SQL program disables the IM FastStart feature:

```sql
EXEC DBMS_INMEMORY_ADMIN.FASTSTART_DISABLE;
```

The following query shows that the LOB for the IM FastStart tablespace has been deleted (sample output included):

```sql
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT 1.OWNER, 1.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM DBA_LOBS l, DBA_SEGMENTS s
WHERE 1.SEGMENT_NAME = s.SEGMENT_NAME
AND 1.TABLESPACE_NAME = 'FS_TBS'
GROUP BY 1.OWNER, 1.SEGMENT_NAME;
```

no rows selected
85.4.4 FASTSTART_ENABLE Procedure

This procedure enables In-Memory FastStart (IM FastStart), and designates a tablespace for the IM FastStart (FastStart) area.

Syntax

```
DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE(
    tbs_name    IN    VARCHAR2,
    nologging   IN    BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tbs_name</td>
<td>The name of the ASSM tablespace for the FastStart area.</td>
</tr>
<tr>
<td>nologging</td>
<td>The logging mode of the LOB created for the FastStart area.</td>
</tr>
<tr>
<td></td>
<td>If the nologging parameter is set to FALSE, then the database creates the</td>
</tr>
<tr>
<td></td>
<td>FastStart LOB with the LOGGING option. If set to TRUE (default), then the</td>
</tr>
<tr>
<td></td>
<td>database creates the LOB with the NOLOGGING option.</td>
</tr>
</tbody>
</table>

Security Model

Administrator privileges are required to execute this procedure.

Usage Notes

To enable IM FastStart, the ASSM tablespace specified in FASTSTART_ENABLE must exist, and the SYSAUX tablespace must be online. Only one FastStart tablespace can exist for every PDB or non-CDB. The specified tablespace must have enough space to store data for the IM column store, and it must not contain any other data before it is designated for the FastStart area. Oracle recommends sizing the tablespace at least twice of the size of the INMEMORY_SIZE initialization parameter.

The database does not create the FastStart area on disk until the IM column store is populated. After population, the data periodically saves the columnar data (but not metadata such as the transaction journal) to the FastStart area, which is represented on disk as the SYSDBIMFS_LOBSEG$ segment. The database stores the FastStart metadata in the SYSAUX tablespace. In an Oracle Real Application Clusters (Oracle RAC) environment, IM FastStart data is shared across all nodes.

Note:

IM FastStart is not supported in a standby database instance.

Whereas the initial loading of IMCUs into memory is expensive and CPU-bound, an IM FastStart tablespace requires intermittent I/O. The database periodically writes columnar data to the IM FastStart area. If a database instance must restart, then Oracle Database reads the columnar data directly from the IM FastStart area rather
than reconstructing the IMCUs from scratch. No compression or formatting of the columnar data is required.

Examples

This example creates `fs_tbs` as an ASSM tablespace, and then uses `FASTSTART_ENABLE` to specify this tablespace as the IM FastStart area:

```sql
CREATE TABLESPACE fs_tbs
    DATAFILE 'fs_tbs.dbf' SIZE 500M
    EXTENT MANAGEMENT LOCAL
    SEGMENT SPACE MANAGEMENT AUTO;

EXEC DBMS_INMEMORY_ADMIN.FASTSTART_ENABLE('fs_tbs');
```

The following query shows that the IM FastStart LOB was created (sample output included):

```sql
COL OWNER FORMAT a5
COL SEGMENT_NAME FORMAT a20
SELECT   l.OWNER, l.SEGMENT_NAME, SUM(s.BYTES)/1024/1024 MB
FROM     DBA_LOBS l, DBA_SEGMENTS s
WHERE    l.SEGMENT_NAME = s.SEGMENT_NAME
AND      l.TABLESPACE_NAME = 'FS_TBS'
GROUP BY l.OWNER, l.SEGMENT_NAME;

OWNER SEGMENT_NAME         MB
----- -------------------- ----------
SYS   SYSDBIMFS_LOBSEG$    .125
```

85.4.5 FASTSTART_MIGRATE_STORAGE Procedure

This procedure moves the In-Memory FastStart (IM FastStart) data and catalogs from the current tablespace to a new tablespace.

Syntax

```sql
DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE(
    tbs_name    IN    VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tbs_name</td>
<td>The name of the new ASSM tablespace for the IM FastStart area.</td>
</tr>
</tbody>
</table>

Security Model

DBA privileges are required to execute this procedure.

Usage Notes

When you execute the procedure, the database executes the following actions:

1. Waits until all IM FastStart operations complete
2. Disables the IM FastStart feature
3. Copies IM FastStart data and metadata to the new tablespace, leaving the old tablespace intact
4. Re-enables IM FastStart the feature

Examples

The following program obtains the name of the IM FastStart tablespace, if one exists, and prints the result (sample output included):

```sql
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
    :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----------------------------
FS_TBS
```

The following statements create a new tablespace named `fs_tbs2`, and then migrate the IM FastStart area to this tablespace:

```sql
CREATE TABLESPACE fs_tbs2
    DATAFILE 'fs_tbs2.dbf' SIZE 500M
    EXTENT MANAGEMENT LOCAL
    SEGMENT SPACE MANAGEMENT AUTO;
EXEC DBMS_INMEMORY_ADMIN.FASTSTART_MIGRATE_STORAGE('fs_tbs2');
```

The following program prints the name of the current IM FastStart tablespace (sample output included):

```sql
BEGIN
    :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----------------------------
FS_TBS2
```

85.4.6 GET_FASTSTART_TABLESPACE Function

This function returns the tablespace assigned to In-Memory FastStart (IM FastStart). If the feature is disabled, then the function returns `NOT ENABLED`.

Syntax

```sql
DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE();
```

Security Model

DBA privileges are required to execute this function.
Examples

This program obtains the name of the IM FastStart tablespace, if one exists, and prints the result:

```
VARIABLE b_fstbs VARCHAR2(20)
BEGIN
    :b_fstbs := DBMS_INMEMORY_ADMIN.GET_FASTSTART_TABLESPACE;
END;
/
PRINT b_fstbs

B_FSTBS
-----------------------------
NOT ENABLED
```

85.4.7 IME_CAPTURE_EXPRESSIONS Procedure

This procedure captures the 20 most frequently accessed ("hottest") expressions in the database in the specified time interval.

Syntax

```
DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS(
    snapshot    IN    VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snapshot</td>
<td>Specifies a snapshot that defines the time interval in which expression statistics are considered. You can specify any of the following values:</td>
</tr>
<tr>
<td></td>
<td>• CUMULATIVE The database considers all expression statistics since the creation of the database.</td>
</tr>
<tr>
<td></td>
<td>• CURRENT The database considers only expression statistics from the past 24 hours.</td>
</tr>
<tr>
<td></td>
<td>• WINDOW The database considers statistics for expressions tracked in the most recent expression capture window. The database adds hidden virtual columns for expressions tracked in the most recent window. If the capture window is currently open, then the database considers all expressions tracked in the current window up until this point, and then materializes the hottest expressions. To list the expressions that have been tracked in the current window, query <code>DBA_EXPRESSION_STATISTICS</code> with <code>SNAPSHOT='WINDOW'</code>.</td>
</tr>
</tbody>
</table>

Usage Notes

When you invoke this procedure, the database queries the Expression Statistics Store (ESS), and considers only expressions on tables that are at least partially populated in the IM column store. The database adds the 20 hottest expressions to their respective
tables as hidden virtual columns, prefixed with the string SYS_IME, and applies the default INMEMORY column compression clause. If any SYS_IME columns added during a previous invocation are no longer in the latest top 20 list, then the database marks them as NO INMEMORY.

**Note:**

Executing the IME_CAPTURE_EXPRESSIONS procedure on a standby database has no effect.

The maximum number of SYS_IME columns for a table, regardless of whether the attribute is INMEMORY or NO INMEMORY, is 50. After the limit is reached for a table, the database will not add new SYS_IME columns. To make space for new expressions, you must manually drop SYS_IME columns with the IME_DROP_ALL_EXPRESSIONS Procedure or IME_DROP_EXPRESSIONS Procedure.

The 50-expression limit for each table, which includes both INMEMORY and NO INMEMORY expressions, is different from the 20-expression limit for the database, which includes only INMEMORY expressions. For example, if 20 tables are populated in the IM column store, then each table might each have 1 SYS_IME column with the INMEMORY attribute, and 49 SYS_IME columns with the NO INMEMORY attribute.

IM expressions and virtual columns are stored in In-Memory structured called In-Memory Expression Units (IMEUs). Every IMEU is linked to a parent In-Memory Compression Unit (IMCU) from which it inherits compression characteristics.

ESS information is stored in the data dictionary and exposed in the **DBA_EXPRESSION_STATISTICS** view. This view shows the metadata that the optimizer has collected in the ESS. IM expressions are exposed as system-generated virtual columns, prefixed by the string SYS_IME, in the **DBA_IM_EXPRESSIONS** view.

**Example 85-3  Capturing Expressions in a User-Defined Window**

This example demonstrates use of the **WINDOW** capture mode. Your goal is to open and close an expression capture window, and then capture all expressions that the database tracked during this window. You perform the following steps:

1. Open an expression capture window, generate expressions, and then close the window:

   ```sql
   EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
   -- Generate expressions for the database to track
   EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
   ```

2. Query **DBA_EXPRESSION_STATISTICS** (sample output included):

   ```sql
   COL OWNER FORMAT A6
   COL TABLE_NAME FORMAT A9
   COL COUNT FORMAT 99999
   COL CREATED FORMAT A10
   COL EXPRESSION_TEXT FORMAT A29

   SELECT OWNER, TABLE_NAME, EVALUATION_COUNT AS COUNT,
       CREATED, EXPRESSION_TEXT
   FROM   DBA_EXPRESSION_STATISTICS
   WHERE  SNAPSHOT = 'WINDOW'
   AND    OWNER = 'SH';
   ```
The preceding query shows both the columns tracked in the ESS and the expressions captured during the window for queries in the sh schema. During the most recent window, the database captured one expression:

```
QUANTITY_SOLD*AMOUNT_SOLD
```

3. Use `IME_CAPTURE_EXPRESSIONS` to make the database consider all expressions in the current window for materialization:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');
```

4. Query `DBA_IM_EXPRESSIONS` (sample output included):

```
COL OWNER FORMAT a6
COL TABLE_NAME FORMAT a9
COL COLUMN_NAME FORMAT a25
SET LONG 50
SET LINESIZE 150
SELECT OWNER, TABLE_NAME, COLUMN_NAME, SQL_EXPRESSION
FROM DBA_IM_EXPRESSIONS;
```

```
OWNER  TABLE_NAME  COLUMN_NAME               SQL_EXPRESSION
-------- --------- ------------------------- -----------------------------
SH      SALES      SYS_IME000100000025201B   "QUANTITY_SOLD"*"AMOUNT_SOLD"
```

The preceding output shows all virtual columns that were added to the table and marked `INMEMORY` as part of the latest `IME_CAPTURE_EXPRESSIONS` invocation. The database gradually populates the captured expressions into the IM column store when it repopulates different IMCUs of the table.

5. Execute the following procedure to explicitly force a population of all captured IM expressions:

```
EXEC DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS();
```

Note that you can populate IM expressions from a specific table by executing the `DBMS_INMEMORY.REPOPULATE` procedure with the `force` parameter set to `TRUE`.

**Example 85-4 Capturing Expressions for the Past Day**

The following program captures expressions tracked during the last 24 hours:

```
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('CURRENT');
```

**85.4.8 IME_CLOSE_CAPTURE_WINDOW Procedure**

This procedure signals the end of the current expression capture window.

**Syntax**

```
DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
```
Usage Notes

On invocation of this procedure, the optimizer saves all gathered statistics to disk, and essentially freezes the expressions tracked in the window. The database preserves the statistics captured in this window until a new expression capture window is opened, at which point the database purges the statistics captured in the previous window.

Example 85-5  Example

This example opens an expression capture window, and then issues IME_CAPTURE_EXPRESSIONS('WINDOW') so that the database considers all expressions in the current window for materialization. Finally, the example closes the window.

EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
-- Generate expressions so that the database can track them
EXEC DBMS_INMEMORY_ADMIN.IME_CLOSE_CAPTURE_WINDOW();
EXEC DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS('WINDOW');

85.4.9 IME_DROP_ALL_EXPRESSIONS Procedure

This procedure drops all SYS_IME expression virtual columns in the database.

Syntax

DBMS_INMEMORY_ADMIN.IME_DROP_ALL_EXPRESSIONS();

Usage Notes

The IME_DROP_ALL_EXPRESSIONS procedure drops all SYS_IME columns from all tables, regardless of whether they have the INMEMORY attribute. In effect, the procedure acts as a database-wide reset button.

Using IME_DROP_ALL_EXPRESSIONS triggers a drop of all IMEUs and IMCUs for segments that have SYS_IME columns. For example, if 50 populated tables have one SYS_IME column each, then IME_DROP_ALL_EXPRESSIONS removes all 50 tables from the IM column store. To populate these segments again, you must use the DBMS_INMEMORY.POPULATE procedure or perform a full table scan.

85.4.10 IME_GET_CAPTURE_STATE Procedure

This procedure returns the current capture state of the expression capture window and the timestamp of the most recent modification.

Syntax

DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE(
    p_capture_state  OUT  VARCHAR2,
    p_last_modified  OUT  TIMESTAMP);
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| p_capture_state | Describes the current state of the expression capture window. The following states are possible:  
  - OPEN — Indicates that the window is open.  
  - CLOSED — Indicates that the window is closed.  
  - DEFAULT — Indicates that the window has not been used. It is equivalent to the CLOSED state. |
| p_last_modified | Indicates the timestamp of the most recent action.                          |

## Usage Notes

This procedure is useful for avoiding conflicting calls for `IME_OPEN_CAPTURE_WINDOW Procedure` and `IME_CLOSE_CAPTURE_WINDOW Procedure`. For example, if the current expression capture window state is OPEN, then you cannot open another window, and if the window state is CLOSED, then you cannot close a window.

### Example 85-6 Determining the State of an Expression Capture Window

This example opens an expression capture window, and then determines its capture state.

```sql
EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();

VARIABLE b_state VARCHAR2(25)
VARIABLE b_time  VARCHAR2(10)
EXECUTE DBMS_INMEMORY_ADMIN.IME_GET_CAPTURE_STATE(:b_state, :b_time)
PRINT b_state b_time
```

The following sample output indicates that an expression capture window is currently open:

```
B_STATE
-------------------------------
OPEN
B_TIME
-------------------------------
09-OCT-17
```

## 85.4.11 IME_OPEN_CAPTURE_WINDOW Procedure

This procedure signals the beginning of an expression capture window.

### Syntax

```sql
DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();
```

### Security Model

Administrator privileges are required to execute this procedure.
Usage Notes

On invocation of this procedure, the optimizer begins a new window snapshot and starts tracking expressions that occur within this window. An expression capture window is global across all instances in an Oracle RAC database.

Conflicting actions are not permitted. For example, in an Oracle RAC database, opening expression capture window on instance 1 at time t0 and attempting to open another expression capture window on instance 2 at time t1 before closing the first window is a conflicting action. To obtain the current capture state and reduce the potential for conflicting procedure invocations, use the IME_GET_CAPTURE_STATE Procedure.

Example

This following program opens an expression capture window:

EXEC DBMS_INMEMORY_ADMIN.IME_OPEN_CAPTURE_WINDOW();

85.4.12 IME_POPULATE_EXPRESSIONS Procedure

This procedure forces the population of expressions captured in the latest invocation of DBMS_INMEMORY_ADMIN.IME_CAPTURE_EXPRESSIONS.

Syntax

DBMS_INMEMORY_ADMIN.IME_POPULATE_EXPRESSIONS();

Usage Notes

If you do not invoke this procedure, then the database gradually repopulates SYS_IME columns when their parent IMCUs are repopulated. If a table is not repopulated, then any new SYS_IME columns captured by the IME_CAPTURE_EXPRESSIONS procedure are not populated. IME_POPULATE_EXPRESSIONS solves this problem by forcing population.

Internally, the procedure invokes DBMS_INMEMORY.REPOPULATE for all tables that have SYS_IME columns with the INMEMORY attribute. To populate SYS_IME columns in a specified subset of tables, use DBMS_INMEMORY.REPOPULATE instead of IME_POPULATE_EXPRESSIONS.
The `DBMS_IOT` package creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command. `DBMS_IOT` can also create an exception table into which references to the rows of an index-organized table that violate a constraint can be placed during the `enable_constraint` operation.

`DBMS_IOT` is not loaded during database installation. To install `DBMS_IOT`, run `dbmsiotc.sql`, available in the `ADMIN` directory.

This chapter contains the following topics:

- Summary of `DBMS_IOT` Subprograms

---

**Note:**

With the introduction of logical-rowids for IOTs with Oracle Database Release 8.1, you no longer need to use the procedures contained in this package which is retained for backward compatibility only. It is however required for servers running with Oracle Database Release 8.0.

### 86.1 Summary of DBMS_IOT Subprograms

This table lists and briefly describes the `DBMS_IOT` subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>BUILD_CHAIN_ROWS_TABLE</code> Procedure</td>
<td>Creates a table into which references to the chained rows for an index-organized table can be placed using the <code>ANALYZE</code> command</td>
</tr>
<tr>
<td><code>BUILD_EXCEPTIONS_TABLE</code> Procedure</td>
<td>Creates an exception table into which rows of an index-organized table that violate a constraint can be placed</td>
</tr>
</tbody>
</table>

### 86.1.1 BUILD_CHAIN_ROWS_TABLE Procedure

This procedure creates a table into which references to the chained rows for an index-organized table can be placed using the `ANALYZE` command.

**Syntax**

```sql
DBMS_IOT.BUILD_CHAIN_ROWS_TABLE ( 
    owner IN VARCHAR2, 
    iot_name IN VARCHAR2, 
    chainrow_table_name IN VARCHAR2 default 'IOT_CHAINED_ROWS');
```
Parameters

Table 86-2  BUILD_CHAIN_ROWS_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the index-organized table.</td>
</tr>
<tr>
<td>iot_name</td>
<td>Index-organized table name.</td>
</tr>
<tr>
<td>chainrow_table_name</td>
<td>Intended name for the chained-rows table.</td>
</tr>
</tbody>
</table>

Usage Notes

You should create a separate chained-rows table for each index-organized table to accommodate its primary key.

Examples

CREATE TABLE l(a char(16),b char(16), c char(16), d char(240),
PRIMARY KEY(a,b,c)) ORGANIZATION INDEX pctthreshold 10 overflow;
EXECUTE DBMS_IOT.BUILD_CHAIN_ROWS_TABLE('SYS','L','LC');

A chained-row table is created with the following columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>OWNER_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>CLUSTER_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>PARTITION_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>SUBPARTITION_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>HEAD_ROWID</td>
<td></td>
<td>ROWID</td>
</tr>
<tr>
<td>TIMESTAMP</td>
<td></td>
<td>DATE</td>
</tr>
<tr>
<td>A</td>
<td></td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>B</td>
<td></td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>C</td>
<td></td>
<td>CHAR(16)</td>
</tr>
</tbody>
</table>

86.1.2 BUILD_EXCEPTIONS_TABLE Procedure

This procedure creates an exception table.

Rows of an index-organized table that violate a constraint can be placed into this table during the execution of the following SQL statements:

- ALTER TABLE ... ENABLE CONSTRAINT ... EXCEPTIONS INTO
- ALTER TABLE ... ADD CONSTRAINT ... EXCEPTIONS INTO

Syntax

DBMS_IOT.BUILD_EXCEPTIONS_TABLE (   owner IN VARCHAR2,   iot_name IN VARCHAR2,   exceptions_table_name IN VARCHAR2 default 'IOT_EXCEPTIONS');
Parameters

Table 86-3  BUILD_EXCEPTIONS_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the index-organized table.</td>
</tr>
<tr>
<td>iot_name</td>
<td>Index-organized table name.</td>
</tr>
<tr>
<td>exceptions_table_name</td>
<td>Intended name for exception-table.</td>
</tr>
</tbody>
</table>

Usage Notes

You should create a separate exception table for each index-organized table to accommodate its primary key.

Examples

EXECUTE DBMS_IOT.BUILD_EXCEPTIONS_TABLE('SYS','L','LE');

An exception table for the preceding index-organized table with the following columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Null?</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROW_ID</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>OWNER</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>TABLE_NAME</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>CONSTRAINT</td>
<td></td>
<td>VARCHAR2(30)</td>
</tr>
<tr>
<td>A</td>
<td></td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>B</td>
<td></td>
<td>CHAR(16)</td>
</tr>
<tr>
<td>C</td>
<td></td>
<td>CHAR(16)</td>
</tr>
</tbody>
</table>
The DBMS_JAVA package provides a PL/SQL interface for accessing database functionality from Java.

For a complete description of this package within the context of DBMS_JAVA, see DBMS_JAVA in the Oracle Database Java Developer’s Guide.
The DBMS_JOB package schedules and manages jobs in the job queue.

Note:
The DBMS_JOB package has been superseded by the DBMS_SCHEDULER package, and support for DBMS_JOB might be removed in future releases of Oracle Database. In particular, if you are administering jobs to manage system load, you are encouraged to disable DBMS_JOB by revoking the package execution privilege for users.

For more information, see DBMS_SCHEDULER and "Moving from DBMS_JOB to DBMS_SCHEDULER" in the Oracle Database Administrator's Guide.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Summary of DBMS_JOB Subprograms

88.1 DBMS_JOB Security Model

No specific system privileges are required to use DBMS_JOB. No system privileges are available to manage DBMS_JOB. Jobs cannot be altered or deleted other than jobs owned by the user. This is true for all users including those users granted DBA privileges.

You can execute procedures that are owned by the user or for which the user is explicitly granted EXECUTE. However, procedures for which the user is granted the execute privilege through roles cannot be executed.

Note that, once a job is started and running, there is no easy way to stop the job.

88.2 DBMS_JOB Operational Notes

These notes describe stopping a job, and working with Oracle Real Application Clusters.

Stopping a Job

Note that, once a job is started and running, there is no easy way to stop the job.
Working with Oracle Real Application Clusters

DBMS_JOB supports multi-instance execution of jobs. By default jobs can be executed on any instance, but only one single instance will execute the job. In addition, you can force instance binding by binding the job to a particular instance. You implement instance binding by specifying an instance number to the instance affinity parameter. Note, however, that in Oracle Database 10g Release 1 (10.1) instance binding is not recommended. Service affinity is preferred. This concept is implemented in the DBMS_SCHEDULER package.

The following procedures can be used to create, alter or run jobs with instance affinity. Note that not specifying affinity means any instance can run the job.

- DBMS_JOB.SUBMIT
- DBMS_JOB.INSTANCE
- DBMS_JOB.CHANGE
- DBMS_JOB.RUN

**DBMS_JOB.SUBMIT**

To submit a job to the job queue, use the following syntax:

```sql
DBMS_JOB.SUBMIT(
    job       OUT    BINARY_INTEGER,
    what      IN     VARCHAR2,
    next_date IN     DATE DEFAULT SYSDATE,
    interval  IN     VARCHAR2 DEFAULT 'NULL',
    no_parse  IN     BOOLEAN DEFAULT FALSE,
    instance  IN     BINARY_INTEGER DEFAULT ANY_INSTANCE,
    force     IN     BOOLEAN DEFAULT FALSE);
```

Use the parameters `instance` and `force` to control job and instance affinity. The default value of `instance` is 0 (zero) to indicate that any instance can execute the job. To run the job on a certain instance, specify the `instance` value. Oracle displays error ORA-23319 if the `instance` value is a negative number or NULL.

The `force` parameter defaults to false. If `force` is TRUE, any positive integer is acceptable as the job instance. If `force` is FALSE, the specified instance must be running, or Oracle displays error number ORA-23428.

**DBMS_JOB.INSTANCE**

To assign a particular instance to execute a job, use the following syntax:

```sql
DBMS_JOB.INSTANCE(
    JOB IN BINARY_INTEGER,
    instance                IN BINARY_INTEGER,
    force                   IN BOOLEAN DEFAULT FALSE);
```

The `FORCE` parameter in this example defaults to FALSE. If the instance value is 0 (zero), job affinity is altered and any available instance can execute the job despite the value of `force`. If the `instance` value is positive and the `force` parameter is FALSE, job affinity is altered only if the specified instance is running, or Oracle displays error ORA-23428.

If the `force` parameter is TRUE, any positive integer is acceptable as the job instance and the job affinity is altered. Oracle displays error ORA-23319 if the `instance` value is negative or NULL.
To alter user-definable parameters associated with a job, use the following syntax:

```sql
DBMS_JOB.CHANGE(  JOB IN BINARY_INTEGER,
                   what                  IN VARCHAR2 DEFAULT NULL,
                   next_date             IN DATE DEFAULT NULL,
                   interval              IN VARCHAR2 DEFAULT NULL,
                   instance              IN BINARY_INTEGER DEFAULT NULL,
                   force                 IN BOOLEAN DEFAULT FALSE );
```

Two parameters, `instance` and `force`, appear in this example. The default value of `instance` is `null` indicating that job affinity will not change.

The default value of `force` is `FALSE`. Oracle displays error `ORA-23428` if the specified `instance` is not running and error `ORA-23319` if the `instance` number is negative.

**DBMS_JOB.RUN**

The `force` parameter for `DBMS_JOB.RUN` defaults to `FALSE`. If `force` is `TRUE`, instance affinity is irrelevant for running jobs in the foreground process. If `force` is `FALSE`, the job can run in the foreground only in the specified instance. Oracle displays error `ORA-23428` if `force` is `FALSE` and the connected instance is the incorrect instance.

```sql
DBMS_JOB.RUN(
    job    IN BINARY_INTEGER,
    force  IN BOOLEAN DEFAULT FALSE);
```

### 88.3 Summary of DBMS_JOB Subprograms

This table lists the `DBMS_JOB` subprograms and briefly describes them.

#### Table 88-1 DBMS_JOB Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BROKEN Procedure</td>
<td>Disables job execution</td>
</tr>
<tr>
<td>CHANGE Procedure</td>
<td>Alters any of the user-definable parameters associated with a job</td>
</tr>
<tr>
<td>INSTANCE Procedure</td>
<td>Assigns a job to be run by a instance</td>
</tr>
<tr>
<td>INTERVAL Procedure</td>
<td>Alters the interval between executions for a specified job</td>
</tr>
<tr>
<td>NEXT_DATE Procedure</td>
<td>Alters the next execution time for a specified job</td>
</tr>
<tr>
<td>REMOVE Procedure</td>
<td>Removes specified job from the job queue</td>
</tr>
<tr>
<td>RUN Procedure</td>
<td>Forces a specified job to run</td>
</tr>
<tr>
<td>SUBMIT Procedure</td>
<td>Submits a new job to the job queue</td>
</tr>
<tr>
<td>USER_EXPORT Procedures</td>
<td>Re-creates a given job for export, or re-creates a given job for export with instance affinity</td>
</tr>
<tr>
<td>WHAT Procedure</td>
<td>Alters the job description for a specified job</td>
</tr>
</tbody>
</table>
88.3.1 BROKEN Procedure

This procedure sets the broken flag. Broken jobs are never run.

Syntax

```sql
DBMS_JOB.BROKEN (
    job       IN  BINARY_INTEGER,
    broken    IN  BOOLEAN,
    next_date IN  DATE DEFAULT SYSDATE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view.</td>
</tr>
<tr>
<td>broken</td>
<td>Sets the job as broken or not broken. TRUE sets it as broken; FALSE sets it as not broken.</td>
</tr>
<tr>
<td>next_date</td>
<td>Next date when the job will be run.</td>
</tr>
</tbody>
</table>

Note:
If you set job as broken while it is running, Oracle resets the job's status to normal after the job completes. Therefore, only execute this procedure for jobs that are not running.

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- If a job fails 16 times in a row, Oracle automatically sets it as broken and then stops trying to run it.

88.3.2 CHANGE Procedure

This procedure changes any of the fields a user can set in a job.

Syntax

```sql
DBMS_JOB.CHANGE (
    job       IN  BINARY_INTEGER,
    what      IN  VARCHAR2,
    next_date IN  DATE,
    interval  IN  VARCHAR2,
    instance  IN  BINARY_INTEGER DEFAULT NULL,
    force     IN  BOOLEAN DEFAULT FALSE);
```
Parameters

Table 88-3 CHANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL procedure to run.</td>
</tr>
<tr>
<td>next_date</td>
<td>Next date when the job will be run.</td>
</tr>
<tr>
<td>interval</td>
<td>Date function; evaluated immediately before the job starts running.</td>
</tr>
<tr>
<td>instance</td>
<td>When a job is submitted, specifies which instance can run the job. This defaults to NULL, which indicates that instance affinity is not changed.</td>
</tr>
<tr>
<td>force</td>
<td>If this is FALSE, then the specified instance (to which the instance number change) must be running. Otherwise, the routine raises an exception. If this is TRUE, then any positive integer is acceptable as the job instance.</td>
</tr>
</tbody>
</table>

Usage Notes

• Your job will not be available for processing by the job queue in the background until it is committed.

• The parameters instance and force are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

• If the parameters what, next_date, or interval are NULL, then leave that value as it is.

Example

BEGIN
  DBMS_JOB.CHANGE(14144, null, null, 'sysdate+3');
  COMMIT;
END;

88.3.3 INSTANCE Procedure

This procedure changes job instance affinity.

Syntax

```sql
DBMS_JOB.INSTANCE (  
  job IN BINARY_INTEGER,  
  instance IN BINARY_INTEGER,  
  force IN BOOLEAN DEFAULT FALSE);```
Parameters

Table 88-4  INSTANCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
<tr>
<td>instance</td>
<td>When a job is submitted, a user can specify which instance can run the job.</td>
</tr>
<tr>
<td>force</td>
<td>If this is TRUE, then any positive integer is acceptable as the job instance. If this is FALSE (the default), then the specified instance must be running; otherwise the routine raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

88.3.4 INTERVAL Procedure

This procedure changes how often a job runs.

Syntax

```sql
DBMS_JOB.INTERVAL ( 
    job IN BINARY_INTEGER, 
    interval IN VARCHAR2);
```

Parameters

Table 88-5  INTERVAL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
<tr>
<td>interval</td>
<td>Date function, evaluated immediately before the job starts running.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the job completes successfully, then this new date is placed in next_date. interval is evaluated by plugging it into the statement select interval into next_date from dual;

- The interval parameter must evaluate to a time in the future. Legal intervals include:

<table>
<thead>
<tr>
<th>Interval</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'sysdate + 7'</td>
<td>Run once a week.</td>
</tr>
<tr>
<td>'next_day(sysdate,''TUESDAY'')'</td>
<td>Run once every Tuesday.</td>
</tr>
</tbody>
</table>
### Summary of DBMS_JOB Subprograms

<table>
<thead>
<tr>
<th>Interval</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'null'</td>
<td>Run only once.</td>
</tr>
</tbody>
</table>

- If \( \text{interval} \) evaluates to \text{NULL} and if a job completes successfully, then the job is automatically deleted from the queue.
- Your job will not be available for processing by the job queue in the background until it is committed.

#### 88.3.5 NEXT_DATE Procedure

This procedure changes when an existing job next runs.

**Syntax**

```sql
DBMS_JOB.NEXT_DATE (  
    job IN BINARY_INTEGER,  
    next_date IN DATE);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the \text{JOB} column of the \text{USER_JOBS} or \text{DBA_JOBS} view.</td>
</tr>
<tr>
<td>next_date</td>
<td>Date of the next refresh: it is when the job will be automatically run, assuming there are background processes attempting to run it.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Your job will not be available for processing by the job queue in the background until it is committed.

#### 88.3.6 REMOVE Procedure

This procedure removes an existing job from the job queue. This currently does not stop a running job.

**Syntax**

```sql
DBMS_JOB.REMOVE (  
    job IN BINARY_INTEGER );  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the \text{JOB} column of the \text{USER_JOBS} or \text{DBA_JOBS} view.</td>
</tr>
</tbody>
</table>
Usage Notes

Your job will not be available for processing by the job queue in the background until it is committed.

Example

```
BEGIN
  DBMS_JOB.REMOVE(14144);
  COMMIT;
END;
```

88.3.7 RUN Procedure

This procedure runs job JOB now. It runs it even if it is broken.

Running the job recomputes next_date. See data dictionary view USER_JOBS or DBA_JOBS.

Syntax

```
DBMS_JOB.RUN (  
  job       IN  BINARY_INTEGER,  
  force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

Table 88-8  RUN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
<tr>
<td>force</td>
<td>If this is TRUE, then instance affinity is irrelevant for running jobs in the foreground process. If this is FALSE, then the job can be run in the foreground only in the specified instance.</td>
</tr>
</tbody>
</table>

Example

```
EXECUTE DBMS_JOB.RUN(14144);
```

**WARNING:**

This re-initializes the current session's packages.

Exceptions

An exception is raised if force is FALSE, and if the connected instance is the wrong one.
88.3.8 SUBMIT Procedure

This procedure submits a new job. It chooses the job from the sequence `sys.jobseq`.

Syntax

```sql
DBMS_JOB.SUBMIT (
    job       OUT BINARY_INTEGER,
    what      IN  VARCHAR2,
    next_date IN  DATE DEFAULT SYSDATE,
    interval  IN  VARCHAR2 DEFAULT 'null',
    no_parse  IN  BOOLEAN DEFAULT FALSE,
    instance  IN  BINARY_INTEGER DEFAULT any_instance,
    force     IN  BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 88-9  SUBMIT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the <code>JOB</code> column of the <code>USER_JOBS</code> or <code>DBA_JOBS</code> view.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL text o the job to be run. This must be a valid PL/SQL statement or block of code. For example, to run a stored procedure <code>P</code>, you could pass the string <code>P;</code> (with the semi-colon) to this routine. The SQL that you submit in the <code>what</code> parameter is wrapped in the following PL/SQL block:</td>
</tr>
<tr>
<td></td>
<td>DECLARE</td>
</tr>
<tr>
<td></td>
<td>job BINARY_INTEGER := :job;</td>
</tr>
<tr>
<td></td>
<td>next_date DATE := :mydate;</td>
</tr>
<tr>
<td></td>
<td>broken BOOLEAN := FALSE;</td>
</tr>
<tr>
<td></td>
<td>BEGIN</td>
</tr>
<tr>
<td></td>
<td>WHAT</td>
</tr>
<tr>
<td></td>
<td>mydate := next_date;</td>
</tr>
</tbody>
</table>
|           |     IF broken THEN :b := 1; ELSE :b := 0; END IF;
|           |     END; |
|           | Ensure that you include the ; semi-colon with the statement. |
| next_date | Next date when the job will be run. |
| interval  | Date function that calculates the next time to run the job. The default is `NULL`. This must evaluate to a either a future point in time or `NULL`. |
| no_parse  | A flag. The default is `FALSE`. If this is set to `FALSE`, then Oracle parses the procedure associated with the job. If this is set to `TRUE`, then Oracle parses the procedure associated with the job the first time that the job is run. |
|           | For example, if you want to submit a job before you have created the tables associated with the job, then set this to `TRUE`. |
| instance  | When a job is submitted, specifies which instance can run the job. |
| force     | If this is `TRUE`, then any positive integer is acceptable as the job instance. If this is `FALSE` (the default), then the specified instance must be running; otherwise the routine raises an exception. |
Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.

- The parameters instance and force are added for job queue affinity. Job queue affinity gives users the ability to indicate whether a particular instance or any instance can run a submitted job.

Example

This submits a new job to the job queue. The job calls the procedure `DBMS_DDL.ANALYZE_OBJECT` to generate optimizer statistics for the table `DQUON.ACCOUNTS`. The statistics are based on a sample of half the rows of the `ACCOUNTS` table. The job is run every 24 hours:

```sql
VARIABLE jobno number;
BEGIN
    DBMS_JOB.SUBMIT(:jobno,
        'dbms_ddl.analyze_object(''TABLE'','
            ''DQUON'', ''ACCOUNTS'','
            ''ESTIMATE'', NULL, 50);
            SYSDATE, 'SYSDATE + 1');
    COMMIT;
END;
/
Statement processed.
print jobno
JOBNO----------
14144
```

88.3.9 USER_EXPORT Procedures

There are two overloaded procedures. The first produces the text of a call to re-create the given job. The second alters instance affinity (8i and after) and preserves the compatibility.

Syntax

```sql
DBMS_JOB.USER_EXPORT (
    job    IN     BINARY_INTEGER,
    mycall IN OUT VARCHAR2);

DBMS_JOB.USER_EXPORT (
    job      IN     BINARY_INTEGER,
    mycall   IN OUT VARCHAR2,
    myinst   IN OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
</tbody>
</table>
Table 88-10  (Cont.) USER_EXPORT Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mycall</td>
<td>Text of a call to re-create the given job.</td>
</tr>
<tr>
<td>myinst</td>
<td>Text of a call to alter instance affinity.</td>
</tr>
</tbody>
</table>

88.3.10 WHAT Procedure

This procedure changes what an existing job does, and replaces its environment.

Syntax

```plsql
DBMS_JOB.WHAT (    
  job       IN  BINARY_INTEGER,  
  what      IN  VARCHAR2);      
```

Parameters

Table 88-11  WHAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job</td>
<td>System-assigned ID of the job being run. To find this ID, query the JOB column of the USER_JOBS or DBA_JOBS view.</td>
</tr>
<tr>
<td>what</td>
<td>PL/SQL procedure to run.</td>
</tr>
</tbody>
</table>

Usage Notes

- Your job will not be available for processing by the job queue in the background until it is committed.
- Some legal values of what (assuming the routines exist) are:
  - 'myproc('''10-JAN-82'', next_date, broken);'
  - 'scott.emppackage.give_raise('''JENKINS'', 30000.00);'
  - 'dbms_job.remove(job);'
The `DBMS_JSON` package provides an interface for data-guide operations. This chapter contains the following topics:

- **DBMS_JSON Overview**
- **DBMS_JSON Security Model**
- **DBMS_JSON Constants**
- **Summary of DBMS_JSON Subprograms**

### 89.1 DBMS_JSON Overview

Package `DBMS_JSON` provides subprograms for manipulating JavaScript Object Notation (JSON) data that is stored in Oracle Database.

### 89.2 DBMS_JSON Security Model

`PUBLIC` is granted the `EXECUTE` privilege on package `DBMS_JSON`. Its subprograms execute with invoker's rights privileges.

### 89.3 DBMS_JSON Constants

The `DBMS_JSON` package uses these constants to define the JSON schema types and data-guide formatting options.

#### Table 89-1  DBMS_JSON Constants Defined for JSON Data-Guide Formatting

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMAT_FLAT</td>

</tbody>
</table>
89.4 Summary of DBMS_JSON Subprograms

This table lists the DBMS_JSON subprograms and briefly describes them.

### DBMS_JSON Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_VIRTUAL_COLUMNS Procedure</td>
<td>Add virtual columns based on data-guide information. This has no effect when running on the shard catalog server — no virtual column is added.</td>
</tr>
<tr>
<td>CREATE VIEW Procedure</td>
<td>Create a view with relational columns and scalar JSON fields as specified in a data guide.</td>
</tr>
<tr>
<td>CREATE_VIEW_ON_PATH Procedure</td>
<td>Create a view based on data-guide information, with relational columns, top-level scalar types, and fully expanded sub-tree under a given path. When running on the shard catalog server this raises an error stating that the data guide is empty.</td>
</tr>
<tr>
<td>DROP_VIRTUAL_COLUMNS Procedure</td>
<td>Drop virtual columns created by procedure add_virtual_columns. This has no effect when running on the shard catalog server.</td>
</tr>
<tr>
<td>GET_INDEX_DATAGUIDE Function</td>
<td>Get JSON data guide from a data guide-enabled JSON search index. When running on the shard catalog server this returns a single empty row as result.</td>
</tr>
<tr>
<td>RENAME_COLUMN Procedure</td>
<td>Set the preferred name for a view column or a virtual column creating using a data guide. This has no effect when running on the shard catalog server.</td>
</tr>
</tbody>
</table>

**Note:**

In the context of sharding, each individual shard maintains its own data-guide information, which is obtained from the JSON documents stored in that shard. When running on individual shard, procedures in this package that use data-guide information use only the information that is maintained for that shard.

89.4.1 ADD_VIRTUAL_COLUMNS Procedure

This procedure adds virtual columns based on the data guide.

The virtual column name is the value of o:preferred_vc_name in the data guide. The procedure ignores JSON objects, arrays, and fields under arrays in the data guide. Before it adds virtual columns, procedure add_virtual_columns first drops any existing
virtual columns that were projected from fields in the same JSON column by a
previous invocation of add_virtual_columns or by data-guide change-trigger procedure
add_vc (in effect, it does what procedure DBMS_JSON.drop_virtual_columns does).

See Also:

- DROP_VIRTUAL_COLUMNS Procedure
- Oracle Database JSON Developer’s Guide

Syntax

DBMS_JSON.ADD_VIRTUAL_COLUMNS {
  tablename  IN  VARCHAR2,
  jcolname   IN  VARCHAR2,
  dataguide  IN  CLOB);

For the following signature you must have a data guide-enabled search index on the
JSON column. (This is not needed for the previous signature.)

DBMS_JSON.ADD_VIRTUAL_COLUMNS {
  tablename  IN  VARCHAR2,
  jcolname   IN  VARCHAR2,
  frequency      NUMBER    DEFAULT 0,
  hidden         BOOLEAN   DEFAULT FALSE);

Parameters

Table 89-3  ADD_VIRTUAL_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename that contains the data from</td>
</tr>
<tr>
<td></td>
<td>which to create the virtual column.</td>
</tr>
<tr>
<td>frequency</td>
<td>Sets the minimum frequency threshold to display JSON columns. A frequency</td>
</tr>
<tr>
<td></td>
<td>of 0 means display all JSON columns. Also, all JSON columns are displayed</td>
</tr>
<tr>
<td></td>
<td>if statistics have not been collected, effectively overriding any value set</td>
</tr>
<tr>
<td></td>
<td>by this parameter.</td>
</tr>
<tr>
<td>hidden</td>
<td>TRUE means the added virtual column is hidden; FALSE means it is not. The</td>
</tr>
<tr>
<td></td>
<td>default is FALSE.</td>
</tr>
<tr>
<td>dataguide</td>
<td>The data guide. When o:hidden in the data guide for a particular JSON field</td>
</tr>
<tr>
<td></td>
<td>is set to TRUE, the corresponding virtual column is added as a hidden</td>
</tr>
<tr>
<td></td>
<td>column. The default value of o:hidden is FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

Procedure DBMS_STATS.GATHER_STATS collects statistics in the data guide. If the
frequency statistic has not been collected, frequency is NULL. Setting the frequency to a
value greater than zero means do not include columns for which there are no
frequency statistics collected (statistic is NULL), unless DBMS_STATS.GATHER_STATS has
never been executed. In that case, the frequency parameter is ignored and all columns
are displayed in the view.
89.4.2 CREATE_VIEW Procedure

This procedure creates a view with relational columns, using scalar JSON fields as specified in the data guide. A data guide-enabled JSON search index is not required for this procedure; the data guide is passed to the procedure.

See Also:

Oracle Database JSON Developer's Guide

Syntax

(Optinal) Enter syntax information here.

PROCEDURE CREATE_VIEW (  
  viewname VARCHAR2,  
  tablename VARCHAR2,  
  jcolname VARCHAR2,  
  dataguide CLOB);

Parameters

Table 89-4  DBMS_JSON.CREATE_VIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>viewname</td>
<td>Name of the view.</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename that is used to create the view.</td>
</tr>
<tr>
<td>dataguide</td>
<td>The data guide.</td>
</tr>
</tbody>
</table>

89.4.3 CREATE_VIEW_ON_PATH Procedure

This procedure creates a view with relational columns, using top-level scalar values and the scalar values in the expanded sub-tree under a given path. The JSON column must have a data guide-enabled search index.

See Also:

Oracle Database JSON Developer's Guide

Syntax

PROCEDURE CREATE_VIEW_ON_PATH(  
  viewname VARCHAR2,  
  tablename VARCHAR2,  
  jcolname VARCHAR2,
path VARCHAR2,
frequency NUMBER DEFAULT 0);

Parameters

Table 89-5  CREATE_VIEW_ON_PATH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>viewname</td>
<td>Name of the view.</td>
</tr>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename that is used to create the view. The column must have a data guide-enabled JSON search index, or else an error is raised.</td>
</tr>
<tr>
<td>path</td>
<td>The path of the JSON field to be expanded. It uses JSON path-expression syntax. It expands the descendants under the specified path, and creates view columns for each scalar value in the resulting sub-tree. The path $ creates a view starting from the JSON document root.</td>
</tr>
<tr>
<td>frequency</td>
<td>The minimum frequency threshold for displaying the JSON columns. A frequency of 0 means display all JSON columns. All JSON columns are also displayed if statistics have not been collected, effectively overriding any value set by this parameter. The view only displays JSON fields with frequency greater than the given frequency. It does not display JSON fields added after collecting statistics if the given frequency is greater than 0, if their statistic columns are NULL.</td>
</tr>
</tbody>
</table>

89.4.4 DROP_VIRTUAL_COLUMNS Procedure

Drop all virtual columns that were added using PL/SQL procedure DBMS_JSON.add_virtual_columns or using data-guide change-trigger procedure add_vc.

See Also:
- ADD_VIRTUAL_COLUMNS Procedure
- Oracle Database JSON Developer’s Guide

Syntax

PROCEDURE DROP_VIRTUAL_COLUMNS(
    tablename VARCHAR2,
    jcolname VARCHAR2);

Parameters

Table 89-6  DBMS_JSON.DROP_VIRTUAL_COLUMNS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename.</td>
</tr>
</tbody>
</table>
89.4.5 GET_INDEX_DATAGUIDE Function

GET_INDEX_DATAGUIDE gets JSON data guide from data guide-enabled JSON search index.

See Also:
Oracle Database JSON Developer's Guide

Syntex

FUNCTION GET_INDEX_DATAGUIDE(
    tablename VARCHAR2,
    jcolname VARCHAR2,
    format NUMBER,
    pretty NUMBER DEFAULT 0)
RETURN CLOB;

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename that has a data guide-enabled JSON search index.</td>
</tr>
<tr>
<td>format</td>
<td>The data-guide format:</td>
</tr>
<tr>
<td></td>
<td>• FORMAT_HIERARCHICAL — hierarchical format</td>
</tr>
<tr>
<td></td>
<td>• FORMAT_FLAT — flat format</td>
</tr>
<tr>
<td>pretty</td>
<td>A value of DBMS_JSONPRETTY means pretty-print the data guide, using indention to improve readability.</td>
</tr>
</tbody>
</table>

Example 89-1  Example Get Data Guide in Hierarchical Pretty Format

This example returns the data guide in hierarchical format.

```sql
SELECT DBMS_JSON.GET_INDEX_DATAGUIDE('T1', 'PO', DBMS_JSON_FORMAT_HIERARCHICAL, DBMS_JSONPRETTY) 
FROM DUAL;
```

89.4.6 RENAME_COLUMN Procedure

This procedure sets the preferred name for a JSON column, to be used by the create view, or add virtual columns procedure.

See Also:
Oracle Database JSON Developer's Guide
Syntax

PROCEDURE RENAME_COLUMN(
    tablename VARCHAR2,
    jcolname VARCHAR2,
    path VARCHAR2,
    type NUMBER,
    preferred_name VARCHAR2);

Parameters

Table 89-8 RENAME_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablename</td>
<td>Name of the table containing JSON column jcolname.</td>
</tr>
<tr>
<td>jcolname</td>
<td>Name of the JSON column in table tablename. It must have a data guide-enabled JSON search index, or else an error is raised.</td>
</tr>
<tr>
<td>path</td>
<td>Path to the JSON field on which to set the preferred column name.</td>
</tr>
<tr>
<td>type</td>
<td>The type of the JSON field targeted by path. Two JSON fields can have the same path if they are of different types. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• TYPE_NULL</td>
</tr>
<tr>
<td></td>
<td>• TYPE_STRING</td>
</tr>
<tr>
<td></td>
<td>• TYPE_NUMBER</td>
</tr>
<tr>
<td></td>
<td>• TYPE_BOOLEAN</td>
</tr>
<tr>
<td></td>
<td>• TYPE_OBJECT</td>
</tr>
<tr>
<td></td>
<td>• TYPE_ARRAY</td>
</tr>
<tr>
<td>preferred_name</td>
<td>Preferred name for the JSON field specified by path. If there is a name conflict, a system generated name is used instead.</td>
</tr>
</tbody>
</table>

Example 89-2 Example Renaming a Column

This example renames a field to item_name.

EXEC DBMS_JSON.RENAME_COLUMN('T1', 'PO', '$.purchaseOrder.items.name', DBMS_JSON.TYPE_STRING, 'item_name');
The DBMS_LDAP package lets you access data from LDAP servers.

For a complete description of this package within the context of Oracle Internet Directory, see DBMS_LDAP in the Application Developer's Guide for Oracle Identity Management.
The DBMS_LDAP_UTL package contains the Oracle Extension utility functions.

For a complete description of this package within the context of Oracle Internet Directory, see DBMS_LDAP_UTL in the Application Developer's Guide for Oracle Identity Management.
The DBMS_LIBCACHE package consists of one subprogram that prepares the library cache on an Oracle instance by extracting SQL and PL/SQL from a remote instance and compiling this SQL locally without execution. The value of compiling the cache of an instance is to prepare the information the application requires to execute in advance of failover or switchover.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_LIBCACHE Subprograms

### 92.1 DBMS_LIBCACHE Overview

Compiling a shared cursor consists of open, parse, and bind operations, plus the type-checking and execution plan functions performed at the first execution. All of these steps are executed in advance by the package DBMS_LIBCACHE for `SELECT` statements.

The open and parse functions are executed in advance for PL/SQL and DML. For PL/SQL, executing the parse phase has the effect of loading all library cache heaps other than the `MCODE`.

### 92.2 DBMS_LIBCACHE Security Model

To execute DBMS_LIBCACHE you must directly access the same objects as do SQL statements. You can best accomplish this by utilizing the same user id as the original system on the remote system.

When there are multiple schema users, DBMS_LIBCACHE should be called for each.

Alternatively, DBMS_LIBCACHE may be called with the generic user `PARSER`. However, this user cannot parse the SQL that uses objects with access granted through roles. This is a standard PL/SQL security limitation.

### 92.3 Summary of DBMS_LIBCACHE Subprograms

The DBMS_LIBCACHE package includes the `COMPILE_FROM_REMOTE` procedure subprogram.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPILE_FROM_REMOTE Procedure</td>
<td>Extracts SQL in batch from the source instance and compiles the SQL at the target instance</td>
</tr>
</tbody>
</table>
92.3.1 COMPILER_FROM_REMOTE Procedure

This procedure extracts SQL in batch from the source instance and compiles the SQL at the target instance.

Syntax

```sql
DBMS_LIBCACHE.COMPILE_FROM_REMOTE ( 
  p_db_link IN dbms_libcache$def.db_link%type,
  p_username IN VARCHAR2 default null,
  p_threshold_executions IN NATURAL default 3,
  p_threshold_sharable_mem IN NATURAL default 1000,
  p_parallel_degree IN NATURAL default 1);
```

Parameters

Table 92-2  COMPILER_FROM_REMOTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_db_link</td>
<td>Database link to the source name (mandatory). The database link pointing to the instance that will be used for extracting the SQL statements. The user must have the role SELECT_ON_CATALOG at the source instance. For improved security, the connection may use a password file or LDAP authentication. The database link is mandatory only for releases with <code>dbms_libcache$def.ACCESS_METHOD = DB_LINK_METHOD</code></td>
</tr>
<tr>
<td>p_instance_name</td>
<td>(Reserved for future use). The name of the instance that will be used for extracting the SQL statements. The instance name must be unique for all instances excluding the local instance. The name is not case sensitive.</td>
</tr>
<tr>
<td>p_username</td>
<td>Source username (default is all users). The name of the username that will be used for extracting the SQL statements. The username is an optional parameter that is used to ensure the parsing user id is the same as that on the source instance. For an application where users connect as a single user_id, for example APPS, APPS is the parsing user_id that is recorded in the shared pool. To select only SQL statements parsed by APPS, enter the string 'APPS' in this field. To also select statements executed by batch, repeat the executing the procedure with the schema owner, for example GL. If the username is supplied, it must be valid. The name is not case sensitive.</td>
</tr>
<tr>
<td>p_threshold_executions</td>
<td>The lower bound for the number of executions, below which a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with executions, for example, greater than 3. The default value is 1. This means SQL statements that have never executed, including invalid SQL statements, will not be extracted.</td>
</tr>
</tbody>
</table>
Table 92-2  (Cont.) COMPILE_FROM_REMOTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_threshold_sharable_mem</td>
<td>The lower bound for the size of the shared memory consumed by the cursors on the source instance. Below this value a SQL statement will not be selected for parsing. This parameter is optional. It allows the application to extract and compile statements with shared memory for example, greater than 10000 bytes.</td>
</tr>
<tr>
<td>p_parallel_degree</td>
<td>The number of parallel jobs that execute to complete the parse operation. These tasks are spawned as parallel jobs against a sub-range of the SQL statements selected for parsing. This parameter is reserved for parallel compile jobs which are currently not implemented.</td>
</tr>
</tbody>
</table>
The DBMS_LOB package provides subprograms to operate on BLOBs, CLOBs, NCLOBs, BFILEs, and temporary LOBs. You can use DBMS_LOB to access and manipulate specific parts of a LOB or complete LOBs.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Datatypes
- Operational Notes
- Rules and Limits
- Exceptions
- Summary of DBMS_LOB Subprograms

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide

93.1 DBMS_LOB Overview

DBMS_LOB can read and modify BLOBs, CLOBs, and NCLOBs; it provides read-only operations for BFILEs. The bulk of the LOB operations are provided by this package.

93.2 DBMS_LOB Deprecated Subprograms

The DBMS_LOB.LOADFROMFILE program is deprecated from the DBMS_LOB package in Oracle Database 12c release 12.2

Note:

Oracle recommends that do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

Use DBMS_LOB.LoadClobFromFile or DBMS_LOB.LoadBlobFromFile instead.
93.3 DBMS_LOB Security Model

This package must be created under **SYS**. Operations provided by this package are performed under the current calling user, not under the package owner **SYS**.

Any **DBMS_LOB** subprogram called from an anonymous PL/SQL block is executed using the privileges of the current user. Any **DBMS_LOB** subprogram called from a stored procedure is executed using the privileges of the owner of the stored procedure.

When creating the procedure, users can set the **AUTHID** to indicate whether they want definer's rights or invoker's rights. For example:

```sql
CREATE PROCEDURE proc1 AUTHID DEFINER ...
```

or

```sql
CREATE PROCEDURE proc1 AUTHID CURRENT_USER ...
```

---

### See Also:

For more information on **AUTHID** and privileges, see *Oracle Database PL/SQL Language Reference*.

You can provide secure access to **BFILEs** using the **DIRECTORY** feature discussed in the **BFILENAME** function in the *Oracle Database SecureFiles and Large Objects Developer's Guide* and the *Oracle Database SQL Language Reference*.

For information about the security model pertaining to temporary LOBs, see **Operational Notes**.

93.4 DBMS_LOB Constants

This topic describes the constants used by the **DBMS_LOB** package.

These are shown in following tables:

- Table 93-1
- Table 93-2
- Table 93-3
- Table 93-4
- Table 93-5
- Table 93-6

<tr>
<td>BFILE</td>
<td>Large, binary object stored outside the database.</td>
</tr>
</tbody>
</table>

The DBMS_LOB package defines no special types.
An **NCLOB** is a **CLOB** for holding fixed-width and varying-width, multibyte national character sets.

The clause **ANY_CS** in the specification of **DBMS_LOB** subprograms for CLOBs enables the CLOB type to accept a CLOB or NCLOB locator variable as input.

### 93.6 DBMS_LOB Operational Notes

All **DBMS_LOB** subprograms work based on LOB locators. For the successful completion of **DBMS_LOB** subprograms, you must provide an input locator that represents a LOB that already exists in the database table spaces or external file system.

See also Chapter 1 of *Oracle Database SecureFiles and Large Objects Developer's Guide*

Starting from 12.2 release, you can select a persistent LOB locator from a remote table into a local variable. The remote column can be of type BLOB, CLOB, or NCLOB. You cannot select **BFILE** from a remote table. The LOB variable that refers to the LOB value in a remote table is called a remote locator.

All the **DBMS_LOB** APIs other than the ones that are meant for **BFILEs** will now accept and support operations on remote LOB locators. All the APIs that take in two locators must have both LOBs collocated at one database.

> **See Also:**

  Distributed LOBs chapter in *Oracle Database SecureFiles and Large Objects Developer's Guide*.

To use LOBs in your database, you must first use SQL data definition language (DDL) to define the tables that contain LOB columns.

- Internal LOBs
- External LOBs
- Temporary LOBs

**Internal LOBs**

To populate your table with internal LOBs after LOB columns are defined in a table, you use the SQL data manipulation language (DML) to initialize or populate the locators in the LOB columns.

**External LOBs**

For an external LOB (BFILE) to be represented by a LOB locator, you must:

- Ensure that a **DIRECTORY** object representing a valid, existing physical directory has been defined, and that physical files (the LOBs you plan to add) exist with read permission for the database. If your operating system uses case-sensitive path names, then be sure you specify the directory in the correct format.
- Pass the **DIRECTORY** object and the filename of the external LOB you are adding to the **BFILENAME** function to create a LOB locator for your external LOB.
Once you have completed these tasks, you can insert or update a row containing a LOB column using the specified LOB locator.

After the LOBs are defined and created, you can then `SELECT` from a LOB locator into a local PL/SQL LOB variable and use this variable as an input parameter to `DBMS_LOB` for access to the LOB value.

For details on the different ways to do this, see *Oracle Database SecureFiles and Large Objects Developer's Guide*

**Temporary LOBs**

The database supports the definition, creation, deletion, access, and update of temporary LOBs. Your temporary tablespace stores the temporary LOB data. Temporary LOBs are not permanently stored in the database. Their purpose is mainly to perform transformations on LOB data.

For temporary LOBs, you must use the OCI, PL/SQL, or another programmatic interface to create or manipulate them. Temporary LOBs can be either BLOBs, CLOBs, or NCLOBs.

A temporary LOB is empty when it is created. By default, all temporary LOBs are deleted at the end of the session in which they were created. If a process dies unexpectedly or if the database crashes, then temporary LOBs are deleted, and the space for temporary LOBs is freed.

There is also an interface to let you group temporary LOBs together into a logical bucket. The duration represents this logical store for temporary LOBs. Each temporary LOB can have separate storage characteristics, such as `CACHE`/`NOCACHE`. There is a default store for every session into which temporary LOBs are placed if you don't specify a specific duration. Additionally, you are able to perform a free operation on durations, which causes all contents in a duration to be freed.

There is no support for consistent read (CR), undo, backup, parallel processing, or transaction management for temporary LOBs. Because CR and roll backs are not supported for temporary LOBs, you must free the temporary LOB and start over again if you encounter an error.

Because CR, undo, and versions are not generated for temporary LOBs, there is potentially a performance impact if you assign multiple locators to the same temporary LOB. Semantically, each locator should have its own copy of the temporary LOB.

A copy of a temporary LOB is created if the user modifies the temporary LOB while another locator is also pointing to it. The locator on which a modification was performed now points to a new copy of the temporary LOB. Other locators no longer see the same data as the locator through which the modification was made. A deep copy was not incurred by permanent LOBs in these types of situations, because CR snapshots and version pages enable users to see their own versions of the LOB cheaply.

You can gain pseudo-REF semantics by using pointers to locators in OCI and by having multiple pointers to locators point to the same temporary LOB locator, if necessary. In PL/SQL, you must avoid using more than one locator for each temporary LOB. The temporary LOB locator can be passed by reference to other procedures.

Because temporary LOBs are not associated with any table schema, there are no meanings to the terms in-row and out-of-row temporary LOBs. Creation of a temporary LOB instance by a user causes the engine to create and return a locator to the LOB data. The PL/SQL `DBMS_LOB` package, PRO*C/C++, OCI, and other programmatic
interfaces operate on temporary LOBs through these locators just as they do for permanent LOBs.

There is no support for client side temporary LOBs. All temporary LOBs reside in the server.

Temporary LOBs do not support the `EMPTY_BLOB` or `EMPTY_CLOB` functions that are supported for permanent LOBs. The `EMPTY_BLOB` function specifies the fact that the LOB is initialized, but not populated with any data.

A temporary LOB instance can only be destroyed by using OCI or the `DBMS_LOB` package by using the appropriate `FREETEMPORARY` or `OCIDurationEnd` statement.

A temporary LOB instance can be accessed and modified using appropriate OCI and `DBMS_LOB` statements, just as for regular permanent internal LOBs. To make a temporary LOB permanent, you must explicitly use the OCI or `DBMS_LOB COPY` command, and copy the temporary LOB into a permanent one.

Security is provided through the LOB locator. Only the user who created the temporary LOB is able to see it. Locators are not expected to be able to pass from one user's session to another. Even if someone did pass a locator from one session to another, they would not access the temporary LOBs from the original session. Temporary LOB lookup is localized to each user's own session. Someone using a locator from somewhere else is only able to access LOBs within his own session that have the same LOB ID. Users should not try to do this, but if they do, they are not able to affect anyone else's data.

The database keeps track of temporary LOBs for each session in a v$ view called `V$TEMPORARY_LOBS`, which contains information about how many temporary LOBs exist for each session. v$ views are for DBA use. From the session, the database can determine which user owns the temporary LOBs. By using `V$TEMPORARY_LOBS` in conjunction with `DBA_SEGMENTS`, a DBA can see how much space is being used by a session for temporary LOBs. These tables can be used by DBAs to monitor and guide any emergency cleanup of temporary space used by temporary LOBs.

The following notes are specific to temporary LOBs:

1. All functions in `DBMS_LOB` return `NULL` if any of the input parameters are `NULL`. All procedures in `DBMS_LOB` raise an exception if the LOB locator is input as `NULL`.

2. Operations based on `CLOBs` do not verify if the character set IDs of the parameters (`CLOB` parameters, `VARCHAR2` buffers and patterns, and so on) match. It is the user's responsibility to ensure this.

3. Data storage resources are controlled by the DBA by creating different temporary tablespaces. DBAs can define separate temporary tablespaces for different users, if necessary.

93.7 DBMS_LOB Rules and Limits

This topic describes general DBMS_LOB rules and limits, rules and limits specific to external files (BFILEs), and maximum LOB and buffer sizes.

General Rules and Limits

- Oracle Database does not support constraints on columns or attributes whose type is a LOB, with the following exception: NOT NULL constraints are supported for a LOB column or attribute.

- The following rules apply in the specification of subprograms in this package:
  - newlen, offset, and amount parameters for subprograms operating on BLOBs and BFILEs must be specified in terms of bytes.
  - newlen, offset, and amount parameters for subprograms operating on CLOBs must be specified in terms of characters.

In multi-byte character sets, it is not possible to interpret these offsets correctly. As a result, SUBSTR raises the following error: ORA-22998: CLOB or NCLOB in multibyte character set not supported.

- A subprogram raises an INVALID_ARGVAL exception if the following restrictions are not followed in specifying values for parameters (unless otherwise specified):
  1. Only positive, absolute offsets from the beginning of LOB data are permitted: Negative offsets from the tail of the LOB are not permitted.
  2. Only positive, nonzero values are permitted for the parameters that represent size and positional quantities, such as amount, offset, newlen, nth, and so on. Negative offsets and ranges observed in SQL string functions and operators are not permitted.
  3. The value of offset, amount, newlen, nth must not exceed the value lobmaxsize 18446744073709551615 (2^64) in any DBMS_LOB subprogram.
  4. For CLOBs consisting of fixed-width multibyte characters, the maximum value for these parameters must not exceed (lobmaxsize/character_width_in_bytes) characters.

For example, if the CLOB consists of 2-byte characters, such as:

```
JA16SJISFIXED
```

Then, the maximum amount value should not exceed:

```
18446744073709551615/2 = 9223372036854775807
```

- PL/SQL language specifications stipulate an upper limit of 32767 bytes (not characters) for RAW and VARCHAR2 parameters used in DBMS_LOB subprograms. For example, if you declare a variable to be:

```
charbuf VARCHAR2(3000)
```

Then, charbuf can hold 3000 single byte characters or 1500 2-byte fixed width characters. This has an important consequence for DBMS_LOB subprograms for CLOBs and NCLOBs.

- The %CHARSET clause indicates that the form of the parameter with %CHARSET must match the form of the ANY_CS parameter to which it refers.
For example, in DBMS_LOB subprograms that take a VARCHAR2 buffer parameter, the form of the VARCHAR2 buffer must match the form of the CLOB parameter. If the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For DBMS_LOB subprograms that take two CLOB parameters, both CLOB parameters must have the same form; that is, they must both be NCLOBs, or they must both be CLOBs.

- If the value of amount plus the offset exceeds the maximum LOB size allowed by the database, then access exceptions are raised.

Under these input conditions, read subprograms, such as READ, COMPARE, INSTR, and SUBSTR, read until End of Lob/File is reached. For example, for a READ operation on a BLOB or BFILE, if the user specifies offset value of 3 GB and an amount value of 2 GB on a LOB that is 4 GB in size, then READ returns only 1 GB (4 GB - 3 GB) bytes.

- Functions with NULL or invalid input values for parameters return a NULL. Procedures with NULL values for destination LOB parameters raise exceptions.

- Operations involving patterns as parameters, such as COMPARE, INSTR, and SUBSTR do not support regular expressions or special matching characters (such as % in the LIKE operator in SQL) in the pattern parameter or substrings.

- The End Of LOB condition is indicated by the READ procedure using a NO_DATA_FOUND exception. This exception is raised only upon an attempt by the user to read beyond the end of the LOB. The READ buffer for the last read contains 0 bytes.

- For consistent LOB updates, you must lock the row containing the destination LOB before making a call to any of the procedures (mutators) that modify LOB data.

- Unless otherwise stated, the default value for an offset parameter is 1, which indicates the first byte in the BLOB or BFILE data, and the first character in the CLOB or NCLOB value. No default values are specified for the amount parameter — you must input the values explicitly.

- You must lock the row containing the destination internal LOB before calling any subprograms that modify the LOB, such as APPEND, COPY, ERASE, TRIM, or WRITE. These subprograms do not implicitly lock the row containing the LOB.

Rules and Limits Specific to External Files (BFILES)

- The subprograms COMPARE, INSTR, READ, SUBSTR, FILECLOSE, FILECLOSEALL and LOADFROMFILE operate only on an opened BFILE locator; that is, a successful FILEOPEN call must precede a call to any of these subprograms.

- For the functions FILEEXISTS, FILEGETNAME and GETLENGTH, a file’s open/close status is unimportant; however, the file must exist physically, and you must have adequate privileges on the DIRECTORY object and the file.

- DBMS_LOB does not support any concurrency control mechanism for BFILE operations.

- In the event of several open files in the session whose closure has not been handled properly, you can use the FILECLOSEALL subprogram to close all files opened in the session and resume file operations from the beginning.

- If you are the creator of a DIRECTORY, or if you have system privileges, then use the CREATE OR REPLACE, DROP, and REVOKE statements in SQL with extreme caution.
If you, or other grantees of a particular directory object, have several open files in a session, then any of the preceding commands can adversely affect file operations. In the event of such abnormal termination, your only choice is to invoke a program or anonymous block that calls FILECLOSEALL, reopen your files, and restart your file operations.

- All files opened during a user session are implicitly closed at the end of the session. However, Oracle strongly recommends that you close the files after both normal and abnormal termination of operations on the BFILE.

In the event of normal program termination, proper file closure ensures that the number of files that are open simultaneously in the session remains less than SESSION_MAX_OPEN_FILES.

In the event of abnormal program termination from a PL/SQL program, it is imperative that you provide an exception handler that ensures closure of all files opened in that PL/SQL program. This is necessary because after an exception occurs, only the exception handler has access to the BFILE variable in its most current state.

After the exception transfers program control outside the PL/SQL program block, all references to the open BFILES are lost. The result is a larger open file count which may or may not exceed the SESSION_MAX_OPEN_FILES value.

For example, consider a READ operation past the end of the BFILE value, which generates a NO_DATA_FOUND exception:

```sql
-- This assumes a directory 'DDD' whose path is already known
DECLARE
    fil BFILE := bfilename('DDD', 'filename.foo');
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
    dbms_output.put_line('Read F1 past EOF: ' ||
        utl_raw.cast_to_varchar2(buf));
    dbms_lob.close(fil);
END;
ORA-01403: no data found
ORA-06512: at "SYS.DBMS_LOB", line 373
ORA-06512: at line 10

After the exception has occurred, the BFILE locator variable file goes out of scope, and no further operations on the file can be done using that variable. Therefore, the solution is to use an exception handler:

DECLARE
    fil BFILE;
    pos INTEGER;
    amt BINARY_INTEGER;
    buf RAW(40);
BEGIN
    SELECT ad_graphic INTO fil FROM print_media WHERE product_id = 3106;
    dbms_lob.open(fil, dbms_lob.lob_readonly);
    amt := 40; pos := 1 + dbms_lob.getlength(fil); buf := '';
    dbms_lob.read(fil, amt, pos, buf);
```

Chapter 93
DBMS_LOB Rules and Limits

In general, you should ensure that files opened in a PL/SQL block using `DBMS_LOB` are closed before normal or abnormal termination of the block.

### Maximum LOB Size

The maximum size for LOBs supported by the database is equal to the value of the blocksize of the tablespace the LOB column resides in times the value $2^{32}-1$ (4294967295). This allows for a maximum LOB size ranging from 8 terabytes to 128 terabytes.

### Maximum Buffer Size

The maximum buffer size, 32767 bytes.

For **BLOBs**, where buffer size is expressed in bytes, the number of bytes cannot exceed 32767.

For **CLOBs** or **NCLOBs**, where buffer size is expressed in characters, the number of characters cannot result in a buffer larger than 32767 bytes. For example, if you are using fixed-width, two-byte characters, then specifying 20000 characters is an error (20000*2 = 40000, which is greater than 32767).

### 93.8 DBMS_LOB Exceptions

The table in the topic describes the exceptions for DBMS_LOB.

#### Table 93-8   DBMS_LOB Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Code</th>
<th>Description</th>
</tr>

</tbody>
</table>

93.9 Summary of DBMS_LOB Subprograms

This table lists the DBMS_LOB subprograms and briefly describes them.

Table 93-9  DBMS_LOB Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPEND Procedures</td>
<td>Appends the contents of the source LOB to the destination LOB</td>
</tr>
<tr>
<td>CLOB2FILE Procedure</td>
<td>Writes the content of a CLOB into a file.</td>
</tr>
<tr>
<td>CLOSE Procedure</td>
<td>Closes a previously opened internal or external LOB</td>
</tr>
<tr>
<td>COMPARE Functions</td>
<td>Compares two entire LOBs or parts of two LOBs</td>
</tr>
</tbody>
</table>
### Table 93-9  (Cont.) DBMS_LOB Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONVERTTOBLOB Procedure</td>
<td>Reads character data from a source CLOB or NCLOB instance, converts the character data to the specified character, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets</td>
</tr>
<tr>
<td>CONVERTTOCLOB Procedure</td>
<td>Takes a source BLOB instance, converts the binary data in the source instance to character data using the specified character, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets</td>
</tr>
<tr>
<td>COPY Procedures</td>
<td>Copies all, or part, of the source LOB to the destination LOB</td>
</tr>
<tr>
<td>COPY_DBFS_LINK Procedures</td>
<td>Copies the DBFS Link in the source LOB to the destination LOB</td>
</tr>
<tr>
<td>COPY_FROM_DBFS_LINK</td>
<td>Retrieves the data for the LOB from the DBFS store</td>
</tr>
<tr>
<td>CREATETEMPORARY Procedures</td>
<td>Creates a temporary BLOB or CLOB and its corresponding index in the user's default temporary tablespace</td>
</tr>
<tr>
<td>DBFS_LINK_GENERATE_PATH Functions</td>
<td>Returns a unique file path name for use in creating a DBFS Link</td>
</tr>
<tr>
<td>ERASE Procedures</td>
<td>Erases all or part of a LOB</td>
</tr>
<tr>
<td>FILECLOSE Procedure</td>
<td>Closes the file</td>
</tr>
<tr>
<td>FILECLOSEALL Procedure</td>
<td>Closes all previously opened files</td>

<tr>
<td>FILEEXISTS Function</td>
<td>Checks if the file exists on the server</td>
</tr>
<tr>
<td>FILEGETNAME Procedure</td>
<td>Gets the directory object name and file name</td>
</tr>
<tr>
<td>FILEISOPEN Function</td>
<td>Checks if the file was opened using the input BFILE locators</td>
</tr>
<tr>
<td>FILEOPEN Procedure</td>
<td>Opens a file</td>
</tr>
<tr>
<td>FRAGMENT_DELETE Procedure</td>
<td>Deletes the data at the specified offset for the specified length from the LOB</td>
</tr>
<tr>
<td>FRAGMENT_INSERT Procedures</td>
<td>Inserts the specified data (limited to 32K) into the LOB at the specified offset</td>
</tr>
<tr>
<td>FRAGMENT_MOVE Procedure</td>
<td>Moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified</td>
</tr>
<tr>
<td>FRAGMENT_REPLACE Procedures</td>
<td>Replaces the data at the specified offset with the specified data (not to exceed 32K)</td>
</tr>
<tr>
<td>FREETEMPORARY Procedures</td>
<td>Frees the temporary BLOB or CLOB in the default temporary tablespace</td>
</tr>
<tr>
<td>GET_DBFS_LINK Functions</td>
<td>Returns the DBFS Link path associated with the specified SecureFile</td>
</tr>
<tr>
<td>GET_DBFS_LINK_STATE Procedures</td>
<td>Retrieves the current DBFS Link state of the specified SecureFile</td>
</tr>
<tr>
<td>GETCHUNKSIZE Functions</td>
<td>Returns the amount of space used in the LOB chunk to store the LOB value</td>
</tr>
<tr>
<td>GETCONTENTTYPE Functions</td>
<td>Returns the content ID string previously set by means of the SETCONTENTTYPE Procedure</td>
</tr>
<tr>
<td>GETLENGTH Functions</td>
<td>Gets the length of the LOB value</td>
</tr>
<tr>
<td>GETOPTIONS Functions</td>
<td>Obtains settings corresponding to the option_type field for a particular LOB</td>
</tr>
<tr>
<td>Subprogram</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GET_STORAGE_LIMIT Function</td>
<td>Returns the storage limit for LOBs in your database configuration</td>
</tr>
<tr>
<td>INSTR Functions</td>
<td>Returns the matching position of the $n$th occurrence of the pattern in the LOB</td>
</tr>
<tr>
<td>ISOPEN Functions</td>
<td>Checks to see if the LOB was already opened using the input locator</td>
</tr>
<tr>
<td>ISREMOTE Function</td>
<td>Checks to see if the LOB is local to the database or if it belongs to a remote database.</td>
</tr>
<tr>
<td>ISSECUREFILE Function</td>
<td>Returns TRUE if the LOB locator passed to is for a SecureFiles LOB, otherwise, returns FALSE</td>
</tr>
<tr>
<td>ISTEMPORTARY Functions</td>
<td>Checks if the locator is pointing to a temporary LOB</td>
</tr>
<tr>
<td>LOADBLOBFROMFILE Procedure</td>
<td>Loads BFILE data into an internal BLOB</td>
</tr>
<tr>
<td>LOADCLOBFROMFILE Procedure</td>
<td>Loads BFILE data into an internal CLOB</td>
</tr>
<tr>
<td>LOADFROMFILE Procedure</td>
<td>Loads BFILE data into an internal LOB. This procedure has been deprecated starting with Oracle Database 12c release 12.2.</td>
</tr>
<tr>
<td>MOVE_TO_DBFS_LINK Procedures</td>
<td>Writes the specified SecureFile data to the DBFS store</td>
</tr>
<tr>
<td>OPEN Procedures</td>
<td>Opens a LOB (internal, external, or temporary) in the indicated mode</td>
</tr>
<tr>
<td>READ Procedures</td>
<td>Reads data from the LOB starting at the specified offset</td>
</tr>
<tr>
<td>SET_DBFS_LINK Procedures</td>
<td>Links the specified SecureFile to the specified path name. It does not copy the data to the path</td>

<td>SETCONTENTTYPE Procedure</td>
<td>Sets the content type string for the data in the LOB</td>
</tr>
<tr>
<td>SETOPTIONS Procedures</td>
<td>Enables CSCE features on a per-LOB basis, overriding the default LOB column settings</td>
</tr>
<tr>
<td>SUBSTR Functions</td>
<td>Returns part of the LOB value starting at the specified offset</td>
</tr>
<tr>
<td>TRIM Procedures</td>
<td>Trims the LOB value to the specified shorter length</td>
</tr>
<tr>
<td>WRITE Procedures</td>
<td>Writes data to the LOB from a specified offset</td>
</tr>
<tr>
<td>WRITEAPPEND Procedures</td>
<td>Writes a buffer to the end of a LOB</td>
</tr>
</tbody>
</table>

### 93.9.1 APPEND Procedures

This procedure appends the contents of a source internal LOB to a destination LOB. It appends the complete source LOB.

**Syntax**

```sql
DBMS_LOB.APPEND (
    dest_lob IN OUT NOCOPY BLOB,
    src_lob IN     BLOB);
```
Parameters

Table 93-10  APPEND Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>Locator for the internal LOB to which the data is to be appended.</td>
</tr>
<tr>
<td>src_lob</td>
<td>Locator for the internal LOB from which the data is to be read.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-11  APPEND Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Either the source or the destination LOB is NULL.</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform a LOB write inside a query or PDML parallel execution server</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB</td>
</tr>
</tbody>
</table>

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- If APPEND is called on a LOB that has been archived, it implicitly gets the LOB before the first byte is written

- If APPEND is called on a SecureFiles LOB that is a DBFS Link, an exception is thrown.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure.
93.9.2 CLOB2FILE Procedure

This procedure writes the content of a CLOB into a bfile. This procedure gets called from the deprecated `dbms_xslprocessor.clob2file` internally.

Syntax

```sql
DBMS_LOB.CLOB2FILE(
    src_cl      IN  CLOB,
    file_loc    IN  VARCHAR2,
    file_name   IN  VARCHAR2,
    csid        IN  NUMBER   := 0,
    open_mode   IN  VARCHAR2 :='wb');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>src_cl</td>
<td>Source CLOB locator to write into a file</td>
</tr>
<tr>
<td>file_loc</td>
<td>Directory object name where the file is located</td>
</tr>
<tr>
<td>file_name</td>
<td>File name</td>
</tr>
<tr>
<td>csid</td>
<td>Character set id of the CLOB locator</td>
</tr>
<tr>
<td></td>
<td>• Must be a valid Oracle id; otherwise returns an error</td>
</tr>
<tr>
<td></td>
<td>• If the value is 0, then the content of the output file will be in the database character set</td>
</tr>
<tr>
<td>open_mode</td>
<td>The mode to open the output file in.</td>
</tr>
<tr>
<td></td>
<td>• <code>wb</code> — write byte mode, overwrites the file</td>
</tr>
<tr>
<td></td>
<td>The default value is <code>wb</code>.</td>
</tr>
</tbody>
</table>

93.9.3 CLOSE Procedure

This procedure closes a previously opened internal or external LOB.

Syntax

```sql
DBMS_LOB.CLOSE {
    lob_loc    IN OUT NOCOPY BLOB);

DBMS_LOB.CLOSE {
    lob_loc    IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);

DBMS_LOB.CLOSE {
    file_loc   IN OUT NOCOPY BFILE);
Parameters

Table 93-13  CLOSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Exceptions

No error is returned if the BFILE exists but is not opened. An error is returned if the LOB is not open.

Usage Notes

CLOSE requires a round-trip to the server for both internal and external LOBs. For internal LOBs, CLOSE triggers other code that relies on the close call, and for external LOBs (BFILES), CLOSE actually closes the server-side operating system file.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also:
Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.4 COMPARE Functions

This function compares two entire LOBs or parts of two LOBs.

Syntax

DBMS_LOB.COMpare (  
  lob_1            IN BLOB,  
  lob_2            IN BLOB,  
  amount           IN INTEGER := DBMS_LOB.LOBMAXSIZE,  
  offset_1         IN INTEGER := 1,  
  offset_2         IN INTEGER := 1)  
RETURN INTEGER;

DBMS_LOB.COMpare (  
  lob_1            IN CLOB CHARACTER SET ANY_CS,  
  lob_2            IN CLOB CHARACTER SET lob_1%CHARSET,
amount IN INTEGER := DBMS_LOB.LOBMAXSIZE,
offset_1 IN INTEGER := 1,
offset_2 IN INTEGER := 1)
RETURN INTEGER;

DBMS_LOB_COMPARE (lob_1 IN BFILE,
lob_2 IN BFILE,
amount IN INTEGER,
offset_1 IN INTEGER := 1,
offset_2 IN INTEGER := 1)
RETURN INTEGER;

Pragmas
pragma restrict_references(COMPARE, WNDS, WNPS, RNDS, RNPS);

Parameters

Table 93-14 COMPARE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_1</td>
<td>LOB locator of first target for comparison.</td>
</tr>
<tr>
<td>lob_2</td>
<td>LOB locator of second target for comparison.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs/NCLOBs) to compare.</td>
</tr>
<tr>
<td>offset_1</td>
<td>Offset in bytes or characters on the first LOB (origin: 1) for the comparison.</td>
</tr>
<tr>
<td>offset_2</td>
<td>Offset in bytes or characters on the second LOB (origin: 1) for the comparison.</td>
</tr>
</tbody>
</table>

Return Values

- INTEGER: 0 if the comparison succeeds, nonzero if not.
- NULL, if any of amount, offset_1 or offset_2 is not a valid LOB offset value. A valid offset is within the range of 1 to LOBMAXSIZE inclusive.

Usage Notes

- You can only compare LOBs of the same datatype (LOBs of BLOB type with other BLOBs, and CLOBs with CLOBs, and BFILEs with BFILEs). For BFILEs, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.
- COMPARE returns 0 if the data exactly matches over the range specified by the offset and amount parameters. COMPARE returns -1 if the first CLOB is less than the second, and 1 if it is greater.
- For fixed-width n-byte CLOBs, if the input amount for COMPARE is specified to be greater than (DBMS_LOB.LOBMAXSIZE/n), then COMPARE matches characters in a range of size (DBMS_LOB.LOBMAXSIZE/n), or Max(length(clob1), length(clob2)), whichever is lesser.
- If COMPARE is called on any LOB that has been archived, it implicitly gets the LOB before the compare begins.
• If COMPARE() is called on a SecureFiles LOB that is a DBFS Link, the linked LOB is streamed from DBFS, if possible, otherwise an exception is thrown.

Exceptions

Table 93-15  COMPARE Function Exceptions for BFILE operations

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File was not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.5 CONVERTTOBLOB Procedure

This procedure reads character data from a source CLOB or NCLOB instance, converts the character data to the character set you specify, writes the converted data to a destination BLOB instance in binary format, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```sql
DBMS_LOB.CONVERTTOBLOB(
    dest_lob       IN OUT     NOCOPY  BLOB,
    src_clob       IN         CLOB CHARACTER SET ANY_CS,
    amount         IN         INTEGER,
    dest_offset    IN OUT     INTEGER,
    src_offset     IN OUT     INTEGER,
    blob_csid      IN         NUMBER,
    lang_context   IN OUT     INTEGER,
    warning        OUT        INTEGER);
```

Parameters

Table 93-16  CONVERTTOBLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the destination LOB instance.</td>
</tr>
<tr>
<td>src_clob</td>
<td>LOB locator of the source LOB instance.</td>
</tr>
</tbody>
</table>
Table 93-16  (Cont.) CONVERTTOBLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>Number of characters to convert from the source LOB. If you want to copy the entire LOB, pass the constant DBMS_LOB.LOBMAXSIZE. If you pass any other value, it must be less than or equal to the size of the LOB.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in bytes in the destination LOB for the start of the write. Specify a value of 1 to start at the beginning of the LOB. (OUT) The new offset in bytes after the end of the write.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in characters in the source LOB for the start of the read. (OUT) Offset in characters in the source LOB right after the end of the read.</td>
</tr>
<tr>
<td>blob_csid</td>
<td>Desired character set ID of the converted data.</td>
</tr>
<tr>
<td>lang_context</td>
<td>(IN) Language context, such as shift status, for the current conversion. (OUT) The language context at the time when the current conversion is done. This information is returned so you can use it for subsequent conversions without losing or misinterpreting any source data. For the very first conversion, or if do not care, use the default value of zero.</td>
</tr>
<tr>
<td>warning</td>
<td>(OUT) Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant warn_inconvertible_char in the DBMS_LOB package.</td>
</tr>
</tbody>
</table>

Usage Notes

Preconditions

Before calling the CONVERTTOBLOB procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked. To lock the row, select the LOB using the FOR UPDATE clause of the SELECT statement.

Constants and Defaults

All parameters are required. You must pass a variable for each OUT or IN OUT parameter. You must pass either a variable or a value for each IN parameter.

Table 93-17 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the dbmslob.sql package specification file.
Table 93-17  DBMS_LOB.CONVERTTOBLOB Typical Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>LOBMAXSIZE (IN)</td>
<td>convert the entire file</td>
</tr>
<tr>
<td>dest_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>src_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>blob_csid</td>
<td>DEFAULT_CSID (IN)</td>
<td>default CSID, use same CSID as source LOB</td>
</tr>
<tr>
<td>lang_context</td>
<td>DEFAULT_LANG_CTX (IN)</td>
<td>default language context</td>
</tr>
<tr>
<td>warning</td>
<td>NO_WARNING (OUT)</td>
<td>no warning message, success</td>
</tr>
<tr>
<td></td>
<td>WARN_INCONVERTIBLE_CHAR (OUT)</td>
<td>character in source cannot be properly converted</td>
</tr>
</tbody>
</table>

General Notes

- You must specify the desired character set for the destination LOB in the blob_csid parameter. You can pass a zero value for blob_csid. When you do so, the database assumes that the desired character set is the same as the source LOB character set.
- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The amount and src_offset values are in characters and the dest_offset is in bytes. To convert the entire LOB, you can specify LOBMAXSIZE for the amount parameter.
- CONVERTTOBLOB gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

Exceptions

Table 93-18 gives possible exceptions this procedure can throw. The first column lists the exception string and the second column describes the error conditions that can cause the exception.

Table 93-18  CONVERTTOBLOB Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>One or more of the following:</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

Oracle Database SecureFiles and Large Objects Developer's Guide for more information on using LOBs in application development
93.9.6 CONVERTTOCLOB Procedure

This procedure takes a source BLOB instance, converts the binary data in the source instance to character data using the character set you specify, writes the character data to a destination CLOB or NCLOB instance, and returns the new offsets.

You can use this interface with any combination of persistent or temporary LOB instances as the source or destination.

Syntax

```sql
DBMS_LOB.CONVERTTOCLOB(
    dest_lob       IN OUT NOCOPY  CLOB CHARACTER SET ANY_CS,
    src_blob       IN             BLOB,
    amount         IN             INTEGER,
    dest_offset    IN OUT         INTEGER,
    src_offset     IN OUT         INTEGER,
    blob_csid      IN             NUMBER,
    lang_context   IN OUT         INTEGER,
    warning        OUT            INTEGER);
```

Parameters

Table 93-19 CONVERTTOCLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the destination LOB instance.</td>
</tr>
<tr>
<td>src_blob</td>
<td>LOB locator of the source LOB instance.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to convert from the source LOB.</td>
</tr>
<tr>
<td></td>
<td>If you want to copy the entire BLOB, pass the constant DBMS_LOB.LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>If you pass any other value, it must be less than or equal to the size of</td>
</tr>
<tr>
<td></td>
<td>the BLOB.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in characters in the destination LOB for the start of the</td>
</tr>
<tr>
<td></td>
<td>write. Specify a value of 1 to start at the beginning of the LOB.</td>
</tr>
<tr>
<td></td>
<td>(OUT) The new offset in characters after the end of the write. This</td>
</tr>
<tr>
<td></td>
<td>offset always points to the beginning of the first complete character</td>
</tr>
<tr>
<td></td>
<td>after the end of the write.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source LOB for the start of the read.</td>
</tr>
<tr>
<td></td>
<td>(OUT) Offset in bytes in the source LOB right after the end of the read.</td>
</tr>
<tr>
<td>blob_csid</td>
<td>The character set ID of the source data</td>
</tr>
<tr>
<td>lang_context</td>
<td>(IN) Language context, such as shift status, for the current conversion.</td>
</tr>
<tr>
<td></td>
<td>(OUT) The language context at the time when the current conversion is done.</td>
</tr>
<tr>
<td></td>
<td>This information is returned so you can use it for subsequent conversions</td>
</tr>
<tr>
<td></td>
<td>without losing or misinterpreting any source data. For the very first</td>
</tr>
<tr>
<td></td>
<td>conversion, or if do not care, use the default value of zero.</td>
</tr>
</tbody>
</table>
Table 93-19  (Cont.) CONVERTTOCLOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>warning</td>
<td>Warning message. This parameter indicates when something abnormal happened during the conversion. You are responsible for checking the warning message. Currently, the only possible warning is — inconvertible character. This occurs when the character in the source cannot be properly converted to a character in destination. The default replacement character (for example, '?') is used in place of the inconvertible character. The return value of this error message is defined as the constant <code>warn_inconvertible_char</code> in the <code>DBMS_LOB</code> package.</td>
</tr>
</tbody>
</table>

Usage Notes

Preconditions

Before calling the `CONVERTTOCLOB` procedure, the following preconditions must be met:

- Both the source and destination LOB instances must exist.
- If the destination LOB is a persistent LOB, the row must be locked before calling the `CONVERTTOCLOB` procedure. To lock the row, select the LOB using the `FOR UPDATE` clause of the `SELECT` statement.

Constants and Defaults

All parameters are required. You must pass a variable for each `OUT` or `IN OUT` parameter. You must pass either a variable or a value for each `IN` parameter.

Table 93-20 gives a summary of typical values for each parameter. The first column lists the parameter, the second column lists the typical value, and the last column describes the result of passing the value. Note that constants are used for some values. These constants are defined in the `dbmslob.sql` package specification file.

Table 93-20  DBMS_LOB.CONVERTTOCLOB Typical Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>LOBMAXSIZE (IN)</td>
<td>convert the entire file</td>
</tr>
<tr>
<td>dest_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>src_offset</td>
<td>1 (IN)</td>
<td>start from the beginning</td>
</tr>
<tr>
<td>csid</td>
<td>DEFAULT_CSID (IN)</td>
<td>default CSID, use destination CSID</td>
</tr>
<tr>
<td>lang_context</td>
<td>DEFAULT_LANG_CTX (IN)</td>
<td>default language context</td>
</tr>
<tr>
<td>warning</td>
<td>NO_WARNING (OUT)</td>
<td>no warning message, success</td>
</tr>
<tr>
<td></td>
<td>WARN_INCONVERTIBLE_CHAR (OUT)</td>
<td>character in source cannot be properly converted</td>
</tr>
</tbody>
</table>

General Notes

- You must specify the desired character set for the source LOB in the `blob_csid` parameter. You can pass a zero value for `blob_csid`. When you do so, the
database assumes that the desired character set is the same as the destination LOB character set.

- You must specify the offsets for both the source and destination LOBs, and the number of characters to copy from the source LOB. The amount and src_offset values are in bytes and the dest_offset is in characters. To convert the entire LOB, you can specify LOBMAXSIZE for the amount parameter.

- CONVERTTOCLOB gets the source and/or destination LOBs as necessary prior to conversion and write of the data.

Exceptions

### Table 93-21 CONVERTTOCLOB Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>One or more of the following:</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- src_offset or dest_offset &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

*Oracle Database SecureFiles and Large Objects Developer's Guide* for more information on using LOBs in application development

### 93.9.7 COPY Procedures

This procedure copies all, or a part of, a source internal LOB to a destination internal LOB. You can specify the offsets for both the source and destination LOBs, and the number of bytes or characters to copy.

**Syntax**

```sql
DBMS_LOB.COPY (  
    dest_lob IN OUT NOCOPY BLOB,  
    src_lob IN BLOB,  
    amount IN INTEGER,  
    dest_offset IN INTEGER := 1,  
    src_offset IN INTEGER := 1);  
```

```sql
DBMS_LOB.COPY (  
    dest_lob IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,  
    src_lob IN CLOB CHARACTER SET dest_lob%CHARSET,  
    amount IN INTEGER,  
    dest_offset IN INTEGER := 1,  
    src_offset IN INTEGER := 1);  
```
Parameters

Table 93-22  COPY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the copy target.</td>
</tr>
<tr>
<td>src_lob</td>
<td>LOB locator of source for the copy.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to copy.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>Offset in bytes or characters in the destination LOB (origin: 1) for the start of the copy.</td>
</tr>
<tr>
<td>src_offset</td>
<td>Offset in bytes or characters in the source LOB (origin: 1) for the start of the copy.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-23  COPY Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or invalid.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>src_offset or dest_offset &lt; 1</td>
</tr>
<tr>
<td></td>
<td>src_offset or dest_offset &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td></td>
<td>amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>amount &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform a LOB write inside a query or PDML parallel execution server</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on either LOB</td>
</tr>
</tbody>
</table>

Usage Notes

- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- It is not an error to specify an amount that exceeds the length of the data in the source LOB. Thus, you can specify a large amount to copy from the source LOB, which copies data from the src_offset to the end of the source LOB.
- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.
Prior to copy, the source and destination LOBs are retrieved, if they are currently archived. For a complete over-write, the destination LOB is not retrieved.

If the source LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise an exception is thrown. If the destination LOB is a DBFS Link, an exception is thrown.

**See Also:**

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

### 93.9.8 COPY_DBFS_LINK Procedures

This procedure copies the DBFS Link in the source LOB to the destination LOB.

#### Syntax

```sql
DBMS_LOB.COPY_DBFS_LINK (
    lob_loc_dst    IN OUT BLOB,
    lob_loc_src    IN     BLOB,
    flags          IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

```sql
DBMS_LOB.COPY_DBFS_LINK (
    lob_loc_dst    IN OUT CLOB CHARACTER SET ANY_CS,
    lob_loc_src    IN     CLOB CHARACTER SET ANY_CS,
    flags          IN     PLS_INTEGER DEFAULT DBFS_LINK_NOCACHE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc_dst</td>
<td>LOB to be made to reference the same storage data as lob_loc_src</td>
</tr>
<tr>
<td>lob_loc_src</td>
<td>LOB from which to copy the reference</td>
</tr>
<tr>
<td>flags</td>
<td>Options to COPY_DBFS_LINK:</td>
</tr>
<tr>
<td></td>
<td>• DBFS_LINK_NOCACHE specifies to only copy the DBFS Link</td>
</tr>
<tr>
<td></td>
<td>• DBFS_LINK_CACHE specifies to copy the DBFS Link and read the data into the database LOB specified by lob_loc_dst so that the data is cached</td>
</tr>
</tbody>
</table>

#### Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>Either lob_loc_src or lob_loc_dst is not a SECUREFILE</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>lob_loc_src LOB has not been archived</td>
</tr>
</tbody>
</table>
93.9.9 COPY_FROM_DBFS_LINK

This procedure retrieves the archived SecureFiles LOB data from the DBFS HSM store and to the database.

Syntax

```plaintext
DBMS_LOB.COPY_FROM_DBFS_LINK (
    lob_loc       IN OUT BLOB);

DBMS_LOB.COPY_FROM_DBFS_LINK (
    lob_loc       IN OUT CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 93-26  COPY_FROM_DBFS_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be retrieved from the archive</td>
</tr>
</tbody>
</table>

Usage Note

COPY_FROM_DBFS_LINK does not remove the underlying DBFS file.

If the LOB is successfully retrieved, COPY_FROM_DBFS_LINK silently returns success.

Exceptions

Table 93-27  COPY_FROM_DBFS_LINK Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
<tr>
<td>ORA-01555</td>
<td>If the LOB has already been retrieved and has been modified since retrieval, if the LOB has been migrated in and out (modified or not) since the locator was retrieved</td>
</tr>
</tbody>
</table>
93.9.10 CREATETEMPORARY Procedures

This procedure creates a temporary BLOB or CLOB and its corresponding index in your default temporary tablespace.

Syntax

```
DBMS_LOB.CREATETEMPORARY (
    lob_loc IN OUT NOCOPY BLOB,
    cache IN            BOOLEAN,
    dur IN            PLS_INTEGER := DBMS_LOB.SESSION);
```

```
DBMS_LOB.CREATETEMPORARY (
    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
    cache IN            BOOLEAN,
    dur IN            PLS_INTEGER := 10);
```

Parameters

Table 93-28  CREATETEMPORARY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>cache</td>
<td>Specifies if LOB should be read into buffer cache or not.</td>
</tr>
<tr>
<td>dur</td>
<td>1 of 2 predefined duration values (SESSION or CALL) which specifies a hint as to whether the temporary LOB is cleaned up at the end of the session or call. If dur is omitted, then the session duration is used.</td>
</tr>
</tbody>
</table>

See Also:

- Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure
- Oracle Database PL/SQL Language Reference for more information about NOCOPY and passing temporary lobs as parameters

93.9.11 DBFS_LINK_GENERATE_PATH Functions

This subprogram returns a unique file path name for use in creating a DBFS Link.

Syntax

```
DBMS_LOB.DBFS_LINK_GENERATE_PATH (
    lob_loc IN BLOB,
    storage_dir IN VARCHAR2)
RETURN VARCHAR2;
```

```
DBMS_LOB.DBFS_LINK_GENERATE_PATH (
    lob_loc IN CLOB CHARACTER SET ANY_CS,
...
```
storage_dir   IN VARCHAR2)
RETURN VARCHAR2;
```

**Pragmas**

```
PRAGMA RESTRICT_REFERENCES(dbfs_link_generate_path,
     WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

**Table 93-29  DBFS_LINKGENERATE_PATH Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be retrieved from DBFS</td>
</tr>
<tr>
<td>storage_dir</td>
<td>DBFS directory that will be the parent directory of the file</td>
</tr>
</tbody>
</table>

**Exceptions**

**Table 93-30  DBFS_LINK_GENERATE_PATH Function Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_WRONGTYPE</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
</tbody>
</table>

**Usage Notes**

Returns a globally unique file pathname that can be used for archiving. This is guaranteed to be globally unique across all calls to this function for different LOBs and versions of that LOB. It is always the same for the same LOB and version.

### 93.9.12 ERASE Procedures

This procedure erases an entire internal LOB or part of an internal LOB.

**Syntax**

```
DBMS_LOB.ERASE(
    lob_loc           IN OUT NOCOPY   BLOB,
    amount            IN OUT NOCOPY   INTEGER,
    offset            IN                INTEGER := 1);
```

```
DBMS_LOB.ERASE(
    lob_loc           IN OUT NOCOPY   CLOB CHARACTER SET ANY_CS,
    amount            IN OUT NOCOPY   INTEGER,
    offset            IN                INTEGER := 1);
```

**Parameters**

**Table 93-31  ERASE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be erased. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>
Table 93-31  (Cont.) ERASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs or BFILES) or characters (for CLOBs or NCLOBs) to be erased.</td>
</tr>
<tr>
<td>offset</td>
<td>Absolute offset (origin: 1) from the beginning of the LOB in bytes (for BLOBs) or characters (CLOBs).</td>
</tr>
</tbody>
</table>

Usage Notes

- When data is erased from the middle of a LOB, zero-byte fillers or spaces are written for BLOBs or CLOBs respectively.
- The actual number of bytes or characters erased can differ from the number you specified in the amount parameter if the end of the LOB value is reached before erasing the specified number. The actual number of characters or bytes erased is returned in the amount parameter.
- ERASE gets the LOB if it is archived, unless the erase covers the entire LOB.
- If the LOB to be erased is a DBFS Link, an exception is thrown.

Note:

The length of the LOB is not decreased when a section of the LOB is erased. To decrease the length of the LOB value, see the "TRIM Procedures".

Exceptions

Table 93-32  ERASE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any input parameter is NULL.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1 or amount &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1 or offset &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform a LOB write inside a query or PDML parallel execution server</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>

Usage Notes

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

See Also:

- “TRIM Procedures"
- Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.13 FILECLOSE Procedure

This procedure closes a BFILE that has already been opened through the input locator.

Note:

The database has only read-only access to BFILES. This means that BFILES cannot be written through the database.

Syntax

DBMS_LOB.FILECLOSE (  
   file_loc IN OUT NOCOPY BFILE);  

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE to be closed.</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>NULL input value for file_loc.</td>
</tr>
<tr>
<td>UNOPENED_FILE</td>
<td>File was not opened with the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>
See Also:

- "FILEOPEN Procedure"
- "FILECLOSE Procedure"
- Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.14 FILECLOSEALL Procedure

This procedure closes all BFILEs opened in the session.

Syntax

DBMS_LOB.FILECLOSEALL;

Exceptions

Table 93-35  FILECLOSEALL Procedure Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>No file has been opened in the session.</td>
</tr>
</tbody>
</table>

See Also:

- "FILEOPEN Procedure"
- "FILECLOSE Procedure"
- Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.15 FILEEXISTS Function

This function finds out if a specified BFILE locator points to a file that actually exists on the server's file system.

Syntax

DBMS_LOB.FILEEXISTS ( file_loc IN BFILE)
RETURN INTEGER;

Pragmas

pragma restrict_references(FILEEXISTS, WNDS, RNDS, WNPS, RNPS);
Parameters

Table 93-36  FILEEXISTS Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE.</td>
</tr>
</tbody>
</table>

Return Values

Table 93-37  FILEEXISTS Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Physical file does not exist.</td>
</tr>
<tr>
<td>1</td>
<td>Physical file exists.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-38  FILEEXISTS Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
</tbody>
</table>

See Also:

- “FILEISOPEN Function”.
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure.

93.9.16 FILEGETNAME Procedure

This procedure determines the directory object and filename, given a BFILE locator.

This function only indicates the directory object name and filename assigned to the locator, not if the physical file or directory actually exists.

The maximum constraint values for the dir_alias buffer is 30, and for the entire path name, it is 2000.

Syntax

```sql
DBMS_LOB.FILEGETNAME (  
    file_loc IN BFILE,  
    dir_alias OUT VARCHAR2,  
    filename OUT VARCHAR2);  
```
Parameters

Table 93-39 FILEGETNAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE</td>
</tr>
<tr>
<td>dir_alias</td>
<td>Directory object name</td>
</tr>
<tr>
<td>filename</td>
<td>Name of the BFILE</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-40 FILEGETNAME Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>dir_alias or filename are NULL.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.17 FILEISOPEN Function

This function finds out whether a BFILE was opened with the specified FILE locator.

Syntax

```sql
DBMS_LOB.FILEISOPEN ( file_loc IN BFILE )
RETURN INTEGER;
```

Pragmas

```sql
PRAGMA RESTRICT_REFERENCES(fileisopen, WNDS, RNDS, WNPS, RNPS);
```

Parameters

Table 93-41 FILEISOPEN Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE</td>
</tr>
</tbody>
</table>

Return Values

INTEGER: 0 = file is not open, 1 = file is open
Usage Notes

If the input FILE locator was never passed to the FILEOPEN procedure, then the file is considered not to be opened by this locator. However, a different locator may have this file open. In other words, openness is associated with a specific locator.

Exceptions

Table 93-42  FILEISOPEN Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
</tbody>
</table>

[See Also:](#)

- “FILEEXISTS Function”
- Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure

93.9.18 FILEOPEN Procedure

This procedure opens a BFILE for read-only access. BFILE data may not be written through the database.

Syntax

```sql
DBMS_LOB.FILEOPEN (  
    file_loc    IN OUT NOCOPY  BFILE,  
    open_mode   IN             BINARY_INTEGER := file_readonly);
```

Parameters

Table 93-43  FILEOPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>Locator for the BFILE.</td>
</tr>
<tr>
<td>open_mode</td>
<td>File access is read-only.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-44  FILEOPEN Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>file_loc or open_mode is NULL.</td>
</tr>
</tbody>
</table>
Table 93-44  (Cont.) FILEOPEN Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>open_mode is not equal to FILE_READONLY.</td>
</tr>
<tr>
<td>OPEN_TOOMANY</td>
<td>Number of open files in the session exceeds session_max_open_files.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory associated with file_loc does not exist.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
</tbody>
</table>

93.9.19 FRAGMENT_DELETE Procedure

This procedure deletes the data at the specified offset for the specified length from the LOB without having to rewrite all the data in the LOB following the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_DELETE (    
    lob_loc     IN OUT NOCOPY BLOB, 
    amount      IN            INTEGER, 
    offset      IN            INTEGER);
```

```
DBMS_LOB.FRAGMENT_DELETE (    
    lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS, 
    amount      IN            INTEGER, 
    offset      IN            INTEGER);
```

Parameters

Table 93-45  FRAGMENT_DELETE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (BLOB) or characters (CLOB/NCLOB) to be removed from the LOB</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the deletion</td>
</tr>
</tbody>
</table>
Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>A non-SECUREFILE LOB was used in a SECUREFILE LOB only call</td>
</tr>
<tr>
<td>SECUREFILE_OUTOFBOUNDS</td>
<td>Attempted to perform a FRAGMENT_* operation past LOB end</td>
</tr>
</tbody>
</table>

93.9.20 FRAGMENT_INSERT Procedures

This procedure inserts the specified data (limited to 32K) into the LOB at the specified offset.

Syntax

```
DBMS_LOB.FRAGMENT_INSERT (    
    lob_loc     IN OUT NOCOPY BLOB,    
    amount      IN            INTEGER,    
    offset      IN            INTEGER,    
    buffer      IN            RAW);
```

```
DBMS_LOB.FRAGMENT_INSERT (    
    lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,    
    amount      IN            INTEGER,    
    offset      IN            INTEGER,    
    buffer      IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (BLOB) or characters (CLOB/NCLOB) to be inserted into the LOB</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to begin the insertion</td>
</tr>
<tr>
<td>buffer</td>
<td>Data to insert into the LOB</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
</tbody>
</table>
Table 93-48  (Cont.) FRAGMENT_INSERT Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>A non-SECUREFILE LOB was used in a SECUREFILE LOB only call</td>
</tr>
<tr>
<td>SECUREFILE_OUTOFBOUNDS</td>
<td>Attempted to perform a FRAGMENT_* operation past LOB end</td>
</tr>
</tbody>
</table>

Usage Notes

FRAGMENT_INSERT gets the LOB, if necessary, before performing operations on the LOB.

93.9.21 FRAGMENT_MOVE Procedure

This procedure moves the amount of bytes (BLOB) or characters (CLOB/NCLOB) from the specified offset to the new offset specified.

Syntax

```
DBMS_LOB.FRAGMENT_MOVE ( lob_loc       IN OUT NOCOPY BLOB,  
                          amount        IN            INTEGER,  
                          src_offset    IN            INTEGER,  
                          dest_offset   IN            INTEGER);

DBMS_LOB.FRAGMENT_MOVE ( lob_loc       IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,  
                          amount        IN            INTEGER,  
                          src_offset    IN            INTEGER,  
                          dest_offset   IN            INTEGER);
```

Parameters

Table 93-49  FRAGMENT_MOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (BLOB) or characters (CLOB/NCLOB) to be moved in the LOB</td>
</tr>
<tr>
<td>src_offset</td>
<td>Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data</td>
</tr>
<tr>
<td>dest_offset</td>
<td>Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to remove the data</td>
</tr>
</tbody>
</table>
Exceptions

Table 93-50  FRAGMENT_MOVE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>A non-SECUREFILE LOB was used in a SECUREFILE LOB only call</td>
</tr>
<tr>
<td>SECUREFILE_OUTOFSBOUNDS</td>
<td>Attempted to perform a FRAGMENT_* operation past LOB end</td>
</tr>
</tbody>
</table>

Usage Notes

- All offsets are pre-move offsets.
- Offsets of more than 1 past the end of the LOB are not permitted.
- FRAGMENT_MOVE gets the LOB, if necessary, before performing operations on the LOB.

93.9.22 FRAGMENT_REPLACE Procedures

This procedure replaces the data at the specified offset with the specified data (not to exceed 32k).

Syntax

```sql
DBMS_LOB.FRAGMENT_REPLACE (    lob_loc     IN OUT NOCOPY BLOB,
    old_amount  IN            INTEGER,
    new_amount  IN            INTEGER,
    offset      IN            INTEGER,
    buffer      IN            RAW);
```

```sql
DBMS_LOB.FRAGMENT_REPLACE (    lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,   old_amount  IN
    INTEGER,     new_amount  IN            INTEGER,     offset      IN            INTEGER,     buffer      IN           VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

Table 93-51  FRAGMENT_REPLACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>old_amount</td>
<td>Number of bytes (BLOB) or characters (CLOB/NCLOB) to be replaced in the LOB</td>
</tr>
<tr>
<td>new_amount</td>
<td>Number of bytes (BLOB) or characters (CLOB/NCLOB) to written to the LOB</td>
</tr>
</tbody>
</table>
Table 93-51 (Cont.) FRAGMENT_REPLACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>offset</td>
<td>Beginning offset into the LOB in bytes (BLOB) or characters (CLOB/NCLOB) to put the data</td>
</tr>
<tr>
<td>buffer</td>
<td>Data to insert into the LOB</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-52 FRAGMENT_REPLACE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>A non-SECUREFILE LOB was used in a SECUREFILE LOB only call</td>
</tr>
<tr>
<td>SECUREFILE_OUTOFBOUNDS</td>
<td>Attempted to perform a FRAGMENT_* operation past LOB end</td>
</tr>
</tbody>
</table>

Usage Notes

- Invoking this procedure is equivalent to deleting the old amount of bytes/characters at offset and then inserting the new amount of bytes/characters at offset.
- FRAGMENT_REPLACE gets the LOB, if necessary, before performing operations on the LOB.

93.9.23 FREETEMPORARY Procedures

This procedure frees the temporary BLOB or CLOB in the default temporary tablespace.

Syntax

```sql
DBMS_LOB.FREETEMPORARY (    lob_loc IN OUT NOCOPY BLOB);

DBMS_LOB.FREETEMPORARY (    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS);
```

Parameters

Table 93-53 FREETEMPORARY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>
Usage Notes

• When a new temporary LOB is created, and there is currently no temporary LOB in use with the same duration (session, call), a new temporary LOB segment is created. When the temporary LOB is freed, the space it consumed is released to the temporary segment. If there are no other temporary LOBs for the same duration, the temporary segment is also freed.

• After the call to `FREETEMPORARY`, the LOB locator that was freed is marked as invalid.

• If an invalid LOB locator is assigned to another LOB locator using `OCILobLocatorAssign` in OCI or through an assignment operation in PL/SQL, then the target of the assignment is also freed and marked as invalid.

See Also:

Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure

93.9.24 GET_DBFS_LINK Functions

This function returns the DBFS path name for the specified SecureFile LOB.

Syntax

```sql
DBMS_LOB.GET_DBFS_LINK (  
   lob_loc         IN     BLOB,
   storage_path    OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
   lob_length      OUT NUMBER);

DBMS_LOB.GET_DBFS_LINK (  
   lob_loc         IN     CLOB CHARACTER SET ANY_CS,
   storage_path    OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),
   lob_length      OUT NUMBER);
```

Parameters

Table 93-54  GET_DBFS_LINK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be retrieved from DBFS</td>
</tr>
<tr>
<td>storage_path</td>
<td>Path where the LOB is stored in DBFS</td>
</tr>
<tr>
<td>lob_length</td>
<td>LOB length at the time of write to DBFS</td>
</tr>
</tbody>
</table>

Return Values

The Archive ID
Exceptions

Table 93-55    GET_DBFS_LINK Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
<tr>
<td>ORA-01555</td>
<td>The LOB has already been retrieved and has been modified since retrieval or the LOB has been migrated in and out (modified or not) since the locator was retrieved</td>
</tr>
</tbody>
</table>

93.9.25 GET_DBFS_LINK_STATE Procedures

GET_DBFS_LINK_STATE retrieves the current link state of the specified SecureFile.

Syntax

DBMS_LOB.GET_DBFS_LINK_STATE (  
  lob_loc       IN BLOB,  
  storage_path  OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),  
  state         OUT NUMBER,  
  cached        OUT BOOLEAN);  

DBMS_LOB.GET_DBFS_LINK_STATE (  
  lob_loc       IN CLOB CHARACTER SET ANY_CS,  
  storage_path  OUT VARCHAR2(DBFS_LINK_PATH_MAX_SIZE),  
  state         OUT NUMBER,  
  cached        OUT BOOLEAN);  

Parameters

Table 93-56    GET_DBFS_LINK_STATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be retrieved from the archive</td>
</tr>
<tr>
<td>storage_path</td>
<td>Path where the LOB is stored in the DBFS HSM store</td>
</tr>
<tr>
<td>state</td>
<td>One of DBFS_LINK_NEVER, DBFS_LINK_NO or DBFS_LINK_YES</td>
</tr>
<tr>
<td>cached</td>
<td>If the LOB is archived and the data was specified to be cached on put</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-57    GET_DBFS_LINK_STATE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
</tbody>
</table>

Usage Notes

- If the LOB has never been archived, state is set to DBMS_LOB.DBFS_LINK_NEVER. If the LOB has been archived, state is set to DBMS_LOB.DBFS_LINK_YES. If the LOB has been previously retrieved from the archive, state is set to DBFS_LINK_NO.
• If the LOB was archived, but the data was left in the RDBMS, `cached` is set to **TRUE**. If the data was removed after the link was created, `cached` is set to **FALSE**, and NULL if state is **DBMS_LOB.DBFS_LINK_NEVER**.

### 93.9.26 GETCONTENTTYPE Functions

This procedure returns the content type string previously set by means of the `SETCONTENTTYPE` Procedure.

**Syntax**

```sql
DBMS_LOB.GETCONTENTTYPE (lob_loc IN BLOB) RETURN VARCHAR2;

DBMS_LOB.GETCONTENTTYPE (lob_loc IN CLOB CHARACTER SET ANY_CS) RETURN VARCHAR2;
```

**Pragmas**

```
PRAGMA RESTRICT_REFERENCES(getcontenttype, WNDS, RNDS, WNPS, RNPS);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lob_loc</code></td>
<td>LOB whose content type is to be retrieved</td>
</tr>
</tbody>
</table>

**Return Values**

The returned content type.

If the SecureFiles LOB does not have a `contenttype` associated with it, `GETCONTENTTYPE()` returns `NULL`.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SECUREFILE_BADLOB</code></td>
<td><code>lob_loc</code> is not a <code>SECUREFILE</code></td>
</tr>
</tbody>
</table>

**Related Topics**

- **SETCONTENTTYPE Procedure**
  
  This procedure sets the content type string for the data in the LOB.
93.9.27 GET_STORAGE_LIMIT Function

This function returns the LOB storage limit for the specified LOB.

Syntax

```sql
DBMS_LOB.GET_STORAGE_LIMIT (    lob_loc  IN CLOB CHARACTER SET ANY_CS)    RETURN INTEGER;

DBMS_LOB.GET_STORAGE_LIMIT (    lob_loc  IN BLOB)    RETURN INTEGER;
```

Pragmas

```sql
PRAGMA RESTRICT_REFERENCES(get_storage_limit, WNDP, RNPS, WPS, RNPS);
```

Parameters

Table 93-60  GET_STORAGE_LIMIT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Return Value

The value returned from this function is the maximum allowable size for specified LOB locator. For BLOBs, the return value depends on the block size of the tablespace the LOB resides in and is calculated as \(2^{32}-1\) \((4294967295)\) times the block size of the tablespace. For CLOBs/NCLOBs, the value returned is the \(2^{32}-1\) \((4294967295)\) times the block size of the tablespace divided by the character width of the CLOB/NCLOB.

Usage

See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for details on LOB storage limits

93.9.28 GETCHUNKSIZE Functions

When creating the table, you can specify the chunking factor, a multiple of tablespace blocks in bytes. This corresponds to the chunk size used by the LOB data layer when accessing or modifying the LOB value. Part of the chunk is used to store system-related information, and the rest stores the LOB value. This function returns the amount of space used in the LOB chunk to store the LOB value.

Syntax

```sql
DBMS_LOB.GETCHUNKSIZE (    lob_loc IN BLOB)
```
RETURN INTEGER;

DBMS_LOB.GETCHUNKSIZE (  
   lob_loc IN CLOB CHARACTER SET ANY_CS)  
RETURN INTEGER;

Pragmas

PRAGMA RESTRICT_REFERENCES(getchunksize, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 93-61  GETCHUNKSIZE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Return Values

The return value is a usable chunk size in bytes.

Usage Notes

- With regard to basic LOB files, performance is improved if you enter read/write requests using a multiple of this chunk size. For writes, there is an added benefit, because LOB chunks are versioned, and if all writes are done on a chunk basis, then no extra or excess versioning is done or duplicated. You could batch up the WRITE until you have enough for a chunk, instead of issuing several WRITE calls for the same chunk.
- These tactics of performance improvement do not apply to SecureFiles.
- Note that chunk size is independent of LOB type (BLOB, CLOB, NCLOB, Unicode or other character set).

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

Exceptions

Table 93-62  GETCHUNKSIZE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>
93.9.29 GETLENGTH Functions

This function gets the length of the specified LOB. The length in bytes or characters is returned.

The length returned for a BFILE includes the EOF, if it exists. Any 0-byte or space filler in the LOB caused by previous ERASE or WRITE operations is also included in the length count. The length of an empty internal LOB is 0.

Syntax

```sql
DBMS_LOB.GETLENGTH (    
    lob_loc    IN  BLOB)    
RETURN INTEGER;

DBMS_LOB.GETLENGTH (    
    lob_loc    IN  CLOB   CHARACTER SET ANY_CS)    
RETURN INTEGER;

DBMS_LOB.GETLENGTH (    
    file_loc    IN  BFILE)    
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(GETLENGTH, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 93-63 GETLENGTH Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_loc</td>
<td>The file locator for the LOB whose length is to be returned.</td>
</tr>
</tbody>
</table>

Return Values

The length of the LOB in bytes or characters as an INTEGER. NULL is returned if the input LOB is NULL or if the input lob_loc is NULL. An error is returned in the following cases for BFILEs:

- lob_loc does not have the necessary directory and operating system privileges
- lob_loc cannot be read because of an operating system read error

See Also:

*Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure
93.9.30 GETOPTIONS Functions

This function obtains compression, deduplication, and encryption settings corresponding to the option_type field for a particular LOB.

Syntax

DBMS_LOB.GETOPTIONS (   lob_loc IN BLOB,   option_types IN PLS_INTEGER) RETURN PLS_INTEGER;

DBMS_LOB.GETOPTIONS (   lob_loc IN CLOB CHARACTER SET ANY_CS,   option_types IN PLS_INTEGER) RETURN PLS_INTEGER;

Parameters

Table 93-65 GETOPTIONS Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be examined. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>option_type</td>
<td>See Table 93-2</td>
</tr>
</tbody>
</table>

Return Values

The return values are a combination of COMPRESS_ON, ENCRYPT_ON and DEDUPLICATE_ON (see Table 93-3) depending on which option types (see Table 93-2) are passed in.

Exceptions

Table 93-66 GETOPTIONS Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>A non-SECUREFILE LOB was used in a SECUREFILE LOB only call</td>
</tr>
</tbody>
</table>
Usage Notes

You cannot turn compression or deduplication on or off for a SecureFile column that does not have those features on. The GetOptions Functions and SETOPTIONS Procedures work on individual SecureFiles. You can turn off a feature on a particular SecureFile and turn on a feature that has already been turned off by SetOptions, but you cannot turn on an option that has not been given to the SecureFile when the table was created.

93.9.31 INSTR Functions

This function returns the matching position of the $nth$ occurrence of the pattern in the LOB, starting from the offset you specify.

Syntax

```sql
DBMS_LOB.INSTR (  
  lob_loc IN BLOB,  
  pattern IN RAW,  
  offset IN INTEGER := 1,  
  nth IN INTEGER := 1)  
RETURN INTEGER;
```

```sql
DBMS_LOB.INSTR (  
  lob_loc IN CLOB CHARACTER SET ANY_CS,  
  pattern IN VARCHAR2 CHARACTER SET lob_loc%CHARSET,  
  offset IN INTEGER := 1,  
  nth IN INTEGER := 1)  
RETURN INTEGER;
```

```sql
DBMS_LOB.INSTR (  
  file_loc IN BFILE,  
  pattern IN RAW,  
  offset IN INTEGER := 1,  
  nth IN INTEGER := 1)  
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(INSTR, WNDS, WNPS, RNDS, RNPS);
```

Parameters

Table 93-67  INSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be examined. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>file_loc</td>
<td>The file locator for the LOB to be examined.</td>
</tr>
<tr>
<td>pattern</td>
<td>Pattern to be tested for. The pattern is a group of RAW bytes for BLOBs, and a character string (VARCHAR2) for CLOBs. The maximum size of the pattern is 16383 bytes.</td>
</tr>
<tr>
<td>offset</td>
<td>Absolute offset in bytes (BLOBs) or characters (CLOBs) at which the pattern matching is to start. (origin: 1)</td>
</tr>
</tbody>
</table>
Table 93-67  (Cont.) INSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nth</td>
<td>Occurrence number, starting at 1.</td>
</tr>
</tbody>
</table>

Return Values

Table 93-68  INSTR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTEGER</td>
<td>Offset of the start of the matched pattern, in bytes or characters. It returns 0 if the pattern is not found.</td>
</tr>
<tr>
<td>NULL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- any one or more of the IN parameters was NULL or INVALID.</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1 or offset &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- nth &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- nth &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

Usage Notes

The form of the VARCHAR2 buffer (the pattern parameter) must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

For BFILES, the file must be already opened using a successful FILEOPEN operation for this operation to succeed.

Operations that accept RAW or VARCHAR2 parameters for pattern matching, such as INSTR, do not support regular expressions or special matching characters (as in the case of SQL LIKE) in the pattern parameter or substrings.

Exceptions

Table 93-69  INSTR Function Exceptions for BFILES

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File was not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>

- “SUBSTR Functions”
- *Oracle Database SecureFiles and Large Objects Developer's Guide* for additional details on usage of this procedure

### 93.9.32 ISOPEN Functions

This function checks to see if the LOB was already opened using the input locator. This subprogram is for internal and external LOBs.

#### Syntax

```sql
DBMS_LOB.ISOPEN (  
  lob_loc IN BLOB) 
RETURN INTEGER;
```

```sql
DBMS_LOB.ISOPEN (  
  lob_loc IN CLOB CHARACTER SET ANY_CS) 
RETURN INTEGER;
```

```sql
DBMS_LOB.ISOPEN (  
  file_loc IN BFILE) 
RETURN INTEGER;
```

#### Pragmas

```sql
PRAGMA RESTRICT_REFERENCES(isopen, WNDS, RNDS, WNPS, RNPS);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>file_loc</td>
<td>File locator.</td>
</tr>
</tbody>
</table>

#### Return Values

The return value is 1 if the LOB is open, 0 otherwise.

#### Usage Notes

For *BFILES*, openness is associated with the locator. If the input locator was never passed to **OPEN**, the *BFILE* is not considered to be opened by this locator. However, a different locator may have opened the *BFILE*. More than one **OPEN** can be performed on the same *BFILE* using different locators.

For internal LOBs, openness is associated with the LOB, not with the locator. If locator1 opened the LOB, then locator2 also sees the LOB as open. For internal LOBs, **ISOPEN** requires a round-trip, because it checks the state on the server to see if the LOB is indeed open.
For external LOBs (BFILES), ISOPEN also requires a round-trip, because that's where the state is kept.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.33 ISREMOTE Function

This function checks to see if the LOB is local to the database or if it belongs to a remote database.

Syntax

DBMS_LOB.ISREMOTE (lob_loc IN BLOB) RETURN BOOLEAN;

DBMS_LOB.ISREMOTE (lob_loc IN CLOB CHARACTER SET ANY_CS) RETURN BOOLEAN;

Pragmas

PRAGMA RESTRICT_REFERENCES(isremote, WNDS, RNDS, WNPS, RNPS);

Parameters

Table 93-71 ISREMOTE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB.</td>
</tr>
</tbody>
</table>

Return Values

BOOLEAN: TRUE for remote LOBs obtained over a database link; FALSE for LOBs obtained from local database

See Also:

- Distributed LOBs chapter in Database SecureFiles and Large Objects Developer's Guide for more details on the usage of this procedure.
93.9.34 ISSECUREFILE Function

This function returns TRUE if the LOB locator passed to it is for a SecureFile LOB. It returns FALSE otherwise.

Syntax

DBMS_LOB.ISSECUREFILE(
  lob_loc IN BLOB)
RETURN BOOLEAN;

Pragmas

PRAGMA RESTRICT_REFERENCES(issecurefile, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>

Return Values

This function returns TRUE if the LOB locator passed to it is for a SecureFile LOB. It returns FALSE otherwise.

93.9.35 ISTEMPORTARY Functions

This function determines whether a LOB instance is temporary.

Syntax

DBMS_LOB.ISTEMPORTARY(
  lob_loc IN BLOB)
RETURN INTEGER;

DBMS_LOB.ISTEMPORTARY(
  lob_loc IN CLOB CHARACTER SET ANY_CS)
RETURN INTEGER;

Pragmas

PRAGMA RESTRICT_REFERENCES(istemporary, WNDS, RNDS, WNPS, RNPS);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
</tbody>
</table>
Return Values
The return value is 1 if the LOB is temporary and exists; 0 if the LOB is not temporary or does not exist; NULL if the given locator is NULL.

Usage Notes
When you free a Temporary LOB with FREETEMPORARY, the LOB locator is not set to NULL. Consequently, ISTEMPORARY will return 0 for a locator that has been freed but not explicitly reset to NULL.

See Also:
Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure

93.9.36 LOADBLOBFROMFILE Procedure
This procedure loads data from BFILE to internal BLOB. This achieves the same outcome as LOADFROMFILE, and returns the new offsets.

Syntax
DBMS_LOB.LOADBLOBFROMFILE (  
dest_lob    IN OUT NOCOPY BLOB,  
src_bfile   IN            BFILE,  
amount      IN            INTEGER,  
dest_offset IN OUT        INTEGER,  
src_offset  IN OUT        INTEGER);  

Parameters

Table 93-74  LOADBLOBFROMFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>BLOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_bfile</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE. You can also use DBMS_LOB.LOBMAXSIZE to load until the end of the BFILE.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in bytes in the destination BLOB (origin: 1) for the start of the write. (OUT) New offset in bytes in the destination BLOB right after the end of this write, which is also where the next write should begin.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.</td>
</tr>
</tbody>
</table>
Usage Notes

- You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is in bytes for BLOBs.
- If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.
- There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is `LOBMAXSIZE` which you can specify to continue loading until the end of the BFILE is reached).
- It is not mandatory that you wrap the LOB operation inside the `OPEN/CLOSE` operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.
- If you do not wrap the LOB operation inside the `OPEN/CLOSE`, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.
- `LOADFROMFILE` gets the destination LOB prior to the load unless the load covers the entire LOB.

Constants and Defaults

There is no easy way to omit parameters. You must either declare a variable for `IN/OUT` parameter or provide a default value for the `IN` parameter. Here is a summary of the constants and the defaults that can be used.

<table>
<thead>
<tr>
<th>Table 93-75</th>
<th>Suggested Values of the Parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
<td>Default Value</td>
</tr>
<tr>
<td>amount</td>
<td><code>DBMS_LOB.LOBMAXSIZE</code> (IN)</td>
</tr>
<tr>
<td>dest_offset</td>
<td>1 (IN)</td>
</tr>
<tr>
<td>src_offset</td>
<td>1 (IN)</td>
</tr>
</tbody>
</table>

Constants defined in `DBMSLOB.SQL`

`lobmaxsize` := `DBMS_LOB.LOBMAXSIZE`;

Exceptions

<table>
<thead>
<tr>
<th>Table 93-76</th>
<th>LOADBLOBFROMFILE Procedure Exceptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Exception</td>
<td>Description</td>
</tr>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
</tbody>
</table>
### Table 93-76 (Cont.) LOADBLOBFROMFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:&lt;br&gt;- src_offset or dest_offset &lt; 1.&lt;br&gt;- src_offset or dest_offset &gt; LOBMAXSIZE.&lt;br&gt;- amount &lt; 1.&lt;br&gt;- amount &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the BLOB</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Database SecureFiles and Large Objects Developer’s Guide* for additional details on usage of this procedure.

### 93.9.37 LOADCLOBFROMFILE Procedure

This procedure loads data from a BFILE to an internal CLOB/NCLOB with necessary character set conversion and returns the new offsets.

**Syntax**

```sql
DBMS_LOB.LOADCLOBFROMFILE (  
  dest_lob IN OUT NOCOPY NOCOPY CLOB CHARACTER SET ANY_CS,  
  src_bfile IN BFILE,  
  amount IN INTEGER,  
  dest_offset IN OUT INTEGER,  
  src_offset IN OUT INTEGER,  
  bfile_csid IN NUMBER,  
  lang_context IN OUT INTEGER,  
  warning OUT INTEGER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>CLOB/NCLOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_bfile</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE. Use DBMS_LOB.LOBMAXSIZE of load until the end of the BFILE.</td>
</tr>
</tbody>
</table>
Table 93-77 (Cont.) LOADCLOBFROMFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_offset</td>
<td>(IN) Offset in characters in the destination CLOB (origin: 1) for the start of the write. (OUT) The new offset in characters right after the end of this load, which is also where the next load should start. It always points to the beginning of the first complete character after the end of load. If the last character is not complete, offset goes back to the beginning of the partial character.</td>
</tr>
<tr>
<td>src_offset</td>
<td>(IN) Offset in bytes in the source BFILE (origin: 1) for the start of the read. (OUT) Offset in bytes in the source BFILE right after the end of this read, which is also where the next read should begin.</td>
</tr>
<tr>
<td>bfile_csid</td>
<td>Character set id of the source (BFILE) file.</td>
</tr>
<tr>
<td>lang_context</td>
<td>(IN) Language context, such as shift status, for the current load. (OUT) The language context at the time when the current load stopped, and what the next load should be using if continuing loading from the same source. This information is returned to the user so that they can use it for the continuous load without losing or misinterpreting any source data. For the very first load or if do not care, simply use the default 0. The details of this language context is hidden from the user. One does not need to know what it is or what's in it in order to make the call.</td>
</tr>
<tr>
<td>warning</td>
<td>(OUT) Warning message. This indicates something abnormal happened during the loading. It may or may not be caused by the user's mistake. The loading is completed as required, and it's up to the user to check the warning message. Currently, the only possible warning is the inconvertible character. This happens when the character in the source cannot be properly converted to a character in destination, and the default replacement character (for example, &quot;?&quot; ) is used in place. The message is defined the constant value DBMS_LOB.WARN_INCONVERTIBLE_CHAR.</td>
</tr>
</tbody>
</table>

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The amount and src_offset, because they refer to the BFILE, are in terms of bytes, and the dest_offset is in characters for CLOBs.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination CLOB. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE (unless the amount specified is LOBMAXSIZE which you can specify to continue loading until the end of the BFILE is reached).

Note the following requirements:

- The destination character set is always the same as the database character set in the case of CLOB and national character set in the case of NCLOB.
• \texttt{csid=0} indicates the default behavior that uses database \texttt{csid} for CLOB and national \texttt{csid} for NCLOB in the place of source \texttt{csid}. Conversion is still necessary if it is of varying width.

• It is not mandatory that you wrap the LOB operation inside the \texttt{OPEN/CLOSE} operations. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the \texttt{OPEN/CLOSE}, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the \texttt{OPEN} or \texttt{CLOSE} statement.

The source \texttt{BFILE} can contain data in the Unicode character set. The Unicode standard defines many encoding schemes that provide mappings from Unicode characters to sequences of bytes. \textbf{Table 93-78} lists Unicode encodings schemes supported by this subprogram.

\begin{table}[h]
\centering
\caption{Supported Unicode Encoding Schemes}
\begin{tabular}{|l|l|l|}
\hline
Encoding Scheme & Oracle Name & \texttt{bfile}\_\texttt{csid} Value \\
\hline
UTF-8 & AL32UTF8 & 873 \\
UTF-16BE & AL16UTF16 & 2000 \\
UTF-16LE & AL16UTF16LE & 2002 \\
CESU-8 & UTF8 & 871 \\
UTF-EBCDIC & UTF8 & 872 \\
UTF-16 & UTF16 & 1000 \\
\hline
\end{tabular}
\end{table}

All three UTF-16 encoding schemes encode Unicode characters as 2-byte unsigned integers. Integers can be stored in big-endian or in little-endian byte order. The UTF-16BE encoding scheme defines big-endian data. The UTF-16LE scheme defines little-endian data. The UTF-16 scheme requires that the source \texttt{BFILE} contains the Byte Order Mark (BOM) character in the first two bytes to define the byte order. The BOM code is \texttt{0xFEFF}. If the code is stored as \texttt{\{0xFE,0xFF\}}, the data is interpreted as big-endian. If it is stored as \texttt{\{0xFF,0xFE\}}, the data is interpreted as little-endian.

In UTF-8 and in CESU-8 encodings the Byte Order Mark is stored as \texttt{\{0xEF,0xBB,0xBF\}}. With any of the Unicode encodings, the corresponding BOM sequence at the beginning of the file is recognized and not loaded into the destination LOB.

\section*{Constants}
Here is a summary of the constants and the suggested values that can be used.

\begin{table}[h]
\centering
\caption{Suggested Values of the \texttt{LOADCLOBFROMFILE} Parameter}
\begin{tabular}{|l|l|l|}
\hline
Parameter & Suggested Value & Description \\
\hline
\texttt{amount} & \texttt{DBMS\_LOB\_LOBMAXSIZE (IN)} & Load the entire file \\
\texttt{dest\_offset} & 1 (IN) & start from the beginning \\
\hline
\end{tabular}
\end{table}

93.9.38 LOADFROMFILE Procedure

This deprecated procedure copies all, or a part of, a source external LOB (BFILE) to a destination internal LOB.

Note:

This procedure has been deprecated starting in Oracle Database 12c release 12.2.
Syntax

```sql
DBMS_LOB.LOADFROMFILE (
    dest_lob    IN OUT NOCOPY BLOB,
    src_file    IN            BFILE,
    amount      IN            INTEGER,
    dest_offset IN            INTEGER  := 1,
    src_offset  IN            INTEGER  := 1);
```

Parameters

### Table 93-81  LOADFROMFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dest_lob</td>
<td>LOB locator of the target for the load.</td>
</tr>
<tr>
<td>src_file</td>
<td>BFILE locator of the source for the load.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes to load from the BFILE.</td>
</tr>
<tr>
<td>dest_offset</td>
<td>Offset in bytes or characters in the destination LOB (origin: 1) for the start of the load.</td>
</tr>
<tr>
<td>src_offset</td>
<td>Offset in bytes in the source BFILE (origin: 1) for the start of the load.</td>
</tr>
</tbody>
</table>

Usage Notes

You can specify the offsets for both the source and destination LOBs, and the number of bytes to copy from the source BFILE. The `amount` and `src_offset`, because they refer to the BFILE, are in terms of bytes, and the `dest_offset` is either in bytes or characters for BLOBs and CLOBs respectively.

> **Note:**

The input BFILE must have been opened prior to using this procedure. No character set conversions are performed implicitly when binary BFILE data is loaded into a CLOB. The BFILE data must already be in the same character set as the CLOB in the database. No error checking is performed to verify this.

If the offset you specify in the destination LOB is beyond the end of the data currently in this LOB, then zero-byte fillers or spaces are inserted in the destination BLOB or CLOB respectively. If the offset is less than the current length of the destination LOB, then existing data is overwritten.

There is an error if the input amount plus offset exceeds the length of the data in the BFILE.
Note:

If the character set is varying width, UTF-8 for example, the LOB value is stored in the fixed-width UCS2 format. Therefore, if you are using `DBMS_LOB.LOADFROMFILE`, the data in the BFILE should be in the UCS2 character set instead of the UTF-8 character set. However, you should use `sql*loader` instead of `LOADFROMFILE` to load data into a CLOB or NCLOB because `sql*loader` provides the necessary character set conversions.

It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the `OPEN` or `CLOSE` statement.

Exceptions

Table 93-82 LOADFROMFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of the input parameters are NULL or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- <code>src_offset</code> or <code>dest_offset</code> &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- <code>src_offset</code> or <code>dest_offset</code> &gt; LOBMAXSIZE.</td>
</tr>
<tr>
<td></td>
<td>- <code>amount</code> &lt; 1.</td>
</tr>
<tr>
<td></td>
<td>- <code>amount</code> &gt; LOBMAXSIZE.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure.

93.9.39 MOVE_TO_DBFS_LINK Procedures

This procedure archives the specified LOB data (from the database) into the DBFS HSM Store.

Syntax

```sql
DBMS_LOB.MOVE_TO_DBFS_LINK (  
  lob_loc IN OUT BLOB,  
  storage_path IN VARCHAR2(dbfs_link_path_max_size),
)```
flags IN BINARY INTEGER DEFAULT DBFS_LINK_NOCACHE);

DBMS_LOB.MOVE_TO_DBFS_LINK (    
lob_loc IN OUT CLOB CHARACTER SET ANY_CS,    
storage_path IN VARCHAR2(dbfs_link_path_max_size),    
flags IN BINARY INTEGER DEFAULT DBFS_LINK_NOCACHE);

Parameters

Table 93-83 MOVE_TO_DBFS_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be archived</td>
</tr>
<tr>
<td>storage_path</td>
<td>Path where the LOB will be stored</td>
</tr>
<tr>
<td>flags</td>
<td>Either DBFS_LINK_CACHE or DBFS_LINK_NOCACHE. If DBFS_LINK_CACHE is specified, the LOB data continues to be stored in the RDBMS as well as being written to the DBFS store. DBFS_LINK_NOCACHE specifies that the LOB data should be deleted from the RDBMS once written to the DBFS.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-84 MOVE_TO_DBFS_LINK Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
</tbody>
</table>

Usage Notes

- If the LOB is already archived, the procedure silently returns as if the put was successful. In that case, if DBFS_LINK_NOCACHE is specified, or flags is defaulted, the LOB data is removed from the RDBMS.
- Calling this procedure multiple times on the same LOB with the same flags has no effect.
- Calling the procedure on a LOB that is already archived causes the LOB to be cached (DBFS_LINK_CACHE) or removed (DBFS_LINK_NOCACHE) according to the flag setting.

93.9.40 OPEN Procedures

This procedure opens a LOB, internal or external, in the indicated mode. Valid modes include read-only, and read/write.

Syntax

DBMS_LOB.OPEN (    
lob_loc IN OUT NOCOPY BLOB,    
open_mode IN BINARY_INTEGER);

DBMS_LOB.OPEN (    
lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,    
open_mode IN BINARY_INTEGER);

DBMS_LOB.OPEN (    
lob_loc IN OUT NOCOPY BLOB CHARACTER SET ANY_CS,    
open_mode IN BINARY_INTEGER);
Parameters

Table 93-85  OPEN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB locator. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>open_mode</td>
<td>Mode in which to open. For BLOB and CLOB types, the mode can be either: LOB_READONLY or LOB_READWRITE. For BFILE types, the mode must be FILE_READONLY.</td>
</tr>
</tbody>
</table>

Usage Notes

Note: If the LOB was opened in read-only mode, and if you try to write to the LOB, then an error is returned. BFILE can only be opened with read-only mode.

OPEN requires a round-trip to the server for both internal and external LOBs. For internal LOBs, OPEN triggers other code that relies on the OPEN call. For external LOBs (BFILES), OPEN requires a round-trip because the actual operating system file on the server side is being opened.

It is not mandatory that you wrap all LOB operations inside the Open/Close interfaces. However, if you open a LOB, you must close it before you commit the transaction; an error is produced if you do not. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

It is an error to commit the transaction before closing all opened LOBs that were opened by the transaction. When the error is returned, the openness of the open LOBs is discarded, but the transaction is successfully committed. Hence, all the changes made to the LOB and non-LOB data in the transaction are committed, but the domain and function-based indexes are not updated. If this happens, you should rebuild the functional and domain indexes on the LOB column.

See Also:

Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure.
93.9.41 READ Procedures

This procedure reads a piece of a LOB, and returns the specified amount into the buffer parameter, starting from an absolute offset from the beginning of the LOB.

The number of bytes or characters actually read is returned in the amount parameter. If the input offset points past the End of LOB, then amount is set to 0, and a NO_DATA_FOUND exception is raised.

Syntax

```
DBMS_LOB.READ (  
  lob_loc IN BLOB,  
  amount IN OUT NOCOPY INTEGER,  
  offset IN INTEGER,  
  buffer OUT RAW);
```

```
DBMS_LOB.READ (  
  lob_loc IN CLOB CHARACTER SET ANY_CS,  
  amount IN OUT NOCOPY INTEGER,  
  offset IN INTEGER,  
  buffer OUT VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

```
DBMS_LOB.READ (  
  file_loc IN BFILE,  
  amount IN OUT NOCOPY INTEGER,  
  offset IN INTEGER,  
  buffer OUT RAW);
```

Parameters

**Table 93-86 READ Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be read. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>file_loc</td>
<td>The file locator for the LOB to be examined.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to read, or number that were read.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).</td>
</tr>
<tr>
<td>buffer</td>
<td>Output buffer for the read operation.</td>
</tr>
</tbody>
</table>

Exceptions

**Table 93-87 lists exceptions that apply to any LOB instance. Table 93-88 lists exceptions that apply only to BFILES.**

**Table 93-87 READ Procedure Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of lob_loc, amount, or offset parameters are NULL.</td>
</tr>
</tbody>
</table>

<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; 32767 bytes (or the character equivalent)</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- offset &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td></td>
<td>- amount is greater, in bytes or characters, than the capacity of buffer.</td>
</tr>
<tr>
<td>NO_DATA_FOUND</td>
<td>End of the LOB is reached, and there are no more bytes or characters to read from the LOB: amount has a value of 0.</td>
</tr>
</tbody>
</table>

Table 93-88  READ Procedure Exceptions for BFILEs

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File is not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB.</td>
</tr>
</tbody>
</table>

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling DBMS_LOB.READ from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

- READ gets the LOB, if necessary, before the read.

- If the LOB is a DBFS LINK, data is streamed from DBFS, if possible, otherwise an exception is thrown.

See Also:

Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure
93.9.42 SET_DBFS_LINK Procedures

This function links the specified SecureFile to the specified path name. It does not copy the data to the path.

Syntax

```sql
DBMS_LOB.SET_DBFS_LINK (   lob_loc        IN OUT BLOB,   archive_id     IN     RAW(1024));
```

```sql
DBMS_LOB.SET_DBFS_LINK(   lob_loc_dst    IN OUT CLOB CHARACTER SET ANY_CS,   archive_id     IN     RAW(1024));
```

Parameters

Table 93-89  SET_DBFS_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB for which to store the reference value</td>
</tr>
<tr>
<td>archive_id</td>
<td>Archive ID as returned by calling either of the GET_DBFS_LINK Functions</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-90  SET_DBFS_LINK Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
</tbody>
</table>

93.9.43 SETCONTENTTYPE Procedure

This procedure sets the content type string for the data in the LOB.

Syntax

```sql
DBMS_LOB.SETCONTENTTYPE (   lob_loc      IN OUT NOCOPY BLOB,   contenttype  IN            VARCHAR2);
```

```sql
DBMS_LOB.SETCONTENTTYPE (   lob_loc     IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,   contenttype IN            VARCHAR2);
```

Parameters

Table 93-91  SETCONTENTTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>LOB to be assigned the content type</td>
</tr>
</tbody>
</table>
Table 93-91 (Cont.) SETCONTENTTYPE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>contenttype</td>
<td>String to be assigned</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-92 SETCONTENTTYPE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>lob_loc is not a SECUREFILE</td>
</tr>
</tbody>
</table>

Usage Notes

To clear an existing content type associated with a SECUREFILE, invoke SETCONTENTTYPE with contenttype set to empty string.

93.9.44 SETOPTIONS Procedures

This procedure enables/disables compression and deduplication on a per-LOB basis, overriding the default LOB column settings.

Syntax

```sql
DBMS_LOB.SETOPTIONS ( 
  lob_loc IN BLOB,  
  option_types IN PLS_INTEGER,  
  options IN PLS_INTEGER);
```

```sql
DBMS_LOB.SETOPTIONS ( 
  lob_loc IN CLOB CHARACTER SET ANY_CS,  
  option_types IN PLS_INTEGER,  
  options IN PLS_INTEGER);
```

Parameters

Table 93-93 SETOPTIONS Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be examined. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>option_type</td>
<td>See Table 93-2</td>
</tr>
<tr>
<td>options</td>
<td>See Table 93-3</td>
</tr>
</tbody>
</table>
Exceptions

Table 93-94 SETOPTIONS Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_BADLOB</td>
<td>Unsupported object type for the operation</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>A parameter value was invalid</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform operation during a query</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled</td>
</tr>
</tbody>
</table>

Usage Notes

- DBMS_LOB.SETOPTIONS cannot be used to enable or disable encryption on individual LOBs.
- You cannot turn the compression or deduplication features on or off for a SecureFile column if they were not turned when the table was created.

  The GETOPTIONS Functions and SETOPTIONS Procedures work on individual SecureFiles. You can turn off compression or deduplication on a particular SecureFiles LOB and turn on them on, if they have already been turned off by SETOPTIONS.
- This call incurs a round-trip to the server to make the changes persistent.

93.9.45 SUBSTR Functions

This function returns amount bytes or characters of a LOB, starting from an absolute offset from the beginning of the LOB.

For fixed-width n-byte CLOBs, if the input amount for SUBSTR is greater than \((32767/n)\), then SUBSTR returns a character buffer of length \((32767/n)\), or the length of the CLOB, whichever is lesser. For CLOBs in a varying-width character set, \(n\) is the maximum byte-width used for characters in the CLOB.

Syntax

```sql
DBMS_LOB.SUBSTR ( lob_loc     IN    BLOB,             amount      IN    INTEGER := 32767,      offset      IN    INTEGER := 1) RETURN RAW;

DBMS_LOB.SUBSTR ( lob_loc     IN    CLOB   CHARACTER SET ANY_CS, amount      IN    INTEGER := 32767, offset      IN    INTEGER := 1) RETURN VARCHAR2 CHARACTER SET lob_loc%CHARSET;

DBMS_LOB.SUBSTR ( file_loc     IN    BFILE, amount      IN    INTEGER := 32767, offset      IN    INTEGER := 1) RETURN RAW;
```
Pragmas

pragma restrict_references(SUBSTR, WNDS, WNPS, RNDS, RNPS);

Parameters

Table 93-95    SUBSTR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the LOB to be read. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>file_loc</td>
<td>The file locator for the LOB to be examined.</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to be read.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset in bytes (for BLOBs) or characters (for CLOBs) from the start of the LOB (origin: 1).</td>
</tr>
</tbody>
</table>

Return Values

Table 93-96    SUBSTR Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW</td>
<td>Function overloading that has a BLOB or BFILE in parameter.</td>
</tr>
<tr>
<td>VARCHAR2</td>
<td>CLOB version.</td>
</tr>
<tr>
<td>NULL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- any input parameter is NULL</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; 32767</td>
</tr>
<tr>
<td></td>
<td>- offset &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- offset &gt; LOBMAXSIZE</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-97    SUBSTR Function Exceptions for BFILE operations

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNOPENED_FILE</td>
<td>File is not opened using the input locator.</td>
</tr>
<tr>
<td>NOEXIST_DIRECTORY</td>
<td>Directory does not exist.</td>
</tr>
<tr>
<td>NOPRIV_DIRECTORY</td>
<td>You do not have privileges for the directory.</td>
</tr>
<tr>
<td>INVALID_DIRECTORY</td>
<td>Directory has been invalidated after the file was opened.</td>
</tr>
<tr>
<td>INVALID_OPERATION</td>
<td>File does not exist, or you do not have access privileges on the file.</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>

Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must
contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

• When calling DBMS_LOB.SUBSTR from the client (for example, in a BEGIN/END block from within SQL*Plus), the returned buffer contains data in the client's character set. The database converts the LOB value from the server's character set to the client's character set before it returns the buffer to the user.

• DBMS_LOB.SUBSTR will return 8191 or more characters based on the characters stored in the LOBs. If all characters are not returned as a consequence of the character byte size exceeding the available buffer, the user should either call DBMS_LOB.SUBSTR with a new offset to read the remaining characters, or call the subprogram on loop until all the data is extracted.

• SUBSTR gets the LOB, if necessary, before read.

• If the LOB is a DBFS Link, the data is streamed from DBFS, if possible, otherwise, an exception is thrown.

See Also:

• "INSTR Functions"
• “READ Procedures”
• Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure

93.9.46 TRIM Procedures

This procedure trims the value of the internal LOB to the length you specify in the newlen parameter.

Specify the length in bytes for BLOBs, and specify the length in characters for CLOBs.

Note:

The TRIM procedure decreases the length of the LOB to the value specified in the newlen parameter.

If you attempt to TRIM an empty LOB, then nothing occurs, and TRIM returns no error. If the new length that you specify in newlen is greater than the size of the LOB, then an exception is raised.

Syntax

DBMS_LOB.TRIM (lob_loc IN OUT NOCOPY BLOB,
newlen IN INTEGER);

DBMS_LOB.TRIM (lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
newlen IN INTEGER);
Parameters

Table 93-98 TRIM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the internal LOB whose length is to be trimmed. For more information, see Operational Notes.</td>
</tr>
<tr>
<td>newlen</td>
<td>New, trimmed length of the LOB value in bytes for BLOBs or characters for CLOBs.</td>
</tr>
</tbody>
</table>

Exceptions

Table 93-99 TRIM Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>lob_loc is NULL.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- new_len &lt; 0</td>
</tr>
<tr>
<td></td>
<td>- new_len &gt; LOBMAXSIZE</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform a LOB write inside a query or PDML parallel execution server</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>

Usage Notes

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN OR CLOSE statement.

- TRIM gets the LOB, if necessary, before altering the length of the LOB, unless the new length specified is '0'

See Also:

- "ERASE Procedures"
- "WRITEAPPEND Procedures"
- Oracle Database SecureFiles and Large Objects Developer’s Guide for additional details on usage of this procedure
93.9.47 WRITE Procedures

This procedure writes a specified amount of data into an internal LOB, starting from an absolute offset from the beginning of the LOB. The data is written from the buffer parameter.

WRITE replaces (overwrites) any data that already exists in the LOB at the offset, for the length you specify.

Syntax

```sql
DBMS_LOB.WRITE (  
   lob_loc  IN OUT NOCOPY  BLOB,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             RAW);

DBMS_LOB.WRITE (  
   lob_loc  IN OUT  NOCOPY CLOB   CHARACTER SET ANY_CS,
   amount   IN             INTEGER,
   offset   IN             INTEGER,
   buffer   IN             VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

</tr>
</thead>
<tbody>
<tr>
<td>SECUREFILE_OUTOFBOUNDS</td>
<td>Attempted to perform a write operation past the end of a LOB having FRAGMENT_.* on it</td>
</tr>
</tbody>
</table>

Usage Notes

- There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer is written to the LOB. If the offset you specify is beyond the end of the data currently in the LOB, then zero-byte fillers or spaces are inserted in the BLOB or CLOB respectively.

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling DBMS_LOB.WRITE from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- WRITE gets the LOB, if necessary, before writing the LOB, unless the write is specified to overwrite the entire LOB.

See Also:

- "APPEND Procedures"
- "COPY Procedures"
- Oracle Database SecureFiles and Large Objects Developer's Guide for additional details on usage of this procedure
93.9.48 WRITEAPPEND Procedures

This procedure writes a specified amount of data to the end of an internal LOB. The data is written from the buffer parameter.

Syntax

```
DBMS_LOB.WRITEAPPEND (    lob_loc IN OUT NOCOPY BLOB,
                      amount IN            INTEGER,
                      buffer IN            RAW);
```

```
DBMS_LOB.WRITEAPPEND (    lob_loc IN OUT NOCOPY CLOB CHARACTER SET ANY_CS,
                      amount IN            INTEGER,
                      buffer IN            VARCHAR2 CHARACTER SET lob_loc%CHARSET);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lob_loc</td>
<td>Locator for the internal LOB to be written to. For more information, see Operational Notes</td>
</tr>
<tr>
<td>amount</td>
<td>Number of bytes (for BLOBs) or characters (for CLOBs) to write</td>
</tr>
<tr>
<td>buffer</td>
<td>Input buffer for the write</td>
</tr>
</tbody>
</table>

Usage Notes

There is an error if the input amount is more than the data in the buffer. If the input amount is less than the data in the buffer, then only amount bytes or characters from the buffer are written to the end of the LOB.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALUE_ERROR</td>
<td>Any of lob_loc, amount, or offset parameters are NULL, out of range, or INVALID.</td>
</tr>
<tr>
<td>INVALID_ARGVAL</td>
<td>Either:</td>
</tr>
<tr>
<td></td>
<td>- amount &lt; 1</td>
</tr>
<tr>
<td></td>
<td>- amount &gt; 32767 bytes (or the character equivalent)</td>
</tr>
<tr>
<td>QUERY_WRITE</td>
<td>Cannot perform a LOB write inside a query or PDML parallel execution server</td>
</tr>
<tr>
<td>BUFFERING_ENABLED</td>
<td>Cannot perform operation with LOB buffering enabled if buffering is enabled on the LOB</td>
</tr>
</tbody>
</table>
Usage Notes

- The form of the VARCHAR2 buffer must match the form of the CLOB parameter. In other words, if the input LOB parameter is of type NCLOB, then the buffer must contain NCHAR data. Conversely, if the input LOB parameter is of type CLOB, then the buffer must contain CHAR data.

- When calling DBMS_LOB.WRITEAPPEND from the client (for example, in a BEGIN/END block from within SQL*Plus), the buffer must contain data in the client's character set. The database converts the client-side buffer to the server's character set before it writes the buffer data to the LOB.

- It is not mandatory that you wrap the LOB operation inside the Open/Close interfaces. If you did not open the LOB before performing the operation, the functional and domain indexes on the LOB column are updated during the call. However, if you opened the LOB before performing the operation, you must close it before you commit the transaction. When an internal LOB is closed, it updates the functional and domain indexes on the LOB column.

- If you do not wrap the LOB operation inside the Open/Close API, the functional and domain indexes are updated each time you write to the LOB. This can adversely affect performance. Therefore, it is recommended that you enclose write operations to the LOB within the OPEN or CLOSE statement.

- WRITEAPPEND gets the LOB, if necessary, before appending to the LOB.

The DBMS_LOCK package provides an interface to Oracle Lock Management services. You can request a lock of a specific mode, give it a unique name recognizable in another procedure in the same or another instance, change the lock mode, and release it.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Rules and Limits
- Operational Notes
- Summary of DBMS_LOCK Subprograms

See Also:
For more information, and an example of how to use the DBMS_LOCK package, Oracle Database Development Guide

94.1 DBMS_LOCK Overview

The DBMS_LOCK package has many beneficial uses. These uses include the following:

- Providing exclusive access to a device, such as a terminal
- Providing application-level enforcement of read locks
- Detecting when a lock is released and cleanup after the application
- Synchronizing applications and enforcing sequential processing

94.2 DBMS_LOCK Security Model

There might be operating system-specific limits on the maximum number of total locks available. This must be considered when using locks or making this package available to other users. Consider granting the EXECUTE privilege only to specific users or roles.

A better alternative would be to create a cover package limiting the number of locks used and grant EXECUTE privilege to specific users. An example of a cover package is documented in the DBMS_LOCK.SQL package specification file. The abbreviations for these locks as they appear in Enterprise Manager monitors are in parentheses.
94.3 DBMS_LOCK Constants

The DBMS_LOCK package includes several constants to use when specifying parameter values.

These constants are shown in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Alternate Name(s)</th>
<th>Type</th>
<th>Value</th>
<th>OEM Abbreviation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NL_MODE</td>
<td>Null</td>
<td>INTEGER</td>
<td>1</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>SS_MODE</td>
<td>Sub Shared</td>
<td>INTEGER</td>
<td>2</td>
<td>ULRS</td>
<td>This can be used on an aggregate object to indicate that share locks are being acquired on subparts of the object.</td>
</tr>
<tr>
<td>SX_MODE</td>
<td>Sub eXclusive • Row Exclusive Mode</td>
<td>INTEGER</td>
<td>3</td>
<td>ULRX</td>
<td>This can be used on an aggregate object to indicate that exclusive locks are being acquired on sub-parts of the object.</td>
</tr>
<tr>
<td>S_MODE</td>
<td>• Shared • Row Exclusive Mode • Intended Exclusive</td>
<td>INTEGER</td>
<td>4</td>
<td>ULRSX</td>
<td>-</td>
</tr>
<tr>
<td>SSX_MODE</td>
<td>• Shared Sub eXclusive • Share Row Exclusive Mode</td>
<td>INTEGER</td>
<td>5</td>
<td>-</td>
<td>This indicates that the entire aggregate object has a share lock, but some of the sub-parts may additionally have exclusive locks.</td>
</tr>
<tr>
<td>X_MODE</td>
<td>Exclusive</td>
<td>INTEGER</td>
<td>6</td>
<td>ULX</td>
<td>-</td>
</tr>
</tbody>
</table>

These are the various lock modes (nl -> "NuL1", ss -> "Sub Shared", sx -> "Sub eXclusive", s -> "Shared", ssx -> "Shared Sub eXclusive", x -> "eXclusive").

94.4 DBMS_LOCK. Rules and Limits

When another process holds "held", an attempt to get "get" succeeds or fails, based on the held mode and type of get.

The following table describes the results:

<table>
<thead>
<tr>
<th>HELD MODE</th>
<th>GET NL</th>
<th>GET SS</th>
<th>GET SX</th>
<th>GET S</th>
<th>GET SSX</th>
<th>GET X</th>
</tr>
</thead>
<tbody>
<tr>
<td>NL</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
</tr>
<tr>
<td>SS</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Fail</td>
</tr>
<tr>
<td>SX</td>
<td>Success</td>
<td>Success</td>
<td>Success</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
</tr>
</tbody>
</table>
Table 94-2  (Cont.) Lock Compatibility

<table>
<thead>
<tr>
<th>HELD MODE</th>
<th>GET NL</th>
<th>GET SS</th>
<th>GET SX</th>
<th>GET S</th>
<th>GET SSX</th>
<th>GET X</th>
</tr>
</thead>
<tbody>
<tr>
<td>S</td>
<td>Success</td>
<td>Success</td>
<td>Fail</td>
<td>Success</td>
<td>Fail</td>
<td>Fail</td>
</tr>
<tr>
<td>SSX</td>
<td>Success</td>
<td>Success</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
</tr>
<tr>
<td>X</td>
<td>Success</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
<td>Fail</td>
</tr>
</tbody>
</table>

maxwait constant integer := 32767;

The constant `maxwait` waits forever.

94.5 DBMS_LOCK Operational Notes

User locks never conflict with Oracle locks because they are identified with the prefix "UL". You can view these locks using the Enterprise Manager lock monitor screen or the appropriate fixed views.

User locks are automatically released when a session terminates. The lock identifier is a number in the range of 0 to 1073741823.

Because a reserved user lock is the same as an Oracle lock, it has all the functionality of an Oracle lock, such as deadlock detection. Be certain that any user locks used in distributed transactions are released upon `COMMIT`, or an undetected deadlock may occur.

`DBMS_LOCK` is most efficient with a limit of a few hundred locks for each session. Oracle strongly recommends that you develop a standard convention for using these locks in order to avoid conflicts among procedures trying to use the same locks. For example, include your company name as part of your lock names.

94.6 Summary of DBMS_LOCK Subprograms

This table lists the `DBMS_LOCK` subprograms and briefly describes them.

Table 94-3  `DBMS_LOCK` Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ALLOCATE_UNIQUE Procedure</code></td>
<td>Allocates a unique lock ID to a named lock</td>
</tr>
<tr>
<td><code>CONVERT Function</code></td>
<td>Converts a lock from one mode to another</td>
</tr>
<tr>
<td><code>RELEASE Function</code></td>
<td>Releases a lock</td>
</tr>
<tr>
<td><code>REQUEST Function</code></td>
<td>Requests a lock of a specific mode.</td>
</tr>
</tbody>
</table>

94.6.1 ALLOCATE_UNIQUE Procedure

This procedure allocates a unique lock identifier (in the range of 1073741824 to 1999999999) a specified lock name. Lock identifiers are used to enable applications to coordinate their use of locks. This is provided because it may be easier for
applications to coordinate their use of locks based on lock names rather than lock numbers.

Syntax

```
DBMS_LOCK.ALLOCATE_UNIQUE (  
  lockname         IN  VARCHAR2,  
  lockhandle       OUT VARCHAR2,  
  expiration_secs  IN  INTEGER   DEFAULT 864000);
```

Parameters

**Table 94-4  ALLOCATE_UNIQUE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lockname</td>
<td>Name of the lock for which you want to generate a unique ID.</td>
</tr>
<tr>
<td></td>
<td>Do not use lock names beginning with ORA$; these are reserved for products</td>
</tr>
<tr>
<td></td>
<td>supplied by Oracle.</td>
</tr>
<tr>
<td>lockhandle</td>
<td>Returns the handle to the lock ID generated by ALLOCATE_UNIQUE.</td>
</tr>
<tr>
<td></td>
<td>You can use this handle in subsequent calls to REQUEST, CONVERT, and RELEASE.</td>
</tr>
<tr>
<td></td>
<td>A handle is returned instead of the actual lock ID to reduce the chance</td>
</tr>
<tr>
<td></td>
<td>that a programming error accidentally creates an incorrect, but valid, lock</td>
</tr>
<tr>
<td></td>
<td>ID. This provides better isolation between different applications that are</td>
</tr>
<tr>
<td></td>
<td>using this package.</td>
</tr>
<tr>
<td></td>
<td>LOCKHANDLE can be up to VARCHAR2 (128).</td>
</tr>
<tr>
<td></td>
<td>All sessions using a lock handle returned by ALLOCATE_UNIQUE with the same</td>
</tr>
<tr>
<td></td>
<td>lock name are referring to the same lock.</td>
</tr>
<tr>
<td></td>
<td>Therefore, do not pass lock handles from one session to another.</td>
</tr>
<tr>
<td>expiration_secs</td>
<td>Number of seconds to wait after the last ALLOCATE_UNIQUE has been performed</td>
</tr>
<tr>
<td></td>
<td>on a specified lock, before permitting that lock to be deleted from the</td>
</tr>
<tr>
<td></td>
<td>DBMS_LOCK_ALLOCATED table.</td>
</tr>
<tr>
<td></td>
<td>The default waiting period is 10 days. You should not delete locks from the</td>
</tr>
<tr>
<td></td>
<td>table. Subsequent calls to ALLOCATE_UNIQUE may delete expired locks to</td>
</tr>
<tr>
<td></td>
<td>recover space.</td>
</tr>
</tbody>
</table>

Usage Notes

If you choose to identify locks by name, you can use ALLOCATE_UNIQUE to generate a unique lock identification number for these named locks.

The first session to call ALLOCATE_UNIQUE with a new lock name causes a unique lock ID to be generated and stored in the dbms_lock_allocated table. Subsequent calls (usually by other sessions) return the lock ID previously generated.

A lock name is associated with the returned lock ID for at least expiration_secs (defaults to 10 days) past the last call to ALLOCATE_UNIQUE with the specified lock name. After this time, the row in the dbms_lock_allocated table for this lock name may be deleted in order to recover space. ALLOCATE_UNIQUE performs a commit.
WARNING:

Named user locks may be less efficient, because Oracle uses SQL to determine the lock associated with a specified name.

Exceptions

ORA-20000, ORU-10003: Unable to find or insert lock <lockname> into catalog dbms_lock_allocated.

94.6.2 CONVERT Function

This function converts a lock from one mode to another. CONVERT is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

DBMS_LOCK.CONVERT(
    id         IN INTEGER ||
    lockhandle IN VARCHAR2,
    lockmode   IN INTEGER,
    timeout    IN NUMBER DEFAULT MAXWAIT)
RETURN INTEGER;

Parameters

Table 94-5 CONVERT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change</td>
</tr>
<tr>
<td>lockmode</td>
<td>New mode that you want to assign to the specified lock. For the available modes and their associated integer identifiers, see Constants.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds to continue trying to change the lock mode. If the lock cannot be converted within this time period, then the call returns a value of 1 (timeout).</td>
</tr>
</tbody>
</table>

Return Values

Table 94-6 CONVERT Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Timeout</td>
</tr>
<tr>
<td>2</td>
<td>Deadlock</td>
</tr>
<tr>
<td>3</td>
<td>Parameter error</td>
</tr>
</tbody>
</table>
94.6.3 RELEASE Function

This function explicitly releases a lock previously acquired using the REQUEST function.

Locks are automatically released at the end of a session. RELEASE is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.

Syntax

```
DBMS_LOCK.RELEASE (  
   id         IN INTEGER)  
RETURN INTEGER;
```

```
DBMS_LOCK.RELEASE (  
   lockhandle IN VARCHAR2)  
RETURN INTEGER;
```

Parameters

Table 94-7  RELEASE Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by ALLOCATE_UNIQUE, of the lock mode you want to change</td>
</tr>
</tbody>
</table>

Return Values

Table 94-8  RELEASE Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>3</td>
<td>Parameter error</td>
</tr>
<tr>
<td>4</td>
<td>Do not own lock specified by id or lockhandle</td>
</tr>
<tr>
<td>5</td>
<td>Illegal lock handle</td>
</tr>
</tbody>
</table>

94.6.4 REQUEST Function

This function requests a lock with a specified mode.

REQUEST is an overloaded function that accepts either a user-defined lock identifier, or the lock handle returned by the ALLOCATE_UNIQUE procedure.
Syntax

```sql
DBMS_LOCK.REQUEST(
  id                 IN  INTEGER ||
  lockhandle         IN  VARCHAR2,
  lockmode           IN  INTEGER DEFAULT X_MODE,
  timeout            IN  INTEGER DEFAULT MAXWAIT,
  release_on_commit  IN  BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```

The current default values, such as `X_MODE` and `MAXWAIT`, are defined in the `DBMS_LOCK` package specification.

Parameters

**Table 94-9  REQUEST Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id or lockhandle</td>
<td>User assigned lock identifier, from 0 to 1073741823, or the lock handle, returned by <code>ALLOCATE_UNIQUE</code>, of the lock mode you want to change</td>
</tr>
<tr>
<td>lockmode</td>
<td>Mode that you are requesting for the lock.</td>
</tr>
<tr>
<td></td>
<td>For the available modes and their associated integer identifiers, see <code>Constants</code>.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds to continue trying to grant the lock.</td>
</tr>
<tr>
<td></td>
<td>If the lock cannot be granted within this time period, then the call returns a value of 1 (<code>timeout</code>).</td>
</tr>
<tr>
<td>release_on_commit</td>
<td>Set this parameter to TRUE to release the lock on commit or rollback.</td>
</tr>
<tr>
<td></td>
<td>Otherwise, the lock is held until it is explicitly released or until the end of the session.</td>
</tr>
</tbody>
</table>

Return Values

</table>
The `DBMS_LOGMNR` package, one of a set of LogMiner packages, contains the subprograms you use to initialize the LogMiner tool and to begin and end a LogMiner session.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Operational Notes
- Summary of DBMS_LOGMNR Subprograms

See Also:

*Oracle Database Utilities* for information regarding LogMiner.

### 95.1 DBMS_LOGMNR Overview

Oracle LogMiner, which is part of Oracle Database, enables you to query online and archived redo log files through a SQL interface. The `DBMS_LOGMNR` package provides the majority of the tools needed to start and stop LogMiner and specify the redo log files of interest.

All changes made to user data or to the database dictionary are recorded in the Oracle redo log files so that database recovery operations can be performed. You can take advantage of the data recorded in the redo log files to accomplish other tasks, such as:

- Pinpointing when a logical corruption to a database, such as errors made at the application level, may have begun
- Determining what actions you would have to take to perform fine-grained recovery at the transaction level.
- Performance tuning and capacity planning through trend analysis.
- Track any data manipulation language (DML) and data definition language (DDL) statements executed on the database, the order in which they were executed, and who executed them.
95.2 DBMS_LOGMNR Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR package.

95.3 DBMS_LOGMNR Constants

The DBMS_LOGMNR package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGMNR.NEW.

The following table describes the constants for the ADD_LOGFILE options flag in the DBMS_LOGMNR package.

Table 95-1 Constants for ADD_LOGFILE Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW</td>
<td>Implicitly calls the DBMS_LOGMNR.END_LOGMNR procedure to end the current LogMiner session and then creates a new session. The new session starts a new list of redo log files to be analyzed, beginning with the redo log file you specify.</td>
</tr>
<tr>
<td>ADDFILE</td>
<td>Adds the specified redo log file to the list of redo log files to be analyzed. Any attempt to add a duplicate file raises an exception (ORA-01289). This is the default if no options flag is specified.</td>
</tr>
</tbody>
</table>

Table 95-2 describes the constants for the START_LOGMNR options flag in the DBMS_LOGMNR package.

Table 95-2 Constants for START_LOGMNR Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMITTED_DATA_ONLY</td>
<td>If set, DML statements corresponding to committed transactions are returned. DML statements corresponding to a committed transaction are grouped together. Transactions are returned in their commit order. Transactions that are rolled back or in-progress are filtered out, as are internal redo records (those related to index operations, management, and so on). If this option is not set, all rows for all transactions (committed, rolled back, and in-progress) are returned in the order in which they are found in the redo logs (in order of SCN values).</td>
</tr>
</tbody>
</table>
Table 95-2 (Cont.) Constants for START_LOGMNR Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKIP_CORRUPTION</td>
<td>Directs a select operation on the V$LOGMNR_CONTENTS view to skip any corruptions in the redo log file being analyzed and continue processing. This option works only when a block in the redo log file (and not the header of the redo log file) is corrupt. You should check the INFO column in the V$LOGMNR_CONTENTS view to determine the corrupt blocks skipped by LogMiner. When a corruption in the redo log file is skipped, the OPERATION column contains the value CORRUPTED_BLOCKS, and the STATUS column contains the value 1343.</td>
</tr>
<tr>
<td>DDL_DICT_TRACKING</td>
<td>If the LogMiner dictionary in use is a flat file or in the redo log files, LogMiner updates its internal dictionary if a DDL event occurs. This ensures that correct SQL_REDO and SQL_UNDO information is maintained for objects that are modified after the LogMiner internal dictionary is built. The database to which LogMiner is connected must be open. This option cannot be used in conjunction with the DICT_FROM_ONLINE_CATALOG option and cannot be used when the LogMiner dictionary being used is one that was extracted to a flat file prior to Oracle9i.</td>
</tr>
<tr>
<td>DICT_FROM_ONLINE_CATALOG</td>
<td>Directs LogMiner to use the current online database dictionary rather than a LogMiner dictionary contained in a flat file or in the redo log files being analyzed. This option cannot be used in conjunction with the DDL_DICT_TRACKING option. The database to which LogMiner is connected must be the same one that generated the redo log files. Expect to see a value of 2 in the STATUS column of the V$LOGMNR_CONTENTS view if the table definition in the database does not match the table definition in the redo log file.</td>
</tr>
<tr>
<td>DICT_FROM_REDO_LOGS</td>
<td>If set, LogMiner expects to find a LogMiner dictionary in the redo log files that were specified. The redo log files are specified with the DBMS_LOGMNR.ADD_LOGFILE procedure or with the DBMS_LOGMNR.START_LOGMNR procedure with the CONTINUOUS_MINE option.</td>
</tr>
<tr>
<td>NO_SQL_DELIMITER</td>
<td>If set, the SQL delimiter (a semicolon) is not placed at the end of reconstructed SQL statements. This is helpful for applications that open a cursor and then execute the reconstructed statements.</td>
</tr>
<tr>
<td>NO_ROWID_IN_STMT</td>
<td>If set, the ROWID clause is not included in the reconstructed SQL statements. The redo log file may already contain logically unique identifiers for modified rows if supplemental logging is enabled. When using this option, you must be sure that supplemental logging was enabled in the source database at the appropriate level and that no duplicate rows exist in the tables of interest. LogMiner does not make any guarantee regarding the uniqueness of logical row identifiers.</td>
</tr>
<tr>
<td>PRINTPRETTY_SQL</td>
<td>If set, LogMiner formats the reconstructed SQL statements for ease of reading. These reconstructed SQL statements are not executable.</td>
</tr>
</tbody>
</table>
### Table 95-2 (Cont.) Constants for START_LOGMNR Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTINUOUS_MINE</td>
<td>Directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You only need to specify the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. You are not required to specify any redo log files explicitly. LogMiner automatically adds and mines the (archived and online) redo log files for the data of interest. This option requires that LogMiner is connected to the same database instance that is generating the redo log files. It also requires that the database be mounted and that archiving be enabled.</td>
</tr>
</tbody>
</table>

**Note:**
As of Oracle Database 12c Release 2 (12.2.0.1), the LogMiner CONTINUOUS_MINE option is deprecated. It is still supported for backward compatibility reasons, but Oracle recommends that you discontinue using it. There is no replacement functionality.

| STRING_LITERALS_IN_STMT | If set, SQL_REDO and SQL_UNDO use literals for numbers and datetime and interval column types. |

To specify more than one option, use a plus sign (+) between them. For example:

```sql
EXECUTE DBMS_LOGMNR.START_LOGMNR(OPTIONS => -
   DBMS_LOGMNR.DDL_DICT_TRACKING + DBMS_LOGMNR.DICT_FROM_REDO_LOGS);
```

### 95.4 DBMS_LOGMNR Views

The `DBMS_LOGMNR` package uses the views listed under *Accessing Logminer Operational Information In Views* in *Oracle Database Utilities*.

**See Also:**
*Oracle Database Utilities*

### 95.5 DBMS_LOGMNR Operational Notes

A LogMiner session begins with a call to `DBMS_LOGMNR.ADD_LOGFILE` or `DBMS_LOGMNR.START_LOGMNR` (the former if you plan to specify log files explicitly; the latter...
if you plan to use continuous mining). The session ends with a call to
DBMS_LOGMNR.END_LOGMNR.

Within a LogMiner session, you can specify the redo log files to be analyzed and the
SCN or time range of interest; then you can issue SQL select statements against the
V$LOGMNR_CONTENTS view to retrieve the data of interest.

95.6 Summary of DBMS_LOGMNR Subprograms

This table lists the DBMS_LOGMNR subprograms and briefly describes them.

In a multitenant container database (CDB) some subprograms must be called from the
root. There may be other differences as well. See the individual subprogram
descriptions for details.

<table>
<thead>
<tr>
<th>Table 95-3</th>
<th>DBMS_LOGMNR Package Subprograms</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Subprogram</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>ADD_LOGFILE Procedure</td>
<td>Adds a redo log file to the existing or newly created list of redo log files for LogMiner to process, so that if a new list is created, this marks the beginning of a LogMiner session</td>
</tr>
<tr>
<td>COLUMN_PRESENT Function</td>
<td>Call this function for any row returned from the V$LOGMNR_CONTENTS view to determine if undo or redo column values exist for the column specified by the column_name input parameter to this function</td>
</tr>
<tr>
<td>END_LOGMNR Procedure</td>
<td>Finishes a LogMiner session</td>
</tr>
<tr>
<td>MINE_VALUE Function</td>
<td>Call this function for any row returned from the V$LOGMNR_CONTENTS view to retrieve the undo or redo column value of the column specified by the column_name input parameter to this function</td>
</tr>
<tr>
<td>REMOVE_LOGFILE Procedure</td>
<td>Removes a redo log file from the list of redo log files for LogMiner to process</td>
</tr>
<tr>
<td>START_LOGMNR Procedure</td>
<td>Initializes the LogMiner utility and starts LogMiner (unless the session was already started with a call to DBMS_LOGMNR.ADD_LOGFILE)</td>
</tr>
</tbody>
</table>

95.6.1 ADD_LOGFILE Procedure

This procedure adds a file to an existing or newly created list of log files for LogMiner to process.

In a CDB, the ADD_LOGFILE procedure must be called from the root database. You must have the LOGMINING administrative privilege to use this procedure.

Syntax

DBMS_LOGMNR.ADD_LOGFILE ( LogFileName IN VARCHAR2, options IN BINARY_INTEGER default ADDFILE );
Parameters

Table 95-4   ADD_LOGFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogFileName</td>
<td>Specifies the name of the redo log file to add to the list of redo log files to be analyzed during this session.</td>
</tr>
</tbody>
</table>
| options | Does one of the following:  
• Starts a new LogMiner session and a new list of redo log files for analysis (DBMS_LOGMNR.NEW)  
• Adds a file to an existing list of redo log files for analysis (DBMS_LOGMNR.ADDFILE)  
See Table 95-1. |

Exceptions

Table 95-5   ADD_LOGFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01284</td>
<td>Specified file cannot be opened.</td>
</tr>
<tr>
<td>ORA-01287</td>
<td>Specified file is from a different database incarnation.</td>
</tr>
<tr>
<td>ORA-01289</td>
<td>Specified file has already been added to the list. Duplicate redo log files cannot be added.</td>
</tr>
<tr>
<td>ORA-01290</td>
<td>Specified file is not in the current list and therefore cannot be removed from the list.</td>
</tr>
<tr>
<td>ORA-01324</td>
<td>Specified file cannot be added to the list because there is a DB_ID mismatch.</td>
</tr>
</tbody>
</table>

Usage Notes

• Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).

• Unless you specify the CONTINUOUS_MINE option, the LogMiner session must be set up with a list of redo log files to be analyzed. Use the ADD_LOGFILE procedure to specify the list of redo log files to analyze.

• If you are not using the CONTINUOUS_MINE option and you want to analyze more than one redo log file, you must call the ADD_LOGFILE procedure separately for each redo log file. The redo log files do not need to be registered in any particular order.

• Both archived and online redo log files can be mined.

• After you have added the first redo log file to the list, each additional redo log file that you add to the list must be associated with the same database and database RESETLOGS SCN as the first redo log file. (The database RESETLOGS SCN uniquely identifies each execution of an ALTER DATABASE OPEN RESETLOGS statement. When the online redo logs are reset, Oracle creates a new and unique incarnation of the database.)

• To analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files was set up, you must first remove the redo log files from the current list. Then, you must issue the ADD_LOGFILE procedure with the CONTINUOUS_MINE option.
log files is associated, use the `END_LOGMNR` procedure to end the current LogMiner session, and then build a new list using the `ADD_LOGFILE` procedure.

- LogMiner matches redo log files by the log sequence number. Thus, two redo log files with different names but with the same log sequence number will return the ORA-01289 exception. For instance, the online counterpart of an archived redo log file has a different name from the archived redo log file, but attempting to register it with LogMiner after registering the archived counterpart will result in the ORA-01289 exception being returned.

### 95.6.2 COLUMN_PRESENT Function

This function is designed to be used in conjunction with the `MINE_VALUE` function.

If the `MINE_VALUE` function returns a NULL value, it can mean either:

- The specified column is not present in the redo or undo portion of the data.
- The specified column is present and has a NULL value.

To distinguish between these two cases, use the `COLUMN_PRESENT` function, which returns a 1 if the column is present in the redo or undo portion of the data. Otherwise, it returns a 0.

**Syntax**

```sql
DBMS_LOGMNR.COLUMN_PRESENT (
    sql_redo_undo    IN  RAW,
    column_name      IN  VARCHAR2 default '') RETURN NUMBER;
```

**Parameters**

**Table 95-6  COLUMN_PRESENT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_redo_undo</td>
<td>Specifies either the <code>REDO_VALUE</code> or the <code>UNDO_VALUE</code> column in the <code>V$LOGMNR_CONTENTS</code> view from which to extract data values. See the Usage Notes for more information.</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the fully qualified name (<code>schema.table.column</code>) of the column for which this function will return information. In a CDB, the column name is specified as follows: <code>container_name:schema.table.column</code>.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 95-7** describes the return values for the `COLUMN_PRESENT` function. The `COLUMN_PRESENT` function returns 1 if the self-describing record (the first parameter) contains the column specified in the second parameter. This can be used to determine the meaning of NULL values returned by the `DBMS_LOGMNR.MINE_VALUE` function.
Table 95-7  Return Values for COLUMN_PRESENT Function

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Specified column is not present in this row of V$LOGMNR_CONTENTS.</td>
</tr>
<tr>
<td>1</td>
<td>Column is present in this row of V$LOGMNR_CONTENTS.</td>
</tr>
</tbody>
</table>

Exceptions

Table 95-8  COLUMN_PRESENT Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01323</td>
<td>Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.</td>
</tr>
<tr>
<td>ORA-00904</td>
<td>Value specified for the column_name parameter is not a fully qualified column name.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the COLUMN_PRESENT function, you must have successfully started LogMiner.
- The COLUMN_PRESENT function must be invoked in the context of a select operation on the V$LOGMNR_CONTENTS view.
- The COLUMN_PRESENT function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be NULL).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be NULL).

95.6.3 END_LOGMNR Procedure

This procedure finishes a LogMiner session. Because this procedure performs cleanup operations that may not otherwise be done, you must use it to properly end a LogMiner session. This procedure is called automatically when you log out of a database session or when you call DBMS_LOGMNR.ADD_LOGFILE and specify the NEW option.

Syntax

DBMS_LOGMNR.END_LOGMNR;
Exceptions

Table 95-9  END_LOGMNR Procedure Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01307</td>
<td>No LogMiner session is currently active. The END_LOGMNR procedure was called without adding any log files or before the START_LOGMNR procedure was called</td>
</tr>
</tbody>
</table>

95.6.4 MINE_VALUE Function

This function facilitates queries based on a column's data value.

This function takes two arguments. The first one specifies whether to mine the redo (REDO_VALUE) or undo (UNDO_VALUE) portion of the data. The second argument is a string that specifies the fully qualified name of the column to be mined. The MINE_VALUE function always returns a string that can be converted back to the original datatype.

Syntax

```sql
DBMS_LOGMNR.MINE_VALUE (  
    sql_redo_undo IN RAW,  
    column_name  IN VARCHAR2 default '' ) RETURN VARCHAR2;
```

Parameters

Table 95-10  MINE_VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_redo_undo</td>
<td>Specifies either the REDO_VALUE or the UNDO_VALUE column in the V$LOGMNR_CONTENTS view from which to extract data values. See the Usage Notes for more information.</td>
</tr>
<tr>
<td>column_name</td>
<td>Specifies the fully qualified name (schema.table.column) of the column for which this function will return information. In a CDB, the column name is specified as follows: container_name:schema.table.column</td>
</tr>
</tbody>
</table>

Return Values

Table 95-11  Return Values for MINE_VALUE Function

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULL</td>
<td>The column is not contained within the self-describing record, or the column value is NULL. To distinguish between the two different null possibilities, use the DBMS_LOGMNR.COLUMN_PRESENT function.</td>
</tr>
<tr>
<td>NON-NULL</td>
<td>The column is contained within the self-describing record; the value is returned in string format.</td>
</tr>
</tbody>
</table>
Exceptions

Table 95-12  MINE_VALUE Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01323</td>
<td>Invalid state. Currently, a LogMiner dictionary is not associated with the LogMiner session. You must specify a LogMiner dictionary for the LogMiner session.</td>
</tr>
<tr>
<td>ORA-00904</td>
<td>Invalid identifier. The value specified for the column_name parameter was not a fully qualified column name.</td>
</tr>
</tbody>
</table>

Usage Notes

- To use the MINE_VALUE function, you must have successfully started LogMiner.
- The MINE_VALUE function must be invoked in the context of a select operation from the V$LOGMNR_CONTENTS view.
- The MINE_VALUE function does not support LONG, LOB, ADT, or COLLECTION datatypes.
- The value for the sql_redo_undo parameter depends on the operation performed and the data of interest:
  - If an update operation was performed and you want to know what the value was prior to the update operation, specify UNDO_VALUE.
  - If an update operation was performed and you want to know what the value is after the update operation, specify REDO_VALUE.
  - If an insert operation was performed, typically you would specify REDO_VALUE (because the value of a column prior to an insert operation will always be null).
  - If a delete operation was performed, typically you would specify UNDO_VALUE (because the value of a column after a delete operation will always be null).
- If the DBMS_LOGMNR.MINE_VALUE function is used to get an NCHAR value that includes characters not found in the database character set, then those characters are returned as the replacement character (for example, an inverted question mark) of the database character set.

95.6.5 REMOVE_LOGFILE Procedure

This procedure removes a redo log file from an existing list of redo log files for LogMiner to process.

In a CDB, the REMOVE_LOGFILE procedure must be called from the root database. You must have the LOGMINING administrative privilege to use this procedure.

Syntax

```sql
DBMS_LOGMNR.REMOVE_LOGFILE (    LogFileName IN VARCHAR2);```

Parameters

Table 95-13  REMOVE_LOGFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LogFileName</td>
<td>Specifies the name of the redo log file to be removed from the list of redo log files to be analyzed during this session.</td>
</tr>
</tbody>
</table>

Exceptions

Table 95-14  REMOVE_LOGFILE Procedure Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01290</td>
<td>Cannot remove unlisted log file</td>
</tr>
</tbody>
</table>

Usage Notes

- Before querying the V$LOGMNR_CONTENTS view, you must make a successful call to the DBMS_LOGMNR.START_LOGMNR procedure (within the current LogMiner session).
- You can use this procedure to remove a redo log file from the list of redo log files for LogMiner to process if you know that redo log file does not contain any data of interest.
- Multiple redo log files can be removed by calling this procedure repeatedly.
- The redo log files do not need to be removed in any particular order.
- To start a new list of redo log files for analysis, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.
- Even if you remove all redo log files from the list, any subsequent calls you make to the ADD_LOGFILE procedure must match the database ID and RESETLOGS SCN of the removed redo log files. Therefore, to analyze the redo log files from a different database (or a database incarnation with a different database RESETLOGS SCN) than that with which the current list of redo log files is associated, use the END_LOGMNR procedure to end the current LogMiner session, and then build a new list using the ADD_LOGFILE procedure.

95.6.6 START_LOGMNR Procedure

This procedure starts LogMiner by loading the dictionary that LogMiner will use to translate internal schema object identifiers to names.

In a CDB, the START_LOGMNR procedure must be called from the root database. You must have the LOGMINING administrative privilege to use this procedure.

Syntax

```
DBMS_LOGMNR.START_LOGMNR (
    startScn           IN NUMBER default 0,
    endScn             IN NUMBER default 0,
    startTime          IN DATE default '01-jan-1988',
    endTime            IN DATE default '31-dec-2110',
) `
### Parameters

#### Table 95-15 START_LOGMNR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>startScn</td>
<td>Directs LogMiner to return only redo records with an SCN greater than or equal to the <code>startScn</code> specified. This fails if there is no redo log file containing the specified <code>startScn</code> value. (You can query the <code>FILENAME</code>, <code>LOW_SCN</code>, and <code>NEXT_SCN</code> columns in the <code>V$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)</td>
</tr>
<tr>
<td>endScn</td>
<td>Directs LogMiner to return only redo records with an SCN less than or equal to the <code>endScn</code> specified. If you specify an <code>endScn</code> value that is beyond the value in any redo log file, then LogMiner uses the greatest <code>endScn</code> value in the redo log file that contains the most recent changes. (You can query the <code>FILENAME</code>, <code>LOW_SCN</code>, and <code>NEXT_SCN</code> columns in the <code>V$LOGMNR_LOGS</code> view for each redo log file to determine the range of SCN values contained in each redo log file.)</td>
</tr>
<tr>
<td>startTime</td>
<td>Directs LogMiner to return only redo records with a timestamp greater than or equal to the <code>startTime</code> specified. This fails if there is no redo log file containing the specified <code>startTime</code> value. (You can query the <code>FILENAME</code>, <code>LOW_TIME</code>, and <code>HIGH_TIME</code> columns in the <code>V$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>startScn</code> is specified. See the Usage Notes for additional information.</td>
</tr>
<tr>
<td>endTime</td>
<td>Directs LogMiner to return only redo records with a timestamp less than or equal to the <code>endTime</code> specified. If you specify an <code>endTime</code> value that is beyond the value in any redo log file, then LogMiner will use the greatest <code>endTime</code> in the redo log file that contains the most recent changes. You can query the <code>FILENAME</code>, <code>LOW_TIME</code>, and <code>HIGH_TIME</code> columns in the <code>V$LOGMNR_LOGS</code> view for each redo log file to determine the range of time covered in each redo log file.) This parameter is ignored if <code>endScn</code> is specified. See the Usage Notes for additional information.</td>
</tr>
<tr>
<td>DictFileName</td>
<td>Specifies the flat file that contains the LogMiner dictionary. It is used to reconstruct <code>SQL_REDO</code> and <code>SQL_UNDO</code> columns in <code>V$LOGMNR_CONTENTS</code>, as well as to fully translate <code>SEG_NAME</code>, <code>SEG_OWNER</code>, <code>SEG_TYPE_NAME</code>, <code>TABLE_NAME</code>, and <code>TABLE_SPACE</code> columns. The fully qualified path name for the LogMiner dictionary file must be specified. (This file must have been created previously through the DBMS_LOGMNR_D.BUILD procedure.) You need to specify this parameter only if neither <code>DICT_FROM_REDO_LOGS</code> nor <code>DICT_FROM_ONLINE_CATALOG</code> is specified.</td>
</tr>
<tr>
<td>options</td>
<td>See Table 95-2.</td>
</tr>
</tbody>
</table>
## Exceptions

<td>ORA-01299</td>
<td>Specified LogMiner dictionary corresponds to a different database incarnation.</td>
</tr>
<tr>
<td>ORA-01300</td>
<td>Writable database required for specified LogMiner options.</td>
</tr>
</tbody>
</table>

### Usage Notes

- LogMiner can use a dictionary that you previously extracted to the redo log files or to a flat file, or you can specify that LogMiner use the online catalog if LogMiner is mining data from the source system.

- **After executing the** START_LOGMNR **procedure, you can query the following views:**
  - **V$LOGMNR_CONTENTS** - contains history of information in redo log files
  - **V$LOGMNR_DICTIONARY** - contains current information about the LogMiner dictionary file extracted to a flat file
  - **V$LOGMNR_PARAMETERS** - contains information about the LogMiner session

(You can query the **V$LOGMNR_LOGS** view after a redo log file list has been added to the list of files that LogMiner is to mine.)
• Parameters and options are not persistent across calls to DBMS_LOGMNR.START_LOGMNR. You must specify all desired parameters and options (including SCN and time ranges) each time you call DBMS_LOGMNR.START_LOGMNR.

• Be aware that specifying redo log files using a timestamp is not precise.

• The CONTINUOUS_MINE option directs LogMiner to automatically add redo log files, as needed, to find the data of interest. You need to specify only the first log to start mining, or just the starting SCN or date to indicate to LogMiner where to begin mining logs. Keep the following in mind when using the CONTINUOUS_MINE option:

  – The database control file will hold information about a limited number of archived redo log files, although the number of entries can be quite large. Query the V$ARCHIVED_LOGS view to determine which redo log file entries will be found by LogMiner.

    Even if an entry is listed in the database control file (and the V$ARCHIVED_LOGS view), the archived redo log file may not be accessible by LogMiner for various reasons. For example, the archived redo log file may have been deleted or moved from its location (maybe because of a backup operation to tape), or the directory where it resides may not be not available.

  – If you specify the CONTINUOUS_MINE option and an ending time or SCN that will occur in the future (or you do not specify an end time or SCN), a query of the V$LOGMNR_CONTENTS view will not finish until the database has generated redo log files beyond the specified time or SCN. In this scenario, LogMiner will automatically add archived redo log files to the LogMiner redo log file list as they are generated. In addition, in this scenario only, LogMiner may automatically remove redo log files from the list to keep it at 50 processed redo files. This is to save PGA memory as LogMiner automatically adds redo log files to the list. If LogMiner did not perform automated removal, memory could eventually be exhausted.

  – LogMiner can mine online redo logs. However, if the CONTINUOUS_MINE option is not specified, it is possible that the database is writing to the online redo log file at the same time that LogMiner is reading the online redo log file. If a log switch occurs while LogMiner is reading an online redo log file, the database will overwrite what LogMiner is attempting to read. The data that LogMiner returns if the file it is trying to read gets overwritten by the database is unpredictable.

• Keep the following in mind regarding starting and ending times or SCN ranges:

  – If you specify neither a startTime nor a startScn parameter, LogMiner will set the startScn parameter to use the lowest SCN value from the redo log file that contains the oldest changes.

  – If you specify both time and SCN values, LogMiner uses the SCN value or values and ignores the time values.

  – If you specify starting and ending time or SCN values and they are found in the LogMiner redo log file list, then LogMiner mines the logs indicated by those values.

  – If you specify starting and ending times or SCN values that are not in the LogMiner redo log file list, and you specify DBMS_LOGMNR.START_LOGMNR without the CONTINUOUS_MINE option, and you specify:

    * 0 for the startTime or startScn value, then the lowest SCN in the LogMiner redo log file list will be used as the startScn

* A nonzero number for the `startTime` or `startScn` value, then an error is returned.

* 0 or a nonzero number for the `endTime` or `endScn` value, then the highest SCN in the LogMiner redo log file list will be used as the `endScn`.

If you specify starting and ending times or SCN values and they are not found in the LogMiner redo log file list, and you specify `DBMS_LOGMNR.START_LOGMNR` with the `CONTINUOUS_MINE` option, and you specify:

* 0 for the `startTime` or `startScn` value, then an error is returned.

* A `startTime` or `startScn` value that is greater than any value in the database’s archived redo log files, then LogMiner starts mining in the online redo log file. LogMiner will continue to process the online redo log file until it finds a change at, or beyond, the requested starting point before it returns rows from the `V$LOGMNR_CONTENTS` view.

* An `endTime` or `endScn` parameter value that indicates a time or SCN in the future, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until LogMiner sees a change beyond the requested ending point.

* 0 for the `endTime` or `endScn` parameter value, then LogMiner includes the online redo log files when it mines. When you query the `V$LOGMNR_CONTENTS` view, rows will be returned from this view as changes are made to the database, and will not stop until you enter CTL+C or you terminate the PL/SQL cursor.
The `DBMS_LOGMNR_D` package, one of a set of LogMiner packages, contains two subprograms: the `BUILD` procedure and the `SET_TABLESPACE` procedure.

- The `BUILD` procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file. This information is saved in preparation for future analysis of redo log files using the LogMiner tool.
- The `SET_TABLESPACE` procedure re-creates all LogMiner tables in an alternate tablespace.

The LogMiner data dictionary consists of the memory data structures and the database tables that are used to store and retrieve information about objects and their versions. It is referred to as the LogMiner dictionary throughout the LogMiner documentation.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_LOGMNR_D Subprograms

See Also:

Oracle Database Utilities for information regarding LogMiner.

### 96.1 DBMS_LOGMNR_D Overview

LogMiner requires a dictionary to translate object IDs into object names when it returns redo data to you.

LogMiner gives you three options for supplying the dictionary:

- Using the online catalog
- Extracting a LogMiner dictionary to the redo log files
- Extracting a LogMiner dictionary to a flat file

Use the `BUILD` procedure to extract the LogMiner dictionary to the redo log files or a flat file. If you want to specify the online catalog as the dictionary source, you do so when you start LogMiner with the `DBMS_LOGMNR.START_LOGMNR` package.

Use the `SET_TABLESPACE` procedure if you want LogMiner tables to use a tablespace other than the default `SYSAUX` tablespace.
96.2 DBMS_LOGMNR_D Security Model

You must have the EXECUTE_CATALOG_ROLE role to use the DBMS_LOGMNR_D package.

96.3 Summary of DBMS_LOGMNR_D Subprograms

This table lists and briefly describes the DBMS_LOGMNR_D subprograms.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

Table 96-1  DBMS_LOGMNR_D Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD Procedure</td>
<td>Extracts the LogMiner dictionary to either a flat file or one or more redo log files</td>
</tr>
<tr>
<td>SET_TABLESPACE Procedure</td>
<td>Re-creates all LogMiner tables in an alternate tablespace</td>
</tr>
</tbody>
</table>

96.3.1 BUILD Procedure

This procedure extracts the LogMiner data dictionary to either the redo log files or to a flat file.

The following considerations apply to a multitenant container database (CDB) environment.

- In a CDB environment, when you extract to the redo log files, the BUILD procedure must be called from the root database. The LogMiner data dictionary for the entire CDB is extracted to the redo log files.
- In a CDB environment, when you extract to flat files, you can mine only one pluggable database (PDB) at a time. You must first explicitly build the flat file dictionary for that specific PDB by running the BUILD procedure from it. The LogMiner data dictionary for each PDB for which the BUILD procedure is run is extracted to a flat file.
- You cannot add or remove PDBs from a CDB while this procedure is executing.

Syntax

```sql
DBMS_LOGMNR_D.BUILD (  
dictionary_filename  IN  VARCHAR2,  
dictionary_location  IN  VARCHAR2,  
options              IN  NUMBER);  
```
Parameters

Table 96-2  BUILD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_filename</td>
<td>Specifies the name of the LogMiner dictionary file.</td>
</tr>
<tr>
<td>dictionary_location</td>
<td>Specifies the directory object for the LogMiner dictionary file.</td>
</tr>
<tr>
<td>options</td>
<td>Specifies that the LogMiner dictionary is written to either a flat file</td>
</tr>
<tr>
<td></td>
<td>(STORE_IN_FLAT_FILE) or the redo log files (STORE_IN_REDO_LOGS).</td>
</tr>
</tbody>
</table>

Exceptions

Table 96-3  BUILD Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01302</td>
<td>Dictionary build options are missing or incorrect.</td>
</tr>
<tr>
<td></td>
<td>This error is returned under the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If the value of the OPTIONS parameter is not one of the supported values</td>
</tr>
<tr>
<td></td>
<td>(STORE_IN_REDO_LOGS, STORE_IN_FLAT_FILE) or is not specified</td>
</tr>
<tr>
<td></td>
<td>• If the STORE_IN_REDO_LOGS option is not specified and either the</td>
</tr>
<tr>
<td></td>
<td>dictionary_filename or the dictionary_location parameter is specified</td>
</tr>
<tr>
<td>ORA-01308</td>
<td>Initialization parameter UTL_FILE_DIR is not set.</td>
</tr>
<tr>
<td>ORA-01336</td>
<td>Specified dictionary file cannot be opened.</td>
</tr>
<tr>
<td></td>
<td>This error is returned under the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The dictionary file is read-only.</td>
</tr>
</tbody>
</table>

Note:

In prior releases, you used the UTL_FILE_DIR initialization parameter to specify a directory location. However, as of Oracle Database 18c, the UTL_FILE_DIR initialization parameter is desupported. It is still supported for backward compatibility, but Oracle recommends that you instead use directory objects.
Table 96-3 (Cont.) BUILD Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01308</td>
<td>Dictionary directory is not set. This error is returned under the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• The specified value for the dictionary_location is not a directory object.</td>
</tr>
<tr>
<td></td>
<td>• The specified value for the dictionary_location is a directory object that is defined to be a file path that cannot be accessed.</td>
</tr>
</tbody>
</table>

Usage Notes

• To extract the LogMiner dictionary to a flat file, you must supply a filename and location. The location must be specified as a database directory object. (See CREATE DIRECTORY in the Oracle Database SQL Language Reference.)

To extract the LogMiner dictionary to the redo log files, specify only the STORE_IN_REDO_LOGS option. The size of the LogMiner dictionary may cause it to be contained in multiple redo log files.

The combinations of parameters used result in the following behavior:

– If you do not specify any parameters, an error is returned.
– If you specify a filename and location, without any options, the LogMiner dictionary is extracted to a flat file with that name.
– If you specify a filename and location, as well as the STORE_IN_FLAT_FILE option, the LogMiner dictionary is extracted to a flat file with the specified name.
– If you do not specify a filename and location, but do specify the STORE_IN_REDO_LOGS option, the LogMiner dictionary is extracted to the redo log files.
– If you specify a filename and location, as well as the STORE_IN_REDO_LOGS option, an error is returned.
– If you do not specify a filename and location, but do specify the STORE_IN_FLAT_FILE option, an error is returned.

• Ideally, the LogMiner dictionary file will be created after all database dictionary changes have been made and prior to the creation of any redo log files that are to be analyzed. As of Oracle9i release 1 (9.0.1), you can use LogMiner to dump the LogMiner dictionary to the redo log files or a flat file, perform DDL operations, and dynamically apply the DDL changes to the LogMiner dictionary.

• The database must be open when you run the DBMS_LOGMNR_D.BUILD procedure.

• When extracting a LogMiner dictionary to a flat file, the procedure queries the dictionary tables of the current database and creates a text-based file containing the contents of the tables. To extract a LogMiner dictionary to a flat file, the following conditions must be met:

– You must specify a directory for use by the PL/SQL procedure. To do so, first create an Oracle directory object with a pathname that specifies where the dictionary file is to be generated. For example:
create directory my_dictionary_dir as '/oracle/dictionary';

Be aware that the **DDL_DICT_TRACKING** option to the **DBMS_LOGMNR.START_LOGMNR** procedure is not supported for flat file dictionaries created prior to Oracle9i. If you attempt to use the **DDL_DICT_TRACKING** option with a LogMiner database extracted to a flat file prior to Oracle9i, the ORA-01330 error (problem loading a required build table) is returned.

- To extract a LogMiner dictionary file to the redo log files, the following conditions must be met:
  - The **DBMS_LOGMNR_D.BUILD** procedure must be run on a system that is running Oracle9i or later.
  - Archivelog mode must be enabled in order to generate usable redo log files.
  - The **COMPATIBLE** parameter in the initialization parameter file must be set to 9.2.0 or higher.
  - The database to which LogMiner is attached must be Oracle9i or later.

In addition, supplemental logging (at least the minimum level) should be enabled to ensure that you can take advantage of all the features that LogMiner offers.

**Examples**

**Example 1: Extracting the LogMiner Dictionary to a Flat File**

The following example extracts the LogMiner dictionary file to a flat file named `dictionary.ora` in a specified path (`/oracle/database`).

```
SQL> create directory my_dictionary_dir as '/oracle/database';
SQL> EXECUTE dbms_logmnr_d.build(dictionary_location=>my_dictionary_dir, -
   2   dictionary_filename=>'dictionary.ora', -
   3   options => dbms_logmnr_d.store_in_flat_file);
```

**Example 2: Extracting the LogMiner Dictionary to the Redo Log Files**

The following example extracts the LogMiner dictionary to the redo log files.

```
SQL> EXECUTE dbms_logmnr_d.build( -
   2   options => dbms_logmnr_d.store_in_redo_logs);
```

### 96.3.2 SET_TABLESPACE Procedure

This procedure moves LogMiner tables from the default **SYSAUX** tablespace to an alternate tablespace.

By default, all LogMiner tables are created to use the **SYSAUX** tablespace. However, it may be desirable to have LogMiner tables use an alternate tablespace. Use this procedure to move LogMiner tables to this alternate tablespace.

In a CDB, only the LogMiner metadata in the local container is moved to the requested tablespace.

**Syntax**

```
DBMS_LOGMNR_D.SET_TABLESPACE {
   new_tablespace   IN VARCHAR2;
```
Parameters

Table 96-4  SET_TABLESPACE Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_tablespace</td>
<td>A string naming a preexisting tablespace. To move all LogMiner tables to</td>
</tr>
<tr>
<td></td>
<td>employ this tablespace, supply this parameter.</td>
</tr>
</tbody>
</table>

Usage Notes

- Users upgrading from earlier versions of Oracle Database may find LogMiner tables in the \texttt{SYSTEM} tablespace. Oracle encourages such users to consider using the \texttt{SET_TABLESPACE} procedure to move the tables to the \texttt{SYSAUX} tablespace once they are confident that they will not be downgrading to an earlier version of Oracle Database.
- Users of this routine must supply an existing tablespace.

Example: Using the DBMS_LOGMNR_D.SET_TABLESPACE Procedure

The following example shows the creation of an alternate tablespace and execution of the \texttt{DBMS_LOGMNR_D.SET_TABLESPACE} procedure.

```sql
SQL> CREATE TABLESPACE logmnrts$ datafile '/usr/oracle/dbs/logmnrts.f'
       SIZE 25 M REUSE AUTOEXTEND ON MAXSIZE UNLIMITED;

SQL> EXECUTE dbms_logmnr_d.set_tablespace('logmnrts$');
```
97

DBMS_LOGSTDBY

The DBMS_LOGSTDBY package provides subprograms for configuring and managing the logical standby database environment.

This chapter contains the following topics:

• Overview
• Security Model
• Constants
• Summary of DBMS_LOGSTDBY Subprograms

See Also:

Oracle Data Guard Concepts and Administration

97.1 DBMS_LOGSTDBY Overview

The DBMS_LOGSTDBY package helps you manage the SQL Apply (logical standby database) environment.

The subprograms in the DBMS_LOGSTDBY package help you to accomplish the following main objectives:

• Manage configuration parameters used by SQL Apply.
  For example, controlling how transactions are applied on the logical standby database, how much shared pool is used, and how many processes are used by SQL Apply to mine and apply the changes.

• Ensure an appropriate level of supplemental logging is enabled, and a LogMiner dictionary is built correctly for logical standby database creation.

• Provide a way to skip the application of changes to selected tables or entire schemas in the logical standby database, and specify ways to handle exceptions encountered by SQL Apply.

• Allow controlled access to tables in the logical standby database that may require maintenance.

97.2 DBMS_LOGSTDBY Security Model

You must have the DBA role to use the DBMS_LOGSTDBY package.

A prototype role, LOGSTDBY_ADMINISTRATOR, is created by default with RESOURCE and EXECUTE privileges on DBMS_LOGSTDBY. If you choose to use this role, consider granting...
ALTER DATABASE and ALTER SESSION privileges to the role so that the grantee can start and stop SQL Apply and can enable and disable the database guard.

The procedures associated with skipping transactions (SKIP and UNSKIP, SKIP_ERROR and UNSKIP_ERROR, and SKIP_TRANSACTION and UNSKIP_TRANSACTION) all require DBA privileges to execute because their scope may contain wildcard schemas. Oracle recommends that where SKIP procedures are specified, these be owned by a secure account with appropriate privileges on the schemas they act on (for example, SYS).

The procedures associated with EDS-based replication require the EXECUTE privilege on the DBMS_LOGSTDBY package. They also require the CREATE TABLE and DROP TABLE system privileges to create (and drop) shadow tables in the target schema. If materialized views are used, then the CREATE MATERIALIZED VIEW and DROP ANY MATERIALIZED VIEW system privileges are also required.

Note:
As of Oracle Database 12c Release 2 (12.2.0.2), Extended Datatype Support (EDS) is deprecated. All EDS-supported Oracle data types are now supported natively by logical standbys or Oracle GoldenGate.

97.3 DBMS_LOGSTDBY Constants

The DBMS_LOGSTDBY package defines several enumerated constants for specifying parameter values. Enumerated constants must be prefixed with the package name, for example, DBMS_LOGSTDBY.SKIP_ACTION_SKIP.

The following table describes the constants for the proc_name parameter in the DBMS_LOGSTDBY.SKIP procedure.

Table 97-1 Constants for SKIP Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAX_EVENTS</td>
<td>Maximum number of events to log in the DBA_LOGSTDBY_EVENTS view. See the DBMS_LOGSTDBY APPLY_SET Procedure.</td>
</tr>
<tr>
<td>SKIP_ACTION_APPLY</td>
<td>Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the DDL or PL/SQL statement.</td>
</tr>
<tr>
<td>SKIP_ACTION_ERROR</td>
<td>Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to error out.</td>
</tr>
<tr>
<td>SKIP_ACTION_REPLACE</td>
<td>Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to apply the replacement DDL. (This constant should not be used while handling an Oracle Supplied PL/SQL procedure call).</td>
</tr>
</tbody>
</table>
Table 97-1  (Cont.) Constants for SKIP Options Flag

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SKIP_ACTION_SKIP</td>
<td>Used inside the user-defined procedure registered with DBMS_LOGSTDBY.SKIP. Use this constant when setting the value of the SKIP_ACTION parameter with DBMS_LOGSTDBY_CONTEXT if you want SQL Apply to skip the associated DDL or Oracle supplied PL/SQL procedure call.</td>
</tr>
</tbody>
</table>

97.4 Summary of DBMS_LOGSTDBY Subprograms

This table describes each subprogram of the DBMS_LOGSTDBY procedure, including a reference to the section where each procedure is described in more detail.

In a multitenant container database (CDB), some subprograms must be called from the root. There may be other differences as well. See the individual subprogram descriptions for details.

Note:

As of Oracle Database 12c Release 2 (12.2.0.2), DBMS_LOGSTDBY subprograms related to Extended Datatype Support (EDS) are deprecated. All EDS-supported Oracle data types are now supported natively by logical standbys or Oracle GoldenGate.

Table 97-2  DBMS_LOGSTDBY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLY_SET Procedure</td>
<td>Sets the values of various parameters that configure and maintain SQL Apply.</td>
</tr>
<tr>
<td>APPLY_UNSET Procedure</td>
<td>Restores the default values of various parameters that configure and maintain SQL Apply.</td>
</tr>
<tr>
<td>BUILD Procedure</td>
<td>Ensures supplemental logging is enabled properly and builds the LogMiner dictionary.</td>
</tr>
<tr>
<td>EDS_ADD_TABLE</td>
<td>Adds EDS-based replication for the table. It should be invoked on the primary database first and then on the standby database.</td>
</tr>
<tr>
<td>EDS_EVOLVE_AUTOMATIC</td>
<td>Enables or disables automatic DDL handling for EDS tables.</td>
</tr>
<tr>
<td>EDS_EVOLVE_MANUAL</td>
<td>Allows you to evolve EDS tables manually (that is, manually take compensating actions based on DDLs on the base tables with EDS-replication).</td>
</tr>
<tr>
<td>EDS_REMOVE_TABLE</td>
<td>Removes EDS-based replication for the specified table. It also drops the shadow table and triggers.</td>
</tr>
<tr>
<td>INSTANTIATE_TABLE Procedure</td>
<td>Creates and populates a table in the standby database from a corresponding table in the primary database.</td>
</tr>
</tbody>
</table>
Table 97-2  (Cont.) DBMS_LOGSTDBY Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IS_APPLY_SERVER Function</td>
<td>This function returns <code>TRUE</code> if it is executed from PL/SQL in the context of a logical standby apply server process. This function is used in conjunction with triggers that have the <code>fire_once</code> parameter in the <code>DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY</code> subprogram set to <code>FALSE</code> (the default is <code>TRUE</code>). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.</td>
</tr>
<tr>
<td>MAP_PRIMARY_SCN Function</td>
<td>Maps an SCN relevant to the primary database to a corresponding SCN at the logical standby database. The mapped SCN is conservative in nature, and can thus be used to flash back the logical standby database to compensate for a flashback database operation performed at the primary database.</td>
</tr>
<tr>
<td>PREPARE_FOR_NEW_PRIMARY Procedure</td>
<td>Used after a failover, this procedure ensures a local logical standby database that was not involved in the failover has not processed more redo than the new primary database and reports the set of archive redo log files that must be replaced to ensure consistency.</td>
</tr>
<tr>
<td>PURGE_SESSION Procedure</td>
<td>Identifies the archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply.</td>
</tr>
<tr>
<td>REBUILD Procedure</td>
<td>Records relevant metadata (including the LogMiner dictionary) in the redo stream in case a database that has recently changed its role to a primary database following a failover operation fails to do so during the failover process.</td>
</tr>
<tr>
<td>SET_TABLESPACE Procedure</td>
<td>Moves metadata tables required by SQL Apply to the user-specified tablespace. By default, the metadata tables are created in the <code>SYSAUX</code> tablespace.</td>
</tr>
<tr>
<td>SKIP Procedure</td>
<td>Specifies rules that control database operations that should not be applied to the logical standby database.</td>
</tr>
<tr>
<td>SKIP_ERROR Procedure</td>
<td>Specifies rules regarding what action to take upon encountering errors.</td>
</tr>
<tr>
<td>SKIP_TRANSACTION Procedure</td>
<td>Specifies transactions that should not be applied on the logical standby database. Be careful in using this procedure, because not applying specific transactions may cause data corruption at the logical standby database.</td>
</tr>
<tr>
<td>UNSKIP Procedure</td>
<td>Deletes rules specified by the <code>SKIP</code> procedure.</td>
</tr>
<tr>
<td>UNSKIP_ERROR Procedure</td>
<td>Deletes rules specified by the <code>SKIP_ERROR</code> procedure.</td>
</tr>
<tr>
<td>UNSKIP_TRANSACTION Procedure</td>
<td>Deletes rules specified by the <code>SKIP_TRANSACTION</code> procedure.</td>
</tr>
</tbody>
</table>
97.4.1 APPLY_SET Procedure

Use this procedure to set values of parameters that configure and manage SQL Apply in a logical standby database environment. All parameters, except for PRESERVE_COMMIT_ORDER, can be changed without having to stop SQL Apply.

In a CDB, the APPLY_SET procedure must be called from the root database.

Syntax

```sql
DBMS_LOGSTDBY.APPLY_SET (  
inname             IN VARCHAR,  
value              IN VARCHAR);
```

Parameters

Table 97-3  APPLY_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLY_SERVERS</td>
<td>Controls the number of APPLIER processes used to apply changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.</td>
</tr>
</tbody>
</table>
| EVENT_LOG_DEST        | Controls where SQL Apply records the occurrence of an interesting event. It takes the following values:  
                         • DEST_ALL - All events will be recorded in the  
                           DBA_LOGSTDBY_EVENTS view and in the alert log.  
                         • DEST_EVENTS_TABLE - All events that contain information about user data will be recorded only in the  
                           DBA_LOGSTDBY_EVENTS view. This is the default value.  
                           For example, if SQL Apply receives an ORA-1403 error, the whole event is recorded in the  
                           DBA_LOGSTDBY_EVENTS view. Whereas, the alert log records only that SQL Apply stopped because of ORA-1403. No information regarding the user table or offending statement is logged in the alert log.  
                           However, if you stop the SQL Apply engine, it gets recorded in both the DBA_LOGSTDBY_EVENTS view and in the alert log.  
                           Note that this parameter affects the behavior of the following parameters: RECORD_APPLIEDDDL, RECORD_SKIP_DDL, RECORD_SKIP_ERRORS, and RECORD_UNSUPPORTED_OPERATIONS. For example, if RECORD_APPLIEDDDL is set to TRUE, but EVENT_LOG_DEST is set to DEST_EVENTS_TABLE, then the applied DDL string will only be recorded in the  
                           DBA_LOGSTDBY_EVENTS view. |
<p>| LOG_AUTO_DEL_RETENTION_TARGET | This parameter setting is only meaningful if LOG_AUTO_DELETE has been set to TRUE. The value you supply for this parameter controls how long (in minutes) a remote archived log that is received from the primary database will be retained at the logical standby database once all redo records contained in the log have been applied at the logical standby database. The default value is 1440 minutes. |</p>
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOG_AUTO_DELETE</td>
<td>Automatically deletes foreign archived redo log files as soon as they have been applied on the logical standby database. By default, a foreign archived redo log file is not deleted until 24 hours (the default value of LOG_AUTO_DEL_RETENTION_TARGET parameter) after it has been applied at the logical standby database. Set to TRUE to enable automatic deletion of archived redo log files. Set to FALSE to disable automatic deletion. The default value is TRUE.</td>
</tr>
<tr>
<td>MAX_EVENTS_RECORDED</td>
<td>Number of recent events that will be visible through the DBA_LOGSTDBY_EVENTS view. To record all events encountered by SQL Apply, use the DBMS_LOGSTDBY.MAX_EVENTS constant as the number value. The default value is 10,000.</td>
</tr>
<tr>
<td>MAX_SERVERS</td>
<td>Number of processes that SQL Apply uses to read and apply redo. The default value is 9. The maximum number allowed is 2048.</td>
</tr>
<tr>
<td>MAX_SGA</td>
<td>Number of megabytes from shared pool in System Global Area (SGA) that SQL Apply will use. The default value is 30 megabytes or one quarter of the value set for SHARED_POOL_SIZE, whichever is lower. The maximum size allowed is 4095 megabytes.</td>
</tr>
<tr>
<td>PREPARE_SERVERS</td>
<td>Controls the number of PREPARER processes used to prepare changes. The maximum number allowed is 1024, provided the MAX_SERVERS parameter is set to accommodate this.</td>
</tr>
</tbody>
</table>
| PRESERVE_COMMIT_ORDER | TRUE: Transactions are applied to the logical standby database in the exact order in which they were committed on the primary database. This is the default parameter setting.  
FALSE: Transactions containing non-overlapping sets of rows may be committed in a different order than they were committed on the primary database.  
Regardless of the level chosen, modifications done to the same row are always applied in the same order as they happened on the primary database. See the Usage Notes for details and recommendations.  
You cannot modify this parameter while SQL Apply is running. |
| RECORD_APPLIED_DDL    | Controls whether DDL statements that have been applied to the logical standby database are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:  
TRUE: Indicates that DDL statements applied to the logical standby database are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log.  
FALSE: Indicates that applied DDL statements are not recorded. This is the default parameter setting. |
### Table 97-3  (Cont.) APPLY_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| RECORD_SKIP_DDL               | Controls whether skipped DDL statements are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:  
  TRUE: Skipped DDL statements are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.  
  FALSE: Skipped DDL statements are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. |
| RECORD_SKIP_ERRORS            | Controls whether skipped errors (as described by the SKIP_ERROR procedure) are recorded in the location specified by the EVENT_LOG_DEST parameter. Specify one of the following values:  
  TRUE: Skipped errors are recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. This is the default parameter setting.  
  FALSE: Skipped errors are not recorded in the DBA_LOGSTDBY_EVENTS table and the alert log. |
| RECORD_UNSUPPORTED_OPERATIONS | Captures information about transactions running on the primary database that will not be supported by a logical standby database. This procedure records its information as events in the DBA_LOGSTDBY_EVENTS table. Specify one of the following values:  
  TRUE: The information is captured and recorded as events in the DBA_LOGSTDBY_EVENTS table.  
  FALSE: The information is not captured. This is the default. |

If a parameter is changed while SQL Apply is running, the change will take effect at some point in the future. In such a case, an informational row is inserted into the DBA_LOGSTDBY_EVENTS view at the time the parameter change takes effect.

Additionally, if you are modifying a parameter while SQL Apply is running on an Oracle RAC configuration, you must be connected to the same instance where SQL Apply is running.

#### Exceptions

### Table 97-4  APPLY_SET Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
<tr>
<td>ORA-16236</td>
<td>Logical Standby metadata operation in progress</td>
</tr>
</tbody>
</table>

#### Usage Notes

- Use the APPLY_UNSET procedure to restore the default settings of a parameter.
- See Oracle Data Guard Concepts and Administration for help with tuning SQL Apply and for information about setting appropriate values for different parameters.
Examples

To record DDLs in the `DBA_LOGSTDBY_EVENTS` view and in the alert log, issue the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_SET('RECORD_APPLIED_DDL', TRUE);
```

97.4.2 APPLY_UNSET Procedure

Use the `APPLY_UNSET` procedure to restore the default values of the parameters that you changed with the `APPLY_SET` procedure.

In a CDB, the `APPLY_UNSET` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.APPLY_UNSET (iname IN VARCHAR);
```

Parameters

The parameter information for the `APPLY_UNSET` procedure is the same as that described for the `APPLY_SET` procedure. See Table 97-3 for complete parameter information.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
<tr>
<td>ORA-16236</td>
<td>Logical Standby metadata operation in progress</td>
</tr>
</tbody>
</table>

Usage Notes

- Use the `APPLY_SET` procedure to specify a nondefault value for a parameter.

Examples

If you previously specified that applied DDLs show up in the `DBA_LOGSTDBY_EVENTS` view and the alert log, you can restore the default behavior of SQL Apply regarding applied DDL statements with the following statement:

```
SQL> EXECUTE DBMS_LOGSTDBY.APPLY_UNSET('RECORD_APPLIED_DDL');
```

97.4.3 BUILD Procedure

Use this procedure on the primary database to record relevant metadata (LogMiner dictionary) information in the redo log, which will subsequently be used by SQL Apply. This procedure will enable database-wide primary- and unique-key supplemental logging, if necessary.

In a CDB, the `BUILD` procedure must be called from the root database on the primary. Additionally, you cannot add or remove PDBs from a CDB while this procedure is executing.
Note:

In databases created using Oracle Database 11g release 2 (11.2) or later, supplemental logging information is automatically propagated to any existing physical standby databases. However, for databases in earlier releases, or if the database was created using an earlier release and then upgraded to 11.2, you must check whether supplemental logging is enabled at the physical standby(s) if it is also enabled at the primary database. If it is not enabled at the physical standby(s), then before performing a switchover or failover, you must enable supplemental logging on all existing physical standby databases. To do so, issue the following SQL command on each physical standby:

```
SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA (PRIMARY KEY, UNIQUE INDEX) COLUMNS;
```

If you do not do this, then any logical standby that is also in the same Data Guard configuration will be unusable if a switchover or failover is performed to one of the physical standby databases. If a switchover or failover has already occurred and supplemental logging was not enabled, then you must recreate all logical standby databases.

Syntax

```
DBMS_LOGSTDBY.BUILD;
```

Usage Notes

- Supplemental log information includes extra information in the redo logs that uniquely identifies a modified row in the logical standby database, and also includes information that helps efficient application of changes to the logical standby database.
- LogMiner dictionary information allows SQL Apply to interpret data in the redo logs.
- `DBMS_LOGSTDBY.BUILD` should be run only once for each logical standby database you want to create. You do not need to use `DBMS_LOGSTDBY.BUILD` for each Oracle RAC instance.
- `DBMS_LOGSTDBY.BUILD` waits for all transactions (including distributed transactions) that are active at the time of the procedure invocation to complete before returning. See `Oracle Database Administrator's Guide` for information about how to handle in-doubt transactions.

Examples

To build the LogMiner dictionary in the redo stream of the primary database and to record additional information so that a logical standby database can be instantiated, issue the following SQL statement at the primary database

```
SQL> EXECUTE DBMS_LOGSTDBY.BUILD;
```
97.4.4 EDS_ADD_TABLE

This procedure adds EDS-based replication for the table. It should be invoked on the primary database first and then on the standby database.

Syntax

```sql
DBMS_LOGSTDBY.EDS_ADD_TABLE (table_owner IN VARCHAR2,
                                 table_name IN VARCHAR2,
                                 p_dblink  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_owner</td>
<td>Owner of the table to be created or re-created in the standby database</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to be created or re-created in the standby database</td>
</tr>
<tr>
<td>p_dblink</td>
<td>A database link to the primary database</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-942</td>
<td>Table or view does not exist</td>
</tr>
<tr>
<td>ORA-16103</td>

</tr>
<tr>
<td>ORA-16279</td>
<td>Specified database link does not have the necessary roles for operation</td>
</tr>
<tr>
<td>ORA-16302</td>
<td>Extended datatype support is not supported for specified table</td>
</tr>
<tr>
<td>ORA-16303</td>
<td>Specified table already has EDS on this database</td>
</tr>
<tr>
<td>ORA-16304</td>
<td>Procedure must first be called at the primary database</td>
</tr>
<tr>
<td>ORA-16306</td>
<td>Specified table does not have a primary key</td>
</tr>
</tbody>
</table>

Usage Notes

- When this procedure is invoked on the primary, the definition of the local table is used to compose the shadow table and both the base and shadow table triggers.
- When this procedure is invoked on the standby, a database link to the primary (p_dblink) must be provided so that the definition of the table on the primary can
be used to compose the shadow table and its trigger on the standby. After the shadow table and its trigger are composed on the standby, the `DBMS_LOGSTDBY.INSTANTIATE_TABLE` procedure is called on the base table, using the provided database link to the primary. The `p_dblink` parameter is ignored when called on the primary and it defaults to NULL.

- Error checking is done up front. Generally, if the table contains a datatype that this procedure does not support, then an error is raised.

If the table is already supported by SQL Apply, then an exception is raised. To determine whether a table is a candidate for extended datatype support (EDS), query the `DBA_LOGSTDBY_EDS_SUPPORTED` view on the primary.

- This procedure must be executed on the primary before it is executed on the standby; otherwise an error is raised.

- For role changes to a logical standby it is essential that EDS be added to both the primary and the standby prior to the role change. If it is added only on the primary, then it must be removed after the role change because the EDS context would then be invalid.

- For rolling upgrades the procedure only needs to be called on the primary.

- This procedure is not replicated to a logical standby and therefore must be executed on both the primary and the standby databases. It is replicated to a physical standby so when it is used for rolling upgrades it should only be called on the primary.

- When this procedure is executed on the standby, it requires that SQL Apply be stopped and the database guard set to either STANDBY or NONE. When the procedure is complete, the table is protected by the database guard.

**Examples**

To add EDS for the table `OE.CUSTOMERS`, issue the following commands, first on the primary and then on the standby.

On the primary database, issue the following command:

```sql
execute dbms_logstdby.eds_add_table('OE','CUSTOMERS');
```

On the standby database, issue the following commands:

```sql
alter database stop logical standby apply;
execute dbms_logstdby.eds_add_table('OE','CUSTOMERS','dblink-to-primary');
alter database start logical standby apply immediate;
```

### 97.4.5 EDS_EVOLVE_AUTOMATIC

This procedure either enables or disables automatic DDL handling for EDS tables.

**Syntax**

```sql
DBMS_LOGSTDBY.EDS_EVOLVE_AUTOMATIC (options IN VARCHAR2);
```
Parameters

Table 97-8  EDS_EVOLVE_AUTOMATIC Parameter Descriptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Specify ENABLE to enable automatic DDL handling for EDS.</td>
</tr>
<tr>
<td></td>
<td>Specify DISABLE to disable automatic DDL handling for EDS.</td>
</tr>
</tbody>
</table>

Exceptions

Table 97-9  EDS_EVOLVE_AUTOMATIC Exception Descriptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16104</td>
<td>The specified parameter is not valid</td>
</tr>
<tr>
<td>ORA-16305</td>
<td>Procedure not supported on a logical standby</td>
</tr>
</tbody>
</table>

Usage Notes

- For transparent handling of DDLs on all EDS-enabled tables, this procedure must be called at the primary database once (with the ENABLE option) prior to the first call to EDS_ADD_TABLE.
- If an EDS-specific DDL trigger is enabled, it fires after every DDL to determine whether the DDL affects the viability of EDS-replication of any of the tables presently enabled for EDS. If it does, then a separate EVOLVING trigger is generated on the table that ensures no DMLs are allowed on the affected base table until the compensating actions are taken to repair the EDS-specific metadata.
- If the SQL statements ALTER TABLE or CREATE UNIQUE INDEX are executed on an EDS-maintained table, then an evolve operation is started if automatic evolve has been enabled.
- This procedure can be called on a primary database only and is replicated via SQL Apply to a logical standby database.
- When the procedure is executed on the standby it succeeds regardless of the database guard setting and whether or not apply is running.

Examples

To enable automatic evolution of all EDS-maintained tables, issue the following statement:

```sql
execute dbms_logstdby.eds_evolve_automatic('ENABLE');
```

After automatic evolve has been enabled, there is no need to issue eds_evolve commands. They will be done automatically for you upon completion of a DDL command issued against an EDS table.

To disable automatic evolution of all EDS-maintained tables, issue the following statement:

```sql
execute dbms_logstdby.eds_evolve_automatic('DISABLE');
```
97.4.6 EDS_EVOLVE_MANUAL

This procedure allows you to evolve EDS tables manually (that is, manually take compensating actions based on DDLs on the base tables with EDS-replication).

Syntax

```sql
DBMS_LOGSTDBY.EDS_EVOLVE_MANUAL (
  options            IN VARCHAR2,
  table_owner        IN VARCHAR2,
  table_name         IN VARCHAR2);
```

Parameters

Table 97-10   EDS_EVOLVE_MANUAL Parameter Descriptions

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Valid options are:</td>
</tr>
<tr>
<td></td>
<td>• START - start an evolve operation, prior to performing the DDL</td>
</tr>
<tr>
<td></td>
<td>• FINISH - finish an evolve operation after performing the DDL</td>
</tr>
<tr>
<td></td>
<td>• CANCEL - cancel a started evolve operation</td>
</tr>
<tr>
<td>table_owner</td>
<td>Owner of the table to be created or re-created in the standby database</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to be created or re-created in the standby database</td>
</tr>
</tbody>
</table>

Exceptions

Table 97-11   EDS_EVOLVE_MANUAL Exception Descriptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16302</td>
<td>Extended datatype support is not supported for specified table</td>
</tr>
<tr>
<td>ORA-16305</td>
<td>Procedure not supported on a logical standby</td>
</tr>
<tr>
<td>ORA-16306</td>
<td>Specified table does not have a primary key</td>
</tr>
<tr>
<td>ORA-16307</td>
<td>Table not prepared for extended datatype support operation</td>
</tr>
</tbody>
</table>

Usage Notes

- To perform a manual evolve operation, you must call `EDS_EVOLVE_MANUAL` before and after any DDL that may affect the base table being replicated with EDS. The following is the prescribed method for evolving manually:
  1. Call `EDS_EVOLVE_MANUAL` with the **START** option.
  2. Perform the DDL.
  3. Call `EDS_EVOLVE_MANUAL` with the **FINISH** option.

Deviation from this order could lead to data loss. An error is returned if the procedure is called with the **FINISH** option before it is called with **START** for the specified table. When the procedure is called with the **START** option, DML on the table is blocked by an evolve trigger.
• This procedure can only be invoked on a primary database.

• When this procedure is executed on the standby, SQL Apply must be stopped and the database guard set to either STANDBY or NONE. When the procedure is complete, the table is protected by the database guard.

Examples

To manually evolve an EDS table, issue the following commands on the primary database:

```sql
execute dbms_logstdby.eds_evolve_manual('START','OE','CUSTOMERS');
alter table oe.customers some_DDL_construct;
execute dbms_logstdby.eds_evolve_manual('FINISH','OE','CUSTOMERS');
```

97.4.7 EDS_REMOVE_TABLE

This procedure removes EDS-based replication for the specified table. It also drops the shadow table and triggers.

Syntax

```sql
DBMS_LOGSTDBY.EDS_REMOVE_TABLE (
    table_owner    IN VARCHAR2,
    table_name     IN VARCHAR2,
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_owner</td>
<td>Owner of the table to be created or re-created in the standby database</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to be created or re-created in the standby database</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
</tbody>
</table>

Usage Notes

• When this procedure is called on the standby, the shadow table and both triggers are dropped locally but not on the primary.

When this procedure is called on the primary, the shadow table and both triggers are dropped and the procedure is re-executed on the standby by the apply engine. Therefore, the supporting shadow table and triggers are also dropped at the logical standby. Using this approach, a single call made on the primary can remove EDS from the entire configuration for a table.
• In a multi-standby configuration, you can remove support on a single standby by calling this procedure on that standby.

• This procedure takes out an exclusive table lock to ensure isolation in the presence of ongoing user writes on the same table. Thus the procedure will block until existing write-transactions that have outstanding row locks on the table are completed.

• When this procedure is executed on the standby, SQL Apply must be stopped and the database guard set to either STANDBY or NONE. When the procedure is complete, the table is protected by the database guard.

Examples

To remove EDS for the table OE.CUSTOMERS, issue the following command on the primary database:

```sql
execute dbms_logstdby.eds_remove_table('OE','CUSTOMERS');
```

97.4.8 INSTANTIATE_TABLE Procedure

This procedure creates and populates a table in the standby database from a corresponding table in the primary database.

The table requires the name of the database link (dblink) as an input parameter. If the table already exists in the logical standby database, it will be dropped and re-created based on the table definition at the primary database. This procedure only brings over the data associated with the table, and not the associated indexes and constraints.

Use the INSTANTIATE_TABLE procedure to:

• Add a table to a standby database.

• Re-create a table in a standby database.

In a CDB, the INSTANTIATE_TABLE procedure must be called from within the container in which the table to be instantiated resides. Additionally, the database link that is provided to the primary database must point to the corresponding container on the primary.

Syntax

```sql
DBMS_LOGSTDBY.INSTANTIATE_TABLE (  
    schema_name IN VARCHAR2,  
    table_name IN VARCHAR2,  
    dblink IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table to be created or re-created in the standby database</td>
</tr>
</tbody>
</table>

97-15
Table 97-14  (Cont.) INSTANTIATE_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of the database link account that has privileges to read and lock the table in the primary database, as well as the SELECT_CATALOG_ROLE on the primary database</td>
</tr>
</tbody>
</table>

Exceptions

Table 97-15  INSTANTIATE_TABLE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16236</td>
<td>Logical Standby metadata operation in progress</td>
</tr>
<tr>
<td>ORA-16276</td>
<td>Specified database link does not correspond to primary database</td>
</tr>
<tr>
<td>ORA-16277</td>
<td>Specified table is not supported by logical standby database</td>
</tr>
<tr>
<td>ORA-16278</td>
<td>Specified table has a multi-object skip rule defined</td>
</tr>
</tbody>
</table>

Usage Notes

- Use this procedure to create and populate a table in a way that keeps the data on the standby database transactionally consistent with the primary database.
- This table will not be synchronized with the rest of the tables being maintained by SQL Apply and SQL Apply will not start to maintain it until SQL Apply encounters redo that occurred after the table was instantiated from the primary. The SCN at which the table was instantiated from the primary database is available in the DBA_LOGSTDBY_EVENTS view.
- The specified table must be a table that is supported by logical standby (that is, it does not appear in the DBA_LOGSTDBY_UNSUPPORTED_TABLES view on the primary database).
- If there are any skip rules that specifically name this table (without any wildcards), those skip rules will be dropped as part of INSTANTIATE_TABLE, so that the table will be properly maintained by SQL Apply in the future. If there are skip rules that indirectly reference this table (match a skip rule with a wildcard in the schema_name or table_name, and have a TABLE, DML, or SCHEMA_DDL statement type), INSTANTIATE_TABLE will fail with an ORA-16278 error. Any multi-object skip rules that pertain to the table must be dropped or changed before re-attempting the INSTANTIATE_TABLE call.

Examples

```
SQL> EXECUTE DBMS_LOGSTDBY.INSTANTIATE_TABLE (-
    2    SCHEMA_NAME => 'HR', TABLE_NAME => 'EMPLOYEES', -
    3    DBLINK => 'INSTANTIATE_TBL_LINK');
```
97.4.9 IS_APPLY_SERVER Function

This function returns TRUE if it is executed from PL/SQL in the context of a logical standby apply server process.

This function is used in conjunction with triggers that have the fire_once parameter in the DBMS_DDL.SET_TRIGGER_FIRING_PROPERTY subprogram set to FALSE (the default is TRUE). Such triggers are executed when the relevant target is updated by an apply process. This function can be used within the body of the trigger to ensure that the trigger takes different (or no) actions on the primary or on the standby.

Syntax

DBMS_LOGSTDBY.IS_APPLY_SERVER
RETURN BOOLEAN;

Parameters
None

97.4.10 MAP_PRIMARY_SCN Function

This function returns an SCN on the standby that predates the supplied SCN from the primary database by at least 5 minutes.

It can be used to determine a safe SCN to use in a compensating flashback database operation at the logical standby database, following a flashback database operation or a point-in-time recovery operation at the primary database.

Syntax

DBMS_LOGSTDBY.MAP_PRIMARY_SCN(primary_scn NUMBER) RETURN NUMBER;

Exceptions

Table 97-16   MAP_PRIMARY_SCN Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20001</td>
<td>Primary SCN is before mapped range</td>
</tr>
<tr>
<td>ORA-20002</td>
<td>SCN mapping requires PRESERVE_COMMIT_ORDER to be TRUE</td>
</tr>
</tbody>
</table>

Usage Notes

Use this function to get a conservative SCN at the logical standby database that corresponds to an SCN at the primary database. This function is useful in the context of doing compensating flashback database operations at the logical standby following a flashback database or a point-in-time recovery operation done at the primary database.
97.4.11 PREPARE_FOR_NEW_PRIMARY Procedure

The `PREPARE_FOR_NEW_PRIMARY` procedure must be invoked at a logical standby database following a failover, if that standby database was not the target of the failover operation.

Such a standby database must process the exact same set of redo logs processed at the new primary database. This routine ensures that the local logical standby database has not processed more redo than the new primary database and reports the set of archive logs that must be replaced to ensure consistency. The set of replacement logs will be reported in the alert.log. These logs must be copied to the logical standby and registered using the `ALTER DATABASE REGISTER LOGICAL LOGFILE` statement.

In a CDB, the `PREPARE_FOR_NEW_PRIMARY` procedure must be called from the root database.

Syntax

```
DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (
    FORMER_STANDBY_TYPE         IN VARCHAR2,
    DBLINK                      IN VARCHAR2);
```

Parameters

Table 97-17  PREPARE_FOR_NEW_PRIMARY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORMER_STANDBY_TYPE</td>
<td>The type of standby database that was the target of the failover operation to become the new primary database. Valid values are 'PHYSICAL' if the new primary was formerly a physical standby, and 'LOGICAL' if the new primary database was formerly a logical standby database.</td>
</tr>
<tr>
<td>DBLINK</td>
<td>The name of a database link to the new primary database</td>
</tr>
</tbody>
</table>

Exceptions

Table 97-18  PREPARE_FOR_NEW_PRIMARY Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16104</td>
<td>Invalid Logical Standby option.</td>
</tr>
<tr>
<td>ORA-16109</td>
<td>Failed to apply log data from previous primary.</td>
</tr>
</tbody>
</table>

Usage Notes

- This routine is intended only for logical standby systems. This routine will fail if the new primary database was formerly a logical standby database and the LogMiner dictionary build has not completed successfully. Log files displayed in the alert log will be referred to as terminal logs. Users should keep in mind that file paths are relative to the new primary database and may not resolve locally. Upon manual registration of the terminal logs, users should complete the process by calling either `START LOGICAL STANDBY APPLY` if the new primary database was formerly a physical standby database or `START LOGICAL STANDBY APPLY NEW PRIMARY` if the new
primary database was formerly a logical standby database. See the alert log for more details regarding the reasons for any exception.

Examples

SQL> EXECUTE DBMS_LOGSTDBY.PREPARE_FOR_NEW_PRIMARY (  -
  FORMER_STANDBY_TYPE => 'LOGICAL',  -
  DBLINK => 'dblink_to_newprimary');

97.4.12 PURGE_SESSION Procedure

PURGE_SESSION identifies all archived redo log files that have been applied to the logical standby database and are no longer needed by SQL Apply.

Once identified, you can issue operating system commands to delete some or all of the unnecessary archived redo log files.

In a CDB, the PURGE_SESSION procedure must be called from the root database.

Syntax

DBMS_LOGSTDBY.PURGE_SESSION;

Exceptions

Table 97-19  PURGE_SESSION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01309</td>
<td>Invalid session</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure does not delete the archived redo log files. You must issue operating system commands to delete unneeded files.
- This procedure updates the DBA_LOGMNR_PURGED_LOG view that displays the archived redo log files that have been applied to the logical standby database.
- In Oracle Database 10g Release 2, metadata related to the archived redo log files (and the actual archived redo log files) are purged automatically based on the default setting of the LOG_AUTO_DELETE parameter described in the DBMS_LOGSTDBY.APPLY_SET procedure described.

Example

To identify and remove unnecessary files:

1. Enter the following statement on the logical standby database:
   SQL> EXECUTE DBMS_LOGSTDBY.PURGE_SESSION;

2. Query the DBA_LOGMNR_PURGED_LOG view to list the archived redo log files that can be removed:
   SQL> SELECT * FROM DBA_LOGMNR_PURGED_LOG;

   FILE_NAME
   ------------------------------------
   /boston/arc_dest/arc_1_40_509538672.log
3. Use operating system-specific commands to delete archived redo log files from the file system.

97.4.13 REBUILD Procedure

This procedure is used if a database that has recently changed its role to a primary database following a failover operation fails to record relevant metadata (including the LogMiner dictionary) in the redo stream required for other logical standby databases.

In a CDB, the `REBUILD` procedure must be called from the root database.

**Syntax**

```sql
DBMS_LOGSTDBY.REBUILD;
```

**Usage Notes**

- LogMiner dictionary information is logged in the redo log files. The standby redo log files (if present) are archived.

**Examples**

```sql
SQL> EXECUTE DBMS_LOGSTDBY.REBUILD;
```

97.4.14 SET_TABLESPACE Procedure

This procedure moves metadata tables required by SQL Apply to the user-specified tablespace.

By default, the metadata tables are created in the `SYSAUX` tablespace. SQL Apply cannot be running when you invoke this procedure.

In a CDB, the `SET_TABLESPACE` procedure must be called from the root database.

**Syntax**

```sql
DBMS_LOGSTDBY.SET_TABLESPACE(
    NEW_TABLESPACE IN VARCHAR2)
```

**Parameters**

**Table 97-20  SET_TABLESPACE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEW_TABLESPACE</td>
<td>Name of the new tablespace where metadata tables will reside.</td>
</tr>
</tbody>
</table>
Exceptions

Table 97-21  SET_TABLESPACE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16236</td>
<td>Logical Standby metadata operation in progress</td>
</tr>
</tbody>
</table>

Examples

To move metadata tables to a new tablespace named LOGSTDBY_TBS, issue the following statement:

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SET_TABLESPACE (new_tablespace => 'LOGSTDBY_TBS');
```

97.4.15 SKIP Procedure

The SKIP procedure can be used to define rules that will be used by SQL Apply to skip the application of certain changes to the logical standby database.

For example, the SKIP procedure can be used to skip changes to a subset of tables in the logical standby database. It can also be used to specify DDL statements that should not be applied at the logical standby database or should be modified before they are applied in the logical standby database. One reason why a DDL statement may need to be modified is to accommodate a different directory structure on the logical standby database.

Note:

For information about skipping containers, see "Skipping Containers."

Syntax

```sql
DBMS_LOGSTDBY.SKIP (stmt                      IN VARCHAR2,
                     schema_name               IN VARCHAR2 DEFAULT NULL,
                     object_name               IN VARCHAR2 DEFAULT NULL,
                     proc_name                 IN VARCHAR2 DEFAULT NULL,
                     use_like                  IN BOOLEAN DEFAULT TRUE,
                     esc                       IN CHAR1 DEFAULT NULL);
```
Parameters

Table 97-22  SKIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt</td>
<td>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration since keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 97-23 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter. The keyword PL/SQL is used for the execution of Oracle-supplied packages which are supported for replication.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>proc_name</td>
<td>Name of a stored procedure to call when SQL Apply determines that a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: 'schema.package.procedure' This procedure returns a value that directs SQL Apply to perform one of the following: execute the statement, skip the statement, or execute a replacement statement. The procedures to be invoked in the case of DDL or PL/SQL take no arguments. You can access the various information needed inside the procedure by accessing the context associated with the namespace,LSBY_APPLY_CONTEXT. For a full list of parameters that are accessible in the context of the skip procedure, see the DBMS_LOGSTDBY_CONTEXT package. The parameters of interest in the case of DDLs are: STATEMENT, STATEMENT_TYPE, SCHEMA, NAME, CURRENT_SCHEMA, XIDUSN, XIDSLT, XIDSQN and SKIP_ACTION. The parameters of interest in the case of PL/SQL are: STATEMENT, PACKAGE_SCHEMA, PACKAGE_NAME, PROCEDURE_NAME, CURRENT_SCHEMA, XIDUSN, XIDSLT, XIDSQN, EXIT_STATUS, and SKIP_ACTION. Note 1: The DBMS_LOGSTDBY.SKIP_ACTION_REPLACE constant is not supported for PL/SQL. Note 2: SQL Apply calls the skip handler when the procedure's exit is processed. Note 3: The use_like parameter must be set to FALSE for PL/SQL since wildcarding PL/SQL is not supported.</td>
</tr>
</tbody>
</table>
A sample conditional skip rule on DBMS_RLS.DROP_POLICY is as follows:

```
create or replace procedure sec.mgr.skip_drop_policy
is
  l_stmt  CLOB;
  l_pkgown varchar2(30);
  l_pkgnam varchar2(30);
  l_procnm varchar2(30);
  l_cur_schema varchar2(30);
  l_xidusn number;
  l_xidslt number;
  l_xidsqn number;
  l_exit_status number;
  l_skip_action number;
begin
  -- read all relevant info
  dbms_logstdby_context.get_context(name => 'STATEMENT', value => l_stmt);
  dbms_logstdby_context.get_context(name => 'PACKAGE_SCHEMA', value => l_pkgown);
  dbms_logstdby_context.get_context(name => 'PACKAGE_NAME', value => l_pkgnam);
  dbms_logstdby_context.get_context(name => 'PROCEDURE_NAME', value => l_procnm);
  dbms_logstdby_context.get_context(name => 'CURRENT_SCHEMA', value => l_cur_schema);
  dbms_logstdby_context.get_context(name => 'XIDUSN', value => l_xidusn);
  dbms_logstdby_context.get_context(name => 'XIDSLT', value => l_xidslt);
  dbms_logstdby_context.get_context(name => 'XIDSQN', value => l_xidsqn);
  dbms_logstdby_context.get_context(name => 'EXIT_STATUS', value => l_exit_status);

  if 0 == l_exit_status then
    insert into sec_mgr.logit values ('Success: '||l_pkgown||'.'||l_pkgnam||'.'||l_procnm|| ' by '||
    l_current_user);
    if l_current_user != 'TESTSCHEMA' Then
      l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_APPLY;
    Else
      l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_SKIP;
    End If;
  end if;
  dbms_logstdby_context.set_context(name=>'SKIP_ACTION', value => l_skip_action);
end skip_drop_policy;
```

EXECUTE DBMS_LOGSTDBY.SKIP( -
  stmt => 'PL/SQL', -
  schema_name => 'SYS', -
  object_name => 'DBMS_RLS.DROP_POLICY', -
  proc_name => 'SEC_MGR.SKIP_DROP_POLICY' - use_like=> FALSE);
Table 97-22  (Cont.) SKIP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>use_like</td>
<td>Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in Oracle Database SQL Language Reference.</td>
</tr>
<tr>
<td>esc</td>
<td>Identifies an escape character (such as the character &quot;)&quot;) that you can use for pattern matching. If the escape character appears in the pattern before the character &quot;%&quot; or &quot;_&quot; then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character. See Oracle Database SQL Language Reference for more information about pattern matching.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure requires DBA privileges to execute.
- You cannot associate a stored procedure to be invoked in the context of a DML statement. For example, the following statement returns the ORA-16104: invalid Logical Standby option requested error:

  SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'DML', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'DML_HANDLER');

Also, if an event matches multiple rules either because of the use of wildcards while specifying the rule or because of a specification of overlapping rules. For example, if you specify a rule for the SCHEMA_DDL event for the HR.EMPLOYEES table, and a rule for the ALTER TABLE event for the HR.EMPLOYEES table, only one of the matching procedures will be invoked (alphabetically, by procedure). In the following code example, consider the following rules:

  SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'SCHEMA_DDL', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'SCHEMA_DDL_HANDLER');

  SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'TABLE_ALTER_HANDLER');

On encountering an ALTER TABLE statement, the schema_ddl_handler procedure will be invoked because its name will be at the top of an alphabetically sorted list of procedures that are relevant to the statement. Collisions on a rule set because of a specification containing wildcard entries are resolved in a similar fashion. For example, the rules in the following example will result in the empddl_handler procedure being invoked upon encountering the ALTER TABLE HR.EMPLOYEES ADD COLUMN RATING NUMBER statement:

  SQL> EXECUTE DBMS_LOGSTDBY.SKIP(-
     stmt => 'ALTER TABLE', -
     schema_name => 'HR', -
     object_name => 'EMPLOYEES', -
     proc_name => 'TABLE_ALTER_HANDLER');
• **Use the** **SKIP** **procedure with caution**, particularly when skipping DDL statements. If a `CREATE TABLE` statement is skipped, for example, you must also specify other DDL statements that refer to that table in the **SKIP** procedure. Otherwise, the statements will fail and cause an exception. When this happens, SQL Apply stops running.

• **Before calling the** **SKIP** **procedure**, SQL Apply must be halted. Do this by issuing an `ALTER DATABASE STOP LOGICAL STANDBY APPLY` statement. Once all desired filters have been specified, issue an `ALTER DATABASE START LOGICAL STANDBY APPLY IMMEDIATE` statement to start SQL Apply using the new filter settings.

• **See the** **UNSKIP** **procedure** for information about reversing (undoing) the settings of the **SKIP** procedure.

• For **USER** statements, the `SCHEMA_NAME` parameter will be the user and specify '%' for the `OBJECT_NAME` parameter.

• If the `PROC_NAME` parameter is supplied, it must already exist in `DBA_PROCEDURES` and it must execute with `DEFINER` rights. If the procedure is declared with `INVOKER` rights, the `ORA-1031: insufficient privileges` message will be returned.

• If the procedure returns a `REPLACEMENT` statement, the `REPLACEMENT` statement will be executed using the `SYSTEM` and `OBJECT` privileges of the owner of the procedure.

• The PL/SQL block of a **SKIP** procedure cannot contain transaction control statements (for example, `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction.

**Skip Statement Options**

**Table 97-23** lists the supported values for the `stmt` parameter of the **SKIP** procedure. The left column of the table lists the keywords that may be used to identify the set of SQL statements to the right of the keyword. In addition, any of the SQL statements listed in the `sys.audit_actions` table (shown in the right column of **Table 97-23**) are also valid values. Note that keywords are generally defined by database object.

</tbody>
</table>

1 All directory objects are owned by SYS, but for the purpose of filtering them with a skip directive the schema should be specified as "%".

2 See Oracle Data Guard Concepts and Administration for information about supported packages.

3 Java schema objects (sources, classes, and resources) are considered the same as procedure for purposes of skipping (ignoring) SQL statements.

Exceptions

Table 97-24  DBMS_LOGSTDBY.SKIP Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
</table>
| ORA-01031 | Insufficient privileges:  
- Procedure used INVOKER rights  
- Procedure needs DBA privileges |
| ORA-16103 | Logical standby apply must be stopped to allow this operation. |
| ORA-16104 | Invalid logical standby option requested. |
| ORA-16203 | "Unable to interpret SKIP procedure return values."  
Indicates that a SKIP procedure has either generated an exception or has returned ambiguous values. You can identify the offending procedure by examining the DBA_LOGSTDBY_EVENTS view. |
| ORA-16236 | Logical standby metadata operation in progress. |

Examples

Example 1. Skipping all DML and DDL changes made to a schema
The following example shows how to specify rules so that SQL Apply will skip both DDL and DML statements made to the HR schema.

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'SCHEMA_DDL', -     schema_name => 'HR', -     object_name => '%', -     proc_name => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(STMT => 'DML', -     schema_name => 'HR', -     object_name => '%', -     proc_name => null);
```

Example 2. Creating a procedure to handle different file system organization
For example, if the file system organization in the logical standby database is different than that in the primary database, you can write a SKIP procedure to handle DDL
statements with file specifications transparently. The following procedure can handle DDL statements as long as you follow a specific naming convention for the file specification string.

1. **Create the SKIP procedure to handle tablespace DDL statements:**

   ```sql
   CREATE OR REPLACE PROCEDURE sys.handle_tbs_ddl
   IS
     l_old_stmt varchar2(4000);
     l_stmt_typ varchar2(40);
     l_schema varchar2(30);
     l_name varchar2(30);
     l_xidusn number;
     l_xidslt number;
     l_xidsqn number;
     l_skip_action number;
     l_new_stmt varchar2(4000);
   
   -- read all information
   dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_old_stmt);
   dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
   dbms_logstdby_context.get_context(name=>'OWNER',value=>l_schema);
   dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
   dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
   dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
   dbms_logstdby_context.get_context(name=>'XIDSQN',value=>l_xidsqn);
   dbms_logstdby_context.get_context(name=>'CONTAINER_NAME',value=>l_conname);

   --
   -- All primary file specification that contains a directory
   -- /usr/orcl/primary/dbs
   -- should go to /usr/orcl/stdby directory specification

   BEGIN
     l_new_stmt := replace (l_old_stmt, '/usr/orcl/primary/dbs','/usr/orcl/stdby');
     l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_REPLACE;
   EXCEPTION
     WHEN OTHERS THEN
       l_skip_action := DBMS_LOGSTDBY.SKIP_ACTION_ERROR;
       l_new_stmt := NULL;
   END;

   dbms_logstdby_context.set_context(name=>'new_statement', value => l_new_stmt);
   dbms_logstdby_context.set_context(name=>'SKIP_ACTION', value => l_skip_action);
   END handle_tbs_ddl;
   
   2. **Register the SKIP procedure with SQL Apply:**

   ```sql
   SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'TABLESPACE', proc_name => 'SYS.HANDLE_TBS_DDL');
   ```

Skipping Containers

To skip a container (either a PDB or the root), use the CONTAINER keyword. All SQL statements executed on the container, as well as any other actions taken on the container, are skipped.

You can skip a particular PDB within a CDB. For example, the following command skips the PDB named PDB1. The command must be executed at the root level:

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'PDB1');
```
As shown in the following example, you could also skip only the root of the CDB, but not any of the PDBs that exist under the root. The command must be executed at the root level:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP(stmt => 'CONTAINER', object_name => 'CDB$ROOT');
```

**Note:**

To create other skip rules for a container, create the rules from within the container. The container to which the rules will apply is automatically derived from the container in which the rules are created.

### 97.4.16 SKIP_ERROR Procedure

The SKIP_ERROR procedure specifies the action to take when a logical standby database detects an error.

Upon encountering an error, the logical standby database uses the criteria contained in this procedure to determine a course of action. The default action when a match is found is to skip the error and continue with applying changes. However, if a procedure is supplied, then SKIP_ERROR can take other actions depending on the situation. It can do nothing, which causes SQL Apply to stop, or it can change the error message text and stop SQL Apply, or it can actually skip the error.

**Syntax**

```
DBMS_LOGSTDBY.SKIP_ERROR (
    stmt                      IN VARCHAR2,
    schema_name               IN VARCHAR2 DEFAULT NULL,
    object_name               IN VARCHAR2 DEFAULT NULL,
    proc_name                 IN VARCHAR2 DEFAULT NULL,
    use_like                  IN BOOLEAN  DEFAULT NULL,
    esc                       IN CHAR1    DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt</td>
<td>Either a keyword that identifies a set of SQL statements or a specific SQL statement. The use of keywords simplifies configuration because keywords, generally defined by the database object, identify all SQL statements that operate on the specified object. Table 97-23 shows a list of keywords and the equivalent SQL statements, either of which is a valid value for this parameter.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The name of one or more schemas (wildcards are permitted) associated with the SQL statements identified by the stmt parameter. If not applicable, this value must be set to NULL.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of one or more objects (wildcards are permitted) associated with the SQL statements identified by the stmt. If not applicable, this value must be set to NULL.</td>
</tr>
</tbody>
</table>
Table 97-25  (Cont.) SKIP_ERROR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| proc_name | Name of a stored procedure to call when SQL Apply encounters an error and determines a particular statement matches the filter defined by the stmt, schema_name, and object_name parameters. Specify the procedure in the following format: 

""schema"."package"."procedure"

This procedure returns an error message that directs SQL Apply to perform one of the following actions:

- Silently skip the error and continue with SQL Apply
- Replace the error message that would have been created with a custom one, and stop SQL Apply
- Do nothing, causing SQL Apply to stop and the original error message to be logged

The procedure registered with SQL Apply does not take any parameters. The context associated with LSBY_APPLY_CONTEXT can be used to retrieve all relevant information related to the error. See the DBMS_LOGSTDBY_CONTEXT package for a list of all parameters associated with LSBY_APPLY_CONTEXT.

The parameters of interest for procedures registered with SKIP_ERROR are CONTAINER_NAME, STATEMENT, STATEMENT_TYPE, SCHEMA, NAME, XIDUSN, XIDSILT, XIDSQN, ERROR and NEW_ERROR.

use_like | Allows pattern matching to isolate the tables that you want to skip on the logical standby database. The use_like parameter matches a portion of one character value to another by searching the first value for the pattern specified by the second, and calculates strings using characters as defined by the input character set. This parameter follows the same rules for pattern matching described in Oracle Database SQL Language Reference.

esc | Identifies an escape character (such as the characters "%" or "\") that you can use for pattern matching. If the escape character appears in the pattern before the character "%" or "\" then Oracle interprets this character literally in the pattern, rather than as a special pattern matching character.

Usage Notes

- A stored procedure provided to the SKIP_ERROR procedure is called when SQL Apply encounters an error that could shut down the application of redo logs to the standby database.

- Running this stored procedure affects the error being written in the STATUS column of the DBA_LOGSTDBY_EVENTS table. The STATUS_CODE column remains unchanged. If the stored procedure is to have no effect, that is, apply will be stopped, then the NEW_ERROR is written to the events table. To truly have no effect, set NEW_ERROR to ERROR in the procedure.

- If the stored procedure requires that a shutdown be avoided, then you must set NEW_ERROR to NULL.

- This procedure requires DBA privileges to execute.

- For USER statements, the SCHEMA_NAME parameter will be the user and you should specify '%' for the OBJECT_NAME parameter.
• If the `PROC_NAME` parameter is specified, it must already exist in `DBA_PROCEDURES` and it must execute with `DEFINERS` rights. If the procedure is declared with `INVOKERS` rights, the `ORA-1031: insufficient privileges` message will be returned.

• The PL/SQL block of a `SKIP_ERROR` procedure cannot contain transaction control statements (for example: `COMMIT`, `ROLLBACK`, `SAVEPOINT`, and `SET CONSTRAINT`) unless the block is declared to be an autonomous transaction using the following syntax:

```
PRAGMA AUTONOMOUS_TRANSACTION
```

### Exceptions

#### Table 97-26  SKIP_ERROR Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
</table>
| ORA-01031   | Insufficient privileges:  
  • Procedure used `INVOKER` rights  
  • Procedure needs `DBA` privileges |
| ORA-16103   | Logical Standby apply must be stopped to allow this operation               |
| ORA-16104   | invalid Logical Standby option requested                                    |
| ORA-16236   | Logical Standby metadata operation in progress                               |

#### Example 1

The following example shows how to specify rules so that SQL Apply will skip any error raised from any `GRANT DDL` command.

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR('GRANT')
```

#### Example 2

To skip errors on `GRANT` statements on `SYS` or `HR` schemas, define a procedure `handle_error_ddl` and register it. In the following example, assume that `handle_error_ddl` is a free-standing procedure in the `SYS` schema.

1. Create the error-handler procedure:

```sql
CREATE OR REPLACE PROCEDURE sys.handle_error_ddl
is
    l_stmt    VARCHAR2(4000);
    l_stmt_type VARCHAR2(40);
    l_schema    VARCHAR2(30);
    l_name      VARCHAR2(30);
    l_xidusn      NUMBER;
    l_xidslt      NUMBER;
    l_xidsqn      NUMBER;
    l_error     VARCHAR2(4000);
    l_conname    VARCHAR2(30);
    l_newerr   VARCHAR2(4000);
BEGIN
    dbms_logstdby_context.get_context(name=>'STATEMENT',value=>l_stmt);
    dbms_logstdby_context.get_context(name=>'STATEMENT_TYPE',value=>l_stmt_type);
    dbms_logstdby_context.get_context(name=>'SCHEMA',value=>l_schema);
    dbms_logstdby_context.get_context(name=>'NAME',value=>l_name);
    dbms_logstdby_context.get_context(name=>'XIDUSN',value=>l_xidusn);
    dbms_logstdby_context.get_context(name=>'XIDSLT',value=>l_xidslt);
```

97-32
-- default error to what we already have
l_new_error := l_error;

-- Ignore any GRANT errors on SYS or HR schemas
IF INSTR(UPPER(l_stmt), 'GRANT') > 0
THEN
  IF l_schema is NULL
  OR (l_schema is NOT NULL AND
      (UPPER(l_schema) = 'SYS' OR
       UPPER(l_schema) = 'HR')
  THEN
    l_new_error := NULL;
  END IF;
  END IF;
END IF;

dbms_logstdby_context.set_context(name => 'NEW_ERROR', value => l_new_error);
END handle_error_ddl;
/

2. Register the error handler with SQL Apply:

  SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR ( -
     2   statement => 'NON_SCHEMA_DDL', -
     2   schema_name => NULL, -
     2   object_name => NULL, -
     2   proc_name => 'SYS.HANDLE_ERROR_DDL');

97.4.17 SKIP_TRANSACTION Procedure

This procedure provides a way to skip (ignore) applying transactions to the logical standby database. You can skip specific transactions by specifying transaction identification information.

Syntax

DBMS_LOGSTDBY.SKIP_TRANSACTION ( -
  xidusn IN NUMBER, -
  xidslt IN NUMBER, -
  xidsqn IN NUMBER);

Parameters

Table 97-27   SKIP_TRANSACTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XIDUSN NUMBER</td>
<td>Transaction ID undo segment number of the transaction being skipped</td>
</tr>
<tr>
<td>XIDSLT NUMBER</td>
<td>Transaction ID slot number of the transaction being skipped</td>
</tr>
<tr>
<td>XIDSQN NUMBER</td>
<td>Transaction ID sequence number of the transaction being skipped</td>
</tr>
</tbody>
</table>
Usage Notes

If SQL Apply stops due to a particular transaction (for example, a DDL transaction), you can specify that transaction ID and then continue to apply. You can call this procedure multiple times for as many transactions as you want SQL Apply to ignore.

**WARNING:**

SKIP_TRANSACTION is an inherently dangerous operation. Do not invoke this procedure unless you have examined the transaction in question through the V$LOGMNR_CONTENTS view and have taken compensating actions at the logical standby database. SKIP_TRANSACTION is not the appropriate procedure to invoke to skip DML changes to a table.

To skip a DML failure, use a SKIP procedure, such as SKIP('DML','MySchema','MyFailed Table'). Using the SKIP_TRANSACTION procedure for DML transactions may skip changes for other tables, thus logically corrupting them.

- This procedure requires DBA privileges to execute.
- Use the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Exceptions

Table 97-28  SKIP_TRANSACTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01031</td>
<td>Need DBA privileges</td>
</tr>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
</tbody>
</table>

Examples

To skip a DDL transaction with \((XIDUSN, XIDSLT, XIDSQN)\) of \((1.13.1726)\) you can register a rule as shown in the following example:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_TRANSACTION (-
     XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```

97.4.18 UNSKIP Procedure

Use the UNSKIP procedure to delete rules specified earlier with the SKIP procedure.

The parameters specified in the UNSKIP procedure must match exactly for it to delete an already-specified rule.

The container_name argument is valid only in a CDB.
Syntax

```
DBMS_LOGSTDBY.UNSKIP (  
    stmt                      IN VARCHAR2,  
    schema_name               IN VARCHAR2 DEFAULT NULL,  
    object_name               IN VARCHAR2 DEFAULT NULL,  
    container_name            IN VARCHAR2 DEFAULT NULL);
```

Parameters

The parameter information for the `UNSKIP` procedure is the same as that described for the `SKIP` procedure. See Table 97-22 for complete parameter information.

Exceptions

### Table 97-29   UNSKIP Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01031</td>
<td>need DBA privileges to execute this procedure</td>
</tr>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
</tbody>
</table>

Usage Notes

**WARNING:**

If DML changes for a table have been skipped and not compensated for, you must follow the call to the `UNSKIP` procedure with a call to the `INSTANTIATE_TABLE` procedure to synchronize this table with those maintained by SQL Apply.

- This procedure requires DBA privileges to execute.
- Wildcards passed in the `schema_name` or the `object_name` parameter are not expanded. The wildcard character is matched at the character level. Thus, you can delete only one specified rule by invoking the `UNSKIP` procedure, and you will need a distinct `UNSKIP` procedure call to delete each rule that was previously specified.

For example, assume you have specified the following two rules to skip applying DML statements to the `HR.EMPLOYEE` and `HR.EMPTEMP` tables:

```
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML',-  
    SCHEMA_NAME => 'HR', -  
    OBJECT_NAME => 'EMPLOYEE', -  
    PROC_NAME => null);
SQL> EXECUTE DBMS_LOGSTDBY.SKIP (stmt => 'DML',-  
    SCHEMA_NAME => 'HR', -  
    OBJECT_NAME => 'EMPTEMP', -  
    PROC_NAME => null);
```

In the following example, the wildcard in the `TABLE_NAME` parameter cannot be used to delete the rules that were specified:
In fact, this **UNSKIP** procedure matches neither of the rules, because the wildcard character in the **TABLE_NAME** parameter is not expanded. Instead, the wildcard character will be used in an exact match to find the corresponding **SKIP** rule.

### 97.4.19 UNSKIP_ERROR Procedure

Use the **UNSKIP_ERROR** procedure to delete rules specified earlier with the **SKIP_ERROR** procedure.

The parameters specified in the **UNSKIP_ERROR** procedure must match exactly for the procedure to delete an already-specified rule.

The **container_name** argument is valid only in a CDB.

**Syntax**

```sql
DBMS_LOGSTDBY.UNSKIP_ERROR(
    stmt IN VARCHAR2,
    schema_name IN VARCHAR2 DEFAULT NULL,
    object_name IN VARCHAR2 DEFAULT NULL,
    container_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

The parameter information for the **UNSKIP_ERROR** procedure is the same as that described for the **SKIP_ERROR** procedure. See Table 97-25 for complete parameter information.

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01031</td>
<td>Need DBA privileges</td>
</tr>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
</tbody>
</table>

**Usage Notes**

- This procedure requires DBA privileges to execute.
- Wildcards passed in the **schema_name** or the **object_name** parameters are not expanded. Instead, the wildcard character is treated as any other character and an exact match is made. Thus, you can delete only one specified rule by invoking the **UNSKIP_ERROR** procedure, and you need a distinct **UNSKIP_ERROR** procedure call to delete each rule that you previously specified.

For example, assume you have specified the following two rules to handle the **HR.EMPLOYEE** and **HR.EMPTEMP** tables:

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMPLOYEE');
```

```sql
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
    SCHEMA_NAME => 'HR', -
    OBJECT_NAME => 'EMP%');
```
PROC_NAME => 'hr_employee_handler');
SQL> EXECUTE DBMS_LOGSTDBY.SKIP_ERROR (STMT => 'DML',-
SCHEMA_NAME => 'HR', -
OBJECT_NAME => 'EMPTEMP', -
PROC_NAME => 'hr_tempemp_handler');

In this case, the following UNSKIP procedure cannot be used to delete the rules that you have specified:

SQL> EXECUTE DBMS_LOGSTDBY.UNSKIP_ERROR (STMT => 'DML',-
SCHEMA_NAME => 'HR', -
OBJECT_NAME => 'EMP%');

In fact, the UNSKIP procedure will match neither of the rules, because the wildcard character in the OBJECT_NAME parameter will not be expanded.

Example
To remove a handler that was previously registered with SQL Apply from getting called on encountering an error, you can issue the following statement:

DBMS_LOGSTDBY.UNSKIP_ERROR ( -
statement => 'NON_SCHEMA_DDL', -
schema_name => NULL, -
object_name => NULL);

97.4.20 UNSKIP_TRANSACTION Procedure

Use the UNSKIP_TRANSACTION procedure to delete rules specified earlier with the SKIP_TRANSACTION procedure.

The parameters specified in the UNSKIP_TRANSACTION procedure must match exactly for the procedure to delete an already-specified rule.

Syntax

DBMS_LOGSTDBY.UNSKIP_TRANSACTION (  
exidusn_p   IN NUMBER,  
exidslt_p   IN NUMBER,  
exidsqn_p   IN NUMBER);

Parameters

Table 97-31  UNSKIP_TRANSACTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XIDUSN</td>
<td>Transaction ID undo segment number of the transaction being skipped</td>
</tr>
<tr>
<td>XIDSLT</td>
<td>Transaction ID slot number of the transaction being skipped</td>
</tr>
<tr>
<td>XIDSQN</td>
<td>Transaction ID sequence number of the transaction being skipped</td>
</tr>
</tbody>
</table>
Exceptions

Table 97-32  UNSKIP_TRANSACTION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-01031</td>
<td>need DBA privileges to execute this procedure</td>
</tr>
<tr>
<td>ORA-16103</td>
<td>Logical Standby apply must be stopped to allow this operation</td>
</tr>
<tr>
<td>ORA-16104</td>
<td>invalid Logical Standby option requested</td>
</tr>
</tbody>
</table>

Usage Notes

• This procedure requires DBA privileges to execute.
• Query the DBA_LOGSTDBY_SKIP_TRANSACTION view to list the transactions that are going to be skipped by SQL Apply.

Examples

To remove a rule that was originally specified to skip the application of a transaction with (XIDUSN, XIDSLT, XIDSQN) of (1.13.1726) issue the following statement:

```sql
SQL> DBMS_LOGSTDBY.UNSKIP_TRANSACTION (XIDUSN => 1, XIDSLT => 13, XIDSQN => 1726);
```
As of Oracle Database 12c release 1 (12.1), SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`. You can use the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package to set and retrieve various parameters associated with `LSBY_APPLY_CONTEXT`. This is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTBDY.SKIP` and `DBMS_LOGSTBDY.SKIP_ERROR` procedures.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_LOGSTDBY_CONTEXT Subprograms

See Also:

*Oracle Data Guard Concepts and Administration* for more information about SQL Apply and logical standby databases

### 98.1 DBMS_LOGSTDBY_CONTEXT Overview

SQL Apply processes have access to a context namespace called `LSBY_APPLY_CONTEXT`.

The following table lists the predefined parameters associated with `LSBY_APPLY_CONTEXT` that you can set and retrieve by using the procedures provided in the `DBMS_LOGSTDBY_CONTEXT` package. The ability to set and retrieve the parameters in this way is useful when writing skip procedures that are registered with SQL Apply using the `DBMS_LOGSTBDY.SKIP` and `DBMS_LOGSTBDY.SKIP_ERROR` procedures.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATEMENT</td>
<td>First 4000 bytes of the statement that the Apply process is processing.</td>
</tr>
<tr>
<td>STATEMENT_TYPE</td>
<td>See Table 97-23 for a list of various statement types.</td>
</tr>
<tr>
<td>PACKAGE_SCHEMA</td>
<td>Schema that owns the PL/SQL package being processed (if applicable).</td>
</tr>
<tr>
<td>PACKAGE_NAME</td>
<td>Name of the PL/SQL package being processed (if applicable).</td>
</tr>
<tr>
<td>PROCEDURE_NAME</td>
<td>Name of the PL/SQL procedure being processed (if applicable).</td>
</tr>
<tr>
<td>CURRENT_SCHEMA</td>
<td>Current schema in effect when the DDL or PL/SQL procedure was executed at the primary.</td>
</tr>
<tr>
<td>XIDUSN</td>
<td>XIDUSN of the transaction at the primary database.</td>
</tr>
</tbody>
</table>
**Table 98-1** (Cont.) Predefined Parameters of Namespace
*LSBY_APPLY_CONTEXT*

<table>

</tr>
</tbody>
</table>

98.3.1 CLEAR_ALL_CONTEXT Procedure

This procedure clears all parameters contained within namespace LSBY_APPLY_CONTEXT.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_ALL_CONTEXT;
```

Parameters

None

98.3.2 CLEAR_CONTEXT Procedure

This procedure clears the specific parameter.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.CLEAR_CONTEXT (name IN VARCHAR2);
```

Parameters

Table 98-3  CLEAR_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the parameter to be cleared.</td>
</tr>
</tbody>
</table>

98.3.3 GET_CONTEXT Procedure

This procedure retrieves the value for the specified parameter.

Syntax

```
DBMS_LOGSTDBY_CONTEXT.GET_CONTEXT (name IN VARCHAR2, value OUT VARCHAR2);
```
Parameters

Table 98-4  GET_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>

<td>The value retrieved for the parameter.</td>
</tr>
</tbody>
</table>

98.3.4 SET_CONTEXT Procedure

This procedure sets the named parameter with the specified value.

Syntax

```sql
DBMS_LOGSTDBY_CONTEXT.SET_CONTEXT (
    name            IN VARCHAR2
    value           IN VARCHAR2);
```

Parameters

</table>
The `DBMS_MEMOPTIMIZE` package provides an interface for managing data in the memoptimize pool.

This chapter contains the following topics:

- `DBMS_MEMOPTIMIZE` Overview
- Summary of `DBMS_MEMOPTIMIZE` Subprograms

### 99.1 DBMS_MEMOPTIMIZE Overview

The `DBMS_MEMOPTIMIZE` package provides an interface for managing data in the memoptimize pool. The memoptimize pool is a memory area in the system global area (SGA) that stores table data and hash index related to Memoptimized Rowstore.

The `DBMS_MEMOPTIMIZE` package provides the following functionality:

- Populate the Memoptimized Rowstore hash index with the data related to a specific table.
- Remove the data from the Memoptimized Rowstore hash index related to a specific table.

### 99.2 Summary of DBMS_MEMOPTIMIZE Subprograms

This table lists the `DBMS_MEMOPTIMIZE` subprograms and briefly describes them.

**Table 99-1 DBMS_MEMOPTIMIZE Package Subprograms**

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DROP_OBJECT Procedure</td>
<td>Removes the in-memory hash index related to a table.</td>
</tr>
<tr>
<td>POPULATE Procedure</td>
<td>Populates the in-memory hash index with a table data.</td>
</tr>
</tbody>
</table>

### 99.2.1 DROP_OBJECT Procedure

This procedure removes the in-memory hash index for a table.

**Syntax**

```sql
DBMS_MEMOPTIMIZE.DROP_OBJECT (
    schema_name    IN VARCHAR2,
    table_name     IN VARCHAR2,
    partition_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 99-2  DROP_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table whose data is to be removed from the in-memory hash index.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the table partition whose data is to be removed from the in-memory hash index. This is an optional parameter and its default value is NULL.</td>
</tr>
</tbody>
</table>

99.2.2 POPULATE Procedure

This procedure populates the in-memory hash index for a table.

Syntax

```
DBMS_MEMOPTIMIZE.POPULATE (
    schema_name        IN VARCHAR2,
    table_name         IN VARCHAR2,
    partition_name     IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 99-3  POPULATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table from which the data is to be stored into the in-memory hash index.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the table partition from which the data is to be stored into the in-memory hash index. This is an optional parameter and its default value is NULL.</td>
</tr>
</tbody>
</table>
The DBMS_METADATA package provides a way for you to retrieve metadata from the database dictionary as XML or creation DDL and to submit the XML to re-create the object.

See Also:
Oracle Database Utilities for more information and for examples of using the DBMS_METADATA package.

This chapter contains the following topics:
• Overview
• Security Model
• Rules and Limits
• Data Structures - Object and Table Types
• Subprogram Groupings
  – Subprograms for Retrieving Multiple Objects From the Database
  – Subprograms for Submitting XML to the Database
• Summary of All DBMS_METADATA Subprograms

100.1 DBMS_METADATA Overview

You can use the DBMS_METADATA package to retrieve metadata and to submit XML.

Retrieving Metadata

If you are retrieving metadata, you can specify:
• The kind of object to be retrieved. This can be either a particular object type (such as a table, index, or procedure) or a heterogeneous collection of object types that form a logical unit (such as a database export or schema export).
• Optional selection criteria, such as owner or name.
• Parse items (attributes of the returned objects to be parsed and returned separately).
• Optional transformations on the output, implemented by XSLT (Extensible Stylesheet Language Transformation) scripts. By default the output is represented in XML, but you can specify transformations (into SQL DDL, for example), which are implemented by XSLT stylesheets stored in the database or externally.

DBMS_METADATA provides the following retrieval interfaces:
• For programmatic use: OPEN, SET_FILTER, SET_COUNT, GET_QUERY, SET_PARSE_ITEM, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, FETCH_xxx, and CLOSE retrieve multiple objects.

• For use in SQL queries and for browsing: GET_XML, GET_DDL and GET_SXML return metadata for a single named object. The GET_DEPENDENT_XML, GET_DEPENDENT_DDL, GET_GRANTED_XML, and GET_GRANTED_DDL interfaces return metadata for one or more dependent or granted objects. These procedures do not support heterogeneous object types.

Submitting XML

If you are submitting XML, you specify:

• The type of object
• Optional transform parameters to modify the object (for example, changing the object's owner)
• Parse items (attributes of the submitted objects to be parsed and submitted separately)
• Whether to execute the operation or simply return the generated DDL

DBMS_METADATA provides a programmatic interface for submission of XML. It is comprised of the following procedures: OPENW, ADD_TRANSFORM, SET_TRANSFORM_PARAM, SET_REMAP_PARAM, SET_PARSE_ITEM, CONVERT, PUT, and CLOSE.

100.2 DBMS_METADATA Security Model

The DBMS_METADATA package considers a privileged user to be one who is connected as user SYS or who has the SELECT_CATALOG_ROLE role.

The object views of the Oracle metadata model implement security as follows:

• Nonprivileged users can see the metadata of only their own objects.
• Nonprivileged users can also retrieve public synonyms, system privileges granted to them, and object privileges granted to them or by them to others. This also includes privileges granted to PUBLIC.
• If callers request objects they are not privileged to retrieve, no exception is raised; the object is simply not retrieved.
• If nonprivileged users are granted some form of access to an object in someone else's schema, they will be able to retrieve the grant specification through the Metadata API, but not the object's actual metadata.
• In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.
• For all objects that have passwords, except database links (for example, users and roles), the following rules apply:
  – A user who has the SELECT_CATALOG_ROLE can see all metadata for an object except the passwords for that object.
– The SYS user, users who have the EXP_FULL_DATABASE role, and users who own an object can see all metadata for that object, including passwords.

• For database links the password is never displayed. For security reasons Oracle restricts visibility of the password value to SYS users who query the link$.passwordx column directly. Instead of the password, DBMS_METADATA returns the following invalid syntax:

  IDENTIFIED BY VALUES ':1'

A user who knows the password of the database link can manually replace the :1 with the password.

100.3 Rules and Limits

In an Oracle Shared Server (OSS) environment, the DBMS_METADATA package must disable session migration and connection pooling.

This results in any shared server process that is serving a session running the package to effectively become a default, dedicated server for the life of the session. You should ensure that sufficient shared servers are configured when the package is used and that the number of servers is not artificially limited by too small a value for the MAX_SHARED_SERVERS initialization parameter.

100.4 DBMS_METADATA Data Structures - Object and Table Types

The DBMS_METADATA package defines, in the SYS schema, the OBJECT and TABLE types shown in this code.

```sql
CREATE TYPE sys.ku$_parsed_item AS OBJECT (
  item VARCHAR2(30),
  value VARCHAR2(4000),
  object_row NUMBER ) /
/
CREATE PUBLIC SYNONYM ku$_parsed_item FOR sys.ku$_parsed_item;

CREATE TYPE sys.ku$_parsed_items IS TABLE OF sys.ku$_parsed_item /
/
CREATE PUBLIC SYNONYM ku$_parsed_items FOR sys.ku$_parsed_items;

CREATE TYPE sys.ku$_ddl AS OBJECT (
  ddlText CLOB,
  parsedItems sys.ku$_parsed_items ) /
/
CREATE PUBLIC SYNONYM ku$_ddl FOR sys.ku$_ddl;

CREATE TYPE sys.ku$_ddls IS TABLE OF sys.ku$_ddl /
/
CREATE PUBLIC SYNONYM ku$_ddls FOR sys.ku$_ddls;

CREATE TYPE sys.ku$_multi_ddl AS OBJECT {
  object_row NUMBER,
```
CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddl FOR sys.ku$_multi_ddl;

CREATE TYPE sys.ku$_multi_ddls IS TABLE OF sys.ku$_multi_ddl;
/

CREATE OR REPLACE PUBLIC SYNONYM ku$_multi_ddls FOR sys.ku$_multi_ddls;

CREATE TYPE sys.ku$_ErrorLine IS OBJECT (  
  errorNumber    NUMBER,
  errorText      VARCHAR2(2000)  )
/

CREATE PUBLIC SYNONYM ku$_ErrorLine FOR sys.ku$_ErrorLine;

CREATE TYPE sys.ku$_ErrorLines IS TABLE OF sys.ku$_ErrorLine
/
CREATE PUBLIC SYNONYM ku$ErrorLines FOR sys.ku$_ErrorLines;

CREATE TYPE sys.ku$_SubmitResult AS OBJECT (  
  ddl          sys.ku$_ddl,
  errorLines   sys.ku$_ErrorLines   );
/

CREATE TYPE sys.ku$_SubmitResults IS TABLE OF sys.ku$_SubmitResult
/

CREATE PUBLIC SYNONYM ku$_SubmitResults FOR sys.ku$_SubmitResults;

---

**Note:**

The maximum size of the VARCHAR2, NVARCHAR2, and RAW datatypes has been increased to 32 KB when the COMPATIBLE initialization parameter is set to 12.0 and the MAX_STRING_SIZE initialization parameter is set to EXTENDED. The DBMS_METADATA package supports this increased size unless the version of the metadata is earlier than Oracle Database 12c Release 1 (12.1).

---

### 100.5 DBMS_METADATA Subprogram Groupings

The DBMS_METADATA subprograms retrieve objects from, and submit XML to, a database. Some subprograms are used for both activities, while others are used only for retrieval or only for submission.

- **Table 100-1** provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to retrieve multiple objects from a database.
- **Table 100-2** provides a summary, in alphabetical order, of DBMS_METADATA subprograms used to submit XML metadata to a database.
100.5.1 DBMS_METADATA Subprograms for Retrieving Multiple Objects From the Database

DBMS_METADATA uses these subprograms used for retrieving multiple objects from the database.

Table 100-1   DBMS_METADATA Subprograms for Retrieving Multiple Objects

<td>Specifies parameters to the XSLT styleheets identified by transform_handle</td>
</tr>
</tbody>
</table>

100.6.1 ADD_TRANSFORM Function

The DBMS_METADATA.ADD_TRANSFORM function is used for both retrieval and submission.

- When this procedure is used to retrieve objects, it specifies a transform that FETCH_xxx applies to the XML representation of the retrieved objects.
When used to submit objects, it specifies a transform that `CONVERT` or `PUT` applies to the XML representation of the submitted objects. It is possible to add more than one transform.

See Also:

- Subprograms for Retrieving Multiple Objects From the Database
- Subprograms for Submitting XML to the Database
- "SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures" for information about how to modify and customize transform output

Syntax

```sql
DBMS_METADATA.ADD_TRANSFORM (
    handle       IN NUMBER,
    name         IN VARCHAR2,
    encoding     IN VARCHAR2 DEFAULT NULL,
    object_type  IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```

Parameters

Table 100-4  ADD_TRANSFORM Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from <code>OPEN</code> when this transform is used to retrieve objects. Or the handle returned from <code>OPENW</code> when this transform is used in the submission of XML metadata.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transform. The name can be an internal keyword like <code>DDL</code> to use internally stored stylesheets. If the name contains a colon, it is interpreted as <code>directory_object_name:file_name</code> of a user-supplied Extensible Stylesheet Language Transformation (XSLT) script. Otherwise, name designates a transform implemented by <code>DBMS_METADATA</code>. See Table 100-5 for descriptions of available transforms.</td>
</tr>
<tr>
<td>encoding</td>
<td>The name of the Globalization Support character set in which the stylesheet pointed to by <code>name</code> is encoded. This is only valid if name is a URL. If left <code>NULL</code> and the URL is external to the database, UTF-8 encoding is assumed. If left <code>NULL</code> and the URL is internal to the database (that is, it begins with <code>/oradb/</code>), then the encoding is assumed to be the database character set.</td>
</tr>
</tbody>
</table>
Table 100-4  (Cont.) ADD_TRANSFORM Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The definition of this parameter depends upon whether you are retrieving objects or submitting XML metadata.</td>
</tr>
<tr>
<td>1. When you use ADD_TRANSFORM to retrieve objects, the following definition of object_type applies: Designates the object type to which the transform applies. (Note that this is an object type name, not a path name.) By default the transform applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, the following behavior can occur: • if object_type is omitted, the transform applies to all object types within the heterogeneous collection • if object_type is specified, the transform only applies to that specific object type within the collection If you omit this parameter you can add the DDL transform to all objects in a heterogeneous collection with a single call. If you supply this parameter, you can add a transform for a specific object type.</td>
<td></td>
</tr>
<tr>
<td>2. When you use ADD_TRANSFORM in the submission of XML metadata, this parameter is the object type to which the transform applies. By default, it is the object type of the OPENW handle. Because the OPENW handle cannot designate a heterogeneous object type, the caller would normally leave this parameter NULL in the ADD_TRANSFORM calls.</td>
<td></td>
</tr>
</tbody>
</table>

The following table describes the transforms available on the ADD_TRANSFORM function.

Because new transforms are occasionally added, you might want to query the DBMS_METADATA_TRANSFORMS view to see all valid Oracle-supplied transforms for specific object types.

</tbody>
</table>

Return Values

The opaque handle that is returned is used as input to SET_TRANSFORM_PARAM and SET_REMAP_PARAM. Note that this handle is different from the handle returned by OPEN or OPENW; it refers to the transform, not the set of objects to be retrieved.

Usage Notes

• With no transforms added, objects are returned by default as XML documents. You call ADD_TRANSFORM to specify the XSLT stylesheets to be used to transform the returned XML documents.

• You can call ADD_TRANSFORM more than once to apply multiple transforms to XML documents. The transforms are applied in the order in which they were specified, the output of the first transform being used as input to the second, and so on.

• The output of a DDL transform is not an XML document. Therefore, no transform should be added after the DDL transform.

• Each transform expects a certain format XML document as input. If the input document is unspecified, metadata XML format is assumed.

• When the ALTERXML transform is used, parse items are returned in a PARSE_LIST element of the ALTER_XML document. Each PARSE_LIST_ITEM element contains an ITEM and a VALUE. For example:
Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INVALID_OPERATION.** ADD_TRANSFORM was called after the first call to FETCH_*** for the OPEN context. After the first call to FETCH_*** is made, no further calls to ADD_TRANSFORM for the current OPEN context are permitted.

- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
  - encoding is specified even though name is not a URL.
  - object_type is not part of the collection designated by handle.

100.6.2 CLOSE Procedure

This procedure is used for both retrieval and submission. This procedure invalidates the handle returned by OPEN (or OPENW) and cleans up the associated state.

See Also:

For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database
- Subprograms for Submitting XML to the Database

Syntax

```sql
DBMS_METADATA.CLOSE (
    handle  IN NUMBER);
```
Parameters

Table 100-6  CLOSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN (or OPENW).</td>
</tr>
</tbody>
</table>

Usage Notes

Note:
The following notes apply only to object retrieval

You can prematurely terminate the stream of objects established by OPEN or (OPENW).

- If a call to FETCH_xxx returns NULL, indicating no more objects, a call to CLOSE is made transparently. In this case, you can still call CLOSE on the handle and not get an exception. (The call to CLOSE is not required.)
- If you know that only one specific object will be returned, you should explicitly call CLOSE after the single FETCH_xxx call to free resources held by the handle.

Exceptions

- INVALID_ARGVAL. The value for the handle parameter is NULL or invalid.

100.6.3 CONVERT Functions and Procedures

The DBMS_METADATA.CONVERT functions and procedures transform input XML documents. The CONVERT functions return creation DDL. The CONVERT procedures return either XML or DDL, depending on the specified transforms.

See Also:

- Subprograms for Submitting XML to the Database

Syntax

The CONVERT functions are as follows:

```sql
DBMS_METADATA.CONVERT (    handle   IN NUMBER,    document IN sys/XMLSchema)
RETURN sys.ku$_multi_ddls;
```

```sql
DBMS_METADATA.CONVERT (    handle   IN NUMBER,    document IN CLOB)
RETURN sys.ku$_multi_ddls;
```
The **CONVERT** procedures are as follows:

```
DBMS_METADATA.CONVERT (  
    handle   IN NUMBER,  
    document IN sys.XMLType,  
    result   IN OUT NOCOPY CLOB);
```

```
DBMS_METADATA.CONVERT (  
    handle   IN NUMBER,  
    document IN CLOB,  
    result   IN OUT NOCOPY CLOB);
```

### Parameters

#### Table 100-7  CONVERT Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from <strong>OPENW</strong></td>
</tr>
<tr>
<td>document</td>
<td>The XML document containing object metadata of the type of the <strong>OPENW</strong> handle</td>
</tr>
<tr>
<td>result</td>
<td>The converted document</td>
</tr>
</tbody>
</table>

### Return Values

Either XML or DDL, depending on the specified transforms.

### Usage Notes

You can think of **CONVERT** as the second half of **FETCH_xxx**, either **FETCHDDL** (for the function variants) or **FETCH_CLOB** (for the procedure variants). There are two differences:

- **FETCH_xxx** gets its XML document from the database, but **CONVERT** gets its XML document from the caller
- **FETCHDDL** returns its results in a sys.ku$_ddls$ nested table, but **CONVERT** returns a sys.ku$_multi_ddls$ nested table

The transforms specified with **ADD_TRANSFORM** are applied in turn, and the result is returned to the caller. For the function variants, the DDL transform must be specified. If parse items were specified, they are returned in the parsedItems column. Parse items are ignored by the procedure variants.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in **OPENW**.

### Exceptions

- **INVALID_ARGVAL**. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INCONSISTENT_OPERATION**. No transform was specified. The DDL transform was not specified (function variants only).
- **INCOMPATIBLE_DOCUMENT**. The version of the XML document is not compatible with this version of the software.
100.6.4 FETCH_xxx Functions and Procedures

These functions and procedures return metadata for objects meeting the criteria established by OPEN, SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on.

See "Usage Notes" for the variants.

See Also:

For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database

Syntax

The FETCH functions are as follows:

```sql
DBMS_METADATA.FETCH_XML (
    handle  IN NUMBER)
RETURN sys.XMLType;

DBMS_METADATA.FETCH_DDL (
    handle  IN NUMBER)
RETURN sys.ku$_ddls;

DBMS_METADATA.FETCH_CLOB (
    handle       IN NUMBER,
    cache_lob    IN BOOLEAN DEFAULT TRUE,
    lob_duration IN PLS INTEGER DEFAULT DBMS_LOB.SESSION)
RETURN CLOB;
```

The FETCH procedures are as follows:

```sql
DBMS_METADATA.FETCH_CLOB (
    handle  IN NUMBER,
    doc     IN OUT NOCOPY CLOB);

DBMS_METADATA.FETCH_XML_CLOB (
    handle  IN NUMBER,
    doc     IN OUT NOCOPY CLOB,
    parsed_items OUT sys.ku$_parsed_items,
    object_type_path OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
<tr>
<td>cache_lob</td>
<td>TRUE=read LOB into buffer cache</td>
</tr>
<tr>
<td>lob_duration</td>
<td>The duration for the temporary LOB created by FETCH_CLOB, either DBMS_LOB.SESSION (the default) or DBMS_LOB.CALL.</td>
</tr>
</tbody>
</table>
Table 100-8  (Cont.) FETCH_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>doc</td>
<td>The metadata for the objects, or NULL if all objects have been returned.</td>
</tr>
<tr>
<td>parsed_items</td>
<td>A nested table containing the items specified by SET_PARSE_ITEM. If SET_PARSE_ITEM was not called, a NULL is returned.</td>
</tr>
<tr>
<td>object_type_path</td>
<td>For heterogeneous object types, this is the full path name of the object type for the objects returned by the call to FETCH_xxx. If handle designates a homogeneous object type, a NULL is returned.</td>
</tr>
</tbody>
</table>

Return Values

The metadata for the objects or NULL if all objects have been returned.

Usage Notes

These functions and procedures return metadata for objects meeting the criteria established by the call to OPEN that returned the handle, and subsequent calls to SET_FILTER, SET_COUNT, ADD_TRANSFORM, and so on. Each call to FETCH_xxx returns the number of objects specified by SET_COUNT (or less, if fewer objects remain in the underlying cursor) until all objects have been returned. After the last object is returned, subsequent calls to FETCH_xxx return NULL and cause the stream created by OPEN to be transparently closed.

There are several different FETCH_xxx functions and procedures:

- The FETCH_XML function returns the XML metadata for an object as an XMLType. It assumes that if any transform has been specified, that transform will produce an XML document. In particular, it assumes that the DDL transform has not been specified.

- The FETCH_DDL function returns the DDL (to create the object) in a sys.ku$_ddls nested table. It assumes that the DDL transform has been specified. Each row of the sys.ku$_ddls nested table contains a single DDL statement in the ddlText column; if requested, parsed items for the DDL statement will be returned in the parsedItems column. Multiple DDL statements may be returned under the following circumstances:
  - When you call SET_COUNT to specify a count greater than 1
  - When an object is transformed into multiple DDL statements. For example, a TYPE object that has a DDL transform applied to it can be transformed into both CREATE TYPE and CREATE TYPE BODY statements. A TABLE object can be transformed into a CREATE TABLE, and one or more ALTER TABLE statements

- The FETCH_CLOB function simply returns the object, transformed or not, as a CLOB. By default, the CLOB is read into the buffer cache and has session duration, but these defaults can be overridden with the cache_lob and lob_duration parameters.

- The FETCH_CLOB procedure returns the objects by reference in an IN OUT NOCOPY parameter. This is faster than the function variant, which returns LOBs by value, a practice that involves an expensive LOB copy.

- The FETCH_XML_CLOB procedure returns the XML metadata for the objects as a CLOB in an IN OUT NOCOPY parameter. This helps to avoid LOB copies, which can
consume a lot of resources. It also returns a nested table of parse items and the full path name of the object type of the returned objects.

- All LOBs returned by `FETCH_xxx` are temporary LOBs. You must free the LOB. If the LOB is supplied as an `IN OUT NOCOPY` parameter, you must also create the LOB.

- If `SET_PARSE_ITEM` was called, `FETCH_DDL` and `FETCH_XML_CLOB` return attributes of the object’s metadata (or the DDL statement) in a `sys.ku$_parsed_items` nested table. For `FETCH_XML_CLOB`, the nested table is an `OUT` parameter. For `FETCH_DDL`, it is a column in the returned `sys.ku$_ddls` nested table. Each row of the nested table corresponds to an item specified by `SET_PARSE_ITEM` and contains the following columns:
  - `item`—the name of the attribute as specified in the `name` parameter to `SET_PARSE_ITEM`.
  - `value`—the attribute value, or `NULL` if the attribute is not present in the DDL statement.
  - `object-row`—a positive integer indicating the object to which the parse item applies. If multiple objects are returned by `FETCH_xxx`, (because `SET_COUNT` specified a count greater than 1) then `object_row=1` for all items for the first object, 2 for the second, and so on.

- The rows of the `sys.ku$_parsed_items` nested table are ordered by ascending `object_row`, but otherwise the row order is undetermined. To find a particular parse item within an object row the caller must search the table for a match on `item`.

- In general there is no guarantee that a requested parse item will be returned. For example, the parse item may not apply to the object type or to the particular line of DDL, or the item's value may be `NULL`.

- If `SET_PARSE_ITEM` was not called, `NULL` is returned as the value of the parsed items nested table.

- It is expected that the same variant of `FETCH_xxx` will be called for all objects selected by `OPEN`. That is, programs will not intermix calls to `FETCH_XML`, `FETCH_DDL`, `FETCH_CLOB`, and so on using the same `OPEN` handle. The effect of calling different variants is undefined; it might do what you expect, but there are no guarantees.

- Every object fetched will be internally consistent with respect to on-going DDL (and the subsequent recursive DML) operations against the dictionary. In some cases, multiple queries may be issued, either because the object type is heterogeneous or for performance reasons (for example, one query for heap tables, one for index-organized tables). Consequently the `FETCH_xxx` calls may in fact be fetches from different underlying cursors (meaning that read consistency is not guaranteed).

**Exceptions**

Most exceptions raised during execution of the query are propagated to the caller. Also, the following exceptions may be raised:

- **INVALID_ARGVAL.** A `NULL` or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- **INCONSISTENT_OPERATION.** Either `FETCH_XML` was called when the DDL transform had been specified, or `FETCH_DDL` was called when the DDL transform had not been specified.
100.6.5 GET_xxx Functions

GET_xxx functions let you fetch metadata for objects with a single call.

These GET_xxx functions are:

- GET_XML
- GET_DDL
- GET_SXML
- GET_DEPENDENT_XML
- GET_DEPENDENT_DDL
- GET_GRANTED_XML
- GET_GRANTED_DDL

See Also:

For more information about related subprograms:
- Subprograms for Retrieving Multiple Objects From the Database

Syntax

DBMS_METADATA.GET_XML (object_type IN VARCHAR2,
name IN VARCHAR2,
schema IN VARCHAR2 DEFAULT NULL,
version IN VARCHAR2 DEFAULT 'COMPATIBLE',
model IN VARCHAR2 DEFAULT 'ORACLE',
transform IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA.GET_DDL (object_type IN VARCHAR2,
name IN VARCHAR2,
schema IN VARCHAR2 DEFAULT NULL,
version IN VARCHAR2 DEFAULT 'COMPATIBLE',
model IN VARCHAR2 DEFAULT 'ORACLE',
transform IN VARCHAR2 DEFAULT 'DDL')
RETURN CLOB;

DBMS_METADATA.GET_SXML (object_type IN VARCHAR2,
name IN VARCHAR2 DEFAULT NULL,
schema IN VARCHAR2 DEFAULT NULL,
version IN VARCHAR2 DEFAULT 'COMPATIBLE',
model IN VARCHAR2 DEFAULT 'ORACLE',
transform IN VARCHAR2 DEFAULT 'SXML')
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_XML (object_type IN VARCHAR2,
base_object_name IN VARCHAR2,
base_object_schema IN VARCHAR2 DEFAULT NULL,
version IN VARCHAR2 DEFAULT 'COMPATIBLE',
model IN VARCHAR2 DEFAULT 'ORACLE',
transform IN VARCHAR2 DEFAULT NULL,
object_count IN NUMBER DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_DEPENDENT_DDL (  
object_type IN VARCHAR2,  
base_object_name IN VARCHAR2,  
base_object_schema IN VARCHAR2 DEFAULT NULL,  
version IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model IN VARCHAR2 DEFAULT 'ORACLE',  
transform IN VARCHAR2 DEFAULT 'DDL',  
object_count IN NUMBER DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_XML (  
object_type IN VARCHAR2,  
grantee IN VARCHAR2 DEFAULT NULL,  
version IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model IN VARCHAR2 DEFAULT 'ORACLE',  
transform IN VARCHAR2 DEFAULT NULL,  
object_count IN NUMBER DEFAULT 10000)
RETURN CLOB;

DBMS_METADATA.GET_GRANTED_DDL (  
object_type IN VARCHAR2,  
grantee IN VARCHAR2 DEFAULT NULL,  
version IN VARCHAR2 DEFAULT 'COMPATIBLE',  
model IN VARCHAR2 DEFAULT 'ORACLE',  
transform IN VARCHAR2 DEFAULT 'DDL',  
object_count IN NUMBER DEFAULT 10000)
RETURN CLOB;

Parameters

Table 100-9 GET_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The type of object to be retrieved. This parameter takes the same values as the OPEN object_type parameter, except that it cannot be a heterogeneous object type. The attributes of the object type must be appropriate to the function. That is, for GET_xxx it must be a named object.</td>
</tr>
<tr>
<td>name</td>
<td>The object name. It is used internally in a NAME filter. (If the name is longer than 30 characters, it will be used in a LONGNAME filter.) If this parameter is NULL, then no NAME or LONGNAME filter is specified. See Table 100-18 for a list of filters.</td>
</tr>
<tr>
<td>schema</td>
<td>The object schema. It is used internally in a SCHEMA filter. The default is the current user.</td>
</tr>
<tr>
<td>version</td>
<td>The version of metadata to be extracted. This parameter takes the same values as the OPEN version parameter.</td>
</tr>
<tr>
<td>model</td>
<td>The object model to use. This parameter takes the same values as the OPEN model parameter.</td>
</tr>
</tbody>
</table>
Table 100-9  (Cont.) GET_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transform</td>
<td>The name of a transformation on the output. This parameter takes the same values as the ADD_TRANSFORM name parameter. For GET_XML this must not be DDL.</td>
</tr>
<tr>
<td>base_object_name</td>
<td>The base object name. It is used internally in a BASE_OBJECT_NAME filter.</td>
</tr>
<tr>
<td>base_object_schema</td>
<td>The base object schema. It is used internally in a BASE_OBJECT_SCHEMA filter. The default is the current user.</td>
</tr>
<tr>
<td>grantee</td>
<td>The grantee. It is used internally in a GRANTEE filter. The default is the current user.</td>
</tr>
<tr>
<td>object_count</td>
<td>The maximum number of objects to return. See SET_COUNT Procedure.</td>
</tr>
</tbody>
</table>

Return Values

The metadata for the specified object as XML or DDL.

Usage Notes

- These functions allow you to fetch metadata for objects with a single call. They encapsulate calls to OPEN, SET_FILTER, and so on. The function you use depends on the characteristics of the object type and on whether you want XML, SXML, or DDL.
  - GET_xxx is used to fetch named objects, especially schema objects (tables, views).
  - GET_DEPENDENT_xxx is used to fetch dependent objects (audits, object grants).
  - GET_GRANTED_xxx is used to fetch granted objects (system grants, role grants).

- For some object types you can use more than one function. For example, you can use GET_xxx to fetch an index by name, or GET_DEPENDENT_xxx to fetch the same index by specifying the table on which it is defined.

- GET_xxx only returns a single named object.

- For GET_DEPENDENT_xxx and GET_GRANTED_xxx, an arbitrary number of dependent or granted objects can match the input criteria. You can specify an object count when fetching these objects. (The default count of 10000 should be adequate in most cases.)

- If the DDL transform is specified, session-level transform parameters are inherited.

- If you invoke these functions from SQL*Plus, you should set the PAGESIZE to 0 and set LONG to some large number to get complete, uninterrupted output.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

- OBJECT_NOT_FOUND. The specified object was not found in the database.
Examples

Example: Fetch the XML Representation of SCOTT.EMP

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
SELECT DBMS_METADATA.GET_XML('TABLE','EMP','SCOTT') FROM DUAL;
```

Example: Fetch the DDL for all Complete Tables in the Current Schema, Filter Out Nested Tables and Overflow Segments

This example fetches the DDL for all "complete" tables in the current schema, filtering out nested tables and overflow segments. The example uses SET_TRANSFORM_PARAM (with the handle value = DBMS_METADATA.SESSION_TRANSFORM meaning "for the current session") to specify that storage clauses are not to be returned in the SQL DDL. Afterwards, the example resets the session-level parameters to their defaults.

To generate complete, uninterrupted output, set the PAGESIZE to 0 and set LONG to some large number, as shown, before executing your query.

```
SET LONG 2000000
SET PAGESIZE 0
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'STORAGE',false);
SELECT DBMS_METADATA.GET_DDL('TABLE',u.table_name) FROM USER_ALL_TABLES u
  WHERE u.nested='NO'
  AND (u.iot_type is null or u.iot_type='IOT');
EXECUTE DBMS_METADATA.SET_TRANSFORM_PARAM(DBMS_METADATA.SESSION_TRANSFORM,'DEFAULT');
```

Example: Fetch the DDL For All Object Grants On HR.EMPLOYEES

```
SELECT DBMS_METADATA.GET_DEPENDENT_DDL('OBJECT_GRANT','EMPLOYEES','HR') FROM DUAL;
```

Example: Fetch the DDL For All System Grants Granted To SCOTT

```
SELECT DBMS_METADATA.GET_GRANTED_DDL('SYSTEM_GRANT','SCOTT') FROM DUAL;
```

100.6.6 GET_QUERY Function

This function returns the text of the queries that are used by FETCH_xxx. This function assists in debugging.

See Also:

For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database
Syntax

```
DBMS_METADATA.GET_QUERY(
    handle    IN NUMBER)
RETURN VARCHAR2;
```

Parameters

**Table 100-10 GET_QUERY Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN. It cannot be the handle for a heterogeneous object type.</td>
</tr>
</tbody>
</table>

Return Values

The text of the queries that will be used by FETCH_xxx.

Exceptions

- **INVALID_ARGVAL**. A NULL or invalid value was supplied for the handle parameter.

100.6.7 OPEN Function

The DBMS_METADATA.OPEN function specifies the type of object to be retrieved, the version of its metadata, and the object model.

The return value is an opaque context handle for the set of objects to be used in subsequent calls.

⚠️ **See Also:**

For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database

Syntax

```
DBMS_METADATA.OPEN(
    object_type IN VARCHAR2,
    version     IN VARCHAR2 DEFAULT 'COMPATIBLE',
    model       IN VARCHAR2 DEFAULT 'ORACLE',
    network_link IN VARCHAR2 DEFAULT NULL)
RETURN NUMBER;
```
Parameters

Table 100-11  Open Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| object_type     | The type of object to be retrieved. Table 100-12 lists the valid type names and their meanings. These object types will be supported for the ORACLE model of metadata (see model in this table). The Attributes column in Table 100-12 specifies some object type attributes:  
  • Schema objects, such as tables, belong to schemas.  
  • Named objects have unique names (if they are schema objects, the name is unique to the schema).  
  • Dependent objects, such as indexes, are defined with reference to a base schema object.  
  • Granted objects are granted or assigned to a user or role and therefore have a named grantee.  
  • Heterogeneous object types denote a collection of related objects of different types. See Table 100-13 for a listing of object types returned for the heterogeneous object type. These attributes are relevant when choosing object selection criteria. See “SET_FILTER Procedure” for more information. |
| version         | The version of metadata to be extracted. Database objects or attributes that are incompatible with the version will not be extracted. Legal values for this parameter are as follows: COMPATIBLE (default)—the version of the metadata corresponds to the database compatibility level. LATEST—the version of the metadata corresponds to the database version. A specific database version. The value cannot be lower than 9.2.0. |
| model           | Specifies which view to use, because the API can support multiple views on the metadata. Only the ORACLE model is supported. |
| network_link    | The name of a database link to the database whose metadata is to be retrieved. If NULL (the default), metadata is retrieved from the database on which the caller is running. |

Table 100-12 provides the name, meaning, attributes, and notes for the DBMS_METADATA package object types. In the attributes column, S represents a schema object, N represents a named object, D represents a dependent object, G represents a granted object, and H represents a heterogeneous object.

</tbody>
</table>
Return Values

An opaque handle to the class of objects. This handle is used as input to SET_FILTER, SET_COUNT, ADD_TRANSFORM, GET_QUERY, SET_PARSE_ITEM, FETCH_xxx, and CLOSE.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The version or model parameter was not valid for the object_type.

100.6.8 OPENW Function

This function specifies the type of object to be submitted and the object model. The return value is an opaque context handle.

See Also:

For more information about related subprograms:

- Subprograms for Submitting XML to the Database

Syntax

```sql
DBMS_METADATA.OPENW
  (object_type  IN VARCHAR2,
   version       IN VARCHAR2 DEFAULT 'COMPATIBLE',
   model         IN VARCHAR2 DEFAULT 'ORACLE')
RETURN NUMBER;
```

Parameters

Table 100-14  OPENW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The type of object to be submitted. Valid types names and their meanings are listed in Table 100-12. The type cannot be a heterogeneous object type.</td>
</tr>
<tr>
<td>version</td>
<td>The version of DDL to be generated by the CONVERT function. DDL clauses that are incompatible with the version will not be generated. The legal values for this parameter are as follows:</td>
</tr>
<tr>
<td></td>
<td>• COMPATIBLE - This is the default. The version of the DDL corresponds to the database compatibility level. Database compatibility must be set to 9.2.0 or higher.</td>
</tr>
<tr>
<td></td>
<td>• LATEST - The version of the DDL corresponds to the database version.</td>
</tr>
<tr>
<td></td>
<td>• A specific database version. The value cannot be lower than 9.2.0.</td>
</tr>
<tr>
<td>model</td>
<td>Specifies which view to use. Only the Oracle proprietary (ORACLE) view is supported by DBMS_METADATA.</td>
</tr>
</tbody>
</table>
Return Values

An opaque handle to write context. This handle is used as input to the ADD_TRANSFORM, CONVERT, PUT, and CLOSE procedures.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INVALID_OBJECT_PARAM. The model parameter was not valid for the object_type.

100.6.9 PUT Function

This function submits an XML document containing object metadata to the database to create the object.

See Also:

For more information about related subprograms:

- Subprograms for Submitting XML to the Database

Syntax

```sql
DBMS_METADATA.PUT (  
    handle IN NUMBER,  
    document IN sys.XMLType,  
    flags IN NUMBER,  
    results IN OUT NOCOPY sys.ku$_SubmitResults)  
RETURN BOOLEAN;
```

```sql
DBMS_METADATA.PUT (  
    handle IN NUMBER,  
    document IN CLOB,  
    flags IN NUMBER,  
    results IN OUT NOCOPY sys.ku$_SubmitResults)  
RETURN BOOLEAN;
```

Parameters

Table 100-15  PUT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPENW.</td>
</tr>
<tr>
<td>document</td>
<td>The XML document containing object metadata for the type of the OPENW handle.</td>
</tr>
<tr>
<td>flags</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>results</td>
<td>Detailed results of the operation.</td>
</tr>
</tbody>
</table>
Return Values

TRUE if all SQL operations succeeded; FALSE if there were any errors.

Usage Notes

The PUT function converts the XML document to DDL just as CONVERT does (applying the specified transforms in turn) and then submits each resultant DDL statement to the database. As with CONVERT, the DDL transform must be specified. The DDL statements and associated parse items are returned in the sys.ku$SubmitResults nested table. With each DDL statement is a nested table of error lines containing any errors or exceptions raised by the statement.

The encoding of the XML document is embedded in its CLOB or XMLType representation. The version of the metadata is embedded in the XML. The generated DDL is valid for the database version specified in OPENW.

Exceptions

- INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- INCONSISTENT_OPERATION. The DDL transform was not specified.
- INCOMPATIBLE_DOCUMENT. The version of the XML document is not compatible with this version of the software.

100.6.10 SET_COUNT Procedure

This procedure specifies the maximum number of objects to be retrieved in a single FETCH_xxx call.

By default, each call to FETCH_xxx returns one object. You can use the SET_COUNT procedure to override this default. If FETCH_xxx is called from a client, specifying a count value greater than 1 can result in fewer server round trips and, therefore, improved performance.

For heterogeneous object types, a single FETCH_xxx operation only returns objects of a single object type.

See Also:

For more information about related subprograms:
- Subprograms for Retrieving Multiple Objects From the Database

Syntax

DBMS_METADATA.SET_COUNT (  
    handle IN NUMBER,  
    value IN NUMBER,  
    object_type_path IN VARCHAR2 DEFAULT NULL);
Parameters

Table 100-16  SET_COUNT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
<tr>
<td>value</td>
<td>The maximum number of objects to retrieve.</td>
</tr>
</tbody>
</table>
| object_type_path   | A path name designating the object types to which the count value applies. By default, the count value applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following:  
• If object_type_path is omitted, then the count applies to all object types within the heterogeneous collection.  
• If object_type_path is specified, then the count only applies to the specific node (or set of nodes) within the tree of object types forming the heterogeneous collection. |

Exceptions

• INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

• INVALID_OPERATION. SET_COUNT was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_COUNT for the current OPEN context are permitted.

• INCONSISTENT_ARGS. object_type parameter is not consistent with handle.

100.6.11 SET_FILTER Procedure

This procedure specifies restrictions on the objects to be retrieved, for example, the object name or schema.

See Also:

For more information about related subprograms:

• Subprograms for Retrieving Multiple Objects From the Database

Syntax

```
DBMS_METADATA.SET_FILTER (  
    handle IN NUMBER,  
    name IN VARCHAR2,  
    value IN VARCHAR2,  
    object_type_path IN VARCHAR2 DEFAULT NULL);  
```

```
DBMS_METADATA.SET_FILTER (  
    handle IN NUMBER,  
    name IN VARCHAR2,  
    value IN BOOLEAN DEFAULT TRUE,  
    object_type_path IN VARCHAR2 DEFAULT NULL);  
```
DBMS_METADATA.SET_FILTER (  
  handle IN NUMBER,  
  name IN VARCHAR2,  
  value IN NUMBER,  
  object_type_path IN VARCHAR2 DEFAULT NULL);

Parameters

Table 100-17  SET_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the filter. For each filter, Table 100-18 lists the object_type it applies to, its name, its datatype (text or Boolean), and its meaning or effect (including its default value, if any). The Datatype column of Table 100-18 also indicates whether a text filter is an expression filter. An expression filter is the right-hand side of a SQL comparison (that is, a SQL comparison operator (=, !=, and so on.) and the value compared against. The value must contain parentheses and quotation marks where appropriate. Note that in PL/SQL and SQL*Plus, two single quotes (not a double quote) are needed to represent an apostrophe. For example, an example of a NAME_EXPR filter in PL/SQL is as follows: 'IN (&quot;DEPT&quot;,&quot;EMP&quot;)' The filter value is combined with a particular object attribute to produce a WHERE condition in the query that fetches the objects. In the preceding example, the filter is combined with the attribute corresponding to an object name; objects named 'DEPT' and 'EMP' are selected.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the filter. Text, Boolean, and Numeric filters are supported.</td>
</tr>
<tr>
<td>object_type_path</td>
<td>A path name designating the object types to which the filter applies. By default, the filter applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, you can use this parameter to specify a filter for a specific node or set of nodes within the tree of object types that form the heterogeneous collection. See Table 100-19 for a listing of some of the values for this parameter.</td>
</tr>
</tbody>
</table>

Table 100-18 describes the object type, name, datatype, and meaning of the filters available with the SET_FILTER procedure.

Table 100-18  SET_FILTER: Filters

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>

<th>Name</th>
<th>Datatype</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TABLE_EXPORT</td>
<td>NAME</td>
<td>Text</td>
<td>The table with this exact name is selected along with its dependent objects.</td>
</tr>
<tr>
<td>TABLE_EXPORT</td>
<td>NAME_EXPR</td>
<td>Text expression</td>
<td>The filter value is combined with the attribute corresponding to a table name in the queries that fetch tables and their dependent objects. By default, all tables in the selected schemas are selected, along with their dependent objects.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>BEGIN_WITH</td>
<td>Text</td>
<td>The fully qualified path name of the first object type in the heterogeneous collection to be retrieved. Objects normally fetched prior to this object type will not be retrieved.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>BEGIN_AFTER</td>
<td>Text</td>
<td>The fully qualified path name of an object type after which the heterogeneous retrieval should begin. Objects of this type will not be retrieved, nor will objects normally fetched prior to this object type.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>END_BEFORE</td>
<td>Text</td>
<td>The fully qualified path name of an object type where the heterogeneous retrieval should end. Objects of this type will not be retrieved, nor will objects normally fetched after this object type.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>END_WITH</td>
<td>Text</td>
<td>The fully qualified path name of the last object type in the heterogeneous collection to be retrieved. Objects normally fetched after this object type will not be retrieved.</td>
</tr>
<tr>
<td>Heterogeneous objects</td>
<td>INCLUDE_PATH_EXPR, EXCLUDE_PATH_EXPR</td>
<td>Text expression</td>
<td>For these two filters, the filter value is combined with the attribute corresponding to an object type path name to produce a WHERE condition in the query that fetches the object types belonging to the heterogeneous collection. Objects of types satisfying this condition are included (INCLUDE_PATH_EXPR) or excluded (EXCLUDE_PATH_EXPR) from the set of object types fetched. Path names in the filter value do not have to be fully qualified. See Table 100-19 for valid path names that can be used with these filters. BEGIN_WITH, BEGIN_AFTER, END_BEFORE, END_WITH, INCLUDE_PATH_EXPR, and EXCLUDE_PATH_EXPR all restrict the set of object types in the heterogeneous collection. By default, objects of all object types in the heterogeneous collection are retrieved.</td>
</tr>
</tbody>
</table>

#### Usage Notes

- Each call to `SET_FILTER` causes a WHERE condition to be added to the underlying query that fetches the set of objects. The WHERE conditions are concatenated with the AND keyword so that you can use multiple `SET_FILTER` calls to refine the set of objects to be returned. For example to specify that you want the object named `EMP` in schema `SCOTT`, do the following:
SET_FILTER(handle, 'SCHEMA', 'SCOTT');
SET_FILTER(handle, 'NAME', 'EMP');

- You can use the same text expression filter multiple times with different values. All the filter conditions will be applied to the query. For example, to get objects with names between Felix and Oscar, do the following:
  
  SET_FILTER(handle, 'NAME_EXPR','>="FELIX"');
  SET_FILTER(handle, 'NAME_EXPR','<="OSCAR"');

- With SET_FILTER, you can specify the schema of objects to be retrieved, but security considerations may override this specification. If the caller is SYS or has the SELECT_CATALOG_ROLE role, then any object can be retrieved; otherwise, only the following can be retrieved:
  
  - Schema objects owned by the current user
  - Public synonyms
  - System privileges granted to the current user or to PUBLIC
  - Grants on objects for which the current user is owner, grantor, or grantee (either explicitly or as PUBLIC).
  - SCHEMA_EXPORT where the name is the current user
  - TABLE_EXPORT where SCHEMA is the current user

If you request objects that you are not privileged to retrieve, no exception is raised; the object is not retrieved, as if it did not exist.

In stored procedures, functions, and definers-rights packages, roles (such as SELECT_CATALOG_ROLE) are disabled. Therefore, such a PL/SQL program can only fetch metadata for objects in its own schema. If you want to write a PL/SQL program that fetches metadata for objects in a different schema (based on the invoker's possession of SELECT_CATALOG_ROLE), you must make the program invokers-rights.

- For heterogeneous object types, the BEGIN_WITH and BEGIN_AFTER filters allow restart on an object type boundary. Appropriate filter values are returned by the FETCH_XML_CLOB procedure.

Filters on heterogeneous objects provide default values for filters on object types within the collection. You can override this default for a particular object type by specifying the appropriate filter for the specific object type path. For example, for SCHEMA_EXPORT the NAME filter specifies the schema to be fetched including all the tables in the schema, but you can further restrict this set of tables by supplying a NAME_EXPR filter explicitly for the TABLE object type path. Table 100-19 lists valid object type path names for the major heterogeneous object types along with an explanation of the scope of each path name. (The same information is available in the following catalog views: DATABASE_EXPORT_OBJECTS, SCHEMA_EXPORT_OBJECTS, and TABLE_EXPORT_OBJECTS.) See Table 100-18 for filters defined for each path name. These path names are valid in the INCLUDE_PATH_EXPR and EXCLUDE_PATH_EXPR filters. Path names marked with an asterisk (*) are only valid in those filters; they cannot be used as values of the SET_FILTER object_type_path parameter.

Exceptions

- **INVALID_ARGVAL.** A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION.** `SET_FILTER` was called after the first call to `FETCH_xxx` for the OPEN context. After the first call to `FETCH_xxx` is made, no further calls to `SET_FILTER` are permitted.
- **INCONSISTENT_ARGS.** The arguments are inconsistent. Possible inconsistencies include the following:
The filter name is not valid for the object type associated with the OPEN context.

- The filter name is not valid for the object_type_path.
- The object_type_path is not part of the collection designated by handle.
- The filter value is the wrong datatype.

## 100.6.12 SET_PARSE_ITEM Procedure

This procedure is used for both retrieval and submission. This procedure enables output parsing and specifies an object attribute to be parsed and returned.

### See Also:

For more information about related subprograms:

- Subprograms for Retrieving Multiple Objects From the Database
- Subprograms for Submitting XML to the Database

### Syntax

The following syntax applies when SET_PARSE_ITEM is used for object retrieval:

```sql
DBMS_METADATA.SET_PARSE_ITEM (  
  handle       IN  NUMBER,  
  name         IN  VARCHAR2,  
  object_type  IN  VARCHAR2 DEFAULT NULL);
```

The following syntax applies when SET_PARSE_ITEM is used for XML submission:

```sql
DBMS_METADATA.SET_PARSE_ITEM (  
  handle     IN NUMBER,  
  name        IN VARCHAR2);
```

### Parameters

#### Table 100-20  SET_PARSE_ITEM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPEN (or OPENW).</td>
</tr>
<tr>
<td>name</td>
<td>The name of the object attribute to be parsed and returned. See Table 100-21 for the attribute object type, name, and meaning.</td>
</tr>
</tbody>
</table>
Table 100-20 (Cont.) SET_PARSE_ITEM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| object_type | Designates the object type to which the parse item applies (this is an object type name, not a path name). By default, the parse item applies to the object type of the OPEN handle. When the OPEN handle designates a heterogeneous object type, behavior can be either of the following:  
  - If object_type is omitted, then the parse item applies to all object types within the heterogeneous collection.  
  - If object_type is specified, then the parse item only applies to that specific object type within the collection.  
  This parameter only applies when SET_PARSE_ITEM is used for object retrieval. |

Table 100-21 describes the object type, name, and meaning of the items available in the SET_PARSE_ITEM procedure.

Because new items are occasionally added, you can query the DBMS_METADATA_PARSE_ITEMS view to see a complete list of valid parse items or to find valid parse items for a specific object type.

<td>VERB</td>
<td>If FETCH_XML_CLOB is called, no value is returned. If FETCH_DDL is called, then for every row in the sys.ku$_ddls nested table returned by FETCH_DDL, the verb in the corresponding ddlText is returned. If the ddlText is a SQL DDL statement, then the SQL verb (for example, CREATE, GRANT, AUDIT) is returned. If the ddlText is a procedure call (for example, DBMS_AQADM.CREATE_QUEUE_TABLE()) then the package.procedure-name is returned.</td>
</tr>
<tr>
<td>All objects</td>
<td>OBJECT_TYPE</td>
<td>If FETCH_XML_CLOB is called, an object type name from Table 100-12 is returned. If FETCH_DDL is called and the ddlText is a SQL DDL statement whose verb is CREATE or ALTER, the object type as used in theDDL statement is returned (for example, TABLE, PACKAGE_BODY, and so on). Otherwise, an object type name from Table 100-12 is returned.</td>
</tr>
<tr>
<td>Schema objects</td>
<td>SCHEMA</td>
<td>The object schema is returned. If the object is not a schema object, no value is returned.</td>
</tr>
<tr>
<td>Named objects</td>
<td>NAME</td>
<td>The object name is returned. If the object is not a named object, no value is returned.</td>
</tr>
<tr>
<td>TABLE, TABLE_DATA, INDEX</td>
<td>TABLESPACE</td>
<td>The name of the object's tablespace or, if the object is a partitioned table, the default tablespace is returned. For a TABLE_DATA object, this is always the tablespace where the rows are stored.</td>
</tr>
</tbody>
</table>
### Table 100-21 (Cont.) SET_PARSE_ITEM: Parse Items

<table>
<thead>
<tr>
<th>Object Type</th>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRIGGER</td>
<td>ENABLE</td>
<td>If the trigger is enabled, ENABLE is returned. If the trigger is disabled, DISABLE is returned.</td>
</tr>
<tr>
<td>OBJECT_GRANT,</td>
<td>GRANTOR</td>
<td>The grantor is returned.</td>
</tr>
<tr>
<td>TABLESPACE QUOTA</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dependent objects</td>
<td>BASE_OBJECT_NAME</td>
<td>The name of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>(including domain index secondary tables)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dependent objects</td>
<td>BASE_OBJECT_SCHEMA</td>
<td>The schema of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>(including domain index secondary tables)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Dependent objects</td>
<td>BASE_OBJECT_TYPE</td>
<td>The object type of the base object is returned. If the object is not a dependent object, no value is returned.</td>
</tr>
<tr>
<td>(including domain index secondary tables)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Granted objects</td>
<td>GRANTEE</td>
<td>The grantee is returned. If the object is not a granted object, no value is returned.</td>
</tr>
</tbody>
</table>

#### Usage Notes

These notes apply when using SET_PARSE_ITEM to retrieve objects.

By default, the FETCH_xxx routines return an object's metadata as XML or creation DDL. By calling SET_PARSE_ITEM you can request that individual attributes of the object be returned as well.

You can call SET_PARSE_ITEM multiple times to ask for multiple items to be parsed and returned. Parsed items are returned in the `sys.ku$_parsed_items` nested table.

For TABLE_DATA objects, the following parse item return values are of interest:

<table>
<thead>
<tr>
<th>If Object Is</th>
<th>NAME, SCHEMA</th>
<th>BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA</th>
</tr>
</thead>
<tbody>
<tr>
<td>nonpartitioned table</td>
<td>table name, schema</td>
<td>table name, schema</td>
</tr>
<tr>
<td>table partition</td>
<td>partition name, schema</td>
<td>table name, schema</td>
</tr>
<tr>
<td>nested table</td>
<td>storage table name, schema</td>
<td>name and schema of top-level table (not the parent nested table)</td>
</tr>
</tbody>
</table>

Tables are not usually thought of as dependent objects. However, secondary tables for domain indexes are dependent on the domain indexes. Consequently, the BASE_OBJECT_NAME, BASE_OBJECT_SCHEMA and BASE_OBJECT_TYPE parse items for secondary TABLE objects return the name, schema, and type of the domain index.
By default, the `CONVERT` and `PUT` procedures simply transform an object's XML metadata to DDL. By calling `SET_PARSE_ITEM` you can request that individual attributes of the object be returned as well.

**Exceptions**

- **INVALID_ARGVAL**: A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- **INVALID_OPERATION**: `SET_PARSE_ITEM` was called after the first call to `FETCH_xxx` for the `OPEN` context. After the first call to `FETCH_xxx` is made, no further calls to `SET_PARSE_ITEM` are permitted.
- **INCONSISTENT_ARGS**: The attribute `name` is not valid for the object type associated with the `OPEN` context.

### 100.6.13 SET_TRANSFORM_PARAM and SET_REMAP_PARAM Procedures

These procedures are used for both retrieval and submission. `SET_TRANSFORM_PARAM` and `SET_REMAP_PARAM` specify parameters to the XSLT stylesheet identified by `transform_handle`.

Use them to modify or customize the output of the transform.

#### Syntax

```sql
DBMS_METADATA.SET_TRANSFORM_PARAM (  
    transform_handle   IN NUMBER,  
    name               IN VARCHAR2,  
    value              IN VARCHAR2,  
    object_type        IN VARCHAR2 DEFAULT NULL);
DBMS_METADATA.SET_TRANSFORM_PARAM (  
    transform_handle   IN NUMBER,  
    name               IN VARCHAR2,  
    value              IN BOOLEAN DEFAULT TRUE,  
    object_type        IN VARCHAR2 DEFAULT NULL);  
```
Parameters

Table 100-22 describes the parameters for the SET_TRANSFORM_PARAM and SET_REMAP_PARAM procedures.

Because new parameters are occasionally added, you might want to query the DBMS_METADATA_TRANSFORM_PARAMS view to see all the valid transform parameters for each transform or to find valid transform parameters for specific object types.

Table 100-22  SET_TRANSFORM_PARAM and SET_REMAP_PARAM Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>transform_handle</td>
<td>Either (1) the handle returned from ADD_TRANSFORM, or (2) the enumerated constant SESSION_TRANSFORM that designates the DDL transform for the whole session. Note that the handle returned by OPEN is not a valid transform handle. For SET_REMAP_PARAM, the transform handle must designate the MODIFY transform.</td>
</tr>
<tr>
<td>name</td>
<td>The name of the transform parameter. For descriptions of the parameters available for each transform on the SET_TRANSFORM_PARAM procedure, see the following: Table 100-23 - DDL transform Table 100-24 - MODIFY transform Table 100-26 - SXML transform Table 100-27 - MODIFY_SXML transform Table 100-28 - SXMLDDL transform For descriptions of the parameters available for the MODIFY transform on the SET_REMAP_PARAM procedure, see Table 100-25. For descriptions of the parameters available for the ALTERXML transform, see Table 100-4.</td>
</tr>
<tr>
<td>value</td>
<td>The value of the transform. This parameter is valid only for SET_TRANSFORM_PARAM.</td>
</tr>
<tr>
<td>old_value</td>
<td>The old value for the remapping. This parameter is valid only for SET_REMAP_PARAM.</td>
</tr>
<tr>
<td>new_value</td>
<td>The new value for the remapping. This parameter is valid only for SET_REMAP_PARAM.</td>
</tr>
</tbody>
</table>
Table 100-22  (Cont.) SET_TRANSFORM_PARAM and SET_REMAP_PARAM

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Designates the object type to which the transform or remap parameter applies. By default, it applies to the same object type as the transform. In cases where the transform applies to all object types within a heterogeneous collection, the following apply:</td>
</tr>
<tr>
<td></td>
<td>• If object_type is omitted, the parameter applies to all applicable object types within the heterogeneous collection.</td>
</tr>
<tr>
<td></td>
<td>• If object_type is specified, the parameter only applies to that object type.</td>
</tr>
<tr>
<td></td>
<td>This allows a caller who has added a transform to a heterogeneous collection to specify different transform parameters for different object types within the collection.</td>
</tr>
</tbody>
</table>

Table 100-23 describes the object type, name, datatype, and meaning of the parameters for the DDL transform in the SET_TRANSFORM_PARAM procedure.

Defaults to FALSE. |
| TABLE, INDEX, CLUSTER, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG | SEGMENT_ATTRIBUTES | Boolean  | If TRUE, include segment attributes clauses (physical attributes, storage attributes, tablespace, logging) in the DDL. If FALSE, omit them.  
Defaults to TRUE. |
| TABLESPACE  | REUSE                 | Boolean  | If TRUE, include the REUSE parameter for datafiles in a tablespace to indicate that existing files can be reused. If FALSE, omit the REUSE parameter.  
Defaults to FALSE. |
| TABLE, INDEX | PARTITIONING  | Boolean  | If TRUE, include partitioning clauses in the DDL. If FALSE, omit them.  
Defaults to TRUE. |
| TABLE       | CONSTRAINTS           | Boolean  | If TRUE, include all non-referential table constraints in the output SXML. If FALSE, omit them.  
Defaults to TRUE. |

Exceptions

• INVALID_ARGVAL. A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
INVALID_OPERATION. Either SET_TRANSFORM_PARAM or SET_REMAP_PARAM was called after the first call to FETCH_xxx for the OPEN context. After the first call to FETCH_xxx is made, no further calls to SET_TRANSFORM_PARAM or SET_REMAP_PARAM are permitted.

INCONSISTENT_ARGS. The arguments are inconsistent. This can mean the following:

- The transform parameter name is not valid for the object type associated with the OPEN context or for the transform associated with the transform handle.
- The transform applies to all object types in a heterogeneous collection, but object_type is not part of the collection.

Usage Notes

XSLT allows parameters to be passed to stylesheets. You call SET_TRANSFORM_PARAM or SET_REMAP_PARAM to specify the value of a parameter to be passed to the stylesheet identified by transform_handle.

Normally, if you call SET_TRANSFORM_PARAMETER multiple times for the same parameter name, each call overrides the prior call. For example, the following sequence simply sets the STORAGE transform parameter to TRUE.

```sql
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',false);
SET_TRANSFORM_PARAM(tr_handle,'STORAGE',true);
```

However, some transform parameters are additive which means that all specified parameter values are applied to the document, not just the last one. For example, the OBJECT_ROW parameter to the MODIFY transform is additive. If you specify the following, then both specified rows are copied to the output document.

```sql
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',5);
SET_TRANSFORM_PARAM(tr_handle,'OBJECT_ROW',8);
```

The REMAP_TABLESPACE parameter is also additive. If you specify the following, then tablespaces TBS1 and TBS3 are changed to TBS2 and TBS4, respectively.

```sql
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS3','TBS4');
```

The order in which the transformations are performed is undefined. For example, if you specify the following, the result is undefined.

```sql
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS1','TBS2');
SET_REMAP_PARAM(tr_handle,'REMAP_TABLESPACE','TBS2','TBS3');
```

Note:

The number of remap parameters that can be specified for a MODIFY transform is limited to ten. That is, you can specify up to ten REMAP_DATAFILE parameters, up to ten REMAP_SCHEMA parameters and so on. Additional instances are ignored. To work around this, you can perform another DBMS_METADATA.ADD_TRANSFORM and specify additional remap parameters.

The GET_DDL, GET_DEPENDENT_DDL, and GET_GRANTED_DDL functions allow the casual browser to extract the creation DDL for an object. So that you can specify transform parameters, this package defines an enumerated constant SESSION_TRANSFORM as the handle of the DDL transform at the session level. You can call SET_TRANSFORM_PARAM...
using DBMS_METADATA.SESSION_TRANSFORM as the transform handle to set transform parameters for the whole session. GET_DDL, GET_DEPENDENT_DDL, and GET_GRANTED_DDL inherit these parameters when they invoke the DDL transform.

 développer Note:

The enumerated constant must be prefixed with the package name DBMS_METADATA.SESSION_TRANSFORM.
The DBMS_METADATA_DIFF package contains the interfaces for comparing two metadata documents in SXML format.

This chapter contains the following topics:

• Overview
• Security Model
• Browsing APIs for Fetching and Comparing Objects
• Summary of DBMS_METADATA_DIFF Subprograms

See Also:
Oracle Database Utilities for more information and for examples of using the DBMS_METADATA_DIFF package.

101.1 DBMS_METADATA_DIFF Overview

You can use the interfaces contained in the DBMS_METADATA_DIFF package to compare two metadata documents in SXML format.

The result of the comparison is an SXML difference document. This document can be converted to other formats using the DBMS_METADATA submit interface and the CONVERT API.

101.2 DBMS_METADATA_DIFF Security Model

The browsing interface of the DBMS_METADATA_DIFF package actually uses the DBMS_METADATA package to fetch the metadata to be compared. Therefore, the security model used for DBMS_METADATA also applies to DBMS_METADATA_DIFF. (Note, however, that DBMS_METADATA_DIFF does not support all object types.)

See Also:
DBMS_METADATA for information about the DBMS_METADATA security model
101.3 DBMS_METADATA_DIFF — Browsing APIs for Fetching and Comparing Objects

These functions allow you to compare the metadata for two objects with a single call.

Syntax

DBMS_METADATA_DIFF.COMPARE_SXML(
  object_type   IN VARCHAR2,
  name1         IN VARCHAR2,
  name2         IN VARCHAR2,
  schema1       IN VARCHAR2 DEFAULT NULL,
  schema2       IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA_DIFF.COMPARE_ALTER(
  object_type   IN VARCHAR2,
  name1         IN VARCHAR2,
  name2         IN VARCHAR2,
  schema1       IN VARCHAR2 DEFAULT NULL,
  schema2       IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

DBMS_METADATA_DIFF.COMPARE_ALTER_XML(
  object_type   IN VARCHAR2,
  name1         IN VARCHAR2,
  name2         IN VARCHAR2,
  schema1       IN VARCHAR2 DEFAULT NULL,
  schema2       IN VARCHAR2 DEFAULT NULL,
  network_link1 IN VARCHAR2 DEFAULT NULL,
  network_link2 IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;

Parameters

Table 101-1  COMPARE_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.</td>
</tr>
<tr>
<td>name1</td>
<td>The name of the first object in the comparison.</td>
</tr>
<tr>
<td>name2</td>
<td>The name of the second object in the comparison.</td>
</tr>
<tr>
<td>schema1</td>
<td>The schema of the first object in the comparison. The default is the current user.</td>
</tr>
</tbody>
</table>
Table 101-1  (Cont.) COMPARE_xxx Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema2</td>
<td>The schema of the second object in the comparison. The default is the value</td>
</tr>
<tr>
<td></td>
<td>of schema1.</td>
</tr>
<tr>
<td>network_link1</td>
<td>The name of a database link to the database on which the first object resides.</td>
</tr>
<tr>
<td></td>
<td>If NULL (the default), then the object is assumed to be in the database on</td>
</tr>
<tr>
<td></td>
<td>which the caller is running.</td>
</tr>
<tr>
<td>network_link2</td>
<td>The name of a database link to the database on which the second object resides.</td>
</tr>
<tr>
<td></td>
<td>The default is the value of network_link1.</td>
</tr>
</tbody>
</table>

Return Values

DBMS_METADATA_DIFF.COMPARE_xxx returns the differences between two objects.

Exceptions

- INVALID_ARGVAL
  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
- OBJECT_NOT_FOUND
  The specified object was not found in the database.

Usage Notes

These functions encapsulate calls to both DBMS_METADATA and DBMS_METADATA_DIFF functions and procedures to fetch the metadata for each of the two objects and compare them.

Which function you use depends on the comparison format you want:

- COMPARE_SXML returns an SXML difference document.
- COMPARE_ALTER returns a set of ALTER statements for making the first object like the second object.
- COMPARE_ALTER_XML returns an ALTER_XML document.

101.4 Summary of DBMS_METADATA_DIFF Subprograms

The DBMS_METADATA_DIFF subprograms provide comparison functionality for different object types.

These subprograms are used to:

- Specify the type of objects to be compared
- Specify the SXML documents to be compared
- Show the differences between the compared documents
- Clean up after the comparison

Table 101-2 provides a summary of DBMS_METADATA_DIFF subprograms.
### Table 101-2 DBMS_METADATA_DIFF Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPENC Function</td>
</tr>
<tr>
<td>ADD_DOCUMENT Procedure</td>
</tr>
<tr>
<td>FETCH_CLOB Functions and Procedures</td>
</tr>
<tr>
<td>CLOSE Procedure</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifies the type of objects to be compared</td>
</tr>
<tr>
<td>Specifies an SXML document to be compared</td>
</tr>
<tr>
<td>Returns a CLOB showing the differences between the two documents specified by ADD_DOCUMENT</td>
</tr>
<tr>
<td>Invalidates the handle returned by OPENC and cleans up associated state</td>
</tr>
</tbody>
</table>

### 101.4.1 OPENC Function

This function specifies the type of objects to be compared. The return value is an opaque context handle.

#### Syntax

```sql
DBMS_METADATA_DIFF.OPENC (object_type IN VARCHAR2)
RETURN NUMBER;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>The type of object to be compared. Valid type names are CLUSTER, CONTEXT, DB_LINK, FGA_POLICY, INDEX, MATERIALIZED_VIEW, MATERIALIZED_VIEW_LOG, QUEUE, QUEUE_TABLE, RLS_CONTEXT, RLS_GROUP, RLS_POLICY, ROLE, SEQUENCE, SYNONYM, TABLE, TABLESPACE, TRIGGER, TYPE, TYPE_SPEC, TYPE_BODY, USER, and VIEW.</td>
</tr>
</tbody>
</table>

#### Return Values

The opaque handle that is returned is used as input to ADD_DOCUMENT, FETCH_xxx and CLOSE.

#### Exceptions

- INVALID_ARGVAL

A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
### 101.4.2 ADD_DOCUMENT Procedure

This procedure specifies an SXML document that is to be compared.

**Syntax**

```sql
DBMS_METADATA_DIFF.ADD_DOCUMENT(
  handle IN NUMBER, document IN sys.XMLType);
```

```sql
DBMS_METADATA_DIFF.ADD_DOCUMENT(
  handle IN NUMBER, document IN CLOB);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from <code>OPENC</code></td>
</tr>
<tr>
<td>document</td>
<td>A document to be compared. The document must be of the type specified in <code>OPENC</code></td>
</tr>
</tbody>
</table>

**Usage Notes**

Because the comparison interface allows you to compare exactly two SXML documents, a program must call `ADD_DOCUMENT` exactly twice for each `OPENC` handle. In the comparison result, the document specified by the first call is document 1, and the document specified by the second call is document 2.

**Exceptions**

- `INVALID_ARGVAL`

  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

### 101.4.3 FETCH_CLOB Functions and Procedures

The `FETCH_CLOB` functions and procedures return a CLOB showing the differences between the two documents specified by `ADD_DOCUMENT`.

**Syntax**

```sql
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER)
RETURN CLOB;
```

```sql
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER,
  doc    IN  OUT NOCOPY CLOB);
```

```sql
DBMS_METADATA_DIFF.FETCH_CLOB(
  handle IN NUMBER,
  doc    IN  OUT NOCOPY CLOB,
  diffs  OUT BOOLEAN);
```
Parameters

Table 101-5  FETCH_CLOB Subprogram Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPENC.</td>
</tr>
<tr>
<td>doc</td>
<td>A CLOB containing the differences between documents 1 and 2.</td>
</tr>
<tr>
<td>diffs</td>
<td>TRUE if the documents are different or FALSE if they are identical.</td>
</tr>
</tbody>
</table>

Return Values

The differences between documents 1 and 2.

Exceptions

- INVALID_ARGVAL
  
  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.

101.4.4 CLOSE Procedure

This procedure invalidates the handle returned by OPENC and cleans up associated state.

Syntax

```sql
DBMS_METADATA_DIFF.CLOSE(
    handle IN NUMBER);
```

Parameters

Table 101-6  CLOSE Function Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>handle</td>
<td>The handle returned from OPENC</td>
</tr>
</tbody>
</table>

Exceptions

- INVALID_ARGVAL
  
  A NULL or invalid value was supplied for an input parameter. The error message text identifies the parameter.
The **DBMS_MGD_ID_UTL** package contains various utility functions and procedures.

These consist of the following utility subprograms:

- A logging utility that sets and gets Java and PL/SQL logging levels.
- A proxy utility consisting of two procedures used to set and unset the host and port of the proxy server.
- A metadata utility consisting of functions and procedures used for managing metadata.

**See Also:**

*Oracle Database Development Guide* for more information.

This chapter describes each of these utility subprograms and contains the following topics:

- Security Model
- Constants
- Exceptions
- Summary of DBMS_MGD_ID_UTL Subprograms

The examples in this chapter assume that the user has run the following set of commands before running the contents of each script:

```sql
SQL> connect / as sysdba;
Connected.
SQL> create user mgduser identified by password;
SQL> grant connect, resource to mgduser;
SQL> connect mgduser Enter password: mgduserpassword
Connected.
SQL> set serveroutput on;
```

**102.1 DBMS_MGD_ID_UTL Security Model**

You must run the `catmgd.sql` script to load the **DBMS_MGD_ID_UTL** package and Identity Code Package schema objects in the **MGDSYS** schema.

**DBMS_MGD_ID_UTL** is a **MGDSYS**-owned package. Any **DBMS_MGD_ID_UTL** subprogram called from an anonymous PL/SQL block is run using the privileges of the current user.

A user must be granted connect and resource roles to use the **DBMS_MGD_ID_UTL** package and its subprograms.
EXECUTE privilege is granted to PUBLIC for these ADTs: MGD_ID, MGD_ID_COMPONENT, MGD_ID_COMPONENT_VARRAY, and for this package DBMS_MGD_ID_UTL.

SELECT or READ privilege is granted to PUBLIC for these read-only views: MGD_ID_CATEGORY and MGD_ID_SCHEME and for these metadata views: USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME, and for table MGD_ID_XML_VALIDATOR, and for sequence MGD$SEQUENCECATEGORY.

INSERT, UPDATE and DELETE privilege is granted to PUBLIC for these metadata views: USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME.

Public synonyms, by the same name, are created for these ADTs: MGD_ID, MGD_ID_COMPONENT, MGD_ID_COMPONENT_VARRAY and for this package DBMS_MGD_ID_UTL, as well as for these read-only views: MGD_ID_CATEGORY and MGD_ID_SCHEME and for these metadata views: USER_MGD_ID_CATEGORY and USER_MGD_ID_SCHEME, and for table MGD_ID_XML_VALIDATOR.

102.2 DBMS_MGD_ID_UTL Constants

The DBMS_MGD_ID_UTL package defines several constants for specifying parameter values.

These constants are shown in the following tables.

Table 102-1  DBMS_MGD_ID_UTL Constants — Installed Category IDs and Names

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>EPC_ENCODING_CATEGORY_ID</td>
<td>1</td>
</tr>
<tr>
<td>EPC_ENCODING_CATEGORY_NAME</td>
<td>EPC</td>
</tr>
</tbody>
</table>

Table 102-2  DBMS_MGD_ID_UTL Constants — Logging Levels

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOGGING_LEVEL_OFF</td>
<td>0</td>
</tr>
<tr>
<td>LOGGING_LEVEL.SEVERE</td>
<td>1</td>
</tr>
<tr>
<td>LOGGING_LEVEL.WARNING</td>
<td>2</td>
</tr>
<tr>
<td>LOGGING_LEVEL.INFO</td>
<td>3</td>
</tr>
<tr>
<td>LOGGING_LEVEL.FINE</td>
<td>4</td>
</tr>
<tr>
<td>LOGGING_LEVEL.FINER</td>
<td>5</td>
</tr>
<tr>
<td>LOGGING_LEVEL.FINEST</td>
<td>6</td>
</tr>
<tr>
<td>LOGGING_LEVEL.ALL</td>
<td>7</td>
</tr>
</tbody>
</table>
102.3 DBMS_MGD_ID_UTL Exceptions

The table in this topic lists the DBMS_MGD_ID_UTL exceptions.

Table 102-3  Exceptions Raised by DBMS_MGD_ID_UTL Package

<table>
<thead>
<tr>
<th>Name</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TDJJavaException</td>
<td>-55200</td>
<td>During the tag data translation, a Java exception was raised.</td>
</tr>
<tr>
<td>TDTCategoryNotFound</td>
<td>-55201</td>
<td>The specified category was not found.</td>
</tr>
<tr>
<td>TDTSchemeNotFound</td>
<td>-55202</td>
<td>During the tag data translation, the specified scheme was not found.</td>
</tr>
<tr>
<td>TDTLevelNotFound</td>
<td>-55203</td>
<td>During the tag data translation, the specified level was not found.</td>
</tr>
<tr>
<td>TDTOptionNotFound</td>
<td>-55204</td>
<td>During the tag data translation, the specified option was not found.</td>
</tr>
<tr>
<td>TDTFieldValidationException</td>
<td>-55205</td>
<td>During the tag data translation, the validation operation failed on a field.</td>
</tr>
<tr>
<td>TDTUndefinedField</td>
<td>-55206</td>
<td>During the tag data translation, an undefined field was detected.</td>
</tr>
<tr>
<td>TDTRuleEvaluationFailed</td>

<td>During the tag data translation, the rule evaluation operation failed.</td>
</tr>
<tr>
<td>TDTOoManyMatchingLevels</td>
<td>-55208</td>
<td>During the tag data translation, too many matching levels were found.</td>
</tr>
</tbody>
</table>

102.4 Summary of DBMS_MGD_ID_UTL Subprograms

This table describes the utility subprograms in the DBMS_MGD_ID_UTL package.

All the values and names passed to the procedures defined in the DBMS_MGD_ID_UTL package are case insensitive unless otherwise mentioned. To preserve the case, enclose the values with double quotation marks.

Table 102-4  DBMS_MGD_ID_UTL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD SCHEME Procedure</td>
<td>Adds a tag data translation scheme to an existing category</td>
</tr>
<tr>
<td>CREATE CATEGORY Function</td>
<td>Creates a new category or a new version of a category</td>
</tr>
<tr>
<td>EPC_TO_ORACLE_SCHEME Function</td>
<td>Converts the EPCglobal tag data translation (TDT) XML to Oracle tag data translation XML</td>
</tr>
<tr>
<td>GET CATEGORY_ID Function</td>
<td>Returns the category ID given the category name and the category version</td>
</tr>
<tr>
<td>GET COMPONENTS Function</td>
<td>Returns all relevant separated component names separated by semicolon (‘;’) for the specified scheme</td>
</tr>
<tr>
<td>GET ENCODINGS Function</td>
<td>Returns a list of semicolon (‘;’) separated encodings (formats) for the specified scheme</td>
</tr>
</tbody>
</table>

<td>Sets the host and port of the proxy server for Internet access</td>
</tr>
<tr>
<td>VALIDATE_SCHEME Function</td>
<td>Validates the input tag data translation XML against the Oracle tag data translation schema</td>
</tr>
</tbody>
</table>

### 102.4.1 ADD_SCHEME Procedure

This procedure adds a tag data translation scheme to an existing category.

**Syntax**

```sql
DBMS_MGD_ID_UTL.ADD_SCHEME (  
    category_id IN  VARCHAR2,  
    tdt_xml     IN  CLOB);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
<tr>
<td>tdt_xml</td>
<td>Tag data translation XML</td>
</tr>
</tbody>
</table>

**Examples**

This example performs the following actions:

1. Creates a category.
Chapter 102

Summary of DBMS_MGD_ID_UTL Subprograms

2.

Adds a contractor scheme and an employee scheme to the MGD_SAMPLE_CATEGORY
category.

3.

Validates the MGD_SAMPLE_CATEGORY scheme.

4.

Tests the tag translation of the contractor scheme and the employee scheme.

5.

Removes the contractor scheme.

6.

Tests the tag translation of the contractor scheme and this returns the expected
exception for the removed contractor scheme.

7.

Tests the tag translation of the employee scheme and this returns the expected
values.

8.

Removes the MGD_SAMPLE_CATEGORY category.

102.4.2 CREATE_CATEGORY Function

This function creates a new category or a new version of a category.

**Syntax**

```
DBMS_MGD_ID_UTL.CREATE_CATEGORY(
    category_name    IN  VARCHAR2,
    category_version IN  VARCHAR2,
    agency           IN  VARCHAR2,
    URI              IN  VARCHAR2)
RETURN VARCHAR2;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version</td>
</tr>
<tr>
<td>agency</td>
<td>Organization that owns the category. For example, EPCglobal owns the category EPC.</td>
</tr>
<tr>
<td>URI</td>
<td>URI that provides additional information about the category</td>
</tr>
</tbody>
</table>

**Usage Notes**

The return value is the category ID.

**Examples**

See the ADD_SCHEME Procedure for an example of creating the MGD_SAMPLE_CATEGORY category.

102.4.3 EPC_TO_ORACLE_SCHEME Function

This function converts the EPCglobal tag data translation (TDT) XML to Oracle Database tag data translation XML.

**Syntax**

```
DBMS_MGD_ID_UTL.EPC_TO_ORACLE_SCHEME(
    xml_scheme IN CLOB)
RETURN CLOB;
```
Chapter 102

Summary of DBMS_MGD_ID_UTL Subprograms

Parameters
Table 102-7

EPC_TO_ORACLE_SCHEME Function Parameters

Parameter

Description

xml_scheme

Name of EPC tag scheme to be converted

Usage Notes
The return value is the contents of the CLOB containing the Oracle Datanase tag data
translation XML.
Examples
The following example converts standard EPCglobal Tag Data Translation (TDT) files
into Oracle Database TDT files:
--Contents of MGD_ID_DOC2.sql
----------------------------- EPC_TO_ORACLE_SCHEME ----------------------------call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
BEGIN
DBMS_JAVA.set_output(1000000);
DBMS_OUTPUT.ENABLE(1000000);
DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_SEVERE);
END;

Validate the Oracle Scheme

PL/SQL procedure successfully completed.

102.4.4 GET_CATEGORY_ID Function

This function returns the category ID for a given category name and category version.

Syntax

```sql
DBMS_MGD_ID_UTL.GET_CATEGORY_ID (    category name IN VARCHAR2,    category version IN VARCHAR2)    RETURN VARCHAR2;
```
Parameters

Table 102-8  GET_CATEGORY_ID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version</td>
</tr>
</tbody>
</table>

Usage Notes

- If the value of category_version is NULL, then the ID of the latest version of the specified category is returned.
- The return value is the category ID for the specified category name.

Examples

The following example returns a category ID given a category name and its version:

```sql
-- Contents of get_category1.sql file
SELECT DBMS_MGD_ID_UTL.get_category_id('EPC', NULL) FROM DUAL;
```

102.4.5 GET_COMPONENTS Function

This function returns all relevant separated component names separated by semicolon (;) for the specified scheme.

Syntax

```sql
DBMS_MGD_ID_UTL.GET_COMPONENTS (  
  category_id IN VARCHAR2,  
  scheme_name IN VARCHAR2) 
RETURN VARCHAR2;
```

Parameters

Table 102-9  GET_COMPONENTS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
<tr>
<td>scheme_name</td>
<td>Name of scheme</td>
</tr>
</tbody>
</table>
Usage Notes

The return value contains the component names separated by a semicolon (;) for the specified scheme.

Examples

The following example gets the components:

```sql
--Contents of get_components.sql
DECLARE
    id             mgd_id;
    getcomps       VARCHAR2(1000);
    getencodings   VARCHAR2(1000);
    getschemenames VARCHAR2(1000);
BEGIN
    DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
    DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
    getcomps := DBMS_MGD_ID_UTL.get_components(1,'SGTIN-64');
    DBMS_OUTPUT.put_line('Component names are: ' || getcomps);
    getencodings := DBMS_MGD_ID_UTL.get_encodings(1,'SGTIN-64');
    DBMS_OUTPUT.put_line('Encodings are: ' || getencodings);
    getschemenames := DBMS_MGD_ID_UTL.get_scheme_names(1);
    DBMS_OUTPUT.put_line('Scheme names are: ' || getschemenames);
END;
/
SHOW ERRORS;

102.4.6 GET_ENCODINGS Function

This function returns a list of semicolon (;) separated encodings (formats) for the specified scheme.

Syntax

```sql
DBMS_MGD_ID_UTL.GET_ENCODINGS (category_id IN VARCHAR2,
                                 scheme_name IN VARCHAR2)
RETURN VARCHAR2;
```
Parameters

Table 102-10  GET_ENCODINGS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
<tr>
<td>scheme_name</td>
<td>Name of scheme</td>
</tr>
</tbody>
</table>

Usage Notes

The return value contains the encodings separated by a semicolon (;) for the specified scheme.

Examples

See the GET_COMPONENTS Function for an example.

102.4.7 GET_JAVA_LOGGING_LEVEL Function

This function returns an integer representing the current trace logging level.

Syntax

```
DBMS_MGD_ID_UTL.GET_JAVA_LOGGING_LEVEL
RETURN INTEGER;
```

Usage Notes

The return value is the integer value denoting the current Java logging level.

Examples

The following example gets the Java logging level.

```
--Contents of getjavalogginglevel.sql
DECLARE
  loglevel NUMBER;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  loglevel := DBMS_MGD_ID_UTL.get_java_logging_level();
  dbms_output.put_line('Java logging level = ' ||loglevel);
END;
/
SHOW ERRORS;
```

SQL> @getjavalogginglevel.sql

PL/SQL procedure successfully completed.
.
.
.
ORACLE
102.4.8 GET_PLSQL_LOGGING_LEVEL Function

This function returns an integer representing the current PL/SQL trace logging level.

Syntax

DBMS_MGD_ID_UTL.GET_PLSQL_LOGGING_LEVEL
RETURN INTEGER;

PRAGMA restrict_references(get_plsql_logging_level, WNDS);

Usage Notes

The return value is the integer value denoting the current PL/SQL logging level.

Examples

The following example gets the PL/SQL logging level.

```
--Contents of getplsqllogginglevel.sql
DECLARE
    loglevel   NUMBER;
BEGIN
    DBMS_MGD_ID_UTL.set_plsql_logging_level(0);
    loglevel := DBMS_MGD_ID_UTL.get_plsql_logging_level();
    dbms_output.put_line('PL/SQL logging level = ' ||loglevel);
END;
/
SHOW ERRORS;
```

SQL> @getplsqllogginglevel.sql
.
.
.
PL/SQL logging level = 0
PL/SQL procedure successfully completed.
.
.
.

102.4.9 GET_SCHEME_NAMES Function

This function returns a list of semicolon (;) separated scheme names for the specified category.

Syntax

DBMS_MGD_ID_UTL.GET_SCHEME_NAMES (    category_id IN VARCHAR2)
RETURN VARCHAR2;
Parameters

Table 102-11  GET_SCHEME_NAMES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
</tbody>
</table>

Usage Notes

The return value contains the scheme names for the specified category ID.

Examples

See the GET_COMPONENTS Function for an example.

102.4.10 GET_TDT_XML Function

This function returns the Oracle Database tag data translation XML for the specified scheme.

Syntax

```
DBMS_MGD_ID_UTL.GET_TDT_XML (
    category_id  IN VARCHAR2,
    scheme_name  IN VARCHAR2)
RETURN CLOB;
```

Parameters

Table 102-12  GET_TDT_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
<tr>
<td>scheme_name</td>
<td>Name of scheme</td>
</tr>
</tbody>
</table>

Usage Notes

The return value contains the Oracle Database tag data translation XML for the specified scheme.

Examples

The following example gets the Oracle Database TDT XML for the specified scheme:

```sql
--Contents of get_tdtxml.sql
DECLARE
    gettdtxml  CLOB;
BEGIN
    gettdtxml := DBMS_MGD_ID_UTL.get_tdt_xml(1,'SGTIN-64');
    dbms_output.put_line('Length of tdt XML is '||DBMS_LOB.GETLENGTH(gettdtxml));
    dbms_output.put_line(DBMS_LOB.SUBSTR(gettdtxml, DBMS_LOB.GETLENGTH(gettdtxml), 1));
END;
/```
SHOW ERRORS;

SQL> @get_tdtxml.sql

.
102.4.11 GET_VALIDATOR Function

This function returns the Oracle Database tag data translation schema.

Syntax

```
DBMS_MGD_ID_UTL.GET_VALIDATOR
RETURN CLOB;
```

Usage Notes

The return value contains the Oracle Database tag data translation schema.

Examples

This example returns the Oracle Database TDT schema.
--Contents of get_validator.sql

Chapter 102
Summary of DBMS_MGD_ID_UTL Subprograms

102-20
102.4.12 REFRESH_CATEGORY Function

This function refreshes the metadata information on the Java stack for the specified category.

This function must be called before using MGD_ID functions.

Syntax

DBMS_MGD_ID_UTL.REFRESH_CATEGORY (category_id IN VARCHAR2);

Parameters

Table 102-13  REFRESH_CATEGORY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
</tbody>
</table>
Examples

The following example refreshes the metadata information for the EPC category ID.

```sql
-- Contents of tostring3.sql
call DBMS_MGD_ID_UTL.set_proxy('www-proxy.example.com', '80');
DECLARE
  id MGD_ID;
BEGIN
  DBMS_MGD_ID_UTL.set_java_logging_level(DBMS_MGD_ID_UTL.LOGGING_LEVEL_OFF);
  DBMS_MGD_ID_UTL.refresh_category(DBMS_MGD_ID_UTL.get_category_id('EPC', NULL));
  dbms_output.put_line('..Testing to_string');
  DBMS_OUTPUT.PUT_LINE('test to_string');
  id := mgd_id('EPC', NULL, 'urn:epc:id:gid:0037000.30241.1041970',
                 'scheme=GID-96');
  DBMS_OUTPUT.PUT_LINE('mgd_id object as a string');
  DBMS_OUTPUT.PUT_LINE(id.to_string);
END;
/
SHOW ERRORS;
call DBMS_MGD_ID_UTL.remove_proxy();

SQL> @tostring3.sql
..Testing to_string
test to_string
mgd_id object as a string
category_id =1;schemes = GID-96;objectclass = 30241;generalmanager = 0037000;scheme = GID-96;1 = 1;serial = 1041970

PL/SQL procedure successfully completed.

102.4.13 REMOVECATEGORY Procedure

This procedure removes a category including all the related TDT XML.

This procedure is overloaded. The different functionality of each form of syntax is presented along with the definitions.

Syntax

Removes a category based on the specified category ID.

```
DBMS_MGD_ID_UTL.REMOVECATEGORY {
  category_id IN VARCHAR2};
```

Removes a category based on the specified category name and category version.

```
DBMS_MGD_ID_UTL.REMOVECATEGORY {
  category_name IN VARCHAR2,
  category_version IN VARCHAR2};
```

Parameters

**Table 102-14  REMOVECATEGORY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
</tbody>
</table>
### Table 102-14   (Cont.) REMOVE_CATEGORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_name</td>
<td>Name of category</td>
</tr>
<tr>
<td>category_version</td>
<td>Category version</td>
</tr>
</tbody>
</table>

#### Usage Notes

If the value of category_version is NULL, all versions for the specified category will be removed.

#### Examples

See the ADD_SCHEME Procedure for an example of removing a category.

### 102.4.14 REMOVE_PROXY Procedure

This procedure unsets the host and port of the proxy server.

#### Syntax

```
DBMS_MGD_ID_UTL.REMOVE_PROXY;
```

#### Examples

See the REFRESH_CATEGORY Function for an example.

### 102.4.15 REMOVE_SCHEME Procedure

This procedure removes a tag data translation scheme from a category.

#### Syntax

```
DBMS_MGD_ID_UTL.REMOVE_SCHEME (  
    category_id  IN  VARCHAR2,  
    scheme_name  IN  VARCHAR2);  
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category_id</td>
<td>Category ID</td>
</tr>
<tr>
<td>scheme_name</td>
<td>Name of scheme</td>
</tr>
</tbody>
</table>

#### Examples

See the ADD_SCHEME Procedure for an example of removing a scheme.
102.4.16 SET_JAVA_LOGGING_LEVEL Procedure

This procedure sets the Java trace logging level.

Syntax

DBMS_MGD_ID_UTL.SET_JAVA_LOGGING_LEVEL (    logginglevel IN INTEGER);

Parameters

Table 102-16  SET_JAVA_LOGGING_LEVEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logginglevel</td>
<td>Logging level. The Java logging level can be one of the following values in descending order:</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_OFF CONSTANT INTEGER := 0</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_INFO CONSTANT INTEGER := 3</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINE CONSTANT INTEGER := 4</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINER CONSTANT INTEGER := 5</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_ALL CONSTANT INTEGER := 7</td>
</tr>
</tbody>
</table>

Examples

See the GET_JAVA_LOGGING_LEVEL Function for an example.

102.4.17 SET_PLSQL_LOGGING_LEVEL Procedure

This procedure sets the PL/SQL trace logging level.

Syntax

DBMS_MGD_ID_UTL.SET_PLSQL_LOGGING_LEVEL (    level IN INTEGER);

PRAGMA restrict_references(set_plsql_logging_level, WNDS);
Parameters

Table 102-17  SET_PLSQL_LOGGING_LEVEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>Logging level. The PL/SQL logging level can be one of the following values in descending order:</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_OFF CONSTANT INTEGER := 0</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_SEVERE CONSTANT INTEGER := 1</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_WARNING CONSTANT INTEGER := 2</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_INFO CONSTANT INTEGER := 3</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINE CONSTANT INTEGER := 4</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINER CONSTANT INTEGER := 5</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_FINEST CONSTANT INTEGER := 6</td>
</tr>
<tr>
<td></td>
<td>• LOGGING_LEVEL_ALL CONSTANT INTEGER := 7</td>
</tr>
</tbody>
</table>

Examples

See the GET_PLSQL_LOGGING_LEVEL Function for an example.

102.4.18 SET_PROXY Procedure

This procedure sets the host and port of the proxy server for Internet access.

This procedure must be called if the database server accesses the Internet using a proxy server. Internet access is necessary because some rules need to look up the Object Naming Service (ONS) table to get the company prefix index.

You do not need to call this procedure does if you are only using schemes that do not contain any rules requiring Internet access.

Syntax

```sql
DBMS_MGD_ID_UTL.SET_PROXY (    proxt_host IN VARCHAR2,    proxy_port IN VARCHAR2);```

Parameters

Table 102-18  SET_PROXY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>proxy_host</td>
<td>Name of host</td>
</tr>
<tr>
<td>proxy_port</td>
<td>Host port number</td>
</tr>
</tbody>
</table>

Examples

See the REFRESHCATEGORY Function for an example.
102.4.19 VALIDATE_SCHEME Function

This function validates the input tag data translation XML against the Oracle Database tag data translation schema.

Syntax

```
DBMS_MGD_ID_UTL.VALIDATE_SCHEME (
    xml_scheme IN CLOB)
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xml_scheme</td>
<td>Scheme to be validated.</td>
</tr>
</tbody>
</table>

Usage Notes

The return value contains the components names for the specified scheme.

Examples

See the ADD_SCHEME Procedure or the EPC_TO_ORACLE_SCHEME Function for an example.
DBMS_MGWADM defines the Messaging Gateway administrative interface. The package and object types are owned by SYS.

Note:
You must run the catmgw.sql script to load the Messaging Gateway packages and types into the database.

See Also:
Oracle Database Advanced Queuing User’s Guide contains information on loading database objects and using DBMS_MGWADM.

This chapter contains the following topics:
- Security Model
- Deprecated Subprograms
- Constants
- Data Structures
- Summary of DBMS_MGWADM Subprograms

103.1 DBMS_MGWADM Security Model
A user with administrative privilege can run all procedures in DBMS_MGWADM.

103.2 DBMS_MGWADM Deprecated Subprograms
Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 11g Release 1 having been superseded by improved technology:
- ADD_SUBSCRIBER Procedure - use instead CREATE_JOB Procedure
- ALTER_PROPAGATION_SCHEDULE Procedure - use instead ALTER_JOB Procedure
- ALTER_SUBSCRIBER Procedure - use instead ALTER_JOB Procedure
- DB_CONNECT_INFO Procedure - use instead ALTER_AGENT Procedures
103.3 DBMS_MGWADM Constants

The DBMS_MGWADM package defines various constants for specifying parameter values.

103.4 DBMS_MGWADM Data Structures

The DBMS_MGWADM package defines several OBJECT types.

DBMS_MGWADM Object Types

- SYS.MGW_MQSERIES_PROPERTIES Object Type
- SYS.MGW_PROPERTIES Object Type
- SYS.MGW_PROPERTY Object Type
- SYS.MGW_TIBRV_PROPERTIES Object Type

103.4.1 DBMS_MGWADM SYS.MGW_MQSERIES_PROPERTIES Object Type

This type specifies basic properties for a WebSphere MQ messaging system link.

Syntax

```plaintext
TYPE SYS.MGW_MQSERIES_PROPERTIES IS OBJECT (   queue_manager VARCHAR2(64),   hostname VARCHAR2(64),   port INTEGER,   channel VARCHAR2(64),   interface_type INTEGER,   max_connections INTEGER,   username VARCHAR2(64),   password VARCHAR2(64),   inbound_log_queue VARCHAR2(64),   outbound_log_queue VARCHAR2(64),   -- Methods   STATIC FUNCTION construct   RETURN SYS.MGW_MQSERIES_PROPERTIES,)

Attributes

Table 103-12  SYS.MGW_MQSERIES_PROPERTIES Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_manager</td>
<td>The name of the WebSphere MQ queue manager</td>
</tr>
<tr>
<td>hostname</td>
<td>The host on which the WebSphere MQ messaging system resides. If hostname is NULL, then a WebSphere MQ bindings connection is used. If not NULL, then a client connection is used and requires that a port and channel be specified.</td>
</tr>
<tr>
<td>port</td>
<td>The port number. This is used only for client connections; that is, when hostname is not NULL.</td>
</tr>
<tr>
<td>channel</td>
<td>The channel used when establishing a connection to the queue manager. This is used only for client connections; that is, when hostname is not NULL.</td>
</tr>
<tr>
<td>interface_type</td>
<td>The type of messaging interface to use. Values:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_MGWADM.MQSERIES_BASE_JAVA_INTERFACE if the WebSphere MQ Base Java interface should be used.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_MGWADM.JMS_CONNECTION if the link is to be used to access JMS destinations in a unified, domain-independent manner.</td>
</tr>
<tr>
<td>max_connections</td>
<td>The maximum number of messaging connections to the WebSphere MQ messaging system</td>
</tr>
<tr>
<td>username</td>
<td>The username used for authentication to the WebSphere MQ messaging system</td>
</tr>
<tr>
<td>password</td>
<td>The password used for authentication to the WebSphere MQ messaging system</td>
</tr>
<tr>
<td>inbound_log_queue</td>
<td>The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for inbound propagation; that is, when queues associated with this link serve as a propagation source:</td>
</tr>
<tr>
<td></td>
<td>• For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>• For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.</td>
</tr>
<tr>
<td></td>
<td>• For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE.</td>
</tr>
</tbody>
</table>
Table 103-12  (Cont.) SYS.MGW_MQSERIES_PROPERTIES Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| outbound_log_queue| The name of the WebSphere MQ queue used for propagation recovery purposes when this messaging link is used for outbound propagation; that is, when queues associated with this link serve as a propagation destination:  
  • For MQSERIES_BASE_JAVA_INTERFACE, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.  
  • For the JMS_CONNECTION interface and the JMS_QUEUE_CONNECTION interface, this is the name of a physical WebSphere MQ queue created using WebSphere MQ administration tools.  
  • For JMS_TOPIC_CONNECTION interface, this specifies the name of a WebSphere MQ JMS topic. The physical WebSphere MQ queue used by subscribers of that topic must be created using WebSphere MQ administration tools. By default, the physical queue used is SYSTEM.JMS.D.SUBSCRIBER.QUEUE. |

Methods

Table 103-13  SYS.MGW_MQSERIES_PROPERTIES Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>construct</td>
<td>Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance. All attributes are assigned a value of NULL</td>
</tr>
<tr>
<td>alter_construct</td>
<td>Constructs a new SYS.MGW_MQSERIES_PROPERTIES instance for altering the properties of an existing messaging link. All attributes having a VARCHAR2 datatype are assigned a value of DBMS_MGWADM.NO_CHANGE. Attributes of other datatypes are assigned a value of NULL.</td>
</tr>
</tbody>
</table>

103.4.2 DBMS_MGWADM SYS.MGW_PROPERTIES Object Type

This type specifies an array of properties.

Syntax

```
TYPE SYS.MGW_PROPERTIES AS VARRAY (2000) OF SYS.MGW_PROPERTY;
```

Attributes

Table 103-14  SYS.MGW_PROPERTIES Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Property name</td>
</tr>
<tr>
<td>value</td>
<td>Property value</td>
</tr>
</tbody>
</table>
Usage Notes

Unless noted otherwise, Messaging Gateway uses named properties as follows:

• Names with the `MGWPROP$` prefix are reserved. They are used for special purposes and are invalid when used as a normal property name.

• A property name can exist only once in a property list; that is, a list can contain only one value for a given name. The name is case-insensitive.

• In general, a property list is order-independent, and the property names may appear in any order. An alter property list is an exception.

• You can use a new property list to alter an existing property list. Each new property modifies the original list in one of the following ways: adds a new property, modifies a property, removes a property, or removes all properties.

The alter list is processed in order, from the first element to the last element. Thus the order in which the elements appear in the alter list is meaningful, especially when the alter list is used to remove properties from an existing list.

The property name and value are used to determine how that element affects the original list. The following rules apply:

• Add or modify property

```
MGW_PROPERTY.NAME = property_name
MGW_PROPERTY.VALUE = property_value
```

If a property of the given name already exists, then the current value is replaced with the new value; otherwise the new property is added to the end of the list.

• Remove property

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE'
MGW_PROPERTY.VALUE = name_of_property_to_remove
```

No action is taken if the property name does not exist in the original list.

• Remove all properties

```
MGW_PROPERTY.NAME = 'MGWPROP$_REMOVE_ALL'
MGW_PROPERTY.VALUE = not used
```

See Also:

"The `DBMS_MGWADM` package defines constants to represent the reserved property names on Table 103-4"

103.4.3 DBMS_MGWADM SYS.MGW_PROPERTY Object Type

This type specifies a named property which is used to specify optional properties for messaging links, foreign queues, and subscribers.

Syntax

```
TYPE SYS.MGW_PROPERTY IS OBJECT(
  name VARCHAR2(500),
);```

value VARCHAR2(4000),

-- Methods
STATIC FUNCTION construct --- (1)
RETURN SYS.MGW_PROPERTY,

STATIC FUNCTION construct(   --- (2)
  p_name   IN VARCHAR2,
  p_value  IN VARCHAR2)
RETURN SYS.MGW_PROPERTY );

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>

<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>construct --- (1)</td>
<td>Constructs a new MGWPROPERTY instance. All attributes are assigned a value of NULL</td>
</tr>
<tr>
<td>construct --- (2)</td>
<td>Constructs a new MGWPROPERTY instance initialized using the given parameters</td>
</tr>
</tbody>
</table>

See Also:
"The DBMS_MGWADM package defines constants to represent the reserved property names on Table 103-4"

103.4.4 SYS.MGW_TIBRV_PROPERTIES Object Type

A type that specifies basic properties for a TIB/Rendezvous messaging system link. The Messaging Gateway agent creates a TIB/Rendezvous transport of type TibrvRvdTransport for each Messaging Gateway link.

Syntax

```sql
TYPE SYS.MGW_TIBRV_PROPERTIES IS OBJECT(
    service   VARCHAR2(128),
    daemon    VARCHAR2(128),
    network   VARCHAR2(256),
    cm_name   VARCHAR2(256),
    cm_ledger VARCHAR2(256),

    -- Methods
    STATIC FUNCTION construct
```
RETURN SYS.MGW_TIBRV_PROPERTIES,

STATIC FUNCTION alter_construct
RETURN SYS.MGW_TIBRV_PROPERTIES );

Attributes

Table 103-17 SYS.MGW_TIBRV_PROPERTIES Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>The service parameter for the rvd transport</td>
</tr>
<tr>
<td>daemon</td>
<td>The daemon parameter for the rvd transport</td>
</tr>
<tr>
<td>network</td>
<td>The network parameter for the rvd transport</td>
</tr>
<tr>
<td>cm_name</td>
<td>The CM correspondent name. Reserved for future use.</td>
</tr>
<tr>
<td>cm_ledger</td>
<td>The CM ledger file name. Reserved for future use.</td>
</tr>
</tbody>
</table>

Methods

103.5.1 ADD_SUBSCRIBER Procedure

This procedure adds a subscriber used to consume messages from a source queue for propagation to a destination.

**Note:**
This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure), and is retained only for reasons of backward compatibility.

**Syntax**

```sql
DBMS_MGWADM.ADD_SUBSCRIBER(
  subscriber_id     IN VARCHAR2,
  propagation_type  IN BINARY_INTEGER,
  queue_name        IN VARCHAR2,
  destination       IN VARCHAR2,
  rule              IN VARCHAR2 DEFAULT NULL,
  transformation    IN VARCHAR2 DEFAULT NULL,
  exception_queue   IN VARCHAR2 DEFAULT NULL,
  options           IN SYS.MGW_PROPERTIES DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Specifies a user-defined name that identifies this subscriber.</td>
</tr>
<tr>
<td>propagation_type</td>
<td>Specifies the type of message propagation. For OUTBOUND_PROPAGATION, see Oracle Database Advanced Queuing to non-Oracle propagation. For INBOUND_PROPAGATION, see non-Oracle to Oracle Database Advanced Queuing propagation.</td>
</tr>
<tr>
<td>queue_name</td>
<td>Specifies the source queue to which this subscriber is being added. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>destination</td>
<td>Specifies the destination queue to which messages consumed by this subscriber are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>rule</td>
<td>Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. This is NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type. If NULL, then the Oracle Database Advanced Queuing payload type must be supported by Messaging Gateway.</td>
</tr>
</tbody>
</table>
### Table 103-20  (Cont.) ADD_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exception_queue</td>
<td>Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, then an exception queue is not used and propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type. The source queue and exception queue cannot be the same queue.</td>
</tr>
<tr>
<td>options</td>
<td>Optional subscriber properties. NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.</td>
</tr>
</tbody>
</table>

#### Usage Notes

**See Also:**

"Handling Arbitrary Payload Types Using Message Transformations", in *Oracle Database Advanced Queuing User's Guide* for more information regarding message conversion and transformation

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

**See Also:**

For additional information regarding subscriber options

- "WebSphere MQ System Properties" in *Oracle Database Advanced Queuing User's Guide*
- “TIB/Rendezvous System Properties” in *Oracle Database Advanced Queuing User's Guide*

#### OUTBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for outbound propagation are interpreted as follows:

- `queue_name` specifies the local Oracle Database Advanced Queuing queue that is the propagation source. This must have a syntax of `schema.queue`. 
• **destination** specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

• **rule** specifies an optional Oracle Database Advanced Queuing subscriber rule if the native Oracle Database Advanced Queuing interface is used, or a JMS selector if the Oracle JMS interface is used. If **NULL**, then no rule or selector is used.

• **transformation** specifies the transformation used to convert the Oracle Database Advanced Queuing payload to an ADT defined by Messaging Gateway. Messaging Gateway propagation dequeues messages from the Oracle Database Advanced Queuing queue using the transformation to convert the Oracle Database Advanced Queuing payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the foreign messaging system based on the Messaging Gateway ADT.

• **exception_queue** specifies the name of a local Oracle Database Advanced Queuing queue to which messages are moved if an exception occurs. This must have a syntax of `schema.queue`.

If the native Oracle Database Advanced Queuing interface is used, then a subscriber will be added to the Oracle Database Advanced Queuing queue when this procedure is called, whether or not Messaging Gateway is running. The local subscriber will be of the form `sys.aq$_agent('MGW_subscriber_id', NULL, NULL)`.

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of `MGW_subscriber_id`. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following caveats:

• The user is responsible for creating the Oracle Database Advanced Queuing queue to be used as the exception queue.

• The payload type of the source and exception queue must match.

• The exception queue must be created as a queue type of `DBMS_AQADM.NORMAL_QUEUE` rather than `DBMS_AQADM.EXCEPTION_QUEUE`. Enqueue restrictions prevent Messaging Gateway propagation from using an Oracle Database Advanced Queuing queue of type `EXCEPTION_QUEUE` as a Messaging Gateway exception queue.

### INBOUND_PROPAGATION Subscribers

The parameters for a subscriber used for inbound propagation are interpreted as follows:

• **queue_name** specifies the foreign queue that is the propagation source. This must have a syntax of `registered_queue@message_link`.

• **destination** specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

• **rule** specifies an optional subscriber rule that is valid for the foreign messaging system. This is **NULL** if no rule is needed.

• **transformation** specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Database Advanced Queuing payload type. Messaging Gateway propagation dequeues messages from the foreign messaging system and converts the message body to a known ADT defined by Messaging.
Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Database Advanced Queuing payload type when the message is enqueued to the Oracle Database Advanced Queuing queue.

- Exception_queue specifies the name of a foreign queue to which messages are moved if an exception occurs. This must have a syntax of registered_queue@message_link.

Whether or not a subscriber is needed depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then it will be created by the Messaging Gateway agent. If the agent is not running at the time this procedure is called, then the creation of the subscriber on the non-Oracle messaging system will occur when the agent next starts.

The exception queue has the following caveats:

- The exception queue must be a registered non-Oracle queue.
- The source and exception queues must use the same messaging system link.

103.5.2 ALTER_AGENT Procedures

This procedure configures Messaging Gateway agent parameters.

Syntax

```sql
DBMS_MGWADM.ALTER_AGENT (  
  max_connections  IN  BINARY_INTEGER DEFAULT NULL,  
  max_memory       IN  BINARY_INTEGER DEFAULT NULL,  
  max_threads      IN  BINARY_INTEGER DEFAULT NULL,  
  service          IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

```sql
DBMS_MGWADM.ALTER_AGENT (  
  agent_name      IN   VARCHAR2,  
  username        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  password        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  database        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  conntype        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  max_memory      IN   PLS_INTEGER DEFAULT NULL,  
  max_threads     IN   PLS_INTEGER DEFAULT NULL,  
  service         IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  initfile        IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  comment         IN   VARCHAR2  DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

Table 103-21 ALTER_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_connections</td>
<td>The maximum number of messaging connections to Oracle Database used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged. Caution: This parameter has been deprecated.</td>
</tr>
<tr>
<td>max_memory</td>
<td>The maximum heap size, in MB, used by the Messaging Gateway agent. If it is NULL, then the current value is unchanged.</td>
</tr>
</tbody>
</table>
### Table 103-21  (Cont.) ALTER_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>max_threads</strong></td>
<td>The number of messaging threads that the Messaging Gateway agent creates. If it is NULL, then the current value is unchanged. The maximum value of max_threads is limited to 128.</td>
</tr>
<tr>
<td><strong>service</strong></td>
<td>Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will run on only those database instances that are assigned to the service. If NULL, the job class used by this agent will be altered to belong to the default service which is mapped to every instance. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.</td>
</tr>
<tr>
<td><strong>agent_name</strong></td>
<td>Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.</td>
</tr>
<tr>
<td><strong>username</strong></td>
<td>Specifies the username used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. If a username is specified then a password must also be specified.</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td>Specifies the password used for connections to the Oracle Database. NULL is not allowed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. A password must be specified if a username is specified.</td>
</tr>
<tr>
<td><strong>database</strong></td>
<td>Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. Oracle strongly recommends that a connect string, rather than NULL, be specified. Usually it will be a net service name from tnsnames.ora.</td>
</tr>
<tr>
<td><strong>conntype</strong></td>
<td>Specifies the type of connection to the Oracle Database, DBMS_MGWADM.JDBC_OCI or DBMS_MGWADM.JDBC_THIN. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.</td>
</tr>
<tr>
<td><strong>initfile</strong></td>
<td>Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.</td>
</tr>
<tr>
<td><strong>comment</strong></td>
<td>Optional comments for this agent. NULL if a comment is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.</td>
</tr>
</tbody>
</table>

**Note:**

The max_connections parameter included in previous versions of this subprogram has been deprecated and is non-operational.

**Usage Notes**

- Default values for these configuration parameters are set when the Messaging Gateway agent is installed.
• Changes to the `max_memory` and `max_threads` parameters take effect the next time the Messaging Gateway agent is active. If the Messaging Gateway agent is currently active, then it must be shut down and restarted for the changes to take effect.

• The `service` parameter is used to set an Oracle Scheduler job class attribute. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is NULL, the job class will belong to an internal service that is mapped to all instances.

• The `max_connections` parameter is being deprecated as of the Oracle RDBMS 11g release. The number of messaging connections used by the Messaging Gateway Agent is based on the value of the `max_threads` parameter.

• The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the user and grant it the role `MGW_AGENT_ROLE`.

103.5.3 ALTER_JOB Procedure

This procedure alters the properties of a propagation job.

Syntax

```
DBMS_MGWADM.ALTER_JOB (  
  job_name       IN   VARCHAR2,  
  rule           IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  transformation IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  exception_queue IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE,  
  poll_interval  IN   PLS_INTEGER DEFAULT 0,  
  options        IN   SYS.MGW_PROPERTIES DEFAULT NULL,  
  comments       IN   VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>job_name</code></td>
<td>Identifies the propagation job</td>
</tr>
<tr>
<td><code>rule</code></td>
<td>Specifies an optional subscription rule used to dequeue messages from the propagation source. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no subscription rule is needed. If <code>DBMS_MGWADM.NO_CHANGE</code>, then the current value is unchanged.</td>
</tr>
<tr>
<td><code>transformation</code></td>
<td>Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for <code>propagation_type</code>. A NULL value indicates that no transformation is needed. If <code>DBMS_MGWADM.NO_CHANGE</code>, the current value is unchanged.</td>
</tr>
</tbody>
</table>
### Table 103-22  (Cont.) ALTER_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exception_queue</td>
<td>Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. In cases in which no exception queue is associated with the job, propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the propagation type. A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, the current value is unchanged.</td>
</tr>
</tbody>
</table>
| poll_interval     | Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL, 0, or value > 0:  
  - If zero (default), the current value will not be changed.  
  - If NULL, the current value will be reset and the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file. |
| options           | Optional job properties. If NULL, no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of job options. |
| comments          | An optional comment for this agent, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, the current value will not be changed. |

### Usage Notes

- If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

- The subscriber rule cannot be altered when propagating from a JMS source. Instead, the propagation job must be dropped and re-created with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

- Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).

- The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner; add a new property, replace an existing property, remove an existing property or remove all properties.
103.5.4 ALTER_MSGSYSTEM_LINK Procedure for TIB/Rendezvous

This procedure alters the properties of a TIB/Rendezvous messaging system link.

Syntax

```
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (
    linkname      IN  VARCHAR2,
    properties    IN  SYS.MGW_TIBRV_PROPERTIES,
    options       IN  SYS.MGW_PROPERTIES DEFAULT NULL,
    comment       IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE );
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>The messaging system link name</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties for a TIB/Rendezvous messaging system link. If NULL, then no link properties will be changed.</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description, or NULL if one is not desired. If DBMS_MGWADM.NO_CHANGE, then the current value will not be changed.</td>
</tr>
</tbody>
</table>

Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 datatype, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another datatype, specify NULL for that property.

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.
Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

### 103.5.5 ALTER_MSGSYSTEM_LINK Procedure for WebSphere MQ

This procedure alters the properties of a WebSphere MQ messaging system link.

#### Syntax

```sql
DBMS_MGWADM.ALTER_MSGSYSTEM_LINK (  
    linkname   IN  VARCHAR2,  
    properties IN  SYS.MGW_MQSERIES_PROPERTIES,  
    options    IN  SYS.MGW_PROPERTIES DEFAULT NULL,  
    comment    IN  VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>The messaging system link name</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties for a WebSphere MQ messaging system link. If it is NULL, then no link properties are changed.</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if no options are changed. If not NULL, then the properties specified in this list are combined with the current options properties to form a new set of link options.</td>
</tr>
<tr>
<td>comment</td>
<td>An optional description or NULL if not desired. If DBMS_MGWADM.NO_CHANGE is specified, then the current value is not changed.</td>
</tr>
</tbody>
</table>

#### Usage Notes

To retain an existing value for a messaging link property with a VARCHAR2 datatype, specify DBMS_MGWADM.NO_CHANGE for that particular property. To preserve an existing value for a property of another datatype, specify NULL for that property.
The `options` parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

See Also:

SYS.MGW_PROPERTIES Object Type

Some properties cannot be modified, and this procedure will fail if an attempt is made to alter such a property. For properties and options that can be changed, a few are dynamic, and Messaging Gateway uses the new values immediately. Others require the Messaging Gateway agent to be shut down and restarted before they take effect.

See Also:

"WebSphere MQ System Properties" in Oracle Database Advanced Queuing User's Guide for more information about the messaging system properties and options

103.5.6 ALTER_PROPAGATION_SCHEDULE Procedure

This procedure alters a propagation schedule.

Note:

This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure), and is retained only for reasons of backward compatibility.

Syntax

```
DBMS_MGWADM.ALTER_PROPAGATION_SCHEDULE (
    schedule_id  IN VARCHAR2,
    duration     IN NUMBER DEFAULT NULL,
    next_time    IN VARCHAR2 DEFAULT NULL,
    latency      IN NUMBER DEFAULT NULL);
```

Parameters

Table 103-25 ALTER_PROPAGATION_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be altered</td>
</tr>
<tr>
<td>duration</td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>
Table 103-25  (Cont.) ALTER_PROPAGATION_SCHEDULE Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>next_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>latency</td>
<td>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value &gt; 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds, but it can be overridden by the Messaging Gateway initialization file.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure always overwrites the existing value for each parameter. If a given parameter is not specified, then the existing values are overwritten with the default value.

103.5.7 ALTER_SUBSCRIBER Procedure

This procedure alters the parameters of a subscriber used to consume messages from a source queue for propagation to a destination.

**Note:**

This subprogram has been deprecated as a result of improved technology (see ALTER_JOB Procedure), and is retained only for reasons of backward compatibility.

Syntax

```sql
DBMS_MGWADM.ALTER_SUBSCRIBER ( 
    subscriber_id    IN VARCHAR2, 
    rule             IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE, 
    transformation   IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE, 
    exception_queue  IN VARCHAR2 DEFAULT DBMS_MGWADM.NO_CHANGE, 
    options          IN SYS.MGW_PROPERTIES DEFAULT NULL );
```

Parameters

Table 103-26  ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber to be altered</td>
</tr>
</tbody>
</table>
Table 103-26  (Cont.) ALTER_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| rule         | Specifies an optional subscription rule used by the subscriber to dequeue messages from the source queue. The syntax and interpretation of this parameter depend on the subscriber propagation type.  
A NULL value indicates that no subscription rule is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |
| transformation | Specifies the transformation needed to convert between the Oracle Database Advanced Queuing payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the subscriber propagation type.  
A NULL value indicates that no transformation is needed. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged. |
| exception_queue | Specifies a queue used for exception message logging. This queue must be on the same messaging system as the propagation source. If no exception queue is associated with the subscriber, then propagation stops if a problem occurs. The syntax and interpretation of this parameter depend on the subscriber propagation type.  
A NULL value indicates that no exception queue is used. If DBMS_MGWADM.NO_CHANGE, then the current value is unchanged.  
The source queue and exception queue cannot be the same queue. |
| options      | Optional subscriber properties. If NULL, then no options will be changed. If not NULL, then the properties specified in this list are combined with the current optional properties to form a new set of subscriber options. |

Usage Notes

If the non-Oracle messaging link being accessed for the subscriber uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Database Advanced Queuing queues. Otherwise the native Oracle Database Advanced Queuing interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

When propagating from a JMS source, the subscriber rule cannot be altered. Instead, the subscriber must be removed and added with the new rule. For JMS, changing the message selector on a durable subscription is equivalent to deleting and re-creating the subscription.

Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be DBMS_MGWADM.NO_CHANGE (the default value).

The options parameter specifies a set of properties used to alter the current optional properties. Each property affects the current property list in a particular manner: add a new property, replace an existing property, remove an existing property, or remove all properties.

- INBOUND_PROPAGATION Subscribers for inbound propagation parameter interpretation

103.5.8 CLEANUP_GATEWAY Procedures

This procedure cleans up Messaging Gateway. The procedure performs cleanup or recovery actions that may be needed when Messaging Gateway is left in some abnormal or unexpected condition. The MGW_GATEWAY view lists Messaging Gateway status and configuration information that pertains to the cleanup actions.

Syntax

```sql
DBMS_MGWADM.CLEANUP_GATEWAY(
    action       IN   BINARY_INTEGER,
    sarg         IN   VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_MGWADM.CLEANUP_GATEWAY(
    agent_name   IN   VARCHAR2,   action       IN   BINARY_INTEGER,   sarg
    IN   VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>action</td>
<td>The cleanup action to be performed. Values:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.CLEAN_STARTUP_STATE for Messaging Gateway start up state recovery</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.CLEAN_LOG_QUEUES for log queue cleanup</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.RESET_SUB_MISSING_LOG_REC for propagation job recovery due to missing log record</td>
</tr>
<tr>
<td></td>
<td>- DBMS_MGWADM.RESET_SUB_MISSING_MESSAGE for propagation job recovery due to missing message</td>
</tr>
<tr>
<td>sarg</td>
<td>Optional argument whose meaning depends on the value specified for action. This should be NULL if it is not used for the specified action.</td>
</tr>
</tbody>
</table>
Table 103-27  (Cont.) CLEANUP_GATEWAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Identifies the Messaging Gateway agent.</td>
</tr>
<tr>
<td></td>
<td>DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.</td>
</tr>
</tbody>
</table>

Usage Notes

CLEAN_STARTUP_STATE

sarg is not used and must be NULL.

The CLEAN_STARTUP_STATE action recovers Messaging Gateway to a known state when the Messaging Gateway agent has crashed or some other abnormal event occurs, and Messaging Gateway cannot be restarted. This should be done only when the Messaging Gateway agent has been started but appears to have crashed or has been nonresponsive for an extended period of time.

The CLEAN_STARTUP_STATE action may be needed when the MGW_GATEWAY view shows that the AGENT_STATUS value is something other than NOT_STARTED or START_SCHEDULED, and the AGENT_PING value is UNREACHABLE for an extended period of time.

If the AGENT_STATUS value is BROKEN, then the Messaging Gateway agent cannot be started until the problem has been resolved and the CLEAN_STARTUP_STATE action used to reset the agent status. A BROKEN status can indicate that the Messaging Gateway start job detected a Messaging Gateway agent already running. This condition that should never occur under normal use.

Cleanup tasks include:

- Removing the Scheduler job used to start the external Messaging Gateway agent process.
- Setting certain configuration information to a known state. For example, setting the agent status to NOT_STARTED.

Execution of this command fails if:

- The agent status is NOT_STARTED or START_SCHEDULED.
- No shutdown attempt has been made prior to calling this procedure, except if the agent status is STARTING.
- The Messaging Gateway agent is successfully contacted.

The assumption is that the agent is active, and this procedure fails. If the agent does not respond after several attempts have been made, then the cleanup tasks are performed. This procedure takes at least several seconds and possibly up to one minute. This is expected behavior under conditions where this particular cleanup action is appropriate and necessary.
Note:

Terminate any Messaging Gateway agent process that may still be running after a CLEAN_STARTUP_STATE action has been successfully performed. This should be done before calling DBMS_MGWADM.STARTUP to start Messaging Gateway. The process is usually named extprocmgwextproc.

CLEAN_LOG_QUEUES

sarg is not used and must be NULL.

The Messaging Gateway agent will clean log queues for all configured messaging system links. The agent will temporarily stop all propagation activity and then remove all obsolete and bad log records from the log queues for all links. The procedure will fail if the Messaging Gateway agent is not running.

This cleanup action is automatically performed each time the Messaging Gateway agent is started.

Note:

The CLEAN_LOG_QUEUES action is performed only on agent startup. If this procedure is called when the agent is running, then the Messaging Gateway agent ignores it.

RESET_SUB_MISSING_LOG_REC

sarg specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be NULL.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing log record. The agent will reset the source and destination log records. The procedure will fail if the Messaging Gateway agent is not running.

Note:

If the messages in the source queue had already been propagated to the destination queue, then this action may result in duplicate messages.

RESET_SUB_MISSING_MESSAGE

sarg specifies a Messaging Gateway job name (or subscriber ID) to be reset. It must not be NULL.

The Messaging Gateway agent recovers a Messaging Gateway propagation job that has failed due to a missing persistent source message. The agent will treat the message as a non-persistent message and continue processing that propagation job. The procedure will fail if the Messaging Gateway agent is not running.
103.5.9 CREATE_AGENT Procedure

This procedure creates a Messaging Gateway agent that will be used to process propagation jobs.

Syntax

```sql
DBMS_MGWADM.CREATE_AGENT (  
    agent_name IN VARCHAR2,
    username IN VARCHAR2 DEFAULT NULL,
    password IN VARCHAR2 DEFAULT NULL,
    database IN VARCHAR2 DEFAULT NULL,
    conntype IN VARCHAR2 DEFAULT DBMS_MGWADM.JDBC_OCI,
    max_memory IN PLS_INTEGER DEFAULT 64,
    max_threads IN PLS_INTEGER DEFAULT 1,
    service IN VARCHAR2 DEFAULT NULL,
    initfile IN VARCHAR2 DEFAULT NULL,
    comment IN VARCHAR2 DEFAULT NULL );
```

Parameters

Table 103-28  CREATE_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>A name used to identify the agent</td>
</tr>
<tr>
<td>username</td>
<td>Specifies the username used for connections to the Oracle Database</td>
</tr>
<tr>
<td>password</td>
<td>Specifies the password used for connections to the Oracle Database. A password must be specified if a username is specified.</td>
</tr>
<tr>
<td>database</td>
<td>Specifies the database connect string used for connections to the Oracle Database. NULL indicates that a local connection should be used. A value can be specified only if username is specified. Oracle strongly recommends that a connect string, rather than NULL be specified. Usually it will be a net service name from tnsnames.ora.</td>
</tr>
<tr>
<td>conntype</td>
<td>Specifies the type of connection to the Oracle Database. Values: DBMS_MGWADM.JDBC_OCI, DBMS_MGWADM.JDBC_THIN</td>
</tr>
<tr>
<td>max_memory</td>
<td>Specifies the maximum heap size, in MB, used by the Messaging Gateway agent</td>
</tr>
<tr>
<td>max_threads</td>
<td>Specifies the number of messaging threads that the Messaging Gateway agent creates. This determines the number of propagation jobs that the agent can concurrently process. The maximum value of max_threads is limited to 128.</td>
</tr>
<tr>
<td>service</td>
<td>Specifies the database service that the Oracle Scheduler job class used by this agent will have affinity to. In an Oracle RAC environment, this means that the Messaging Gateway agent will only run on those database instances that are assigned to the service. If NULL, then the job class will belong to the default service which is mapped to every instance.</td>
</tr>
<tr>
<td>initfile</td>
<td>Specifies a Messaging Gateway initialization file used by this agent. NULL indicates that the default initialization file is used. If a value is specified, it should be the full path name of the file.</td>
</tr>
</tbody>
</table>
### Table 103-28  (Cont.) CREATE_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comment</td>
<td>An optional comment for this agent. NULL if one is not desired.</td>
</tr>
</tbody>
</table>

#### Usage Notes

- The Messaging Gateway automatically configures a default agent when Messaging Gateway is installed. The name of the default agent is `DEFAULT_AGENT`. This procedure can be used to create additional agents.
- The `username`, `password`, and `database` parameters specify connection information used by the Messaging Gateway agent for connections to the Oracle Database. An Oracle administrator should create the database user and grant it the role `MGW_AGENT_ROLE`. It is not mandatory that the connection information be specified when this procedure is called but it must be set before the agent can be started.
- The `service` parameter is used to create an Oracle Scheduler job class. The job class is used to create a Scheduler job that starts the Messaging Gateway agent. An Oracle administrator must create the database service. If the value is `NULL`, the job class will belong to an internal service that is mapped to all instances.

### 103.5.10 CREATE_JOB Procedure

This procedure creates a job used to propagate message from a source to a destination.

#### Syntax

```sql
DBMS_MGWADM.CREATE_JOB (   job_name           IN   VARCHAR2,
    propagation_type   IN   PLS_INTEGER,
    source             IN   VARCHAR2,
    destination        IN   VARCHAR2,
    rule               IN   VARCHAR2 DEFAULT NULL,
    transformation     IN   VARCHAR2 DEFAULT NULL,
    exception_queue    IN   VARCHAR2 DEFAULT NULL,
    poll_interval      IN   PLS_INTEGER DEFAULT NULL,
    options            IN   SYS.MGW_PROPERTIES DEFAULT NULL,
    enabled            IN   BOOLEAN DEFAULT TRUE,
    comments           IN   VARCHAR2 DEFAULT NULL);
```

#### Parameters

- **job_name**: A user defined name to identify the propagation job.
- **propagation_type**: Specifies the type of message propagation.
  - `DBMS_MGWADM.OUTBOUND_PROPAGATION` for Oracle Streams AQ to non-Oracle propagation.
  - `DBMS_MGWADM.INBOUND_PROPAGATION` for non-Oracle to Oracle Streams AQ propagation.
### Table 103-29  (Cont.) CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>destination</td>
<td>Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>rule</td>
<td>Specifies an optional subscription rule used to dequeue messages from the source queue. This should be NULL if no rule is needed. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>transformation</td>
<td>Specifies the transformation needed to convert between the Oracle Streams AQ payload and an ADT defined by Messaging Gateway. The type of transformation needed depends on the value specified for propagation_type.</td>
</tr>
<tr>
<td>exception_queue</td>
<td>Specifies a queue used for exception message logging purposes. This queue must be on the same messaging system as the propagation source. If NULL, an exception queue will not be used and propagation will stop if a problem occurs. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>poll_interval</td>
<td>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value &gt; 0. If NULL, then the Messaging Gateway default polling interval will be used. The default polling interval is 5 seconds and can be overridden by the Messaging Gateway initialization file.</td>
</tr>
<tr>
<td>options</td>
<td>Optional job properties, NULL if there are none. Typically these are lesser used configuration properties supported by the messaging system.</td>
</tr>
<tr>
<td>enabled</td>
<td>Specifies whether this propagation job is enabled after creation. Values: TRUE, FALSE.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment for this job. NULL if one is not desired.</td>
</tr>
</tbody>
</table>

#### Usage Notes
- The job must be enabled and Messaging Gateway agent started in order for messages to be propagated.
• If the non-Oracle messaging link being accessed for the propagation job uses a JMS interface, then the Messaging Gateway agent will use the Oracle JMS interface to access the Oracle Streams AQ queues. Otherwise the native Oracle Streams AQ interface will be used. Parameters are interpreted differently when the Messaging Gateway agent uses Oracle JMS for JMS connections.

• Transformations are not currently supported if the Oracle JMS interface is used for propagation. The transformation parameter must be NULL.

OUTBOUND_PROPAGATION Jobs

The parameters for an outbound propagation job are interpreted as follows:

• source specifies the local Oracle Streams AQ queue that is the propagation source. This must have syntax of schema.queue. This can be either a multiple consumer queue or a single consumer queue.

• destination specifies the non-Oracle queue to which messages are propagated. This must have syntax of registered_queue@message_link.

• rule specifies an optional Oracle Streams AQ subscriber rule if the native Oracle Stream AQ interface is used, or a JMS selector if the Oracle JMS interface is used. If NULL, then no rule or selector is used. This parameter must be NULL if the native Oracle Stream AQ interface is used and the propagation source is a single consumer queue.

• transformation specifies the transformation used to convert the Oracle Streams AQ payload to an ADT defined by Messaging Gateway. The full transformation name (schema.name) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the Oracle Streams AQ queue using the transformation to convert the Oracle Streams AQ payload to a known ADT defined by Messaging Gateway. The message is then enqueued in the non-Oracle messaging system based on the Messaging Gateway ADT.

• exception_queue specifies the name of a local Oracle Streams AQ queue to which messages are moved if an exception occurs. The syntax must be schema.queue.

If the native Oracle Streams AQ interface is used and the source is a multiple consumer queue, then a subscriber will be added to the Oracle Streams AQ queue when this procedure is called, whether or not the Messaging Gateway agent is running. The local subscriber will be of the form sys.aq$_agent('MGW_job_name', NULL, NULL).

If the Oracle JMS interface is used, then the Messaging Gateway agent will create a JMS durable subscriber with the name of MGW_job_name. If the agent is not running when this procedure is called, then the durable subscriber will be created the next time the agent starts.

The exception queue has the following conditions:

– The user is responsible for creating the Oracle Streams AQ queue to be used as the exception queue.

– The payload type of the source queue and exception queue must match.

– The exception queue must be created as a queue type of DBMS_AQADM.NORMAL_QUEUE. Enqueue restrictions prevent Messaging Gateway from using an Oracle Streams AQ queue of type DBMS_AQADM.EXCEPTION_QUEUE as a Messaging Gateway exception queue.

INBOUND_PROPAGATION Jobs
The parameters for an inbound propagation job are interpreted as follows:

- **source** specifies the non-Oracle queue that is the propagation source. The syntax must be `registered_queue@message_link`.
- **destination** specifies the local Oracle Streams AQ queue to which messages are propagated. The syntax must be `schema.queue`.
- **rule** specifies an optional subscriber rule that is valid for the non-Oracle messaging system. This should be `NULL` if no rule is needed.
- **transformation** specifies the transformation used to convert an ADT defined by Messaging Gateway to the Oracle Streams AQ payload type. The full transformation name (`schema.name`) should be used if one is specified.

Messaging Gateway propagation dequeues messages from the non-Oracle messaging system and converts the message body to a known ADT defined by Messaging Gateway. The transformation is used to convert the Messaging Gateway ADT to an Oracle Streams AQ payload type when the message is enqueued to the Oracle Streams AQ queue.

- **exception_queue** specifies the name of a registered non-Oracle queue to which messages are moved if an exception occurs. The syntax must be `registered_queue@message_link`.

Whether or not a subscriber is needed for the source queue depends on the requirements of the non-Oracle messaging system. If a durable subscriber is necessary, then the Messaging Gateway agent will create it. If the agent is not running when this procedure is called, then the subscriber will be created on the non-Oracle messaging system the next time the agent starts.

The exception queue has the following conditions:

- The exception queue must be a registered non-Oracle queue.
- The source queue and exception queue must use the same messaging system link.

### 103.5.11 CREATE_MSGSYSTEM_LINK Procedures for TIB/Rendezvous

This procedure creates a link to a TIB/Rendezvous messaging system.

#### Syntax

```sql
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (  
  linkname IN VARCHAR2,  
  properties IN SYS.MGW_TIBRV_PROPERTIES,  
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,  
  comment IN VARCHAR2 DEFAULT NULL );
```

```sql
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK (  
  linkname IN VARCHAR2,  
  agent_name IN VARCHAR2,  
  properties IN SYS.MGW_TIBRV_PROPERTIES,  
  options IN SYS.MGW_PROPERTIES DEFAULT NULL,  
  comment IN VARCHAR2 DEFAULT NULL );
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>A user-defined name to identify this messaging system link.</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties of a TIB/Rendezvous messaging system link.</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. NULL if one is not desired.</td>
</tr>
<tr>
<td>agent_name</td>
<td>Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also:

"TIB/Rendezvous System Properties" in Oracle Database Advanced Queuing User's Guide for more information about the messaging system properties and options.

103.5.12 CREATE_MSGSYSTEM_LINK Procedures for WebSphere MQ

This procedure creates a messaging system link to a WebSphere MQ messaging system.

Syntax

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(  
    linkname    IN VARCHAR2,  
    properties  IN SYS.MGW_MQSERIES_PROPERTIES,  
    options     IN SYS.MGW_PROPERTIES DEFAULT NULL,  
    comment     IN VARCHAR2 DEFAULT NULL);  
```

```
DBMS_MGWADM.CREATE_MSGSYSTEM_LINK(  
    linkname    IN VARCHAR2,  
    agent_name  IN VARCHAR2,  
    properties  IN SYS.MGW_MQSERIES_PROPERTIES,  
    options     IN SYS.MGW_PROPERTIES DEFAULT NULL,  
    comment     IN VARCHAR2 DEFAULT NULL);  
```
Parameters

Table 103-31  CREATE_MSGSYSTEM_LINK Procedure Parameters for WebSphere MQ

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>A user-defined name to identify the messaging system link</td>
</tr>
<tr>
<td>properties</td>
<td>Basic properties of a WebSphere MQ messaging system link</td>
</tr>
<tr>
<td>options</td>
<td>Optional link properties. NULL if there are none. These are less frequently used configuration properties supported by the messaging system.</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. NULL if one is not desired</td>
</tr>
<tr>
<td>agent_name</td>
<td>Specifies the Messaging Gateway agent that will be used to process all propagation jobs associated with this link. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.</td>
</tr>
</tbody>
</table>

Usage Notes

The Messaging Gateway default agent will process the propagation jobs associated with this link if an agent name is not specified.

See Also:

"WebSphere MQ System Properties" in Oracle Database Advanced Queuing User's Guide for more information about the messaging system properties and options.

103.5.13 DB_CONNECT_INFO Procedure

This deprecated procedure configures connection information used by the Messaging Gateway default agent for connections to Oracle Database.

Note:

This subprogram has been deprecated as a result of improved technology (see ALTER_AGENT Procedures), and is retained only for reasons of backward compatibility.

Syntax

```sql
DBMS_MGWADM.DB_CONNECT_INFO (    username      IN VARCHAR2,    password      IN VARCHAR2,    database      IN VARCHAR2 DEFAULT NULL);```
Parameters

Table 103-32  DB_CONNECT_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The username used for connections to Oracle Database. NULL is not allowed</td>
</tr>
<tr>
<td>password</td>
<td>The password used for connections to Oracle Database. NULL is not allowed</td>
</tr>
<tr>
<td>database</td>
<td>The database connect string used by the Messaging Gateway agent. NULL indicates that a local connection should be used. Oracle strongly recommends that a not NULL value be specified. Usually it will be a net service name from tnsnames.ora.</td>
</tr>
</tbody>
</table>

Usage Notes

The Messaging Gateway agent connects to Oracle Database as the user configured by this procedure. An Oracle administrator should create the user, grant it the role MGW_AGENT_ROLE, and then call this procedure to configure Messaging Gateway. Role MGW_AGENT_ROLE is used to grant this user special privileges needed to access Messaging Gateway configuration information stored in the database, enqueue or dequeue messages to and from Oracle Database Advanced Queuing queues, and perform certain Oracle Database Advanced Queuing administration tasks.

103.5.14 DISABLE_JOB Procedure

This procedure disables a propagation job.

Syntax

```sql
DBMS_MGWADM.DISABLE_JOB ( job_name IN VARCHAR2);
```

Parameters

Table 103-33  DISABLE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Identifies the propagation job</td>
</tr>
</tbody>
</table>
103.5.15 DISABLE_PROPAGATION_SCHEDULE Procedure

This deprecated procedure disables a propagation schedule.

![Note:](image)

This subprogram has been deprecated as a result of improved technology (see DISABLE_JOB Procedure), and is retained only for reasons of backward compatibility.

**Syntax**

```sql
DBMS_MGWADM.DISABLE_PROPAGATION_SCHEDULE (  
    schedule_id IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be disabled</td>
</tr>
</tbody>
</table>

103.5.16 ENABLE_JOB Procedure

This procedure enables a propagation job.

**Syntax**

```sql
DBMS_MGWADM.ENABLE_JOB (  
    job_name IN VARCHAR2 );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Identifies the propagation job</td>
</tr>
</tbody>
</table>
103.5.17 ENABLE_PROPAGATION_SCHEDULE Procedure

This deprecated procedure enables a propagation schedule.

**Note:**

This subprogram has been deprecated as a result of improved technology (see ENABLE_JOB Procedure), and is retained only for reasons of backward compatibility.

Syntax

```sql
DBMS_MGWADM.ENABLE_PROPAGATION_SCHEDULE ( schedule_id  IN VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be enabled</td>
</tr>
</tbody>
</table>

103.5.18 REGISTER_FOREIGN_QUEUE Procedure

This procedure registers a non-Oracle queue entity in Messaging Gateway.

Syntax

```sql
DBMS_MGWADM.REGISTER_FOREIGN_QUEUE (  
    name            IN VARCHAR2,  
    linkname        IN VARCHAR2,  
    provider_queue  IN VARCHAR2  DEFAULT NULL,  
    domain          IN INTEGER DEFAULT NULL,  
    options         IN SYS.MGW_PROPERTIES DEFAULT NULL,  
    comment         IN VARCHAR2  DEFAULT NULL  );
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The registered queue name. This name identifies the foreign queue within Messaging Gateway and need not match the name of the queue in the foreign messaging system.</td>
</tr>
<tr>
<td>linkname</td>
<td>The link name for the messaging system on which this queue exists</td>
</tr>
<tr>
<td>provider_queue</td>
<td>The message provider (native) queue name. If NULL, then the value provided for the name parameter is used as the provider queue name.</td>
</tr>
</tbody>
</table>
Table 103-37  (Cont.) REGISTER_FOREIGN_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>domain</td>
<td>The domain type of the queue. NULL means the domain type is automatically determined based on the messaging system of the queue. DBMS_MGWADM.DOMAIN_QUEUE is for a queue (point-to-point model). DBMS_MGWADM.DOMAIN_TOPIC is for a topic (publish-subscribe model).</td>
</tr>
<tr>
<td>options</td>
<td>Optional queue properties</td>
</tr>
<tr>
<td>comment</td>
<td>A user-specified description. Can be NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not create the physical queue in the non-Oracle messaging system. The non-Oracle queue must be created using the administration tools for that messaging system.

See Also:

For more information when registering queues for the WebSphere MQ messaging system or the TIB/Rendezvous messaging system, specifically “Optional Foreign Queue Configuration Properties” in Oracle Database Advanced Queuing User’s Guide.

103.5.19 REMOVE_AGENT Procedure

This procedure removes a Messaging Gateway agent.

Syntax

```
DBMS_MGWADM.REMOVE_AGENT(
    agent_name   IN   VARCHAR2);
```

Parameters

Table 103-38  REMOVE_AGENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>Identifies the Messaging Gateway agent</td>
</tr>
</tbody>
</table>

Usage Notes

All messaging system links associated with this Messaging Gateway agent must be removed and the agent must be stopped before it can be removed. The Messaging Gateway default agent cannot be removed.
103.5.20 REMOVE_JOB Procedure

This procedure removes a propagation job.

Syntax

```sql
DBMS_MGWADM.REMOVE_JOB(
    job_name   IN   VARCHAR2,   force      IN   PLS_INTEGER DEFAULT
    DBMS_MGWADM.NO_FORCE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Identifies the propagation job</td>
</tr>
<tr>
<td>force</td>
<td>Specifies whether the procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this propagation job.</td>
</tr>
</tbody>
</table>

**Values:** DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE

- NO_FORCE (default) means the job is not removed if Messaging Gateway is unable to clean up successfully
- FORCE means the job is removed even though all cleanup actions may not be done

Usage Notes

- The Messaging Gateway agent uses various resources of the Oracle Database and the non-Oracle messaging system for its propagation work. These resources need to be released when the job is removed. For example, Messaging Gateway may create a durable subscriber on the source queue that should be removed when the job is removed. Therefore, this procedure should normally be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this job.

- For outbound propagation, a local subscriber is removed from the Oracle Streams AQ queue when the propagation source is a multiple consumer queue.

103.5.21 REMOVE_MSGSYSTEM_LINK Procedure

This procedure removes a messaging system link for a non-Oracle messaging system.

Syntax

```sql
DBMS_MGWADM.REMOVE_MSGSYSTEM_LINK(
    linkname   IN   VARCHAR2);
```
Parameters

Table 103-40 REMOVE_MSGSYSTEM_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linkname</td>
<td>The messaging system link name</td>
</tr>
</tbody>
</table>

Usage Notes

All registered queues associated with this link must be removed before the messaging system link can be removed. This procedure fails if there is a registered foreign (non-Oracle) queue that references this link.

103.5.22 REMOVE_OPTION Procedure

This procedure removes a Messaging Gateway configuration option. It can be used to remove an agent option, a messaging link option, or a propagation job option.

Syntax

```sql
DBMS_MGWADM.REMOVE_OPTION (  
    target_type IN PLS_INTEGER,  
    target_name IN VARCHAR2,  
    option_name IN VARCHAR2);  
```

Parameters

Table 103-41 REMOVE_OPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>target_type</td>
<td>Specifies the target type of the Messaging Gateway entity:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_MGWADM.AGENT_JAVA_PROP to remove a Java System property for a Messaging Gateway agent</td>
</tr>
<tr>
<td></td>
<td>• DBMS_MGWADM.MSGLINK_OPTION to remove a messaging link option</td>
</tr>
<tr>
<td></td>
<td>• DBMS_MGWADM JOB_OPTION to remove a propagation job option</td>
</tr>
<tr>
<td>target_name</td>
<td>Name or identifier of the target. The value for this parameter depends on the value specified for target_type parameter. This must not be NULL.</td>
</tr>
<tr>
<td>option_name</td>
<td>Option name. This must not be NULL.</td>
</tr>
</tbody>
</table>

See Also:

Table 103-10 regarding options for the option_type parameter

Usage Notes

DBMS_MGWADM.AGENT_JAVA_PROP Target
The procedure removes an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

- **target_name** specifies the name of the Messaging Gateway agent. `DBMS_MGWADM.DEFAULT_AGENT` can be used for the default agent.
- **option_name** specifies the Java System property
- **encrypted** can be either `TRUE` or `FALSE`

**DBMS_MGWADM.MSGLINK_OPTION** Target

The procedure removes a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the options parameter to remove an option.

The parameters are interpreted as follows:

- **target_name** specifies the name of the message system link
- **option_name** specifies the option to set
- **encrypted** must be `FALSE`

**DBMS_MGWADM.JOB_OPTION** Target

The procedure removes a single option for a Messaging Gateway propagation job. This is equivalent to calling `DBMS_MGWADM.ALTER_JOB` and using the options parameter to remove an option.

The parameters are interpreted as follows:

- **target_name** specifies the name of the propagation job
- **option_name** specifies the option to set
- **encrypted** must be `FALSE`

### 103.5.23 REMOVE_SUBSCRIBER Procedure

This procedure removes a subscriber used to consume messages from a source queue for propagation to a destination.

**Note:**

This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure), and is retained only for reasons of backward compatibility.

**Syntax**

```sql
DBMS_MGWADM.REMOVE_SUBSCRIBER (  
    subscriber_id  IN VARCHAR2,  
    force          IN BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE );
```
Parameters

Table 103-42  REMOVE_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber to be removed</td>
</tr>
<tr>
<td>force</td>
<td>Specifies whether this procedure should succeed even if Messaging Gateway is not able to perform all cleanup actions pertaining to this subscriber. Values: DBMS_MGWADM.NO_FORCE, DBMS_MGWADM.FORCE</td>
</tr>
<tr>
<td></td>
<td>• NO_FORCE means the subscriber is not removed if Messaging Gateway is unable to clean up successfully (default)</td>
</tr>
<tr>
<td></td>
<td>• FORCE means the subscriber is removed even though all cleanup actions may not be done</td>
</tr>
</tbody>
</table>

Usage Notes

- The Messaging Gateway agent uses various resources of Oracle Database and the non-Oracle messaging system for its propagation work. These resources are typically associated with each subscriber and need to be released when the subscriber is no longer needed. Therefore, this procedure should only be called when the Messaging Gateway agent is running and able to access the non-Oracle messaging system associated with this subscriber.

- For outbound propagation, a local subscriber is removed from the Oracle Database Advanced Queuing queue.

103.5.24 RESET_JOB Procedure

This procedure resets the propagation error state for a propagation job.

Syntax

DBMS_MGWADM.RESET_JOB (  
    job_name IN VARCHAR2);  

Parameters

Table 103-43  RESET_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Identifies the propagation job</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be used to reset a propagation job that has been set to a failed state and propagation activities have been stopped. The administrator should correct the problem and then call this procedure to allow the agent to retry the propagation job. The STATUS field of the MGW_JOBS view indicates the job status.
103.5.25 RESET_SUBSCRIBER Procedure

This procedure resets the propagation error state for a subscriber.

> **Note:**
> This subprogram has been deprecated as a result of improved technology (see RESET_JOB Procedure), and is retained only for reasons of backward compatibility.

**Syntax**

```sql
DBMS_MGWADM.RESET_SUBSCRIBER (
    subscriber_id  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_id</td>
<td>Identifies the subscriber</td>
</tr>
</tbody>
</table>

103.5.26 SCHEDULE_PROPAGATION Procedure

This procedure schedules message propagation from a source to a destination.

The schedule must be enabled and Messaging Gateway started in order for messages to be propagated.

> **Note:**
> This subprogram has been deprecated as a result of improved technology (see CREATE_JOB Procedure), and is retained only for reasons of backward compatibility.

**Syntax**

```sql
DBMS_MGWADM.SCHEDULE_PROPAGATION (
    schedule_id       IN VARCHAR2,
    propagation_type  IN BINARY_INTEGER,
    source            IN VARCHAR2,
    destination       IN VARCHAR2,
    start_time        IN DATE DEFAULT SYSDATE,
    duration          IN NUMBER DEFAULT NULL,
    next_time         IN VARCHAR2 DEFAULT NULL,
    latency           IN NUMBER DEFAULT NULL);
```
## Parameters

### Table 103-45  SCHEDULE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Specifies a user-defined name that identifies the schedule</td>
</tr>
<tr>
<td>propagation_type</td>
<td>Specifies the type of message propagation. DBMS_MGWADM.OUTBOUND_PROPAGATION is for Oracle Database Advanced Queuing to non-Oracle propagation. DBMS_MGWADM.INBOUND_PROPAGATION is for non-Oracle to Oracle Database Advanced Queuing propagation.</td>
</tr>
<tr>
<td>source</td>
<td>Specifies the source queue whose messages are to be propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>destination</td>
<td>Specifies the destination queue to which messages are propagated. The syntax and interpretation of this parameter depend on the value specified for propagation_type.</td>
</tr>
<tr>
<td>start_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>duration</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>next_time</td>
<td>Reserved for future use</td>
</tr>
<tr>
<td>latency</td>
<td>Specifies the polling interval, in seconds, used by the Messaging Gateway agent when checking for messages in the source queue. If no messages are available in the source queue, then the agent will not poll again until the polling interval has passed. Once the agent detects a message it will continue propagating messages as long as any are available. Values: NULL or value &gt; 0. If latency is NULL, then the Messaging Gateway agent default polling interval will be used. The default polling interval is 5 seconds but it can be overridden by the Messaging Gateway initialization file.</td>
</tr>
</tbody>
</table>

### Usage Notes

For outbound propagation, parameters are interpreted as follows:

- **source** specifies the local Oracle Database Advanced Queuing queue from which messages are propagated. This must have a syntax of `schema.queue`.
- **destination** specifies the foreign queue to which messages are propagated. This must have a syntax of `registered_queue@message_link`.

For inbound propagation, parameters are interpreted as follows:

- **source** specifies the foreign queue from which messages are propagated. This must have a syntax of `registered_queue@message_link`.
- **destination** specifies the local Oracle Database Advanced Queuing queue to which messages are propagated. This must have a syntax of `schema.queue`.

The schedule is set to an enabled state when it is created.
103.5.27 SET_LOG_LEVEL Procedures

This procedure dynamically alters the Messaging Gateway agent logging level. The Messaging Gateway agent must be running.

Syntax

```
DBMS_MGWADM.SET_LOG_LEVEL (log_level    IN   BINARY_INTEGER);
```

```
DBMS_MGWADM.SET_LOG_LEVEL (agent_name   IN   VARCHAR2,
       log_level    IN   BINARY_INTEGER);
```

Parameters

Table 103-46 SET_LOG_LEVEL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_level</td>
<td>Level at which the Messaging Gateway agent logs information. DBMS_MGWADM.BASIC_LOGGING generates the least information while DBMS_MGWADM.TRACE_DEBUG_LOGGING generates the most information.</td>
</tr>
<tr>
<td>agent_name</td>
<td>Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent.</td>
</tr>
</tbody>
</table>

See Also:

Table 103-3 for details on the log_level parameter

103.5.28 SET_OPTION Procedure

This procedure sets a Messaging Gateway configuration option. It can be used to set an agent option, a messaging link option, or a propagation job option.

Syntax

```
DBMS_MGWADM.SET_OPTION (target_type   IN   PLS_INTEGER,
       target_name   IN   VARCHAR2,
       option_name   IN   VARCHAR2,
       option_value  IN   VARCHAR2,
       encrypted     IN   BOOLEAN DEFAULT FALSE );
```
Parameters

Table 103-47  SET_OPTION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| target_type | Specifies the target type of the Messaging Gateway entity:  
• `DBMS_MGWADM.AGENT_JAVA_PROP` to set a Java System property for a Messaging Gateway agent  
• `DBMS_MGWADM.MSGLINK_OPTION` to set a messaging link option  
• `DBMS_MGWADM.JOB_OPTION` to set a propagation job option |
| target_name | Name or identifier of the target. The value for this parameter depends on the value specified for `target_type` parameter. This must not be `NULL`. |
| option_name | Option name. This must not be `NULL`.                                                                                                       |
| option_value| Option value                                                                                                                                |
| encrypted   | Indicates whether the value should be stored as encrypted:  
• `TRUE` if the value should be stored in an encrypted form  
• `FALSE` if the value should be stored in a cleartext form |

**See Also:**

Table 103-10 regarding options for the `option_type` parameter

Usage Notes

**DBMS_MGWADM.AGENT_JAVA_PROP Target**

The procedure will store an agent option used to set a Java System property when the Messaging Gateway agent is started. The agent must be restarted for the change to take effect.

The parameters are interpreted as follows:

• `target_name` specifies the name of the Messaging Gateway agent.  
  `DBMS_MGWADM.DEFAULT_AGENT` can be used for the default agent.  
• `option_name` specifies the Java System property  
• `encrypted` can be either `TRUE` or `FALSE`

**DBMS_MGWADM.MSGLINK_OPTION Target**

The procedure will set or alter a single option for a Messaging Gateway messaging system link. This is equivalent to calling `DBMS_MGWADM.ALTER_MSGSYSTEM_LINK` and using the options parameter to set an option.

The parameters are interpreted as follows:

• `target_name` specifies the name of the message system link  
• `option_name` specifies the option to set  
• `encrypted` must be `FALSE`
DBMS_MGWADM.JOB_OPTION Target

The procedure will set or alter a single option for a Messaging Gateway propagation job. This is equivalent to calling DBMS_MGWADM.ALTER_JOB and using the options parameter to set an option.

The parameters are interpreted as follows:

- target_name specifies the name of the propagation job
- option_name specifies the option to set
- encrypted must be FALSE

103.5.29 SHUTDOWN Procedures

This procedure shuts down the Messaging Gateway agent. No propagation activity occurs until Messaging Gateway is restarted.

Syntax

```
DBMS_MGWADM.SHUTDOWN (
    sdmode      IN BINARY_INTEGER DEFAULT DBMS_MGWADM.SHUTDOWN_NORMAL);
```

```
DBMS_MGWADM.SHUTDOWN (
    agent_name  IN VARCHAR2);
```

Parameters

Table 103-48  SHUTDOWN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| sdmode      | The shutdown mode. The only value currently supported is
               DBMS_MGWADM.SHUTDOWN_NORMAL for normal shutdown. The
               Messaging Gateway agent may attempt to complete any
               propagation work currently in progress.              |
| agent_name  | Identifies the Messaging Gateway agent. DBMS_MGWADM.DEFAULT_AGENT specifies the default agent. |

Usage Notes

The Messaging Gateway default agent is shut down if no agent name is specified.

103.5.30 STARTUP Procedures

This procedure starts the Messaging Gateway agent. It must be called before any propagation activity can take place.

Syntax

```
DBMS_MGWADM.STARTUP(
    instance       IN  BINARY_INTEGER DEFAULT 0,
    force          IN  BINARY_INTEGER DEFAULT DBMS_MGWADM.NO_FORCE);
```

```
DBMS_MGWADM.STARTUP(
    agent_name     IN  VARCHAR2);
```
Parameters

Table 103-49 STARTUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance</td>
<td>Specifies which instance can run the job queue job used to start the Messaging Gateway agent. If this is zero, then the job can be run by any instance. <strong>Caution: This parameter has been deprecated.</strong></td>
</tr>
<tr>
<td>force</td>
<td>If this is <code>DBMS_MGWADM.FORCE</code>, then any positive integer is acceptable as the job instance. If this is <code>DBMS_MGWADM.NO_FORCE</code> (the default), then the specified instance must be running; otherwise the routine raises an exception. <strong>Caution: This parameter has been deprecated.</strong></td>
</tr>
<tr>
<td>agent_name</td>
<td>Identifies the Messaging Gateway agent. <code>DBMS_MGWADM.DEFAULT_AGENT</code> specifies the default agent.</td>
</tr>
</tbody>
</table>

Usage Notes

- The Messaging Gateway default agent will be started if an agent name is not specified.
- The `force` and `instance` parameters are no longer used and will be ignored. If the `instance` affinity parameters were being used to start the default agent on a specific instance, the administrator will need to create a database service and then assign that service to the default agent using the `DBMS_MGWADM.ALTER_AGENT` procedure.
- The Messaging Gateway agent cannot be started until an agent user has been configured by the `DBMS_MGWADM.CREATE_AGENT` or `DBMS_MGWADM.ALTER_AGENT` subprograms.

103.5.31 UNREGISTER_FOREIGN_QUEUE Procedure

This procedure removes a non-Oracle queue entity in Messaging Gateway.

Syntax

```sql
DBMS_MGWADM.UNREGISTER_FOREIGN_QUEUE(
    name         IN VARCHAR2,
    linkname     IN VARCHAR2);
```

Parameters

Table 103-50 UNREGISTER_FOREIGN_QUEUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The queue name</td>
</tr>
<tr>
<td>linkname</td>
<td>The link name for the messaging system on which the queue exists</td>
</tr>
</tbody>
</table>
Usage Notes

- This procedure does not remove the physical queue in the non-Oracle messaging system.
- All propagation jobs, subscribers and schedules referencing this queue must be removed before it can be unregistered. This procedure fails if a propagation job, subscriber, or propagation schedule references the non-Oracle queue.

103.5.32 UNSCHEDULE_PROPAGATION Procedure

This deprecated procedure removes a propagation schedule.

Note:
This subprogram has been deprecated as a result of improved technology (see REMOVE_JOB Procedure), and is retained only for reasons of backward compatibility.

Syntax

```sql
DBMS_MGWADM.UNSCHEDULE_PROPAGATION ( schedule_id IN VARCHAR2 );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_id</td>
<td>Identifies the propagation schedule to be removed</td>
</tr>
</tbody>
</table>
DBMS_MGWMSG provides object types used by the canonical message types to convert message bodies, and methods, constants, and subprograms for working with Messaging Gateway message types.

This chapter contains the following topics:

- Security Model
- Constants
- Types
- Summary of DBMS_MGWMSG Subprograms

**See Also:**

DBMS_MGWADM which describes the Messaging Gateway administrative interface, DBMS_MGWADM

### 104.1 DBMS_MGWMSG Security Model

The `EXECUTE` privilege is granted to `PUBLIC` on all types defined in the DBMS_MGWMSG package as well as the canonical types. The DBMS_MGWMSG packages and object types are owned by `SYS`.

**Note:**

You must run the `catmgw.sql` script to load the Messaging Gateway packages and object types into the database. Refer to the Oracle Database Advanced Queuing User’s Guide for information on loading database objects and using DBMS_MGWMSG.

### 104.2 DBMS_MGWMSG Constants

The DBMS_MGWMSG package defines constants for specifying various parameter values.

**Table 104-1**

<table>
<thead>
<tr>
<th>Value</th>
<th>Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXT_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 1</td>
</tr>
</tbody>
</table>
### Table 104-1  DBMS_MGWMSG Constants: Value Types and Constants Representing the Type of Value for a SYS.MGW_NAME_VALUE_T Object

<table>
<thead>
<tr>
<th>Value</th>
<th>Constant</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAW_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 2</td>
</tr>
<tr>
<td>BOOLEAN_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 3</td>
</tr>
<tr>
<td>BYTE_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 4</td>
</tr>
<tr>
<td>SHORT_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 5</td>
</tr>
<tr>
<td>INTEGER_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 6</td>
</tr>
<tr>
<td>LONG_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 7</td>
</tr>
<tr>
<td>FLOAT_VALUE</td>
<td>CONSTANT BINARY_INTEGER := 8</td>

</table>

### 104.3 DBMS_MGWMSG Types

DBMS_MGWMSG uses types to specify certain information.

- SYS.MGW_NAME_VALUE_T Type
- SYS.MGW_NAME_VALUE_T Type-Attribute Mapping
- SYS.MGW_NAME_TYPE_ARRAY_T Type
- SYS.MGW_TEXT_VALUE_T Type
- SYS.MGW_RAW_VALUE_T Type
- SYS.MGW_BASIC_MSG_T Type
- SYS.MGW_NUMBER_ARRAY_T Type
- SYS.MGW_TIBRV_FIELD_T Type
- SYS.MGW_TIBRV_MSG_T Type

#### 104.3.1 DBMS_MGWMSG SYS.MGW_NAME_VALUE_T Type

This type specifies a named value.

The `name` attribute, `type` attribute, and one of the `<>_value` attributes are typically not NULL.

**Syntax**

```sql
TYPE SYS.MGW_NAME_VALUE_T IS OBJECT(
    name       VARCHAR2(250),
    type       INTEGER,
    integer_value INTEGER,
    number_value NUMBER,
    text_value VARCHAR2(4000),
    raw_value  RAW(2000),
    date_value DATE,

    -- Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_NAME_VALUE_T,
```

**Chapter 104**

DBMS_MGWMSG Types
STATIC FUNCTION CONSTRUCT_BOOLEAN (  
    name   IN VARCHAR2,  
    value  IN INTEGER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_BYTE (  
    name   IN VARCHAR2,  
    value  IN INTEGER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_SHORT (  
    name   IN VARCHAR2,  
    value  IN INTEGER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_INTEGER (  
    name   IN VARCHAR2,  
    value  IN INTEGER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_LONG (  
    name   IN VARCHAR2,  
    value  IN NUMBER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_FLOAT (  
    name   IN VARCHAR2,  
    value  IN NUMBER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DOUBLE (  
    name   IN VARCHAR2,  
    value  IN NUMBER )  
RETURN SYS.MGW_NAME_VALUE_T,

STATIC FUNCTION CONSTRUCT_DATE (  
    name   IN VARCHAR2,  
    value  IN DATE )  
RETURN SYS.MGW_NAME_VALUE_T);

Attributes

Table 104-5  SYS.MGW_NAME_VALUE_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name associated with the value</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Value type. Refer to the DBMS_MGWMSG.&lt;&gt;_VALUE constants in Table 104-1. This indicates which Java datatype and class are associated with the value. It also indicates which attribute stores the value.</td>
</tr>
<tr>
<td>integer_value</td>
<td>Stores a numeric integer value</td>
</tr>
<tr>
<td>number_value</td>
<td>Stores a numeric float or large integer value</td>
</tr>
<tr>
<td>text_value</td>
<td>Stores a text value</td>
</tr>
<tr>
<td>raw_value</td>
<td>Stores a RAW (bytes) value</td>
</tr>
<tr>
<td>date_value</td>
<td>Stores a date value</td>
</tr>
</tbody>
</table>

SYS.MGW_NAME_VALUE_T Type-Attribute Mapping

Table 104-6 shows the mapping between the value type and the attribute used to store the value.

Table 104-6  SYS.MGW_NAME_VALUE_T Type Attribute Mapping

<table>
<thead>
<tr>
<th>Type</th>
<th>Value Stored in Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_MGWMSG.TEXT_VALUE</td>
<td>text_value</td>
</tr>
<tr>

</tr>
<tr>
<td>DBMS_MGWMSG.DOUBLE_VALUE</td>
<td>number_value</td>
</tr>
<tr>
<td>DBMS_MGWMSG.DATE_VALUE</td>
<td>date_value</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_NAME_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_NAME_VALUE_T;
```

CONSTRUCT_TYPE Methods

These methods construct a new SYS.MGW_NAME_VALUE_T instance initialized with the value of a specific type. Each method sets the name and type attributes and one of the <>_value attributes, as shown in the mappings in Table 104-6.

Syntax
STATIC FUNCTION CONSTRUCT_<>() {
    name IN VARCHAR2,
    value IN datatype
RETURN SYS.MGW_NAME_VALUE_T;
}

Usage Notes

The construct_boolean method sets the value to either DBMS_MGWMSG.BOOLEAN_TRUE or DBMS_MGWMSG.BOOLEAN_FALSE.

104.3.2 DBMS_MGWMSG SYS.MGW_NAME_TYPE_ARRAY_T Type

This type specifies an array of name-value pairs. An object of SYS.MGW_NAME_VALUE_ARRAY_T type can have up to 1024 elements.

Syntax

TYPE SYS.MGW_NAME_VALUE_ARRAY_T AS VARRAY (1024) OF SYS.MGW_NAME_VALUE_T;

104.3.3 DBMS_MGWMSG SYS.MGW_TEXT_VALUE_T Type

This type specifies a TEXT value. It can store a large value as a CLOB or a smaller value (size <= 4000) as VARCHAR2. Only one of the < >_ value attributes should be set.

Syntax

TYPE SYS.MGW_TEXT_VALUE_T IS OBJECT(
    small_value VARCHAR2(4000),
    large_value CLOB,

    -- Methods
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T);

Attributes

Table 104-7  SYS.MGW_TEXT_VALUE_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>small_value</td>
<td>Small TEXT value. Used for values &lt;= 4000.</td>
</tr>
<tr>
<td>large_value</td>
<td>Large TEXT value. Used when the value is too large for the small_value attribute.</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_TEXT_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_TEXT_VALUE_T;
104.3.4 DBMS_MGWMSG SYS.MGW_RAW_VALUE_T Type

This type specifies a RAW value. This type can store a large value as a BLOB or a smaller value (size <= 2000) as RAW. You must set no more than one of the < >_value attributes.

Syntax

```plaintext
TYPE SYS.MGW_RAW_VALUE_T IS OBJECT(
    small_value RAW(2000),
    large_value BLOB,

    --Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_RAW_VALUE_T);
```

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>small_value</td>
<td>Small RAW (bytes) value &lt;= 2000</td>
</tr>
<tr>
<td>large_value</td>
<td>Large RAW value. Used when the value is too large for the small_value attribute.</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_RAW_VALUE_T instance. All attributes are assigned a value of NULL.

Syntax

```plaintext
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_RAW_VALUE_T;
```

104.3.5 DBMS_MGWMSG SYS.MGW_BASIC_MSG_T Type

This is a canonical type for a basic TEXT or RAW message. Only a single TEXT or RAW value is typically set. An object of this type must not have both TEXT and RAW set to a not NULL value at the same time.

Syntax

```plaintext
TYPE SYS.MGW_BASIC_MSG_T IS OBJECT(
    header     SYS.MGW_NAME_VALUE_ARRAY_T,
    text_body  SYS.MGW_TEXT_VALUE_T,
    raw_body   SYS.MGW_RAW_VALUE_T,

    --Methods
    STATIC FUNCTION CONSTRUCT
    RETURN SYS.MGW_BASIC_MSG_T);
```
Attributes

Table 104-9  SYS.MGW_BASIC_MSG_T Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>header</td>
<td>Message header information as an array of name-value pairs</td>
</tr>
<tr>
<td>text_body</td>
<td>Message body for a TEXT message</td>
</tr>
<tr>
<td>raw_body</td>
<td>Message body for a RAW (bytes) message</td>
</tr>
</tbody>
</table>

CONSTRUCT Method

This method constructs a new SYS.MGW_BASIC_MSG_T instance. All attributes are assigned a value of NULL.

Syntax

```
STATIC FUNCTION CONSTRUCT
RETURN SYS.MGW_BASIC_MSG_T;
```

104.3.6 DBMS_MGWMSG SYS.MGW_NUMBER_ARRAY_T Type

A type that specifies an array of numbers.

Syntax

```
TYPE SYS.MGW_NUMBER_ARRAY_T AS VARRAY(1024) OF NUMBER;
```

104.3.7 DBMS_MGWMSG SYS.MGW_TIBRV_FIELD_T Type

This type represents a TIB/Rendezvous message field, typically used in a read-only fashion to retrieve field information from a SYS.MGW_TIBRV_MSG_T instance.

Syntax

```
TYPE SYS.MGW_TIBRV_FIELD_T IS OBJECT(
  field_name       VARCHAR2(256),
  field_id         INTEGER,
  field_type       INTEGER,
  number_value     NUMBER,
  number_array_value SYS.MGW_NUMBER_ARRAY_T,
  text_value       VARCHAR2(4000),
  raw_value        RAW(2000),
  date_value       DATE,
  clob_value       CLOB,
  blob_value       BLOB);
```

104.3.8 DBMS_MGWMSG SYS.MGW_TIBRV_MSG_T Type

This type represents a TIB/Rendezvous message. You must never directly reference the attributes of this type. Instead use the type methods.

Syntax

```sql
TYPE SYS.MGW_TIBRV_MSG_T IS OBJECT(
    send_subject    VARCHAR2(256),
    reply_subject   VARCHAR2(256),
    cm_time_limit   NUMBER,
    cm_sender_name  VARCHAR2(256),
    cm_sequence_num NUMBER,
    fields          SYS.MGW_TIBRV_IFIELDS_T,
    clob_data1      CLOB,
    clob_data2      CLOB,
    clob_data3      CLOB,
    blob_data1      BLOB,
    blob_data2      BLOB,
    blob_data3      BLOB,

    STATIC FUNCTION construct
        RETURN SYS.MGW_TIBRV_MSG_T,

    MEMBER PROCEDURE add_bool (  
        name  IN   VARCHAR2,
        id    IN   INTEGER,
        value IN   INTEGER ),

Construct Method

Constructs a new SYS.MGW_TIBRV_MSG_T instance. All attributes are set to NULL.

Syntax

STATIC FUNCTION construct
RETURN SYS.MGW_TIBRV_MSG_T;

ADD_<> Methods

Adds a new field to the message.

Syntax
MEMBER PROCEDURE ADD_<>() {
    name IN VARCHAR2,
    id IN INTEGER,
    value IN datatype);

Parameters

Table 104-13  SYS.MGW_TIBRV_MSG_T ADD_<>() Method Parameters

</table>
SET_< > Methods
Accessor methods to set an instance attribute to a specific value.

Syntax

MEMBER PROCEDURE SET_< > ( 
    value IN datatype );

Parameters

Table 104-15    SYS.MGW_TIBRV_MSG_T SET_< > Method Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Value to be assigned</td>
</tr>
</tbody>
</table>

GET_< > Methods
Accessor methods to retrieve the value for an instance attribute.

Syntax

MEMBER PROCEDURE GET_< > 
RETURN datatype;

Parameters

None

Return Values

Returns the attribute value.

GET_FIELD_COUNT Function

Gets the number of message fields.

Syntax

MEMBER PROCEDURE get_field_count 
RETURN INTEGER;

Parameters

None

Return Values

Returns the number of fields, or zero (0) if there are none.

GET_FIELD Function

Retrieves field information for the field having a given field collection index. This method should only be called if the GET_FIELD_COUNT Function returns a nonzero value and idx must specify a valid collection index; that is, 1<=idx<=get_field_count().

Syntax
MEMBER PROCEDURE get_field ( 
    idx    IN    INTEGER ) 
RETURN SYS.MGW_TIBRV_FIELD_T;

Parameters

Table 104-16  SYS.MGW_TIBRV_MSG_T GET_FIELD Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>idx</td>
<td>Specifies the 1-based field collection index of the field to retrieve</td>
</tr>
</tbody>
</table>

Note: A 1-based index begins at one (1) instead of zero (0).

Return Values

Returns the field information.

GET_FIELD_BY_NAME Function

Retrieves field information for the first field that has a given field name. The name comparison is case-sensitive.

Syntax

MEMBER PROCEDURE get_field_by_name ( 
    name  IN   VARCHAR2 ) 
RETURN SYS.MGW_TIBRV_FIELD_T;

Parameters

Table 104-17  SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the field name to search for. This can be NULL to find the first field that does not have a field name.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field information, or NULL if no match was found.

GET_FIELD_BY_ID Function

Retrieves field information for the first field that has a given field identifier.

A field can have either a unique identifier or no identifier. If the field identifier value is zero (0) or NULL, then the field is considered to have no identifier. Otherwise, the identifier is a nonzero value that is unique for all the fields of this message.

Syntax
MEMBER PROCEDURE get_field_by_id (  
   id   IN  INTEGER )  
RETURN SYS.MGW_TIBRV_FIELD_T;

Parameters

Table 104-18  SYS.MGW_TIBRV_MSG_T GET_FIELD_BY_ID Function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Specifies the field identifier to search for. This can be zero (0) or NULL to find the first field that does not have an identifier.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field information, or NULL if no match was found.

FIND_FIELD_NAME Function

Searches for a field with a given field name, starting from a given index of the field collection. It returns the index of that field. The name comparison is case-sensitive. This function is useful for finding all the fields that have the same name.

Syntax

MEMBER PROCEDURE find_field_name (  
   name      IN  VARCHAR2,  
   start_idx IN  INTEGER )  
RETURN INTEGER;

Parameters

Table 104-19  SYS.MGW_TIBRV_MSG_T FIND_FIELD_NAME Function
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Specifies the field name to search for. This can be NULL to search for a field that does not have a field name.</td>
</tr>
<tr>
<td>start_idx</td>
<td>Specifies the 1-based field collection index from which the search should start.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

FIND_FIELD_ID Function

Searches for a field with a given field identifier, starting from a given index of the field collection. It returns the index of that field.

Syntax

MEMBER PROCEDURE find_field_id (  
   id        IN  INTEGER,  
   start_idx IN INTEGER )  
RETURN    INTEGER;
Table 104-20  SYS.MGW_TIBRV_MSG_T FIND_FIELD_ID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Specifies the field identifier to search for. This can be zero (0) or NULL to find a field that does not have an identifier.</td>
</tr>
<tr>
<td>start_idx</td>
<td>Specifies the 1-based field collection index from which the search should start.</td>
</tr>
</tbody>
</table>

Return Values

Returns the field index (> 0) if a match was found, or zero (0) if no match was found.

104.4 Summary of DBMS_MGWMSG Subprograms

This table lists the DBMS_MGWMSG subprograms and briefly describes them.

Table 104-21  DBMS_MGWMSG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCR_TO_XML Function</td>

</table>

### 104.4.1 LCR\_TO\_XML Function

This function converts a \textit{SYS.ANYDATA} object encapsulating a row LCR (Logical Change Record, in this case a \textit{LCR\_ROW\_RECORD}) or a DDL LCR (\textit{LCR\_DDL\_RECORD}) to a \textit{SYS.XMLTYPE} object.

#### Syntax

```sql
DBMS_MGWMSG.LCR\_TO\_XML ( 
  p\_anydata IN SYS.ANYDATA )
RETURN SYS.XMLTYPE;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_anydata</td>
<td>An ANYDATA object to be converted</td>
</tr>
</tbody>
</table>

#### Return Values

Returns a \textit{SYS.XMLTYPE} object.

#### Usage Notes

An exception is raised if the encapsulated type \textit{p\_anydata} is not an LCR.
104.4.2 NVARRAY_ADD Procedure

This procedure appends a name-value element to the end of a name-value array.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_ADD (
    p_array  IN OUT SYS.MGW_NAME_VALUE_ARRAY_T,
    p_value  IN     SYS.MGW_NAME_VALUE_T );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>On input, the name-value array instance to modify. If NULL, then a new array is created. On output, the modified name-value array instance.</td>
</tr>
<tr>
<td>p_value</td>
<td>The value to add. If NULL, then p_array is not changed.</td>
</tr>
</tbody>
</table>

104.4.3 NVARRAY_FIND_NAME Function

This function searches a name-value array for the element with the name you specify in `p_name`.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_FIND_NAME (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN BINARY_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array to search</td>
</tr>
<tr>
<td>p_name</td>
<td>The name to find</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code>.</td>
</tr>
</tbody>
</table>

Return Values

Returns a positive integer that is the array index of the matching element or zero (0) if the specified name is not found.
104.4.4 NVARRAY_FIND_NAME_TYPE Function

This function searches a name-value array for an element with the name and value type you specify.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_FIND_NAME_TYPE (  
p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,
p_name IN VARCHAR2,
p_type IN BINARY_INTEGER  
p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN BINARY_INTEGER;
```

Parameters

Table 104-25 NVARRAY_FIND_NAME_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array to search</td>
</tr>
<tr>
<td>p_name</td>
<td>The name to find</td>
</tr>
<tr>
<td>p_type</td>
<td>The value type. Refer to the value type constants in Table 104-1.</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns a positive integer that is the array index of the matching element, zero (0) if the specified name is not found, or negative one (-1) if the specified name is found but a type mismatch exists.

104.4.5 NVARRAY_GET Function

This function gets the name-value element of the name you specify in `p_name` from a name-value array.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET (  
p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,
p_name IN VARCHAR2,  
p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN SYS.MGW_NAME_VALUE_T;
```

Parameters

Table 104-26 NVARRAY_GET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
</tbody>
</table>
Table 104-26  (Cont.) NVARRAY_GET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the matching element, or NULL if the specified name is not found.

104.4.6 NVARRAY_GET_BOOLEAN Function

This function gets the value of the name-value array element that you specify in p_name and with the BOOLEAN_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_BOOLEAN (  
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
  p_name     IN VARCHAR2,  
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;  
```

Parameters

Table 104-27  NVARRAY_GET_BOOLEAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.7 NVARRAY_GET_BYTE Function

This function gets the value of the name-value array element that you specify in p_name and with the BYTE_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_BYTE (  
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,  
  p_name     IN VARCHAR2,  
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN INTEGER;  
```
Parameters

Table 104-28 NVARRAY_GET_BYTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.8 NVARRAY_GET_DATE Function

This function gets the value of the name-value array element that you specify in p_name and with the DATE_VALUE value type.

Syntax

```
DBMS_MGWMSG.NVARRAY_GET_DATE (  
    p_array IN SYS.MGW_NAME_VALUE_ARRAY_T,  
    p_name IN VARCHAR2,  
    p_compare IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )  
RETURN DATE;
```

Parameters

Table 104-29 NVARRAY_GET_DATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
104.4.9 NVARRAY_GET_DOUBLE Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `DOUBLE_VALUE` value type.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY_GET_DOUBLE (  
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code>.</td>
</tr>
</tbody>
</table>

**Return Values**

Returns the value, or `NULL` if either the specified name is not found or a type mismatch exists.

104.4.10 NVARRAY_GET_FLOAT Function

This function gets the value of the name-value array element that you specify in `p_name` and with the `FLOAT_VALUE` value type.

**Syntax**

```sql
DBMS_MGWMSG.NVARRAY_GET_FLOAT (  
  p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
  p_name     IN VARCHAR2,
  p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are <code>CASE_SENSITIVE</code> and <code>CASE_INSENSITIVE</code>.</td>
</tr>
</tbody>
</table>
Return Values
Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.11 NVARRAY_GET_INTEGER Function
This function gets the value of the name-value array element that you specify in \texttt{p\_name} and with the \texttt{INTEGER\_VALUE} value type.

Syntax

\begin{verbatim}
DBMS_MGWMSG.NVARRAY_GET_INTEGER ( 
    p_array    IN SYS.MGW\_NAME\_VALUE\_ARRAY\_T, 
    p_name     IN VARCHAR2, 
    p_compare  IN BINARY\_INTEGER DEFAULT CASE\_SENSITIVE ) 
RETURN INTEGER;
\end{verbatim}

Parameters

Table 104-32 NVARRAY_GET_INTEGER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are \texttt{CASE_SENSITIVE} and \texttt{CASE_INSENSITIVE}.</td>
</tr>
</tbody>
</table>

Return Values
Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.12 NVARRAY_GET_LONG Function
This function gets the value of the name-value array element that you specify in \texttt{p\_name} and with the \texttt{LONG\_VALUE} value type.

Syntax

\begin{verbatim}
DBMS_MGWMSG.NVARRAY_GET_LONG ( 
    p_array    IN SYS.MGW\_NAME\_VALUE\_ARRAY\_T, 
    p_name     IN VARCHAR2, 
    p_compare  IN BINARY\_INTEGER DEFAULT CASE\_SENSITIVE ) 
RETURN NUMBER;
\end{verbatim}

Parameters

Table 104-33 NVARRAY_GET_LONG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
</tbody>
</table>
Table 104-33  (Cont.) NVARRAY_GET_LONG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.13 NVARRAY_GET_RAW Function

This function gets the value of the name-value array element that you specify in p_name and with the RAW_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_RAW (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN RAW;
```

Parameters

Table 104-34  NVARRAY_GET_RAW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.14 NVARRAY_GET_SHORT Function

This function gets the value of the name-value array element that you specify in p_name and with the SHORT_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_SHORT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE )
RETURN INTEGER;
```
Parameters

Table 104-35 NVARRAY_GET_SHORT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.

104.4.15 NVARRAY_GET_TEXT Function

This function gets the value of the name-value array element that you specify in p_name and with the TEXT_VALUE value type.

Syntax

```sql
DBMS_MGWMSG.NVARRAY_GET_TEXT (
    p_array    IN SYS.MGW_NAME_VALUE_ARRAY_T,
    p_name     IN VARCHAR2,
    p_compare  IN BINARY_INTEGER DEFAULT CASE_SENSITIVE
) RETURN VARCHAR2;
```

Parameters

Table 104-36 NVARRAY_GET_TEXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_array</td>
<td>The name-value array</td>
</tr>
<tr>
<td>p_name</td>
<td>The value name</td>
</tr>
<tr>
<td>p_compare</td>
<td>Name comparison method. Values are CASE_SENSITIVE and CASE_INSENSITIVE.</td>
</tr>
</tbody>
</table>

Return Values

Returns the value, or NULL if either the specified name is not found or a type mismatch exists.
104.4.16 XML_TO_LCR Function

This function converts a SYS.XMLTYPE object to a SYS.ANYDATA object encapsulating a row LCR (LCR$_ROW_RECORD) or a DDL LCR (LCR$_DDL_RECORD).

See Also:

LCR_TO_XML Function

Syntax

DBMS_MGWMSG.XML_TO_LCR (  
   p_xmldata IN SYS.XMLTYPE )  
RETURN SYS.ANYDATA;

Parameters

Table 104-37  XML_TO_LCR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_xmldata</td>
<td>An XMLTYPE object representing an LCR</td>
</tr>
</tbody>
</table>

Return Values

Returns a SYS.ANYDATA object.

Usage Notes

An exception is raised if p_xmldata cannot be converted to an LCR.
105
DBMS_MONITOR

The DBMS_MONITOR package enables you to use PL/SQL for controlling additional tracing and statistics gathering.

The chapter contains the following topics:

• Summary of DBMS_MONITOR Subprograms

105.1 Summary of DBMS_MONITOR Subprograms

This table lists the DBMS_MONITOR subprograms and briefly describes them.

Table 105-1  DBMS_MONITOR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_ID_STAT_DISABLE Procedure</td>
<td>Disables statistic gathering previously enabled for a given Client Identifier</td>
</tr>
<tr>
<td>CLIENT_ID_STAT_ENABLE Procedure</td>
<td>Enables statistic gathering for a given Client Identifier</td>
</tr>
<tr>
<td>CLIENT_ID_TRACE_DISABLE Procedure</td>
<td>Disables the trace previously enabled for a given Client Identifier globally for the database</td>
</tr>
<tr>
<td>CLIENT_ID_TRACE_ENABLE Procedure</td>
<td>Enables the trace for a given Client Identifier globally for the database</td>
</tr>
<tr>
<td>DATABASE_TRACE_DISABLE Procedure</td>
<td>Disables SQL trace for the whole database or a specific instance</td>
</tr>
<tr>
<td>DATABASE_TRACE_ENABLE Procedure</td>
<td>Enables SQL trace for the whole database or a specific instance</td>
</tr>
<tr>
<td>SERV_MOD_ACT_STAT_DISABLE Procedure</td>
<td>Disables statistic gathering enabled for a given combination of Service Name, MODULE and ACTION</td>
</tr>
<tr>
<td>SERV_MOD_ACT_STAT_ENABLE Procedure</td>
<td>Enables statistic gathering for a given combination of Service Name, MODULE and ACTION</td>
</tr>
<tr>
<td>SERV_MOD_ACT_TRACE_DISABLE Procedure</td>
<td>Disables the trace for ALL enabled instances for a or a given combination of Service Name, MODULE and ACTION globally</td>
</tr>
<tr>
<td>SERV_MOD_ACT_TRACE_ENABLE Procedure</td>
<td>Enables SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified</td>
</tr>
<tr>
<td>SESSION_TRACE_DISABLE Procedure</td>
<td>Disables the previously enabled trace for a given database session identifier (SID) on the local instance</td>
</tr>
<tr>
<td>SESSION_TRACE_ENABLE Procedure</td>
<td>Enables the trace for a given database session identifier (SID) on the local instance</td>
</tr>
</tbody>
</table>
105.1.1 CLIENT_ID_STAT_DISABLE Procedure

This procedure will disable statistics accumulation for all instances and remove the accumulated results from V$CLIENT_STATS view enabled by the CLIENT_ID_STAT_ENABLE Procedure.

Syntax

DBMS_MONITOR.CLIENT_ID_STAT_DISABLE(
    client_id            IN   VARCHAR2);

Parameters

Table 105-2 CLIENT_ID_STAT_DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Client Identifier for which statistic aggregation is disabled</td>
</tr>
</tbody>
</table>

Examples

To disable accumulation:

EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_DISABLE('janedoe');

105.1.2 CLIENT_ID_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given Client Identifier.

Statistics gathering is global for the database and persistent across instance starts and restarts. That is, statistics are enabled for all instances of the same database, including restarts. Statistics are viewable through V$CLIENT_STATS views.

Syntax

DBMS_MONITOR.CLIENT_ID_STAT_ENABLE(
    client_id            IN   VARCHAR2);

Parameters

Table 105-3 CLIENT_ID_STAT_ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Client Identifier for which statistic aggregation is enabled</td>
</tr>
</tbody>
</table>

Examples

To enable statistic accumulation for a client with a given client ID:

EXECUTE DBMS_MONITOR.CLIENT_ID_STAT_ENABLE('janedoe');
105.1.3 CLIENT_ID_TRACE_DISABLE Procedure

This procedure will disable tracing enabled by the CLIENT_ID_TRACE_ENABLE Procedure.

Syntax

DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE(
  client_id    IN  VARCHAR2);

Parameters

Table 105-4  CLIENT_ID_TRACE_DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Client Identifier for which SQL tracing is disabled</td>
</tr>
</tbody>
</table>

Examples

EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_DISABLE ('janedoe');

105.1.4 CLIENT_ID_TRACE_ENABLE Procedure

This procedure will enable the trace for a given client identifier globally for the database.

Syntax

DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE(
  client_id    IN  VARCHAR2,
  waits        IN  BOOLEAN DEFAULT TRUE,
  binds        IN  BOOLEAN DEFAULT FALSE,
  plan_stat    IN  VARCHAR2 DEFAULT NULL);

Parameters

Table 105-5  CLIENT_ID_TRACE_ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Database Session Identifier for which SQL tracing is enabled</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>

Usage Notes

- The trace will be written to multiple trace files because more than one Oracle shadow process can work on behalf of a given client identifier.
- The tracing is enabled for all instances and persistent across restarts.
Examples

EXECUTE DBMS_MONITOR.CLIENT_ID_TRACE_ENABLE('janedoe', TRUE, FALSE);

105.1.5 DATABASE_TRACE_DISABLE Procedure

This procedure disables SQL trace for the whole database or a specific instance.

Syntax

DBMS_MONITOR.DATABASE_TRACE_DISABLE(
    instance_name  IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_name</td>
<td>Disables tracing for the named instance</td>
</tr>
</tbody>
</table>

105.1.6 DATABASE_TRACE_ENABLE Procedure

This procedure enables SQL trace for the whole database or a specific instance.

Syntax

DBMS_MONITOR.DATABASE_TRACE_ENABLE(
    waits          IN BOOLEAN DEFAULT TRUE,
    binds          IN BOOLEAN DEFAULT FALSE,
    instance_name  IN VARCHAR2 DEFAULT NULL,
    plan_stat      IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>waits</td>
<td>If TRUE, wait information will be present in the trace</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information will be present in the trace</td>
</tr>
<tr>
<td>instance_name</td>
<td>If set, restricts tracing to the named instance</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>
105.1.7 SERV_MOD_ACT_STAT_DISABLE Procedure

This procedure will disable statistics accumulation and remove the accumulated results from V$SERV_MOD_ACT_STATS view.

Statistics disabling is persistent for the database. That is, service statistics are disabled for instances of the same database (plus dblinks that have been activated as a result of the enable).

Syntax

DBMS_MONITOR.SERV_MOD_ACT_STAT_DISABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);

Parameters

Table 105-8  SERV_MOD_ACT_STAT_DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which statistic aggregation is disabled</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE. An additional qualifier for the service. It is a required parameter.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.</td>
</tr>
</tbody>
</table>

Usage Notes

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

105.1.8 SERV_MOD_ACT_STAT_ENABLE Procedure

This procedure enables statistic gathering for a given combination of Service Name, MODULE and ACTION.

Calling this procedure enables statistic gathering for a hierarchical combination of Service name, MODULE name, and ACTION name on all instances for the same database. Statistics are accessible by means of the V$SERV_MOD_ACT_STATS view.

Syntax

DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2,
    action_name     IN VARCHAR2 DEFAULT ALL_ACTIONS);
Parameters

Table 105-9  SERV_MOD_ACT_STAT_ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which statistic aggregation is enabled</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE. An additional qualifier for the service. It is a required parameter.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION. An additional qualifier for the Service and MODULE name. Omitting the parameter (or supplying ALL_ACTIONS constant) means enabling aggregation for all Actions for a given Service/MODULE combination. In this case, statistics are aggregated on the module level.</td>
</tr>
</tbody>
</table>

Usage Notes

Enabling statistic aggregation for the given combination of Service/Module/Action names is slightly complicated by the fact that the Module/Action values can be empty strings which are indistinguishable from NULLs. For this reason, we adopt the following conventions:

A special constant (unlikely to be a real action names) is defined:

```
ALL_ACTIONS constant VARCHAR2 := '###ALL_ACTIONS';
```

Using ALL_ACTIONS for an action specification means that aggregation is enabled for all actions with a given module name, while using NULL (or empty string) means that aggregation is enabled for an action whose name is an empty string.

Regarding statistics gathering, when you change the module or action, the change takes effect when the next user call is executed in the session. For example, if a module is set to 'module 1' in a session, and the module is reset to 'module 2' in a user call in the session, then the module remains 'module 1' during this user call. The module is changed to 'module 2' in the next user call in the session.

Examples

To enable statistic accumulation for a given combination of Service name and MODULE:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE( 'APPS1','PAYROLL');
```

To enable statistic accumulation for a given combination of Service name, MODULE and ACTION:

```
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_STAT_ENABLE('APPS1','GLEDGER','DEBIT_ENTRY');
```

If both of the preceding commands are issued, statistics are accumulated as follows:

- For the APPS1 service, because accumulation for each Service Name is the default.
- For all actions in the PAYROLL Module.
- For the DEBIT_ENTRY Action within the GLEDGER Module.
105.1.9 SERV_MOD_ACT_TRACE_DISABLE Procedure

This procedure will disable the trace at all enabled instances for a given combination of Service Name, Module, and Action name globally.

Syntax

```sql
DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE(
    service_name    IN  VARCHAR2,
    module_name     IN  VARCHAR2,
    action_name     IN  VARCHAR2 DEFAULT ALL_ACTIONS,
    instance_name   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 105-10  SERV_MOD_ACT_TRACE_DISABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which tracing is disabled.</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the module. An additional qualifier for the service.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the action. An additional qualifier for the Service and Module name.</td>
</tr>
<tr>
<td>instance_name</td>
<td>If set, this restricts tracing to the named instance_name</td>
</tr>
</tbody>
</table>

Usage Notes

Specifying NULL for the module_name parameter means that statistics will no longer be accumulated for the sessions which do not set the Module attribute.

Examples

To enable tracing for a Service named APPS1:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
    DBMS_MONITOR.ALL_MODULES,  DBMS_MONITOR.ALL_ACTIONS,TRUE,
    FALSE,NULL);
```

To disable tracing specified in the previous step:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1');
```

To enable tracing for a given combination of Service and Module (all Actions):

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1','PAYROLL',
    DBMS_MONITOR.ALL_ACTIONS,TRUE,FALSE,NULL);
```

To disable tracing specified in the previous step:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_DISABLE('APPS1','PAYROLL');
```
105.1.10 SERV_MOD_ACT_TRACE_ENABLE Procedure

This procedure will enable SQL tracing for a given combination of Service Name, MODULE and ACTION globally unless an instance_name is specified.

Syntax

```sql
DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE(
    service_name    IN VARCHAR2,
    module_name     IN VARCHAR2 DEFAULT ANY_MODULE,
    action_name     IN VARCHAR2 DEFAULT ANY_ACTION,
    waits           IN BOOLEAN DEFAULT TRUE,
    binds           IN BOOLEAN DEFAULT FALSE,
    instance_name   IN VARCHAR2 DEFAULT NULL,
    plan_stat       IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service for which SQL trace is enabled</td>
</tr>
<tr>
<td>module_name</td>
<td>Name of the MODULE for which SQL trace is enabled. An optional additional qualifier for the service. If omitted, SQL trace is enabled or all modules and actions in a given service.</td>
</tr>
<tr>
<td>action_name</td>
<td>Name of the ACTION for which SQL trace is enabled. An optional additional qualifier for the Service and MODULE name. If omitted, SQL trace is enabled for all actions in a given module.</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace</td>
</tr>
<tr>
<td>instance_name</td>
<td>If set, this restricts tracing to the named instance_name</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure enables a trace for a given combination of Service, MODULE and ACTION name. The specification is strictly hierarchical: Service Name or Service Name/MODULE, or Service Name, MODULE, and ACTION name must be specified. Omitting a qualifier behaves like a wild-card, so that not specifying an ACTION means all ACTIONS. Using the ALL_ACTIONS constant achieves the same purpose.
- This tracing is useful when an application MODULE and optionally known ACTION is experiencing poor service levels.
- By default, tracing is enabled globally for the database. The instance_name parameter is provided to restrict tracing to named instances that are known, for example, to exhibit poor service levels.
- Tracing information is present in multiple trace files and you must use the trcsess tool to collect it into a single file.
• Specifying `NULL` for the `module_name` parameter means that statistics will be accumulated for the sessions which do not set the `MODULE` attribute.

**Examples**

To enable tracing for a Service named `APPS1`:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1',
                                       DBMS_MONITOR.ALL_MODULES,
                                       DBMS_MONITOR.ALL_ACTIONS, TRUE,
                                       FALSE, NULL);
```

To enable tracing for a given combination of Service and `MODULE (all ACTIONS)`:

```sql
EXECUTE DBMS_MONITOR.SERV_MOD_ACT_TRACE_ENABLE('APPS1', 'PAYROLL',
                                       DBMS_MONITOR.ALL_ACTIONS, TRUE, FALSE, NULL);
```

### 105.11 SESSION_TRACE_DISABLE Procedure

This procedure will disable the trace for a given database session at the local instance.

**Syntax**

```sql
DBMS_MONITOR.SESSION_TRACE_DISABLE(
    session_id      IN     BINARY_INTEGER DEFAULT NULL,
    serial_num      IN     BINARY_INTEGER DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Database Session Identifier for which SQL trace is disabled</td>
</tr>
<tr>
<td>serial_num</td>
<td>Serial number for this session</td>
</tr>
</tbody>
</table>

**Usage Notes**

If `serial_num` is `NULL` but `session_id` is specified, a session with a given `session_id` is no longer traced irrespective of its serial number. If both `session_id` and `serial_num` are `NULL`, the current user session is no longer traced. It is illegal to specify `NULL` `session_id` and non-`NULL` `serial_num`. In addition, the `NULL` values are default and can be omitted.

**Examples**

To enable tracing for a client with a given client session ID:

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7, 4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```sql
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7, 4634);
```
105.1.12 SESSION_TRACE_ENABLE Procedure

This procedure enables a SQL trace for the given Session ID on the local instance.

Syntax

```
DBMS_MONITOR.SESSION_TRACE_ENABLE(
    session_id   IN  BINARY_INTEGER DEFAULT NULL,
    serial_num   IN  BINARY_INTEGER DEFAULT NULL,
    waits        IN  BOOLEAN DEFAULT TRUE,
    binds        IN  BOOLEAN DEFAULT FALSE,
    plan_stat    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>Client Identifier for which SQL trace is enabled. If omitted (or NULL), the user's own session is assumed.</td>
</tr>
<tr>
<td>serial_num</td>
<td>Serial number for this session. If omitted (or NULL), only the session ID is used to determine a session.</td>
</tr>
<tr>
<td>waits</td>
<td>If TRUE, wait information is present in the trace</td>
</tr>
<tr>
<td>binds</td>
<td>If TRUE, bind information is present in the trace</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>

Usage Notes

The procedure enables a trace for a given database session, and is still useful for client/server applications. The trace is enabled only on the instance to which the caller is connected, since database sessions do not span instances. This tracing is strictly local to an instance.

If `serial_num` is NULL but `session_id` is specified, a session with a given `session_id` is traced irrespective of its serial number. If both `session_id` and `serial_num` are NULL, the current user session is traced. It is illegal to specify `NULL` `session_id` and non-NULL `serial_num`. In addition, the NULL values are default and can be omitted.

Examples

To enable tracing for a client with a given client session ID:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(7,4634, TRUE, FALSE);
```

To disable tracing specified in the previous step:

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_DISABLE(7,4634);
```

Either

```
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5);
```

or
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(5, NULL);

traces the session with session ID of 5, while either
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE();

or
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL);

traces the current user session. Also,
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(NULL, NULL, TRUE, TRUE);

traces the current user session including waits and binds. The same can also be expressed using keyword syntax:
EXECUTE DBMS_MONITOR.SESSION_TRACE_ENABLE(binds=>TRUE);
DBMS_MVIEW enables you to understand capabilities for materialized views and potential materialized views, including their rewrite availability. It also enables you to refresh materialized views that are not part of the same refresh group and purge logs.

**Note:**

DBMS_MVIEW is a synonym for DBMS_SNAPSHOT.

**See Also:**

*Oracle Database Data Warehousing Guide* for more information about using materialized views in a data warehousing environment.

This chapter contains the following topics:

- Operational Notes
- Security Model
- Rules and Limits
- Summary of DBMS_MVIEW Subprograms

### 106.1 DBMS_MVIEW Operational Notes

If a query is less than 256 characters long, you can invoke `EXPLAIN_REWRITE` using the `EXECUTE` command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL `BEGIN..END` block, as shown in the examples in `/rdbms/demo/smfrw.sql`.

### 106.2 DBMS_MVIEW Security Model

The **DBMS_MVIEW** package consists of a number of materialized view-related subprograms, each of which has different functionality and privilege requirements.

The privilege model is generally based on the invoker's right. Each package subprogram is executed by first checking the privileges against the invoker. If all the required privileges are met, the subprogram will be executed. Otherwise, an insufficient privileges error will be thrown.
106.3 DBMS_MVIEW Rules and Limits

The DBMS_MVIEW.EXPLAIN_REWRITE procedure cannot accept queries longer than 32627 characters. These restrictions also apply when passing the defining query of a materialized view to the DBMS_MVIEW.EXPLAIN_MVIEW procedure.

106.4 Summary of DBMS_MVIEW Subprograms

This table lists the DBMS_MVIEW subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_TABLE_REORGANIZATION Procedure</td>
<td>Performs a process to preserve materialized view data needed for refresh</td>
</tr>
<tr>
<td>END_TABLE_REORGANIZATION Procedure</td>
<td>Ensures that the materialized view data for the master table is valid and that the master table is in the proper state</td>
</tr>
<tr>
<td>ESTIMATE_MVIEW_SIZE Procedure</td>
<td>Estimates the size of a materialized view that you might create, in bytes and rows</td>
</tr>
<tr>
<td>EXPLAIN_MVIEW Procedure</td>
<td>Explains what is possible with a materialized view or potential materialized view</td>
</tr>
<tr>
<td>EXPLAIN_REWRITE Procedure</td>
<td>Explains why a query failed to rewrite or why the optimizer chose to rewrite a query with a particular materialized view or materialized views</td>
</tr>
<tr>
<td>I_AM_A_REFRESH Function</td>
<td>Returns the value of the I_AM_REFRESH package state</td>
</tr>
<tr>
<td>PMARKER Function</td>
<td>Returns a partition marker from a rowid, and is used for Partition Change Tracking (PCT)</td>
</tr>
<tr>
<td>PURGE_DIRECT_LOAD_LOG Procedure</td>
<td>Purges rows from the direct loader log after they are no longer needed by any materialized views (used with data warehousing)</td>

<tr>
<td>REFRESH Procedures</td>
<td>Refreshes one or more materialized views that are not members of the same refresh group</td>
</tr>
<tr>
<td>REFRESH_ALL_MVIEWS Procedure</td>
<td>Refreshes all materialized views that do not reflect changes to their master table or master materialized view</td>
</tr>
<tr>
<td>REFRESH_DEPENDENT Procedures</td>
<td>Refreshes all table-based materialized views that depend on a specified master table or master materialized view, or list of master tables or master materialized views</td>
</tr>
<tr>
<td>REGISTER_MVIEW Procedure</td>
<td>Enables the administration of individual materialized views</td>
</tr>
<tr>
<td>UNREGISTER_MVIEW Procedure</td>
<td>Enables the administration of individual materialized views once invoked at a master site or master materialized view site to unregister a materialized view</td>
</tr>
</tbody>
</table>
106.4.1 BEGIN_TABLE_REORGANIZATION Procedure

This procedure performs a process to preserve materialized view data needed for refresh. It must be called before a master table is reorganized.

Syntax

```
DBMS_MVIEW.BEGIN_TABLE_REORGANIZATION (
  tabowner    IN   VARCHAR2,
  tabname     IN   VARCHAR2);
```

Parameters

Table 106-2  BEGIN_TABLE_REORGANIZATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tabowner</td>
<td>Owner of the table being reorganized</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table being reorganized</td>
</tr>
</tbody>
</table>

106.4.2 END_TABLE_REORGANIZATION Procedure

This procedure ensures that the materialized view data for the master table is valid and that the master table is in the proper state. It must be called after a master table is reorganized.

Syntax

```
DBMS_MVIEW.END_TABLE_REORGANIZATION (
  tabowner    IN   VARCHAR2,
  tabname     IN   VARCHAR2);
```

Parameters

Table 106-3  END_TABLE_REORGANIZATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tabowner</td>
<td>Owner of the table being reorganized</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table being reorganized</td>
</tr>
</tbody>
</table>

106.4.3 ESTIMATE_MVIEW_SIZE Procedure

This procedure estimates the size of a materialized view that you might create, in bytes and number of rows.

Syntax

```
DBMS_MVIEW.ESTIMATE_MVIEW_SIZE (  
  stmt_id       IN  VARCHAR2,
  select_clause IN  VARCHAR2,
  num_rows      OUT NUMBER,
  num_bytes     OUT NUMBER);
```
Parameters

Table 106-4 ESTIMATE_MVIEW_SIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stmt_id</td>
<td>Arbitrary string used to identify the statement in an EXPLAIN PLAN</td>
</tr>
<tr>
<td>select_clause</td>
<td>The SELECT statement to be analyzed</td>
</tr>
<tr>
<td>num_rows</td>
<td>Estimated cardinality</td>
</tr>
<tr>
<td>num_bytes</td>
<td>Estimated number of bytes</td>
</tr>
</tbody>
</table>

106.4.4 EXPLAIN_MVIEW Procedure

This procedure enables you to learn what is possible with a materialized view or potential materialized view. For example, you can determine if a materialized view is fast refreshable and what types of query rewrite you can perform with a particular materialized view.

Using this procedure is straightforward. You simply call DBMS_MVIEW.EXPLAIN_MVIEW, passing in as parameters the schema and materialized view name for an existing materialized view. Alternatively, you can specify the SELECT string or CREATE MATERIALIZED VIEW statement for a potential materialized view. The materialized view or potential materialized view is then analyzed and the results are written into either a table called MV_CAPABILITIES_TABLE, which is the default, or to an array called MSG_ARRAY.

The procedure is overloaded:

- The first version is for explaining an existing or potential materialized view with output to MV_CAPABILITIES_TABLE.
- The second version is for explaining an existing or potential materialized view with output to a VARRAY.

Syntax

DBMS_MVIEW.EXPLAIN_MVIEW (
    mv            IN VARCHAR2,
    statement_id  IN VARCHAR2:= NULL);

DBMS_MVIEW.EXPLAIN_MVIEW (
    mv            IN VARCHAR2,
    msg_array    OUT SYS.ExplainMVArrayType);

Parameters

Table 106-5 EXPLAIN_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv</td>
<td>The name of an existing materialized view (optionally qualified with the owner name separated by a &quot;.&quot;) or a SELECT statement or a CREATE MATERIALIZED VIEW statement for a potential materialized view.</td>
</tr>
<tr>
<td>statement_id</td>
<td>A client-supplied unique identifier to associate output rows with specific invocations of EXPLAIN_MVIEW</td>
</tr>
</tbody>
</table>
**Table 106-5  (Cont.) EXPLAIN_MVIEW Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>msg_array</td>
<td>The PL/SQL VARRAY that receives the output. Use this parameter to direct EXPLAIN_MVIEW's output to a PL/SQL VARRAY rather than MV_CAPABILITIES_TABLE.</td>
</tr>
</tbody>
</table>

**Usage Notes**

You must run the utlxmv.sql script to create MV_CAPABILITIES_TABLE in the current schema prior to calling EXPLAIN_MVIEW except when you direct output to a VARRAY. The script is found in the ADMIN directory.

## 106.4.5 EXPLAIN_REWRITE Procedure

This procedure enables you to learn why a query failed to rewrite, or, if it rewrites, which materialized views will be used.

Using the results from the procedure, you can take the appropriate action needed to make a query rewrite if at all possible. The query specified in the EXPLAIN_REWRITE statement is never actually executed.

A demo file, xrwutl.sql, is available to help format the output from EXPLAIN_REWRITE.

**Syntax**

You can obtain the output from DBMS_MVIEW.EXPLAIN_REWRITE in two ways. The first is to use a table, while the second is to create a VARRAY. The following shows the basic syntax for using an output table:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query VARCHAR2,
    mv VARCHAR2(30),
    statement_id VARCHAR2(30));
```

You can create an output table called REWRITE_TABLE by executing the utlxrw.sql script.

The query parameter is a text string representing the SQL query. The parameter, mv, is a fully qualified materialized view name in the form of schema.mv. This is an optional parameter. When it is not specified, EXPLAIN_REWRITE returns any relevant messages regarding all the materialized views considered for rewriting the given query. When schema is omitted and only mv is specified, EXPLAIN_REWRITE looks for the materialized view in the current schema.

If you want to direct the output of EXPLAIN_REWRITE to a VARRAY instead of a table, you should call the procedure as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE (
    query [VARCHAR2 | CLOB],
    mv VARCHAR2(30),
    output_array SYS.RewriteArrayType);
```

Note that if the query is less than 256 characters long, EXPLAIN_REWRITE can be easily invoked with the EXECUTE command from SQL*Plus. Otherwise, the recommended method is to use a PL/SQL BEGIN... END block, as shown in the examples in /rdbsm/demo/smxrw*.
You can also use `EXPLAIN_REWRITE` with multiple materialized views, in which case the syntax will be the same as with a single materialized view, except that the materialized views are specified by a comma-delimited string. For example, to find out whether a given set of materialized views `mv1`, `mv2`, and `mv3` could be used to rewrite the query, `query_txt`, and, if not, why not, use `EXPLAIN_REWRITE` as follows:

```
DBMS_MVIEW.EXPLAIN_REWRITE(query_txt, 'mv1, mv2, mv3')
```

See *Oracle Database Data Warehousing Guide* for more information on using the `EXPLAIN_REWRITE` procedure.

**Parameters**

**Table 106-6  EXPLAIN_REWRITE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>query</code></td>
<td>SQL SELECT statement to be explained</td>
</tr>
<tr>
<td><code>mv</code></td>
<td>The fully qualified name of an existing materialized view in the form of <code>SCHEMA.MV</code>. For multiple materialized views, you can provide a comma-delimited list of names.</td>
</tr>
<tr>
<td><code>statement_id</code></td>
<td>A client-supplied unique identifier to distinguish output messages</td>
</tr>
<tr>
<td><code>msg_array</code></td>
<td>The PL/SQL <code>VARRAY</code> that receives the output. Use this parameter to direct <code>EXPLAIN_REWRITE</code>'s output to a PL/SQL <code>VARRAY</code>.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To obtain the output into a table, you must run the `utlxrw.sql` script before calling `EXPLAIN_REWRITE`. This script creates a table named `REWRITE_TABLE` in the current schema.

**106.4.6 I_AM_A_REFRESH Function**

This function returns the value of the `I_AM_REFRESH` package state.

**Syntax**

```
DBMS_MVIEW.I_AM_A_REFRESH
   RETURN BOOLEAN;
```

**Return Values**

A return value of `true` indicates that all local replication triggers for materialized views are effectively disabled in this session because each replication trigger first checks this state. A return value of `false` indicates that these triggers are enabled.
106.4.7 PMARKER Function

This function returns a partition marker from a rowid. It is used for Partition Change Tracking (PCT).

Syntax

DBMS_MVIEW.PMARKER(
    rid IN ROWID)
RETURN NUMBER;

Parameters

Table 106-7  PMARKER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rid</td>
<td>The rowid of a row entry in a master table</td>
</tr>
</tbody>
</table>

106.4.8 PURGE.Direct_Load_LOG Procedure

This procedure removes entries from the direct loader log after they are no longer needed for any known materialized view. This procedure usually is used in environments using Oracle's data warehousing technology.

Syntax

DBMS_MVIEW.PURGE_DIRECT_LOAD_LOG();

106.4.9 PURGE_LOG Procedure

This procedure purges rows from the materialized view log.

Syntax

DBMS_MVIEW.PURGE_LOG (
    master        IN   VARCHAR2,
    num           IN   BINARY_INTEGER := 1,
    flag          IN   VARCHAR2       := 'NOP');

Parameters

Table 106-8  PURGE_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>master</td>
<td>Name of the master table or master materialized view.</td>
</tr>
</tbody>
</table>
Table 106-8 (Cont.) PURGE_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| num       | Number of least recently refreshed materialized views whose rows you want to remove from materialized view log. For example, the following statement deletes rows needed to refresh the two least recently refreshed materialized views:  
   ```sql
   DBMS_MVIEW.PURGE_LOG('master_table', 2);
   ```  
   To delete all rows in the materialized view log, indicate a high number of materialized views to disregard, as in this example:  
   ```sql
   DBMS_MVIEW.PURGE_LOG('master_table', 9999);
   ```  
   This statement completely purges the materialized view log that corresponds to `master_table` if fewer than 9999 materialized views are based on `master_table`. A simple materialized view whose rows have been purged from the materialized view log must be completely refreshed the next time it is refreshed. |
| flag      | Specify `delete` to guarantee that rows are deleted from the materialized view log for at least one materialized view. This parameter can override the setting for the parameter `num`. For example, the following statement deletes rows from the materialized view log that has dependency rows in the least recently refreshed materialized view:  
   ```sql
   DBMS_MVIEW.PURGE_LOG('master_table', 1, 'delete');
   ``` |

106.4.10 PURGE_MVIEW_FROM_LOG Procedure

This procedure is called on the master site or master materialized view site to delete the rows in materialized view refresh related data dictionary tables maintained at the master for the specified materialized view identified by `mview_id` or the combination of `mviewowner`, `mviewname`, and `mviewsite`. If the materialized view specified is the oldest materialized view to have refreshed from any of the master tables or master materialized views, then the materialized view log is also purged. This procedure does not unregister the materialized view.

Syntax

```sql
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (  
mview_id       IN   BINARY_INTEGER);
```

```sql
DBMS_MVIEW.PURGE_MVIEW_FROM_LOG (  
mviewowner     IN   VARCHAR2,
mviewname      IN   VARCHAR2,
mviewsite      IN   VARCHAR2);
```

**Note:** This procedure is overloaded. The parameter `mview_id` is mutually exclusive with the three remaining parameters: `mviewowner`, `mviewname`, and `mviewsite`. 
Parameters

Table 106-9  PURGE_MVIEW_FROM_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mview_id</td>
<td>If you want to execute this procedure based on the identification of the target materialized view, specify the materialized view identification using the mview_id parameter. Query the DBA_BASE_TABLE_MVIEWS view at the materialized view log site for a listing of materialized view IDs. Executing this procedure based on the materialized view identification is useful if the target materialized view is not listed in the list of registered materialized views (DBA_REGISTERED_MVIEWS).</td>
</tr>
<tr>
<td>mviewowner</td>
<td>If you do not specify an mview_id, enter the owner of the target materialized view using the mviewowner parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view owners.</td>
</tr>
<tr>
<td>mviewname</td>
<td>If you do not specify an mview_id, enter the name of the target materialized view using the mviewname parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view names.</td>
</tr>
<tr>
<td>mviewsite</td>
<td>If you do not specify an mview_id, enter the site of the target materialized view using the mviewsite parameter. Query the DBA_REGISTERED_MVIEWS view at the materialized view log site to view the materialized view sites.</td>
</tr>
</tbody>
</table>

Usage Notes

If there is an error while purging one of the materialized view logs, the successful purge operations of the previous materialized view logs are not rolled back. This is to minimize the size of the materialized view logs. In case of an error, this procedure can be invoked again until all the materialized view logs are purged.

106.4.11 REFRESH Procedures

This procedure refreshes a list of materialized views.

Syntax

```sql
DBMS_MVIEW.REFRESH (
| list         IN  VARCHAR2,
| tab          IN  DBMS_UTILITY.UNCL_ARRAY,)
method        IN  VARCHAR2  := NULL,
rollback_seg  IN  VARCHAR2  := NULL,
push_deferred_rpc IN  BOOLEAN  := true,
refresh_after_errors IN  BOOLEAN  := false,
purge_option  IN  BINARY_INTEGER  := 1,
parallelism   IN  BINARY_INTEGER  := 0,
heap_size     IN  BINARY_INTEGER  := 0,
atomic_refresh IN  BOOLEAN  := true,
nested        IN  BOOLEAN  := false,
out_of_place  IN  BOOLEAN  := false);
```
Note:
This procedure is overloaded. The list and tab parameters are mutually exclusive.

Parameters

Table 106-10  REFRESH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>tab</td>
</tr>
<tr>
<td>method</td>
<td>A string of refresh methods indicating how to refresh the listed materialized views. An f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a materialized view does not have a corresponding refresh method (that is, if more materialized views are specified than refresh methods), then that materialized view is refreshed according to its default refresh method. For example, consider the following EXECUTE statement within SQL*Plus: DBMS_MVIEW.REFRESH ('countries_mv,regions_mv,hr.employees_mv','cf'); This statement performs a complete refresh of the countries_mv materialized view, a fast refresh of the regions_mv materialized view, and a default refresh of the hr.employees materialized view.</td>
</tr>
<tr>
<td>rollback_seg</td>
<td>Name of the materialized view site rollback segment to use while refreshing materialized views</td>
</tr>
<tr>
<td>push_deferred_rpc</td>
<td>Used by updatable materialized views only. Set this parameter to true if you want to push changes from the materialized view to its associated master tables or master materialized views before refreshing the materialized view. Otherwise, these changes may appear to be temporarily lost.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view's master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.</td>
</tr>
</tbody>
</table>
### Table 106-10 (Cont.) REFRESH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>purge_option</td>
<td>If you are using the parallel propagation mechanism (in other words, parallelism is set to 1 or greater), 0 means do not purge, 1 means lazy purge, and 2 means aggressive purge. In most cases, lazy purge is the optimal setting. Set purge to aggressive to trim the queue if multiple master replication groups are pushed to different target sites, and updates to one or more replication groups are infrequent and infrequently pushed. If all replication groups are infrequently updated and pushed, then set this parameter to 0 and occasionally execute <code>PUSH</code> with this parameter set to 2 to reduce the queue.</td>
</tr>
<tr>
<td>parallelism</td>
<td>0 specifies serial propagation. &lt;br&gt;[ n &gt; 1 ] specifies parallel propagation with [ n ] parallel processes. &lt;br&gt;1 specifies parallel propagation using only one parallel process.</td>
</tr>
<tr>
<td>heap_size</td>
<td>Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance. &lt;br&gt;Note: Do not set this parameter unless directed to do so by Oracle Support Services.</td>
</tr>
<tr>
<td>atomic_refresh</td>
<td>If this parameter is set to <code>true</code>, then the list of materialized views is refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. &lt;br&gt;If this parameter is set to <code>false</code>, then each of the materialized views is refreshed non-atomically in separate transactions. &lt;br&gt;As part of complete refresh, if truncate is used (non-atomic refresh), unique index rebuild is executed. <code>INDEX REBUILD</code> automatically computes statistics. Thus, statistics are updated for truncated tables.</td>
</tr>
<tr>
<td>nested</td>
<td>If <code>true</code>, then perform nested refresh operations for the specified set of materialized views. Nested refresh operations refresh all the depending materialized views and the specified set of materialized views based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables.</td>
</tr>
<tr>
<td>out_of_place</td>
<td>If <code>true</code>, then it performs an out-of-place refresh. The default is <code>false</code>. &lt;br&gt;This parameter uses the four methods of refresh (F, P, C,?). So, for example, if you specify <code>P</code> and <code>out_of_place = true</code>, then an out-of-place PCT refresh will be attempted. Similarly, if you specify <code>F</code> and <code>out_of_place = true</code>, then out-of-place PCT refresh will be attempted.</td>
</tr>
</tbody>
</table>

### 106.4.12 REFRESH_ALL_MVIEWS Procedure

This procedure refreshes all materialized views that have certain properties:

All materialized views with the following properties are refreshed:

- The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.
- The materialized view and all of the master tables or master materialized views on which it depends are local.
- The materialized view is in the view `DBA_MVIEWS`.
This procedure is intended for use with data warehouses.

Syntax

```sql
DBMS_MVIEW.REFRESH_ALL_MVIEWS (
    number_of_failures OUT BINARY_INTEGER,
    method IN VARCHAR2 := NULL,
    rollback_seg IN VARCHAR2 := NULL,
    refresh_after_errors IN BOOLEAN := false,
    atomic_refresh IN BOOLEAN := true,
    out_of_place IN BOOLEAN := false);
```

Parameters

Table 106-11  REFRESH_ALL_MVIEWS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_of_failures</td>
<td>Returns the number of failures that occurred during processing</td>
</tr>
<tr>
<td>method</td>
<td>A single refresh method indicating the type of refresh to perform for each materialized view that is refreshed. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. If no method is specified, a materialized view is refreshed according to its default refresh method. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables.</td>
</tr>
<tr>
<td>rollback_seg</td>
<td>Name of the materialized view site rollback segment to use while refreshing materialized views</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view’s master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view.</td>
</tr>
<tr>
<td>atomic_refresh</td>
<td>If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions.</td>
</tr>
<tr>
<td>out_of_place</td>
<td>If true, then it performs an out-of-place refresh. The default is false. This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify F and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted.</td>
</tr>
</tbody>
</table>

106.4.13 REFRESH_DEPENDENT Procedures

This procedure refreshes all materialized views that have certain properties.

Materialized views with the following properties are refreshed:
The materialized view depends on a master table or master materialized view in the list of specified masters.

The materialized view has not been refreshed since the most recent change to a master table or master materialized view on which it depends.

The materialized view and all of the master tables or master materialized views on which it depends are local.

The materialized view is in the view `DBA_MVIEWS`.

This procedure is intended for use with data warehouses.

**Syntax**

```sql
DBMS_MVIEW.REFRESH_DEPENDENT (  
    number_of_failures     OUT    BINARY_INTEGER,  
    { list                 IN     VARCHAR2,  
      | tab                  IN     DBMS_UTILITY.UNCL_ARRAY, }  
    method                 IN     VARCHAR2    := NULL,  
    rollback_seg           IN     VARCHAR2    := NULL,  
    refresh_after_errors   IN     BOOLEAN     := false,  
    atomic_refresh         IN     BOOLEAN     := true,  
    nested                 IN     BOOLEAN     := false,  
    out_of_place           IN     BOOLEAN     := false);
```

**Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

**Parameters**

**Table 106-12  REFRESH_DEPENDENT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_of_failures</td>
<td>Returns the number of failures that occurred during processing</td>
</tr>
<tr>
<td>list</td>
<td>tab</td>
</tr>
</tbody>
</table>
Table 106-12  (Cont.) REFRESH_DEPENDENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| method        | A string of refresh methods indicating how to refresh the dependent materialized views. All of the materialized views that depend on a specific table are refreshed according to the refresh method associated with that table. F or f indicates fast refresh, ? indicates force refresh, C or c indicates complete refresh, and A or a indicates always refresh. A and C are equivalent. P or p refreshes by recomputing the rows in the materialized view affected by changed partitions in the detail tables. If a table does not have a corresponding refresh method (that is, if more tables are specified than refresh methods), then any materialized view that depends on that table is refreshed according to its default refresh method. For example, the following EXECUTE statement within SQL*Plus:  

```
DBMS_MVIEW.REFRESH_DEPENDENT
   ('employees,departments,hr.regions','cf');
```

performs a complete refresh of the materialized views that depend on the employees table, a fast refresh of the materialized views that depend on the departments table, and a default refresh of the materialized views that depend on the hr.regions table. |
| rollback_seg  | Name of the materialized view site rollback segment to use while refreshing materialized views |
| refresh_after_errors | If this parameter is true, an updatable materialized view continues to refresh even if there are outstanding conflicts logged in the DEFERROR view for the materialized view’s master table or master materialized view. If this parameter is true and atomic_refresh is false, this procedure continues to refresh other materialized views if it fails while refreshing a materialized view. |
| atomic_refresh | If this parameter is set to true, then the refreshed materialized views are refreshed in a single transaction. All of the refreshed materialized views are updated to a single point in time. If the refresh fails for any of the materialized views, none of the materialized views are updated. If this parameter is set to false, then each of the materialized views is refreshed non-atomically in separate transactions. |
| nested        | If true, then perform nested refresh operations for the specified set of tables. Nested refresh operations refresh all the depending materialized views of the specified set of tables based on a dependency order to ensure the nested materialized views are truly fresh with respect to the underlying base tables. |
| out_of_place  | If true, then it performs an out-of-place refresh. The default is false. This parameter uses the four methods of refresh (F, P, C, ?). So, for example, if you specify P and out_of_place = true, then an out-of-place fast refresh will be attempted. Similarly, if you specify P and out_of_place = true, then out-of-place PCT refresh will be attempted. |
106.4.14 REGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to register a materialized view.

Note that, typically, a materialized view is registered automatically during materialized view creation. You should only run this procedure to manually register a materialized view if the automatic registration failed or if the registration information was deleted.

Syntax

```
DBMS_MVIEW.REGISTER_MVIEW (  
  mviewowner  IN   VARCHAR2,  
  mviewname   IN   VARCHAR2,  
  mviewsite   IN   VARCHAR2,  
  mview_id    IN   DATE | BINARY_INTEGER,  
  flag        IN   BINARY_INTEGER,  
  qry_txt     IN   VARCHAR2,  
  rep_type    IN   BINARY_INTEGER := DBMS_MVIEW.REG_UNKNOWN);
```

Parameters

Table 106-13  REGISTER_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mviewowner</td>
<td>Owner of the materialized view.</td>
</tr>
<tr>
<td>mviewname</td>
<td>Name of the materialized view.</td>
</tr>
<tr>
<td>mviewsite</td>
<td>Name of the materialized view site for a materialized view registering at an Oracle database version 8.x and higher master site or master materialized view site. This name should not contain any double quotes.</td>
</tr>
<tr>
<td>mview_id</td>
<td>The identification number of the materialized view. Specify an Oracle database version 8.x and higher materialized view as a BINARY_INTEGER. Specify an Oracle database version 7 materialized view registering at an Oracle database version 8.x and higher master sites or master materialized view sites as a DATE.</td>
</tr>
<tr>
<td>flag</td>
<td>A constant that describes the properties of the materialized view being registered. Valid constants that can be assigned include the following: DBMS_MVIEW.REG_ROWID_MVIEW for a rowid materialized view DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW for a primary key materialized view DBMS_MVIEW.REG_OBJECT_ID_MVIEW for an object id materialized view DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW for a materialized view that can be fast refreshed DBMS_MVIEW.REG_UPDATABLE_MVIEW for a materialized view that is updatable A materialized view can have more than one of these properties. In this case, use the plus sign (+) to specify more than one property. For example, if a primary key materialized view can be fast refreshed, you can enter the following for this parameter: DBMS_MVIEW.REG_PRIMARY_KEY_MVIEW + DBMS_MVIEW.REG_FAST_REFRESHABLE_MVIEW You can determine the properties of a materialized view by querying the ALL_MVIEWS data dictionary view.</td>
</tr>
<tr>
<td>qry_txt</td>
<td>The first 32,000 bytes of the materialized view definition query.</td>
</tr>
</tbody>
</table>
Table 106-13 (Cont.) REGISTER_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| rep_type   | Version of the materialized view. Valid constants that can be assigned include the following:  
  - DBMS_MVIEW.REG_V7_SNAPSHOT if the materialized view is at an Oracle database version 7 site  
  - DBMS_MVIEW.REG_V8_SNAPSHOT if the materialized view is at an Oracle database version 8.x or higher site  
  - DBMS_MVIEW.REG_UNKNOWN (the default) if you do not know whether the materialized view is at an Oracle database version 7 site or an Oracle database version 8.x (or higher) site |

Usage Notes

This procedure is invoked at the master site or master materialized view site by a remote materialized view site using a remote procedure call. If REGISTER_MVIEW is called multiple times with the same mviewowner, mviewname, and mviewsite, then the most recent values for mview_id, flag, and qry_txt are stored. If a query exceeds the maximum VARCHAR2 size, then qry_txt contains the first 32000 characters of the query and the remainder is truncated. When invoked manually, the value of mview_id must be looked up in the materialized view data dictionary views by the person who calls the procedure.

106.4.15 UNREGISTER_MVIEW Procedure

This procedure enables the administration of individual materialized views. It is invoked at a master site or master materialized view site to unregister a materialized view.

Syntax

```
DBMS_MVIEW.UNREGISTER_MVIEW (  
    mviewowner      IN   VARCHAR2,  
    mviewname       IN   VARCHAR2,  
    mviewsite       IN   VARCHAR2);
```

Parameters

Table 106-14 UNREGISTER_MVIEW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mviewowner</td>
<td>Owner of the materialized view</td>
</tr>
<tr>
<td>mviewname</td>
<td>Name of the materialized view</td>
</tr>
<tr>
<td>mviewsite</td>
<td>Name of the materialized view site</td>
</tr>
</tbody>
</table>
DBMS_MVIEW_STATS package provides an interface to manage the collection and retention of statistics for materialized view refresh operations.

See Also:

Oracle Database Data Warehousing Guide for information about managing and using materialized view refresh statistics

This chapter contains the following topics:

• DBMS_MVIEW_STATS Overview
• DBMS_MVIEW_STATS Security Model
• Summary of DBMS_MVIEW_STATS Subprograms

107.1 DBMS_MVIEW_STATS Overview

You can use the procedures contained in the DBMS_MVIEW_STATS package to manage the collection and retention of statistics for materialized view refresh operations. This includes the level and granularity at which these statistics are collected and the duration for which they are retained in the database.

You can also set database level system defaults for the parameters that control statistics collection.

107.2 DBMS_MVIEW_STATS Security Model

Refer to the Usage Notes section in each subprogram for information about the privileges required to use the subprogram.

107.3 Summary of DBMS_MVIEW_STATS Subprograms

This table lists the DBMS_MVIEW_STATS subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE_REFRESH_STATS Procedure</td>
<td>Purges the statistics of materialized view refresh operations that are older than the specified retention period.</td>
</tr>
</tbody>
</table>
Table 107-1  (Cont.) DBMS_MVIEW_STATS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_MVREF_STATS_PARAMS</td>
<td>Sets the values of parameters that define the collection level and retention period for materialized view refresh statistics. You can set the values either at the database level or for individual materialized views.</td>
</tr>
<tr>
<td>SET_SYSTEM_DEFAULT</td>
<td>Sets the system default value of a refresh statistics parameter. The two refresh statistics parameters are collection level and the retention period.</td>
</tr>
</tbody>
</table>

107.3.1 PURGE_REFRESH_STATS Procedure

This procedure purges refresh statistics that are older than the specified retention period for the specified materialized views.

This procedure forces a purge of refresh statistics without altering the retention period defined for the specified materialized views.

Syntax

```sql
DBMS_MVIEW_STATS.PURGE_REFRESH_STATISTICS (  
  mv_list               IN     VARACHAR2,  
  retention_period      IN     NUMBER);
```

Parameters

Table 107-2  PURGE_REFRESH_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views. Specify <code>NULL</code> to purge materialized view refresh statistics for all materialized views in the database.</td>
</tr>
<tr>
<td>retention_period</td>
<td>The number of days for which refresh statistics must be preserved in the data dictionary. Statistics for materialized view refresh operations that are older than the retention period are purged from the data dictionary. The retention period specified in this procedure overrides the retention period that may have been set previously either at the database level or for specified materialized views. Specify <code>NULL</code> to use the purging policy defined by the automatic statistics purge. Specify <code>-1</code> to purge all refresh statistics.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure, you need either the `SYSDBA` privilege or privileges on every materialized view that is specified in `mv_list`. 
107.3.2 SET_MVREF_STATS_PARAMS Procedure

This procedure sets the collection level and retention period for materialized view refresh statistics. You can set these properties either for individual materialized views or for all materialized views in the database.

Syntax

```
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (  
  mv_list            IN    VARACHAR2,  
  collection_level   IN    VARCHAR2 DEFAULT NULL,  
  retention_period   IN    NUMBER DEFAULT NULL);
```

Parameters

Table 107-3 SET_MVREF_STATS_PARAMS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mv_list</td>
<td>The fully-qualified name of an existing materialized view in the form of <code>schema_name.mv_name</code>. Use a comma-separated list to specify multiple materialized views. Specify NULL to set properties for all existing materialized views in the database.</td>
</tr>
<tr>
<td>collection_level</td>
<td>Specifies the level of detail used when collecting refresh statistics for the materialized views specified in <code>mv_list</code>.</td>
</tr>
<tr>
<td></td>
<td>Set one of the following values for <code>collection_level</code>:</td>
</tr>
<tr>
<td></td>
<td>• NONE: No materialized view refresh statistics are collected.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: Only basic refresh statistics are collected and stored for the materialized views specified in <code>mv_list</code>.</td>
</tr>
<tr>
<td></td>
<td>• ADVANCED: Detailed refresh statistics are collected and stored for materialized view specified in <code>mv_list</code>.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, then the system default value for <code>collection_level</code> (set using <code>SET_SYSTEM_DEFAULT</code>) is used.</td>
</tr>
<tr>
<td>retention_period</td>
<td>Specifies the retention period, in days, for the refresh statistics of the materialized views specified in <code>mv_list</code>. Statistics that are older than the retention period are automatically purged from the data dictionary.</td>
</tr>
<tr>
<td></td>
<td>Valid values are between 1 and 1365000.</td>
</tr>
<tr>
<td></td>
<td>If this parameter is set to NULL, then the system default value for <code>retention_period</code> (set using <code>SET_SYSTEM_DEFAULT</code>) is used.</td>
</tr>
<tr>
<td></td>
<td>Set <code>retention_period</code> to -1 to specify that refresh statistics for the materialized views in <code>mv_list</code> must never be purged.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the collection level or retention period of one or more materialized views, you must have privileges on those materialized views. To set the collection level or retention period for all materialized views in the database, you must have either the `SYSDBA` privilege or privileges on every materialized view in the database.

To set the system-level default values for statistics collection level and retention period, use the `SET_SYSTEM_DEFAULT` procedure.
Use the `DBA_MVREF_STATS_PARAMS` view to determine the currently-set retention period and collection level for materialized view statistics collection.

To disable refresh statistics collection for all materialized views in the database, use the following:

```sql
DBMS_MVIEW_STATS.SET_MVREF_STATS_PARAMS (NULL, 'NONE', NULL);
```

Note that the parameters set using `SET_MVREF_STATS_PARAMS` only affect materialized views that exist in the database at the time the procedure is run. Any new materialized views created after this procedure is run will use the system default values for `collection_level` and `retention_period`.

### 107.3.3 SET_SYSTEM_DEFAULT Procedure

This procedure sets system-wide defaults that manage the collection and retention of materialized view refresh statistics. All newly-created materialized views use these defaults until the parameters are reset explicitly using the `SET_MVREF_STATS_PARAMS` procedure.

**Syntax**

```sql
DBMS_MVIEW_STATS.SET_SYSTEM_DEFAULT (parameter_name IN VARCHAR2, value IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 107-4  SET_SYSTEM_DEFAULT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| `parameter_name` | The name of the materialized view refresh statistics parameter whose system default value is being set. The parameters that can be set are:  
  - `COLLECTION_LEVEL`: Specifies the level of detail for collecting materialized view refresh statistics.  
  - `RETENTION_PERIOD`: Specifies the duration, in days, for which refresh statistics are retained in the data dictionary. |
| `value` | The value of the materialized view refresh statistics parameter. The valid values for `COLLECTION_LEVEL` are:  
  - `NONE`: No refresh statistics are collected for the refresh operation.  
  - `TYPICAL`: Only basic refresh statistics are collected for the refresh operation. This is the default setting.  
  - `ADVANCED`: Detailed refresh statistics are collected for the refresh operation. The valid values for `RETENTION_PERIOD` are:  
    - `-1`  
    - Numbers between 1 and 1365000  
    The default value for `retention_period` is 31. If you specify `NULL` for any of the parameters, then the system default setting for that parameter is used. |
Usage Notes

You must have SYSDBA privilege to invoke this procedure.

Use the DBA_MVREF_STATS_SYS_DEFAULTS view to display the current default settings for materialized view refresh statistics collection.
The DBMS_NETWORK_ACL_ADMIN package provides the interface to administer the network Access Control List (ACL).

The chapter contains the following topics:

- Overview
- Deprecated Subprograms
- Security Model
- Constants
- Exceptions
- Examples
- Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

See Also:

For more information, see "Managing Fine-grained Access to External Network Services" in Oracle Database Security Guide

108.1 DBMS_NETWORK_ACL_ADMIN Overview

The DBMS_NETWORK_ACL_ADMIN package provides the interface to administer the network access control lists (ACL).

ACLs are used to control access by users to external network services and resources from the database through PL/SQL network utility packages including UTL_TCP, UTL_HTTP, UTL_SMTP and UTL_INETADDR.

108.2 DBMS_NETWORK_ACL_ADMIN Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with release Oracle Database 12c:

- ADD_PRIVILEGE Procedure
- ASSIGN_ACL Procedure
- ASSIGN_WALLET_ACL Procedure
- CHECK_PRIVILEGE Function
108.3 DBMS_NETWORK_ACL_ADMIN Security Model

The `EXECUTE` privilege on the `DBMS_NETWORK_ACL_ADMIN` package is granted to the `DBA` role and to the `EXECUTE_CATALOG_ROLE` by default.

108.4 DBMS_NETWORK_ACL_ADMIN Constants

The `DBMS_NETWORK_ACL_ADMIN` package defines constants to use specifying parameter values.

These are shown in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP_ADDR_MASK</td>
<td>VARCHAR2(80)</td>
<td><code>'^{[:digit:]+\.(?:[[:digit:]]+\.)?}'</code></td>
<td>IP address mask: xxx.xxx.xxx.xxx</td>
</tr>
<tr>
<td>IP_SUBNET_MASK</td>
<td>VARCHAR2(80)</td>
<td><code>'^{[:digit:]+\.(?:[[:digit:]]\.)?}'</code></td>
<td>IP subnet mask: xxx.xxx...*</td>
</tr>
<tr>
<td>HOSTNAME_MASK</td>
<td>VARCHAR2(80)</td>
<td><code>[\^\.:\/*]+\([^\.:\/*]+\)*</code></td>
<td>Hostname mask: ???...??...???</td>
</tr>
<tr>
<td>DOMAIN_MASK</td>
<td>VARCHAR2(80)</td>
<td><code>'^\([^\.:\/*]+\)*'</code></td>
<td>Domain mask: *.????...???</td>
</tr>
</tbody>
</table>

108.5 DBMS_NETWORK_ACL_ADMIN Exceptions

The following table lists the exceptions raised by the `DBMS_NETWORK_ACL_ADMIN` package.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE_ALREADY_EXISTS</td>
<td>24243</td>
<td>ACE already exists</td>

<td>Privilege not granted</td>
</tr>
</tbody>
</table>

108.6 DBMS_NETWORK_ACL_ADMIN Examples

Grant the `connect` and `resolve` privileges for host `www.us.example.com` to SCOTT.

**Example 1**

```sql
DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE(
    host => 'www.us.example.com',
    ace  => xs$ace_type(privilege_list => xs$name_list('connect', 'resolve'),
                     principal_name => 'scott',
                     principal_type => xs_acl.ptype_db));
```

**Example 2**

Revoke the `resolve` privilege for host `www.us.example.com` from SCOTT.

```sql
dbms_network_acl_admin.remove_host_ace(
    host => 'www.us.example.com',
    ace  => xs$ace_type(privilege_list => xs$name_list('resolve'),
                     principal_name => 'scott',
                     principal_type => xs_acl.ptype_db));
```

**Example 3**

Grant the `use_client_certificates` and `use_passwords` privileges for wallet `file:/example/wallets/hr_wallet` to SCOTT.

```sql
dbms_network_acl_admin.append_wallet_ace(
    wallet_path => 'file:/example/wallets/hr_wallet',
    ace         => xs$ace_type(privilege_list => xs$name_list('use_client_certificates', 'use_passwords'),
                     principal_name => 'scott',
                     principal_type => xs_acl.ptype_db));
```

**Example 4**

Revoke the `use_passwords` privilege for wallet `file:/example/wallets/hr_wallet` from SCOTT.

```sql
dbms_network_acl_admin.remove_wallet_ace(
    wallet_path => 'file:/example/wallets/hr_wallet',
    ace         => xs$ace_type(privilege_list => xs$name_list('use_passwords'),
                     principal_name => 'scott',
                     principal_type => xs_acl.ptype_db));
```
Example 5

The CONTAINS_HOST in the DBMS_NETWORK_ACLUTILITY package determines if a host is contained in a domain. It can be used in conjunction with the DBA_HOST_ACE view to determine the users and their privilege assignments to access a network host. For example, for access to www.us.example.com:

```sql
SELECT HOST, LOWER_PORT, UPPER_PORT,
    ACE_ORDER, PRINCIPAL, PRINCIPAL_TYPE,
    GRANT_TYPE, INVERTED_PRINCIPAL, PRIVILEGE,
    START_DATE, END_DATE
FROM (SELECT ACES.*,
    DBMS_NETWORK_ACLUTILITY.CONTAINS_HOST('www.us.example.com',
    HOST) PRECEDENCE
    FROM DBA_HOST_ACES ACES)
WHERE PRECEDENCE IS NOT NULL
ORDER BY PRECEDENCE DESC,
    LOWER_PORT NULLS LAST,
    UPPER_PORT NULLS LAST,
    ACE_ORDER;
```

<table>
<thead>
<tr>
<th>HOST</th>
<th>LOWER_PORT</th>
<th>UPPER_PORT</th>
<th>PRIVILEGE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.us.example.com">www.us.example.com</a></td>
<td>80</td>
<td>80</td>
<td>GRANT</td>
<td>GRANTED</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>NO</td>
<td></td>
</tr>
<tr>
<td>*</td>
<td></td>
<td></td>
<td>CONNECT</td>
<td>GRANTED</td>
</tr>
<tr>
<td>*</td>
<td></td>
<td></td>
<td>RESOLVE</td>
<td>GRANTED</td>
</tr>
</tbody>
</table>

Example 6

For example, for HQ_DBA’s own permission to access to www.us.example.com:

```sql
SELECT HOST, LOWER_PORT, UPPER_PORT, PRIVILEGE, STATUS
FROM (SELECT ACES.*,
    DBMS_NETWORK_ACLUTILITY.CONTAINS_HOST('www.us.example.com',
    HOST) PRECEDENCE
    FROM USER_HOST_ACES ACES)
WHERE PRECEDENCE IS NOT NULL
ORDER BY PRECEDENCE DESC,
    LOWER_PORT NULLS LAST,
    UPPER_PORT NULLS LAST;
```

<table>
<thead>
<tr>
<th>HOST</th>
<th>LOWER_PORT</th>
<th>UPPER_PORT</th>
<th>PRIVILEGE</th>
<th>STATUS</th>
</tr>
</thead>
<tbody>
<tr>
<td>*</td>
<td></td>
<td></td>
<td>CONNECT</td>
<td>GRANTED</td>
</tr>
<tr>
<td>*</td>
<td></td>
<td></td>
<td>RESOLVE</td>
<td>GRANTED</td>
</tr>
</tbody>
</table>

108.7 Summary of DBMS_NETWORK_ACL_ADMIN Subprograms

This table lists and briefly describes the DBMS_NETWORK_ACL_ADMIN package subprograms.
### Table 108-3  DBMS_NETWORK_ACL_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_PRIVILEGE Procedure</td>
<td>[DEPRECATED] Adds a privilege to grant or deny the network access to the user in an access control list (ACL)</td>
</tr>
<tr>
<td>APPEND_HOST_ACE Procedure</td>
<td>Appends an access control entry (ACE) to the access control list (ACL) of a network host.</td>
</tr>
<tr>
<td>APPEND_HOST_ACL Procedure</td>
<td>Appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host.</td>
</tr>
<tr>
<td>APPEND_WALLET_ACE Procedure</td>
<td>Appends an access control entry (ACE) to the access control list (ACL) of a wallet.</td>
</tr>
<tr>
<td>APPEND_WALLET_ACL Procedure</td>
<td>Appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet.</td>
</tr>
<tr>
<td>ASSIGN_ACL Procedure</td>
<td>[DEPRECATED] Assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.</td>
</tr>
<tr>
<td>ASSIGN_WALLET_ACL Procedure</td>
<td>[DEPRECATED] Assigns an access control list (ACL) to a wallet.</td>
</tr>
<tr>
<td>CHECK_PRIVILEGE Function</td>
<td>[DEPRECATED] Checks if a privilege is granted or denied the user in an access control list (ACL)</td>
</tr>
<tr>
<td>CHECK_PRIVILEGE_ACLID Function</td>
<td>[DEPRECATED] Checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.</td>
</tr>
<tr>
<td>CREATE_ACL Procedure</td>
<td>[DEPRECATED] Creates an access control list (ACL) with an initial privilege setting.</td>
</tr>
<tr>
<td>DELETE_PRIVILEGE Procedure</td>
<td>[DEPRECATED] Deletes a privilege in an access control list (ACL).</td>
</tr>
<tr>
<td>DROP_ACL Procedure</td>
<td>[DEPRECATED] Drops an access control list (ACL).</td>
</tr>
<tr>
<td>REMOVE_HOST_ACE Procedure</td>
<td>Removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE.</td>
</tr>
<tr>
<td>REMOVE_WALLET_ACE Procedure</td>
<td>Removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE.</td>
</tr>
<tr>
<td>SET_HOST_ACL Procedure</td>
<td>Sets the access control list (ACL) of a network host which controls access to the host from the database.</td>
</tr>
<tr>
<td>SET_WALLET_ACL Procedure</td>
<td>Sets the access control list (ACL) of a wallet which controls access to the wallet from the database.</td>
</tr>
<tr>
<td>UNASSIGN_ACL Procedure</td>
<td>[DEPRECATED] Unassigns the access control list (ACL) currently assigned to a network host.</td>
</tr>
<tr>
<td>UNASSIGN_WALLET_ACL Procedure</td>
<td>[DEPRECATED] Unassigns the access control list (ACL) currently assigned to a wallet.</td>
</tr>
</tbody>
</table>
108.7.1 ADD_PRIVILEGE Procedure

This procedure adds a privilege to grant or deny the network access to the user. The access control entry (ACE) is created if it does not exist.

**Note:**

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the APPEND_HOST_ACE Procedure and the APPEND_WALLET_ACE Procedure.

**Syntax**

```sql
DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE (  
acl             IN VARCHAR2,  
principal       IN VARCHAR2,  
is_grant        IN BOOLEAN,  
privilege       IN VARCHAR2,  
position        IN PLS_INTEGER DEFAULT NULL,  
start_date      IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL,  
end_date        IN TIMESTAMP WITH TIMESTAMP DEFAULT NULL );
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to “/sys/acls”</td>
</tr>
<tr>
<td>principal</td>
<td>Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.</td>
</tr>
<tr>
<td>is_grant</td>
<td>Privilege is granted or denied.</td>
</tr>
<tr>
<td>privilege</td>
<td>Network privilege to be granted or denied</td>
</tr>
<tr>
<td>position</td>
<td>Position (1-based) of the ACE. If a non-NULL value is given, the privilege will be added in a new ACE at the given position and there should not be another ACE for the principal with the same is_grant (grant or deny). If a NULL value is given, the privilege will be added to the ACE matching the principal and the is_grant if one exists, or to the end of the ACL if the matching ACE does not exist.</td>
</tr>
<tr>
<td>start_date</td>
<td>Start date of the access control entry (ACE). When specified, the ACE will be valid only on and after the specified date. The start_date will be ignored if the privilege is added to an existing ACE.</td>
</tr>
<tr>
<td>end_date</td>
<td>End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date. The end_date will be ignored if the privilege is added to an existing ACE.</td>
</tr>
</tbody>
</table>
Usage Notes

To remove the permission, use the DELETE_PRIVILEGE Procedure.

Examples

BEGIN
    DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
        acl => 'us-example-com-permissions.xml',
        principal => 'ST_USERS',
        is_grant => TRUE,
        privilege => 'connect')
END;

108.7.2 APPEND_HOST_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a network host. The ACL controls access to the given host from the database and the ACE specifies the privileges granted to or denied from the specified principal.

Syntax

DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACE (
    host IN VARCHAR2,
    lower_port IN PLS_INTEGER DEFAULT NULL,
    upper_port IN PLS_INTEGER DEFAULT NULL,
    ace IN XS$ACE_TYPE);

Parameters

Table 108-5   APPEND_HOST_ACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of an optional TCP port range</td>
</tr>
<tr>
<td>upper_port</td>
<td>Upper bound of an optional TCP port range. If NULL, lower_port is assumed.</td>
</tr>
<tr>
<td>ace</td>
<td>The ACE</td>
</tr>
</tbody>
</table>

Usage Notes

• Duplicate privileges in the matching ACE in the host ACL will be skipped.
• To remove the ACE, use the REMOVE_HOST_ACE Procedure.
• A host's ACL takes precedence over its domains' ACLs. For a given host, say www.us.example.com, the following domains are listed in decreasing precedence:
  - www.us.example.com
  - *.us.example.com
  - *.example.com
  - *.com
An IP address’ ACL takes precedence over its subnets’ ACLs. For a given IP address, say 192.168.0.100, the following subnets are listed in decreasing precedence:
- 192.168.0.100
- 192.168.0.*
- 192.168.*
- 192.*
- *

An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.

When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.

When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.

If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.

**See Also:**

Oracle Database Real Application Security Administrator's and Developer's Guide for more information about the XS$ACE_TYPE object type

108.7.3 APPEND_HOST_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a network host.

**Syntax**

DBMS_NETWORK_ACL_ADMIN.APPEND_HOST_ACL (  
host IN VARCHAR2,  
lower_port IN PLS_INTEGER DEFAULT NULL,  
upper_port IN PLS_INTEGER DEFAULT NULL,  
acl IN VARCHAR2);

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of an optional TCP port range</td>
</tr>
</tbody>
</table>
Table 108-6 (Cont.) APPEND_HOST_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper_port</td>
<td>Upper bound of an optional TCP port range. If <code>NULL</code>, <code>lower_port</code> is assumed.</td>
</tr>
<tr>
<td>acl</td>
<td>The ACL from which to append</td>
</tr>
</tbody>
</table>

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the `REMOVE_HOST_ACE` Procedure.
- A host's ACL takes precedence over its domains' ACLs. For a given host, say `www.us.example.com`, the following domains are listed in decreasing precedence:
  - `www.us.example.com`
  - `*.us.example.com`
  - `*.example.com`
  - `*.com`
  - `*`
- An IP address' ACL takes precedence over its subnets' ACLs. For a given IP address, say `192.168.0.100`, the following subnets are listed in decreasing precedence:
  - `192.168.0.100`
  - `192.168.0.*`
  - `192.168.*`
  - `192.*`
  - `*`
- An ACE with a "resolve" privilege can be appended only to a host's ACL without a port range.
- When ACEs with "connect" privileges are appended to a host's ACLs with and without a port range, the one appended to the host with a port range takes precedence.
- When specifying a TCP port range of a host, it cannot overlap with other existing port ranges of the host.- If the ACL is shared with another host or wallet, a copy of the ACL will be made before the ACL is modified.
108.7.4 APPEND_WALLET_ACE Procedure

This procedure appends an access control entry (ACE) to the access control list (ACL) of a wallet. The ACL controls access to the given wallet from the database and the ACE specifies the privileges granted to or denied from the specified principal.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACE (
    wallet_path    IN VARCHAR2,
    ace            IN XS$ACE_TYPE);
```

Parameters

Table 108-7  APPEND_WALLET_ACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet. The path is case-sensitive of the format file:directory-path.</td>
</tr>
<tr>
<td>ace</td>
<td>The ACE</td>
</tr>
</tbody>
</table>

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use the REMOVE_WALLET_ACE Procedure.
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

See Also:

Oracle Database Real Application Security Administrator's and Developer's Guide for more information about the XS$ACE_TYPE object type

108.7.5 APPEND_WALLET_ACL Procedure

This procedure appends access control entries (ACE) of an access control list (ACL) to the ACL of a wallet.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.APPEND_WALLET_ACL (
    wallet_path    IN VARCHAR2,
    acl            IN VARCHAR2);
```
Parameters

Table 108-8   APPEND_WALLET_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet. The path is case-sensitive of the format file:directory-path.</td>
</tr>
<tr>
<td>ace</td>
<td>The ACL from which to append</td>
</tr>
</tbody>
</table>

Usage Notes

- Duplicate privileges in the matching ACE in the host ACL will be skipped.
- To remove the ACE, use REMOVE_WALLET_ACE.
- If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

108.7.6 ASSIGN_ACL Procedure

This procedure assigns an access control list (ACL) to a host computer, domain, or IP subnet, and if specified, the TCP port range.

\[\text{Syntax:}\]

```sql
DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL (acl IN VARCHAR2, host IN VARCHAR2, lower_port IN PLS_INTEGER DEFAULT NULL, upper_port IN PLS_INTEGER DEFAULT NULL);
```

Parameters

Table 108-9   ASSIGN_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;.</td>
</tr>
<tr>
<td>host</td>
<td>Host to which the ACL is to be assigned. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of a TCP port range if not NULL</td>
</tr>
</tbody>
</table>

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the APPEND_HOST_ACE Procedure and the APPEND_WALLET_ACE Procedure.
Table 108-9  (Cont.) ASSIGN_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper_port</td>
<td>Upper bound of a TCP port range. If NULL, lower_port is assumed.</td>
</tr>
</tbody>
</table>

Usage Notes

- Only one ACL can be assigned to any host computer, domain, or IP subnet, and if specified, the TCP port range. When you assign a new access control list to a network target, Oracle Database unassigns the previous access control list that was assigned to the same target. However, Oracle Database does not drop the access control list. You can drop the access control list by using the DROP_ACL Procedure. To remove an access control list assignment, use the UNASSIGN_ACL Procedure.

- The ACL assigned to a domain takes a lower precedence than the other ACLs assigned sub-domains, which take a lower precedence than the ACLs assigned to the individual hosts. So for a given host, for example, "www.us.example.com", the following domains are listed in decreasing precedences:
  - www.us.example.com
  - *.us.example.com
  - *.example.com
  - *.com
  - *

In the same way, the ACL assigned to an subnet takes a lower precedence than the other ACLs assigned smaller subnets, which take a lower precedence than the ACLs assigned to the individual IP addresses. So for a given IP address, for example, "192.168.0.100", the following subnets are listed in decreasing precedences:
  - 192.168.0.100
  - 192.168.0.*
  - 192.168.*
  - 192.*
  - *

- The port range is applicable only to the "connect" privilege assignments in the ACL. The "resolve" privilege assignments in an ACL have effects only when the ACL is assigned to a host without a port range.

  For the "connect" privilege assignments, an ACL assigned to the host without a port range takes a lower precedence than other ACLs assigned to the same host with a port range.

- When specifying a TCP port range, both lower_port and upper_port must not be NULL and upper_port must be greater than or equal to lower_port. The port range must not overlap with any other port ranges for the same host assigned already.

- To remove the assignment, use UNASSIGN_ACL Procedure.
Examples

BEGIN
  DBMS_NETWORK_ACL_ADMIN.ASSIGN_ACL(
    acl => 'us-example-com-permissions.xml',
    host => '*.us.example.com',
    lower_port => 80);
END;

108.7.7 ASSIGN_WALLET_ACL Procedure

This procedure assigns an access control list (ACL) to a wallet.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the APPEND_HOST_ACE Procedure and the APPEND_WALLET_ACE Procedure.

Syntax

UTL_HTTP.ASSIGN_WALLET_ACL (  
  acl IN VARCHAR2,  
  wallet_path IN VARCHAR2);

Parameters

Table 108-10 ASSIGN_WALLET_ACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;*/sys/acls&quot;</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet to which the ACL is to be assigned. The path is case-sensitive and of the format file:directory-path.</td>
</tr>
</tbody>
</table>

Usage Notes

To remove the assignment, use the UNASSIGN_WALLET_ACL Procedure.

Examples

BEGIN
  DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
    acl => 'wallet-acl.xml',
    description => 'Wallet ACL',
    principal => 'SCOTT',
    is_grant => TRUE,
    privilege => 'use-client-certificates');

  DBMS_NETWORK_ACL_ADMIN.ADD_PRIVILEGE(
    acl => 'wallet-acl.xml',
    principal => 'SCOTT',
    privilege => 'use-client-certificates');

END;
is_grant    => TRUE,
privilege   => 'use-passwords');

DBMS_NETWORK_ACL_ADMIN.ASSIGN_WALLET_ACL(
  acl         => 'wallet-acl.xml',
  wallet_path => 'file:/example/wallets/test_wallet');
END;

108.7.8 CHECK_PRIVILEGE Function

This function checks if a privilege is granted or denied the user in an ACL.

Note:
This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE (  
  acl             IN VARCHAR2,  
  user            IN VARCHAR2,  
  privilege       IN VARCHAR2)  
RETURN NUMBER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;.</td>
</tr>
<tr>
<td>user</td>
<td>User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the USERNAME column of the ALL_USERS view.</td>
</tr>
<tr>
<td>privilege</td>
<td>Network privilege to check</td>
</tr>
</tbody>
</table>

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; NULL when the privilege is neither granted or denied.

Examples

```
SELECT DECODE(  
  DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE(  
    'us-example-com-permissions.xml', 'SCOTT', 'resolve'),  
  1, 'GRANTED', 0, 'DENIED', NULL) PRIVILEGE  
FROM DUAL;
```
108.7.9 CHECK_PRIVILEGE_ACLID Function

This function checks if a privilege is granted to or denied from the user in an ACL by specifying the object ID of the access control list.

Note:
This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.

Syntax

```sql
DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(
    aclid           IN RAW,
    user            IN VARCHAR2 DEFAULT NULL,
    privilege       IN VARCHAR2,
) RETURN NUMBER;
```

Parameters

**Table 108-12  CHECK_PRIVILEGE_ACLID Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aclid</td>
<td>Object ID of the ACL</td>
</tr>
<tr>
<td>user</td>
<td>User to check against. If the user is NULL, the invoker is assumed. The username is case-sensitive as in the <code>USERNAME</code> column of the <code>ALL_USERS</code> view.</td>
</tr>
<tr>
<td>privilege</td>
<td>Network privilege to check</td>
</tr>
</tbody>
</table>

Return Values

Returns 1 when the privilege is granted; 0 when the privilege is denied; `NULL` when the privilege is neither granted or denied.

108.7.10 CREATE_ACL Procedure

This deprecated procedure creates an access control list (ACL) with an initial privilege setting. An ACL must have at least one privilege setting. The ACL has no access control effect unless it is assigned to the network target.

Note:
This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the `APPEND_HOST_ACE Procedure` and the `APPEND_WALLET_ACE Procedure`.
Syntax

```sql
DBMS_NETWORK_ACL_ADMIN.CREATE_ACL (  
    acl             IN VARCHAR2,
    description     IN VARCHAR2,
    principal       IN VARCHAR2,
    is_grant        IN BOOLEAN,
    privilege       IN VARCHAR2,
    start_date      IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    end_date        IN TIMESTAMP WITH TIMEZONE DEFAULT NULL );
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;.</td>
</tr>
<tr>
<td>description</td>
<td>Description attribute in the ACL</td>
</tr>
<tr>
<td>principal</td>
<td>Principal (database user or role) to whom the privilege is granted or denied. Case sensitive.</td>
</tr>
<tr>
<td>is_grant</td>
<td>Privilege is granted or not (denied)</td>
</tr>
<tr>
<td>privilege</td>
<td>Network privilege to be granted or denied - 'connect</td>
</tr>
<tr>
<td>start_date</td>
<td>Start date of the access control entry (ACE). When specified, the ACE is valid only on and after the specified date.</td>
</tr>
<tr>
<td>end_date</td>
<td>End date of the access control entry (ACE). When specified, the ACE expires after the specified date. The end_date must be greater than or equal to the start_date.</td>
</tr>
</tbody>
</table>

Usage Notes

To drop the access control list, use the DROP_ACL Procedure.

Examples

```sql
BEGIN
    DBMS_NETWORK_ACL_ADMIN.CREATE_ACL(
        acl              => 'us-example-com-permissions.xml',
        description      => 'Network permissions for *.us.example.com',
        principal        => 'SCOTT',
        is_grant         => true,
        privilege        => 'connect');
END;
```
108.7.11 DELETE_PRIVILEGE Procedure

This deprecated procedure deletes a privilege in an access control list.

**Note:**

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the REMOVE_HOST_ACE Procedure and the REMOVE_WALLET_ACE Procedure.

**Syntax**

```sql
DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE (  
    acl           IN VARCHAR2,  
    principal     IN VARCHAR2,  
    is_grant      IN BOOLEAN DEFAULT NULL,  
    privilege     IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;.</td>
</tr>
<tr>
<td>principal</td>
<td>Principal (database user or role) for whom all the ACE will be deleted</td>
</tr>
<tr>
<td>is_grant</td>
<td>Privilege is granted or not (denied). If a NULL value is given, the deletion is applicable to both granted or denied privileges.</td>
</tr>
<tr>
<td>privilege</td>
<td>Network privilege to be deleted. If a NULL value is given, the deletion is applicable to all privileges.</td>
</tr>
</tbody>
</table>

**Examples**

```sql
BEGIN  
    DBMS_NETWORK_ACL_ADMIN.DELETE_PRIVILEGE(  
        acl => 'us-example-com-permissions.xml',  
        principal => 'ST_USERS')
END;
```

108.7.12 DROP_ACL Procedure

This deprecated procedure drops an access control list (ACL).

**Note:**

This procedure is deprecated in Oracle Database 12c. The procedure remains available in the package only for reasons of backward compatibility.
Syntax

DBMS_NETWORK_ACL_ADMIN.DROP_ACL (acl IN VARCHAR2);

Parameters

Table 108-15 DROP_ACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;.</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_NETWORK_ACL_ADMIN.DROP_ACL (acl => 'us-example-com-permissions.xml');
END;

108.7.13 REMOVE_HOST_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a network host matching the given ACE.

Syntax

DBMS_NETWORK_ACL_ADMIN.REMOVE_HOST_ACE (host IN VARCHAR2,
  lower_port IN PLS_INTEGER DEFAULT NULL,
  upper_port IN PLS_INTEGER DEFAULT NULL,
  ace IN XS$ACE_TYPE,
  remove_empty_acl IN BOOLEAN DEFAULT FALSE);

Parameters

Table 108-16 REMOVE_HOST_ACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of an optional TCP port range</td>
</tr>
<tr>
<td>upper_port</td>
<td>Upper bound of an optional TCP port range. If NULL, lower_port is assumed.</td>
</tr>
<tr>
<td>ace</td>
<td>The ACE</td>
</tr>
<tr>
<td>remove_empty_acl</td>
<td>Whether to remove the ACL when it becomes empty when the ACE is removed</td>
</tr>
</tbody>
</table>

Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.
108.7.14 REMOVE_WALLET_ACE Procedure

This procedure removes privileges from access control entries (ACE) in the access control list (ACL) of a wallet matching the given ACE.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.REMOVE_WALLET_ACE (  
    wallet_path        IN VARCHAR2,  
    ace                IN XS$ACE_TYPE,  
    remove_empty_acl   IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet. The path is case-sensitive of the format file:directory-path.</td>
</tr>
<tr>
<td>ace</td>
<td>The ACE</td>
</tr>
<tr>
<td>remove_empty_acl</td>
<td>Whether to remove the ACL when it becomes empty when the ACE is removed</td>
</tr>
</tbody>
</table>

Usage Notes

If the ACL is shared with another host or wallet, a copy of the ACL is made before the ACL is modified.

108.7.15 SET_HOST_ACL Procedure

This procedure sets the access control list (ACL) of a network host which controls access to the host from the database.

Syntax

```
DBMS_NETWORK_ACL_ADMIN.SET_HOST_ACL (  
    host         IN VARCHAR2,  
    lower_port   IN PLS_INTEGER DEFAULT NULL,  
    upper_port   IN PLS_INTEGER DEFAULT NULL,  
    acl          IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>The host, which can be the name or the IP address of the host. You can use a wildcard to specify a domain or a IP subnet. The host or domain name is case-insensitive.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of an optional TCP port range</td>
</tr>
<tr>
<td>upper_port</td>
<td>Upper bound of an optional TCP port range. If NULL, lower_port is assumed.</td>
</tr>
</tbody>
</table>
### Table 108-18  (Cont.) SET_HOST_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>The ACL. NULL to unset the host's ACL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A host's ACL is created and set on-demand when an access control entry (ACE) is appended to the host's ACL. Users are discouraged from setting a host's ACL manually.

### 108.7.16 SET_WALLET_ACL Procedure

This procedure sets the access control list (ACL) of a wallet which controls access to the wallet from the database.

**Syntax**

```sql
DBMS_NETWORK_ACL_ADMIN.SET_WALLET_ACL (
    wallet_path    IN VARCHAR2,
    acl            IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet. The path is case-sensitive of the format <code>file:directory-path</code>.</td>
</tr>
<tr>
<td>acl</td>
<td>The ACL. NULL to unset the host's ACL.</td>
</tr>
</tbody>
</table>

**Usage Notes**

A wallet's ACL is created and set on-demand when an access control entry (ACE) is appended to the wallet's ACL. Users are discouraged from setting a wallet's ACL manually.

### 108.7.17 UNASSIGN_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a network host.

**Note:**

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the `REMOVE_HOST_ACE Procedure` and the `REMOVE_WALLET_ACE Procedure`.
Syntax

DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL (
  acl         IN VARCHAR2 DEFAULT NULL,
  host        IN VARCHAR2 DEFAULT NULL,
  lower_port  IN PLS_INTEGER DEFAULT NULL,
  upper_port  IN PLS_INTEGER DEFAULT NULL);

Parameters

Table 108-20 UNASSIGN_ACL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;. If ACL is NULL, any ACL assigned to the host is unassigned.</td>
</tr>
<tr>
<td>host</td>
<td>Host from which the ACL is to be removed. The host can be the name or the IP address of the host. A wildcard can be used to specify a domain or a IP subnet. The host or domain name is case-insensitive. If host is NULL, the ACL will be unassigned from any host. If both host and acl are NULL, all ACLs assigned to any hosts are unassigned.</td>
</tr>
<tr>
<td>lower_port</td>
<td>Lower bound of a TCP port range if not NULL</td>
</tr>
<tr>
<td>upper_port</td>
<td>Upper bound of a TCP port range. If NULL, lower_port is assumed.</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_NETWORK_ACL_ADMIN.UNASSIGN_ACL(
    host => '*.us.example.com',
    lower_port => 80);
END;

108.7.18 UNASSIGN_WALLET_ACL Procedure

This deprecated procedure unassigns the access control list (ACL) currently assigned to a wallet.

Note:

This procedure is deprecated in Oracle Database 12c. While the procedure remains available in the package for reasons of backward compatibility, Oracle recommends using the REMOVE_HOST_ACE Procedure and the REMOVE_WALLET_ACE Procedure.

Syntax

UTL_HTTP.UNASSIGN_WALLET_ACL (
  acl          IN VARCHAR2 DEFAULT NULL,
  wallet_path  IN VARCHAR2 DEFAULT NULL);
Parameters

Table 108-21  UNASSIGN_WALLET_ACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Name of the ACL. Relative path will be relative to &quot;/sys/acls&quot;. If acl is NULL, any ACL assigned to the wallet is unassigned</td>
</tr>
<tr>
<td>wallet_path</td>
<td>Directory path of the wallet to which the ACL is assigned. The path is case-sensitive and of the format file:directory-path. If both acl and wallet_path are NULL, all ACLs assigned to any wallets are unassigned.</td>
</tr>
</tbody>
</table>

Examples

BEGIN
    DBMS_NETWORK_ACL_ADMIN.UNASSIGN_WALLET_ACL(
        acl => 'wallet-acl.xml',
        wallet_path => 'file:/example/wallets/test_wallet');
END;
DBMS_NETWORK_ACL.Utility

The **DBMS_NETWORK_ACL.Utility** package provides the utility functions to facilitate the evaluation of access control list (ACL) assignments governing TCP connections to network hosts.

**See Also:**

For more information, see ""Managing Fine-grained Access to External Network Services" in *Oracle Database Security Guide*.

The chapter contains the following topics:

- Security Model
- Examples
- Summary of DBMS_NETWORK_ACL.Utility Subprograms

### 109.1 DBMS_NETWORK_ACL.Utility Security Model

**EXECUTE** on the **DBMS_NETWORK_ACL.Utility** package is granted to **PUBLIC**.

### 109.2 DBMS_NETWORK_ACL.Utility Examples

The **CONTAINS_HOST** Function in this package indicates if a domain or subnet contains a given host or IP address.

It can be used in conjunction with the **CHECK_PRIVILEGE_ACLID** Function in the **DBMS_NETWORK_ACL.ADMIN** package to determine the privilege assignments affecting a user's permission to access a network host. The return value of the **CONTAINS_HOST** Function in can also be used to order the ACL assignments by their precedence.

**Example 1**

For example, for SCOTT's permission to connect to www.hr.example.com:

```sql
SELECT host, lower_port, upper_port, acl,
       DECODE(
           DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'connect'),
           1, 'GRANTED', 0, 'DENIED', NULL) privilege
FROM (SELECT host, acl, aclid, lower_port, upper_port,
       DBMS_NETWORK_ACL_UTILILITY.CONTAINS_HOST('www.hr.example.com', host) precedence
       FROM dba_network_acls)
WHERE precedence > 0
ORDER BY precedence DESC, lower_port nulls LAST;
```
Example 2

For example, for SCOTT's permission to do domain name resolution for www.hr.example.com:

```
SELECT host, acl, 
    DECODE(
        DBMS_NETWORK_ACL_ADMIN.CHECK_PRIVILEGE_ACLID(aclid, 'SCOTT', 'resolve'),
        1, 'GRANTED', 0, 'DENIED', null) privilege 
FROM (SELECT host, acl, aclid, 
    DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('www.hr.example.com', host) precedence 
FROM dba_network_acls 
WHERE lower_port IS NULL AND upper_port IS NULL) 
WHERE precedence > 0 
ORDER BY precedence DESC;
```

Note that the "resolve" privilege takes effect only in ACLs assigned without any port range (when lower_port and upper_port are NULL). For this reason, the example does not include lower_port and upper_port columns in the query.

Related Topics

- CONTAINS_HOST Function
  This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

109.3 Summary of DBMS_NETWORK_ACL_UTILITY Subprograms

This table lists and briefly describes the DBMS_NETWORK_ACL_UTILITY package subprograms.
### Table 109-1  DBMS_NETWORK_ACL.Utility Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONTAINS_HOST Function</td>
<td>Determines if the given host is equal to or contained in the given host, domain, or subnet</td>
</tr>
<tr>
<td>DOMAIN_LEVEL Function</td>
<td>Returns the domain level of the given host name, domain, or subnet</td>
</tr>
<tr>
<td>DOMAINS Function</td>
<td>For a given host, this function returns the domains whose ACL assigned is used to determine if a user has the privilege to access the given host or not.</td>
</tr>
<tr>
<td>EQUALS_HOST Function</td>
<td>Determines if the two given hosts, domains, or subnets are equal</td>
</tr>
</tbody>
</table>

#### 109.3.1 CONTAINS_HOST Function

This function determines if the given host is equal to or contained in the given host, domain, or subnet. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4-native address it represents. It does not perform domain name resolution when evaluating the host or domain.

**Syntax**

```sql
DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST (
    host IN VARCHAR2,
    domain IN VARCHAR2
) RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Network host</td>
</tr>
<tr>
<td>domain</td>
<td>Network host, domain, or subnet</td>
</tr>
</tbody>
</table>

**Return Values**

Returns a non-NULL value if the given host is equal to or contained in the related host, domain, or subnet:

- If `domain` is a hostname, returns the level of its domain + 1
- If `domain` is a domain name, returns the domain level
- If `domain` is an IP address or subnet, return the number of significant address bits of the IP address or subnet
- If `domain` is the wildcard "*", returns 0

The non-NULL value returned indicates the precedence of the domain or subnet for ACL assignment. The higher the value, the higher is the precedence. NULL will be returned if the host is not equal to or contained in the given host, domain or subnet.
Examples
SELECT host, acl, precedence
FROM (select host, acl,
       DBMS_NETWORK_ACL_UTILITY.CONTAINS_HOST('192.0.2.3', host)
       precedence
       FROM dba_network_acls)
WHERE precedence > 0
ORDER BY precedence DESC;

<table>
<thead>
<tr>
<th>HOST</th>
<th>ACL</th>
<th>PRECEDENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>192.0.2.3</td>
<td>/sys/acls/hr-www.xml</td>
<td>32</td>
</tr>
<tr>
<td>::ffff:192.0.2.0/120</td>
<td>/sys/acls/hr-domain.xml</td>
<td>24</td>
</tr>
<tr>
<td>::ffff:192.0.0.0/104</td>
<td>/sys/acls/corp-domain.xml</td>
<td>8</td>
</tr>
</tbody>
</table>

109.3.2 DOMAIN_LEVEL Function
This function returns the domain level of the given host name, domain, or subnet.
Syntax
DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL (host IN VARCHAR2)
RETURN NUMBER;
Parameters
Table 109-3  DOMAIN_LEVEL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Network host, domain, or subnet</td>
</tr>
</tbody>
</table>

Return Values
The domain level of the given host, domain, or subnet.
Usage Notes
Note that this function cannot handle IPv6 addresses and subnets, and subnets in CIDR notation.
Examples
SELECT host, acl, domain_level
FROM (select host, acl,
         DBMS_NETWORK_ACL_UTILITY.DOMAIN_LEVEL(host) domain_level
         FROM dba_network_acls)
ORDER BY domain_level desc;

<table>
<thead>
<tr>
<th>HOST</th>
<th>ACL</th>
<th>DOMAIN_LEVEL</th>
</tr>
</thead>
<tbody>
<tr>
<td><a href="http://www.hr.example.com">www.hr.example.com</a></td>
<td>/sys/acls/hr-www.xml</td>
<td>4</td>
</tr>
<tr>
<td>* .hr.example.com</td>
<td>/sys/acls/hr-domain.xml</td>
<td>3</td>
</tr>
<tr>
<td>*.example.com</td>
<td>/sys/acls/corp-domain.xml</td>
<td>2</td>
</tr>
</tbody>
</table>
109.3.3 DOMAINS Function

For a given host, this function returns the domains whose ACL assigned determines if a user has the privilege to access the given host or not. When the IP address of the host is given, return the subnets instead.

Syntax

\[
\text{DBMS\_NETWORK\_ACL\_UTILITY.DOMAINS (}
\text{ host \hspace{1em} IN VARCHAR2)}
\text{ RETURN DOMAIN\_TABLE PIPELINED;}
\]

Parameters

Table 109-4  DOMAINS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host</td>
<td>Network host</td>
</tr>
</tbody>
</table>

Return Values

The domains or subnets for the given host.

Usage Notes

Note that this function cannot handle IPv6 addresses. Nor can it generate subnets of arbitrary number of prefix bits for an IPv4 address.

Examples

\[
\text{select * from table(dbms_network_acl_utility.domains('www.hr.example.com'));}
\]

109.3.4 EQUALS_HOST Function

This function determines if the two given hosts, domains, or subnets are equal. It handles different representation of the same IP address or subnet. For example, an IPv4-mapped IPv6 address is considered equal to the IPv4- native address it represents. It does not perform domain name resolution when comparing the two hosts or domains.

Syntax

\[
\text{DBMS\_NETWORK\_ACL\_UTILITY.EQUALS\_HOST (}
\text{ host1 \hspace{1em} IN VARCHAR2,}
\text{ host2 \hspace{1em} IN VARCHAR2)}
\text{ RETURN NUMBER;}
\]
Parameters

Table 109-5  EQUALS_HOST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>host1</td>
<td>Network host, domain, or subnet to compare</td>
</tr>
<tr>
<td>host2</td>
<td>Network host, domain, or subnet to compare</td>
</tr>
</tbody>
</table>

Return Values

1 if the two hosts, domains, or subnets are equal. 0 otherwise.

Examples

SELECT host, acl
FROM dba_network_acls
WHERE DBMS_NETWORK_ACL_UTILITY.EQUALS_HOST('192.0.2.*', host) = 1;

<table>
<thead>
<tr>
<th>HOST</th>
<th>ACL</th>
</tr>
</thead>
<tbody>
<tr>
<td>::ffff:192.0.2.0/120</td>
<td>/sys/acls/hr-domain.xml</td>
</tr>
</tbody>
</table>
110

DBMS_ODCI

The DBMS_ODCI package contains a single user function related to the use of Data Cartridges.

This chapter contains the following topic:

• Summary of DBMS_ODCI Subprograms

See Also:

• Oracle Database Data Cartridge Developer’s Guide

110.1 Summary of DBMS_ODCI Subprograms

The DBMS_ODCI package has one subprogram, the ESTIMATE_CPU_UNITS function.

Table 110-1  DBMS_ODCI Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESTIMATE_CPU_UNITS Function</td>
<td>Returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds)</td>
</tr>
</tbody>
</table>

110.1.1 ESTIMATE_CPU_UNITS Function

This function returns the approximate number of CPU instructions (in thousands) corresponding to a specified time interval (in seconds). This information can be used to associate the CPU cost with a user-defined function for the extensible optimizer.

The function takes as input the elapsed time of the user function, measures CPU units by multiplying the elapsed time by the processor speed of the machine, and returns the approximate number of CPU instructions that should be associated with the user function. For a multiprocessor machine, ESTIMATE_CPU_UNITS considers the speed of a single processor.

Syntax

```sql
DBMS_ODCI.ESTIMATE_CPU_UNITS(
    elapsed_time  NUMBER)
RETURN NUMBER;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elapsed_time</td>
<td>The elapsed time in seconds that it takes to execute a function.</td>
</tr>
</tbody>
</table>

Usage Notes

When associating CPU cost with a user-defined function, use the full number of CPU units rather than the number of *thousands* of CPU units returned by `ESTIMATE_CPU_UNITS`; multiply the number returned by `ESTIMATE_CPU_UNITS` by 1,000.
DBMS_OUTLN

The `DBMS_OUTLN` package, synonymous with `OUTLN_PKG`, contains the functional interface for subprograms associated with the management of stored outlines.

See Also:
For more information about using the `DBMS_OUTLN` package, see Oracle Database SQL Tuning Guide.

Note:
Stored outlines will be desupported in a future release in favor of SQL plan management. In Oracle Database 11g Release 1 (11.1), stored outlines continue to function as in past releases. However, Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the `LOAD_PLANS_FROM_CURSOR_CACHE` Functions or `LOAD_PLANS_FROM_SQLSET` Function of the `DBMS_SPM` package. When the migration is complete, you should disable or remove the stored outlines.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_OUTLN Subprograms

111.1 DBMS_OUTLN Overview

A stored outline is the stored data that pertains to an execution plan for a given SQL statement. It enables the optimizer to repeatedly re-create execution plans that are equivalent to the plan originally generated along with the outline. The data stored in an outline consists, in part, of a set of hints that are used to achieve plan stability.

Stored outlines will be de-supported in a future release in favor of SQL plan management. As of 11g R1, stored outlines continue to function as in past releases, but Oracle strongly recommends that you use SQL plan management for new applications. SQL plan management creates SQL plan baselines, which offer superior SQL performance and stability compared with stored outlines. If you have existing stored outlines, please consider migrating them to SQL plan baselines by using the `LOAD_PLANS_FROM_CURSOR_CACHE` Functions or the
LOAD_PLANS_FROM_SQLSET Function of the DBMS_SPM package. When the migration is complete, you should disable or remove the stored outlines.

111.2 DBMS_OUTLN Security Model

DBMS_OUTLN contains management procedures that should be available to appropriate users only. EXECUTE privilege is not extended to the general user community unless the DBA explicitly does so.

PL/SQL functions that are available for outline management purposes can be executed only by users with EXECUTE privilege on the procedure (or package).

111.3 Summary of DBMS_OUTLN Subprograms

This table lists the DBMS_OUTLN subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_USED Procedure</td>
<td>Clears the outline ‘used’ flag</td>
</tr>
<tr>
<td>CREATE_OUTLINE Procedure</td>
<td>Generates outlines from the shared cursor identified by hash value and child number</td>
</tr>
<tr>
<td>DROP_BY_CAT Procedure</td>
<td>Drops outlines that belong to a specified category</td>
</tr>
<tr>
<td>DROP_UNUSED Procedure</td>
<td>Drops outlines that have never been applied in the compilation of a SQL statement</td>
</tr>
<tr>
<td>EXACT_TEXT_SIGNATURES Procedure</td>
<td>Updates outline signatures to those that compute based on exact text matching</td>
</tr>
<tr>
<td>UPDATE_BY_CAT Procedure</td>
<td>Changes the category of outlines in one category to a new category</td>
</tr>
<tr>
<td>UPDATE_SIGNATURES Procedure</td>
<td>Updates outline signatures to the current version's signature</td>
</tr>
</tbody>
</table>

111.3.1 CLEAR_USED Procedure

This procedure clears the outline ‘used’ flag.

Syntax

```
DBMS_OUTLN.CLEAR_USED (name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the outline.</td>
</tr>
</tbody>
</table>
111.3.2 CREATE_OUTLINE Procedure

This procedure generates an outline by reparsing the SQL statement from the shared cursor identified by hash value and child number.

Syntax

DBMS_OUTLN.CREATE_OUTLINE (  
  hash_value    IN NUMBER,  
  child_number  IN NUMBER,  
  category      IN VARCHAR2 DEFAULT 'DEFAULT');

Parameters

Table 111-3 CREATE_OUTLINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hash_value</td>
<td>Hash value identifying the target shared cursor.</td>
</tr>
<tr>
<td>child_number</td>
<td>Child number of the target shared cursor.</td>
</tr>
<tr>
<td>category</td>
<td>Category in which to create outline (optional).</td>
</tr>
</tbody>
</table>

111.3.3 DROP_BY_CAT Procedure

This procedure drops outlines that belong to a particular category. While outlines are put into the DEFAULT category unless otherwise specified, users have the option of grouping their outlines into groups called categories.

Syntax

DBMS_OUTLN.DROP_BY_CAT (  
  cat VARCHAR2);

Parameters

Table 111-4 DROP_BY_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cat</td>
<td>Category of outlines to drop.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure purges a category of outlines in a single call.

Examples

This example drops all outlines in the DEFAULT category:

DBMS_OUTLN.DROP_BY_CAT('DEFAULT');
111.3.4 DROP_UNUSED Procedure

This procedure drops outlines that have never been applied in the compilation of a SQL statement.

Syntax

DBMS_OUTLN.DROP UNUSED;

Usage Notes

You can use DROP UNUSED for outlines generated by an application for one-time use SQL statements created as a result of dynamic SQL. These outlines are never used and take up valuable disk space.

111.3.5 EXACT_TEXT_SIGNATURES Procedure

This procedure updates outline signatures to those that compute based on exact text matching.

Syntax

DBMS_OUTLN.EXACT_TEXT_SIGNATURES;

Usage Notes

This procedure is relevant only for downgrading an outline to 8.1.6 or earlier.

111.3.6 UPDATE_BY_CAT Procedure

This procedure changes the category of all outlines in one category to a new category.

Syntax

DBMS_OUTLN.UPDATE_BY_CAT (oldcat VARCHAR2 default 'DEFAULT', newcat VARCHAR2 default 'DEFAULT');

Parameters

Table 111-5  UPDATE_BY_CAT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oldcat</td>
<td>The current category of outlines.</td>
</tr>
<tr>
<td>newcat</td>
<td>The new category of outlines.</td>
</tr>
</tbody>
</table>

111.3.7 UPDATE_SIGNATURES Procedure

This procedure updates outline signatures to the current version's signature.

Syntax

DBMS_OUTLN.UPDATE_SIGNATURES;
Usage Notes

You should execute this procedure if you have imported outlines generated in an earlier release to ensure that the signatures are compatible with the current release's computation algorithm.
112

DBMS_OUTPUT

The DBMS_OUTPUT package enables you to send messages from stored procedures, packages, and triggers. The package is especially useful for displaying PL/SQL debugging information.

This chapter contains the following topics:

• Overview
• Security Model
• Operational Notes
• Exceptions
• Rules and Limits
• Examples
• Data Structures
• Summary of DBMS_OUTPUT Subprograms

112.1 DBMS_OUTPUT Overview

The package is typically used for debugging, or for displaying messages and reports to SQL*DBA or SQL*Plus (such as are produced by applying the SQL command DESCRIBE to procedures).

The PUT Procedure and PUT_LINE Procedure in this package enable you to place information in a buffer that can be read by another trigger, procedure, or package. In a separate PL/SQL procedure or anonymous block, you can display the buffered information by calling the GET_LINE Procedure and GET_LINES Procedure.

If the package is disabled, all calls to subprograms are ignored. In this way, you can design your application so that subprograms are available only when a client is able to process the information.

112.2 DBMS_OUTPUT Security Model

The dbmsotpt.sql script must be run as user SYS. This creates the public synonym DBMS_OUTPUT, and EXECUTE permission on this package is granted to public.

112.3 DBMS_OUTPUT Operational Notes

The following operational notes apply to DBMS_OUTPUT.

• If you do not call GET_LINE, or if you do not display the messages on your screen in SQL*Plus, the buffered messages are ignored.

• SQL*Plus calls GET_LINES after issuing a SQL statement or anonymous PL/SQL calls.
Typing `SET SERVEROUTPUT ON` in SQL*Plus has the effect of invoking

```sql
DBMS_OUTPUT.ENABLE (buffer_size => NULL);
```

with no limit on the output.

You should generally avoid having application code invoke either the `DISABLE Procedure` or `ENABLE Procedure` because this could subvert the attempt of an external tool like SQL*Plus to control whether or not to display output.

**Note:**

Messages sent using `DBMS_OUTPUT` are not actually sent until the sending subprogram or trigger completes. There is no mechanism to flush output during the execution of a procedure.

### 112.4 DBMS_OUTPUT Exceptions

`DBMS_OUTPUT` subprograms raise the application error `ORA-20000` and return errors.

The output procedures can return the following errors:

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORU-10027:</td>
<td>Buffer overflow</td>
</tr>
<tr>
<td>ORU-10028:</td>
<td>Line length overflow</td>
</tr>
</tbody>
</table>

### 112.5 DBMS_OUTPUT Rules and Limits

The following are limits on DBMS_OUTPUT line and buffer size.

- The maximum line size is 32767 bytes.
- The default buffer size is 20000 bytes. The minimum size is 2000 bytes and the maximum is unlimited.

### 112.6 DBMS_OUTPUT Examples

This topic contains three examples of using `DBMS_OUTPUT`.

**Example 1: Using a Trigger to Produce Output**

You can use a trigger to print out some output from the debugging process. For example, you could code the trigger to invoke:

```sql
DBMS_OUTPUT.PUT_LINE('I got here:'||:new.col||' is the new value');
```

If you have enabled the `DBMS_OUTPUT` package, then the text produced by this `PUT_LINE` would be buffered, and you could, after executing the statement (presumably some `INSERT`, `DELETE`, or `UPDATE` that caused the trigger to fire), retrieve the line of information. For example:
BEGIN
  DBMS_OUTPUT.GET_LINE (:buffer, :status);
END;

You could then optionally display the buffer on the screen. You repeat calls to GET_LINE until status comes back as nonzero. For better performance, you should use calls to GET_LINES Procedure which can return an array of lines.

Example 2: Debugging Stored Procedures and Triggers

The DBMS_OUTPUT package is commonly used to debug stored procedures and triggers. This package can also be used to enable you to retrieve information about an object and format this output, as shown in "Example 3: Retrieving Information About an Object".

This function queries the employee table and returns the total salary for a specified department. The function includes several calls to the PUT_LINE procedure:

CREATE FUNCTION dept_salary (dnum NUMBER) RETURN NUMBER IS
  CURSOR emp_cursor IS
    SELECT sal, comm FROM emp WHERE deptno = dnum;
  total_wages NUMBER(11, 2) := 0;
  counter NUMBER(10) := 1;
BEGIN
  FOR emp_record IN emp_cursor LOOP
    emp_record.comm := NVL(emp_record.comm, 0);
    total_wages := total_wages + emp_record.sal + emp_record.comm;
    DBMS_OUTPUT.PUT_LINE ('Loop number = ' || counter || '
                            Wages = ' || TO_CHAR (total_wages)); /* Debug line */
    counter := counter + 1; /* Increment debug counter */
  END LOOP;
  /* Debug line */
  TO_CHAR (total_wages));
  RETURN total_wages;
END dept_salary;

Assume the EMP table contains the following rows:

<table>
<thead>
<tr>
<th>EMPNO</th>
<th>SAL</th>
<th>COMM</th>
<th>DEPT</th>
</tr>
</thead>
<tbody>
<tr>
<td>1002</td>
<td>1500</td>
<td>500</td>
<td>20</td>
</tr>
<tr>
<td>1203</td>
<td>1000</td>
<td></td>
<td>30</td>
</tr>
<tr>
<td>1289</td>
<td>1000</td>
<td></td>
<td>10</td>
</tr>
<tr>
<td>1347</td>
<td>1000</td>
<td>250</td>
<td>20</td>
</tr>
</tbody>
</table>

Assume the user executes the following statements in SQL*Plus:

SET SERVEROUTPUT ON
VARIABLE salary NUMBER;
EXECUTE :salary := dept_salary(20);

The user would then see the following information displayed in the output pane:

Loop number = 1; Wages = 2000
Loop number = 2; Wages = 3250
Total wages = 3250
Example 3: Retrieving Information About an Object

In this example, the user has used the EXPLAIN PLAN command to retrieve information about the execution plan for a statement and has stored it in PLAN_TABLE. The user has also assigned a statement ID to this statement. The example EXPLAIN_OUT procedure retrieves the information from this table and formats the output in a nested manner that more closely depicts the order of steps undergone in processing the SQL statement.

```
CREATE OR REPLACE PROCEDURE explain_out
  (statement_id IN VARCHAR2) AS

  CURSOR explain_rows IS
    SELECT level, id, position, operation, options,
           object_name
    FROM plan_table
    WHERE statement_id = explain_out.statement_id
    CONNECT BY PRIOR id = parent_id
    AND statement_id = explain_out.statement_id
    START WITH id = 0
    ORDER BY id;

  BEGIN
    -- Loop through information retrieved from PLAN_TABLE:
    FOR line IN explain_rows LOOP
      -- At start of output, include heading with estimated cost.
      IF line.id = 0 THEN
        DBMS_OUTPUT.PUT_LINE ('Plan for statement ' || statement_id || ', estimated cost = ' || line.position);
      END IF;

      -- Output formatted information. LEVEL determines indentation level.
      DBMS_OUTPUT.PUT_LINE (lpad('',2*(line.level-1)) ||
        line.operation || ' ' || line.options || ' ' || line.object_name);
    END LOOP;
  END;
```

UTL_FILE
112.7 DBMS_OUTPUT Data Structures

The DBMS_OUTPUT package declares 2 collection types for use with the GET_LINES Procedure.

TABLE Types
CHARARR Table Type

OBJECT Types
DBMSOUTPUT_LINESARRAY Object Type

Related Topics
• GET_LINES Procedure
  This procedure retrieves an array of lines from the buffer.

112.7.1 CHARARR Table Type

This package type is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```sql
TYPE CHARARR IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

Related Topics
• GET_LINES Procedure
  This procedure retrieves an array of lines from the buffer.
• PUT Procedure
  This procedure places a partial line in the buffer.
• PUT_LINE Procedure
  This procedure places a line in the buffer.

112.7.2 DBMS_OUTPUT DBMSOUTPUT_LINESARRAY Object Type

This type, defined outside the package, is to be used with the GET_LINES Procedure to obtain text submitted through the PUT Procedure and PUT_LINE Procedure.

Syntax

```sql
TYPE DBMSOUTPUT_LINESARRAY IS
  VARRAY(2147483647) OF VARCHAR2(32767);
```

Related Topics
• GET_LINES Procedure
  This procedure retrieves an array of lines from the buffer.
• PUT Procedure
  This procedure places a partial line in the buffer.
• PUT_LINE Procedure
  This procedure places a line in the buffer.
112.8 Summary of DBMS_OUTPUT Subprograms

This table lists the DBMS_OUTPUT subprograms and briefly describes them.

### Table 112-2 DBMS_OUTPUT Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISABLE Procedure</td>
<td>Disables message output</td>
</tr>
<tr>
<td>ENABLE Procedure</td>
<td>Enables message output</td>
</tr>
<tr>
<td>GET_LINE Procedure</td>
<td>Retrieves one line from buffer</td>
</tr>
<tr>
<td>GET_LINES Procedure</td>
<td>Retrieves an array of lines from buffer</td>
</tr>
<tr>
<td>NEW_LINE Procedure</td>
<td>Terminates a line created with PUT</td>
</tr>
<tr>
<td>PUT Procedure</td>
<td>Places a partial line in the buffer</td>
</tr>
<tr>
<td>PUT_LINE Procedure</td>
<td>Places line in buffer</td>
</tr>
</tbody>
</table>

**Note:**

The PUT Procedure that take a number are obsolete and, while currently supported, are included in this release for legacy reasons only.

### 112.8.1 DISABLE Procedure

This procedure disables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES, and purges the buffer of any remaining information.

As with the ENABLE Procedure, you do not need to call this procedure if you are using the SERVEROUTPUT option of SQL*Plus.

**Syntax**

```sql
DBMS_OUTPUT.DISABLE;
```

**Pragmas**

```sql
pragma restrict_references(disable,WNDS,RNDS);
```

### 112.8.2 ENABLE Procedure

This procedure enables calls to PUT, PUT_LINE, NEW_LINE, GET_LINE, and GET_LINES.

Calls to these procedures are ignored if the DBMS_OUTPUT package is not activated.

**Syntax**

```sql
DBMS_OUTPUT.ENABLE (
    buffer_size IN INTEGER DEFAULT 20000);
```
Pragmas

pragma restrict_references(enable, WNDS, RNDS);

Parameters

Table 112-3  ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer_size</td>
<td>Upper limit, in bytes, the amount of buffered information. Setting buffer_size to NULL specifies that there should be no limit.</td>
</tr>
</tbody>
</table>

Usage Notes

- It is not necessary to call this procedure when you use the SET SERVEROUTPUT option of SQL*Plus.
- If there are multiple calls to ENABLE, then buffer_size is the last of the values specified. The maximum size is 1,000,000, and the minimum is 2,000 when the user specifies buffer_size (NOT NULL).
- NULL is expected to be the usual choice. The default is 20,000 for backwards compatibility with earlier database versions that did not support unlimited buffering.

112.8.3 GET_LINE Procedure

This procedure retrieves a single line of buffered information.

Syntax

```
DBMS_OUTPUT.GET_LINE (  
  line    OUT VARCHAR2,  
  status  OUT INTEGER);  
```

Parameters

Table 112-4  GET_LINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>line</td>
<td>Returns a single line of buffered information, excluding a final newline character. You should declare the actual for this parameter as VARCHAR2 (32767) to avoid the risk of &quot;ORA-06502: PL/SQL: numeric or value error: character string buffer too small&quot;.</td>
</tr>
<tr>
<td>status</td>
<td>If the call completes successfully, then the status returns as 0. If there are no more lines in the buffer, then the status is 1.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
112.8.4 GET_LINES Procedure

This procedure retrieves an array of lines from the buffer.

Syntax

```
DBMS_OUTPUT.GET_LINES (  
    lines       OUT     CHARARR,  
    numlines    IN OUT  INTEGER);  

DBMS_OUTPUT.GET_LINES (  
    lines       OUT     DBMSOUTPUT_LINESARRAY,  
    numlines    IN OUT INTEGER);  
```

Parameters

Table 112-5  GET_LINES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lines</td>
<td>Returns an array of lines of buffered information. The maximum length of each line in the array is 32767 bytes. It is recommended that you use the VARRAY overload version in a 3GL host program to execute the procedure from a PL/SQL anonymous block.</td>
</tr>
<tr>
<td>numlines</td>
<td>Number of lines you want to retrieve from the buffer. After retrieving the specified number of lines, the procedure returns the number of lines actually retrieved. If this number is less than the number of lines requested, then there are no more lines in the buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can choose to retrieve from the buffer a single line or an array of lines. Call the GET_LINE procedure to retrieve a single line of buffered information. To reduce the number of calls to the server, call the GET_LINES procedure to retrieve an array of lines from the buffer.
- You can choose to automatically display this information if you are using SQL*Plus by using the special SET SERVEROUTPUT ON command.
- After calling GET_LINE or GET_LINES, any lines not retrieved before the next call to PUT, PUT_LINE, or NEW_LINE are discarded to avoid confusing them with the next message.
112.8.5 NEW_LINE Procedure

This procedure puts an end-of-line marker.

The GET_LINE Procedure and the GET_LINES Procedure return "lines" as delimited by "newlines". Every call to the PUT_LINE Procedure or NEW_LINE Procedure generates a line that is returned by GET_LINE(s).

Syntax

DBMS_OUTPUT.NEW_LINE;

112.8.6 PUT Procedure

This procedure places a partial line in the buffer.

Note:

The PUT procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

Syntax

DBMS_OUTPUT.PUT (item IN VARCHAR2);

Parameters

Table 112-6 PUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Item to buffer.</td>
</tr>
</tbody>
</table>

Exceptions

Table 112-7 PUT Procedure Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000, ORU-10027:</td>
<td>Buffer overflow, limit of &lt;buf_limit&gt; bytes.</td>
</tr>
<tr>
<td>ORA-20000, ORU-10028:</td>
<td>Line length overflow, limit of 32767 bytes for each line.</td>
</tr>
</tbody>
</table>

Usage Notes

- You can build a line of information piece by piece by making multiple calls to PUT, or place an entire line of information into the buffer by calling PUT_LINE.
- When you call PUT_LINE the item you specify is automatically followed by an end-of-line marker. If you make calls to PUT to build a line, then you must add your own
end-of-line marker by calling NEW_LINE. GET_LINE and GET_LINES do not return lines that have not been terminated with a newline character.

- If your lines exceed the line limit, you receive an error message.
- Output that you create using PUT or PUT_LINE is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display DBMS_OUTPUT messages until the PL/SQL program completes. There is no mechanism for flushing the DBMS_OUTPUT buffers within the PL/SQL program.

```
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```

### 112.8.7 PUT_LINE Procedure

This procedure places a line in the buffer.

#### Note:

The PUT_LINE procedure that takes a NUMBER is obsolete and, while currently supported, is included in this release for legacy reasons only.

#### Syntax

```
DBMS_OUTPUT.PUT_LINE (item IN VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Item to buffer.</td>
</tr>
</tbody>
</table>

#### Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20000, ORU-10027:</td>
<td>Buffer overflow, limit of &lt;buf_limit&gt; bytes.</td>
</tr>
<tr>
<td>ORA-20000, ORU-10028:</td>
<td>Line length overflow, limit of 32767 bytes for each line.</td>
</tr>
</tbody>
</table>
Usage Notes

- You can build a line of information piece by piece by making multiple calls to `PUT`, or place an entire line of information into the buffer by calling `PUT_LINE`.

- When you call `PUT_LINE` the item you specify is automatically followed by an end-of-line marker. If you make calls to `PUT` to build a line, then you must add your own end-of-line marker by calling `NEW_LINE`. `GET_LINE` and `GET_LINES` do not return lines that have not been terminated with a newline character.

- If your lines exceeds the line limit, you receive an error message.

- Output that you create using `PUT` or `PUT_LINE` is buffered. The output cannot be retrieved until the PL/SQL program unit from which it was buffered returns to its caller.

For example, SQL*Plus does not display `DBMS_OUTPUT` messages until the PL/SQL program completes. There is no mechanism for flushing the `DBMS_OUTPUT` buffers within the PL/SQL program. For example:

```sql
SQL> SET SERVEROUTPUT ON
SQL> BEGIN
  2  DBMS_OUTPUT.PUT_LINE ('hello');
  3  DBMS_LOCK.SLEEP (10);
  4  END;
```
The DBMS_PARALLEL_EXECUTE package enables incremental update of table data in parallel.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Views
- Exceptions
- Examples
- Summary of DBMS_PARALLEL_EXECUTE Subprograms

See Also:

- Oracle Database Development Guide
- Oracle Database Reference

113.1 DBMS_PARALLEL_EXECUTE Overview

This package lets you incrementally update table data in parallel, in two high-level steps.

1. Group sets of rows in the table into smaller-sized chunks.
2. Run a user-specified statement on these chunks in parallel, and commit when finished processing each chunk.

This package introduces the notion of parallel execution task. This task groups the various steps associated with the parallel execution of a PL/SQL block, which is typically updating table data.

All of the package subroutines (except the GENERATE_TASK_NAME Function and the TASK_STATUS Procedure) perform a commit.

113.2 DBMS_PARALLEL_EXECUTE Security Model

DBMS_PARALLEL_EXECUTE is a SYS-owned package which is granted to PUBLIC.

Users who have the ADM_PARALLEL_EXECUTE_TASK role can perform administrative routines (qualified by the prefix ADM_) and access the DBA view.
Apart from the administrative routines, all the subprograms refer to tasks owned by the current user.

To execute chunks in parallel, you must have `CREATE JOB` system privilege.

The `CHUNK_BY_SQL`, `RUN_TASK`, and `RESUME_TASK` subprograms require a query, and are executed using `DBMS_SQL`. Invokers of the `DBMS_SQL` interface must ensure that no query contains SQL injection.

### 113.3 DBMS_PARALLEL_EXECUTE Constants

The `DBMS_PARALLEL_EXECUTE` package uses the constants described in these two tables.

<table>
<thead>
<tr>
<th>Table 113-1</th>
<th>DBMS_PARALLEL_EXECUTE Constants - Chunk Status Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>Type</td>
</tr>
<tr>
<td>ASSIGNING</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROCESSED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROCESSED_WITH_ERROR</td>
<td>NUMBER</td>
</tr>
<tr>
<td>UNASSIGNED</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Table 113-2</th>
<th>DBMS_PARALLEL_EXECUTE Constants - Task Status Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>Type</td>
</tr>
<tr>
<td>CHUNKED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CHUNKING</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CRASHED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>CREATED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>FINISHED</td>
<td>NUMBER</td>
</tr>
<tr>
<td>FINISHED_WITH_ERROR</td>
<td>NUMBER</td>
</tr>
<tr>
<td>PROCESSING</td>
<td>NUMBER</td>
</tr>
</tbody>
</table>

### 113.4 DBMS_PARALLEL_EXECUTE Views

The `DBMS_PARALLEL_EXECUTE` package uses the following views.

- `DBA_PARALLEL_EXECUTE_CHUNKS`
- `DBA_PARALLEL_EXECUTE_TASKS`
### 113.5 DBMS_PARALLEL_EXECUTE Exceptions

The following table lists the exceptions raised by `DBMS_PARALLEL_EXECUTE`.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHUNK_NOT_FOUND</td>
<td>29499</td>
<td>Specified chunk does not exist</td>
</tr>
<tr>
<td>DUPLICATE_TASK_NAME</td>
<td>29497</td>
<td>Same task name has been used by an existing task</td>
</tr>
<tr>
<td>INVALID_STATE_FOR CHUNK</td>
<td>29492</td>
<td>Attempts to chunk a table that is not in <code>CREATED</code> or <code>CHUNKING FAILED</code> state</td>
</tr>
<tr>
<td>INVALID_STATE_FOR REDSUME</td>
<td>29495</td>
<td>Attempts to resume execution, but the task is not in <code>FINISHED WITH_ERROR</code> or <code>CRASHED</code> state</td>
</tr>
<tr>
<td>INVALID_STATE_FOR RUN</td>
<td>29494</td>
<td>Attempts to execute the task that is not in <code>CHUNKED</code> state</td>
</tr>
<tr>
<td>INVALID_STATUS</td>
<td>29493</td>
<td>Attempts to set an invalid value to the chunk status</td>
</tr>
<tr>
<td>INVALID_TABLE</td>
<td>29491</td>
<td>Attempts to chunk a table by rowid in cases in which the table is not a physical table, or the table is an IOT</td>
</tr>
<tr>
<td>MISSING_ROLE</td>
<td>29490</td>
<td>User does not have the necessary <code>ADM_PARALLEL_EXECUTE</code> role</td>
</tr>
<tr>
<td>TASK_NOT_FOUND</td>
<td>29498</td>
<td>Specified task_name does not exist</td>
</tr>
</tbody>
</table>

### 113.6 DBMS_PARALLEL_EXECUTE Examples

The following examples run on the Human Resources (HR) schema of the Oracle Database Sample Schemas. They require that the HR schema be created with the `JOB SYSTEM` privilege.

**Chunk by ROWID**

This example shows the most common usage of this package. After calling the `RUN_TASK Procedure`, it checks for errors and reruns in the case of error.

```sql
DECLARE
    l_sql_stmt VARCHAR2(1000);
    l_try NUMBER;
    l_status NUMBER;
BEGIN

    -- Create the TASK
    DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');

    -- Chunk the table by ROWID
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true, 100);

    -- Execute the DML in parallel
    l_sql_stmt := 'update EMPLOYEES e
```
SET e.salary = e.salary + 10
WHERE rowid BETWEEN :start_id AND :end_id;
DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
    parallel_level => 10);
-- If there is an error, RESUME it for at most 2 times.
L_try := 0;
L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
    LOOP
        L_try := l_try + 1;
        DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
        L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    END LOOP;
-- Done with processing; drop the task
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

END;
/

Chunk by User-Provided SQL

A user can specify a chunk algorithm by using the CREATE_CHUNKS_BY_SQL Procedure. This example shows that rows with the same manager_id are grouped together and processed in one chunk.

DECLARE
    l_chunk_sql VARCHAR2(1000);
    l_sql_stmt VARCHAR2(1000);
    l_try NUMBER;
    l_status NUMBER;
BEGIN
    -- Create the TASK
    DBMS_PARALLEL_EXECUTE.CREATE_TASK('mytask');
    -- Chunk the table by MANAGER_ID
    l_chunk_sql := 'SELECT distinct manager_id, manager_id FROM employees';
    DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL('mytask', l_chunk_sql, false);
    -- Execute the DML in parallel
    -- the WHERE clause contain a condition on manager_id, which is the chunk
    -- column. In this case, grouping rows is by manager_id.
    l_sql_stmt := 'UPDATE EMPLOYEES e
        SET e.salary = e.salary + 10
        WHERE manager_id between :start_id and :end_id';
    DBMS_PARALLEL_EXECUTE.RUN_TASK('mytask', l_sql_stmt, DBMS_SQL.NATIVE,
        parallel_level => 10);
    -- If there is error, RESUME it for at most 2 times.
    L_try := 0;
    L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
    WHILE(l_try < 2 and L_status != DBMS_PARALLEL_EXECUTE.FINISHED)
        LOOP
            L_try := l_try + 1;
            DBMS_PARALLEL_EXECUTE.RESUME_TASK('mytask');
            L_status := DBMS_PARALLEL_EXECUTE.TASK_STATUS('mytask');
        END LOOP;
    -- Done with processing; drop the task
    DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');
END;
DBMS_PARALLEL_EXECUTE.DROP_TASK('mytask');

EXECUTING CHUNKS IN AN USER-DEFINED FRAMEWORK

You can execute chunks in a self-defined framework without using the RUN_TASK Procedure. This example shows how to use GET_ROWID_CHUNK Procedure, EXECUTE IMMEDIATE, SET_CHUNK_STATUS Procedure to execute the chunks.

DECLARE
  l_sql_stmt varchar2(1000);
  l_try number;
  l_status number;
  l_chunk_id number;
  l_start_rowid rowid;
  l_end_rowid rowid;
  l_any_rows boolean;
CURSOR c1 IS SELECT chunk_id
FROM user_parallel_execute_chunks
WHERE task_name = 'mytask'
AND STATUS IN (DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR,
DBMS_PARALLEL_EXECUTE.ASSIGNED);

BEGIN

  -- Create the Objects, task, and chunk by ROWID
  DBMS_PARALLEL_EXECUTE.CREATE_TASK ('mytask');
  DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID('mytask', 'HR', 'EMPLOYEES', true,
100);

  l_sql_stmt := 'update EMPLOYEES e
    SET e.salary = e.salary + 10
    WHERE rowid BETWEEN :start_id AND :end_id';

  -- Execute the DML in his own framework
  --
  -- Process each chunk and commit.
  -- After processing one chunk, repeat this process until
  -- all the chunks are processed.
  --
  --<<main_processing>>
  LOOP
    --
    -- Get a chunk to process; if there is nothing to process, then exit the
    -- loop;
    --
    DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK('mytask',
      l_chunk_id,
      l_start_rowid,
      l_end_rowid,
      l_any_rows);

    IF (l_any_rows = false) THEN EXIT; END IF;

    --
    -- The chunk is specified by start_id and end_id.
    -- Bind the start_id and end_id and then execute it
    --
    -- If no error occured, set the chunk status to PROCESSED.
    --
    -- Catch any exception. If an exception occured, store the error num/msg
-- into the chunk table and then continue to process the next chunk.
--
BEGIN
  EXECUTE IMMEDIATE l_sql_stmt using l_start_rowid, l_end_rowid;
  DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask', l_chunk_id,
                                            DBMS_PARALLEL_EXECUTE.PROCESSED);
EXCEPTION WHEN OTHERS THEN
  DBMS_PARALLEL_EXECUTE.SET_CHUNK_STATUS('mytask', l_chunk_id,
                                            DBMS_PARALLEL_EXECUTE.PROCESSED_WITH_ERROR, SQLCODE, SQLERRM);
END;

--
-- Finished processing one chunk; Commit here
--
COMMIT;
END LOOP;

113.7 Summary of DBMS_PARALLEL_EXECUTE Subprograms

This table lists the DBMS_PARALLEL_EXECUTE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADM_DROP_CHUNKS Procedure</td>
<td>Drops all chunks of the specified task owned by the specified owner</td>
</tr>
<tr>
<td>ADM_DROP_TASK Procedure</td>
<td>Drops the task of the given user and all related chunks</td>
</tr>
<tr>
<td>ADM_TASK_STATUS Function</td>
<td>Returns the task status</td>
</tr>
<tr>
<td>ADM_STOP_TASK Procedure</td>
<td>Stops the task of the given owner and related job slaves</td>
</tr>
<tr>
<td>CREATE_TASK Procedure</td>
<td>Creates a task for the current user</td>
</tr>
<tr>
<td>CREATE_CHUNKS_BY_NUMBER_COLUMN Procedure</td>
<td>Chunks the table associated with the given task by the specified column.</td>
</tr>
<tr>
<td>CREATE_CHUNKS_BY_ROWID Procedure</td>
<td>Chunks the table associated with the given task by ROWID</td>
</tr>
<tr>
<td>CREATE_CHUNKS_BY_SQL Procedure</td>
<td>Chunks the table associated with the given task by means of a user-provided SELECT statement</td>
</tr>
<tr>
<td>DROP_TASK Procedure</td>
<td>Drops the task and all related chunks</td>
</tr>

113.7.1 ADM_DROP_CHUNKS Procedure

This procedure drops all chunks of the specified task owned by the specified owner.

Syntax

```sql
DBMS_PARALLEL_EXECUTE.ADM_DROP_CHUNKS (
    task_owner IN VARCHAR2,
    task_name IN VARCHAR2);
```

Parameters

Table 113-5   ADM_DROP_CHUNKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_owner</td>
<td>Owner of the task</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.2 ADM_DROP_TASK Procedure

This procedure drops the task of the specified user and all related chunks.

Syntax

```sql
DBMS_PARALLEL_EXECUTE.ADM_DROP_TASK (
    task_owner IN VARCHAR2,
    task_name IN VARCHAR2);
```

Parameters

Table 113-6   ADM_DROP_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_owner</td>
<td>Owner of the task</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>
113.7.3 ADM_TASK_STATUS Function

This function returns the task status.

**Syntax**

```sql
DBMS_PARALLEL_EXECUTE.ADM_TASK_STATUS  (
    task_owner      IN  VARCHAR2,
    task_name       IN  VARCHAR2)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_owner</td>
<td>Owner of the task</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.4 ADM_STOP_TASK Procedure

This procedure stops the task of the specified owner and related job slaves.

**Syntax**

```sql
DBMS_PARALLEL_EXECUTE.ADM_STOP_TASK (  
    task_owner      IN  VARCHAR2,
    task_name       IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_owner</td>
<td>Owner of the task</td>
</tr>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.5 CREATE_TASK Procedure

This procedure creates a task for the current user. The pairing of `task_name` and `current_user` must be unique.

**Syntax**

```sql
DBMS_PARALLEL_EXECUTE.CREATE_TASK (  
    task_name        IN   VARCHAR2,
    comment          IN   VARCHAR2 DEFAULT NULL);
```
Parameters

Table 113-9  CREATE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task. The task_name can be any string in which related length must be less than or equal to 128 bytes.</td>
</tr>
<tr>
<td>comment</td>
<td>Comment field. The comment must be less than 4000 bytes.</td>
</tr>
</tbody>
</table>

113.7.6 CREATE_CHUNKS_BY_NUMBER_COL Procedure

This procedure chunks the table (associated with the specified task) by the specified column. The specified column must be a NUMBER column. This procedure takes the MIN and MAX value of the column, and then divides the range evenly according to chunk_size.

The chunks are:

<table>
<thead>
<tr>
<th>START_ID</th>
<th>END_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>min_id_val</td>
<td>min_id_val+1*chunk_size-1</td>
</tr>
<tr>
<td>min_id_val+1*chunk_size</td>
<td>min_id_val+2*chunk_size-1</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
</tr>
<tr>
<td>min_id_val+i*chunk_size</td>
<td>max_id_val</td>
</tr>
</tbody>
</table>

Syntax

```sql
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_NUMBER_COL (  
  task_name       IN  VARCHAR2,  
  table_owner     IN  VARCHAR2,  
  table_name      IN  VARCHAR2,  
  table_column    IN  VARCHAR2,  
  chunk_size      IN  NUMBER);  
```

Parameters

Table 113-10  CREATE_CHUNKS_BY_NUMBER_COL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>table_owner</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table</td>
</tr>
<tr>
<td>table_column</td>
<td>Name of the NUMBER column</td>
</tr>
<tr>
<td>chunk_size</td>
<td>Range of each chunk</td>
</tr>
</tbody>
</table>
113.7.7 CREATE_CHUNKS_BY_ROWID Procedure

This procedure chunks the table (associated with the specified task) by ROWID.

`num_row` and `num_block` are approximate guidance for the size of each chunk. The table to be chunked must be a physical table with physical ROWID having views and table functions. Index-organized tables are not allowed.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_ROWID (  
  task_name       IN  VARCHAR2,  
  table_owner     IN  VARCHAR2,  
  table_name      IN  VARCHAR2,  
  by_row          IN  BOOLEAN,  
  chunk_size      IN  NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>table_owner</td>
<td>Owner of the table</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of the table</td>
</tr>
<tr>
<td>by_row</td>
<td>TRUE if <code>chunk_size</code> refers to the number of rows, otherwise, <code>chunk_size</code> refers to the number of blocks</td>
</tr>
<tr>
<td>chunk_size</td>
<td>Approximate number of rows/blocks to process for each commit cycle</td>
</tr>
</tbody>
</table>

113.7.8 CREATE_CHUNKS_BY_SQL Procedure

This procedure chunks the table (associated with the specified task) by means of a user-provided SELECT statement.

The SELECT statement that returns the range of each chunk must have two columns: `start_id` and `end_id`. If the task is to chunk by ROWID, then the two columns must be of ROWID type. If the task is to chunk the table by NUMBER column, then the two columns must be of NUMBER type. The procedure provides the flexibility to users who want to deploy user-defined chunk algorithms.

**Syntax**

```
DBMS_PARALLEL_EXECUTE.CREATE_CHUNKS_BY_SQL (  
  task_name       IN  VARCHAR2,  
  sql_statement   IN  CLOB,  
  by_rowid        IN  BOOLEAN);
```
Parameters

Table 113-12  CREATE_CHUNKS_BY_SQL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>sql_statment</td>
<td>SQL that returns the chunk ranges</td>
</tr>
<tr>
<td>by_rowid</td>
<td>TRUE if the table is chunked by rowids</td>
</tr>
</tbody>
</table>

113.7.9 DROP_TASK Procedure

This procedure drops the task and all related chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_TASK (
    task_name       IN VARCHAR2);
```

Parameters

Table 113-13  DROP_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.10 DROP_CHUNKS Procedure

This procedure drops the task's chunks.

Syntax

```
DBMS_PARALLEL_EXECUTE.DROP_CHUNKS (
    task_name       IN VARCHAR2);
```

Parameters

Table 113-14  DROP_CHUNKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.11 GENERATE_TASK_NAME Function

This function returns a unique name for a task.

The name is of the form prefixN where N is a number from a sequence. If no prefix is specified, the generated name is, by default, TASK$1, TASK$2, TASK$3, and so on. If 'SCOTT' is specified as the prefix, the name is SCOTT1, SCOTT2, and so on.
Syntax

DBMS_PARALLEL_EXECUTE.GENERATE_TASK_NAME (  
    prefix IN VARCHAR2 DEFAULT 'TASK$_')  
RETURN VARCHAR2;

Parameters

Table 113-15  GENERATE_TASK_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>The prefix to use when generating the task name</td>
</tr>
</tbody>
</table>

113.7.12 GET_NUMBER_COL_CHUNK Procedure

This procedure picks an unassigned `NUMBER` chunk and changes it to `ASSIGNED`. If there are no more chunks to assign, `any_rows` is set to `FALSE`. Otherwise, the `chunk_id`, `start`, and `end_id` of the chunk are returned as `OUT` parameters.

The chunk information in `DBMS_PARALLEL_EXECUTE_CHUNKS$` is updated as follows: `STATUS` becomes `ASSIGNED`; `START_TIMESTAMP` records the current time; `END_TIMESTAMP` is cleared.

See Also:

Views

Syntax

DBMS_PARALLEL_EXECUTE.GET_NUMBER_COL_CHUNK (  
    task_name IN VARCHAR2,  
    chunk_id OUT NUMBER,  
    start_rowid OUT ROWID,  
    end_id OUT ROWID,  
    any_rows OUT BOOLEAN);  

Parameters

Table 113-16  GET_NUMBER_COL_CHUNK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>chunk_id</td>
<td>Chunk_id of the chunk</td>
</tr>
<tr>
<td>start_rowid</td>
<td>Start rowid in the returned range</td>
</tr>
<tr>
<td>end_id</td>
<td>End rowid in the returned range</td>
</tr>
<tr>
<td>any_rows</td>
<td>Indicating if there could be any rows to process in the range</td>
</tr>
</tbody>
</table>
Usage Notes

If the task is chunked by ROWID, then use get_rowid_range. If the task is chunked by NUMBER column, then use get_number_col_range. If you make the wrong function call, the returning chunk_id and any_rows have valid values but start_id and end_id are NULL.

113.7.13 GET_ROWID_CHUNK Procedure

This procedure picks an unassigned ROWID chunk and changes it to ASSIGNED.

If there are no more chunks to assign, any_rows is set to FALSE. Otherwise, the chunk_id, start, and end_id of the chunk are returned as OUT parameters. The chunk info in DBMS_PARALLEL_EXECUTE_CHUNKS is updated as follows: STATUS becomes ASSIGNED; START_TIMESTAMP records the current time; END_TIMESTAMP is cleared.

🔗 See Also:
Views

Syntax

DBMS_PARALLEL_EXECUTE.GET_ROWID_CHUNK (
    task_name       IN VARCHAR2,
    chunk_id        OUT NUMBER,
    start_rowid     OUT ROWID,
    end_id          OUT ROWID,
    any_rows        OUT BOOLEAN);

Parameters

Table 113-17   GET_ROWID_CHUNK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>chunk_id</td>
<td>Chunk_id of the chunk</td>
</tr>
<tr>
<td>start_rowid</td>
<td>Start rowid in the returned range</td>
</tr>
<tr>
<td>end_id</td>
<td>End rowid in the returned range</td>
</tr>
<tr>
<td>any_rows</td>
<td>Indicates that the range could include rows to process</td>
</tr>
</tbody>
</table>

Usage Notes

If the task is chunked by ROWID, then use get_rowid_range. If the task is chunked by NUMBER column, then use get_number_col_range. If you make the wrong function call, the returning chunk_id and any_rows will still have valid values but start_id and end_id are NULL.
113.7.14 PURGE_PROCESSED_CHUNKS Procedure

This procedure deletes all the processed chunks whose status is PROCESSED or PROCESSED_WITH_ERROR.

Syntax

```
DBMS_PARALLEL_EXECUTE.PURGE_PROCESSED_CHUNKS (task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
</tbody>
</table>

113.7.15 RESUME_TASK Procedures

This procedure retries the specified task if the RUN_TASK Procedure finished with an error, or resumes the task if a crash occurred.

You can only invoke this procedure if the task is in a CRASHED or FINISHED_WITH_ERROR state.

For a crashed serial execution, the state remains in PROCESSING. The FORCE option allows you to resume any task in PROCESSING state. However, it is your responsibility to determine that a crash has occurred.

The procedure resumes processing the chunks which have not been processed. Also, chunks which are in PROCESSED_WITH_ERROR or ASSIGNED (due to crash) state are processed because those chunks did not commit.

This procedure takes the same argument as the RUN_TASK Procedure. The overload which takes task_name as the only input argument re-uses the arguments provided in the previous invoking of the RUN_TASK Procedure or RESUME_TASK Procedures.

See Also:

- Table 113-2

Syntax

```
DBMS_PARALLEL_EXECUTE.RESUME_TASK (  
  task_name      IN VARCHAR2,  
  sql_stmt       IN CLOB,  
  language_flag  IN NUMBER,  
  edition        IN VARCHAR2 DEFAULT NULL,  
  apply_crossedition_trigger IN VARCHAR2 DEFAULT NULL,  
  fire_apply_trigger   IN BOOLEAN DEFAULT TRUE,  
  parallel_level   IN NUMBER DEFAULT 0,  
  job_class        IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
)  
```
force               IN  BOOLEAN   DEFAULT FALSE);

DBMS_PARALLEL_EXECUTE.RESUME_TASK (  
task_name               IN  VARCHAR2,  
force               IN  BOOLEAN   DEFAULT FALSE);

Parameters

Table 113-19   RESUME_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>sql_stmt</td>
<td>SQL statement; must have :start_id and :end_id placeholders</td>
</tr>
<tr>
<td>language_flag</td>
<td>Determines how Oracle handles the SQL statement. The following options are recognized:</td>
</tr>
<tr>
<td></td>
<td>• V6 (or 0) specifies version 6 behavior</td>
</tr>
<tr>
<td></td>
<td>• NATIVE (or 1) specifies normal behavior for the database to which the program is connected</td>
</tr>
<tr>
<td></td>
<td>• V7 (or 2) specifies Oracle database version 7 behavior</td>
</tr>
<tr>
<td>edition</td>
<td>Specifies the edition in which to run the statement. Default is the current edition.</td>
</tr>
<tr>
<td>apply_crossedition_trigg er</td>
<td>Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user who executes the statement.</td>
</tr>
<tr>
<td>fire_apply_trigger</td>
<td>Indicates whether the specified apply_crossedition_trigger is itself to be executed, or only to used as be a guide in selecting other triggers</td>
</tr>
<tr>
<td>parallel_level</td>
<td>Number of parallel jobs; zero if run in serial; NULL uses the default parallelism</td>
</tr>
<tr>
<td>job_class</td>
<td>If running in parallel, the jobs all belong to the specified job class</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, do not raise an error if the status is PROCESSING.</td>
</tr>
</tbody>
</table>

Examples

Suppose the chunk table contains the following chunk ranges:

<table>
<thead>
<tr>
<th>START_ID</th>
<th>END_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10</td>
</tr>
<tr>
<td>11</td>
<td>20</td>
</tr>
<tr>
<td>21</td>
<td>30</td>
</tr>
</tbody>
</table>

And the specified SQL statement is:

```
UPDATE employees  
    SET salary = salary + 10  
    WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees  
    SET salary = salary + 10  WHERE employee_id BETWEEN 1 and 10;  
COMMIT;
```
UPDATE employees
SET salary = salary + 10  WHERE employee_id between 11 and 20;
COMMIT;

UPDATE employees
SET salary = salary + 10  WHERE employee_id between 21 and 30;
COMMIT;

Related Topics
• RUN_TASK Procedure
  This procedure executes the specified statement (sql_stmt) on the chunks in parallel.

113.7.16 RUN_TASK Procedure
This procedure executes the specified statement (sql_stmt) on the chunks in parallel.

It commits after processing each chunk.

The specified statement must have two placeholders called \texttt{start\_id} and \texttt{end\_id}, respectively, which represent the range of the chunk to be processed. The type of each placeholder must be \texttt{ROWID} when \texttt{ROWID}-based chunking was used, or \texttt{NUMBER} when \texttt{NUMBER}-based chunking was used.

Syntax

\begin{verbatim}
DBMS_PARALLEL_EXECUTE.RUN_TASK (  
  task_name                     IN  VARCHAR2,  
  sql_stmt                      IN  CLOB,  
  language_flag                 IN  NUMBER, DEFAULT NULL,  
  edition                       IN  VARCHAR2  DEFAULT NULL,  
  apply_crossedition_trigger    IN  VARCHAR2  DEFAULT NULL,  
  fire_apply_trigger            IN  BOOLEAN   DEFAULT TRUE,  
  parallel_level                IN  NUMBER    DEFAULT 0,  
  job_class                     IN  VARCHAR2  DEFAULT 'DEFAULT\_JOB\_CLASS');
\end{verbatim}

Parameters

Table 113-20  RUN_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task</td>
</tr>
<tr>
<td>sql_stmt</td>
<td>SQL statement; must have \texttt{:start_id} and \texttt{:end_id} placeholders</td>

<td>Number of parallel jobs; zero if run in serial; NULL uses the default parallelism.</td>
</tr>
<tr>
<td>job_class</td>
<td>If running in parallel, the jobs belong to the specified job class</td>
</tr>
</tbody>
</table>

Usage Notes

- The SQL statement is executed as the current user.
- Since this subprogram is subject to reexecution on error, you need to take great care in submitting a statement to RUN_TASK that is not idempotent.
- Chunks can be executed in parallel by DBMS_SCHEDULER job slaves. Therefore, parallel execution requires CREATE JOB system privilege. The job slaves are created under the current user. The default number of job slaves is computed as the product of Oracle parameters cpu_count and parallel_threads_per_cpu. On a Real Application Clusters installation, the number of job slaves is the sum of individual settings on each node in the cluster. This procedure returns only when all the chunks are processed. In parallel cases, this procedure returns only when all the job slaves finished.

Examples

Suppose the chunk table contains the following chunk ranges:

<table>
<thead>
<tr>
<th>START_ID</th>
<th>END_ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>10</td>
</tr>
<tr>
<td>11</td>
<td>20</td>
</tr>
<tr>
<td>21</td>
<td>30</td>
</tr>
</tbody>
</table>

And the specified SQL statement is:

```
UPDATE employees
SET salary = salary + 10
WHERE e.employee_id BETWEEN :start_id AND :end_id
```

This procedure executes the following statements in parallel:

```
UPDATE employees
SET salary = salary + 10  WHERE employee_id BETWEEN 1 and 10;
COMMIT;

UPDATE employees
SET salary = salary + 10  WHERE employee_id between 11 and 20;
COMMIT;
```
UPDATE employees
SET salary = salary + 10 WHERE employee_id between 21 and 30;
COMMIT;

113.7.17 SET_CHUNK_STATUS Procedure

This procedure sets the status of the chunk.

The START_TIMESTAMP and END_TIMESTAMP of the chunk is updated according to the new status:

<table>
<thead>
<tr>
<th>Value of the new Status</th>
<th>Side Effect</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNASSIGNED</td>
<td>START_TIMESTAMP and END_TIMESTAMP will be cleared</td>
</tr>
<tr>
<td>ASSIGNED</td>
<td>START_TIMESTAMP will be the current time</td>
</tr>
<tr>
<td></td>
<td>and END_TIMESTAMP will be cleared.</td>
</tr>
<tr>
<td>PROCESSED or PROCESSED_WITH_ERROR</td>
<td>The current time will be recorded</td>
</tr>
<tr>
<td></td>
<td>in END_TIMESTAMP</td>
</tr>
</tbody>
</table>

- Oracle Database Reference for related views

This chapter contains the following topics:
- Security Model
- Operational Notes
- Summary of DBMS_PART Subprograms

114.1 DBMS_PART Security Model

DBMS_PART is an invoker's rights package, running with the privileges of the user.

114.2 DBMS_PART Operational Notes

The following operational notes apply to DBMS_PART.
- DBMS_PART ignores all the errors that it runs into during the cleanup process.
- To display the message PL/SQL procedure executed successfully requires at least one cleanup operation to be successful.

114.3 Summary of DBMS_PART Subprograms

This table briefly describes the subprograms of DBMS_PART package.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEANUP_GIDX Procedure</td>
<td>Gathers the list of global indexes where optimized asynchronous index maintenance has taken place to clean up entries pointing to data segments that no longer exist</td>
</tr>
<tr>
<td>CLEANUP_ONLINE_OP Procedure</td>
<td>Cleans up failed online move operations</td>
</tr>
</tbody>
</table>
114.3.1 CLEANUP_GIDX Procedure

As a consequence of prior partition maintenance operations with asynchronous global index maintenance, global indexes can contain entries pointing to data segments that no longer exist. These stale index rows will not cause any correctness issues or corruptions during any operation on the table or index, whether these are queries, DMLs, DDLs or analyze. This procedure will identify and cleanup these global indexes to ensure efficiency in terms of storage and performance.

Syntax

```
DBMS_PART.CLEANUP_GIDX (  
    schema_name_in    IN   VARCHAR2 DEFAULT NULL,  
    table_name_in     IN   VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

114.3.2 CLEANUP_ONLINE_OP Procedure

There are many possible points of failure when performing `ALTER TABLE ... MOVE PARTITION ... ONLINE` operations. This procedure pro-actively cleans up such failed online move operations instead of waiting for the background process (`SMON`) to do so.

Syntax

```
DBMS_PART.CLEANUP_ONLINE_OP (  
    schema_name       IN   VARCHAR2 DEFAULT NULL,  
    table_name        IN   VARCHAR2 DEFAULT NULL,  
    partition_name    IN   VARCHAR2 DEFAULT NULL);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

Usage Notes

- If `schema_name, table_name` and `partition_name` are specified, this cleans up the failed online move operation for the specified partition.
• If `schema_name` and `table_name` are specified, this cleans up all failed online move operations for all the partitions of the specified table.

• If only `schema_name` is specified, this cleans up all failed online move operations in the schema.

• If no arguments are provided, we cleans up all the failed online move operations in the system.

• **All other cases raise ORA-20000** to inform the user of invalid inputs as arguments.
The DBMS_PCLXUTIL package provides intra-partition parallelism for creating partition-wise local indexes. DBMS_PCLXUTIL circumvents the limitation that, for local index creation, the degree of parallelism is restricted to the number of partitions as only one parallel execution server process for each partition is used.

See Also:
There are several rules concerning partitions and indexes. For more information, see Oracle Database Concepts and Oracle Database Administrator’s Guide.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Rules and Limits
- Summary of DBMS_PCLXUTIL Subprograms

115.1 DBMS_PCLXUTIL Overview

DBMS_PCLXUTIL uses the DBMS_JOB package to provide a greater degree of parallelism for creating a local index for a partitioned table. This is achieved by asynchronous inter-partition parallelism using the background processes (with DBMS_SCHEDULER), in combination with intra-partition parallelism using the parallel execution server.

DBMS_PCLXUTIL works with both range and range-hash composite partitioning.

The DBMS_PCLXUTIL package can be used during the following DBA tasks:

1. Local index creation

   The procedure BUILD_PART_INDEX assumes that the dictionary information for the local index already exists. This can be done by issuing the create index SQL command with the UNUSABLE option.

   CREATE INDEX <idx_name> on <tab_name>{...} local{...} unusable;

   This causes the dictionary entries to be created without “building” the index itself, the time consuming part of creating an index. Now, invoking the procedure BUILD_PART_INDEX causes a concurrent build of local indexes with the specified degree of parallelism.

   EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
For composite partitions, the procedure automatically builds local indexes for all subpartitions of the composite table.

2. Local index maintenance

By marking desired partitions usable or unusable, the BUILD_PART_INDEX procedure also enables selective rebuilding of local indexes. The force_opt parameter provides a way to override this and build local indexes for all partitions.

```
ALTER INDEX <idx_name> local(...) unusable;
```

Rebuild only the desired (sub)partitions (that are marked unusable):

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,FALSE);
```

Rebuild all (sub)partitions using force_opt = TRUE:

```
EXECUTE dbms_pclxutil.build_part_index(4,4,<tab_name>,<idx_name>,TRUE);
```

A progress report is produced, and the output appears on screen when the program is ended (because the DBMS_OUTPUT package writes messages to a buffer first, and flushes the buffer to the screen only upon termination of the program).

### 115.2 DBMS_PCLXUTIL Security Model

This utility can be run only as table owner, and not as any other user.

### 115.3 DBMS_PCLXUTIL Operational Notes

DBMS_PCLXUTIL submits a job for each partition. It is the responsibility of the user/dba to control the number of concurrent jobs by setting the INIT.ORA parameter JOB_QUEUE_PROCESSES correctly. There is minimal error checking for correct syntax. Any errors are reported in the job queue process trace files.

### 115.4 DBMS_PCLXUTIL Rules and Limits

Because DBMS_PCLXUTIL uses the DBMS_JOB package, you must be aware of the following limitations pertaining to DBMS_JOB:

- You must decide appropriate values for the job_queue_processes initialization parameter. Clearly, if the job processes are not started before calling BUILD_PART_INDEX(), the package will not function properly. The background processes are specified by the following init.ora parameters:

  ```
  job_queue_processes=n #the number of background processes = n
  ```

- Failure conditions are reported only in the trace files (a DBMS_JOB limitation), making it impossible to give interactive feedback to the user. This package prints a failure message, removes unfinished jobs from the queue, and requests the user to take a look at the j*.trc trace files.
115.5 Summary of DBMS_PCLXUTIL Subprograms

The DBMS_PCLXUTIL package has one subprogram, the BUILD_PART_INDEX procedure.

Table 115-1  DBMS_PCLXUTIL Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUILD_PART_INDEX Procedure</td>
<td>Provides intra-partition parallelism for creating partition-wise local indexes</td>
</tr>
</tbody>
</table>

115.5.1 BUILD_PART_INDEX Procedure

This procedure provides intra-partition parallelism for creating partition-wise local indexes.

Syntax

```sql
DBMS_PCLXUTIL.BUILD_PART_INDEX (  
    jobs_per_batch  IN NUMBER   DEFAULT 1,  
    procs_per_job   IN NUMBER   DEFAULT 1,  
    tab_name        IN VARCHAR2 DEFAULT NULL,  
    idx_name        IN VARCHAR2 DEFAULT NULL,  
    force_opt       IN BOOLEAN  DEFAULT FALSE);
```

Parameters

Table 115-2  BUILD_PART_INDEX Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobs_per_batch</td>
<td>The number of concurrent partition-wise &quot;local index builds&quot;.</td>
</tr>
<tr>
<td>procs_per_job</td>
<td>The number of parallel execution servers to be utilized for each local index build (1 &lt;= procs_per_job &lt;= max_slaves).</td>
</tr>
<tr>
<td>tab_name</td>
<td>The name of the partitioned table (an exception is raised if the table does not exist or not partitioned).</td>
</tr>
<tr>
<td>idx_name</td>
<td>The name given to the local index (an exception is raised if a local index is not created on the table tab_name).</td>
</tr>
<tr>
<td>force_opt</td>
<td>If TRUE, then force rebuild of all partitioned indexes; otherwise, rebuild only the partitions marked 'UNUSABLE'.</td>
</tr>
</tbody>
</table>

Usage Notes

This utility can be run only as table owner, and not as any other user.
Examples

Suppose a table PROJECT is created with two partitions PROJ001 and PROJ002, along with a local index IDX.

A call to the procedure BUILD_PART_INDEX(2,4,'PROJECT','IDX',TRUE) produces the following output:

SQLPLUS> EXECUTE dbms_pclxutil.build_part_index(2,4,'PROJECT','IDX',TRUE);
Statement processed.
INFO: Job #21 created for partition PROJ002 with 4 slaves
INFO: Job #22 created for partition PROJ001 with 4 slaves
The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs) in a multitenant container database (CDB). It also contains an interface specify which database objects are application common objects. You can migrate a PDB from one CDB to another CDB. After the migration is complete, all backups of the PDB before migration is available and useable in the destination CDB.

See Also:

- Oracle Database Administrator's Guide for information about creating and managing PDBs and CDBs
- Oracle XML DB Developer's Guide for information about configuring protocol ports and DNS mappings
- Oracle Database SQL Language Reference for information about creating PDBs
- Oracle Database Security Guide regarding how to create audit policies in a multitenant environment

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_PDB Subprograms

116.1 DBMS_PDB Overview

A multitenant container database (CDB) is an Oracle database that includes zero, one, or many user-created pluggable databases (PDBs). The DBMS_PDB package provides an interface to examine and manipulate data about pluggable databases (PDBs). The subprograms in this package can also set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in the application container have the same structure for the object but different data. This
package also contains a procedure that specifies that a database object is not an application common object.

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

- An application is installed in an application root using an installation program that does not allow setting application common objects.

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

116.2 DBMS_PDB Security Model

Users must have the EXECUTE privilege to run the procedures of DBMS_PDB package.

116.3 Summary of DBMS_PDB Subprograms

This table lists and describes DBMS_PDB package subprograms.

Table 116-1 DBMS_PDB Package Subprograms

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

116.3.1 CHECK_PLUG_COMPATIBILITY Function

This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

Syntax

```sql
DBMS_PDB.CHECK_PLUG_COMPATIBILITY (
    pdb_descr_file    IN   VARCHAR2,
    pdb_name          IN   VARCHAR2 DEFAULT NULL)
RETURN BOOLEAN;
```

Parameters

Table 116-2  CHECK_PLUG_COMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdb_descr_file</td>
<td>Path of the XML file that will contain description of a PDB</td>
</tr>
<tr>
<td>pdb_name</td>
<td>Name which will be given to the PDB represented by <code>pdb_descr_file</code> when plugged into a given CDB. If not specified, the name will be extracted from <code>pdb_descr_file</code>.</td>
</tr>
</tbody>
</table>

Return Values

TRUE if the PDB described by `pdb_descr_file` is compatible with the given CDB, FALSE otherwise. If this function returns FALSE, then query the `PDB_PLUG_IN_VIOLATIONS` data dictionary view to find information about the errors that are found.

See Also:

`Oracle Database Reference` for information about the `PDB_PLUG_IN_VIOLATIONS` view

116.3.2 DESCRIBE Procedure

This procedure generates an XML file describing the specified pluggable database (PDB). This file can then be passed to the CHECK_PLUG_COMPATIBILITY Function.
to determine if the PDB described by the XML file may be plugged into a given multitenant container database (CDB).

Syntax

DBMS_PDB.DESCRIBE (  
    pdb_descr_file    IN   VARCHAR2,  
    pdb_name          IN   VARCHAR2 DEFAULT NULL);

Parameters

Table 116-3  DESCRIBE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdb_descr_file</td>
<td>Path of the XML file that will contain description of a PDB</td>
</tr>
<tr>
<td>pdb_name</td>
<td>Name of a PDB to be described. A remote database is specified by including @dblink.</td>
</tr>
</tbody>
</table>

Usage Notes

• If pdb_name is omitted, the PDB to which the session is connected will be described.
• If pdb_name is omitted, and the session is connected to the Root, an error will be returned.

Related Topics

• CHECK_PLUG_COMPATIBILITY Function
  This function uses an XML file describing a pluggable database (PDB) to determine whether it may be plugged into a given multitenant container database (CDB).

116.3.3 EXPORTRMANBACKUP Procedure

This procedure exports the RMAN backup information that belongs to a pluggable database to its dictionary before unplug so that pre-plugin backups can be used. This procedure needs to be called only for non-CDB to PDB migration. For PDB relocation, this procedure need not be called.

Syntax

DBMS_PDB.EXPORTRMANBACKUP (  
    pdb_name     IN VARCHAR2  DEFAULT NULL);

Parameters

Table 116-4  EXPORTRMANBACKUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pdb_name  | Name of a pluggable database whose backup information needs to be exported. Omit this parameter if you are connected to a pluggable database or a non-cdb.
Usage Notes

- The PDB must be opened in read/write mode.
- If the database is non-CDB, then pdb_name must be omitted.
- If the pdb_name is omitted, then the pluggable database to which the session is connected is exported.
- If the pdb_name is omitted and the session is connected to the root, an error is returned.

116.3.4 RECOVER Procedure

This procedure generates an XML file describing a pluggable database by using data files belonging to the pluggable database. This XML file can then be used to plug the pluggable database into a multitenant container database (CDB) using the `CREATE PLUGGABLE DATABASE` statement.

Use this procedure when an XML file describing a pluggable database is corrupted or lost.

Syntax

```sql
DBMS_PDB.RECOVER (  
    pdb_descr_file  IN   VARCHAR2,  
    pdb_name        IN   VARCHAR2,  
    filenames       IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pdb_descr_file</td>
<td>Path of the XML file that contains description of a pluggable database</td>
</tr>
<tr>
<td>pdb_name</td>
<td>Name of a pluggable database</td>
</tr>
<tr>
<td>filenames</td>
<td>Comma-separated list of datafile paths and/or directories containing datafiles for the pluggable database</td>
</tr>
</tbody>
</table>

116.3.5 REMOVE_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

Syntax

```sql
DBMS_PDB.REMOVE_LINK (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 116-6  REMOVE_LINK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the database object.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition for the database object.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container

116.3.6 SET_DATA_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```sql
DBMS_PDB.SET_DATA_LINKED ( 
    schema_name  IN VARCHAR2, 
    object_name  IN VARCHAR2, 
    namespace    IN NUMBER, 
    edition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 116-7  SET_DATA_LINKED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
</tbody>
</table>
116.3.7 SET_EXT_DATA_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```
DBMS_PDB.SET_EXT_DATA_LINKED (
    schema_name  IN VARCHAR2,
    object_name  IN VARCHAR2,
    namespace    IN NUMBER,
    edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

Table 116-8  SET_EXT_DATA_LINKED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the database object.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition for the database object.</td>
</tr>
</tbody>
</table>

See Also:

*Oracle Database Administrator's Guide* for information about migrating an application to an application container
116.3.8 SET_METADATA_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```sql
DBMS_PDB.SET_METADATA_LINKED (schema_name  IN VARCHAR2,
                                object_name  IN VARCHAR2,
                                namespace    IN NUMBER,
                                edition_name IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the database object.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The NAME$PACE column of the DBA_OBJECTS view shows the namespace of an object.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container
116.3.9 SET_PROFILE_EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```sql
DBMS_PDB.SET_PROFILE_EXPLICIT (
    profile_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator’s Guide for information about migrating an application to an application container.

116.3.10 SET_ROLE_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```sql
DBMS_PDB.SET_ROLE_EXPLICIT (
    role_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>The name of the role.</td>
</tr>
</tbody>
</table>
116.3.11 SET_USER_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```sql
DBMS_PDB.SET_USER_EXPLICIT (user_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>The name of the user.</td>
</tr>
</tbody>
</table>

Oracle Database Administrator's Guide for information about migrating an application to an application container.
In an application container with a pre-installed application, the `DBMS_PDB_ALTER_SHARING` package provides an interface to set database objects as application common objects or to specify that a database object is not an application common object.

**Note:**
This package provides a subset of the subprograms in the `DBMS_PDB` package. Users who do not have `EXECUTE` privilege on the `DBMS_PDB` package can be granted `EXECUTE` privilege on this package to run these subprograms.

**See Also:**
- `Oracle Database Administrator's Guide` for information about migrating an application to an application container
- `Oracle XML DB Developer's Guide` for information about configuring protocol ports and DNS mappings
- `Oracle Database SQL Language Reference` for information about creating PDBs
- `Oracle Database Security Guide` regarding how to create audit policies in a multitenant environment

This chapter contains the following topics:
- `DBMS_PDB_ALTER_SHARING` Overview
- `DBMS_PDB_ALTER_SHARING` Security Model
- Summary of `DBMS_PDB_ALTER_SHARING` Subprograms

### 117.1 DBMS_PDB_ALTER_SHARING Overview

The subprograms in this package can set a database object to one of the following types of application common objects in an application container: data-linked object, extended data-linked object, or metadata-linked object.

A data-linked application common object stores data in the application root that can be accessed and modified by all of the application PDBs in the application container. For an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, with an extended data-linked object, only the data stored in the application root is common for all application PDBs. A metadata-linked application common object stores the metadata for the specific object, such as a table, in the application root, so that the containers in
the application container have the same structure for the object but different data. This package also contains a procedure that specifies that a database object is not an application common object.

You can use the subprograms in this package when you

Typically, the subprograms in this package are used in the following cases:

- An application that is installed in a PDB is migrated to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.
- An application is installed in an application root using an installation program that does not allow setting application common objects.

See Also:
Oracle Database Administrator's Guide for information about migrating an application to an application container

117.2 DBMS_PDB_ALTER_SHARING Security Model

This package provides a subset of the subprograms in the DBMS_PDB package. User who do not have EXECUTE privilege on the DBMS_PDB package can be granted EXECUTE privilege on this package to run these subprograms.

Security on this package can be controlled in either of the following ways:

- Granting EXECUTE on this package to selected users or roles.
- Granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

117.3 Summary of DBMS_PDB_ALTER_SHARING Subprograms

This table lists and briefly describes DBMS_PDB_ALTER_SHARING package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>

</table>

#### 117.3.1 REMOVE_LINK Procedure

This procedure specifies that a database object is not an application common object. In an application container, application common objects are shared between multiple containers.

**Syntax**

```sql
DBMS_PDB_ALTER_SHARING.REMOVE_LINK (  
schema_name  IN VARCHAR2,
object_name  IN VARCHAR2,
namespace    IN NUMBER,
edition_name IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

117.3.2 SET_DATA_LINKED Procedure

This procedure sets a database object to a data-linked application common object. In an application container, data-linked application common objects store data in the application root only, and the data can be accessed by all of the application PDBs in the application container. The data in a data-linked application common object can be modified only in the application root.

You can use this procedure to set data-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

```sql
DBMS_PDB_ALTER_SHARING.SET_DATA_LINKED (  
    schema_name  IN VARCHAR2,
    object_name  IN VARCHAR2,
    namespace    IN NUMBER,
    edition_name IN VARCHAR2  DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
<tr>
<td>namespace</td>
<td>The namespace of the database object.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition for the database object.</td>
</tr>
</tbody>
</table>

The NAMESPACE column of the DBA_OBJECTS view shows the namespace of an object.

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container.

117.3.3 SET_EXT_DATA_LINKED Procedure

This procedure sets a database object to an extended data-linked application common object. In an application container, for an extended data-linked object, each application PDB can create its own specific data while sharing the common data in the application root. Therefore, only the data stored in the application root is common for all application PDBs.

You can use this procedure to set extended data-linked application common objects when you migrate an application that is installed in a PDB to an application container.
The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

DBMS_PDB_ALTER_SHARING.SET_EXT_DATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN NUMBER,  
    edition_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 117-4  SET_EXT_DATA_LINKED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>The name of the schema that owns the database object.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the database object.</td>
</tr>
<tr>
<td>namespace</td>

117.3.4 SET_METADATA_LINKED Procedure

This procedure sets a database object to a metadata-linked application common object. In an application container, metadata-linked application common objects store the metadata for specific objects, such as tables, so that the containers that share the application common object have the same structure but different data.

You can use this procedure to set metadata-linked application common objects when you migrate an application that is installed in a PDB to an application container. The application can be migrated to the application root or to an application PDB. For example, you can migrate an application installed in a PDB plugged into an Oracle Database 12c Release 1 (12.1) CDB to an application container in an Oracle Database 12c Release 2 (12.2) CDB.

Syntax

DBMS_PDB_ALTER_SHARING.SET_METADATA_LINKED (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    namespace    IN VARCHAR2,  
    edition_name IN VARCHAR2 DEFAULT NULL);
117.3.5 SET PROFILE EXPLICIT Procedure

This procedure sets a profile as an application common profile in an application container. This procedure is intended for migrating a profile from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDBALTER_SHARING.SET_PROFILE_EXPLICIT {
    profile_name IN VARCHAR2};
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator's Guide for information about migrating an application to an application container.
117.3.6 SET_ROLE_EXPLICIT Procedure

This procedure sets a role as an application common role in an application container. This procedure is intended for migrating a role from a previous release to an application container in the current release.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_ROLE_EXPLICIT (
   role_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>The name of the role.</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator’s Guide for information about migrating an application to an application container.

117.3.7 SET_USER_EXPLICIT Procedure

This procedure sets a local user as an application common user in an application container.

This procedure must be invoked in an application install, patch, upgrade, or uninstall operation in an application root.

Syntax

```
DBMS_PDB_ALTER_SHARING.SET_USER_EXPLICIT (
   user_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>The name of the user.</td>
</tr>
</tbody>
</table>

The DBMS_PERF package provides an interface to generate active reports for monitoring database performance.

---

**See Also:**

*Oracle Database PL/SQL Language Reference* for more information about “Avoiding SQL Injection in PL/SQL”

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_PERF Subprograms

### 118.1 DBMS_PERF Overview

The DBMS_PERF package provides an interface for generating database performance reports. All subprograms return an active report and these reports can be generated at the system level, session level or at SQL level.

### 118.2 DBMS_PERF Security Model

The DBMS_PERF package requires the DBA role.

### 118.3 Summary of DBMS_PERF Subprograms

This table lists the DBMS_PERF subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>REPORT_PERFHUB Function</td>
<td>Generates a composite active performance report of the entire database system for a specified time period</td>
</tr>
<tr>
<td>REPORT_SESSION Function</td>
<td>Generates a performance report for a specific database session where a session is identified by inst_id, sid, and serial_num.</td>
</tr>
<tr>
<td>REPORT_SQL Function</td>
<td>Generates an active performance report for a particular SQL statement identified by its sql_id.</td>
</tr>
</tbody>
</table>
118.3.1 REPORT_PERFHUB Function

This function generates a composite active performance report of the entire database system for a specified time period.

Syntax

```sql
DBMS_PERF.REPORT_PERFHUB (
  is_realtime         IN NUMBER   DEFAULT NULL,
  outer_start_time    IN DATE     DEFAULT NULL,
  outer_end_time      IN DATE     DEFAULT NULL,
  selected_start_time IN DATE     DEFAULT NULL,
  selected_end_time   IN DATE     DEFAULT NULL,
  inst_id             IN NUMBER   DEFAULT NULL,
  dbid                IN NUMBER   DEFAULT NULL,
  monitor_list_detail IN NUMBER   DEFAULT NULL,
  workload_sql_detail IN NUMBER   DEFAULT NULL,
  addm_task_detail    IN NUMBER   DEFAULT NULL,
  report_reference    IN VARCHAR2 DEFAULT NULL,
  report_level        IN VARCHAR2 DEFAULT NULL,
  type                IN VARCHAR2 DEFAULT 'ACTIVE',
  base_path           IN VARCHAR2 DEFAULT NULL);
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_realtime</td>
<td>If 1, then real-time. If NULL (default) or 0, then historical mode.</td>
</tr>
</tbody>
</table>
| outer_start_time | Start time of outer period shown in the time selector. If NULL (default):
  - If is_realtime=0 (historical), then 24 hours before outer_end_time.
  - If is_realtime=1 (realtime mode), then 1 hour before outer_end_time.                                   |
| outer_end_time   | End time of outer period shown in the time selector. If NULL (default), then latest AWR snapshot.      |
  - If is_realtime=0 (historical), then the latest AWR snapshot
  - If is_realtime=1 (realtime mode), this is the current time (and any input is ignored)                   |
| selected_start_time | Start time period of selection. If NULL (default)
  - If is_realtime=0, then 1 hour before selected_end_time
  - If is_realtime=1, then 5 minutes before selected_end_time                                               |
| selected_end_time | End time period of selection. If NULL (default)
  - If is_realtime=0, then latest AWR snapshot
  - If is_realtime=1, then current time                                                                       |
| inst_id          | Instance ID to for which to retrieve data                                                               |
  - If -1, then current instance
  - If number is specified, then for that instance
  - If NULL (default), then all instances                                                                  |

<tr>
<td>base_path</td>
<td>URL path for HTML resources since flex HTML requires access to external files. This is only valid for type='ACTIVE' and is typically not used. Default value will retrieve the required files from OTN.</td>
</tr>
</tbody>
</table>

#### Usage Notes

- Once a time period is selected, the performance information is collected and presented based on performance subject areas.
- The time period can be real-time or historical.
- When real-time data is selected, more granular data is presented because data points are available every minute.
- When historical data is selected, more detailed data (broken down by different metrics) is presented, but the data points are averaged out to the Automatic Workload Repository (AWR) interval (usually an hour).
- Different tabs are available in the Performance Hub, depending on whether is_real-time is 1 for real time mode or 0 for historical mode.

#### 118.3.2 REPORT_SESSION Function

This function produces a performance report for a specific database session where a session is identified by `inst_id, sid, and serial_num`.

If any of those parameters are missing, then the report is for the current session.

The session-level performance report contains the following tabs:
• Summary - This tab contains key identifiers and attributes of the session along with a summary of its activity data. It also contains a list of SQLs, PLSQL blocks and Database Operations (DBOP) executed by that session that were monitored by Real-time SQL Monitoring.

• Activity - This tab shows activity broken down by wait classes for this session. The data used for this chart is fetched from Active Session History (ASH).

• Metrics - This tab shows charts for certain key metrics for the selected session over time and is only available in historical mode. Some of the metrics shown are CPU usage, PGA usage, IO Throughput and IO Requests.

Syntax

```sql
DBMS_PERF.REPORT_SESSION (
  inst_id              IN NUMBER   DEFAULT NULL,
  sid                  IN NUMBER   DEFAULT NULL,
  serial               IN NUMBER   DEFAULT NULL,
  is_realtime          IN NUMBER   DEFAULT NULL,
  outer_start_time     IN DATE     DEFAULT NULL,
  outer_end_time       IN DATE     DEFAULT NULL,
  selected_start_time  IN DATE     DEFAULT NULL,
  selected_end_time    IN DATE     DEFAULT NULL,
  dbid                 IN NUMBER   DEFAULT NULL,
  monitor_list_detail  IN NUMBER   DEFAULT NULL,
  report_reference     IN VARCHAR2 DEFAULT NULL,
  report_level         IN VARCHAR2 DEFAULT NULL,
  type                 IN VARCHAR2 DEFAULT 'ACTIVE',
  base_path            IN VARCHAR2 DEFAULT NULL)
RETURN CLOB;
```

</tr>
</tbody>
</table>

118.3.3 REPORT_SQL Function

This function generates an active performance report for a particular SQL statement identified by its sql_id.

The SQL-level performance report contains the following tabs:

- Summary - This tab contains an overview of the SQL statement with key attributes like the SQL text, user name, sessions executing it, and related information. It also contains a Plans tab which shows statistics and activity for each distinct plan for this SQL statement found in memory and in the AWR.
- Activity - This tab shows activity broken down by wait classes for this SQL statement. The data used for this chart is fetched from Active Session History (ASH).
- Execution Statistics - This tab shows statistics and activity for each distinct plan for this statement along with a graphical and tabular representation of the plan.
- Monitored SQL - All executions of this SQL statement that were monitored by Real-time SQL Monitoring are listed in this tab.
- Plan Control - This tab shows information about SQL Profiles and SQL Plan Baselines if they exist for this SQL statement.
- Historical Statistics - This tab is available only in Historical mode. It contains statistics, such as number of executions, number of I/Os, rows processed, and
other information produced over time for different execution plans. This information is retrieved from AWR.

**Syntax**

```
DBMS_PERF.REPORT_SQL (
    sql_id               IN varchar2 default null,
    is_realtime          IN number   default null,
    outer_start_time     IN date     default null,
    outer_end_time       IN date     default null,
    selected_start_time  IN date     default null,
    selected_end_time    IN date     default null,
    inst_id              IN number   default null,
    dbid                 IN number   default null,
    monitor_list_detail  IN number   default null,
    report_reference     IN varchar2 default null,
    report_level         IN varchar2 default null,    type                 IN varchar2 default 'ACTIVE',
    base_path            IN varchar2 default null);
RETURN CLOB;
```

DBMS_PIPE

The DBMS_PIPE package lets two or more sessions in the same instance communicate. Oracle pipes are similar in concept to the pipes used in UNIX, but Oracle pipes are not implemented using the operating system pipe mechanisms.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Exceptions
- Examples
- Summary of DBMS_PIPE Subprograms

119.1 DBMS_PIPE Overview

Pipe functionality has several potential applications: external service interface, independent transactions, alerters (non-transactional), debugging, and concentrator.

- External service interface: You can communicate with user-written services that are external to the RDBMS. This can be done effectively in a shared server process, so that several instances of the service are executing simultaneously. Additionally, the services are available asynchronously. The requestor of the service does not need to block a waiting reply. The requestor can check (with or without timeout) at a later time. The service can be written in any of the 3GL languages that Oracle supports.

- Independent transactions: The pipe can communicate to a separate session which can perform an operation in an independent transaction (such as logging an attempted security violation detected by a trigger).

- Alerters (non-transactional): You can post another process without requiring the waiting process to poll. If an "after-row" or "after-statement" trigger were to alert an application, then the application would treat this alert as an indication that the data probably changed. The application would then read the data to get the current value. Because this is an "after" trigger, the application would want to do a "SELECT FOR UPDATE" to make sure it read the correct data.

- Debugging: Triggers and stored procedures can send debugging information to a pipe. Another session can keep reading out of the pipe and display it on the screen or write it to a file.

- Concentrator: This is useful for multiplexing large numbers of users over a fewer number of network connections, or improving performance by concentrating several user-transactions into one DBMS transaction.
119.2 DBMS_PIPE Security Model

Security can be achieved by use of GRANT EXECUTE on the DBMS_PIPE package by creating a pipe using the private parameter in the CREATE_PIPE function and by writing cover packages that only expose particular features or pipenames to particular users or roles.

Depending upon your security requirements, you may choose to use either public pipes or private pipes, which are described in DBMS_PIPE Operational Notes.

119.3 DBMS_PIPE Constants

This is the maximum time to wait attempting to send or receive a message.

\[
\text{maxwait constant integer} := 86400000; /* 1000 days */
\]

119.4 DBMS_PIPE Operational Notes

Information sent through Oracle pipes is buffered in the system global area (SGA). All information in pipes is lost when the instance is shut down.

⚠️ WARNING:

Pipes are independent of transactions. Be careful using pipes when transaction control can be affected.

The operation of DBMS_PIPE is considered with regard to the following topics:

- Public Pipes
- Writing and Reading Pipes
- Private Pipes

Public Pipes

You may create a public pipe either implicitly or explicitly. For implicit public pipes, the pipe is automatically created when it is referenced for the first time, and it disappears when it no longer contains data. Because the pipe descriptor is stored in the SGA, there is some space usage overhead until the empty pipe is aged out of the cache.

You create an explicit public pipe by calling the CREATE_PIPE function with the private flag set to FALSE. You must deallocate explicitly-created pipes by calling the REMOVE_PIPE function.

The domain of a public pipe is the schema in which it was created, either explicitly or implicitly.

Reading and Writing Pipes

Each public pipe works asynchronously. Any number of schema users can write to a public pipe, as long as they have EXECUTE permission on the DBMS_PIPE package, and they know the name of the public pipe. However, once buffered information is read by
one user, it is emptied from the buffer, and is not available for other readers of the same pipe.

The sending session builds a message using one or more calls to the PACK_MESSAGE procedure. This procedure adds the message to the session’s local message buffer. The information in this buffer is sent by calling the SEND_MESSAGE function, designating the pipe name to be used to send the message. When SEND_MESSAGE is called, all messages that have been stacked in the local buffer are sent.

A process that wants to receive a message calls the RECEIVE_MESSAGE function, designating the pipe name from which to receive the message. The process then calls the UNPACK_MESSAGE procedure to access each of the items in the message.

Private Pipes

You explicitly create a private pipe by calling the CREATE_PIPE function. Once created, the private pipe persists in shared memory until you explicitly deallocate it by calling the REMOVE_PIPE function. A private pipe is also deallocated when the database instance is shut down.

You cannot create a private pipe if an implicit pipe exists in memory and has the same name as the private pipe you are trying to create. In this case, CREATE_PIPE returns an error.

Access to a private pipe is restricted to:

- Sessions running under the same userid as the creator of the pipe
- Stored subprograms executing in the same userid privilege domain as the pipe creator
- Users connected as SYSDBA

An attempt by any other user to send or receive messages on the pipe, or to remove the pipe, results in an immediate error. Any attempt by another user to create a pipe with the same name also causes an error.

As with public pipes, you must first build your message using calls to PACK_MESSAGE before calling SEND_MESSAGE. Similarly, you must call RECEIVE_MESSAGE to retrieve the message before accessing the items in the message by calling UNPACK_MESSAGE.

119.5 DBMS_PIPE Exceptions

DBMS_PIPE package subprograms can return the errors listed in the following table.

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-23321</td>
<td>Pipename may not be null. This can be returned by the CREATE_PIPE function, or any subprogram that takes a pipe name as a parameter.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Insufficient privilege to access pipe. This can be returned by any subprogram that references a private pipe in its parameter list.</td>
</tr>
</tbody>
</table>
119.6 DBMS_PIPE Examples

These examples show use of DBMS_PIPE in debugging PL/SQL, debugging Pro*C, executing system commands, and an external service interface.

Example 1: Debugging - PL/SQL

This example shows the procedure that a PL/SQL program can call to place debugging information in a pipe.

```sql
CREATE OR REPLACE PROCEDURE debug (msg VARCHAR2) AS
    status NUMBER;
BEGIN
    DBMS_PIPE.PACK_MESSAGE(LENGTH(msg));
    DBMS_PIPE.PACK_MESSAGE(msg);
    status := DBMS_PIPE.SEND_MESSAGE('plsql_debug');
    IF status != 0 THEN
        raise_application_error(-20099, 'Debug error');
    END IF;
END debug;
```

Example 2: Debugging - Pro*C

The following Pro*C code receives messages from the PLSQL_DEBUG pipe in the previous example, and displays the messages. If the Pro*C session is run in a separate window, then it can be used to display any messages that are sent to the debug procedure from a PL/SQL program executing in a separate session.

```c
#include <stdio.h>
#include <string.h>

EXEC SQL BEGIN DECLARE SECTION;
    VARCHAR username[20];
    int     status;
    int     msg_length;
    char    retval[2000];
EXEC SQL END DECLARE SECTION;

EXEC SQL INCLUDE SQLCA;
void sql_error();

main()
{
    -- Prepare username:
    strcpy(username.arr, "SCOTT/TIGER");
    username.len = strlen(username.arr);
    EXEC SQL WHENEVER SQLERROR DO sql_error();
    EXEC SQL CONNECT :username;
    printf("connected\n");
    -- Start an endless loop to look for and print messages on the pipe:
    FOR (;;) { 
        EXEC SQL EXECUTE
            DECLARE
                DECLARE
**Example 3: Execute System Commands**

This example shows PL/SQL and Pro*C code let a PL/SQL stored procedure (or anonymous block) call PL/SQL procedures to send commands over a pipe to a Pro*C program that is listening for them.

The Pro*C program sleeps and waits for a message to arrive on the named pipe. When a message arrives, the Pro*C program processes it, carrying out the required action, such as executing a UNIX command through the `system()` call or executing a SQL command using embedded SQL.

`DAEMON.SQL` is the source code for the PL/SQL package. This package contains procedures that use the `DBMS_PIPE` package to send and receive message to and from the Pro*C daemon. Note that full handshaking is used. The daemon always sends a message back to the package (except in the case of the `STOP` command). This is valuable, because it allows the PL/SQL procedures to be sure that the Pro*C daemon is running.

You can call the DAEMON packaged procedures from an anonymous PL/SQL block using SQL*Plus or Enterprise Manager. For example:

```
SQLPLUS> variable rv number
SQLPLUS> execute :rv := DAEMON.EXECUTE_SYSTEM('ls -la');
```
On a UNIX system, this causes the Pro*C daemon to execute the command `system("ls -la").`

Remember that the daemon needs to be running first. You might want to run it in the background, or in another window beside the SQL*Plus or Enterprise Manager session from which you call it.

The `DAEMON.SQL` also uses the `DBMS_OUTPUT` package to display the results. For this example to work, you must have execute privileges on this package.

**DAEMON.SQL Example.** This is the code for the PL/SQL `DAEMON` package:

```sql
CREATE OR REPLACE PACKAGE daemon AS
    FUNCTION execute_sql(command VARCHAR2,  
                           timeout NUMBER DEFAULT 10)  
        RETURN NUMBER;

    FUNCTION execute_system(command VARCHAR2,  
                            timeout NUMBER DEFAULT 10)  
        RETURN NUMBER;

    PROCEDURE stop(timeout NUMBER DEFAULT 10);
END daemon;
/

CREATE OR REPLACE PACKAGE BODY daemon AS

    FUNCTION execute_system(command VARCHAR2,  
                             timeout NUMBER DEFAULT 10)  
        RETURN NUMBER IS
        status       NUMBER;
        result       VARCHAR2(20);
        command_code NUMBER;
        pipe_name    VARCHAR2(30);
        BEGIN
            pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;

            DBMS_PIPE.PACK_MESSAGE('SYSTEM');
            DBMS_PIPE.PACK_MESSAGE(pipe_name);
            DBMS_PIPE.PACK_MESSAGE(command);
            status := DBMS_PIPE.SEND_MESSAGE('daemon', timeout);
            IF status <> 0 THEN
                RAISE_APPLICATION_ERROR(-20010,  
                'Execute_system: Error while sending. Status = ' || status);
            END IF;

            status := DBMS_PIPE.RECEIVE_MESSAGE(pipe_name, timeout);
            IF status <> 0 THEN
                RAISE_APPLICATION_ERROR(-20011,  
                'Execute_system: Error while receiving. Status = ' || status);
            END IF;
            DBMS_PIPE.UNPACK_MESSAGE(result);
            IF result <> 'done' THEN
                RAISE_APPLICATION_ERROR(-20012,  
                'Execute_system: Done not received.');
            END IF;

            DBMS_PIPE.UNPACK_MESSAGE(command_code);
        END;
```

**Chapter 119**

**DBMS_PIPE Examples**

119-6
DBMS_OUTPUT.PUT_LINE ('System command executed. result = ' || command_code);
RETURN command_code;
END execute_system;

FUNCTION execute_sql(command VARCHAR2,
  timeout NUMBER DEFAULT 10)
RETURN NUMBER IS
  status       NUMBER;
  result       VARCHAR2(20);
  command_code NUMBER;
  pipe_name    VARCHAR2(30);
BEGIN
  pipe_name := DBMS_PIPE.UNIQUE_SESSION_NAME;
  DBMS_PIPE.PACK_MESSAGE ('SQL');
  DBMS_PIPE.PACK_MESSAGE (pipe_name);
  DBMS_PIPE.PACK_MESSAGE (command);
  status := DBMS_PIPE.SEND_MESSAGE ('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR (-20020,
      'Execute_sql: Error while sending. Status = ' || status);
  END IF;
  status := DBMS_PIPE.RECEIVE_MESSAGE (pipe_name, timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR (-20021,
      'execute_sql: Error while receiving. Status = ' || status);
  END IF;
  DBMS_PIPE.UNPACK_MESSAGE (result);
  IF result <> 'done' THEN
    RAISE_APPLICATION_ERROR (-20022,
      'execute_sql: done not received.');
  END IF;
  DBMS_PIPE.UNPACK_MESSAGE (command_code);
  DBMS_OUTPUT.PUT_LINE
    ('SQL command executed. sqlcode = ' || command_code);
RETURN command_code;
END execute_sql;

PROCEDURE stop(timeout NUMBER DEFAULT 10) IS
  status NUMBER;
BEGIN
  DBMS_PIPE.PACK_MESSAGE ('STOP');
  status := DBMS_PIPE.SEND_MESSAGE ('daemon', timeout);
  IF status <> 0 THEN
    RAISE_APPLICATION_ERROR (-20030,
      'stop: error while sending. status = ' || status);
  END IF;
END stop;
END daemon;

daemon.pc Example. This is the code for the Pro*C daemon. You must precompile this using the Pro*C Precompiler, Version 1.5.x or later. You must also specify the USERID and SQLCHECK options, as the example contains embedded PL/SQL code.
Note:

To use a VARCHAR output host variable in a PL/SQL block, you must initialize the length component before entering the block.

```
proc iname=daemon userid=scott/tiger sqlcheck=semantics

Then C-compile and link in the normal way.

#include <stdio.h>
#include <string.h>
EXEC SQL INCLUDE SQLCA;
EXEC SQL BEGIN DECLARE SECTION;
char *uid = "scott/tiger";
int status;
VARCHAR command[20];
VARCHAR value[2000];
VARCHAR return_name[30];
EXEC SQL END DECLARE SECTION;

void
connect_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while connecting:\n");
    printf("%.*s\n", msg_length, msg_buffer);
    printf("Daemon quitting.\n");
    exit(1);
}

void
sql_error()
{
    char msg_buffer[512];
    int msg_length;
    int buffer_size = 512;

    EXEC SQL WHENEVER SQLERROR CONTINUE;
    sqlglm(msg_buffer, &buffer_size, &msg_length);
    printf("Daemon error while executing:\n");
    printf("%.*s\n", msg_length, msg_buffer);
    printf("Daemon continuing.\n");
}
main()
{
    command.len = 20; /*initialize length components*/
    value.len = 2000;
    return_name.len  = 30;
    EXEC SQL WHENEVER SQLERROR DO connect_error();
    EXEC SQL CONNECT :uid;
    printf("Daemon connected.\n");
```
EXEC SQL WHENEVER SQLERROR DO sql_error();
printf("Daemon waiting...
");
while (1) {
  EXEC SQL EXECUTE
BEGIN
    :status := DBMS_PIPE.RECEIVE_MESSAGE('daemon');
    IF :status = 0 THEN
      DBMS_PIPE.UNPACK_MESSAGE(:command);
    END IF;
  END;
END-EXEC;
IF (status == 0)
{
  command.arr[command.len] = '\0';
  IF (!strcmp((char *) command.arr, "STOP"))
  {
    printf("Daemon exiting.
");
    break;
  }
ELSE IF (!strcmp((char *) command.arr, "SYSTEM"))
  {
    EXEC SQL EXECUTE
    BEGIN
      DBMS_PIPE.UNPACK_MESSAGE(:return_name);
      DBMS_PIPE.UNPACK_MESSAGE(:value);
    END;
END-EXEC;
  value.arr[value.len] = '\0';
  printf("Will execute system command \"%s\"\n", value.arr);
  status = system(value.arr);
  EXEC SQL EXECUTE
  BEGIN
    DBMS_PIPE.PACK_MESSAGE('done');
    DBMS_PIPE.PACK_MESSAGE(:status);
    :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
  END;
END-EXEC;
  IF (status)
  {
    printf
    ("Daemon error while responding to system command.");
    printf(" status: %d\n", status);
  }
ELSE IF (!strcmp((char *) command.arr, "SQL"))
  {
    EXEC SQL EXECUTE
    BEGIN
      DBMS_PIPE.UNPACK_MESSAGE(:return_name);
      DBMS_PIPE.UNPACK_MESSAGE(:value);
    END;
END-EXEC;
  value.arr[value.len] = '\0';
  printf("Will execute sql command \"%s\"\n", value.arr);
EXEC SQL WHENEVER SQLERROR CONTINUE;
EXEC SQL EXECUTE IMMEDIATE :value;
status = sqlca.sqlcode;
EXEC SQL WHENEVER SQLERROR DO sql_error();
EXEC SQL EXECUTE
BEGIN
  DBMS_PIPE.PACK_MESSAGE('done');
  DBMS_PIPE.PACK_MESSAGE(:status);
  :status := DBMS_PIPE.SEND_MESSAGE(:return_name);
END;
END-EXEC;

IF (status)
{
  printf("Daemon error while responding to sql command.\n");
  printf("  status: %d\n", status);
}
ELSE
{
  printf("Daemon error: invalid command '%s' received.\n", command.arr);
}
ELSE
{
  printf("Daemon error while waiting for signal.\n");
  printf("  status = %d\n", status);
}
EXEC SQL COMMIT WORK RELEASE;
exit(0);

Example 4: External Service Interface

Put the user-written 3GL code into an OCI or Precompiler program. The program
connects to the database and executes PL/SQL code to read its request from the pipe,
computes the result, and then executes PL/SQL code to send the result on a pipe
back to the requestor.

Below is an example of a stock service request. The recommended sequence for the
arguments to pass on the pipe for all service requests is:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protocol_version</td>
<td>VARCHAR2 - '1', 10 bytes or less</td>
</tr>
<tr>
<td>returnpipe</td>
<td>VARCHAR2 - 30 bytes or less</td>
</tr>
<tr>
<td>service</td>
<td>VARCHAR2 - 30 bytes or less</td>
</tr>
<tr>
<td>arg1</td>
<td>VARCHAR2/NUMBER/DATE</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>argn</td>
<td>VARCHAR2/NUMBER/DATE</td>
</tr>
</tbody>
</table>

The recommended format for returning the result is:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>success</td>
<td>VARCHAR2 - 'SUCCESS' if OK, otherwise error message</td>
</tr>
<tr>
<td>arg1</td>
<td>VARCHAR2/NUMBER/DATE</td>
</tr>
<tr>
<td>...</td>
<td></td>
</tr>
<tr>
<td>argn</td>
<td>VARCHAR2/NUMBER/DATE</td>
</tr>
</tbody>
</table>

The "stock price request server" would do, using OCI or PRO* (in pseudo-code):

<loop forever>
BEGIN dbms_stock_server.get_request(:stocksymbol); END;
A client would do:

```
BEGIN :price := stock_request('YOURCOMPANY'); end;
```

The stored procedure, `dbms_stock_server`, which is called by the preceding "stock price request server" is:

```
CREATE OR REPLACE PACKAGE dbms_stock_server IS
    PROCEDURE get_request(symbol OUT VARCHAR2);
    PROCEDURE return_price(errormsg IN VARCHAR2, price IN VARCHAR2);
END;

CREATE OR REPLACE PACKAGE BODY dbms_stock_server IS
    returnpipe VARCHAR2(30);

    PROCEDURE returnerror(reason VARCHAR2) IS
        s INTEGER;
    BEGIN
        dbms_pipe.pack_message(reason);
        s := dbms_pipe.send_message(returnpipe);
        IF s <> 0 THEN
            raise_application_error(-20000, 'Error:' || to_char(s) || ' sending on pipe');
        END IF;
    END;

    PROCEDURE get_request(symbol OUT VARCHAR2) IS
        protocol_version VARCHAR2(10);
        s INTEGER;
        service VARCHAR2(30);
    BEGIN
        s := dbms_pipe.receive_message('stock_service');
        IF s <> 0 THEN
            raise_application_error(-20000, 'Error:' || to_char(s) || ' reading pipe');
        END IF;
        dbms_pipe.unpack_message(protocol_version);
        IF protocol_version <> '1' THEN
            raise_application_error(-20000, 'Bad protocol: ' || protocol_version);
        END IF;
        dbms_pipe.unpack_message(returnpipe);
        dbms_pipe.unpack_message(service);
        IF service != 'getprice' THEN
            returnerror('Service ' || service || ' not supported');
        END IF;
        dbms_pipe.unpack_message(symbol);
    END;

    PROCEDURE return_price(errormsg in VARCHAR2, price in VARCHAR2) IS
        s INTEGER;
    BEGIN
        IF errormsg is NULL THEN
            dbms_pipe.pack_message('SUCCESS');
            dbms_pipe.pack_message(price);
        ELSE
            dbms_pipe.pack_message(errormsg);
        END IF;
    END;
```

<figure out price based on stocksymbol (probably from some radio signal), set error if can't find such a stock>

```
BEGIN dbms_stock_server.return_price(:error, :price); END;
```
The procedure called by the client is:

```
CREATE OR REPLACE FUNCTION stock_request (symbol VARCHAR2) RETURN VARCHAR2 IS
  s INTEGER;
  price VARCHAR2(20);
  errmsg VARCHAR2(512);
BEGIN
  dbms_pipe.pack_message('1');  -- protocol version
  dbms_pipe.pack_message(dbms_pipe.unique_session_name); -- return pipe
  dbms_pipe.pack_message('getprice');
  dbms_pipe.pack_message(symbol);
  s := dbms_pipe.send_message('stock_service');
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
                          ' sending on pipe');
  END IF;
  s := dbms_pipe.receive_message(dbms_pipe.unique_session_name);
  IF s <> 0 THEN
    raise_application_error(-20000, 'Error:'||to_char(s)||
                          ' receiving on pipe');
  END IF;
  dbms_pipe.unpack_message(errormsg);
  IF errmsg <> 'SUCCESS' THEN
    raise_application_error(-20000, errmsg);
  END IF;
  dbms_pipe.unpack_message(price);
  RETURN price;
END;
```

You would typically only GRANT EXECUTE on DBMS_STOCK_SERVICE to the stock service application server, and would only GRANT EXECUTE on stock_request to those users allowed to use the service.

119.7 Summary of DBMS PIPE Subprograms

This table lists the DBMS_PIPE subprograms and briefly describes them.
Table 119-2  DBMS_PIPE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_PIPE Function</td>
<td>Creates a pipe (necessary for private pipes)</td>
</tr>
<tr>
<td>NEXT_ITEM_TYPE Function</td>
<td>Returns datatype of next item in buffer</td>
</tr>
<tr>
<td>PACK_MESSAGE Procedures</td>
<td>Builds message in local buffer</td>
</tr>
<tr>
<td>PURGE Procedure</td>
<td>Purges contents of named pipe</td>
</tr>
<tr>
<td>RECEIVE_MESSAGE Function</td>
<td>Copies message from named pipe into local buffer</td>
</tr>
<tr>
<td>REMOVE_PIPE Function</td>
<td>Removes the named pipe</td>
</tr>
<tr>
<td>RESET_BUFFER Procedure</td>
<td>Purges contents of local buffer</td>
</tr>
<tr>
<td>SEND_MESSAGE Function</td>
<td>Sends message on named pipe: This implicitly creates a public pipe if the named pipe does not exist</td>
</tr>
<tr>
<td>UNIQUE_SESSION_NAME Function</td>
<td>Returns unique session name</td>
</tr>
<tr>
<td>UNPACK_MESSAGE Procedures</td>
<td>Accesses next item in buffer</td>
</tr>
</tbody>
</table>

119.7.1 CREATE_PIPE Function

This function explicitly creates a public or private pipe. If the private flag is TRUE, then the pipe creator is assigned as the owner of the private pipe.

Explicitly-created pipes can only be removed by calling REMOVE_PIPE, or by shutting down the instance.

Syntax

```sql
DBMS_PIPE.CREATE_PIPE (  
    pipename     IN VARCHAR2,  
    maxpipesize  IN INTEGER DEFAULT 8192,  
    private      IN BOOLEAN DEFAULT TRUE)  
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(create_pipe,WNDS,RNDS);
```

Parameters

Table 119-3  CREATE_PIPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe you are creating. You must use this name when you call SEND_MESSAGE and RECEIVE_MESSAGE. This name must be unique across the instance. Caution: Do not use pipe names beginning with ORA$. These are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case insensitive. At this time, the name cannot contain Globalization Support characters.</td>
</tr>
</tbody>
</table>
Table 119-3  (Cont.) CREATE_PIPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxpipesize</td>
<td>The maximum size allowed for the pipe, in bytes.</td>
</tr>
<tr>
<td></td>
<td>The total size of all of the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default maxpipesize is 8192 bytes.</td>
</tr>
<tr>
<td></td>
<td>The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value use the existing, larger value.</td>
</tr>
<tr>
<td>private</td>
<td>Uses the default, TRUE, to create a private pipe.</td>
</tr>
<tr>
<td></td>
<td>Public pipes can be implicitly created when you call SEND_MESSAGE.</td>
</tr>
</tbody>
</table>

Return Values

Table 119-4  CREATE_PIPE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Successful.</td>
</tr>
<tr>
<td></td>
<td>If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains.</td>
</tr>
<tr>
<td></td>
<td>If a user connected as SYSDBA/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Failure due to naming conflict.</td>
</tr>
<tr>
<td></td>
<td>If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</td>
</tr>
</tbody>
</table>

Exceptions

Table 119-5  CREATE_PIPE Function Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error: Pipe with the same name already exists, and you are not allowed to use it.</td>
</tr>
</tbody>
</table>

119.7.2 NEXT_ITEM_TYPE Function

This function determines the datatype of the next item in the local message buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call NEXT_ITEM_TYPE.
Syntax

DBMS_PIPE.NEXT_ITEM_TYPE
    RETURN INTEGER;

Pragmas

pragma restrict_references(next_item_type,WDNS,RNDS);

Return Values

Table 119-6  NEXT_ITEM_TYPE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No more items</td>
</tr>
<tr>
<td>6</td>
<td>NUMBER</td>
</tr>
<tr>
<td>9</td>
<td>VARCHAR2</td>
</tr>
<tr>

<td>DATE</td>
</tr>
<tr>
<td>23</td>
<td>RAW</td>
</tr>
</tbody>
</table>

119.7.3 PACK_MESSAGE Procedures

This procedure builds your message in the local message buffer.

To send a message, first make one or more calls to PACK_MESSAGE. Then, call SEND_MESSAGE to send the message in the local buffer on the named pipe.

The procedure is overloaded to accept items of type VARCHAR2, NCHAR, NUMBER, DATE, RAW and ROWID items. In addition to the data bytes, each item in the buffer requires one byte to indicate its type, and two bytes to store its length. One additional byte is needed to terminate the message. The overhead for all types other than VARCHAR is 4 bytes.

Syntax

DBMS_PIPE.PACK_MESSAGE (item IN VARCHAR2);

DBMS_PIPE.PACK_MESSAGE (item IN NCHAR);

DBMS_PIPE.PACK_MESSAGE (item IN NUMBER);

DBMS_PIPE.PACK_MESSAGE (item IN DATE);

DBMS_PIPE.PACK_MESSAGE_RAW (item IN RAW);

DBMS_PIPE.PACK_MESSAGE_ROWID (item IN ROWID);
Pragmas

```
pragma restrict_references(pack_message,WNDS,RNDS);
pragma restrict_references(pack_message_raw,WNDS,RNDS);
pragma restrict_references(pack_message_rowid,WNDS,RNDS);
```

Parameters

**Table 119-7  PACK_MESSAGE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Item to pack into the local message buffer.</td>
</tr>
</tbody>
</table>

Usage Notes

In Oracle database version 8.x, the char-set-id (2 bytes) and the char-set-form (1 byte) are stored with each data item. Therefore, the overhead when using Oracle database version 8.x is 7 bytes.

When you call `SEND_MESSAGE` to send this message, you must indicate the name of the pipe on which you want to send the message. If this pipe already exists, then you must have sufficient privileges to access this pipe. If the pipe does not already exist, then it is created automatically.

Exceptions

ORA-06558 is raised if the message buffer overflows (currently 4096 bytes). Each item in the buffer takes one byte for the type, two bytes for the length, plus the actual data. There is also one byte needed to terminate the message.

119.7.4 PURGE Procedure

This procedure empties the contents of the named pipe.

An empty implicitly-created pipe is aged out of the shared global area according to the least-recently-used algorithm. Thus, calling `PURGE` lets you free the memory associated with an implicitly-created pipe.

**Syntax**

```
DBMS_PIPE.PURGE (  
    pipename  IN  VARCHAR2);  
```

Pragmas

```
pragma restrict_references(purge,WNDS,RNDS);
```
Parameters

Table 119-8  PURGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of pipe from which to remove all messages. The local buffer may be</td>
</tr>
<tr>
<td></td>
<td>overwritten with messages as they are discarded. Pipename should not</td>
</tr>
<tr>
<td></td>
<td>be longer than 128 bytes, and is case-insensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

Because PURGE calls RECEIVE_MESSAGE, the local buffer might be overwritten with messages as they are purged from the pipe. Also, you can receive an ORA-23322 (insufficient privileges) error if you attempt to purge a pipe with which you have insufficient access rights.

Exceptions

Permission error if pipe belongs to another user.

119.7.5 RECEIVE_MESSAGE Function

This function copies the message into the local message buffer.

Syntax

```sql
DBMS_PIPE.RECEIVE_MESSAGE (
  pipename     IN VARCHAR2,
  timeout      IN INTEGER      DEFAULT maxwait)
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(receive_message,WNDS,RNDS);
```

Parameters

Table 119-9  RECEIVE_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe on which you want to receive a message. Names beginning</td>
</tr>
<tr>
<td></td>
<td>with ORA$ are reserved for use by Oracle</td>
</tr>
<tr>
<td>timeout</td>
<td>Time to wait for a message, in seconds. The default value is the constant</td>
</tr>
<tr>
<td></td>
<td>MAXWAIT, which is defined as 86400000 (1000 days). A timeout of 0 lets you</td>
</tr>
<tr>
<td></td>
<td>read without blocking.</td>
</tr>
</tbody>
</table>
Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td>1</td>
<td>Timed out. If the pipe was implicitly-created and is empty, then it is removed.</td>
</tr>
<tr>
<td>2</td>
<td>Record in the pipe is too large for the buffer. (This should not happen.)</td>
</tr>
<tr>
<td>3</td>
<td>An interrupt occurred.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>User has insufficient privileges to read from the pipe.</td>
</tr>
</tbody>
</table>

Usage Notes

To receive a message from a pipe, first call `RECEIVE_MESSAGE`. When you receive a message, it is removed from the pipe; hence, a message can only be received once. For implicitly-created pipes, the pipe is removed after the last record is removed from the pipe.

If the pipe that you specify when you call `RECEIVE_MESSAGE` does not already exist, then Oracle implicitly creates the pipe and waits to receive the message. If the message does not arrive within a designated timeout interval, then the call returns and the pipe is removed.

After receiving the message, you must make one or more calls to `UNPACK_MESSAGE` to access the individual items in the message. The `UNPACK_MESSAGE` procedure is overloaded to unpack items of type `DATE`, `NUMBER`, `VARCHAR2`, and there are two additional procedures to unpack `RAW` and `ROWID` items. If you do not know the type of data that you are attempting to unpack, then call `NEXT_ITEM_TYPE` to determine the type of the next item in the buffer.

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error. Insufficient privilege to remove the record from the pipe. The pipe is owned by someone else.</td>
</tr>
</tbody>
</table>

119.7.6 RESET_BUFFER Procedure

This procedure resets the `PACK_MESSAGE` and `UNPACK_MESSAGE` positioning indicators to 0.

Because all pipes share a single buffer, you may find it useful to reset the buffer before using a new pipe. This ensures that the first time you attempt to send a message to your pipe, you do not inadvertently send an expired message remaining in the buffer.

Syntax

```
DBMS_PIPE.RESET_BUFFER;
```
**Pragmas**

pragma restrict_references(reset_buffer,WNDS,RNDS);

### 119.7.7 REMOVE_PIPE Function

This function removes explicitly-created pipes.

Pipes created implicitly by `SEND_MESSAGE` are automatically removed when empty. However, pipes created explicitly by `CREATE_PIPE` are removed only by calling `REMOVE_PIPE`, or by shutting down the instance. All unconsumed records in the pipe are removed before the pipe is deleted.

This is similar to calling `PURGE` on an implicitly-created pipe.

**Syntax**

```sql
DBMS_PIPE.REMOVE_PIPE (  
   pipename  IN  VARCHAR2)  
RETURN INTEGER;
```

**Pragmas**

pragma restrict_references(remove_pipe,WNDS,RNDS);

**Parameters**

**Table 119-12  REMOVE_PIPE Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of pipe that you want to remove.</td>
</tr>
</tbody>
</table>

**Return Values**

**Table 119-13  REMOVE_PIPE Function Return Values**

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success</td>
</tr>
<tr>
<td></td>
<td>If the pipe does not exist, or if the pipe already exists and the user attempting to remove it is authorized to do so, then Oracle returns 0, indicating success, and any data remaining in the pipe is removed.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Insufficient privileges.</td>
</tr>
<tr>
<td></td>
<td>If the pipe exists, but the user is not authorized to access the pipe, then Oracle signals error ORA-23322, indicating insufficient privileges.</td>
</tr>
</tbody>
</table>
Exceptions

Table 119-14 REMOVE_PIPE Function Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error: Insufficient privilege to remove pipe. The pipe was created and is owned by someone else.</td>
</tr>
</tbody>
</table>

119.7.8 SEND_MESSAGE Function

This function sends a message on the named pipe.

The message is contained in the local message buffer, which was filled with calls to PACK_MESSAGE. You can create a pipe explicitly using CREATE_PIPE, otherwise, it is created implicitly.

Syntax

```sql
DBMS_PIPE.SEND_MESSAGE (
    pipename     IN VARCHAR2,
    timeout      IN INTEGER DEFAULT MAXWAIT,
    maxpipesize  IN INTEGER DEFAULT 8192)
RETURN INTEGER;
```

Pragmas

```sql
pragma restrict_references(send_message,WNDS,RNDS);
```

Parameters

Table 119-15 SEND_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pipename</td>
<td>Name of the pipe on which you want to place the message. If you are using an explicit pipe, then this is the name that you specified when you called CREATE_PIPE. Caution: Do not use pipe names beginning with 'ORA$'. These names are reserved for use by procedures provided by Oracle. Pipename should not be longer than 128 bytes, and is case-insensitive. At this time, the name cannot contain Globalization Support characters.</td>
</tr>
<tr>
<td>timeout</td>
<td>Time to wait while attempting to place a message on a pipe, in seconds. The default value is the constant MAXWAIT, which is defined as 86400000 (1000 days).</td>
</tr>
</tbody>
</table>
Table 119-15  (Cont.) SEND_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maxpipesize</td>
<td>Maximum size allowed for the pipe, in bytes. The total size of all the messages on the pipe cannot exceed this amount. The message is blocked if it exceeds this maximum. The default is 8192 bytes. The maxpipesize for a pipe becomes a part of the characteristics of the pipe and persists for the life of the pipe. Callers of SEND_MESSAGE with larger values cause the maxpipesize to be increased. Callers with a smaller value simply use the existing, larger value. Specifying maxpipesize as part of the SEND_MESSAGE procedure eliminates the need for a separate call to open the pipe. If you created the pipe explicitly, then you can use the optional maxpipesize parameter to override the creation pipe size specifications.</td>
</tr>
</tbody>
</table>

Return Values

Table 119-16  SEND_MESSAGE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Success. If the pipe already exists and the user attempting to create it is authorized to use it, then Oracle returns 0, indicating success, and any data already in the pipe remains. If a user connected as SYSDBS/SYSOPER re-creates a pipe, then Oracle returns status 0, but the ownership of the pipe remains unchanged.</td>
</tr>
<tr>
<td>1</td>
<td>Timed out. This procedure can timeout either because it cannot get a lock on the pipe, or because the pipe remains too full to be used. If the pipe was implicitly-created and is empty, then it is removed.</td>
</tr>
<tr>
<td>3</td>
<td>An interrupt occurred. If the pipe was implicitly created and is empty, then it is removed.</td>
</tr>
<tr>
<td>ORA-23322</td>
<td>Insufficient privileges. If a pipe with the same name exists and was created by a different user, then Oracle signals error ORA-23322, indicating the naming conflict.</td>
</tr>
</tbody>
</table>

Exceptions

Table 119-17  SEND_MESSAGE Function Exception

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null pipe name</td>
<td>Permission error. Insufficient privilege to write to the pipe. The pipe is private and owned by someone else.</td>
</tr>
</tbody>
</table>
119.7.9 UNIQUE_SESSION_NAME Function

This function receives a name that is unique among all of the sessions that are currently connected to a database.

Multiple calls to this function from the same session always return the same value. You might find it useful to use this function to supply the PIPENAME parameter for your SEND_MESSAGE and RECEIVE_MESSAGE calls.

Syntax

`DBMS_PIPE.UNIQUE_SESSION_NAME`  
`RETURN VARCHAR2;`

Pragmas

`pragma restrict_references(unique_session_name,WNDS,RNDS,WNPS);`

Return Values

This function returns a unique name. The returned name can be up to 30 bytes.

119.7.10 UNPACK_MESSAGE Procedures

This procedure retrieves items from the buffer.

After you have called RECEIVE_MESSAGE to place pipe information in a local buffer, call UNPACK_MESSAGE.

Note:

The UNPACK_MESSAGE procedure is overloaded to return items of type VARCHAR2, NCHAR, NUMBER, or DATE. There are two additional procedures to unpack RAW and ROWID items.

Syntax

`DBMS_PIPE.UNPACK_MESSAGE {`  
`item OUT VARCHAR2};`  
`DBMS_PIPE.UNPACK_MESSAGE {`  
`item OUT NCHAR};`  
`DBMS_PIPE.UNPACK_MESSAGE {`  
`item OUT NUMBER};`  
`DBMS_PIPE.UNPACK_MESSAGE {`  
`item OUT DATE};`  
`DBMS_PIPE.UNPACK_MESSAGE_RAW {`  
`item OUT RAW};`  
`DBMS_PIPE.UNPACK_MESSAGE_ROWID {`  
`item OUT ROWID};`
Pragmas

pragma restrict_references(unpack_message,WNDS,RNDS);
pragma restrict_references(unpack_message_raw,WNDS,RNDS);
pragma restrict_references(unpack_message_rowid,WNDS,RNDS);

Parameters

Table 119-18 UNPACK_MESSAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>item</td>
<td>Argument to receive the next unpacked item from the local message buffer.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06556 or 06559 are generated if the buffer contains no more items, or if the item is not of the same type as that requested.
The DBMS_PLSQL_CODE_COVERAGE package provides an interface for the collection of code coverage data of PL/SQL applications at the basic block level.

This chapter contains the following topics:
- DBMS_PLSQL_CODE_COVERAGE Overview
- DBMS_PLSQL_CODE_COVERAGE Security Model
- Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms

### 120.1 DBMS_PLSQL_CODE_COVERAGE Overview

The DBMS_PLSQL_CODE_COVERAGE package provides an interface for collecting code coverage information at the basic block level of PL/SQL applications. A basic block refers to a single entry single exit block of PL/SQL code. PL/SQL developers want to know how well their test infrastructure exercised their code. The coverage tables are created using the CREATE_COVERAGE_TABLES procedure.

A typical code coverage run in a session involves calls to:
- START_COVERAGE
- Run PL/SQL code
- STOP_COVERAGE

**See Also:**
- Oracle Database Development Guide for more information about using PL/SQL basic block coverage to maintain quality
- Oracle Database PL/SQL Language Reference for the COVERAGE PRAGMA syntax and semantics
- Oracle Database PL/SQL Language Reference for more information about the PLSQL_OPTIMIZE_LEVEL compilation parameter

### 120.2 DBMS_PLSQL_CODE_COVERAGE Security Model

The user must have EXECUTE privilege on the DBMS_PLSQL_CODE_COVERAGE package.

The user must have CREATE privilege on the unit to collect coverage information about this unit.

Coverage information is not collected for wrapped units.
### 120.3 Summary of DBMS_PLSQL_CODE_COVERAGE Subprograms

This table lists the DBMS_PLSQL_CODE_COVERAGE subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_COVERAGE_TABLES Procedure</td>
<td>Creates coverage tables</td>
</tr>
<tr>
<td>START_COVERAGE Function</td>
<td>Starts the coverage data collection in the user's session and returns the RUN_ID</td>
</tr>
<tr>
<td>STOP_COVERAGE Procedure</td>
<td>Ends the current coverage run</td>
</tr>
</tbody>
</table>

#### 120.3.1 CREATE_COVERAGE_TABLES Procedure

This procedure creates the tables used for coverage data collection.

**Syntax**

```sql
DBMS_PLSQL_CODE_COVERAGE.CREATE_COVERAGE_TABLES (FORCE_IT IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORCE_IT</td>
<td>The default is to raise an error if the coverage tables already exist. If set to TRUE, the tables are dropped silently if the tables already exist, and new tables are created.</td>
</tr>
</tbody>
</table>

**Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COVERAGE_ERROR</td>
<td>The FORCE_IT parameter is FALSE and the tables already exist.</td>
</tr>
</tbody>
</table>

#### 120.3.2 START_COVERAGE Function

This function starts the coverage data collection in the user's session and returns a unique identifier RUN_ID for the run.

**Syntax**

```sql
DBMS_PLSQL_CODE_COVERAGE.START_COVERAGE (run_comment IN VARCHAR2) RETURN NUMBER;
```
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_comment</td>
<td>Allows the user to name a run and identify the test.</td>
</tr>
</tbody>
</table>

#### 120.3.3 STOP_COVERAGE Procedure

This procedure ends the current coverage run.

**Syntax**

```sql
DBMS_PLSQL_CODE_COVERAGE.STOP_COVERAGE;
```

**Exceptions**

**Table 120-3 STOP_COVERAGE Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COVERAGED_ERROR</td>
<td>An error is raised if the coverage tables do not exist.</td>
</tr>
</tbody>
</table>
DBMS_PREDICTIVE_ANALYTICS

Data mining can discover useful information buried in vast amounts of data. However, it is often the case that both the programming interfaces and the data mining expertise required to obtain these results are too complex for use by the wide audiences that can obtain benefits from using Oracle Data Mining.

The DBMS_PREDICTIVE_ANALYTICS package addresses both of these complexities by automating the entire data mining process from data preprocessing through model building to scoring new data. This package provides an important tool that makes data mining possible for a broad audience of users, in particular, business analysts.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

121.1 DBMS_PREDICTIVE_ANALYTICS Overview

DBMS_PREDICTIVE_ANALYTICS automates parts of the data mining process.

Data mining, according to a commonly used process model, requires the following steps:

1. Understand the business problem.
2. Understand the data.
3. Prepare the data for mining.
4. Create models using the prepared data.
5. Evaluate the models.
6. Deploy and use the model to score new data.

DBMS_PREDICTIVE_ANALYTICS automates parts of step 3 — 5 of this process.

Predictive analytics procedures analyze and prepare the input data, create and test mining models using the input data, and then use the input data for scoring. The results of scoring are returned to the user. The models and supporting objects are not preserved after the operation completes.

121.2 DBMS_PREDICTIVE_ANALYTICS Security Model

The DBMS_PREDICTIVE_ANALYTICS package is owned by user SYS and is installed as part of database installation. Execution privilege on the package is granted to public. The
The DBMS_PREDICTIVE_ANALYTICS package exposes APIs which are leveraged by the Oracle Data Mining option. Users who wish to invoke procedures in this package require the CREATE_MINING_MODEL system privilege (as well as the CREATE_TABLE and CREATE_VIEW system privilege).

121.3 Summary of DBMS_PREDICTIVE_ANALYTICS Subprograms

This table lists and briefly describes the DBMS_PREDICTIVE_ANALYTICS package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXPLAIN Procedure</td>
<td>Ranks attributes in order of influence in explaining a target column.</td>
</tr>
<tr>
<td>PREDICT Procedure</td>
<td>Predicts the value of a target column based on values in the input data.</td>
</tr>
<tr>
<td>PROFILE Procedure</td>
<td>Generates rules that identify the records that have the same target value.</td>
</tr>
</tbody>
</table>

121.3.1 EXPLAIN Procedure

The EXPLAIN procedure identifies the attributes that are important in explaining the variation in values of a target column.

The input data must contain some records where the target value is known (not NULL). These records are used by the procedure to train a model that calculates the attribute importance.

**Note:**

EXPLAIN supports DATE and TIMESTAMP datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in Oracle Data Mining User's Guide.

The EXPLAIN procedure creates a result table that lists the attributes in order of their explanatory power. The result table is described in the Usage Notes.

**Syntax**

```sql
DBMS_PREDICTIVE_ANALYTICS.EXPLAIN (  
    data_table_name     IN VARCHAR2,  
    explain_column_name IN VARCHAR2,  
```
Parameters

### Table 121-2  EXPLAIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_table_name</td>
<td>Name of input table or view</td>
</tr>
<tr>
<td>explain_column_name</td>
<td>Name of the column to be explained</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table where results are saved</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.</td>
</tr>
</tbody>
</table>

Usage Notes

The EXPLAIN procedure creates a result table with the columns described in Table 121-3.

### Table 121-3  EXPLAIN Procedure Result Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTRIBUTE_NAME</td>
<td>VARCHAR2(30)</td>
<td>Name of a column in the input data; all columns except the explained column are listed in the result table.</td>
</tr>
<tr>
<td>EXPLANATORY_VALUE</td>
<td>NUMBER</td>
<td>Value indicating how useful the column is for determining the value of the explained column. Higher values indicate greater explanatory power. Value can range from 0 to 1.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An individual column's explanatory value is independent of other columns in the input table. The values are based on how strong each individual column correlates with the explained column. The value is affected by the number of records in the input table, and the relations of the values of the column to the values of the explain column.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>An explanatory power value of 0 implies there is no useful correlation between the column's values and the explain column's values. An explanatory power of 1 implies perfect correlation; such columns should be eliminated from consideration for PREDICT. In practice, an explanatory power equal to 1 is rarely returned.</td>
</tr>
<tr>
<td>RANK</td>
<td>NUMBER</td>
<td>Ranking of explanatory power. Rows with equal values for explanatory_value have the same rank. Rank values are not skipped in the event of ties.</td>
</tr>
</tbody>
</table>

Example

The following example performs an EXPLAIN operation on the SUPPLEMENTARY_DEMOGRAPHICS table of Sales History.

```sql
--Perform EXPLAIN operation
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.EXPLAIN(
    data_table_name => 'supplementary_demographics',
    explain_column_name => 'home_theater_package',
    result_table_name => 'demographics_explain_result');
END;
/```
--Display results
SELECT * FROM demographics_explain_result;

<table>
<thead>
<tr>
<th>ATTRIBUTE_NAME</th>
<th>EXPLANATORY_VALUE</th>
<th>RANK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y_BOX_GAMES</td>
<td>.524311073</td>
<td>1</td>
</tr>
<tr>
<td>YRS_RESIDENCE</td>
<td>.495987246</td>
<td>2</td>
</tr>
<tr>
<td>HOUSEHOLD_SIZE</td>
<td>.146208506</td>
<td>3</td>
</tr>
<tr>
<td>AFFINITY_CARD</td>
<td>.0598227</td>
<td>4</td>
</tr>
<tr>
<td>EDUCATION</td>
<td>.018462703</td>
<td>5</td>
</tr>
<tr>
<td>OCCUPATION</td>
<td>.009721543</td>
<td>6</td>
</tr>
<tr>
<td>FLAT_PANEL_MONITOR</td>
<td>.00013733</td>
<td>7</td>
</tr>
<tr>
<td>PRINTER_SUPPLIES</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>OS_DOC_SET_KANJI</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>BULK_PACK_DISKETTES</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>BOOKKEEPING_APPLICATION</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>COMMENTS</td>
<td>0</td>
<td>8</td>
</tr>
<tr>
<td>CUST_ID</td>
<td>0</td>
<td>8</td>
</tr>
</tbody>
</table>

The results show that **Y_BOX_GAMES**, **YRS_RESIDENCE**, and **HOUSEHOLD_SIZE** are the best predictors of **HOME_THEATER_PACKAGE**.

### 121.3.2 PREDICT Procedure

The **PREDICT** procedure predicts the values of a target column.

The input data must contain some records where the target value is known (not **NULL**). These records are used by the procedure to train and test a model that makes the predictions.

**Note:**

**PREDICT** supports **DATE** and **TIMESTAMP** datatypes in addition to the numeric, character, and nested datatypes supported by Oracle Data Mining models.

Data requirements for Oracle Data Mining are described in *Oracle Data Mining User's Guide*.

The **PREDICT** procedure creates a result table that contains a predicted target value for every record. The result table is described in the Usage Notes.

**Syntax**

```sql
DBMS_PREDICTIVE_ANALYTICS.PREDICT (  
  accuracy OUT NUMBER,  
  data_table_name IN VARCHAR2,  
  case_id_column_name IN VARCHAR2,  
  target_column_name IN VARCHAR2,  
  result_table_name IN VARCHAR2,  
  data_schema_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 121-4  PREDICT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accuracy</td>
<td>Output parameter that returns the predictive confidence, a measure of the accuracy of the predicted values. The predictive confidence for a categorical target is the most common target value; the predictive confidence for a numerical target is the mean.</td>
</tr>
<tr>
<td>data_table_name</td>
<td>Name of the input table or view.</td>
</tr>
<tr>
<td>case_id_column_name</td>
<td>Name of the column that uniquely identifies each case (record) in the input data.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of the column to predict.</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table where results will be saved.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.</td>
</tr>
</tbody>
</table>

Usage Notes

The PREDICT procedure creates a result table with the columns described in Table 121-5.

Table 121-5  PREDICT Procedure Result Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Case ID column name</td>
<td>VARCHAR2 or NUMBER</td>
<td>The name of the case ID column in the input data.</td>
</tr>
<tr>
<td>PREDICTION</td>
<td>VARCHAR2 or NUMBER</td>
<td>The predicted value of the target column for the given case.</td>
</tr>
<tr>
<td>PROBABILITY</td>
<td>NUMBER</td>
<td>For classification (categorical target), the probability of the prediction. For regression problems (numerical target), this column contains NULL.</td>
</tr>
</tbody>
</table>

Note:

Make sure that the name of the case ID column is not 'PREDICTION' or 'PROBABILITY'.

Predictions are returned for all cases whether or not they contained target values in the input.

Predicted values for known cases may be interesting in some situations. For example, you could perform deviation analysis to compare predicted values and actual values.
Example

The following example performs a PREDICT operation and displays the first 10 predictions. The results show an accuracy of 79% in predicting whether each customer has an affinity card.

```sql
--Perform PREDICT operation
DECLARE
  v_accuracy NUMBER(10,9);
BEGIN
  DBMS_PREDICTIVE_ANALYTICS.PREDICT(
    accuracy             => v_accuracy,
    data_table_name      => 'supplementary_demographics',
    case_id_column_name  => 'cust_id',
    target_column_name   => 'affinity_card',
    result_table_name    => 'pa_demographics_predict_result');
  DBMS_OUTPUT.PUT_LINE('Accuracy = ' || v_accuracy);
END;

121.3.3 PROFILE Procedure

The PROFILE procedure generates rules that describe the cases (records) from the input data.

For example, if a target column CHURN has values 'Yes' and 'No', PROFILE generates a set of rules describing the expected outcomes. Each profile includes a rule, record count, and a score distribution.

The input data must contain some cases where the target value is known (not NULL). These cases are used by the procedure to build a model that calculates the rules.

Note:

PROFILE does not support nested types or dates.

Data requirements for Oracle Data Mining are described in Oracle Data Mining User's Guide.
The PROFILE procedure creates a result table that specifies rules (profiles) and their corresponding target values. The result table is described in the Usage Notes.

Syntax

```sql
DBMS_PREDICTIVE_ANALYTICS.PROFILE (
    data_table_name           IN VARCHAR2,
    target_column_name        IN VARCHAR2,
    result_table_name         IN VARCHAR2,
    data_schema_name          IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 121-6  PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>data_table_name</td>
<td>Name of the table containing the data to be analyzed.</td>
</tr>
<tr>
<td>target_column_name</td>
<td>Name of the target column.</td>
</tr>
<tr>
<td>result_table_name</td>
<td>Name of the table where the results will be saved.</td>
</tr>
<tr>
<td>data_schema_name</td>
<td>Name of the schema where the input table or view resides and where the result table is created. Default: the current schema.</td>
</tr>
</tbody>
</table>

Usage Notes

The PROFILE procedure creates a result table with the columns described in Table 121-7.

Table 121-7  PROFILE Procedure Result Table

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PROFILE_ID</td>
<td>NUMBER</td>
<td>A unique identifier for this profile (rule).</td>
</tr>
<tr>
<td>RECORD_COUNT</td>
<td>NUMBER</td>
<td>The number of records described by the profile.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>SYS.XMLTYPE</td>
<td>The profile rule. See &quot;XML Schema for Profile Rules&quot;.</td>
</tr>
</tbody>
</table>

XML Schema for Profile Rules

The DESCRIPTION column of the result table contains XML that conforms to the following XSD:

```xml
<xs:element name="SimpleRule">
    <xs:complexType>
        <xs:sequence>
            <xs:group ref="PREDICATE"/>
            <xs:element ref="ScoreDistribution" minOccurs="0" maxOccurs="unbounded"/>
        </xs:sequence>
        <xs:attribute name="id" type="xs:string" use="optional"/>
        <xs:attribute name="score" type="xs:string" use="required"/>
        <xs:attribute name="recordCount" type="NUMBER" use="optional"/>
    </xs:complexType>
</xs:element>
```
Example

This example generates a rule describing customers who are likely to use an affinity card (target value is 1) and a set of rules describing customers who are not likely to use an affinity card (target value is 0). The rules are based on only two predictors: education and occupation.

```
SET serveroutput ON
SET trimspool ON
SET pages 10000
SET long 10000
SET pagesize 10000
SET linesize 150
CREATE VIEW cust_edu_occ_view AS
    SELECT cust_id, education, occupation, affinity_card
    FROM sh.supplementary_demographics;
BEGIN
    DBMS_PREDICTIVE_ANALYTICS.PROFILE(
        DATA_TABLE_NAME    => 'cust_edu_occ_view',
        TARGET_COLUMN_NAME => 'affinity_card',
        RESULT_TABLE_NAME  => 'profile_result');
END;
/
```

This example generates eight rules in the result table `profile_result`. Seven of the rules suggest a target value of 0; one rule suggests a target value of 1. The `score` attribute on a rule identifies the target value.

This `SELECT` statement returns all the rules in the result table.

```
SELECT a.profile_id, a.record_count, a.description.getstringval()
FROM profile_result a;
```

This `SELECT` statement returns the rules for a target value of 0.

```
SELECT *
FROM profile_result t
WHERE extractvalue(t.description, '/SimpleRule/@score') = 0;
```

The eight rules generated by this example are displayed as follows.

```
<SimpleRule id="1" score="0" recordCount="443">

The DBMS_PREPROCESSOR package provides an interface to print or retrieve the source text of a PL/SQL unit in its post-processed form.

This package contains the following topics:

- Overview
- Operating Notes
- Data Structures
- Summary of DBMS_PREPROCESSOR Subprograms

### 122.1 DBMS_PREPROCESSOR Overview

It is necessary to first understand the three styles of subprograms, in order to understand how DBMS_PREPROCESSOR works.

The following are the three styles of subprograms:

1. Subprograms that take a schema name, a unit type name, and the unit name.
2. Subprograms that take a VARCHAR2 string which contains the source text of an arbitrary PL/SQL compilation unit.
3. Subprograms that take a VARCHAR2 index-by table which contains the segmented source text of an arbitrary PL/SQL compilation unit.

Subprograms of the first style are used to print or retrieve the post-processed source text of a stored PL/SQL unit. The user must have the privileges necessary to view the original source text of this unit. The user must also specify the schema in which the unit is defined, the type of the unit, and the name of the unit. If the schema is null, then the current user schema is used. If the status of the stored unit is VALID and the user has the required privilege, then the post-processed source text is guaranteed to be the same as that of the unit the last time it was compiled.

Subprograms of the second or third style are used to generate post-processed source text in the current user schema. The source text is passed in as a single VARCHAR2 string in the second style, or as a VARCHAR2 index-by table in the third style. The source text can represent an arbitrary PL/SQL compilation unit. A typical usage is to pass the source text of an anonymous block and generate its post-processed source text in the current user schema. The third style can be useful when the source text exceeds the VARCHAR2 length limit.

### 122.2 DBMS_PREPROCESSOR Operating Notes

These notes explain how DBMS_PREPROCESSOR works with the three subprogram styles.

- For subprograms of the first style, the status of the stored PL/SQL unit does not need to be VALID. Likewise, the source text passed in as a VARCHAR2 string or a
VARCHAR2 index-by table may contain compile time errors. If errors are found when generating the post-processed source, the error message text will also appear at the end of the post-processed source text. In some cases, the preprocessing can be aborted because of errors. When this happens, the post-processed source text will appear to be incomplete and the associated error message can help to indicate that an error has occurred during preprocessing.

- For subprograms of the second or third style, the source text can represent any arbitrary PL/SQL compilation unit. However, the source text of a valid PL/SQL compilation unit cannot include commonly used prefixes such as `CREATE OR REPLACE`. In general, the input source should be syntactically prepared in a way as if it were obtained from the `ALL_SOURCE` view. The following list gives some examples of valid initial syntax for some PL/SQL compilation units.

```
anonymous block   (BEGIN | DECLARE) ...
package           PACKAGE <name> ...
package body      PACKAGE BODY <name> ...
procedure         PROCEDURE <name> ...
function          FUNCTION <name> ...
type              TYPE <name> ...
type body         TYPE BODY <name> ...
trigger           (BEGIN | DECLARE) ...
```

If the source text represents a named PL/SQL unit that is valid, that unit will not be created after its post-processed source text is generated.

- If the text of a wrapped PL/SQL unit is obtained from the `ALL_SOURCE` view, the keyword `WRAPPED` always immediately follows the name of the unit, as in this example:

```
PROCEDURE "some proc" WRAPPED
a000000
b2
...
```

If such source text is presented to one of the `GET_POST_PROCESSED_SOURCE Functions` or to one of the `PRINT_POST_PROCESSED_SOURCE Procedures`, the exception `DBMS_PREPROCESSOR.WRAPPED_INPUT` is raised.

### 122.3 DBMS_PREPROCESSOR Data Structures

The `DBMS_PREPROCESSOR` package defines a `TABLE` type.

#### Table Types

**SOURCE_LINES_T Table Type**

### 122.3.1 DBMS_PREPROCESSOR SOURCE_LINES_T Table Type

This table type stores lines of post-processed source text. It is used to hold PL/SQL source text both before and after it is processed. It is especially useful in cases in which the amount of text exceeds 32K.

**Syntax**

```
TYPE source_lines_t IS
    TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```
122.4 Summary of DBMS_PREPROCESSOR Subprograms

This table lists the DBMS_PREPROCESSOR subprograms and briefly describes them.

Table 122-1  DBMS_PREPROCESSOR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET_POST_PROCESSED_SOURCE Functions</td>
<td>Returns the post-processed source text</td>
</tr>
<tr>
<td>PRINT_POST_PROCESSED_SOURCE Procedures</td>
<td>Prints post-processed source text</td>
</tr>
</tbody>
</table>

122.4.1 GET_POST_PROCESSED_SOURCE Functions

This overloaded function returns the post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Returns post-processed source text of a stored PL/SQL unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (  
    object_type    IN VARCHAR2,  
    schema_name    IN VARCHAR2,  
    object_name    IN VARCHAR2)  
RETURN source_lines_t;
```

Returns post-processed source text of a compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (  
    source        IN VARCHAR2)  
RETURN source_lines_t;
```

Returns post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

```
DBMS_PREPROCESSOR.GET_POST_PROCESSED_SOURCE (  
    source        IN source_lines_t)  
RETURN source_lines_t;
```

Parameters

Table 122-2  GET_POST_PROCESSED_SOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object. Case insensitive. If a quoted identifier is used.</td>
</tr>
<tr>
<td>source</td>
<td>The source text of the compilation unit</td>
</tr>
</tbody>
</table>
Table 122-2  (Cont.) GET_POST_PROCESSED_SOURCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_lines_t</td>
<td>INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.</td>
</tr>
</tbody>
</table>

Return Values

The function returns an INDEX-BY table containing the lines of the post-processed source text starting from index 1.

Usage Notes

- Newline characters are not removed.
- Each line in the post-processed source text is mapped to a row in the INDEX-BY table.
- In the post-processed source, unselected text will have blank lines.

Exceptions

Table 122-3  GET_POST_PROCESSED_SOURCE Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24234</td>
<td>Insufficient privileges or object does not exist</td>
</tr>
<tr>
<td>ORA-24235</td>
<td>Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.</td>
</tr>
<tr>
<td>ORA-24236</td>
<td>The source text is empty</td>
</tr>
<tr>
<td>ORA-00931</td>
<td>Missing identifier. The object_name should not be NULL.</td>
</tr>
<tr>
<td>ORA-06502</td>
<td>Numeric or value error:</td>
</tr>
<tr>
<td></td>
<td>• Character string buffer too small</td>
</tr>
<tr>
<td></td>
<td>• A line is too long (&gt; 32767 bytes)</td>
</tr>
</tbody>
</table>

122.4.2 PRINT_POST_PROCESSED_SOURCE Procedures

This overloaded procedure calls DBMS_OUTPUT.PUT_LINE to let you view post-processed source text. The different functionality of each form of syntax is presented along with the definition.

Syntax

Prints post-processed source text of a stored PL/SQL unit:

```sql
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (  
    object_type    IN VARCHAR2,  
    schema_name    IN VARCHAR2,  
    object_name    IN VARCHAR2);  
```

Prints post-processed source text of a compilation unit:
DBMS_PREPROCESSOR.PRINT_POST_PROCESSED_SOURCE (  
  source        IN VARCHAR2);

Prints post-processed source text of an INDEX-BY table containing the source text of the compilation unit:

DBMS_Preprocessor.Print_Post_Processed_Source (  
  source        IN source_lines_t);

Parameters

Table 122-4  PRINT_POST_PROCESSED_SOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Must be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER. Case sensitive.</td>
</tr>
<tr>
<td>schema_name</td>
<td>The schema name. Case insensitive unless a quoted identifier is used. If NULL, use current schema.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object. The object_type is always case insensitive. Case insensitive unless a quoted identifier is used.</td>
</tr>
<tr>
<td>source</td>
<td>The source text of the compilation unit</td>
</tr>
<tr>
<td>source_lines_t</td>
<td>INDEX-BY table containing the source text of the compilation unit. The source text is a concatenation of all the non-NULL INDEX-BY table elements in ascending index order.</td>
</tr>
</tbody>
</table>

Exceptions

Table 122-5  PRINT_POST_PROCESSED_SOURCE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-24234</td>
<td>Insufficient privileges or object does not exist</td>
</tr>
<tr>
<td>ORA-24235</td>
<td>Bad value for object type. Should be one of PACKAGE, PACKAGE BODY, PROCEDURE, FUNCTION, TYPE, TYPE, BODY or TRIGGER.</td>
</tr>
<tr>
<td>ORA-24236</td>
<td>The source text is empty</td>
</tr>
<tr>
<td>ORA-00931</td>
<td>Missing identifier. The object_name should not be NULL.</td>
</tr>
<tr>
<td>ORA-06502</td>
<td>Numeric or value error:</td>
</tr>
<tr>
<td></td>
<td>• Character string buffer too small</td>
</tr>
<tr>
<td></td>
<td>• A line is too long (&gt; 32767 bytes)</td>
</tr>
</tbody>
</table>

Usage Notes

The index-by table may contain holes. NULL elements are ignored when doing the concatenation.
The `DBMS_PRIVILEGE_CAPTURE` package provides an interface to database privilege analysis.

**See Also:**

*Oracle Database Vault Administrator's Guide* regarding on how to analyze the use of privilege grants

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Examples
- Summary of `DBMS_PRIVILEGE_CAPTURE` Subprograms

### 123.1 DBMS_PRIVILEGE_CAPTURE Overview

Database privilege analysis enables you to create a policy that records the usage of system and object privileges that have been granted to users. You then can determine the privileges that your users are using and not using. From there, you can revoke any unused privileges, thereby reducing the number of excess privilege grants for users.

By analyzing the privileges that users must have to perform specific tasks, privilege analysis policies help you to achieve a least privilege model for your users.

### 123.2 DBMS_PRIVILEGE_CAPTURE Security Model

The privilege analysis administrator role, `CAPTURE_ADMIN`, is granted `EXECUTE` permission on the `DBMS_PRIVILEGE_CAPTURE` package by default.

The `CAPTURE_ADMIN` role is granted to the `DBA` role during database installation.

### 123.3 DBMS_PRIVILEGE_CAPTURE Constants

The `DBMS_PRIVILEGE_CAPTURE` package defines several enumerated constants for specifying parameter values.
Table 123-1  DBMS_PRIVILEGE_CAPTURE Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>G_DATABASE</td>
<td>1</td>
<td>NUMBER</td>
<td>Analyzes all privilege use, except privileges used by the SYS user.</td>
</tr>
<tr>
<td>G_ROLE</td>
<td>2</td>
<td>NUMBER</td>
<td>Analyzes privilege use for the specified roles.</td>
</tr>
<tr>
<td>G_CONTEXT</td>
<td>3</td>
<td>NUMBER</td>
<td>Analyzes privilege use when the condition parameter evaluates to true.</td>
</tr>
<tr>
<td>G_ROLE_AND_CONTEXT</td>
<td>4</td>
<td>NUMBER</td>
<td>Analyzes privilege use for the specified roles when the condition parameter evaluates to true.</td>
</tr>
</tbody>
</table>

123.4 DBMS_PRIVILEGE_CAPTURE Examples

These examples illustrate using the DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE procedure to create various types of privilege analysis, like database analysis, role analysis, and context-specific analysis. The examples also illustrate combining different conditions in context-specific analysis.

```
--Create a database privilege analysis policy
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name => 'all_priv_analysis_pol',
    description => 'database-wide policy to analyze all privileges',
    type => DBMS_PRIVILEGE_CAPTURE.G_DATABASE);
END;

--Create a privilege analysis policy to analyze privileges from the role PUBLIC
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name => 'pub_analysis_pol',
    description => 'Policy to record privilege use by PUBLIC',
    type => DBMS_PRIVILEGE_CAPTURE.G_ROLE,
    roles => role_name_list('PUBLIC'));
END;

-- Create a policy to analyze privileges from the application module, "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name => 'acc_pay_analysis_pol',
    type => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable''');
END;

-- Create a policy that records privileges for session user APPS when running the application module "Account Payable"
BEGIN
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE(
    name => 'acc_pay_analysis_pol',
    type => DBMS_PRIVILEGE_CAPTURE.G_CONTEXT,
    condition => 'SYS_CONTEXT(''USERENV'', ''MODULE'') = ''Account Payable'' AND
```
123.5 Summary of DBMS_PRIVILEGE_CAPTURE Subprograms

This table lists and briefly describes the DBMS_PRIVILEGE_CAPTURE package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAPTURE_DEPENDENCY_PRIVS</td>
<td>Captures the privileges that are used by definer’s rights and invoker’s rights PL/SQL program units for compilation.</td>
</tr>
<tr>
<td>CREATE_CAPTURE Procedure</td>
<td>Creates a policy that specifies the conditions for analyzing privilege use.</td>
</tr>
<tr>
<td>DELETE_RUN Procedure</td>
<td>Deletes a privilege analysis capture run</td>
</tr>
<tr>
<td>DISABLE_CAPTURE Procedure</td>
<td>Stops the recording of privilege use for a specified privilege analysis policy</td>
</tr>
<tr>
<td>DROP_CAPTURE Procedure</td>
<td>Removes a privilege analysis policy together with the data recorded</td>
</tr>
<tr>
<td>ENABLE_CAPTURE Procedure</td>
<td>Starts the recording of privilege analysis for a specified privilege analysis policy</td>
</tr>
<tr>
<td>GENERATE_RESULT Procedure</td>
<td>Populates the privilege analysis data dictionary views with data</td>
</tr>
</tbody>
</table>

123.5.1 CAPTURE_DEPENDENCY_PRIVS Procedure

This procedure captures the privileges that are used by definer’s rights and invoker’s rights PL/SQL program units for compilation.

Syntax

DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS ();

Parameters

This procedure has no parameters.

Usage Notes

Every rerun of the DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS procedure deletes any existing records from the privilege analysis data dictionary views. It then recaptures records based on the existing PL/SQL program units.
123.5.2 CREATE_CAPTURE Procedure

This procedure creates a privilege analysis policy that specifies the conditions for analyzing privilege use. It also optionally specifies the roles for which privilege use is to be analyzed, and the conditions under which privilege use is to be analyzed.

Syntax

```sql
DBMS_PRIVILEGE_CAPTURE.CREATE_CAPTURE (
    name            IN  VARCHAR2,
    description     IN  VARCHAR2 DEFAULT NULL,
    type            IN  NUMBER DEFAULT G_DATABASE,
    roles           IN  ROLE_NAME_LIST DEFAULT ROLE_NAME_LIST(),
    condition       IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy. A string of size up to 30 characters.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the policy (up to 1024 characters)</td>
</tr>
<tr>
<td>type</td>
<td>Type of the privilege analysis policy. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- G_DATABASE: Captures all privilege use in the database, except privileges used by the SYS user.</td>
</tr>
<tr>
<td></td>
<td>- G_ROLE: Captures the use of a privilege if the privilege is part of a specified role or list of roles.</td>
</tr>
<tr>
<td></td>
<td>- G_CONTEXT: Captures the use of a privilege if the context specified by the condition parameter evaluates to true.</td>
</tr>
<tr>
<td></td>
<td>- G_ROLE_AND_CONTEXT: Captures the use of a privilege if the privilege is part of the specified list of roles and when the condition specified by the condition parameter is true.</td>
</tr>
<tr>
<td>roles</td>
<td>The roles whose privileges are to be analyzed. Required if the type is G_ROLE or G_ROLE_AND_CONTEXT.</td>
</tr>
<tr>
<td>condition</td>
<td>PL/SQL boolean expression containing up to 4000 characters. Required if type is G_CONTEXT or G_ROLE_AND_CONTEXT. Note that the boolean expression can only contain SYS_CONTEXT, but not other functions.</td>
</tr>
</tbody>
</table>

Usage Notes

- When using role-based analysis for the CREATE_CAPTURE procedure, privilege use is analyzed even if the privilege is indirectly granted to the specified role.

  For example, say role R2 contains role R1, and R1 contains privilege P1. If the privilege policy includes only role R2, any use of the P1 privilege is still analyzed, as privilege P1 is an indirect part of role R2.

- When using the condition parameter, use the following syntax for the PL/SQL expression:

  ```sql
  condition::= predicate | (predicate1) AND (predicate2) | (predicate1) OR (predicate2)
  ```
WHERE,

\[
\begin{align*}
\text{predicate} &::= \text{sys_context}(\text{namespace}, \text{attribute}) \; \text{rel}$op$ \; \text{constant_value} \\
&| \text{sys_context}(\text{namespace}, \text{attribute}) \; \text{between} \; \text{constant_value} \; \text{and} \; \text{constant_value} \\
&| \text{sys_context}(\text{namespace}, \text{attribute}) \; \text{in} \{\text{constant_value} \,, \text{constant_value}^{*} \} \\
\end{align*}
\]

WHERE,

\[
\text{rel}$op$ ::= = | < | <= | > | >= | <> \\
\]

- A privilege analysis policy cannot analyze the use of SY$S$ user privileges.

### 123.5.3 DELETE_RUN Procedure

This procedure deletes a privilege analysis capture run.

**Syntax**

```sql
DBMS_PRIVILEGE_CAPTURE.DELETE_RUN (name IN VARCHAR2, run_name IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy with which the capture run is associated</td>
</tr>
<tr>
<td>run_name</td>
<td>Name of the capture run</td>
</tr>
</tbody>
</table>

**Usage Notes**

- You can find the names of existing privilege capture policies by querying the `DBA_PRIV_CAPTURES` data dictionary view.
- Another way to delete a capture run is to drop the policy with which the capture run is associated. Dropping the policy automatically drops its associated capture runs.
- When you drop a capture run it is no longer accessible through the privilege capture data dictionary views.

### 123.5.4 DISABLE_CAPTURE Procedure

This procedure stops the recording of privilege use for a specified privilege analysis policy. When a policy is disabled, privilege use meeting the policy condition is no longer recorded.

**Syntax**

```sql
DBMS_PRIVILEGE_CAPTURE.DISABLE_CAPTURE (name IN VARCHAR2);
```
Parameters

Table 123-5  DISABLE_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy to be disabled</td>
</tr>
</tbody>
</table>

Usage Notes

When a privilege analysis policy is first created, it is disabled by default.

123.5.5 DROP_CAPTURE Procedure

This procedure removes a privilege analysis policy together with the data recorded. When a policy is removed, all previously recorded privilege use data associated with the policy is deleted.

Syntax

```sql
DBMS_PRIVILEGE_CAPTURE.DROP_CAPTURE (独角兽 IN VARCHAR2);
```

Parameters

Table 123-6  DROP_CAPTURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy to be removed</td>
</tr>
</tbody>
</table>

Usage Notes

- You must disable a privilege analysis policy before removing it. An enabled policy cannot be removed.
- If there are capture runs associated with this policy, then they are automatically dropped when you drop the policy.

123.5.6 ENABLE_CAPTURE Procedure

This procedure starts the recording of privilege analysis for a specified privilege analysis policy and optionally provides a capture run for this policy. After a policy is enabled, all privilege use under the policy condition is recorded.

Syntax

```sql
DBMS_PRIVILEGE_CAPTURE.ENABLE_CAPTURE (独角兽 IN VARCHAR2,
run_name IN VARCHAR2 DEFAULT NULL);
```
**Parameters**

Table 123-7  
**ENABLE_CAPTURE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy to be enabled</td>
</tr>
<tr>
<td>run_name</td>
<td>Name of the capture run to associate with this policy, less than 128 characters. Enclose exotic characters in double quotation marks.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following usage notes apply:

- When a privilege analysis policy is first created, it is disabled by default. You must run `ENABLE_CAPTURE` to enable the privilege analysis policy.
- You can enable only one privilege analysis policy at a time. However, a database-wide privilege analysis of the `G_DATABASE` type can be enabled together with another non `G_DATABASE` privilege analysis.
- You cannot enable the same run multiple times. For example, `run_01` cannot be used again if you want to re-enable the capture for `run_01`. Instead, create a new run.

### 123.5.7 GENERATE_RESULT Procedure

This procedure populates the privilege analysis data dictionary views with data.

**See Also:**

*Oracle Database Vault Administrator's Guide* for more information about privilege analysis views.

**Syntax**

```sql
DBMS_PRIVILEGE_CAPTURE.GENERATE_RESULT (  
    name IN VARCHAR2,  
    run_name IN VARCHAR2 DEFAULT NULL,  
    DEPENDENCY IN BOOLEAN DEFAULT NULL);
```

**Parameters**

Table 123-8  
**GENERATE_RESULT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the privilege analysis policy for which views are populated</td>
</tr>
</tbody>
</table>
Table 123-8 (Cont.) GENERATE_RESULT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_name</td>
<td>Name of the capture run that is associated with the privilege analysis policy. If you omit this parameter, then the records of all created runs will be analyzed. When you specify the run_name parameter, only the records of that run are analyzed and all other runs are unaffected.</td>
</tr>
<tr>
<td>dependency</td>
<td>Enter Y (yes) or N (no) to indicate if PL/SQL compilation privileges, set by the DBMS_PRIVILEGE_CAPTURE.CAPTURE_DEPENDENCY_PRIVS procedure, should be included in the report.</td>
</tr>
</tbody>
</table>

Usage Notes

You must disable a privilege analysis policy before populating the privilege analysis views for the policy. You cannot invoke this subprogram on an enabled privilege analysis policy.
The DBMS_PROCESS package provides an interface to manage the prespawned servers.

This chapter contains the following topics:

- DBMS_PROCESS Overview
- DBMS_PROCESS Security Model
- Summary of DBMS_PROCESS Subprograms

124.1 DBMS_PROCESS Overview

By default, Oracle Database can prespawn foreground processes to improve the performance of client connections.

A prespawned process refers to a process that has been spawned but does not have a session yet. When a user connects to the database or a service process is needed, the process performs further initialization as needed.

To manage foreground processes, use the DBMS_PROCESS package. The procedures in this package configure the number of foreground processes for a connection pool, start a connection pool, and stop a connection pool.

See Also:

- Oracle Database Administrator’s Guide for a detailed description of managing a pre-created processes
- Oracle Database Reference for information about the USEDEDICATEDBROKER parameter, which determines how dedicated servers are spawned. TRUE enables the listener to send the connection to a dedicated connection broker that spawns the dedicated server. FALSE sets the listener to spawn a dedicated server directly.

124.2 DBMS_PROCESS Security Model

You must be granted the SYSDBA administrative privilege to use the DBMS_PROCESS package.
124.3 Summary of DBMS_PROCESS Subprograms

This table lists the DBMS_PROCESS subprograms and briefly describes them.

Table 124-1  DBMS_PROCESS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONFIGURE_POOL Procedure</td>
<td>Configures the minimum number of prespawned processes, the number of prespawned processes in a batch, and the initial number of pre-spawned processes for a foreground connection pool.</td>
</tr>
<tr>
<td>START_POOL Procedure</td>
<td>Starts a prespawned foreground process pool.</td>
</tr>
<tr>
<td>STOP_POOL Procedure</td>
<td>Stops a prespawned foreground process pool.</td>
</tr>
</tbody>
</table>

124.3.1 CONFIGURE_POOL Procedure

This procedure configures the minimum number of prespawned processes, the number of prespawned processes in a batch, and the initial number of pre-spawned processes for a foreground connection pool.

Syntax

```sql
DBMS_PROCESS.CONFIGURE_POOL(
    pool_name       IN  VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL",
    min_count       IN  NUMBER DEFAULT 10,
    batch_count     IN  NUMBER DEFAULT 20,
    init_count      IN  NUMBER DEFAULT 0);
```

Parameters

Table 124-2  CONFIGURE_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Name of the foreground pool</td>
</tr>
<tr>
<td>min_count</td>
<td>Count after which a batch of prespawned processes will be spawned in the pool (default 10; maximum number of processes 64,000)</td>
</tr>
<tr>
<td>batch_count</td>
<td>Batch of prespawned servers to be spawned in the pool (default 20). The total value of the min_count and batch_count values cannot exceed the PROCESSES parameter value.</td>
</tr>
<tr>
<td>init_count</td>
<td>Set of prespawned servers to be spawned in startup, or before a storm of connections, spawned in batches (default 0). Do not exceed the PROCESSES parameter value.</td>
</tr>
</tbody>
</table>
Exceptions

Table 124-3 CONFIGURE_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-456</td>
<td>Prespawn not enabled</td>
</tr>
<tr>
<td>ORA-457</td>
<td>Prespawn pool not found</td>
</tr>
<tr>
<td>ORA-458</td>
<td>Prespawn pool already started</td>
</tr>
<tr>
<td>ORA-459</td>
<td>Prespawn pool not started</td>
</tr>
<tr>
<td>ORA-460</td>
<td>Process pool invalid configuration value(s)</td>
</tr>
</tbody>
</table>

Usage Notes

- To find information about foreground processes, query the `V$PROCESS_POOL` dynamic view.

Example

```
BEGIN
  DBMS_PROCESS.CONFIGURE_POOL (  
    pool_name   => 'hrdb_pool',
    min_count   => 40,
    batch_count => 20,
    init_count  => 10);
END;
/
```

124.3.2 START_POOL Procedure

This procedure starts a prespawned foreground process pool.

Syntax

```
DBMS_PROCESS.START_POOL (  
  pool_name IN VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

Parameters

Table 124-4 START_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Name of prespawned foreground process pool. To find existing pools, query the V$PROCESS_POOL dynamic view.</td>
</tr>
</tbody>
</table>

Exceptions

Table 124-5 START_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-457</td>
<td>Prespawn pool not found</td>
</tr>
</tbody>
</table>
Table 124-5  (Cont.) START_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-458</td>
<td>Prespawn pool already started</td>
</tr>
<tr>
<td>ORA-459</td>
<td>Prespawn pool not started</td>
</tr>
</tbody>
</table>

**Example**

```sql
BEGIN
    DBMS_PROCESS.START_POOL (pool_name => 'hrdb_pool',
END;
```

### 124.3.3 STOP_POOL Procedure

This procedure stops a prespawned foreground process pool.

**Syntax**

```sql
DBMS_PROCESS.STOP_POOL (pool_name IN VARCHAR2 DEFAULT "SYS_DEFAULT_FOREGROUND_POOL");
```

**Parameters**

Table 124-6  STOP_POOL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pool_name</td>
<td>Name of the prespawned foreground process pool. To find existing pools, query the V$PROCESS_POOL dynamic view.</td>
</tr>
</tbody>
</table>

**Exceptions**

Table 124-7  STOP_POOL Procedure Exceptions

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-457</td>
<td>Prespawn pool not found</td>
</tr>
<tr>
<td>ORA-458</td>
<td>Prespawn pool already started</td>
</tr>
<tr>
<td>ORA-459</td>
<td>Prespawn pool not started</td>
</tr>
</tbody>
</table>

**Example**

```sql
BEGIN
    DBMS_PROCESS.STOP_POOL (pool_name => 'hrdb_pool',
END;
```
The package provides an interface to profile existing PL/SQL applications and identify performance bottlenecks. You can then collect and persistently store the PL/SQL profiler data.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Exceptions
- Summary of DBMS_PROFILER Subprograms

### 125.1 DBMS_PROFILER Overview

This package enables the collection of profiler (performance) data for performance improvement or for determining code coverage for PL/SQL applications. Application developers can use code coverage data to focus their incremental testing efforts.

With this interface, you can generate profiling information for all named library units that are executed in a session. The profiler gathers information at the PL/SQL virtual machine level. This information includes the total number of times each line has been executed, the total amount of time that has been spent executing that line, and the minimum and maximum times that have been spent on a particular execution of that line.

Note:

It is possible to infer the code coverage figures for PL/SQL units for which data has been collected.

The profiling information is stored in database tables. This enables querying on the data: you can build customizable reports (summary reports, hottest lines, code coverage data, and so on. And you can analyze the data.

The `PROFTAB.SQL` script creates tables with the columns, datatypes, and definitions as shown in the following tables.

<table>
<thead>
<tr>
<th>Table 125-1  Columns in Table PLSQL_PROFILER_RUNS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column</td>
</tr>
<tr>
<td>runid</td>
</tr>
<tr>
<td>related_run</td>
</tr>
</tbody>
</table>
### Table 125-1  (Cont.) Columns in Table PLSQL_PROFILER_RUNS

<table>
<thead>
<tr>
<th>Column</th>
<th>Datatype</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_owner</td>
<td>VARCHAR2(128)</td>
<td>User who started run</td>
</tr>
<tr>
<td>run_date</td>
<td>DATE</td>
<td>Start time of run</td>
</tr>
<tr>
<td>run_comment</td>
<td>VARCHAR2(2047)</td>
<td>User provided comment for this run</td>
</tr>
<tr>
<td>run_total_time</td>
<td>NUMBER</td>
<td>Elapsed time for this run in nanoseconds</td>
</tr>
<tr>

</tbody>
</table>
With Oracle database version 8.x, a sample textual report writer (profrep.sql) is provided with the PL/SQL demo scripts.

Note that prior to Oracle Database 10g, the DBMS_PROFILER package was not automatically loaded when the database was created, and the Oracle-supplied PROFLOAD.SQL script was used to create it. In 10g and beyond, the DBMS_PROFILER package is loaded automatically when the database is created, and PROFLOAD.SQL is no longer needed.

125.2 DBMS_PROFILER Security Model

The profiler only gathers data for units for which a user has CREATE privilege; you cannot use the package to profile units for which EXECUTE ONLY access has been granted. In general, if a user can debug a unit, the same user can profile it. However, a unit can be profiled whether or not it has been compiled Debug. Oracle advises that modules that are being profiled should be compiled Debug, since this provides additional information about the unit in the database.

Note:

DBMS_PROFILER treats any program unit that is compiled in NATIVE mode as if you do not have CREATE privilege, that is, you will not get any output.

125.3 DBMS_PROFILER Operational Notes

These notes describe a typical run, how to interpret output, and two methods of exception generation.

Typical Run

Improving application performance is an iterative process. Each iteration involves the following steps:

1. Running the application with one or more benchmark tests with profiler data collection enabled.
2. Analyzing the profiler data and identifying performance problems.
3. Fixing the problems.

The PL/SQL profiler supports this process using the concept of a “run”. A run involves running the application through benchmark tests with profiler data collection enabled. You can control the beginning and the ending of a run by calling the START_PROFILER and STOP_PROFILER functions.

The user must first create database tables in the profiler user’s schema to collect the data. The PROFTAB.SQL script creates the tables and other data structures required for persistently storing the profiler data.

Note that running PROFTAB.SQL drops the current tables. The PROFTAB.SQL script is in the RDBMS/ADMIN directory. Some PL/SQL operations, such as the first execution of a PL/SQL unit, may involve I/O to catalog tables to load the byte code for the PL/SQL unit being executed. Also, it may take some time executing package initialization code the first time a package procedure or function is called.
To avoid timing this overhead, "warm up" the database before collecting profile data. To do this, run the application once without gathering profiler data.

You can allow profiling across all users of a system, for example, to profile all users of a package, independent of who is using it. In such cases, the SYSADMIN should use a modified PROFTAB.SQL script which:

- Creates the profiler tables and sequence
- Grants SELECT/INSERT/UPDATE on those tables and sequence to all users
- Defines public synonyms for the tables and sequence

**Note:**

Do not alter the actual fields of the tables.

A typical run then involves:

- Starting profiler data collection in the run.
- Executing PL/SQL code for which profiler and code coverage data is required.
- Stopping profiler data collection, which writes the collected data for the run into database tables

**Note:**

The collected profiler data is not automatically stored when the user disconnects. You must issue an explicit call to the FLUSH_DATA or the STOP_PROFILER function to store the data at the end of the session. Stopping data collection stores the collected data.

As the application executes, profiler data is collected in memory data structures that last for the duration of the run. You can call the FLUSH_DATA function at intermediate points during the run to get incremental data and to free memory for allocated profiler data structures. Flushing the collected data involves storing collected data in the database tables created earlier.

**See Also:**

"FLUSH_DATA Function and Procedure".

**Interpreting Output**

The table plsql_profiler_data contains one row for each line of the source unit for which code was generated. The line# value specifies which source line. If the row exists, and the total_occur value in that row is > 0, some code associated with that line was executed. If the row exists, and total_occur value is 0, no code associated with that line was executed. If the row doesn't exist in the table, no code was generated for that line, and therefore it should not be mentioned in reports.
If the source of a single statement is on a single line, any code generated for that statement will be attributed to that line number. (In some cases, such as a simple declaration, or because of optimization, no code will be needed). To get coverage information, units should be compiled with `PLSQL_OPTIMIZE_LEVEL=1`.

If a statement spans multiple lines, any code generated for that statement will be attributed to some line in the range, but it is not guaranteed that every line in the range will have code attributed to it. In such a case there will be gaps in the set of line# values. In particular, multi-line SQL-related statements may appear to be on a single line (usually the first). This is because PL/SQL passes the processed text of the cursor to the SQL engine; therefore, as far as PL/SQL is concerned, the entire SQL statement is a single indivisible operation.

When multiple statements are on the same line, the profiler will combine the occurrences for each statement. This may be confusing if a line has embedded control flow. For example, if 'then ...' and 'else ...' are on the same line, it will not be possible to determine whether the 'then' or the 'else' was taken.

In general, profiler and coverage reports are most easily interpreted if each statement is on its own line.

**Two Methods of Exception Generation**

Each routine in this package has two versions that allow you to determine how errors are reported.

- A function that returns success/failure as a status value and will never raise an exception
- A procedure that returns normally if it succeeds and raises an exception if it fails

In each case, the parameters of the function and procedure are identical. Only the method by which errors are reported differs. If there is an error, there is a correspondence between the error codes that the functions return, and the exceptions that the procedures raise.

To avoid redundancy, the following section only provides details about the functional form.

**125.4 DBMS_PROFILER Exceptions**

DBMS_PROFILER throws the exceptions described in this topic.

**Table 125-4  DBMS_PROFILER Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>version_mismatch</td>
<td>Corresponds to error_version.</td>
</tr>
<tr>
<td>profiler_error</td>
<td>Corresponds to either &quot;error_param&quot; or &quot;error_io&quot;.</td>
</tr>
</tbody>
</table>

A 0 return value from any function denotes successful completion; a nonzero return value denotes an error condition. The possible errors are as follows:

- 'A subprogram was called with an incorrect parameter.'

  ```sql
  error_param constant binary_integer := 1;
  ```
• 'Data flush operation failed. Check whether the profiler tables have been created, are accessible, and that there is adequate space.'

```plaintext
error_io constant binary_integer := 2;
```

• There is a mismatch between package and database implementation. Oracle returns this error if an incorrect version of the **DBMS_PROFILER** package is installed, and if the version of the profiler package cannot work with this database version. The only recovery is to install the correct version of the package.

```plaintext
error_version constant binary_integer := -1;
```

### 125.5 Summary of DBMS_PROFILER Subprograms

This table lists the **DBMS_PROFILER** subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLUSH_DATA Function and Procedure</td>
<td>Flushes profiler data collected in the user's session</td>
</tr>
<tr>
<td>GET_VERSION Procedure</td>
<td>Gets the version of this API</td>
</tr>
<tr>
<td>INTERNAL_VERSION_CHECK Function</td>
<td>Verifies that this version of the <strong>DBMS_PROFILER</strong> package can work with the implementation in the database</td>
</tr>
<tr>
<td>PAUSE_PROFILER Function and Procedure</td>
<td>Pauses profiler data collection</td>
</tr>
<tr>
<td>RESUME_PROFILER Function and Procedure</td>
<td>Resumes profiler data collection</td>
</tr>
<tr>
<td>START_PROFILER Functions and Procedures</td>
<td>Starts profiler data collection in the user's session</td>
</tr>
<tr>
<td>STOP_PROFILER Function and Procedure</td>
<td>Stops profiler data collection in the user's session</td>
</tr>
</tbody>
</table>

#### 125.5.1 FLUSH_DATA Function and Procedure

This function flushes profiler data collected in the user's session. The data is flushed to database tables, which are expected to preexist.

**Note:**

Use the **PROFTAB.SQL** script to create the tables and other data structures required for persistently storing the profiler data.

**Syntax**

```plaintext
DBMS_PROFILER.FLUSH_DATA RETURN BINARY_INTEGER;

DBMS_PROFILER.FLUSH_DATA;
```
125.5.2 GET_VERSION Procedure

This procedure gets the version of this API.

Syntax

```
DBMS_PROFILER.GET_VERSION (
    major  OUT BINARY_INTEGER,
    minor  OUT BINARY_INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>major</td>
<td>Major version of DBMS_PROFILER.</td>
</tr>
<tr>
<td>minor</td>
<td>Minor version of DBMS_PROFILER.</td>
</tr>
</tbody>
</table>

125.5.3 INTERNAL_VERSION_CHECK Function

This function verifies that this version of the DBMS_PROFILER package can work with the implementation in the database.

Syntax

```
DBMS_PROFILER.INTERNAL_VERSION_CHECK
    RETURN BINARY_INTEGER;
```

125.5.4 PAUSE_PROFILER Function and Procedure

This function pauses profiler data collection.

Syntax

```
DBMS_PROFILER.PAUSE_PROFILER
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.PAUSE_PROFILER;
```

125.5.5 RESUME_PROFILER Function and Procedure

This function resumes profiler data collection.

Syntax

```
DBMS_PROFILER.RESUME_PROFILER
    RETURN BINARY_INTEGER;
```

```
DBMS_PROFILER.RESUME_PROFILER;
```
125.5.6 START_PROFILER Functions and Procedures

This function starts profiler data collection in the user's session.

There are two overloaded forms of the START_PROFILER function; one returns the run number of the started run, as well as the result of the call. The other does not return the run number. The first form is intended for use with GUI-based tools controlling the profiler.

**Syntax**

```sql
DBMS_PROFILER.START_PROFILER(
    run_comment   IN VARCHAR2 := sysdate,
    run_comment1  IN VARCHAR2 := '',
    run_number    OUT BINARY_INTEGER)
RETURN BINARY_INTEGER;
```

```sql
DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '')
RETURN BINARY_INTEGER;
```

```sql
DBMS_PROFILER.START_PROFILER(
    run_comment   IN VARCHAR2 := sysdate,
    run_comment1  IN VARCHAR2 := '',
    run_number    OUT BINARY_INTEGER);
```

```sql
DBMS_PROFILER.START_PROFILER(
    run_comment IN VARCHAR2 := sysdate,
    run_comment1 IN VARCHAR2 := '');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>run_comment</td>
<td>Each profiler run can be associated with a comment. For example, the comment could provide the name and version of the benchmark test that was used to collect data.</td>
</tr>
<tr>
<td>run_number</td>
<td>Stores the number of the run so you can store and later recall the run's data.</td>
</tr>
<tr>
<td>run_comment1</td>
<td>Allows you to make interesting comments about the run.</td>
</tr>
</tbody>
</table>

125.5.7 STOP_PROFILER Function and Procedure

This function stops profiler data collection in the user's session.

This function has the side effect of flushing data collected so far in the session, and it signals the end of a run.

**Syntax**

```sql
DBMS_PROFILER.STOP_PROFILER
RETURN BINARY_INTEGER;
```
The **DBMS_PROPAGATION_ADM** package, one of a set of Oracle Streams packages, provides administrative interfaces for configuring a propagation from a source queue to a destination queue.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_PROPAGATION_ADM Subprograms

### 126.1 DBMS_PROPAGATION_ADM Overview

This package provides interfaces to start, stop, and configure a propagation.

See Also:

*Oracle Streams Concepts and Administration* and *Oracle Streams Replication Administrator's Guide* for more information about this package and propagations

### 126.2 DBMS_PROPAGATION_ADM Security Model

Security on this package can be controlled by granting `EXECUTE` on this package to selected users or roles, or by granting `EXECUTE_CATALOG_ROLE` to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted `EXECUTE` privilege on the package directly. It cannot be granted through a role.

When the **DBMS_PROPAGATION_ADM** package is used to manage an Oracle Streams configuration, it requires that the user is granted the privileges of an Oracle Streams administrator.

See Also:

*Oracle Streams Concepts and Administration* for information about configuring an Oracle Streams administrator
126.3 Summary of DBMS_PROPAGATION_ADM Subprograms

This table lists the DBMS_PROPAGATION_ADM subprograms and briefly describes them.

Table 126-1  DBMS_PROPAGATION_ADM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_PROPAGATION Procedure</td>
<td>Adds, alters, or removes a rule set for a propagation</td>
</tr>
<tr>
<td>CREATE_PROPAGATION Procedure</td>
<td>Creates a propagation and specifies the source</td>
</tr>
<tr>
<td></td>
<td>queue, destination queue, and rule set for the propagation</td>
</tr>
<tr>
<td>DROP_PROPAGATION Procedure</td>
<td>Drops a propagation</td>
</tr>
<tr>
<td>START_PROPAGATION Procedure</td>
<td>Starts a propagation</td>
</tr>
<tr>
<td>STOP_PROPAGATION Procedure</td>
<td>Stops a propagation</td>
</tr>
</tbody>
</table>

**Note:**
All subprograms commit unless specified otherwise.

126.3.1 ALTER_PROPAGATION Procedure

This procedure adds, alters, or removes a rule set for a propagation.

**See Also:**
*Oracle Streams Concepts and Administration* and *DBMS_RULE_ADM* for more information about rules and rule sets

**Syntax**

```sql
DBMS_PROPAGATION_ADM.ALTER_PROPAGATION(
    propagation_name IN VARCHAR2,
    rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_rule_set IN BOOLEAN DEFAULT FALSE,
    negative_rule_set_name IN VARCHAR2 DEFAULT NULL,
    remove_negative_rule_set IN BOOLEAN DEFAULT FALSE);
```
Parameters

Table 126-2  ALTER_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are altering. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_rule_set parameter is set to FALSE, then the procedure retains any existing positive rule set. If you specify NULL and the remove_rule_set parameter is set to TRUE, then the procedure removes any existing positive rule set.</td>
</tr>
<tr>
<td>remove_rule_set</td>
<td>If TRUE, then the procedure removes the positive rule set for the specified propagation. If you remove a positive rule set for a propagation, and the propagation does not have a negative rule set, then the propagation propagates all messages. If you remove a positive rule set for a propagation, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set. If FALSE, then the procedure retains the positive rule set for the specified propagation. If the rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>
### Table 126-2  (Cont.) ALTER_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>negative_rule_set_name</td>
<td>The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.</td>
</tr>
<tr>
<td></td>
<td>If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL and the remove_negative_rule_set parameter is set to FALSE, then the procedure retains any existing negative rule set. If you specify NULL and the remove_negative_rule_set parameter is set to TRUE, then the procedure removes any existing negative rule set. If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>remove_negative_rule_set</td>
<td>If TRUE, then the procedure removes the negative rule set for the specified propagation. If you remove a negative rule set for a propagation, and the propagation does not have a positive rule set, then the propagation propagates all messages. If you remove a negative rule set for a propagation, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set. If FALSE, then the procedure retains the negative rule set for the specified propagation. If the negative_rule_set_name parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>

### 126.3.2 CREATE_PROPAGATION Procedure

This procedure creates a propagation and specifies the source queue, destination queue, and any rule set for the propagation. A propagation propagates messages in a local source queue to a destination queue. The destination queue might or might not be in the same database as the source queue.

#### Syntax

```
DBMS_PROPAGATION_ADM.CREATE_PROPAGATION(
  propagation_name           IN  VARCHAR2,
  source_queue               IN  VARCHAR2,
  destination_queue          IN  VARCHAR2,
  destination_dblink         IN  VARCHAR2  DEFAULT NULL,
  rule_set_name              IN  VARCHAR2  DEFAULT NULL,
  negative_rule_set_name     IN  VARCHAR2  DEFAULT NULL,
  queue_to_queue             IN  BOOLEAN   DEFAULT NULL,
)
```
original_propagation_name IN VARCHAR2 DEFAULT NULL,
auto_merge_threshold IN NUMBER DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are creating. A NULL setting is not allowed. Do not specify an owner.</td>
</tr>
<tr>
<td>source_queue</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue.</td>
</tr>
<tr>
<td>destination_queue</td>
<td>The name of the destination queue, specified as [schema_name.]queue_name.</td>
</tr>
<tr>
<td>destination_dblink</td>
<td>The name of the database link that will be used by the propagation. The database link is from the database that contains the source queue to the database that contains the destination queue.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the positive rule set for the propagation. The positive rule set contains the rules that instruct the propagation to propagate messages. If you want to use a positive rule set for the propagation, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a positive rule set in the hr schema named prop_rules, enter hr.prop_rules. If the schema is not specified, then the current user is the default. An error is returned if the specified rule set does not exist. You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If you specify NULL, and no negative rule set exists for the propagation, then the propagation propagates all messages in its queue. If you specify NULL, and a negative rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the negative rule set.</td>
</tr>
</tbody>
</table>

Note: Connection qualifiers are not allowed.
Table 126-3  (Cont.) CREATE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| negative_rule_set_name | The name of the negative rule set for the propagation. The negative rule set contains the rules that instruct the propagation to discard messages.  
If you want to use a negative rule set for the propagation, then you must specify an existing rule set in the form [schema_name.]rule_set_name. For example, to specify a negative rule set in the hr schema named neg_rules, enter hr.neg_rules. If the schema is not specified, then the current user is the default.  
An error is returned if the specified rule set does not exist.  
You can create a rule set and add rules to it using the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.  
If you specify NULL, and no positive rule set exists for the propagation, then the propagation propagates all messages in its queue.  
If you specify NULL, and a positive rule set exists for the propagation, then the propagation propagates all messages in its queue that are not discarded by the positive rule set.  
If you specify both a positive and a negative rule set for a propagation, then the negative rule set is always evaluated first. |
| queue_to_queue       | If TRUE or NULL, then the propagation is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.  
If FALSE, then the propagation is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. |
| original_propagation_name | Specify the original propagation name if the propagation being created is part of a split and merge operation initiated by the SPLIT_STREAMS procedure in the DBMS_STREAMS_ADM package. The split operation clones the original propagation under a new name. The name of the original propagation is important when the cloned propagation is copied back to the original stream using the MERGE_STREAMS procedure in the DBMS_STREAMS_ADM package.  
Specify NULL if the propagation being created is not part of a split and merge operation.  
See Also: SPLIT_STREAMS Procedure and MERGE_STREAMS Procedure |
Table 126-3  (Cont.) CREATE_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_merge_threshold</td>
<td>Specify a positive number if both of the following conditions are met:</td>
</tr>
<tr>
<td></td>
<td>• The propagation being created is part of a split and merge operation initiated by the <code>SPLIT_STREAMS</code> procedure in the <code>DBMS_STREAMS_ADM</code> package.</td>
</tr>
<tr>
<td></td>
<td>• The stream will be merged back to the original stream automatically.</td>
</tr>
<tr>
<td></td>
<td>Specify <code>NULL</code> if either of the following conditions are met:</td>
</tr>
<tr>
<td></td>
<td>• The propagation being created is not part of a split and merge operation.</td>
</tr>
<tr>
<td></td>
<td>• The propagation being created is part of a split and merge operation, but the stream being split off will not be merged back to the original stream automatically.</td>
</tr>
<tr>
<td>See Also:</td>
<td><code>SPLIT_STREAMS</code> Procedure and <code>MERGE_STREAMS</code> Procedure</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure starts propagation and might create a propagation job. If this procedure creates a propagation job, then it establishes a default schedule for the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

The user who owns the source queue is the user who propagates messages. This user must have the necessary privileges to propagate messages.

See Also:
- `DBMS_RULE_ADM`
- `Oracle Streams Concepts and Administration` for more information about propagations, the privileges required to propagate messages, propagation jobs, and propagation schedules

126.3.3 DROP_PROPAGATION Procedure

This procedure drops a propagation and deletes all messages for the destination queue in the source queue. This procedure also removes the schedule for propagation from the source queue to the destination queue.

Syntax

```sql
DBMS_PROPAGATION_ADM.DROP_PROPAGATION(
    propagation_name IN VARCHAR2,
    drop_unused_rule_sets IN BOOLEAN DEFAULT FALSE);
```
Parameters

Table 126-4  DROP_PROPAGATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are dropping. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>dropUnusedRuleSets</td>
<td>If TRUE, then the procedure drops any rule sets, positive and negative, used by the specified propagation if these rule sets are not used by any other Oracle Streams client, which includes capture processes, propagations, apply processes, and messaging clients. If this procedure drops a rule set, then this procedure also drops any rules in the rule set that are not in another rule set. If FALSE, then the procedure does not drop the rule sets used by the specified propagation, and the rule sets retain their rules.</td>
</tr>
</tbody>
</table>

Usage Notes

When you use this procedure to drop a propagation, information about rules created for the propagation using the DBMS_STREAMS_ADM package is removed from the data dictionary views for Oracle Streams rules. Information about such a rule is removed even if the rule is not in either rule set for the propagation.

See Also:

Oracle Streams Concepts and Administration for more information about Oracle Streams data dictionary views

The following are the data dictionary views for Oracle Streams rules:

- ALL_STREAMS_GLOBAL_RULES
- DBA_STREAMS_GLOBAL_RULES
- ALL_STREAMS_MESSAGE_RULES
- DBA_STREAMS_MESSAGE_RULES
- ALL_STREAMS_SCHEMA_RULES
- DBA_STREAMS_SCHEMA_RULES
- ALL_STREAMS_TABLE_RULES
- DBA_STREAMS_TABLE_RULES

Note:

When you drop a propagation, the propagation job used by the propagation is dropped automatically, if no other propagations are using the propagation job.
126.3.4 START_PROPAGATION Procedure

This procedure starts a propagation.

Syntax

DBMS_PROPAGATION_ADM.START_PROPAGATION(
    propagation_name  IN  VARCHAR2);

Parameter

Table 126-5  START_PROPAGATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are starting. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
</tbody>
</table>

Usage Notes

The propagation status is persistently recorded. Hence, if the status is ENABLED, then the propagation is started upon database instance startup.

126.3.5 STOP_PROPAGATION Procedure

This procedure stops a propagation.

Syntax

DBMS_PROPAGATION_ADM.STOP_PROPAGATION(
    propagation_name  IN  VARCHAR2,
    force             IN  BOOLEAN  DEFAULT FALSE);

Parameter

Table 126-6  STOP_PROPAGATION Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>propagation_name</td>
<td>The name of the propagation you are stopping. You must specify an existing propagation name. Do not specify an owner.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure stops the propagation and clears the statistics for the propagation. If FALSE, then the procedure stops the propagation without clearing the statistics for the propagation.</td>
</tr>
</tbody>
</table>

Usage Notes

The propagation status is persistently recorded. Hence, if the status is DISABLED or ABORTED, then the propagation is not started upon database instance startup.
127

DBMS_QOPATCH

The DBMS_QOPATCH package provides an interface to view the installed database patches.

This chapter contains the following topics:

- Overview
- Security Model
- Operational Notes
- Error Messages
- Summary of DBMS_QOPATCH Subprograms

127.1 DBMS_QOPATCH Overview

The DBMS_QOPATCH package provides a PLSQL/SQL interface to view the installed database patches. The interface provides all the patch information available as part of the OPATCH LSINVENTORY --XML command. The package accesses the OUI patch inventory in real time to provide patch and meta-information.

127.2 DBMS_QOPATCH Security Model

The DBMS_QOPATCH package is created as part of SYS schema and SYS is the only user who can execute these subprograms.

127.3 DBMS_QOPATCH Operational Notes

The following operational notes apply to DBMS_QOPATCH.

- The package will work only if the database is OPEN.
- In an Oracle Real Application Clusters (RAC) environment, if the subprogram requires to fetch data from other RAC nodes it spawns a job in the other node(s) to get the data. In this case JOB_QUEUE_PROCESSES needs to be >0 for the package to fetch the data from other RAC nodes.
- If there is a delay in the job execution, the package returns ORA-20008 error.

127.4 DBMS_QOPATCH Exceptions

This table lists the exceptions raised by the DBMS_QOPATCH package.
Table 127-1  DBMS_QOPATCH Error Messages

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-20001</td>
<td>Latest XML inventory is not loaded into table.</td>
</tr>
<tr>
<td>ORA-20002</td>
<td>Directory creation failed.</td>
</tr>
<tr>
<td>ORA-20003</td>
<td>Configuration of a job on a node failed.</td>
</tr>
<tr>
<td>ORA-20004</td>
<td>Job configuration failed as node is inactive.</td>
</tr>
<tr>
<td>ORA-20005</td>
<td>Job is not configured with given node, instance name.</td>
</tr>
<tr>
<td>ORA-20006</td>
<td>Number of RAC active instances and opatch jobs configured are not same.</td>
</tr>
<tr>
<td>ORA-20007</td>
<td>Job configuration failed as node or instance is not active.</td>
</tr>
<tr>
<td>ORA-20008</td>
<td>Timed out - job execution time is more than 120Secs.</td>
</tr>
<tr>
<td>ORA-20009</td>
<td>Job execution failed.</td>
</tr>
<tr>
<td>ORA-20010</td>
<td>Node is inactive and job cannot be executed.</td>
</tr>
<tr>
<td>ORA-20011</td>
<td>Job name is NULL and inventory cannot be loaded.</td>
</tr>
<tr>
<td>ORA-20012</td>
<td>JOB_QUEUEProcesses is set to zero and the inventory cannot be loaded.</td>
</tr>
<tr>
<td>ORA-20013</td>
<td>DBMS_QOPATCH ran mostly in non-install area.</td>
</tr>
<tr>
<td>ORA-20014</td>
<td>Database is not opened.</td>
</tr>
<tr>
<td>ORA-20015</td>
<td>Database opened as read-only.</td>
</tr>
</tbody>
</table>

127.5 Summary of DBMS_QOPATCH Subprograms

This table lists and briefly describes the DBMS_QOPATCH package subprograms.

Table 127-2  DBMS_QOPATCH Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CHECK_PATCH_INSTALL ED Function</td>
<td>Checks if a patch is installed.</td>
</tr>
<tr>
<td>GET_OPATCH_BUGS Function</td>
<td>Provides a bugs list for a patch in XML format if the patch number is given. If patch is not given then it lists all the bugs installed in all the patches in XML format.</td>
</tr>
<tr>
<td>GET_OPATCH_COUNT Function</td>
<td>Provides the total number of installed patches in XML format.</td>
</tr>
<tr>
<td>GET_OPATCH_DATA Function</td>
<td>Provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.</td>
</tr>
<tr>
<td>GET_OPATCH_FILES Function</td>
<td>Provides the list of files modified in the given patch number in XML format.</td>
</tr>
<tr>
<td>GET_OPATCH_INSTALL_INFO Function</td>
<td>Returns the XML element containing the ORACLE_HOME details such as patch and inventory location.</td>
</tr>
<tr>
<td>GET_OPATCH_LIST Function</td>
<td>Provides list of patches installed as an XML element from the XML inventory.</td>
</tr>
<tr>
<td>GET_OPATCH_LSINVENTORY</td>
<td>Returns whole opatch inventory as XML instance document.</td>
</tr>
</tbody>
</table>
Table 127-2  (Cont.) DBMS_QOPATCH Package Subprograms

</tr>
<tr>
<td>GET_SQLPATCH_STATUS</td>
<td>Displays the SQL patch status by querying from SQL patch registry to produce complete patch level information</td>
</tr>
<tr>
<td>IS_PATCH_INSTALLED</td>
<td>Provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory</td>
</tr>
<tr>
<td>OPATCH_COMPARE_CURRENT</td>
<td>Compares the current database with a list of bugs.</td>
</tr>
<tr>
<td>OPATCH_COMPARE_NODES</td>
<td>Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.</td>
</tr>
<tr>
<td>SET_CURRENT_OPINST</td>
<td>Sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment</td>
</tr>
</tbody>
</table>

127.5.1 CHECK_PATCH_INSTALLED Function

Checks if the patch is installed.

Syntax

```sql
DBMS_QOPATCH.CHECK_PATCH_INSTALLED (    bugs     IN QOPATCH_LIST);    RETURN VARCHAR2;
```

Parameters

Table 127-3  CHECK_PATCH_INSTALLED Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bugs</td>
<td>List of patches to be checked.</td>
</tr>
</tbody>
</table>
127.5.2 GET_OPATCH_BUGS Function

This function provides a bugs list in a patch if the patch number is given. If a patch number is not given, it lists all the bugs in the specified XML format.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_BUGS (  
    patchnum IN VARCHAR2 DEFAULT NULL);  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.3 GET_OPATCH_COUNT Function

This function provides the total number of installed patches in XML format.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_COUNT (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.4 GET_OPATCH_DATA Function

This function provides top level patch information for the patch (such as Patch ID, patch creation time) in the XML element.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_DATA (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.5 GET_OPATCH_FILES Function

This function provides the list of files modified in the given patch number in XML format.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_FILES (
    patchnum IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.6 GET_OPATCH_INSTALL_INFO Function

This function returns the XML element containing the ORACLE_HOME details such as patch and inventory location.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_INSTALL_INFO
    RETURNS XMLTYPE;
```

127.5.7 GET_OPATCH_LIST Function

This function provides list of patches installed as an XML element from the XML inventory.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_LIST
    RETURN XMLTYPE;
```
127.5.8 GET_OPATCH_LSINVENTORY

This function returns whole opatch inventory as XML instance document.

Syntax

DBMS_QOPATCH.GET_OPATCH_LSINVENTORY
RETURN XMLTYPE;

127.5.9 GET_OPATCH_OLAYS Function

This function provides overlay patches for a given patch as XML element.

Syntax

DBMS_QOPATCH.GET_OPATCH_OLAYS (patchnum IN VARCHAR2);
RETURN XMLTYPE;

Parameters

Table 127-8  GET_OPATCH_OLAYS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.10 GET_OPATCH_PREQS Function

This function provides prerequisite patches for a given patch as XML element.

Syntax

DBMS_QOPATCH.GET_OPATCH_PREQS (patchnum IN VARCHAR2);
RETURN XMLTYPE;

Parameters

Table 127-9  GET_OPATCH_PREQS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>
127.5.11 GET_OPATCH_XSLT

This function returns the style-sheet for the opatch XML inventory presentation. You can use the return type of this subprogram to perform XMLTRANSFORM and the transformed result has the same appearance as opatch text output.

Syntax

```sql
DBMS_QOPATCH.GET_OPATCH_XSLT
RETURN XMLTYPE;
```

127.5.12 GET_PATCH_DETAILS Function

Displays the detailed patch information from opatch lsinventory.

Syntax

```sql
DBMS_QOPATCH.GET_PATCH_DETAILS (    patch IN VARCHAR2);
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch</td>
<td>The patch number.</td>
</tr>
</tbody>
</table>

127.5.13 GET_SQLPATCH_STATUS Procedure

This procedure displays the SQL patch status by querying from SQL patch registry to produce complete patch level information. If the patch number is given, it displays the information specific to the given SQL patch, otherwise information for all SQL patches.

Syntax

```sql
DBMS_QOPATCH.GET_SQLPATCH_STATUS (    patchnum IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>
127.5.14 IS_PATCH_INSTALLED Function

This function provides information (such as patchID, application date, and SQL patch information) on the installed patch as XML node by querying the XML inventory.

Syntax

```sql
DBMS_QOPATCH.IS_PATCH_INSTALLED (  
    patchnum IN VARCHAR2);  
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patchnum</td>
<td>Patch number</td>
</tr>
</tbody>
</table>

127.5.15 OPATCH_COMPARE_CURRENT Function

Compares the current database with a list of bugs.

Syntax

```sql
DBMS_QOPATCH.OPATCH_COMPARE_CURRENT Function (  
    bugs IN QOPATCH_LIST);  
RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bugs</td>
<td>List of bugs to compare with the current database.</td>
</tr>
</tbody>
</table>

127.5.16 OPATCH_COMPARE_NODES Function

Compares the given RAC node(s) with the instance to the present connected node with current node. The return value indicates whether the data was refreshed or not.

Syntax

```sql
DBMS_QOPATCH.OPATCH_COMPARE_NODES (  
    node IN VARCHAR2 DEFAULT NULL,  
    inst IN VARCHAR2 DEFAULT NULL);  
RETURN VARCHAR2;
```
Parameters

Table 127-14 OPATCHCOMPARE_NODES Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>Node name</td>
</tr>
<tr>
<td>inst</td>
<td>Instance name</td>
</tr>
</tbody>
</table>

127.5.17 SET_CURRENT_OPINST Procedure

This procedure sets the node name and instance to get the inventory details specific to it in an Oracle Real Application Clusters (RAC) environment.

Syntax

```sql
DBMS_QOPATCH.SET_CURRENT_OPINST (  
    node_name   IN VARCHAR2 DEFAULT NULL,  
    inst_name   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 127-15 SET_CURRENT_OPINST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node_name</td>
<td>Name of node</td>
</tr>
<tr>
<td>inst_name</td>
<td>Name of instance</td>
</tr>
</tbody>
</table>
The **DBMS_RANDOM** package provides a built-in random number generator. **DBMS_RANDOM** is not intended for cryptography.

This chapter contains the following topics:

- Deprecated Subprograms
- Security Model
- Operational Notes
- Summary of DBMS_RANDOM Subprograms

### 128.1 DBMS_RANDOM Deprecated Subprograms

These subprograms are deprecated with Oracle Database 11g. Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

- **INITIALIZE Procedure**
- **RANDOM Function**
- **TERMINATE Procedure**

### 128.2 DBMS_RANDOM Security Model

This package should be installed as **SYS**. By default, the package is initialized with the current user name, current time down to the second, and the current session. Oracle recommends that users who need to execute this package should be given **EXECUTE** privilege explicitly and should not rely on **PUBLIC EXECUTE** privilege.

### 128.3 DBMS_RANDOM Operational Notes

These operational notes apply to DBMS_RANDOM.

- **DBMS_RANDOM.RANDOM** produces integers in \([-2^{31}, 2^{31})\).
- **DBMS_RANDOM.VALUE** produces numbers in \([0, 1)\) with 38 digits of precision.

**DBMS_RANDOM** can be explicitly initialized, but does not need to be initialized before calling the random number generator. It will automatically initialize with the date, user ID, and process ID if no explicit initialization is performed.

If this package is seeded twice with the same seed, then accessed in the same way, it will produce the same results in both cases.

In some cases, such as when testing, you may want the sequence of random numbers to be the same on every run. In that case, you seed the generator with a constant value by calling one of the overloads of **DBMS_RANDOM.SEED**. To produce different output...
for every run, simply to omit the call to "Seed" and the system will choose a suitable seed for you.

128.4 Summary of DBMS_RANDOM Subprograms

This table lists the DBMS_RANDOM subprograms and briefly describes them.

Table 128-1  DBMS_RANDOM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITIALIZE Procedure</td>
<td>Initializes the package with a seed value</td>
</tr>
<tr>
<td>NORMAL Function</td>
<td>Returns random numbers in a normal distribution</td>
</tr>
<tr>
<td>RANDOM Function</td>
<td>Generates a random number</td>
</tr>
<tr>
<td>SEED Procedures</td>
<td>Resets the seed</td>
</tr>
<tr>
<td>STRING Function</td>
<td>Gets a random string</td>
</tr>
<tr>
<td>TERMINATE Procedure</td>
<td>Terminates package</td>
</tr>
<tr>
<td>VALUE Functions</td>
<td>Gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision), while the overloaded function gets a random Oracle number x, where x is greater than or equal to low and less than high</td>
</tr>
</tbody>
</table>

128.4.1 INITIALIZE Procedure

This deprecated procedure initializes the generator.

Note:

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

```sql
DBMS_RANDOM.INITIALIZE (val IN BINARY_INTEGER);
```

Pragmas

```sql
PRAGMA restrict_references (initialize, WNDS);
```

Parameters

Table 128-2  INITIALIZE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Seed number used to generate a random number</td>
</tr>
</tbody>
</table>
Usage Notes
This procedure is obsolete as it simply calls the SEED Procedures.

128.4.2 NORMAL Function
This function returns random numbers in a standard normal distribution.

Syntax
DBMS_RANDOM.NORMAL
   RETURN NUMBER;

Pragmas
PRAGMA restrict_references (normal, WNDS);

Return Values
Table 128-3 NORMAL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number</td>
<td>Returns a random number</td>
</tr>
</tbody>
</table>

128.4.3 RANDOM Function
This deprecated procedure generates a random number.

Note:
This function is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax
DBMS_RANDOM.RANDOM
   RETURN binary_integer;

Pragmas
PRAGMA restrict_references (random, WNDS);

Return Values
Table 128-4 RANDOM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>binary_integer</td>
<td>Returns a random integer greater or equal to -power(2,31) and less than power(2,31)</td>
</tr>
</tbody>
</table>
128.4.4 SEED Procedures

This procedure resets the seed.

Syntax

DBMS_RANDOM.SEED (val IN BINARY_INTEGER);

DBMS_RANDOM.SEED (val IN VARCHAR2);

Pragmas

PRAGMA restrict_references (seed, WNDS);

Parameters

Table 128-5  SEED Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>val</td>
<td>Seed number or string used to generate a random number</td>
</tr>
</tbody>
</table>

Usage Notes

The seed can be a string up to length 2000.

128.4.5 STRING Function

This function gets a random string.

Syntax

DBMS_RANDOM.STRING (opt IN CHAR, len IN NUMBER) RETURN VARCHAR2;

Pragmas

PRAGMA restrict_references (string, WNDS);
Parameters

Table 128-6  STRING Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opt</td>
<td>Specifies what the returning string looks like:</td>
</tr>
<tr>
<td></td>
<td>• 'u', 'U' - returning string in uppercase alpha characters</td>
</tr>
<tr>
<td></td>
<td>• 'l', 'L' - returning string in lowercase alpha characters</td>
</tr>
<tr>
<td></td>
<td>• 'a', 'A' - returning string in mixed case alpha characters</td>
</tr>
<tr>
<td></td>
<td>• 'x', 'X' - returning string in uppercase alpha-numeric characters</td>
</tr>
<tr>
<td></td>
<td>• 'p', 'P' - returning string in any printable characters. Otherwise the returning string is in uppercase alpha characters.</td>
</tr>
<tr>
<td>len</td>
<td>Length of the returning string</td>
</tr>
</tbody>
</table>

Return Values

Table 128-7  STRING Function Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VARCHAR2</td>
<td>Returns a VARCHAR2</td>
</tr>
</tbody>
</table>

128.4.6 TERMINATE Procedure

When you are finished with the package, call the TERMINATE procedure.

Note:

This procedure is deprecated with Release 11gR1 and, although currently supported, it should not be used.

Syntax

DBMS_RANDOM.TERMINATE;

128.4.7 VALUE Functions

The basic function gets a random number, greater than or equal to 0 and less than 1, with 38 digits to the right of the decimal (38-digit precision). Alternatively, you can get a random Oracle number x, where x is greater than or equal to low and less than high.

Syntax

DBMS_RANDOM.VALUE
RETURN NUMBER;

DBMS_RANDOM.VALUE(
low IN NUMBER,
Parameters

Table 128-8  VALUE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>low</td>
<td>Lowest number in a range from which to generate a random number. The number generated may be equal to low.</td>
</tr>
<tr>
<td>high</td>
<td>Highest number below which to generate a random number. The number generated will be less than high.</td>
</tr>
</tbody>
</table>

Return Values

Table 128-9  VALUE Function Return Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>Returns an Oracle Number</td>
</tr>
</tbody>
</table>
The **DBMS_REDACT** package provides an interface to Oracle Data Redaction, which enables you to mask (redact) data that is returned from queries issued by low-privileged users or an application.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operating Procedures
- Summary of DBMS_REDACT Subprograms

### 129.1 DBMS_REDACT Overview

Data redaction provides a way to define masking policies for an application. Oracle Data Redaction provides functionality to mask (redact) data that is returned from user `SELECT` queries in an application. The masking takes place in real time. The Data Redaction policy applies to the querying user, depending on this user's `SYS_CONTEXT` or `XS_SYS_CONTEXT` values. This redaction process does not require that the queried data be static or unchanging, or for the entire data set to be redacted at one time in an off-line manner. Oracle Database redacts only the data for the rows specified by the user's query, not the data for the entire column. The redaction takes place immediately before the data is returned to the querying user or application.

### 129.2 DBMS_REDACT Security Model

If the querying user has the `EXEMPT REDACTION POLICY` system privilege, redaction will not be performed. If the user does not have the `EXEMPT REDACTION POLICY` system privilege, the policy expression will be evaluated in the current user's environment. If the policy expression evaluates to `TRUE`, then redaction will be performed, otherwise no redaction will be performed.

You need the `EXECUTE` privilege on the **DBMS_REDACT** package in order to execute its subprograms. Procedures in the interface are executed with privileges of the current user.
129.3 DBMS_REDACT Constants

The DBMS_REDACT package defines several constants for specifying parameter values.

### Table 129-1 Values for function_type Parameter of DBMS_REDACT.ADD_POLICY

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NONE</td>
<td>0</td>
<td>BINARY_INTEGER</td>
<td>No redaction</td>
</tr>
<tr>
<td>FULL</td>
<td>1</td>
<td>BINARY_INTEGER</td>
<td>Redact to fixed values</td>
</tr>
<tr>
<td>NULLIFY</td>
<td>6</td>
<td>BINARY_INTEGER</td>
<td>Returns a null value as a redacted value</td>
</tr>
<tr>
<td>PARTIAL</td>
<td>2</td>
<td>BINARY_INTEGER</td>
<td>Partial redaction, redact a portion of the column data</td>
</tr>
<tr>
<td>RANDOM</td>
<td>4</td>
<td>BINARY_INTEGER</td>
<td>Random redaction, each query results in a different random value</td>
</tr>
<tr>
<td>REGEXP</td>
<td>5</td>
<td>BINARY_INTEGER</td>
<td>Regular expression based redaction</td>
</tr>
<tr>
<td>REGEXP_WIDTH</td>
<td>7</td>
<td>BINARY_INTEGER</td>
<td>Regular expression based redaction that preserves the width of a column that uses a regular expression; designed for applications use the OCI_ATTR_CHAR_SIZE attribute of the Oracle OLE DB Provider interface</td>
</tr>
</tbody>
</table>

### Table 129-2 Values for action Parameter of DBMS_REDACT.ALTER_POLICY

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_COLUMN</td>
<td>1</td>
<td>BINARY_INTEGER</td>
<td>Add a column to the redaction policy</td>
</tr>
<tr>
<td>DROP_COLUMN</td>
<td>2</td>
<td>BINARY_INTEGER</td>
<td>Drop a column from the redaction policy</td>
</tr>
<tr>
<td>MODIFY_EXPRESSION</td>
<td>3</td>
<td>BINARY_INTEGER</td>
<td>Modify the expression of a redaction policy (the expression evaluates to a BOOLEAN value: if TRUE then redaction is applied, otherwise not)</td>
</tr>
<tr>
<td>MODIFY_COLUMN</td>
<td>4</td>
<td>BINARY_INTEGER</td>
<td>Modify a column in the redaction policy to change the redaction function_type or the function_parameters</td>
</tr>
<tr>
<td>SET_POLICY_DESCRIPTION</td>
<td>5</td>
<td>BINARY_INTEGER</td>
<td>Set a description for the redaction policy</td>
</tr>
<tr>
<td>SET_COLUMN_DESCRIPTION</td>
<td>6</td>
<td>BINARY_INTEGER</td>
<td>Set a description for the redaction performed on the column</td>
</tr>
</tbody>
</table>
### 129.4 DBMS_REDACT Operating Procedures

The following table presents the relationship between the type of redaction function and its parameters, based on the datatype of the column being redacted. Examples of the various format strings are provided, showing how to perform some commonplace redaction for a string datatype (in this case, a Social Security Number (SSN)), a `DATE` datatype, and various examples of redaction for the number datatype.

#### Table 129-3 Data Redaction Function Types

<table>
<thead>
<tr>
<th>function_type</th>
<th>function_parameters</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_REDACT.NONE</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>DBMS_REDACT.FULL</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>DBMS_REDACT.PARTIAL (for character types)</td>
<td>A comma-separated list, containing the following five fields (with no spaces after the commas delimiting the fields):</td>
<td>'VVVFVVFFVVFVVV, VVV-VV-VVVV, X, 1,5' for masking the first 5 digits of SSN strings like 123-45-6789, adding dashes back to format it, resulting in strings like XXX-XX-6789</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_INPUT_FORMAT</td>
<td>The REDACT_PARTIAL_INPUT_FORMAT field value VVVFVVFFVVFVVV for matching SSN strings like 123-45-6789</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_OUTPUT_FORMAT</td>
<td>The REDACT_PARTIAL_OUTPUT_FORMAT field value VVV-VV-VVVV can be used to redact SSN strings into XXX-XX-6789 (X comes from REDACT_PARTIAL_MASKCHAR field).</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_MASKCHAR</td>
<td>The value X for redacting SSN strings into XXX-XX-6789.</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_MASKFROM</td>
<td>The value 1 for redacting SSN strings starting at the first V of VVVFVVFFVVFVVV into strings like XXX-XX-6789.</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_MASKTO</td>
<td>See Table 129-4.</td>
</tr>
</tbody>
</table>

**Note:**
- `V` represents a value that is possibly redacted.
- `F` represents a formatting character to be ignored.
- `X` is the character used to redact the input.
Table 129-3  (Cont.) Data Redaction Function Types

<table>
<thead>
<tr>
<th>function_type</th>
<th>function_parameters</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBMS_REDACT.PARTIAL (for character types), continued</td>
<td>REDACT_PARTIAL_INPUT_FORMAT = VVVVVFVVVV</td>
<td>The value 5 for redacting SSN strings up to and including the fifth V within REDACT_PARTIAL_INPUT_FORMAT of VVVVVFVVVV into strings like XXX-XX-6789. Note how the format character '-' (corresponding to the first V within REDACT_PARTIAL_INPUT_FORMAT) is ignored as far as redaction is concerned, so the value here is 5 as opposed to 6.</td>
</tr>
<tr>
<td></td>
<td>REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO</td>
<td>The REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO field values are specified as counts of the number of V characters in the REDACT_PARTIAL_INPUT_FORMAT field, up to and including the intended position, starting from the leftmost V. This way, REDACT_PARTIAL_MASKFROM and REDACT_PARTIAL_MASKTO are independent of the specific formatting of the data. For example, in the common use case of masking an SSN to show only the last four digits, data like 123456789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVVVVVVV) and data like 123-45-6789 (with REDACT_PARTIAL_INPUT_FORMAT of VVVVVVVVVV), would both use REDACT_PARTIAL_MASKFROM of 1 and REDACT_PARTIAL_MASKTO of 5.</td>
</tr>
<tr>
<td>DBMS_REDACT.PARTIAL (for number types)</td>
<td>A comma-separated list, containing the following three fields (with no spaces after the commas delimiting the fields): • REDACT_PARTIAL_MASKCHAR • REDACT_PARTIAL_MASKFROM • REDACT_PARTIAL_MASKTO</td>
<td>'9,1,5' for redacting the first 5 digits of an SSN number 123456789 into 999996789; or '0,1,2' for redacting a number 1.23 to 0.03.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>See Table 129-4.</td>
</tr>
</tbody>
</table>
### Table 129-3  (Cont.) Data Redaction Function Types

<table>
<thead>
<tr>
<th>function_type</th>
<th>function_parameters</th>

129.5.1 ADD_POLICY Procedure

This procedure defines a Data Redaction policy for a table or view.

Syntax

```sql
DBMS_REDACT.ADD_POLICY ( |
object_schema IN VARCHAR2 := NULL, |
object_name IN VARCHAR2, |
policy_name IN VARCHAR2, |
column_name IN VARCHAR2 := NULL, |
function_type IN BINARY_INTEGER := DBMS_REDACT.FULL, |
function_parameters IN VARCHAR2 := NULL, |
expression IN VARCHAR2, |
enable IN BOOLEAN := TRUE, |
regexp_pattern IN VARCHAR2 := NULL, |
regexp_replace_string IN VARCHAR2 := NULL, |
regexp_position IN BINARY_INTEGER := 1, |
regexp_occurrence IN BINARY_INTEGER := 0, |
regexp_match_parameter IN VARCHAR2 := NULL, |
policy_description IN VARCHAR2 := NULL, |
column_description IN VARCHAR2 := NULL);
```
Parameters

Table 129-6  ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema owning the table, current user if NULL</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table or view to which to add a Data Redaction policy</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy</td>
</tr>
<tr>
<td>column_name</td>
<td>[Optional] Name of one column to which the redaction policy applies. If you must redact more than one column, use the ALTER_POLICY Procedure to add the additional columns.</td>
</tr>
<tr>
<td>function_type</td>
<td>Type of redaction function to use. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.NONE</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.FULL (default)</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.NULLIFY</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.PARTIAL</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.RANDOM</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.REGEXP</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.REGEXP_WIDTH</td>
</tr>
<tr>
<td></td>
<td>If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</td>
</tr>
<tr>
<td></td>
<td>See Table 129-1 for an overview of the meanings of these values, and for some examples of their use.</td>
</tr>
</tbody>
</table>
### Table 129-6  (Cont.) ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>function_parameters</td>
<td>Parameters to the redaction function. The possible values depend on the value of the function_type provided. If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGREXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_* parameters to define the Data Redaction policy.</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.NONE: Can be omitted entirely and defaults to NULL</td>
</tr>
<tr>
<td></td>
<td>- DBMS_REDACT.FULL: Can be omitted entirely and defaults to NULL</td>
</tr>
<tr>
<td></td>
<td>- Masking parameters for partial character masking. For character datatypes, a comma-separated list containing these fields:</td>
</tr>
<tr>
<td></td>
<td>• Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored</td>
</tr>
<tr>
<td></td>
<td>• Output format: 'V' for output of masking, any other characters will be treated as formatting characters.</td>
</tr>
<tr>
<td></td>
<td>• Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.</td>
</tr>
<tr>
<td></td>
<td>• Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.</td>
</tr>
<tr>
<td></td>
<td>• Ending digit position: specifies the ending (character) position to end masking. An example is 'VVVVVFFFFV, VVV-VVVVV, x, 1, 5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789.</td>
</tr>
<tr>
<td></td>
<td>- Masking parameters for partial character masking. For number datatypes, a comma-separated list containing these fields:</td>
</tr>
<tr>
<td></td>
<td>• Mask character: this is a character between '0' to '9' that will be used to replace the actual values.</td>
</tr>
<tr>
<td></td>
<td>• Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.</td>
</tr>
<tr>
<td></td>
<td>• Ending digit position: this specifies the ending digit position to end masking. An example is '9, 1, 5' for masking the first 5 digits of a Social Security number number 123456789, resulting in 999996789.</td>
</tr>
<tr>
<td></td>
<td>- Masking parameters for partial character masking. For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value.</td>
</tr>
<tr>
<td></td>
<td>• Month: 'M' (no masking of month) or 'm#' (mask month to a specific month, if possible), where # (the month specified by its number) is between 1 and 12.</td>
</tr>
</tbody>
</table>
Table 129-6  (Cont.) ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day: 'D' (no masking of date) or 'd#' (mask day to #, if possible), # between 1 and 31</td>
<td></td>
</tr>
<tr>
<td>Year: 'Y' (no masking of year) or 'y#' (mask year to #, if possible), # between 1 and 9999</td>
<td></td>
</tr>
<tr>
<td>Hour: 'H' (no masking of hour) or 'h#' (mask hour to #, if possible), # between 0 and 23</td>
<td></td>
</tr>
<tr>
<td>Minute: 'M' (no masking of minute) or 'm#' (mask minute to #, if possible), # between 0 and 59</td>
<td></td>
</tr>
<tr>
<td>Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</td>
<td></td>
</tr>
</tbody>
</table>

An example is "m12dyhs", which changes 02-May-13 12:30:23 to 01-Dec-01 01:01:01

For partial character and number-masking shortcuts, see Oracle Database Advanced Security Guide.

expression

Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.

See

The following functions are supported:

- SYS_CONTEXT
- XS_SYS_CONTEXT
- SUBSTR functions (includes SUBSTRB, SUBSTRC, SUBSTR2, SUBSTR4)
- LENGTH functions (includes LENGTHB, LENGTHC, LENGTH2, LENGTH4)
- V (APEX_UTIL.GET_SESSION_STATE)
- NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE)
- OLS_LABEL_DOMINATES
- DOMINATES
- OLS_DOMINATES
- OLS_DOM
- DOM
- OLS_STRICTLY_DOMINATES
- STRICTLY_DOMINATES
- S_DOM
- SA_UTL.DOMINATES
- SA_UTL.CHECK_READ
- SA_UTL.NUMERIC_LABEL
- CHAR_TO_LABEL
- SA_SESSION.LABEL

See Oracle Database Advanced Security Guide for more information about these supported functions.
Table 129-6  (Cont.) ADD_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Boolean value that determines whether the Data Redaction policy is enabled on creation. The default value is TRUE, which means that the policy is automatically enabled upon creation. If the enable parameter is set to FALSE, the policy takes effect only when it is subsequently enabled by calling the DBMS_REDACT.ENABLE_POLICY procedure.</td>
</tr>
<tr>
<td>regexp_pattern</td>
<td>Regular expression pattern up to 512 bytes. Use only if the function_type parameter is DBMS_REDACT.REEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REEXP. See Oracle Database SQL Language Reference for more information and examples on using regular expression patterns.</td>
</tr>
<tr>
<td>regexp_replace_string</td>
<td>Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where n is a number between 1 and 9. Use only if the function_type parameter is DBMS_REDACT.REEXP.</td>
</tr>
<tr>
<td>regexp_position</td>
<td>Integer counting from 1, specifies the position where the search must begin. Use only if the function_type parameter is DBMS_REDACT.REEXP.</td>
</tr>
<tr>
<td>regexp_occurrence</td>
<td>• Use 0 to replace all occurrences of the match. • Use positive integer n to replace the n-th occurrence of the match. Use only if the function_type parameter is DBMS_REDACT.REEXP.</td>
</tr>
<tr>
<td>regexp_match_parameter</td>
<td>Changes the default matching behavior, possible values are a combination of 'i', 'c', 'n', 'm', 'x' Use only if the function_type parameter is DBMS_REDACT.REEXP. See Oracle Database SQL Language Reference for more information and examples on using regular expression match parameters.</td>
</tr>
<tr>
<td>policy_description</td>
<td>Description of redaction policy</td>
</tr>
<tr>
<td>column_description</td>
<td>Description of the column being redacted</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28060 - A Data Redaction policy already exists on this column.
- ORA-28061 - This object cannot have a Data Redaction policy defined on it.
- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
• ORA-28066 - **Invalid column** `column`
• ORA-28069 - A Data Redaction policy already exists on this object.
• ORA-28073 - The column `column_name` has an unsupported datatype.
• ORA-28074 - The field `field_name` of the masking parameters is not valid

The field can be any of the following:

- `REDACT_PARTIAL_INPUT_FORMAT`
- `REDACT_PARTIAL_OUTPUT_FORMAT`
- `REDACT_PARTIAL_MASKCHAR`
- `REDACT_PARTIAL_MASKFROM`
- `REDACT_PARTIAL_MASKTO`
- `REDACT_PARTIAL_DATE_MONTH`
- `REDACT_PARTIAL_DATE_DAY`
- `REDACT_PARTIAL_DATE_YEAR`
- `REDACT_PARTIAL_DATE_HOUR`
- `REDACT_PARTIAL_DATE_MINUTE`
- `REDACT_PARTIAL_DATE_SECOND`

See Table 129-3 and Table 129-4 for examples of the field contents and field ordering.

• ORA-28075 - The policy expression has unsupported functions
• ORA-28076 - An attribute was not specified for `SYS_SESSION_ROLES`
• ORA-28077 - The attribute specified `(attribute)` exceeds the maximum length
• ORA-28078 - A regular expression parameter is missing or invalid
• ORA-28082 - The parameter `parameter` is invalid (where the possible values are `function_parameters`, `column_description`, `policy_name` and `policy_description`)
• ORA-28085 - The input and output lengths of the redaction do not match.

**Usage Notes**

See *Operating Procedures* for more information regarding function types and function parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the `expression` parameter. To find redacted columns that are affected by named policy expressions, query the `REDACTION_EXPRESSIONS` data dictionary view.

**Example**

Partial redaction policy:

```sql
BEGIN
    DBMS_REDACT.ADD_POLICY(
        object_schema => 'hr',
        object_name   => 'employees',
        column_name   => 'employee_id',
        policy_name   => 'mask_emp_id_nums',
```
function_type => DBMS_REDACT.PARTIAL,
function_parameters => '7,1,5',
expression => '1=1');
END;

Full redaction policy:
BEGIN
    DBMS_REDACT.ADD_POLICY(
        object_schema => 'hr',
        object_name => 'employees',
        column_name => 'employee_id',
        policy_name => 'mask_emp_ids',
        function_type => DBMS_REDACT.FULL,
        expression => 'SYS_CONTEXT(''SYS_SESSION_ROLES'',''CLERK'')
                       = ''FALSE''');
END;

129.5.2 ALTER_POLICY Procedure

This procedure alters an existing Data Redaction policy for a table or view. It alters the policy in one or more of the following ways:

- By changing the policy expression
- By changing the type of redaction for a specified column
- By changing the parameters to the redaction function for a specified column
- By adding a column to the redaction policy (the redaction type and any parameters must be specified).
- By removing a column from the redaction policy

Syntax

```plsql
DBMS_REDACT.ALTER_POLICY(
    object_schema => VARCHAR2 := NULL,
    object_name => VARCHAR2,
    policy_name => VARCHAR2,
    action => BINARY_INTEGER := DBMS_REDACT.ADD_COLUMN,
    column_name => VARCHAR2 := NULL,
    function_type => BINARY_INTEGER := DBMS_REDACT.FULL,
    function_parameters => VARCHAR2 := NULL,
    expression => VARCHAR2,
    regexp_pattern => VARCHAR2 := NULL,
    regexp_replace_string => VARCHAR2 := NULL,
    regexp_position => BINARY_INTEGER := 1,
    regexp_occurrence => BINARY_INTEGER := 0,
    regexp_match_parameter => VARCHAR2 := NULL,
    policy_description => VARCHAR2 := NULL,
    column_description => VARCHAR2 := NULL);
```

### Table 129-7  (Cont.) ALTER_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| function_parameters | Parameters to the redaction function. The possible values depend on the value of the function_type provided. If the function_type is DBMS_REDACT.REGEXP or DBMS_REDACT.REGEXP_WIDTH, then you must omit the function_parameters parameter, and use the regexp_pattern, regexp_replace_string, regexp_position, regexp_occurrence, and regexp_match_parameter to define the Data Redaction policy. - If the function_type is DBMS_REDACT.NONE, the function_parameters parameter can be omitted entirely and defaults to NULL. - If the function_type is DBMS_REDACT.FULL, the function_parameters parameter can be omitted entirely and defaults to NULL. - If the function_type is DBMS_REDACT.PARTIAL, the function_parameters parameter represents the masking parameters for partial masking.  
  • Input format: 'V' for value to be possibly masked, 'F' for formatting character to be ignored  
  • Output format: 'V' for output of masking, any other characters will be treated as formatting characters.  
  • Mask character: a character that will be used to replace the actual values. Examples are '*' and 'x'.  
  • Starting digit position: specifies the starting (character) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include formatting characters.  
  • Ending digit position: specifies the ending (character) position to end masking. An example is 'VVFVVFVVVV, VV-VV-VVVV, X, 1, 5' for masking the first 5 digits of SSN string 123-45-6789, and adding dashes back to format it like an SSN, resulting in XXX-XX-6789. For number datatypes, a comma-separated list containing these fields:  
  • Mask character: this is a character between '0' to '9' that will be used to replace the actual values.  
  • Starting digit position: specifies the starting (digit) position to begin replacing actual values with the masking character. The beginning of the string is position 1. Positions do not include the decimal point.  
  • Ending digit position: this specifies the ending digit position to end masking. An example is '9, 1, 5' for masking the first 5 digits of a Social Security number number 123456789, resulting in 999996789. For datetime datatypes, the format is a packed string (no spaces or commas) containing the following sequence of fields. Please note that each field can consist of one or more characters, and the field length depends on whether masking is required. The one-character fields are used to specify that no redaction of that component of the datetime value is to take place. The longer fields indicate a specific time or date to use as the redacted value of that component of the datetime value. |

</tr>
<tr>
<td>• Second: 'S' (no masking of second) or 's#' (mask second to #, if possible), # between 0 and 59</td>
<td></td>
</tr>
</tbody>
</table>

An example is 'm12DYHMS', which changes 01-May-01 01:01:01 to 01-Dec-01 01:01:01

For partial character and number-masking shortcuts, see Oracle Database Advanced Security Guide.

equation

Default boolean expression for the table or view. If this expression is used, then redaction takes place only if this policy expression evaluates to TRUE.

The following functions are supported:
- SYS_CONTEXT
- NV (APEX_UTIL.GET_NUMERIC_SESSION_STATE)
- V (APEX_UTIL.GET_SESSION_STATE)
- OLS_LABEL_DOMINATES
- DOMINATES
- OLS_DOMINATES
- OLS_DOM
- DOM
- OLSStrictlyDOMinates
- STRICTLYDOMinates
- S_DOM
- SA_UtL.DOMINATES
- SA_UtL.CHECK_READ
- SA_UtL.NUMERIC_LABEL
- CHAR_TO_LABEL
- SA_SESSION_LABEL

regexp_pattern

Regular expression pattern up to 512 bytes.

Use only if the function_type parameter is DBMS_REDACT.REGEXP. Also, do not specify the function_parameters parameter when function_type is DBMS_REDACT.REGEXP.

See Oracle Database SQL Language Reference for more information and examples on using regular expression patterns.
Table 129-7 (Cont.) ALTER_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regexp_replace_string</td>
<td>Replacement string (up to 4000 characters in length) with up to 500 back-references to subexpressions in the form \n, where \n is a number between 1 and 9. Use only if the function_type parameter is DBMS_REDACT.REGEXP</td>
</tr>
<tr>
<td>regexp_position</td>

</tr>
<tr>
<td>policy_description</td>
<td>Description of redaction policy</td>
</tr>
<tr>
<td>column_description</td>
<td>Description of the column being redacted</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28062 - The policy expression is too long.
- ORA-28063 - The policy expression is empty.
- ORA-28064 - The type of redaction function is not valid.
- ORA-28066 - Invalid column column
- ORA-28067 - Missing or invalid column name
- ORA-28068 - The object object does not have a Data Redaction policy.
- ORA-28070 - The column column does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28073 - The column column_name has an unsupported datatype.
- ORA-28074 - The field field_name of the masking parameters is not valid

The field can be any of the following:

- REDACT_PARTIAL_INPUT_FORMAT
- REDACT_PARTIAL_OUTPUT_FORMAT
- REDACT_PARTIAL_MASKCHAR
See Table 129-3 and Table 129-4 for examples of the field contents and field ordering.

- ORA-28075 - The policy expression has unsupported functions.
- ORA-28076 - An attribute was not specified for SYS_SESSION_ROLES.
- ORA-28077 - The attribute specified (attribute) exceeds the maximum length.
- ORA-28078 - A regular expression parameter is missing or invalid.
- ORA-28082 - The parameter parameter is invalid (where the possible values are function Parameters, column description, policy name and policy description)
- ORA-28085 - The input and output lengths of the redaction do not match.

Usage Notes

See Operating Procedures for more information regarding Function Types and Function Parameters with related examples.

A named Data Redaction policy expression that has been applied to a redacted column takes precedence over the expression defined in the expression parameter. To find redacted columns that are affected by named policy expressions, query the REDACTION_EXPRESSIONS data dictionary view.

Examples

BEGIN
    DBMS_REDACT.ALTER_POLICY(
        object_schema => 'HR',
        object_name  => 'EMPLOYEES',
        policy_name  => 'mask_emp_id_nums',
        action       => DBMS_REDACT.DROP_COLUMN,
        column_name  => 'EMAIL');
END;

129.5.3 APPLY_POLICY_EXPR_TO_COL Procedure

This procedure associates a named Oracle Data Redaction policy expression with a redacted column from a table or view.

Syntax

DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL ( 
    object_schema IN VARCHAR2 := NULL,
    object_name IN VARCHAR2,
column_name IN VARCHAR2,
policy_expression_name IN VARCHAR2 := NULL);

Parameters

Table 129-8 APPLY_POLICY_EXPR_TO_COL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Name of the schema that contains the redacted column</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object (table or view) that contains the</td>
</tr>
<tr>
<td></td>
<td>redacted column</td>
</tr>
<tr>
<td>column_name</td>
<td>Name of the redacted column to which the policy</td>
</tr>
<tr>
<td></td>
<td>expression is applied</td>
</tr>
<tr>
<td>policy_expression_name</td>
<td>Name of the policy expression</td>
</tr>
</tbody>
</table>

Exceptions

• ORA-28068 - The object object does not have a Data Redaction policy.
• ORA-28082 - The parameter parameter is invalid.
• ORA-28092 - The parameter parameter with value value has an error.

Usage Notes

You can find existing Data Redaction policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view. To find columns that have been redacted, query the REDACTION_COLUMNS data dictionary view.

Example

BEGIN
   DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL(
      object_schema => 'OE',
      object_name   => 'CUSTOMERS',
      column_name   => 'INCOME_LEVEL',
      policy_expression_name => 'oe_redact_pol');
END;

129.5.4 CREATE_POLICY_EXPRESSION Procedure

This procedure creates a named Oracle Data Redaction policy expression.

Syntax

DBMS_REDACT.CREATE_POLICY_EXPRESSION (  
   policy_expression_name IN VARCHAR2,  
   expression IN VARCHAR2,  
   policy_expression_description IN VARCHAR2 := NULL);
### Parameters

#### Table 129-9  **CREATE_POLICY_EXPRESSION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_expression_name</td>
<td>Name of the policy expression</td>

<td>Definition of the policy expression</td>
</tr>
<tr>
<td>policy_expression_description</td>
<td>Description of the policy expression</td>
</tr>
</tbody>
</table>

#### Exceptions

- ORA-28082 - The parameter `parameter` is invalid.
- ORA-28092 - The parameter `parameter` with value `value` has an error.

#### Usage Notes

See [Operating Procedures](#) for more information regarding function types and function parameters with related examples.

After you create a policy expression, you can associate it with a redacted table or view column by running the `DBMS_REDACT.APPLY_POLICY_EXPR_TO_COL` procedure. To find existing redacted columns, query the `REDACTION_COLUMNS` data dictionary view.

#### Example

```sql
BEGIN
    DBMS_REDACT.CREATE_POLICY_EXPRESSION(
        policy_expression_name => 'oe_redact_pol',
        expression => 'SYS_CONTEXT(''USERENV'',''SESSION_USER'') = ''OE'''),
        policy_expression_description => 'Enables policy for user OE ');
END;
```

---

### 129.5.5 DISABLE_POLICY Procedure

This procedure disables a Data Redaction policy.

#### Syntax

```sql
DBMS_REDACT.DISABLE_POLICY (  
    object_schema IN VARCHAR2 := NULL,
    object_name IN VARCHAR2,
    policy_name IN VARCHAR2);
```

#### Parameters

#### Table 129-10  **DISABLE_POLICY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema owning the table or view, current user if NULL</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table or view for which to disable a Data Redaction policy</td>
</tr>
</tbody>
</table>
Table 129-10  (Cont.) DISABLE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of policy to be disabled</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28068 - The object object does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28080 - The policy was already disabled.

Examples

```
BEGIN
    DBMS_REDACT.DISABLE_POLICY (
        object_schema => 'hr',
        object_name    => 'employees',
        policy_name    => 'mask_emp_ids');
END;
```

129.5.6 DROP_POLICY Procedure

This procedure drops a Data Redaction policy by removing a masking policy from the table or view.

Syntax

```
DBMS_REDACT.DROP_POLICY (  
    object_schema IN VARCHAR2 := NULL,
    object_name    IN VARCHAR2,
    policy_name    IN VARCHAR2);
```

Parameters

Table 129-11  DROP_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema owning the table or view, current user if NULL</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table or view from which to drop a Data Redaction policy</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be dropped</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28068 - The object object does not have a Data Redaction policy.
- ORA-28072 - The specified policy name is incorrect.

Examples

```
BEGIN
    DBMS_REDACT.DROP_POLICY (  
        object_schema => 'hr',
        object_name    => 'employees',
```
129.5.7 DROP_POLICY_EXPRESSION Procedure

This procedure drops a named policy expression.

Syntax

```
DBMS_REDACT.DROP_POLICY_EXPRESSION (  
    policy_expression_name IN VARCHAR2);
```

Parameters

Table 129-12  DROP_POLICY_EXPRESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_expression_name</td>
<td>Name of the policy expression</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28082 - The parameter `parameter` is invalid.
- ORA-28092 - The parameter `parameter` with value `value` has an error.

Usage Notes

You can find existing Data Redaction policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view.

Example

```
BEGIN
    DBMS_REDACT.DROP_POLICY_EXPRESSION(  
        policy_expression_name => 'oe_redact_pol');
END;
```

129.5.8 ENABLE_POLICY Procedure

This procedure re-enables a Data Redaction policy.

Syntax

```
DBMS_REDACT.ENABLE_POLICY (  
    object_schema IN VARCHAR2 := NULL,  
    object_name IN VARCHAR2,  
    policy_name IN VARCHAR2);
```

Parameters

Table 129-13  ENABLE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema owning the table or view, current user if NULL</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table or view to which to enable a Data Redaction policy</td>
</tr>
</tbody>
</table>
Table 129-13  (Cont.) ENABLE_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of policy to be enabled</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28068 - The object object does not have a Data Redaction policy.
- ORA-28071 - The action is not valid.
- ORA-28072 - The specified policy name is incorrect.
- ORA-28079 - The policy was already enabled.

Examples

```
BEGIN
    DBMS_REDACT.ENABLE_POLICY (  
        object_schema => 'hr',    
        object_name   => 'employees',    
        policy_name   => 'mask_emp_ids');
END;
```

129.5.9 UPDATE_FULL_REDACTION_VALUES Procedure

This procedure modifies the default displayed values for a Data Redaction policy for full redaction.

Syntax

```sql
DBMS_REDACT.UPDATE_FULL_REDACTION_VALUES (  
    number_val       IN NUMBER                    :=  NULL,  
    binfloat_val     IN BINARY_FLOAT              :=  NULL,  
    bindouble_val    IN BINARY_DOUBLE             :=  NULL,  
    char_val         IN CHAR                      :=  NULL,  
    varchar_val      IN VARCHAR2                  :=  NULL,  
    nchar_val        IN NCHAR                     :=  NULL,  
    nvarchar_val     IN NVARCHAR2                 :=  NULL,  
    date_val         IN DATE                      :=  NULL,  
    ts_val           IN TIMESTAMP                 :=  NULL,  
    tswtz_val        IN TIMESTAMP WITH TIME ZONE  :=  NULL,  
    blob_val         IN BLOB                      :=  NULL,  
    clob_val         IN CLOB                      :=  NULL,  
    nclob_val        IN NCLOB                     NULL);  
```

Parameters

Table 129-14  UPDATE_FULL_REDACTION_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>number_val</td>
<td>Modifies the default value for columns of the NUMBER datatype</td>
</tr>
<tr>
<td>binfloat_val</td>
<td>Modifies the default value for columns of the BINARY_FLOAT datatype</td>
</tr>
</tbody>
</table>
Table 129-14 (Cont.) UPDATE_FULL_REDACTION_VALUES Procedure Parameters

<table>
<thead>

<td>Modifies the default value for columns of the DATE datatype</td>
</tr>
<tr>
<td>ts_val</td>
<td>Modifies the default value for columns of the TIMESTAMP datatype</td>
</tr>
<tr>
<td>tswtz_val</td>
<td>Modifies the default value for columns of the TIMESTAMP WITH TIME ZONE</td>
</tr>
<tr>
<td>blob_val</td>
<td>Modifies the default value for columns of the BLOB datatype</td>
</tr>
<tr>
<td>clob_val</td>
<td>Modifies the default value for columns of the CLOB datatype</td>
</tr>
<tr>
<td>nclob_val</td>
<td>Modifies the default value for columns of the NCLOB datatype</td>
</tr>
</tbody>
</table>

Exceptions

ORA-28082 - The parameter parameter is invalid (where the possible values are char_val, nchar_val, varchar_val and nvarchar_val)

129.5.10 UPDATE_POLICY_EXPRESSION Procedure

This procedure updates a named Oracle Data Redaction policy expression.

Syntax

```sql
DBMS_REDACT.UPDATE_POLICY_EXPRESSION (  
    policy_expression_name          IN    VARCHAR2,  
    expression                      IN    VARCHAR2,  
    policy_expression_description   IN    VARCHAR2 := NULL);
```

Parameters

Table 129-15 UPDATE_POLICY_EXPRESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_expression_name</td>
<td>Name of the policy expression</td>
</tr>
<tr>
<td>expression</td>
<td>Definition of the policy expression</td>
</tr>
<tr>
<td>policy_expression_description</td>
<td>Description of the policy expression</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-28082 - The parameter parameter is invalid.
- ORA-28092 - The parameter parameter with value value has an error.
Usage Notes

You can find existing policy expressions by querying the REDACTION_EXPRESSIONS data dictionary view.

Example

BEGIN
  DBMS_REDACT.UPDATE_POLICY_EXPRESSION(
    policy_expression_name => 'oe_redact_pol',
    expression => 'SYS_CONTEXT(''USERENV'',''SESSION_USER'') != ''OE''),
    policy_expression_description => 'Disables policy for user OE ');
END;
The **DBMS_REDEFINITION** package provides an interface to perform an online redefinition of tables.

This chapter contains the following topics:

- **Overview**
- **Security Model**
- **Constants**
- **Operational Notes**
- **Rules and Limits**
- **Examples**
- **Summary of DBMS_REDEFINITION Subprograms**

**See Also:**

*Oracle Database Administrator's Guide* for more information about online redefinition of tables

### 130.1 DBMS_REDEFINITION Overview

To achieve online redefinition, incrementally maintainable local materialized views are used. These logs keep track of the changes to the master tables and are used by the materialized views during refresh synchronization.

### 130.2 DBMS_REDEFINITION Security Model

Subprograms in the **DBMS_REDEFINITION** package are run with invokers' rights (with the privileges of the current user).

There are two modes:

- In **USER** mode, the user who has the **CREATE TABLE** and **CREATE MVIEW** privileges may redefine a table residing in his own schema.
- In **FULL** mode, the user who has the **ANY** privilege may redefine tables in any schema.

### 130.3 DBMS_REDEFINITION Constants

The **DBMS_REDEFINITION** package defines several constants for specifying parameter values.
### Table 130-1  DBMS_REDEFINITION Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONS_CONSTRAINT</td>
<td>PLS_INTEGER</td>
<td>3</td>
<td>Used to specify that dependent object type is a constraint</td>
</tr>
<tr>
<td>CONS_INDEX</td>
<td>PLS_INTEGER</td>
<td>2</td>
<td>Used to specify that dependent object type is a index</td>
</tr>
<tr>
<td>CONS_MVLOG</td>
<td>PLS_INTEGER</td>
<td>10</td>
<td>Used to (un)register a materialized view log, as a dependent object of the table, through the REGISTER_DEPENDENT_OBJECT Procedure and the UNREGISTER_DEPENDENT_OBJECT Procedure.</td>
</tr>
<tr>
<td>CONS_ORIG_PARAMS</td>
<td>PLS_INTEGER</td>
<td>1</td>
<td>Used to specify that indexes should be cloned with their original storage parameters</td>
</tr>
<tr>
<td>CONS_TRIGGER</td>
<td>PLS_INTEGER</td>
<td>4</td>
<td>Used to specify that dependent object type is a trigger</td>
</tr>
<tr>
<td>CONS_USE_PK</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Used to indicate that the redefinition should be done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints)</td>
</tr>
<tr>
<td>CONS_USE_ROWID</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Used to indicate that the redefinition should be done using rowids</td>
</tr>
<tr>
<td>CONS_VPD_AUTO</td>
<td>BINARY_INTEGER</td>
<td>2</td>
<td>Used to indicate to copy VPD policies automatically</td>
</tr>
<tr>
<td>CONS_VPD_MANUAL</td>
<td>BINARY_INTEGER</td>
<td>4</td>
<td>Used to indicate to copy VPD policies manually</td>
</tr>
<tr>
<td>CONS_VPD_NONE</td>
<td>BINARY_INTEGER</td>
<td>1</td>
<td>Used to indicate that there are no VPD policies on the original table</td>
</tr>
</tbody>
</table>

### 130.4 DBMS_REDEFINITION Operational Notes

The following operational notes apply to DBMS_REDEFINITION.

- **CONS_USE_PK** and **CONS_USE_ROWID** are constants used as input to the "options_flag" parameter in both the **START_REDEF_TABLE Procedure** and **CAN_REDEF_TABLE Procedure**. **CONS_USE_ROWID** is used to indicate that the redefinition should be done using rowids while **CONS_USE_PK** implies that the redefinition should be done using primary keys or pseudo-primary keys (which are unique keys with all component columns having NOT NULL constraints).

- **CONS_INDEX**, **CONS_MVLOG**, **CONS_TRIGGER** and **CONS_CONSTRAINT** are used to specify the type of the dependent object being (un)registered in **REGISTER_DEPENDENT_OBJECT Procedure** and **UNREGISTER_DEPENDENT_OBJECT Procedure** (parameter "dep_type").

**CONS_INDEX ==⇒ dependent object is of type INDEX**
CONS_TRIGGER == dependent object is of type TRIGGER

CONS_CONSTRAINT == dependent object type is of type CONSTRAINT

CONS_MVLOG == dependent object is of type MATERIALIZED VIEW LOG

- CONS_ORIG_PARAMS as used as input to the "copy_indexes" parameter in COPY_TABLE_DEPENDENTS Procedure. Using this parameter implies that the indexes on the original table be copied onto the interim table using the same storage parameters as that of the original index.

130.5 DBMS_REDEFINITION Rules and Limits

Various rules and limits apply to implementation of the DBMS_REDEFINITION package.

For more information about these, see the Oracle Database Administrator's Guide.

130.6 DBMS_REDEFINITION Examples

The following examples demonstrate DBMS_REDEFINITION functionality.

We create two tables EMP and EMP_INT as the original and the interim tables, respectively:

```sql
CREATE TABLE "EMP"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
TABLESPACE myts;

CREATE TABLE "EMP_INT"
( "EMPNO" NUMBER(4,0) PRIMARY KEY,
  "ENAME" VARCHAR2(10),
  "JOB" VARCHAR2(9),
  "MGR" NUMBER(4,0),
  "HIREDATE" DATE,
  "SAL" NUMBER(7,2),
  "COMM" NUMBER(7,2),
  "DEPTNO" NUMBER(2,0))
TABLESPACE compressed_ts;
```

Regular Multi-Step Redefinition

```sql
DBMS_REDEFINITION.START_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT', ENABLE_ROLLBACK => TRUE);
DBMS_REDEFINITION.FINISH_REDEF_TABLE('SCOTT', 'EMP', 'EMP_INT');
```

Assume the DBA wants to evaluate the performance of the application for 2 days, after moving the table EMP from tablespace myts to compressed_ts. One can run sync_interim_table SYNC_INTERIM_TABLE Procedure to keep both the tables in sync (say, every hour).
Case 1 — DBA is not happy with the performance, so decides to rollback.

DBMS_REDEFINITION.ROLLBACK('SCOTT', 'EMP', 'EMP_INT');

Case 2 — DBA is happy with the performance, so decides not to rollback.

DBMS_REDEFINITION.ABORT_ROLLBACK('SCOTT', 'EMP', 'EMP_INT');

This terminates the possibility of rollback.

Single-Step Redefinition

DBMS_REDEFINITION.REDEF_TABLE('SCOTT', 'EMP', 'ROW STORE COMPRESS ADVANCED', enable_rollback => TRUE);

Note:

Online table redefinition rollback is not supported when the REDEF_TABLE procedure is used to redefine a table.

130.7 Summary of DBMS_REDEFINITION Subprograms

This table lists the DBMS_REDEFINITION subprograms and briefly describes them.

Table 130-2  DBMS_REDEFINITION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORT_REDEF_TABLE Procedure</td>
<td>Cleans up errors that occur during the redefinition process and removes all temporary objects created by the reorganization process</td>
</tr>
<tr>
<td>ABORT_ROLLBACK Procedure</td>
<td>Aborts rollback</td>
</tr>
<tr>
<td>ABORT_UPDATE Procedure</td>
<td>Aborts an update started with the EXECUTE_UPDATE procedure</td>
</tr>
<tr>
<td>CAN_REDEF_TABLE Procedure</td>
<td>Determines if a given table can be redefined online</td>
</tr>
<tr>
<td>COPY_TABLE_DEPENDENTS Procedure</td>
<td>Copies the dependent objects of the original table onto the interim table</td>
</tr>
<tr>
<td>EXECUTE_UPDATE Procedure</td>
<td>Optimizes the performance of bulk updates to a table</td>
</tr>
<tr>
<td>FINISH_REDEF_TABLE Procedure</td>
<td>Completes the redefinition process</td>
</tr>
<tr>
<td>REDEF_TABLE Procedure</td>
<td>Provides a single push-button interface that integrates several redefinition steps</td>
</tr>
<tr>
<td>REGISTER_DEPENDENT_OBJECT Procedure</td>
<td>Registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table</td>
</tr>
<tr>
<td>ROLLBACK Procedure</td>
<td>Performs rollback</td>
</tr>
</tbody>
</table>
### Table 130-2 (Cont.) DBMS_REDEFINITION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET_PARAM Procedure</td>
<td>Sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID</td>
</tr>
<tr>
<td>START_REDEF_TABLE Procedure</td>
<td>Initiates the redefinition process</td>
</tr>
<tr>
<td>SYNC_INTERIM_TABLE Procedure</td>
<td>Keeps the interim table synchronized with the original table</td>
</tr>
<tr>
<td>UNREGISTER_DEPENDENT_OBJECT Procedure</td>
<td>Unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table</td>
</tr>
</tbody>
</table>

### 130.7.1 ABORT_REDEF_TABLE Procedure

This procedure cleans up errors that occur during the redefinition process.

This procedure can also be used to terminate the redefinition process any time after the START_REDEF_TABLE Procedure has been called and before the FINISH_REDEF_TABLE Procedure is called. This process will remove the temporary objects that are created by the redefinition process such as materialized view logs.

**Syntax**

```sql
DBMS_REDEFINITION.ABORT_REDEF_TABLE ( 
    uname                   IN  VARCHAR2,  
    orig_table              IN  VARCHAR2,  
    int_table               IN  VARCHAR2,  
    part_name               IN  VARCHAR2 := NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table. Can take a comma-delimited list of interim table names.</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.</td>
</tr>
</tbody>
</table>

### 130.7.2 ABORT_ROLLBACK Procedure

This procedure aborts rollback for a table that was redefined.

When online redefinition of a table is started with the START_REDEF_TABLE procedure, rollback can be enabled for the changes performed by online redefinition of a table by setting the enable_rollback parameter to TRUE. If you want to retain the changes made
by online redefinition, you can abort the rollback to clean up the database objects that enable rollback.

**Syntax**

```sql
DBMS_REDEFINITION.ABORT_ROLLBACK (
    uname       IN  VARCHAR2,
    orig_table  IN  VARCHAR2,
    int_table   IN  VARCHAR2 := NULL,
    part_name   IN  VARCHAR2 := NULL);
```

**Parameters**

Table 130-4  ABORT_ROLLBACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined</td>
</tr>
</tbody>
</table>

**130.7.3 ABORT_UPDATE Procedure**

This procedure can abort an update started with the `EXECUTE_UPDATE` procedure in the `RDBMS_REDEFINITION` package.

**Syntax**

```sql
DBMS_REDEFINITION.ABORT_UPDATE (update_stmt IN CLOB);
```

**Parameters**

Table 130-5  ABORT_UPDATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_stmt</td>
<td>The SQL UPDATE statement to be aborted</td>
</tr>
<tr>
<td></td>
<td>The SQL statement must exactly match the SQL statement in the <code>EXECUTE_UPDATE</code> procedure.</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Database Administrator's Guide*
130.7.4 CAN_REDEF_TABLE Procedure

This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.

Syntax

DBMS_REDEFINITION.CAN_REDEF_TABLE (
   uname         IN  VARCHAR2,
   tname        IN  VARCHAR2,
   options_flag  IN  PLS_INTEGER := 1,
   part_name     IN  VARCHAR2 := NULL);

Parameters

Table 130-6  CAN_REDEF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tname</td>
<td>Name of the table to be re-organized</td>
</tr>
<tr>
<td>options_flag</td>
<td>Indicates the type of redefinition method to use.</td>
</tr>
<tr>
<td></td>
<td>• If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</td>
</tr>
<tr>
<td></td>
<td>• If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined.</td>
</tr>
</tbody>
</table>

Exceptions

If the table is not a candidate for online redefinition, an error message is raised.

130.7.5 COPY_TABLE_DEPENDENTS Procedure

This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

This subprogram is used to clone the dependent objects like grants, triggers, constraints and privileges from the table being redefined to the interim table (which represents the post-redefinition table).

Syntax

DBMS_REDEFINITION.COPY_TABLE_DEPENDENTS(
   uname                          IN  VARCHAR2,
   orig_table                    IN  VARCHAR2,
   int_table                     IN  VARCHAR2,
   copy_indexes                  IN  PLS_INTEGER := 1,
   copy_triggers                 IN  BOOLEAN := TRUE,
copy_constraints  IN  BOOLEAN  := TRUE,
copy_privileges  IN  BOOLEAN  := TRUE,
ignore_errors  IN  BOOLEAN  := FALSE,
num_errors  OUT  PLS_INTEGER,
copy_statistics  IN  BOOLEAN  := FALSE,
copy_mvlog  IN  BOOLEAN  := FALSE);

Parameters

Table 130-7  COPY_TABLE_DEPENDENTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table being redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table</td>
</tr>
<tr>
<td>copy_indexes</td>
<td>Flag indicating whether to copy the indexes</td>
</tr>
<tr>
<td></td>
<td>• 0 - do not copy any index</td>
</tr>
<tr>
<td></td>
<td>• dbms_redefinition.cons_orig_params – copy the indexes using the physical</td>
</tr>
<tr>
<td></td>
<td>parameters of the source indexes</td>
</tr>
<tr>
<td>copy_triggers</td>
<td>TRUE = clone triggers, FALSE = do nothing</td>
</tr>
<tr>
<td>copy_constraints</td>
<td>TRUE = clone constraints, FALSE = do nothing. If compatibility setting is 10.2</td>
</tr>
<tr>
<td></td>
<td>or higher, then clone CHECK and NOT NULL constraints</td>
</tr>
<tr>
<td>copy_privileges</td>
<td>TRUE = clone privileges, FALSE = do nothing</td>
</tr>
<tr>
<td>ignore_errors</td>
<td>TRUE = if an error occurs while cloning a particular dependent object, then</td>
</tr>
<tr>
<td></td>
<td>skip that object and continue cloning other dependent objects. FALSE = that</td>
</tr>
<tr>
<td></td>
<td>the cloning process should stop upon encountering an error.</td>
</tr>
<tr>
<td>num_errors</td>
<td>Number of errors that occurred while cloning dependent objects</td>
</tr>
<tr>
<td>copy_statistics</td>
<td>TRUE = copy statistics, FALSE = do nothing</td>
</tr>
<tr>
<td>copy_mvlog</td>
<td>TRUE = copy materialized view log, FALSE = do nothing</td>
</tr>
</tbody>
</table>

Usage Notes

- The user must check the column num_errors before proceeding to ensure that no errors occurred during the cloning of the objects.
- In case of an error, the user should fix the cause of the error and call the COPY_TABLE_DEPENDENTS Procedure again to clone the dependent object. Alternatively the user can manually clone the dependent object and then register the manually cloned dependent object using the REGISTER_DEPENDENT_OBJECT Procedure.
- All cloned referential constraints involving the interim tables will be created disabled (they will be automatically enabled after the redefinition) and all triggers on interim tables will not fire till the redefinition is completed. After the redefinition is complete, the cloned objects will be renamed to the corresponding pre-redefinition names of the objects (from which they were cloned from).
- It is the user's responsibility that the cloned dependent objects are unaffected by the redefinition. All the triggers will be cloned and it is the user's responsibility that the cloned triggers are unaffected by the redefinition.
130.7.6 EXECUTE_UPDATE Procedure

This procedure can optimize the performance of bulk updates to a table. Performance is optimized because the updates are not logged in the redo log.

The EXECUTE_UPDATE procedure automatically uses the components of online table redefinition, such an interim table, a materialized view, and a materialized view log, to enable optimized bulk updates to a table. The EXECUTE_UPDATE procedure also removes fragmentation of the affected rows and ensures that the update is atomic. If the bulk updates raise any errors, then you can use the ABORT_UPDATE procedure to undo the changes made by the EXECUTE_UPDATE procedure.

Syntax

```
DBMS_REDEFINITION.EXECUTE_UPDATE (
    update_stmt IN CLOB);
```

Parameters

**Table 130-8  EXECUTE_UPDATE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>update_stmt</td>
<td>The SQL UPDATE statement</td>
</tr>
</tbody>
</table>

See Also:

Oracle Database Administrator's Guide

130.7.7 FINISH_REDEF_TABLE Procedure

This procedure completes the redefinition process.

Before this step, you can create new indexes, triggers, grants, and constraints on the interim table. The referential constraints involving the interim table must be disabled. After completing this step, the original table is redefined with the attributes and data of the interim table. The original table is locked briefly during this procedure.

Syntax

```
DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    uname                   IN   VARCHAR2,  
    orig_table              IN   VARCHAR2,  
    int_table               IN   VARCHAR2,  
    part_name               IN   VARCHAR2 := NULL,  
    dml_lock_timeout        IN   PLS_INTEGER := NULL,  
    continue_after_errors   IN   BOOLEAN := FALSE,  
    disable_rollback        IN   PLS_INTEGER := FALSE);
```
Parameters

Table 130-9  **FINISH_REDEF_TABLE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>uname</strong></td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td><strong>orig_table</strong></td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td><strong>int_table</strong></td>
<td>Name of the interim table. Can take a comma-delimited list of interim table names.</td>
</tr>
<tr>
<td><strong>part_name</strong></td>
<td>Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.</td>
</tr>
<tr>
<td><strong>dml_lock_timeout</strong></td>
<td>Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).</td>
</tr>
<tr>
<td><strong>continue_after_errors</strong></td>
<td>When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition).</td>
</tr>
<tr>
<td><strong>disable_rollback</strong></td>
<td>When set to TRUE, disables the rollback option if it was enabled in the START_REDEF_TABLE procedure. Specifying TRUE cleans up the database objects that enable rollback.</td>
</tr>
</tbody>
</table>

Examples

Wait up to 600 seconds for required locks on **SH.SALES**:

```sql
EXECUTE DBMS_REDEFINITION.FINISH_REDEF_TABLE (  
    'SH', 'SALES', 'INT_SALES', 600);
```

### 130.7.8 **REDEF_TABLE Procedure**

This procedure provides a single interface that integrates several redefinition steps including the **CAN_REDEF_TABLE Procedure**, the **START_REDEF_TABLE Procedure**, the **COPY_TABLE_DEPENDENTS Procedure** and the **FINISH_REDEF_TABLE Procedure**.

This procedure can change data storage properties including tablespaces (for table, partition, subpartition, index, LOB column), compress type (for table, partition, subpartition, index, LOB column) and **STORE_AS** clause for the LOB column.

**Syntax**

```sql
DBMS_REDEFINITION.REDEF_TABLE (  
    uname IN VARCHAR2,  
    tname IN VARCHAR2,  
    table_compression_type IN VARCHAR2 := NULL,  
    table_part_tablespace IN VARCHAR2 := NULL,  
    index_key_compression_type IN VARCHAR2 := NULL,  
    index_tablespace IN VARCHAR2 := NULL,  
    lob_compression_type IN VARCHAR2 := NULL,  
    lob_tablespace IN VARCHAR2 := NULL,  
    lob_store_as IN VARCHAR2 := NULL,
```

---

**Oracle**
Parameters

Table 130-10   REDEF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>tname</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>table_compression_type</td>
<td>Text string of the table compression clause. NULL means there is no change.</td>
</tr>
<tr>
<td>table_part_tablespace</td>
<td>Tablespace name for the entire table or partitions. NULL means there is no change.</td>
</tr>
<tr>
<td>index_key_compression_type</td>
<td>Text string of the compression clause for all indexes on the table. NULL means there is no change.</td>
</tr>
<tr>
<td>index_tablespace</td>
<td>Tablespace name for all indexes on the table. NULL means there is no change.</td>
</tr>
<tr>
<td>lob_compression_type</td>
<td>Text string of the compression clause for all LOBs in the entire table. NULL means there is no change.</td>
</tr>
<tr>
<td>lob_tablespace</td>
<td>Tablespace name for all LOBs in the table. NULL means there is no change.</td>
</tr>
<tr>
<td>lob_store_as</td>
<td>Specifies LOB store as 'SECUREFILE' or 'BASICFILE'. NULL means there is no change.</td>
</tr>
<tr>
<td>refresh_dep_mviews</td>
<td>When set to 'Y', fast refresh of dependent materialized views is performed once at the end of the redefinition operation.</td>
</tr>
<tr>
<td>dml_lock_timeout</td>
<td>Specifies the number of seconds the procedure waits for its required locks before failing. The permissible range of values for timeout is 0 to 1,000,000. The default is NULL (wait mode).</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_REDEFINITION.REDEF_TABLE(
    uname => 'TABOWNER2',
    tname => 'EMP2',
    table_compression_type => 'ROW STORE COMPRESS ADVANCED',
    table_part_tablespace => 'NEWTBS',
    index_key_compression_type => 'COMPRESS 1',
    index_tablespace => 'NEWIDXTBS',
    lob_compression_type => 'COMPRESS HIGH',
    lob_tablespace => 'SLOBTBS',
    lob_store_as => 'SECUREFILE');
END;

Related Topics

- CAN_REDEF_TABLE Procedure
  This procedure determines if a given table can be redefined online. This is the first step of the online redefinition process. If the table is not a candidate for online redefinition, an error message is raised.
• **START_REDEF_TABLE Procedure**
  This procedure starts a table redefinition.

• **COPY_TABLE_DEPENDENTS Procedure**
  This procedure clones the dependent objects of the table being redefined onto the interim table and registers the dependent objects. This procedure does not clone the already registered dependent objects.

• **FINISH_REDEF_TABLE Procedure**
  This procedure completes the redefinition process.

---

**See Also:**

*Oracle Database Administrator's Guide* regarding "Performing Online Redefinition with the **REDEF_TABLE Procedure**"

---

### 130.7.9 REGISTER_DEPENDENT_OBJECT Procedure

This procedure registers a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

This can be used to have the same object on each table but with different attributes. For example: for an index, the storage and tablespace attributes could be different but the columns indexed remain the same.

**Syntax**

```sql
DBMS_REDEFINITION.REGISTER_DEPENDENT_OBJECT(
    uname                  IN    VARCHAR2,
    orig_table             IN    VARCHAR2,
    int_table              IN    VARCHAR2,
    dep_type               IN    PLS_INTEGER,
    dep_owner              IN    VARCHAR2,
    dep_orig_name          IN    VARCHAR2,
    dep_int_name           IN    VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table</td>
</tr>
<tr>
<td>dep_type</td>
<td>Type of the dependent object (see <em>Constants and Operational Notes</em>)</td>
</tr>
<tr>
<td>dep_owner</td>
<td>Owner of the dependent object</td>
</tr>
<tr>
<td>dep_orig_name</td>
<td>Name of the original dependent object</td>
</tr>
<tr>
<td>dep_int_name</td>
<td>Name of the interim dependent object</td>
</tr>
</tbody>
</table>
Usage Notes

• Attempting to register an already registered object will raise an error.
• Registering a dependent object will automatically remove that object from
  DBA_REDEFINITION_ERRORS if an entry exists for that object.

130.7.10 ROLLBACK Procedure

This procedure rolls back changes to a table after online table redefinition to return the
table to its original definition and preserve DML changes made to the table.

Syntax

DBMS_REDEFINITION.ROLLBACK (
  uname                   IN  VARCHAR2,
  orig_table              IN  VARCHAR2,
  int_table               IN  VARCHAR2 := NULL,
  part_name               IN  VARCHAR2 := NULL,
  dml_lock_timeout        IN  PLS_INTEGER := NULL,
  continue_after_errors   IN  BOOLEAN := FALSE);

Parameters

Table 130-12  ROLLBACK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the table to be redefined</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table.</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined.</td>
</tr>
<tr>
<td>dml_lock_timeout</td>
<td>Specifies the number of seconds the procedure waits for its required locks</td>
</tr>
<tr>
<td></td>
<td>before failing. The permissible range of values for timeout is 0 to 1,000,000.</td>
</tr>
<tr>
<td></td>
<td>The default is NULL (wait mode).</td>
</tr>
<tr>
<td>continue_after_errors</td>
<td>When rolling back redefinition changes on multiple partitions,</td>
</tr>
<tr>
<td></td>
<td>allows operation execution to continue on the next partition (applies only</td>
</tr>
<tr>
<td></td>
<td>to batched partition redefinition).</td>
</tr>
</tbody>
</table>
130.7.11 SET_PARAM Procedure

This procedure sets a new value for a specified parameter used by the redefinition process identified by a redefinition ID.

**Note:**
Currently, the only value that can be changed by this procedure is the value for the `refresh_dep_mviews` parameter that is specified in the `REDEF_TABLE` procedure or the `START_REDEF_TABLE` procedure. You can determine the redefinition ID and check the value of the `refresh_dep_mviews` parameter for an online table redefinition operation by querying the `DBA_REDEFINITION_STATUS` view.

**Syntax**

```sql
DBMS_REDEFINITION.SET_PARAM (    redefinition_id  IN  VARCHAR2,    param_name       IN  VARCHAR2,    param_value      IN  VARCHAR2);
```

**Parameters**

**Table 130-13  SET_PARAM Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>redefinition_id</td>
<td>The redefinition ID that identifies the redefinition process</td>
</tr>
<tr>
<td>param_name</td>
<td>The parameter name</td>
</tr>
<tr>
<td>param_value</td>
<td>The new parameter value</td>
</tr>
</tbody>
</table>

**See Also:**

*Oracle Database Administrator's Guide*

130.7.12 START_REDEF_TABLE Procedure

This procedure starts a table redefinition.

Prior to calling this procedure, you must manually create an empty interim table (in the same schema as the table to be redefined) with the desired attributes of the post-redefinition table, and then call this procedure to initiate the redefinition.

**Syntax**

```sql
DBMS_REDEFINITION.START_REDEF_TABLE (    uname                   IN  VARCHAR2,    orig_table              IN  VARCHAR2,    int_table               IN  VARCHAR2,    ...);
```
Parameters

Table 130-14  START_REDEF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table. Can take a comma-delimited list of interim table names.</td>
</tr>
<tr>
<td>col_mapping</td>
<td>Mapping information from the columns in the original table to the columns in the interim table. (This is similar to the column list on the SELECT clause of a query.) If NULL, all the columns in the original table are selected and have the same name after redefinition.</td>
</tr>
<tr>
<td>options_flag</td>
<td>Indicates the type of redefinition method to use:</td>
</tr>
<tr>
<td></td>
<td>• If dbms_redefinition.cons_use_pk, the redefinition is done using primary keys or pseudo-primary keys (unique keys with all component columns having NOT NULL constraints). The default method of redefinition is using primary keys.</td>
</tr>
<tr>
<td></td>
<td>• If dbms_redefinition.cons_use_rowid, the redefinition is done using rowids.</td>
</tr>
<tr>
<td>orderby_cols</td>
<td>This optional parameter accepts the list of columns (along with the optional keyword(s) ascending/descending) with which to order by the rows during the initial instantiation of the interim table (the order by is only done for the initial instantiation and not for subsequent synchronizations)</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.</td>
</tr>
<tr>
<td>continue_after_errors</td>
<td>When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)</td>
</tr>
<tr>
<td>copy_vpd_opt</td>
<td>Specifies how VPD policies are handled in online redefinition</td>
</tr>
<tr>
<td>refresh_dep_mviews</td>
<td>When set to ‘Y’, fast refresh of dependent materialized views is performed when the START_REDEF_TABLE procedure is run, each time the SYNC_INTERIM_TABLE procedure is run, and when the FINISH_REDEF_TABLE procedure is run.</td>
</tr>
</tbody>
</table>
Table 130-14 (Cont.) START_REDEF_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable_rollback</td>
<td>When set to TRUE, enables the rollback option. When this parameter is set to true, Oracle Database maintains the interim table created during redefinition after redefinition is complete. You can run the SYNC_INTERIM_TABLE procedure to synchronize the interim table periodically to apply DML changes made to the redefined table to the interim table. An internal materialized view and materialized view log enables maintenance of the interim table. If you decide to roll back the online table redefinition with the ROLLBACK procedure, then the interim table is synchronized, and Oracle Database switches back to it so that the table has its original definition.</td>
</tr>
</tbody>
</table>

Examples

Start redefinition of three partitions (sal03q1,sal03q2,sal03q3) in table 'STEVE.salestable' using three interim tables of int_salestable1, int_salestable2 and int_salestable3, respectively. The operation will continue on sal03q3 even if it fails on sal03q1.

DBMS_REDEFINITION.START_REDEF_TABLE(
  uname => 'STEVE',
  orig_table => 'salestable',
  int_table => 'int_salestable1, int_salestable2, int_salestable3',
  col_mapping => NULL,
  options_flag => DBMS_REDEFINITION.CONS_USE_ROWID,
  part_name => 'sal03q1,sal03q2,sal03q3',
  continue_after_errors => TRUE);

Specify to copy VPD policies automatically:

EXECUTE DBMS_REDEFINITION.START_REDEF_TABLE(  
  uname => 'SCOTT',
  orig_table => 'T',
  int_table => 'INT_T',
  copy_vpd_opt => DBMS_REDEFINITION.CONS_VPD_AUTO);

130.7.13 SYNC_INTERIM_TABLE Procedure

This procedure keeps the interim table synchronized with the original table.

Syntax

DBMS_REDEFINITION.SYNC_INTERIM_TABLE (  
  uname IN VARCHAR2,
  orig_table IN VARCHAR2,
  int_table IN VARCHAR2,
  part_name IN VARCHAR2 := NULL,
  continue_after_errors IN BOOLEAN := FALSE);
Parameters

Table 130-15  SYNCH_INTERIM_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the table</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>
<td>int_table</td>
<td>Name of the interim table. Can take a comma-delimited list of interim table names.</td>
</tr>
<tr>
<td>part_name</td>
<td>Name of the partition being redefined. If redefining only a single partition of a table, specify the partition name in this parameter. NULL implies the entire table is being redefined. Can take a comma-delimited list of partition names to be redefined.</td>
</tr>
<tr>
<td>continue_after_errors</td>
<td>When redefining multiple partitions allows operation execution to continue on the next partition (applies only to batched partition redefinition)</td>
</tr>
</tbody>
</table>

Usage Notes

- This step is useful in minimizing the amount of synchronization needed to be done by the FINISH_REDEF_TABLE Procedure before completing the online redefinition.
- This procedure can be called between long running operations (such as CREATE INDEX) on the interim table to sync it up with the data in the original table and speed up subsequent operations.

130.7.14 UNREGISTER_DEPENDENT_OBJECT Procedure

This procedure unregisters a dependent object (index, trigger, constraint or materialized view log) on the table being redefined and the corresponding dependent object on the interim table.

Syntax

DBMS_REDEFINITION.UNREGISTER_DEPENDENT_OBJECT(
    uname IN VARCHAR2,
    orig_table IN VARCHAR2,
    int_table IN VARCHAR2,
    dep_type IN PLS_INTEGER,
    dep_owner IN VARCHAR2,
    dep_orig_name IN VARCHAR2,
    dep_int_name IN VARCHAR2);

Parameters

Table 130-16  UNREGISTER_DEPENDENT_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uname</td>
<td>Schema name of the tables</td>
</tr>
<tr>
<td>orig_table</td>
<td>Name of the table to be redefined</td>
</tr>
<tr>

<td>dep_orig_name</td>
<td>Name of the original dependent object</td>
</tr>
<tr>
<td>dep_int_name</td>
<td>Name of the interim dependent object</td>
</tr>
</tbody>
</table>
The `DBMS_REFRESH` package enables you to create groups of materialized views that can be refreshed together to a transactionally consistent point in time. These groups are called refresh groups.

This chapter contains the following topics:

- **DBMS_REFRESH Overview**
- **DBMS_REFRESH Security Model**

### 131.1 DBMS_REFRESH Overview

When it is important for materialized views to be transactionally consistent with each other, you can organize them into refresh groups.

By refreshing the refresh group, you can ensure that the data in all of the materialized views in the refresh group correspond to the same transactionally consistent point in time. A materialized view in a refresh group still can be refreshed individually, but doing so nullifies the benefits of the refresh group because refreshing the materialized view individually does not refresh the other materialized views in the refresh group.

### 131.2 DBMS_REFRESH Security Model

Users must have the `EXECUTE` privilege to run the procedures of `DBMS_REFRESH` package.

### 131.3 Summary of DBMS_REFRESH Subprograms

This table lists the `DBMS_REFRESH` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ADD Procedure</code></td>
<td>Adds materialized views to a refresh group</td>
</tr>
<tr>
<td><code>CHANGE Procedure</code></td>
<td>Changes the refresh interval for a refresh group</td>
</tr>
<tr>
<td><code>DESTROY Procedure</code></td>
<td>Removes all of the materialized views from a refresh group and deletes the refresh group</td>
</tr>
<tr>
<td><code>MAKE Procedure</code></td>
<td>Specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group</td>
</tr>
<tr>
<td><code>REFRESH Procedure</code></td>
<td>Manually refreshes a refresh group</td>
</tr>
<tr>
<td><code>SUBTRACT Procedure</code></td>
<td>Removes materialized views from a refresh group</td>
</tr>
</tbody>
</table>
131.3.1 ADD Procedure

This procedure adds materialized views to a refresh group.

Syntax

```sql
DBMS_REFRESH.ADD (  
    name     IN VARCHAR2,  
    { list   IN VARCHAR2,  
    | tab    IN DBMS_UTILITY.UNCL_ARRAY, }  
    lax      IN BOOLEAN := FALSE);
```

**Note:**

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the refresh group to which you want to add members, specified as <code>[schema_name.]refresh_group_name</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>list</td>
<td>Comma-delimited list of materialized views that you want to add to the refresh group. Synonyms are not supported. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>tab</td>
<td>Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code>. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>lax</td>
<td>A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from one group to another, then you must set the <code>lax</code> flag to <code>TRUE</code> to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to <code>ADD</code> generates an error message.</td>
</tr>
</tbody>
</table>
131.3.2 CHANGE Procedure

This procedure changes the refresh interval for a refresh group.

Syntax

```
DBMS_REFRESH.CHANGE (  
    name                  IN VARCHAR2,  
    next_date             IN DATE           := NULL,  
    interval              IN VARCHAR2       := NULL,  
    implicit_destroy      IN BOOLEAN        := NULL,  
    rollback_seg          IN VARCHAR2       := NULL,  
    push_deferred_rpc     IN BOOLEAN        := NULL,  
    refresh_after_errors  IN BOOLEAN        := NULL,  
    purge_option          IN BINARY_INTEGER := NULL,  
    parallelism           IN BINARY_INTEGER := NULL,  
    heap_size             IN BINARY_INTEGER := NULL);
```

Parameters

Table 131-3  CHANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the refresh group for which you want to alter the refresh interval.</td>
</tr>
<tr>
<td>next_date</td>
<td>Next date that you want a refresh to occur. By default, this date remains unchanged.</td>
</tr>
<tr>
<td>interval</td>
<td>Function used to calculate the next time to refresh the materialized views in the refresh group. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh. By default, the interval remains unchanged.</td>
</tr>
<tr>
<td>implicit_destroy</td>
<td>Allows you to reset the value of the implicit_destroy flag. If this flag is set, then Oracle automatically deletes the group if it no longer contains any members. By default, this flag remains unchanged.</td>
</tr>
<tr>
<td>rollback_seg</td>
<td>Allows you to change the rollback segment used. By default, the rollback segment remains unchanged. To reset this parameter to use the default rollback segment, specify NULL, including the quotes. Specifying NULL without quotes indicates that you do not want to change the rollback segment currently being used.</td>
</tr>
<tr>
<td>push_deferred_rpc</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
<tr>
<td>purge_option</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
</tbody>
</table>
| parallelism     | • 0 specifies serial propagation.  
                 • n > 1 specifies parallel propagation with n parallel processes.  
                 • 1 specifies parallel propagation using only one parallel process. |
Table 131-3  (Cont.) CHANGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heap_size</td>
<td>Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.</td>
</tr>
</tbody>
</table>

**Note:**
Do not set this parameter unless directed to do so by Oracle Support Services.

131.3.3 DESTROY Procedure

This procedure removes all of the materialized views from a refresh group and delete the refresh group.

**Syntax**

```sql
DBMS_REFRESH.DESTROY (name   IN   VARCHAR2);
```

**Parameters**

Table 131-4  DESTROY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the refresh group that you want to destroy.</td>
</tr>
</tbody>
</table>

131.3.4 MAKE Procedure

This procedure specifies the members of a refresh group and the time interval used to determine when to refresh the members of this group.

**Syntax**

```sql
DBMS_REFRESH.MAKE (name                  IN    VARCHAR2
                   { list                IN    VARCHAR2,
                     | tab                 IN    DBMS_UTILITY.UNCL_ARRAY,}
                   next_date             IN    DATE,
                   interval              IN    VARCHAR2,
                   implicit_destroy      IN    BOOLEAN         := FALSE,
                   lax                   IN    BOOLEAN         := FALSE,
                   job                   IN    BINARY_INTEGER  := 0,
                   rollback_seg          IN    VARCHAR2        := NULL,
                   push_deferred_rpc     IN    BOOLEAN         := TRUE,
                   refresh_after_errors  IN    BOOLEAN         := FALSE,
                   purge_option          IN    BINARY_INTEGER  := NULL,
                   parallelism           IN    BINARY_INTEGER  := NULL,
                   heap_size             IN    BINARY_INTEGER  := NULL
                   );
```
job_name          IN    VARCHAR2        := NULL,
auto_commit       IN    BOOLEAN         := NULL);

**Note:**
This procedure is overloaded. The list and tab parameters are mutually exclusive.

### Parameters

#### Table 131-5  MAKE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Unique name used to identify the refresh group, specified as [schema_name.]refresh_group_name. If the schema is not specified, then the current user is the default. Refresh groups must follow the same naming conventions as tables.</td>
</tr>
<tr>
<td>list</td>
<td>Comma-delimited list of materialized views that you want to refresh. Synonyms are not supported. These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as [schema_name.]materialized_view_name. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>tab</td>
<td>Instead of a comma-delimited list, you can supply a PL/SQL associative array of names of materialized views that you want to refresh using the data type DBMS_UTILITY.UNCL_ARRAY. If the table contains the names of n materialized views, then the first materialized view should be in position 1 and the n+1 position should be set to NULL. Each materialized view is specified as [schema_name.]materialized_view_name. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>next_date</td>
<td>Next date that you want a refresh to occur.</td>
</tr>
<tr>
<td>interval</td>
<td>Function used to calculate the next time to refresh the materialized views in the group. This field is used with the next_date value. For example, if you specify NEXT_DAY(SYSDATE+1, &quot;MONDAY&quot;) as your interval, and if your next_date evaluates to Monday, then Oracle refreshes the materialized views every Monday. This interval is evaluated immediately before the refresh. Thus, select an interval that is greater than the time it takes to perform a refresh.</td>
</tr>
<tr>
<td>implicit_destroy</td>
<td>Set this to TRUE to delete the refresh group automatically when it no longer contains any members. Oracle checks this flag only when you call the SUBTRACT procedure. That is, setting this flag still enables you to create an empty refresh group.</td>
</tr>
<tr>
<td>lax</td>
<td>A materialized view can belong to only one refresh group at a time. If you are moving a materialized view from an existing group to a new refresh group, then you must set this to TRUE to succeed. Oracle then automatically removes the materialized view from the other refresh group and updates its refresh interval to be that of its new group. Otherwise, the call to MAKE generates an error message.</td>
</tr>
<tr>
<td>job</td>
<td>Needed by the Import utility. Use the default value, 0.</td>
</tr>
</tbody>
</table>
Table 131-5  (Cont.) MAKE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rollback_seg</td>
<td>Name of the rollback segment to use while refreshing materialized views. The default, NULL, uses the default rollback segment.</td>
</tr>
<tr>
<td>push_deferred_rpc</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
<tr>
<td>refresh_after_errors</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
<tr>
<td>purge_option</td>
<td>Starting with Oracle Database 12c Release 2 (12.2), this parameter is ignored.</td>
</tr>
<tr>
<td>parallelism</td>
<td>• 0 specifies serial propagation.</td>
</tr>
<tr>
<td></td>
<td>• n &gt; 1 specifies parallel propagation with n parallel processes.</td>
</tr>
<tr>
<td></td>
<td>• 1 specifies parallel propagation using only one parallel process.</td>
</tr>
<tr>
<td>heap_size</td>
<td>Maximum number of transactions to be examined simultaneously for parallel propagation scheduling. Oracle automatically calculates the default setting for optimal performance.</td>
</tr>
</tbody>
</table>

**Note:**

Do not set this parameter unless directed to do so by Oracle Support Services.

job_name

This parameter is needed by the import utility. User should use the default value, NULL.

auto_commit

Supported values are NULL, TRUE, and FALSE.

- NULL—allows the user to continue using DBMS_JOB.
- TRUE—commit statement will be automatically issued after the job of the refresh group are created by DBMS_REFRESH.MAKE.
- FALSE—user must issue a commit statement to finish the transaction after calling DBMS_REFRESH.MAKE.

The default value is NULL.

Usage Notes

Import utility and export utility need CREATE JOB privilege if DBMS_SCHEDULER jobs are used.

131.3.5 REFRESH Procedure

This procedure manually refreshes a refresh group.

**Syntax**

```
DBMS_REFRESH.REFRESH (  
   name IN VARCHAR2);  
```
Parameters

Table 131-6  REFRESH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the refresh group that you want to refresh manually.</td>
</tr>
</tbody>
</table>

131.3.6 SUBTRACT Procedure

This procedure removes materialized views from a refresh group.

Syntax

```sql
DBMS_REFRESH.SUBTRACT (
    name      IN    VARCHAR2,
    { list    IN    VARCHAR2,
      | tab     IN    DBMS_UTILITY.UNCL_ARRAY, }
    lax       IN    BOOLEAN := FALSE);
```

Note:

This procedure is overloaded. The `list` and `tab` parameters are mutually exclusive.

Parameters

Table 131-7  SUBTRACT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the refresh group from which you want to remove members, specified as <code>[schema_name.]refresh_group_name</code>. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>list</td>
<td>Comma-delimited list of materialized views that you want to remove from the refresh group. (Synonyms are not supported.) These materialized views can be located in different schemas and have different master tables or master materialized views. However, all of the listed materialized views must be in your current database. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>tab</td>
<td>Instead of a comma-delimited list, you can supply a PL/SQL associative array of type <code>DBMS_UTILITY.UNCL_ARRAY</code>, where each element is the name of a materialized view. The first materialized view should be in position 1. The last position must be <code>NULL</code>. Each materialized view is specified as <code>[schema_name.]materialized_view_name</code>. If the schema is not specified, then the refresh group owner is the default.</td>
</tr>
<tr>
<td>lax</td>
<td>Set this to <code>FALSE</code> if you want Oracle to generate an error message if the materialized view you are attempting to remove is not a member of the refresh group.</td>
</tr>
</tbody>
</table>
The DBMS_REPAIR package contains data corruption repair procedures that enable you to detect and repair corrupt blocks in tables and indexes. You can address corruptions where possible and continue to use objects while you attempt to rebuild or repair them.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operating Notes
- Exceptions
- Examples
- Summary of DBMS_REPAIR Subprograms

See Also:
For detailed information about using the DBMS_REPAIR package, see Oracle Database Administrator’s Guide

132.1 DBMS_REPAIR Overview

The DBMS_REPAIR package is intended for use by database administrators only. It is not intended for use by application developers.

132.2 DBMS_REPAIR Security Model

The package is owned by SYS. Execution privilege is not granted to other users.

132.3 DBMS_REPAIR Constants

The DBMS_REPAIR package defines several enumerated constants that should be used for specifying parameter values. Enumerated constants must be prefixed with the package name. For example, DBMS_REPAIR.TABLE_OBJECT.

The following table lists the parameters and the enumerated constants.
Table 132-1 DBMS_REPAIR Parameters with Enumerated Constants

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Option</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>• TABLE_OBJECT</td>
<td>BINARY_INTEGER</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>• INDEX_OBJECT</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• CLUSTER_OBJECT</td>
<td></td>
<td></td>
</tr>
<tr>
<td>action</td>
<td>• CREATE_ACTION</td>
<td>BINARY_INTEGER</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>• DROP_ACTION</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• PURGE_ACTION</td>
<td></td>
<td></td>
</tr>
<tr>
<td>table_type</td>
<td>• REPAIR_TABLE</td>
<td>BINARY_INTEGER</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>• ORPHAN_TABLE</td>
<td></td>
<td></td>
</tr>
<tr>
<td>flags</td>
<td>• SKIP_FLAG</td>
<td>BINARY_INTEGER</td>
<td>-</td>
</tr>
<tr>
<td></td>
<td>• NOSKIP_FLAG</td>
<td></td>
<td></td>
</tr>
<tr>
<td>object_id</td>
<td>• ALL_INDEX_ID := 0</td>
<td>BINARY_INTEGER</td>
<td>Clean up all objects that qualify</td>
</tr>
<tr>
<td>wait_for_lock</td>
<td>• LOCK_WAIT := 1</td>
<td>BINARY_INTEGER</td>
<td>Specifies whether to try getting DML locks on</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>underlying table [(sub]partition] object</td>
</tr>
</tbody>
</table>

**Note:**
The default table name will be **REPAIR_TABLE** when `table_type` is `REPAIR_TABLE`, and will be **ORPHAN_KEY_TABLE** when `table_type` is **ORPHAN_TABLE**.

132.4 DBMS_REPAIR Operating Notes

The procedure to create the **ORPHAN_KEYS_TABLE** is similar to the one used to create the **REPAIR_TABLE**.

CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_KEYS_TABLE', DBMS_REPAIR.ORPHAN_TABLE, DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_TABLE', DBMS_REPAIR.REPAIR_TABLE, DBMS_REPAIR.CREATE_ACTION);

DESCRIBE ORPHAN_KEYS_TABLE;
DESCRIBE REPAIR_TABLE;
SELECT * FROM ORPHAN_KEYS_TABLE;
SELECT * FROM REPAIR_TABLE;

The DBA would create the repair and orphan keys tables once. Subsequent executions of the **CHECK_OBJECT Procedure** would add rows into the appropriate table indicating the types of errors found.

The name of the repair and orphan keys tables can be chosen by the user, with the following restriction: the name of the repair table must begin with the `'REPAIR_` prefix, and the name of the orphan keys table must begin with the `'ORPHAN_` prefix. The following code is also legal:

CONNECT / AS SYSDBA;
EXEC DBMS_REPAIR.ADMIN_TABLES('ORPHAN_FOOBAR', DBMS_REPAIR.ORPHAN_TABLE, DBMS_REPAIR.CREATE_ACTION);
EXEC DBMS_REPAIR.ADMIN_TABLES('REPAIR_ABCD', DBMS_REPAIR.REPAIR_TABLE, DBMS_REPAIR.CREATE_ACTION);
When invoking the `CHECK_OBJECT` Procedure, the name of the repair and orphan keys tables that were created should be specified correctly, especially if the default values were not used in the `ADMIN_TABLES Procedure` or `CREATE_ACTION`.

Other actions in the `ADMIN_TABLES Procedure` can be used to purge/delete the `REPAIR_TABLE` and the `ORPHAN_KEYS_TABLE`.

### 132.5 DBMS_REPAIR Exceptions

The table in this topic describes the exceptions raised by the DDBMS_REPAIR subprograms.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>942</td>
<td>Reported by <code>DBMS_REPAIR.ADMIN_TABLES</code> during a <code>DROP_ACTION</code> when the specified table doesn't exist.</td>
<td>-</td>
</tr>
<tr>
<td>955</td>
<td>Reported by <code>DBMS_REPAIR.CREATE_ACTION</code> when the specified table already exists.</td>
<td>-</td>
</tr>
<tr>
<td>24120</td>
<td>An invalid parameter was passed to the specified <code>DBMS_REPAIR</code> procedure.</td>
<td>Specify a valid parameter value or use the parameter's default.</td>
</tr>
<tr>
<td>24122</td>
<td>An incorrect block range was specified.</td>
<td>Specify correct values for the <code>BLOCK_START</code> and <code>BLOCK_END</code> parameters.</td>
</tr>
<tr>
<td>24123</td>
<td>An attempt was made to use the specified feature, but the feature is not yet implemented.</td>
<td>Do not attempt to use the feature.</td>
</tr>
<tr>
<td>24124</td>
<td>An invalid <code>ACTION</code> parameter was specified.</td>
<td>Specify <code>CREATE_ACTION</code>, <code>PURGE_ACTION</code> or <code>DROP_ACTION</code> for the <code>ACTION</code> parameter.</td>
</tr>
<tr>
<td>24125</td>
<td>An attempt was made to fix corrupt blocks on an object that has been dropped or truncated since <code>DBMS_REPAIR.CHECK_OBJECT</code> was run.</td>
<td>Use <code>DBMS_REPAIR.ADMIN_TABLES</code> to purge the repair table and run <code>DBMS_REPAIR.CHECK_OBJECT</code> to determine whether there are any corrupt blocks to be fixed.</td>
</tr>
<tr>
<td>24127</td>
<td><code>TABLESPACE</code> parameter specified with an <code>ACTION</code> other than <code>CREATE_ACTION</code>.</td>
<td>Do not specify <code>TABLESPACE</code> when performing actions other than <code>CREATE_ACTION</code>.</td>
</tr>
<tr>
<td>24128</td>
<td>A partition name was specified for an object that is not partitioned.</td>
<td>Specify a partition name only if the object is partitioned.</td>
</tr>
<tr>
<td>24129</td>
<td>An attempt was made to pass a table name parameter without the specified prefix.</td>
<td>Pass a valid table name parameter.</td>
</tr>
</tbody>
</table>
Table 132-2  (Cont.) DBMS_REPAIR Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>24130</td>
<td>An attempt was made to specify a repair or orphan table that does not exist.</td>
<td>Specify a valid table name parameter.</td>
</tr>
<tr>
<td>24131</td>
<td>An attempt was made to specify a repair or orphan table that does not have a correct definition.</td>
<td>Specify a table name that refers to a properly created table.</td>
</tr>
<tr>
<td>24132</td>
<td>An attempt was made to specify a table name is greater than 30 characters long.</td>
<td>Specify a valid table name parameter.</td>
</tr>
</tbody>
</table>

132.6 DBMS_REPAIR Examples

This topic shows examples of DBMS_REPAIR usage.

```sql
/* Fix the bitmap status for all the blocks in table mytab in schema sys */
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB');

/* Mark block number 45, filenumber 1 for table mytab in sys schema as FULL.*/
EXECUTE DBMS_REPAIR.SEGMENT_FIX_STATUS('SYS', 'MYTAB', TABLE_OBJECT, 1, 45, 1);
```

132.7 Summary of DBMS_REPAIR Subprograms

This table lists the DBMS_REPAIR subprograms and briefly describes them.

Table 132-3  DBMS_REPAIR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADMIN_TABLES Procedure</td>
<td>Provides administrative functions for the DBMS_REPAIR package repair and orphan key tables, including create, purge, and drop functions</td>
</tr>
<tr>
<td>CHECK_OBJECT Procedure</td>
<td>Detects and reports corruptions in a table or index</td>
</tr>
<tr>
<td>DUMP_ORPHAN_KEYS Procedure</td>
<td>Reports on index entries that point to rows in corrupt data blocks</td>
</tr>
<tr>
<td>FIX_CORRUPT_BLOCKS Procedure</td>
<td>Marks blocks software corrupt that have been previously detected as corrupt by CHECK_OBJECT</td>
</tr>
<tr>
<td>ONLINE_INDEX_CLEAN Function</td>
<td>Performs a manual cleanup of failed or interrupted online index builds or rebuilds</td>
</tr>
<tr>
<td>REBUILD_FREELISTS Procedure</td>
<td>Rebuilds an object's freelists</td>
</tr>
<tr>
<td>SEGMENT_FIX_STATUS Procedure</td>
<td>Fixes the corrupted state of a bitmap entry</td>
</tr>
<tr>
<td>SKIP_CORRUPT_BLOCKS Procedure</td>
<td>Sets whether to ignore blocks marked corrupt during table and index scans or to report ORA-1578 when blocks marked corrupt are encountered</td>
</tr>
</tbody>
</table>
132.7.1 ADMIN_TABLES Procedure

This procedure provides administrative functions for the DBMS_REPAIR package repair and orphan key tables.

Syntax

```sql
DBMS_REPAIR.ADMIN_TABLES (
    table_name  IN   VARCHAR2,
    table_type  IN   BINARY_INTEGER,
    action      IN   BINARY_INTEGER,
    tablespace  IN   VARCHAR2  DEFAULT NULL);
```

Parameters

Table 132-4  ADMIN_TABLES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of the table to be processed. Defaults to ORPHAN_KEY_TABLE or REPAIR_TABLE based on the specified table_type. When specified, the table name must have the appropriate prefix: ORPHAN_ or REPAIR_.</td>
</tr>
<tr>
<td>table_type</td>
<td>Type of table; must be either ORPHAN_TABLE or REPAIR_TABLE. See &quot;Constants&quot;.</td>
</tr>
<tr>
<td>action</td>
<td>Indicates what administrative action to perform. Must be either CREATE_ACTION, PURGE_ACTION, or DROP_ACTION. If the table already exists, and if CREATE_ACTION is specified, then an error is returned. PURGE_ACTION indicates to delete all rows in the table that are associated with non-existent objects. If the table does not exist, and if DROP_ACTION is specified, then an error is returned. When CREATE_ACTION and DROP_ACTION are specified, an associated view named DBA_&lt;table_name&gt; is created and dropped respectively. The view is defined so that rows associated with non-existent objects are eliminated. Created in the SYS schema. See &quot;Constants&quot;.</td>
</tr>
<tr>
<td>tablespace</td>
<td>Indicates the tablespace to use when creating a table. By default, the SYS default tablespace is used. An error is returned if the tablespace is specified and if the action is not CREATE_ACTION.</td>
</tr>
</tbody>
</table>

132.7.2 CHECK_OBJECT Procedure

This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.

Validation consists of block checking all blocks in the object.

Syntax

```sql
DBMS_REPAIR.CHECK_OBJECT (
    schema_name       IN  VARCHAR2,
```

---

Chapter 132
Summary of DBMS_REPAIR Subprograms

132-5
object_name       IN  VARCHAR2,
partition_name    IN  VARCHAR2       DEFAULT NULL,
object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,
repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',
flags             IN  BINARY_INTEGER DEFAULT NULL,
relative_fno      IN  BINARY_INTEGER DEFAULT NULL,
block_start       IN  BINARY_INTEGER DEFAULT NULL,
block_end         IN  BINARY_INTEGER DEFAULT NULL,
corrupt_count     OUT BINARY_INTEGER);

Parameters

Table 132-5  CHECK_OBJECT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the object to be checked.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table or index to be checked.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name to be checked.</td>
</tr>
<tr>
<td></td>
<td>If this is a partitioned object, and if partition_name is not specified, then all partitions and subpartitions are checked. If this is a partitioned object, and if the specified partition contains subpartitions, then all subpartitions are checked.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. This must be either TABLE_OBJECT (default) or INDEX_OBJECT.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot;.</td>
</tr>
<tr>
<td>repair_table_name</td>
<td>Name of the repair table to be populated.</td>
</tr>
<tr>
<td></td>
<td>The table must exist in the SYS schema. Use the ADMIN_TABLES Procedure to create a repair table. The default name is REPAIR_TABLE.</td>
</tr>
<tr>
<td>flags</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number: Used when specifying a block range.</td>
</tr>
<tr>
<td>block_start</td>
<td>First block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition.</td>
</tr>
<tr>
<td>block_end</td>
<td>Last block to process if specifying a block range. May be specified only if the object is a single table, partition, or subpartition. If only one of block_start or block_end is specified, then the other defaults to the first or last block in the file respectively.</td>
</tr>
<tr>
<td>corrupt_count</td>
<td>Number of corruptions reported.</td>
</tr>
</tbody>
</table>

Usage Notes

You may optionally specify a DBA range, partition name, or subpartition name when you want to check a portion of an object.
132.7.3 DUMP_ORPHAN_KEYS Procedure

This procedure reports on index entries that point to rows in corrupt data blocks. For each such index entry encountered, a row is inserted into the specified orphan table.

If the repair table is specified, then any corrupt blocks associated with the base table are handled in addition to all data blocks that are marked software corrupt. Otherwise, only blocks that are marked corrupt are handled.

This information may be useful for rebuilding lost rows in the table and for diagnostic purposes.

Syntax

```sql
DBMS_REPAIR.DUMP_ORPHAN_KEYS (    schema_name IN VARCHAR2,    object_name IN VARCHAR2,    partition_name IN VARCHAR2 DEFAULT NULL,    object_type IN BINARY_INTEGER DEFAULT INDEX_OBJECT,    repair_table_name IN VARCHAR2 DEFAULT 'REPAIR_TABLE',    orphan_table_name IN VARCHAR2 DEFAULT 'ORPHAN_KEYS_TABLE',    flags IN BINARY_INTEGER DEFAULT NULL,    key_count OUT BINARY_INTEGER);```

Parameters

Table 132-6  DUMP_ORPHAN_KEYS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name.</td>
</tr>
<tr>
<td>object_name</td>
<td>Object name.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name to be processed.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. The default is INDEX_OBJECT. See &quot;Constants&quot;.</td>
</tr>
<tr>
<td>repair_table_name</td>
<td>Name of the repair table that has information regarding corrupt blocks in the base table. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.</td>
</tr>
<tr>
<td>orphan_table_name</td>
<td>Name of the orphan key table to populate with information regarding each index entry that refers to a row in a corrupt data block. The specified table must exist in the SYS schema. The ADMIN_TABLES Procedure is used to create the table.</td>
</tr>
<tr>
<td>flags</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>key_count</td>
<td>Number of index entries processed.</td>
</tr>
</tbody>
</table>
132.7.4 FIX_CORRUPT_BLOCKS Procedure

This procedure fixes the corrupt blocks in specified objects based on information in the repair table that was previously generated by the CHECK_OBJECT Procedure.

Prior to effecting any change to a block, the block is checked to ensure the block is still corrupt. Corrupt blocks are repaired by marking the block software corrupt. When a repair is effected, the associated row in the repair table is updated with a fix timestamp.

Syntax

DBMS_REPAIR.FIX_CORRUPT_BLOCKS (  
    schema_name       IN  VARCHAR2,  
    object_name       IN  VARCHAR2,  
    partition_name    IN  VARCHAR2       DEFAULT NULL,  
    object_type       IN  BINARY_INTEGER DEFAULT TABLE_OBJECT,  
    repair_table_name IN  VARCHAR2       DEFAULT 'REPAIR_TABLE',  
    flags             IN  BINARY_INTEGER DEFAULT NULL,  
    fix_count         OUT BINARY_INTEGER);  

Parameters

Table 132-7  FIX_CORRUPT_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object with corrupt blocks to be fixed.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name to be processed.</td>
</tr>
<tr>
<td></td>
<td>If this is a partitioned object, and if partition_name is not specified,</td>
</tr>
<tr>
<td></td>
<td>then all partitions and subpartitions are processed. If this is a</td>
</tr>
<tr>
<td></td>
<td>partitioned object, and if the specified partition contains</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>flags</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>fix_count</td>
<td>Number of blocks fixed.</td>
</tr>
</tbody>
</table>

Related Topics

- **CHECK_OBJECT Procedure**
  
  This procedure checks the specified objects and populates the repair table with information about corruptions and repair directives.
132.7.5 ONLINE_INDEX_CLEAN Function

This function performs a manual cleanup of failed or interrupted online index builds or rebuilds.

This action is also performed periodically by SMON, regardless of user-initiated cleanup.

This function returns TRUE if all indexes specified were cleaned up and FALSE if one or more indexes could not be cleaned up.

Syntax

```sql
DBMS_REPAIR.ONLINE_INDEX_CLEAN (object_id      IN BINARY_INTEGER DEFAULT ALL_INDEX_ID,
                               wait_for_lock  IN BINARY_INTEGER DEFAULT LOCK_WAIT)
RETURN BOOLEAN;
```

Parameters

Table 132-8 ONLINE_INDEX_CLEAN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>Object id of index to be cleaned up. The default cleans up all object ids that qualify.</td>
</tr>
<tr>
<td>wait_for_lock</td>
<td>This parameter specifies whether to try getting DML locks on underlying table [sub]partition object. The default retries up to an internal retry limit, after which the lock get will give up. If LOCK_NOWAIT is specified, then the lock get does not retry.</td>
</tr>
</tbody>
</table>

132.7.6 REBUILD_FREELISTS Procedure

This procedure rebuilds the freelists for the specified object.

All free blocks are placed on the master freelist. All other freelists are zeroed.

If the object has multiple freelist groups, then the free blocks are distributed among all freelists, allocating to the different groups in round-robin fashion.

Syntax

```sql
DBMS_REPAIR.REBUILD_FREELISTS (schema_name    IN VARCHAR2,
                                object_name    IN VARCHAR2,
                                partition_name IN VARCHAR2 DEFAULT NULL,
                                object_type    IN BINARY_INTEGER DEFAULT TABLE_OBJECT);
```

Parameters

Table 132-9 REBUILD_FREELISTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name.</td>
</tr>
</tbody>
</table>
Table 132-9  (Cont.) REBUILD_FREELISTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>Name of the object whose freelists are to be rebuilt.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Partition or subpartition name whose freelists are to be rebuilt.</td>
</tr>
<tr>
<td></td>
<td>If this is a partitioned object, and partition_name is not specified,</td>
</tr>
<tr>
<td></td>
<td>then all partitions and subpartitions are processed. If this is a</td>
</tr>
<tr>
<td></td>
<td>partitioned object, and the specified partition contains</td>
</tr>
<tr>
<td></td>
<td>subpartitions, then all subpartitions are processed.</td>
</tr>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. This must be either</td>
</tr>
<tr>
<td></td>
<td>TABLE_OBJECT (default) or INDEX_OBJECT.</td>
</tr>
<tr>
<td></td>
<td>See &quot;Constants&quot;.</td>
</tr>
</tbody>
</table>

132.7.7 SEGMENT_FIX_STATUS Procedure

With this procedure you can fix the corrupted state of a bitmap entry. The procedure either recalculates the state based on the current contents of the corresponding block or sets the state to a specific value.

Syntax

DBMS_REPAIR.SEGMENT_FIX_STATUS (segment_owner IN VARCHAR2,
segment_name IN VARCHAR2,
segment_type IN BINARY_INTEGER DEFAULT TABLE_OBJECT,
file_number IN BINARY_INTEGER DEFAULT NULL,
block_number IN BINARY_INTEGER DEFAULT NULL,
status_value IN BINARY_INTEGER DEFAULT NULL,
partition_name IN VARCHAR2 DEFAULT NULL,);

Parameters

Table 132-10  SEGMENT_FIX_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_owner</td>
<td>Schema name of the segment.</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name.</td>
</tr>
<tr>
<td>partition_name</td>
<td>Optional. Name of an individual partition. NULL for nonpartitioned objects. Default is NULL.</td>
</tr>
<tr>
<td>segment_type</td>
<td>Optional Type of the segment (for example, TABLE_OBJECT or INDEX_OBJECT). Default is NULL.</td>
</tr>
<tr>
<td>file_number</td>
<td>(optional) The tablespace-relative file number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.</td>
</tr>
<tr>
<td>block_number</td>
<td>(optional) The file-relative block number of the data block whose status has to be fixed. If omitted, all the blocks in the segment will be checked for state correctness and fixed.</td>
</tr>
</tbody>
</table>
Table 132-10  (Cont.) SEGMENT_FIX_STATUS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status_value</td>
<td>(optional) The value to which the block status described by the file_number and block_number will be set. If omitted, the status will be set based on the current state of the block. This is almost always the case, but if there is a bug in the calculation algorithm, the value can be set manually. Status values: 1 = block is full, 2 = block is 0-25% free, 3 = block is 25-50% free, 4 = block is 50-75% free, 5 = block is 75-100% free. The status for bitmap blocks, segment headers, and extent map blocks cannot be altered. The status for blocks in a fixed hash area cannot be altered. For index blocks, there are only two possible states: 1 = block is full and 3 = block has free space.</td>
</tr>
</tbody>
</table>

132.7.8 SKIP_CORRUPT_BLOCKS Procedure

This procedure enables or disables the skipping of corrupt blocks during index and table scans of the specified object.

When the object is a table, skip applies to the table and its indexes. When the object is a cluster, it applies to all of the tables in the cluster, and their respective indexes.

Note:

When Oracle performs an index range scan on a corrupt index after DBMS_REPAIR.SKIP_CORRUPT_BLOCKS has been set for the base table, corrupt branch blocks and root blocks are not skipped. Only corrupt non-root leaf blocks are skipped.

Syntax

```
DBMS_REPAIR.SKIP_CORRUPT_BLOCKS (  
    schema_name  IN VARCHAR2,  
    object_name  IN VARCHAR2,  
    object_type  IN BINARY_INTEGER DEFAULT TABLE_OBJECT,  
    flags        IN BINARY_INTEGER DEFAULT SKIP_FLAG);
```

Parameters

Table 132-11  SKIP_CORRUPT_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Schema name of the object to be processed.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the object.</td>
</tr>
</tbody>
</table>
### Table 132-11  (Cont.) SKIP_CORRUPT_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_type</td>
<td>Type of the object to be processed. This must be either TABLE_OBJECT (default) or CLUSTER_OBJECT. See &quot;Constants&quot;.</td>
</tr>
<tr>
<td>flags</td>
<td>If SKIP_FLAG is specified, then it turns on the skip of software corrupt blocks for the object during index and table scans. If NOSKIP_FLAG is specified, then scans that encounter software corrupt blocks return an ORA-1578. See &quot;Constants&quot;.</td>
</tr>
</tbody>
</table>
133

DBMS_RESCONFIG

The DBMS_RESCONFIG package provides an interface to operate on the resource configuration list, and to retrieve listener information for a resource.

This chapter contains the following topics:

- Overview
- Summary of DBMS_RESCONFIG Subprograms

See Also:
Oracle XML DB Developer's Guide for more information about "Resource Configuration".

133.1 DBMS_RESCONFIG Overview

The DBMS_RESCONFIG package contains functions and procedures to manage the resource configuration lists of individual resources and the repository.

133.2 Summary of DBMS_RESCONFIG Subprograms

This table lists and briefly describes the DBMS_RESCONFIG package subprograms.

Table 133-1   DBMS_RESCONFIG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADDREPOSITORYRESCONFIG Procedure</td>
<td>Inserts the resource configuration specified by absolute path at the given position of the repository's configuration list</td>
</tr>
<tr>
<td>ADDRESCONFIG Procedure</td>
<td>Inserts the resource configuration specified by the absolute path at the given position in the target resource's configuration list</td>
</tr>
<tr>
<td>APPENDRESCONFIG Procedure</td>
<td>Appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list</td>
</tr>
<tr>
<td>DELETEREPPOSITORYRESCONFIG Procedure</td>
<td>Removes the configuration at the given position in the repository's configuration list.</td>
</tr>
<tr>
<td>DELETeresCONFIG Procedures</td>
<td>Removes the configuration at the given position in the target resource's configuration list.</td>
</tr>
<tr>
<td>GETLISTENERS Function</td>
<td>Returns the list of listeners applicable for a given resource</td>
</tr>
</tbody>
</table>
Table 133-1  (Cont.) DBMS_RESCONFIG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETREPOSITORYRESCONFIG Function</td>
<td>Returns the resource configuration at the specified position of the repository's configuration list</td>
</tr>
<tr>
<td>GETREPOSITORYRESCONFIGPATHS Function</td>
<td>Returns a list of resource configuration paths defined for the repository</td>
</tr>
<tr>
<td>GETRESCONFIG Function</td>
<td>Returns the resource configuration at the specified position of the target resource's configuration list</td>
</tr>
<tr>
<td>GETRESCONFIGPATHS Function</td>
<td>Returns a list of resource configuration paths defined in the target resource's configuration list</td>
</tr>
<tr>
<td>PATCHREPOSITORYRESCONFIGLIST Procedure</td>
<td>Removes invalid references from the repository resource configuration list, and makes the repository available</td>
</tr>
</tbody>
</table>

133.2.1 ADDREPOSITORYRESCONFIG Procedure

This procedure inserts the resource configuration specified by absolute path of the resource configuration at the specified position of the repository's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```plsql
DBMS_RESCONFIG.ADDREPOSITORYRESCONFIG(
  rcpath     IN   VARCHAR2,
  pos        IN   PLS_INTEGER := NULL);
```

Parameters

Table 133-2  ADDREPOSITORYRESCONFIG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rcpath</td>
<td>Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.</td>
</tr>
<tr>
<td>pos</td>
<td>Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (pos &lt; 0 or pos &gt; the size of the target resource's configuration list).</td>
</tr>
</tbody>
</table>

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have XDBADMIN role and READ privilege on the resource configuration to be inserted; otherwise, an error is returned.
133.2.2 ADDRESCONFIG Procedure

This procedure inserts the resource configuration specified by the absolute path of the resource configuration at the given position in the target resource's configuration list. It shifts the element currently at that position (if any) and any subsequent elements to the right.

Syntax

```sql
DBMS_RESCONFIG.ADDRESCONFIG(
    respath    IN   VARCHAR2,
    rcpath     IN   VARCHAR2,
    pos        IN   PLS_INTEGER := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>respath</td>
<td>Absolute path of the target resource</td>
</tr>
<tr>
<td>rcpath</td>
<td>Absolute path of the resource configuration to be inserted. An exception is raised if rcpath already exists in the target's configuration list.</td>
</tr>
<tr>
<td>pos</td>
<td>Index at which the new configuration is to be inserted. If this parameter is not specified then the new configuration is appended to the end of the list. An exception is raised if the index is out of range (pos &lt; 0 or pos &gt; the size of the target resource's configuration list).</td>
</tr>
</tbody>
</table>

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on the target resource and read privilege on the resource configuration to be inserted; otherwise, an error is returned.

133.2.3 APPENDRESCONFIG Procedure

This procedure appends the resource configuration specified by rcpath to the target resource's configuration list if it is not already included in the list.

Syntax

```sql
DBMS_RESCONFIG.ADDRESCONFIG(
    respath       IN   VARCHAR2,
    rcpath        IN   VARCHAR2,
    appendOption  IN   PLS_INTEGER);
```
Parameters

Table 133-4  ADDRESCONFIG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>respath</td>
<td>Absolute path of the target resource</td>
</tr>
<tr>
<td>rcpath</td>
<td>Absolute path of the resource configuration to be appended at the end of the target's configuration list. If rcpath already exists in the list then nothing is appended.</td>
</tr>
<tr>
<td>appendOption</td>
<td>Either APPEND_RESOURCE or APPEND_RECURSIVE. If APPEND_RESOURCE is specified then only the target resource is affected. If APPEND_RECURSIVE is specified then the target resource and all its descendents will be affected.</td>
</tr>
</tbody>
</table>

Usage Notes

- An error is raised if the document referenced by rcpath is not based on XDBResConfig.xsd schema.
- Users must have WRITE-CONFIG privilege on all affected resources and required read privilege on the resource configuration to be inserted; otherwise, an error is returned.

133.2.4 DELETEREPOSITORYRESCONFIG Procedure

This procedure removes the configuration at the given position in the repository's configuration list. It shifts any subsequent elements to the left.

Syntax

```sql
DBMS_RESCONFIG.DELETEREPOSITORYRESCONFIG(  
pos        IN         PLS_INTEGER);
```

Parameters

Table 133-5  DELETEREPOSITORYRESCONFIG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>The index of the configuration to be removed. An exception is raised if the index is out of range (pos &lt; 0 or pos &gt;= the size of the target resource's configuration list).</td>
</tr>
</tbody>
</table>

Usage Notes

- Users must have XDBADMIN role to execute this.
- This statement is treated as if it is a DDL statement. This means the system will implicitly commit before and after this statement.
133.2.5 DELETERESCONFIG Procedures

This procedure removes the configuration at the given position in the target resource's configuration list. It shifts any subsequent elements to the left. Users can use the overloaded for recursive deletion.

**Syntax**

```sql
DBMS_RESCONFIG.DELETERESCONFIG(
    respath       IN   VARCHAR2,
    pos           IN   PLS_INTEGER);
```

**Parameters**

*Table 133-6  DELETERESCONFIG Procedure Parameters*

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>respath</td>
<td>Absolute path of the target resource</td>
</tr>
<tr>
<td>pos</td>
<td>The index of the configuration to be removed. An exception is raised if the index is out of range (pos &lt; 0 or pos &gt;= the size of the target resource's configuration list).</td>
</tr>
<tr>
<td>rcpath</td>
<td>Absolute path of the resource configuration to be deleted if found in list.</td>
</tr>
<tr>
<td>deleteOption</td>
<td>Either DELETE_RESOURCE or DELETE_RECURSIVE. If DELETE_RESOURCE is specified then only the configuration list of the target resource is affected. If DELETE_RECURSIVE is specified then the configuration list of the target resource and all its descendents will be affected.</td>
</tr>
</tbody>
</table>

*Usage Notes*

Users must have WRITE-CONFIG privilege on the target resource to execute this.

133.2.6 GETLISTENERS Function

This function returns the list of listeners applicable for a given resource.

The value returned by this function is an XML document containing the `<event-listeners>` element of the `XDBResconfig.xsd` schema. It contains all the listeners applicable to the target resource, including repository-level listeners. From the returned XML document users can use the `EXTRACT` operator to retrieve the listeners defined for a specific event.

**Syntax**

```sql
DBMS_RESCONFIG.GETLISTENERS(
    path    IN   VARCHAR2)
RETURN XMLTYPE;
```
Parameters

Table 133-7  GETLISTENERS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>Absolute path of the target resource</td>
</tr>
</tbody>
</table>

Usage Notes

Users must have the required access privilege on all resource configurations referenced by the repository and the target resource; otherwise, an error is returned.

133.2.7 GETREPOSITORYRESCONFIG Function

This function returns the resource configuration at the specified position of the repository's configuration list.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIG(
    pos IN PLS_INTEGER)
RETURN XMLTYPE;
```

Parameters

Table 133-8  GETREPOSITORYRESCONFIG Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pos</td>
<td>Index of element to return. An exception is raised if the index is out of range (pos &lt; 0 or pos &gt;= the size of the repository's configuration list).</td>
</tr>
</tbody>
</table>

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

133.2.8 GETREPOSITORYRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined for the repository.

Syntax

```
DBMS_RESCONFIG.GETREPOSITORYRESCONFIGPATHS
    RETURN XDB$STRING_LIST_T;
```

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.
133.2.9 GETRESCONFIG Function

This function returns the resource configuration at the specified position of the target resource's configuration list.

Syntax

```sql
DBMS_RESCONFIG.GETRESCONFIG(
    respath IN VARCHAR2,
    pos IN PLS_INTEGER)
RETURN XMLTYPE;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>respath</td>
<td>Absolute path of the target resource</td>
</tr>
<tr>
<td>pos</td>
<td>Index of element to return. An exception is raised if the index is out of range ((pos &lt; 0 ) or (pos \geq) the size of the target resource's configuration list).</td>
</tr>
</tbody>
</table>

Usage Notes

Users must have the required read privilege on the requested resource configuration; otherwise, an error is returned.

133.2.10 GETRESCONFIGPATHS Function

This function returns a list of resource configuration paths defined in the target resource's configuration list.

Syntax

```sql
DBMS_RESCONFIG.GETRESCONFIGPATHS(
    respath IN VARCHAR2)
RETURN XDB$STRING_LIST_T;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>respath</td>
<td>Absolute path of the target resource</td>
</tr>
</tbody>
</table>

Usage Notes

Users must be able to access all the referenced resource configurations; otherwise, an error is returned.
133.2.11 PATCHREPOSITORYRESCONFIGLIST Procedure

This procedure removes invalid references from the repository resource configuration list, and makes the repository available.

Under normal circumstances, deletion of a resource configuration resource cannot be performed if it is part of the repository resource configuration list. If, for some reason, the deletion of a resource configuration resource that is part of the repository resource configuration list succeeds, then any repository operation results in a ‘dangling reference’ error. This procedure removes those invalid references.

This procedure must be run as SYS.

Syntax

```
DBMS_RESCONFIG.PATCHREPOSITORYRESCONFIGLIST;
```
The `DBMS_RESOURCE_MANAGER` package maintains plans, consumer groups, and plan directives. It also provides semantics so that you may group together changes to the plan schema.

This chapter contains the following topics:

- Deprecated Subprograms
- Security Model
- Constants
- Summary of `DBMSRESOURCE_MANAGER` Subprograms

**See Also:**
For more information on using the Database Resource Manager, see *Oracle Database Administrator's Guide*.

### 134.1 DBMS_RESOURCE_MANAGER Deprecated Subprograms

The `SET_INITIAL_CONSUMER_GROUP` Procedure has been deprecated with Oracle Database 11g.

- `SET_INITIAL_CONSUMER_GROUP` Procedure

**Note:**
Oracle recommends that you do not use deprecated procedures in new applications. Support for deprecated features is for backward compatibility only.

### 134.2 DBMS_RESOURCE_MANAGER Security Model

The invoker must have the `ADMINISTER_RESOURCE_MANAGER` system privilege to execute these procedures.

The procedures to grant and revoke this privilege are in the package `DBMSRESOURCE_MANAGER_PRIVS`. 
134.3 DBMS_RESOURCE_MANAGER Constants

The **DBMS_RESOURCE_MANAGER** package defines several constants for specifying parameter values.

These are shown in the following table.

**Table 134-1  DBMS_RESOURCE_MANAGER Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT_ID</td>
<td>VARCHAR2(30)</td>
<td>CLIENT_ID</td>
<td>Client identifier of the session</td>
</tr>
<tr>
<td>CLIENT_MACHINE</td>
<td>VARCHAR2(30)</td>
<td>CLIENT_MACHINE</td>
<td>Name of the computer from which the client is making the connection</td>
</tr>
<tr>
<td>CLIENT_OS_USER</td>
<td>VARCHAR2(30)</td>
<td>CLIENT_OS_USER</td>
<td>Operating system user name of the client that is logging in</td>
</tr>
<tr>
<td>CLIENT_PROGRAM</td>
<td>VARCHAR2(30)</td>
<td>CLIENT_PROGRAM</td>
<td>Name of the client program used to log in to the server</td>
</tr>
<tr>
<td>MODULE_NAME</td>
<td>VARCHAR2(30)</td>
<td>MODULE_NAME</td>
<td>Module name in the currently running application as set by the SET_MODULE Procedure in the DBMS_APPLICATION_INFO package, or the equivalent OCI attribute setting</td>
</tr>
</tbody>
</table>
| MODULE_NAME_ACTION    | VARCHAR2(30)      | MODULE_NAME_ACTION | A combination of the current module and the action being performed as set by either of the following procedures in the DBMS_APPLICATION_INFO package, or their equivalent OCI attribute setting:  
  • SET_MODULE Procedure  
  • SET_ACTION Procedure  
  The attribute is specified as the module name followed by a period (.), followed by the action name (*module_name.action_name*). |
| ORACLE_FUNCTION       | VARCHAR2(30)      | ORACLE_FUNCTION    | Function the session is currently executing. Valid functions are the BACKUP, COPY, DATALOAD, and INMEMORY. BACKUP is set for sessions that are doing backup operations using RMAN. COPY is set for sessions that are doing image copies using RMAN. DATALOAD is set for sessions that are loading data using Oracle Data Pump. |
| ORACLE_USER           | VARCHAR2(30)      | ORACLE_USER        | Oracle Database user name                                                  |
### Table 134-1  (Cont.) DBMS_RESOURCE_MANAGER Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>SERVICE_MODULE</td>
<td>VARCHAR2(30)</td>
<td>SERVICE_MODULE</td>
<td>Combination of service and module names in this form: service_name.module_name</td>
</tr>
<tr>
<td>SERVICE_MODULE_ACTION</td>
<td>VARCHAR2(30)</td>
<td>SERVICE_MODULE_ACTION</td>
<td>Combination of service name, module name, and action name, in this form: service_name.module_name.action_name</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>VARCHAR2(30)</td>
<td>SERVICE_NAME</td>
<td>Service name used by the client to establish a connection</td>
</tr>
</tbody>
</table>

### 134.4 Summary of DBMS_RESOURCE_MANAGER Subprograms

This table lists the DBMS_RESOURCE_MANAGER subprograms and briefly describes them.

#### Table 134-2  DBMS_RESOURCE_MANAGER Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_SQL_BLOCK Procedure</td>
<td>Indicates the start of a block of SQL statements to be treated as a group by resource manager</td>
</tr>
<tr>
<td>CALIBRATE_IO Procedure</td>
<td>Calibrates the I/O capabilities of storage</td>
</tr>
<tr>
<td>CLEAR_PENDING_AREA Procedure</td>
<td>Clears the work area for the resource manager</td>
</tr>
<tr>
<td>CREATE_CATEGORY Procedure</td>
<td>Creates a new resource consumer group category</td>
</tr>
<tr>
<td>CREATE_CDB_PLAN Procedure</td>
<td>Creates entries which define consolidation resource plans.</td>
</tr>
<tr>
<td>CREATE_CDB_PLAN_DIRECITIVE Procedure</td>
<td>Creates the plan directives of the consolidation resource plan</td>
</tr>
<tr>
<td>CREATE_CDB_PROFILE_DIRECITIVE Procedure</td>
<td>Creates the performance profile directives of the consolidation resource plan</td>
</tr>
<tr>
<td>CREATE_CONSUMER_GROUP Procedure</td>
<td>Creates entries which define resource consumer groups</td>
</tr>
<tr>
<td>CREATE_PENDING_AREA Procedure</td>
<td>Creates a work area for changes to resource manager objects</td>
</tr>
<tr>
<td>CREATE_PLAN Procedure</td>
<td>Creates entries which define resource plans</td>
</tr>
<tr>
<td>CREATE_PLAN_DIRECTIVE Procedure</td>
<td>Creates resource plan directives</td>
</tr>
<tr>
<td>CREATE_SIMPLE_PLAN Procedure</td>
<td>Creates a single-level resource plan containing up to eight consumer groups in one step</td>
</tr>
<tr>
<td>DELETE_CATEGORY Procedure</td>
<td>Deletes an existing resource consumer group category</td>
</tr>
</tbody>
</table>
Table 134-2  (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DELETE_CDB_PLAN Procedure</td>
<td>Deletes the consolidation resource plan</td>
</tr>
<tr>
<td>DELETE_CDB_PLAN_DIRECTIVE Procedure</td>
<td>Deletes the plan directive of the consolidation resource plan</td>
</tr>
<tr>
<td>DELETE_CDB_PROFILE_DIRECTIVE Procedure</td>
<td>Deletes the performance profile directive of the consolidation resource plan</td>
</tr>
<tr>
<td>DELETE_CONSUMER_GROUP Procedure</td>
<td>Deletes entries which define resource consumer groups</td>
</tr>
<tr>
<td>DELETE_PLAN Procedure</td>
<td>Deletes the specified plan as well as all the plan directives it refers to</td>
</tr>
<tr>
<td>DELETE_PLAN_CASCADE Procedure</td>
<td>Deletes the specified plan as well as all its descendants (plan directives, subplans, consumer groups)</td>
</tr>
<tr>
<td>DELETE_PLAN_DIRECTIVE Procedure</td>
<td>Deletes resource plan directives</td>
</tr>
<tr>
<td>DEQUEUE_PARALLEL_STATEMENT Procedure</td>
<td>Dequeues a parallel statement from the parallel statement queue</td>
</tr>
<tr>
<td>END_SQL_BLOCK Procedure</td>
<td>Indicates the end of a block of SQL statements that should be treated as a group by resource manager</td>
</tr>
<tr>
<td>SET_CONSUMER_GROUP_MAPPING Procedure</td>
<td>Adds, deletes, or modifies entries for the login and run-time attribute mappings</td>
</tr>
<tr>
<td>SET_CONSUMER_GROUP_MAPPING_PRI Procedure</td>
<td>Creates the session attribute mapping priority list</td>
</tr>
<tr>
<td>SET_INITIAL_CONSUMER_GROUP Procedure</td>
<td>Assigns the initial resource consumer group for a user (Caution: Deprecated Subprogram)</td>
</tr>
<tr>
<td>SUBMIT_PENDING_AREA Procedure</td>
<td>Submits pending changes for the resource manager</td>
</tr>
<tr>
<td>SWITCH_CONSUMER_GROUP_P_FOR_SESS Procedure</td>
<td>Changes the resource consumer group of a specific session</td>
</tr>
<tr>
<td>SWITCH_CONSUMER_GROUP_P_FOR_USER Procedure</td>
<td>Changes the resource consumer group for all sessions with a given user name</td>
</tr>
<tr>
<td>SWITCH_PLAN Procedure</td>
<td>Sets the current resource manager plan</td>
</tr>
<tr>
<td>UPDATE_CATEGORY Procedure</td>
<td>Updates an existing resource consumer group category</td>
</tr>
<tr>
<td>UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure</td>
<td>Updates the plan directives with regard to automated maintenance tasks</td>
</tr>
<tr>
<td>UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</td>
<td>Updates the default values for a consolidation plan</td>
</tr>
<tr>
<td>UPDATE_CDB_PLAN Procedure</td>
<td>Updates the consolidation resource plan</td>
</tr>
<tr>
<td>UPDATE_CDB_PLAN_DIRECTIVE Procedure</td>
<td>Updates the plan directives for a consolidation resource plan</td>
</tr>
<tr>
<td>UPDATE_CDB_PROFILE_DIRECTIVE Procedure</td>
<td>Updates the performance profile directives of the consolidation resource plan</td>
</tr>
<tr>
<td>UPDATE_CONSUMER_GROUP Procedure</td>
<td>Updates entries which define resource consumer groups</td>
</tr>
</tbody>
</table>
Table 134-2  (Cont.) DBMS_RESOURCE_MANAGER Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE_PLAN Procedure</td>
<td>Updates entries which define resource plans</td>
</tr>
<tr>
<td>UPDATE_PLAN_DIRECTIVE</td>
<td>Updates resource plan directives</td>
</tr>
<tr>
<td>VALIDATE_PENDING_AREA</td>
<td>Validates pending changes for the resource manager</td>
</tr>
</tbody>
</table>

134.4.1 BEGIN_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the start of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.BEGIN_SQL_BLOCK;
```

Usage Notes

For more information, see “Parallel Statement Queuing” and “Managing Parallel Statement Queuing with Resource Manager” in Oracle Database VLDB and Partitioning Guide.

134.4.2 CALIBRATE_IO Procedure

This procedure calibrates the I/O capabilities of storage. Calibration status is available from the V$IO_CALIBRATION_STATUS view and results for a successful calibration run are located in DBA_RSRC_IO_CALIBRATE table.

Syntax

```
DBMS_RESOURCE_MANAGER.CALIBRATE_IO (  
  num_physical_disks      IN  PLS_INTEGER DEFAULT 1,  
  max_latency             IN  PLS_INTEGER DEFAULT 20,  
  max_iops                OUT PLS_INTEGER,  
  max_mbps                OUT PLS_INTEGER,  
  actual_latency          OUT PLS_INTEGER);  
```

Parameters

Table 134-3  CALIBRATE_IO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>num_physical_disks</td>
<td>Approximate number of physical disks in the database storage. This parameter is used to determine the initial I/O load for the calibration run.</td>
</tr>
<tr>
<td>max_latency</td>
<td>Maximum tolerable latency in milliseconds for database-block-sized I/O requests</td>
</tr>
<tr>
<td>max_iops</td>
<td>Maximum number of I/O requests per second that can be sustained. The I/O requests are randomly-distributed, database-block-sized reads.</td>
</tr>
</tbody>
</table>
Table 134-3  (Cont.) CALIBRATE_IO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_mbps</td>
<td>Maximum throughput of I/O that can be sustained, expressed in megabytes per second. The I/O requests are randomly-distributed, 1 megabyte reads.</td>
</tr>
<tr>
<td>actual_latency</td>
<td>Average latency of database-block-sized I/O requests at max_iops rate, expressed in milliseconds</td>
</tr>
</tbody>
</table>

Usage Notes

- Only users with the SYSDBA privilege can run this procedure. Qualified users must also turn on `timed_statistics`, and ensure `async_io` is enabled for datafiles. This can be achieved by setting `filesystemio_options` to either `ASYNCH` or `SETALL`. One can also query the `async_io` status by means of the following SQL statement:

```sql
col name format a50
SELECT name, async_io FROM v$datafile f,v$iostat_file i
WHERE f.file# = i.file_no
AND filetype_name = 'Data File'
/
```

- Only one calibration can be run at a time. If another calibration is initiated at the same time, it will fail.

- For an Oracle Real Application Clusters (Oracle RAC) database, the workload is simultaneously generated from all instances.

- In a multitenant container database (CDB), calibration can only be run from the CDB root (`CDB$ROOT`).

- Calibration is extremely disruptive to the database performance. It is strongly recommended to run calibration only when database users can tolerate severe deterioration to database performance.

- For optimal calibration results, no other database workloads should be running.

See Also:

`Oracle Database Performance Tuning Guide` for more information about calibration

Examples

Example of using I/O Calibration procedure

```sql
SET SERVEROUTPUT ON
DECLARE
  lat INTEGER;
  iops INTEGER;
  mbps INTEGER;
BEGIN
  -- DBMS_RESOURCE_MANAGER.CALIBRATE_IO (<DISKS>, <MAX_LATENCY>, iops, mbps, lat);
  DBMS_RESOURCE_MANAGER.CALIBRATE_IO (2, 10, iops, mbps, lat);
END;
```
DBMS_OUTPUT.PUT_LINE ('max_iops = ' || iops);
DBMS_OUTPUT.PUT_LINE ('latency = ' || lat);
DBMS_OUTPUT.PUT_LINE ('max_mbps = ' || mbps);
end;
/

View for I/O calibration results

SQL> desc V$IO_CALIBRATION_STATUS

134.4.3 CLEAR_PENDING_AREA Procedure

This procedure clears pending changes for the resource manager.

Syntax

DBMS_RESOURCE_MANAGER.CLEAR_PENDING_AREA;

134.4.4 CREATE_CATEGORY Procedure

This procedure creates a new consumer group category. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans.

The view DBA_RSRC_CATEGORIES defines the currently defined categories. The ADMINISTRATIVE, INTERACTIVE, BATCH, MAINTENANCE, and OTHER categories are available.

Syntax

DBMS_RESOURCE_MANAGER.CREATECATEGORY (category IN VARCHAR2,
comment IN VARCHAR2 DEFAULT NULL);

Parameters

Table 134-4 CREATE_CATEGORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>Name of consumer group category</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
</tbody>
</table>

134.4.5 CREATE_CDB_PLAN Procedure

Creates entries which define consolidation resource plans.

Syntax

DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN (plan IN VARCHAR2(32),
comment IN VARCHAR2(2000) DEFAULT NULL);
Parameters

Table 134-5  CREATE_CDB_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run only from the CDB root (CDB$ROOT).

134.4.6 CREATE_CDB_PLAN_DIRECTIVE Procedure

This procedure creates the plan directives of the consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

DBMS_RESOURCE_MANAGER.CREATE_CDB_PLAN_DIRECTIVE ( plan IN VARCHAR2, pluggable_database IN VARCHAR2, comment IN VARCHAR2 (2000) DEFAULT '', shares IN NUMBER DEFAULT NULL, utilization_limit IN NUMBER DEFAULT NULL, parallel_server_limit IN NUMBER DEFAULT NULL, memory_limit IN NUMBER DEFAULT 100, memory_min IN NUMBER DEFAULT 0);

Parameters

Table 134-6  CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>pluggable_database</td>
<td>Name of the PDB</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
<tr>
<td>shares</td>
<td>Specifies the share of resource allocation for the PDB.</td>
</tr>
<tr>
<td></td>
<td>CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through UPDATE_CDB_DEFAULT_DIRECTIVE Procedure.</td>
</tr>
<tr>
<td>utilization_limit</td>
<td>Specifies the maximum percentage of the CDB's CPU and Exadata I/O resources that the PDB can utilize. CPU Resource Manager and Exadata I/O Resource Manager can also be limited by setting the CPU_COUNT parameter for the PDB.</td>
</tr>
</tbody>
</table>
### Table 134-6  (Cont.) CREATE_CDB_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallel_server_limit</td>
<td>Parallel servers that the PDB can use after which parallel statements are queued. Alternatively, you can set the parallel_servers_target at the PDB level. A PDB can set a lower limit for parallel execution servers than the limit specified in the CDB resource plan. When the PARALLEL_SERVERS_TARGET initialization parameter is set in a PDB, and parallel execution server limit is specified for a PDB in the CDB resource plan, then the lower limit is used. For example, assume that the parallel_servers_target initialization parameter is set to 100 in the CDB root and parallel_server_limit is set to 70 for hrpdb in the CDB resource plan. Also, assume that hrpdb has its parallel_servers_target initialization parameter set to 50. In this case, the limit for parallel execution servers for hrpdb is 50, because 50 is lower than the CDB resource plan limit of 70 for hrpdb.</td>
</tr>
<tr>
<td>memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- The default value for shares, utilization_limit, and parallel_server_limit is NULL. When a user specifies NULL, or does not specify a value, this indicates that the default value should be used.
- This procedure can be run only from the CDB root (CDB$ROOT).

### 134.4.7 CREATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure creates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use the new performance profile, the PDB must have the DB_PERFORMANCE_PROFILE initialization parameter set to the profile name.
This procedure provides an easy way to specify the directive for a large number of PDBs with the same resource requirements. Each PDB with a **DB_PERFORMANCE_PROFILE** initialization parameter set to the performance profile name inherits the settings specified by this directive, including the shares, utilization limit, and so on.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.CREATE_CDB_PROFILE_DIRECTIVE (
    plan                    IN    VARCHAR2,
    profile                 IN    VARCHAR2,
    comment                 IN    VARCHAR2 (2000) DEFAULT '',
    shares                  IN    NUMBER          DEFAULT NULL,
    utilization_limit       IN    NUMBER          DEFAULT NULL,
    parallel_server_limit   IN    NUMBER          DEFAULT NULL,
    memory_limit            IN    NUMBER          DEFAULT 100,
    memory_min              IN    NUMBER          DEFAULT 0);
```

**Parameters**

**Table 134-7  CREATE_CDB_PROFILE_DIRECTIVE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>profile</td>
<td>Name of the performance profile</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
<tr>
<td>shares</td>
<td>Specifies the share of resource allocation for PDBs that use the performance profile. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through <strong>UPDATE_CDB_DEFAULT_DIRECTIVE Procedure</strong>.</td>
</tr>
<tr>
<td>utilization_limit</td>
<td>Specifies the maximum percentage of CPU Resource Manager and Exadata I/O Resource Manager that PDBs that use the performance profile can utilize.</td>
</tr>
<tr>
<td>parallel_server_limit</td>
<td>Specifies the maximum percentage of <code>parallel_servers_target</code> parallel servers that PDBs that use the performance profile can use.</td>
</tr>
<tr>
<td>memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

**134.4.8 CREATE_CONSUMER_GROUP Procedure**

This procedure creates entries which define resource consumer groups.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.CREATE_CONSUMER_GROUP (
    consumer_group  IN VARCHAR2,
    comment         IN VARCHAR2 DEFAULT NULL,
    cpu_mth         IN VARCHAR2 DEFAULT NULL,
```
mgmt_mth IN VARCHAR2 DEFAULT 'ROUND-ROBIN',
category IN VARCHAR2 DEFAULT 'OTHER');

Parameters

Table 134-8   CREATE_CONSUMER_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>Name of the consumer group</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
<tr>
<td>cpu_mth</td>
<td>Name of CPU resource allocation method (deprecated)</td>
</tr>
<tr>
<td>mgmt_mth</td>
<td>Name of CPU resource allocation method</td>
</tr>
<tr>
<td>category</td>
<td>Describes the category of the consumer group. The primary purpose of this attribute is to support Exadata I/O Resource Manager category plans. The view DBA_RSRC_CATEGORIES defines the currently defined categories. Categories can be modified, using the CREATE_CATEGORY Procedure, UPDATECATEGORY Procedure, and DELETECATEGORY Procedure.</td>
</tr>
</tbody>
</table>

134.4.9 CREATE_PENDING_AREA Procedure

This procedure makes changes to resource manager objects.

All changes to the plan schema must be done within a pending area. The pending area can be thought of as a "scratch" area for plan schema changes. The administrator creates this pending area, makes changes as necessary, possibly validates these changes, and only when the submit is completed do these changes become active.

Syntax

DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA;

Usage Notes

You may, at any time while the pending area is active, view the current plan schema with your changes by selecting from the appropriate user views.

At any time, you may clear the pending area if you want to stop the current changes. You may also call the VALIDATE procedure to confirm whether the changes you have made are valid. You do not have to perform your changes in a given order to maintain a consistent group of entries. These checks are also implicitly done when the pending area is submitted.

Note:

Oracle allows "orphan" consumer groups (in other words, consumer groups that have no plan directives that refer to them). This is in anticipation that an administrator may want to create a consumer group that is not currently being used, but will be used in the future.
For resource plans, the following rules must be adhered to, and they are checked whenever the validate or submit procedures are executed:

- No plan schema may contain any loops.
- All plans and consumer groups referred to by plan directives must exist.
- All plans must have plan directives that refer to either plans or consumer groups.
- All percentages in any given level must not add up to greater than 100 for the emphasis resource allocation method.
- No plan may be deleted that is currently being used as a top plan by an active instance.
- The plan directive parameter, `parallel_degree_limit_p1`, may only appear in plan directives that refer to consumer groups (that is, not at subplans).
- There cannot be more than 28 plan directives coming from any given plan (that is, no plan can have more than 28 children).
- There cannot be more than 28 consumer groups in any active plan schema.
- Plans and consumer groups use the same namespace; therefore, no plan can have the same name as any consumer group.
- There must be a plan directive for `OTHER_GROPS` somewhere in any active plan schema. This ensures that a session not covered by the currently active plan is allocated resources as specified by the `OTHER_GROPS` directive.

Note:
These rules are not applicable for CDB resource plans.

If any of the preceding rules are broken when checked by the `validate` or `submit` procedures, then an informative error message is returned. You may then make changes to fix one or more problems and reissue the validate or submit procedures.

### 134.4.10 CREATE_PLAN Procedure

This procedure creates entries which define resource plans.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.CREATE_PLAN (  
plan            IN   VARCHAR2,  
comment        IN   VARCHAR2 DEFAULT NULL,  
cpu_mth         IN   VARCHAR2 DEFAULT NULL, -- deprecated  
active_sess_pool_mth IN   VARCHAR2 DEFAULT 'ACTIVE_SESS_POOL_ABSOLUTE',  
parallel_degree_limit_mth IN   VARCHAR2 DEFAULT 'PARALLEL_DEGREE_LIMIT_ABSOLUTE',  
queueing_mth    IN   VARCHAR2 DEFAULT 'FIFO_TIMEOUT',  
mgmt_mth        IN   VARCHAR2 DEFAULT 'EMPHASIS',  
sub_plan        IN   BOOLEAN DEFAULT FALSE,  
max_iops        IN   NUMBER DEFAULT NULL,  
max_mbps        IN   NUMBER DEFAULT NULL);  
```
## Parameters

### Table 134-9  CREATE_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the resource plan</td>
</tr>
<tr>
<td>comment</td>
<td>User comment</td>
</tr>
<tr>
<td>cpu_mth</td>
<td>Allocation method for CPU resources (deprecated)</td>
</tr>
<tr>
<td>active_sess_pool_mth</td>
<td>Active session pool resource allocation method. Limits the number of active sessions. All other sessions are inactive and wait in a queue to be activated. ACTIVE_SESS_POOL_ABSOLUTE is the default and only method available.</td>
</tr>
<tr>
<td>parallel_degree_limit_mth</td>
<td>Resource allocation method for specifying a limit on the degree of parallelism of any operation. PARALLEL_DEGREE_LIMIT_ABSOLUTE is the default and only method available.</td>
</tr>
<tr>
<td>queueing_mth</td>
<td>Queuing resource allocation method. Controls order in which queued inactive sessions will execute. FIFO_TIMEOUT is the default and only method available.</td>
</tr>
<tr>
<td>mgmt_mth</td>
<td>Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets</td>
</tr>
<tr>
<td></td>
<td>• EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups</td>
</tr>
<tr>
<td></td>
<td>• RATIO - for single-level plans that use ratios to specify how I/O resources are distributed</td>
</tr>
<tr>
<td>sub_plan</td>
<td>If TRUE, indicates that this plan is only intended for use as a sub-plan. Sub-plans are not required to have an OTHER_GROUPS directive. Default is FALSE.</td>
</tr>
<tr>
<td>max_iops</td>
<td>Nonoperative</td>
</tr>
<tr>
<td>max_mbps</td>
<td>Nonoperative</td>
</tr>
</tbody>
</table>

### Usage Notes

If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

### 134.4.11 CREATE_PLAN_DIRECTIVE Procedure

This procedure creates resource plan directives.

---

**Note:**  

The parameters `max_utilization_limit` and `parallel_target_percentage` are deprecated with Oracle Database 11g Release 1 (11.1.0.1), and are replaced by `utilization_limit` and `parallel_server_limit`.  

---
Syntax

```sql
DBMS_RESOURCE_MANAGER.CREATE_PLAN_DIRECTIVE (    
  plan                         IN VARCHAR2,
  group_or_subplan             IN VARCHAR2,
  comment                      IN VARCHAR2 DEFAULT NULL,
  cpu_p1                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p2                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p3                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p4                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p5                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p6                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p7                       IN NUMBER   DEFAULT NULL, -- deprecated
  cpu_p8                       IN NUMBER   DEFAULT NULL, -- deprecated
  active_sess_pool_p1          IN NUMBER   DEFAULT NULL,
  queueing_p1                  IN NUMBER   DEFAULT NULL,
  parallel_degree_limit_p1     IN NUMBER   DEFAULT NULL,
  switch_group                 IN VARCHAR2 DEFAULT NULL,
  switch_time                  IN NUMBER   DEFAULT NULL,
  switch_estimate              IN BOOLEAN  DEFAULT FALSE,
  max_est_exec_time            IN NUMBER   DEFAULT NULL,
  undo_pool                    IN NUMBER   DEFAULT NULL,
  max_idle_time                IN NUMBER   DEFAULT NULL,
  max_idle_blocker_time        IN NUMBER   DEFAULT NULL,
  switch_time_in_call          IN NUMBER   DEFAULT NULL, -- deprecated
  mgmt_p1                      IN NUMBER   DEFAULT NULL,
  mgmt_p2                      IN NUMBER   DEFAULT NULL,
  mgmt_p3                      IN NUMBER   DEFAULT NULL,
  mgmt_p4                      IN NUMBER   DEFAULT NULL,
  mgmt_p5                      IN NUMBER   DEFAULT NULL,
  mgmt_p6                      IN NUMBER   DEFAULT NULL,
  mgmt_p7                      IN NUMBER   DEFAULT NULL,
  mgmt_p8                      IN NUMBER   DEFAULT NULL,
  switch_io_megabytes          IN NUMBER   DEFAULT NULL,
  switch_io_reqs               IN NUMBER   DEFAULT NULL,
  switch_for_call              IN BOOLEAN  DEFAULT NULL,
  max_utilization_limit        IN NUMBER   DEFAULT NULL,  -- deprecated
  parallel_target_percentage   IN NUMBER   DEFAULT NULL,  -- deprecated
  parallel_server_limit        IN NUMBER   DEFAULT NULL,
  utilization_limit            IN NUMBER   DEFAULT NULL,
  switch_io_logical            IN NUMBER   DEFAULT NULL,
  switch_elapsed_time          IN NUMBER   DEFAULT NULL,
  shares                       IN NUMBER   DEFAULT NULL,
  parallel_stmt_critical       IN VARCHAR2 DEFAULT NULL,
  session_pga_limit            IN NUMBER   DEFAULT NULL,
  pq_timeout_action            IN NUMBER   DEFAULT NULL,
  parallel_queue_timeout       IN NUMBER   DEFAULT NULL,);
```

Note:
Oracle recommends that you use `shares` instead of `mgmt_p*`. 
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the resource plan</td>
</tr>
<tr>
<td>group_or_subplan</td>
<td>Name of the consumer group or subplan</td>
</tr>
<tr>
<td>comment</td>
<td>Comment for the plan directive</td>
</tr>
<tr>
<td>cpu_p1</td>
<td>-- deprecated: use mgmt_p1 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p2</td>
