<td>-- deprecated: use mgmt_p2 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p3</td>
<td>-- deprecated: use mgmt_p3 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p4</td>
<td>-- deprecated: use mgmt_p4 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p5</td>
<td>-- deprecated: use mgmt_p5 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p6</td>
<td>-- deprecated: use mgmt_p6 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p7</td>
<td>-- deprecated: use mgmt_p7 or, even better, shares instead</td>
</tr>
<tr>
<td>cpu_p8</td>
<td>-- deprecated: use mgmt_p8 or, even better, shares instead</td>
</tr>
<tr>
<td>active_sess_pool_p1</td>
<td>Specifies maximum number of sessions that can currently have an active call</td>
</tr>
<tr>
<td>queueing_p1</td>
<td>Specified time (in seconds) after which a call in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>parallel_degree_limit_p1</td>
<td>Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited. If the value is 0, then all operations will be serial.</td>
</tr>
<tr>
<td>switch_group</td>
<td>Specifies consumer group to switch to, once a switch condition is met. If the group name is CANCEL_SQL, then the current call is canceled when the switch condition is met. If the group name is KILL_SESSION, then the session is killed when the switch condition is met. If the group name is LOG_ONLY, then no action is taken other than recording this event via SQL monitor. Default is NULL.</td>
</tr>
<tr>
<td>switch_time</td>
<td>Specifies the time on CPU (not elapsed time) that a session can execute before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if switch_for_call is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.</td>
</tr>
<tr>
<td>switch_estimate</td>
<td>If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. This is used in conjunction with the switch_time directive. Default value is FALSE.</td>
</tr>
<tr>
<td>max_est_exec_time</td>
<td>Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.</td>
</tr>
</tbody>
</table>
Table 134-10  (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

<td></td>
<td>• EMPHASIS - specifies the resource percentage at the eighth level</td>
</tr>
<tr>
<td></td>
<td>• RATIO - non-applicable</td>
</tr>
<tr>
<td>switch_io_megabytes</td>
<td>Specifies the amount of I/O (in MB) that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if switch_for_call is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.</td>
</tr>
</tbody>
</table>
### Table 134-10  (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>switch_io_reqs</td>
<td>Specifies the number of I/O requests that a session can issue before an action is taken. Default is NULL, which means unlimited. As with other switch directives, if switch_for_call is TRUE, the number of CPUs is accumulated from the start of a call. Otherwise, the number of CPUs is accumulated for the length of the session.</td>
</tr>
<tr>
<td>switch_for_call</td>
<td>Specifies that if an action is taken because of the switch_time, switch_io_megabytes, switch_io_reqs, switch_io_logical or switch_elapsed_time parameters, the consumer group is restored to its original consumer group at the end of the top call. Default is NULL, which means that the original consumer group is not restored at the end of the top call.</td>
</tr>
<tr>
<td>max_utilization_limit</td>
<td><strong>-- deprecated: use utilization_limit instead</strong></td>
</tr>
<tr>
<td>parallel_target_percentage</td>
<td><strong>-- deprecated: use parallel_sever_limit instead</strong></td>
</tr>
<tr>
<td>parallel_queue_timeout</td>
<td>Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed and terminated with an error (ORA- 07454).</td>
</tr>
<tr>
<td>parallel_sever_limit</td>
<td>Specifies the maximum percentage of parallel_servers_target parallel servers that the Consumer Group can use, after which parallel statements are queued.</td>
</tr>
<tr>
<td>utilization_limit</td>
<td>Resource limit. Currently it includes CPU and I/O for Exadata. For CPU, this limits the CPU utilization for the consumer group. For Exadata I/O, this limits the disk utilization for the consumer group. This does not apply to parallel servers.</td>
</tr>
<tr>
<td>switch_io_logical</td>
<td>Number of logical IOs that will trigger the action specified by switch_group. As with other switch directives, if switch_for_call is TRUE, the number of logical IOs is accumulated from the start of a call. Otherwise, the number of logical IOs is accumulated for the length of the session.</td>
</tr>
<tr>
<td>switch_elapsed_time</td>
<td>Elapsed time that will trigger the action specified by switch_group. As with other switch directives, if switch_for_call is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.</td>
</tr>
</tbody>
</table>

---

**Note:**

You can use the pq_timeout_action parameter to specify the action to be taken when a parallel statement is removed from the queue.
Table 134-10   (Cont.) CREATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>shares</td>
<td>Specifies the share of resource allocation for the consumer group. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each consumer group. The shares parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.</td>
</tr>
<tr>
<td>parallel_stmt_critical</td>
<td>If set to BYPASS_QUEUE, parallel statements from the Consumer Group are not queued, regardless of the PARALLEL_DEGREE_POLICY parameter value. If set to QUEUE, all the parallel statements from the consumer group, irrespective of the parallel_degree_policy parameter value, are eligible for queuing. Default is FALSE, which means that parallel statements are eligible for queuing, based on the parallel_degree_policy parameter value.</td>
</tr>
<tr>
<td>session_pga_limit</td>
<td>Maximum amount of untunable PGA (in MB) that a session in this consumer group can allocate before being terminated. NULL (default) indicates no limit. SQL operations that allocate tunable PGA (operations that can opt to use temp space) are not controlled by this limit.</td>
</tr>
<tr>
<td>pq_timeout_action</td>
<td>Specifies the action to be taken when a parallel statement is removed from the queue due to parallel_queue_timeout. The values are:</td>
</tr>
<tr>
<td></td>
<td>• CANCEL — The parallel statement is terminated with error ORA-7454</td>
</tr>
<tr>
<td></td>
<td>• RUN — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable</td>
</tr>
<tr>
<td></td>
<td>The default action of this parameter is CANCEL.</td>
</tr>
</tbody>
</table>

Usage Notes

• All parameters default to NULL.

• For max_idle_time and max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.

• The parameter switch_for_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By using switch_for_call, the resource usage of one client will not affect a future client that happens to be executed on the same session.

• An error is thrown if PQ_TIMEOUT_ACTION is specified, but PARALLEL_QUEUE_TIMEOUT is not specified.

• Specifies the action to be taken when a parallel statement is removed from the queue.
134.4.12 CREATE_SIMPLE_PLAN Procedure

This procedure creates a single-level resource plan containing up to eight consumer groups in one step. You do not need to create a pending area manually before creating a resource plan, or use the CREATE_CONSUMER_GROUP and CREATE_RESOURCE_PLAN_DIRECTIVES procedures separately.

Syntax

```
DBMS_RESOURCE_MANAGER.CREATE_SIMPLE_PLAN (  
  simple_plan  IN  VARCHAR2  DEFAULT NULL,  
  consumer_group1  IN  VARCHAR2  DEFAULT NULL,  
  group1_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group2  IN  VARCHAR2  DEFAULT NULL,  
  group2_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group3  IN  VARCHAR2  DEFAULT NULL,  
  group3_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group4  IN  VARCHAR2  DEFAULT NULL,  
  group4_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group5  IN  VARCHAR2  DEFAULT NULL,  
  group5_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group6  IN  VARCHAR2  DEFAULT NULL,  
  group6_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group7  IN  VARCHAR2  DEFAULT NULL,  
  group7_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  consumer_group8  IN  VARCHAR2  DEFAULT NULL,  
  group8_cpu       IN  NUMBER    DEFAULT NULL,   -- deprecated  
  group1_percent   IN  NUMBER    DEFAULT NULL,  
  group2_percent   IN  NUMBER    DEFAULT NULL,  
  group3_percent   IN  NUMBER    DEFAULT NULL,  
  group4_percent   IN  NUMBER    DEFAULT NULL,  
  group5_percent   IN  NUMBER    DEFAULT NULL,  
  group6_percent   IN  NUMBER    DEFAULT NULL,  
  group7_percent   IN  NUMBER    DEFAULT NULL,  
  group8_percent   IN  NUMBER    DEFAULT NULL);  
```

Parameters

</tbody>
</table>

134.4.13 DELETE_CATEGORY Procedure

This procedure deletes an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CATEGORY (category IN VARCHAR2);
```

Parameters

Table 134-12  DELETE_CATEGORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>Name of consumer group</td>
</tr>
</tbody>
</table>

134.4.14 DELETE_CDB_PLAN Procedure

This procedure deletes the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN (plan IN VARCHAR2(32) DEFAULT NULL);
```
Parameters

Table 134-13  DELETE_CDB_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run only from the CDB root (CDB$ROOT).

134.4.15 DELETE_CDB_PLAN_DIRECTIVE Procedure

This procedure deletes the plan directives of the consolidation resource plan. Once the plan directive is deleted, the pluggable database will get the default resource allocation.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_CDB_PLAN_DIRECTIVE (plan                    IN    VARCHAR2(32)   DEFAULT NULL,
pluggable_database      IN    VARCHAR2(32)   DEFAULT NULL);
```

Parameters

Table 134-14  DELETE_CDB_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>pluggable_database</td>
<td>Name of the pluggable database in which the plan directive is to be deleted</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run only from the CDB root (CDB$ROOT).

134.4.16 DELETE_CDB_PROFILE_DIRECTIVE Procedure

This procedure deletes the performance profile directive of the consolidation resource plan. Once the directive is deleted, the pluggable databases (PDBs) that use the performance profile use the default resource allocation.

For a PDB to use a performance profile, the PDB must have the DB_PERFORMANCE_PROFILE initialization parameter set to the performance profile name.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_CDB_PROFILE_DIRECTIVE (plan          IN    VARCHAR2(32)   DEFAULT NULL,
profile       IN    VARCHAR2(32)   DEFAULT NULL);
```
Parameters

**Table 134-15  DELETE_CDB_PROFILE_DIRECTIVE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>profile</td>
<td>Name of the performance profile directive to be deleted</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure can be run only from the CDB root (CDB$ROOT).

134.4.17 DELETE_CONSUMER_GROUP Procedure

This procedure deletes entries which define resource consumer groups.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.DELETE_CONSUMER_GROUP (
    consumer_group IN VARCHAR2);
```

**Parameters**

**Table 134-16  DELETE_CONSUMER_GROUP Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>Name of the consumer group to be deleted</td>
</tr>
</tbody>
</table>

134.4.18 DELETE_PLAN Procedure

This procedure deletes the specified plan as well as all the plan directives to which it refers.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.DELETE_PLAN (
    plan IN VARCHAR2);
```

**Parameters**

**Table 134-17  DELETE_PLAN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the resource plan to delete</td>
</tr>
</tbody>
</table>
134.4.19 DELETE_PLAN_CASCADE Procedure

This procedure deletes the specified plan and all of its descendents (plan directives, subplans, consumer groups). Mandatory objects and directives are not deleted.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_PLAN_CASCADE (plan IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the plan</td>
</tr>
</tbody>
</table>

Usage Notes

If `DELETE_PLAN_CASCADE` encounters any error, then it rolls back the operation, and nothing is deleted.

134.4.20 DELETE_PLAN_DIRECTIVE Procedure

This procedure deletes resource plan directives.

Syntax

```sql
DBMS_RESOURCE_MANAGER.DELETE_PLAN_DIRECTIVE (plan              IN VARCHAR2,
                                           group_or_subplan  IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the resource plan</td>
</tr>
<tr>
<td>group_or_subplan</td>
<td>Name of the group or subplan</td>
</tr>
</tbody>
</table>

134.4.21 DEQUEUE_PARALLEL_STATEMENT Procedure

This procedure dequeues a parallel statement from the parallel statement queue.

If the `PARALLEL_DEGREE_POLICY` initialization parameter is set to `AUTO` or `ADAPTIVE`, then parallel statement queuing is enabled. If a parallel statement is in the parallel statement queue, then you can use this procedure to dequeue the parallel statement so that it runs immediately.
Syntax

```
DBMS_RESOURCE_MANAGER.DEQUEUE_PARALLEL_STATEMENT (  
  session_id      IN  PLS_INTEGER,  
  session_serial  IN  PLS_INTEGER,  
  inst_id         IN  PLS_INTEGER  DEFAULT NULL,  
  sql_id          IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 134-20  DEQUEUE_PARALLEL_STATEMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>The session id of the session running the parallel statement to be dequeued.</td>
</tr>
<tr>
<td>session_serial</td>
<td>The serial number of the session.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Instance ID where the session is running. If NULL, then the current instance is used.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The SQL ID of the session's statement to dequeue. If the session is running SQL with a different SQL ID, then the statement is not dequeued.</td>
</tr>
</tbody>
</table>

134.4.22 END_SQL_BLOCK Procedure

This procedure, to be used with parallel statement queuing, indicates the end of a block of SQL statements that should be treated as a group by resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.END_SQL_BLOCK;
```

Usage Notes

For more information, see "Parallel Statement Queuing" and "Managing Parallel Statement Queuing with Resource Manager" in Oracle Database VLDB and Partitioning Guide.

134.4.23 SET_CONSUMER_GROUP_MAPPING Procedure

This procedure adds, deletes, or modifies entries that map sessions to consumer groups, based on the session's login and runtime attributes.

Syntax

```
DBMS_RESOURCE_MANAGER_SET_CONSUMER_GROUP_MAPPING(  
  attribute        IN VARCHAR2,  
  value            IN VARCHAR2,  
  consumer_group   IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 134-21  SET_CONSUMER_GROUP_MAPPING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>Mapping attribute to add or modify. It can be one of the Constants listed.</td>
</tr>
<tr>
<td>value</td>
<td>Attribute value to match. This includes both absolute mapping and regular expressions.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of the mapped consumer group, or NULL to delete a mapping</td>
</tr>
</tbody>
</table>

Usage Notes

• If no mapping exists for the given attribute and value, a mapping to the given consumer group will be created. If a mapping already exists for the given attribute and value, the mapped consumer group will be updated to the one given. If the consumer_group argument is NULL, then any mapping from the given attribute and value will be deleted.

• The subprogram supports simple regex expressions for the value parameter. It implements the same semantics as the SQL 'LIKE' operator. Specifically, it uses '%' as a multicharacter wildcard and '_' as a single character wildcard. The '\' character can be used to escape the wildcards. Note that wildcards can only be used if the attribute is one of the following:
  — CLIENT_OS_USER
  — CLIENT_PROGRAM
  — CLIENT_MACHINE
  — MODULE_NAME
  — MODULE_NAME_ACTION
  — SERVICE_MODULE
  — SERVICE_MODULE_ACTION

• Consumer group mapping comparisons for DBMS_RESOURCE_MANAGER.CLIENT_PROGRAM are performed by stripping the @ sign and following characters from V$SESSION.PROGRAM before comparing it to the CLIENT_PROGRAM value supplied.

134.4.24 SET_CONSUMER_GROUP_MAPPING_PRI Procedure

Multiple attributes of a session can be used to map the session to a consumer group. This procedure prioritizes the attribute mappings.

Syntax

DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING_PRI(
  explicit IN NUMBER,
  oracle_user IN NUMBER,
  service_name IN NUMBER,
  client_os_user IN NUMBER,
  client_program IN NUMBER,
  client_machine IN NUMBER,
);
module_name            IN NUMBER,
module_name_action     IN NUMBER,
service_module         IN NUMBER,
service_module_action  IN NUMBER,
client_id              IN NUMBER DEFAULT 11);

Parameters

Table 134-22    SET_CONSUMER_GROUP_MAPPING_PRI Procedure Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>explicit</td>
<td>Priority of the explicit mapping</td>
</tr>
<tr>
<td>oracle_user</td>
<td>Priority of the Oracle user name mapping</td>
</tr>
<tr>
<td>service_name</td>
<td>Priority of the client service name mapping</td>
</tr>
<tr>
<td>client_os_user</td>
<td>Priority of the client operating system user name mapping</td>
</tr>
<tr>
<td>client_program</td>
<td>Priority of the client program mapping</td>
</tr>
<tr>
<td>client_machine</td>
<td>Priority of the client machine mapping</td>
</tr>
<tr>
<td>module_name</td>
<td>Priority of the application module name mapping</td>
</tr>
<tr>
<td>module_name_action</td>
<td>Priority of the application module name and action mapping</td>
</tr>
<tr>
<td>service_module</td>
<td>Priority of the service name and application module name mapping</td>
</tr>
<tr>
<td>module_name_action</td>
<td>Priority of the service name, application module name, and</td>
</tr>
<tr>
<td></td>
<td>application action mapping</td>
</tr>
<tr>
<td>client_id</td>
<td>Client identifier</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure requires that you include the pseudo-attribute `explicit` as an argument. It must be set to 1. It indicates that explicit consumer group switches have the highest priority. You explicitly switch consumer groups with these package procedures:
  - `DBMS_SESSION.SWITCH_CURRENT_CONSUMER_GROUP`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS`
  - `DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER`
- Each priority value must be a unique integer from 1 to 11. Together, they establish an ordering where 1 is the highest priority and 11 is the lowest.

134.4.25 SET_INITIAL_CONSUMER_GROUP Procedure

This deprecated procedure sets the initial resource consumer group for a user.

The initial consumer group of a user is the consumer group to which any session created by that user initially belongs.
This procedure is deprecated in Release 11gR1. While the procedure remains available in the package, Initial Consumer Group is set by the session-to-consumer group mapping rules.

Syntax

```sql
DBMS_RESOURCE_MANAGER.SET_INITIAL_CONSUMER_GROUP (
    user IN VARCHAR2,
    consumer_group IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Name of the user</td>
</tr>
<tr>
<td>consumer_group</td>
<td>User's initial consumer group</td>
</tr>
</tbody>
</table>

Usage Notes

- The `ADMINISTER_RESOURCE_MANAGER` or the `ALTER USER` system privilege are required to be able to execute this procedure. The user, or `PUBLIC`, must be directly granted switch privilege to a consumer group before it can be set to be the user's initial consumer group. Switch privilege for the initial consumer group cannot come from a role granted to that user.

  **Note:** These semantics are similar to those for `ALTER USER DEFAULT ROLE`.

- If the initial consumer group for a user has never been set, then the user's initial consumer group is automatically the consumer group: `DEFAULT_CONSUMER_GROUP`.

- `DEFAULT_CONSUMER_GROUP` has switch privileges granted to `PUBLIC`; therefore, all users are automatically granted switch privilege for this consumer group. Upon deletion of a consumer group, all users having the deleted group as their initial consumer group now have `DEFAULT_CONSUMER_GROUP` as their initial consumer group. All currently active sessions belonging to a deleted consumer group are switched to `DEFAULT_CONSUMER_GROUP`.
134.4.26 SUBMIT_PENDING_AREA Procedure

This procedure submits pending changes for the resource manager. It clears the pending area after validating and committing the changes (if valid).

**Note:**
A call to `SUBMIT_PENDING_AREA` may fail even if `VALIDATE_PENDING_AREA` succeeds. This may happen if a plan being deleted is loaded by an instance after a call to `VALIDATE_PENDING_AREA`, but before a call to `SUBMIT_PENDING_AREA`.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA;
```

134.4.27 SWITCH_CONSUMER_GROUP_FOR_SESS Procedure

This procedure changes the resource consumer group of a specific session. It also changes the consumer group of any parallel execution servers that are related to the top user session.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_SESS (  
    session_id      IN NUMBER,  
    session_serial  IN NUMBER,  
    consumer_group  IN VARCHAR2);
```

**Parameters**

Table 134-24  SWITCH_CONSUMER_GROUP_FOR_SESS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>SID column from the view <code>V$SESSION</code></td>
</tr>
<tr>
<td>session_serial</td>
<td>SERIAL# column from view <code>V$SESSION</code>.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of the consumer group to which to switch</td>
</tr>
</tbody>
</table>

134.4.28 SWITCH_CONSUMER_GROUP_FOR_USER Procedure

This procedure changes the resource consumer group for all sessions with a given user ID. It also changes the consumer group of any parallel execution servers that are related to the top user session.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER.SWITCH_CONSUMER_GROUP_FOR_USER (  
    user            IN VARCHAR2,  
    consumer_group  IN VARCHAR2);
```
Parameters

Table 134-25  SWITCH_CONSUMER_GROUP_FOR_USER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>Name of the user</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of the consumer group to which to switch</td>
</tr>
</tbody>
</table>

Usage Notes

- The `SWITCH_CONSUMER_GROUP_FOR_SESS Procedure` and the `SWITCH_CONSUMER_GROUP_FOR_USER` procedures let you raise or lower the allocation of CPU resources of certain sessions or users. This provides a functionality similar to the `nice` command on UNIX.
- These procedures cause the session to be moved into the newly specified consumer group immediately.

134.4.29 SWITCH_PLAN Procedure

This procedure sets the current resource manager plan.

Syntax

```sql
DBMS_RESOURCE_MANAGER.SWITCH_PLAN(
    plan_name                     IN   VARCHAR2,
    sid                           IN   VARCHAR2 DEFAULT '*',
    allow_scheduler_plan_switches IN   BOOLEAN DEFAULT TRUE);
```

Parameters

Table 134-26  SWITCH_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_name</td>
<td>Name of the plan to which to switch. Passing in an empty string (&quot;&quot;&quot;) for the <code>plan_name</code>, disables the resource manager</td>
</tr>
<tr>
<td>sid</td>
<td>The <code>sid</code> parameter is relevant only in an Oracle Real Application Clusters environment. This parameter lets you change the plan for a particular instance. Specify the <code>sid</code> of the instance where you want to change the plan. Or specify &quot;*&quot; if you want Oracle to change the plan for all instances.</td>
</tr>
<tr>
<td>allow_scheduler_plan_switches</td>
<td>FALSE - disables automated plan switches by the job scheduler at window boundaries. To reenable automated plan switches, <code>switch_plan</code> must be called again by the administrator with <code>allow_scheduler_plan_switches</code> set to TRUE. By default automated plan switches by the job scheduler are enabled.</td>
</tr>
</tbody>
</table>
134.4.30 UPDATE_CATEGORY Procedure

This procedure updates an existing resource consumer group category.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CATEGORY (
    category        IN    VARCHAR2,
    new_comment     IN    VARCHAR2  DEFAULT NULL);
```

Parameters

Table 134-27  UPDATE_CATEGORY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>category</td>
<td>Name of consumer group category</td>
</tr>
<tr>
<td>new_comment</td>
<td>User comment</td>
</tr>
</tbody>
</table>

134.4.31 UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure

This procedure updates the plan directives with regard to automated maintenance tasks in the CDB root (CDB$ROOT).

By default, all maintenance tasks occur directly in the PDBs themselves.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_AUTOTASK_DIRECTIVE (
    plan                        IN    VARCHAR2,
    new_comment                 IN    VARCHAR2       DEFAULT NULL,
    new_shares                  IN    NUMBER         DEFAULT NULL,
    new_utilization_limit       IN    NUMBER         DEFAULT NULL,
    new_parallel_server_limit   IN    NUMBER         DEFAULT NULL,
    new_memory_limit            IN    NUMBER         DEFAULT NULL,
    new_memory_min              IN    NUMBER         DEFAULT NULL);
```

Parameters

Table 134-28  UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_shares</td>
<td>Specifies the new share of resource allocation for CDB root's automated maintenance tasks</td>
</tr>
<tr>
<td>new_utilization_limit</td>
<td>Specifies the new maximum percentage of CPU that automated maintenance tasks in the CDB root can utilize</td>
</tr>
<tr>
<td>new_parallel_server_limit</td>
<td>Specifies the new maximum percentage of parallel servers that automated maintenance tasks in the CDB root are allowed to use</td>
</tr>
</tbody>
</table>
Table 134-28  (Cont.) UPDATE_CDB_AUTOTASK_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>new_memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

Usage Notes

- By default for automated maintenance tasks, the values are
  - `shares`: -1
  - `utilization_limit`: 90
  - `parallel_server_limit`: 100
- The `shares` = -1 means that the automated maintenance tasks get an allocation of 20% of the system. If the user specifies the `shares`, it behaves the same properties as the other CDB plan directive functions. If the user does not change the shares or later changes it back to -1, autotask will get 20% of the system.
- This procedure can be run only from the CDB root.

134.4.32 UPDATE_CDB_DEFAULT_DIRECTIVE Procedure

This procedure updates the plan directives of the consolidation resource plan.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_CDB_DEFAULT_DIRECTIVE (  
  plan                        IN    VARCHAR2    DEFAULT NULL,  
  new_comment                 IN    VARCHAR2    DEFAULT NULL,  
  new_shares                  IN    NUMBER      DEFAULT NULL,  
  new_utilization_limit       IN    NUMBER      DEFAULT NULL,  
  new_parallel_server_limit   IN    NUMBER      DEFAULT NULL,  
  new_memory_limit            IN    NUMBER      DEFAULT NULL,  
  new_memory_min              IN    NUMBER      DEFAULT NULL);  
```

Parameters

Table 134-29  UPDATE_CDB_DEFAULT_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_shares</td>
<td>Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The <code>new_shares</code> parameter is also used for Parallel Statement Queuing.</td>
</tr>
</tbody>
</table>
Table 134-29  (Cont.) UPDATE_CDB_DEFAULT_DIRECTIVE Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_utilization_limit</td>
<td>Specifies the maximum percentage of CPU that the pluggable database can utilize.</td>
</tr>
<tr>
<td>new_parallel_server_limit</td>
<td>Specifies the maximum percentage of parallel_servers_target parallel servers that the pluggable database can use.</td>
</tr>
<tr>
<td>new_memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>new_memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

Usage Notes

- By default, the default values are
  - `new_shares`: 1
  - `utilization_limit`: 100
  - `parallel_server_limit`: 100
- Note that the default values are `NULL`. This has the same meaning as in UPDATE_CDB_PLAN_DIRECTIVE Procedure. If the user does not specify a value, the value will not be modified.
- This procedure can be run only from the CDB root (`CDB$ROOT`).

134.4.33 UPDATE_CDB_PLAN Procedure

This procedure updates the consolidation resource plan.

Syntax

```
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN (    
  plan                        IN    VARCHAR2(32),    
  new_comment                 IN    VARCHAR2(2000)   DEFAULT NULL);
```

Parameters

Table 134-30  UPDATE_CDB_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>new_comment</td>
<td>User comment</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run only from the CDB root (`CDB$ROOT`).
134.4.34 UPDATE_CDB_PLAN_DIRECTIVE Procedure

Updates the plan directives for a consolidation resource plan. Plan directives specify the resource allocation policy for pluggable databases (PDBs).

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PLAN_DIRECTIVE (
plan                        IN    VARCHAR2 (30),
pluggable_database          IN    VARCHAR2 (30),
new_comment                 IN    VARCHAR2 (200)  DEFAULT NULL,
new_shares                  IN    NUMBER          DEFAULT NULL,
new_utilization_limit       IN    NUMBER          DEFAULT NULL,
new_parallel_server_limit   IN    NUMBER          DEFAULT NULL,
new_memory_limit            IN    NUMBER          DEFAULT NULL,
new_memory_min              IN    NUMBER          DEFAULT NULL);
```

Parameters

**Table 134-31  UPDATE_CDB_PLAN_DIRECTIVE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>pluggable_database</td>
<td>Name of the pluggable database</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_shares</td>
<td>The share of resource allocation for the pluggable database</td>
</tr>
<tr>
<td></td>
<td>CPU Resource Manager is enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If no share is specified, the default is obtained from the default directive, specified through the UPDATE_CDB_DEFAULT_DIRECTIVE Procedure.</td>
</tr>
<tr>
<td>new_utilization_limit</td>
<td>The new maximum percentage of CPU that the pluggable database can utilize</td>
</tr>
<tr>
<td>new_parallel_server_limit</td>
<td>The new maximum percentage of parallel_servers_target parallel servers that the pluggable database can use</td>
</tr>
<tr>
<td>new_memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>new_memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

Usage Notes

- The default value for the `new_*` parameters is `NULL` which indicates that the existing value is left unchanged. If the user does not specify one of the arguments when calling this function, the value is not modified.
- This procedure can be run only from the CDB root (CDB$ROOT).
134.4.35 UPDATE_CDB_PROFILE_DIRECTIVE Procedure

This procedure updates the performance profile directives of the consolidation resource plan. The directives specify the resource allocation policy for pluggable databases (PDBs) that use the performance profile.

For a PDB to use a performance profile, the PDB must have the `DB_PERFORMANCE_PROFILE` initialization parameter set to the performance profile name.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_CDB_PROFILE_DIRECTIVE (
    plan                        IN    VARCHAR2,
    profile                     IN    VARCHAR2,
    new_comment                 IN    VARCHAR2 (2000) DEFAULT '',
    new_shares                  IN    NUMBER          DEFAULT NULL,
    new_utilization_limit       IN    NUMBER          DEFAULT NULL,
    new_parallel_server_limit   IN    NUMBER          DEFAULT NULL,
    new_memory_limit            IN    NUMBER          DEFAULT 100,
    new_memory_min              IN    NUMBER          DEFAULT 0);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of the consolidation plan</td>
</tr>
<tr>
<td>profile</td>
<td>Name of the performance profile</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_shares</td>
<td>The share of resource allocation for the PDBs that use the performance profile</td>
</tr>
<tr>
<td>new_utilization_limit</td>
<td>The new maximum percentage of CPU that PDBs that use the performance profile can use</td>
</tr>
<tr>
<td>new_parallel_server_limit</td>
<td>The new maximum percentage of parallel servers that PDBs that use the performance profile can use</td>
</tr>
<tr>
<td>new_memory_limit</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
<tr>
<td>new_memory_min</td>
<td>This parameter is only applicable to Oracle Exadata storage for configuring the Database Smart Flash Cache.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure can be run only from the CDB root (`CDB$ROOT`).

134.4.36 UPDATE_CONSUMER_GROUP Procedure

This procedure updates entries which define resource consumer groups.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_CONSUMER_GROUP (            consumer_group  IN VARCHAR2,
```

---

**Oracle**

Chapter 134

Summary of DBMS_RESOURCE_MANAGER Subprograms

134-35
Parameters

Table 134-33 UPDATE_CONSUMER_GROUP Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>consumer_group</td>
<td>Name of consumer group</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_cpu_mth</td>
<td>Name of new method for CPU resource allocation (deprecated)</td>
</tr>
<tr>
<td>new_mgmt_mth</td>
<td>Name of new method for CPU resource allocation</td>
</tr>
<tr>
<td>new_category</td>
<td>New consumer group category</td>
</tr>
</tbody>
</table>

Usage Notes

If the parameters to the UPDATE_CONSUMER_GROUP procedure are not specified, then they remain unchanged in the data dictionary.

134.4.37 UPDATE_PLAN Procedure

This procedure updates entries which define resource plans.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_PLAN (
    plan                               IN VARCHAR2,
    new_comment                        IN VARCHAR2 DEFAULT NULL,
    new_cpu_mth                        IN VARCHAR2 DEFAULT NULL, -- deprecated
    new_active_sess_pool_mth           IN VARCHAR2 DEFAULT NULL,
    new_parallel_degree_limit_mth      IN VARCHAR2 DEFAULT NULL,
    new_queueing_mth                   IN VARCHAR2 DEFAULT NULL,
    new_mgmt_mth                       IN VARCHAR2 DEFAULT NULL,
    new_sub_plan                       IN BOOLEAN DEFAULT FALSE,
    new_max_iops                       IN NUMBER DEFAULT NULL,
    new_max_mbps                       IN NUMBER DEFAULT NULL);
```

Parameters

Table 134-34 UPDATE_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan</td>
<td>Name of resource plan</td>
</tr>
<tr>
<td>new_comment</td>
<td>New user comment</td>
</tr>
<tr>
<td>new_cpu_mth</td>
<td>Name of new allocation method for CPU resources (deprecated)</td>
</tr>
<tr>
<td>new_active_sess_pool_mth</td>
<td>Name of new method for maximum active sessions</td>
</tr>
<tr>
<td>new_parallel_degree_limit_mth</td>
<td>Name of new method for degree of parallelism</td>
</tr>
</tbody>
</table>
Table 134-34 (Cont.) UPDATE_PLAN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_queueing_mth</td>
<td>Specifies type of queuing policy to use with active session pool feature</td>
</tr>
<tr>
<td>new_mgmt_mth</td>
<td>Resource allocation method for specifying how much resources (for example, CPU or I/O) each consumer group or sub-plan gets</td>
</tr>
<tr>
<td></td>
<td>• EMPHASIS - for multilevel plans that use percentages to specify how I/O resources are distributed among consumer groups.</td>
</tr>
<tr>
<td></td>
<td>• RATIO - for single-level plans that use ratios to specify how I/O resources are distributed.</td>
</tr>
<tr>
<td>new_sub_plan</td>
<td>New setting for whether the plan is only intended for use as a sub-plan</td>
</tr>
<tr>
<td>new_max_iops</td>
<td>Nonoperative</td>
</tr>
<tr>
<td>new_max_mbps</td>
<td>Nonoperative</td>
</tr>
</tbody>
</table>

Usage Notes

- If the parameters to UPDATE_PLAN Procedure are not specified, then they remain unchanged in the data dictionary.
- If you want to use any default resource allocation method, then you do not need to specify it when creating or updating a plan.

134.4.38 UPDATE_PLAN_DIRECTIVE Procedure

This procedure updates resource plan directives.

Note:

The parameters new_max_utilization_limit and new_parallel_target_percentage are deprecated with Oracle Database 11g Release 1 (12.1.0.1), and are replaced by new_utilization_limit and new_parallel_server_limit.

Syntax

```sql
DBMS_RESOURCE_MANAGER.UPDATE_PLAN_DIRECTIVE (
  plan                             IN VARCHAR2,
  group_or_subplan                 IN VARCHAR2,
  new_comment                      IN VARCHAR2 DEFAULT NULL,
  new_cpu_p1                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p2                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p3                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p4                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p5                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p6                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p7                       IN NUMBER DEFAULT NULL, -- deprecated
  new_cpu_p8                       IN NUMBER DEFAULT NULL, -- deprecated
  new_active_sess_pool_p1          IN NUMBER DEFAULT NULL,
)
```
Parameters

Table 134-35  (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_queueing_p1</td>
<td>Specified time (in seconds) after which a job in the inactive session queue (waiting for execution) will time out. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_parallel_degree_limit_p1</td>
<td>Specifies a limit on the degree of parallelism for any operation. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_switch_group</td>
<td>Specifies consumer group to which this session is switched if other switch criteria are met. Default is NULL. If the group name is 'CANCEL_SQL', the current call will be canceled when other switch criteria are met. If the group name is 'KILL_SESSION', the session will be killed when other switch criteria are met.</td>
</tr>
<tr>
<td>new_switch_time</td>
<td>Specifies time (in CPU seconds) that a session can execute before an action is taken. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_switch_estimate</td>
<td>If TRUE, tells Oracle to use its execution time estimate to automatically switch the consumer group of an operation before beginning its execution. Default is FALSE.</td>
</tr>
<tr>
<td>new_max_est_exec_time</td>
<td>Specifies the maximum execution time (in CPU seconds) allowed for a session. If the optimizer estimates that an operation will take longer than MAX_EST_EXEC_TIME, the operation is not started and ORA-07455 is issued. If the optimizer does not provide an estimate, this directive has no effect. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_undo_pool</td>
<td>Limits the size in kilobytes of the undo records corresponding to uncommitted transactions by this consumer group</td>
</tr>
<tr>
<td>new_max_idle_time</td>
<td>Indicates the maximum session idle time. Default is NULL, which means unlimited.</td>
</tr>
<tr>
<td>new_max_idle_blocker_time</td>
<td>Maximum amount of time in seconds that a session can be idle while blocking another session's acquisition of a resource</td>
</tr>
<tr>
<td>new_switch_time_in_call</td>

<td>Resource limit. For CPU, this limits the CPU utilization for the consumer group. For parallel servers, this limits the parallel servers used as a percentage of parallel_servers_target.</td>
</tr>
<tr>
<td>new_switch_elapsed_time</td>
<td>Elapsed time that will trigger the action specified by switch_group. As with other switch directives, if new_switch_for_call is TRUE, the elapsed time is accumulated from the start of a call. Otherwise, the elapsed time is accumulated for the length of the session.</td>
</tr>
<tr>
<td>new_shares</td>
<td>Specifies the share of resource allocation for the pluggable database. CPU Resource Manager and Exadata I/O Resource Manager are enabled by specifying shares for each PDB. The shares parameter is also used for Parallel Statement Queuing. If CPU Resource Manager and Exadata I/O Resource Manager are enabled, then the default value is 1.</td>
</tr>
</tbody>
</table>
Table 134-35 (Cont.) UPDATE_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_parallel_stmt_critical</td>
<td>If set to BYPASS_QUEUE, parallel statements from this consumer group are not queued. If set to QUEUE, all the parallel statements, irrespective of the parallel_degree_policy parameter value, from the consumer group get queued. Default is FALSE, which means that certain parallel statements are eligible for queuing depending upon the parallel_degree_policy parameter value.</td>
</tr>
<tr>
<td>new_session_pga_limit</td>
<td>Maximum amount of PGA in MB that sessions in this consumer group can allocate before being terminated. NULL (default) indicates no change.</td>
</tr>
<tr>
<td>new_parallel_queue_timeout</td>
<td>Specifies the time (in seconds) that a parallel statement may remain in its Consumer Group's parallel statement queue before it is removed. The default action of this parameter is ERROR. This action can be altered using the new_pq_timeout_action parameter.</td>
</tr>
<tr>
<td>new_pq_timeout_action</td>
<td>Specifies the action to be taken when a parallel statement is removed from the queue due to new_parallel_queue_timeout. The values are: CANCEL — The SQL statement is terminated with error ORA-7454, RUN — The SQL statement runs immediately, and might get downgraded if parallel servers are unavailable.</td>
</tr>
</tbody>
</table>

Usage Notes

- If the parameters for UPDATE_PLAN_DIRECTIVE are left unspecified, then they remain unchanged in the data dictionary.
- For new_max_idle_time and new_max_idle_blocker_time, PMON will check these limits once a minute. If it finds a session that has exceeded one of the limits, it will forcibly kill the session and clean up all its state.
- The parameter new_switch_time_in_call is mostly useful for three-tier applications where the mid-tier server is implementing session pooling. By turning on new_switch_time_in_call, the resource usage of one client will not affect the consumer group of a future client that happens to be executed on the same session.
- To clear (zero or nullify) any numeric parameter in a resource plan directive, set it to -1 using the UPDATE_PLAN_DIRECTIVE Procedure.

134.4.39 VALIDATE_PENDING_AREA Procedure

This procedure validates pending changes for the resource manager.

Syntax

```
DBMS_RESOURCE_MANAGER.VALIDATE_PENDING_AREA;
```
The DBMS_RESOURCE_MANAGER_PRIVS package maintains privileges associated with the Resource Manager.

This chapter contains the following topics:

- Summary of DBMSRESOURCE_MANAGER_PRIVS Subprograms

See Also:
For more information on using the Database Resource Manager, see Oracle Database Administrator's Guide

135.1 Summary of DBMS_RESOURCE_MANAGER_PRIVS Subprograms

This table lists the DBMS_RESOURCE_MANAGER_PRIVS subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT_SWITCH_CONSUMER_GROUP Procedure</td>
<td>Grants the privilege to switch to resource consumer groups</td>
</tr>
<tr>
<td>GRANT_SYSTEM_PRIVILEGE Procedure</td>
<td>Performs a grant of a system privilege</td>
</tr>
<tr>
<td>REVOKE_SWITCH_CONSUMER_GROUP Procedure</td>
<td>Revokes the privilege to switch to resource consumer groups.</td>
</tr>
<tr>
<td>REVOKE_SYSTEM_PRIVILEGE Procedure</td>
<td>Performs a revoke of a system privilege</td>
</tr>
</tbody>
</table>

135.1.1 GRANT_SWITCH_CONSUMER_GROUP Procedure

This procedure grants the privilege to switch to a resource consumer group.

Syntax

```
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP (
    grantee_name   IN VARCHAR2,
    consumer_group IN VARCHAR2,
    grant_option   IN BOOLEAN);
```
Parameters

Table 135-2  GRANT_SWITCH_CONSUMER_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee_name</td>
<td>Name of the user or role to whom privilege is to be granted.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of consumer group.</td>
</tr>
<tr>
<td>grant_option</td>
<td>TRUE if grantee should be allowed to grant access, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Usage Notes

If you grant permission to switch to a particular consumer group to a user, then that user can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to a role, then any users who have been granted that role and have enabled that role can immediately switch their current consumer group to the new consumer group.

If you grant permission to switch to a particular consumer group to PUBLIC, then any user can switch to that consumer group.

If the grant_option parameter is TRUE, then users granted switch privilege for the consumer group may also grant switch privileges for that consumer group to others.

In order to set the initial consumer group of a user, you must grant the switch privilege for that group to the user.

See Also:

DBMS_RESOURCE_MANAGER

Examples

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SWITCH_CONSUMER_GROUP ('scott', 'mail_maintenance_group', true);
DBMS_RESOURCE_MANAGER.CREATE_PENDING_AREA();
DBMS_RESOURCE_MANAGER.set_consumer_group_mapping(
    dbms_resource_manager.oracle_user, 'scott','mail_maintenance_group');
DBMS_RESOURCE_MANAGER.SUBMIT_PENDING_AREA();
END;
/

135.1.2 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure performs a grant of a system privilege to a user or role.

Syntax

DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE (
    grantee_name IN VARCHAR2,
privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER',
admin_option IN BOOLEAN);

Parameters

Table 135-3 GRANT_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>grantee_name</td>
<td>Name of the user or role to whom privilege is to be granted.</td>
</tr>
<tr>
<td>privilege_name</td>
<td>Name of the privilege to be granted.</td>
</tr>
<tr>
<td>admin_option</td>
<td>TRUE if the grant is with admin_option, FALSE otherwise.</td>
</tr>
</tbody>
</table>

Usage Notes

Currently, Oracle provides only one system privilege for the Resource Manager: ADMINISTER_RESOURCE_MANAGER. Database administrators have this system privilege with the ADMIN option. The grantee and the revokee can either be a user or a role. Users that have been granted the system privilege with the ADMIN option can also grant this privilege to others.

Examples

The following call grants this privilege to a user called scott without the ADMIN option:

BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.GRANT_SYSTEM_PRIVILEGE {
  grantee_name => 'scott',
  privilege_name => 'ADMINISTER_RESOURCE_MANAGER',
  admin_option => FALSE);
END;
/

135.1.3 REVOKE_SWITCH_CONSUMER_GROUP Procedure

This procedure revokes the privilege to switch to a resource consumer group.

Syntax

DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP {
  revokee_name IN VARCHAR2,
  consumer_group IN VARCHAR2);

Parameters

Table 135-4 REVOKE_SWITCH_CONSUMER_GROUP Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>revokee_name</td>
<td>Name of user/role from which to revoke access.</td>
</tr>
<tr>
<td>consumer_group</td>
<td>Name of consumer group.</td>
</tr>
</tbody>
</table>

Usage Notes

If you revoke a user's switch privilege for a particular consumer group, then any subsequent attempts by that user to switch to that consumer group will fail.
If you revoke the initial consumer group from a user, then that user will automatically be part of the `DEFAULT_CONSUMER_GROUP` consumer group when logging in.

If you revoke the switch privilege for a consumer group from a role, then any users who only had switch privilege for the consumer group through that role will not be able to switch to that consumer group.

If you revoke the switch privilege for a consumer group from `PUBLIC`, then any users who could previously only use the consumer group through `PUBLIC` will not be able to switch to that consumer group.

**Examples**

The following example revokes the privileges to switch to `mail_maintenance_group` from Scott:

```sql
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SWITCH_CONSUMER_GROUP ('scott', 'mail_maintenance_group');
END;
/
```

### 135.1.4 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure performs a revoke of a system privilege from a user or role.

**Syntax**

```sql
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE (
  revokee_name   IN VARCHAR2,
  privilege_name IN VARCHAR2 DEFAULT 'ADMINISTER_RESOURCE_MANAGER');
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>revokee_name</td>
<td>Name of the user or role from whom privilege is to be revoked.</td>
</tr>
<tr>
<td>privilege_name</td>
<td>Name of the privilege to be revoked.</td>
</tr>
</tbody>
</table>

**Examples**

The following call revokes the `ADMINISTER_RESOURCE_MANAGER` from user scott:

```sql
BEGIN
DBMS_RESOURCE_MANAGER_PRIVS.REVOKE_SYSTEM_PRIVILEGE ('scott');
END;
/
```
**The DBMS_RESULT_CACHE package** provides an interface to allow the DBA to administer that part of the shared pool that is used by the SQL result cache and the PL/SQL function result cache.

Both these caches use the same infrastructure. Therefore, for example, `DBMS_RESULT_CACHE.BYPASS` determines whether both caches are bypassed or both caches are used, and `DBMS_RESULT_CACHE.FLUSH` flushes both all the cached results for SQL queries and all the cached results for PL/SQL functions.

This chapter contains the following topics:

- Security Model
- Constants
- Summary of DBMS_RESULT_CACHE Subprograms

---

### 136.1 DBMS_RESULT_CACHE Security Model

Only database administrators should be granted the `EXECUTE` privilege for this package.

---

### 136.2 DBMS_RESULT_CACHE Constants

The `DBMS_RESULT_CACHE` package defines several constants for specifying parameter values.

The following table describes these constants.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_BYPS</td>
<td><code>CONSTANT VARCHAR(10) := 'BYPASS';</code></td>
</tr>
<tr>
<td>STATUS_CORR</td>
<td><code>CONSTANT VARCHAR(10) := 'CORRUPT';</code></td>
</tr>
<tr>
<td>STATUS_DISA</td>
<td><code>CONSTANT VARCHAR(10) := 'DISABLED';</code></td>
</tr>
<tr>
<td>STATUS_ENAB</td>
<td><code>CONSTANT VARCHAR(10) := 'ENABLED';</code></td>
</tr>
</tbody>
</table>
### 136.3 Summary of DBMS_RESULT_CACHE Subprograms

This table lists the `DBMS_RESULT_CACHE` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLACK_LIST Function</td>
<td>Returns a pipelined BL_TABT.</td>
</tr>
<tr>
<td>BLACK_LIST_ADD Procedure</td>
<td>Adds a <code>cache_id</code> to the black-list.</td>
</tr>
<tr>
<td>BLACK_LIST_CLEAR Procedure</td>
<td>Removes all <code>cache_ids</code> from the black-list.</td>
</tr>
<tr>
<td>BLACK_LIST_REMOVE Procedure</td>
<td>Removes the <code>cache_id</code> from the black-list.</td>
</tr>
<tr>
<td>BYPASS Procedure</td>
<td>Sets the bypass mode for the Result Cache</td>
</tr>
<tr>
<td>FLUSH Function &amp; Procedure</td>
<td>Attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics</td>
</tr>
<tr>
<td>INVALIDATE Functions &amp; Procedures</td>
<td>Invalidates all the result-set objects that dependent upon the specified dependency object</td>
</tr>
<tr>
<td>INVALIDATE_OBJECT Functions &amp; Procedures</td>
<td>Invalidates the specified result-set object(s)</td>
</tr>
<tr>
<td>MEMORY_REPORT Procedure</td>
<td>Produces the memory usage report for the Result Cache</td>
</tr>
<tr>
<td>STATUS Function</td>
<td>Checks the status of the Result Cache</td>
</tr>
</tbody>
</table>

#### 136.3.1 BLACK_LIST Function

This function returns all the blacklisted cache ids of a local instance.

**Syntax**

```sql
DBMS_RESULT_CACHE.BLACK_LIST
RETURN BL_TABT;
```

#### 136.3.2 BLACK_LIST_ADD Procedure

This procedure adds a `cache_id` to the black-list.

**Syntax**

```sql
DBMS_RESULT_CACHE.BLACK_LIST_ADD (cache_id IN VARCHAR2,
global IN BOOLEAN DEFAULT FALSE);
```
Parameters

Table 136-3    BLACK_LIST_ADD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache_id</td>
<td>The <code>cache_id</code> is added to the black-list.</td>
</tr>
<tr>
<td>global</td>
<td>TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.</td>
</tr>
</tbody>
</table>

136.3.3 BLACK_LIST_CLEAR Procedure

This procedure removes all cache_ids from the black-list.

Syntax

```sql
DBMS_RESULT_CACHE.BLACK_LIST_CLEAR (
    global IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 136-4    BLACK_LIST_CLEAR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>global</td>
<td>TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.</td>
</tr>
</tbody>
</table>

136.3.4 BLACK_LIST_REMOVE Procedure

This procedure removes the `cache_id` from the black-list.

Syntax

```sql
DBMS_RESULT_CACHE.BLACK_LIST_REMOVE (
    cache_id IN VARCHAR2,
    global IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 136-5    BLACK_LIST_REMOVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cache_id</td>
<td>The <code>cache_id</code> is removed from the black-list.</td>
</tr>
<tr>
<td>global</td>
<td>TRUE — applies to all caches in a RAC cluster. FALSE (default) — applies only to the local instance cache.</td>
</tr>
</tbody>
</table>
136.3.5 BYPASS Procedure

This procedure sets the bypass mode for the Result Cache.

It sets one of the following bypass modes:

- When bypass mode is turned on, it implies that cached results are no longer used and that no new results are saved in the cache.
- When bypass mode is turned off, the cache resumes normal operation.

Syntax

```sql
DBMS_RESULT_CACHE.BYPASS (
    bypass_mode    IN   BOOLEAN,
    session        IN   BOOLEAN);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bypass_mode</td>
<td>• TRUE =&gt; Result Cache usage is bypassed</td>
</tr>
<tr>
<td></td>
<td>• FALSE =&gt; Result Cache usage is turned on</td>
</tr>
<tr>
<td>session</td>
<td>• TRUE =&gt; Applies to current session</td>
</tr>
<tr>
<td></td>
<td>• FALSE (default) =&gt; Applies to all sessions</td>
</tr>
</tbody>
</table>

Usage Notes

This operation is database instance specific.

Examples

This operation can be used when there is a need to hot patch PL/SQL code in a running system. If a code-patch is applied to a PL/SQL module on which a result cached function directly or transitively depends, then the cached results associated with the result cache function are not automatically flushed (if the instance is not restarted/bounced). This must be manually achieved.

To ensure correctness during the patching process follow these steps:

1. Place the result cache in bypass mode, and flush existing result.
   ```sql
   BEGIN
     DBMS_RESULT_CACHE.BYPASS(TRUE);
     DBMS_RESULT_CACHE.FLUSH;
   END;
   /
   ```
   This step must be performed on each instance if in a Oracle Real Application Clusters environment.

2. Apply the PL/SQL code patches.

3. Resume use of the result cache, by turning off the cache bypass mode.
   ```sql
   BEGIN
     DBMS_RESULT_CACHE.BYPASS(FALSE);
   ```
This step must be performed on each instance if in an Oracle Real Application Clusters environment.

136.3.6 FLUSH Function & Procedure

This function and procedure attempts to remove all the objects from the Result Cache, and depending on the arguments retains or releases the memory and retains or clears the statistics.

**Syntax**

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem  IN  BOOLEAN DEFAULT FALSE,  
    retainSta  IN  BOOLEAN DEFAULT FALSE)  
RETURN BOOLEAN;
```

```
DBMS_RESULT_CACHE.FLUSH (  
    retainMem  IN  BOOLEAN DEFAULT FALSE,  
    retainSta  IN  BOOLEAN DEFAULT FALSE);
```

**Parameters**

**Table 136-7  FLUSH Function & Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>retainMem</td>
<td>• TRUE =&gt; retains the free memory in the cache</td>
</tr>
<tr>
<td></td>
<td>• FALSE (default) =&gt; releases the free memory to the system</td>
</tr>
<tr>
<td>retainSta</td>
<td>• TRUE =&gt; retains the existing cache statistics</td>
</tr>
<tr>
<td></td>
<td>• FALSE (default) =&gt; clears the existing cache statistics</td>
</tr>
</tbody>
</table>

**Return Values**

TRUE if successful in removing all the objects.

136.3.7 INVALIDATE Functions & Procedures

This function and procedure invalidates all the result-set objects that dependent upon the specified dependency object.

**Syntax**

```
DBMS_RESULT_CACHE.INVALIDATE (  
    owner        IN  VARCHAR2,  
    name         IN  VARCHAR2)  
RETURN NUMBER;
```

```
DBMS_RESULT_CACHE.INVALIDATE (  
    owner        IN  VARCHAR2,  
    name         IN  VARCHAR2);
```

```
DBMS_RESULT_CACHE.INVALIDATE (  
    object_id    IN  BINARY_INTEGER)  
RETURN NUMBER;
```
DBMS_RESULT_CACHE.INVALIDATE (object_id IN BINARY_INTEGER);

Parameters

Table 136-8 INVALIDATE Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Schema name</td>
</tr>
<tr>
<td>name</td>
<td>Object name</td>
</tr>
<tr>
<td>object_id</td>
<td>Dictionary object number</td>
</tr>
</tbody>
</table>

Return Values

The number of objects invalidated.

136.3.8 INVALIDATE_OBJECT Functions & Procedures

This function and procedure invalidates the specified result-set object(s).

Syntax

DBMS_RESULT_CACHE.INVALIDATE_OBJECT (id IN BINARY_INTEGER) RETURN NUMBER;

Parameters

Table 136-9 INVALIDATE_OBJECT Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>Address of the cache object in the Result Cache</td>
</tr>
<tr>
<td>cache_id</td>
<td>Cache-id</td>
</tr>
</tbody>
</table>

Return Values

The number of objects invalidated.
136.3.9 MEMORY_REPORT Procedure

This procedure produces the memory usage report for the Result Cache.

Syntax

DBMS_RESULT_CACHE.MEMORY_REPORT (  
    detailed IN BOOLEAN DEFAULT FALSE);

Parameters

Table 136-10 MEMORY_REPORT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| detailed  | • TRUE => produces a more detailed report  
            • FALSE (default) => produces the standard report |

Usage Notes

Invoking this procedure from SQL*Plus requires that the serveroutput be turned on.

136.3.10 STATUS Function

This function checks the status of the Result Cache.

Syntax

DBMS_RESULT_CACHE.STATUS  
    RETURN VARCHAR2;

Return Values

One of the following values:

• STATUS_DISA - Cache is not available
• STATUS_ENAB - Cache is available
• STATUS_BYPS: Cache has been made temporarily unavailable.
• STATUS_SYNC - Cache is available, but synchronizing with Oracle RAC nodes
With the `DBMS_RESUMABLE` package, you can suspend large operations that run out of space or reach space limits after executing for a long time, fix the problem, and make the statement resume execution. In this way you can write applications without worrying about running into space-related errors.

This chapter contains the following topics:

- Operational Notes
- Summary of DBMS_RESUMABLE Subprograms

### 137.1 DBMS_RESUMABLE Operational Notes

When you suspend a statement, you should log the suspension in the alert log. You should also register a procedure to be executed when the statement is suspended. Using a view, you can monitor the progress of the statement and indicate whether the statement is currently executing or suspended.

Suspending a statement automatically results in suspending the transaction. Thus all transactional resources are held during a statement suspend and resume. When the error condition disappears, the suspended statement automatically resumes execution. A resumable space allocation can be suspended and resumed multiple times during execution.

A suspension timeout interval is associated with resumable space allocations. A resumable space allocation that is suspended for the timeout interval (the default is two hours) wakes up and returns an exception to the user. A suspended statement may be forced to throw an exception using the `DBMS_RESUMABLE.ABORT()` procedure.

### 137.2 Summary of DBMS_RESUMABLE Subprograms

This table lists the `DBMS_RESUMABLE` subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ABORT Procedure</code></td>
<td>Aborts a suspended resumable space allocation</td>
</tr>
<tr>
<td><code>GET_SESSION_TIMEOUT</code></td>
<td>Returns the current timeout value of the resumable space allocations for a session with <code>session_id</code></td>
</tr>
<tr>
<td><code>GET_TIMEOUT</code></td>
<td>Returns the current timeout value of resumable space allocations for the current session</td>
</tr>
<tr>
<td><code>SET_SESSION_TIMEOUT</code></td>
<td>Sets the timeout of resumable space allocations for a session with <code>session_id</code></td>
</tr>
<tr>
<td><code>SET_TIMEOUT</code></td>
<td>Sets the timeout of resumable space allocations for the current session</td>
</tr>
</tbody>
</table>
### 137.2.1 ABORT Procedure

This procedure aborts a suspended resumable space allocation.

The parameter `session_id` is the session ID in which the statement is executed. For a parallel DML/DDL, `session_id` is any session ID that participates in the parallel DML/DDL. This operation is guaranteed to succeed. The procedure can be called either inside or outside of the `AFTER SUSPEND` trigger.

**Syntax**

```sql
DBMS_RESUMABLE.ABORT (
    session_id  IN NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>The session identifier of the resumable space allocation.</td>
</tr>
</tbody>
</table>

**Usage Notes**

To call an `ABORT` procedure, you must be the owner of the session with `session_id`, have `ALTER SYSTEM` privileges, or be a DBA.

### 137.2.2 GET_SESSION_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for a session with `session_id`.

**Syntax**

```sql
DBMS_RESUMABLE.GET_SESSION_TIMEOUT (
    session_id  IN NUMBER)
RETURN NUMBER;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>The session identifier of the resumable space allocation.</td>
</tr>
</tbody>
</table>
Return Values

Table 137-4  GET_SESSION_TIMEOUT Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>The current timeout value of resumable space allocations for a session with</td>
</tr>
<tr>
<td></td>
<td>session_id. The timeout is returned in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

If session_id does not exist, the GET_SESSION_TIMEOUT function returns -1.

137.2.3 GET_TIMEOUT Function

This function returns the current timeout value of resumable space allocations for the current session.

Syntax

```sql
DBMS_RESUMABLE.GET_TIMEOUT
RETURN NUMBER;
```

Return Values

Table 137-5  GET_TIMEOUT Function Return Values

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NUMBER</td>
<td>The current timeout value of resumable space allocations for the current</td>
</tr>
<tr>
<td></td>
<td>session. The returned value is in seconds.</td>
</tr>
</tbody>
</table>

Usage Notes

If the current session is not resumable enabled, the GET_TIMEOUT function returns -1.

137.2.4 SET_SESSION_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for a session with session_id.

The new timeout setting applies to the session immediately. If session_id does not exist, no operation occurs.

Syntax

```sql
DBMS_RESUMABLE.SET_SESSION_TIMEOUT {
    session_id IN NUMBER,
    timeout   IN NUMBER);
```
137.2.5 SET_TIMEOUT Procedure

This procedure sets the timeout of resumable space allocations for the current session. The new timeout setting applies to the session immediately.

Syntax

```
DBMS_RESUMABLE.SET_TIMEOUT (
    timeout  IN NUMBER);
```

Parameters

Table 137-7  SET_TIMEOUT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>The timeout of the resumable space allocation.</td>
</tr>
</tbody>
</table>

137.2.6 SPACE_ERROR_INFO Function

This function looks for space-related errors in the error stack.

If it cannot find a space related error, it will return FALSE. Otherwise, TRUE is returned and information about the particular object that causes the space error is returned.

Syntax

```
DBMS_RESUMABLE.SPACE_ERROR_INFO
    error_type        OUT VARCHAR2,
    object_type       OUT VARCHAR2,
    object_owner      OUT VARCHAR2,
    table_space_name  OUT VARCHAR2,
    object_name       OUT VARCHAR2,
    sub_object_name   OUT VARCHAR2)
RETURN BOOLEAN;
```
Parameters

</table>
The DBMS_RLS package contains the fine-grained access control administrative interface, which is used to implement Virtual Private Database (VPD).

DBMS_RLS is available with the Enterprise Edition only.

See Also:
Oracle Database Security Guide for usage information about DBMS_RLS

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operational Notes
- Rules and Limits
- Summary of DBMS_RLS Subprograms

138.1 DBMS_RLS Overview

The functionality to support fine-grained access control is based on dynamic predicates, where security rules are not embedded in views, but are acquired at the statement parse time, when the base table or view is referenced in a DML statement.

A dynamic predicate for a table, view, or synonym is generated by a PL/SQL function, which is associated with a security policy through a PL/SQL interface. For example:

```sql
DBMS_RLS.ADD_POLICY ('hr', 'employees', 'emp_policy', 'hr', 'emp_sec', 'select', 'user_ctx', 'time');
```

Whenever the EMPLOYEES table, under the HR schema, is referenced in a query or subquery (SELECT), the server calls the EMP_SEC function (under the HR schema). This function returns a predicate specific to the current schema for the EMP_POLICY policy. The policy function may generate the predicates based on the session environment variables available during the function call. These variables usually appear in the form of application contexts. The policy can specify any combination of security-relevant columns and of these statement types: INDEX, SELECT, INSERT, UPDATE, or DELETE.

The server then produces a transient view with the text:

```sql
SELECT * FROM hr.employees WHERE P1
```

Here, P1 (for example, where SAL > 10000, or even a subquery) is the predicate returned from the EMP_SEC function. The server treats the EMPLOYEES table as a view and
does the view expansion just like the ordinary view, except that the view text is taken from the transient view instead of the data dictionary.

If the predicate contains subqueries, then the owner (definer) of the policy function is used to resolve objects within the subqueries and checks security for those objects. In other words, users who have access privilege to the policy-protected objects do not need to know anything about the policy. They do not need to be granted object privileges for any underlying security policy. Furthermore, the users do not require EXECUTE privilege on the policy function, because the server makes the call with the function definer's right.

**Note:**
The transient view can preserve the updatability of the parent object because it is derived from a single table or view with predicate only; that is, no JOIN, ORDER BY, GROUP BY, and so on.

DBMS_RLS also provides the interface to drop or enable security policies. For example, you can drop or enable the EMP_POLICY with the following PL/SQL statements:

```sql
DBMS_RLS.DROP_POLICY('hr', 'employees', 'emp_policy');
DBMS_RLS.ENABLE_POLICY('hr', 'employees', 'emp_policy', TRUE);
```

### 138.2 DBMS_RLS Security Model

A security check is performed when the transient view is created with a subquery. The schema owning the policy function, which generates the dynamic predicate, is the transient view's definer for security check and object lookup.

### 138.3 DBMS_RLS Constants

The DBMS_RLS package includes constants that can be used for specifying parameter values.

**Table 138-1  DBMS_RLS Constants**

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_ATTRIBUTE_ASSOCIATION</td>
<td>BINARY_INT</td>
<td>1</td>
<td>Used with DBMS_RLS.ALTER_POLICY and DBMS_RLS.ALTER_GROUPED_POLICY: adds the specified namespace and attribute to the policy or grouped policy</td>
</tr>
<tr>
<td>REMOVE_ATTRIBUTE_ASSOCIATION</td>
<td>BINARY_INT</td>
<td>2</td>
<td>Used with DBMS_RLS.ALTER_POLICY and DBMS_RLS.ALTER_GROUPED_POLICY: removes the specified namespace and attribute to the policy or grouped policy</td>
</tr>
</tbody>
</table>
138.4 DBMS_RLS Operational Notes

The DBMS_RLS procedures cause current DML transactions, if any, to commit before the operation. However, the procedures do not cause a commit first if they are inside a DDL event trigger. With DDL transactions, the DBMS_RLS procedures are part of the DDL transaction.

For example, you may create a trigger for CREATE TABLE. Inside the trigger, you may add a column through ALTER TABLE, and you can add a policy through DBMS_RLS. All these operations are in the same transaction as CREATE TABLE, even though each one is a DDL statement. The CREATE TABLE succeeds only if the trigger is completed successfully.

Views of current cursors and corresponding predicates are available from V$VPD_POLICIES.

A synonym can reference only a view or a table.

138.5 DBMS_RLS Rules and Limits

Using long identifiers is supported for VPD. The maximum length for arguments such as object_schema, object_name, and policy_name, which apply to objects (table names, policy names, and subprogram names) and views is 128 bytes.

138.6 Summary of DBMS_RLS Subprograms

This table lists and briefly describes the subprograms available in DBMS_RLS.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_GROUPED_POLICY Procedure</td>
<td>Adds a policy associated with a policy group</td>
</tr>
<tr>
<td>ADD_POLICY Procedure</td>
<td>Adds a fine-grained access control policy to a table, view, or synonym</td>
</tr>
<tr>
<td>ADD_POLICY_CONTEXT Procedure</td>
<td>Adds the context for the active application</td>
</tr>
<tr>
<td>ALTER_POLICY Procedure</td>
<td>Associates an application context attribute with VPD policies</td>
</tr>
<tr>
<td>ALTER_GROUPED_POLICY Procedure</td>
<td>Adds application context related changes</td>
</tr>
<tr>
<td>CREATE_POLICY_GROUP Procedure</td>
<td>Creates a policy group</td>
</tr>
<tr>
<td>DELETE_POLICY_GROUP Procedure</td>
<td>Deletes a policy group</td>
</tr>
<tr>
<td>DISABLE_GROUPED_POLICY Procedure</td>
<td>Disables a row-level group security policy</td>
</tr>
<tr>
<td>DROP_GROUPED_POLICY Procedure</td>
<td>Drops a policy associated with a policy group</td>
</tr>
<tr>
<td>DROP_POLICY Procedure</td>
<td>Drops a fine-grained access control policy from a table, view, or synonym</td>
</tr>
<tr>
<td>DROP_POLICY_CONTEXT Procedure</td>
<td>Drops a driving context from the object so that it will have one less driving context</td>
</tr>
</tbody>
</table>
### Table 138-2 (Cont.) DBMS_RLS Package Subprograms

<table>

<td>Enables or disables a row-level group security policy</td>
</tr>
<tr>
<td>ENABLE_POLICY Procedure</td>
<td>Enables or disables a fine-grained access control policy</td>
</tr>
<tr>
<td>REFRESH_GROUPED_POLICY Procedure</td>
<td>Reparses the SQL statements associated with a refreshed policy</td>
</tr>
<tr>
<td>REFRESH_POLICY Procedure</td>
<td>Causes all the cached statements associated with the policy to be reparsed</td>
</tr>
</tbody>
</table>

## 138.6.1 ADD_GROUPED_POLICY Procedure

This procedure adds a policy associated with a policy group.

### Syntax

```sql
DBMS_RLS.ADD_GROUPED_POLICY(
  object_schema IN VARCHAR2 DEFAULT NULL,
  object_name   IN VARCHAR2,
  policy_group  IN VARCHAR2 DEFAULT 'SYS_DEFAULT',
  policy_name   IN VARCHAR2,
  function_schema IN VARCHAR2 DEFAULT NULL,
  policy_function IN VARCHAR2,
  statement_types IN VARCHAR2 DEFAULT NULL,
  update_check IN BOOLEAN DEFAULT FALSE,
  enable IN BOOLEAN DEFAULT TRUE,
  static_policy IN BOOLEAN DEFAULT FALSE,
  policy_type IN BINARY_INTEGER DEFAULT NULL,
  long_predicate IN BOOLEAN DEFAULT FALSE,
  sec_relevant_cols IN VARCHAR2,
  sec_relevant_cols_opt IN BINARY_INTEGER DEFAULT NULL,
  namespace IN VARCHAR2 DEFAULT NULL,
  attribute IN VARCHAR2 DEFAULT NULL);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group to which the policy belongs.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy; must be unique for the same table or view.</td>
</tr>
<tr>
<td>function_schema</td>
<td>Schema owning the policy function. If no function_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>policy_function</td>
<td>Name of the function that generates a predicate for the policy. If the function is defined within a package, the name of the package must be present.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td>namespace</td>
<td>Name which determines the application context namespace</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute which determines the application context attribute name</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure adds a policy to the specified table, view, or synonym and associates the policy with the specified policy group.
- The policy group must have been created by using the CREATE_POLICY_GROUP Procedure.
- The policy name must be unique within a policy group for a specific object.
- Policies from the default policy group, SYS_DEFAULT, are always executed regardless of the active policy group; however, fine-grained access control policies do not apply to users with EXEMPT ACCESS POLICY system privilege.
138.6.2 ADD_POLICY Procedure

This procedure adds a fine-grained access control policy to a table, view, or synonym. The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

A COMMIT is also performed at the end of the operation.

Syntax

```sql
DBMS_RLS.ADD_POLICY ( 
  object_schema            IN  VARCHAR2       DEFAULT NULL,
  object_name              IN  VARCHAR2,
  policy_name              IN  VARCHAR2,
  function_schema          IN  VARCHAR2       DEFAULT NULL,
  policy_function          IN  VARCHAR2,
  statement_types          IN  VARCHAR2       DEFAULT NULL,
  update_check             IN  BOOLEAN        DEFAULT FALSE,
  enable                   IN  BOOLEAN        DEFAULT TRUE,
  static_policy            IN  BOOLEAN        DEFAULT FALSE,
  policy_type              IN  BINARY_INTEGER DEFAULT NULL,
  long_predicate           IN  BOOLEAN        DEFAULT FALSE,
  sec_relevant_cols        IN  VARCHAR2       DEFAULT NULL,
  sec_relevant_cols_opt    IN  BINARY_INTEGER DEFAULT NULL,
  namespace                IN  VARCHAR2       DEFAULT NULL,
  attribute                IN  VARCHAR2       DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be added. It must be unique for the same table or view. Do not enter special characters such as spaces or commas. If you want to use special characters for the policy name, then enclose the name in quotation marks.</td>
</tr>
<tr>
<td>function_schema</td>
<td>Schema owning the policy function. If no function_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>policy_function</td>
<td>Name of a function which generates a predicate for the policy. If the function is defined within a package, then the name of the package must be present.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>statement_types</td>
<td>Statement types to which the policy applies. It can be any combination of INDEX, SELECT, UPDATE, or DELETE. The default is to apply to all of these types except INSERT and INDEX.</td>
</tr>
<tr>
<td>update_check</td>
<td>Optional argument for the INSERT or UPDATE statement type. The default is FALSE. If you plan to use the INSERT statement type, then you must set update_check to TRUE. Otherwise, an ORA-28104 input value for string is not valid error is generated. The check applies only to the security relevant columns that are included in the policy definition. In other words, the INSERT or UPDATE operation will fail only if the security relevant column that is defined in the policy is added or updated in the INSERT or UPDATE statement.</td>
</tr>
<tr>
<td>enable</td>
<td>Indicates if the policy is enabled when it is added. The default is TRUE.</td>
</tr>
<tr>
<td>static_policy</td>
<td>The default is FALSE. If it is set to TRUE, the server assumes that the policy function for the static policy produces the same predicate string for anyone accessing the object, except for SYS or the privileged user who has the EXEMPT ACCESS POLICY privilege.</td>
</tr>
<tr>
<td>policy_type</td>
<td>Default is NULL, which means policy_type is decided by the value of static_policy. The available policy types are listed in Table 138-5. Specifying any of these policy types overrides the value of static_policy.</td>
</tr>
<tr>
<td>long_predicate</td>
<td>Default is FALSE, which means the policy function can return a predicate with a length of up to 4000 bytes. TRUE means the predicate text string length can be up to 32K bytes. Policies existing prior to the availability of this parameter retain a 32K limit.</td>
</tr>
<tr>
<td>sec_relevant_cols</td>
<td>Enables column-level Virtual Private Database (VPD), which enforces security policies when a column containing sensitive information is referenced in a query. Applies to tables and views, but not to synonyms. Specify a list of comma- or space-separated valid column names of the policy-protected object. The policy is enforced only if a specified column is referenced (or, for an abstract datatype column, its attributes are referenced) in the user SQL statement or its underlying view definition. Default is all the user-defined columns for the object.</td>
</tr>
<tr>
<td>sec_relevant_cols_op t</td>
<td>Use with sec_relevant_cols to display all rows for column-level VPD filtered queries (SELECT only), but where sensitive columns appear as NULL. Default is set to NULL, which allows the filtering defined with sec_relevant_cols to take effect. Set to dbms_rls.ALL_ROWS to display all rows, but with sensitive column values, which are filtered by sec_relevant_cols, displayed as NULL. See Usage Notes for restrictions and additional information about this option.</td>
</tr>
<tr>
<td>namespace</td>
<td>Name which determines the application context namespace</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute which determines the application context attribute name</td>
</tr>
<tr>
<td>Policy Type</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STATIC</td>
<td>Predicate is assumed to be the same regardless of the runtime environment. Static policy functions are executed once and then cached in SGA. Statements accessing the same object do not reexecute the policy function. However, each execution of the same cursor could produce a different row set even for the same predicate because the predicate may filter the data differently based on attributes such as SYS_CONTEXT or SYSDATE. Applies to only one object.</td>
</tr>
<tr>
<td>SHARED_STATIC</td>
<td>Same as STATIC except that the server first looks for a cached predicate generated by the same policy function of the same policy type. Shared across multiple objects.</td>
</tr>
<tr>
<td>CONTEXT_SENSITIVE</td>
<td>Server re-evaluates the policy function at statement execution time if it detects context changes since the last use of the cursor. For session pooling where multiple clients share a database session, the middle tier must reset context during client switches. Note that the server does not cache the value returned by the function for this policy type; it always executes the policy function on statement parsing. Applies to only one object.</td>
</tr>
<tr>
<td>SHARED_CONTEXT_SENSITIVE</td>
<td>Same as CONTEXT_SENSITIVE except that the server first looks for a cached predicate generated by the same policy function of the same policy type within the same database session. If the predicate is found in the session memory, the policy function is not reexecuted and the cached value is valid until session private application context changes occur. Shared across multiple objects.</td>
</tr>
<tr>
<td>DYNAMIC</td>
<td>The default policy type. Server assumes the predicate may be affected by any system or session environment at any time, and so always reexecutes the policy function upon each statement parsing and execution. Applies to only one object.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- **SYS** is free of any security policy.
- The policy functions are called by the server. Following is the interface for the function:
  ```sql
  FUNCTION policy_function (object_schema IN VARCHAR2, object_name VARCHAR2) RETURN VARCHAR2
  --- object_schema is the schema owning the table or view.
  --- object_name is the name of table, view, or synonym to which the policy applies.
  ```
- The policy functions must have the purity level of `WNDS` (write no database state).
- Predicates generated from different VPD policies for the same object have the combined effect of a conjunction (anded) of all the predicates.

**See Also:**

The *Oracle Database Development Guide* has more details about the `RESTRICT_REFERENCES` pragma.
• The security check and object lookup are performed against the owner of the policy function for objects in the subqueries of the dynamic predicates.

• If the function returns a zero length predicate, then it is interpreted as no restriction being applied to the current user for the policy.

• When a table alias is required (for example, parent object is a type table) in the predicate, the name of the table or view itself must be used as the name of the alias. The server constructs the transient view as something like

*select c1, c2, ... from tab tab where <predicate>*

• Validity of the function is checked at runtime for ease of installation and other dependency issues during import and export.

• Column-level VPD column masking behavior (specified with sec_relevant_cols_opt => dbms_rls.ALL_ROWS) is fundamentally different from all other VPD policies, which return only a subset of rows. Instead the column masking behavior returns all rows specified by the user's query, but the sensitive column values display as NULL. The restrictions for this option are as follows:

  – Only applies to SELECT statements

  – Unlike regular VPD predicates, the masking condition that is generated by the policy function must be a simple boolean expression.

  – If your application performs calculations, or does not expect NULL values, then you should use the default behavior of column-level VPD, which is specified with the sec_relevant_cols parameter.

  – If you use UPDATE AS SELECT with this option, then only the values in the columns you are allowed to see will be updated.

  – This option may prevent some rows from displaying. For example:

    SELECT * FROM employees
    WHERE salary = 10

    This query may not return rows if the salary column returns a NULL value because the column masking option has been set.

• When you add a VPD policy to a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked INVALID.

• You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.

• The maximum number of policies that can be created for a single object is 255.

Examples

As the first of two examples, the following creates a policy that applies to the hr.employee table. This is a column-level VPD policy that will be enforced only if a SELECT or an INDEX statement refers to the salary, birthdate, or SSN columns of the table explicitly, or implicitly through a view. It is also a CONTEXT_SENSITIVE policy, so the server will invoke the policy function hr.hrfun at parse time. The namespace and attribute application context parameters restrict the policy evaluation only when the application context values change. During execution, it will only invoke the function if there has been any session private context change since the last use of the statement cursor. The predicate generated by the policy function must not exceed 4000 bytes, the default length limit, since the long_predicate parameter is omitted from the call.
BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hr_policy',
    function_schema => 'hr',
    policy_function => 'hrfun',
    statement_types => 'select,index',
    policy_type => DBMS_RLS.CONTEXT_SENSITIVE,
    sec_relevant_cols => 'salary,birthdate,ssn',
    namespace => 'empno_ctx',
    attribute => 'emp_id');
END;

As the second example, the following command creates another policy that applies to
the same object for hosting, so users can access only data based on their subscriber
ID. Since it is defined as a SHARED_STATIC policy type, the server will first try to find the
predicate in the SGA cache. The server will only invoke the policy function, subfun, if
that search fails.

BEGIN
  DBMS_RLS.ADD_POLICY(
    object_schema => 'hr',
    object_name   => 'employee',
    policy_name   => 'hosting_policy',
    function_schema => 'hr',
    policy_function => 'subfun',
    policy_type => DBMS_RLS.SHARED_STATIC);
END;

138.6.3 ADD_POLICY_CONTEXT Procedure

This procedure adds the context for the active application.

Syntax

DBMS_RLS.ADD_POLICY_CONTEXT (
  object_schema IN VARCHAR2 NULL,
  object_name IN VARCHAR2,
  namespace IN VARCHAR2,
  attribute IN VARCHAR2);

Parameters

Table 138-6   ADD_POLICY_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added.</td>
</tr>
<tr>
<td>namespace</td>
<td>Name which determines the application context namespace</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute which determines the application context attribute name</td>
</tr>
</tbody>
</table>

Usage Notes

Note the following:
• This procedure indicates the application context that drives the enforcement of policies; this is the context that determines which application is running.

• The driving context can be session or global.

• At execution time, the server retrieves the name of the active policy group from the value of this context.

• There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.

• Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.

• If the driving context is NULL, policies from all policy groups are used.

• If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.

• To add a policy to table HR.EMPLOYEES in group access_control_group, the following command is issued:

  DBMS_RLS.ADD_GROUPED_POLICY('hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');

138.6.4 ALTER_POLICY Procedure

This procedure associates an application context attribute with VPD policies.

Syntax

DBMS_RLS.ALTER_POLICY (
  object_schema    IN VARCHAR2 DEFAULT NULL,
  object_name      IN VARCHAR2,
  policy_name      IN VARCHAR2,
  alter_option     IN NUMBER,
  namespace        IN VARCHAR2 DEFAULT NULL,
  attribute        IN VARCHAR2 DEFAULT NULL);

Parameters

Table 138-7  ALTER_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy, unique for the same table or view</td>
</tr>
<tr>
<td>alter_option</td>
<td>Used to determine whether the application context is being added or removed from an Oracle Virtual Private Database policy</td>
</tr>
<tr>
<td>namespace</td>
<td>Name which determines the application context namespace</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute which determines the application context attribute name</td>
</tr>
</tbody>
</table>
Usage Notes

Note the following:

• This procedure associates an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHARED_STATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.

• You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.

• Invocations of ALTER_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.

• The driving context can be session or global.

• At execution time, the server retrieves the name of the active policy group from the value of this context.

• There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.

• Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.

• If the driving context is NULL, policies from all policy groups are used.

• If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.

• To add a policy to table hr.employees in group access_control_group, the following command is issued:

  DBMS_RLS.ADD_GROUPED_POLICY(
      'hr','employees','access_control_group','policy1','SYS', 'HR.ACCESS');

138.6.5 ALTER_GROUPED_POLICY Procedure

This procedure adds application context related changes.

Syntax

DBMS_RLS.ALTER_GROUPED_POLICY (  
  object_schema    IN VARCHAR2 DEFAULT NULL,  
  object_name      IN VARCHAR2,  
  policy_group     IN VARCHAR2 DEFAULT SYS_DEFAULT,  
  policy_name      IN VARCHAR2,  
  alter_option     IN NUMBER,  
  namespace        IN VARCHAR2 DEFAULT NULL,  
  attribute        IN VARCHAR2 DEFAULT NULL);
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group to which this policy belongs; must be unique for the same table or view</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy, unique for the same table or view</td>
</tr>
<tr>
<td>alter_option</td>
<td>Used to determine whether the application context is being added or removed from the Oracle Virtual Private Database policy</td>
</tr>
<tr>
<td>namespace</td>
<td>Name that determines the application context namespace</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute determines the application context attribute name</td>
</tr>
</tbody>
</table>

Usage Notes

Note the following:

- This procedure will associate an application context namespace and application context attribute to context sensitive and shared context sensitive policies only. Specifying application context namespace and application context attribute for DYNAMIC, STATIC or SHAREDSTATIC policies will result in an error. If namespace is specified, attribute should also be specified for the procedure call.
- You cannot associate a global application context with a context sensitive policy or a context shared sensitive policy.
- Invocations of ALTER_GROUPED_POLICY which modify a shared context sensitive VPD policy have an effect on all shared context sensitive VPD policies that have the same VPD policy function.
- The driving context can be session or global.
- At execution time, the server retrieves the name of the active policy group from the value of this context.
- There must be at least one driving context defined for each object that has fine-grained access control policies; otherwise, all policies for the object will be executed.
- Adding multiple context to the same object will cause policies from multiple policy groups to be enforced.
- If the driving context is NULL, policies from all policy groups are used.
- If the driving context is a policy group with policies, all enabled policies from that policy group will be applied, along with all policies from the SYS_DEFAULT policy group.
- To add a policy to table hr.employees in group access_control_group, the following command is issued:

  \[
  \text{DBMS_RLS.ADD_GROUPED_POLICY} (\text{'}hr', \text{'employees'}, \text{'}access_control_group'}, \text{'}policy1', \text{'}SYS', \text{'}HR.ACCESS'});
\]
138.6.6 CREATE_POLICY_GROUP Procedure

This procedure creates a policy group.

Syntax

```
DBMS_RLS.CREATE_POLICY_GROUP (  
   object_schema   IN VARCHAR2 NULL,  
   object_name     IN VARCHAR2,  
   policy_group    IN VARCHAR2);
```

Parameters

Table 138-9  CREATE_POLICY_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group that the policy belongs to</td>
</tr>
</tbody>
</table>

Usage Notes

The group must be unique for each table or view.

138.6.7 DELETE_POLICY_GROUP Procedure

This procedure deletes a policy group.

Syntax

```
DBMS_RLS.DELETE_POLICY_GROUP (  
   object_schema   IN VARCHAR2 NULL,  
   object_name     IN VARCHAR2,  
   policy_group    IN VARCHAR2);
```

Parameters

Table 138-10  DELETE_POLICY_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is added</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group that the policy belongs to</td>
</tr>
</tbody>
</table>

Usage Notes

Note the following:

- This procedure deletes a policy group for the specified table, view, or synonym.
• No policy can be in the policy group.

### 138.6.8 DISABLE_GROUPED_POLICY Procedure

This procedure disables a row-level group security policy.

**Syntax**

```sql
DBMS_RLS.DISABLE_GROUPED_POLICY (  
    object_schema   IN VARCHAR2 NULL,  
    object_name     IN VARCHAR2,  
    group_name      IN VARCHAR2,  
    policy_name     IN VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym with which the policy is associated</td>
</tr>
<tr>
<td>group_name</td>
<td>Name of the group of the policy</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy to be enabled or disabled</td>
</tr>
</tbody>
</table>

**Usage Notes**

• The procedure causes the current transaction, if any, to commit before the operation is carried out.
• A commit is performed at the end of the operation.
• A policy is disabled when this procedure is executed or when the `ENABLE_GROUPED_POLICY` procedure is executed with "enable" set to FALSE.

### 138.6.9 DROP_GROUPED_POLICY Procedure

This procedure drops a policy associated with a policy group.

**Syntax**

```sql
DBMS_RLS.DROP_GROUPED_POLICY (  
    object_schema   IN VARCHAR2 NULL,  
    object_name     IN VARCHAR2,  
    policy_group    IN VARCHAR2 'SYS_DEFAULT',  
    policy_name     IN VARCHAR2);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| object_schema | Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.
|
### Table 138-12 (Cont.) DROP_GROUPED_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is dropped</td>
</tr>
<tr>
<td>policy_group</td>
<td>Name of the policy group to which the policy belongs</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy</td>
</tr>
</tbody>
</table>

### 138.6.10 DROP_POLICY Procedure

This procedure drops a fine-grained access control policy from a table, view, or synonym.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

A COMMIT is also performed at the end of the operation.

#### Syntax

```sql
DBMS_RLS.DROP_POLICY (  
    object_schema   IN VARCHAR2 NULL,  
    object_name     IN VARCHAR2,  
    policy_name     IN VARCHAR2);  
```

#### Parameters

- **object_schema**: Schema containing the table, view, or synonym. If no `object_schema` is specified, or `NULL` is provided, then the current user's schema is assumed.
- **object_name**: Name of the table, view, or synonym for which the policy is dropped.
- **policy_name**: Name of policy to be dropped from table, view, or synonym.

#### Usage Notes

- When you drop a VPD policy from a synonym, it causes all the dependent objects of the synonym, including policy functions that reference the synonym, to be marked `INVALID`. 
138.6.11 DROP_POLICY_CONTEXT Procedure

This procedure drops a driving context from the object so that it will have one less driving context.

Syntax

```
DBMS_RLS.DROP_POLICY_CONTEXT (
    object_schema   IN VARCHAR2 NULL,
    object_name     IN VARCHAR2,
    namespace       IN VARCHAR2,
    attribute       IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym to which the policy is dropped</td>
</tr>
<tr>
<td>namespace</td>
<td>Namespace of the driving context</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute of the driving context</td>
</tr>
</tbody>
</table>

138.6.12 ENABLE_GROUPED_POLICY Procedure

This procedure enables or disables a row-level group security policy.

Syntax

```
DBMS_RLS.ENABLE_GROUPED_POLICY (
    object_schema   IN VARCHAR2 NULL,
    object_name     IN VARCHAR2,
    group_name      IN VARCHAR2,
    policy_name     IN VARCHAR2,
    enable          IN BOOLEAN TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the table, view, or synonym with which the policy is associated</td>
</tr>
<tr>
<td>group_name</td>
<td>Name of the group of the policy</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of the policy to be enabled or disabled</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE enables the policy; FALSE disables the policy</td>
</tr>
</tbody>
</table>
Usage Notes

- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- A policy is enabled when it is created.

138.6.13 ENABLE_POLICY Procedure

This procedure enables or disables a fine-grained access control policy. A policy is enabled when it is created.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

See Also:
Operational Notes

A COMMIT is also performed at the end of the operation.

Syntax

```sql
DBMS_RLS.ENABLE_POLICY (  
    object_schema IN VARCHAR2 NULL,
    object_name   IN VARCHAR2,
    policy_name   IN VARCHAR2,
    enable        IN BOOLEAN TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym with which the policy is associated</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be enabled or disabled</td>
</tr>
<tr>
<td>enable</td>
<td>TRUE to enable the policy, FALSE to disable the policy</td>
</tr>
</tbody>
</table>

138.6.14 REFRESH_GROUPED_POLICY Procedure

This procedure reparses the SQL statements associated with a refreshed policy.

Syntax

```sql
DBMS_RLS.REFRESH_GROUPED_POLICY (  
    object_schema IN VARCHAR2 NULL,
```
Parameter Description

object_schema  Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.

goject_name  Name of the table, view, or synonym with which the policy is associated.

group_name  Name of the group of the policy.

policy_name  Name of the policy.

Usage Notes

- This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to the policy has immediate effect after the procedure is executed.
- The procedure causes the current transaction, if any, to commit before the operation is carried out.
- A commit is performed at the end of the operation.
- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.

138.6.15 REFRESH_POLICY Procedure

This procedure causes all the cached statements associated with the policy to be reparsed. This guarantees that the latest change to this policy will have immediate effect after the procedure is executed.

The procedure causes the current transaction, if any, to commit before the operation is carried out. However, this does not cause a commit first if it is inside a DDL event trigger.

A COMMIT is also performed at the end of the operation.

Syntax

```
DBMS_RLS.REFRESH_POLICY (  
    object_schema  IN VARCHAR2 NULL,  
    object_name   IN VARCHAR2 NULL,  
    policy_name   IN VARCHAR2 NULL);  
```
Parameters

Table 138-18  REFRESH_POLICY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_schema</td>
<td>Schema containing the table, view, or synonym. If no object_schema is specified or is NULL, then the current schema is used.</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of table, view, or synonym with which the policy is associated</td>
</tr>
<tr>
<td>policy_name</td>
<td>Name of policy to be refreshed</td>
</tr>
</tbody>
</table>

Usage Notes

- The procedure returns an error if it tries to refresh a disabled policy.
- The procedure removes the cached results of context and shared sensitive VPD policies.
The DBMS_ROLLING PL/SQL package is used to implement the Rolling Upgrade Using Active Data Guard feature, which streamlines the process of upgrading Oracle Database software in a Data Guard configuration in a rolling fashion. The Rolling Upgrade Using Active Data Guard feature requires a license for the Oracle Active Data Guard option, and can be used for database version upgrades starting with the first patchset of Oracle Database 12c.

Additionally, you can use this feature immediately for other database maintenance tasks. The database where maintenance is performed must be operating at a minimum of Oracle Database 12c Release 1 (12.1). Such maintenance tasks include:

- Adding partitioning to non-partitioned tables
- Changing BasicFiles LOBs to SecureFiles LOBs
- Changing XMLType stored as CLOB to XMLType stored as binary XML
- Altering tables to be OLTP-compressed

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_ROLLING Subprograms

See Also:

- Oracle Data Guard Concepts and Administration for information about using DBMS_ROLLING to perform a rolling upgrade

139.1 DBMS_ROLLING Overview

The DBMS_ROLLING PL/SQL package provides procedures that you can use to perform any change throughout a Data Guard configuration in a rolling fashion, including a rolling upgrade of the Oracle Database software. Although the focus of this document is rolling upgrade operations, the content is applicable to the deployment of any rolling changes.

All the procedures are executed at the current primary database, which eliminates the potential confusion of moving between remote databases to perform various operations related to the rolling upgrade. If necessary, all the procedures can be called again to resume the rolling upgrade after an error or interruption. (The upgrade script must still be run at the standby.)
The package also provides a procedure that allows you to return a Data Guard configuration back to its original, pre-upgrade state in the event users wish to abandon the rolling upgrade.

The actual execution of a rolling upgrade has been reduced to three steps (excluding the upgrade of the Oracle Database software itself and the on-disk setup of the new Oracle Database software). The number of steps remains the same regardless of the size of the Data Guard configuration.

Conceptually, for the purposes of the `DBMS_ROLLING` package, you divide your Data Guard configuration into two groups: the leading group and the trailing group. The databases in the leading group undergo the upgrade operation (or any other change that you are deploying) first. The databases in the trailing group undergo the upgrade of the Oracle Database software (or any other change that you are deploying) only after the switchover operation. This insulates them from the upgrade and gives you time to evaluate the effect of the change in the leading group databases.

Each group has a master database: the future primary database as specified in the `DBMS_ROLLING.INIT_PLAN` procedure is the master of the leading group, called Leading Group Master (LGM), while the original primary database is the master of the trailing group called Trailing Group Master (TGM). You can configure databases to protect the LGM and the TGM. Standbys designated to protect the LGM are referred to as Leading Group Standbys (LGS). Standbys designated to protect the TGM are referred to as Trailing Group Standbys (TGS). These terms are used throughout this documentation.

### 139.2 DBMS_ROLLING Security Model

The `DBMS_ROLLING` package is available to users who have been granted the DBA role.

### 139.3 Summary of DBMS_ROLLING Subprograms

This table lists and briefly describes the `DBMS_ROLLING` package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>INIT_PLAN Procedure</strong></td>
<td>Initializes a rolling operation plan with system-generated default values.</td>
</tr>
<tr>
<td><strong>DESTROY_PLAN Procedure</strong></td>
<td>Destroys any existing rolling operation plan, its parameters, and all resources associated with the rolling operation.</td>
</tr>
<tr>
<td><strong>BUILD_PLAN Procedure</strong></td>
<td>Validates plan parameters and creates or modifies a rolling operation plan.</td>
</tr>
<tr>
<td><strong>SET_PARAMETER Procedure</strong></td>
<td>Modifies a rolling operation parameter.</td>
</tr>
<tr>
<td><strong>START_PLAN Procedure</strong></td>
<td>Starts the rolling operation.</td>
</tr>
<tr>
<td><strong>SWITCHOVER Procedure</strong></td>
<td>Performs a switchover between the current primary database and the transient logical standby database.</td>
</tr>
<tr>
<td><strong>FINISH_PLAN Procedure</strong></td>
<td>Finalizes the rolling operation.</td>
</tr>
<tr>
<td><strong>ROLLBACK_PLAN Procedure</strong></td>
<td>Completely rolls back the rolling operation.</td>
</tr>
</tbody>
</table>
139.3.1 INIT_PLAN Procedure

This procedure initializes a rolling operation plan with system-generated default values.

Syntax

```
DBMS_ROLLING.INIT_PLAN (
    future_primary   IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>future_primary</td>
<td>DB_UNIQUE_NAME of the future primary (also known as the Leading Group Master (LGM))</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45401: upgrade plan is already active
- ORA-45402: LOG_ARCHIVE_CONFIG must contain the DG_CONFIG attribute
- ORA-45403: database %s must be specified in DG_CONFIG
- ORA-45411: operation requires additional arguments
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- A plan must be prepared before any parameters can be customized.

139.3.2 DESTROY_PLAN Procedure

This procedure destroys any existing upgrade plan, its parameters, and all resources associated with a rolling operation.

Syntax

```
DBMS_ROLLING.DESTROY_PLAN ();
```

Parameters

This procedure has no parameters.

Exceptions

- ORA-45422: operation requires existing plan
- ORA-65040: operation not allowed from within a pluggable database
139.3.3 BUILD_PLAN Procedure

This procedure validates plan parameters and creates or modifies a rolling operation plan.

A successfully constructed plan is required in order to perform a rolling operation. This procedure must return successfully before the START_PLAN procedure can be called to start the rolling operation. Parameter changes made after a plan has been created may require calling the BUILD_PLAN procedure to modify the existing plan. The DBA_ROLLING_EVENTS view will indicate if any invocation of the SET_PARAMETER procedure requires a plan rebuild. Failure to rebuild the plan will result in an ORA-45416 error when attempting to resume the rolling operation.

Syntax

DBMS_ROLLING.BUILD_PLAN ();

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45403: database %s must be specified in the DG_CONFIG
- ORA-45414: could not connect to a remote database
- ORA-45419: DB_UNIQUE_NAME parameter must be specified
- ORA-45433: failover was detected on an unsupported database
- ORA-45434: multiple failovers of the same type detected
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure connects to databases specified as plan parameters. These instances must be mounted or open, and must be reachable via the network.

139.3.4 SET_PARAMETER Procedure

This procedure modifies a rolling operation parameter.

Syntax

DBMS_ROLLING.SET_PARAMETER (  
    scope IN VARCHAR2 DEFAULT NULL,  
    name IN NUMBER,  
    value IN VARCHAR2);
Parameters

Table 139-3  SET_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scope</td>
<td>Parameter scope. It can either be NULL for global parameters, or the <code>DB_UNIQUE_NAME</code> of a specific database for local parameters.</td>
</tr>
<tr>
<td>name</td>
<td>The <code>DBMS_ROLLING</code> constant for a given parameter.</td>
</tr>
<tr>
<td>value</td>
<td>New value for the parameter or NULL to revert to a default value.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45408: parameter name is unknown
- ORA-45409: parameter value is invalid or out of bounds
- ORA-45410: parameter may not be modified
- ORA-45411: operation requires additional arguments
- ORA-45412: parameter scope argument is unknown
- ORA-45413: parameter has no default value
- ORA-45414: could not connect to a remote database
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- Changes to a parameter value may require a call to the `DBMS_ROLLING.BUILD_PLAN` procedure to modify the existing plan. Users should check the `DBA_ROLLING_EVENTS` view after setting a parameter to determine if a rebuild is necessary.
- **Table 139-4** lists all the available parameters and their descriptions. The parameter names and values described in the table are all of type `VARCHAR2`.
- The `MINVAL` and `MAXVAL` columns in the `DBA_ROLLING_PARAMETERS` view identify the valid range of values for a parameter. The view does not contain any parameters until the `DBMS_ROLLING.INIT_PLAN` procedure has been successfully invoked.

Table 139-4  Valid Values for DBMS_ROLLING.SET_PARAMETER Procedure

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Global?</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE_SESSIONS_TIMEOUT</td>
<td>Yes</td>
<td>The maximum amount of time in seconds to enforce <code>ACTIVE_SESSIONS_WAIT</code> before halting the rolling upgrade. This parameter is only valid if <code>ACTIVE_SESSIONS_WAIT</code> is set to 1.</td>
<td>3600</td>
</tr>
<tr>
<td>ACTIVE_SESSIONS_WAIT</td>
<td>Yes</td>
<td>Whether the switchover operation will wait for active sessions to finish. If set to 1, the <code>SWITCHOVER</code> procedure waits for active sessions to complete. If set to 0, the <code>SWITCHOVER</code> procedure kills active sessions to expedite the switchover.</td>
<td>0</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Global?</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>BACKUP_CONTROLFILE</td>
<td>Yes</td>
<td>File name of the backup control file that is created during a rolling upgrade.</td>
<td>rolling_change_backup.f</td>
</tr>
<tr>
<td>DGBROKER</td>
<td>Yes</td>
<td>Use Data Guard broker for managing apply, recovery, and log archive destinations.</td>
<td></td>
</tr>
<tr>
<td>DICTIONARY_LOAD_TIMEOUT</td>
<td>Yes</td>
<td>The maximum amount of time in seconds to enforce DICTIONARY_LOAD_WAIT before halting the rolling upgrade. This parameter is only valid if DICTIONARY_LOAD_WAIT is set to 1.</td>
<td>3600</td>
</tr>
<tr>
<td>DICTIONARY_LOAD_WAIT</td>
<td>Yes</td>
<td>Whether the instantiation of the transient logical standby will include a wait for the complete loading of the data dictionary snapshot in redo. If set to 1, then the START_PLAN procedure will not return until the dictionary has been completely loaded. If set to 0, then the START_PLAN procedure will only verify that the loading of the dictionary has started.</td>
<td>0</td>
</tr>
<tr>
<td>DICTIONARY_PLS_WAIT_INIT</td>
<td>Yes</td>
<td>The time in seconds to wait in between attempts to quiesce PL/SQL activity in order to write the data dictionary to redo.</td>
<td>300</td>
</tr>
<tr>
<td>DICTIONARY_PLS_WAIT_TIMEOUT</td>
<td>Yes</td>
<td>The maximum amount of time in seconds to attempt to quiesce PL/SQL activity in order to write the data dictionary to redo.</td>
<td>3600</td>
</tr>
<tr>
<td>EVENT_RECORDS</td>
<td>Yes</td>
<td>The maximum number of records to permit in DBA_ROLLING_EVENTS</td>
<td>10000</td>
</tr>
<tr>
<td>FAILOVER</td>
<td>Yes</td>
<td>Automatically attempt to adjust the upgrade plan as a result of a failover event. This parameter resets its value to 0 upon completion of a subsequent call to BUILD_PLAN.</td>
<td>0</td>
</tr>
<tr>
<td>GRP_PREFIX</td>
<td></td>
<td>Execution of procedures in DBMS_ROLLING results in a number of Guaranteed Restore Points (GRP) taken in various databases participating in the Data Guard configuration. All such GRPs have the same prefix in their names. You can use this parameter to override the default prefix.</td>
<td>DBMSRU</td>
</tr>
<tr>
<td>IGNORE_BUILD_WARNINGS</td>
<td>Yes</td>
<td>Ignore warnings which would otherwise raise exceptions during execution of the BUILD_PLAN procedure.</td>
<td>1</td>
</tr>
<tr>
<td>IGNORE_LAST_ERROR</td>
<td>Yes</td>
<td>Ignore last encountered error upon startup of next rolling operation. This parameter resets its value to 0 upon invocation of a procedure call which resumes the rolling upgrade.</td>
<td>0</td>

</tr>
</tbody>
</table>

### 139.3.5 START_PLAN Procedure

This procedure starts the rolling operation. This procedure must be executed on the primary database to formally start the rolling operation.

When the START_PLAN procedure is complete, the LGM (identified with the future_primary parameter in the INIT_PLAN procedure) will be converted into a fully configured transient logical standby database.

**Syntax**

```sql
DBMS_ROLLING.START_PLAN ();
```

**Parameters**

This procedure has no parameters.

**Exceptions**

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: Operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
• ORA-45486: database update progress is inconsistent
• ORA-65040: operation not allowed from within a pluggable database

Usage Notes
• A rolling operation plan must have previously been generated through the BUILD_PLAN procedure.

139.3.6 SWITCHOVER Procedure

This procedure performs a switchover between the current primary database (also known as the TGM) and the transient logical standby database (also known as the LGM).

At the successful completion of the procedure, the LGM assumes the primary role for the Data Guard configuration.

Syntax

DBMS_ROLLING.SWITCHOVER ();

Parameters

This procedure has no parameters.

Exceptions
• ORA-45400: operation not permitted on current database
• ORA-45414: could not connect to a remote database
• ORA-45415: instruction execution failure
• ORA-45416: operation cannot start until plan rebuild
• ORA-45417: operation not permitted since current phase was not %s
• ORA-45422: operation requires existing plan
• ORA-45426: managed recovery process was not running
• ORA-45427: logical standby Redo Apply process was not running
• ORA-45428: database was not in expected database role
• ORA-45435: managed recovery process was running
• ORA-45436: logical standby Redo Apply process was running
• ORA-45438: database is not in mounted mode
• ORA-45439: database is not in open read/write mode
• ORA-45486: database update progress is inconsistent
• ORA-65040: operation not allowed from within a pluggable database

Usage Notes
• This procedure can only be called after you have manually upgraded the transient logical standby and opened it on the higher Oracle Database version.
139.3.7 FINISH_PLAN Procedure

This procedure finalizes the rolling operation.

It configures the former primary (also known as the TGM) as a physical standby, and configures remaining physical standbys to recover the upgrade redo from the future primary.

Syntax

DBMS_ROLLING.FINISH_PLAN ();

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45416: operation cannot start until plan rebuild
- ORA-45417: operation not permitted since current phase was not %s
- ORA-45422: operation requires existing plan
- ORA-45426: managed recovery process was not running
- ORA-45427: logical standby Redo Apply process was not running
- ORA-45428: database was not in expected database role
- ORA-45435: managed recovery process was running
- ORA-45436: logical standby Redo Apply process was running
- ORA-45438: database is not in mounted mode
- ORA-45439: database is not in open read/write mode
- ORA-45486: database update progress is inconsistent
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- This procedure can only be called after you have remounted the former primary and remaining physical standbys on the higher Oracle Database version.

139.3.8 ROLLBACK_PLAN Procedure

This procedure rolls back the configuration-wide rolling operation.

Once completed, all of the databases in the leading group become physical standbys of the original primary database. This procedure can only be called if the configuration has not yet gone through a switchover operation since the START_PLAN procedure was invoked.
Syntax

DBMS_ROLLING.ROLLBACK_PLAN;

Parameters

This procedure has no parameters.

Exceptions

- ORA-45400: operation not permitted on current database
- ORA-45414: could not connect to a remote database
- ORA-45415: instruction execution failure
- ORA-45441: no databases eligible for rollback
- ORA-45442: rollback is not permitted after a role change
- ORA-65040: operation not allowed from within a pluggable database

Usage Notes

- You must manually restart media recovery on the lower Oracle Database version if the upgrade of the transient logical standby has already been performed.
The DBMS_ROWID package lets you create ROWIDs and obtain information about ROWIDs from PL/SQL programs and SQL statements. You can find the data block number, the object number, and other ROWID components without writing code to interpret the base-64 character external ROWID. DBMS_ROWID is intended for upgrading from Oracle database version 7 to Oracle database version 8.X.

**Note:**

DBMS_ROWID is not to be used with universal ROWIDs (UROWIDs).

This chapter contains the following topics:

- Security Model
- Types
- Exceptions
- Operational Notes
- Examples
- Summary of DBMS_ROWID Subprograms

### 140.1 DBMS_ROWID Security Model

This package runs with the privileges of calling user, rather than the package owner SYS.

### 140.2 DBMS_ROWID Types

There are four DBMS_ROWID types.

These are:

- Extension and restriction types
- Verification types
- Object types
- Conversion types

**Extension and Restriction Type**

The types are as follows:

- RESTRICTED—restricted ROWID
• **EXTENDED**—*extended* ROWID

For example:

```sql
rowid_type_restricted constant integer := 0;
rowid_type_extended   constant integer := 1;
```

---

**Note:**

Extended ROWIDs are only used in Oracle database version 8.Xi and higher.

---

**Verification Types**

**Table 140-1** Verification Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>VALID</td>
<td>Valid ROWID</td>
</tr>
<tr>
<td>INVALID</td>
<td>Invalid ROWID</td>
</tr>
</tbody>
</table>

For example:

```sql
rowid_is_valid   constant integer := 0;
rowid_is_invalid constant integer := 1;
```

---

**Object Types**

**Table 140-2** Object Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNDEFINED</td>
<td>Object Number not defined (for restricted ROWIDs)</td>
</tr>
</tbody>
</table>

For example:

```sql
rowid_object_undefined constant integer := 0;
```

---

**Conversion Types**

**Table 140-3** Conversion Types

<table>
<thead>
<tr>
<th>Result</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INTERNAL</td>
<td>Convert to/from column of ROWID type</td>
</tr>
<tr>
<td>EXTERNAL</td>
<td>Convert to/from string format</td>
</tr>
</tbody>
</table>

For example:

```sql
rowid_convert_internal constant integer := 0;
rowid_convert_external constant integer := 1;
```
### 140.3 DBMS_ROWID Exceptions

This table describes the Exceptions raised by DBMS_ROWID subprograms.

**Table 140-4  Exceptions**

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID_INVALID</td>
<td>Invalid rowid format</td>
</tr>
<tr>
<td>ROWID_BAD_BLOCK</td>
<td>Block is beyond end of file</td>
</tr>
</tbody>
</table>

For example:

ROWID_INVALID exception;
    pragma exception_init(ROWID_INVALID, -1410);

ROWID_BAD_BLOCK exception;
    pragma exception_init(ROWID_BAD_BLOCK, -28516);

### 140.4 DBMS_ROWID Operational Notes

These operation notes apply to DBMS_ROWID.

- Some of the functions in this package take a single parameter, such as a ROWID. This can be a character or a PL/SQL ROWID, either restricted or extended, as required.
- You can call the DBMS_ROWID functions and procedures from PL/SQL code, and you can also use the functions in SQL statements.

**Note:**

ROWID_INFO is a procedure. It can only be used in PL/SQL code.

- You can use functions from the DBMS_ROWID package just like built-in SQL functions; in other words, you can use them wherever you can use an expression. In this example, the ROWID_BLOCK_NUMBER function is used to return just the block number of a single row in the EMP table:

```sql
SELECT DBMS_ROWID.ROWID_BLOCK_NUMBER(rowid)
FROM emp
WHERE ename = 'KING';
```

- If Oracle returns the error "ORA:452, 0, 'Subprogram %s' violates its associated pragma" for pragma restrict_references, it could mean the violation is due to:
  - A problem with the current procedure or function
  - Calling a procedure or function without a pragma or due to calling one with a less restrictive pragma
  - Calling a package procedure or function that touches the initialization code in a package or that sets the default values
140.5 DBMS_ROWID Examples

This example returns the ROWID for a row in the EMP table, extracts the data object number from the ROWID, using the ROWID_OBJECT function in the DBMS_ROWID package, then displays the object number:

```sql
DECLARE
  object_no  INTEGER;
  row_id     ROWID;
  ...
BEGIN
  SELECT ROWID INTO row_id FROM emp
  WHERE empno = 7499;
  object_no := DBMS_ROWID.ROWID_OBJECT(row_id);
  DBMS_OUTPUT.PUT_LINE('The obj. # is '|| object_no);
  ...
```

140.6 Summary of DBMS_ROWID Subprograms

This table lists the DBMS_ROWID subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROWID_BLOCK_NUMBER Function</td>
<td>Returns the block number of a ROWID</td>
</tr>
<tr>
<td>ROWID_CREATE Function</td>
<td>Creates a ROWID, for testing only</td>
</tr>
<tr>
<td>ROWID_INFO Procedure</td>
<td>Returns the type and components of a ROWID</td>
</tr>
<tr>
<td>ROWID_OBJECT Function</td>
<td>Returns the object number of the extended ROWID</td>
</tr>
<tr>
<td>ROWID_RELATIVE_FNO Function</td>
<td>Returns the file number of a ROWID</td>
</tr>
<tr>
<td>ROWID_ROW_NUMBER Function</td>
<td>Returns the row number</td>
</tr>
<tr>
<td>ROWID_TO_ABSOLUTE_FNO Function</td>
<td>Returns the absolute file number associated with the ROWID for a row in a specific table</td>
</tr>
<tr>
<td>ROWID_TO_EXTENDED Function</td>
<td>Converts a ROWID from restricted format to extended</td>
</tr>
<tr>
<td>ROWID_TO_RESTRICTED Function</td>
<td>Converts an extended ROWID to restricted format</td>
</tr>
<tr>
<td>ROWID_TYPE Function</td>
<td>Returns the ROWID type: 0 is restricted, 1 is extended</td>
</tr>
<tr>
<td>ROWID_VERIFY Function</td>
<td>Checks if a ROWID can be correctly extended by the ROWID_TO_EXTENDED function</td>
</tr>
</tbody>
</table>
140.6.1 ROWID_BLOCK_NUMBER Function

This function returns the database block number for the input ROWID.

Syntax

```sql
DBMS_ROWID.ROWID_BLOCK_NUMBER (
    row_id      IN   ROWID,
    ts_type_in  IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_block_number,WNDS,RNDS,WNPS,RNPS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted</td>
</tr>
<tr>
<td>ts_type_in</td>
<td>The type of the tablespace (bigfile/smallfile) to which the row belongs</td>
</tr>
</tbody>
</table>

Examples

The example SQL statement selects the block number from a ROWID and inserts it into another table:

```sql
INSERT INTO T2 (SELECT dbms_rowid.rowid_block_number(ROWID, 'BIGFILE')
    FROM some_table
    WHERE key_value = 42);
```

140.6.2 ROWID_CREATE Function

This function lets you create a ROWID, given the component parts as parameters.

This is useful for testing ROWID operations, because only the Oracle Server can create a valid ROWID that points to data in a database.

Syntax

```sql
DBMS_ROWID.ROWID_CREATE (
    rowid_type    IN NUMBER,
    object_number IN NUMBER,
    relative_fno  IN NUMBER,
    block_number  IN NUMBER,
    row_number    IN NUMBER)
RETURN ROWID;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_create,WNDS,RNDS,WNPS,RNPS);
```
Parameters

Table 140-7  ROWID_CREATE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_type</td>
<td>Type (restricted or extended)</td>
</tr>
<tr>
<td></td>
<td>Set the rowid_type parameter to 0 for a restricted ROWID. Set it to 1 to create an extended ROWID.</td>
</tr>
<tr>
<td></td>
<td>If you specify rowid_type as 0, then the required object_number parameter is ignored, and ROWID_CREATE returns a restricted ROWID.</td>
</tr>
<tr>
<td>object_number</td>
<td>Data object number (rowid_object_undefined for restricted)</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Relative file number</td>
</tr>
<tr>
<td>block_number</td>
<td>Block number in this file</td>
</tr>
<tr>
<td>row_number</td>
<td>Returns row number in this block</td>
</tr>
</tbody>
</table>

Examples

Create a dummy extended ROWID:

```
my_rowid := DBMS_ROWID.ROWID_CREATE(1, 9999, 12, 1000, 13);
```

Find out what the rowid_object function returns:

```
obj_number := DBMS_ROWID.ROWID_OBJECT(my_rowid);
```

The variable obj_number now contains 9999.

140.6.3 ROWID_INFO Procedure

This procedure returns information about a ROWID, including its type (restricted or extended), and the components of the ROWID.

This is a procedure, and it cannot be used in a SQL statement.

Syntax

```
DBMS_ROWID.ROWID_INFO (
    rowid_in     IN   ROWID,
    rowid_type   OUT  NUMBER,
    object_number OUT  NUMBER,
    relative_fno OUT  NUMBER,
    block_number OUT  NUMBER,
    row_number   OUT  NUMBER);
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_info,WNDS,RNDS,WNPS,RNPS);
```
Parameters

Table 140-8  ROWID_INFO Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_in</td>
<td>ROWID to be interpreted. This determines if the ROWID is a restricted (0) or extended (1) ROWID.</td>
</tr>
<tr>
<td>rowid_type</td>
<td>Returns type (restricted/extended)</td>
</tr>
<tr>
<td>object_number</td>
<td>Returns data object number (rowid_object_undefined for restricted)</td>
</tr>
<tr>
<td>relative_fno</td>
<td>Returns relative file number</td>
</tr>
<tr>
<td>block_number</td>
<td>Returns block number in this file</td>
</tr>
<tr>
<td>row_number</td>
<td>Returns row number in this block</td>
</tr>
</tbody>
</table>

See Also:
“ROWID_TYPE Function”

Examples

This example reads back the values for the ROWID that you created in the ROWID_CREATE:

```sql
DBMS_ROWID.ROWID_INFO (my_rowid, rid_type, obj_num, file_num, block_num, row_num, 'BIGFILE');
```

140.6.4 ROWID_OBJECT Function

This function returns the data object number for an extended ROWID.

The function returns zero if the input ROWID is a restricted ROWID.

Syntax

```sql
DBMS_ROWID.ROWID_OBJECT (rowid_id IN ROWID) RETURN NUMBER;
```

Pragmas

```sql
pragma RESTRICT_REFERENCES(rowid_object,WNDS,RNDS,WNPS,RNPS);
```

Parameters

Table 140-9  ROWID_OBJECT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted</td>
</tr>
</tbody>
</table>
Note: The ROWID_OBJECT_UNDEFINED constant is returned for restricted ROWIDs.

Examples

SELECT dbms_rowid.rowid_object(ROWID)
FROM emp
WHERE empno = 7499;

140.6.5 ROWID_RELATIVE_FNO Function

This function returns the relative file number of the ROWID specified as the IN parameter. (The file number is relative to the tablespace.)

Syntax

DBMS_ROWID.ROWID_RELATIVE_FNO (
    rowid_id      IN   ROWID,
    ts_type_in    IN   VARCHAR2 DEFAULT 'SMALLFILE')
RETURN NUMBER;

Pragmas

pragma RESTRICT_REFERENCES(rowid_relative_fno,WNDS,RNDS,WNPS,RNPS);

Parameters

<table>
<thead>
<tr>
<th>Table 140-10 ROWID_RELATIVE_FNO Function Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parameter</td>
</tr>
<tr>
<td>row_id</td>
</tr>
<tr>
<td>ts_type_in</td>
</tr>
</tbody>
</table>

Examples

The example PL/SQL code fragment returns the relative file number:

DECLARE
    file_number    INTEGER;
    rowid_val      ROWID;
BEGIN
    SELECT ROWID INTO rowid_val
    FROM dept
    WHERE loc = 'Boston';
    file_number :=
        dbms_rowid.rowid_relative_fno(rowid_val, 'SMALLFILE');
    ...

140.6.6 ROWID_ROW_NUMBER Function

This function extracts the row number from the ROWID IN parameter.

Syntax

DBMS_ROWID.ROWID_ROW_NUMBER (row_id IN ROWID) RETURN NUMBER;

Pragmas

PRAGMA RESTRICT_REFERENCES(rowid_row_number,WNDS,RNDS,WNPS,RNPS);

Parameters

Table 140-11  ROWID_ROW_NUMBER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted.</td>
</tr>
</tbody>
</table>

Examples

Select a row number:

SELECT dbms_rowid.rowid_row_number(ROWID)
    FROM emp
    WHERE ename = 'ALLEN';

140.6.7 ROWID_TO_ABSOLUTE_FNO Function

This function extracts the absolute file number from a ROWID, where the file number is absolute for a row in a given schema and table.

The schema name and the name of the schema object (such as a table name) are provided as IN parameters for this function.

Syntax

DBMS_ROWID.ROWID_TO_ABSOLUTE_FNO (row_id IN ROWID,
    schema_name IN VARCHAR2,
    object_name IN VARCHAR2) RETURN NUMBER;

Pragmas

pragma RESTRICT_REFERENCES(rowid_to_absolute_fno,WNDS,WNPS,RNPS);
Parameters

Table 140-12  ROWID_TO_ABSOLUTE_FNO Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    abs_fno INTEGER;
    rowid_val CHAR(18);
    object_name VARCHAR2(20) := 'EMP';
BEGIN
    SELECT ROWID INTO rowid_val
    FROM emp
    WHERE empno = 9999;
    abs_fno := dbms_rowid.rowid_to_absolute_fno(
               rowid_val, 'SCOTT', object_name);

Note:

For partitioned objects, the name must be a table name, not a partition or a sub/partition name.

140.6.8 ROWID_TO_EXTENDED Function

This function translates a restricted ROWID that addresses a row in a schema and table that you specify to the extended ROWID format.

Later, it may be removed from this package into a different place.

Syntax

DBMS_ROWID.ROWID_TO_EXTENDED (  
    old_rowid   IN ROWID,  
    schema_name IN VARCHAR2,  
    object_name IN VARCHAR2,  
    conversion_type IN INTEGER)  
RETURN ROWID;

Pragmas

pragma RESTRICT_REFERENCES(rowid_to_extended,WNDS,WNPS,RNPS);
Parameters

Table 140-13  ROWID_TO_EXTENDED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_rowid</td>
<td>ROWID to be converted</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table (optional)</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name (optional).</td>
</tr>
<tr>
<td>conversion_type</td>
<td>The following constants are defined:</td>
</tr>
<tr>
<td></td>
<td>ROWID_CONVERT_INTERNAL (=0)</td>
</tr>
<tr>
<td></td>
<td>ROWID_CONVERT_EXTERNAL (=1)</td>
</tr>
</tbody>
</table>

Return Values

ROWID_TO_EXTENDED returns the ROWID in the extended character format. If the input ROWID is NULL, then the function returns NULL. If a zero-valued ROWID is supplied (00000000.0000.0000), then a zero-valued restricted ROWID is returned.

Examples

Assume that there is a table called RIDS in the schema SCOTT, and that the table contains a column ROWID_COL that holds ROWIDs (restricted), and a column TABLE_COL that point to other tables in the SCOTT schema. You can convert the ROWIDs to extended format with the statement:

UPDATE SCOTT.RIDS
SET rowid_col =
  dbms_rowid.rowid_to_extended (rowid_col, 'SCOTT', TABLE_COL, 0);

Usage Notes

- If the schema and object names are provided as IN parameters, then this function verifies SELECT authority on the table named, and converts the restricted ROWID provided to an extended ROWID, using the data object number of the table. That ROWID_TO_EXTENDED returns a value, however, does not guarantee that the converted ROWID actually references a valid row in the table, either at the time that the function is called, or when the extended ROWID is actually used.

- If the schema and object name are not provided (are passed as NULL), then this function attempts to fetch the page specified by the restricted ROWID provided. It treats the file number stored in this ROWID as the absolute file number. This can cause problems if the file has been dropped, and its number has been reused prior to the migration. If the fetched page belongs to a valid table, then the data object number of this table is used in converting to an extended ROWID value. This is very inefficient, and Oracle recommends doing this only as a last resort, when the target table is not known. The user must still know the correct table name at the time of using the converted value.

- If an extended ROWID value is supplied, the data object number in the input extended ROWID is verified against the data object number computed from the table name parameter. If the two numbers do not match, the INVALID_ROWID exception is raised. If they do match, the input ROWID is returned.
• **ROWID_TO_EXTENDED** cannot be used with partition tables.

**See Also:**

The **ROWID_VERIFY Function** has a method to determine if a given **ROWID** can be converted to the extended format.

### 140.6.9 ROWID_TO_RESTRICTED Function

This function converts an extended **ROWID** into restricted **ROWID** format.

**Syntax**

```sql
DBMS_ROWID.ROWID_TO_RESTRICTED (  
    old_rowid       IN ROWID,  
    conversion_type IN INTEGER)  
RETURN ROWID;
```

**Pragmas**

```
pragma RESTRICT_REFERENCES(rowid_to_restricted,WNDS,RNDS,WNPS,RNPS);
```

**Parameters**

**Table 140-14  ROWID_TO_RESTRICTED Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_rowid</td>
<td><strong>ROWID</strong> to be converted</td>
</tr>
<tr>
<td>conversion_type</td>
<td>The following constants are defined:</td>
</tr>
<tr>
<td></td>
<td><strong>ROWID_CONVERT_INTERNAL</strong> (:=0)</td>
</tr>
<tr>
<td></td>
<td><strong>ROWID_CONVERT_EXTERNAL</strong> (:=1)</td>
</tr>
</tbody>
</table>

### 140.6.10 ROWID_TYPE Function

This function returns 0 if the **ROWID** is a restricted **ROWID**, and 1 if it is extended.

**Syntax**

```sql
DBMS_ROWID.ROWID_TYPE (  
    rowid_id IN ROWID)  
RETURN NUMBER;
```

**Pragmas**

```
pragma RESTRICT_REFERENCES(rowid_type,WNDS,RNDS,WNPS,RNPS);
```
Parameters

Table 140-15  ROWID_TYPE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>row_id</td>
<td>ROWID to be interpreted</td>
</tr>
</tbody>
</table>

Examples

IF DBMS_ROWID.ROWID_TYPE(my_rowid) = 1 THEN
    my_obj_num := DBMS_ROWID.ROWID_OBJECT(my_rowid);

140.6.11 ROWID_VERIFY Function

This function verifies the ROWID.

It returns 0 if the input restricted ROWID can be converted to extended format, given the input schema name and table name, and it returns 1 if the conversion is not possible.

Note:

You can use this function in a WHERE clause of a SQL statement, as shown in the example.

Syntax

```
DBMS_ROWID.ROWID_VERIFY (  
    rowid_in        IN ROWID,  
    schema_name     IN VARCHAR2,  
    object_name     IN VARCHAR2,  
    conversion_type IN INTEGER  
) RETURN NUMBER;
```

Pragmas

```
pragma RESTRICT_REFERENCES(rowid_verify,WNDS,WNPS,RNPS);
```

Parameters

Table 140-16  ROWID_VERIFY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowid_in</td>
<td>ROWID to be verified</td>
</tr>
<tr>
<td>schema_name</td>
<td>Name of the schema which contains the table</td>
</tr>
<tr>
<td>object_name</td>
<td>Table name</td>
</tr>
</tbody>
</table>
| conversion_type | The following constants are defined:  
                        ROWID_CONVERT_INTERNAL (=0)  
                        ROWID_CONVERT_EXTERNAL (=1)  |
Examples

Considering the schema in the example for the ROWID_TO_EXTENDED function, you can use the following statement to find bad ROWID_s prior to conversion. This enables you to fix them beforehand.

```sql
SELECT ROWID, rowid_col
FROM SCOTT.RIDS
WHERE dbms_rowid.rowid_verify(rowid_col, NULL, NULL, 0) = 1;
```

DBMS_RULE

The DBMS_RULE package contains subprograms that enable the evaluation of a rule set for a specified event.

This chapter contains the following topics:

• Overview
• Security Model
• Summary of DBMS_RULE Subprograms

141.1 DBMS_RULE Overview

This package contains subprograms that enable the evaluation of a rule set for a specified event.

See Also:

• Rule TYPES for more information about the types used with the DBMS_RULE package
• DBMS_RULE_ADM and Oracle Streams Concepts and Administration for more information about this package and rules

141.2 DBMS_RULE Security Model

PUBLIC is granted EXECUTE privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group PUBLIC

141.3 Summary of DBMS RULE Subprograms

This table lists the DBMS_RULE subprograms and briefly describes them.
### Table 141-1 DBMS_RULE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOSE_ITERATOR Procedure</td>
<td>Closes an open iterator</td>
</tr>
<tr>
<td>EVALUATE Procedure</td>
<td>Evaluates the rules in the specified rule set that use the evaluation context specified</td>
</tr>
<tr>
<td>EVALUATE_EXPRESSION Procedure</td>
<td>Evaluates an expression under the logged in user in a session</td>
</tr>
<tr>
<td>EVALUATE_EXPRESSION_ITERATOR</td>
<td>Finds the relevant datapoints and pass re$value_list into evaluation interface</td>
</tr>
<tr>
<td>EVALUATE_RULE Procedure</td>
<td>Evaluates the condition defined in the Rule</td>
</tr>
<tr>
<td>EVALUATE_RULE_ITERATOR Procedure</td>
<td>Finds the relevant datapoints and pass re$value_list into evaluation interface</td>
</tr>
<tr>
<td>GET_NEXT_HIT Function</td>
<td>Returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator; returns NULL if there are no more rules that evaluated to TRUE or MAYBE.</td>
</tr>
<tr>
<td>IS_FAST Procedure</td>
<td>Returns TRUE if the expression can be evaluated fast. An expression can be evaluated fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.</td>
</tr>
<tr>
<td>GET_NEXT_RESULT Function</td>
<td>Iterates over result from the expression given result_val_iterator.</td>
</tr>
</tbody>
</table>

### 141.3.1 CLOSE_ITERATOR Procedure

This procedure closes an open iterator.

**Syntax**

```sql
DBMS_RULE.CLOSE_ITERATOR(
    iterator  IN  BINARY_INTEGER);
```

**Parameter**

**Table 141-2 CLOSE_ITERATOR Procedure Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator</td>
<td>Iterator to be closed</td>
</tr>
</tbody>
</table>

**Usage Notes**

This procedure requires an open iterator that was returned by an earlier call to `DBMS_RULE.EVALUATE` in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

Closing an iterator frees resources, such as memory, associated with the iterator. Therefore, Oracle recommends that you close an iterator when it is no longer needed.
141.3.2 EVALUATE Procedure

This procedure evaluates the rules in the specified rule set that use the evaluation context specified for a specified event.

This procedure is overloaded. The true_rules and maybe_rules parameters are mutually exclusive with the true_rules_iterator and maybe_rules_iterator parameters. In addition, the procedure with the true_rules and maybe_rules parameters includes the stop_on_first_hit parameter, but the other procedure does not.

Syntax

**DBMS_RULE.EVALUATE**{
  rule_set_name IN VARCHAR2,
  evaluation_context IN VARCHAR2,
  event_context IN SYS.RE$NV_LIST DEFAULT NULL,
  table_values IN SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
  column_values IN SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values IN SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values IN SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  skip_rules IN SYS.RE$RULE_NAME_LIST DEFAULT NULL,
  dop IN NUMBER,
  result_cache IN BOOLEAN DEFAULT FALSE,
  stop_on_first_hit IN BOOLEAN DEFAULT FALSE,
  simple_rules_only IN BOOLEAN DEFAULT FALSE,
  true_rules OUT SYS.RE$RULE_HIT_LIST,
  maybe_rules OUT SYS.RE$RULE_HIT_LIST);}

**DBMS_RULE.EVALUATE**{
  rule_set_name IN VARCHAR2,
  evaluation_context IN VARCHAR2,
  event_context IN SYS.RE$NV_LIST DEFAULT NULL,
  table_values IN SYS.RE$TABLE_VALUE_LIST DEFAULT NULL,
  column_values IN SYS.RE$COLUMN_VALUE_LIST DEFAULT NULL,
  variable_values IN SYS.RE$VARIABLE_VALUE_LIST DEFAULT NULL,
  attribute_values IN SYS.RE$ATTRIBUTE_VALUE_LIST DEFAULT NULL,
  skip_rules IN SYS.RE$RULE_NAME_LIST DEFAULT NULL,
  dop IN NUMBER,
  simple_rules_only IN BOOLEAN DEFAULT FALSE,
  true_rules_iterator OUT BINARY_INTEGER,
  maybe_rules_iterator OUT BINARY_INTEGER);
Parameters

Table 141-3  EVALUATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>Name of the rule set in the form <code>[schema_name.]rule_set_name</code>. For example, to evaluate all of the rules in a rule set named hr_rules in the hr schema, enter hr.hr_rules for this parameter. If the schema is not specified, then the schema of the current user is used.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>. If the schema is not specified, then the name of the current user is used. Only rules that use the specified evaluation context are evaluated.</td>
</tr>
<tr>
<td>event_context</td>
<td>A list of name-value pairs that identify events that cause evaluation.</td>
</tr>
<tr>
<td>table_values</td>
<td>Contains the data for table rows using the table aliases specified when the evaluation context was created. Each table alias in the list must be unique.</td>
</tr>
<tr>
<td>column_values</td>
<td>Contains the partial data for table rows. It must not contain column values for tables, whose values are already specified in table_values.</td>
</tr>
<tr>
<td>variable_values</td>
<td>A list containing the data for variables. The only way for an explicit variable value to be known is to specify its value in this list. If an implicit variable value is not specified in the list, then the function used to obtain the value of the implicit variable is invoked. If an implicit variable value is specified in the list, then this value is used and the function is not invoked.</td>
</tr>
<tr>
<td>attribute_values</td>
<td>Contains the partial data for variables. It must not contain attribute values for variables whose values are already specified in variable_values.</td>
</tr>
<tr>
<td>stop_on_first_hit</td>
<td>If TRUE, then the rules engine stops evaluation as soon as it finds a TRUE rule. If TRUE and there are no TRUE rules, then the rules engine stops evaluation as soon as it finds a rule that may evaluate to TRUE given more data. If FALSE, then the rules engine continues to evaluate rules even after it finds a TRUE rule.</td>
</tr>
<tr>
<td>simple_rules_only</td>
<td>If TRUE, then only those rules that are simple enough to be evaluated fast (without issuing SQL) are considered for evaluation. If FALSE, then evaluates all rules.</td>
</tr>
<tr>
<td>true_rules</td>
<td>Receives the output of the EVALUATE procedure into a varray of RE$RULE_HIT_LIST type. If no rules evaluate to TRUE, then true_rules is empty. If at least one rule evaluates to TRUE and stop_on_first_hit is TRUE, then true_rules contains one rule that evaluates to TRUE. If stop_on_first_hit is FALSE, then true_rules contains all rules that evaluate to TRUE.</td>
</tr>
</tbody>
</table>
Table 141-3  (Cont.) EVALUATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>maybe_rules</td>
<td>If all rules can be evaluated completely, without requiring any additional data, then maybe_rules is empty.</td>
</tr>
<tr>
<td></td>
<td>If stop_on_first_hit is TRUE, then if there is at least one rule that may evaluate to TRUE given more data, and no rules evaluate to TRUE, then maybe_rules contains one rule that may evaluate to TRUE.</td>
</tr>
<tr>
<td></td>
<td>If stop_on_first_hit is FALSE, then maybe_rules contains all rules that may evaluate to TRUE given more data.</td>
</tr>
<tr>
<td>true_rules_iterator</td>
<td>Contains the iterator for accessing rules that are TRUE.</td>
</tr>
<tr>
<td>maybe_rules_iterator</td>
<td>Contains the iterator for accessing rules that may be TRUE given additional data or the ability to issue SQL.</td>
</tr>
<tr>
<td>skip_rules</td>
<td>List of rules to skip within this evaluation.</td>
</tr>
<tr>
<td>dop</td>
<td>Degree of parallelism</td>
</tr>
<tr>
<td>result_cache</td>
<td>If TRUE, Result Cache will be created. If evaluate procedure is called with either true_rules_iterator or maybe_rules_iterator, then result_cache is not enabled.</td>
</tr>
</tbody>
</table>

Usage Notes

- **Note:**
  
  Rules in the rule set that use an evaluation context different from the one specified are not considered for evaluation.

The rules in the rule set are evaluated using the data specified for table_values, column_values, variable_values, and attribute_values. These values must refer to tables and variables in the specified evaluation context. Otherwise, an error is raised.

The caller may specify, using stop_on_first_hit, if evaluation must stop as soon as the first TRUE rule or the first MAYBE rule (if there are no TRUE rules) is found.

The caller may also specify, using simple_rules_only, if only rules that are simple enough to be evaluated fast (which means without SQL) should be considered for evaluation. This makes evaluation faster, but causes rules that cannot be evaluated without SQL to be returned as MAYBE rules.

Partial evaluation is supported. The EVALUATE procedure can be called with data for only some of the tables, columns, variables, or attributes. In such a case, rules that cannot be evaluated because of a lack of data are returned as MAYBE rules, unless they can be determined to be TRUE or FALSE based on the values of one or more simple expressions within the rule. For example, given a value of 1 for attribute "a.b" of variable "x", a rule with the following rule condition can be returned as TRUE, without a value for table "tab":

```
(:x.a.b = 1) or (tab.c > 10)
```

The results of an evaluation are the following:
• **TRUE** rules, which is the list of rules that evaluate to **TRUE** based on the given data. These rules are returned either in the OUT parameter `true_rules`, which returns all of the rules that evaluate to **TRUE**, or in the OUT parameter `true_rules_iterator`, which returns each rule that evaluates to **TRUE** one at a time.

• **MAYBE** rules, which is the list of rules that could not be evaluated for one of the following reasons:
  - The rule refers to data that was unavailable. For example, a variable attribute "x.a.b" is specified, but no value is specified for the variable "x", the attribute "a", or the attribute "a.b".
  - The rule is not simple enough to be evaluated fast (without SQL) and `simple_rules_only` is specified as **TRUE**, or partial data is available.

Maybe rules are returned either in the OUT parameter `maybe_rules`, which returns all of the rules that evaluate to **MAYBE**, or in the OUT parameter `maybe_rules_iterator`, which returns each rule that evaluates to **MAYBE** one at a time.

The caller may specify whether the procedure returns all of the rules that evaluate to **TRUE** and **MAYBE** for the event or an iterator for rules that evaluate to **TRUE** and **MAYBE**. A true rules iterator enables the client to fetch each rule that evaluates to **TRUE** one at a time, and a maybe rules iterator enables the client to fetch each rule that evaluates to **MAYBE** one at a time.

If you use an iterator, then you use the `GET_NEXT_HIT` function in the `DBMS_RULE` package to retrieve the next rule that evaluates to **TRUE** or **MAYBE** from an iterator. Oracle recommends that you close an iterator if it is no longer needed to free resources, such as memory, used by the iterator. An iterator can be closed in the following ways:

• The `CLOSE_ITERATOR` procedure in the `DBMS_RULE` package is run with the iterator specified.

• The iterator returns `NULL` because no more rules evaluate to **TRUE** or **MAYBE**.

• The session in which the iterator is running ends.

To run the `DBMS_RULE.EVALUATE` procedure, a user must meet at least one of the following requirements:

• Have `EXECUTE_ON_RULE_SET` privilege on the rule set
• Have `EXECUTE_ANY_RULE_SET` system privilege
• Be the rule set owner

---

**Note:**

The rules engine does not invoke any actions. An action context can be returned with each returned rule, but the client of the rules engine must invoke any necessary actions.
This procedure allows user to evaluate an expression under the logged in user in a session.

Any re-execute of the same expression with same table alias and variable type will result in reusing the same compiled context. With fixed compile cache size, it's possible of aging....

**Syntax**

```sql
DBMS_RULE.EVALUATE_EXPRESSION(
    rule_expression IN VARCHAR2,
    table_aliases IN SYS.RE$TABLE_ALIAS_LIST:= NULL,
    variable_types IN SYS.RE$VARIABLE_TYPE_LIST:= NULL,
    table_values IN SYS.RE$TABLE_VALUE_LIST:= NULL,
    column_values IN SYS.RE$COLUMN_VALUE_LIST:= NULL,
    variable_values IN SYS.RE$VARIABLE_VALUE_LIST:= NULL,
    attribute_values IN SYS.RE$ATTRIBUTE_VALUE_LIST:= NULL,
    cache IN BOOLEAN DEFAULT FALSE,
    result_val OUT BOOLEAN);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_expression</td>
<td>Contains an expression string.</td>
</tr>
<tr>
<td>table_aliases</td>
<td>Contains alias of tables referred in the expression string.</td>
</tr>
<tr>
<td>variable_types</td>
<td>Contains type definitions of variables used in expression.</td>
</tr>
<tr>
<td>table_values</td>
<td>Contains ROWID of table row for expression evaluation.</td>
</tr>
<tr>
<td>column_values</td>
<td>Contains values of columns referred in the expression.</td>
</tr>
<tr>
<td>variable_values</td>
<td>Contains values of variables referred in the expression.</td>
</tr>
<tr>
<td>attribute_values</td>
<td>Contains values of attributes referred in the expression.</td>
</tr>
<tr>
<td>cache</td>
<td>If TRUE, Result Cache will be created.</td>
</tr>
<tr>
<td>result_val</td>
<td>Result of the evaluation.</td>
</tr>
</tbody>
</table>

**141.3.4 EVALUATE_EXPRESSION_ITERATOR Procedure**

This is an user visible interface. Because PL/SQL based callbacks can be expensive, we provide an array based approach. The client program is assumed to find the
relevant datapoints and pass `re$value_list` into evaluation interface. The expression evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element.

**Syntax**

```sql
DBMS_RULE.EVALUATE_EXPRESSION_ITERATOR(
    rule_expression        IN              varchar2,
    table_aliases          IN              sys.re$table_alias_list:= NULL,
    variable_types         IN              sys.re$variable_type_list:= NULL,
    values                 IN              sys.re$value_list,
    cache                  IN              boolean DEFAULT FALSE,
    result_val_iter_id     OUT             BINARY_INTEGER)
```

**Parameters**

**Table 141-5**  EVALUATE_EXPRESSION_ITERATOR Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_expression</td>
<td>Contains an expression string.</td>
</tr>
<tr>
<td>table_aliases</td>
<td>Alias of tables referred in the above expression string.</td>
</tr>
<tr>
<td>variable_types</td>
<td>Type definitions of variables used in expression.</td>
</tr>
<tr>
<td>values</td>
<td>List of datapoint values for evaluation.</td>
</tr>
<tr>
<td>cache</td>
<td>If TRUE, Result Cache will be created.</td>
</tr>
<tr>
<td>result_val_iter_id</td>
<td>Contains iterator for result of array of values sent using <code>value</code>.</td>
</tr>
</tbody>
</table>

141.3.5 EVALUATE_RULE Procedure

The Rule Evaluation API expects that `CREATE_RULE` procedure has been called with an legitimate `EVALUATION_CONTEXT` prior. This API will evaluate the condition defined in the Rule.

**Syntax**

```sql
DBMS_RULE.EVALUATE_RULE(
    rule_name            IN   VARCHAR2,
    event_context        IN   SYS.RE$NV_LIST               DEFAULT NULL,
    table_values         IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
    column_values        IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
    variable_values      IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
    attribute_values     IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
    cache                IN   BOOLEAN DEFAULT FALSE,
    result_val           OUT  BOOLEAN);                 
```

**Parameters**

**Table 141-6**  EVALUATE_RULE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>Name of the rule previously create using <code>CREATE_RULE</code> procedure.</td>
</tr>
</tbody>
</table>
### EVALUATE_RULE Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_context</td>
<td>A list of name-value pairs that identify events that cause evaluation.</td>
</tr>
<tr>
<td>table_values</td>
<td>ROWID of table row for expression evaluation.</td>
</tr>
<tr>
<td>column_values</td>
<td>Values of columns referred in the expression</td>
</tr>
<tr>
<td>variable_values</td>
<td>Values of variables referred in expression</td>
</tr>
<tr>
<td>attribute_values</td>
<td>Values of attributes referred in expression</td>
</tr>
<tr>
<td>cache</td>
<td>If TRUE, Result Cache will be created.</td>
</tr>
<tr>
<td>result_val</td>
<td>Result of the evaluation</td>
</tr>
</tbody>
</table>

### 141.3.6 EVALUATE_RULE_ITERATOR Procedure

This is an iterative interface. The client program is assumed to find the relevant datapoints and pass `re$value_list` into evaluation interface.

Evaluation engine is expected to walk through this list and evaluate expression for each datapoint (`re$value_list`) element. User can use `DBMS_RULE.GET_NEXT_RESULT` procedure to iterate through the result list.

### Syntax

```sql
DBMS_RULE.EVALUATE_RULE_ITERATOR(
  rule_name            IN       VARCHAR2,
  event_context        IN       SYS.RE$NV_LIST DEFAULT NULL,
  values               IN       SYS.RE$VALUE_LIST,
  cache                IN       BOOLEAN DEFAULT FALSE,
  result_val_iter_id   OUT      BINARY_INTEGER);
```

### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>Name of the rule previously create using <code>CREATE_RULE</code> procedure.</td>
</tr>
<tr>
<td>event_context</td>
<td>A list of name-value pairs that identify events that cause evaluation</td>
</tr>
<tr>
<td>values</td>
<td>List of datapoint values for evaluation.</td>
</tr>
<tr>
<td>cache</td>
<td>If TRUE, Result Cache will be created.</td>
</tr>
<tr>
<td>result_val_iter_id</td>
<td>Contains iterator for result of array of values sent using <code>values</code></td>
</tr>
</tbody>
</table>
141.3.7 GET_NEXT_HIT Function

This function returns the next rule that evaluated to TRUE from a true rules iterator, or returns the next rule that evaluated to MAYBE from a maybe rules iterator. The function returns NULL if there are no more rules that evaluated to TRUE or MAYBE.

Syntax

DBMS_RULE.GET_NEXT_HIT(
    iterator IN BINARY_INTEGER)
RETURN SYS.RE$RULE_HIT;

Parameter

Table 141-8  GET_NEXT_HIT Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator</td>
<td>The iterator from which the rule that evaluated to TRUE or MAYBE is retrieved</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires an open iterator that was returned by an earlier call to DBMS_RULE.EVALUATE in the same session. The user who runs this procedure does not require any privileges on the rule set being evaluated.

When an iterator returns NULL, it is closed automatically. If an open iterator is no longer needed, then use the CLOSE_ITERATOR procedure in the DBMS_RULE package to close it.

Note:

This function raises an error if the rule set being evaluated was modified after the call to the DBMS_RULE.EVALUATE procedure that returned the iterator. Modifications to a rule set include added rules to the rule set, changing existing rules in the rule set, dropping rules from the rule set, and dropping the rule set.

See Also:

- Rule TYPES for more information about the types used with the DBMS_RULE package
- EVALUATE Procedure
- CLOSE_ITERATOR Procedure
141.3.8 GET_NEXT_RESULT Function

This function iterates over result from the expression given in RESULT_VAL_ITERATOR. It returns the expression at iterator evaluated to TRUE or FALSE.

Syntax

DBMS_RULE.GET_NEXT_RESULT(
    result_val_iterator_id IN BINARY_INTEGER
) RETURN BOOLEAN;

Parameter

Table 141-9  GET_NEXT_RESULT Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>result_val_iterator_id</td>
<td>Iterator returned from EVALUATE_EXPRESSION_ITERATOR</td>
</tr>
</tbody>
</table>

141.3.9 IS_FAST Procedure

Given an expression, of either rule or Independent Expression, this procedure will return TRUE if the expression can be evaluated as fast. An expression can be evaluated as fast if the engine does not need to run any internal SQL and does not need to go to PL/SQL layer in case there are any PL/SQL functions referred.

Syntax

DBMS_RULE.IS_FAST(
    expression IN VARCHAR2,
    table_aliases IN SYS.RE$TABLE_ALIAS_LIST:= NULL,
    variable_types IN SYS.RE$VARIABLE_TYPE_LIST:= NULL,
    result_val OUT BOOLEAN)

Parameter

Note:

All subprograms commit unless specified otherwise.

142.3.1 ADD_RULE Procedure

This procedure adds the specified rule to the specified rule set.

Syntax

```
DBMS_RULE_ADM.ADD_RULE(
  rule_name          IN  VARCHAR2,
  rule_set_name      IN  VARCHAR2,
  evaluation_context IN  VARCHAR2  DEFAULT NULL,
  rule_comment       IN  VARCHAR2  DEFAULT NULL);
```
Parameters

Table 142-2 ADD_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are adding to the rule set, specified as [schema_name.]rule_name. For example, to add a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set to which you are adding the rule, specified as [schema_name.]rule_set_name. For example, to add the rule to a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An evaluation context name in the form [schema_name.]evaluation_context_name. If the schema is not specified, then the current user is the default. Only specify an evaluation context if the rule itself does not have an evaluation context and you do not want to use the rule set's evaluation context for the rule.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>Optional description, which can contain the reason for adding the rule to the rule set</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- **Have** ALTER_ON_RULE_SET privilege on the rule set
- **Have** ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set

Also, the rule set owner must meet at least one of the following requirements:

- **Have** EXECUTE_ON_RULE privilege on the rule
- **Have** EXECUTE_ANY_RULE system privilege
- Be the rule owner

If the rule has no evaluation context and no evaluation context is specified when you run this procedure, then the rule uses the evaluation context associated with the rule set. In such a case, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:

- **Have** EXECUTE_ON_EVALUATION_CONTEXT privilege on the evaluation context
- **Have** EXECUTE_ANY_EVALUATION_CONTEXT system privilege, and the owner of the evaluation context must not be SYS
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.
142.3.2 ALTER_EVALUATION_CONTEXT Procedure

This procedure alters a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

DBMS_RULE_ADM.ALTER_EVALUATION_CONTEXT(
  evaluation_context_name      IN  VARCHAR2,
  table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
  remove_table_aliases         IN  BOOLEAN                    DEFAULT FALSE,
  variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
  remove_variable_types        IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
  remove_evaluation_function   IN  BOOLEAN                    DEFAULT FALSE,
  evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL,
  remove_eval_context_comment  IN  BOOLEAN                    DEFAULT FALSE);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluation_context_name</td>
<td>The name of the evaluation context you are altering, specified as [schema_name.]evaluation_context_name. For example, to alter an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_aliases</td>
<td>If NULL and remove_table_aliases is FALSE, then the procedure retains the existing table aliases. If NULL and remove_table_aliases is TRUE, then the procedure removes the existing table aliases. If non-NULL, then the procedure replaces the existing table aliases for the evaluation context with the specified table aliases. Table aliases specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.</td>
</tr>
<tr>
<td>remove_table_aliases</td>
<td>If TRUE and table_aliases is NULL, then the procedure removes the existing table aliases for the evaluation context. If TRUE and table_aliases is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove table aliases.</td>
</tr>
</tbody>
</table>
### Table 142-3  (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>variable_types</td>
<td>If NULL and remove_variable_types is FALSE, then the procedure retains the variable types. If NULL and remove_variable_types is TRUE, then the procedure removes the existing variable types. If non-NULL, then the procedure replaces the existing variable types for the evaluation context with the specified variable types.</td>
</tr>
<tr>
<td>remove_variable_types</td>
<td>If TRUE and variable_types is NULL, then the procedure removes the existing variable types for the evaluation context. If TRUE and variable_types is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the variable types.</td>
</tr>
<tr>
<td>evaluation_function</td>
<td>If NULL and remove_evaluation_function is FALSE, then the procedure retains the existing evaluation function. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation function. If non-NULL, then the procedure replaces the existing evaluation function for the evaluation context with the specified evaluation function. An evaluation function is an optional function that will be called to evaluate rules that use the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See CREATE_EVALUATION_CONTEXT Procedure for more information about evaluation functions.</td>
</tr>
<tr>
<td>remove_evaluation_function</td>
<td>If TRUE and evaluation_function is NULL, then the procedure removes the existing evaluation function for the evaluation context. If TRUE and evaluation_function is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation function.</td>
</tr>
<tr>
<td>evaluation_context_comment</td>
<td>If NULL and remove_eval_context_comment is FALSE, then the procedure retains the existing evaluation context comment. If NULL and remove_evaluation_function is TRUE, then the procedure removes the existing evaluation context comment. If non-NULL, then the procedure replaces the existing comment for the evaluation context with the specified comment. An evaluation context comment is an optional description of the rule evaluation context.</td>
</tr>
</tbody>
</table>
Table 142-3  (Cont.) ALTER_EVALUATION_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remove_eval_context_comment</td>
<td>If TRUE and evaluation_context_comment is NULL, then the procedure removes the existing comment for the evaluation context. If TRUE and evaluation_context_comment is non-NULL, then the procedure raises an error. If FALSE, then the procedure does not remove the evaluation context comment.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being altered
- Have ALL_ON_EVALUATION_CONTEXT or ALTER_ON_EVALUATION_CONTEXT object privilege on an evaluation context owned by another user
- Have ALTER_ANY_EVALUATION_CONTEXT system privilege

See Also:

Rule TYPES for more information about the types used with the DBMS_RULE_ADM package

142.3.3 ALTER_RULE Procedure

This procedure changes one or more aspects of the specified rule.

Syntax

```sql
DBMS_RULE_ADM.ALTER_RULE(
    rule_name        IN  VARCHAR2,
    condition        IN  VARCHAR2        DEFAULT NULL,
    evaluation_context IN  VARCHAR2        DEFAULT NULL,
    remove_evaluation_context  IN  BOOLEAN         DEFAULT FALSE,
    action_context   IN  SYS.RE$NV_LIST  DEFAULT NULL,
    remove_action_context      IN  BOOLEAN         DEFAULT FALSE,
    rule_comment       IN  BOOLEAN         DEFAULT FALSE,
    remove_rule_comment IN  VARCHAR2        DEFAULT NULL,
    remove_rule_comment IN  BOOLEAN         DEFAULT FALSE);
```
### Parameters

#### Table 142-4 ALTER_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are altering, specified as [schema_name.]rule_name. For example, to alter a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>condition</td>
<td>The condition to be associated with the rule. If non-NULL, then the procedure replaces the existing condition of the rule with the specified condition.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An evaluation context name in the form [schema_name.]evaluation_context_name. If the schema is not specified, then the current user is the default. If non-NULL, then the procedure replaces the existing evaluation context of the rule with the specified evaluation context.</td>
</tr>
<tr>
<td>remove_evaluation_context</td>
<td>If TRUE, then the procedure sets the evaluation context for the rule to NULL, which effectively removes the evaluation context from the rule. If FALSE, then the procedure retains any evaluation context for the specified rule. If the evaluation_context parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>action_context</td>
<td>If non-NULL, then the procedure changes the action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.</td>
</tr>
<tr>
<td>remove_action_context</td>
<td>If TRUE, then the procedure sets the action context for the rule to NULL, which effectively removes the action context from the rule. If FALSE, then the procedure retains any action context for the specified rule. If the action_context parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>If non-NULL, then the existing comment of the rule is replaced by the specified comment.</td>
</tr>
<tr>
<td>remove_rule_comment</td>
<td>If TRUE, then the procedure sets the comment for the rule to NULL, which effectively removes the comment from the rule. If FALSE, then the procedure retains any comment for the specified rule. If the rule_comment parameter is non-NULL, then this parameter should be set to FALSE.</td>
</tr>
</tbody>
</table>

#### Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE privilege on the rule
• Have `ALTER ANY RULE` system privilege
• Be the owner of the rule being altered

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

• Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
• Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be `SYS`
• Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:

`Rule TYPES` for more information about the types used with the `DBMS_RULE_ADM` package

142.3.4 CREATE_EVALUATION_CONTEXT Procedure

This procedure creates a rule evaluation context. A rule evaluation context defines external data that can be referenced in rule conditions. The external data can either exist as variables or as table data.

Syntax

```
DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT(
    evaluation_context_name      IN  VARCHAR2,
    table_aliases                IN  SYS.RE$TABLE_ALIAS_LIST    DEFAULT NULL,
    variable_types               IN  SYS.RE$VARIABLE_TYPE_LIST  DEFAULT NULL,
    evaluation_function          IN  VARCHAR2                   DEFAULT NULL,
    evaluation_context_comment   IN  VARCHAR2                   DEFAULT NULL);
```

Parameters

Table 142-5  CREATE_EVALUATION_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>evaluation_context_name</strong></td>
<td>The name of the evaluation context you are creating, specified as <code>[schema_name.]evaluation_context_name</code>. For example, to create an evaluation context named <code>dept_eval_context</code> in the <code>hr</code> schema, enter <code>hr.dept_eval_context</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td><strong>table_aliases</strong></td>
<td>Table aliases that specify the tables in an evaluation context. The table aliases can be used to reference tables in rule conditions.</td>
</tr>
<tr>
<td><strong>variable_types</strong></td>
<td>A list of variables for the evaluation context.</td>
</tr>
</tbody>
</table>
Table 142-5  (Cont.) CREATE_EVALUATION_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluation_function</td>
<td>An optional function that will be called to evaluate rules using the evaluation context. It must have the same form as the DBMS_RULE.EVALUATE procedure. If the schema is not specified, then the current user is the default. See &quot;Usage Notes&quot; for more information about the evaluation function.</td>
</tr>
<tr>
<td>evaluation_context_comment</td>
<td>An optional description of the rule evaluation context.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the evaluation context being created and have CREATE_EVALUATION_CONTEXT_OBJ system privilege
- Have CREATE_ANY_EVALUATION_CONTEXT system privilege

See Also:

Rule TYPES for more information about the types used with the DBMS_RULE_ADM package

The evaluation function must have the following signature:

```java
FUNCTION evaluation_function_name(
    rule_set_name       IN   VARCHAR2,
    evaluation_context  IN   VARCHAR2,
    event_context       IN   SYS.RE$NV_LIST               DEFAULT NULL,
    table_values        IN   SYS.RE$TABLE_VALUE_LIST      DEFAULT NULL,
    column_values       IN   SYS.RE$COLUMN_VALUE_LIST     DEFAULT NULL,
    variable_values     IN   SYS.RE$VARIABLE_VALUE_LIST   DEFAULT NULL,
    attribute_values    IN   SYS.RE$ATTRIBUTE_VALUE_LIST  DEFAULT NULL,
    stop_on_first_hit   IN   BOOLEAN                      DEFAULT FALSE,
    simple_rules_only   IN   BOOLEAN                      DEFAULT FALSE,
    true_rules          OUT  SYS.RE$RULE_HIT_LIST,
    maybe_rules         OUT  SYS.RE$RULE_HIT_LIST)
RETURN BINARY_INTEGER;
```

Note:

Each parameter is required and must have the specified datatype. However, you can change the names of the parameters.

The return value of the function must be one of the following:

- DBMS_RULE_ADM.EVALUATION_SUCCESS: The user specified evaluation function completed the rule set evaluation successfully. The rules engine returns the
results of the evaluation obtained by the evaluation function to the rules engine client using the `DBMS_RULE.EVALUATE` procedure.

- `DBMS_RULE_ADM.EVALUATION_CONTINUE`: The rules engine evaluates the rule set as if there were no evaluation function. The evaluation function is not used, and any results returned by the evaluation function are ignored.

- `DBMS_RULE_ADM.EVALUATION_FAILURE`: The user specified evaluation function failed. Rule set evaluation stops, and an error is raised.

### 142.3.5 CREATE_RULE Procedure

This procedure creates a rule.

**Syntax**

```sql
DBMS_RULE_ADM.CREATE_RULE(
    rule_name           IN  VARCHAR2,
    condition           IN  VARCHAR2,
    evaluation_context  IN  VARCHAR2  DEFAULT NULL,
    action_context      IN  SYS.RE$NV_LIST  DEFAULT NULL,
    rule_comment        IN  VARCHAR2  DEFAULT NULL);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are creating, specified as <code>[schema_name.]rule_name</code>. For example, to create a rule named <code>all_a</code> in the <code>hr</code> schema, enter <code>hr.all_a</code> for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>condition</td>
<td>The condition to be associated with the rule. A condition evaluates to <code>TRUE</code> or <code>FALSE</code> and can be any condition allowed in the <code>WHERE</code> clause of a <code>SELECT</code> statement. For example, the following is a valid rule condition: <code>department_id = 30</code> Ensure that the proper case is used for text in rule conditions. <strong>Note</strong>: Do not include the word &quot;WHERE&quot; in the condition.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An optional evaluation context name in the form <code>[schema_name.]evaluation_context_name</code>, which is associated with the rule. If the schema is not specified, then the current user is the default. If <code>evaluation_context</code> is not specified, then the rule inherits the evaluation context from its rule set.</td>
</tr>
<tr>
<td>action_context</td>
<td>The action context associated with the rule. A rule action context is information associated with a rule that is interpreted by the client of the rules engine when the rule is evaluated.</td>
</tr>
<tr>
<td>rule_comment</td>
<td>An optional description of the rule</td>
</tr>
</tbody>
</table>

**Usage Notes**

To run this procedure, a user must meet at least one of the following requirements:
Be the owner of the rule being created and have the CREATE RULE OBJ system privilege

Have CREATE ANY RULE system privilege

If an evaluation context is specified, then the rule owner must meet at least one of the following requirements:

- Have EXECUTE ON EVALUATION CONTEXT privilege on the evaluation context
- Have EXECUTE ANY EVALUATION CONTEXT system privilege, and the owner of the evaluation context must not be SYS.
- Be the evaluation context owner

Also, the rule owner must have the necessary privileges on all the base objects accessed by the rule using the evaluation context.

See Also:
Rule TYPES for more information about the types used with the DBMS_RULE_ADM package

142.3.6 CREATE_RULE_SET Procedure

This procedure creates a rule set.

Syntax

```
DBMS_RULE_ADM.CREATE_RULE_SET(
    rule_set_name       IN  VARCHAR2,
    evaluation_context  IN  VARCHAR2  DEFAULT NULL,
    rule_set_comment    IN  VARCHAR2  DEFAULT NULL);
```

Parameters

Table 142-7 CREATE_RULE_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set you are creating, specified as [schema_name.]rule_set_name. For example, to create a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>evaluation_context</td>
<td>An optional evaluation context name in the form [schema_name.]evaluation_context_name, which applies to all rules in the rule set that are not associated with an evaluation context explicitly. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_comment</td>
<td>An optional description of the rule set</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:
• Be the owner of the rule set being created and have `CREATE_RULE_SET_OBJ` system privilege
• Have `CREATE_ANY_RULE_SET` system privilege

If an evaluation context is specified, then the rule set owner must meet at least one of the following requirements:
• Have `EXECUTE_ON_EVALUATION_CONTEXT` privilege on the evaluation context
• Have `EXECUTE_ANY_EVALUATION_CONTEXT` system privilege, and the owner of the evaluation context must not be SYS
• Be the evaluation context owner

142.3.7 DROP_EVALUATIONCONTEXT Procedure

This procedure drops a rule evaluation context.

Syntax

```
DBMS_RULE_ADM.DROP_EVALUATIONCONTEXT(
    evaluation_context_name  IN  VARCHAR2,
    force                    IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>evaluation_context_name</td>
<td>The name of the evaluation context you are dropping, specified as `[schema_name.evaluation_context_name]. For example, to drop an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure removes the rule evaluation context from all rules and rule sets that use it. If FALSE and no rules or rule sets use the rule evaluation context, then the procedure drops the rule evaluation context. If FALSE and one or more rules or rule sets use the rule evaluation context, then the procedure raises an exception. <strong>Caution:</strong> Setting <code>force</code> to TRUE can result in rules and rule sets that do not have an evaluation context. If neither a rule nor the rule set it is in has an evaluation context, and no evaluation context was specified for the rule by the <code>ADD_RULE</code> procedure, then the rule cannot be evaluated.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:
• Be the owner of the evaluation context
• Have `DROP_ANY_EVALUATION_CONTEXT` system privilege
142.3.8 DROP_RULE Procedure

This procedure drops a rule.

Syntax

DBMS_RULE_ADM.DROP_RULE(
    rule_name  IN  VARCHAR2,
    force      IN  BOOLEAN   DEFAULT FALSE);

Parameters

Table 142-9  DROP_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are dropping, specified as [schema_name.]rule_name. For example, to drop a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, then the procedure removes the rule from all rule sets that contain it. If FALSE and no rule sets contain the rule, then the procedure drops the rule. If FALSE and one or more rule sets contain the rule, then the procedure raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the rule
- Have DROP_ANY_RULE system privilege

Note:

- To remove a rule from a rule set without dropping the rule from the database, use the REMOVE_RULE procedure.
- The rule evaluation context associated with the rule, if any, is not dropped when you run this procedure.

142.3.9 DROP_RULE_SET Procedure

This procedure drops a rule set.

Syntax

DBMS_RULE_ADM.DROP_RULE_SET(
    rule_set_name IN VARCHAR2,
    delete_rules IN BOOLEAN   DEFAULT FALSE);
Parameters

Table 142-10  DROP_RULE_SET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set you are dropping, specified as [schema_name.]rule_set_name. For example, to drop a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>delete_rules</td>
<td>If TRUE, then the procedure drops any rules that are in the rule set. If any of the rules in the rule set are also in another rule set, then these rules are not dropped. If FALSE, then the procedure does not drop the rules in the rule set.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have DROP_ANY_RULE_SET system privilege
- Be the owner of the rule set

Note:
The rule evaluation context associated with the rule set, if any, is not dropped when you run this procedure.

142.3.10 GRANT_OBJECT_PRIVILEGE Procedure

This procedure grants the specified object privilege on the specified object to the specified user or role. If a user owns the object, then the user automatically is granted all privileges on the object, with grant option.

Syntax

```
DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
   privilege      IN  BINARY_INTEGER,  
   object_name    IN  VARCHAR2,       
   grantee        IN  VARCHAR2,        
   grant_option   IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

Table 142-11  GRANT_OBJECT_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the object privilege to grant to the grantee on the object. See &quot;Usage Notes&quot; for the available object privileges.</td>
</tr>
</tbody>
</table>
Table 142-11  (Cont.) GRANT_OBJECT_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of the object for which you are granting the privilege to the grantee, specified as [schema_name.]object_name. For example, to grant the privilege on a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.</td>
</tr>
<tr>
<td>grantee</td>
<td>The name of the user or role for which the privilege is granted. The specified user cannot be the owner of the object.</td>
</tr>
<tr>
<td>grant_option</td>
<td>If TRUE, then the specified user or users granted the specified privilege can grant this privilege to others. If FALSE, then the specified user or users granted the specified privilege cannot grant this privilege to others.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Be the owner of the object on which the privilege is granted
- Have the same privilege as the privilege being granted with the grant option

In addition, if the object is a rule set, then the user must have EXECUTE privilege on all the rules in the rule set with grant option or must own the rules in the rule set.

Table 142-12 lists the object privileges.

Table 142-12  Object Privileges for Evaluation Contexts, Rules, and Rule Sets

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULE_ADM.ALL_ON_EVALUATION_CONTEXT</td>

<td>Alter a particular rule set in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_EVALUATION_CONTEXT</td>
<td>Execute a particular evaluation context in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE</td>
<td>Execute a particular rule in another user's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ON_RULE_SET</td>
<td>Execute a particular rule set in another user's schema</td>
</tr>
</tbody>
</table>
Examples

For example, to grant the HR user the privilege to alter a rule named hr_dml in the strmadmin schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_OBJECT_PRIVILEGE(
    privilege => SYS.DBMS_RULE_ADM.ALTER_ON_RULE,
    object_name => 'strmadmin.hr_dml',
    grantee => 'hr',
    grant_option => FALSE);
END;
/```

142.3.11 GRANT_SYSTEM_PRIVILEGE Procedure

This procedure grant the specified system privilege to the specified user or role.

Syntax

```
DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
  privilege     IN  BINARY_INTEGER,
  grantee       IN  VARCHAR2,
  grant_option  IN  BOOLEAN   DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the system privilege to grant to the grantee.</td>
</tr>
<tr>
<td>grantee</td>
<td>The name of the user or role for which the privilege is granted</td>
</tr>
</tbody>
</table>
| grant_option| If TRUE, then the specified user or users granted the specified privilege can grant the system privilege to others.  
  If FALSE, then the specified user or users granted the specified privilege cannot grant the system privilege to others. |

Usage Notes

Table 142-14 lists the system privileges.

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ANY_EVALUATION_CONTEXT</td>
<td>Alter any evaluation context owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ANY_RULE</td>
<td>Alter any rule owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.ALTER_ANY_RULE_SET</td>
<td>Alter any rule set owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_ANY_EVALUATION_CONTEXT</td>
<td>Create a new evaluation context in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT_OBJ</td>
<td>Create a new evaluation context in the grantee's schema</td>
</tr>
</tbody>
</table>
Table 142-14  (Cont.) System Privileges for Evaluation Contexts, Rules, and Rule Sets

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_ANY_RULE</td>
<td>Create a new rule in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_RULE_OBJ</td>
<td>Create a new rule in the grantee's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET</td>
<td>Create a new rule set in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.CREATE_RULE_SET_OBJ</td>
<td>Create a new rule set in the grantee's schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_EVALUATION_CONTEXT</td>
<td>Drop any evaluation context in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_RULE</td>
<td>Drop any rule in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.DROP_ANY_RULE_SET</td>
<td>Drop any rule set in any schema</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_EVALUATION_CONTEXT</td>
<td>Execute any evaluation context owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE</td>
<td>Execute any rule owned by any user</td>
</tr>
<tr>
<td>SYS.DBMS_RULE_ADM.EXECUTE_ANY_RULE_SET</td>
<td>Execute any rule set owned by any user</td>
</tr>
</tbody>
</table>

For example, to grant the strmadmin user the privilege to create a rule set in any schema, enter the following:

```
BEGIN
  DBMS_RULE_ADM.GRANT_SYSTEM_PRIVILEGE(
    privilege    => SYS.DBMS_RULE_ADM.CREATE_ANY_RULE_SET,
    grantee      => 'strmadmin',
    grant_option => FALSE);
END;
/
```

Note: When you grant a privilege on "ANY" object (for example, ALTER_ANY_RULE), and the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE, you give the user access to that type of object in all schemas except the SYS schema. By default, the initialization parameter O7_DICTIONARY_ACCESSIBILITY is set to FALSE.

If you want to grant access to an object in the SYS schema, then you can grant object privileges explicitly on the object. Alternatively, you can set the O7_DICTIONARY_ACCESSIBILITY initialization parameter to TRUE. Then privileges granted on "ANY" object allows access to any schema, including SYS.

142.3.12 REMOVE_RULE Procedure

This procedure removes the specified rule from the specified rule set.

Syntax

```
DBMS_RULE_ADM.REMOVE_RULE(
  rule_name IN VARCHAR2,
  rule_set_name IN VARCHAR2,
)
```
Parameters

Table 142-15  REMOVE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule you are removing from the rule set, specified as [schema_name.]rule_name. For example, to remove a rule named all_a in the hr schema, enter hr.all_a for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>The name of the rule set from which you are removing the rule, specified as [schema_name.]rule_set_name. For example, to remove the rule from a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>evaluation_context_name</td>
<td>The name of the evaluation context associated with the rule you are removing, specified as [schema_name.]evaluation_context_name. For example, to specify an evaluation context named dept_eval_context in the hr schema, enter hr.dept_eval_context for this parameter. If the schema is not specified, then the current user is the default. If an evaluation context was specified for the rule you are removing when you added the rule to the rule set using the ADD_RULE procedure, then specify the same evaluation context. If you added the same rule more than once with different evaluation contexts, then specify the rule with the evaluation context you want to remove. If you specify an evaluation context that is not associated with the rule, then the procedure raises an error. Specify NULL if you did not specify an evaluation context when you added the rule to the rule set. If you specify NULL and there are one or more evaluation contexts associated with the rule, then the procedure raises an error.</td>
</tr>
<tr>
<td>all_evaluation_contexts</td>
<td>If TRUE, then the procedure removes the rule from the rule set with all of its associated evaluation contexts. If FALSE, then the procedure only removes the rule with the specified evaluation context. This parameter is relevant only if the same rule is added more than once to the rule set with different evaluation contexts.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, a user must meet at least one of the following requirements:

- Have ALTER_ON_RULE_SET privilege on the rule set
- Have ALTER_ANY_RULE_SET system privilege
- Be the owner of the rule set
142.3.13 REVOKE_OBJECT_PRIVILEGE Procedure

This procedure revokes the specified object privilege on the specified object from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_OBJECT_PRIVILEGE(
    privilege    IN  BINARY_INTEGER,
    object_name  IN  VARCHAR2,
    revokee      IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the object privilege on the object to revoke from the revokee. See GRANT_OBJECT_PRIVILEGE Procedure for a list of the object privileges.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object for which you are revoking the privilege from the revokee, specified as [schema_name.]object_name. For example, to revoke an object privilege on a rule set named apply_rules in the hr schema, enter hr.apply_rules for this parameter. If the schema is not specified, then the current user is the default. The object must be an existing rule, rule set, or evaluation context.</td>
</tr>
<tr>
<td>revokee</td>
<td>The name of the user or role from which the privilege is revoked. The user who owns the object cannot be specified.</td>
</tr>
</tbody>
</table>

142.3.14 REVOKE_SYSTEM_PRIVILEGE Procedure

This procedure revokes the specified system privilege from the specified user or role.

Syntax

```
DBMS_RULE_ADM.REVOKE_SYSTEM_PRIVILEGE(
    privilege  IN  BINARY_INTEGER,
    revokee    IN  VARCHAR2);
```
Parameters

Table 142-17  REVOKE_SYSTEM_PRIVILEGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>privilege</td>
<td>The name of the system privilege to revoke from the revokee. See <a href="#">GRANT_SYSTEM_PRIVILEGE Procedure</a> for a list of the system privileges.</td>
</tr>
<tr>
<td>revokee</td>
<td>The name of the user or role from which the privilege is revoked</td>
</tr>
</tbody>
</table>
The DBMS_SCHEDULER package provides a collection of scheduling functions and procedures that can be called from any PL/SQL program.

This chapter contains the following topics:

- Deprecated Subprograms
- Security Model
- Rules and Limits
- Operational Notes
- Data Structures
- Summary of DBMS_SCHEDULER Subprograms

See Also:
Oracle Database Administrator's Guide for more information regarding how to use DBMS_SCHEDULER.

143.1 DBMS_SCHEDULER Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms in new applications. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 12c Release 1 (12.1):

- CREATE_CREDENTIAL Procedure
- DROP_CREDENTIAL Procedure

143.2 DBMS_SCHEDULER Security Model

The DBMS_SCHEDULER package ignores privileges granted on scheduler objects, such as jobs or chains, through roles. Object privileges must be granted directly to the user.

143.3 DBMS_SCHEDULER Rules and Limits

These rules apply when using the DBMS_SCHEDULER package.

- Only SYS can perform actions on objects in the SYS schema.
- Several of the procedures accept comma-delimited lists of object names. If you provide a list of names, then the Scheduler stops executing the list at the first
object that returns an error. Therefore, the Scheduler does not perform the tasks
needed for the remaining objects on the list.

For example, consider the statement DBMS_SCHEDULER.STOP_JOB ('job1, job2, job3,
sys.jobclass1, sys.jobclass2, sys.jobclass3');

If job3 cannot be stopped, then the jobs that follow it, jobclass1, jobclass2, and
jobclass3 cannot be stopped. The jobs that preceded job3, job1 and job2, are
stopped.

• Performing an action on an object that does not exist returns a PL/SQL exception
stating that the object does not exist.

143.4 DBMS_SCHEDULER Operational Notes

The Scheduler uses a rich calendaring syntax to enable you to define repeating
schedules, such as "every Tuesday and Friday at 4:00 p.m." or "the second
Wednesday of every month." This calendaring syntax is used in calendaring
expressions in the repeat_interval argument of a number of package subprograms.
Evaluating a calendaring expression results in a set of discrete timestamps.

See Oracle Database Administrator's Guide for examples of the calendaring syntax.

Calendaring Syntax

This section starts with the calendaring syntax. It is followed by descriptions of various
parts of the syntax.

In the calendaring syntax, * means 0 or more.

repeat_interval = regular_schedule | combined_schedule

regular_schedule = frequency_clause

Table 143-1  Values for repeat_interval

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREQ</td>
<td>This specifies the type of recurrence. It must be specified. The possible predefined frequency values are YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, and SECONDLY. Alternatively, specifies an existing schedule to use as a user-defined frequency.</td>
</tr>
<tr>
<td>INTERVAL</td>
<td>This specifies a positive integer representing how often the recurrence repeats. The default is 1, which means every second for secondly, every day for daily, and so on. The maximum value is 99.</td>
</tr>
<tr>
<td>BYMONTH</td>
<td>This specifies which month or months you want the job to execute in. You can use numbers such as 1 for January and 3 for March, as well as three-letter abbreviations such as FEB for February and JUL for July.</td>
</tr>
<tr>
<td>BYWEEKNO</td>
<td>This specifies the week of the year as a number. It follows ISO-8601, which defines the week as starting with Monday and ending with Sunday; and the first week of a year as the first week, which is mostly within the Gregorian year. The first week is equivalent to the following two variants: the week that contains the first Thursday of the Gregorian year; and the week containing January 4th. The ISO-8601 week numbers are integers from 1 to 52 or 53; parts of week 1 may be in the previous calendar year; parts of week 52 may be in the following calendar year; and if a year has a week 53, parts of it must be in the following calendar year. As an example, in the year 1998, the ISO week 1 began on Monday December 29th, 1997; and the last ISO week (week 53) ended on Sunday January 3rd, 1999. So December 29th, 1997, is in the ISO week 1998-01, and January 1st, 1999, is in the ISO week 1998-53. byweekno is only valid for YEARLY. Examples of invalid specifications are &quot;FREQ=YEARLY; BYWEEKNO=1; BYMONTH=12&quot; and &quot;FREQ=YEARLY; BYWEEKNO=53; BYMONTH=1&quot;.</td>
</tr>
<tr>
<td>BYYEARDAY</td>
<td>This specifies the day of the year as a number. Valid values are 1 to 366. An example is 69, which is March 10 (31 for January, 28 for February, and 10 for March). 69 evaluates to March 10 for non-leap years and March 9 in leap years. -2 will always evaluate to December 30th independent of whether it is a leap year.</td>
</tr>
<tr>
<td>BYDATE</td>
<td>This specifies a list of dates, where each date is of the form [YYYY]MMDD. A list of consecutive dates can be generated by using the SPAN modifier, and a date can be adjusted with the OFFSET modifier. An example of a simple BYDATE clause follows: BYDATE=0115,0315,0615,0915,1215,20060115 The following SPAN example is equivalent to BYDATE=0110,0111,0112,0113,0114, which is a span of 5 days starting at 1/10: BYDATE=0110+SPAN:5D The plus sign in front of the SPAN keyword indicates a span starting at the supplied date. The minus sign indicates a span ending at the supplied date, and the &quot;^&quot; sign indicates a span of ( n ) days or weeks centered around the supplied date. If ( n ) is an even number, it is adjusted up to the next odd number. Offsets adjust the supplied date by adding or subtracting ( n ) days or weeks. BYDATE=0205-OFFSET:2W is equivalent to BYDATE=0205-14D (the OFFSET: keyword is optional), which is also equivalent to BYDATE=0122.</td>
</tr>
</tbody>
</table>

Chapter 143  DBMS_SCHEDULER Operational Notes
Table 143-1    (Cont.) Values for repeat_interval

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BYMONTHDAY</td>
<td>This specifies the day of the month as a number. Valid values are 1 to 31. An example is 10, which means the 10th day of the selected month. You can use the minus sign (-) to count backward from the last day, so, for example, BYMONTHDAY=-1 means the last day of the month and BYMONTHDAY=-2 means the next to last day of the month.</td>
</tr>
<tr>
<td>BYDAY</td>
<td>This specifies the day of the week from Monday to Sunday in the form MON, TUE, and so on. Using numbers, you can specify the 26th Friday of the year, if using a YEARLY frequency, or the 4th THU of the month, using a MONTHLY frequency. Using the minus sign, you can say the second to last Friday of the month. For example, -1 FRI is the last Friday of the month.</td>
</tr>
<tr>
<td>BYHOUR</td>
<td>This specifies the hour on which the job is to run. Valid values are 0 to 23. As an example, 10 means 10 a.m.</td>
</tr>
<tr>
<td>BYMINUTE</td>
<td>This specifies the minute on which the job is to run. Valid values are 0 to 59. As an example, 45 means 45 minutes past the chosen hour.</td>
</tr>
<tr>
<td>BYSECOND</td>
<td>This specifies the second on which the job is to run. Valid values are 0 to 59. As an example, 30 means 30 seconds past the chosen minute.</td>
</tr>
<tr>
<td>BYSETPOS</td>
<td>This selects one or more items, by position, in the list of timestamps that result after the whole calendaring expression is evaluated. It is useful for requirements such as running a job on the last workday of the month. Rather than attempting to express this with the other BY clauses, you can code the calendaring expression to evaluate to a list of every workday of the month, and then add the BYSETPOS clause to select only the last item of that list. Assuming that workdays are Monday through Friday, the syntax would then be: FREQ=MONTHLY; BYDAY=MON,TUE,WED,THU,FRI; BYSETPOS=-1. Valid values are 1 through 9999. A negative number selects an item from the end of the list (-1 is the last item, -2 is the next to last item, and so on) and a positive number selects from the front of the list. The BYSETPOS clause is always evaluated last. BYSETPOS is only supported with the MONTHLY and YEARLY frequencies. The BYSETPOS clause is applied to the list of timestamps once per frequency period. For example, when the frequency is defined as MONTHLY, the Scheduler determines all valid timestamps for the month, orders that list, and then applies the BYSETPOS clause. The Scheduler then moves on to the next month and repeats the procedure. Assuming a start date of Jun 10, 2004, the example evaluates to: Jun 30, Jul 30, Aug 31, Sep 30, Oct 29, and so on.</td>
</tr>
<tr>
<td>INCLUDE</td>
<td>This includes one or more named schedules in the calendaring expression. That is, the set of timestamps defined by each included named schedule is added to the results of the calendaring expression. If an identical timestamp is contributed by both an included schedule and the calendaring expression, it is included in the resulting set of timestamps only once. The named schedules must have been defined with the CREATE_SCHEDULE procedure. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</td>
</tr>
</tbody>
</table>

Chapter 143

DBMS_SCHEDULER Operational Notes
### Table 143-1 (Cont.) Values for repeat_interval

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXCLUDE</td>
<td>This excludes one or more named schedules from the calendaring expression. That is, the set of timestamps defined by each excluded named schedule is removed from the results of the calendaring expression. The named schedules must have been defined with the CREATE_SCHEDULE procedure. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</td>
</tr>
<tr>
<td>INTERSECT</td>
<td>This specifies an intersection between the calendaring expression results and the set of timestamps defined by one or more named schedules. Only the timestamps that appear both in the calendaring expression and in one of the named schedules are included in the resulting set of timestamps. For example, assume that the named schedule last_sat indicates the last Saturday in every month, and that for the year 2005, the only months where the last day of the month is also a Saturday are April and December. Assume also that the named schedule end_qtr indicates the last day of each quarter in 2005: 3/31/2005, 6/30/2005, 9/30/2005, 12/31/2005. These calendaring expressions result in the dates that follow: 3/31/2005, 4/30/2005, 6/30/2005, 9/30/2005, 12/31/2005. FREQ=MONTHLY; BYMONTHDAY=-1; INTERSECT=last_sat,end_qtr In this example, the terms FREQ=MONTHLY; BYMONTHDAY=-1 indicate the last day of each month. This clause only works on a full day and therefore cannot be used with BYHOUR, BYMIN, and BYSECOND.</td>
</tr>
<tr>
<td>PERIODS</td>
<td>This identifies the number of periods that together form one cycle of a user-defined frequency. It is used in the repeat_interval expression of the schedule that defines the user-defined frequency. It is mandatory when the repeat_interval expression in the main schedule contains a BYPERIOD clause. The following example defines the quarters of a fiscal year: FREQ=YEARLY; BYDATE=0301,0601,0901,1201; PERIODS=4</td>
</tr>
<tr>
<td>BYPERIOD</td>
<td>This selects periods from a user-defined frequency. For example, if a main schedule names a user-defined frequency schedule that defines the fiscal quarters shown in the previous example, the clause BYPERIOD=2,4 in the main schedule selects the 2nd and 4th fiscal quarters.</td>
</tr>
</tbody>
</table>

### Combining Schedules

There are two ways to combine schedules:

- Using a combined schedule expression, which is a list of individual schedules
  
  For example, to create a schedule for all company holidays, you provide a list of individual schedules, where each schedule in the list defines a single holiday. The Scheduler evaluates each individual schedule, and then returns a union of the timestamps returned by each individual schedule.
Embedding other schedules into the main schedule using include, exclude, and intersect clauses

With this method, the embedded schedules inherit certain attributes from the main schedule.

- Timestamps generated by the include clause that fall into periods that are skipped by the main schedule are ignored. This is the case when the main schedule skips periods due to the INTERVAL clause, the BYPERIOD clause, or the BYMONTH clause for freq=monthly.

- Days that are added by the include clause follow the hourly/minutely/secondly execution pattern of the main schedule.

- When the include clause is present, no date-specific defaults are retrieved from the start date (but time-specific defaults can be). (See "Start Dates and Repeat Intervals", later in this section.) For example, a repeat_interval of FREQ=MONTHLY;INCLUDE=HOLIDAY executes only on holidays and not on the month/day defaults retrieved from the start date.

The following is an example:

```sql
BEGIN
  dbms_scheduler.create_schedule('embed_sched', repeat_interval => 'FREQ=YEARLY;BYDATE=0301,0601,0901,1201');
  dbms_scheduler.create_schedule('main_sched', repeat_interval => 'FREQ=MONTHLY;INTERVAL=2;BYMONTHDAY=15;BYHOUR=9,17;INCLUDE=embed_sched');
END;
/
```

In this example, the dates 3/30, 6/20, and 7/25 are added to the main schedule. However, the Scheduler does not include dates that fall in months that are skipped by the INTERVAL clause. If the start date of the main schedule is 1/1/2005, then 2/20 is not added. On the dates that are added, the embedded schedule follows the execution pattern of the main schedule: jobs are executed at 9:00 a.m. and 5:00 p.m. on 1/30 and 7/25. If the embedded schedule does not itself have a start date, it inherits the start date from the main schedule.

User-Defined Frequencies

Instead of using predefined frequencies like DAILY, WEEKLY, MONTHLY, and so on, you can create your own frequencies by creating a schedule that returns the start date of each period. For example, the following repeat_interval expression is used in a schedule named fiscal_year that defines the start of each quarter in a fiscal year:

```
FREQ=YEARLY;BYDATE=0301,0601,0901,1201;PERIODS=4
```

To return the last Wednesday of every quarter, you create a schedule (the "main schedule") that uses the fiscal_year schedule as a user-defined frequency:

```
FREQ=fiscal_year;BYDAY=-1WED
```

Periods in a user-defined frequency do not have to be equal in length. In the main schedule, the BYSETPOS clause and numbered weekdays are recalculated based on the size of each period. To select dates in specific periods, you must use the BYPERIOD clause in the main schedule. To enable this, the schedule that is used as the user-defined frequency must include a PERIODS clause, and it must set its start date appropriately. The first date returned by this schedule is used as the starting point of period 1.
As another example, assuming work days are Monday through Friday, to get the last work day of the 2nd and 4th quarters of the fiscal year, the `repeat_interval` clause in the main schedule is the following:

```
FREQ=fiscal_year;BYDAY=MON,TUE,WED,THU,FRI;BYPERIOD=2,4;BYSETPOS=-1
```

Start Dates and Repeat Intervals

The Scheduler retrieves the date and time from the job or schedule start date and incorporates them as defaults into the `repeat_interval`. For example, if the specified frequency is yearly and there is no `BYP MONTH` or `B YMONTHDAY` clause in the repeat interval, then the month and day that the job runs on are retrieved from the start date. Similarly, if frequency is monthly but there is no `B YMONTHDAY` clause in the repeat interval, then the day of the month that the job runs on is retrieved from the start date. If present, `BYHOUR`, `BYMINUTE`, and `BYSECOND` defaults are also retrieved from the start date, and used if those clauses are not specified. Note that if the `INCLUDE`, `EXCLUDE`, or `INTERSECT` clauses are present, no date-related defaults are retrieved from the start date, but time-related defaults are.

The following are some examples:

```
start_date:  4/15/05 9:00:00
repeat_interval: freq=yearly
```

is expanded internally to:

```
freq=yearly;bymonth=4;bymonthday=15;byhour=9;byminute=0;bysecond=0
```

The preceding schedule executes on 04/15/05 9:00:00, 04/15/06 9:00:00, 04/15/07 9:00:00, and so on.

For the next example, assume that schedule $S1$ has a `repeat_interval` of `FREQ=YEARLY;BYDATE=0701`.

```
start_date:  01/20/05 9:00:00
repeat_interval: freq=yearly;include=S1
```

is expanded internally to:

```
freq=yearly;byhour=9;byminute=0;bysecond=0;include=S1
```

Because an `INCLUDE` clause is present, date-related information is not retrieved from the start date. However, time-specific information is, so the preceding schedule executes on 07/01/05 9:00:00, 07/01/06 9:00:00, 07/01/08 9:00:00, and so on.

General Rules

When using a calendaring expression, consider the following rules:

- For a regular schedule (as opposed to a combined schedule), the calendar string must start with the frequency clause. All other clauses are optional and can be put in any order.
- All clauses are separated by a semicolon, and each clause can be present at most once, with the exception of the `include`, `exclude`, and `intersect` clauses.
- Spaces are allowed between syntax elements and the strings are case-insensitive.
- The list of values for a specific `BY` clause do not need to be ordered.
- When not enough `BY` clauses are present to determine what the next date is, this information is retrieved from the start date. For example, "$FREQ=YEARLY$" with a start
The date of 02/15/2003 becomes "FREQ=YEARLY;B YMONTH=FEB; BYMONTHDAY=15", which means every year on the 15th of February.

"FREQ=YEARLY;B YMONTH=JAN, JUL" with start date 01/21/2003 becomes "FREQ=YEARLY;B YMONTH=JAN, JUL; BYMONTHDAY=21", which means every year on January 21 and July 21.

• The byweekno clause is only allowed if the frequency is YEARLY. It cannot be used with other frequencies. When it is present, it will return all days in that week number. If you want to limit it to specific days within the week, you have to add a BYDAY clause. For example, "FREQ=YEARLY;BYWEEKNO=2" with a start date of 01/01/2003 will return:

01/06/2003, 01/07/2003, 01/08/2003, 01/09/2003, 01/10/2003, 01/11/2003, 01/12/2003, 01/05/2004, 01/06/2004, 01/07/2004, .... and so on.

Note that when the byweekno clause is used, it is possible that the dates returned are from a year other than the current year. For example, if returning dates for the year 2004 and the calendar string is "FREQ=YEARLY;BYWEEKNO=1, 53" for the specified week numbers in 2004, it will return the dates:

12/29/03, 12/30/03, 12/31/03, 01/01/04, 01/02/04, 01/03/04, 01/04/04, 12/27/04, 12/28/04, 12/29/04, 12/30/04, 12/31/04, 01/01/05, 01/02/05

• For those BY clauses that do not have a consistent range of values, you can count backward by putting a "-" in front of the numeric value. For example, specifying BYMONTHDAY=-31 will not give you the last day of every month, because not every month has 31 days. Instead, BYMONTHDAY=1 will give you the last day of the month.

This is not supported for BY clauses that are fixed in size. In other words, BYMONTH, BYHOUR, BYMINUTE, and BYSECOND are not supported.

• The basic values for the BYDAY clause are the days of the week. When the frequency is YEARLY, or MONTHLY, you are allowed to specify a positive or negative number in front of each day of the week. In the case of YEARLY, BYDAY=40MON indicates the 40th Monday of the year. In the case of MONTHLY, BYDAY=-2SAT, indicates the second to last Saturday of the month.

Note that positive or negative numbers in front of the weekdays are not supported for other frequencies and that in the case of yearly, the number ranges from -53 ... -1, 1 ... 53, whereas for the monthly frequency it is limited to -5 ... -1, 1 ... 5.

If no number is present in front of the weekday it specifies, every occurrence of that weekday in the specified frequency.

• The first day of the week is Monday.

• Repeating jobs with frequencies smaller than daily follow their frequencies exactly across daylight savings adjustments. For example, suppose that a job is scheduled to repeat every 3 hours, the clock is moved forward from 1:00 a.m. to 2:00 a.m., and the last time the job ran was midnight. Its next scheduled time will be 4:00 a.m. Thus, the 3 hour period between subsequent job runs is retained. The same applies when the clock is moved back. This behavior is not the case for repeating jobs that have frequencies of daily or larger. For example, if a repeating job is supposed to be executed on a daily basis at midnight, it will continue to run at midnight if the clock is moved forward or backward. When the execution time of such a daily (or larger frequency) job happens to fall inside a window where the clock is moved forward, the job executes at the end of the window.

• The calendaring syntax does not allow you to specify a time zone. Instead the Scheduler retrieves the time zone from the start_date argument. If jobs must
follow daylight savings adjustments, then you must specify a region name for the time zone of the \texttt{start_date}. For example specifying the \texttt{start_date} time zone as ‘US/Eastern’ in New York ensures that daylight saving adjustments are automatically applied. If instead, the time zone of the \texttt{start_date} is set to an absolute offset, such as ‘-5:00’, then daylight savings adjustments are not followed and your job execution is off by an hour for half the year.

- When \texttt{start_date} is \texttt{NULL}, the Scheduler determines the time zone for the repeat interval as follows:

  1. It checks whether or not the session time zone is a region name. The session time zone can be set by either:

     - Issuing an \texttt{ALTER SESSION} statement, for example:

       
       SQL> ALTER SESSION SET time_zone = 'Asia/Shanghai';

     - Setting the \texttt{ORA_SDTZ} environment variable.

  2. If the session time zone is an absolute offset instead of a region name, the Scheduler uses the value of the \texttt{DEFAULT_TIMEZONE} Scheduler attribute. For more information, see the \texttt{SET_SCHEDULER_ATTRIBUTE} Procedure.

  3. If the \texttt{DEFAULT_TIMEZONE} attribute is \texttt{NULL}, the Scheduler uses the time zone of \texttt{systimestamp} when the job or window is enabled.

\section*{BYSETPOS Clause Rules}

The following are rules for the \texttt{BYSETPOS} clause.

- The \texttt{BYSETPOS} clause is the last clause to be evaluated. It is processed after all other \texttt{BY} clauses and the \texttt{INCLUDE}, \texttt{EXCLUDE} and \texttt{INTERSECT} clauses have been evaluated.

- The \texttt{INTERVAL} clause does not change the size of the period to which the \texttt{BYSETPOS} clause is applied. For example, when the frequency is set to monthly and interval is set to 3, the list of timestamps to which \texttt{BYSETPOS} is applied is generated from a month, not a quarter. The only impact of the \texttt{INTERVAL} clause is to cause months to be skipped. However, you can still select the second to last workday of the quarter like this:

  \begin{verbatim}
  FREQ=MONTHLY;INTERVAL=3;BYDAY=MON,TUE,WED,THU,FRI;BYSETPOS=-2
  \end{verbatim}

  provided that you set the start date in the right month. This example returns the next to last workday of a month, and repeats once a quarter.

- To get consistent results, the set to which \texttt{BYSETPOS} is applied is determined from the beginning of the frequency period independently of when the evaluation occurs. Whether the Scheduler evaluates

  \begin{verbatim}
  FREQ=MONTHLY;BYDAY=MON,TUE,FRI;BYSETPOS=1,3
  \end{verbatim}

  on 01/01/2004 or 01/15/2004, in both cases the expression evaluates to Friday 01/02/2004, and Tuesday 01/06/2004. The only difference is that when the expression is evaluated on 01/15/2004, the Scheduler determines that there are no matches in January because the timestamps found are in the past, and it moves on to the matches in the next month, February.
• If dates in the **BYDATE** clause do not have their optional year component, the job runs on those dates every year.

• The job execution times on the included dates are derived from the **BY** clauses in the calendaring expression. For example, if **repeat_interval** is defined as

  \[
  \text{freq=daily;byhour=8,13,18;byminute=0;bysecond=0;bydate=0502,0922}
  \]

  then the execution times on 05/02 and 09/22 are 8:00 a.m., 1:00 p.m., and 6:00 p.m.

**EXCLUDE Clause Rules**

Excluded dates without a time component are 24 hour periods. All timestamps that fall on an excluded date are removed. In the following example, **jan_fifteen** is a named schedule that resolves to the single date of 01/15:

\[
\text{freq=monthly;bymonthday=15,30;byhour=8,13,18;byminute=0;bysecond=0;exclud=jan_fifteenth}
\]

In this case, all three instances of the job are removed for 01/15.

**OFFSET Rules**

You can adjust the dates of individual named schedules by adding positive offsets to them. For example, to execute **JOB2** exactly 15 days after every occurrence of **JOB1**, add **+OFFSET:15D** to the schedule of **JOB1**, as follows:

```sql
BEGIN
  dbms_scheduler.create_schedule('job2_schedule', repeat_interval =>
    'job1_schedule+OFFSET:15D');
END; /
```

Note that negative offsets to named schedules are not supported.

**Example 143-1 Putting It All Together**

This example demonstrates the use of user-defined frequencies, spans, offsets, and the **BYSETPOS** and **INCLUDE** clauses. (Note that the **OFFSET:** keyword is optional in an offset clause.)

Many companies in the retail industry share the same fiscal year. The fiscal year starts on the Sunday closest to February 1st, and subsequent quarters start exactly 13 weeks later. The fiscal year schedule for the retail industry can be defined as the following:

```sql
begin
  dbms_scheduler.create_schedule('year_start', repeat_interval =>
      'FREQ=YEARLY;BYDATE=0201^SPAN:1W;BYDAY=SUN');
  dbms_scheduler.create_schedule('retail_fiscal_year',
      to_timestamp_tz('15-JAN-2005 12:00:00','DD-MON-YYYY HH24:MI:SS'),
      'year_start,year_start+13w,year_start+26w,year_start+39w;periods=4');
end; /
```

The following schedule can be used to execute a job on the 5th day off in the 2nd and the 4th quarters of the retail industry. This assumes that Saturday and Sunday are off days as well as the days in the existing **holiday** schedule.

```sql
begin
  dbms_scheduler.create_schedule('fifth_day_off', repeat_interval =>
```
The `DBMS_SCHEDULER` package defines **OBJECT** types and **TABLE** types.

**OBJECT Types**
- JOBARG Object Type
- JOB_DEFINITION Object Type
- JOBATTR Object Type
- SCHEDULER$_STEP_TYPE Object Type
- SCHEDULER$_EVENT_INFO Object Type
- SCHEDULER_FILEWATCHER_RESULT Object Type
- SCHEDULER_FILEWATCHER_REQUEST Object Type

**TABLE Types**
- JOBARG_ARRAY Table Type
- JOB_DEFINITION_ARRAY Table Type
- JOBATTR_ARRAY Table Type
- SCHEDULER$_STEP_TYPE_LIST Table Type

### 143.5.1 DBMS_SCHEDULER JOBARG Object Type

This type is used by the JOB and JOBATTR object types. It represents a job argument in a batch of job arguments.

**Syntax**

```
TYPE jobarg IS OBJECT (  
  arg_position         NUMBER,  
  arg_text_value       VARCHAR2(4000),  
  arg_anydata_value    ANYDATA,  
  arg_operation        VARCHAR2(5));
```

**Attributes**

**Table 143-2  JOBARG Object Type Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg_position</td>
<td>Position of the argument</td>
</tr>
<tr>
<td>arg_text_value</td>
<td>Value of the argument if the type is VARCHAR2</td>
</tr>
<tr>
<td>arg_anydata_value</td>
<td>Value of the argument if the type is AnyData</td>
</tr>
</tbody>
</table>
### Table 143-2  (Cont.) JOBARG Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg_operation</td>
<td>Type of the operation:</td>
</tr>
<tr>
<td></td>
<td>• SET</td>
</tr>
<tr>
<td></td>
<td>• RESET</td>
</tr>
</tbody>
</table>

### JOBARG Constructor Function

This constructor function constructs a job argument. It is overloaded to construct job arguments with different types of values.

#### Syntax

Constructs a job argument with a text value.

```sql
constructor function jobarg (  
    arg_position    IN POSITIVEN,  
    arg_value       IN VARCHAR2)  
RETURN SELF AS RESULT;
```

Constructs a job argument with an AnyData value.

```sql
constructor function jobarg (  
    arg_position    IN POSITIVEN,  
    arg_value       IN ANYDATA)  
RETURN SELF AS RESULT;
```

Constructs a job argument with a NULL value.

```sql
constructor function jobarg (  
    arg_position    IN POSITIVEN,  
    arg_reset       IN BOOLEAN DEFAULT FALSE)  
RETURN SELF AS RESULT;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arg_position</td>
<td>Position of the argument</td>
</tr>
<tr>
<td>arg_value</td>
<td>Value of the argument</td>
</tr>
<tr>
<td>arg_reset</td>
<td>If arg_reset is TRUE, then the argument at that position is reset. Setting arg_reset to FALSE (which is the default) will create an argument with a NULL value.</td>
</tr>
</tbody>
</table>

### JOBARG_ARRAY Table Type

#### Syntax

```sql
TYPE jobarg_array IS TABLE OF jobarg;
```
143.5.2 JOBARG_ARRAY Table Type

The jobarg_array type is a table of jobarg.

Syntax

```sql
TYPE jobarg_array IS TABLE OF jobarg;
```

143.5.3 DBMS_SCHEDULER JOB_DEFINITION Object Type

This type is used by the CREATE_JOBS procedure and represents a job in a batch of jobs.

Syntax

```sql
TYPE job_definition IS OBJECT {
    job_name                      VARCHAR2(100),
    job_class                     VARCHAR2(32),
    job_style                     VARCHAR2(11),
    program_name                  VARCHAR2(100),
    job_action                    VARCHAR2(4000),
    job_type                      VARCHAR2(20),
    schedule_name                 VARCHAR2(65),
    repeat_interval               VARCHAR2(4000),
    schedule_limit                INTERVAL DAY TO SECOND,
    start_date                    TIMESTAMP WITH TIME ZONE,
    end_date                      TIMESTAMP WITH TIME ZONE,
    event_condition               VARCHAR2(4000),
    queue_spec                    VARCHAR2(100),
    number_of_arguments           NUMBER,
    arguments                     SYS.JOBARG_ARRAY,
    job_priority                  NUMBER,
    job_weight                    NUMBER,
    max_run_duration              INTERVAL DAY TO SECOND,
    max_runs                      NUMBER,
    max_failures                  NUMBER,
    logging_level                 NUMBER,
    restartable                   VARCHAR2(5),
    stop_on_window_close          VARCHAR2(5),
    raise_events                  NUMBER,
    comments                      VARCHAR2(240),
    auto_drop                     VARCHAR2(5),
    enabled                       VARCHAR2(5),
    follow_default_timezone       VARCHAR2(5),
    parallel_instances            VARCHAR2(5),
    ag_job                        VARCHAR2(5),
    instance_id                   NUMBER,
    credential_name               VARCHAR2(65),
    destination                   VARCHAR2(4000),
    database_role                 VARCHAR2(20),
    allow_runs_in_restricted_mode VARCHAR2(5);
    restart_on_recovery           BOOLEAN;
    restart_on_failure            BOOLEAN;
}
```

Object Attributes

Table 143-4 provides brief descriptions of the attributes of the JOB_DEFINITION object type. For more complete information about these attributes, see the "CREATE_JOB Procedure" and the "SET_ATTRIBUTE Procedure".
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job</td>
</tr>
<tr>
<td>job_class</td>
<td>Name of the job class</td>
</tr>
<tr>
<td>job_style</td>
<td>Style of the job: • REGULAR • LIGHTWEIGHT • IN_MEMORY_RUNTIME • IN_MEMORY_FULL</td>
</tr>
<tr>
<td>program_name</td>
<td>Name of the program that the job runs</td>
</tr>
<tr>
<td>job_action</td>
<td>Inline action of the job. This is either the code for an anonymous PL/SQL block or the name of a stored procedure, external executable, or chain.</td>
</tr>
<tr>
<td>job_type</td>
<td>Job action type ('PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT')</td>
</tr>
<tr>
<td>schedule_name</td>
<td>Name of the schedule that specifies when the job has to execute</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>Inline time-based schedule</td>
</tr>
<tr>
<td>schedule_limit</td>
<td>Maximum delay time between scheduled and actual job start before a job run is canceled</td>
</tr>
<tr>
<td>start_date</td>
<td>Start date and time of the job</td>
</tr>
<tr>
<td>end_date</td>
<td>End date and time of the job</td>
</tr>
<tr>
<td>event_condition</td>
<td>Event condition for event-based jobs</td>
</tr>
<tr>
<td>queue_spec</td>
<td>File watcher name or queue specification for event-based jobs</td>
</tr>
<tr>
<td>number_of_arguments</td>
<td>Number of job arguments</td>
</tr>
<tr>
<td>arguments</td>
<td>Array of job arguments</td>
</tr>
<tr>
<td>job priority</td>
<td>Job priority</td>
</tr>
<tr>
<td>job_weight</td>
<td>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.</td>
</tr>
<tr>
<td>max_run_duration</td>
<td>Maximum run duration of the job</td>
</tr>
<tr>
<td>max_runs</td>
<td>Maximum number of runs before the job is marked as completed</td>
</tr>
<tr>
<td>max_failures</td>
<td>Maximum number of failures tolerated before the job is marked as broken</td>
</tr>
<tr>
<td>logging_level</td>
<td>Job logging level</td>
</tr>
<tr>
<td>restartable</td>
<td>Indicates whether the job is restartable (TRUE) or not (FALSE)</td>
</tr>
<tr>
<td>stop_on_window_close</td>
<td>Indicates whether the job is stopped when the window that it runs in ends (TRUE) or not (FALSE). Equivalent to the stop_on_window_close job attribute described in the SET_ATTRIBUTE Procedure.</td>
</tr>
<tr>
<td>raise_events</td>
<td>State changes that raise events</td>
</tr>
<tr>
<td>comments</td>
<td>Comments on the job</td>
</tr>
<tr>
<td>auto_drop</td>
<td>If TRUE (the default), indicates that the job should be dropped once completed</td>
</tr>
</tbody>
</table>
Table 143-4  (Cont.) JOB_DEFINITION Object Types

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Indicates whether the job should be enabled immediately after creating it (TRUE) or not (FALSE)</td>
</tr>
<tr>
<td>follow_default_timezone</td>
<td>If TRUE and if the job start_date is null, then when the default_timezone scheduler attribute is changed, the Scheduler recomputes the next run date and time for this job so that it is in accordance with the new time zone.</td>
</tr>
<tr>
<td>parallel_instances</td>
<td>For event-based jobs only.</td>
</tr>
<tr>
<td></td>
<td>If TRUE, on the arrival of the specified event, the Scheduler creates a new lightweight job to handle that event, so multiple instances of the same event-based job can run in parallel.</td>
</tr>
<tr>
<td></td>
<td>If FALSE, then an event is discarded if it is raised while the job that handles it is already running,</td>
</tr>
<tr>
<td>aq_job</td>
<td>For internal use only</td>
</tr>
<tr>
<td>instance_id</td>
<td>The instance ID of the instance that the job must run on</td>
</tr>
<tr>
<td></td>
<td>For in-memory full jobs, the instance_id value determines in which instance to stop the job; if left NULL, the job is stopped in all instances.</td>
</tr>
<tr>
<td>credential_name</td>
<td>The credential to use for a single destination or the default credential for a group of destinations</td>
</tr>
<tr>
<td>destination</td>
<td>The name of a single external destination or database destination, or a group name of type external destination or database destination</td>
</tr>
<tr>
<td>database_role</td>
<td>In an Oracle Data Guard environment, the database role ('PRIMARY' or 'LOGICAL STANDBY') for which the job runs</td>
</tr>
<tr>
<td>allow_runs_in_restricted_mode</td>
<td>If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode.</td>
</tr>
<tr>
<td>restart_on_recovery</td>
<td>If set to TRUE for a job and the job is stopped by a database shutdown, then the job is restarted when the database is recovered.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE, and the job is stopped by a database shutdown, then the job is marked as stopped when the database is recovered.</td>
</tr>
<tr>
<td>restart_on_failure</td>
<td>If set to TRUE for a job and the job fails due to an application error, then the job is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the job is marked FAILED.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE (the default), a failed job is immediately marked FAILED.</td>
</tr>
</tbody>
</table>

JOB_DEFINITION Constructor Function

This constructor function constructs a job_definition object.

Syntax

```
constructor function job_definition (    job_name                IN     VARCHAR2,
```
job_style               IN     VARCHAR2 DEFAULT 'REGULAR',
program_name            IN     VARCHAR2 DEFAULT NULL,
job_action              IN     VARCHAR2 DEFAULT NULL,
job_type                IN     VARCHAR2 DEFAULT NULL,
schedule_name           IN     VARCHAR2 DEFAULT NULL,
repeat_interval         IN     VARCHAR2 DEFAULT NULL,
event_condition         IN     VARCHAR2 DEFAULT NULL,
queue_spec              IN     VARCHAR2 DEFAULT NULL,
start_date              IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
end_date                IN     TIMESTAMP WITH TIME ZONE DEFAULT NULL,
number_of_arguments     IN     NATURAL DEFAULT NULL,
arguments               IN     SYS.JOBARG_ARRAY DEFAULT NULL,
job_class               IN     VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
schedule_limit          IN     INTERVAL DAY TO SECOND DEFAULT NULL,
job_priority            IN     NATURAL DEFAULT NULL,
job_weight              IN     NATURAL DEFAULT NULL,
max_run_duration        IN     INTERVAL DAY TO SECOND DEFAULT NULL,
max_runs                IN     NATURAL DEFAULT NULL,
max_failures            IN     NATURAL DEFAULT NULL,
logging_level           IN     NATURALN DEFAULT 64,
restartable             IN     BOOLEAN DEFAULT FALSE,
stop_on_window_close    IN     BOOLEAN DEFAULT FALSE,
raise_events            IN     NATURAL DEFAULT NULL,
comments                IN     VARCHAR2 DEFAULT NULL,
auto_drop               IN     BOOLEAN DEFAULT TRUE,
enabled                 IN     BOOLEAN DEFAULT FALSE,
follow_default_timezone IN     BOOLEAN DEFAULT FALSE,
parallel_instances      IN     BOOLEAN DEFAULT FALSE,
ag_job                  IN     BOOLEAN DEFAULT FALSE,
instance_id             IN     NATURAL DEFAULT NULL,
credential_name         IN     VARCHAR2 DEFAULT NULL,
destination             IN     VARCHAR2 DEFAULT NULL,
database_role           IN     VARCHAR2 DEFAULT NULL,
allow_runs_in_restricted_mode IN BOOLEAN DEFAULT FALSE)
RETURN SELF AS RESULT;

JOB_DEFINITION_ARRAY Table Type

Syntax

TYPE job_definition_array IS TABLE OF job_definition;

143.5.4 JOB_DEFINITION_ARRAY Table Type

The type job_definition_array is a table of job_definition.

Syntax

TYPE job_definition_array IS TABLE OF job_definition;

143.5.5 JOBATTR Object Type

This type is used by the SET_JOB_ATTRIBUTES procedure and represents a job attribute in a batch of job attributes.

Syntax

TYPE jobattr IS OBJECT {
    job_name             VARCHAR2(100),
    attr_name            VARCHAR2(30),
    ...}
char_value | VARCHAR2(4000),
char_value2 | VARCHAR2(4000),
args_value | JOBARG_ARRAY,
num_value | NUMBER,
timestamp_value | TIMESTAMP(6) WITH TIME ZONE,
interval_value | INTERVAL DAY(2) TO SECOND(6));

**Attributes**

**Table 143-5  JOBATTR Object Type Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job</td>
</tr>
<tr>
<td>attr_name</td>
<td>Name of the attribute</td>
</tr>
<tr>
<td>char_value</td>
<td>Value of the argument if the type is VARCHAR2</td>
</tr>
<tr>
<td>char_value2</td>
<td>Second VARCHAR2 attribute value</td>
</tr>
<tr>
<td>args_value</td>
<td>Value of the argument if the type is a JOBARG array</td>
</tr>
<tr>
<td>num_value</td>
<td>Value of the argument if the type is NUMBER</td>
</tr>
<tr>
<td>timestamp_value</td>
<td>Value of the argument if the type is TIMESTAMP WITH TIME ZONE</td>
</tr>
<tr>
<td>interval_value</td>
<td>Value of the argument if the type is INTERVAL DAY TO SECOND</td>
</tr>
</tbody>
</table>

**JOBATTR Constructor Function**

This constructor function constructs a job attribute. It is overloaded to create attribute values of the following types: VARCHAR2, NUMBER, TIMESTAMP WITH TIME ZONE, INTERVAL DAY TO SECOND, and an array of JOBARG types.

**Syntax**

```sql
constructor function jobattr (  
  job_name            IN VARCHAR2,
  attr_name           IN VARCHAR2,
  attr_value          IN VARCHAR2,
  attr_value2         IN VARCHAR2 DEFAULT NULL)  
RETURN SELF AS RESULT;
```

```sql
constructor function jobattr (  
  job_name            IN VARCHAR2,
  attr_name           IN VARCHAR2,
  attr_value          IN [NUMBER, BOOLEAN,
                           TIMESTAMP WITH TIME ZONE,
                           INTERVAL DAY TO SECOND, JOBARG_ARRAY])  
RETURN SELF AS RESULT;
```

```sql
constructor function jobattr (  
  job_name            IN VARCHAR2,
  attr_name           IN VARCHAR2)  
RETURN SELF AS RESULT;
```

**Parameters**
Table 143-6  JOBATTR Constructor Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job</td>
</tr>
<tr>
<td>attr_name</td>
<td>Name of the argument</td>
</tr>
<tr>
<td>attr_value</td>
<td>Value of the argument</td>
</tr>
<tr>
<td>attr_value2</td>
<td>Most attributes have only one value associated with them, but some can have two. The attr_value2 argument is for this optional second value.</td>
</tr>
</tbody>
</table>

JOBATTR Table Type

Syntax

```plsql
TYPE jobattr_array IS TABLE OF jobattr;
```

143.5.6 JOBATTR_ARRAY Table Type

The type jobattr_array is a table of jobattr.

Syntax

```plsql
TYPE jobattr_array IS TABLE OF jobattr;
```

143.5.7 SCHEDULER$_STEP_TYPE Object Type

This type is used by RUN_CHAIN to return a list of chain steps with an initial state.

Syntax

```plsql
TYPE scheduler$_step_type IS OBJECT (
  step_name  VARCHAR2(32),
  step_type  VARCHAR2(32));
```

Attributes

Table 143-7  SCHEDULER$_STEP_TYPE Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>step_name</td>
<td>Name of the step</td>
</tr>
<tr>
<td>step_type</td>
<td>State of the step</td>
</tr>
</tbody>
</table>

143.5.8 SCHEDULER$_STEP_TYPE_LIST Table Type

This type is a table of scheduler$_step_type.

Syntax

```plsql
TYPE scheduler$_step_type_list IS TABLE OF scheduler$_step_type;
```
143.5.9 SCHEDULER$_EVENT_INFO Object Type

This is the datatype of the Scheduler event queue SYS.SCHEDULER$_EVENT_QUEUE, from which your application consumes job state events raised by the Scheduler.

It is a secure queue owned by SYS.

Syntax

TYPE SCHEDULER$_EVENT_INFO IS OBJECT (
    event_type VARCHAR2(4000),
    object_owner VARCHAR2(4000),
    object_name VARCHAR2(4000),
    event_timestamp TIMESTAMP WITH TIME ZONE,
    error_code NUMBER,
    error_msg VARCHAR2(4000),
    event_status NUMBER,
    log_id NUMBER,
    run_count NUMBER,
    failure_count NUMBER,
    retry_count NUMBER,
    spare1 NUMBER,
    spare2 NUMBER,
    spare3 VARCHAR2(4000),
    spare4 VARCHAR2(4000),
    spare5 TIMESTAMP WITH TIME ZONE,
    spare6 TIMESTAMP WITH TIME ZONE,
    spare7 RAW(2000),
    spare8 RAW(2000));

Attributes

Table 143-8  SCHEDULER_EVENT_INFO Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>event_type</td>
<td>One of &quot;JOB_STARTED&quot;, &quot;JOB_SUCCEEDED&quot;, &quot;JOB_FAILED&quot;, &quot;JOB_BROKEN&quot;, &quot;JOB_COMPLETED&quot;, &quot;JOB_STOPPED&quot;, &quot;JOB_SCH_LIM_REACHED&quot;, &quot;JOB_DISABLED&quot;, &quot;JOB_CHAIN_STALLED&quot;, &quot;JOB_OVER_MAX_DUR&quot;. For descriptions of these event types, see Table 143-84.</td>
</tr>
<tr>
<td>object_owner</td>
<td>Owner of the job that raised the event</td>
</tr>
<tr>
<td>object_name</td>
<td>Name of the job that raised the event</td>
</tr>
<tr>
<td>event_timestamp</td>
<td>Time at which the event occurred</td>
</tr>
<tr>
<td>error_code</td>
<td>Applicable only when an error is thrown during job execution. Contains the top-level error code.</td>
</tr>
<tr>
<td>error_msg</td>
<td>Applicable only when an error is thrown during job execution. Contains the entire error stack.</td>
</tr>
</tbody>
</table>
Table 143-8  (Cont.) SCHEDULER_EVENT_INFO Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
</table>
| event_status    | Adds further qualification to the event type. If event_type is "JOB_STARTED," status 1 indicates that it is a normal start, and status 2 indicates that it is a retry.  
If event_type is "JOB_FAILED," status 4 indicates that it was a failure due to an error that was thrown during job execution, and status 8 indicates that it was an abnormal termination of some kind.  
If event_type is "JOB_STOPPED," status 16 indicates that it was a normal stop, and status 32 indicates that it was a stop with the FORCE option set to TRUE. |
| log_id          | Points to the ID in the scheduler job log from which additional information can be obtained. Note that there need not always be a log entry corresponding to an event. In such cases, log_id is NULL. |
| run_count       | Run count for the job when the event was raised.                                                                                               |
| failure_count   | Failure count for the job when the event was raised.                                                                                           |
| retry_count     | Retry count for the job when the event was raised.                                                                                             |
| spare1 – spare8 | Not currently in use.                                                                                                                          |

143.5.10 SCHEDULER_FILEWATCHER_RESULT Object Type

This is the datatype of a file arrival event message.

You access the event message as a parameter of an event-based job (or a parameter of a program referenced by an event-based job). The message contains information needed to locate and process a file that arrived on a local or remote system.

Syntax

```sql
TYPE scheduler_filewatcher_result IS OBJECT (  
destination VARCHAR2(4000),  
directory_path VARCHAR2(4000),  
actual_file_name VARCHAR2(4000),  
file_size NUMBER,  
file_timestamp TIMESTAMP WITH TIME ZONE,  
ts_ms_from_epoch NUMBER,  
matching_requests SYS.SCHEDULER_FILEWATCHER_REQ_LIST);  
```

Attributes

Table 143-9  SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Destination at which the file was found, expressed as a host name or IP address.</td>
</tr>
<tr>
<td>directory_path</td>
<td>Absolute path of directory in which the file was found.</td>
</tr>
<tr>
<td>actual_file_name</td>
<td>Actual name of the file that was found. If the file name specified in the file watcher did not contain wildcards, then this is the same as the name specified in the file watcher.</td>
</tr>
</tbody>
</table>
Table 143-9  (Cont.) SCHEDULER_FILEWATCHER_RESULT Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_size</td>
<td>Size of the file that was found, in bytes.</td>
</tr>
<tr>
<td>file_timestamp</td>
<td>Timestamp assigned to the file when the file watcher considered the file found, based on the minimum file size and steady state duration attributes.</td>
</tr>
<tr>
<td>ts_ms_from_epoch</td>
<td>For internal use only.</td>
</tr>
<tr>
<td>matching_requests</td>
<td>List of matching requests. This is a TABLE of type objects SCHEDULER_FILEWATCHER_REQUEST. Each matching request corresponds to a file watcher whose destination, directory_path, and file_name attributes matched the arrived file. See &quot;SCHEDULER_FILEWATCHER_REQUEST Object Type&quot;.</td>
</tr>
</tbody>
</table>

143.5.11 SCHEDULER_FILEWATCHER_REQUEST Object Type

This type is returned in the matching_requests attribute of the SCHEDULER_FILEWATCHER_RESULT Object Type. Its attributes are similar to the attributes of a file watcher.

Syntax

```sql
TYPE scheduler_filewatcher_request IS OBJECT (
  owner      VARCHAR2(4000),
  name       VARCHAR2(4000),
  requested_path_name VARCHAR2(4000),
  requested_file_name VARCHAR2(4000),
  credential_owner VARCHAR2(4000),
  credential_name VARCHAR2(4000),
  min_file_size NUMBER,
  steady_state_dur NUMBER);
```

Attributes

Table 143-10  SCHEDULER_FILEWATCHER_REQUEST Object Type Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner</td>
<td>Owner of the matched file watcher.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the matched file watcher.</td>
</tr>
<tr>
<td>requested_path_name</td>
<td>Value of the directory_path attribute of the matched file watcher.</td>
</tr>
<tr>
<td>requested_file_name</td>
<td>Value of the file_name attribute of the matched file watcher.</td>
</tr>
<tr>
<td>credential_owner</td>
<td>Owner of the credential referenced by the matched file watcher.</td>
</tr>
<tr>
<td>credential_name</td>
<td>Name of the credential referenced by the matched file watcher.</td>
</tr>
<tr>
<td>min_file_size</td>
<td>Value of the min_file_size attribute of the matched file watcher.</td>
</tr>
<tr>
<td>steady_state_dur</td>
<td>Value of the steady_state_duration attribute of the matched file watcher.</td>
</tr>
</tbody>
</table>

</table>

#### 143.6.1 ADD_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure adds a user as a subscriber to the Scheduler event queue `SYS.SCHEDULER$_EVENT_QUEUE`, and grants the user permission to dequeue from this queue using the designated agent.

**Syntax**

```sql
DBMS_SCHEDULER.ADD_EVENT_QUEUE_SUBSCRIBER {
   subscriber_name IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 143-12  ADD_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_name</td>
<td>Name of the Oracle Streams Advanced Queuing (AQ) agent to be used to subscribe to the Scheduler event queue. If NULL, an agent is created and assigned the user name of the calling user.</td>
</tr>
</tbody>
</table>

Usage Notes

The subscription is rule-based. The rule permits the user to see only events raised by jobs that the user owns, and filters out all other messages. If an AQ agent with the same name already exists, an error is raised.

143.6.2 ADD_GROUP_MEMBER Procedure

This procedure adds one or more members to an existing group.

Syntax

```sql
DBMS_SCHEDULER.ADD_GROUP_MEMBER (  
group_name              IN VARCHAR2,  
member                  IN VARCHAR2);```

Parameters

Table 143-13  ADD_GROUP_MEMBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the group.</td>
</tr>
<tr>
<td>member</td>
<td>A comma-separated list of members to add to the group. Members must match the group type. A group of the same type can be a member. The Scheduler immediately expands the included group name into its list of members. An error is returned if any of the members do not exist. A member that is already in the group is skipped, and no error is generated. The keyword LOCAL can be included as a member for database destination or external destination groups. See the &quot;CREATE_GROUP Procedure&quot; for information about this keyword.</td>
</tr>
</tbody>
</table>

Usage Notes

The following users may add members to a group:

- The group owner
- A user that has been granted the ALTER object privilege on the group
- A user with the CREATE ANY JOB system privilege

You must have the MANAGE_SCHEDULER privilege to add a member to a group of type WINDOW.
143.6.3 ADD_JOB_EMAIL_NOTIFICATION Procedure

This procedure adds e-mail notifications for a job. E-mails are then sent to the specified list of recipients whenever any of the specified job state events is raised.

Syntax

```sql
DBMS_SCHEDULER.ADD_JOB_EMAIL_NOTIFICATION (  
  job_name             IN VARCHAR2,
  recipients           IN VARCHAR2,
  sender               IN VARCHAR2 DEFAULT NULL,
  subject              IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_SUBJECT,
  body                 IN VARCHAR2 DEFAULT DBMS_SCHEDULER.DEFAULT_NOTIFICATION_BODY,
  events               IN VARCHAR2 DEFAULT 'JOB_FAILED,JOB_BROKEN,JOB_SCH_LIM_REACHED,
                        JOB_CHAIN_STALLED,JOB_OVER_MAX_DUR',
  filter_condition     IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job that e-mail notifications are added for. Cannot be NULL.</td>
</tr>
<tr>
<td>recipients</td>
<td>Comma-separated list of e-mail addresses to send notifications to. E-mail</td>
</tr>
<tr>
<td></td>
<td>notifications for all listed events are sent to all recipients. Cannot be</td>
</tr>
<tr>
<td></td>
<td>NULL.</td>
</tr>
<tr>
<td>sender</td>
<td>e-mail address to use as the sender address (the From: address) in the e-mail</td>
</tr>
<tr>
<td></td>
<td>header. If NULL or omitted, the e-mail address specified in the Scheduler</td>
</tr>
<tr>
<td></td>
<td>attribute email_sender is used. See Oracle Database Administrator's Guide</td>
</tr>
<tr>
<td></td>
<td>for more information on this Scheduler attribute.</td>
</tr>
<tr>
<td>subject</td>
<td>The subject to use in the e-mail header. Table 143-15 describes the variables</td>
</tr>
<tr>
<td></td>
<td>that you can include within this parameter. The Scheduler assigns values to</td>
</tr>
<tr>
<td></td>
<td>these variables before sending the notification. If subject is omitted, the</td>
</tr>
<tr>
<td></td>
<td>default subject is used. The default subject is the following text, where</td>
</tr>
<tr>
<td></td>
<td>text enclosed in the '%' character represents a variable:</td>
</tr>
<tr>
<td></td>
<td>'Oracle Scheduler Job Notification - %job_owner%.%job_name%.</td>
</tr>
<tr>
<td></td>
<td>%job_subname% %event_type%'</td>
</tr>
</tbody>
</table>
Table 143-14  (Cont.) ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>body</td>
<td>The body of the e-mail message. Table 143-15 describes the variables that you can include within this parameter. The Scheduler assigns values to these variables before sending the notification. If <code>body</code> is omitted, the default body is used. The default body is the following text, where text enclosed in the '%' character represents a variable:</td>
</tr>
</tbody>
</table>
|             | 'Job: %job_owner%.%job_name%.%job_subname%  
|             | Event: %event_type%  
|             | Date: %event_timestamp%  
|             | Log id: %log_id%  
|             | Job class: %job_class_name%  
|             | Run count: %run_count%  
|             | Failure count: %failure_count%  
|             | Retry count: %retry_count%  
|             | Error code: %error_code%  
|             | Error message: %error_message%' |
| events      | Comma-separated list of job state events to send e-mail notifications for. Cannot be NULL. A notification is sent to all recipients if any of the listed events is raised. Table 143-84 lists the valid events for this parameter. If `events` is omitted, notifications are sent for the following default events: |
|             | JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, JOB_CHAIN_STALLED, JOB_OVER_MAX_DUR |
| filter_condition | Used to filter events to send e-mail notifications for. If NULL, all occurrences of the specified events cause e-mail notifications to be sent. `filter_condition` must be a boolean SQL WHERE clause that may refer to the `:event` bind variable. This bind variable is automatically bound to an object of type SCHEDULER$_EVENT_INFO that represents the raised event. |
|             | For example, to send an e-mail notification only when the error number in an event is 600 or 700, use the following `filter_condition`: |
|             | :event.error_code=600 or :event.error_code=700 |
|             | See "SCHEDULER$_EVENT_INFO Object Type". |

Table 143-15 lists the variables that you can use in the subject and body arguments.

</tr>
<tr>
<td>%failure_count%</td>
<td>Failure count for the job when the event was raised</td>
</tr>
<tr>
<td>%retry_count%</td>
<td>Retry count for the job when the event was raised</td>
</tr>
</tbody>
</table>

Usage Notes

You can call ADD_JOB_EMAIL_NOTIFICATION once for each different set of notifications that you want to configure for a particular job. For example, you may want to send notifications for the JOB_FAILED, JOB_BROKEN, JOB_SCH_LIM_REACHED, and JOB_CHAIN_STALLED events to the principle DBA and all senior DBAs, but send a notification for the JOB_OVER_MAX_DUR event only to the principle DBA.

This procedure succeeds only if the Scheduler attribute email_server is set to a valid SMTP server. See Oracle Database Administrator’s Guide for more information.

To call this procedure, you must be the job owner or have the CREATE ANY JOB system privilege or have the ALTER object privilege on the job.

143.6.4 ADD_TO_INCOMPATIBILITY Procedure

This procedure adds jobs or programs to an existing incompatibility definition.

Syntax

```sql
DBMS_SCHEDULER.ADD_TO_INCOMPATIBILITY (incompatibility_name    IN VARCHAR2,
                                        object_name             IN VARCHAR2);
```

Parameters

Table 143-16  ADD_TO_INCOMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incompatibility_name</td>
<td>The name of the incompatibility definition.</td>
</tr>
<tr>
<td>object_name</td>
<td>One or more (comma-separated) programs or jobs</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not raise an error if any specified objects already exist in the incompatibility definition.
143.6.5 ALTER_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects all future runs of the specified steps, both in the currently running chain job and in future runs of the same chain job or other chain jobs that point to the chain.

Syntax

Alters the value of a boolean attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (  
    chain_name IN VARCHAR2,  
    step_name IN VARCHAR2,  
    attribute IN VARCHAR2,  
    value IN BOOLEAN);
```

Alters the value of a character attribute of one or more steps:

```
DBMS_SCHEDULER.ALTER_CHAIN (  
    chain_name IN VARCHAR2,  
    step_name IN VARCHAR2,  
    attribute IN VARCHAR2,  
    char_value IN VARCHAR2);
```

Parameters

Table 143-17 ALTER_CHAIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step or a comma-separated list of steps to alter. This cannot be NULL.</td>
</tr>
</tbody>
</table>

</tr>
<tr>
<td></td>
<td>• 'PAUSE'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step, after the step has run, its state changes to PAUSED (and the completed attribute remains FALSE).</td>
</tr>
<tr>
<td></td>
<td>If PAUSE is reset to FALSE for a paused chain step (using ALTER_RUNNING_CHAIN), the state is set to its completion state (SUCCEEDED, FAILED, or STOPPED) and the completed attribute is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>Setting PAUSE has no effect on steps that have already run. This allows execution of a chain to be suspended after the execution of certain steps.</td>
</tr>
<tr>
<td></td>
<td>• 'PAUSED_BEFORE'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step and if any of the rule conditions that start the step are true, then its state changes to PAUSED and the step does not run.</td>
</tr>
<tr>
<td></td>
<td>If PAUSE_BEFORE is reset to FALSE for a chain step that has paused before starting (using ALTER_RUNNING_CHAIN), then the step starts running if any of the rule conditions that start the step are true.</td>
</tr>
<tr>
<td></td>
<td>Setting PAUSE BEFORE has no effect on steps that are running or have already run. This allows execution of a chain to be suspended before the execution of certain steps.</td>
</tr>
<tr>
<td></td>
<td>• 'SKIP'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded.</td>
</tr>
<tr>
<td></td>
<td>Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met, the step immediately changes to state PAUSED.</td>
</tr>
<tr>
<td></td>
<td>• 'RESTART_ON_FAILURE'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</td>
</tr>
<tr>
<td></td>
<td>• 'RESTART_ON_RECOVERY'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step and the step is stopped by a database shutdown, then the step is restarted when the database is recovered.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE, and the step is stopped by a database shutdown, then the step is marked as stopped when the database is recovered and the chain continues.</td>
</tr>
<tr>
<td></td>
<td>• 'DESTINATION_NAME'</td>
</tr>
<tr>
<td></td>
<td>The name of an existing database destination or external destination. You can view external destination names in the view ALL_SCHEDULER_EXTERNAL_DESTS, and database destination names in the views *_SCHEDULER_DB_DESTS. You cannot specify a destination group for this attribute. This parameter is NULL by default.</td>
</tr>
<tr>
<td></td>
<td>• 'CREDENTIAL_NAME'</td>
</tr>
</tbody>
</table>
|                 | The credential to use when running this step. NULL by default. }
**Table 143-17 (Cont.) ALTER_CHAIN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>The value to set for the attribute (for a boolean attribute).</td>
</tr>
<tr>
<td>char_value</td>
<td>The value to set for the attribute (for a character attribute).</td>
</tr>
</tbody>
</table>

**Usage Notes**

Altering a chain requires `ALTER` privileges on the chain either by being the owner of the chain, or by having the `ALTER` object privilege on the chain or by having the `CREATE ANY JOB` system privilege.

### 143.6.6 ALTER_RUNNING_CHAIN Procedure

This procedure alters an attribute of the specified steps of a chain. This affects only steps of the instance of the chain for the specified running chain job.

**Syntax**

```sql
DBMS_SCHEDULER.ALTER_RUNNING_CHAIN (  
    job_name    IN VARCHAR2,  
    step_name   IN VARCHAR2,  
    attribute   IN VARCHAR2,  
    value       IN (BOOLEAN|VARCHAR2)),
```

**Parameters**

**Table 143-18 ALTER_RUNNING_CHAIN Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job that is running the chain</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step or a comma-separated list of steps to alter. If this is set to <code>NULL</code> and attribute is <code>PAUSE</code> or <code>SKIP</code>, then all steps of the running chain are altered.</td>
</tr>
</tbody>
</table>
### Table 143-18  (Cont.) ALTER_RUNNING_CHAIN Procedure Parameters

<td>• 'SKIP'</td>
</tr>
<tr>
<td></td>
<td>If the SKIP attribute is set to TRUE for a step, when the step condition is met, instead of being run, the step is treated as if it has immediately succeeded. Setting SKIP to TRUE has no effect for a step that is running, scheduled to run after a delay, or has already run.</td>
</tr>
<tr>
<td></td>
<td>If step_name is set to NULL, SKIP is set TRUE for all steps of this running chain. If SKIP is set TRUE for a step that PAUSE is also set for, when the step condition is met the step immediately changes to state PAUSED.</td>
</tr>
<tr>
<td></td>
<td>• 'RESTART_ON_FAILURE'</td>
</tr>
<tr>
<td></td>
<td>If set to TRUE for a step and the step fails due to an application error, then the step is retried using the normal Scheduler retry mechanism (after 1 second, after 10 seconds, after 100 seconds, and so on, up to a maximum of 6 times). If all 6 retries fail (after about 30 hours), then the chain step is marked FAILED.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE (the default), a failed chain step is immediately marked FAILED.</td>
</tr>
<tr>
<td></td>
<td>• 'RESTART_ON_RECOVERY'</td>
</tr>
<tr>
<td></td>
<td>If the RESTART_ON_RECOVERY attribute is set to TRUE for a step, then if the step is stopped by a database shutdown, it is restarted when the database is recovered.</td>
</tr>
<tr>
<td></td>
<td>If set to FALSE, then if the step is stopped by a database shutdown, the step is marked as stopped when the database is recovered and the chain continues.</td>
</tr>
<tr>
<td></td>
<td>• 'STATE'</td>
</tr>
<tr>
<td></td>
<td>This changes the state of the steps. The state can only be changed if the step is not running. The state can only be changed to one of the following:</td>
</tr>
<tr>
<td></td>
<td>'NOT_STARTED', 'SUCCEEDED', 'FAILED error_code'</td>
</tr>
<tr>
<td></td>
<td>If the state is being changed to FAILED, an error code must be included (this must be a positive integer).</td>
</tr>
<tr>
<td>value</td>
<td>The value to set for the attribute. Valid values are: TRUE, FALSE, 'NOT_STARTED', 'SUCCEEDED', or 'FAILED error_code'</td>
</tr>
</tbody>
</table>

Usage Notes

Altering a running chain requires you to have alter privileges on the job that is running (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

143.6.7 CLOSE_WINDOW Procedure

This procedure closes an open window prematurely. A closed window means that it is no longer in effect. When a window is closed, the Scheduler switches the resource
plan to the one that is in effect outside the window, or in the case of overlapping windows, to another window.

Syntax

```sql
DBMS_SCHEDULER.CLOSE_WINDOW (
    window_name             IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window</td>
</tr>
</tbody>
</table>

Usage Notes

If you try to close a window that does not exist or is not open, an error is generated.

A job that is running does not stop when the window it is running in closes, unless the attribute `stop_on_window_close` is set to TRUE for the job. However, the resources allocated to the job can change if the resource plan changes.

When a running job has a group of type `WINDOW` as its schedule, the job is not stopped when its window is closed if another window in the same window group becomes active. This is the case even if the job has the attribute `stop_on_window_close` set to TRUE.

Closing a window requires the `MANAGE_SCHEDULER` privilege.

143.6.8 COPY_JOB Procedure

This procedure copies all attributes of an existing job to a new job. The new job is created disabled, while the state of the existing job is unaltered.

Syntax

```sql
DBMS_SCHEDULER.COPY_JOB (
    old_job                IN VARCHAR2,
    new_job                IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_job</td>
<td>The name of the existing job</td>
</tr>
<tr>
<td>new_job</td>
<td>The name of the new job</td>
</tr>
</tbody>
</table>

Usage Notes

To copy a job, you must have privileges to create a job in the schema of the new job (the `CREATE_JOB` system privilege if it is in your own schema, otherwise, the `CREATE ANY...`
JOB system privilege). If the old job is not in the your own schema, then you must also have ALTER privileges on the old job or the CREATE ANY JOB system privilege.

143.6.9 CREATE_CHAIN Procedure

This procedure creates a new chain. The chain name can be optionally qualified with a schema name (for example, myschema.myname).

A chain is always created as disabled and must be enabled with the ENABLE Procedure before it can be used.

Syntax

```
DBMS_SCHEDULER.CREATE_CHAIN (
    chain_name              IN VARCHAR2,
    rule_set_name           IN VARCHAR2 DEFAULT NULL,
    evaluation_interval     IN INTERVAL DAY TO SECOND DEFAULT NULL,
    comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 143-21**  CREATE_CHAIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name to assign to the new chain, which can optionally be qualified with a schema. This must be unique in the SQL namespace, therefore, there cannot already be a table or other object with this name and schema.</td>
</tr>
<tr>
<td>rule_set_name</td>
<td>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use DEFINE_CHAIN_RULE to add rules and DROP_CHAIN_RULE to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form SCHED_RULESET${N} and the evaluation context created is of the form SCHED_EVCTX${N}. See Oracle Streams Concepts and Administration for information on rules and rule sets.</td>
</tr>
<tr>
<td>evaluation_interval</td>
<td>If this is NULL, reevaluation of the rules of a running chain are performed only when the job starts and when a step completes. A non-NULL value causes rule evaluations to also occur periodically at the specified interval. Because evaluation may be CPU-intensive, this should be conservatively set to the highest possible value or left at NULL if possible. evaluation_interval cannot be less than a minute or greater than a day.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment describing the purpose of the chain</td>
</tr>
</tbody>
</table>

Usage Notes

To create a chain in your own schema, you must have the CREATE JOB system privilege. To create a chain in a different schema you must have the CREATE ANY JOB system privilege. If you do not provide a rule_set_name, a rule set and evaluation context is created in the schema that the chain is being created in, so you must have the...
privileges required to create these objects. See the `DBMS_RULE_ADM.CREATE_RULE_SET` and `DBMS_RULE_ADM.CREATE_EVALUATION_CONTEXT` procedures for more information.

### 143.6.10 CREATE_CREDENTIAL Procedure

This deprecated procedure creates a stored username/password pair. Credentials are assigned to jobs so that they can authenticate with a local or remote host operating system or a remote Oracle database.

> **Note:**
>
> This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the `CREATE_CREDENTIAL` Procedure.

#### Syntax

```sql
DBMS_SCHEDULER.CREATE_CREDENTIAL (
    credential_name         IN VARCHAR2,
    username                IN VARCHAR2,
    password                IN VARCHAR2,
    database_role           IN VARCHAR2 DEFAULT NULL,
    windows_domain          IN VARCHAR2 DEFAULT NULL,
    comments                IN VARCHAR2 DEFAULT NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>credential_name</code></td>
<td>The name to assign to the credential. It can optionally be prefixed with a schema name. It cannot be set to NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td><code>username</code></td>
<td>The user name for logging into the host operating system or remote Oracle database. This cannot be set to NULL and is case-sensitive. It cannot contain double quotes or spaces. Maximum length is 64.</td>
</tr>
<tr>
<td><code>password</code></td>
<td>The password for the user name. This cannot be set to NULL and is case sensitive. The password is stored obfuscated and is not displayed in the Scheduler dictionary views. Maximum length is 128.</td>
</tr>
</tbody>
</table>
| `database_role`   | The value of the `database_role` attribute is used as the system privilege for logging into a remote database to run a remote database job.  
                     Valid values are: `SYSDBA` and `SYSOPER` |
| `windows_domain`  | For a Windows remote executable target, this is the domain that the specified user belongs to. The domain is converted to uppercase automatically. Maximum length is 64. |
| `comments`        | A text string that can be used to describe the credential. Scheduler does not use this parameter. Maximum length is 240. |
Usage Notes

Credentials reside in a particular schema and can be created by any user with the 
`CREATE JOB` system privilege. To create a credential in a schema other than your own, 
you must have the `CREATE ANY JOB` privilege.

143.6.11 CREATE_DATABASE_DESTINATION Procedure

This procedure creates a database destination. A database destination represents an 
Oracle database on which remote database jobs run.

The host that the remote database resides on must have a running Scheduler agent 
that is registered with the database that this procedure is called from.

Syntax

```sql
DBMS_SCHEDULER.CREATE_DATABASE_DESTINATION (  
    destination_name        IN VARCHAR2,  
    agent                   IN VARCHAR2,  
    tns_name                IN VARCHAR2,  
    comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_name</td>
<td>The name to assign to the database destination. It can optionally be prefixed with a schema name. Cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
<tr>
<td>agent</td>
<td>The external destination name of the Scheduler agent to connect. Equivalent to an agent name. The external destination must already exist. The external destination representing an agent is created automatically on a database instance when the agent registers with that instance. An agent's name is specified in its agent configuration file. If it is not specified, it defaults to the first part (before the first period) of the name of the host it resides on.</td>
</tr>
<tr>
<td>tns_name</td>
<td>An Oracle Net connect identifier that is resolved to the Oracle database instance being connected to. The exact syntax depends on the Oracle Net configuration. The connect identifier can be a complete Oracle Net connect descriptor (network address and database service name) or a <code>net service name</code>, which is an alias for a connect descriptor. The alias must be resolved in the tnsnames.ora file on the local computer. The maximum size for tns_name is 2000 characters. If tns_name is NULL, the agent connects to the default Oracle database on its host. You specify the default database by assigning values to the <code>ORACLE_HOME</code> and <code>ORACLE_SID</code> parameters in the agent configuration file, schagent.conf, located in the agent home directory. See Oracle Database Net Services Administrator's Guide for more information on connect identifiers.</td>
</tr>
<tr>
<td>comments</td>
<td>A text string that describes the database destination. Scheduler does not use this argument.</td>
</tr>
</tbody>
</table>
Usage Notes

Database destinations reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a database destination in a schema other than your own, you must have the CREATE ANY JOB privilege.

143.6.12 CREATE_EVENT_SCHEDULE Procedure

This procedure creates an event schedule, which is used to start a job when a particular event is raised.

Syntax

```sql
DBMS_SCHEDULER.CREATE_EVENT_SCHEDULE (    
schedule_name IN VARCHAR2,    
start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,    
event_condition IN VARCHAR2 DEFAULT NULL,    
queue_spec IN VARCHAR2,    
end_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,    
comments IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the date and time that this schedule becomes valid. Occurrences of the event before this date and time are ignored in the context of this schedule.</td>
</tr>
<tr>
<td>event_condition</td>
<td>This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression, provided that the message payload is an object type, and that you prefix object attributes in the expression with <code>tab.user_data</code>. For more information on rules, see the <code>DBMS_AQADM.ADD_SUBSCRIBER</code> procedure.</td>
</tr>
<tr>
<td>queue_spec</td>
<td>This argument specifies either a file watcher name or the queue into which events that start this particular job are enqueued (the source queue). If the source queue is a secure queue, the <code>queue_spec</code> argument is a string containing a pair of values of the form <code>queue_name, agent name</code>. For non-secure queues, only the queue name need be provided. If a fully qualified queue name is not provided, the queue is assumed to be in the job owner's schema. In the case of secure queues, the agent name provided should belong to a valid agent that is currently subscribed to the queue.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date and time after which jobs do not run and windows do not open. An event schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> must be after the <code>start_date</code>. If it is not, then an error is generated when the schedule is created.</td>
</tr>
</tbody>
</table>
Table 143-24  (Cont.) CREATE_EVENT_SCHEDULE Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else’s schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

See Also:
"CREATE_FILE_WATCHER Procedure"

143.6.13 CREATE_FILE_WATCHER Procedure

This procedure creates a file watcher, which is a Scheduler object that defines the location, name, and other properties of a file whose arrival on a system causes the Scheduler to start a job. After you create a file watcher, you reference it in an event-based job or event schedule.

Syntax

DBMS_SCHEDULER.CREATE_FILE_WATCHER ( 
  file_watcher_name            IN VARCHAR2,  
  directory_path               IN VARCHAR2,  
  file_name                    IN VARCHAR2,  
  credential_name              IN VARCHAR2,  
  destination                  IN VARCHAR2  DEFAULT NULL,  
  min_file_size                IN PLS_INTEGER DEFAULT 0,  
  steady_state_duration        IN INTERVAL DAY TO SECOND DEFAULT NULL,  
  comments                     IN VARCHAR2 DEFAULT NULL,  
  enabled                      IN BOOLEAN DEFAULT TRUE);  

Parameters

Table 143-25  CREATE_FILE_WATCHER Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_watcher_name</td>
<td>The name to assign to the file watcher. The name must be unique in the SQL namespace. For example, a file watcher cannot have the same name as a table in a schema. This can optionally be prefixed with a schema name. Cannot be NULL.</td>
</tr>
</tbody>
</table>
Table 143-25  (Cont.) CREATE_FILE_WATCHER Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory_path</td>
<td>Directory in which the file is expected to arrive. The single wildcard '?' at the beginning of the path denotes the Oracle home path. For example, '/rdbms/log' denotes the rdbms/log subdirectory of the Oracle home directory.</td>
</tr>
<tr>
<td>file_name</td>
<td>Name of the file to look for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.</td>
</tr>
<tr>
<td>credential_name</td>
<td>Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have EXECUTE privileges on the credential. Cannot be NULL.</td>
</tr>
<tr>
<td>destination</td>
<td>Name of an external destination. You create an external destination by registering a remote Scheduler agent with the database. See the view ALL_SCHEDULER_EXTERNAL_DESTS for valid external destination names. If this parameter is NULL, the file watcher is created on the local host.</td>
</tr>
<tr>
<td>min_file_size</td>
<td>Minimum size in bytes that the file must be before the file watcher considers the file found. Default is 0.</td>
</tr>
<tr>
<td>steady_state_duration</td>
<td>Minimum time interval that the file must remain unchanged before the file watcher considers the file found. Cannot exceed one hour. If NULL, an internal value is used. The minimum value is 10 seconds. Oracle recommends similar steady_state_duration values for all file watchers for efficient file watcher job operation. Also, the repeat interval of the file watcher schedule must be equal or greater than the steady_state_duration value.</td>
</tr>
<tr>
<td>comments</td>
<td>Optional comment.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE (the default), the file watcher is enabled.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the CREATE JOB system privilege to create a file watcher in your own schema. You require the CREATE ANY JOB system privilege to create a file watcher in a schema different from your own (except the SYS schema, which is disallowed).

143.6.14 CREATE_GROUP Procedure

This procedure creates a group. Groups contain members, which you can specify when you create the group or at a later time. There are three types of groups: window groups, database destination groups, and external destination groups.

You can use a group name in other DBMS_SCHEDULER package procedures to specify a list of objects. For example, to specify multiple destinations for a remote database job, you provide a group name for the DESTINATION_NAME parameter of the job.

Syntax

```
DBMS_SCHEDULER.CREATE_GROUP (
    group_name IN VARCHAR2,
    group_type IN VARCHAR2,
);```
Parameters

Table 143-26 CREATE_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name to assign to the group. It can optionally be prefixed with a schema name. It cannot be NULL. It is converted to uppercase unless enclosed in double quotation marks.</td>
</tr>
</tbody>
</table>
| group_type | The type of members in the group. All members must be of the same type. Possible types are:  
  - 'DB_DEST'  
    Database destination: Members are database destinations, for running remote database jobs.  
  - 'EXTERNAL_DEST'  
    External destination: Members are external destinations, for running remote external jobs.  
  - 'WINDOW'  
    Members are Scheduler windows. You must have the MANAGE SCHEDULER privilege to create a group of this type.  

Members in database destination and external destination groups have the following format:

```
[[schema.]credential@][schema.]destination
```

where:

- credential is the name of an existing credential.
- destination is the name of an existing database destination or external destination.

The credential portion of a destination member is optional. If omitted, the job using this destination member uses its default credential. Members in window groups are window names. Because all Scheduler windows reside in the SYS schema, you do not specify a schema name for windows.

| member | Optional comma-separated list of group members. The default is NULL. If NULL, use the ADD_GROUP_MEMBER procedure to add members. You can also use ADD_GROUP_MEMBER to add additional members at a later time.  

The keyword LOCAL can be used as a member in database destination groups and external destination groups.  

- In database destination groups, LOCAL represents the source database on which the job is created. It cannot be preceded with a credential.  
- In external destination groups, LOCAL represents the host on which the source database resides. It can be optionally preceded with a credential name. If no credential is provided, jobs that use this group as their destination must have a default credential. |
| comments | A text string that describes the group. Scheduler does not use this argument. |
Usage Notes

Groups reside in a particular schema and can be created by any user with the CREATE JOB system privilege. To create a group in a schema other than your own, you must have the CREATE ANY JOB privilege. The group name must be unique among all Scheduler objects.

You can grant the SELECT or READ privilege on a group so that other users can reference the group when creating jobs or schedules. To enable other users to modify a group, you can grant the ALTER privilege on the group.

Each group member must be unique within the group. For destination groups, the credential/destination name pairs must be unique within the group. An error is generated if any of the group members do not exist. For destination groups, both the credential and destination portions of a member must exist.

Another group of the same type can be a group member. The Scheduler immediately expands the included group name into its list of members.

Groups are created enabled, but you can disable them.

Example

The following PL/SQL block creates a group named production_dest1, whose members are database destinations for a collection of production databases.

BEGIN
  DBMS_SCHEDULER.CREATE_GROUP(
      GROUP_NAME    => 'production_dest1',
      GROUP_TYPE    => 'DB_DEST',
      MEMBER        => 'LOCAL, oracle_cred@prodhost1, prodhost2',
      COMMENTS      => 'All sector1 production machines');
END;

143.6.15 CREATE_INCOMPATIBILITY Procedure

This procedure creates an incompatibility definition.

Syntax

DBMS_SCHEDULER.CREATE_INCOMPATIBILITY (  
  incompatibility_name    IN VARCHAR2,  
  object_name             IN VARCHAR2,  
  constraint_level        IN VARCHAR2 DEFAULT 'JOB_LEVEL',  
  enabled                 IN BOOLEAN DEFAULT TRUE,  
  comments                IN VARCHAR2 DEFAULT NULL);

Parameters

Table 143-27  CREATE_INCOMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incompatibility_name</td>
<td>The name of the incompatibility definition.</td>
</tr>
<tr>
<td>object_name</td>
<td>One or more (comma-separated) programs or jobs.</td>
</tr>
<tr>
<td>constraint_level</td>
<td>One or more (comma-separated) programs or jobs.</td>
</tr>
</tbody>
</table>
### Table 143-27  (Cont.) CREATE_INCOMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>Specifies whether the constraint is initially enabled (true) or not enabled (false).</td>
</tr>
<tr>
<td>comments</td>
<td>Optional descriptive comment.</td>
</tr>
</tbody>
</table>

### Usage Notes

If `object_name` contains multiple (comma-separated) values, they must be either all programs or all jobs that are incompatible with each other (that is, they cannot be run at the same time). For jobs, the list must consist of two or more jobs, and `constraint_level` must be 'JOB_LEVEL'. For programs, `constraint_level` can be either 'JOB_LEVEL' or 'PROGRAM_LEVEL'. When set to the default value 'JOB_LEVEL', only a single job that is based on the program (or programs) mentioned in `object_name` can run at the same time. When `constraint_level` is set to 'PROGRAM_LEVEL', the programs are incompatible, but the jobs based on the same program are not incompatible.

For example, if the value of `object_name` is 'P1,P2,P3' and `constraint_level` is 'PROGRAM_LEVEL', many jobs based on P1 can be running at the same time, but if any P1 based job is running, none based on P2 or P3 can be running. Or, similarly, many jobs based on P3 can be running at the same time, but none based on P1 or P2. If `constraint_level` is set to 'JOB_LEVEL', then only a single job out of all the jobs based on programs P1, P2 and P3 can be running at a time.

---

### 143.6.16 CREATE_JOB Procedure

This procedure creates a single job.

If you create the job as enabled by setting the `enabled` attribute to TRUE, the Scheduler automatically runs the job according to its schedule. If you create the job disabled, the job does not run until you enable it with the `SET_ATTRIBUTE` Procedure.

The procedure is overloaded. The different functionality of each form of syntax is presented along with the syntax declaration.

#### Syntax

Creates a job in a single call without using an existing program or schedule:

```sql
DBMS_SCHEDULER.CREATE_JOB (  
    job_name             IN VARCHAR2,  
    job_type             IN VARCHAR2,  
    job_action           IN VARCHAR2,  
    number_of_arguments  IN PLS_INTEGER DEFAULT 0,  
    start_date           IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    repeat_interval      IN VARCHAR2 DEFAULT NULL,  
    end_date             IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
```
job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
enabled IN BOOLEAN DEFAULT FALSE,
auto_drop IN BOOLEAN DEFAULT TRUE,
comments IN VARCHAR2 DEFAULT NULL,
credential_name IN VARCHAR2 DEFAULT NULL,
destination_name IN VARCHAR2 DEFAULT NULL);

Creates a job using a named schedule object and a named program object:

DBMS_SCHEDULER.CREATE_JOB (
  job_name IN VARCHAR2,
  program_name IN VARCHAR2,
  schedule_name IN VARCHAR2,
  job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
  enabled IN BOOLEAN DEFAULT FALSE,
  auto_drop IN BOOLEAN DEFAULT TRUE,
  comments IN VARCHAR2 DEFAULT NULL,
  job_style IN VARCHAR2 DEFAULT 'REGULAR',
  credential_name IN VARCHAR2 DEFAULT NULL,
  destination_name IN VARCHAR2 DEFAULT NULL);

Creates a job using a named program object and an inlined schedule:

DBMS_SCHEDULER.CREATE_JOB (
  job_name IN VARCHAR2,
  program_name IN VARCHAR2,
  start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval IN VARCHAR2 DEFAULT NULL,
  end_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
  enabled IN BOOLEAN DEFAULT FALSE,
  auto_drop IN BOOLEAN DEFAULT TRUE,
  comments IN VARCHAR2 DEFAULT NULL,
  job_style IN VARCHAR2 DEFAULT 'REGULAR',
  credential_name IN VARCHAR2 DEFAULT NULL,
  destination_name IN VARCHAR2 DEFAULT NULL);

Creates a job using a named schedule object and an inlined program:

DBMS_SCHEDULER.CREATE_JOB (
  job_name IN VARCHAR2,
  schedule_name IN VARCHAR2,
  job_type IN VARCHAR2,
  job_action IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER DEFAULT 0,
  job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
  enabled IN BOOLEAN DEFAULT FALSE,
  auto_drop IN BOOLEAN DEFAULT TRUE,
  comments IN VARCHAR2 DEFAULT NULL,
  credential_name IN VARCHAR2 DEFAULT NULL,
  destination_name IN VARCHAR2 DEFAULT NULL);

Creates a job using an inlined program and an event:

DBMS_SCHEDULER.CREATE_JOB (
  job_name IN VARCHAR2,
  job_type IN VARCHAR2,
  job_action IN VARCHAR2,
  number_of_arguments IN PLS_INTEGER DEFAULT 0,
  start_date IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  event_condition IN VARCHAR2 DEFAULT NULL,
  queue_spec IN VARCHAR2,
Creates a job using a named program object and an event:

```
DBMS_SCHEDULER.CREATE_JOB
(job_name IN VARCHAR2,
program_name IN VARCHAR2,
start_date IN TIMESTAMP WITH TIME ZONE,
event_condition IN VARCHAR2,
queue_spec IN VARCHAR2,
end_date IN TIMESTAMP WITH TIME ZONE,
job_class IN VARCHAR2 DEFAULT 'DEFAULT_JOB_CLASS',
enabled IN BOOLEAN DEFAULT FALSE,
auto_drop IN BOOLEAN DEFAULT TRUE,
comments IN VARCHAR2 DEFAULT NULL,
credential_name IN VARCHAR2 DEFAULT NULL,
destination_name IN VARCHAR2 DEFAULT NULL);
```

### Parameters

Table 143-28  **CREATE_JOB Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name to assign to the job. The name must be unique in the SQL namespace. For example, a job cannot have the same name as a table in a schema. If the job being created will reside in another schema, it must be qualified with the schema name. If job_name is not specified, an error is generated. If you want to have a name generated by the Scheduler, you can use the GENERATE_JOB_NAME procedure to generate a name and then use the output in the CREATE_JOB procedure. The GENERATE_JOB_NAME procedure generates a number from a sequence, which is the job name. You can prefix the number with a string. The job name will then be the string with the number from the sequence appended to it. See “GENERATE_JOB_NAME Function” for more information.</td>
</tr>
</tbody>
</table>
Table 143-28  (Cont.) CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_type</td>
<td>This attribute specifies the type of job that you are creating. If it is not specified, an error is generated. See job_action in the next row for related information. The supported values are:</td>
</tr>
<tr>
<td></td>
<td>- 'PLSQL_BLOCK' This specifies that the job is an anonymous PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</td>
</tr>
<tr>
<td></td>
<td>- 'STORED_PROCEDURE' This specifies that the job is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported.</td>
</tr>
<tr>
<td></td>
<td>- 'EXECUTABLE' This specifies that the job is going to be run outside the database using an external executable. External jobs are anything that can be executed from the command line of the operating system. Anydata arguments are not supported with a job or program type of EXECUTABLE. The job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.</td>
</tr>
<tr>
<td></td>
<td>- 'CHAIN' This specifies that the job is a chain. Arguments are not supported for a chain, so number_of_arguments must be 0.</td>
</tr>
<tr>
<td></td>
<td>- 'EXTERNAL_SCRIPT' This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the sh shell, unless a different interpreter is specified by prefixing the first line of the script with #!.</td>
</tr>
<tr>
<td></td>
<td>- 'SQL_SCRIPT' This specifies that the job is a SQL<em>Plus script. The job must point to a credential that contains a valid operating system username and password. The SQL</em>Plus script is run by the SQL<em>Plus executable. The job may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL</em>Plus script. Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password. The job owner must have the CREATE EXTERNAL JOB system privilege.</td>
</tr>
<tr>
<td></td>
<td>- 'BACKUP_SCRIPT' This specifies that the job is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The job points to a credential that contains a valid operating system username and password. The RMAN session runs under this operating system user. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing. The job owner must have the CREATE EXTERNAL JOB system privilege.</td>
</tr>
</tbody>
</table>
**Table 143-28  (Cont.) CREATE_JOB Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| job_action | This attribute specifies the action of the job. If job_action is not specified for an inline program, then an error is generated when creating the job. The job action is executed inside an autonomous transaction, and all autonomous transaction guidelines and restrictions apply. For example, online DDL operations are not allowed inside an autonomous transaction, and therefore cannot be used in the job action. The following actions are possible:  
  • For a PL/SQL block:  
    The action is to execute PL/SQL code. These blocks must end with a semicolon. For example, my_proc(); or BEGIN my_proc(); END; or DECLARE arg pls_integer:= 10; BEGIN my_proc2(arg); END.  
    Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution: DECLARE ... BEGIN job_action END; This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 143-40 for details on available metadata attributes.  
  • For a stored procedure:  
    The action is the name of the stored procedure. You have to specify the schema if the procedure resides in another schema than the job. If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, job_action_action=>'"Schema"."Procedure"'.  
    PL/SQL procedures with INOUT or OUT arguments are not supported as job_action when the job or program type is STORED_PROCEDURE.  
  • For an executable:  
    The action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at-sign ('@') and the job is local, the at-sign is replaced with the SID of the current Oracle instance.  
    NOTE: Shell script syntax is not supported, only syntax for the name of and path to an executable is supported.  
  • For a chain:  
    The action is the name of a Scheduler chain object. You must specify the schema of the chain if it resides in a different schema than the job.  
  • For an external script:  
    The job_action must be either the path to an operating system script or an inline operating system script. If the job_action is a path to a script, then the script must reside on every computer that the job runs on. The job_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The job must point to a credential that contains a valid operating system username and password.  
  • For a SQL script: |
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_action</td>
<td>The job must be either the path to a SQL<em>Plus script or an inline SQL</em>Plus script. If the job action is a path to a script, then the script must reside on every computer that the job runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.</td>
</tr>
<tr>
<td>number_of_arguments</td>
<td>This attribute specifies the number of arguments that the job expects. The range is 0-255, with the default being 0.</td>
</tr>
<tr>
<td>program_name</td>
<td>The name of the program associated with this job. If the program is of type executable, the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the first date and time on which this job is scheduled to start. If start_date and repeat_interval are left null, then the job is scheduled to run as soon as the job is enabled. For repeating jobs that use a calendaring expression to specify the repeat interval, start_date is used as a reference date. The first time the job runs is the first match of the calendaring expression that is on or after the current date and time. The Scheduler cannot guarantee that a job executes on an exact time because the system may be overloaded and thus resources unavailable.</td>
</tr>
<tr>
<td>event_condition</td>
<td>This is a conditional expression based on the columns of the event source queue table. The expression must have the syntax of an Advanced Queuing rule. Accordingly, you can include user data properties in the expression provided that the message payload is an object type, and that you prefix object attributes in the expression with tab.user_data. For more information on rules, see the DBMS_AQADM.ADD_SUBSCRIBER procedure.</td>
</tr>
<tr>
<td>queue_spec</td>
<td>This argument specifies either of the following:</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>This attribute specifies how often the job repeats. You can specify the repeat interval by using calendaring or PL/SQL expressions. The expression specified is evaluated to determine the next time the job should run. If repeat_interval is not specified, the job runs only once at the specified start date. See &quot;Calendaring Syntax&quot; for further information.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>The name of the schedule, window, or window group associated with this job.</td>
</tr>
</tbody>
</table>
**Table 143-28  (Cont.) CREATE_JOB Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
<tr>
<td>end_date</td>
<td>This attribute specifies the date and time after which the job expires and is no longer run. After the end_date, if auto_drop is TRUE, the job is dropped. If auto_drop is FALSE, the job is disabled and the STATE of the job is set to COMPLETED. If no value for end_date is specified, the job repeats forever unless max_runs or max_failures is set, in which case the job stops when either value is reached. The value for end_date must be after the value for start_date. If end_date is less than start_date, then an error will be generated. If end_date is the same as start_date, then the job will not execute and no error will be generated.</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute specifies a comment about the job. By default, this attribute is NULL.</td>
</tr>
<tr>
<td>job_style</td>
<td>Style of the job being created. This argument can have one of the following values:</td>
</tr>
<tr>
<td>credential_name</td>
<td>The default credential to use with the job. Applicable only to remote database jobs, remote external jobs, local external jobs, script jobs, and event-based jobs that process file arrival events. The credential must exist. For local database jobs, it must be NULL. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See Oracle Database Administrator's Guide for information about preferred credentials for local external jobs. See also: &quot;CREATE_CREDENTIAL Procedure&quot;</td>
</tr>
</tbody>
</table>
### CREATE_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_name | The database destination or external destination for the job. Use for remote database jobs and remote external jobs only. Must be NULL for jobs running on the local database or for local external jobs (executables).  
This attribute can be a single destination name or the name of a group of type 'EXTERNAL_DEST' or 'DB_DEST'. The single destination or group must already exist.  
The following applies to this attribute:  
• If it is a database destination, it must have been created by the CREATE_DATABASE_DESTINATION Procedure.  
• If it is an external destination, it must have been implicitly created by registering a remote Scheduler agent with the local database.  
• If it is a group, each member of the group must exist, and the job must run on all destinations named in the group. See "CREATE_GROUP Procedure".  
destination_name cannot reference a destination group when:  
• The job type is 'CHAIN'  
• The job style is 'LIGHTWEIGHT', 'IN_MEMORY_RUNTIME', or 'IN_MEMORY_FULL', If the credential_name argument of CREATE_JOB is NULL, each destination must be preceded by a credential, in the following format:  
credential.destination  
The credential must already exist. If the credential_name argument is provided, then it serves as the default credential for every destination that is not preceded by a credential.  
You can query the views *_SCHEDULER_DB_DESTS and ALL_SCHEDULER_EXTERNAL_DESTS for existing destinations and *_SCHEDULER_GROUP_MEMBERS for existing groups and their members.  
*** destination job attribute is deprecated in Oracle Database 11gR2 and superseded by destination_name.  
enabled | This attribute specifies whether the job is created enabled or not. The possible settings are TRUE or FALSE. By default, this attribute is set to FALSE and, therefore, the job is created as disabled. A disabled job means that the metadata about the job has been captured, and the job exists as a database object. However, the Scheduler ignores the job and the job coordinator does not pick it for processing. In order for the job coordinator to process the job, the job must be enabled. You can enable a job by setting this argument to TRUE or by using the ENABLE procedure.  

---

</tr>
<tr>
<td></td>
<td>• It is not a repeating job and has run once.</td>
</tr>
<tr>
<td></td>
<td>A job is disabled when it has failed max_failures times. max_failures is also</td>
</tr>
<tr>
<td></td>
<td>set with SET_ATTRIBUTE.</td>
</tr>
<tr>
<td></td>
<td>If this flag is set to FALSE, the jobs are not dropped and their metadata is</td>
</tr>
<tr>
<td></td>
<td>kept until the job is explicitly dropped with the DROP_JOB procedure.</td>
</tr>
<tr>
<td></td>
<td>By default, jobs are created with auto_drop set to TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

Jobs are created as disabled by default. You must explicitly enable them so that they will become active and scheduled. Before enabling a job, ensure that all program arguments, if any, are defined, either by defining default values in the program object or by supplying values with the job.

The JOB_QUEUE_PROCESSES initialization parameter specifies the maximum number of processes that can be created for the execution of jobs. Beginning with Oracle Database 11g Release 2, JOB_QUEUE_PROCESSES applies to DBMS_SCHEDULER jobs. Setting this parameter to 0 disables DBMS_SCHEDULER jobs.

To create a job in your own schema, you need to have the CREATE_JOB privilege. A user with the CREATE ANY JOB privilege can create a job in any schema. If the job being created will reside in another schema, the job name must be qualified with the schema name. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

Associating a job with a particular class or program requires EXECUTE privileges for that class or program.

Not all possible job attributes can be set with CREATE_JOB. Some must be set after the job is created. For example, job arguments must be set with the SET_JOB_ARGUMENT_VALUE Procedure or the SET_JOB_ANYDATA_VALUE Procedure. Other job attributes, such as job_priority and max_runs, are set with the SET_ATTRIBUTE Procedure.

To create multiple jobs efficiently, use the CREATE_JOBS procedure.
The Scheduler runs event-based jobs for each occurrence of an event that matches the event condition of the job. However, events that occur while the job is already running are ignored; the event gets consumed, but does not trigger another run of the job.

143.6.17 CREATE_JOB_CLASS Procedure

This procedure creates a job class. Job classes are created in the SYS schema.

Syntax

```sql
DBMS_SCHEDULER.CREATE_JOB_CLASS (  
  job_class_name            IN VARCHAR2,  
  resource_consumer_group   IN VARCHAR2 DEFAULT NULL,  
  service                   IN VARCHAR2 DEFAULT NULL,  
  logging_level             IN PLS_INTEGER      
    DEFAULT DBMS_SCHEDULER.LOGGING_RUNS,  
  log_history               IN PLS_INTEGER DEFAULT NULL,  
  comments                  IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name to assign to the job class. Job classes can only be created in the SYS schema. The name must be unique in the SQL namespace. For example, a job class cannot have the same name as a table in a schema.</td>
</tr>
<tr>
<td>resource_consumer_group</td>
<td>This attribute specifies the resource consumer group that his class is associated with. A resource consumer group is a set of synchronous or asynchronous sessions that are grouped together based on their processing needs. A job class has a many-to-one relationship with a resource consumer group. The resource consumer group that the job class associates with determines the resources that are allocated to the job class. If a resource consumer group is dropped, job classes associated with it are then associated with the default resource consumer group. If no resource consumer group is specified, job classes are associated with the default resource consumer group. If the specified resource consumer group does not exist when creating the job class, an error occurs.</td>
</tr>
</tbody>
</table>
Table 143-29  (Cont.) CREATE_JOB_CLASS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service</td>
<td>This attribute specifies the database service that the jobs in this class have affinity to. In an Oracle RAC environment, this means that the jobs in this class only run on those database instances that are assigned to the specific service. Note that a service can be mapped to a resource consumer group, so you can also control resources allocated to jobs by specifying a service. See DBMS_RESOURCE_MANAGER.SET_CONSUMER_GROUP_MAPPING for details. If both the resource_consumer_group and service attributes are specified, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence. If no service is specified, the job class belongs to the default service, which means it has no service affinity and any one of the database instances within the cluster might run the job. If the service that a job class belongs to is dropped, the job class will then belong to the default service. If the specified service does not exist when creating the job class, then an error occurs.</td>
</tr>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The possible options are: • DBMS_SCHEDULER.LOGGING_OFF No logging is performed for any jobs in this class. • DBMS_SCHEDULER.LOGGING_RUNS The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default. • DBMS_SCHEDULER.LOGGING_FAILED_RUNS The Scheduler logs only jobs that failed in this class. • DBMS_SCHEDULER.LOGGING_FULL In addition to recording every run of a job, the Scheduler records all operations performed on all jobs in this class. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so, an entry is recorded in the log.</td>
</tr>
<tr>
<td>log_history</td>
<td>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL (the default), retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute is for an optional comment about the job class. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

For users to create jobs that belong to a job class, the job owner must have EXECUTE privileges on the job class. Therefore, after the job class has been created, EXECUTE privileges must be granted on the job class so that users create jobs belonging to that class. You can also grant the EXECUTE privilege to a role.

Creating a job class requires the MANAGE_SCHEDULER system privilege.
143.6.18 CREATE_JOBS Procedure

This procedure creates multiple jobs and sets the values of their arguments in a single call.

Syntax

```
DBMS_SCHEDULER.CREATE_JOBS (  
  jobdef_array      IN SYS.JOB_DEFINITION_ARRAY,  
  commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 143-30  CREATE_JOBS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobdef_array</td>
<td>The array of job definitions. See &quot;Data Structures&quot; for a description of the</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>JOB_DEFINITION_ARRAY and JOB_DEFINITION datatypes.</td>
</tr>
<tr>
<td></td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>• STOP_ON_FIRST_ERROR returns on the first error. Previous successfully</td>
</tr>
<tr>
<td></td>
<td>created jobs are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL returns on the first error and everything that happened</td>
</tr>
<tr>
<td></td>
<td>before that error is rolled back.</td>
</tr>
<tr>
<td></td>
<td>• ABSORB_ERRORS tries to absorb any errors and attempts to create the</td>
</tr>
<tr>
<td></td>
<td>rest of the jobs on the list. It commits all successfully created jobs.</td>
</tr>
<tr>
<td></td>
<td>If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for</td>
</tr>
<tr>
<td></td>
<td>details.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure creates many jobs in the context of a single transaction. To realize the desired performance gains, the jobs being created must be grouped in batches of sufficient size. Calling CREATE_JOBS with a small array size may not be much faster than calling CREATE_JOB once for each job.

You cannot use this procedure to create multiple-destination jobs. That is, the destination attribute of the job_definition object cannot reference a destination group.

Examples

See Oracle Database Administrator's Guide.

143.6.19 CREATE_PROGRAM Procedure

This procedure creates a program.

Syntax

```
DBMS_SCHEDULER.CREATE_PROGRAM (  
  program_name             IN VARCHAR2,  
  program_type             IN VARCHAR2,  
  program_action           IN VARCHAR2,  
  number_of_arguments      IN PLS_INTEGER DEFAULT 0,  
  )
```
enabled IN BOOLEAN DEFAULT FALSE,
comments IN VARCHAR2 DEFAULT NULL);

Parameters

Table 143-31 CREATE_PROGRAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name to assign to the program. The name must be unique in the SQL namespace. For example, a program cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
</tbody>
</table>
Table 143-31  (Cont.) CREATE_PROGRAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_type</td>
<td>This attribute specifies the type of program you are creating. If it is not specified then you get an error. These are the supported values for program_type:</td>
</tr>
<tr>
<td></td>
<td>• 'PLSQL_BLOCK'</td>
</tr>
<tr>
<td></td>
<td>This specifies that the program is a PL/SQL block. Job or program arguments are not supported when the job or program type is PLSQL_BLOCK. In this case, the number of arguments must be 0.</td>
</tr>
<tr>
<td></td>
<td>• 'STORED_PROCEDURE'</td>
</tr>
<tr>
<td></td>
<td>This specifies that the program is a PL/SQL or Java stored procedure, or an external C subprogram. Only procedures, not functions with return values, are supported. PL/SQL procedures with INOUT or OUT arguments are not supported.</td>
</tr>
<tr>
<td></td>
<td>• 'EXECUTABLE'</td>
</tr>
<tr>
<td></td>
<td>This specifies that the job is going to be run outside the database using an external executable. External programs imply anything that can be executed from the operating system command line. AnyData arguments are not supported with job or program type EXECUTABLE.</td>
</tr>
<tr>
<td></td>
<td>• 'EXTERNAL_SCRIPT'</td>
</tr>
<tr>
<td></td>
<td>project 25230, this bullet and next two</td>
</tr>
<tr>
<td></td>
<td>This specifies that the job is an external script that uses the command shell of the computer running the job. For Windows this is cmd.exe and for UNIX based systems the shell, unless a different interpreter is specified by prefixing the first line of the script with #! .</td>
</tr>
<tr>
<td></td>
<td>• 'SQL_SCRIPT'</td>
</tr>
<tr>
<td></td>
<td>This specifies that the program is a SQL<em>Plus script. A job using this program must point to a credential that contains a valid operating system username and password. The SQL</em>Plus script is run by SQL<em>Plus executable. The job using this program may point to a connect credential that contains a database credential. If so, this credential is used to connect to the database before running the SQL</em>Plus script. Note that if you choose to use connect credential, you must use set_attribute to specify the Connect_Credential_Name attribute. If you do not have connect credential, you must include an explicit SQL*Plus connect statement providing a valid database userid / password.</td>
</tr>
<tr>
<td></td>
<td>• 'BACKUP_SCRIPT'</td>
</tr>
<tr>
<td></td>
<td>This specifies that the program is an RMAN backup script. The script runs a connect statement that uses either a password or OS authentication before it executes any target commands. The Scheduler uses the RMAN executable from the current Oracle home to run the script and throws an error if this is missing.</td>
</tr>
</tbody>
</table>
Table 143-31  (Cont.) CREATE_PROGRAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_action</td>
<td>This attribute specifies the action of the program. If program_action is not specified, an error is generated.</td>
</tr>
</tbody>
</table>

The following actions are possible:

- For a PL/SQL block, the action is to execute PL/SQL code. These blocks must end with a semicolon.
  
  For example, my_proc(); or BEGIN my_proc(); END; or
  DECLARE arg pls_integer:= 10; BEGIN
  my_proc2(arg); END;

  Note that the Scheduler wraps job_action in its own block and passes the following to PL/SQL for execution:
  DECLARE ... BEGIN job_action END;

  This is done to declare some internal Scheduler variables. You can include any Scheduler metadata attribute except event_message in your PL/SQL code. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value. See Table 143-40 for details on available metadata attributes.

- For a stored procedure, the action is the name of the stored procedure. You have to specify the schema if the procedure resides in a schema other than the job.
  If case sensitivity is needed, enclose the schema name and the store procedure name in double quotes. For example, program_action=>'"Schema"."Procedure"'.

- For an executable, the action is the name of the external executable, including the full path name, but excluding any command-line arguments. If the action starts with a single question mark ('?'), the question mark is replaced by the path to the Oracle home directory for a local job or to the Scheduler agent home for a remote job. If the action contains an at sign (@) and the job is local, the at sign is replaced with the SID of the current Oracle instance.

- For an external script, the action must be either the path to an operating system script or an inline operating system script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The program_action may contain calls to SQL*Plus or RMAN executables directly, without having to specify its full path, given that they are stored on their default location for every computer that runs the job.

  The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. The program points to a credential that contains a valid operating system username and password.
### Table 143-31  (Cont.) CREATE_PROGRAM Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
|                  | • For a SQL script, the action must be either the path to a SQL*Plus script or an inline SQL*Plus script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. If the arguments are named, they are also bound to named variables in the SQL*Plus session.  
• For a backup script, the action must be either the path to a RMAN script or an inline RMAN script. If the program_action is a path to a script, then the script must reside on every computer that the program runs on. The job can only have arguments that are strings or that can be cast to strings. These arguments are passed positionally when the script is called. |
| number_of_arguments | This attribute specifies the number of arguments the program takes. If this parameter is not specified, then the default is 0. A program can have a maximum of 255 arguments. If the program_type is PLSQL_BLOCK, then this parameter is ignored. |
| enabled          | This flag specifies whether the program should be created as enabled or not. If the flag is set to TRUE, then validity checks are made and the program is created as ENABLED if all the checks be successful. By default, this flag is set to FALSE, meaning not created enabled. You can also call the ENABLE procedure to enable the program before it can be used. |
| comments         | A comment about the program. By default, this attribute is NULL.                                                                               |

### Usage Notes

To create a program in their own schema, users need the CREATE JOB privilege. A user with the CREATE ANY JOB privilege can create a program in any schema. A program is created in a disabled state by default (unless the enabled parameter is set to TRUE). It cannot be executed by a job until it is enabled.

To use your programs, other users must have EXECUTE privileges, therefore once a program has been created, you have to grant EXECUTE privileges on it.

---

*See Also:*

"DEFINE_PROGRAM_ARGUMENT Procedure"
143.6.20 CREATE_RESOURCE Procedure

This procedure allows users to specify the resources used by jobs or to create a new resource.

Syntax

```sql
DBMS_SCHEDULER.CREATE_RESOURCE (
  resource_name    IN VARCHAR2,
  units            IN PLS_INTEGER,
  status           IN VARCHAR2 DEFAULT 'ENFORCE_CONSTRAINTS',
  constraint_level IN VARCHAR2 DEFAULT 'JOB_LEVEL',
  comments         IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource_name</td>
<td>The name of the resource.</td>
</tr>
<tr>
<td>units</td>
<td>The number of units of this resource that the job or program uses.</td>
</tr>
<tr>
<td>status</td>
<td>The status of the resource.</td>
</tr>
<tr>
<td>constraint_level</td>
<td>Level of the constraint: JOB_LEVEL or PROGRAM_LEVEL.</td>
</tr>
<tr>
<td>comments</td>
<td>Descriptive comment about the resource.</td>
</tr>
</tbody>
</table>

Usage Notes

The following example creates a new resource.

```sql
BEGIN
  DBMS_SCHEDULER.CREATE_RESOURCE(
    resource_name => 'my_resource',
    units => 3,
    state => 'ENFORCE_CONSTRAINTS',
    comments => 'Resource1'
  )
END;
/
## 143.6.21 CREATE_SCHEDULE Procedure

This procedure creates a schedule.

### Syntax

```sql
DBMS_SCHEDULER.CREATE_SCHEDULE (
    schedule_name          IN VARCHAR2,
    start_date             IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    repeat_interval        IN VARCHAR2,
    end_date               IN TIMESTAMP WITH TIMEZONE DEFAULT NULL,
    comments               IN VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 143-33  CREATE_SCHEDULE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name to assign to the schedule. The name must be unique in the SQL namespace. For example, a schedule cannot have the same name as a table in a schema. If no name is specified, then an error occurs.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the first date and time on which this schedule becomes valid. For a repeating schedule, the value for <code>start_date</code> is a reference date. In this case, the start of the schedule is not the <code>start_date</code>; it depends on the repeat interval specified. <code>start_date</code> is used to determine the first instance of the schedule. If <code>start_date</code> is specified in the past and no value for <code>repeat_interval</code> is specified, the schedule is invalid. For a repeating job or window, <code>start_date</code> can be derived from the <code>repeat_interval</code> if it is not specified. If <code>start_date</code> is null, then the date that the job or window is enabled is used. <code>start_date</code> and <code>repeat_interval</code> cannot both be null.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>This attribute specifies how often the schedule repeats. It is expressed using calendaring syntax. See &quot;Calendaring Syntax&quot; for further information. PL/SQL expressions are not allowed as repeat intervals for named schedules.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date and time after which jobs will not run and windows will not open. A non-repeating schedule that has no <code>end_date</code> is valid forever. <code>end_date</code> has to be after the <code>start_date</code>. If this is not the case, then an error is generated when the schedule is created.</td>
</tr>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the schedule. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

---

See Also:

- Creating or Dropping a Resource in *Oracle Database Administrator's Guide*
- `SET_RESOURCE_CONSTRAINT` Procedure
Usage Notes

This procedure requires the CREATE JOB privilege to create a schedule in your own schema or the CREATE ANY JOB privilege to create a schedule in someone else's schema by specifying schema.schedule_name. Once a schedule has been created, it can be used by other users. The schedule is created with access to PUBLIC. Therefore, there is no need to explicitly grant access to the schedule.

143.6.22 CREATE_WINDOW Procedure

This procedure creates a recurring time window and associates it with a resource plan. You can then use the window to schedule jobs that run under the associated resource plan. Windows are created in the SYS schema.

The procedure is overloaded.

Syntax

Creates a window using a named schedule object:

```sql
DBMS_SCHEDULER.CREATE_WINDOW (  
  window_name             IN VARCHAR2,
  resource_plan           IN VARCHAR2,
  schedule_name           IN VARCHAR2,
  duration                IN INTERVAL DAY TO SECOND,
  window_priority         IN VARCHAR2 DEFAULT 'LOW',
  comments                IN VARCHAR2 DEFAULT NULL);
```

Creates a window using an inlined schedule:

```sql
DBMS_SCHEDULER.CREATE_WINDOW (  
  window_name             IN VARCHAR2,
  resource_plan           IN VARCHAR2,
  start_date              IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  repeat_interval         IN VARCHAR2,
  end_date                IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
  duration                IN INTERVAL DAY TO SECOND,
  window_priority         IN VARCHAR2 DEFAULT 'LOW',
  comments                IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 143-34  CREATE_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name to assign to the window. The name must be unique in the SQL namespace. All windows are in the SYS schema, so the preface 'SYS' is optional.</td>
</tr>
</tbody>
</table>
Table 143-34  (Cont.) CREATE_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource_plan</td>
<td>This attribute specifies the resource plan that automatically activates when the window opens. When the window closes, the system switches to the appropriate resource plan, which is usually the plan that was in effect before the window opened, but can also be the plan of a different window. Only one resource plan can be associated with a window. It may be NULL or the empty string (&quot;`). When it is NULL, the resource plan in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window. If the window is open and the resource plan is dropped, then the resource allocation for the duration of the window is not affected.</td>
</tr>
<tr>
<td>start_date</td>
<td>This attribute specifies the first date and time on which this window is scheduled to open. If the value for start_date specified is in the past or is not specified, the window opens as soon as it is created. For repeating windows that use a calendaring expression to specify the repeat interval, the value for start_date is a reference date. The first time the window opens depends on the repeat interval specified and the value for start_date.</td>
</tr>
<tr>
<td>duration</td>
<td>This attribute specifies how long the window stays open. For example, 'interval '5' hour' for five hours. There is no default value for this attribute. Therefore, if no value is specified when the window is created, an error occurs. The duration is of type interval day to seconds and ranges from one minute to 99 days.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>This attribute specifies the name of the schedule associated with the window.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>This attribute specifies how often the window repeats. It is expressed using the Scheduler calendaring syntax. See &quot;Calendaring Syntax&quot; for more information. A PL/SQL expression cannot be used to specify the repeat interval for a window. The expression specified is evaluated to determine the next time the window opens. If no repeat_interval is specified, the window opens only once at the specified start date.</td>
</tr>
<tr>
<td>end_date</td>
<td>This attribute specifies the date and time after which the window no longer opens. When the value for end_date is reached, the window is disabled. In the *_SCHEDULER_WINDOWS views, the enabled flag of the window is set to FALSE. A non-repeating window that has no value for end_date opens only once for the duration of the window. For a repeating window, if no end_date is specified, then the window keeps repeating forever. The end_date must be after the start_date. If it is not, then an error is generated when the window is created.</td>
</tr>
<tr>
<td>window_priority</td>
<td>This attribute is only relevant when two windows overlap. Because only one window can be in effect at one time, the window priority determines which window opens. The two possible values for this attribute are 'HIGH' and 'LOW'. A high priority window has precedence over a low priority window, therefore, the low priority window does not open if it overlaps a high priority window. By default, windows are created with priority 'LOW'.</td>
</tr>
</tbody>
</table>
Table 143-34  (Cont.) CREATE_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>This attribute specifies an optional comment about the window. By default, this attribute is NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

Creating a window requires the MANAGE SCHEDULER privilege.

Scheduler windows are the principal mechanism used to automatically switch resource plans according to a schedule. You can also manually activate a resource plan by using the ALTER SYSTEM SET RESOURCE_MANAGER_PLAN statement or the DBMS_RESOURCE_MANAGER.SWITCH_PLAN package procedure. Note that either of these manual methods can also disable resource plan switching by Scheduler windows. For more information, see Oracle Database Administrator's Guide and "SWITCH_PLAN Procedure".

143.6.23 DEFINE_ANYDATA_ARGUMENT Procedure

This procedure defines a name or default value for a program argument that is of a complex type and must be encapsulated within an ANYDATA object. A job that references the program can override the default value.

Syntax

DBMS_SCHEDULER.DEFINE_ANYDATA_ARGUMENT (program_name            IN VARCHAR2,
argument_position       IN PLS_INTEGER,
argument_name           IN VARCHAR2 DEFAULT NULL,
argument_type           IN VARCHAR2,
default_value           IN SYS.ANYDATA,
out_argument            IN BOOLEAN DEFAULT FALSE);

Parameters

Table 143-35  DEFINE_ANYDATA_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique, so it can replace any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ANYDATA_VALUE Procedure.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The datatype of the argument being defined. This is not verified or used by the Scheduler. It is only used by the user of the program when deciding what value to assign to the argument.</td>
</tr>
</tbody>
</table>
Table 143-35  (Cont.) DEFINE_ANYDATA_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument encapsulated within an AnyData object. This is optional.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

All program arguments from one to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

See Also:

• "DEFINE_PROGRAM_ARGUMENT Procedure"
• "SET_JOB_ANYDATA_VALUE Procedure"

143.6.24 DEFINE_CHAIN_EVENT_STEP Procedure

This procedure adds or replaces a chain step and associates it with an event schedule or an inline event.

Once started in a running chain, this step does not complete until the specified event has occurred. Every step in a chain must be defined before the chain can be enabled and used. Defining a step gives it a name and specifies what happens during the step. If a step already exists with this name, the new step replaces the old one.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (  
    chain_name IN VARCHAR2,  
    step_name IN VARCHAR2,  
    event_schedule_name IN VARCHAR2,  
    timeout IN INTERVAL DAY TO SECOND DEFAULT NULL);
```

```sql
DBMS_SCHEDULER.DEFINE_CHAIN_EVENT_STEP (  
    chain_name IN VARCHAR2,  
    step_name IN VARCHAR2,  
    event_condition IN VARCHAR2,  
    queue_spec IN VARCHAR2,  
    timeout IN INTERVAL DAY TO SECOND DEFAULT NULL);
```
Parameters

Table 143-36 DEFINE_CHAIN_EVENT_STEP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain that the step is in</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step</td>
</tr>
<tr>
<td>event_schedule_name</td>
<td>The name of the event schedule that the step waits for</td>
</tr>
<tr>
<td>timeout</td>
<td>This parameter is reserved for future use</td>
</tr>
<tr>
<td>event_condition</td>
<td>See the CREATE_EVENT_SCHEDULE Procedure</td>
</tr>
<tr>
<td>queue_spec</td>
<td>See the CREATE_EVENT_SCHEDULE Procedure</td>
</tr>
</tbody>
</table>

Usage Notes

Defining a chain step requires ALTER privileges on the chain either as the owner of the chain, or as a user with the ALTER object privilege on the chain or the CREATE ANY JOB system privilege.

You can base a chain step on a file watcher as well. To do this, provide the file watcher name directly in the queue_spec parameter, or use a file watcher schedule for the event_schedule_name parameter.

See Also:

"DEFINE_CHAIN_STEP Procedure"

143.6.25 DEFINE_CHAIN_RULE Procedure

This procedure adds a new rule to an existing chain, specified as a condition-action pair. The condition is expressed using either SQL or the Scheduler chain condition syntax and indicates the prerequisites for the action to occur. The action is a result of the condition being met.

An actual rule object is created to store the rule in the schema where the chain resides. If a rule name is given, this name is used for the rule object. If an existing rule name in the schema of the chain is given, the existing rule is altered. (A schema different than the schema of the chain cannot be specified). If no rule name is given, one is generated in the form SCHED_RULE${N}.

Syntax

```
DBMS_SCHEDULER.DEFINE_CHAIN_RULE (  
    chain_name IN VARCHAR2,  
    condition IN VARCHAR2,  
    action IN VARCHAR2,  
    rule_name IN VARCHAR2 DEFAULT NULL,  
    comments IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 143-37  DEFINE_CHAIN_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>condition</td>
<td>A boolean expression which must evaluate to TRUE for the action to be performed. Every chain must have a rule that evaluates to TRUE to start the chain. For this purpose, you can use a rule that has 'TRUE' as its condition if you are using Scheduler chain condition syntax, or '1=1' as its condition if you are using SQL syntax.</td>
</tr>
<tr>
<td>action</td>
<td>The action to be performed when the rule evaluates to TRUE. The action must consist of at least one keyword with an optional value and an optional delay clause. Possible actions include:</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule being created. If no rule_name is given, one is generated in the form SCHED_RULE$_{N}$.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment describing the rule. This is stored in the rule object created.</td>
</tr>
</tbody>
</table>

Scheduler Chain Condition Syntax

The Scheduler chain condition syntax provides an easy way to construct a condition using the states and error codes of steps in the current chain.
The following are the available constructs for Scheduler chain condition syntax, which are all boolean expressions:

TRUE
FALSE
stepname [NOT] SUCCEEDED
stepname [NOT] FAILED
stepname [NOT] STOPPED
stepname [NOT] COMPLETED
stepname ERROR_CODE IN (integer, integer, integer ...)
stepname ERROR_CODE NOT IN (integer, integer, integer ...)
stepname ERROR_CODE = integer
stepname ERROR_CODE != integer
stepname ERROR_CODE <> integer
stepname ERROR_CODE > integer
stepname ERROR_CODE >= integer
stepname ERROR_CODE < integer
stepname ERROR_CODE <= integer

These boolean operators are available to create more complex conditions:

expression AND expression
expression OR expression
NOT (expression)

integer Can be positive or negative. Parentheses may be used for clarity or to enforce ordering. You must use parentheses with the NOT operator.

PL/SQL code that runs as part of a step can set the value of ERROR_CODE for that step with the RAISE_APPLICATION_ERROR statement.

Usage Notes

Defining a chain rule requires ALTER privileges on the chain (either as the owner, or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

You must define at least one rule that starts the chain and at least one that ends it. See the section "Adding Rules to a Chain" in Oracle Database Administrator's Guide for more information.

Examples

The following are examples of using rule conditions and rule actions.

Rule Conditions Using Scheduler Chain Condition Syntax

'step1 completed'
-- satisfied when step step1 has completed. (step1 completed is also TRUE when any
-- of the following are TRUE: step1 succeeded, step1 failed, step1 stopped.)

'step1 succeeded and step2 succeeded'
-- satisfied when steps step1 and step2 have both succeeded

'step1 error_code > 100'
-- satisfied when step step1 has failed with an error_code greater than 100

'step1 error_code IN (1, 3, 5, 7)'
-- satisfied when step step1 has failed with an error_code of 1, 3, 5, or 7

Rule Conditions Using SQL Syntax
'step1.completed = ''TRUE'' AND :step1.end_date >SYSDATE-1/24'
--satisfied when step step1 completed less than an hour ago

'step1.duration > interval ''5'' minute'
-- satisfied when step step1 has completed and took longer than 5 minutes to complete

**Rule Actions**

'AFTER 01:00:00 START step1, step2'
--After an hour start steps step1 and step2

'STOP step1'
--Stop step step1

END step4.error_code'
--End the chain with the error code that step step4 finished with. If step4 has not
completed, the chain will be ended unsuccessfully with error code 27435.

'END' or 'END 0'
--End the chain successfully (with error_code 0)

'END 100'
--End the chain unsuccessfully with error code 100.

### 143.6.26 DEFINE_CHAIN_STEP Procedure

This procedure adds or replaces a chain step and associates it with a program or a
nested chain. When the chain step is started, the specified program or chain is run. If a
step already exists with the name supplied in the *chain_name* argument, the new step
replaces the old one.

The chain owner must have **EXECUTE** privileges on the program or chain associated with
the step. Only one program or chain can run during a step.

You cannot set all possible step attributes with this procedure. Use the **ALTER_CHAIN**
procedure to set additional chain step attributes, such as *credential_name* and
*destination_name*.

**Syntax**

```
DBMS_SCHEDULER.DEFINE_CHAIN_STEP (  
    chain_name              IN VARCHAR2,  
    step_name               IN VARCHAR2,  
    program_name            IN VARCHAR2,  
);  
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter.</td>
</tr>
</tbody>
</table>
| step_name  | The name of the step being defined. If a step already exists with
this name, the new step replaces the old one. |
| program_name | The name of a program or chain to run during this step. The chain owner must have **EXECUTE** privileges on this program or chain. |
Usage Notes

Defining a chain step requires ALTER privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

See Also:

- "ALTER_CHAIN Procedure"
- "DEFINE_CHAIN_EVENT_STEP Procedure"

143.6.27 DEFINE_METADATA_ARGUMENT Procedure

This procedure defines a special metadata argument for the program. The Scheduler can pass Scheduler metadata through this argument to your stored procedure or other executable. You cannot set values for jobs using this argument.

Syntax

```sql
DBMS_SCHEDULER.DEFINE_METADATA_ARGUMENT (  
  program_name            IN VARCHAR2,  
  metadata_attribute      IN VARCHAR2,  
  argument_position       IN PLS_INTEGER,  
  argument_name           IN VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered</td>
</tr>
<tr>
<td>metadata_attribute</td>
<td>The metadata to be passed. Valid metadata attributes are: 'job_name', 'job_subname', 'job_owner', 'job_start', 'window_start', 'window_end', and 'event_message'. Table 143-40 describes these attributes in detail.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. The position cannot be greater than the number_of_arguments specified for the program. It must be unique, so it replaces any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique for the program if it is specified. If you assign a name, the name can then be used by other package procedures.</td>
</tr>
</tbody>
</table>

Table 143-40  Metadata Attributes

<table>
<thead>
<tr>
<th>Metadata Attribute</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>VARCHAR2</td>
<td>Name of the currently running job</td>
</tr>
</tbody>
</table>
Table 143-40  (Cont.) Metadata Attributes

<table>
<thead>
<tr>
<th>Metadata Attribute</th>
<th>Datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_subname</td>
<td>VARCHAR2</td>
<td>Subname of the currently running job. The name + subname form a unique identifier for a job that is running a chain step. NULL if the job is not part of a chain.</td>
</tr>
<tr>
<td>job_owner</td>
<td>VARCHAR2</td>
<td>Owner of the currently running job</td>
</tr>
<tr>
<td>job_scheduled_start</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>When the currently running job was scheduled to start</td>
</tr>
<tr>
<td>job_start</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>When the currently running job started</td>
</tr>
<tr>
<td>window_start</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>If the job was started by a window, the time that the window opened</td>
</tr>
<tr>
<td>window_end</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>If the job was started by a window, the time that the window is scheduled to close</td>
</tr>
<tr>
<td>event_message</td>
<td>(See Description)</td>
<td>For an event-based job, the message content of the event that started the job. The datatype of this attribute depends on the queue used for the event. It has the same type as the USER_DATA column of the queue table. In the case of a file arrival event, event_message is of type SYS.SCHEDULER_FILEWATCHER_RESULT. See &quot;SCHEDULER_FILEWATCHER_RESULT Object Type&quot;.</td>
</tr>
</tbody>
</table>

Usage Notes

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

All metadata attributes except event_message can be used in PL/SQL blocks that you enter into the job_action or program_action attributes of jobs or programs, respectively. You use the attribute name as you use any other PL/SQL identifier, and the Scheduler assigns it a value.

143.6.28 DEFINE_PROGRAM_ARGUMENT Procedure

This procedure defines a name or default value for a program argument. If no default value is defined for a program argument, the job that references the program must supply an argument value. (The job can also override a default value.)

This procedure is overloaded.

Syntax

Defines a program argument without a default value:

PROCEDURE define_program_argument(
    program_name            IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_name           IN VARCHAR2 DEFAULT NULL,
    argument_type           IN VARCHAR2,
    out_argument            IN BOOLEAN DEFAULT FALSE);

Defines a program argument with a default value:
PROCEDURE define_program_argument(
  program_name            IN VARCHAR2,
  argument_position       IN PLS_INTEGER,
  argument_name           IN VARCHAR2 DEFAULT NULL,
  argument_type           IN VARCHAR2,
  default_value           IN VARCHAR2,
  out_argument            IN BOOLEAN DEFAULT FALSE);

Parameters

Table 143-41  DEFINE_PROGRAM_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument as it is passed to the executable. Argument numbers go from one to the number_of_arguments specified for the program. This must be unique so it replaces any argument already defined at this position.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name to assign to the argument. It is optional, but must be unique for the program if specified. If you assign a name, the name can then be used by other package procedures, including the SET_JOB_ARGUMENT_VALUE Procedure.</td>
</tr>
<tr>
<td>argument_type</td>
<td>The datatype of the argument being defined. This is not verified or used by the Scheduler. The program user uses argument_type when deciding what value to assign to the argument. Any valid SQL datatype is allowed.</td>
</tr>
<tr>
<td>default_value</td>
<td>The default value to be assigned to the argument if none is specified by the job.</td>
</tr>
<tr>
<td>out_argument</td>
<td>This parameter is reserved for future use. It must be set to FALSE.</td>
</tr>
</tbody>
</table>

Usage Notes

All program arguments from 1 to the number_of_arguments value must be defined before a program can be enabled. If a default value for an argument is not defined with this procedure, a value must be defined in the job.

Defining a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also define a program argument if you have the CREATE ANY JOB privilege.

DEFINE_PROGRAM_ARGUMENT only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

See Also:

- “DEFINE_ANYDATA_ARGUMENT Procedure”
- “SET_JOB_ARGUMENT_VALUE Procedure”
143.6.29 DISABLE Procedure

This procedure disables a program, job, chain, window, database destination, external destination, file watcher, or group. When an object is disabled, its enabled attribute is set to FALSE.

Syntax

```sql
DBMS_SCHEDULER.DISABLE (
    name              IN VARCHAR2,
    force             IN BOOLEAN DEFAULT FALSE,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object being disabled. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, objects are disabled even if other objects depend on them. See the usage notes for more information.</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>• STOP_ON_FIRST_ERROR: The procedure returns on the first error and the previous disable operations that were successful are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL: The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when disabling a job or a list of jobs. In addition, this type is not supported when force is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>• ABSORB_ERRORS: The procedure tries to absorb any errors and disable the rest of the jobs and commits all the disable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when disabling a job or a list of jobs.</td>
</tr>
</tbody>
</table>

Usage Notes

Windows must be preceded by SYS.

Disabling an object that is already disabled does not generate an error.

The purpose of the force option is to point out dependencies. No dependent objects are altered.

To run DISABLE for a window or a group of type WINDOW, you must have the MANAGE SCHEDULER privilege.

You can use DISABLE with any schema except the SYS schema.
Jobs

Disabling a job means that, although the metadata of the job is there, it should not run and the job coordinator will not pick up these jobs for processing. When a job is disabled, its state in the job queue is changed to disabled.

If force is set to FALSE and the job is currently running, an error is returned.

If force is set to TRUE, the job is disabled, but the currently running instance is allowed to finish.

For jobs with multiple destinations, you cannot disable a child job at a specific destination. Instead, you can disable the destination.

Programs

When a program is disabled, the status is changed to disabled. A disabled program implies that, although the metadata is still there, jobs that point to this program cannot run.

If force is set to FALSE, the program must not be referenced by any job, otherwise an error will occur.

If force is set to TRUE, those jobs that point to the program will not be disabled, however, they will fail at runtime because their program will not be valid.

Running jobs that point to the program are not affected by the DISABLE call and are allowed to continue.

No arguments that pertain to the program are affected when the program is disabled.

File Watchers

If force is set to FALSE, the file watcher must not be referenced by any job, otherwise an error will occur. If you force disabling a file watcher, jobs that depend on it become disabled.

Windows

This means that the window will not open, however, the metadata of the window is still there, so it can be reenabled.

If force is set to FALSE, the window must not be open or referenced by any job otherwise an error occurs.

If force is set to TRUE, disabling a window that is open will succeed but the window will not be closed. It will prevent the window from opening in the future until it is reenabled.

When the window is disabled, those jobs that have the window as their schedule will not be disabled.

Window Groups

When a group of type WINDOW is disabled, jobs (other than a running job) that have the window group as their schedule will not run when the member windows open. However, a job that has one of the window group members as its schedule still runs.

The metadata of the window group is still there, so it can be reenabled. Note that the members of the window group will still open.

If force is set to FALSE, the window group must not have any members that are open or referenced by any job, otherwise an error will occur.
If `force` is set to `TRUE`:

- The window group is disabled and the open window will be not closed or disabled. It will be allowed to continue to its end.
- The window group is disabled but those jobs that have the window group as their schedule will not be disabled.

Job Chains

When a chain is disabled, the metadata for the chain is still there, but jobs that point to it will not be able to be run. This allows changes to the chain to be made safely without the risk of having an incompletely specified chain run. If `force` is set to `FALSE`, the chain must not be referenced by any job, otherwise an error will occur. If `force` is set to `TRUE`, those jobs that point to the chain will not be disabled, however, they will fail at runtime. Running jobs that point to this chain are not affected by the `DISABLE` call and are allowed to complete.

Database Destinations

When you disable a database destination:

- The destination is skipped when a multiple destination job runs.
- If all destinations are disabled for a job, the Scheduler generates an error when it attempts to run the job.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all jobs that reference the database destination.

External Destinations

When you disable an external destination:

- Dependent database destinations remain enabled, but the Scheduler generates an error when it attempts to run a job with a database destination that depends on the external destination.
- The `REFS_ENABLED` column in `*_SCHEDULER_JOB_DESTS` is set to `FALSE` for all external jobs that reference the external destination and for all database jobs with a database destination that depends on the external destination.

Groups

If you disable an external destination group or database destination group, the Scheduler generates an error when it attempts to run a job that names the group as its destination.

143.6.30 DROP_AGENT_DESTINATION Procedure

This procedure drops one or more external destinations, also known as agent destinations. It should be used only when the preferred method of dropping an external destination, using the `schagent` Utility to unregister a Scheduler agent with a database, is unavailable due to failures.

This procedure can be called only by the `SYS` user or a user with the `MANAGE_SCHEDULER` privilege.
Note:

External destinations are created on a source database only implicitly by registering an agent with the database. There is no user-callable CREATE_AGENT_DESTINATION procedure.

Syntax

DBMS_SCHEDULER.DROP_AGENT_DESTINATION (destination_name IN VARCHAR2);

Parameters

Table 143-43 DROP_AGENT_DESTINATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_name</td>
<td>A comma-separated list of external destinations to drop. Because user SYS owns all external destinations, do not prefix them with a schema name. The procedure stops processing if it encounters an external destination that does not exist. All external destinations processed before the error are dropped. Cannot be NULL.</td>
</tr>
</tbody>
</table>

Usage Notes

When an external destination is dropped:

- All database destinations that refer to the external destination are disabled and their agent attribute is set to NULL.
- Members of external destination groups that refer to the destination are removed from the group.
- All job instances in the *_SCHEDULER_JOB_DESTS views that refer to the external destination are also dropped.
- Jobs running against the destination are stopped.

143.6.31 DROP_CHAIN Procedure

This procedure drops an existing chain.

Syntax

DBMS_SCHEDULER.DROP_CHAIN (chain_name IN VARCHAR2, force IN BOOLEAN DEFAULT FALSE);
Parameters

Table 143-44  DROP_CHAIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to drop. Can also be a comma-delimited list of chains.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the chain must not be referenced by any job, otherwise an error will occur. If force is set to TRUE, all jobs pointing to the chain are disabled before the chain is dropped. Running jobs that point to this chain are stopped before the chain is dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a chain requires alter privileges on the chain (either as the owner, or a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

All steps associated with the chain are dropped. If no rule set was specified when the chain was created, then the automatically created rule set and evaluation context associated with the chain are also dropped, so the user must have the privileges required to do this. See the DBMS_RULE_ADM.DROP_RULE_SET and DBMS_RULE_ADM.DROP_EVALUATION_CONTEXT procedures for more information.

If force is FALSE, no jobs may be using this chain. If force is TRUE, any jobs that use this chain are disabled before the chain is dropped (and any of these jobs that are running will be stopped).

143.6.32 DROP_CHAIN_RULE Procedure

This procedure removes a rule from an existing chain. The rule object corresponding to this rule will also be dropped. The chain will not be disabled. If dropping this rule makes the chain invalid, the user should first disable the chain to ensure that it does not run.

Syntax

```sql
DBMS_SCHEDULER.DROP_CHAIN_RULE (  
  chain_name              IN VARCHAR2,  
  rule_name               IN VARCHAR2,  
  force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-45  DROP_CHAIN_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule to drop</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to TRUE, the drop operation proceeds even if the chain is currently running. The running chain is not stopped or interrupted. If force is set to FALSE and the chain is running, an error is generated.</td>
</tr>
</tbody>
</table>
Usage Notes

Dropping a chain rule requires alter privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

Dropping a chain rule also drops the underlying rule database object so you must have the privileges to drop this rule object. See the DBMS_RULE_ADM.DROP_RULE procedure for more information.

143.6.33 DROP_CHAIN_STEP Procedure

This procedure drops a chain step. If this chain step is still used in the chain rules, the chain will be disabled.

Syntax

```sql
DBMS_SCHEDULER.DROP_CHAIN_STEP (  
    chain_name  IN VARCHAR2,  
    step_name   IN VARCHAR2,  
    force       IN BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to alter</td>
</tr>
<tr>
<td>step_name</td>
<td>The name of the step being dropped. Can be a comma-separated list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to TRUE, this succeeds even if this chain is currently running. The running chain will not be stopped or interrupted. If force is set to FALSE and this chain is currently running, an error is thrown.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a chain step requires ALTER privileges on the chain (either as the owner or as a user with ALTER privileges on the chain or the CREATE ANY JOB system privilege).

143.6.34 DROP_CREDENTIAL Procedure

This deprecated procedure drops a credential.

Note:

This procedure is deprecated with Oracle Database 12c Release 1 (12.1). While the procedure remains available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the DBMS_CREDENTIAL package, specifically the DROP_CREDENTIAL Procedure.
Syntax

```
DBMS_SCHEDULER.DROP_CREDENTIAL (  
    credential_name         IN VARCHAR2,  
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 143-47  DROP_CREDENTIAL Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential_name</td>
<td>The name of the credential being dropped. This can optionally be prefixed with a schema name. This cannot be set to NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the credential must not be referenced by any job, or an error will occur. If set to TRUE, the credential is dropped whether or not there are jobs referencing it. Jobs that reference the credential will continue to point to a nonexistent credential and throw an error at runtime.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner of a credential or a user with the CREATE ANY JOB system privilege may drop the credential.

Running jobs that point to the credential are not affected by this procedure and are allowed to continue.

**143.6.35 DROP_DATABASE_DESTINATION Procedure**

This procedure drops one or more database destinations.

Syntax

```
DBMS_SCHEDULER.DROP_DATABASE_DESTINATION (  
    destination_name        IN VARCHAR2);
```

Parameters

**Table 143-48  DROP_DATABASE_DESTINATION Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| destination_name | The name of the destination to drop. Can be a comma-separated list of database destinations to drop. Each database destination can optionally be prefixed with a schema name.  
                     The procedure stops processing if it encounters a database destination that does not exist. All database destinations processed before the error are dropped.  
                     Cannot be NULL.                                                                                           |

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the database destination.
When a database destination is dropped:

- All job instances that refer to the destination in the \_SCHEDULER\_JOB\_DESTS views are also dropped.
- Jobs running against the destination are stopped.
- Members of database destination groups that refer to the destination are removed from the group.

**See Also:**

CREATE_DATABASE_DESTINATION Procedure

### 143.6.36 DROP_FILE_WATCHER Procedure

This procedure drops one or more file watchers.

**Syntax**

```sql
DBMS_SCHEDULER.DROP_FILE_WATCHER (
    file_watcher_name IN VARCHAR2,
    force           IN BOOLEAN DEFAULT FALSE);
```

**Parameters**

**Table 143-49** DROP_FILE_WATCHER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file_watcher_name</td>
<td>The file watcher to drop. Can be a comma-separated list of file watchers. Each file watcher name can optionally be prefixed with a schema name. Cannot be NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If set to FALSE, the file watcher must not be referenced by any job, or an error occurs. If set to TRUE, the file watcher is dropped whether or not there are jobs referencing it. In this case, jobs that reference the dropped file watcher are disabled.</td>
</tr>
</tbody>
</table>

**Usage Notes**

Only the owner of a file watcher or a user with the CREATE ANY JOB system privilege may drop the file watcher.

Running jobs that point to the file watcher are not affected by this procedure and are allowed to continue.

**See Also:**

"CREATE_FILE_WATCHER Procedure"
143.6.37 DROP_GROUP Procedure

This procedure drops one or more groups.

Syntax

```
DBMS_SCHEDULER.DROP_GROUP (  
    group_name       IN VARCHAR2,  
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-50 DROP_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>A group to drop. Can be a comma-separated list of group names. Each group name can optionally be prefixed with a schema name. The procedure stops processing if it encounters a group that does not exist. All groups processed before the error are dropped. Cannot be NULL.</td>
</tr>
<tr>
<td>force</td>
<td>If FALSE, the group must not be referenced by any job, otherwise an error occurs. If TRUE, the group is dropped whether or not there are jobs referencing it. In this case, all jobs referencing the group are disabled and all job instances that reference the group are removed from the *_SCHEDULER_JOB_DESTS views.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop a group. You must have the MANAGE SCHEDULER privilege to drop a group of type WINDOW.

See Also:

"CREATE_FILE_WATCHER Procedure"

143.6.38 DROP_INCOMPATIBILITY Procedure

This procedure drops an existing incompatibility definition.

Syntax

```
DBMS_SCHEDULER.DROP_INCOMPATIBILITY (  
    incompatibility_name IN VARCHAR2);  
```
Parameters

Table 143-51  DROP_INCOMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incompatibility_name</td>
<td>The name of the incompatibility definition.</td>
</tr>
</tbody>
</table>

Usage Notes

See Also:
Using Incompatibility Definitions in Oracle Database Administrator’s Guide

143.6.39 DROP_JOB Procedure

This procedure drops one or more jobs or all jobs in one or more job classes. Dropping a job also drops all argument values set for that job.

Syntax

```sql
DBMS_SCHEDULER.DROP_JOB (
    job_name                IN VARCHAR2,
    force                   IN BOOLEAN DEFAULT FALSE,
    defer                   IN BOOLEAN DEFAULT FALSE,
    commit_semantics        IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 143-52  DROP_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of a job or job class. Can be a comma-delimited list. For a job class, the SYS schema should be specified.</td>
</tr>
<tr>
<td></td>
<td>If the name of a job class is specified, the jobs that belong to that job class are dropped, but the job class itself is not dropped.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to TRUE, the Scheduler first attempts to stop the running job instances (by issuing the STOP_JOB call with the force flag set to false), and then drops the jobs.</td>
</tr>
<tr>
<td>defer</td>
<td>If defer is set to TRUE, the Scheduler allows the running jobs to complete and then drops the jobs.</td>
</tr>
</tbody>
</table>
Table 143-52  (Cont.) DROP_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>• STOP_ON_FIRST_ERROR returns on the first error and previous successful drop operations are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL returns on the first error. Everything that happened before that error is rolled back. This type is not supported when force is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>• ABSORB_ERRORS tries to absorb any errors and drop the rest of the jobs, and commits all the successful drops. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details.</td>
</tr>
<tr>
<td></td>
<td>Only STOP_ON_FIRST_ERROR is permitted when job classes are included in the job_name list.</td>
</tr>
</tbody>
</table>

Usage Notes

If both force and defer are set to FALSE and a job is running at the time of the call, the attempt to drop that job fails. The entire call to DROP_JOB may then fail, depending on the setting of commit_semantics.

Setting both force and defer to TRUE results in an error.

Dropping a job requires ALTER privileges on the job either as the owner of the job or as a user with the ALTER object privilege on the job or the CREATE ANY JOB system privilege.

143.6.40 DROP_JOB_CLASS Procedure

This procedure drops a job class. Dropping a job class means that all the metadata about the job class is removed from the database.

Syntax

DBMS_SCHEDULER.DROP_JOB_CLASS (  
    job_class_name IN VARCHAR2,  
    force IN BOOLEAN DEFAULT FALSE);  

Parameters

Table 143-53  DROP_JOB_CLASS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_class_name</td>
<td>The name of the job class. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, a class being dropped must not be referenced by any jobs, otherwise an error occurs.</td>
</tr>
<tr>
<td></td>
<td>If force is set to TRUE, jobs belonging to the class are disabled and their class is set to the default class. Only if this is successful is the class dropped.</td>
</tr>
<tr>
<td></td>
<td>Running jobs that belong to the job class are not affected.</td>
</tr>
</tbody>
</table>
### Usage Notes

Dropping a job class requires the `MANAGE SCHEDULER` system privilege.

### 143.6.41 DROP_PROGRAM Procedure

This procedure drops a program. Any arguments that pertain to the program are also dropped when the program is dropped.

#### Syntax

```sql
DBMS_SCHEDULER.DROP_PROGRAM (  
    program_name            IN VARCHAR2,  
    force                   IN BOOLEAN DEFAULT FALSE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be dropped. Can be a comma-delimited list.</td>
</tr>
</tbody>
</table>
| force         | If `force` is set to `FALSE`, the program must not be referenced by any job, otherwise an error occurs.  
|              | If `force` is set to `TRUE`, all jobs referencing the program are disabled before the program is dropped.  
|              | Running jobs that point to the program are not affected by the `DROP_PROGRAM` call and are allowed to continue. |

#### Usage Notes

Dropping a program requires that you be the owner of the program or have `ALTER` privileges on that program. You can also drop a program if you have the `CREATE ANY JOB` privilege.

### 143.6.42 DROP_PROGRAM_ARGUMENT Procedure

This procedure drops a program argument. An argument can be specified by either name (if one has been given) or position.

The procedure is overloaded.

#### Syntax

**Drops a program argument by position:**

```sql
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name            IN VARCHAR2,  
    argument_position       IN PLS_INTEGER);
```

**Drops a program argument by name:**

```sql
DBMS_SCHEDULER.DROP_PROGRAM_ARGUMENT (  
    program_name            IN VARCHAR2,  
    argument_name           IN VARCHAR2);
```
Parameters

Table 143-55  DROP_PROGRAM_ARGUMENT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>program_name</td>
<td>The name of the program to be altered. A program with this name must exist.</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the argument being dropped</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the argument to be dropped</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a program argument requires that you be the owner of the program or have ALTER privileges on that program. You can also drop a program argument if you have the CREATE ANY JOB privilege.

143.6.43 DROP_RESOURCE Procedure

This procedure drops a resource.

Syntax

```sql
DBMS_SCHEDULER.DROP_RESOURCE ( resource_name  IN VARCHAR2,
                                force          IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-56  DROP_RESOURCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource_name</td>
<td>The name of the resource to be dropped. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the resource must not have any existing constraints, otherwise an error occurs. If force is set to TRUE, the resource will be dropped and any constraints defined on this resource will also be dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Only the owner or a user with the CREATE ANY JOB system privilege may drop the resource.

See Also:

Creating or Dropping a Resource in Oracle Database Administrator's Guide
143.6.44 DROP_SCHEDULE Procedure

This procedure drops a schedule.

Syntax

```sql
DBMS_SCHEDULER.DROP_SCHEDULE (
    schedule_name IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-57  DROP_SCHEDULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schedule_name</td>
<td>The name of the schedule. Can be a comma-delimited list.</td>
</tr>
<tr>
<td>force</td>
<td>If force is set to FALSE, the schedule must not be referenced by any job or window, otherwise an error will occur. If force is set to TRUE, any jobs or windows that use this schedule are disabled before the schedule is dropped. Running jobs and open windows that point to the schedule are not affected.</td>
</tr>
</tbody>
</table>

Usage Notes

You must be the owner of the schedule being dropped or have ALTER privileges for the schedule or the CREATE ANY JOB privilege.

143.6.45 DROP_WINDOW Procedure

This procedure drops a window. All metadata about the window is removed from the database. The window is removed from any groups that reference it.

Syntax

```sql
DBMS_SCHEDULER.DROP_WINDOW (
    window_name IN VARCHAR2,
    force            IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-58  DROP_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window. Can be a comma-delimited list.</td>
</tr>
</tbody>
</table>
Table 143-58  (Cont.) DROP_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>If force is set to FALSE, the window must not be open or referenced by any job, otherwise an error occurs. If force is set to TRUE, the window is dropped and those jobs that have the window as their schedule are disabled. However, jobs that have a window group, of which the dropped window is a member, as their schedule, are not disabled. If the window is open then, the Scheduler attempts to first close the window and then drop it. When the window is closed, normal close window rules apply. Running jobs that have the window as their schedule is allowed to continue, unless the stop_on_window_close flag is set to TRUE for the job. If this is the case, the job is stopped when the window is dropped.</td>
</tr>
</tbody>
</table>

Usage Notes

Dropping a window requires the MANAGE_SCHEDULER privilege.

143.6.46 ENABLE Procedure

This procedure enables a program, job, chain, window, database destination, external destination, file watcher, or group.

When an object is enabled, its enabled attribute is set to TRUE. By default, jobs, chains, and programs are created disabled and database destinations, external destinations, file watchers, windows, and groups are created enabled.

If a job was disabled and you enable it, the Scheduler begins to automatically run the job according to its schedule. Enabling a disabled job also resets the job run_count, failure_count and retry_count columns in the *_SCHEDULER_JOBS data dictionary views.

Validity checks are performed before enabling an object. If the check fails, the object is not enabled, and an appropriate error is returned. This procedure does not return an error if the object was already enabled.

Syntax

```
DBMS_SCHEDULER.ENABLE (  
    name              IN VARCHAR2,  
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 143-59  ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the Scheduler object being enabled. Can be a comma-delimited list of names. If a job class name is specified, then all the jobs in the job class are enabled. If a group name is specified, then the group is enabled, but the enabled state of the group members is unaffected.</td>
</tr>
</tbody>
</table>
Table 143-59  (Cont.) ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>• STOP_ON_FIRST_ERROR - The procedure returns on the first error and previous successful enable operations are committed to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL - The procedure returns on the first error and everything that happened before that error is rolled back. This type is only supported when enabling a job or a list of jobs.</td>
</tr>
<tr>
<td></td>
<td>• ABSORB_ERRORS - The procedure tries to absorb any errors and enable the rest of the jobs. It commits all the enable operations that were successful. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. This type is only supported when enabling a job or a list of jobs.</td>
</tr>
</tbody>
</table>

Usage Notes

Window names must be preceded by SYS.

To run ENABLE for a window or group of type WINDOW, you must have the MANAGE SCHEDULER privilege. For a job of type EXECUTABLE (or for a job that points to a program of type EXECUTABLE), the job owner must have the CREATE EXTERNAL JOB system privilege before the job can be enabled or run.

To enable a file watcher, the file watcher owner must have the EXECUTE privilege on the designated credential.

You can use ENABLE with any schema except the SYS schema.

143.6.47 END_DETACHED_JOB_RUN Procedure

This procedure ends a detached job run. A detached job points to a detached program, which is a program with the detached attribute set to TRUE.

A detached job run does not end until this procedure or the STOP_JOB Procedure is called.

Syntax

```sql
DBMS_SCHEDULER.END_DETACHED_JOB_RUN (  
    job_name          IN VARCHAR2,  
    error_number      IN PLS_INTEGER DEFAULT 0,  
    additional_info   IN VARCHAR2 DEFAULT NULL);
```

Parameters

Table 143-60  END_DETACHED_JOB_RUN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to end. Must be a detached job that is running.</td>
</tr>
</tbody>
</table>
Table 143-60  (Cont.) END_DETACHED_JOB_RUN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_number</td>
<td>If zero, then the job run is logged as succeeded. If -1013, then the job run is logged as stopped. If any other number, then the job run is logged as failed with that error number.</td>
</tr>
<tr>
<td>additional_info</td>
<td>This text is stored in the additional_info column of the *_scheduler_job_run_details views for this job run.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires that you either own the job or have ALTER privileges on it. You can also end any detached job run if you have the CREATE ANY JOB privilege.

See Also:

Oracle Database Administrator's Guide for information about detached jobs.

143.6.48 EVALUATE_CALENDAR_STRING Procedure

You can define repeat intervals of jobs, windows or schedules using the Scheduler calendaring syntax. This procedure evaluates the calendar expression and tells you the next execution date and time of a job or window. This is very useful for testing the correct definition of the calendar string without actually scheduling the job or window.

This procedure can also get multiple steps of the repeat interval by passing the next_run_date returned by one invocation as the return_date_after argument of the next invocation.

See the calendaring syntax described in "Operational Notes".

Syntax

```sql
DBMS_SCHEDULER.EVALUATE_CALENDAR_STRING (    calendar_string    IN  VARCHAR2,
    start_date         IN  TIMESTAMP WITH TIME ZONE,
    return_date_after  IN  TIMESTAMP WITH TIME ZONE,
    next_run_date      OUT TIMESTAMP WITH TIME ZONE);
```

Parameters

Table 143-61  EVALUATE_CALENDAR_STRING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>calendar_string</td>
<td>The calendar expression to be evaluated. The string must be in the calendaring syntax described in &quot;Operational Notes&quot;.</td>
</tr>
<tr>
<td>start_date</td>
<td>The date and time after which the repeat interval becomes valid. It can also be used to fill in specific items that are missing from the calendar string. Can optionally be NULL.</td>
</tr>
</tbody>
</table>
Table 143-61  (Cont.) EVALUATECALENDARSTRING Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>return_date_after</td>
<td>The return_date_after argument helps the Scheduler determine which one of all possible matches (all valid execution dates) to return from those determined by the start_date and the calendar string. When a NULL value is passed for this argument, the Scheduler automatically fills in systimestamp as its value.</td>
</tr>
<tr>
<td>next_run_date</td>
<td>The first timestamp that matches the calendar string and start date that occur after the value passed in for the return_date_after argument.</td>
</tr>
</tbody>
</table>

Examples

The following code fragment can be used to determine the next five dates a job will run given a specific calendar string.

```
SET SERVEROUTPUT ON;
ALTER SESSION set NLS_DATE_FORMAT = 'DD-MON-YYYY HH24:MI:SS';
DECLARE
    start_date        TIMESTAMP;
    return_date_after TIMESTAMP;
    next_run_date     TIMESTAMP;
BEGIN
    start_date := to_timestamp_tz('01-JAN-2003 10:00:00','DD-MON-YYYY HH24:MI:SS');
    return_date_after := start_date;
    FOR i IN 1..5 LOOP
        DBMS_SCHEDULER.EVALUATECALENDARSTRING('FREQ=DAILY;BYHOUR=9;BYMINUTE=30;BYDAY=MON,TUE,WED,THU,FRI',
                                               start_date, return_date_after, next_run_date);
        DBMS_OUTPUT.PUT_LINE('next_run_date: ' || next_run_date);
        return_date_after := next_run_date;
    END LOOP;
END;
/  
next_run_date: 02-JAN-03 09.30.00.000000 AM
next_run_date: 03-JAN-03 09.30.00.000000 AM
next_run_date: 06-JAN-03 09.30.00.000000 AM
next_run_date: 07-JAN-03 09.30.00.000000 AM
next_run_date: 08-JAN-03 09.30.00.000000 AM
```

Usage Notes

No specific Scheduler privileges are required.

143.6.49 EVALUATE_RUNNING_CHAIN Procedure

This procedure forces reevaluation of the rules of a running chain to trigger any rules for which the conditions have been satisfied. The job passed as an argument must
point to a chain and must be running. If the job is not running, an error is thrown. (RUN_JOB can be used to start the job.)

If any of the steps of the chain are themselves running chains, another EVALUATE_RUNNING_CHAIN is performed on each of the nested running chains.

Syntax

DBMS_SCHEDULER.EVALUATE_RUNNING_CHAIN (job_name IN VARCHAR2);

Parameters

Table 143-62  EVALUATE_RUNNING_CHAIN Procedure Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the running job (pointing to a chain) to reevaluate the rules for</td>
</tr>
</tbody>
</table>

Usage Notes

Running EVALUATE_RUNNING_CHAIN on a job requires alter privileges on the job (either as the owner, or as a user with ALTER privileges on the job or the CREATE ANY JOB system privilege).

Note:

The Scheduler automatically evaluates a chain:

- At the start of the chain job
- When a chain step completes
- When an event occurs that is associated with an event step in the chain

For most chains, this is sufficient. EVALUATE_RUNNING_CHAIN should be used only under the following circumstances:

- After manual intervention of a running chain with the ALTER_RUNNING_CHAIN procedure
- When chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler.

In these cases, EVALUATE_RUNNING_CHAIN may not be needed if you set the evaluation_interval attribute when you created the chain.

143.6.50 GENERATE_JOB_NAME Function

This function returns a unique name for a job.

The name will be of the form (prefix)N where N is a number from a sequence. If no prefix is specified, the generated name will, by default, be JOBS_1, JOBS_2, JOBS_3, and so on. If 'SCOTT' is specified as the prefix, the name will be SCOTT1, SCOTT2, and so on.
Syntax

```sql
DBMS_SCHEDULER.GENERATE_JOB_NAME (    prefix        IN VARCHAR2 DEFAULT 'JOB$_') RETURN VARCHAR2;
```

Parameters

**Table 143-63**  GENERATE_JOB_NAME Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prefix</td>
<td>The prefix to use when generating the job name</td>
</tr>
</tbody>
</table>

Usage Notes

If the prefix is explicitly set to `NULL`, the name is just the sequence number. In order to successfully use such numeric names, they must be surrounded by double quotes throughout the `DBMS_SCHEDULER` calls. A prefix cannot be longer than 18 characters and cannot end with a digit.

Note that, even though the `GENERATE_JOB_NAME` function never returns the same job name twice, there is a small chance that the returned name matches an already existing database object.

No specific Scheduler privileges are required to use this function.

### 143.6.51 GET_AGENT_INFO Function

This function can return job information specific to an agent, such as how many are running and so on, depending on the attribute selected.

Syntax

```sql
DBMS_SCHEDULER.GET_AGENT_INFO (    agent_name        IN VARCHAR2,    attribute         IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

**Table 143-64**  GET_AGENT_INFO Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_name</td>
<td>The name of an external destination where the agent is running</td>
</tr>
</tbody>
</table>
Table 143-64  (Cont.) GET_AGENT_INFO Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>Possible Attributes values</td>
</tr>
<tr>
<td>• VERSION:</td>
<td>Returns the agent version number. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td>• UPTIME:</td>
<td>Returns the time the agent has been up and running. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td>• NUMBER_OF_RUNNING_JOBS:</td>
<td>Returns the number of jobs that the agent is currently running. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td>• TOTAL_JOBS_RUN:</td>
<td>Returns the number of jobs run by the agent since it was started. Requires the CREATE JOB system privilege.</td>
</tr>
<tr>
<td>• RUNNING_JOBS:</td>
<td>Returns a comma-separated list of the names of the jobs running currently. Requires the MANAGE SCHEDULER system privilege.</td>
</tr>
<tr>
<td>• ALL:</td>
<td>Returns all the information the previous options return. It requires the MANAGE SCHEDULER system privilege.</td>
</tr>
</tbody>
</table>

Usage Notes

This function returns the same information as the schagent utility status option. See Oracle Database Administrator's Guide.

143.6.52 GET_AGENT_VERSION Function

This function returns the version string of a Scheduler agent that is registered with the database and is currently running. GET_AGENT_VERSION throws an error if the agent is not registered with the database or if the agent is not currently running.

Syntax

```
DBMS_SCHEDULER.GET_AGENT_VERSION (
    agent_host        IN VARCHAR2) RETURN VARCHAR2;
```

Parameters

Table 143-65  GET_AGENT_VERSION Function Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent_host</td>
<td>Either the hostname and port on which the agent is running in the form hostname:port or the name of the agent as shown in the destination_name column of the ALL_SCHEDULER_EXTERNAL_DESTS view which lists all Scheduler agents registered with the database.</td>
</tr>
</tbody>
</table>

Usage Notes

This function requires the CREATE EXTERNAL JOB system privilege.
143.6.53 GET_ATTRIBUTE Procedure

This procedure retrieves the value of an attribute of a Scheduler object. It is overloaded to retrieve values of various types.

Syntax

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT {VARCHAR2|PLS_INTEGER|BOOLEAN|DATE|TIMESTAMP|
                     TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                     INTERVAL DAY TO SECOND});
```

```
DBMS_SCHEDULER.GET_ATTRIBUTE (
    name           IN VARCHAR2,
    attribute      IN VARCHAR2,
    value          OUT VARCHAR2,
    value2         OUT VARCHAR2);
```

Parameters

Table 143-66  GET_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being retrieved. See the SET_ATTRIBUTE Procedure for tables of attribute values.</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute</td>
</tr>
<tr>
<td>value2</td>
<td>The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.</td>
</tr>
</tbody>
</table>

Usage Notes

To run GET_ATTRIBUTE for a job class, you must have the MANAGE_SCHEDULER privilege or have EXECUTE privileges on the class. For a schedule, window, or group, no privileges are necessary. Otherwise, you must be the owner of the object or have ALTER or EXECUTE privileges on that object or have the CREATE ANY_JOB privilege.

See the SET_ATTRIBUTE Procedure for tables of attribute values that you can retrieve for the various Scheduler object types.

143.6.54 GET_FILE Procedure

This procedure retrieves a file from the operating system file system of a specified host. The file is copied to a destination, or its contents are returned in a procedure output parameter.

You can also use this procedure to retrieve the standard output or error text for a run of an external job that has an associated credential.
This procedure differs from the equivalent UTL_FILE procedure in that it uses a credential and can retrieve files from remote hosts that have only a Scheduler agent (and not an Oracle database) installed.

Syntax

```
DBMS_SCHEDULER.GET_FILE (
    source_file                  IN VARCHAR2,
    source_host                  IN VARCHAR2,
    credential_name              IN VARCHAR2,
    file_contents                IN OUT NOCOPY {BLOB|CLOB});
```

```
DBMS_SCHEDULER.GET_FILE (
    source_file                  IN VARCHAR2,
    source_host                  IN VARCHAR2,
    credential_name              IN VARCHAR2,
    destination_file_name        IN VARCHAR2,
    destination_directory_object IN VARCHAR2,
    destination_permissions      IN VARCHAR2 DEFAULT NULL);
```

Parameters

### Table 143-67  GET_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| source_file     | Fully qualified path name of the file to retrieve from the operating system. The file name is case-sensitive and is not converted to uppercase. If the file name starts with a question mark (’?’), the question mark is replaced by the path to the Oracle home if getting a file from the local host, or to the Scheduler agent home if getting a file from a remote host. If the format of this parameter is `external_log_id_stdout`, then the stdout from the designated external job run is returned. If the format of this parameter is `external_log_id_stderr`, the error text from the designated external job run is returned. You obtain the value of `external_log_id` from the ADDITIONAL_INFO column of the *
|                 | SCHEDULER_JOB_RUN_DETAILS views. This column contains a set of name/value pairs in an indeterminate order, so you must parse this column for the `external_log_id` name/value pair, and then append either `_stdout` or `_stderr` to its value. The external job must have an associated credential. The `credential_name` parameter of GET_FILE must name the same credential that is used by the job, and the `source_host` parameter must be the same as the `destination` attribute of the job. |
| source_host     | If the file is to be retrieved from a remote host, then this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *
|                 | SCHEDULER_EXTERNAL_DESTS.) If `source_host` is NULL or set to 'localhost', then the file is retrieved from the file system of the local host. To determine the port number of a Scheduler agent, view the schagent.conf file, which is located in the Scheduler agent home directory on the remote host. |
| credential_name | The name of the credential to use for accessing the file system.                                                                                                                                              |
| file_contents   | The variable into which the file contents is read.                                                                                                                                                           |
Table 143-67  (Cont.) GET_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_file_name</td>
<td>The file to which the file contents is written.</td>
</tr>
<tr>
<td>destination_directory_object</td>
<td>The directory object that specifies the path to the destination file, when destination_file_name is used. The caller must have the necessary privileges on the directory object.</td>
</tr>
<tr>
<td>destination_permissions</td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

143.6.55 GET_SCHEDULER_ATTRIBUTE Procedure

This procedure retrieves the value of a Scheduler attribute.

Syntax

```sql
DBMS_SCHEDULER.GET_SCHEDULER_ATTRIBUTE (attribute IN VARCHAR2, value OUT VARCHAR2);
```

Parameters

Table 143-68  GET_SCHEDULER_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the attribute</td>
</tr>
<tr>
<td>value</td>
<td>The existing value of the attribute</td>
</tr>
</tbody>
</table>

Usage Notes

To run GET_SCHEDULER_ATTRIBUTE, you must have the MANAGE_SCHEDULER privilege.

Table 143-69 lists the Scheduler attributes that you can retrieve. For more detail on these attributes, see Table 143-101 and the section "Configuring the Scheduler" in Oracle Database Administrator's Guide.

Table 143-69  Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

<table>
<thead>
<tr>
<th>Scheduler Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>current_open_window</td>
<td>Name of the currently open window</td>
</tr>
<tr>
<td>default_timezone</td>
<td>Default time zone used by the Scheduler for repeat intervals and windows</td>
</tr>
</tbody>
</table>
Table 143-69  (Cont.) Scheduler Attributes Retrievable with GET_SCHEDULER_ATTRIBUTE

<table>
<thead>
<tr>
<th>Scheduler Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>email_sender</td>
<td>The default e-mail address of the sender for job state e-mail notifications</td>
</tr>
<tr>
<td>email_server</td>
<td>The SMTP server address that the Scheduler uses to send e-mail notifications for job state events. E-mail notifications cannot be sent if this attribute is NULL.</td>
</tr>
<tr>
<td>event_expiry_time</td>
<td>Time in seconds before an event generated by the Scheduler and enqueued onto the Scheduler event queue expires. May be NULL.</td>
</tr>
<tr>
<td>log_history</td>
<td>Retention period in days for job and window logs. The range of valid values is 0 through 1000000.</td>
</tr>
<tr>
<td>max_job_slave_processes</td>
<td>This Scheduler attribute is not used.</td>
</tr>
</tbody>
</table>

143.6.56 OPEN_WINDOW Procedure

This procedure manually opens a window, unrelated to its schedule.

The window opens and the resource plan associated with it takes effect immediately, for the duration specified or for the normal duration of the window, if no duration is given. Only an enabled window can be manually opened.

Syntax

```
DBMS_SCHEDULER.OPEN_WINDOW (  
    window_name             IN VARCHAR2,  
    duration                IN INTERVAL DAY TO SECOND,  
    force                   IN BOOLEAN DEFAULT FALSE);
```

Parameters

Table 143-70  OPEN_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>window_name</td>
<td>The name of the window</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the window. It is of type interval day to second. If it is NULL, then the window opens for the regular duration as specified in the window metadata.</td>
</tr>
</tbody>
</table>
Table 143-70  (Cont.) OPEN_WINDOW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| force     | If force is set to FALSE, then opening an already open window generates an error.  
If force is set to TRUE:  
You can open a window that is already open. The window stays open for the duration specified in the call, from the time the OPEN_WINDOW command was issued.  
For example: window1 was created with a duration of four hours. It has been open for two hours. If, at this point, you reopen window1 using the OPEN_WINDOW call and do not specify a duration, then window1 stays open for four hours because it was created with that duration. If you specified a duration of 30 minutes, the window will close in 30 minutes.  
The Scheduler automatically closes any window that is open at that time, even if it has a higher priority. For the duration of this manually opened window, the Scheduler does not open any other scheduled windows even if they have a higher priority. |

**Usage Notes**

Opening a window manually has no impact on regular scheduled runs of the window. The next open time of the window is not updated and is determined by the regular scheduled opening.

When a window that was manually opened closes, the rules about overlapping windows are applied to determine which other window should be opened at that time if any at all.

If there are jobs running when the window opens, the resources allocated to them might change if there is a switch in resource plan.

If a window fails to switch resource plans because the designated resource plan no longer exists or because resource plan switching by windows is disabled (for example, by using the ALTER SYSTEM statement with the force option), the failure to switch resource plans is recorded in the window log.

Opening a window requires the MANAGE SCHEDULER privilege.

### 143.6.57 PURGE_LOG Procedure

The PURGE_LOG procedure purges rows from the job and window log that were not purged automatically by the scheduler.

By default, the Scheduler automatically purges all rows in the job log and window log that are older than 30 days. The PURGE_LOG procedure can be used to purge additional rows from the job and window log.

Rows in the job log table pertaining to the steps of a chain are purged only when the entry for the main chain job is purged (either manually or automatically).

**Syntax**

```
DBMS_SCHEDULER.PURGE_LOG  (
    log_history             IN PLS_INTEGER  DEFAULT 0,
```
which_log IN VARCHAR2 DEFAULT 'JOB_AND_WINDOW_LOG',
job_name IN VARCHAR2 DEFAULT NULL);

Parameters

Table 143-71  PURGE_LOG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>log_history</td>
<td>This specifies how much history (in days) to keep. The valid range is 0 - 1000000. If set to 0, no history is kept.</td>
</tr>
<tr>
<td>which_log</td>
<td>This specifies the log type. Valid values are: job_log, window_log, and job_and_window_log.</td>
</tr>
<tr>
<td>job_name</td>
<td>This specifies which job-specific entries must be purged from the job log. This can be a comma-delimited list of job names and job classes. Whenever job_name has a value other than NULL, the which_log argument implicitly includes the job log.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure requires the MANAGE_SCHEDULER privilege.

Examples

The following completely purges all rows from both the job log and the window log:

DBMS_SCHEDULER.PURGE_LOG();

The following purges all rows from the window log that are older than 5 days:

DBMS_SCHEDULER.PURGE_LOG(5, 'window_log');

The following purges all rows from the window log that are older than 1 day and all rows from the job log that are related to jobs in jobclass1 and older than 1 day:

DBMS_SCHEDULER.PURGE_LOG(1, 'job_and_window_log', 'sys.jobclass1');

143.6.58 PUT_FILE Procedure

This procedure saves a file to the operating system file system of a specified remote host or of the local computer.

It differs from the equivalent UTL_FILE procedure in that it uses a credential and can save files to a remote host that has only a Scheduler agent (and not an Oracle Database) installed.

Syntax

DBMS_SCHEDULER.PUT_FILE (
  destination_file IN VARCHAR2,
  destination_host IN VARCHAR2,
  credential_name IN VARCHAR2,
  file_contents IN {BLOB|CLOB},
  destination_permissions IN VARCHAR2 DEFAULT NULL);

DBMS_SCHEDULER.PUT_FILE (
  destination_file IN VARCHAR2,
  destination_host IN VARCHAR2,
Parameters

Table 143-72 PUT_FILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_file</td>
<td>Fully qualified path name of the file to save to the operating system file system. The file name is case-sensitive. If the file name starts with a question mark (&quot;?&quot;) , the question mark is replaced by the path to the Oracle home if saving to the local host, or to the Scheduler agent home if saving to a remote host.</td>
</tr>
<tr>
<td>destination_host</td>
<td>If NULL or set to 'localhost', the file is saved to the file system of the local computer. To save to a remote host, this parameter must be a valid external destination name. (An external destination is created when you register a remote Scheduler agent with the database. You can view external destination names in the views *_SCHEDULER_EXTERNAL_DESTS.)</td>
</tr>
<tr>
<td>credential_name</td>
<td>The name of the credential to use for accessing the destination file system.</td>
</tr>
<tr>
<td>file_contents</td>
<td>The variable from which the file contents is read.</td>
</tr>
<tr>
<td>source_file_name</td>
<td>The file from which the file contents is written</td>
</tr>
<tr>
<td>source_directory_object</td>
<td>The directory object that specifies the path to the source file, when source_file_name is used. The caller must have the necessary privileges on the directory object.</td>
</tr>
<tr>
<td>destination_permissions</td>
<td>Reserved for future use</td>
</tr>
</tbody>
</table>

Usage Notes

The caller must have the CREATE EXTERNAL JOB system privilege and have EXECUTE privileges on the credential.

143.6.59 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure

This procedure unsubscribes a user from the Scheduler event queue SYS.SCHEDULER$$_EVENT_QUEUE.

Syntax

```sql
DBMS_SCHEDULER.REMOVE_EVENT_QUEUE_SUBSCRIBER ( subscriber_name IN VARCHAR2 DEFAULT NULL);```
Parameters

Table 143-73 REMOVE_EVENT_QUEUE_SUBSCRIBER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>subscriber_name</td>
<td>Name of the Oracle Streams Advanced Queuing (AQ) agent to remove the subscription from. If <strong>NULL</strong>, the user name of the calling user is used.</td>
</tr>
</tbody>
</table>

Usage Notes

After the agent is unsubscribed, it is deleted. If the agent does not exist or is not currently subscribed to the Scheduler event queue, an error is raised.

143.6.60 REMOVE_FROM_INCOMPATIBILITY Procedure

This procedure removes jobs or programs from an existing incompatibility definition.

Syntax

```sql
DBMS_SCHEDULER.REMOVE_FROM_INCOMPATIBILITY (
    incompatibility_name    IN VARCHAR2,
    object_name             IN VARCHAR2);
```

Parameters

Table 143-74 REMOVE_FROM_INCOMPATIBILITY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incompatibility_name</td>
<td>The name of the incompatibility definition.</td>
</tr>
<tr>
<td>object_name</td>
<td>One or more (comma-separated) programs or jobs</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure does not raise an error if any specified objects do not already exist in the incompatibility definition.

See Also:

Using Incompatibility Definitions in *Oracle Database Administrator’s Guide*
### 143.6.61 REMOVE_GROUP_MEMBER Procedure

This procedure removes one or more members from an existing group.

**Syntax**

```sql
DBMS_SCHEDULER.REMOVE_GROUP_MEMBER (  
  group_name              IN VARCHAR2,  
  member                  IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>The name of the group.</td>
</tr>
<tr>
<td>member_name</td>
<td>The name of the member to remove from group. Comma-separated list of members to remove. An error is returned if any of the members is not part of the group. A group of the same type can be named as a member. The Scheduler immediately expands the included group name into its list of members. If the member is a destination, any job instances that run on this destination are removed from the *_SCHEDULER_JOB_DESTS views.</td>
</tr>
</tbody>
</table>

**Usage Notes**

The following users may remove members from a group:

- The group owner
- A user that has been granted the **ALTER** object privilege on the group
- A user with the **CREATE ANY JOB** system privilege

You must have the **MANAGE SCHEDULER** privilege to remove a member from a group of type **WINDOW**.

**See Also:**

"**CREATE_GROUP Procedure**"

### 143.6.62 REMOVE_JOB_EMAIL_NOTIFICATION Procedure

This procedure removes e-mail notifications for a job. You can remove all e-mail notifications or remove notifications only for specified recipients or specified events.

**Syntax**

```sql
DBMS_SCHEDULER.REMOVE_JOB_EMAIL_NOTIFICATION (  
  job_name             IN VARCHAR2,  
  recipients           IN VARCHAR2 DEFAULT NULL,  
  events               IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 143-76  ADD_JOB_EMAIL_NOTIFICATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of the job to remove e-mail notifications for. Cannot be NULL.</td>
</tr>
<tr>
<td>recipients</td>
<td>E-mail address to remove e-mail notification for. Comma-separated list of e-mail addresses.</td>
</tr>
<tr>
<td>events</td>
<td>Job state event to remove e-mail notification for. Comma-separate list of job state events.</td>
</tr>
</tbody>
</table>

Usage Notes

When you specify multiple recipients and multiple events, the notification for each specified event is removed for each specified recipient. The procedure ignores any recipients or events that are specified but that were not previously added.

If recipients is NULL, e-mail notifications for the specified events are removed for all existing recipients. If events is NULL, notifications for all events are removed for the specified recipients. If both recipients and events are NULL, all e-mail notifications are removed for the job.

For example, if recipients is 'jsmith@example.com,rjones@example.com' and events is 'JOB_FAILED,JOB_BROKEN', then notifications for both the job FAILED and JOB_BROKEN events are removed for both jsmith and rjones. If recipients is NULL, then notifications for both the JOB_FAILED and JOB_BROKEN events are removed for jsmith, rjones, and any other previously defined recipients for these events.

To call this procedure, you must be the job owner or a user with the CREATE ANY JOB system privilege or ALTER object privilege on the job.

See Also:

"ADD_JOB_EMAIL_NOTIFICATION Procedure"

143.6.63 RESET_JOB_ARGUMENT_VALUE Procedure

This procedure resets (clears) the value previously set to an argument for a job. RESET_JOB_ARGUMENT_VALUE is overloaded.

Syntax

Clears a previously set job argument value by argument position:

```sql
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (  
  job_name                 IN VARCHAR2,  
  argument_position        IN PLS_INTEGER);  
```

Clears a previously set job argument value by argument name:
DBMS_SCHEDULER.RESET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_name           IN VARCHAR2);

Parameters

Table 143-77  RESET_JOB_ARGUMENT_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job being altered</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being reset</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being reset</td>
</tr>
</tbody>
</table>

Usage Notes

If the corresponding program argument has no default value, the job is disabled. Resetting a program argument of a job belonging to another user requires ALTER privileges on that job. Arguments can be specified by position or by name.

RESET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also reset a job argument value if you have the CREATE ANY JOB privilege.

RESET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

143.6.64 RUN_CHAIN Procedure

This procedure immediately runs a chain or part of a chain by creating a run-once job with the job name given.

If no job_name is given, one is generated of the form RUN_CHAIN$_chainnameN, where chainname is the first 8 characters of the chain name and N is an integer.

If a list of start steps is given, only those steps are started when the chain begins running. Steps not in the list that would normally have started are skipped and paused (so that they or the steps after them do not run).

If start_steps is NULL, then the chain starts normally—that is, it performs an initial evaluation to see which steps to start running).

If a list of initial step states is given, the newly created chain job sets every listed step to the state specified for that step before evaluating the chain rules to see which steps to start. (Steps in the list are not started.)

Syntax

Runs a chain, with a list of start steps.

DBMS_SCHEDULER.RUN_CHAIN (
    chain_name                IN VARCHAR2,
    start_steps               IN VARCHAR2,
    job_name                  IN VARCHAR2 DEFAULT NULL);

Runs a chain, with a list of initial step states.
DBMS_SCHEDULER.RUN_CHAIN {  
  chain_name IN VARCHAR2,  
  step_state_list IN SYS.SCHEDULER$_STEP_TYPE_LIST,  
  job_name IN VARCHAR2 DEFAULT NULL);  
}

Parameters

Table 143-78  RUN_CHAIN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chain_name</td>
<td>The name of the chain to run</td>
</tr>
<tr>
<td>job_name</td>
<td>The name of the job to create to run the chain</td>
</tr>
<tr>
<td>start_steps</td>
<td>Comma-separated list of the steps to start when the chain starts running</td>
</tr>
<tr>
<td>step_state_list</td>
<td>List of chain steps with an initial state (SUCCEEDED or FAILED) to set for each.</td>
</tr>
</tbody>
</table>

Set the attributes of sys.scheduling$_step_type as follows:

- step_name: The name of the step
- step_type: 'SUCCEEDED' or 'FAILED'
- error_number: where error_number is a positive or negative integer.

Usage Notes

Running a chain requires CREATE JOB if the job is being created in the user's schema, or CREATE ANY JOB otherwise. In addition, the owner of the job being created needs execute privileges on the chain (as the owner of the chain, or as a user with the EXECUTE privilege on the chain or the EXECUTE ANY PROGRAM system privilege).

Examples

The following example illustrates how to start a chain in the middle by providing the initial state of some chain steps.

```sql
declare
  initial_step_states sys.scheduling$_step_type_list;
begin
  initial_step_states := sys.scheduling$_step_type_list(
    sys.scheduling$_step_type('step1', 'SUCCEEDED'),
    sys.scheduling$_step_type('step2', 'FAILED 27486'),
    sys.scheduling$_step_type('step3', 'SUCCEEDED'),
    sys.scheduling$_step_type('step5', 'SUCCEEDED'));
  dbms_scheduler.run_chain('my_chain', initial_step_states);
end;
/
```

143.6.65 RUN_JOB Procedure

This procedure runs a job immediately.

If a job is enabled, the Scheduler runs it automatically. It is not necessary to call RUN_JOB to run a job according to its schedule. Use RUN_JOB to run a job outside of its normal schedule.
### Syntax

```sql
DBMS_SCHEDULER.RUN_JOB (  
    job_name                IN VARCHAR2,
    use_current_session     IN BOOLEAN DEFAULT TRUE);
```

### Parameters

Table 143-79  RUN_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>A job name or a comma-separate list of entries, where each is the name of an existing job, optionally preceded by a schema name and dot separator. If you specify a multiple-destination job, the job runs on all destinations. In this case, the <code>use_current_session</code> argument must be <code>FALSE</code>.</td>
</tr>
</tbody>
</table>
| use_current_session  | This specifies whether or not the job run should occur in the same session that the procedure was invoked from. The job always runs as the job owner, in the job owner's schema, unless it has credential specified, then the job runs using the user named in the credential. When `use_current_session` is set to `TRUE`:  
  - You can test a job and see any possible errors on the command line.  
  - `state`, `run_count`, `last_start_date`, `last_run_duration`, and `failure_count` of `*_scheduler_jobs` are not updated.  
  - `RUN_JOB` can be run in parallel with a regularly scheduled job run.  
  - When `use_current_session` is set to `FALSE`:  
    - You need to check the job log to find error information.  
    - All relevant fields in `*_scheduler_jobs` are updated.  
    - `RUN_JOB` fails if a regularly scheduled job is running.  
  For jobs that have a specified destination or destination group, or point to chains or programs with the detached attribute set to `TRUE`, `use_current_session` must be `FALSE`. |

### Usage Notes

Jobs do not have to be enabled. If a job is disabled, the following validity checks are performed before running it:

- The job points to a valid job class.
- The job owner has `EXECUTE` privileges on the job class.
- If a program or chain is referenced, the program/chain exists.
- If a program or chain is referenced, the job owner has privileges to execute the program/chain.
- All argument values have been set (or have defaults).
- The job owner has the `CREATE EXTERNAL JOB` privilege if this is an external job.

A `TRUE` value for `use_current_session` is not permitted for the following types of jobs:

- Jobs that specify a destination or destination group in the `destination_name` attribute
• Jobs that point to chains (chain jobs)
• Jobs that make use of detached programs (detached jobs).

above bug fix 1261887 6.12.11

When `use_current_session` is `TRUE`, the call to `RUN_JOB` blocks until the job completes. Any errors that occur during the execution of the job are returned as errors to the `RUN_JOB` procedure.

Using `RUN_JOB` with `use_current_session=True` does not update the job state and the job will not appear in `*_SCHEDULER_RUNNING_JOBS` views.

above bug fix 19185177 9.15.14

When `use_current_session` is `FALSE`, `RUN_JOB` returns immediately and the job is picked up by the job coordinator and passed on to a job slave for execution. The Scheduler views and logs must be queried for the outcome of the job.

Multiple user sessions can use `RUN_JOB` in their sessions simultaneously when `use_current_session` is set to `TRUE`.

`RUN_JOB` requires that you own the job or have `ALTER` privileges on that job. You can also run a job if you have the `CREATE ANY JOB` privilege.

Example

The following is an example of using `RUN_JOB`.

```sql
BEGIN
    DBMS_SCHEDULER.RUN_JOB(
        JOB_NAME => 'EODJOB, DSS.ETLJOB',
        USE_CURRENT_SESSION => FALSE
    );
END;
```

143.6.66 SET_AGENT_REGISTRATION_PASS Procedure

This procedure sets the agent registration password for a database.

A Scheduler agent must register with the database before the database can submit jobs to the agent. The agent must provide this password when registering.

Syntax

```sql
DBMS_SCHEDULER.SET_AGENT_REGISTRATION_PASS (  
    registration_password   IN VARCHAR2,
    expiration_date         IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    max_uses                IN NUMBER DEFAULT NULL);
```

Parameters

Table 143-80  SET_AGENT_REGISTRATION_PASS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>registration_password</td>
<td>This is the password that remote agents must specify in order to successfully register with the database. If this is <code>NULL</code>, then no agents will be able to register with the database.</td>
</tr>
</tbody>
</table>
Table 143-80  (Cont.) SET_AGENT_REGISTRATION_PASS Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expiration_date</td>
<td>If this is set to a non-NULL value, then the registration_password is not valid after this date. After this date, no agents can register with the database. This cannot be set to a date in the past.</td>
</tr>
<tr>
<td>max_uses</td>
<td>This is the maximum number of successful registrations that can be performed with this password. After the number of successful registrations has been performed with this password, then no agents can register with the database. This cannot be set to 0 or a negative value. If this is set to NULL, then there will be no limit on the number of successful registrations.</td>
</tr>
</tbody>
</table>

Usage Notes

To prevent abuse, this password can be set to expire after a given date or a maximum number of successful registrations. This procedure will overwrite any password already set. This requires the MANAGE SCHEDULER system privilege.

By default, max_uses is set to NULL, which means that there is no limit to the number of successful registrations.

Oracle recommends that an agent registration password be reset after every agent registration or every known set of agent registrations. Furthermore, Oracle recommends that this password be set to NULL if no new agents are being registered.

143.6.67 SET_ATTRIBUTE Procedure

This procedure modifies an attribute of a Scheduler object. It is overloaded to accept values of various types.

To set an attribute to NULL, use the SET_ATTRIBUTE_NULL procedure. The attributes that can be set depend on the object being altered. All object attributes can be changed, except the object name.

Syntax

```sql
DBMS_SCHEDULER.SET_ATTRIBUTE (name     IN VARCHAR2,
                               attribute IN VARCHAR2,
                               value      IN BOOLEAN|DATE|TIMESTAMP|
                               |TIMESTAMP WITH TIME ZONE|TIMESTAMP WITH LOCAL TIME ZONE|
                               |INTERVAL DAY TO SECOND|);
```

```sql
DBMS_SCHEDULER.SET_ATTRIBUTE (name     IN VARCHAR2,
                               attribute IN VARCHAR2,
                               value      IN VARCHAR2,
                               value2     IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 143-81 SET_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>attribute</td>
<td>See Table 143-83 through Table 143-93.</td>
</tr>
<tr>
<td>value</td>
<td>The new value being set for the attribute. This cannot be NULL. To set an attribute value to NULL, use the SET_ATTRIBUTE_NULL procedure.</td>
</tr>
<tr>
<td>value2</td>
<td>The value2 argument is for an optional second value. Most attributes have only one value associated with them, but some can have two.</td>
</tr>
</tbody>
</table>

Table 143-82 is a directory of Scheduler object types and tables of attributes for the object types.

These object types can be viewed with Scheduler Data Dictionary Views, listed in Oracle Database Administrator's Guide.

Usage Notes

If an object is altered and it was in the enabled state, the Scheduler first disables it, then makes the change and reenables it. If any errors are encountered during the enable process, the object is not reenabled and an error is generated.

If an object is altered and it was in the disabled state, it remains disabled after it is altered.

To run SET_ATTRIBUTE for a window, a group of type WINDOW, or job class, you must have the MANAGE_SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.
Job

If there is a running instance of the job when the SET_ATTRIBUTE call is made, it is not affected by the call. The change is only affects future runs of the job.

If any of the schedule attributes of a job are altered while the job is running, the time of the next job run is scheduled using the new schedule attributes. Schedule attributes of a job include schedule_name, start_date, end_date, and repeat_interval.

If any of the program attributes of a job are altered while the job is running, the new program attributes take effect the next time the job runs. Program attributes of a job include program_name, job_action, job_type, and number_of_arguments.

If any job argument values are altered while the job is running, the new values take effect the next time the job runs.

Granting the ALTER privilege on a job lets a user alter all attributes of that job except its program attributes (program_name, job_type, job_action, program_action, and number_of_arguments) and does not allow a user to use a PL/SQL expression to specify the schedule for a job.

Oracle recommends that you not alter a job that was automatically created for you by the database. Jobs that were created by the database have the column SYSTEM set to TRUE in job views.

Program

If any currently running jobs use the program that was altered, they continue to run with the program definition prior to the alter. The job runs with the new program definition the next time the job executes.

Schedule

If a schedule is altered, the change does not affect running jobs and open windows that use this schedule. The change only goes into effect the next time the jobs runs or the window opens.

File Watcher

If a file watcher is altered, any currently running event-based jobs started by the file arrival event are not affected. On the local system, the new file watcher attributes take effect the next time that the file watcher checks for the arrival of the file (every ten minutes by default). On remote systems, there may be an additional delay before the new file watcher attributes take effect.

Job Class

With the exception of the default job class, all job classes can be altered. To alter a job class, you must have the MANAGE SCHEDULER privilege.

When a job class is altered, running jobs that belong to the class are not affected. The change only takes effect for jobs that have not started running yet.

Window

When a window is altered, it does not affect an active window. The changes only take effect the next time the window opens.

If there is no current resource plan, when a window with a designated resource plan opens, the Resource Manager activates with that plan.
Job Attribute Values

Table 143-83 lists attribute values for jobs.

![Note:]
See the CREATE_JOB procedure and the CREATE_JOBS procedure for more complete descriptions of the attributes in this table.

Table 143-83  Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_runs_in_restricted_mode</td>
<td>If TRUE, the job is permitted to run when the database is in restricted mode, provided that the job owner is permitted to log in during this mode. FALSE by default.</td>
</tr>
</tbody>
</table>
| auto_drop             | This attribute, if TRUE, causes a job to be automatically dropped after it completes or is automatically disabled. A job is considered completed if:  
  • Its end date (or the end date of the schedule) has passed.  
  • It has run max_runs number of times. max_runs must be set with SET_ATTRIBUTE.  
  • It is not a repeating job and has run once.  
  A job is automatically disabled when it has failed max_failures times. max_failures is also set with SET_ATTRIBUTE.  
If this attribute is set to FALSE, the jobs are not dropped and their metadata is kept until the job is explicitly dropped with the DROP_JOB procedure. By default, jobs are created with auto_drop set to TRUE. |
| comments              | An optional comment.                                                                                                                                                                                        |
| connect_credential_name | feature 25230  
This attribute may be set to point to a database credential. For a SQL*Plus or backup script job, the credential connects to the database before running the script. For other job types, it is ignored. The job owner must have execute privileges on the credential, otherwise the job fails.  
Using a connect_credential_name is recommended since it allows the password to be stored securely in a credential in the database rather than in plain view in the job, program action, or script. |
| credential_name       | This attribute specifies the name of the credential object (credential) to use for a remote database job, a remote external job, a local external job, or an event-based job that processes a file arrival event. For local external jobs only, if this attribute is NULL (the default), then a preferred (default) credential is selected. See Oracle Database Administrator's Guide for information about preferred credentials for local external jobs. |
| database_role         | This attribute applies when the database participates in an Oracle Data Guard environment. If this attribute is set to 'PRIMARY', the job runs only when the database is in the role of the primary database. If set to 'LOGICAL STANDBY', the job runs only when the database is in the role of a logical standby. The default is 'PRIMARY' when the database is the primary database, and 'LOGICAL STANDBY' when the database is a logical standby.  
Note: If you want a job to run for all database roles on a particular host, you must create two copies of the job on that host: one with a database_role of 'PRIMARY', and the other with a database_role of 'LOGICAL STANDBY'. |

</table>
Table 143-83  (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_stickiness</td>
<td>This attribute should only be used for a database running in an Oracle Real Application Clusters (Oracle RAC) environment. By default, it is set to TRUE. If you set instance_stickiness to TRUE, jobs start running on the instance with the lightest load and the Scheduler thereafter attempts to run on the instance that it last ran on. If that instance is either down or so overloaded that it does not start new jobs for a significant period of time, another instance runs the job. If the interval between runs is large, instance_stickiness is ignored and the job is handled as if it were a non-sticky job. If instance_stickiness is set to FALSE, each instance of the job runs on the first instance available. For environments other than Oracle RAC, this attribute is not useful because there is only one instance.</td>
</tr>
<tr>
<td>job_action</td>
<td>The action that the job performs, depending on the job_type attribute. For example, if job_type is 'STORED_PROCEDURE', job_action contains the name of the stored procedure.</td>
</tr>
<tr>
<td>job_class</td>
<td>The class this job is associated with.</td>
</tr>
<tr>
<td>job_priority</td>
<td>This attribute specifies the priority of this job relative to other jobs in the same class as this job. If multiple jobs within a class are scheduled to be executed at the same time, the job priority determines the order in which jobs from that class are picked up for execution by the job coordinator. It can be a value from 1 through 5, with 1 being the first to be picked up for job execution. If no job priority is specified when creating a job, the default priority of 3 is assigned to it.</td>
</tr>
<tr>
<td>job_type</td>
<td>The type of this job. Valid values are: 'PLSQL_BLOCK', 'STORED_PROCEDURE', 'EXECUTABLE', 'CHAIN', 'EXTERNAL_SCRIPT', 'SQL_SCRIPT', and 'BACKUP_SCRIPT'. If this is set, program_name must be NULL.</td>
</tr>
<tr>
<td>job_weight</td>
<td>*** Deprecated in Oracle Database 11gR2. Do not change the value of this attribute from the default, which is 1. Weight of the job for parallel execution.</td>
</tr>
</tbody>
</table>
### Table 143-83  (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The possible options are:</td>
</tr>
<tr>
<td></td>
<td>- <strong>DBMS_SCHEDULER.LOGGING_OFF</strong></td>
</tr>
<tr>
<td></td>
<td>(The default) No logging is performed for this job. However, the logging level of the job class takes precedence and job logging may occur.</td>
</tr>
<tr>
<td></td>
<td>- <strong>DBMS_SCHEDULER.LOGGING_FAILED_RUNS</strong></td>
</tr>
<tr>
<td></td>
<td>The Scheduler logs only jobs that failed, with the reason for failure. If the job class has a higher logging level, then the higher logging level takes precedence.</td>
</tr>
<tr>
<td></td>
<td>- <strong>DBMS_SCHEDULER.LOGGING_RUNS</strong></td>
</tr>
<tr>
<td></td>
<td>The Scheduler writes detailed information to the job log for all runs of each job in this class. If the job class has a higher logging level, then the higher logging level takes precedence.</td>
</tr>
<tr>
<td></td>
<td>- <strong>DBMS_SCHEDULER.LOGGING_FULL</strong></td>
</tr>
<tr>
<td></td>
<td>In addition to recording every run of a job, the Scheduler records all operations performed on the job, including create, enable, disable, alter (with SET_ATTRIBUTE), stop, and so on.</td>
</tr>
<tr>
<td>max_failures</td>
<td>This attribute specifies the number of times a job can fail on consecutive scheduled runs before it is automatically disabled. Once a job is disabled, it is no longer executed and its <strong>STATE</strong> is set to <strong>BROKEN</strong> in the <em><strong>_SCHEDULER_JOB</strong></em> views.</td>
</tr>
<tr>
<td></td>
<td><strong>max_failures</strong> can be an integer between 1 to 1,000,000. By default, it is set to <strong>NULL</strong>, which indicates that new instances of the job are started regardless of how many previous instances have failed.</td>
</tr>
<tr>
<td>max_run_duration</td>
<td>This attribute specifies the maximum amount of time that the job should be allowed to run. Its datatype is <strong>INTERVAL DAY TO SECOND</strong>. If this attribute is set to a non-zero and non-<strong>NULL</strong> value, and job duration exceeds this value, the Scheduler raises an event of type <strong>JOB_OVER_MAX_DUR</strong>. It is then up to your event handler to decide whether or not to allow the job to continue.</td>
</tr>
<tr>
<td>max_runs</td>
<td>This attribute specifies the maximum number of consecutive scheduled runs of the job. Once <strong>max_runs</strong> is reached, the job is disabled and its <strong>STATE</strong> is changed to <strong>COMPLETED</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>max_runs</strong> can be an integer between 1 and 1,000,000. By default, it is set to <strong>NULL</strong>, which means that it repeats forever or until <strong>end_date</strong> or <strong>max_failures</strong> is reached.</td>
</tr>
<tr>
<td>number_of_arguments</td>
<td>The number of arguments if the program is inlined. If this is set, <strong>program_name</strong> should be <strong>NULL</strong>.</td>
</tr>
</tbody>
</table>
### Table 143-83  (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parallel_instances</td>
<td>This is a boolean attribute that can be set only for event-based jobs. If <strong>FALSE</strong> (the default), then if an event is raised and the event-based job that processes that event is already running, the new event is ignored. If <strong>TRUE</strong>, then an instance of the job is started for every instance of the event, and each job instance is a lightweight job so multiple instances of the same event-based job can run in parallel. Each lightweight job takes its attributes (such as action, maximum run duration, and so on) from the definition of the event-based job (its <strong>parent job</strong>). After the lightweight job completes, it is dropped. There is no explicit limit to the number of lightweight jobs that can run simultaneously to process multiple instances of the event. However, limitations may be imposed by available system resources. The lightweight jobs are not visible in any of the <em><strong>_SCHEDULER_JOBS</strong></em> views. However, they are visible in the <em><strong>_SCHEDULER_RUNNING_JOBS</strong></em> views. The name of each lightweight job is the same as that of the parent job, and a subname is automatically generated to distinguish each lightweight job from its parent and from its siblings.</td>
</tr>
<tr>
<td>program_name</td>
<td>The name of a program object to use with this job. If this is set, <strong>job_action</strong>, <strong>job_type</strong> and <strong>number_of_arguments</strong> should be <strong>NULL</strong>.</td>

</tr>
<tr>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| restartable   | This attribute specifies whether or not a job can be restarted in case of failure. By default, jobs are not restartable and this attribute is set to FALSE. Setting this to TRUE means that if a job fails while running, it is restarted from the beginning point of the job. In the case of a chain job, if this attribute is TRUE, the chain is restarted from the beginning after an application failure. If this attribute is FALSE, or if there has been a database failure, the chain is restarted at the last running step. The restart_on_recovery attribute of that step then determines if the step is restarted or marked as stopped. (If marked as stopped, the chain evaluates rules and continues.) Note that setting this attribute to TRUE might lead to data inconsistencies in some situations, for example, if data is committed within a job. Retries on errors are not counted as regular runs. The run count or failure count is not incremented until the job succeeds or has failed all its six retries. The restartable attribute is used by the Scheduler to determine whether to retry the job not only on regular application errors, but after a database malfunction as well. The Scheduler retries the job a maximum of six times. The first time, it waits for one second and multiplies this wait time with a factor of 10 each time thereafter. Both the run count and failure count are incremented by 1 if the job has failed all its six retries. If the job immediately succeeds, or it succeeds on one of its retries, run count is incremented by 1. The Scheduler stops retrying a job when:  
- One of the retries succeeds.  
- All of its six retries have failed.  
- The next retry would occur after the next regularly scheduled run of the job. The Scheduler no longer retries the job if the next scheduled retry is past the next regularly scheduled run for repeating jobs.                                                                 |
| schedule_limit| In heavily loaded systems, jobs are not always started at their scheduled time. This attribute enables you to have the Scheduler not start a job at all if the delay in starting the job is larger than the interval specified. It can be a value of 1 minute to 99 days. For example, if a job was supposed to start at noon and the schedule limit is set to 60 minutes, the job will not be run if it has not started to run by 1:00 p.m. If schedule_limit is not specified, the job is executed at some later date as soon as there are resources available to run it. By default, this attribute is set to null, which indicates that the job can be run at any time after its scheduled time. A scheduled job run that is skipped because of this attribute does not count against the number of runs and failures of the job. An entry in the job log reflects the skipped run.                                                                 |
| schedule_name | The name of a schedule, window, or group of type WINDOW to use as the schedule for this job. If this is set, end_date, start_date and repeat_interval should all be NULL.                                                                                                         |
| start_date    | The original date and time on which this job started or is scheduled to start. If this is set, schedule_name should be NULL.                                                                                              |
Table 143-83  (Cont.) Job Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| stop_on_window_close  | This attribute only applies if the schedule of a job is a window or a window group. Setting this attribute to **TRUE** implies that the job should stop once the associated window is closed. The job is stopped using the `stop_job` procedure with force set to **FALSE**.  
  By default, `stop_on_window_close` is set to **FALSE**. Therefore, if you do not set this attribute, the job continues after the window closes.  
  Note that, although the job is allowed to continue, its resource allocation will probably change because closing a window generally also implies a change in resource plans. |
| store_output          | This is a boolean attribute. If set to **TRUE**, then for job runs that are logged, all job output and error messages are stored in the `_JOB_RUN_DETAILS` views. If set to **FALSE**, then the output and messages are not stored. For new jobs, this is set, by default, to **TRUE**. |

The following event types are valid values for the `raise_events` attribute in Table 143-83.

Table 143-84  Event Types Raised by the Scheduler

<table>
<thead>
<tr>
<th>Event Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_all_events</td>
<td>Not an event, but a constant that provides an easy way for you to enable all events</td>
</tr>
<tr>
<td>job_broken</td>
<td>The job has been disabled and has changed to the <strong>BROKEN</strong> state because it exceeded the number of failures defined by the <code>max_failures</code> job attribute</td>
</tr>
<tr>
<td>job_chain_stalled</td>
<td>A job running a chain is in the <strong>CHAIN_STALLED</strong> state. A running chain becomes stalled if there are no steps running or scheduled to run and the chain <code>evaluation_interval</code> is set to <strong>NULL</strong>. No progress is made in the chain unless there is manual intervention.</td>
</tr>
<tr>
<td>job_completed</td>
<td>The job completed because it reached its <code>max_runs</code> or <code>end_date</code></td>
</tr>
<tr>
<td>job_disabled</td>
<td>The job was disabled by the Scheduler or by a call to <code>SET_ATTRIBUTE</code></td>
</tr>
<tr>
<td>job_failed</td>
<td>The job failed, either due to an error or an abnormal termination.</td>
</tr>
<tr>
<td>job_over_max_dur</td>
<td>The job exceeded the maximum run duration specified by its <code>max_run_duration</code> attribute. (Note: you do not need to enable this event with the <code>raise_events</code> <code>job</code> attribute; it is always enabled.)</td>
</tr>
<tr>
<td>job_run_completed</td>
<td>A job run either failed, succeeded, or was stopped</td>
</tr>
<tr>
<td>job_sch_lim_reached</td>
<td>The schedule limit of the job was reached. The job was not started because the delay in starting the job exceeded the value of the <code>schedule_limit</code> job attribute.</td>
</tr>
<tr>
<td>job_started</td>
<td>The job started</td>
</tr>
<tr>
<td>job_stopped</td>
<td>The job was stopped by a call to <code>STOP_JOB</code></td>
</tr>
<tr>
<td>job_succeeded</td>
<td>The job completed successfully</td>
</tr>
</tbody>
</table>

Program Attribute Values
Table 143-85 lists program attribute values.

**Note:**

See the "CREATE_PROGRAM Procedure" for more complete descriptions of the attributes in this table.

### Table 143-85 Program Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment. This can describe what the program does or give usage details.</td>
</tr>
<tr>
<td>detached</td>
<td>If TRUE, the program is a detached program. See Oracle Database Administrator's Guide for information about detached jobs and detached programs.</td>
</tr>
<tr>
<td>number_of_arguments</td>
<td>The number of arguments required by the stored procedure or other executable that the program invokes</td>
</tr>
<tr>
<td>program_action</td>
<td>The action that the program performs, indicated by the program_type attribute. For example, if program_type is 'STORED_PROCEDURE', program_action contains the name of the stored procedure.</td>
</tr>
<tr>
<td>program_type</td>
<td>The type of program. This must be one of these supported program types: 'PLSQL_BLOCK', 'STORED_PROCEDURE', and 'EXECUTABLE'.</td>
</tr>
</tbody>
</table>

Schedule Attribute Values

Table 143-86 lists schedule attribute values.

**Note:**

See "CREATE_SCHEDULE Procedure" for more complete descriptions of the attributes in this table.

### Table 143-86 Schedule Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment.</td>
</tr>
<tr>
<td>end_date</td>
<td>The cutoff date and time after which the schedule does not specify any dates.</td>
</tr>
<tr>
<td>event_spec</td>
<td>This attribute takes two values: the value argument should contain the event condition and the value2 argument should contain the queue specification. For more details, see the descriptions for the event_condition and queue_spec arguments to the &quot;CREATE_JOB Procedure&quot;.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>An attribute specifying how often the schedule should repeat, using the calendaring syntax. See &quot;Calendaring Syntax&quot; for more information.</td>
</tr>
<tr>
<td>start_date</td>
<td>The start or reference date and time used by the calendaring syntax.</td>
</tr>
</tbody>
</table>
File Watcher Attribute Values

Table 143-87 lists file watcher attribute values.

Table 143-87  File Watcher Attribute Values

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination</td>
<td>Remote host name or IP address where the file is expected to arrive. If NULL, destination is the local host.</td>
</tr>
<tr>
<td>directory_path</td>
<td>Directory in which the file is expected to arrive. The single wildcard &quot;?&quot; at the beginning of the path denotes the Oracle home path. For example, &quot;?/rdbms/log&quot; denotes the rdbms/log subdirectory of the Oracle home directory.</td>
</tr>
<tr>
<td>file_name</td>
<td>Name of the file being looked for. Two wildcards are permitted anywhere in the file name: '?' denotes any single character, and '*' denotes zero or more characters. This attribute cannot be NULL.</td>
</tr>
<tr>
<td>credential_name</td>
<td>Name of a valid credential object. The file watcher uses the credential to authenticate itself with the host operating system to access the watched-for file. The file watcher owner must have the EXECUTE privilege on the credential. Cannot be NULL.</td>
</tr>
<tr>
<td>min_file_size</td>
<td>Minimum file size in bytes before the file watcher considers the file found. Default is 0.</td>
</tr>
<tr>
<td>steady_state_duration</td>
<td>Minimum time interval that the file must remain unchanged before the file watcher considers the file found. If NULL, an internal value is used. The lower limit for this attribute is 10 seconds.</td>
</tr>
<tr>
<td>comments</td>
<td>Optional comment.</td>
</tr>
</tbody>
</table>

Job Class Attribute Values

Table 143-88 lists job class attribute values.

Note:

See the "CREATE_JOB_CLASS Procedure" for more complete descriptions of the attributes in this table.

Table 143-88  Job Class Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment about the class.</td>
</tr>
<tr>
<td>log_history</td>
<td>This attribute controls the number of days that job log entries for jobs in this class are retained. It helps prevent the job log from growing indiscriminately. The range of valid values is 0 through 1000000. If set to 0, no history is kept. If NULL, retention days are set by the log_history Scheduler attribute (set with SET_SCHEDULER_ATTRIBUTE).</td>
</tr>
</tbody>
</table>
Table 143-88 (Cont.) Job Class Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>logging_level</td>
<td>This attribute specifies how much information is logged. The valid values are:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SCHEDULER.LOGGING_OFF</td>
</tr>
<tr>
<td></td>
<td>No logging is performed for any jobs in this class.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SCHEDULER.LOGGING_FAILED_RUNS</td>
</tr>
<tr>
<td></td>
<td>The Scheduler logs only jobs in the class that failed, with the reason for failure.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SCHEDULER.LOGGING_RUNS</td>
</tr>
<tr>
<td></td>
<td>The Scheduler writes detailed information to the job log for all runs of each job in this class. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SCHEDULER.LOGGING_FULL</td>
</tr>
<tr>
<td></td>
<td>The Scheduler records all operations performed on all jobs in this class, in addition to recording every run of a job. Every time a job is created, enabled, disabled, altered (with SET_ATTRIBUTE), stopped, and so on, an entry is recorded in the log.</td>
</tr>
<tr>
<td>resource_consumer_group</td>
<td>The resource consumer group that a class is associated with. All jobs in the class run under this resource consumer group. See Oracle Database Administrator's Guide for a description of resource consumer groups and the Database Resource Manager.</td>
</tr>
<tr>
<td>service</td>
<td>The database service that the jobs in the job class have affinity to. If both the resource_consumer_group and service attributes are set for a job class, and if the service is mapped to a resource consumer group, the resource_consumer_group attribute takes precedence.</td>
</tr>
</tbody>
</table>

Window Attribute Values

Table 143-89 lists window attribute values.

**Note:**

See the "CREATE_WINDOW Procedure" for more complete descriptions of the attributes in this table.

Table 143-89 Window Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment about the window.</td>
</tr>
<tr>
<td>duration</td>
<td>The duration of the window.</td>
</tr>
<tr>
<td>end_date</td>
<td>The date after which the window no longer opens. If this is set, schedule_name must be NULL.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>An attribute specifying how often the schedule should repeat, using the calendaring syntax. PL/SQL date functions are not allowed. If this is set, schedule_name must be NULL. See &quot;Calendaring Syntax&quot; for more information.</td>
</tr>
</tbody>
</table>
Table 143-89  (Cont.) Window Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource_plan</td>
<td>The resource plan to be associated with a window. When the window opens, the system switches to this resource plan. When the window closes, the original resource plan is restored. If a resource plan has been made active with the <code>force</code> option, no resource plan switch occurs. Only one resource plan can be associated with a window. It may be <code>NULL</code> or the empty string (&quot;&quot;). When it is <code>NULL</code>, the resource plan that is in effect when the window opens stays in effect for the duration of the window. When it is the empty string, the resource manager is disabled for the duration of the window.</td>
</tr>
<tr>
<td>schedule_name</td>
<td>The name of a schedule to use with this window. If this is set, <code>start_date</code>, <code>end_date</code>, and <code>repeat_interval</code> must all be <code>NULL</code>.</td>
</tr>
<tr>
<td>start_date</td>
<td>The next date and time on which this window is scheduled to open. If this is set, <code>schedule_name</code> must be <code>NULL</code>.</td>
</tr>
<tr>
<td>window_priority</td>
<td>The priority of the window. Must be either 'LOW' (default) or 'HIGH'.</td>
</tr>
</tbody>
</table>

Chain Attribute Values

Table 143-90 lists chain attribute values.

Note:

See the "CREATE_CHAIN Procedure" for more complete descriptions of the attributes in this table.

Table 143-90  Chain Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comments</td>
<td>An optional comment describing the purpose of the chain.</td>
</tr>
<tr>
<td>evaluation_interval</td>
<td>If not NULL, provides an additional evaluation of the chain at this interval, as well as at normal evaluation times (when the job starts, when a step completes, or when an event that is associated with an event step arrives) This attribute should only to be used when chain rules use SQL syntax and the rule conditions contain elements that are not under the control of the Scheduler, because the extra interval is CPU intensive. For most chains, the normal evaluation times are sufficient.</td>
</tr>
</tbody>
</table>
Table 143-90  (Cont.) Chain Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_set_name</td>
<td>In the normal case, no rule set should be passed in. The Scheduler automatically creates a rule set and associated empty evaluation context. You then use <code>DEFINE_CHAIN_RULE</code> to add rules and <code>DROP_CHAIN_RULE</code> to remove them. Advanced users can create a rule set that describes their chain dependencies and pass it in here. This allows greater flexibility in defining rules. For example, conditions can refer to external variables, and tables can be exposed through the evaluation context. If you pass in a rule set, you must ensure that it is in the format of a chain rule set. (For example, all steps must be listed as variables in the evaluation context). If no rule set is passed in, the rule set created is of the form <code>SCHED_RULESET${N}</code> and the evaluation context created is of the form <code>SCHED_EVCTX${N}</code>. See <em>Oracle Streams Concepts and Administration</em> for information on rules and rule sets.</td>
</tr>
</tbody>
</table>

Database Destination Attribute Values

Table 143-91 lists database destination attribute values.

**Note:**

See the "CREATE_DATABASE_DESTINATION Procedure" for more complete descriptions of the attributes in this table.

Table 143-91  Database Destination Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agent</td>
<td>The name of the external destination (also known as agent destination) that is used to connect to the remote database. You can obtain valid external destination names from the view <code>ALL_SCHEDULER_EXTERNAL_DESTS</code>.</td>
</tr>
<tr>
<td>connect_info</td>
<td>The TNS connect descriptor that identifies the remote database to connect to, or the net service name (alias) in tnsnames.ora that resolves to the connect descriptor. Note: This corresponds to the <code>tns_name</code> argument of <code>CREATE_DATABASE_DESTINATION</code>.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the database destination is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the database destination.</td>
</tr>
</tbody>
</table>

External Destination Attribute Values

Table 143-92 lists external destination attribute values.
Note:
External destinations are created only implicitly by registering a remote Scheduler agent with the local database.

Table 143-92  External Destination Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hostname</td>
<td>(GET_ATTRIBUTE only) The fully qualified host name (including domain) or IP address of the computer on which the Scheduler agent resides.</td>
</tr>
<tr>
<td>port</td>
<td>(GET_ATTRIBUTE only) The TCP port number on which the agent listens.</td>
</tr>
<tr>
<td>ip_address</td>
<td>(GET_ATTRIBUTE only) The IP address of the host on which the agent resides.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the external destination is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the external destination.</td>
</tr>
</tbody>
</table>

Group Attribute Values

Table 143-93 lists group attribute values.

Note:
See the "CREATE_GROUP Procedure" for more complete descriptions of the attributes in this table.

Table 143-93  Group Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_type</td>
<td>(GET_ATTRIBUTE only) The group type (either WINDOW, DB_DEST, or EXTERNAL_DEST).</td>
</tr>
<tr>
<td>member_name</td>
<td>Comma-separated list of members. Replaces the existing list of members. To add one or more members to the existing list, use ADD_GROUP_MEMBER. Note: this attribute corresponds to the member argument of CREATE_GROUP.</td>
</tr>
<tr>
<td>enabled</td>
<td>If TRUE, the group is enabled.</td>
</tr>
<tr>
<td>comments</td>
<td>An optional comment about the group.</td>
</tr>
<tr>
<td>number_of_members</td>
<td>(GET_ATTRIBUTE only) The number of members in the group.</td>
</tr>
</tbody>
</table>

Credential Attribute Values

Table 143-94 lists credential attribute values.
Note:

Credential attribute values for the `SET_ATTRIBUTE` and `GET_ATTRIBUTE` procedures are deprecated with Oracle Database Release 12c Release 1 (12.1). While these attribute values remain available in this package, for reasons of backward compatibility, Oracle recommends using the alternative enhanced functionality provided in the `DBMS_CREDENTIAL` package, specifically the attribute parameter in the `UPDATE_CREDENTIAL Procedure`.

Table 143-94  Credential Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>The user name for logging into the host operating system or remote Oracle database. Maximum length is 64.</td>
</tr>
<tr>
<td>password</td>
<td>The password for the user name. Maximum length is 128.</td>
</tr>
<tr>
<td>comments</td>
<td>A description of the credential. Maximum length is 240.</td>
</tr>
<tr>
<td>windows_domain</td>
<td>For a Windows remote executable target, this is the domain that the specified user belongs to. Maximum length is 64.</td>
</tr>
<tr>
<td>database_role</td>
<td>The value of the <code>database_role</code> attribute is used as the system privilege for logging into a remote database to run a remote database job.</td>
</tr>
<tr>
<td></td>
<td>Valid values are: <code>SYSDBA</code> and <code>SYSOPER</code>.</td>
</tr>
</tbody>
</table>

Resource Attribute Values

Table 143-95 lists resource attribute values.

Table 143-95  Resource Attribute Values

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resource_name</td>
<td>The name of the resource</td>
</tr>
<tr>
<td>units</td>
<td>The number of units of this resource that the job or program uses.</td>
</tr>
<tr>
<td>status</td>
<td>The status of the resource.</td>
</tr>
<tr>
<td></td>
<td><code>ENFORCE_CONSTRAINTS</code>. This is the default value, and when set, will force the scheduler to enforce resource limits. When the maximum number of units of this resource has been reached, no additional jobs using this resource will get started.</td>
</tr>
<tr>
<td></td>
<td><code>IGNORE_CONSTRAINTS</code>. When set, the scheduler will ignore any constraints on this resource.</td>
</tr>
<tr>
<td></td>
<td><code>BLOCKED_ALL_JOBS</code>. No jobs having a constraint on this resource will be allowed to run. The resource is considered to be permanently blocking until switched to one of the other two states.</td>
</tr>
<tr>
<td>constraint_level</td>
<td>Level of the constraint: <code>JOB_LEVEL</code> or <code>PROGRAM_LEVEL</code></td>
</tr>
<tr>
<td></td>
<td>For incompatibilities, for <code>JOB_LEVEL</code>, the incompatibility members must be jobs; for <code>PROGRAM_LEVEL</code> the incompatibility members must be programs.</td>
</tr>
<tr>
<td>comments</td>
<td>Descriptive comment about the resource.</td>
</tr>
</tbody>
</table>
143.6.68 SET_ATTRIBUTE_NULL Procedure

This procedure sets an attribute of an object to NULL.

The attributes that can be set depend on the object being altered. If the object is enabled, it is disabled before being altered and reenabled afterward. If the object cannot be reenabled, an error is generated and the object is left in a disabled state.

Syntax

```sql
DBMS_SCHEDULER.SET_ATTRIBUTE_NULL (
    name              IN VARCHAR2,
    attribute         IN VARCHAR2);
```

Parameters

Table 143-96  SET_ATTRIBUTE_NULL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object</td>
</tr>
<tr>
<td>attribute</td>
<td>The attribute being changed</td>
</tr>
</tbody>
</table>

Usage Notes

To run `SET_ATTRIBUTE_NULL` for a window, group of type WINDOW, or job class, you must have the MANAGE SCHEDULER privilege. Otherwise, you must be the owner of the object being altered or have ALTER privileges on that object or have the CREATE ANY JOB privilege.

143.6.69 SET_JOB_ANYDATA_VALUE Procedure

This procedure sets the value for an argument of the associated program for a job, encapsulated in an AnyData object.

It overrides any default value set for the program argument. NULL is a valid assignment for a program argument.

The argument can be specified by position or by name. You can specify by name only when:

- The job points to a saved program object
- The argument was assigned a name with the `DEFINE_ANYDATA_ARGUMENT Procedure`

Scheduler does no type checking of the argument at any time.

`SET_JOB_ANYDATA_VALUE` is overloaded.

Syntax

Sets a program argument by its position.

```sql
DBMS_SCHEDULER.SET_JOB_ANYDATA_VALUE (
    job_name                IN VARCHAR2,
    argument_value          IN AnyData);
```
null
Syntax

Sets an argument value by position:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_position       IN PLS_INTEGER,
    argument_value          IN VARCHAR2);
```

Sets an argument value by name:

```sql
DBMS_SCHEDULER.SET_JOB_ARGUMENT_VALUE (
    job_name                IN VARCHAR2,
    argument_name           IN VARCHAR2,
    argument_value          IN VARCHAR2);
```

Parameters

Table 143-98  SET_JOB_ARGUMENT_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>The name of the job to be altered</td>
</tr>
<tr>
<td>argument_name</td>
<td>The name of the program argument being set</td>
</tr>
<tr>
<td>argument_position</td>
<td>The position of the program argument being set</td>
</tr>
<tr>
<td>argument_value</td>
<td>The new value to be set for the program argument. To set a non-VARCHAR value, use the SET_JOB_ANYDATA_VALUE procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

SET_JOB_ARGUMENT_VALUE requires that you be the owner of the job or have ALTER privileges on that job. You can also set a job argument value if you have the CREATE ANY JOB privilege.

SET_JOB_ARGUMENT_VALUE only supports arguments of SQL type. Therefore, argument values that are not of SQL type, such as booleans, are not supported as program or job arguments.

SET_JOB_ARGUMENT_VALUE can be used to set arguments of lightweight jobs but only if the argument is of type VARCHAR2.

See Also:

- "SET_JOB_ANYDATA_VALUE Procedure"
- "DEFINE_PROGRAM_ARGUMENT Procedure"
143.6.71 SET_JOB_ATTRIBUTES Procedure

This procedure changes an attribute of a job.

Syntax

```sql
DBMS_SCHEDULER.SET_JOB_ATTRIBUTES (
    jobattr_array     IN JOBATTR_ARRAY,
    commit_semantics  IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobattr_array</td>
<td>The array of job attribute changes.</td>
</tr>
<tr>
<td>commit_semantics</td>
<td>The commit semantics. The following types are supported:</td>
</tr>
<tr>
<td></td>
<td>• STOP_ON_FIRST_ERROR returns on the first error and commits previous</td>
</tr>
<tr>
<td></td>
<td>successful attribute changes to disk. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL returns on the first error and rolls back everything</td>
</tr>
<tr>
<td></td>
<td>that happened before that error.</td>
</tr>
<tr>
<td></td>
<td>• ABSORB_ERRORS tries to absorb any errors and complete the rest of the</td>
</tr>
<tr>
<td></td>
<td>job attribute changes on the list. It commits all the successful</td>
</tr>
<tr>
<td></td>
<td>changes. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS</td>
</tr>
<tr>
<td></td>
<td>for details.</td>
</tr>
</tbody>
</table>

Usage Notes

Calling SET_ATTRIBUTE on an enabled job disables the job, changes the attribute value, and reenables the job. SET_JOB_ATTRIBUTES changes the attribute values in the context of a single transaction.

143.6.72 SET_RESOURCECONSTRAINT Procedure

This procedure allows users to specify the resources used by jobs.

Syntax

```sql
DBMS_SCHEDULER.SET_RESOURCE_CONSTRAINT (
    object_name       IN VARCHAR2,
    resource_name     IN VARCHAR2,
    units             IN NUMBER DEFAULT 1);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_name</td>
<td>The name of a program or a job, or a comma separated list of these objects.</td>
</tr>
<tr>
<td>resource_name</td>
<td>The name of the resource.</td>
</tr>
</tbody>
</table>
Table 143-100  (Cont.) SET_RESOURCE_CONSTRAINT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>The number of units of this resource that the job or program uses.</td>
</tr>
</tbody>
</table>

Usages Notes

object_name can be the name or comma-separated list of names of either programs or jobs. This creates a constraint on the named resource for these programs or jobs.

units specifies the number of units of the resource that the program or job can use. If units is set to 0, then the program or job does not use this resource anymore, and the resulting constraint is deleted. Setting units to 0 on a resource with no previous constraint results in an error.

When multiple constraints are defined on the same resource, the object types must match. When one or more existing constraints for a resource are based on jobs and a new constraint is added for the same resource that is based on a program (or vice versa) an error will be raised.

143.6.73 SET_SCHEDULER_ATTRIBUTE Procedure

This procedure sets the value of a Scheduler attribute. This takes effect immediately but the resulting changes may not be seen immediately, depending on the attribute affected.

Table 143-101 provides short attribute descriptions for the SET_SCHEDULER_ATTRIBUTE procedure. For complete descriptions, see section “Setting Scheduler Preferences” in Oracle Database Administrator’s Guide.

Syntax

```
DBMS_SCHEDULER.SET_SCHEDULER_ATTRIBUTE (    attribute IN VARCHAR2,    value IN VARCHAR2);
```
Parameters

Table 143-101  SET_SCHEDULER_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>The name of the Scheduler attribute. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• 'default_timezone': Repeating jobs and windows that use the calendaring</td>
</tr>
<tr>
<td></td>
<td>syntax retrieve the time zone from this attribute when start_date is</td>
</tr>
<tr>
<td></td>
<td>not specified. See &quot;Calendaring Syntax&quot; for more information.</td>
</tr>
<tr>
<td></td>
<td>• 'email_server': The SMTP server address that the Scheduler uses to send</td>
</tr>
<tr>
<td></td>
<td>e-mail notifications for job state events. E-mail notifications cannot</td>
</tr>
<tr>
<td></td>
<td>be sent if this attribute is NULL.</td>
</tr>
<tr>
<td></td>
<td>• 'email_sender': The default e-mail address of the sender of job state</td>
</tr>
<tr>
<td></td>
<td>e-mail notifications.</td>
</tr>
<tr>
<td></td>
<td>• 'email_server_credential': The schema and name of an existing credential</td>
</tr>
<tr>
<td></td>
<td>object that SYS has execute object privileges on. Default is NULL. The</td>
</tr>
<tr>
<td></td>
<td>username and password stored in this credential are used to authenticate</td>
</tr>
<tr>
<td></td>
<td>with the e-mail server when sending e-mail notifications.</td>
</tr>
<tr>
<td></td>
<td>• 'email_server_encryption': This attribute indicates whether or not</td>
</tr>
<tr>
<td></td>
<td>encryption is enabled for this email server connection, and if so, at</td>
</tr>
<tr>
<td></td>
<td>what point encryption starts, and with which protocol. Values are:</td>
</tr>
<tr>
<td></td>
<td>– NONE: the default, indicating no encryption used</td>
</tr>
<tr>
<td></td>
<td>– SSL_TLS: indicating that either SSL or TLS are used, from the</td>
</tr>
<tr>
<td></td>
<td>beginning of the connection</td>
</tr>
<tr>
<td></td>
<td>– STARTTLS: indicating that the connection starts unencrypted, but the</td>
</tr>
<tr>
<td></td>
<td>command STARTTLS is sent to the e-mail server and starts encryption</td>
</tr>
<tr>
<td></td>
<td>• 'event_expiry_time': The time, in seconds, before a job state event</td>
</tr>
<tr>
<td></td>
<td>generated by the Scheduler expires from the Scheduler event queue. If</td>
</tr>
<tr>
<td></td>
<td>NULL, job state events expire after 24 hours.</td>
</tr>
<tr>
<td></td>
<td>• 'log_history': The number of days that log entries for both the job log</td>
</tr>
<tr>
<td></td>
<td>and the window log are retained. Default is 30 and the range of valid</td>
</tr>
<tr>
<td></td>
<td>values is 0 through 1000000.</td>
</tr>
<tr>
<td></td>
<td>• 'max_job_slave_processes': This Scheduler attribute is not used.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of the attribute</td>
</tr>
</tbody>
</table>

Usage Notes

To run SET_SCHEDULER_ATTRIBUTE, you must have the MANAGE SCHEDULER privilege.

See Also:

Oracle Database Administrator’s Guide for more detailed descriptions of Scheduler attributes
143.6.74 STOP_JOB Procedure

This procedure stops currently running jobs or all jobs in a job class.

After stopping the job, the state of a one-time job is set to STOPPED, whereas the state of a repeating job is set to SCHEDULED or COMPLETED, depending on whether the next run of the job is scheduled.

If a job pointing to a chain is stopped, all running steps of the running chain are stopped.

If a job has multiple destinations, the database attempts to stop the job at all destinations.

For external jobs, STOP_JOB stops only the external process that was directly started by the job action. It does not stop child processes of external jobs.

For in-memory full jobs in an Oracle Real Application Clusters environment, STOP_JOB uses the instance_id attribute of the job definition to determine in which instance (or all of them if the attribute is left null) to stop the in-memory full job. (In-memory full jobs are kept cached in memory, and as such are limited to the instance currently caching them. Because of this, the same job_name can in some conditions be used for different jobs on different instances.)

Syntax

```sql
DBMS_SCHEDULER.STOP_JOB (  
  job_name         IN VARCHAR2,
  force            IN BOOLEAN DEFAULT FALSE,
  commit_semantics IN VARCHAR2 DEFAULT 'STOP_ON_FIRST_ERROR');
```

Parameters

Table 143-102 STOP_JOB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>job_name</td>
<td>Name of a job to stop. Can be a comma-separate list of jobs, where each entry can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Job name: the name of an existing job, optionally preceded by a schema name and dot separator.</td>
</tr>
<tr>
<td></td>
<td>• Job destination ID: a number, obtained from the JOB_DEST_ID column of the *_SCHEDULER_JOB_DESTS views, that represents</td>
</tr>
<tr>
<td></td>
<td>the unique combination of a job, a credential, and a destination.</td>
</tr>
<tr>
<td></td>
<td>• Job class: the name of a job class. Must be preceded by the SYS schema name and a dot separator.</td>
</tr>
<tr>
<td></td>
<td>If you specify a job class, all jobs that belong to that job class are stopped. If you specify a job that was created with a destination</td>
</tr>
<tr>
<td></td>
<td>group as its destination_name attribute, all job instances on all destinations are stopped.</td>
</tr>
</tbody>
</table>
Table 143-102  (Cont.) STOP_JOB Procedure Parameters

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>If force is set to FALSE, the Scheduler tries to gracefully stop the job using an interrupt mechanism. This method gives control back to the slave process, which can update the status of the job in the job queue to stopped. If this fails, an error is returned. If force is set to TRUE, the Scheduler immediately terminates the job slave. Oracle recommends that STOP_JOB with force set to TRUE be used only after a STOP_JOB with force set to FALSE has failed. Use of the force option requires the MANAGE SCHEDULER system privilege.</td>
</tr>
</tbody>
</table>
| commit_semantics | The commit semantics. The following two types are supported:  
|               | • STOP_ON_FIRST_ERROR: The procedure returns on the first error and commits previous successful stop operations to disk. This is the default.  
|               | • ABSORB_ERRORS: The procedure tries to absorb any errors, stops the rest of the jobs, and commits all the successful stop operations. This type is available only if no job classes are specified in the job_name list. If errors occur, you can query the view SCHEDULER_BATCH_ERRORS for details. |

Usage Notes

STOP_JOB without the force option requires that you be the owner of the job or have ALTER privileges on that job. You can also stop a job if you have the CREATE ANY JOB or MANAGE SCHEDULER privilege.

STOP_JOB with the force option requires that you have the MANAGE SCHEDULER privilege.

Example

The following is an example of using STOP_JOB.

BEGIN
    DBMS_SCHEDULER.STOP_JOB('DSS.ETLJOB, 984, 1223, SYS.ETLJOBCLASS');
END;
The DBMS_SERVER_ALERT package enables you to configure the Oracle Database server to issue an alert when a threshold for a specified server metric has been violated. You can configure both warning and critical thresholds for a large number of predefined metrics.

If a warning threshold is reached, the server generates a severity level 5 alert. If a critical threshold is reached, the server generates a severity level 1 alert.

The chapter contains the following topics:

- Security Model
- Object Types
- Relational Operators
- Supported Metrics
- Summary of DBMS_SERVER_ALERT Subprograms

144.1 DBMS_SERVER_ALERT Security Model

The user needs DBA or IMP_FULL_DATABASE roles to use the DBMS_SERVER_ALERT package.

144.2 DBMS_SERVER_ALERT Object Types

You qualify the metric by an individual object for the listed object types.

Table 144-1  Object Types Defined as Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OBJECT_TYPE_SYSTEM</td>
<td>Metrics collected on the system level for each instance.</td>
</tr>
<tr>
<td>OBJECT_TYPE_FILE</td>
<td>Metrics collected on the file level. These are used for AVG_FILE_READ_TIME and AVG_FILE_WRITE_TIME metrics.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SERVICE</td>
<td>Metrics collected on the service level. Currently ELAPSED_TIME_PER_CALL and CPU_TIME_PER_CALL are collected.</td>
</tr>
<tr>
<td>OBJECT_TYPE_TABLESPACE</td>
<td>Metrics collected on the tablespace level.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Dictionary managed tablespaces are not supported.</td>
</tr>
<tr>
<td>OBJECT_TYPE_EVENT_CLASS</td>
<td>Metrics collected on wait event class level. Currently supported metrics are AVG_USERS_WAITING and DB_TIME_WAITING.</td>
</tr>
<tr>
<td>OBJECT_TYPE_SESSION</td>
<td>Metrics collected on the session level. Currently only BLOCKED_USERS is collected. The threshold can only be set at the instance level, which means that no object name should be specified when setting the threshold for this type of metric.</td>
</tr>
</tbody>
</table>
144.3 DBMS_SERVER_ALERT Relational Operators

You can specify a relational comparison operator to determine whether or not a given metric's value violates the threshold setting. The server supports the following operators.

Table 144-2  Relational Operators Defined as Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPERATOR_CONTAINS</td>
<td>A metric value matching an entry in a list of threshold values is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_DO_NOT_CHECK</td>
<td>The metric value is not compared to the threshold value, and no alerts are generated. Use this operator to disable alerts for a metric.</td>
</tr>
<tr>
<td>OPERATOR_EQ</td>
<td>A metric value equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GE</td>
<td>A metric value greater than or equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_GT</td>
<td>A metric value greater than the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LE</td>
<td>A metric value less than or equal to the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_LT</td>
<td>A metric value less than the threshold value is considered a violation.</td>
</tr>
<tr>
<td>OPERATOR_NE</td>
<td>A metric value not equal to the threshold value is considered a violation.</td>
</tr>
</tbody>
</table>

144.4 DBMS_SERVER_ALERT Supported Metrics

These metrics are supported. All internal metric names are supplied as package constants.

Table 144-3  List of Supported Metrics

<table>
<thead>
<tr>
<th>Metric Name (Internal)</th>
<th>Metric Name (External)</th>
<th>Units</th>
</tr>
</thead>

</tr>
</tbody>
</table>

### 144.5.1 EXPAND_MESSAGE Function

This function expands alert messages.

#### Syntax

```sql
DBMS_SERVER_ALERT.EXPAND_MESSAGE(
    user_language            IN   VARCHAR2,
    message_id               IN   NUMBER,
    argument_1               IN   VARCHAR2,
    argument_2               IN   VARCHAR2,
    argument_3               IN   VARCHAR2,
    argument_4               IN   VARCHAR2,
    argument_5               IN   VARCHAR2,

RETURN VARCHAR2;
```

#### Parameters

#### Table 144-5  EXPAND_MESSAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_language</td>
<td>The language of the current session.</td>
</tr>
<tr>
<td>message_id</td>
<td>Id of the alert message</td>
</tr>
<tr>
<td>argument_1</td>
<td>The first argument in the alert message.</td>
</tr>
<tr>
<td>argument_2</td>
<td>The second argument in the alert message.</td>
</tr>
<tr>
<td>argument_3</td>
<td>The third argument in the alert message.</td>
</tr>
<tr>
<td>argument_4</td>
<td>The fourth argument in the alert message.</td>
</tr>
<tr>
<td>argument_5</td>
<td>The fifth argument in the alert message.</td>
</tr>
</tbody>
</table>
144.5.2 GET_THRESHOLD Procedure

This procedure gets the current threshold settings for the specified metric.

Syntax

```sql
DBMS_SERVER_ALERT.GET_THRESHOLD(
  metrics_id               IN   BINARY_INTEGER,
  warning_operator         OUT  BINARY_INTEGER,
  warning_value            OUT  VARCHAR2,
  critical_operator        OUT  BINARY_INTEGER,
  critical_value           OUT  VARCHAR2,
  observation_period       OUT  BINARY_INTEGER,
  consecutive_occurrences  OUT  BINARY_INTEGER,
  instance_name            IN   VARCHAR2,
  object_type              IN   BINARY_INTEGER,
  object_name              IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metric. See &quot;Supported Metrics&quot;.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for the comparing the actual value with the warning threshold.</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for the comparing the actual value with the critical threshold.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metric values are computed and verified against the threshold setting.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metric value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts. In cases in which this parameter is not NULL, this should be set to one of the INSTANCE_NAME values found in the GV$INSTANCE View.</td>
</tr>
<tr>
<td>object_type</td>
<td>Either OBJECT_TYPE_SYSTEM or OBJECT_TYPE_SERVICE.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid.
144.5.3 SET_THRESHOLD Procedure

This procedure sets the warning and critical thresholds for a specified metric.

Syntax

```
DBMS_SERVER_ALERT.SET_THRESHOLD(
    metrics_id               IN   BINARY_INTEGER,
    warning_operator         IN   BINARY_INTEGER,
    warning_value            IN   VARCHAR2,
    critical_operator        IN   BINARY_INTEGER,
    critical_value           IN   VARCHAR2,
    observation_period       IN   BINARY_INTEGER,
    consecutive_occurrences  IN   BINARY_INTEGER,
    instance_name            IN   VARCHAR2,
    object_type              IN   BINARY_INTEGER,
    object_name              IN   VARCHAR2);
```

Parameters

Table 144-7  SET_THRESHOLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>metrics_id</td>
<td>The internal name of the metric. See “Supported Metrics”.</td>
</tr>
<tr>
<td>warning_operator</td>
<td>The operator for the comparing the actual value with the warning threshold (such as OPERATOR_GE). See “Relational Operators”.</td>
</tr>
<tr>
<td>warning_value</td>
<td>The warning threshold value. This is NULL if no warning threshold is set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>critical_operator</td>
<td>The operator for the comparing the actual value with the critical threshold. See “Relational Operators”.</td>
</tr>
<tr>
<td>critical_value</td>
<td>The critical threshold value. This is NULL if not set. A list of values may be specified for OPERATOR_CONTAINS.</td>
</tr>
<tr>
<td>observation_period</td>
<td>The period at which the metric values are computed and verified against the threshold setting. The valid range is 1 to 60 minutes.</td>
</tr>
<tr>
<td>consecutive_occurrences</td>
<td>The number of observation periods the metric value should violate the threshold value before the alert is issued.</td>
</tr>
<tr>
<td>instance_name</td>
<td>The name of the instance for which the threshold is set. This is NULL for database-wide alerts.</td>
</tr>
<tr>
<td>object_type</td>
<td>See “Object Types”.</td>
</tr>
<tr>
<td>object_name</td>
<td>The name of the object. This is NULL for SYSTEM.</td>
</tr>
</tbody>
</table>

Usage Notes

Note that this subprogram does not check if the value of the instance_name parameter is meaningful or valid. Passing a name that does not identify a valid instance will result in a threshold that is not used by any by any instance although the threshold setting will be visible in the DBA_THRESHOLDS view. The exception is the lower-case string ‘database_wide’ which is semantically equivalent to passing NULL for the instance name, the latter being the preferred usage.
The DBMS_SERVICE package lets you create, delete, activate, and deactivate services for a single instance.

The chapter contains the following topics:

- Overview
- Security Model
- Constants
- Operating Procedures
- Exceptions
- Summary of DBMS_SERVICE Subprograms

Oracle Real Application Clusters Administration and Deployment Guide
for administering services in Oracle Real Application Clusters.

145.1 DBMS_SERVICE Overview

DBMS_SERVICE supports the workload management of high availability, quality of service, job scheduling, and other planned operations in the RDBMS for the purposes of workload measurement, management, prioritization, and XA and distributed transaction management.

Oracle Real Application Clusters (RAC) can manage service names across instances as administered through SRVCTL. The DBMS_SERVICE package allows the creation, deletion, starting, and stopping of services in a single instance. Additionally, it provides the ability to disconnect all sessions that connect to an instance with a service name.

See Also:

For more information about Oracle Real Application Clusters, Oracle Real Application Clusters Administration and Deployment Guide.
145.2 DBMS_SERVICE Security Model

The **DBMS_SERVICE** package has certain security requirements.

**Privileges**

The client using this package must have the `ALTER SYSTEM` execution privilege and the `V$SESSION` table read privilege.

**Schemas**

This package must be installed under `SYS` schema.

**Roles**

The `EXECUTE` privilege of the package is granted to the `DBA` role only.

145.3 DBMS_SERVICE Constants

The **DBMS_SERVICE** package provides constants that can be used for specifying parameter values.

- Constants used in calling arguments are described in **Table 145-1**
- Constants used in connection balancing goal arguments are described in **Table 145-2**
- Constants used in TAF failover attribute arguments are described in **Table 145-3**

**Table 145-1  Constants Used in Calling Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GOAL_NONE</td>
<td>NUMBER</td>
<td>0</td>
<td>Disables Load Balancing Advisory</td>
</tr>
<tr>
<td>GOAL_SERVICE_TIME</td>
<td>NUMBER</td>
<td>1</td>
<td>Load Balancing Advisory is based on elapsed time for work done in the service plus available bandwidth to the service</td>
</tr>
<tr>
<td>GOAL_THROUGHPUT</td>
<td>NUMBER</td>
<td>2</td>
<td>Load Balancing Advisory is based on the rate that work is completed in the service plus available bandwidth to the service</td>
</tr>
</tbody>
</table>

**Table 145-2  Constants Used in Connection Balancing Goal Arguments**

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLB_GOAL_SHORT</td>
<td>NUMBER</td>
<td>1</td>
<td>Connection load balancing uses Load Balancing Advisory, when Load Balancing Advisory is enabled (either goal_service_time or goal_throughput). When GOAL=None (no load balancing advisory), connection load balancing uses an abridged advice based on CPU utilization.</td>
</tr>
</tbody>
</table>
Table 145-2  (Cont.) Constants Used in Connection Balancing Goal Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLB_GOAL_LONG</td>
<td>NUMBER</td>
<td>2</td>
<td>Balances the number of connections for each instance using session count for each service. This setting is recommended for applications with long connections such as forms. This setting can be used with Load Balancing Advisory when the connection pool is sized to accommodate gravitation within the pool itself (without adding or removing connections). The latter is the most efficient design.</td>
</tr>
</tbody>
</table>

Table 145-3  Constants Used in High Availability Attribute Arguments for FAN, Application Continuity, Transaction Guard and TAF

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FAILOVER_METHOD_NONE</td>
<td>VARCHAR2</td>
<td>0</td>
<td>Server side TAF is not enabled for this service</td>
</tr>
<tr>
<td>FAILOVER_METHOD_BASIC</td>
<td>VARCHAR2</td>
<td>1</td>
<td>Server side TAF method is BASIC. BASIC is the only value currently supported. This means that a new connection is established at failure time.</td>
</tr>
<tr>
<td>FAILOVER_TYPE_NONE</td>
<td>VARCHAR</td>
<td></td>
<td>Server side TAF type is NONE</td>
</tr>
<tr>
<td>FAILOVER_TYPE_SESSION</td>
<td>VARCHAR</td>
<td></td>
<td>Server side TAF failover type is SESSION. At failure time, if the failover type is SESSION, TAF reconnects to a surviving node and re-establish a vanilla database session. Customizations (for example, ALTER SESSION) must be re-executed in a failover callback.</td>
</tr>
<tr>
<td>FAILOVER_TYPE_SELECT</td>
<td>VARCHAR</td>
<td></td>
<td>Server side TAF failover type is SELECT</td>
</tr>
<tr>
<td>FAILOVER_RETRIES</td>
<td>NUMBER</td>
<td></td>
<td>Number of connection attempts when failover occurs. Specifies the number of times for Application Continuity and TAF to attempt the reconnect and re-authenticate pair. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) for Application Continuity is 30.</td>
</tr>
<tr>
<td>FAILOVER_RESTORE_NONE</td>
<td>CONSTANT</td>
<td>NONE</td>
<td>The initial state is not restored before replaying for Application Continuity and TAF. This is recommended for OCI applications that use Application Continuity and build their own state in the request. For example, SQLPLUS.</td>
</tr>
<tr>
<td>Name</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------</td>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>FAILOVER_RESTORE_BASIC</td>
<td>VARCHAR2</td>
<td>LEVEL1</td>
<td>This is the recommended value for Java and ODP.NET applications using Application Continuity. The initial states that the user knows are restored automatically before replaying. If the user needs additional states, a callback must be registered.</td>
</tr>
<tr>
<td>FAILOVER_DELAY</td>
<td>NUMBER</td>
<td></td>
<td>Number of seconds delay between each connection attempt. This is the delay that Application Continuity and TAF waits if a reconnect and re-authentication fails. The value must be an integer greater than 0. The default in Oracle Database 12c Release 1 (12.1) is 10s when using Application Continuity. Using FAILOVER_DELAY the failover can be delayed until the service is next available. This can work well in conjunction with a planned outage that may make a service temporarily unavailable (such as for several minutes).</td>
</tr>
<tr>
<td>STOP_OPTION_NONE</td>
<td>VARCHAR</td>
<td></td>
<td>Sessions are not disconnected.</td>
</tr>
<tr>
<td>STOP_OPTION_IMMEDIATE</td>
<td>VARCHAR</td>
<td></td>
<td>Sessions are disconnected immediately after the drain_timeout expires.</td>
</tr>
<tr>
<td>STOP_OPTION_TRANSACTION</td>
<td>VARCHAR</td>
<td></td>
<td>Sessions are disconnected after the transactions during the drain_timeout. The sessions disconnect immediately when drain_timeout expires.</td>
</tr>
<tr>
<td>DYNAMIC</td>
<td>NUMBER</td>
<td></td>
<td>For Application Continuity, this parameter specifies whether the session state that is not transactional is changed by the application during request execution. A value of DYNAMIC is recommended for all applications. If you are in any doubt, or the application can be customized, you must use DYNAMIC.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- If a TAF callback has been registered, then the failover retries and failover delay are ignored. If an error occurs, TAF continues to re-attempt the connect and authentication as long as the callback returns a value of OCI_FO_RETRY. Any delay must be coded into the callback logic.
- Server side TAF settings override client-side counterparts that might be configured in TNS connect descriptors. If TAF is not configured on the client side, then at a minimum, the failover type must be set to enable TAF. If the failover type is set on the server side, then the failover method defaults to BASIC. Delay and retries are optional and may be specified independently.
145.4 DBMS_SERVICE Operating Procedures

You cannot use the following procedures with Oracle Real Applications Clusterware, Oracle Restart, and Oracle Global Data Services.

- CREATE_SERVICE Procedure
- DELETE_SERVICE Procedure
- MODIFY_SERVICE Procedure
- START_SERVICE Procedure
- STOP_SERVICE Procedure

- With Oracle Database 12c release 1, you are advised to use the parameter interface in all service-related subprograms.
- If you wish to use DBMS_SERVICE on a pluggable database (PDB) in a single instance, you must connect to that PDB first.

145.5 DBMS_SERVICE Exceptions

This table lists the exceptions raised by the DBMS_SERVICE package.

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

### 145.6 Summary of DBMS_SERVICE Subprograms

This table lists the DBMS_SERVICE subprograms and briefly describes them.

### Table 145-5  DBMS_SERVICE Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_SERVICE Procedure</td>
<td>Creates service</td>
</tr>
<tr>
<td>DELETE_SERVICE Procedure</td>
<td>Deletes service</td>
</tr>
<tr>
<td>DISCONNECT_SESSION Procedure</td>
<td>Disconnects sessions running under this service</td>
</tr>
<tr>
<td>MODIFY_SERVICE Procedure</td>
<td>Modifies service</td>
</tr>
<tr>
<td>START_SERVICE Procedure</td>
<td>Activates service</td>
</tr>
<tr>
<td>STOP_SERVICE Procedure</td>
<td>Stops service</td>
</tr>
</tbody>
</table>
145.6.1 CREATE_SERVICE Procedure

This procedure creates a service name in the data dictionary. Services are also created in the data dictionary implicitly when you set the service in the `service_name` parameter or by means of the `ALTER SYSTEM SET SERVICE_NAMES` command.

**Note:**

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

**Syntax**

```sql
DBMS_SERVICE.CREATE_SERVICE(
    service_name               IN VARCHAR2,
    network_name               IN VARCHAR2,
    parameter_array            IN TABLE OF VARCHAR2(100));
```

This overload is maintained for backward compatibility:

```sql
DBMS_SERVICE.CREATE_SERVICE(
    service_name               IN VARCHAR2,
    network_name               IN VARCHAR2,
    goal                       IN NUMBER DEFAULT NULL,
    dtp                        IN BOOLEAN DEFAULT NULL,
    aq_ha_notifications        IN BOOLEAN DEFAULT NULL,
    failover_method            IN VARCHAR2 DEFAULT NULL,
    failover_type              IN VARCHAR2 DEFAULT NULL,
    failover_retries           IN NUMBER DEFAULT NULL,
    failover_delay             IN NUMBER DEFAULT NULL,
    clb_goal                   IN NUMBER DEFAULT NULL,
    edition                    IN VARCHAR2 DEFAULT NULL);
```

**Parameters**

**Table 145-6  CREATE_SERVICE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>network_name</td>
<td>Network name of the service as used in SQLNet connect descriptors for client connections. This is limited to the NET service_names character set (see Oracle Database Net Services Reference).</td>
</tr>
</tbody>
</table>
### Table 145-6  (Cont.) CREATE_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_array</td>
<td>Associative array with name-value pairs of the service attributes. Supported names:</td>
</tr>
<tr>
<td></td>
<td>• goal</td>
</tr>
<tr>
<td></td>
<td>• dtp</td>
</tr>
<tr>
<td></td>
<td>• aq_ha_notifications</td>
</tr>
<tr>
<td></td>
<td>• failover_method</td>
</tr>
<tr>
<td></td>
<td>• failover_type</td>
</tr>
<tr>
<td></td>
<td>• failover_retries</td>
</tr>
<tr>
<td></td>
<td>• failover_restore</td>
</tr>
<tr>
<td></td>
<td>• failover_delay</td>
</tr>
<tr>
<td></td>
<td>• clb_goal</td>
</tr>
<tr>
<td></td>
<td>• edition</td>
</tr>
<tr>
<td></td>
<td>• commit_outcome</td>
</tr>
<tr>
<td></td>
<td>• retention_timeout</td>
</tr>
<tr>
<td></td>
<td>• replay_initiation_timeout</td>
</tr>
<tr>
<td></td>
<td>• session_state_consistency</td>
</tr>
<tr>
<td></td>
<td>• sql_translation_profile</td>
</tr>
<tr>
<td></td>
<td>• drain_timeout</td>
</tr>
<tr>
<td></td>
<td>• stop_option</td>
</tr>
<tr>
<td>goal</td>
<td>Workload management goal directive for the service. Valid values:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SERVICE.GOAL_SERVICE_TIME</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SERVICE.GOAL_THROUGHPUT</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SERVICE.GOAL_NONE</td>
</tr>
<tr>
<td>dtp</td>
<td>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</td>
</tr>
<tr>
<td>aq_ha_notifications</td>
<td>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</td>
</tr>
<tr>
<td>failover_method</td>
<td>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</td>
</tr>
<tr>
<td>failover_type</td>
<td>TRANSACTION for Application Continuity. SELECT or BASIC for TAF.</td>
</tr>
<tr>
<td>failover_retries</td>
<td>Number of connection retries for Application Continuity and TAF. Using the failover_retries and failover_delay parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.</td>
</tr>
</tbody>
</table>
Table 145-6  (Cont.) CREATE_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>failover_delay</td>
<td>Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with RAC when the service is already available.</td>
</tr>
<tr>
<td>edition</td>
<td>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</td>
</tr>
<tr>
<td>drain_timeout</td>
<td>If this parameter is defined, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The drain_timeout can be set on the service, so stopping and relocating drains for this time by default.</td>
</tr>
</tbody>
</table>
| stop_option   | Provides options to terminate a session. The supported values are:  
• TRANSACTIONAL  
  drain_timeout applies to the transactions. After the drain_timeout expire, the sessions are immediately killed.  
• IMMEDIATE  
  The sessions are killed after drain_timeout expires.  
• NONE  
  Sessions are not terminated. However, these parameter values can be overridden using the command line. |
| commit_outcome| Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:  
• Invoking the GET_LTXID_OUTCOME Procedure of the DBMS_APP_CONT package requires that the commit_outcome attribute be set.  
• commit_outcome has no effect on active Data Guard and read-only databases.  
• commit_outcome is only allowed on the database service and on user-defined database services |
| retention_timeout | Used in conjunction with commit_outcome, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000). |
Table 145-6  (Cont.) CREATE_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>replay_initiation_timeout</td>
<td>For Application Continuity, replay_initiation_timeout is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds.</td>
</tr>
<tr>
<td>session_state_consistency</td>
<td>Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.</td>
</tr>
<tr>
<td>sql_translation_name</td>
<td>Name of SQL translation unit</td>
</tr>
<tr>
<td>clb_goal</td>
<td>Method used for Connection Load Balancing (see Table 145-2)</td>
</tr>
</tbody>
</table>

Examples

```
DBMS_SERVICE.CREATE_SERVICE('ernie.example.com','ernie.example.com');

DECLARE
  params dbms_service.svc_parameter_array;
BEGIN
  params('FAILOVER_TYPE')            :='TRANSACTION';
  params('REPLAY_INITIATION_TIMEOUT'):=1800;
  params('RETENTION_TIMEOUT')        :=86400;
  params('FAILOVER_DELAY')           :=10;
  params('FAILOVER_RETRIES')         :=30;
  params('DRAIN_TIMEOUT')            :=60;
  params('STOP_OPTION')              :='DBMS_SERVICE.STOP_OPTION_IMMEDIATE';
  params('FAILOVER_RESTORE')         :='DBMS_SERVICE.FAILOVER_RESTORE_BASIC';
  params('commit_outcome')           :='true';
  params('aq_ha_notifications')      :='true';
  DBMS_SERVICE.MODIFY_SERVICE('GOLD',params);
END;
```

145.6.2 DELETE_SERVICE Procedure

This procedure deletes a service from the data dictionary.

**Note:**

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services.
Syntax

DBMS_SERVICE.DELETE_SERVICE(
    service_name   IN VARCHAR2);

Parameters

Table 145-7  DELETE_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
</tbody>
</table>

Examples

DBMS_SERVICE.DELETE_SERVICE('ernie.example.com');

145.6.3 DISCONNECT_SESSION Procedure

This procedure disconnects sessions with the named service at the current instance.

Syntax

DBMS_SERVICE.DISCONNECT_SESSION(
    service_name         IN VARCHAR2,
    disconnect_option    IN NUMBER DEFAULT POST_TRANSACTION;
)

Parameters

Table 145-8  DISCONNECT_SESSION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service, limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>disconnect_option</td>
<td>The options, package constants, are expressed as NUMBER:</td>
</tr>
<tr>
<td></td>
<td>• POST_TRANSACTION = 0: session disconnects after the current transaction commits or rolls back</td>
</tr>
<tr>
<td></td>
<td>• IMMEDIATE = 1: session disconnects immediately</td>
</tr>
<tr>
<td></td>
<td>• NOREPLAY = 2: session disconnects immediately and be flagged to not be replayed by application continuity, that is IMMEDIATE and NOREPLAY together</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> IMMEDIATE or POST_TRANSACTION and NOREPLAY is automatically translated as 1 or 0 or 2 respectively. However, passing a string literal (quoted using either the ' or &quot; characters, such as &quot;IMMEDIATE&quot; or 'POST_TRANSACTION' or 'NOREPLAY') raises an error.</td>
</tr>
</tbody>
</table>

Usage Notes

• This procedure can be used in the context of a single instance as well as with Oracle Real Application Clusters.
• This subprogram does not return until all corresponding sessions are disconnected. Therefore, use the DBMS_JOB package or put the SQL session in
background if the caller does not want to wait for all corresponding sessions to be disconnected.

Examples

This disconnects sessions with service_name 'ernie.example.com'.

DBMS_SERVICE.DISCONNECT_SESSION('ernie.example.com');

If a service is using application continuity, and you do not want the sessions replayed but simply terminated, use the following:

EXECUTE DBMS_SERVICE.DISCONNECT_SESSION('service name', DBMS_SERVICE.NOREPLAY);

145.6.4 MODIFY_SERVICE Procedure

This procedure modifies an existing service.

Note:

You cannot use the second version of subprogram if your services are managed by Oracle Clusterware, Oracle Restart, or Oracle Global Data Services. The version with the parameter array interface applies to databases that are not managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services. New attributes are only available using the parameter interface.

Syntax

DBMS_SERVICE.MODIFY_SERVICE(
  service_name               IN VARCHAR2,
  parameter_array            IN svc_parameter_array);

This overload is maintained for backward compatibility:

DBMS_SERVICE.MODIFY_SERVICE(
  service_name               IN VARCHAR2,
  goal                       IN NUMBER DEFAULT NULL,
  dtp                        IN BOOLEAN DEFAULT NULL,
  aq_ha_notifications        IN BOOLEAN DEFAULT NULL,
  failover_method            IN VARCHAR2 DEFAULT NULL,
  failover_type              IN VARCHAR2 DEFAULT NULL,
  failover_retries           IN NUMBER DEFAULT NULL,
  failover_delay             IN NUMBER DEFAULT NULL,
  clb_goal                   IN NUMBER DEFAULT NULL,
  edition                    IN VARCHAR2 DEFAULT NULL,
  modify_edition             IN BOOLEAN DEFAULT FALSE;
Parameters

<tr>
<td>dtp</td>
<td>Declares the service to be for X/Open Distributed Transaction Processing (DTP) or any distributed transaction (especially XA)</td>
</tr>
<tr>
<td>aq_ha_notifications</td>
<td>Determines whether Fast Application Notification (FAN) is enabled for OCI/OCCI/ODP. In Oracle Database 12c, FAN uses Oracle Notification Services (ONS). This parameter is still used to enable FAN. FAN is recommended for all High Availability systems, and is on by default for Application Continuity</td>
</tr>
<tr>
<td>failover_method</td>
<td>Failover TYPE for the service for Application Continuity and TAF. If the failover_type is set to TRANSACTION on the service, this automatically sets COMMIT_OUTCOME to TRUE. JDBC Replay Driver uses the FAILOVER_TYPE service attribute setting of TRANSACTION for TRANSACTION failover. OCI uses the older settings of SELECT and SESSION. The server only accepts FAILOVER_METHOD = BASIC with the TRANSACTION setting.</td>
</tr>
<tr>
<td>failover_type</td>
<td>Failover TYPE for the service for Application Continuity and TAF.</td>
</tr>
<tr>
<td>failover_restore</td>
<td>For Application Continuity, when the failover_restore parameter is set, the session states are restored before replaying for ODP.NET and Java. Use LEVEL1 for ODP.NET and Java with Application Continuity to restore the initial state. For AC OCI, use NONE for applications that are not STATIC.</td>
</tr>
</tbody>
</table>
### Table 145-9  (Cont.) MODIFY_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>failover_retries</code></td>
<td>Number of connection retries for Application Continuity and TAF. Using the <code>failover_retries</code> and <code>failover_delay</code> parameters, the failover can be delayed until the service is next available. This parameter is for connecting. It does not control the number of failovers, which is 3 for each incident for Application Continuity.</td>
</tr>
<tr>
<td><code>failover_delay</code></td>
<td>Delay in seconds between connection retries for Application Continuity and TAF. The default is 10 seconds for Application Continuity. Do not use a 0-second delay if the service needs time to failover and register. Long delays are good for planned outages and to failover to Data Guard. Short delays work well with Oracle RAC when the service is already available.</td>
</tr>
<tr>
<td><code>drain_timeout</code></td>
<td>When this parameter is set, all sessions connected to that service are drained by the client drivers and pools using Fast Connection Failover (FCF). The <code>drain_timeout</code> can be set on the service, to stop and relocate drains for this time by default.</td>
</tr>
<tr>
<td><code>edition</code></td>
<td>If this argument has a non-NULL value, this provides the initial session edition for subsequent database connections using this service that do not specify an edition. If no value is specified, this argument has no effect. During service creation or modification, no validation is performed on this parameter. At connection time, if the connecting user does not have USE privilege on the edition, or the edition does not exist, this raises the error ORA-38802 (edition does not exist).</td>
</tr>
</tbody>
</table>
| `commit_outcome`     | Determines whether transaction COMMIT outcome is accessible after the COMMIT has executed. While the database guarantees that COMMIT is durable, this ensures that the outcome of the COMMIT is durable. Applications use the feature to probe the status of the commit last executed after an outage, and is available to applications to determine an outcome. Note:  
  - Invoking the `GET_LTXID_OUTCOME` Procedure of the `DBMS_APP_CONT` package requires that the `commit_outcome` attribute be set.  
  - `commit_outcome` has no effect on active Data Guard and read-only databases.  
  - `commit_outcome` is allowed only on user-defined database services. |
| `retention_timeout`  | Used in conjunction with `commit_outcome`, it determines the amount of time (in seconds) that the COMMIT_OUTCOME is retained. Default is 24 hours (86400). Maximum value is 30 days (2592000). |
| `replay_initiation_timeout` | For Application Continuity, `replay_initiation_timeout` is the difference between the time of original execution of first operation of a request, and the time that the replay is ready to start after a successful reconnect. Replay initiation time is measured from the time that the request was originally submitted until the time that replay has connected and is ready to replay. When replay is expected, keep this value high. Default is 900 seconds. |
### Table 145-9  (Cont.) MODIFY_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_state_consistency</td>
<td>Describes how nontransactional is changed during a request (values are DYNAMIC or STATIC). This parameter is considered only if failover_type is set to TRANSACTION for Application Continuity. Examples of session state are NLS settings, optimizer preferences, event settings, PL/SQL global variables, temporary tables, advanced queues, LOBs, and result cache. If these values change after the request starts, set to DYNAMIC (default). Almost all applications should use DYNAMIC mode. If you are unsure, use DYNAMIC mode.</td>
</tr>
<tr>
<td>sql_translation_name</td>
<td>Name of SQL translation unit</td>
</tr>
<tr>
<td>modify_edition</td>
<td>If TRUE, the edition service attribute is updated to use the edition argument value. If FALSE or NULL, the edition attribute is not updated.</td>
</tr>
<tr>
<td>clb_goal</td>
<td>Method used for Connection Load Balancing (see Table 145-2)</td>
</tr>
</tbody>
</table>

### Usage Notes

- If you are using Clustered Managed Services with Oracle Clusterware, or using Oracle Restart with your single instance database, you must modify services using the srvctl command rather than DBMS_SERVICE. When the service is started by Oracle Clusterware or Oracle Restart, the service is modified in the database to match the resource defined to either Oracle Clusterware or Oracle Restart. Any changes made with DBMS_SERVICE are lost unless they are also made with the corresponding srvctl command. Starting with 11.2.0.2, service attribute modifications take effect immediately when the service is started or modified by srvctl.

- Although users can modify the edition attribute while the service is up and running, it may not be safe to do so. Users must proceed with caution because this causes new connections to be connected at the new edition, while the existing connection is not affected. This can cause mid-tier operations to connect to the wrong edition.

### 145.6.5 START_SERVICE Procedure

This procedure starts a service. In Oracle RAC, implementing this option acts on the instance specified.

**Note:**

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

**Syntax**

```
DBMS_SERVICE.START_SERVICE(
    service_name  IN VARCHAR2,
    instance_name IN VARCHAR2);
```
Parameters

Table 145-10  START_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>instance_name</td>
<td>Name of the instance where the service must be activated (optional). NULL results in starting of the service on the local instance. In single instance, this can only be the current instance or NULL. Specify DBMS_SERVICE.ALL_INSTANCES to start the service on all configured instances.</td>
</tr>
</tbody>
</table>

Examples

DBMS_SERVICE.START_SERVICE('ernie.example.com');

145.6.6 STOP_SERVICE Procedure

This procedure stops a service.

Note:

You cannot use this subprogram if your services are managed by Oracle Clusterware, Oracle Restart or Oracle Global Data Services.

Syntax

DBMS_SERVICE.STOP_SERVICE(
    service_name   IN VARCHAR2,
    instance_name  IN VARCHAR2;
)

Parameters

Table 145-11  STOP_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_name</td>
<td>Name of the service limited to 64 characters in the Data Dictionary</td>
</tr>
<tr>
<td>instance_name</td>
<td>Name of the instance where the service must be stopped (optional). NULL results in stopping of the service locally. In single instance, this can only be the current instance or NULL. The default in Oracle RAC and exclusive case is NULL. Specify DBMS_SERVICE.ALL_INSTANCES to stop the service on all configured instances.</td>
</tr>
<tr>
<td>drain_timeout</td>
<td>The time in seconds for the session to drain.</td>
</tr>
</tbody>
</table>
Table 145-11  (Cont.) STOP_SERVICE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stop_option</td>
<td>To specify how sessions are stopped with draining. The possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• IMMEDIATE: sessions are aborted immediately after the time specified in drain_timeout.</td>
</tr>
<tr>
<td></td>
<td>• TRANSACTIONAL: applies for transactions. After the transaction expires, the sessions are immediately terminated.</td>
</tr>
<tr>
<td></td>
<td>• NONE: sessions are not terminated.</td>
</tr>
<tr>
<td></td>
<td>These values can be overridden on the command line using SRVCTL.</td>
</tr>
<tr>
<td>noreplay</td>
<td>Disconnected sessions are not recovered by Application Continuity.</td>
</tr>
</tbody>
</table>

Examples

DBMS_SERVICE.STOP_SERVICE('ernie.example.com');
This package provides access to SQL ALTER SESSION and SET ROLE statements, and other session information, from PL/SQL. You can use DBMS_SESSION to set preferences and security levels.

This chapter contains the following topics:

- Security Model
- Operational Notes
- Data Structures
- Summary of DBMS_SESSION Subprograms

### 146.1 DBMS_SESSION Security Model

This package runs with the privileges of the calling user, rather than the package owner SYS.

### 146.2 DBMS_SESSION Operational Notes

You should not attempt to turn close Cached Open Cursors on or off.

### 146.3 DBMS_SESSION Data Structures

The DBMS_SESSION package defines TABLE types.

#### Table Types

- INTEGER_ARRAY Table Type
- LNAME_ARRAY Table Type

#### 146.3.1 DBMS_SERVICE INTEGER_ARRAY Table Type

integer_array is a table type of BINARY_INTEGER.

Syntax

```
TYPE integer_array IS TABLE OF BINARY_INTEGER INDEX BY BINARY_INTEGER;
```

#### 146.3.2 DBMS_SERVICE LNAME_ARRAY Table Type

LNAME_ARRAY is a table type of VARCHAR2.

Syntax

```
TYPE lname_array IS TABLE OF VARCHAR2(4000) INDEX BY BINARY_INTEGER;
```
146.4 Summary of DBMS_SESSION Subprograms

This table lists the DBMS_SESSION subprograms in alphabetical order and briefly describes them.

Table 146-1  DBMS_SESSION Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLEAR_ALL_CONTEXT Procedure</td>
<td>Clears all context information</td>
</tr>
<tr>
<td>CLEAR_CONTEXT Procedure</td>
<td>Clears the context</td>

<tr>
<td>CLEAR_IDENTIFIER Procedure</td>
<td>Clears the identifier</td>
</tr>
<tr>
<td>CLOSE_DATABASE_LINK Procedure</td>
<td>Closes database link</td>
</tr>
<tr>
<td>FREE_UNUSED_USER_MEMORY Procedure</td>
<td>Lets you reclaim unused memory after performing operations requiring large amounts of memory</td>
</tr>
<tr>
<td>GET_PACKAGE_MEMORY_UTILIZATION Procedure</td>
<td>Describes static package memory usage</td>
</tr>
<tr>
<td>IS_ROLE_ENABLED Function</td>
<td>Determines if the named role is enabled for the session.</td>
</tr>
<tr>
<td>IS_SESSION_ALIVE Function</td>
<td>Determines if the specified session is active</td>
</tr>
<tr>
<td>LIST_CONTEXT Procedures</td>
<td>Returns a list of active namespace and context for the current session</td>
</tr>
<tr>
<td>MODIFY_PACKAGE_STATE Procedure</td>
<td>Used to perform various actions (as specified by the action_flags parameter) on the session state of all PL/SQL program units active in the session</td>
</tr>
<tr>
<td>RESET_PACKAGE Procedure</td>
<td>De-instantiates all packages in the session</td>
</tr>
<tr>
<td>SESSION_TRACE_DISABLE Procedure</td>
<td>Resets the session-level SQL trace for the session from which it was called.</td>
</tr>
<tr>
<td>SESSION_TRACE_ENABLE Procedure</td>
<td>Enables session-level SQL trace for the invoking session</td>
</tr>
<tr>
<td>SET_CONTEXT Procedure</td>
<td>Sets or resets the value of a context attribute</td>
</tr>
<tr>
<td>SET_EDITION_DEFERRED Procedure</td>
<td>Requests a switch to the specified edition</td>
</tr>
<tr>
<td>SET_IDENTIFIER Procedure</td>
<td>Sets the identifier</td>
</tr>
<tr>
<td>SET_NLS Procedure</td>
<td>Sets Globalization Support (NLS)</td>
</tr>
<tr>
<td>SET_ROLE Procedure</td>
<td>Sets role</td>
</tr>
<tr>
<td>SET_SQL_TRACE Procedure</td>
<td>Turns tracing on or off</td>
</tr>
<tr>
<td>SLEEP Procedure</td>
<td>Suspends the session for a specified period of time.</td>
</tr>
<tr>
<td>SWITCH_CURRENT_CONSUMER_GROUP Procedure</td>
<td>Facilitates changing the current resource consumer group of a user's current session</td>
</tr>
<tr>
<td>UNIQUE_SESSION_ID Function</td>
<td>Returns an identifier that is unique for all sessions currently connected to this database</td>
</tr>
</tbody>
</table>

146.4.1 ADD_SQL_CONNECTION_TEST Procedure

This procedure adds a new connection test that is used during draining sessions before planned maintenance begins. Use this procedure when the SQL connection
test is not covered by standard tests. The test is enabled when added. If the optional service name qualifier is provided, the test only applies only to that service name.

Syntax

```
DBMS_SESSION.ADD_SQL_CONNECTION_TEST (
    connection_test  IN VARCHAR2
    service_name     IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 146-2  ADD_SQL_CONNECTION_TEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier.</td>
</tr>
</tbody>
</table>

Usage Notes

The ADD_SQL_CONNECTION_TEST Procedure adds a connection test for the purpose of draining sessions before planned maintenance begins. The connection test is used by the application to test connections that are marked for draining. Sessions are set for draining at stop and relocate operations for services or PDBs. When set the RDBMS closes the connection while draining so the application sees no errors during planned maintenance. You can enter as many CONNECTION TESTs as needed. They are used only during planned maintenance. The tests apply to all RAC instances.

Check online documentation for latest updates on service qualifier availability.

Added connection can be viewed by querying the view `DBA_CONNECTION_TESTS`.

This procedure is owned by `SYS` and is granted to users for execution at `CDB$ROOT` or `PDB` levels, or when not multitenant, at dictionary level.

146.4.2 CLEAR_ALLCONTEXT Procedure

This procedure clears application context information in the specified namespace.

Syntax

```
DBMS_SESSION.CLEAR_ALL_CONTEXT
    namespace     VARCHAR2);
```

Parameters

Table 146-3  CLEAR_ALLCONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>The namespace where the application context information is to be cleared. Required.</td>
</tr>
</tbody>
</table>

Usage Notes

- This procedure must be invoked directly or indirectly by the trusted package.
Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

### 146.4.3 CLEAR_CONTEXT Procedure

This procedure clears application context in the specified namespace.

**Syntax**

```sql
DBMS_SESSION.CLEAR_CONTEXT
    namespace VARCHAR2,
    client_identifier VARCHAR2
    attribute VARCHAR2);
```

**Parameters**

**Table 146-4 CLEAR_CONTEXT Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace in which the application context is to be cleared. Required.</td>
</tr>
<tr>
<td></td>
<td>For a session-local context, <code>namespace</code> must be specified. If <code>namespace</code></td>
</tr>
<tr>
<td></td>
<td>is defined as Session Local Context, then <code>client_identifier</code> is optional</td>
</tr>
<tr>
<td></td>
<td>since it is only associated with a globally accessed context.</td>
</tr>
<tr>
<td></td>
<td>For a globally accessed context, <code>namespace</code> must be specified. NULL is</td>
</tr>
<tr>
<td></td>
<td>a valid value for <code>client_identifier</code> because a session with no identifier</td>
</tr>
<tr>
<td></td>
<td>set can see a context that looks like the `(namespace, attribute, value,</td>
</tr>
<tr>
<td></td>
<td>username, null)<code>set using</code>SET_CONTEXT`.</td>
</tr>
<tr>
<td>client_identifier</td>
<td>Applies to a global context and is optional for other types of contexts;</td>
</tr>
<tr>
<td></td>
<td>64-byte maximum</td>
</tr>
<tr>
<td>attribute</td>
<td>Specific attribute in the namespace to be cleared. Optional. the default</td>
</tr>
<tr>
<td></td>
<td>is NULL. If you specify <code>attribute</code> as NULL, then `(namespace, attribute,</td>
</tr>
<tr>
<td></td>
<td>value)<code>for that namespace are cleared from the session. If</code>attribute` is</td>
</tr>
<tr>
<td></td>
<td>not specified, then all context information that has the <code>namespace</code> and</td>
</tr>
<tr>
<td></td>
<td><code>client_identifier</code> arguments is cleared.</td>
</tr>
</tbody>
</table>

**Usage Notes**

- This procedure must be invoked directly or indirectly by the trusted package.
- Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

### 146.4.4 CLEAR_IDENTIFIER Procedure

This procedure removes the `set_client_id` in the session.

**Syntax**

```sql
DBMS_SESSION.CLEAR_IDENTIFIER;
```

**Usage Notes**

This procedure is executable by public.
146.4.5 CLOSE_DATABASE_LINK Procedure

This procedure closes an open database link. It is equivalent to the following SQL statement: ALTER SESSION CLOSE DATABASE LINK <name>

Syntax

DBMS_SESSION.CLOSE_DATABASE_LINK (dblink VARCHAR2);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of the database link to close</td>
</tr>
</tbody>
</table>

146.4.6 DELETE_SQL_CONNECTION_TEST Procedure

This procedure deletes a connection test that is no longer needed for planned draining. Removing a test applies immediately to all RAC instances where the PDB is open.

Syntax

DBMS_SESSION.DELETE_SQL_CONNECTION_TEST (connection_test IN VARCHAR2, service_name IN VARCHAR2 DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier.</td>
</tr>
<tr>
<td></td>
<td>If the optional SERVICE_NAME qualifier is provided,</td>
</tr>
<tr>
<td></td>
<td>only the test for that service name is deleted.</td>
</tr>
</tbody>
</table>

Usage Notes

If you are not certain if a test should be deleted, you can disable the test using DISABLE_CONNECTION_TEST Procedure. Only custom SQL tests can be deleted. Predefined tests cannot be deleted. Check for latest updates on service qualifier availability.

This procedure is owned by SYS at CDB$ROOT or PDB level, or SYS for when not multitenant.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.
146.4.7 DISABLE_CONNECTION_TEST Procedure

This procedure disables usage of a connection test during draining of sessions. Disabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```sql
DBMS_SESSION.DISABLE_CONNECTION_TEST (  
    connection_test_type     IN VARCHAR2,
    connection_test          IN VARCHAR2,
    service_name             IN VARCHAR2   DEFAULT NULL);
```

Parameters

Table 146-7  DISABLE_CONNECTION_TEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONNECTION_TEST_TYPE</td>
<td>The permitted values are:</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SESSION.SQL_TEST</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SESSION.PING_TEST</td>
</tr>
<tr>
<td></td>
<td>• DBMS_SESSION.ENDREQUEST_TEST</td>
</tr>
<tr>
<td>CONNECTION_TEST</td>
<td>The SQL text used to test and drain connections.</td>
</tr>
<tr>
<td></td>
<td>This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST.</td>
</tr>
<tr>
<td>SERVICE_NAME</td>
<td>Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. A disable at service name level takes precedence over an enable at PDB level. That is the PDB can be enabled, and the service disabled.</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

Connection tests and their status can be checked by querying the view DBA_CONNECTION_TESTS.

146.4.8 ENABLE_CONNECTION_TEST Procedure

This procedure enables usage of a connection test for draining database sessions before planned maintenance. Enabling a test applies immediately to all RAC instances where the PDB is open.

Syntax

```sql
DBMS_SESSION.ENABLE_CONNECTION_TEST (  
    connection_test_type     IN VARCHAR2,
    connection_test          IN VARCHAR2,
    service_name             IN VARCHAR2   DEFAULT NULL);
```
Parameters

Table 146-8 ENABLE_CONNECTION_TEST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| CONNECTION_TEST_TYPE | The connection type used when managing connection tests for draining before planned maintenance. See ADD, DELETE, ENABLE, DISABLE procedures for connection tests. The permitted values are:  
  • DBMS_SESSION.SQL_TEST  
  • DBMS_SESSION.PING_TEST  
  • DBMS_SESSION.ENDREQUEST_TEST |
| CONNECTION_TEST    | The SQL text used to test and drain connections at the RDBMS before planned maintenance starts. This parameter is allowed only if the value of CONNECTION_TEST_TYPE is SQL_TEST. |
| SERVICE_NAME       | Optional service name qualifier. If the optional service name qualifier is provided, only the test for that service name is enabled. An enable at service name level overrides any higher-level disables. That is, the PDB can be disabled, and the service enabled. |

Usage Notes

• This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

• ENABLE_CONNECTION_TEST enables a connection test for draining sessions during planned maintenance. The enable operation applies to all RAC instances where the PDB is open. It persists across database restarts.

• This procedure is owned by SYS and is granted to users for execution at CDB$ROOT or PDB levels, or when not multitenant, at dictionary level.

146.4.9 FREE_UNUSED_USER_MEMORY Procedure

This procedure reclaims unused memory after performing operations requiring large amounts of memory (more than 100K).

Examples of operations that use large amounts of memory include:

• Large sorting where entire sort_area_size is used and sort_area_size is hundreds of KB.

• Compiling large PL/SQL packages, procedures, or functions.

• Storing hundreds of KB of data within PL/SQL indexed tables.

You can monitor user memory by tracking the statistics "session UGA memory" and "session PGA memory" in the v$sesstat or v$statname fixed views. Monitoring these statistics also shows how much memory this procedure has freed.
**Note:**

This procedure should only be used in cases where memory is at a premium. It should be used infrequently and judiciously.

**Syntax**

```
DBMS_SESSION.FREE_UNUSED_USER_MEMORY;
```

**Return Values**

The behavior of this procedure depends upon the configuration of the server operating on behalf of the client:

- **Dedicated server**: This returns unused PGA memory and session memory to the operating system. Session memory is allocated from the PGA in this configuration.
- **Shared server**: This returns unused session memory to the `shared_pool`. Session memory is allocated from the `shared_pool` in this configuration.

**Usage Notes**

In order to free memory using this procedure, the memory must not be in use.

After an operation allocates memory, only the same type of operation can reuse the allocated memory. For example, after memory is allocated for sort, even if the sort is complete and the memory is no longer in use, only another sort can reuse the sort-allocated memory. For both sort and compilation, after the operation is complete, the memory is no longer in use, and the user can call this procedure to free the unused memory.

An indexed table implicitly allocates memory to store values assigned to the indexed table's elements. Thus, the more elements in an indexed table, the more memory the RDBMS allocates to the indexed table. As long as there are elements within the indexed table, the memory associated with an indexed table is in use.

The scope of indexed tables determines how long their memory is in use. Indexed tables declared globally are indexed tables declared in packages or package bodies. They allocate memory from session memory. For an indexed table declared globally, the memory remains in use for the lifetime of a user's login (lifetime of a user's session), and is freed after the user disconnects from ORACLE.

Indexed tables declared locally are indexed tables declared within functions, procedures, or anonymous blocks. These indexed tables allocate memory from PGA memory. For an indexed table declared locally, the memory remains in use for as long as the user is still running the procedure, function, or anonymous block in which the indexed table is declared. After the procedure, function, or anonymous block is finished running, the memory is then available for other locally declared indexed tables to use (in other words, the memory is no longer in use).

Assigning an uninitialized, "empty" indexed table to an existing index table is a method to explicitly re-initialize the indexed table and the memory associated with the indexed table. After this operation, the memory associated with the indexed table is no longer in use, making it available to be freed by calling this procedure. This method is particularly useful on indexed tables declared globally which can grow during the
lifetime of a user's session, as long as the user no longer needs the contents of the indexed table.

The memory rules associated with an indexed table's scope still apply; this method and this procedure, however, allow users to intervene and to explicitly free the memory associated with an indexed table.

Examples

The following PL/SQL illustrates the method and the use of procedure FREE_UNUSED_USER_MEMORY.

```
CREATE PACKAGE foobar
    type number_idx_tbl is table of number indexed by binary_integer;

    store1_table  number_idx_tbl;     -- PL/SQL indexed table
    store2_table  number_idx_tbl;     -- PL/SQL indexed table
    store3_table  number_idx_tbl;     -- PL/SQL indexed table
    ...
END;            -- end of foobar

DECLARE
    empty_table   number_idx_tbl;     -- uninitialized ("empty") version
BEGIN
    FOR i in 1..1000000 loop
        store1_table(i) := i;           -- load data
    END LOOP;
    ...
    store1_table := empty_table;      -- "truncate" the indexed table
    ...
    dbms_session.free_unused_user_memory;  -- give memory back to system
    store1_table(1) := 100;           -- index tables still declared;
    store2_table(2) := 200;           -- but truncated.
    ...
END;
```

146.4.10 GET_PACKAGE_MEMORY_UTILIZATION Procedure

This procedure describes static package memory usage.

The output collections describe memory usage in each instantiated package. Each package is described by its owner name, package name, used memory amount, and unused allocated memory amount. The amount of unused memory is greater than zero because of memory fragmentation and also because once used free memory chunks initially go to a free list owned by the package memory heap. They are released back to the parent heap only when the FREE_UNUSED_USER_MEMORY Procedure is invoked.

Syntax

```
DBMS_SESSION.GET_PACKAGE_MEMORY_UTILIZATION缺点{
    owner_names    OUT NOCOPY LNAME_ARRAY,
    unit_names     OUT NOCOPY LNAME_ARRAY,
    unit_types     OUT NOCOPY INTEGER_ARRAY,
    used amounts   OUT NOCOPY INTEGER_ARRAY,
    free amounts   OUT NOCOPY INTEGER_ARRAY);
```
Parameters

Table 146-9  GET_PACKAGE_MEMORY_UTILIZATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>owner_name</td>
<td>Owner of package</td>
</tr>
<tr>
<td>unit_name</td>
<td>Name of package</td>
</tr>
<tr>
<td>unit_types</td>
<td>Value of the type# columns of the dictionary table obj$</td>
</tr>
<tr>
<td>used_amounts</td>
<td>Amount of allocated memory specified in bytes</td>
</tr>
<tr>
<td>free_amounts</td>
<td>Amount of available memory specified in bytes</td>
</tr>
</tbody>
</table>

146.4.11 IS_ROLE_ENABLED Function

This function determines if the named role is enabled for this session.

Syntax

DBMS_SESSION.IS_ROLE_ENABLED (rolename VARCHAR2) RETURN BOOLEAN;

Parameters

Table 146-10  IS_ROLE_ENABLED Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rolename</td>
<td>Name of the role.</td>
</tr>
</tbody>
</table>

Return Values

Table 146-11  IS_ROLE_ENABLED Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_role_enabled</td>
<td>TRUE or FALSE, depending on whether the role is enabled</td>
</tr>
</tbody>
</table>

146.4.12 IS_SESSION_ALIVE Function

This function determines if the specified session is active.

Syntax

DBMS_SESSION.IS_SESSION_ALIVE (uniqueid VARCHAR2) RETURN BOOLEAN;
Parameters

Table 146-12 IS_SESSION_ALIVE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uniqueid</td>
<td>Unique ID of the session: This is the same one as returned by UNIQUE_SESSION_ID.</td>
</tr>
</tbody>
</table>

Return Values

Table 146-13 IS_SESSION_ALIVE Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>is_session_alive</td>
<td>TRUE or FALSE, depending on whether the session is active</td>
</tr>
</tbody>
</table>

146.4.13 LIST_CONTEXT Procedures

This procedure returns a list of active namespaces and contexts for the current session.

Syntax

```
TYPE AppCtxRecTyp IS RECORD (
   namespace VARCHAR2(30),
   attribute VARCHAR2(30),
   value VARCHAR2(256));

TYPE AppCtxTabTyp IS TABLE OF AppCtxRecTyp INDEX BY BINARY_INTEGER;

DBMS_SESSION.LIST_CONTEXT (
   list OUT AppCtxTabTyp,
   size OUT NUMBER);
```

Parameters

Table 146-14 LIST_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>Buffer to store a list of application context set in the current session</td>
</tr>
</tbody>
</table>

Return Values

Table 146-15 LIST_CONTEXT Procedure Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>A list of (namespace, attribute, values) set in current session</td>
</tr>
<tr>
<td>size</td>
<td>Returns the number of entries in the buffer returned</td>
</tr>
</tbody>
</table>
Usage Notes

The context information in the list appears as a series of <namespace> <attribute> <value>. Because list is a table type variable, its size is dynamically adjusted to the size of returned list.

146.4.14 MODIFY_PACKAGE_STATE Procedure

This procedure is used to perform various actions (as specified by the action_flags parameter) on the session state of all PL/SQL program units active in the session. This takes effect after the PL/SQL call that made the current invocation finishes running.

The procedure uses the DBMS_SESSION constants listed in Table 146-17.

Syntax

DBMS_SESSION.MODIFY_PACKAGE_STATE(
    action_flags IN PLS_INTEGER);
Parameters

Table 146-16  MODIFY_PACKAGE_STATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| action_flags   | Bit flags that determine the action taken on PL/SQL program units:  
|                | DBMS_SESSION.FREE_ALL_RESOURCES (or 1)—frees all memory associated with each of the previously run PL/SQL programs from the session. Clears the current values of any package globals and closes cached cursors. On subsequent use, the PL/SQL program units are reinstantiated and package globals are reinitialized. Invoking MODIFY_PACKAGE_STATE with the DBMS_SESSION.FREE_ALL_RESOURCES parameter provides functionality identical to the DBMS_SESSION.RESET_PACKAGE() interface.  
|                | DBMS_SESSION.REINITIALIZE (or 2)—reinitializes packages without actually being freed and recreated from scratch. Instead the package memory is reused. In terms of program semantics, the DBMS_SESSION.REINITIALIZE flag is similar to the DBMS_SESSION.FREE_ALL_RESOURCES flag in that both have the effect of reinitializing all packages. However, DBMS_SESSION.REINITIALIZE should exhibit better performance than the DBMS_SESSION.FREE_ALL_RESOURCES option because:  
|                | • Packages are reinitialized without actually being freed and recreated from scratch. Instead the package memory gets reused.  
|                | • Any open cursors are closed, semantically speaking. However, the cursor resource is not actually freed. It is simply returned to the PL/SQL cursor cache. The cursor cache is not flushed. Hence, cursors corresponding to frequently accessed static SQL in PL/SQL remains cached in the PL/SQL cursor cache and the application does not incur the overhead of opening, parsing, and closing a new cursor for those statements on subsequent use.  
|                | • The session memory for PL/SQL modules without global state (such as types, stored-procedures) are not freed and recreated. |

Usage Notes

See the parameter descriptions in Table 146-18 for the differences between the flags and why DBMS_SESSION.REINITIALIZE exhibits better performance than DBMS_SESSION.FREE_ALL_RESOURCES.

Table 146-17  Action_flags Constants for MODIFY_PACKAGE_STATE

<table>
<thead>
<tr>
<th>Constant</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FREE_ALL_RESOURCES</td>
<td>PLS_INTEGER:= 1</td>
</tr>
<tr>
<td>REINITIALIZE</td>
<td>PLS_INTEGER:= 2</td>
</tr>
</tbody>
</table>
Reinitialization refers to the process of resetting all package variables to their initial values and running the initialization block (if any) in the package bodies. Consider the package:

```plsql
package P is
    n number;
    m number := P2.foo;
    d date := SYSDATE;
    cursor c is select * from emp;
    procedure bar;
end P;
/
package body P is
    v varchar2(20) := 'hello';
    procedure bar is
        begin
            ...
        end;
    procedure init_pkg is
        begin
            ....
        end;
begin
    -- initialization block
    init_pkg;
    ...
end P;
/
```

For the package P, reinitialization involves:

- **Setting** `P.n` to `NULL`
- **Invoking function** `P2.foo` and setting `P.m` to the value returned from `P2.foo`
- **Setting** `P.d` to the return value of `SYSDATE` built-in
- **Closing cursor** `P.c` if it was previously opened
- **Setting** `P.v` to 'hello'
- **Running the initialization block in the package body**
- The reinitialization for a package is done only if the package is actually referenced subsequently. Furthermore, the packages are reinitialized in the order in which they are referenced subsequently.
- When using `FREE_ALL_RESOURCES` or `REINITIALIZE`, make sure that resetting package variable values does not affect the application.
- Because `DBMS_SESSION.REINITIALIZE` does not actually cause all the package state to be freed, in some situations, the application could use significantly more session memory than if the `FREE_ALL_RESOURCES` flag or the `RESET_PACKAGE` procedure had been used. For instance, after performing `DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE)`, if the application does not refer to many of the packages that were previously referenced, then the session memory for those packages remains until the end of the session (or until `DBMS_SESSION.RESET_PACKAGE` is called).
- Because the client-side PL/SQL code cannot reference remote package variables or constants, you must explicitly use the values of the constants. For example,
DBMS_SESSION.MODIFY_PACKAGE_STATE(DBMS_SESSION.REINITIALIZE) does not compile on the client because it uses the constant DBMS_SESSION.REINITIALIZE.

Instead, use DBMS_SESSION.MODIFY_PACKAGE_STATE(2) on the client, because the argument is explicitly provided.

Examples

This example illustrates the use of DBMS_SESSION.MODIFY_PACKAGE_STATE. Consider a package P with some global state (a cursor c and a number cnt). When the package is first initialized, the package variable cnt is 0 and the cursor c is CLOSED. Then, in the session, change the value of cnt to 111 and also execute an OPEN operation on the cursor. If you call print_status to display the state of the package, you see that cnt is 111 and that the cursor is OPEN. Next, call DBMS_SESSION.MODIFY_PACKAGE_STATE. If you print the status of the package P again using print_status, you see that cnt is 0 again and the cursor is CLOSED. If the call to DBMS_SESSION.MODIFY_PACKAGE_STATE had not been made, then the second print_status would have printed 111 and OPEN.

```sql
create or replace package P is
  cnt    number := 0;
  cursor c is select * from emp;
  procedure print_status;
end P;
/
show errors;

create or replace package body P is
  procedure print_status is
    begin
      dbms_output.put_line('P.cnt = ' || cnt);
      if c%ISOPEN then
        dbms_output.put_line('P.c is OPEN');
      else
        dbms_output.put_line('P.c is CLOSED');
      end if;
    end;
end;
end P;
/
show errors;

SQL> set serveroutput on;
SQL> begin
  2   P.cnt := 111;
  3   open p.c;
  4   P.print_status;
  5 end;
  6 /
P.cnt = 111
P.c is OPEN

PL/SQL procedure successfully completed.

SQL> begin
  2   dbms_session.modify_package_state(dbms_session.reinitialize);
  3 end;
  4 /

PL/SQL procedure successfully completed.

SQL> set serveroutput on;
```
PL/SQL procedure successfully completed.

146.4.15 SESSION_TRACE_DISABLE Procedure

This procedure resets the session-level SQL trace for the session from which it was called. Client ID and service/module/action traces are not affected.

Syntax

DBMS_SESSION.SESSION_TRACE_DISABLE;

146.4.16 SESSION_TRACE_ENABLE Procedure

This procedure enables session-level SQL trace for the invoking session. Invoking this procedure results in SQL tracing of every SQL statement issued by the session.

Syntax

DBMS_SESSION.SESSION_TRACE_ENABLE(
    waits    IN   BOOLEAN DEFAULT TRUE,
    binds    IN   BOOLEAN DEFAULT FALSE,
    plan_stat IN   VARCHAR2 DEFAULT NULL);

Parameters

Table 146-18  SESSION_TRACE_ENABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>waits</td>
<td>Specifies if wait information is to be traced</td>
</tr>
<tr>
<td>binds</td>
<td>Specifies if bind information is to be traced</td>
</tr>
<tr>
<td>plan_stat</td>
<td>Frequency at which we dump row source statistics. Value should be 'NEVER', 'FIRST_EXECUTION' (equivalent to NULL) or 'ALL_EXECUTIONS'.</td>
</tr>
</tbody>
</table>
146.4.17 RESET_PACKAGE Procedure

This procedure de-instantiates all packages in this session. It frees the package state.

Note:

See "SESSION_TRACE_ENABLE Procedure". The MODIFY_PACKAGE_STATE interface, introduced in Oracle9i, provides an equivalent of the RESET_PACKAGE capability. It is an efficient, lighter-weight variant for reinitializing the state of all PL/SQL packages in the session.

Memory used for caching the execution state is associated with all PL/SQL functions, procedures, and packages that were run in a session.

For packages, this collection of memory holds the current values of package variables and controls the cache of cursors opened by the respective PL/SQL programs. A call to RESET_PACKAGE frees the memory associated with each of the previously run PL/SQL programs from the session, and, consequently, clears the current values of any package globals and closes any cached cursors.

RESET_PACKAGE can also be used to reliably restart a failed program in a session. If a program containing package variables fails, then it is hard to determine which variables need to be reinitialized. RESET_PACKAGE guarantees that all package variables are reset to their initial values.

Syntax

DBMS_SESSION.RESET_PACKAGE;

Usage Notes

Because the amount of memory consumed by all executed PL/SQL can become large, you might use RESET_PACKAGE to trim down the session memory footprint at certain points in your database application. However, make sure that resetting package variable values does not affect the application. Also, remember that later execution of programs that have lost their cached memory and cursors will perform slower, because they need to re-create the freed memory and cursors.

RESET_PACKAGE does not free the memory, cursors, and package variables immediately when called.

Note:

RESET_PACKAGE only frees the memory, cursors, and package variables after the PL/SQL call that made the invocation finishes running.

For example, PL/SQL procedure P1 calls PL/SQL procedure P2, and P2 calls RESET_PACKAGE. The RESET_PACKAGE effects do not occur until procedure P1 finishes execution (the PL/SQL call ends).
Examples

This SQL*Plus script runs a large program with many PL/SQL program units that may or may not use global variables, but it doesn't need them beyond this execution:

```sql
EXECUTE large_plsql_program1;
```

To free up PL/SQL cached session memory:

```sql
EXECUTE DBMS_SESSION.RESET_PACKAGE;
```

To run another large program:

```sql
EXECUTE large_plsql_program2;
```

146.4.18 SET_CONTEXT Procedure

This procedure sets the context, of which there are four types: session local, globally initialized, externally initialized, and globally accessed.

Of its five parameters, only the first three are required; the final two parameters are optional, used only in globally accessed contexts. Further parameter information appears in the parameter table and the usage notes.

Syntax

```sql
DBMS_SESSION.SET_CONTEXT (  
  namespace VARCHAR2,  
  attribute VARCHAR2,  
  value VARCHAR2,  
  username VARCHAR2,  
  client_id VARCHAR2 );
```

Parameters

Table 146-19  SET_CONTEXT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>namespace</td>
<td>Namespace of the application context to be set, limited to 30 bytes</td>
</tr>
<tr>
<td>attribute</td>
<td>Attribute of the application context to be set, limited to 30 bytes</td>
</tr>
<tr>
<td>value</td>
<td>Value of the application context to be set, limited to 4 kilobytes.</td>
</tr>
<tr>
<td>username</td>
<td>Database username attribute of the application context.</td>
</tr>
<tr>
<td></td>
<td>Default: NULL</td>
</tr>
<tr>
<td>client_id</td>
<td>Application-specific client_id attribute of the application context (64-byte maximum).</td>
</tr>
<tr>
<td></td>
<td>Default: NULL</td>
</tr>
</tbody>
</table>

Usage Notes

- The first three parameters are required for all types of context.
- The `username` parameter must be a valid SQL identifier.
The `client_id` parameter must be a string of at most 64 bytes. It is case-sensitive and must match the argument provided for `set_identifier`.

If the namespace parameter is a global context namespace, then the `username` parameter is matched against the current database user name in the session, and the `client_id` parameter is matched against the current `client_id` in the session. If these parameters are not set, NULL is assumed, enabling any user to see the context values.

This procedure must be invoked directly or indirectly by the trusted package.

The caller of `SET_CONTEXT` must be in the calling stack of a procedure that has been associated to the context namespace through a `CREATE CONTEXT` statement. The checking of the calling stack does not cross a DBMS boundary.

No limit applies to the number of attributes that can be set in a namespace. An attribute retains its value during the user's session unless it is reset by the user.

If the value of the parameter in the namespace has been set, `SET_CONTEXT` overwrites this value.

Any changes in context value are reflected immediately and subsequent calls to access the value through `SYS_CONTEXT` return the most recent value.

See Also:

Oracle Database Security Guide for more information about

- "Setting the username and client ID"
- "Example: Creating a Global Application Context that Uses a Client Session ID"

### 146.4.19 SET_EDITION_DEFERRED Procedure

This procedure requests a switch to the specified edition. The switch takes effect at the end of the current client call.

**Syntax**

```
DBMS_SESSION.SET_EDITION_DEFERRED (edition IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>edition</td>
<td>Name of the edition to which to switch. The contents of the string are</td>
</tr>
<tr>
<td></td>
<td>processed as a SQL identifier; double quotation marks must surround the</td>
</tr>
<tr>
<td></td>
<td>remainder of the string if special characters or lower case characters are</td>
</tr>
<tr>
<td></td>
<td>present in the edition's actual name and, if double quotation marks are</td>
</tr>
<tr>
<td></td>
<td>not used, the contents are set in uppercase. The caller must have <code>USE</code></td>
</tr>
<tr>
<td></td>
<td>privilege on the named edition.</td>
</tr>
</tbody>
</table>
146.4.20 SET_IDENTIFIER Procedure

This procedure sets the client ID in the session.

Syntax

```
DBMS_SESSION.SET_IDENTIFIER (client_id VARCHAR2);
```

Parameters

Table 146-21    SET_IDENTIFIER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_id</td>
<td>Case-sensitive application-specific identifier of the current database session. The maximum number of bytes for this parameter is 64 bytes. If the input exceeds 64 bytes, the additional bytes are truncated.</td>
</tr>
</tbody>
</table>

Usage Notes

- `SET_IDENTIFIER` sets the session's client id to the given value. This value can be used to identify sessions in `v$session` by means of `v$session.client_identifier`. It can also be used to identify sessions by means of `sys_context('USERENV','CLIENT_IDENTIFIER')`.
- This procedure is executable by `PUBLIC`.

146.4.21 SET_NLS Procedure

This procedure sets up your Globalization Support (NLS). It is equivalent to the SQL statement: `ALTER SESSION SET <nls_parameter> = <value>`.

Syntax

```
DBMS_SESSION.SET_NLS (param VARCHAR2, value VARCHAR2);
```

Parameters

Table 146-22    SET_NLS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>param</td>
<td>Globalization Support parameter. The parameter name must begin with 'NLS'.</td>
</tr>
<tr>
<td>value</td>
<td>Parameter value. If the parameter is a text literal, then it needs embedded single-quotes. For example, &quot;set_nls ('nls_date_format','&quot;DD-MON-YY&quot;)&quot;.</td>
</tr>
</tbody>
</table>
146.4.22 SET_ROLE Procedure

This procedure enables and disables roles. It is equivalent to the `SET ROLE` SQL statement.

Syntax

```sql
DBMS_SESSION.SET_ROLE (
    role_cmd VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_cmd</td>
<td>Text is appended to &quot;set role&quot; and then run as SQL</td>
</tr>
</tbody>
</table>

Usage Notes

Note that the procedure creates a new transaction if it is not invoked from within an existing transaction.

146.4.23 SET_SQL_TRACE Procedure

This procedure turns tracing on or off. It is equivalent to the SQL statement `ALTER SESSION SET SQL_TRACE ...`.

Syntax

```sql
DBMS_SESSION.SET_SQL_TRACE (
    sql_trace boolean);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_trace</td>
<td>TRUE turns tracing on, FALSE turns tracing off</td>
</tr>
</tbody>
</table>

146.4.24 SLEEP Procedure

This procedure suspends the session for a specified period of time.

Syntax

```sql
DBMS_SESSION.SLEEP (
    seconds IN NUMBER);
```
Parameters

Table 146-25  SLEEP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Amount of time, in seconds, to suspend the session. The smallest increment can be entered in hundredths of a second; for example, 1.95 is a legal time value.</td>
</tr>
</tbody>
</table>

146.4.25 SWITCH_CURRENT_CONSUMER_GROUP Procedure

This procedure changes the current resource consumer group of a user's current session.

This lets you switch to a consumer group if you have the switch privilege for that particular group. If the caller is another procedure, then this enables the user to switch to a consumer group for which the owner of that procedure has switch privilege.

Syntax

```sql
DBMS_SESSION.switch_current_consumer_group (  
    new_consumer_group     IN  VARCHAR2,  
    old_consumer_group     OUT VARCHAR2,  
    initial_group_on_error IN  BOOLEAN);
```

Parameters

Table 146-26  SWITCH_CURRENT_CONSUMER_GROUP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_consumer_group</td>
<td>Name of consumer group to which you want to switch</td>
</tr>
<tr>
<td>old_consumer_group</td>
<td>Name of the consumer group from which you just switched out</td>
</tr>
<tr>
<td>initial_group_on_error</td>
<td>If TRUE, then sets the current consumer group of the caller to his/her initial consumer group in the event of an error</td>
</tr>
</tbody>
</table>

Return Values

This procedure outputs the old consumer group of the user in the parameter `old_consumer_group`.

Note:

You can switch back to the old consumer group later using the value returned in `old_consumer_group`.
Exceptions

Table 146-27  SWITCH_CURRENT_CONSUMER_GROUP Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>29368</td>
<td>Non-existent consumer group</td>
</tr>
<tr>
<td>1031</td>
<td>Insufficient privileges</td>
</tr>
<tr>
<td>29396</td>
<td>Cannot switch to OTHER_GROUPS consumer group</td>
</tr>
</tbody>
</table>

Usage Notes

The owner of a procedure must have privileges on the group from which a user was switched \((\text{old\_consumer\_group})\) in order to switch them back. There is one exception: The procedure can always switch the user back to his/her initial consumer group (skipping the privilege check).

By setting \text{initial\_group\_on\_error} to TRUE, \text{SWITCH_CURRENT_CONSUMER_GROUP} puts the current session into the default group, if it can't put it into the group designated by \text{new\_consumer\_group}. The error associated with the attempt to move a session into \text{new\_consumer\_group} is raised, even though the current consumer group has been changed to the initial consumer group.

Examples

```sql
CREATE OR REPLACE PROCEDURE high_priority_task is
    old_group varchar2(30);
    prev_group varchar2(30);
    curr_user varchar2(30);
BEGIN
    -- switch invoker to privileged consumer group. If we fail to do so, an error is thrown, but
    -- the consumer group does not change because 'initial\_group\_on\_error' is set to FALSE
    dbms_session.switch_current_consumer_group('tkgrpl', old_group, FALSE);
    -- set up exception handler (in the event of an error, we do not want to return to caller while
    -- leaving the session still in the privileged group)
    BEGIN
        -- perform some operations while under privileged group
    EXCEPTION
        WHEN OTHERS THEN
            -- It is possible that the procedure owner does not have privileges
            -- on old\_group. 'initial\_group\_on\_error' is set to TRUE to make sure
            -- that the user is moved out of the privileged group in such a situation
            dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
            RAISE;
    END;
    -- we've succeeded. Now switch to old\_group, or if cannot do so, switch -- to caller's initial consumer group
    dbms_session.switch_current_consumer_group(old_group,prev_group,TRUE);
END;
```

Chapter 146

Summary of DBMS_SESSION Subprograms
146.4.26 UNIQUE_SESSION_ID Function

This function returns an identifier that is unique for all sessions currently connected to this database. Multiple calls to this function during the same session always return the same result.

Syntax

DBMS_SESSION.UNIQUE_SESSION_ID
    RETURN VARCHAR2;

Pragmas

pragma restrict_references(unique_session_id,WNDS,RNDS,WNPS);

Return Values

Table 146-28  UNIQUE_SESSION_ID Function Return Values

<table>
<thead>
<tr>
<th>Return</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unique_session_id</td>
<td>Returns up to 24 bytes</td>
</tr>
</tbody>
</table>
The DBMS_SFW_ACL_ADMIN package provides interfaces for administering and managing access control policies for the "database service firewall" feature. Each policy is represented by an access control list (ACL) containing hosts that are allowed access to a specific database service. Local listeners and server processes validate all inbound client connections against the ACL.

This chapter contains the following topics:

- **DBMS_SFW_ACL_ADMIN Security Model**
- **DBMS_SFW_ACL_ADMIN Operational Notes**
- **DBMS_SFW_ACL_ADMIN Examples**
- **Summary of DBMS_SFW_ACL_ADMIN Subprograms**

### 147.1 DBMS_SFW_ACL_ADMIN Security Model

This package is owned by the DBSFWUSER schema. The procedures in this package can be run only by the DBSFWUSER user.

### 147.2 DBMS_SFW_ACL_ADMIN Operational Notes

These operation notes apply to DBMS_SFW_ACL_ADMIN.

- An ACL contains entries, which are called "ace", for "access control entries".
- You add entries to an ACL using the **IP_ADD_ACE Procedure** and **IP_ADD_PDB_ACE Procedure**. After calling these procedures, you call the **COMMIT_ACL Procedure** to send the updated ACL to the listeners. Similarly, if you remove entries from an ACL using the **IP_REMOVE_ACE Procedure**, **IP_REMOVE_ACL Procedure**, **IP_REMOVE_PDB_ACE Procedure**, or **IP_REMOVE_PDB_ACL Procedure**, you need to call the **COMMIT_ACL Procedure** to update the ACL on the listeners.
- Access control must be enabled using the new **FIREWALL** endpoint attribute and the new **LOCAL_REGISTRATION_ADDRESS_listenerName** parameter. The configuration can be done manually in **listener.ora** or through the Server Control Utility (SRVCTL). Refer to the *Oracle Database Net Services Reference* and the *Oracle Real Application Clusters Administration and Deployment Guide* for configuration instructions.
- You can query the **IP_ACL** table to show the committed ACLs. But to see the ACLs that have been sent to the local listeners, you have to query the **V$IP_ACL** or **GV$IP_ACL** view. The **IP_ACL** table can contain ACLs that are not in **V$IP_ACL** because the database services for those ACLs were not running at the time of the commit. When the services are running, you can call the **COMMIT_ACL Procedure** again to send the committed ACLs in the **IP_ACL** table to the local listeners.
In an Oracle RAC environment, `GV$IP_ACL` can be used to query ACLs across the database cluster, and `V$IP_ACL` to query ACLs in the connected instance.

## 147.3 DBMS_SFW_ACL_ADMIN Examples

These three examples show how `DBMS_SFW_ACL_ADMIN` can be used to administer and manage access control policies.

The following example adds three access control entries to the ACL and commits them.

```sql
## Connect to DBSFWUSER
SQL> connect dbsfwuser/Welcome1
Connected.

## Create an ACL for database service SVC1
SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.1');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','192.168.12.2');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_ace('svc1','test02.example.com');
PL/SQL procedure successfully completed.

## Commit the ACLs to the DB ACL table.
## This sends the ACLs for running services to ALL local Listeners
SQL> exec dbms_sfw_acl_admin.commit_acl;
PL/SQL procedure successfully completed.
```

The following example retrieves the ACLs committed from the previous example.

```sql
SQL> select * from ip_acl;
SERVICE_NAME              HOST
-----------------------   -------------------
"SVC1.EXAMPLE.COM"        192.168.12.1
"SVC1.EXAMPLE.COM"        192.168.12.2
"SVC1.EXAMPLE.COM"        TEST02.EXAMPLE.COM

## View ACLs sent to the local Listeners
## NOTE: ACLs are sent ONLY to running services
SQL> select * from v$ip_acl;
SERVICE_NAME              HOST                   CON_ID
----------------------    -----------------      --------
SVC1.EXAMPLE.COM          192.168.12.1           1
SVC1.EXAMPLE.COM          192.168.12.2           1
SVC1.EXAMPLE.COM          TEST02.EXAMPLE.COM     1

The following example adds access control entries for pluggable database “PDB1” using various host formats.

```sql
SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.3');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.0/23');
PL/SQL procedure successfully completed.

SQL> exec dbms_sfw_acl_admin.ip_add_pdb_ace('pdb1','192.168.12.*');
PL/SQL procedure successfully completed.
```
147.4 Summary of DBMS_SFW_ACL_ADMIN Subprograms

This table lists the DBMS_SFW_ACL_ADMIN subprograms and briefly describes them.

Table 147-1   DBMS_SFW_ACL_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMIT_ACL Procedure</td>
<td>Commits changes to the ACL tables, and propagates the changes to the local listeners for database instances.</td>
</tr>
<tr>
<td>IP_ADD_ACE Procedure</td>
<td>Adds an access control entry to the ACL for a database service.</td>
</tr>
<tr>
<td>IP_ADD_PDB_ACE Procedure</td>
<td>Adds an access control entry to the ACL for all the database services in a pluggable database (PDB).</td>
</tr>
<tr>
<td>IP_REMOVE_ACE Procedure</td>
<td>Removes an entry from the ACL for a database service.</td>
</tr>
<tr>
<td>IP_REMOVE_ACL Procedure</td>
<td>Removes all entries from the ACL for a database service.</td>
</tr>
<tr>
<td>IP_REMOVE_PDB_ACE Procedure</td>
<td>Removes an access control entry from the ACL for all the database services in a pluggable database (PDB).</td>
</tr>
<tr>
<td>IP_REMOVE_PDB_ACL Procedure</td>
<td>Removes all entries from the ACL for all the database services in a pluggable database (PDB).</td>
</tr>
</tbody>
</table>

147.4.1 COMMIT_ACL Procedure

This procedure commits changes to the ACL tables. It also propagates the changes to the local listeners for database instances.

If you have changed access entries for database services, but the database services were not running at the time when you called the COMMIT_ACL procedure, then those changes will be committed to the ACL tables, but they will not be sent to the local listener. To send the entries to the listener, start up the database services, and call the COMMIT_ACL procedure again.

This procedure returns when the operation has completed successfully.

Syntax

```
DBMS_SFW_ACL_ADMIN.COMMIT_ACL;
```

Parameters

None
147.4.2 IP_ADD_ACE Procedure

This procedure adds an access control entry to the ACL for a database service.

Syntax

\[
\text{DBMS_SFW_ACL_ADMIN.IP_ADD_ACE (}
\text{\hspace{1cm} p_service_name IN VARCHAR2,}
\text{\hspace{1cm} p_host IN VARCHAR2);}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_service_name</td>
<td>The name of the database service for which you want to add an access control entry.</td>
</tr>
<tr>
<td>p_host</td>
<td>The host of the client that is allowed access to the service. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard &quot;*&quot; for IPv4 and CIDR format are also allowed.</td>
</tr>
</tbody>
</table>

147.4.3 IP_ADD_PDB_ACE Procedure

This procedure adds an access control entry to the ACL for all the database services in a pluggable database (PDB).

Syntax

\[
\text{DBMS_SFW_ACL_ADMIN.IP_ADD_PDB_ACE (}
\text{\hspace{1cm} p_pdb_name IN VARCHAR2,}
\text{\hspace{1cm} p_host IN VARCHAR2);}
\]

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_pdb_name</td>
<td>The name of the PDB.</td>
</tr>
<tr>
<td>p_host</td>
<td>The host of the client that is allowed access to the database services in the PDB. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard &quot;*&quot; for IPv4 and CIDR format are also allowed.</td>
</tr>
</tbody>
</table>

147.4.4 IP_REMOVE_ACE Procedure

This procedure removes an entry from the ACL for a database service.

Syntax

\[
\text{DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACE (}
\text{\hspace{1cm} p_service_name IN VARCHAR2,}
\text{\hspace{1cm} p_host IN VARCHAR2);}
\]
Parameters

Table 147-4  IP_REMOVE_ACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_service_name</td>
<td>The name of the database service from which you want to remove an access</td>
</tr>
<tr>
<td></td>
<td>control entry.</td>
</tr>
<tr>
<td>p_host</td>
<td>The host that you want to remove from the ACL. This value can be a host</td>
</tr>
<tr>
<td></td>
<td>name, an IPv4 address, or an IPv6 address. Wildcard &quot;*&quot; for IPv4 and CIDR</td>
</tr>
<tr>
<td></td>
<td>format are also allowed. This has to match the existing value exactly. You</td>
</tr>
<tr>
<td></td>
<td>can query the IP_ACL table to get the list of entries for a database service.</td>
</tr>
</tbody>
</table>

147.4.5 IP_REMOVE_ACL Procedure

This procedure removes all entries from the ACL for a database service.

Syntax

DBMS_SFW_ACL_ADMIN.IP_REMOVE_ACL (  
    p_service_name  IN  VARCHAR2);  

Parameters

Table 147-5  IP_REMOVE_ACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_service_name</td>
<td>The name of the database service whose ACL you want to clear.</td>
</tr>
</tbody>
</table>

147.4.6 IP_REMOVE_PDB_ACE Procedure

This procedure removes an access control entry from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACE (  
    p_pdb_name IN VARCHAR2,  
    p_host     IN VARCHAR2);  

Parameters

Table 147-6  IP_REMOVE_PDB_ACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>p_pdb_name</td>
<td>The name of the PDB.</td>
</tr>
</tbody>
</table>
Table 147-6  (Cont.) IP_REMOVE_PDB_ACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_host</code></td>
<td>The host that you want to remove from the ACL. This value can be a host name, an IPv4 address, or an IPv6 address. Wildcard &quot;*&quot; for IPv4 and CIDR format are also allowed. This has to match the existing value exactly. You can query the <code>IP_ACL</code> table to get the list of entries for a database service.</td>
</tr>
</tbody>
</table>

147.4.7 IP_REMOVE_PDB_ACL Procedure

This procedure removes all entries from the ACL for all the database services in the specified pluggable database (PDB).

Syntax

```sql
DBMS_SFW_ACL_ADMIN.IP_REMOVE_PDB_ACL ( p_pdb_name  IN  VARCHAR2 );
```

Parameters

Table 147-7  IP_REMOVE_PDB_ACL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>p_pdb_name</code></td>
<td>The name of the PDB.</td>
</tr>
</tbody>
</table>
The DBMS_SODA package is a PL/SQL package implementing Simple Oracle Document Access (SODA). SODA allows you to use the Oracle Database as a NoSQL document store. The core abstraction provided by SODA is that of document collections. The DBMS_SODA package allows you to create, list, and delete document collections from PL/SQL, and to perform CRUD (create, replace, update, delete) operations on documents. All DDL functions are encapsulated within this package.

This chapter contains the following topics:

- DBMS_SODA Security Model
- Summary of DBMS_SODA Subprograms

See Also:
Oracle Database SODA for PL/SQL Developer's Guide

148.1 DBMS_SODA Security Model

This package is available to users with the SODA_APP role.

All SODA types (packages and types) are SYS types. PUBLIC is granted EXECUTE privilege on the DBMS_SODA described in this chapter.

148.2 Summary of DBMS_SODA Subprograms

This table lists the DBMS_SODA subprograms in alphabetical order and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_COLLECTION Function</td>
<td>Creates a collection using the collection name and metadata.</td>
</tr>
<tr>
<td>DROP_COLLECTION Function</td>
<td>Drops an existing collection from the user’s schema. This also removes all the documents in the collection.</td>
</tr>
<tr>
<td>LIST_COLLECTION_NAMES Function</td>
<td>Lists the collection names in the user’s schema as a table of NVARCHAR2.</td>
</tr>
<tr>
<td>OPEN_COLLECTION Function</td>
<td>Opens an existing collection.</td>
</tr>
</tbody>
</table>
148.2.1 CREATE_COLLECTION Function

Creates a collection using the collection name and metadata. Uses the settings specified in the metadata and auto-assigns the ones that are not, and returns the collection object. If the metadata argument is omitted or set to NULL, a collection is created with default metadata. The returned collection is open for read and/or write operations. If a collection already exists, the function just opens and returns the collection object.

Syntax

DBMS_SODA.CREATE_COLLECTION (
    collection_Name      IN NVARCHAR2,
    metadata             IN VARCHAR2 DEFAULT NULL
) RETURN SODA_Collection_T;

Parameters

Table 148-2 CREATE_COLLECTION Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection_Name</td>
<td>The name of the collection. The value of collection_Name is case-sensitive.</td>
</tr>
<tr>
<td>metadata</td>
<td>The metadata of the collection in VARCHAR2 format.</td>
</tr>
</tbody>
</table>

Return Values

The function returns a Soda_Collection_T object representing the collection.

Exceptions

- Descriptor Error—if the input descriptor is invalid
- Error—if an error occurs while creating the collection

See Also:

Oracle Database SODA for PL/SQL Developer's Guide

148.2.2 DROP_COLLECTION Function

Drops an existing collection from the user's schema. This also removes all the documents in the collection.

Syntax

DBMS_SODA.DROP_COLLECTION (
    collection_Name      IN NVARCHAR2
) RETURN NUMBER;
Parameters

Table 148-3  DROP_COLLECTION Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection_Name</td>
<td>The name of the collection. The value of collection_Name is case-sensitive.</td>
</tr>
</tbody>
</table>

Return values

This function returns the following values:

- 1—if the collection was dropped successfully
- 0—if the collection does not exist

Exceptions

If an error occurs while dropping the collection, for example, due to uncommitted writes to the collection or privilege issues.

See Also:

Oracle Database SODA for PL/SQL Developer’s Guide

148.2.3 LIST_COLLECTION_NAMES Function

This function returns a list of collection names in the user’s schema as a table of NVARCHAR2.

Syntax

```
DBMS_SODA.LIST_COLLECTION_NAMES ()
RETURN SODA_CollName_List_T;
```

Return Values

This function returns a list of collection names as a table of NVARCHAR2(255). The collection list is empty if there are no collections in the schema.

Exceptions

Error—if an error occurs while listing the collection names.

See Also:

Oracle Database SODA for PL/SQL Developer’s Guide
148.2.4 OPEN_COLLECTION Function

Opens an existing collection for read and/or write operations.

Syntax

DBMS_SODA.OPEN_COLLECTION (  
collection_Name IN NVARCHAR2)  
RETURN SODA_Collection_T;

Parameters

Table 148-4  OPEN_COLLECTION Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>collection_Name</td>
<td>The name of the collection.</td>
</tr>
<tr>
<td></td>
<td>The value of collection_Name is case-sensitive.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the following values:

- a collection object which is open
- NULL, if the collection does not exist

Exceptions

Error—if an error occurs while creating the collection

149

DBMS_SHARED_POOL

The DBMS_SHARED_POOL package provides access to the shared pool, which is the shared memory area where cursors and PL/SQL objects are stored. DBMS_SHARED_POOL enables you to display the sizes of objects in the shared pool, and mark them for keeping or not-keeping in order to reduce memory fragmentation.

This chapter contains the following topics:

- Overview
- Operational Notes
- Summary of DBMS_SHARED_POOL Subprograms

149.1 DBMS_SHARED_POOL Overview

The procedures provided here may be useful when loading large PL/SQL objects. When large PL/SQL objects are loaded, users response time is affected because of the large number of smaller objects that need to be aged out from the shared pool to make room (due to memory fragmentation). In some cases, there may be insufficient memory to load the large objects.

DBMS_SHARED_POOL is also useful for frequently executed triggers. You may want to keep compiled triggers on frequently used tables in the shared pool.

Additionally, DBMS_SHARED_POOL supports sequences. Sequence numbers are lost when a sequence is aged out of the shared pool. DBMS_SHARED_POOL is useful for keeping sequences in the shared pool and thus preventing the loss of sequence numbers.

149.2 DBMS_SHARED_POOL Operational Notes

To create DBMS_SHARED_POOL, run the DBMSPOOL.SQL script. The PRVTPOOL.PLB script is automatically executed after DBMSPOOL.SQL runs. These scripts are not run by as part of standard database creation.

149.3 Summary of DBMS_SHARED_POOL Subprograms

This table lists the DBMS_SHARED_POOL subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABORTED_REQUEST_THRES HOLD Procedure</td>
<td>Sets the aborted request threshold for the shared pool</td>
</tr>
<tr>
<td>KEEP Procedure</td>
<td>Keeps an object in the shared pool</td>
</tr>
<tr>
<td>MARKHOT Procedure</td>
<td>Marks a library cache object as a hot object</td>
</tr>
</tbody>
</table>
Table 149-1  (Cont.)  $DBMS\_SHARED\_POOL$ Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE Procedure</td>
<td>Purges the named object or specified heap(s) of the object</td>
</tr>
<tr>
<td>SIZES Procedure</td>
<td>Shows objects in the shared pool that are larger than the specified size</td>
</tr>
<tr>
<td>UNKEEP Procedure</td>
<td>Unkeeps the named object</td>
</tr>
<tr>
<td>UNMARKHOT Procedure</td>
<td>Unmarks a library cache object as a hot object</td>
</tr>
</tbody>
</table>

149.3.1 ABORTED_REQUEST_THRESHOLD Procedure

This procedure sets the aborted request threshold for the shared pool.

**Syntax**

```sql
DBMS_SHARED_POOL.ABORTED_REQUEST_THRESHOLD (threshold_size NUMBER);
```

**Parameters**

Table 149-2  ABORTED_REQUEST_THRESHOLD Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>threshold_size</td>
<td>Size, in bytes, of a request which does not try to free unpinned (not &quot;unkeep-ed&quot;) memory within the shared pool. The range of threshold_size is 5000 to ~2 GB inclusive.</td>
</tr>
</tbody>
</table>

**Exceptions**

An exception is raised if the threshold is not in the valid range.

**Usage Notes**

Usually, if a request cannot be satisfied on the free list, then the RDBMS tries to reclaim memory by freeing objects from the LRU list and checking periodically to see if the request can be fulfilled. After finishing this step, the RDBMS has performed a near equivalent of an 'ALTER SYSTEM FLUSH SHARED_POOL'.

Because this impacts all users on the system, this procedure "localizes" the impact to the process failing to find a piece of shared pool memory of size greater than threshold_size. This user gets the 'out of memory' error without attempting to search the LRU list.

149.3.2 KEEP Procedure

This procedure keeps an object in the shared pool. Once an object has been kept in the shared pool, it is not subject to aging out of the pool. This may be useful for
frequently used large objects. When large objects are brought into the shared pool, several objects may need to be aged out to create a contiguous area large enough.

Syntax

```sql
DBMS_SHARED_POOL.KEEP (  
    name         VARCHAR2,  
    flag         CHAR DEFAULT 'P');

DBMS_SHARED_POOL.KEEP (  
    schema         VARCHAR2,  
    objname        VARCHAR2,  
    namespace      NUMBER,  
    heaps          NUMBER,  
    edition_name   VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.KEEP (  
    hash           VARCHAR2,  
    namespace      NUMBER,  
    heaps          NUMBER);
```

Parameters

Table 149-3  KEEP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object to unkeep.</td>
</tr>
<tr>
<td>flag</td>
<td>A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.</td>
</tr>
<tr>
<td>schema</td>
<td>The user name or the schema to which the object belongs to.</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object to keep.</td>
</tr>
<tr>
<td>namespace</td>
<td>A number indicating the library cache namespace in which the object has to be searched for.</td>
</tr>
<tr>
<td>heaps</td>
<td>The heaps to keep. For example, if heap 0 and heap 6 are to be kept.</td>
</tr>
<tr>
<td>edition_name</td>
<td>Denotes the name of the edition that the target object resides in. This parameter is optional.</td>
</tr>
<tr>
<td>hash</td>
<td>A 16-byte hash value for the object.</td>
</tr>
</tbody>
</table>

Exceptions

An exception is raised if the named object is not found.

Usage Notes

There are two kinds of objects:

- PL/SQL objects, triggers, sequences, and types which are specified by name
- SQL cursor objects which are specified by a two-part number (indicating a location in the shared pool).
For example:

```sql
DBMS_SHARED_POOL.KEEP('scott.hispackage')
```

This keeps package HISPACKAGE, owned by SCOTT. The names for PL/SQL objects follow SQL rules for naming objects (for example, delimited identifiers and multibyte names are allowed). A cursor can be kept by `DBMS_SHARED_POOL.KEEP('0034CDFF, 20348871','C')`, 0034CDFF being the ADDRESS and 20348871 the HASH_VALUE. Note that the complete hexadecimal address must be in the first 8 characters.

### 149.3.3 MARKHOT Procedure

This procedure marks a library cache object as a hot object.

#### Syntax

```sql
DBMS_SHARED_POOL.MARKHOT (schema VARCHAR2, objname VARCHAR2, namespace NUMBER DEFAULT 1, global BOOLEAN DEFAULT TRUE, edition_name VARCHAR2 DEFAULT NULL);
```

```sql
DBMS_SHARED_POOL.MARKHOT (hash VARCHAR2, namespace NUMBER DEFAULT 1, global BOOLEAN DEFAULT TRUE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>namespace</td>
<td>Number indicating the library cache namespace in which the object is to be searched. Views, such as USER_OBJECTS and DBA_OBJECTS, reflect the namespace as a number column, as do most dictionary tables such as OBJ$.</td>
</tr>
<tr>
<td>global</td>
<td>If TRUE (default), mark the object hot on all Oracle RAC instances</td>
</tr>
<tr>
<td>hash</td>
<td>16-byte hash value for the object</td>
</tr>
<tr>
<td>edition_name</td>
<td>Denotes the name of the edition that the target object resides in. This parameter is optional.</td>
</tr>
</tbody>
</table>

#### Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input)
Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.

149.3.4 PURGE Procedure

This procedure purges the named object or specified heaps of the object.

Syntax

```sql
DBMS_SHARED_POOL.PURGE (  
    name         VARCHAR2,
    flag         CHAR DEFAULT 'P',
    heaps        NUMBER DEFAULT 1);

DBMS_SHARED_POOL.PURGE (  
    schema       VARCHAR2,
    objname      VARCHAR2,
    namespace    NUMBER,
    heaps        NUMBER,
    edition_name VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.PURGE (  
    hash         VARCHAR2,
    namespace    NUMBER,
    heaps        NUMBER);
```

Parameters

Table 149-5   PURGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of the object to purge. The value for this identifier is the concatenation of the address and hash_value columns from the v$sqlarea view. This is displayed by the SIZES procedure. Currently, TABLE and VIEW objects may not be purged.</td>
</tr>
<tr>
<td>flag</td>
<td>(Optional) If this is not specified, then the package assumes that the first parameter is the name of a package/procedure/function and resolves the name. Set to 'P' or 'p' to fully specify that the input is the name of a package/procedure/function. Set to 'T' or 't' to specify that the input is the name of a type. Set to 'R' or 'r' to specify that the input is the name of a trigger. Set to 'Q' or 'q' to specify that the input is the name of a sequence. In case the first argument is a cursor address and hash-value, the parameter should be set to any character except 'P' or 'p' or 'Q' or 'q' or 'R' or 'r' or 'T' or 't'.</td>
</tr>
</tbody>
</table>
Table 149-5  (Cont.) PURGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>heaps</td>
<td>Heaps to be purged. For example, if heap 0 and heap 6 are to be purged: 1&lt;&lt;0</td>
</tr>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object to purge</td>
</tr>
<tr>
<td>namespace</td>
<td>Parameter is a number indicating the library cache namespace in which the object is to be searched</td>
</tr>
<tr>
<td>hash</td>
<td>16-byte hash value for the object</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition that the target object resides in. This parameter is optional.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-6570: An exception is raised if the named object cannot be found
ORA-6570: An object cannot be purged it marked as permanently kept

Usage Notes

All objects supported by the KEEP Procedure are supported for PURGE.

149.3.5 SIZES Procedure

This procedure shows objects in the shared_pool that are larger than the specified size. The name of the object is also given, which can be used as an argument to either the KEEP or UNKEEP calls.

Syntax

```
DBMS_SHARED_POOL.SIZES (
    minsize NUMBER);
```

Parameters

Table 149-6  SIZES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>minsize</td>
<td>Size, in kilobytes, over which an object must be occupying in the shared pool, in order for it to be displayed.</td>
</tr>
</tbody>
</table>

Usage Notes

Issue the SQLDBA or SQLPLUS 'SET SERVEROUTPUT ON SIZE XXXXX' command prior to using this procedure so that the results are displayed.
149.3.6 UNKEEP Procedure

This procedure unkeeps the named object.

Syntax

DBMS_SHARED_POOL.UNKEEP {
    name VARCHAR2,
    flag CHAR DEFAULT 'P'};

DBMS_SHARED_POOL.UNKEEP {
    schema VARCHAR2,
    objname VARCHAR2,
    namespace NUMBER,
    edition_name VARCHAR2 DEFAULT NULL};

DBMS_SHARED_POOL.UNKEEP {
    hash VARCHAR2,
    namespace NUMBER};

⚠️ WARNING:

This procedure may not be supported in the future if automatic mechanisms are implemented to make this unnecessary.

Parameters

Table 149-7 UNKEEP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the object to unkeep.</td>
</tr>
<tr>
<td>flag</td>
<td>A character string indicating what kind of object to keep the name identifies. The string is not case sensitive. This parameter is optional. If the parameter is not specified, the package assumes that the first parameter is the name of a package/procedure/function and will resolve the name.</td>
</tr>
<tr>
<td>schema</td>
<td>The user name or the schema to which the object belongs to.</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object to unkeep.</td>
</tr>
<tr>
<td>namespace</td>
<td>A number that indicates the library cache namespace in which the object has to be searched for. This parameter is optional.</td>
</tr>
<tr>
<td>edition_name</td>
<td>The name of the edition that the target object resides in. This parameter is optional.</td>
</tr>
<tr>
<td>hash</td>
<td>A 16-byte hash value for the object.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06502: An exception is raised if the named object cannot be found
149.3.7 UNMARKHOT Procedure

This procedure unmarks a library cache object as a hot object.

Syntax

```sql
DBMS_SHARED_POOL.UNMARKHOT (
    schema         VARCHAR2,
    objname        VARCHAR2,
    namespace      NUMBER  DEFAULT 1,
    global         BOOLEAN DEFAULT TRUE,
    edition_name   VARCHAR2 DEFAULT NULL);

DBMS_SHARED_POOL.UNMARKHOT (
    hash          VARCHAR2,
    namespace     NUMBER DEFAULT 1,
    global        BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema</td>
<td>User name or the schema to which the object belongs</td>
</tr>
<tr>
<td>objname</td>
<td>Name of the object</td>
</tr>
<tr>
<td>namespace</td>
<td>Number indicating the library cache namespace in which the object is to be searched</td>
</tr>
<tr>
<td>global</td>
<td>If TRUE, unmark the object hot on all Oracle RAC instances. The default value of this parameter is TRUE.</td>
</tr>
<tr>
<td>hash</td>
<td>A 16-byte hash value for the object</td>
</tr>
<tr>
<td>edition_name</td>
<td>Denotes the name of the edition that the target object resides in. This parameter is optional.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-06502: An exception is raised if the named object cannot be found due to incorrect input

ORA-04043: An exception is raised if the named object cannot be found (bad namespace, or hash input, or non-existent object)

Usage Notes

If a package or type's specification is marked hot or unhot, then the corresponding package or type body will be implicitly marked as hot or unhot.
The `DBMS_SPACE` package enables you to analyze segment growth and space requirements.

This chapter contains the following topics:

- Security Model
- Data Structures
- Summary of DBMS_SPACE Subprograms

### 150.1 DBMS_SPACE Security Model

This package runs with `SYS` privileges. The execution privilege is granted to `PUBLIC`. Subprograms in this package run under the caller security. The user must have `ANALYZE` privilege on the object.

### 150.2 DBMS_SPACE Data Structures

The `DBMS_SPACE` package defines an `OBJECT` type, a `RECORD` type, and a `TABLE` type.

**OBJECT Types**

`CREATE_TABLE_COST_COLINFO` Object Type

**RECORD Types**

`ASA_RECO_ROW` Record Type

**TABLE Types**

`ASA_RECO_ROW_TB` Table Type

### 150.2.1 DBMS_SPACE CREATE_TABLE_COST_COLINFO Object Type

This type describes the datatype and size of a column in the table.

**Syntax**

```plaintext
TYPE create_table_cost_colinfo IS OBJECT{
  col_type    VARCHAR(200),
  col_size    NUMBER)
```
Table 150-1 CREATE_TABLE_COST_COLINFO Object Type

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

150.2.2 DBMS_SPACE ASA_RECO_ROW Record Type

This type contains the column type of individual columns returned by the ASA_RECOMMENDATIONS Function.

Syntax

```
TYPE asa_reco_row IS RECORD (
    tablespace_name       VARCHAR2(30),
    segment_owner         VARCHAR2(30),
    segment_name          VARCHAR2(30),
    segment_type          VARCHAR2(18),
    partition_name        VARCHAR2(30),
    allocated_space       NUMBER,
    used_space            NUMBER,
    reclaimable_space     NUMBER,
    chain_rowexcess       NUMBER,
    recommendations       VARCHAR2(1000),
    c1                    VARCHAR2(1000),
    c2                    VARCHAR2(1000),
    c3                    VARCHAR2(1000),
    task_id               NUMBER,
    msg_id                NUMBER);
```

Attributes

Table 150-2 ASA_RECO_ROW Attributes

</tr>
</tbody>
</table>
150.3.1 DBMS_SPACE ASA_RECOMMENDATIONS Function

This function returns recommendations using the stored results of the auto segment advisor. This function returns results from the latest run on any given object.

Syntax

```sql
DBMS_SPACE.ASA_RECOMMENDATIONS (
    all_runs        IN    VARCHAR2 DEFAULT := TRUE,
    show_manual     IN    VARCHAR2 DEFAULT := TRUE,
    show_findings   IN    VARCHAR2 DEFAULT := FALSE)
RETURN ASA_RECO_ROW_TB PIPELINED;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all_runs</td>
<td>If TRUE, returns recommendations/findings for all runs of auto segment advisor. If FALSE, returns the results of the LATEST run only. LATEST does not make sense for manual invocation of segment advisor. This is applicable only for auto advisor.</td>
</tr>
<tr>
<td>show_manual</td>
<td>If TRUE, we show the results of manual invocations only. The auto advisor results are excluded. If FALSE, results of manual invocation of segment advisor are not returned.</td>
</tr>
<tr>
<td>show_findings</td>
<td>Show only the findings instead of the recommendations</td>
</tr>
</tbody>
</table>

150.3.2 CREATE_INDEX_COST Procedure

This procedure determines the cost of creating an index on an existing table. The input is the DDL statement that will be used to create the index. The procedure will output the storage required to create the index.

Syntax

```sql
DBMS_SPACE.CREATE_INDEX_COST (
    ddl             IN    VARCHAR2,
    used_bytes      OUT   NUMBER,
    alloc_bytes     OUT   NUMBER,
    plan_table      IN    VARCHAR2 DEFAULT NULL);
```

Pragmas

```sql
pragma restrict_references(create_index_cost,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ddl</td>
<td>The create index DDL statement</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The number of bytes representing the actual index data</td>
</tr>
</tbody>
</table>
### Table 150-5  (Cont.) CREATE_INDEX_COST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alloc_bytes</td>
<td>Size of the index when created in the tablespace</td>
</tr>
<tr>
<td>plan_table</td>
<td>Which plan table to use, default NULL</td>
</tr>
</tbody>
</table>

#### Usage Notes
- The table on which the index is created must already exist.
- The computation of the index size depends on statistics gathered on the segment.
- It is imperative that the table must have been analyzed recently.
- In the absence of correct statistics, the results may be inaccurate, although the procedure will not raise any errors.

### 150.3.3 CREATE_TABLE_COST Procedures

This procedure is used in capacity planning to determine the size of the table given various attributes. The size of the object can vary widely based on the tablespace storage attributes, tablespace block size, and so on. There are two overloads of this procedure.

- The first version takes the column information of the table as argument and outputs the table size.
- The second version takes the average row size of the table as argument and outputs the table size.

This procedure can be used on tablespace of dictionary managed and locally managed extent management as well as manual and auto segment space management.

#### Syntax

```sql
DBMS_SPACE.CREATE_TABLE_COST (    
  tablespace_name    IN VARCHAR2,    
  avg_row_size       IN NUMBER,    
  row_count          IN NUMBER,    
  pct_free           IN NUMBER,    
  used_bytes         OUT NUMBER,    
  alloc_bytes        OUT NUMBER);  

DBMS_SPACE.CREATE_TABLE_COST (    
  tablespace_name    IN VARCHAR2,    
  colinfos           IN CREATE_TABLE_COST_COLUMNS,    
  row_count          IN NUMBER,    
  pct_free           IN NUMBER,    
  used_bytes         OUT NUMBER,    
  alloc_bytes        OUT NUMBER);  

CREATE TYPE create_table_cost_colinfo IS OBJECT (    
  COL_TYPE   VARCHAR(200),    
  COL_SIZE   NUMBER);  
```
Parameters

Table 150-6  CREATE_TABLE_COST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>The tablespace in which the object will be created. The default is SYSTEM</td>
</tr>
<tr>
<td>avg_row_size</td>
<td>The anticipated average row size in the table</td>
</tr>
<tr>
<td>colinfos</td>
<td>The description of the columns</td>
</tr>
<tr>
<td>row_count</td>
<td>The anticipated number of rows in the table</td>
</tr>
<tr>
<td>pct_free</td>
<td>The percentage of free space in each block for future expansion of existing</td>
</tr>
<tr>
<td></td>
<td>rows due to updates</td>
</tr>
<tr>
<td>used_bytes</td>
<td>The space used by user data</td>
</tr>
<tr>
<td>alloc_bytes</td>
<td>The size of the object taking into account the tablespace extent characteristics</td>
</tr>
</tbody>
</table>

Usage Notes

- The `used_bytes` represent the actual bytes used by the data. This includes the overhead due to the block metadata, pctfree etc.
- The `alloc_bytes` represent the size of the table when it is created in the tablespace. This takes into account, the size of the extents in the tablespace and tablespace extent management properties.

Examples

```sql
-- review the parameters
SELECT argument_name, data_type, type_owner, type_name
FROM all_arguments
WHERE object_name = 'CREATE_TABLE_COST'
AND overload = 2

-- examine the input parameter type
SELECT text
FROM dba_source
WHERE name = 'CREATE_TABLE_COST_COLUMNS';

-- drill down further into the input parameter type
SELECT text
FROM dba_source
WHERE name = 'create_table_cost_colinfo';

set serveroutput on

DECLARE
  ub NUMBER;
  ab NUMBER;
  cl sys.create_table_cost_columns;
BEGIN
  cl := sys.create_table_cost_columns( sys.create_table_cost_colinfo('NUMBER',10),
                                         sys.create_table_cost_colinfo('VARCHAR2',30),
                                         sys.create_table_cost_colinfo('VARCHAR2',30),
                                         sys.create_table_cost_colinfo('DATE',NULL));
```
150.3.4 FREE_BLOCKS Procedure

This procedure returns information about free blocks in an object (table, index, or cluster).

See SPACE_USAGE Procedures for returning free block information in an auto segment space managed segment.

Syntax

```
DBMS_SPACE.FREE_BLOCKS (
    segment_owner     IN  VARCHAR2,
    segment_name      IN  VARCHAR2,
    segment_type      IN  VARCHAR2,
    freelist_group_id IN  NUMBER,
    free_blks         OUT NUMBER,
    scan_limit        IN  NUMBER DEFAULT NULL,
    partition_name    IN  VARCHAR2 DEFAULT NULL);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_type</td>
<td>Type of the segment to be analyzed (TABLE, INDEX, or CLUSTER):</td>
</tr>
<tr>
<td>freelist_group_id</td>
<td>Freelist group (instance) whose free list size is to be computed</td>
</tr>
<tr>
<td>free_blks</td>
<td>Returns count of free blocks for the specified group</td>
</tr>
<tr>
<td>scan_limit</td>
<td>Maximum number of free list blocks to read (optional). Use a scan limit of X</td>
</tr>
<tr>
<td>partition_name</td>
<td>Use a scan limit of X you are interested only in the question, &quot;Do I have X</td>
</tr>
</tbody>
</table>

- TABLE
- TABLE PARTITION
- TABLE SUBPARTITION
- INDEX
- INDEX PARTITION
- INDEX SUBPARTITION
- CLUSTER
- LOB
- LOB PARTITION
- LOB SUBPARTITION
Table 150-7  (Cont.) FREE_BLOCKS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition_name</td>
<td>Partition name of the segment to be analyzed. This is only used for partitioned tables. The name of subpartition should be used when partitioning is composite.</td>
</tr>
</tbody>
</table>

Examples

The following uses the CLUS cluster in SCOTT schema with 4 freelist groups. It returns the number of blocks in freelist group 3 in CLUS.

```
DBMS_SPACE.FREE_BLOCKS('SCOTT', 'CLUS', 'CLUSTER', 3, :free_blocks);
```

Note:

An error is raised if scan_limit is not a positive number.

150.3.5 ISDATAFILEDROPPABLE_NAME Procedure

This procedure checks whether a datafile is droppable. This procedure may be called before actually dropping the file.

Syntax

```
DBMS_SPACE.ISDATAFILEDROPPABLE_NAME (filename     IN     VARCHAR2,
                                      value        OUT    NUMBER);
```

Pragmas

```
pragma restrict_references(free_blocks,WNDS);
```

Parameters

Table 150-8  ISDATAFILEDROPPABLE_NAME Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Name of the file</td>
</tr>
<tr>
<td>value</td>
<td>Values: 0 if the file is not droppable, 1 if the file is droppable.</td>
</tr>
</tbody>
</table>

Examples

```
DECLARE   fname    VARCHAR2(100);   retval   NUMBER;BEGIN   SELECT file_name   INTO   fname   FROM dba_data_files   WHERE file_name like '%empty%';DBMS_SPACE.ISDATAFILEDROPPABLE_NAME(fname,retval);DBMS_OUTPUT.PUT_LINE(retval);END;/
```
150.3.6 OBJECT_DEPENDENT_SEGMENTS Function

This table function, given an object, returns the list of segments that are associated with the object.

Syntax

```
DBMS_SPACE.OBJECT_DEPENDENT_SEGMENTS(
    objowner    IN     VARCHAR2,
    objname     IN     VARCHAR2,
    partname    IN     VARCHAR2,
    objtype     IN     NUMBER)
RETURN dependent_segments_table PIPELINED;
```

Parameters

Table 150-9  OBJECT_DEPENDENT_SEGMENTS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objowner</td>
<td>The schema containing the object</td>
</tr>
<tr>
<td>objname</td>
<td>The name of the object</td>
</tr>
<tr>
<td>partname</td>
<td>The name of the partition</td>
</tr>
<tr>
<td>objtype</td>
<td>Type of the object:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_TABLE constant positive := 1;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_NESTED_TABLE constant positive := 2;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_INDEX constant positive := 3;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_CLUSTER constant positive := 4;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_TABLE_PARTITION constant positive := 7;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_INDEX_PARTITION constant positive := 8;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_TABLE_SUBPARTITION constant positive := 9;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_INDEX_SUBPARTITION constant positive := 10;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_MV constant positive := 13;</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_TYPE_MVLOG constant positive := 14;</td>
</tr>
</tbody>
</table>

Return Values

The content of one row of a dependent_segments_table:

```
TYPE object_dependent_segment IS RECORD {
    segment_owner   VARCHAR2(100),
    segment_name    VARCHAR2(100),
    segment_type    VARCHAR2(100),
    tablespace_name VARCHAR2(100),
    partition_name  VARCHAR2(100),
    lob_column_name VARCHAR2(100));
```

Table 150-10  OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>The schema containing the segment</td>
</tr>
</tbody>
</table>
Table 150-10  (Cont.) OBJECT_DEPENDENT_SEGMENT Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_name</td>
<td>The name of the segment</td>
</tr>
<tr>
<td>segment_type</td>
<td>The type of the segment, such as table, index or LOB</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The name of the tablespace</td>
</tr>
<tr>
<td>partition_name</td>
<td>The name of the partition, if any</td>
</tr>
<tr>
<td>lob_column_name</td>
<td>The name of the LOB column, if any</td>
</tr>
</tbody>
</table>

150.3.7 OBJECT_GROWTH_TREND Function

This is a table function. The output is one or more rows where each row describes the space usage of the object at a specific point in time.

Either the space usage totals will be retrieved from Automatic Workload Repository Facilities (AWRF), or the current space usage will be computed and combined with space usage deltas retrieved from AWRF.

Syntax

```sql
DBMS_SPACE.OBJECT_GROWTH_TREND (    object_owner           IN    VARCHAR2,
object_name            IN    VARCHAR2,
object_type            IN    VARCHAR2,
partition_name         IN    VARCHAR2 DEFAULT NULL,
start_time             IN    TIMESTAMP DEFAULT NULL,
end_time               IN    TIMESTAMP DEFAULT NULL,
interval               IN    DSINTERVAL_UNCONSTRAINED DEFAULT NULL,
skip_interpolated      IN    VARCHAR2 DEFAULT 'FALSE',
timeout_seconds        IN    NUMBER DEFAULT NULL,
single_datapoint_flag  IN    VARCHAR2 DEFAULT 'TRUE')
RETURN object_growth_trend_table PIPELINED;
```

Parameters

Table 150-11  OBJECT_GROWTH_TREND Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_owner</td>
<td>The schema containing the object</td>
</tr>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>single_data_point_flag</td>
<td>Whether in the absence of statistics the segment should be sampled</td>
</tr>
</tbody>
</table>

Return Values

The `object_growth_trend_row` and `object_growth_trend_table` are used by the `OBJECT_GROWTH_TREND` table function to describe its output.

```sql
TYPE object_growth_trend_row IS RECORD(
    timepoint    TIMESTAMP,
    space_usage  NUMBER,
    space_alloc  NUMBER,
    quality      VARCHAR(20));
```

Table 150-12 OBJECT_GROWTH_TREND_ROW Type Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timepoint</td>
<td>The time at which the statistic was recorded</td>
</tr>
<tr>
<td>space_usage</td>
<td>The space used by data</td>
</tr>
<tr>
<td>space_alloc</td>
<td>The size of the segment including overhead and unused space</td>
</tr>
<tr>
<td>quality</td>
<td>The quality of result: &quot;GOOD&quot;, &quot;INTERPOLATED&quot;, &quot;PROJECTION&quot;</td>
</tr>
</tbody>
</table>

```sql
TYPE object_growth_trend_table IS TABLE OF object_growth_trend_row;
```

150.3.8 SPACE_USAGE Procedures

This procedure has two variations to show space usage.

The first form of the procedure shows the space usage of data blocks under the segment High Water Mark. You can calculate usage for LOBS, LOB PARTITIONS and LOB SUBPARTITIONS. This procedure can only be used on tablespaces that are created with auto segment space management. The bitmap blocks, segment header, and extent map blocks are not accounted for by this procedure. Note that this overload cannot be used on SECUREFILE LOBS.

![Note:](image)

For LOB segments, the number of blocks that is returned from `full_blocks` and `unformatted_blocks` is actually the number of chunks for the LOB segment.

The second form of the procedure returns information about SECUREFILE LOB space usage. It will return the amount of space in blocks being used by all the SECUREFILE LOBS in the LOB segment. The procedure displays the space actively used by the LOB column, freed space that has retention expired, and freed space that has retention unexpired. Note that this overload can be used only on SECUREFILE LOBS.
Syntax

DBMS_SPACE.SPACE_USAGE(
    segment_owner           IN  VARCHAR2,
    segment_name            IN  VARCHAR2,
    segment_type            IN  VARCHAR2,
    unformatted_blocks      OUT NUMBER,
    unformatted_bytes       OUT NUMBER,
    fs1_blocks              OUT NUMBER,
    fs1_bytes               OUT NUMBER,
    fs2_blocks              OUT NUMBER,
    fs2_bytes               OUT NUMBER,
    fs3_blocks              OUT NUMBER,
    fs3_bytes               OUT NUMBER,
    fs4_blocks              OUT NUMBER,
    fs4_bytes               OUT NUMBER,
    full_blocks             OUT NUMBER,
    full_bytes              OUT NUMBER,
    partition_name          IN  VARCHAR2 DEFAULT NULL);

DBMS_SPACE.SPACE_USAGE(
    segment_owner           IN    VARCHAR2,
    segment_name            IN    VARCHAR2,
    segment_type            IN    VARCHAR2,
    segment_size_blocks     OUT   NUMBER,
    segment_size_bytes      OUT   NUMBER,
    used_blocks             OUT   NUMBER,
    used_bytes              OUT   NUMBER,
    expired_blocks          OUT   NUMBER,
    expired_bytes           OUT   NUMBER,
    unexpired_blocks        OUT   NUMBER,
    unexpired_bytes         OUT   NUMBER,
    partition_name          IN    VARCHAR2 DEFAULT NULL);

</tr>
</tbody>
</table>

### Examples

```sql
variable unf number;
variable unfb number;
variable fs1 number;
variable fs1b number;
variable fs2 number;
variable fs2b number;
variable fs3 number;
variable fs3b number;
variable fs4 number;
variable fs4b number;
variable full number;
variable fullb number;

begin
  dbms_space.space_usage('U1','T',
```
150.3.9 UNUSED_SPACE Procedure

This procedure returns information about unused space in an object (table, index, or cluster).

Syntax

DBMS_SPACE.UNUSED_SPACE |
| segment_owner | IN VARCHAR2, |
| segment_name | IN VARCHAR2, |
| segment_type | IN VARCHAR2, |
| total_blocks | OUT NUMBER, |
| total_bytes | OUT NUMBER, |
| unused_blocks | OUT NUMBER, |
| unused_bytes | OUT NUMBER, |
| last_used_extent_file_id | OUT NUMBER, |
| last_used_extent_block_id | OUT NUMBER, |
| last_used_block | OUT NUMBER, |
| partition_name | IN VARCHAR2 DEFAULT NULL); |

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema name of the segment to be analyzed</td>
</tr>
<tr>
<td>segment_name</td>
<td>Segment name of the segment to be analyzed</td>
</tr>
</tbody>
</table>
### Table 150-14 (Cont.) UNUSED_SPACE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>

<td>Returns number of blocks which are not used</td>
</tr>
<tr>
<td><strong>unused_bytes</strong></td>
<td>Returns, in bytes, number of blocks which are not used</td>
</tr>
<tr>
<td><strong>last_used_extent_file_id</strong></td>
<td>Returns the file ID of the last extent which contains data</td>
</tr>
<tr>
<td><strong>last_used_extent_block_id</strong></td>
<td>Returns the starting block ID of the last extent which contains data</td>
</tr>
<tr>
<td><strong>last_used_block</strong></td>
<td>Returns the last block within this extent which contains data</td>
</tr>
<tr>
<td><strong>partition_name</strong></td>
<td>Partition name of the segment to be analyzed. This is only used for partitioned tables; the name of subpartition should be used when partitioning is compose.</td>
</tr>
</tbody>
</table>

### Examples

The following declares the necessary bind variables and executes.

```sql
DBMS_SPACE.UNUSED_SPACE('SCOTT', 'EMP', 'TABLE', :total_blocks, :total_bytes, :unused_blocks, :unused_bytes, :lastextf, :lastexth, :lastusedblock);
```
DBMS_SPACE_ADMIN

The DBMS_SPACE_ADMIN package provides functionality for locally managed tablespaces.

This chapter contains the following topics:

• Security Model
• Constants
• Operational Notes
• Summary of DBMS_SPACE_ADMIN Subprograms

See Also:
Oracle Database Administrator's Guide for an example and description of using DBMS_SPACE_ADMIN.

151.1 DBMS_SPACE_ADMIN Security Model

This package runs with SYS privileges; therefore, any user who has privilege to execute the package can manipulate the bitmaps.

151.2 DBMS_SPACE_ADMIN Constants

The DBMS_SPACE_ADMIN package provides constants that can be used for specifying parameter values.

Table 151-1  DBMS_SPACE_ADMIN Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_VERIFY_EXTENTS</td>
<td>POSITIVE</td>
<td>1</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_EXTENTS_GLOBAL</td>
<td>POSITIVE</td>
<td>2</td>
<td>Verifies that the space owned by segment is appropriately reflected in the bitmap as used and that no other segment claims any of this space to be used by it</td>
</tr>
<tr>
<td>SEGMENT_MARK_CORRUPT</td>
<td>POSITIVE</td>
<td>3</td>
<td>Marks a temporary segment as corrupt whereby facilitating its elimination from the dictionary (without space reclamation)</td>
</tr>
<tr>
<td>Constant</td>
<td>Type</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------</td>
<td>---------</td>
<td>-------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SEGMENT_MARK_VALID</td>
<td>POSITIVE</td>
<td>4</td>
<td>Marks a corrupt temporary segment as valid. It is useful when the corruption in the segment extent map or elsewhere has been resolved and the segment can be dropped normally.</td>
</tr>
<tr>
<td>SEGMENT_DUMP_EXTENT_MAP</td>
<td>POSITIVE</td>
<td>5</td>
<td>Dumps the extent map for a given segment</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY_BITMAP</td>
<td>POSITIVE</td>
<td>6</td>
<td>Verifies the bitmap of the tablespace with extent maps of the segments in that tablespace to make sure everything is consistent.</td>
</tr>
<tr>
<td>TABLESPACE_EXTENT_MAKE_FREE</td>
<td>POSITIVE</td>
<td>7</td>
<td>Marks the block range (extent) as free in the bitmaps</td>
</tr>
<tr>
<td>TABLESPACE_EXTENT_MAKE_USED</td>
<td>POSITIVE</td>
<td>8</td>
<td>Marks the block range (extent) as used in the bitmaps</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_BASIC</td>
<td>POSITIVE</td>
<td>9</td>
<td>Performs the basic metadata checks</td>
</tr>
<tr>
<td>SEGMENT_VERIFY_DEEP</td>
<td>POSITIVE</td>

<td>POSITIVE</td>
<td>13</td>
<td>Checks integrity among L1, L2 and L3 BMBs (Bit Map Blocks)</td>
</tr>
<tr>
<td>SEG_DICT_CHECK</td>
<td>POSITIVE</td>
<td>14</td>
<td>Checks consistency of segment header with corresponding SEG entry</td>
</tr>
<tr>
<td>EXTENT_TS_BITMAP_CHECK</td>
<td>POSITIVE</td>
<td>15</td>
<td>Checks whether the tablespace bitmaps corresponding to the extent map are marked used</td>
</tr>
<tr>
<td>DB_BACKPOINTER_CHECK</td>
<td>POSITIVE</td>
<td>16</td>
<td>Checks whether the L1 BMBs, L2 BMBs, L3 BMBs and data blocks point to the same parent segment</td>
</tr>
<tr>
<td>EXTENT_SEGMENT_BITMAP_CHECK</td>
<td>POSITIVE</td>
<td>17</td>
<td>Checks whether the bitmap blocks are consistent with the extent map</td>
</tr>
<tr>
<td>BITMAPS_CHECK</td>
<td>POSITIVE</td>
<td>18</td>
<td>Checks from the datablocks that the bitmap states representing the blocks are consistent</td>
</tr>
<tr>
<td>TS_VERIFY_BITMAPS</td>
<td>POSITIVE</td>
<td>19</td>
<td>Checks whether the tablespace bitmaps are consistent with the extents belonging to that tablespace</td>
</tr>
<tr>
<td>TS_VERIFY_DEEP</td>
<td>POSITIVE</td>
<td>20</td>
<td>Performs TS_VERIFY_BITMAPS and TS_VERIFY_SEGMENTS with DEEP option</td>
</tr>
</tbody>
</table>
### 151.3 DBMS_SPACE_ADMIN Operational Notes

Before migrating the `SYSTEM` tablespace, certain conditions must be met. These conditions are enforced by the `TABLESPACE_MIGRATE_TO_LOCAL` procedure, except for the cold backup.

- The database must have a default temporary tablespace that is not `SYSTEM`.
- Dictionary-managed tablespaces cannot have any rollback segments.
- A locally managed tablespace must have at least one online rollback segment. If you are using automatic undo management, then an undo tablespace must be online.
- All tablespaces—except the tablespace containing the rollback segment or the undo tablespace—must be read-only.
- You must have a cold backup of the database.
- The system must be in restricted mode.

### 151.4 Summary of DBMS_SPACE_ADMIN Subprograms

This table lists the `DBMS_SPACE_ADMIN` subprograms and briefly describes them.

#### Table 151-2  DBMS_SPACE_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ASSM_SEGMENT_VERIFY</code> Procedure</td>
<td>Verifies segments created in ASSM (Automatic Segment-Space Management) tablespaces</td>

<tr>
<td><code>ASSM_TABLESPACE_VERIFY</code> Procedure</td>
<td>Verifies ASSM tablespaces</td>
</tr>
<tr>
<td><code>DROP_EMPTY_SEGMENTS</code> Procedure</td>
<td>Drops segments from empty tables or table fragments and dependent objects</td>
</tr>
<tr>
<td><code>GET_SEGADV_ATTRIB</code> Procedure</td>
<td>Returns the values of attributes of <code>DBMS_SPACE_ADMIN</code> package</td>
</tr>
<tr>
<td><code>MATERIALIZE_DEFERRED_SEGMENTS</code> Procedure</td>
<td>Materializes segments for tables and table fragments with deferred segment creation and their dependent objects</td>
</tr>
<tr>
<td><code>SEGMENT_CORRUPT</code> Procedure</td>
<td>Marks the segment corrupt or valid so that appropriate error recovery can be done</td>
</tr>
</tbody>
</table>
Table 151-2  (Cont.) DBMS_SPACE_ADMIN Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SEGMENT_DROP_CORRUPT Procedure</td>
<td>Drops a segment currently marked corrupt (without reclaiming space)</td>
</tr>
<tr>
<td>SEGMENT_DUMP Procedure</td>
<td>Dumps the segment header and extent maps of a given segment</td>
</tr>
<tr>
<td>SEGMENT_VERIFY Procedure</td>
<td>Verifies the consistency of the extent map of the segment</td>
</tr>
<tr>
<td>SET_SEGADV_ATTRIB Procedure</td>
<td>Sets/changes the values of attributes of DBMS_SPACE_ADMIN package</td>
</tr>
<tr>
<td>TABLESPACE_FIX_BITMAPS Procedure</td>
<td>Marks the appropriate block range (extent) as free or used in bitmap</td>
</tr>
<tr>
<td>TABLESPACE_FIX_SEGMENT_STATES Procedure</td>
<td>Fixes the state of the segments in a tablespace in which migration was aborted</td>
</tr>
<tr>
<td>TABLESPACE_MIGRATE_FROM_LOCAL Procedure</td>
<td>Migrates a locally managed tablespace to dictionary-managed tablespace</td>
</tr>
<tr>
<td>TABLESPACE_MIGRATE_TO_LOCAL Procedure</td>
<td>Migrates a tablespace from dictionary-managed format to locally managed format</td>
</tr>
<tr>
<td>TABLESPACE_REBUILD_BITMAPS Procedure</td>
<td>Rebuilds the appropriate bitmaps</td>
</tr>
<tr>
<td>TABLESPACE_REBUILD QUOTAS Procedure</td>
<td>Rebuilds quotas for given tablespace</td>
</tr>
<tr>
<td>TABLESPACE_RELOCATE_BITMAPS Procedure</td>
<td>Relocates the bitmaps to the destination specified</td>
</tr>
<tr>
<td>TABLESPACE_VERIFY Procedure</td>
<td>Verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized</td>
</tr>
</tbody>
</table>

151.4.1 ASSM_SEGMENT_VERIFY Procedure

Given a segment definition, the procedure verifies the basic consistency of the space metadata blocks as well as consistency between space metadata and segment data blocks. This procedure verifies segments created in Automatic Segment Space Management (ASSM) tablespaces.

There is however a difference between basic verification and deep verification:

- Basic verification involves consistency checks of space metadata, such as integrity among level 1, level 2, level 3 bitmap blocks, consistency of segment extent map and level 1 bitmap ranges.
- Deep verification involves consistency checks between datablocks and space metadata blocks such as whether the datablocks point correctly to the parent level 1 bitmap blocks, and whether the freeness states in the datablocks are consistent with the freeness states of bits in level 1 bitmap blocks corresponding to the datablocks.

Syntax

```
DBMS_SPACE_ADMIN.ASSM_SEGMENT_VERIFY (    
    segment_owner   IN VARCHAR2,    
    segment_name    IN VARCHAR2,    
    segment_type    IN VARCHAR2,   
);```
partition_name IN VARCHAR2,
verify_option IN POSITIVE DEFAULT SEGMENT_VERIFY_BASIC,
attrib IN POSITIVE DEFAULT NULL);

Parameters

Table 151-3 ASSM_SEGMENT_VERIFY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>segment_owner</td>
<td>Schema that owns the segment</td>
</tr>
<tr>
<td>segment_name</td>
<td>Name of the segment to be verified</td>
</tr>
<tr>
<td>segment_type</td>
<td>Segment namespace is one of TABLE, TABLE PARTITION, TABLE SUBPARTITION, INDEX, INDEX PARTITION, INDEX SUBPARTITION, LOB, LOB PARTITION, LOB SUBPARTITION, CLUSTER</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of the partition or subpartition</td>
</tr>
<tr>
<td>verify_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td>attrib</td>
<td>When option SEGMENT_VERIFY_SPECIFIC is specified as option, attrib can be one of the following:</td>
</tr>
</tbody>
</table>

Usage Notes

- Using this procedure requires SYSDBA privileges.
- You can determine the relative file # and header block # (header_relative_file and header_block parameters) by querying DBA_SEGMENTS.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

151.4.2 ASSM_TABLESPACE_VERIFY Procedure

This procedures verifies all the segments created in an ASSM tablespace. The verification for each segment performs basic consistency checks of the space
metadata blocks as well as consistency checks between space metadata and segment data blocks.

Syntax

```sql
DBMS_SPACE_ADMIN.ASSM_TABLESPACE_VERIFY (
    tablespace_name   IN VARCHAR2,
    ts_option         IN POSITIVE,
    segment_option    IN POSITIVE DEFAULT NULL);
```

Parameters

**Table 151-4 ASSM_TABLESPACE_VERIFY Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to verify. The tablespace must be an ASSM tablespace.</td>
</tr>
</tbody>
</table>
| ts_option          | • TS_VERIFY_BITMAPS := 19. The bitmaps are verified against the extents. This detects bits that are marked used or free wrongly and detects multiple allocation of extents. The file metadata is validated against file$ and control file.  
                      • TS_VERIFY_DEEP := 20. This option is used to verify the file bitmaps as well perform checks on all the segments.  
                      • TS_VERIFY_SEGMENTS := 21. This option is used to invoke SEGMENT_VERIFY on all the segments in the tablespace. Optionally you can write a script that queries all the segments in the tablespace and invoke SEGMENT_VERIFY. |
| segment_option     | When TS_VERIFY_SEGMENTS is specified, segment_option can be one of the following:  
                      • SEGMENT_VERIFY_BASIC := 9  
                      • SEGMENT_VERIFY_DEEP := 10  
                      The value of segment_option is NULL when TS_VERIFY_DEEP or TS_VERIFY_BITMAPS is specified. |

Usage Notes

- Using this procedure requires SYSDBA privileges.
- This procedure outputs a dump file named sid_ora_process_ID.trc to the location specified in the USER_DUMP_DEST initialization parameter.

151.4.3 DROP_EMPTY_SEGMENTS Procedure

This procedures drops segments from empty tables or table fragments and dependent objects.

Syntax

```sql
DBMS_SPACE_ADMIN.DROP_EMPTY_SEGMENTS (  
    schema_name       IN   VARCHAR2 DEFAULT NULL,  
    table_name        IN   VARCHAR2 DEFAULT NULL,  
    partition_name    IN   VARCHAR2 DEFAULT NULL);
```
Parameters

Table 151-5 DROP_EMPTY_SEGMENTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the table or any of its fragments are found to be empty, and the table satisfies certain criteria (restrictions being the same as those described in “Restrictions on Deferred Segment Creation”), then the empty table fragment and associated index segments are dropped along with the corresponding LOB data and index segments. A subsequent insert creates segments with the same properties.

Optionally:

- No schema_name is specified, in which case tables belonging to all schemas are scanned.
- Both schema_name and table_name are specified to perform the operation on a specified table.
- All three arguments are supplied, restricting the operation to the partition and its dependent objects.

151.4.4 GET_SEGADV_ATTRIB Procedure

This procedure returns the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

```sql
DBMS_SPACE_ADMIN.GET_SEGADV_ATTRIB(
    attribute  IN  NUMBER,
    value      OUT NUMBER);
```

Parameters

Table 151-6 GET_SEGADV_ATTRIB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>Supported attributes:</td>
</tr>
<tr>
<td></td>
<td>• COMP_ADVISOR — Provides an option to enable or disable Compression Advisor for Automatic Segment Advisor. By default Compression Advisor is enabled for Automatic Segment Advisor.</td>
</tr>
<tr>
<td></td>
<td>• COMP_LOB — Provides an option to enable or disable Compression Advisor for the tables with LOB columns while Automatic Segment Advisor is running. By default Compression Advisor is enabled for tables with LOB columns.</td>
</tr>
</tbody>
</table>
Table 151-6 (Cont.) GET_SEGADV_ATTRIB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Supported values:</td>
</tr>
<tr>
<td></td>
<td>• ATTR_ENABLE : 1</td>
</tr>
<tr>
<td></td>
<td>• ATTR_DISABLE : 0</td>
</tr>
</tbody>
</table>

151.4.5 MATERIALIZE_DEFERRED_SEGMENTS Procedure

This procedure materializes segments for tables and table fragments with deferred segment creation and their dependent objects.

Syntax

```sql
DBMS_SPACE_ADMIN.MATERIALIZE_DEFERRED_SEGMENTS (    
    schema_name       IN     VARCHAR2   DEFAULT NULL,    
    table_name        IN     VARCHAR2   DEFAULT NULL,    
    partition_name    IN     VARCHAR2   DEFAULT NULL);
```

Parameters

Table 151-7 MATERIALIZE_DEFERRED_SEGMENTS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>schema_name</td>
<td>Name of schema</td>
</tr>
<tr>
<td>table_name</td>
<td>Name of table</td>
</tr>
<tr>
<td>partition_name</td>
<td>Name of partition</td>
</tr>
</tbody>
</table>

Usage Notes

Given a schema name, this procedure scans all tables in the schema. For each table, if the deferred or delayed segment property is set for the table or any of its fragments, then a new segment is created for those fragments and their dependent objects.

Optionally:

- **No** `schema_name` is specified, in which case tables belonging to all schemas are scanned
- **Both** `schema_name` and `table_name` are specified to perform the operation on a specified table
- All three arguments are supplied, restricting the operation to the partition and its dependent objects

151.4.6 SEGMENT_CORRUPT Procedure

This procedure marks the segment corrupt or valid so that appropriate error recovery can be performed.

It cannot be used on the `SYSTEM` tablespace.
Syntax

DBMS_SPACE_ADMIN.SEGMENT_CORRUPT (  
tablespace_name IN VARCHAR2,  
header_relative_file IN POSITIVE,  
header_block IN NUMBER,  
corrupt_option IN POSITIVE DEFAULT SEGMENT_MARK_CORRUPT);

Parameters

Table 151-8  SEGMENT_CORRUPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>corrupt_option</td>
<td>SEGMENT_MARK_CORRUPT (default) or SEGMENT_MARK_VALID</td>
</tr>
</tbody>
</table>

Usage Notes

You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

The following example marks the segment as corrupt:

EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_CORRUPT);

Alternately, the next example marks a corrupt segment valid:

EXECUTE DBMS_SPACE_ADMIN.SEGMENT_CORRUPT('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_MARK_VALID);

151.4.7 SEGMENT_DROP_CORRUPT Procedure

This procedure drops a segment currently marked corrupt (without reclaiming space).

For this to work, the segment must be marked temporary. To mark a corrupt segment as temporary, issue a DROP command on the segment.

Syntax

DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT (  
tablespace_name IN VARCHAR2,  
header_relative_file IN POSITIVE,  
header_block IN NUMBER);
Parameters

Table 151-9  SEGMENT_DROP_CORRUPT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
</tbody>
</table>

Usage Notes

- The space for the segment is not released, and it must be fixed by using the TABLESPACE_FIX_BITMAPS Procedure or the TABLESPACE_REBUILD_BITMAPS Procedure.
- The procedure cannot be used on the SYSTEM tablespace.
- You can determine the relative file number and block number (header_relative_file and header_block parameter) of the segment header block by querying DBA_SEGMENTS.

Examples

EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DROP_CORRUPT('USERS', 4, 33);

151.4.8 SEGMENT_DUMP Procedure

This procedure dumps the segment header and bitmap blocks of a specific segment to the location specified in the USER_DUMP_DEST initialization parameter.

Syntax

```sql
DBMS_SPACE_ADMIN.SEGMENT_DUMP (  
    tablespace_name IN VARCHAR2,  
    header_relative_file IN POSITIVE,  
    header_block IN NUMBER,  
    dump_option IN POSITIVE DEFAULT SEGMENT_DUMP_EXTENT_MAP);  
```

Parameters

Table 151-10  SEGMENT_DUMP Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>dump_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>• SEGMENT_DUMP_EXTENT_MAP</td>
</tr>
<tr>
<td></td>
<td>• SEGMENT_DUMP_BITMAP_SUMMARY</td>
</tr>
</tbody>
</table>
Usage Notes

- You can produce a slightly abbreviated dump, which includes the segment header and bitmap block summaries, without percent-free states of each block if you pass `SEGMENT_DUMP_BITMAP_SUMMARY` as the `dump_option` parameter.

- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS.HEADER_FILE`. If `HEADER_FILE` is greater than 1023 then use `DBA_DATA_FILES.RELATIVE_FNO`.

Examples

```
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_DUMP('USERS', 4, 33);
```

151.4.9 SEGMENT_VERIFY Procedure

This procedure checks the consistency of the segment extent map with the tablespace file bitmaps.

Syntax

```
DBMS_SPACE_ADMIN.SEGMENT_VERIFY (    
   tablespace_name         IN    VARCHAR2,  
   header_relative_file    IN    POSITIVE,  
   header_block            IN    NUMBER,    
   verify_option           IN    POSITIVE  DEFAULT SEGMENT_VERIFY_EXTENTS);  
```

Parameters

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace in which segment resides</td>
</tr>
<tr>
<td>header_relative_file</td>
<td>Relative file number of segment header</td>
</tr>
<tr>
<td>header_block</td>
<td>Block number of segment header</td>
</tr>
<tr>
<td>verify_option</td>
<td>What kind of check to do: <code>SEGMENT_VERIFY_EXTENTS</code> or <code>SEGMENT_VERIFY_EXTENTS_GLOBAL</code></td>
</tr>
</tbody>
</table>

Usage Notes

- Anomalies are output as block range, bitmap-block, bitmap-block-range, anomaly-information, in the trace file for all block ranges found to have incorrect space representation. The kinds of problems which would be reported are free space not considered free, used space considered free, and the same space considered used by multiple segments.

- You can determine the relative file number and block number (`header_relative_file` and `header_block` parameter) of the segment header block by querying `DBA_SEGMENTS`.

Examples

The following example verifies that the segment with segment header at relative file number 4, block number 33, has its extent maps and bitmaps synchronized.
EXECUTE DBMS_SPACE_ADMIN.SEGMENT_VERIFY('USERS', 4, 33, DBMS_SPACE_ADMIN.SEGMENT_VERIFY_EXTENTS);

151.4.10 SET_SEGADV_ATTRIB Procedure

This procedure sets the values of attributes of DBMS_SPACE_ADMIN package.

Syntax

DBMS_SPACE_ADMIN.SET_SEGADV_ATTRIB(
    attribute IN NUMBER,
    value    IN NUMBER);

Parameters

Table 151-12  SET_SEGADV_ATTRIB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute</td>
<td>Supported attributes:</td>
</tr>
<tr>
<td></td>
<td>• COMP_ADVISOR — Provides an option to enable or disable</td>
</tr>
<tr>
<td></td>
<td>Compression Advisor for Automatic Segment Advisor. By default</td>
</tr>
<tr>
<td></td>
<td>Compression Advisor is enabled for Automatic Segment Advisor.</td>
</tr>
<tr>
<td></td>
<td>• COMP_LOB — Provides an option to enable or disable</td>
</tr>
<tr>
<td></td>
<td>Compression Advisor for the tables with LOB columns while</td>
</tr>
<tr>
<td></td>
<td>Automatic Segment Advisor is running. By default</td>
</tr>
<tr>
<td></td>
<td>Compression Advisor is enabled for tables with LOB columns.</td>
</tr>
<tr>
<td>value</td>
<td>Supported values:</td>
</tr>
<tr>
<td></td>
<td>• ATTR_ENABLE : 1</td>
</tr>
<tr>
<td></td>
<td>• ATTR_DISABLE : 0</td>
</tr>
</tbody>
</table>

151.4.11 TABLESPACE_FIX_BITMAPS Procedure

This procedure marks the appropriate block range (extent) as free or used in bitmap. It cannot be used on the SYSTEM tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS (
    tablespace_name IN VARCHAR2,
    dbarange_relative_file IN POSITIVE,
    dbarange_begin_block IN POSITIVE,
    dbarange_end_block IN POSITIVE,
    fix_option IN POSITIVE);  

Parameters

Table 151-13  TABLESPACE_FIX_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>dbarange_relative_file</td>
<td>Relative file number of block range (extent)</td>
</tr>
</tbody>
</table>
### Table 151-13  (Cont.) TABLESPACE_FIX_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbarange_begin_block</td>
<td>Block number of beginning of extent</td>
</tr>
<tr>
<td>dbarange_end_block</td>
<td>Block number (inclusice) of end of extent</td>
</tr>
<tr>
<td>fix_option</td>
<td>One of the following options:</td>
</tr>
<tr>
<td></td>
<td>• TABLESPACE_EXTENT_MAKE_FREE</td>
</tr>
<tr>
<td></td>
<td>• TABLESPACE_EXTENT_MAKE_USED</td>
</tr>
</tbody>
</table>

#### Examples

The following example marks bits for 51 blocks for relative file number 4, beginning at block number 33 and ending at 83, as **used** in bitmaps.

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_BITMAPS('USERS', 4, 33, 83, DBMS_SPACE_ADMIN.EXTENT_MAKE_USED);
```

Alternatively, specifying an option of `TABLESPACE_EXTENT_MAKE_FREE` marks the bits free in bitmaps. The `BEGIN` and `END` blocks must be in extent boundary and be extent multiple; otherwise, an error is raised.

### 151.4.12 TABLESPACE_FIX_SEGMENT_STATES Procedure

This procedure fixes the state of the segments in a tablespace in which migration was aborted.

During tablespace migration to or from local, the segments are put in a transient state. If migration is aborted, then the segment states are corrected by SMON when event 10906 is set. A database with segments in such a transient state cannot be downgraded. The procedure can be used to fix the state of such segments.

#### Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES (tablespace_name IN VARCHAR);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace whose segments must be fixed</td>
</tr>
</tbody>
</table>

#### Usage Notes

The tablespace must be kept online and read/write when this procedure is called.

#### Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_FIX_SEGMENT_STATES('TS1')
```
151.4.13 TABLESPACE_MIGRATE_FROM_LOCAL Procedure

This procedure migrates a locally managed tablespace to a dictionary-managed tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL (tablespace_name IN VARCHAR2);

Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

Usage Notes

The tablespace must be kept online and read/write during migration. Migration of temporary tablespaces and migration of SYSTEM tablespaces are not supported.

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_FROM_LOCAL('USERS');

151.4.14 TABLESPACE_MIGRATE_TO_LOCAL Procedure

This procedure migrates the tablespace from a dictionary-managed format to a locally managed format. Tablespaces migrated to locally managed format are user managed.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL (tablespace_name IN VARCHAR2, unit_size IN POSITIVE DEFAULT NULL, rfno IN POSITIVE DEFAULT NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of the tablespace to be migrated</td>
</tr>
<tr>
<td>unit_size</td>
<td>Bitmap unit size (which is the size of the smallest possible chunk of space that can be allocated) in the tablespace specified in number of blocks</td>
</tr>
<tr>
<td>rfno</td>
<td>Relative File Number of the file where the bitmap blocks are placed</td>
</tr>
</tbody>
</table>

Usage Notes

- Before you migrate the SYSTEM tablespace, migrate any dictionary-managed tablespaces that you want to use in read/write mode to locally managed. After the
SYSTEM tablespace is migrated, you cannot change dictionary-managed
      tablespaces to read/write.

See Also:
      Oracle Database Administrator’s Guide

- The tablespace must be kept online and read/write during migration. Note that
temporary tablespaces cannot be migrated.

- Allocation Unit may be specified optionally. The default is calculated by the system
  based on the highest common divisor of all extents (used or free) for the
  tablespace. This number is further trimmed based on the MINIMUM EXTENT for the
tablespace (5 if MINIMUM EXTENT is not specified). Thus, the calculated value will not
be larger than the MINIMUM EXTENT for the tablespace. The last free extent in every
  file is ignored for GCD calculation. If you specify the unit size, then it must be a
factor of the unit_size calculated by the system; otherwise an error message is
  returned.

- The Relative File Number parameter is used to place the bitmaps in a desired file.
  If space is not found in the file, then an error is issued. The data file specified must
be part of the tablespace being migrated. If the dataflow is not specified, then the
  system chooses a dataflow in which to place the initial bitmap blocks. If space is
not found for the initial bitmaps, then an error is raised.

Examples

To migrate a tablespace 'TS1' in 2KB blocksize with minimum extent size 1MB:

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_MIGRATE_TO_LOCAL('TS1', 512, 2);

The bitmaps are placed in file with relative file number 2.

151.4.15 TABLESPACE_REBUILD_BITMAPS Procedure

This procedure rebuilds the appropriate bitmaps. If no bitmap block is specified, then it
rebuilds all bitmaps for the given tablespace.

The procedure cannot be used on the SYSTEM tablespace.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS (  
tablespace_name         IN    VARCHAR2,
  bitmap_relative_file    IN    POSITIVE   DEFAULT NULL,
  bitmap_block            IN    POSITIVE   DEFAULT NULL);

Parameters

Table 151-17   TABLESPACE_REBUILD_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
<tr>
<td>bitmap_relative_file</td>
<td>Relative file number of bitmap block to rebuild</td>
</tr>
</tbody>
</table>
Table 151-17  (Cont.) TABLESPACE_REBUILD_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bitmap_block</td>
<td>Block number of bitmap block to rebuild</td>
</tr>
</tbody>
</table>

Usage Notes

Only full rebuild is supported.

Examples

The following example rebuilds bitmaps for all the files in the `USERS` tablespace.

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_BITMAPS('USERS');
```

151.4.16 TABLESPACE_REBUILD_QUOTAS Procedure

This procedure rebuilds quotas for the given tablespace.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS ( 
    tablespace_name IN VARCHAR2);
```

Parameters

Table 151-18  TABLESPACE_REBUILD_QUOTAS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>

Examples

```sql
EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_REBUILD_QUOTAS('USERS');
```

151.4.17 TABLESPACE_RELOCATE_BITMAPS Procedure

This procedure relocates the bitmaps to the destination specified.

Syntax

```sql
DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS ( 
    tablespace_name IN VARCHAR2, 
    filno IN POSITIVE, 
    blkno IN POSITIVE);
```

Parameters

Table 151-19  TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>
Table 151-19  TABLESPACE_RELOCATE_BITMAPS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filno</td>
<td>Relative File Number of the destination file</td>
</tr>
<tr>
<td>blkno</td>
<td>Block Number of the destination range</td>
</tr>
</tbody>
</table>

Usage Notes

- Migration of a tablespace from dictionary-managed to locally managed format could result in the creation of SPACE HEADER segment that contains the bitmap blocks. The SPACE HEADER segment is treated as user data. If you explicitly resize a file at or below the space header segment, then an error is issued. Use the TABLESPACE_RELOCATE_BITMAPS command to move the control information to a different destination and then resize the file.
- This procedure cannot be used on the SYSTEM tablespace.
- The tablespace must be kept online and read/write during relocation of bitmaps. This can be done only on migrated locally managed tablespaces.

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_RELOCATE_BITMAPS('TS1', 3, 4);

Moves the bitmaps to file 3, block 4.

Note:
The source and the destination addresses must not overlap. The destination block number is rounded down to the unit boundary. If there is user data in that location, then an error is raised.

151.4.18 TABLESPACE_VERIFY Procedure

This procedure verifies that the bitmaps and extent maps for the segments in the tablespace are synchronized.

Syntax

DBMS_SPACE_ADMIN.TABLESPACE_VERIFY (tablespace_name IN VARCHAR2, verify_option IN POSITIVE DEFAULT TABLESPACE_VERIFY_BITMAP);

Parameters

Table 151-20  TABLESPACE_VERIFY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace</td>
</tr>
</tbody>
</table>
Table 151-20  (Cont.) TABLESPACE_VERIFY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>verify_option</td>
<td>One option is supported: TABLESPACE_VERIFY_BITMAP</td>
</tr>
</tbody>
</table>

Examples

EXECUTE DBMS_SPACE_ADMIN.TABLESPACE_VERIFY('USERS');
152

DBMS_SPD

The DBMS_SPD package provides subprograms for managing SQL plan directives (SPD).

This chapter contains the following topics:

• Overview
• Security Model
• Views
• Summary of DBMS_SPD Subprograms

See Also:

• DBMS_STATS
• Oracle Database SQL Tuning Guide regarding SQL plan directives

152.1 DBMS_SPD Overview

This package provides subprograms for managing SQL plan directives (SPD).

SPD are objects generated automatically by Oracle. For example, if Oracle detects that the single table cardinality estimated made by the optimizer is different from the actual number of rows returned when accessing the table, it will automatically create a directive to perform dynamic statistics for the table. When any SQL statement referencing the table is compiled, the optimizer will perform dynamic statistics for the table to get a more accurate estimate.

152.2 DBMS_SPD Security Model

DBMS_SPD is an invoker-rights package. The invoker requires ADMINISTER SQL MANAGEMENT OBJECT privilege for executing most of the subprograms in this package. Also, the subprograms commit the current transaction (if any), perform the operation, and then commit it again.

152.3 DBMS_SPD Views

The DBA view DBA_SQL_PLAN_DIRECTIVES shows all the directives created in the system and the view DBA_SQL_PLAN_DIR_OBJECTS displays the objects that are included in the directives.
152.4 Summary of DBMS_SPD Subprograms

This table lists and briefly describes the DBMS_SPD package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_SQL_PLAN_DIRECTIVE Procedure</td>
<td>Changes different attributes of a SQL plan directive</td>
</tr>
<tr>
<td>CREATE_STGTAB_DIRECTIVE Procedure</td>
<td>Creates a staging table into which to pack (export) SQL plan directives.</td>
</tr>
<tr>
<td>DROP_SQL_PLAN_DIRECTIVE Procedure</td>
<td>Drops a SQL plan directive</td>
</tr>
<tr>
<td>FLUSH_SQL_PLAN_DIRECTIVE Procedure</td>
<td>Allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.</td>
</tr>
<tr>
<td>GET_PREFS Function</td>
<td>Gets the values for preferences for SQL plan directives</td>
</tr>
<tr>
<td>PACK_STGTAB_DIRECTIVE Function</td>
<td>Packs (exports) SQL plan directives into a staging table.</td>
</tr>
<tr>
<td>SET_PREFS Procedure</td>
<td>Allows the setting of different preferences for SQL plan directives</td>
</tr>
<tr>
<td>UNPACK_STGTAB_DIRECTIVE Function</td>
<td>Unpacks (imports) SQL plan directives from a staging table.</td>
</tr>
</tbody>
</table>

152.4.1 ALTER_SQL_PLAN_DIRECTIVE Procedure

This procedure changes different attributes of a SQL plan directive.

Syntax

```sql
DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (
    directive_id IN NUMBER,
    attribute_name IN VARCHAR2,
    attribute_value IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID</td>
</tr>
<tr>
<td>attribute_name</td>
<td>ENABLED</td>
</tr>
<tr>
<td>attribute_value</td>
<td>AUTO_DROP</td>
</tr>
</tbody>
</table>
### ALTER_SQL_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_value</td>
<td>Possible values:</td>
</tr>
<tr>
<td></td>
<td>• ENABLED:</td>
</tr>
<tr>
<td></td>
<td>- If YES directive is enabled and may be used</td>
</tr>
<tr>
<td></td>
<td>- If NO directive is not enabled and will not be used</td>
</tr>
<tr>
<td></td>
<td>• AUTO_DROP:</td>
</tr>
<tr>
<td></td>
<td>- If YES directive will be dropped automatically if not used for</td>
</tr>
<tr>
<td></td>
<td>SPD_RETENTION_WEEKS. This is the default behavior.</td>
</tr>
<tr>
<td></td>
<td>- If NO directive will not be dropped automatically</td>
</tr>
</tbody>
</table>

#### Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

#### Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

#### Examples

```sql
BEGIN
  DBMS_SPD.ALTER_SQL_PLAN_DIRECTIVE (12345, 'STATE', 'PERMANENT');
END;
```

### 152.4.2 CREATE_STGTAB_DIRECTIVE Procedure

This procedure creates a staging table into which to pack (export) SQL plan directives.

#### Syntax

```sql
DBMS_SPD.CREATE_STGTAB_DIRECTIVE (    table_name IN VARCHAR2,    table_owner IN VARCHAR2 := USER,    tablespace_name IN VARCHAR2 := NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace. Default NULL means create staging table in the default tablespace:</td>
</tr>
</tbody>
</table>
Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-13159 TABLE_ALREADY_EXISTS: The specified table already exists.
- ORA-29304 TABLESPACE_MISSING: The specified tablespace does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

152.4.3 DROP_SQL_PLAN_DIRECTIVE Procedure

This procedure drops a SQL plan directive.

Syntax

```sql
DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (
    directive_id IN NUMBER);
```

Parameters

Table 152-4  DROP_SQL_PLAN_DIRECTIVE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-13158 OBJECT DOES NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```sql
BEGIN
    DBMS_SPD.DROP_SQL_PLAN_DIRECTIVE (12345);
END;
```
152.4.4 FLUSH_SQL_PLAN_DIRECTIVE Procedure

This procedure allows for manual flushing of the SQL plan directives that are automatically recorded in SGA memory while executing SQL statements.

The information recorded in the SGA is periodically flushed by an Oracle background process. This procedure provides a way to flush the information manually.

Syntax

`DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;`

Exceptions

ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

```
BEGIN
  DBMS_SPD.FLUSH_SQL_PLAN_DIRECTIVE;
END;
```

152.4.5 GET_PREFS Function

This function returns the value for the specified preferences for SQL plan directives.

Syntax

`DBMS_SPD.GET_PREFS (pname IN VARCHAR2) RETURN VARCHAR2;`

Parameters

**Table 152-5  GET_PREFS Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The procedure supports the preference SPD_RETENTION WEEKS.</td>
</tr>
</tbody>
</table>

Return Values

Preference value

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
Usage Notes

- The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.
- SPD_RETENTION_WEEKS - SQL plan directives are purged if not used for more than the value set for this preference.

Examples

SELECT DBMS_SPD.GET_PREFS('SPD_RETENTION_WEEKS') FROM DUAL;

152.4.6 PACK_STGTAB_DIRECTIVE Function

This function packs (exports) SQL plan directives into a staging table.

Syntax

```
DBMS_SPD.PACK_STGTAB_DIRECTIVE (
    table_name         IN VARCHAR2,
    table_owner        IN VARCHAR2  := USER,
    directive_id       IN NUMBER    := NULL,
    obj_list           IN OBJECTTAB := NULL)
RETURN NUMBER
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID. Default NULL means all directives in the system.</td>
</tr>
<tr>
<td>obj_list</td>
<td>Used to filter the directives to be packed based on the objects used in directives. If obj_list is not NULL, a directive is packed only if all the objects in the directive exist in obj_list.</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan directives packed.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.
Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

-- Pack all directives in the system
SELECT DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Pack directives relevant to objects in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(1);
  my_list(1).owner := 'SH';       -- schema name
  my_list(1).object_name := NULL; -- all tables in SH
  my_list(1).object_type := 'TABLE'; -- type of object

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Pack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
  my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
  dir_cnt  NUMBER;
BEGIN
  my_list.extend(2);
  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

  dir_cnt :=
    DBMS_SPD.PACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
  DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

152.4.7 SET_PREFS Procedure

This procedure allows the setting of different preferences for SQL plan directives.

Syntax

DBMS_SPD.SET_PREFS(
  pname IN VARCHAR2,
  pvalue IN VARCHAR2);
### Parameters

#### Table 152-7  SET_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Preference name. The procedure supports the preference SPD_RETENTION_WEEKS.</td>
</tr>
<tr>
<td>pvalue</td>
<td>Preference value.</td>
</tr>
<tr>
<td></td>
<td>- SPD_RETENTION_WEEKS: SQL plan directives are purged if not used for more than the value set for this preference. Default is 53 (SPD_RETENTION_WEEKS_DEFAULT) weeks, which means a directive is purged if it has been left unused for little over a year. It can be set to any value greater than or equal to 0. Also value NULL can be passed to set the preference to default.</td>
</tr>
</tbody>
</table>

#### Exceptions

- **ORA-38171 INSUFFICIENT_PRIVILEGE**: The user does not have proper privilege to perform the operation.
- **ORA-28104 INVALID_INPUT**: The input value is not valid.

#### Usage Notes

- The **ADMINISTER SQL MANAGEMENT OBJECT** privilege is required to execute this procedure.
- **SPD_RETENTION_WEEKS** - SQL plan directives are purged if not used for more than the value set for this preference.

#### Examples

```sql
BEGIN
    DBMS_SPD.SET_PREFS('SPD_RETENTION_WEEKS', '4');
END;
```

### 152.4.8 UNPACK_STGTAB_DIRECTIVE Function

This procedure unpacks (imports) SQL plan directives from a staging table.

#### Syntax

```sql
DBMS_SPD.UNPACK_STGTAB_DIRECTIVE (    table_name IN VARCHAR2,    table_owner IN VARCHAR2 := USER,    directive_id IN NUMBER := NULL,    obj_list IN OBJECTTAB := NULL) RETURN NUMBER
```
Parameters

Table 152-8 UNPACK_STGTAB_DIRECTIVE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of schema owner of staging table. Default is current schema.</td>
</tr>
<tr>
<td>directive_id</td>
<td>SQL plan directive ID. Default NULL means all directives in the system.</td>
</tr>
<tr>
<td>obj_list</td>
<td>Used to filter the directives to be unpacked based on the objects used in directives. If obj_list is not NULL, a directive is unpacked only if all the objects in the directive exist in obj_list.</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan directives unpacked.

Exceptions

- ORA-38171 INSUFFICIENT_PRIVILEGE: The user does not have proper privilege to perform the operation.
- ORA-28104 INVALID_INPUT: The input value is not valid.
- ORA-44001 INVALID_SCHEMA: The input schema does not exist.
- ORA-29304 INVALID_STGTAB: The specified staging table is invalid or does not exist.
- ORA-13158 OBJECT_DOES_NOT_EXIST: The specified object does not exist.

Usage Notes

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required to execute this procedure.

Examples

-- Unpack all directives in the staging table
SELECT DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab') FROM DUAL;

SET SERVEROUTPUT ON;
-- Unpack directives relevant to objects in SH schema
DECLARE
    my_list               DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
    dir_cnt  number;
BEGIN
    my_list.extend(1);
    my_list(1).owner := 'SH';           -- schema name
    my_list(1).object_name := null;     -- all tables in SH
    my_list(1).object_type := 'TABLE';  -- type of object

    dir_cnt :=
        DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
    DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;

-- Unpack directives relevant to tables SALES and CUSTOMERS in SH schema
DECLARE
my_list  DBMS_SPD.OBJECTTAB := DBMS_SPD.ObjectTab();
dir_cnt  NUMBER;
begin
  my_list.extend(2);

  -- SALES table
  my_list(1).owner := 'SH';
  my_list(1).object_name := 'SALES';
  my_list(1).object_type := 'TABLE';

  -- CUSTOMERS table
  my_list(2).owner := 'SH';
  my_list(2).object_name := 'CUSTOMERS';
  my_list(2).object_type := 'TABLE';

dir_cnt :=
  DBMS_SPD.UNPACK_STGTAB_DIRECTIVE('mydirtab', obj_list => my_list);
DBMS_OUTPUT.PUT_LINE('dir_cnt = ' || dir_cnt);
END;
The **DBMS_SPM** package supports the SQL plan management feature by providing an interface for the DBA or other user to perform controlled manipulation of plan history and SQL plan baselines maintained for various SQL statements.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Examples
- Data Structures
- Summary of DBMS_SPM Subprograms

See Also:

For more information about "Using SQL Plan Management" in the *Oracle Database SQL Tuning Guide*.

### 153.1 DBMS_SPM Overview

The **DBMS_SPM** package allows the user to manage SQL execution plans using SQL plan management.

SQL plan management prevents performance regressions resulting from sudden changes to the execution plan of a SQL statement by recording and evaluating the execution plans of SQL statements over time, and builds SQL plan baselines composed of a set of existing plans known to be efficient. The SQL plan baselines are then used to preserve performance of corresponding SQL statements, regardless of changes occurring in the system. Common usage scenarios where SQL plan management can improve or preserve SQL performance include:

- A database upgrade that installs a new optimizer version usually results in plan changes for a small percentage of SQL statements, with most of the plan changes resulting in either no performance change or improvement. However, certain plan changes may cause performance regressions. The use of SQL plan baselines significantly minimizes potential performance regressions resulting from a database upgrade.
- Ongoing system and data changes can impact plans for some SQL statements, potentially causing performance regressions. The use of SQL plan baselines helps to minimize performance regressions and stabilize SQL performance.
- Deployment of new application modules means introducing new SQL statements into the system. The application software may use appropriate SQL execution
plans developed under a standard test configuration for the new SQL statements. If the system production configuration differs significantly from the test configuration, SQL plan baselines can be evolved over time to produce better performance.

153.2 DBMS_SPM Security Model

The package is owned by SYS. The EXECUTE package privilege is required to execute its procedures. Any user granted the ADMINISTER SQL MANAGEMENT OBJECT privilege is able to execute the DBMS_SPM package.

153.3 DBMS_SPM Constants

The DBMS_SPM package provides constants that can be used for specifying parameter values.

These are shown in the following table. These constants are defined as standard input for the time_limit parameter of the EVOLVE_SQL_PLAN_BASELINE Function.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647</td>
<td>Oracle determines the appropriate time spent by the EVOLVE_SQL_PLAN_BASELINE Function.</td>
</tr>
<tr>
<td>NO_LIMIT</td>
<td>INTEGER</td>
<td>2147483647 -1</td>
<td>There is no limit to the time spent by the EVOLVE_SQL_PLAN_BASELINE Function.</td>
</tr>
</tbody>
</table>

153.4 DBMS_SPM Examples

These examples will help you understand use of DBMS_SPM.

Detailed examples are located under the following topics:

- Migrating Stored Outlines to SQL Plan Baselines
- Migrating Outlines to Utilize SQL Plan Management Features
- Migrating Outlines to Preserve Stored Outline Behavior
- Performing Follow-Up Tasks After Stored Outline Migration

153.5 DBMS_SPM Data Structures

The DBMS_SPM package defines a TABLE type.

Table Types

- NAMELIST Table Type
153.5.1 DBMS_SPM NAMELIST Table Type

This type allows for a list of names as an input parameter.

Syntax

```sql
TYPE name_list IS TABLE OF VARCHAR2(30);
```

153.6 Summary of DBMS_SPM Subprograms

This table lists and briefly describes the DBMS_SPM package subprograms.

### Table 153-2 DBMS_SPM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT_SQL_PLAN_BASSELINE Procedure</td>
<td>Accepts a plan based on the recommendation of an evolve task</td>
</tr>
<tr>
<td>ALTER_SQL_PLAN_BASELINE Function</td>
<td>Changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format</td>
</tr>
<tr>
<td>CANCEL_EVOLVE_TASK Procedure</td>
<td>Cancels a currently executing evolve task</td>
</tr>
<tr>
<td>CONFIGURE Procedure</td>
<td>Sets configuration options for SQL management base, in parameter/value format</td>
</tr>
<tr>
<td>CREATE_EVOLVE_TASK Function</td>
<td>Creates an advisor task and sets its parameters</td>
</tr>
<tr>
<td>CREATE_STGTAB_BASELINE Procedure</td>
<td>Creates a staging table that used for transporting SQL plan baselines from one system to another</td>
</tr>
<tr>
<td>DROP_EVOLVE_TASK Procedure</td>
<td>Drops an evolved task</td>
</tr>
<tr>
<td>DROP_SQL_PLAN_BASELINE Function</td>
<td>Drops a single plan, or all plans associated with a SQL statement</td>
</tr>
<tr>
<td>EVOLVE_SQL_PLAN_BASELINE Function</td>
<td>Evolves SQL plan baselines associated with one or more SQL statements</td>
</tr>
<tr>
<td>EXECUTE_EVOLVE_TASK Function</td>
<td>Executes a previously created evolve task</td>
</tr>
<tr>
<td>IMPLEMENT_EVOLVE_TASK Function</td>
<td>Implements a plan based on the recommendation of an evolve task</td>
</tr>
<tr>
<td>INTERRUPT_EVOLVE_TASK Procedure</td>
<td>Interrupts a currently executing evolve task</td>
</tr>
<tr>
<td>LOAD_PLANS_FROM_CURSOR_CACHE Functions</td>
<td>Loads one or more plans present in the cursor cache for a SQL statement</td>
</tr>
<tr>
<td>LOAD_PLANS_FROM_AWR Function</td>
<td>Loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded</td>
</tr>
<tr>
<td>LOAD_PLANS_FROM_STS Function</td>
<td>Loads plans stored in a SQL tuning set (STS) into SQL plan baselines</td>
</tr>
<tr>
<td>MIGRATE_STORED_OUTLINE Functions</td>
<td>Migrates existing stored outlines to SQL plan baselines</td>
</tr>
</tbody>
</table>
### Table 153-2  (Cont.) DBMS_SPM Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PACK_STGTAB_BASELINE</td>
<td>Packs (exports) SQL plan baselines from SQL management base into a staging table</td>
</tr>
<tr>
<td>RESET_EVOLVE_TASK</td>
<td>Resets an evolve task to its initial state</td>
</tr>
<tr>
<td>RESUME_EVOLVE_TASK</td>
<td>Resumes a previously interrupted task</td>
</tr>
<tr>
<td>REPORT_AUTO_EVOLVE_TASK</td>
<td>Displays the results of an execution of an automatic evolve task.</td>
</tr>
<tr>
<td>REPORT_EVOLVE_TASK</td>
<td>Displays the results of an evolved task</td>
</tr>
<tr>
<td>SET_EVOLVE_TASK_PARAMETER</td>
<td>Sets a parameter of an evolve task</td>
</tr>
<tr>
<td>UNPACK_STGTAB_BASELINE</td>
<td>Unpacks (imports) SQL plan baselines from a staging table into SQL management base</td>
</tr>
</tbody>
</table>

### 153.6.1 ACCEPT_SQL_PLAN_BASELINE Procedure

The procedure accepts a plan based on the recommendation of an evolve task.

#### Syntax

```sql
DBMS_SPM.ACCEPT_SQL_PLAN_BASELINE (  
  task_name       IN  VARCHAR2,  
  object_id       IN  NUMBER    := NULL,  
  task_owner      IN  VARCHAR2  := NULL,  
  force           IN  BOOLEAN   := FALSE);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to implement</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>force</td>
<td>Accept the plan even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.</td>
</tr>
</tbody>
</table>
153.6.2 ALTER_SQL_PLAN_BASELINE Function

This function changes an attribute of a single plan or all plans associated with a SQL statement using the attribute name/value format.

Syntax

```
DBMS_SPM.ALTER_SQL_PLAN_BASELINE (    
  sql_handle       IN VARCHAR2 := NULL,    
  plan_name        IN VARCHAR2 := NULL,    
  attribute_name   IN VARCHAR2,           
  attribute_value  IN VARCHAR2)           
RETURN PLS_INTEGER;
```

Parameters

Table 153-4  ALTER_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement for an attribute change. If NULL then plan_name must be specified.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means set the attribute for all plans associated with a SQL statement identified by sql_handle. If NULL then sql_handle must be specified.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of plan attribute to set (see table below).</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of plan attribute to use (see table below)</td>
</tr>
</tbody>
</table>

Table 153-5  Names & Values for ALTER_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Possible Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>enabled</td>
<td>'YES' means the plan is available for use by the optimizer. It may or may not be used depending on accepted status.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>fixed</td>
<td>'YES' means the SQL plan baseline is not evolved over time. A fixed plan takes precedence over a non-fixed plan.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>autopurge</td>
<td>'YES' means the plan is purged if it is not used for a time period. 'NO' means it is never purged.</td>
<td>'YES' or 'NO'</td>
</tr>
<tr>
<td>plan_name</td>
<td>Name of the plan</td>
<td>String of up to 30 characters</td>
</tr>
<tr>
<td>description</td>
<td>Plan description.</td>
<td>String of up to 500 bytes</td>
</tr>
</tbody>
</table>
Return Values
The number of plans altered.

Usage Notes
When a single plan is specified, one of various statuses, or plan name, or description can be altered. When all plans for a SQL statement are specified, one of various statuses, or description can be altered. This function can be called numerous times, each time setting a different plan attribute of same plan(s) or different plan(s).

153.6.3 CANCEL_EVOLVE_TASK Procedure
The procedure cancels a currently executing evolve task. All intermediate results are removed from the task.

Syntax
DBMS_SPM.CANCEL_EVOLVE_TASK (task_name IN VARCHAR2);

Parameters

Table 153-6  CANCEL_EVOLVE_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to cancel</td>
</tr>
</tbody>
</table>

153.6.4 CONFIGURE Procedure
This procedure sets configuration options for the SQL management base and for the maintenance of SQL plan baselines. You can call this function multiple times, setting a different configuration option each time.

Syntax
DBMS_SPM.CONFIGURE (parameter_name IN VARCHAR2,
                     parameter_value IN VARCHAR2 := NULL,
                     allow IN BOOLEAN := TRUE);

Parameters

Table 153-7  CONFIGURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter_name</td>
<td>Name of parameter to set (see table below).</td>
</tr>
<tr>
<td>parameter_value</td>
<td>Value of parameter to use (see table below). The maximum length of parameter_value is 1000 characters.</td>
</tr>
<tr>
<td>allow</td>
<td>Whether to include (true) or exclude (false) matching SQL statements and plans for the auto_capture_* parameters. If null, then the procedure ignores the specified parameter.</td>
</tr>
<tr>
<td>Parameter Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>auto_capture_action</td>
<td>Action to include (=) or exclude (&lt;&gt; ) for SQL plan management automatic capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.</td>
</tr>
<tr>
<td>auto_capture_module</td>
<td>Module to include (=) or exclude (&lt;&gt; ) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.</td>
</tr>
<tr>
<td>auto_capture_parsing_schema_name</td>
<td>Parsing schema to include (=) or exclude (&lt;&gt; ) for SQL plan management auto capture, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.</td>
</tr>
<tr>
<td>auto_capture_sql_text</td>
<td>Search pattern to apply to SQL text of LIKE or NOT LIKE, depending on whether allow is TRUE or FALSE. A null value removes the filter for parameter_name entirely. The database only uses this filter when OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is TRUE.</td>
</tr>
<tr>
<td>plan_retention_weeks</td>
<td>Number of weeks to retain unused plans before the database purges them. A null value resets to the default value of 53 weeks, or 1 year plus 1 week. (This retains plans for annually executing queries.) The value of allow is ignored.</td>
</tr>
</tbody>
</table>
Table 153-8  (Cont.) Names and Values for CONFIGURE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
<th>Possible Values</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>space_budget_percent</td>
<td>Maximum percent of SYSAUX space that can be used for SQL management base. The database issues alerts when this amount is exceeded. A null value resets the percentage to the default value of 10%. The value of allow is ignored.</td>
<td>1–50</td>
<td>10</td>
</tr>
</tbody>
</table>

Exceptions

Table 153-9  CONFIGURE Exceptions

<table>
<thead>
<tr>
<th>Error Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ORA-38133</td>
<td>Invalid parameter name</td>
</tr>
<tr>
<td>ORA-38134</td>
<td>Invalid parameter value</td>
</tr>
<tr>
<td>ORA-38150</td>
<td>Not enough space for new filter</td>
</tr>
<tr>
<td>ORA-38151</td>
<td>Module name too long</td>
</tr>
<tr>
<td>ORA-38152</td>
<td>Action name too long</td>
</tr>
<tr>
<td>ORA-38304</td>
<td>Missing or invalid user name</td>
</tr>
</tbody>
</table>

Usage Notes

- When parameter_name is auto_capture_sql_text, the parameter_value is an automatic search filter. The filter uses the search pattern of LIKE parameter_name when allow=>true. The filter uses the pattern NOT LIKE parameter_name when allow=>false.

  For all other non-null parameter_name values, the search pattern depends on the allow setting. The parameter uses an equal sign (=) when allow=>true. The parameter uses a not-equal sign (<> when allow=>false.

- You can configure multiple automatic capture parameters of different types. You cannot specify multiple values for the same parameter. Instead, the values specified for a particular parameter are combined. For example, specifying auto_capture_sql_text to be '%TABLE1%', TRUE, and '%TABLE2%', FALSE will result in matching SQL text LIKE '%TABLE1%' and NOT LIKE '%TABLE2%'. The database uses these configuration settings only when the initialization parameter OPTIMIZER_CAPTURE_SQL_PLAN_BASELINES is set to TRUE.

- A null value for parameter_value removes the filter for parameter_name entirely. By using parameter_value='%' in combination with allow=FALSE, you can filter out all values for a parameter, and then create a separate filter to include only specified values. The DBA_SQL_MANAGEMENT_CONFIG view shows the current filters.

- The default space budget for SQL management base is no more than ten percent of the size of SYSAUX tablespace. The space budget can be set to a maximum of 50%. The default unused plan retention period is one year and one week, which means a plan will be automatically purged if it has not been used for more than a
year. The retention period can be set to a maximum of 523 weeks (i.e. a little over 10 years).

- When the space occupied by SQL management base exceeds the defined space budget limit, a weekly database alert is generated.

Examples

The following example creates a filter for SQL text that is like `SELECT a%`:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', 'TRUE');
```

The following example filters out the HR parsing schema:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_PARSING_SCHEMA_NAME', 'HR', 'FALSE');
```

The following example removes any existing filters for SQL text:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', NULL, NULL);
```

The following example removes any LIKE or NOT LIKE filters for the SQL text `select a%`:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_SQL_TEXT', 'select a%', NULL);
```

The following example creates a filter with the predicate `(action LIKE 'R%') OR (action LIKE '%E_')`:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', 'R%', 'TRUE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_ACTION', '%E_', 'TRUE');
```

The following example creates a filter with the predicate `NOT(module LIKE 'LOGGER') AND NOT(module LIKE 'UTIL__')`:

```sql
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'LOGGER', 'FALSE');
EXEC DBMS_SPM.CONFIGURE('AUTO_CAPTURE_MODULE', 'UTIL__', 'FALSE');
```

153.6.5 CREATE_EVOLVE_TASK Function

The function has two overloads, both of which create an advisor task and sets its parameters. This version which takes a SQL handle creates an evolve task in order to evolve one or more plans for a given SQL statement.

Syntax

```sql
DBMS_SPM.CREATE_EVOLVE_TASK (    sql_handle    IN  VARCHAR2  := NULL,    plan_name     IN  VARCHAR2  := NULL,    time_limit    IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,    task_name     IN  VARCHAR2  := NULL,    description   IN  VARCHAR2  := NULL) RETURN VARCHAR2;
```

```sql
DBMS_SPM.CREATE_EVOLVE_TASK (    plan_list     IN  DBMS_SPM.NAME_LIST,    time_limit    IN  NUMBER    := DBMS_SPM.AUTO_LIMIT,    task_name     IN  VARCHAR2  := NULL,    description   IN  VARCHAR2  := NULL) RETURN VARCHAR2;
```
Parameters

Table 153-10 CREATE_EVOLVE_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>Handle of a SQL statement. The default NULL considers all SQL statements with non-accepted plans.</td>
</tr>
<tr>
<td>plan_list</td>
<td>List of plan names. The plans may belong to different SQL statements.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan identifier. The default NULL considers all non-accepted plans of the specified SQL handle or all SQL statements if the SQL handle is NULL.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit in number of minutes. The time limit is global and it is used in the following manner. The time limit for first non-accepted plan is equal to the input value. The time limit for the second non-accepted plan is equal to (input value - time spent in first plan verification) and so on. The default DBMS_SPM.AUTO_LIMIT means let the system choose an appropriate time limit based on the number of plan verifications required to be done. The value DBMS_SPM.NO_LIMIT means no time limit.</td>
</tr>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the task (maximum 256 characters)</td>
</tr>
</tbody>
</table>

Return Values

SQL evolve task unique name

153.6.6 CREATE_STGTAB_BASELINE Procedure

This procedure creates a staging table used for transporting SQL plan baselines from one system to another.

Syntax

```sql
DBMS_SPM.CREATE_STGTAB_BASELINE (
    table_name        IN VARCHAR2,
    table_owner       IN VARCHAR2 := NULL,
    tablespace_name   IN VARCHAR2 := NULL);
```

Parameters

Table 153-11 CREATE_STGTAB_BASELINE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table to create for the purpose of packing and unpacking SQL plan baselines</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of owner of the staging table. Default NULL means current schema is the table owner.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Name of tablespace. Default NULL means create staging table in the default tablespace.</td>
</tr>
</tbody>
</table>
Usage Notes

The creation of staging table is the first step. To migrate SQL plan baselines from one system to another, the user/DBA has to perform a series of steps as follows:

1. Create a staging table in the source system
2. Select SQL plan baselines in the source system and pack them into the staging table
3. Export staging table into a flat file using Oracle EXP utility or Data Pump
4. Transfer flat file to the target system
5. Import staging table from the flat file using Oracle IMP utility or Data Pump
6. Select SQL plan baselines from the staging table and unpack them into the target system

153.6.7 DROP_EVOLVE_TASK Procedure

The procedure drops an evolved task.

Syntax

```
DBMS_SPM.DROP_EVOLVE_TASK  (task_name        IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to drop</td>
</tr>
</tbody>
</table>

153.6.8 DROP_SQL_PLAN_BASELINE Function

This function drops a single plan, or all plans associated with a SQL statement.

Syntax

```
DBMS_SPM.DROP_SQL_PLAN_BASELINE (  
   sql_handle     IN VARCHAR2 := NULL,  
   plan_name      IN VARCHAR2 := NULL)  
RETURN PLS_INTEGER;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement handle. It identifies plans associated with a SQL statement that are to be dropped. If NULL then plan_name must be specified.</td>
</tr>
</tbody>
</table>
Table 153-13  (Cont.) DROP_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_name</td>
<td>Plan name. It identifies a specific plan. Default NULL means to drop all plans associated with the SQL statement identified by sql_handle.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans dropped

153.6.9 EVOLVE_SQL_PLAN_BASELINE Function

This function evolves SQL plan baselines associated with one or more SQL statements. A SQL plan baseline is evolved when one or more of its non-accepted plans is changed to an accepted plan or plans.

If interrogated by the user (parameter verify = 'YES'), the execution performance of each non-accepted plan is compared against the performance of a plan chosen from the associated SQL plan baseline. If the non-accepted plan performance is found to be better than SQL plan baseline performance, the non-accepted plan is changed to an accepted plan provided such action is permitted by the user (parameter commit = 'YES').

The second form of the function employs a plan list format.

Syntax

```sql
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    sql_handle   IN VARCHAR2 := NULL,
    plan_name    IN VARCHAR2 := NULL,
    time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
    verify       IN VARCHAR2 := 'YES',
    commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

```sql
DBMS_SPM.EVOLVE_SQL_PLAN_BASELINE (
    plan_list    IN DBMS_SPM.NAME_LIST,
    time_limit   IN INTEGER  := DBMS_SPM.AUTO_LIMIT,
    verify       IN VARCHAR2 := 'YES',
    commit       IN VARCHAR2 := 'YES')
RETURN CLOB;
```

Parameters

Table 153-14  EVOLVE_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_handle</td>
<td>SQL statement identifier. Unless plan_name is specified, NULL means to consider all statements with non-accepted plans in their SQL plan baselines.</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan identifier. Default NULL means to consider all non-accepted plans in the SQL plan baseline of either the identified SQL statement or all SQL statements if sql_handle is NULL.</td>
</tr>
</tbody>
</table>
Table 153-14  (Cont.) EVOLVE_SQL_PLAN_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>plan_list</td>
<td>A list of plan names. Each plan in the list can belong to same or different SQL statement.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit in number of minutes. This applies only if verify = 'YES'. The time limit is global and it is used as follows: The time limit for first non-accepted plan verification is set equal to the input value; the time limit for second non-accepted plan verification is set equal to (input value - time spent in first plan verification); and so on.</td>
</tr>
<tr>
<td>verify</td>
<td>Specifies whether to execute the plans and compare the performance before changing non-accepted plans into accepted plans. A performance verification involves executing a non-accepted plan and a plan chosen from corresponding SQL plan baseline and comparing their performance statistics. If non-accepted plan shows performance improvement, it is changed to an accepted plan.</td>
</tr>
<tr>
<td>commit</td>
<td>Specifies whether to update the ACCEPTED status of non-accepted plans from 'NO' to 'YES'.</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted text report showing non-accepted plans in sequence, each with a possible change of its ACCEPTED status, and if verify = 'YES' the result of their performance verification.

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.
153.6.10 EXECUTE_EVOLVE_TASK Function

The function executes a previously created evolve task.

Syntax

```sql
DBMS_SPM.EXECUTE_EVOLVE_TASK  
  task_name        IN  VARCHAR2,
  execution_name   IN  VARCHAR2  := NULL,
  execution_desc   IN  VARCHAR2  := NULL); 
RETURN VARCHAR2;
```

Parameters

Table 153-15  EXECUTE_EVOLVE_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If not specified, it is generated by the advisor and returned by the function.</td>
</tr>
<tr>
<td>execution_desc</td>
<td>Description of the execution (maximum 256 characters)</td>
</tr>
</tbody>
</table>

Return Values

Name of the new execution

153.6.11 IMPLEMENT_EVOLVE_TASK Function

The function implements all the actions recommended by an evolve task.

Syntax

```sql
DBMS_SPM.IMPLEMENT_EVOLVE_TASK  
  task_name       IN  VARCHAR2,
  task_owner      IN  VARCHAR2  := NULL,
  execution_name  IN  VARCHAR2  := NULL,
  force           IN BOOLEAN    := FALSE) 
RETURN NUMBER;
```

Parameters

Table 153-16  IMPLEMENT_EVOLVE_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to report</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the action will be taken for the last task execution.</td>
</tr>
</tbody>
</table>
**Table 153-16 (Cont.) IMPLEMENT_EVOLVE_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>Accept all plans even if the advisor did not recommend such an action. The default is FALSE requiring acceptance of the plan only if the plan is verified and shows sufficient improvement in benefit.</td>
</tr>
</tbody>
</table>

**Return Values**

The number of plans accepted

### 153.6.12 INTERRUPT_EVOLVE_TASK Procedure

The procedure interrupts a currently executing evolve task. The task ends its operations as at a normal exit and the user can access the intermediate results. The task can be resumed later.

**Syntax**

```sql
DBMS_SPM.INTERRUPT_EVOLVE_TASK  (
    task_name        IN  VARCHAR2);
```

**Parameters**

**Table 153-17 INTERRUPT_EVOLVE_TASK Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to interrupt</td>
</tr>
</tbody>
</table>

### 153.6.13 LOAD_PLANS_FROM_AWR Function

This function loads the SQL Management Base (SMB) with SQL plan baselines for a set of SQL statements using the plans from the AWR, and returns the number of plans loaded.

**Syntax**

```sql
DBMS_SPM.LOAD_PLANS_FROM_AWR
    begin_snap      IN  NUMBER,
    end_snap        IN  NUMBER,
    basic_filter    IN  VARCHAR2 := NULL,
    fixed           IN  VARCHAR2 := 'NO',
    enabled         IN  VARCHAR2 := 'YES',
    commit_rows     IN  NUMBER := 1000)
RETURN PLS_INTEGER;
```
Parameters

Table 153-18  LOAD_PLANS_FROM_AWR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>Begin snapshot</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from AWR. NULL means all plans in AWR are selected. Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default 'NO' means the loaded plans will not change the current 'fixed' property of the SQL plan baseline into which they are loaded.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans will be considered by the optimizer</td>
</tr>
<tr>
<td>commit_rows</td>
<td>Number of SQL plans to load before doing a periodic commit.</td>
</tr>
<tr>
<td>dbid</td>
<td>The DBID that is used for imported or PDB-level AWR data.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the Administer SQL Management Object privilege

See Also:

For information on the SQLSET_ROW objects, see SQLSET_ROW Object Type.

153.6.14 LOAD_PLANS_FROM_CURSOR_CACHE Functions

This function loads one or more plans present in the cursor cache for a SQL statement, or a set of SQL statements. It has four overloads: using SQL statement text, using SQL handle, using SQL ID, or using attribute_name and attribute_value pair.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (  
sql_id IN VARCHAR2,  
plan_hash_value IN NUMBER := NULL,  
sql_text IN CLOB,  
fixed IN VARCHAR2 := 'NO',  
enabled IN VARCHAR2 := 'YES')  
RETURN PLS_INTEGER;
```

```sql
DBMS_SPM.LOAD_PLANS_FROM_CURSOR_CACHE (  
sql_id IN VARCHAR2,  
plan_hash_value IN NUMBER := NULL,  
```
Parameters

Table 153-19  LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL statement identifier. Identifies a SQL statement in the cursor cache. Note: In the third overload the text of identified SQL statement is extracted from cursor cache and is used to identify the SQL plan baseline into which the plan(s) are loaded. If the SQL plan baseline doesn't exist it is created.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan identifier. Default NULL means capture all plans present in the cursor cache for the SQL statement identified by SQL_ID.</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text to use in identifying the SQL plan baseline into which the plans are loaded. If the SQL plan baseline does not exist, it is created. The use of text is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle to use in identifying the SQL plan baseline into which the plans are loaded. The sql_handle must denote an existing SQL plan baseline. The use of handle is crucial when the user tunes a SQL statement by adding hints to its text and then wants to load the resulting plan(s) into the SQL plan baseline of the original SQL statement.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>One of possible attribute names:</td>
</tr>
<tr>
<td></td>
<td>• SQL_TEXT</td>
</tr>
<tr>
<td></td>
<td>• 'PARSING_SCHEMA_NAME'</td>
</tr>
<tr>
<td></td>
<td>• 'MODULE'</td>
</tr>
<tr>
<td></td>
<td>• 'ACTION'</td>
</tr>
</tbody>
</table>
Table 153-19 LOAD_PLANS_FROM_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_value</td>
<td>Attribute value is used as a search pattern of LIKE predicate if attribute name is 'SQL_TEXT'. Otherwise, it is used as an equality search value. (for example, for specifying attribute_name =&gt; 'SQL_TEXT', and attribute_value =&gt; '%' HR-123 %' means applying SQL_TEXT LIKE '%' HR-123 %' as a selection filter. Similarly, specifying attribute_name =&gt; 'MODULE', and attribute_value =&gt; 'HR' means applying 'MODULE = 'HR' as a plan selection filter). The attribute value is upper-cased except when it is enclosed in double quotes or attribute name is 'SQL_TEXT'.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans are enabled for use by the optimizer</td>
</tr>
</tbody>
</table>

Return Values

Number of plans loaded

Usage Notes

Invoking this subprogram requires the ADMINISTER SQL MANAGEMENT OBJECT privilege.

153.6.15 LOAD_PLANS_FROM_SQLSET Function

This function loads plans stored in a SQL tuning set (STS) into SQL plan baselines. The plans loaded from STS are not verified for performance but added as accepted plans to existing or new SQL plan baselines. This function can be used to seed SQL management base with new SQL plan baselines.

Syntax

```sql
DBMS_SPM.LOAD_PLANS_FROM_SQLSET (  
    sqlset_name      IN  VARCHAR2,  
    sqlset_owner     IN  VARCHAR2 := NULL,  
    basic_filter     IN  VARCHAR2 := NULL,  
    fixed            IN  VARCHAR2 := 'NO',  
    enabled          IN  VARCHAR2 := 'YES'  
    commit_rows      IN  NUMBER   := 1000)  
RETURN PLS_INTEGER;
```

Parameters

Table 153-20 LOAD_PLANS_FROM_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the STS from where the plans are loaded into SQL plan baselines</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of STS. NULL means current schema is the owner.</td>
</tr>
</tbody>
</table>
Table 153-20  (Cont.) LOAD_PLANS_FROM_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>A filter applied to the STS to select only qualifying plans to be loaded. The filter can take the form of any WHERE clause predicate that can specified against the view DATABASE_SET_SQLSTATEMENTS. For example basic_filter =&gt; 'sql_text like 'select /<em>LOAD_STS</em>/%'' or basic_filter =&gt; 'sql_id=''b62q7nc33gzwz'''.</td>
</tr>
<tr>
<td>fixed</td>
<td>Default 'NO' means the loaded plans are used as non-fixed plans. Value 'YES' means the loaded plans are used as fixed plans and the SQL plan baseline will not be evolved over time.</td>
</tr>
<tr>
<td>enabled</td>
<td>Default 'YES' means the loaded plans are enabled for use by the optimizer.</td>
</tr>
<tr>
<td>commit_rows</td>
<td>Number of SQL plans to load before doing a periodic commit. This helps to shorten the undo log.</td>
</tr>
</tbody>
</table>

Return Values

The number of plans loaded

Usage Notes

- To load plans from a remote system, first load the plans into an STS on the remote system, export/import the STS from remote to local system, and then use this function.
- To load plans from Automatic Workload Repository (AWR), first load the plans stored in AWR snapshots into an STS, and then use this procedure.
- The user can also capture plans resident in the cursor cache for one or more SQL statements into an STS, and then use this procedure.

153.6.16 MIGRATE_STORED_OUTLINE Functions

This function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB). Users can specify which stored outline(s) to be migrated based on outline name, SQL text, or outline category, or migrate all stored outlines in the system to SQL plan baselines.

This second overload of the function migrates stored outlines for one or more SQL statements to plan baselines in the SQL management base (SMB) given one or more outline names.

Syntax

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (attribute_name IN VARCHAR2, attribute_value IN CLOB, fixed IN VARCHAR2 := 'NO') RETURN CLOB;
```

```
DBMS_SPM.MIGRATE_STORED_OUTLINE (outln_list IN DBMS_SPM.NAME_LIST,)
```
```sql
fixed IN VARCHAR2 := 'NO')
RETURN CLOB;

Parameters

Table 153-21  MIGRATE_STORED_OUTLINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_name</td>
<td>Specifies the type of parameter used in attribute_value to identify the migrated stored outlines. It is case insensitive. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• outline_name</td>
</tr>
<tr>
<td></td>
<td>• sql_text</td>
</tr>
<tr>
<td></td>
<td>• category</td>
</tr>
<tr>
<td></td>
<td>• all</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Based on attribute_name, this can be:</td>
</tr>
<tr>
<td></td>
<td>• Name of stored outline to be migrated</td>
</tr>
<tr>
<td></td>
<td>• SQL text of stored outlines to be migrated</td>
</tr>
<tr>
<td></td>
<td>• Category of stored outlines to be migrated</td>
</tr>
<tr>
<td></td>
<td>• NULL if attribute_name is all</td>
</tr>
<tr>
<td>fixed</td>
<td>NO (default) or YES. Specifies the &quot;fixed&quot; status of the plans generated during migration. By default, plans are generated as &quot;non-fixed&quot; plans.</td>
</tr>
<tr>
<td>outln_list</td>
<td>List of outline names to be migrated</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing a formatted report to describe the statistics during the migration, including:

- Number of stored outlines successfully migrated
- Number of stored outlines (and also the corresponding outline names) failed to be migrated and the reasons for the failure

Usage Note

- When the user specifies an outline name, the function migrates stored outlines to plan baseline based on given outline name, which uniquely identifies a single stored outline to be migrated.
- When the user specifies SQL text, the function migrates all stored outlines created for a given SQL statement. A single SQL statement can have multiple stored outlines created for it under different category names. One plan baseline plan is created for each stored outline. The new plan baselines have category names set to DEFAULT. The module name of a plan baseline is set to be the same as the stored outline.
- When the user specifies a category name, the function migrates all stored outlines with the given category name. Only one stored outline exists per category per SQL statement. One plan baseline is created for each stored outline.
- When user specifies to migrate all, the function migrates all stored outlines in the system to plan baselines. One plan baseline is created for each stored outline.
153.6.17 PACK_STGTAB_BASELINE Function

This function packs (exports) SQL plan baselines from SQL management base into a staging table.

Syntax

```sql
DBMS_SPM.PACK_STGTAB_BASELINE (  
    table_name       IN VARCHAR2,  
    table_owner      IN VARCHAR2 := NULL,  
    sql_handle       IN VARCHAR2 := NULL,  
    plan_name        IN VARCHAR2 := NULL,  
    sql_text         IN CLOB := NULL,  
    creator          IN VARCHAR2 := NULL,  
    origin           IN VARCHAR2 := NULL,  
    enabled          IN VARCHAR2 := NULL,  
    accepted         IN VARCHAR2 := NULL,  
    fixed            IN VARCHAR2 := NULL,  
    module           IN VARCHAR2 := NULL,  
    action           IN VARCHAR2 := NULL)  
RETURN NUMBER;
```

Parameters

Table 153-22  PACK_STGTAB_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table into which SQL plan baselines are packed (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO-SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

Return Values

Number of SQL plan baselines packed
153.6.18 RESET_EVOLVE_TASK Procedure

This procedure resets an evolve task to its initial state.

All intermediate results will be removed from the task. Call this procedure on a task that is not currently executing.

Syntax

```sql
DBMS_SPM.RESET_EVOLVE_TASK  (
    task_name        IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to reset</td>
</tr>
</tbody>
</table>

153.6.19 RESUME_EVOLVE_TASK Procedure

The procedure resumes a previously interrupted task.

Syntax

```sql
DBMS_SPM.RESUME_EVOLVE_TASK  (
    task_name        IN  VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to resume</td>
</tr>
</tbody>
</table>

153.6.20 REPORT_AUTO_EVOLVE_TASK Function

The procedure displays the results of an execution of an automatic evolve task.

Syntax

```sql
DBMS_SPM.REPORT_AUTO_EVOLVE_TASK  (
    type            IN  VARCHAR2  := TYPE_TEXT,
    level           IN  VARCHAR2  := LEVEL_TYPICAL,
    section         IN  VARCHAR2  := SECTION_ALL,
    object_id       IN  NUMBER    := NULL,
    execution_name  IN  VARCHAR2  := NULL)
RETURN CLOB;
```
Parameters

**Table 153-25 REPORT_AUTO_EVOLVE_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>Type of the report. Possible values are TEXT, HTML, XML</td>
</tr>
<tr>
<td>level</td>
<td>Format of the report. Possible values are BASIC, TYPICAL, ALL</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the report is generated for the last task execution</td>
</tr>
</tbody>
</table>

Return Values

The report

153.6.21 REPORT_EVOLVE_TASK Function

The procedure displays the results of an evolved task.

**Syntax**

```sql
DBMS_SPM.REPORT_EVOLVE_TASK  (
  task_name       IN  VARCHAR2,
  type            IN  VARCHAR2  := TYPE_TEXT,
  level           IN  VARCHAR2  := LEVEL_TYPICAL,
  section         IN  VARCHAR2  := SECTION_ALL,
  object_id       IN  NUMBER    := NULL,
  task_owner      IN  VARCHAR2  := NULL,
  execution_name  IN  VARCHAR2  := NULL)
RETURN CLOB;
```

Parameters

**Table 153-26 REPORT_EVOLVE_TASK Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report. Possible values are TEXT, HTML, XML</td>
</tr>
<tr>
<td>level</td>
<td>Format of the report. Possible values are BASIC, TYPICAL, ALL</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLANS, INFORMATION, ERRORS, ALL</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a single plan. If NULL, the report is generated for all objects</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the evolve task. Defaults to the current schema owner</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name to qualify and identify an execution. If NULL, the report is generated for the last task execution</td>
</tr>
</tbody>
</table>
Return Values

The report

153.6.22 SET_EVOLVE_TASK_PARAMETER Procedure

The procedure sets a parameter of an evolve task, either a VARCHAR2 or a NUMBER.

Syntax

```sql
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (  
  task_name     IN  VARCHAR2,
  parameter     IN  VARCHAR2,
  value         IN  NUMBER);
```

```sql
DBMS_SPM.SET_EVOLVE_TASK_PARAMETER (  
  task_name     IN  VARCHAR2  := NULL,
  parameter     IN  VARCHAR2,
  value         IN  VARCHAR2);
```

Parameters

Table 153-27  SET_EVOLVE_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Evolve task name</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>New value of the parameter</td>
</tr>
</tbody>
</table>

For parameter of type VARCHAR2, the possible parameters are:

- **FIND_NEW_PLANS**: Find new plans and verify them (default 'NO'). When this parameter is 'YES', the task will try to find new plans that are not in the plan history and verify them.
- **ALTERNATE_PLAN_SOURCE**: Determines which sources to search for alternate plans: 'CURSOR_CACHE', 'AUTOMATIC_WORKLOAD_REPOSITORY', or 'SQL_TUNING_SETS'. Multiple values can be combined by delimiting with '+'. The default value is 'CURSOR_CACHE +AUTOMATIC_WORKLOAD_REPOSITORY'.
- **ALTERNATE_PLAN_BASELINE**: Value 'EXISTING' indicates that alternate plans should be loaded for statements with existing SQL plan baselines. Value 'NEW' indicates that alternate plans should be loaded for statements which do not have a SQL plan baseline, in which case a new baseline for the statement will be created. Value 'EXISTING+NEW' will load alternate plans in both cases.

For parameter of type NUMBER, the possible parameters are:

- **TIME_LIMIT**: Global time limit (default DBMS_SPM.AUTO_LIMIT) in minutes. This is the total time allowed for the task.
- **ALTERNATE_PLAN_LIMIT**: The maximum number of alternate plans to load. Default value is 0.
153.6.23 UNPACK_STGTAB_BASELINE Function

This function unpacks (imports) SQL plan baselines from a staging table into SQL management base.

Syntax

```sql
DBMS_SPM.UNPACK_STGTAB_BASELINE (
    table_name       IN VARCHAR2,
    table_owner      IN VARCHAR2 := NULL,
    sql_handle       IN VARCHAR2 := NULL,
    plan_name        IN VARCHAR2 := NULL,
    sql_text         IN CLOB     := NULL,
    creator          IN VARCHAR2 := NULL,
    origin           IN VARCHAR2 := NULL,
    enabled          IN VARCHAR2 := NULL,
    accepted         IN VARCHAR2 := NULL,
    fixed            IN VARCHAR2 := NULL,
    module           IN VARCHAR2 := NULL,
    action           IN VARCHAR2 := NULL)
RETURN NUMBER;
```

Parameters

Table 153-28 UNPACK_STGTAB_BASELINE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Name of staging table from which SQL plan baselines are unpacked (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>table_owner</td>
<td>Name of staging table owner. Default NULL means current schema is the table owner</td>
</tr>
<tr>
<td>sql_handle</td>
<td>SQL handle (case sensitive)</td>
</tr>
<tr>
<td>plan_name</td>
<td>Plan name (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL text string (case sensitive, % wildcards accepted)</td>
</tr>
<tr>
<td>creator</td>
<td>Creator of SQL plan baseline (case insensitive unless double quoted)</td>
</tr>
<tr>
<td>origin</td>
<td>Origin of SQL plan baseline, should be 'MANUAL-LOAD', 'AUTO-CAPTURE', 'MANUAL_SQLTUNE' or 'AUTO_SQLTUNE' (case insensitive)</td>
</tr>
<tr>
<td>enabled</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>accepted</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>fixed</td>
<td>Must be 'YES' or 'NO' (case insensitive)</td>
</tr>
<tr>
<td>module</td>
<td>Module (case sensitive)</td>
</tr>
<tr>
<td>action</td>
<td>Action (case sensitive)</td>
</tr>
</tbody>
</table>

Return Values

Number of plans unpacked
The DBMS_SQL package provides an interface to use dynamic SQL to parse any data manipulation language (DML) or data definition language (DDL) statement using PL/SQL.

For example, you can enter a DROP TABLE statement from within a stored procedure by using the PARSE Procedures supplied with the DBMS_SQL package.

This chapter contains the following topics:

- Overview
- Security Model
- Constants
- Exceptions
- Operational Notes
- Examples
- Data Structures
- Summary of DBMS_SQL Subprograms

See Also:

For more information on native dynamic SQL, see Oracle Database PL/SQL Language Reference.

154.1 DBMS_SQL Overview

Oracle lets you write stored procedures and anonymous PL/SQL blocks that use dynamic SQL. Dynamic SQL statements are not embedded in your source program; rather, they are stored in character strings that are input to, or built by, the program at runtime. This enables you to create more general-purpose procedures. For example, dynamic SQL lets you create a procedure that operates on a table whose name is not known until runtime.

Native Dynamic SQL is an alternative to DBMS_SQL that lets you place dynamic SQL statements directly into PL/SQL blocks. In most situations, Native Dynamic SQL is easier to use and performs better than DBMS_SQL. However, Native Dynamic SQL itself has certain limitations:

- There is no support for so-called Method 4 (for dynamic SQL statements with an unknown number of inputs or outputs)
- There are some tasks that can only be performed using DBMS_SQL. For tasks that require DBMS_SQL, see Oracle Database PL/SQL Language Reference.
The ability to use dynamic SQL from within stored procedures generally follows the model of the Oracle Call Interface (OCI).

See Also:
Oracle Call Interface Programmer's Guide

PL/SQL differs somewhat from other common programming languages, such as C. For example, addresses (also called pointers) are not user-visible in PL/SQL. As a result, there are some differences between the Oracle Call Interface and the \texttt{DBMS\_SQL} package. These differences include the following:

- The OCI binds by address and the \texttt{DBMS\_SQL} package binds by value.
- With \texttt{DBMS\_SQL} you must call \texttt{VARIABLE\_VALUE} to retrieve the value of an \texttt{OUT} parameter for an anonymous block, and you must call \texttt{COLUMN\_VALUE} after fetching rows to retrieve the values of the columns in the rows into your program.
- The current release of the \texttt{DBMS\_SQL} package does not provide \texttt{CANCEL} cursor procedures.
- Indicator variables are not required, because \texttt{NULLs} are fully supported as values of a PL/SQL variable.

154.2 DBMS\_SQL Security Model

\texttt{DBMS\_SQL} is a \texttt{SYS}-owned package compiled with \texttt{AUTHID CURRENT\_USER}. Any \texttt{DBMS\_SQL} subprogram called from an anonymous PL/SQL block runs with the privileges of the current user.

See Also:
Oracle Database PL/SQL Language Reference for more information about using Invoker Rights or Definer Rights

Preventing Malicious or Accidental Access of Open Cursor Numbers

An error, \texttt{ORA-29471}, is raised when any \texttt{DBMS\_SQL} subprogram is called with a cursor number that does not denote an open cursor. When the error is raised, an alert is issued to the alert log and DBMS\_SQL becomes inoperable for the life of the session.

If the actual value for the cursor number in a call to the \texttt{IS\_OPEN Function} denotes a cursor currently open in the session, the return value is \texttt{TRUE}. If the actual value is \texttt{NULL}, then the return value is \texttt{FALSE}. Otherwise, this raises an \texttt{ORA-29471} error.

Preventing Inappropriate Use of a Cursor

Cursors are protected from security breaches that subvert known existing cursors.

Checks are made when binding and executing. Optionally, checks may be performed for every single DBMS\_SQL subprogram call. The check is:
The current_user is the same on calling the subprogram as it was on calling the most recent parse.

The enabled roles on calling the subprogram must be identical to the enabled roles on calling the most recent parse.

The container is the same on calling the subprogram as it was on calling the most recent parse.

Consistent with the use of definer's rights subprograms, roles do not apply.

If either check fails, then an ORA-29470 error is raised.

The mechanism for defining when checks are performed is a new overload for the OPEN_CURSOR subprogram, which takes a formal parameter, security_level, with allowed values NULL, 1 and 2.

- When security_level = 1 (or is NULL), the checks are made only when binding and executing.
- When security_level = 2, the checks are always made.

**Upgrade Considerations**

This security regime is stricter than those in the previous releases. As a consequence, users of DBMS_SQL may encounter runtime errors on upgrade.

### 154.3 DBMS_SQL Constants

The DBMS_SQL Constants package provides constants that are used with the language_flag parameter of the PARSE Procedures.

These constants are described in the following table.

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>V6</td>
<td>INTEGER</td>
<td>0</td>
<td>Specifies Oracle database version 6 behavior</td>
</tr>
<tr>
<td>NATIVE</td>
<td>INTEGER</td>
<td>1</td>
<td>Specifies normal behavior for the database to which the program is connected</td>
</tr>
<tr>
<td>V7</td>
<td>INTEGER</td>
<td>2</td>
<td>Specifies Oracle database version 7 behavior</td>
</tr>
<tr>
<td>FOREIGN_SYNTAX</td>
<td>INTEGER</td>
<td>4294967295</td>
<td>Specifies a non-Oracle database syntax and behavior. The SQL statement to be parsed needs to be translated first using the SQL translation profile set in the database session. The SQL translation profile is a database schema object that directs how SQL statements are translated to Oracle. An error is raised if a profile is not set.</td>
</tr>
</tbody>
</table>
Related Topics

- **PARSE Procedures**
  This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

### 154.4 DBMS_SQL Operational Notes

These operational notes describe processing queries, processing updates, inserts, and deletes, and locating errors.

#### Processing Queries

If you are using dynamic SQL to process a query, then you must perform the following steps:

1. Specify the variables that are to receive the values returned by the `SELECT` statement by calling the `DEFINE_COLUMN Procedures`, the `DEFINE_COLUMN_LONG Procedure`, or the `DEFINE_ARRAY Procedure`.
2. Run your `SELECT` statement by calling the `EXECUTE Function`.
3. Call the `FETCH_ROWS Function` (or `EXECUTE_AND_FETCH`) to retrieve the rows that satisfied your query.
4. Call `COLUMN_VALUE Procedure` or `COLUMN_VALUE_LONG Procedure` to determine the value of a column retrieved by the `FETCH_ROWS Function` for your query. If you used anonymous blocks containing calls to PL/SQL procedures, then you must call the `VARIABLE_VALUE Procedures` to retrieve the values assigned to the output variables of these procedures.

#### Processing Updates, Inserts, and Deletes

If you are using dynamic SQL to process an `INSERT`, `UPDATE`, or `DELETE`, then you must perform the following steps:

1. Run your `INSERT`, `UPDATE`, or `DELETE` statement by calling the `EXECUTE Function`.
2. If statements have the `returning` clause, then you must call the `VARIABLE_VALUE Procedures` to retrieve the values assigned to the output variables.

#### Locating Errors

The `DBMS_SQL` package has additional functions for obtaining information about the last referenced cursor in the session. The values returned by these functions are meaningful only immediately after a SQL statement is run. In addition, some error-locating functions are meaningful only after certain `DBMS_SQL` calls. For example, you call the `LAST_ERROR_POSITION Function` immediately after calling one of the `PARSE Procedures`.

### 154.5 DBMS_SQL Execution Flow

These functions comprise the DBMS_SQL execution flow.

1. `OPEN_CURSOR`
2. `PARSE`
To process a SQL statement, you must have an open cursor. When you call the OPEN_CURSOR Functions, you receive a cursor ID number for the data structure representing a valid cursor maintained by Oracle.

These cursors are distinct from cursors defined at the precompiler, OCI, or PL/SQL level, and are used only by the DBMS_SQL package.

Related Topics
- OPEN_CURSOR Functions
  This function opens a new cursor.

Every SQL statement must be parsed by calling the PARSE procedures. Parsing the statement checks the statement's syntax and associates it with the cursor in your program.

You can parse any DML or DDL statement. DDL statements are run on the parse, which performs the implied commit.

The execution flow of DBMS_SQL is shown in Figure 154-1.
Figure 154-1  DBMS_SQL Execution Flow

Related Topics

- **PARSE Procedures**
  This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.
154.5.3 BIND_VARIABLE, BIND_VARIABLE_PKG or BIND_ARRAY

Many DML statements require that data in your program be input to Oracle. When you define a SQL statement that contains input data to be supplied at runtime, you must use placeholders in the SQL statement to mark where data must be supplied.

For each placeholder in the SQL statement, you must call one of the BIND_ARRAY Procedures, BIND_VARIABLE Procedures, or the BIND_VARIABLE_PKG Procedure to supply the value of a variable in your program (or the values of an array) to the placeholder. When the SQL statement is subsequently run, Oracle uses the data that your program has placed in the output and input, or bind variables.

DBMS_SQL can run a DML statement multiple times — each time with a different bind variable. The BIND_ARRAY procedure lets you bind a collection of scalars, each value of which is used as an input variable once for each EXECUTE. This is similar to the array interface supported by the OCI.

Note that the datatype of the values bound to placeholders cannot be PL/SQL-only datatypes.

154.5.4 DEFINE_COLUMN, DEFINE_COLUMN_LONG, or DEFINE_ARRAY

The DEFINE_COLUMN, DEFINE_COLUMN_LONG, and DEFINE_ARRAY procedures specify the variables that receive SELECT values on a query.

The columns of the row being selected in a SELECT statement are identified by their relative positions as they appear in the select list, from left to right. For a query, you must call one of the define procedures (DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, or DEFINE_ARRAY Procedure) to specify the variables that are to receive the SELECT values, much the way an INTO clause does for a static query.

Use the DEFINE_COLUMN_LONG procedure to define LONG columns, in the same way that DEFINE_COLUMN is used to define non-LONG columns. You must call DEFINE_COLUMN_LONG before using the COLUMN_VALUE_LONG Procedure to fetch from the LONG column.

Use the DEFINE_ARRAY procedure to define a PL/SQL collection into which you want to fetch rows in a single SELECT statement. DEFINE_ARRAY provides an interface to fetch multiple rows at one fetch. You must call DEFINE_ARRAY before using the COLUMN_VALUE procedure to fetch the rows.

154.5.5 EXECUTE

Call the EXECUTE Function to run your SQL statement.

Related Topics

- EXECUTE Function
  This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.
154.5.6 FETCH_ROWS or EXECUTE_AND_FETCH

The FETCH_ROWS Function retrieves the rows that satisfy the query. Each successive fetch retrieves another set of rows, until the fetch is unable to retrieve any more rows. Instead of calling EXECUTE Function and then FETCH_ROWS, you may find it more efficient to call EXECUTE_AND_FETCH Function if you are calling EXECUTE for a single execution.

Related Topics

- **FETCH_ROWS Function**
  This function fetches a row from a given cursor.

- **EXECUTE Function**
  This function executes a given cursor. This function accepts the ID number of the cursor and returns the number of rows processed.

- **EXECUTE_AND_FETCH Function**
  This function executes the given cursor and fetches rows.

154.5.7 VARIABLE_VALUE, VARIABLE_VALUE_PKG, COLUMN_VALUE, or COLUMN_VALUE_LONG

The type of call determines which procedure or function to use.

For queries, call the COLUMN_VALUE Procedure to determine the value of a column retrieved by the FETCH_ROWS Function.

For anonymous blocks containing calls to PL/SQL procedures or DML statements with returning clause, call the VARIABLE_VALUE Procedures or the VARIABLE_VALUE_PKG Procedure to retrieve the values assigned to the output variables when statements were run.

To fetch only part of a LONG database column (which can be up to two gigabytes in size), use the DEFINE_COLUMN_LONG Procedure. You can specify the offset (in bytes) into the column value, and the number of bytes to fetch.

154.5.8 CLOSE_CURSOR

When you no longer need a cursor for a session, close the cursor by calling the CLOSE_CURSOR Procedure. If you are using an Oracle Open Gateway, then you may need to close cursors at other times as well. Consult your Oracle Open Gateway documentation for additional information.

Related Topics

- **CLOSE_CURSOR Procedure**
  This procedure closes a given cursor.
154.6 DBMS_SQL Exceptions

This exception is raised by the COLUMN_VALUE Procedure or the VARIABLE_VALUE Procedures when the type of the given OUT parameter (for where to put the requested value) is different from the type of the value.

```sql
inconsistent_type EXCEPTION;
pragma exception_init(inconsistent_type, -6562);
```

Related Topics

- **COLUMN_VALUE Procedure**
  This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling FETCH_ROWS.

- **VARIABLE_VALUE Procedures**
  This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

154.7 DBMS_SQL Examples

These example procedures use the DBMS_SQL package.

**Example : Using DBMS_SQL Demo**

This example does not need dynamic SQL because the text of the statement is known at compile time, but it illustrates the basic concept underlying the package.

The **DEMO** procedure deletes all of the employees from the **EMP** table whose salaries are greater than the salary that you specify when you run **DEMO**.

```sql
CREATE OR REPLACE PROCEDURE demo(salary IN NUMBER) AS
cursor_name INTEGER;
rows_processed INTEGER;
BEGIN
  cursor_name := dbms_sql.open_cursor;
  DBMS_SQL.PARSE(cursor_name, 'DELETE FROM emp WHERE sal > :x', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(cursor_name, ':x', salary);
  rows_processed := DBMS_SQL.EXECUTE(cursor_name);
  DBMS_SQL.CLOSE_CURSOR(cursor_name);
EXCEPTION
  WHEN OTHERS THEN
    DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;
```

**Example 2**

The following sample procedure is passed a SQL statement, which it then parses and runs:

```sql
CREATE OR REPLACE PROCEDURE exec(STRING IN varchar2) AS
cursor_name INTEGER;
ret INTEGER;
BEGIN
  ...```
cursor_name := DBMS_SQL.OPEN_CURSOR;

DDL statements are run by the parse call, which performs the implied commit.

DBMS_SQL.PARSE(cursor_name, string, DBMS_SQL.NATIVE);
ret := DBMS_SQL.EXECUTE(cursor_name);
DBMS_SQL.CLOSE_CURSOR(cursor_name);
END;

Creating such a procedure enables you to perform the following operations:

• The SQL statement can be dynamically generated at runtime by the calling program.
• The SQL statement can be a DDL statement or a DML without binds.

For example, after creating this procedure, you could make the following call:
exec('create table acct(c1 integer)');

You could even call this procedure remotely, as shown in the following example. This lets you perform remote DDL.
exec@domain.com('CREATE TABLE acct(c1 INTEGER)');

Example 3

The following sample procedure is passed the names of a source and a destination table, and copies the rows from the source table to the destination table. This sample procedure assumes that both the source and destination tables have the following columns:

<table>
<thead>
<tr>
<th>id</th>
<th>of type NUMBER</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>of type VARCHAR2(30)</td>
</tr>
<tr>
<td>birthdate</td>
<td>of type DATE</td>
</tr>
</tbody>
</table>

This procedure does not need the use of dynamic SQL; however, it illustrates the concepts of this package.

CREATE OR REPLACE PROCEDURE copy (
    source      IN VARCHAR2,
    destination IN VARCHAR2) IS
    id_var             NUMBER;
    name_var           VARCHAR2(30);
    birthdate_var      DATE;
    source_cursor      INTEGER;
    destination_cursor INTEGER;
    ignore             INTEGER;
BEGIN
    -- Prepare a cursor to select from the source table:
    source_cursor := dbms_sql.open_cursor;
    DBMS_SQL.PARSE(source_cursor, 'SELECT id, name, birthdate FROM ' || source, DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 1, id_var);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 2, name_var, 30);
    DBMS_SQL.DEFINE_COLUMN(source_cursor, 3, birthdate_var);
    ignore := DBMS_SQL.EXECUTE(source_cursor);

    -- Prepare a cursor to insert into the destination table:
destination_cursor := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(destination_cursor,
   'INSERT INTO ' || destination || |
   ' VALUES (:id_bind, :name_bind, :birthdate_bind)',
   DBMS_SQL.NATIVE);

-- Fetch a row from the source table and insert it into the destination table:
LOOP
   IF DBMS_SQL.FETCH_ROWS(source_cursor)>0 THEN
      -- get column values of the row
      DBMS_SQL.COLUMN_VALUE(source_cursor, 1, id_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 2, name_var);
      DBMS_SQL.COLUMN_VALUE(source_cursor, 3, birthdate_var);
      -- Bind the row into the cursor that inserts into the destination table. You
      -- could alter this example to require the use of dynamic SQL by inserting an
      -- if condition before the bind.
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':id_bind', id_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':name_bind', name_var);
      DBMS_SQL.BIND_VARIABLE(destination_cursor, ':birthdate_bind',
                                 birthdate_var);
      ignore := DBMS_SQL.EXECUTE(destination_cursor);
   ELSE
      -- No more rows to copy:
      EXIT;
   END IF;
END LOOP;

-- Commit and close all cursors:
COMMIT;
DBMS_SQL.CLOSE_CURSOR(source_cursor);
DBMS_SQL.CLOSE_CURSOR(destination_cursor);
EXCEPTION
   WHEN OTHERS THEN
      IF DBMS_SQL.IS_OPEN(source_cursor) THEN
         DBMS_SQL.CLOSE_CURSOR(source_cursor);
      END IF;
      IF DBMS_SQL.IS_OPEN(destination_cursor) THEN
         DBMS_SQL.CLOSE_CURSOR(destination_cursor);
      END IF;
      RAISE;
END;
/

Example 4: RETURNING clause

With this clause, INSERT, UPDATE, and DELETE statements can return values of expressions in bind variables.

If a single row is inserted, updated, or deleted, then use DBMS_SQL.BIND_VARIABLE to bind these outbinds. To get the values in these bind variables, call DBMS_SQL.VARIABLE_VALUE.

Note:

This process is similar to DBMS_SQL.VARIABLE_VALUE, which must be called after running a PL/SQL block with an outbind inside DBMS_SQL.
i) Single-row insert

```
CREATE OR REPLACE PROCEDURE single_Row_insert
   (c1 NUMBER, c2 NUMBER, r OUT NUMBER) is
   c NUMBER;
   n NUMBER;
   begin
   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, 'INSERT INTO tab VALUES (:bnd1, :bnd2) ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
   n := DBMS_SQL.EXECUTE(c);
   DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r); -- get value of outbind variable
   DBMS_SQL.CLOSE_CURSOR(c);
   END;
   /
```

ii) Single-row update

```
CREATE OR REPLACE PROCEDURE single_Row_update
   (c1 NUMBER, c2 NUMBER, r out NUMBER) IS
   c NUMBER;
   n NUMBER;
   BEGIN
   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1, c2 = :bnd2 ' ||
      'WHERE rownum < 2 ' ||
      'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
   n := DBMS_SQL.EXECUTE(c);
   DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
   DBMS_SQL.CLOSE_CURSOR(c);
   END;
   /
```

iii) Single-row delete

```
CREATE OR REPLACE PROCEDURE single_Row_Delete
   (c1 NUMBER, r OUT NUMBER) is
   c NUMBER;
   n number;
   BEGIN
   c := DBMS_SQL.OPEN_CURSOR;
   DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE ROWNUM = :bnd1 ' ||
      'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
   DBMS_SQL.BIND_VARIABLE(c, 'bnd3', r);
   n := DBMS_SQL.EXECUTE(c);
   DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
   DBMS_SQL.CLOSE_CURSOR(c);
   END;
   /
```

iv) Multiple-row insert
CREATE OR REPLACE PROCEDURE multi_Row_insert
  (c1 DBMS_SQL.NUMBER_TABLE, c2 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'insert into tab VALUES (:bnd1, :bnd2) ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

v) Multiple-row update.

CREATE OR REPLACE PROCEDURE multi_Row_update
  (c1 NUMBER, c2 NUMBER, r OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'UPDATE tab SET c1 = :bnd1 WHERE c2 = :bnd2 ' ||
    'RETURNING c1*c2 INTO :bnd3', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd1', c1);
  DBMS_SQL.BIND_VARIABLE(c, 'bnd2', c2);
  DBMS_SQL.BIND_ARRAY(c, 'bnd3', r);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd3', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

Note:

bnd1 and bnd2 can be arrays too. The value of the expression for all the
rows updated will be in bnd3. There is no way to determine which rows were
updated for each value of bnd1 and bnd2.

vi) Multiple-row delete

CREATE OR REPLACE PROCEDURE multi_row_delete
  (c1 DBMS_SQL.NUMBER_TABLE,
   r OUT DBMS_SQL.NUMBER_TABLE) is
  c NUMBER;
  n NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'DELETE FROM tab WHERE c1 = :bnd1' ||
    'RETURNING c1*c2 INTO :bnd2', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', c1);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', c2);
  n := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', r);-- get value of outbind variable
  DBMS_SQL.CLOSE_CURSOR(c);
END;
/

Chapter 154
DBMS_SQL Examples
154-13
vii) outbind in bulk PL/SQL

CREATE OR REPLACE PROCEDURE foo (n NUMBER, square OUT NUMBER) IS
BEGIN square := n * n; END;/

CREATE OR REPLACE PROCEDURE bulk_plsql
  (n DBMS_SQL.NUMBER_TABLE, square OUT DBMS_SQL.NUMBER_TABLE) IS
  c NUMBER;
r NUMBER;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, 'BEGIN foo(:bnd1, :bnd2); END;', DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_ARRAY(c, 'bnd1', n);
  DBMS_SQL.BIND_ARRAY(c, 'bnd2', square);
  r := DBMS_SQL.EXECUTE(c);
  DBMS_SQL.VARIABLE_VALUE(c, 'bnd2', square);
END;
/

Note:

DBMS_SQL.BIND_ARRAY of number_Table internally binds a number. The number of
times statement is run depends on the number of elements in an inbind
array.

Example 5: Binds and Defines of User-defined Types in DBMS_SQL

CREATE TYPE dnames_var IS VARRAY(7) OF VARCHAR2(30)
/

CREATE TABLE depts (region VARCHAR2(25), dept_names dnames_var)
/
INSERT INTO depts VALUES('Europe', dnames_var('Shipping','Sales','Finance'))
/
INSERT INTO depts VALUES('Americas', dnames_var('Sales','Finance','Shipping'))
/
INSERT INTO depts VALUES('Asia', dnames_var('Finance','Payroll','Shipping','Sales'))
/

CREATE OR REPLACE PROCEDURE update_depts(new_dnames dnames_var, region VARCHAR2) IS
  some_dnames dnames_var;
c NUMBER;
r NUMBER;
sql_stmt VARCHAR2(32767) :=
  'UPDATE depts SET dept_names = :b1 WHERE region = :b2 RETURNING dept_names
  INTO :b3';
BEGIN
  c := DBMS_SQL.OPEN_CURSOR;
  DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
  DBMS_SQL.BIND_VARIABLE(c, 'b1', new_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b2', region);
DBMS_SQL.BIND_VARIABLE(c, 'b3', some_dnames);

r := DBMS_SQL.EXECUTE(c);

-- Get value of outbind variable
DBMS_SQL.VARIABLE_VALUE(c, 'b3', some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- select dept_names
sql_stmt := 'SELECT dept_names FROM depts WHERE region = :b1';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);

DBMS_SQL.DEFINE_COLUMN(c, 1, some_dnames);
DBMS_SQL.BIND_VARIABLE(c, 'b1', region);
r := DBMS_SQL.EXECUTE_AND_FETCH(c);

DBMS_SQL.COLUMN_VALUE(c, 1, some_dnames);

DBMS_SQL.CLOSE_CURSOR(c);

-- loop through some_dnames collections
FOR i IN some_dnames.FIRST .. some_dnames.LAST  LOOP
  DBMS_OUTPUT.PUT_LINE('Dept. Name = ' || some_dnames(i) || ' Updated!');
END LOOP;
END;
/

DECLARE
new_dnames dnames_var;
BEGIN
  new_dnames := dnames_var('Benefits', 'Advertising', 'Contracting', 'Executive', 'Marketing');
  update_depts(new_dnames, 'Asia');
END;
/

154.8 DBMS_SQL Data Structures

The DBMS_SQL package defines RECORD type and TABLE type data structures.

RECORD Types

- DBMS_SQL_DESC_REC Record Type (deprecated)
- DBMS_SQL_DESC_REC2 Record Type
- DBMS_SQL_DESC_REC3 Record Type
- DBMS_SQL_DESC_REC4 Record Type

TABLE Types for DESCRIBE_COLUMNS Procedures

- DBMS_SQL_DESC_TAB Table Type
- DBMS_SQL_DESC_TAB2 Table Type
· DBMS_SQL DESC_TAB3 Table Type
· DBMS_SQL DESC_TAB4 Table Type

**TABLE Types For Scalar and LOB Collections**

DBMS_SQL bulk operations are only supported with these predefined DBMS_SQL TABLE types.

· BFILE_TABLE Table Type
· BINARY_DOUBLE_TABLE Table Type
· BINARY_FLOAT_TABLE Table Type
· BLOB_TABLE Table Type
· CLOB_TABLE Table Type
· DATE_TABLE Table Type
· INTERVAL_DAY_TO_SECOND_TABLE Table Type
· INTERVAL_YEAR_TO_MONTH_TABLE Table Type
· NUMBER_TABLE Table Type
· TIME_TABLE Table Type
· TIME_WITH_TIME_ZONE_TABLE Table Type
· TIMESTAMP_TABLE Table Type
· TIMESTAMP_WITH_LTZ_TABLE Table Type
· TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type
· UROWID_TABLE Table Type
· VARCHAR2_TABLE Table Type
· VARCHAR2A Table Type
· VARCHAR2S Table Type

### 154.8.1 DBMS_SQL DESC_REC Record Type

This record type holds the describe information for a single column in a dynamic query.

**Note:**

This type has been deprecated in favor of the DESC_REC2 Record Type.

It is the element type of the DESC_TAB table type and the DESCRIBE_COLUMNS Procedure.

**Syntax**

```
TYPE desc_rec IS RECORD (  
  col_type            BINARY_INTEGER := 0,  
  col_max_len         BINARY_INTEGER := 0,  
);  
```
```sql
col_name            VARCHAR2(32)   := '',
col_name_len        BINARY_INTEGER := 0,
col_schema_name     VARCHAR2(32)   := '',
col_schema_name_len BINARY_INTEGER := 0,
col_precision       BINARY_INTEGER := 0,
col_scale           BINARY_INTEGER := 0,
col_charsetid       BINARY_INTEGER := 0,
col_charsetform     BINARY_INTEGER := 0,
col_null_ok         BOOLEAN        := TRUE);
```

```sql
TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;
```

**Fields**

**Table 154-2 DESC_REC Fields**

<table>
<thead>

</tr>
</tbody>
</table>

### 154.8.2 DBMS_SQL DESC_REC2 Record Type

DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

This record type is identical to DESC_REC except for the col_name field, which has been expanded to the maximum possible size for VARCHAR2. It is therefore preferred to DESC_REC because column name values can be greater than 32 characters. DESC_REC is deprecated as a result.

**Syntax**

```sql
TYPE desc_rec2 IS RECORD (
    col_type            binary_integer := 0,
    col_max_len         binary_integer := 0,
    col_name            varchar2(32767) := '',
    col_name_len        binary_integer := 0,
    col_schema_name     varchar2(32)   := '',
    col_schema_name_len binary_integer := 0,
    col_precision       binary_integer := 0,
    col_scale           binary_integer := 0,
    col_charsetid       binary_integer := 0,
    col_charsetform     binary_integer := 0,
    col_null_ok         boolean        := TRUE);
```

</tr>
</tbody>
</table>

Related Topics

• DESCRIPT_COLUMNS2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIPT_COLUMNS Procedure.

154.8.3 DBMS_SQL DESC_REC3 Record Type

DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

DESC_REC3 is identical to DESC_REC2 except for two additional fields to hold the type name (type_name) and type name len (type_name_len) of a column in a dynamic query. These two fields hold the type name and type name length when the column is a user-defined type (a collection or object type). The col_type_name and col_type_name_len fields are only populated when the col_type field's value is 109, the Oracle type number for user-defined types.

Syntax

```
TYPE desc_rec3 IS RECORD {
  col_type               binary_integer := 0,
  col_max_len            binary_integer := 0,
  col_name               varchar2(32767) := '',
  col_name_len           binary_integer := 0,
  col_schema_name        varchar2(32) := '',
  col_schema_name_len    binary_integer := 0,
  col_precision          binary_integer := 0,
  col_scale              binary_integer := 0,
  col_charsetid          binary_integer := 0,
  col_charsetform        binary_integer := 0,
  col_null_ok            boolean := TRUE,
  col_type_name          varchar2(32767)   := '',
  col_type_name_len      binary_integer := 0);
```

### Related Topics

- **DESCRIBE_COLUMN3 Procedure**
  
  This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

### 154.8.4 DBMS_SQL DESC_REC4 Record Type

DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMN3 Procedure.

DESC_REC4 is identical to DESC_REC3 except that it supports longer identifiers in the fields that hold the schema name (col_schema_name) and type name (col_type_name) of a column in a dynamic query.

#### Syntax

```sql
TYPE desc_rec4 IS RECORD (  
    col_type       binary_integer := 0,  
    col_max_len    binary_integer := 0,  
    col_name       varchar2(32767) := '',  
    col_name_len   binary_integer := 0,  
    col_schema_name DBMS_ID := '',  
    col_schema_name_len binary_integer := 0,  
    col_precision  binary_integer := 0,  
    col_scale      binary_integer := 0,  
    col_charsetid  binary_integer := 0,  
    col_charsetform binary_integer := 0,  
    col_null_ok    boolean := TRUE,  
)`

Related Topics

- DESCRIBE_COLUMNS3 Procedure
  This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

154.8.5 DBMS_SQL BFILE_TABLE Table Type

This is a table of BFILE.

Syntax

```sql
TYPE bfile_table IS TABLE OF BFILE INDEX BY BINARY_INTEGER;
```
154.8.6 DBMS_SQL BINARY_DOUBLE_TABLE Table Type

This is a table of BINARY_DOUBLE.

Syntax

TYPE binary_double_table IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

154.8.7 DBMS_SQL BINARY_FLOAT_TABLE Table Type

This is a table of BINARY_FLOAT.

Syntax

TYPE binary_float_table IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

154.8.8 DBMS_SQL BLOB_TABLE Table Type

This is a table of BLOB.

Syntax

TYPE blob_table IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

154.8.9 DBMS_SQL CLOB_TABLE Table Type

This is a table of CLOB.

Syntax

TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

154.8.10 DBMS_SQL DATE_TABLE Table Type

This is a table of DATE.

Syntax

TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;

154.8.11 DBMS_SQL DESC_TAB Table Type

This is a table of DESC_REC Record Type.

Syntax

TYPE desc_tab IS TABLE OF desc_rec INDEX BY BINARY_INTEGER;

Related Topics

- DBMS_SQL DESC_REC Record Type
  This record type holds the describe information for a single column in a dynamic query.
154.8.12 DBMS_SQL DESC_TAB2 Table Type

This is a table of DESC_REC2 Record Type.

Syntax

TYPE desc_tab2 IS TABLE OF desc_rec2 INDEX BY BINARY_INTEGER;

Related Topics

- DBMS_SQL DESC_REC2 Record Type
  DESC_REC2 is the element type of the DESC_TAB2 table type and the DESCRIBE_COLUMNS2 Procedure.

154.8.13 DBMS_SQL DESC_TAB3 Table Type

This is a table of DESC_REC3 Record Type.

Syntax

TYPE desc_tab3 IS TABLE OF desc_rec3 INDEX BY BINARY_INTEGER;

Related Topics

- DBMS_SQL DESC_REC3 Record Type
  DESC_REC3 is the element type of the DESC_TAB3 table type and the DESCRIBE_COLUMNS3 Procedure.

154.8.14 DBMS_SQL DESC_TAB4 Table Type

This is a table of DBMS_SQL DESC_REC4 Record Type.

Syntax

TYPE DESC_TAB4 IS TABLE OF DESC_REC4 INDEX BY BINARY_INTEGER;

Related Topics

- DBMS_SQL DESC_REC4 Record Type
  DESC_REC4 is the element type of the DESC_TAB4 table type and the DESCRIBE_COLUMNS3 Procedure.

154.8.15 DBMS_SQL INTERVAL_DAY_TO_SECOND_TABLE Table Type

This is a table of DSINTERVAL_UNCONSTRAINED.

Syntax

TYPE interval_day_to_second_table IS TABLE OF DSINTERVAL_UNCONSTRAINED INDEX BY binary_integer;
154.8.16 DBMS_SQL INTERVAL_YEAR_TO_MONTH_TABLE Table Type

This is a table of YMINTERVAL_UNCONSTRAINED.

Syntax

```
TYPE interval_year_to_month_table IS TABLE OF YMINTERVAL_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;
```

154.8.17 DBMS_SQL NUMBER_TABLE Table Type

This is a table of NUMBER.

Syntax

```
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
```

154.8.18 DBMS_SQL TIME_TABLE Table Type

This is a table of TIME_UNCONSTRAINED.

Syntax

```
TYPE time_table IS TABLE OF TIME_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

154.8.19 DBMS_SQL TIME_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIME_TZ_UNCONSTRAINED.

Syntax

```
TYPE time_with_time_zone_table IS TABLE OF TIME_TZ_UNCONSTRAINED
   INDEX BY BINARY_INTEGER;
```

154.8.20 DBMS_SQL TIMESTAMP_TABLE Table Type

This is a table of TIMESTAMP_UNCONSTRAINED.

Syntax

```
TYPE timestamp_table IS TABLE OF TIMESTAMP_UNCONSTRAINED INDEX BY BINARY_INTEGER;
```

154.8.21 DBMS_SQL TIMESTAMP_WITH_LTZ_TABLE Table Type

This is a table of TIMESTAMP_LTZ_UNCONSTRAINED.

Syntax

```
TYPE timestamp_with_ltz_table IS TABLE OF
   TIMESTAMP_LTZ_UNCONSTRAINED INDEX BY binary_integer;
```
154.8.22 DBMS_SQL TIMESTAMP_WITH_TIME_ZONE_TABLE Table Type

This is a table of TIMESTAMP_TZ_UNCONSTRAINED.

Syntax

```
TYPE timestamp_with_time_zone_table IS TABLE OF
    TIMESTAMP_TZ_UNCONSTRAINED INDEX BY binary_integer;
```

154.8.23 DBMS_SQL UROWID_TABLE Table Type

This is a table of UROWID.

Syntax

```
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
```

154.8.24 DBMS_SQL VARCHAR2_TABLE Table Type

This is a table of VARCHAR2(2000).

Syntax

```
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

154.8.25 DBMS_SQL VARCHAR2A Table Type

This is a table of VARCHAR2(32767).

Syntax

```
TYPE varchar2a IS TABLE OF VARCHAR2(32767) INDEX BY BINARY_INTEGER;
```

154.8.26 DBMS_SQL VARCHAR2S Table Type

This is a table of VARCHAR2(256).

**Note:**

This type has been superseded by the VARCHAR2A Table Type. Although it is currently retained for backward compatibility of legacy code, it is in the process of deprecation and will be de-supported in a future release.

Syntax

```
TYPE varchar2s IS TABLE OF VARCHAR2(256) INDEX BY BINARY_INTEGER;
```
154.9 Summary of DBMS_SQL Subprograms

This table lists the DBMS_SQL subprograms and briefly describes them.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>

<td>Takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.</td>
</tr>
<tr>
<td>TO_REFCURSOR Function</td>
<td>Takes an OPENed, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable <code>REF CURSOR</code> (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.</td>
</tr>
<tr>
<td>VARIABLE_VALUE Procedures</td>
<td>Returns value of named variable for given cursor.</td>
</tr>
<tr>
<td>VARIABLE_VALUE_PKG Procedure</td>
<td>Returns value of named variable for given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification.</td>
</tr>
</tbody>
</table>

154.9.1 BIND_ARRAY Procedures

This procedure binds a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

Syntax

```sql
DBMS_SQL.BIND_ARRAY {
    c                   IN INTEGER,
    name                IN VARCHAR2,
    <table_variable>    IN <datatype>
[,index1              IN INTEGER,
    index2              IN INTEGER]
};
```

Where the `<table_variable>` and its corresponding `<datatype>` can be any one of the following matching pairs:

- `<clob_tab>` Clob_Table
- `<bflt_tab>` Binary_Float_Table
- `<bdbl_tab>` Binary_Double_Table
- `<blob_tab>` Blob_Table
- `<bfile_tab>` Bfile_Table
- `<date_tab>` Date_Table
- `<num_tab>` Number_Table
- `<urowid_tab>` Urowid_Table
- `<vchr2_tab>` Varchar2_Table
- `<tm_tab>` Time_Table
- `<ttz_tab>` Time_With_Time_Zone_Table
- `<tms_tab>` Timestamp_Table
- `<tstz_tab>` Timestamp_With_Tz_Table
- `<tstz_tab>` Timestamp_With_Time_Zone_Table
Notice that the `BIND_ARRAY` procedure is overloaded to accept different datatypes.

### Parameters

#### Table 154-7  BIND_ARRAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the collection in the statement.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as <code>&lt;datatype&gt;</code>.</td>
</tr>
<tr>
<td>index1</td>
<td>Index for the table element that marks the lower bound of the range.</td>
</tr>
<tr>
<td>index2</td>
<td>Index for the table element that marks the upper bound of the range.</td>
</tr>
</tbody>
</table>

#### Usage Notes

For binding a range, the table must contain the elements that specify the range — `tab(index1)` and `tab(index2)` — but the range does not have to be dense. `index1` must be less than or equal to `index2`. All elements between `tab(index1)` and `tab(index2)` are used in the bind.

If you do not specify indexes in the bind call, and two different binds in a statement specify tables that contain a different number of elements, then the number of elements actually used is the minimum number between all tables. This is also the case if you specify indexes — the minimum range is selected between the two indexes for all tables.

Not all bind variables in a query have to be array binds. Some can be regular binds and the same value are used for each element of the collections in expression evaluations (and so forth).

#### Bulk Array Binds

Bulk selects, inserts, updates, and deletes can enhance the performance of applications by bundling many calls into one. The `DBMS_SQL` package lets you work on collections of data using the PL/SQL table type.

`Table items` are unbounded homogeneous collections. In persistent storage, they are like other relational tables and have no intrinsic ordering. But when a table item is brought into the workspace (either by querying or by navigational access of persistent data), or when it is created as the value of a PL/SQL variable or parameter, its elements are given subscripts that can be used with array-style syntax to get and set the values of elements.

The subscripts of these elements need not be dense, and can be any number including negative numbers. For example, a table item can contain elements at locations -10, 2, and 7 only.

When a table item is moved from transient workspace to persistent storage, the subscripts are not stored; the table item is unordered in persistent storage.

At bind time the table is copied out from the PL/SQL buffers into local `DBMS_SQL` buffers (the same as for all scalar types) and then the table is manipulated from the local
DBMS_SQL buffers. Therefore, if you change the table after the bind call, then that change does not affect the way the execute acts.

### Types for Scalar and LOB Collections

You can declare a local variable as one of the following table-item types, which are defined as public types in DBMS_SQL.

```sql
TYPE binary_double_table
    IS TABLE OF BINARY_DOUBLE INDEX BY BINARY_INTEGER;

TYPE binary_float_table
    IS TABLE OF BINARY_FLOAT INDEX BY BINARY_INTEGER;

TYPE bfile_table
    IS TABLE OF BFILE INDEX BY BINARY_INTEGER;

TYPE blob_table
    IS TABLE OF BLOB INDEX BY BINARY_INTEGER;

TYPE clob_table
    IS TABLE OF CLOB INDEX BY BINARY_INTEGER;

TYPE date_table
    IS TABLE OF DATE INDEX BY BINARY_INTEGER;

TYPE interval_day_to_second_table
    IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE interval_year_to_MONTH_table
    IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;

TYPE number_table
    IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;

TYPE time_table
    IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;

TYPE time_with_time_zone_table
    IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_table
    IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_ltz_table
    IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;

TYPE timestamp_with_time_zone_table
    IS TABLE OF timestamp_tz_unconstrained INDEX BY BINARY_INTEGER;

TYPE urowid_table
    IS TABLE OF UROWID INDEX BY BINARY_INTEGER;

TYPE varchar2_table
    IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;
```

### Example 154-1 Examples Using Bulk DML

This series of examples shows how to use bulk array binds (table items) in the SQL DML statements `INSERT`, `UPDATE` and `DELETE`.

Here is an example of a bulk `INSERT` statement that demonstrates adding seven new employees to the `emp` table:

```sql
DECLARE
  stmt VARCHAR2(200);
  empno_array  DBMS_SQL.NUMBER_TABLE;
  empname_array DBMS_SQL.VARCHAR2_TABLE;
  jobs_array   DBMS_SQL.VARCHAR2_TABLE;
  mgr_array    DBMS_SQL.NUMBER_TABLE;
  hiredate_array DBMS_SQL.VARCHAR2_TABLE;
  sal_array    DBMS_SQL.NUMBER_TABLE;
  comm_array   DBMS_SQL.NUMBER_TABLE;
  deptno_array DBMS_SQL.NUMBER_TABLE;
  c            NUMBER;
  dummy        NUMBER;
BEGIN
  empno_array(1) := 9001;
```
empno_array(2) := 9002;
empno_array(3) := 9003;
empno_array(4) := 9004;
empno_array(5) := 9005;
empno_array(6) := 9006;
empno_array(7) := 9007;

empname_array(1) := 'Dopey';
empname_array(2) := 'Grumpy';
empname_array(3) := 'Doc';
empname_array(4) := 'Happy';
empname_array(5) := 'Bashful';
empname_array(6) := 'Sneezy';
empname_array(7) := 'Sleepy';

jobs_array(1) := 'Miner';
jobs_array(2) := 'Miner';
jobs_array(3) := 'Miner';
jobs_array(4) := 'Miner';
jobs_array(5) := 'Miner';
jobs_array(6) := 'Miner';
jobs_array(7) := 'Miner';

mgr_array(1) := 9003;
mgr_array(2) := 9003;
mgr_array(3) := 9003;
mgr_array(4) := 9003;
mgr_array(5) := 9003;
mgr_array(6) := 9003;
mgr_array(7) := 9003;

hiredate_array(1) := '06-DEC-2006';
hiredate_array(2) := '06-DEC-2006';
hiredate_array(3) := '06-DEC-2006';
hiredate_array(4) := '06-DEC-2006';
hiredate_array(5) := '06-DEC-2006';
hiredate_array(6) := '06-DEC-2006';
hiredate_array(7) := '06-DEC-2006';

sal_array(1) := 1000;
sal_array(2) := 1000;
sal_array(3) := 1000;
sal_array(4) := 1000;
sal_array(5) := 1000;
sal_array(6) := 1000;
sal_array(7) := 1000;

comm_array(1) := 0;
comm_array(2) := 0;
comm_array(3) := 0;
comm_array(4) := 0;
comm_array(5) := 0;
comm_array(6) := 0;
comm_array(7) := 0;

depthno_array(1) := 11;
depthno_array(2) := 11;
depthno_array(3) := 11;
depthno_array(4) := 11;
depthno_array(5) := 11;
depthno_array(6) := 11;
deptno_array(7) := 11;

stmt := 'INSERT INTO emp VALUES(
    :num_array, :name_array, :jobs_array, :mgr_array, :hiredate_array,
    :sal_array, :comm_array, :deptno_array)';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':name_array', empname_array);
DBMS_SQL.BIND_ARRAY(c, ':jobs_array', jobs_array);
DBMS_SQL.BIND_ARRAY(c, ':mgr_array', mgr_array);
DBMS_SQL.BIND_ARRAY(c, ':hiredate_array', hiredate_array);
DBMS_SQL.BIND_ARRAY(c, ':sal_array', sal_array);
DBMS_SQL.BIND_ARRAY(c, ':comm_array', comm_array);
DBMS_SQL.BIND_ARRAY(c, ':deptno_array', deptno_array);

dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
SHOW ERRORS;

Here is an example of a bulk UPDATE statement that demonstrates updating salaries for four existing employees in the emp table:

DECLARE
    stmt VARCHAR2(200);
    empno_array DBMS_SQL.NUMBER_TABLE;
    salary_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN

    empno_array(1) := 7369;
    empno_array(2) := 7876;
    empno_array(3) := 7900;
    empno_array(4) := 7934;

    salary_array(1) := 10000;
    salary_array(2) := 10000;
    salary_array(3) := 10000;
    salary_array(4) := 10000;

    stmt := 'update emp set sal = :salary_array
        WHERE empno = :num_array';
c := DBMS_SQL.OPEN_CURSOR;
DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
DBMS_SQL.BIND_ARRAY(c, ':num_array', empno_array);
DBMS_SQL.BIND_ARRAY(c, ':salary_array', salary_array);
dummy := DBMS_SQL.EXECUTE(c);
DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
In a DELETE statement, for example, you could bind an array in the WHERE clause and have the statement be run for each element in the array:

```sql
DECLARE
    stmt VARCHAR2(200);
    dept_no_array DBMS_SQL.NUMBER_TABLE;
    c NUMBER;
    dummy NUMBER;
BEGIN
    dept_no_array(1) := 10; dept_no_array(2) := 20;
    dept_no_array(3) := 30; dept_no_array(4) := 40;
    dept_no_array(5) := 30; dept_no_array(6) := 40;
    stmt := 'delete from emp where deptno = :dept_array';
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, stmt, DBMS_SQL.NATIVE);
    DBMS_SQL.BIND_ARRAY(c, ':dept_array', dept_no_array, 1, 4);
    dummy := DBMS_SQL.EXECUTE(c);
    DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION
    WHEN OTHERS THEN
        IF DBMS_SQL.IS_OPEN(c) THEN
            DBMS_SQL.CLOSE_CURSOR(c);
        END IF;
        RAISE;
END;
/
```

In the preceding example, only elements 1 through 4 are used as specified by the BIND_ARRAY call. Each element of the array potentially deletes a large number of employees from the database.

### 154.9.2 BIND_VARIABLE Procedures

These procedures bind a given value or set of values to a given variable in a cursor, based on the name of the variable in the statement.

**Syntax**

```sql
DBMS_SQL.BIND_VARIABLE (c IN INTEGER, name IN VARCHAR2, value IN <datatype>);
```

Where `<datatype>` can be any one of the following types:

- ADT (user-defined object types)
- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BOOLEAN
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NESTED table
- NUMBER
Notice that BIND_VARIABLE is overloaded to accept different datatype.

The following syntax is also supported for BIND_VARIABLE. The square brackets [] indicate an optional parameter for the BIND_VARIABLE procedure.

```
DBMS_SQL.BIND_VARIABLE (c IN INTEGER, name IN VARCHAR2, value IN VARCHAR2 CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

To bind CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```
DBMS_SQL.BIND_VARIABLE_CHAR (c IN INTEGER, name IN VARCHAR2, value IN CHAR CHARACTER SET ANY_CS [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_RAW (c IN INTEGER, name IN VARCHAR2, value IN RAW [,out_value_size IN INTEGER]);
```

```
DBMS_SQL.BIND_VARIABLE_ROWID (c IN INTEGER, name IN VARCHAR2, value IN ROWID);
```

Pragmas

```
pragma restrict_references(bind_variable,WNDS);
```

Parameters

### Table 154-8  BIND_VARIABLE Procedures Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind a value.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable in the statement. The length of the bind variable name must be &lt;=30 bytes.</td>
</tr>
<tr>
<td>value</td>
<td>Value that you want to bind to the variable in the cursor. For IN and INOUT variables, the value has the same type as the type of the value being passed in for this parameter.</td>
</tr>
</tbody>
</table>
Table 154-8  (Cont.) BIND_VARIABLE Procedures Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>out_value_size</td>
<td>Maximum expected OUT value size, in bytes, for the VARCHAR2, RAW, CHAR OUT or IN/OUT variable. If no size is given, then the length of the current value is used. This parameter must be specified if the value parameter is not initialized.</td>
</tr>
</tbody>
</table>

**Usage Notes**

If the variable is an IN or IN/OUT variable or an IN collection, then the given bind value must be valid for the variable or array type. Bind values for OUT variables are ignored.

The bind variables or collections of a SQL statement are identified by their names. When binding a value to a bind variable or bind array, the string identifying it in the statement must contain a leading colon, as shown in the following example:

```
SELECT emp_name FROM emp WHERE SAL > :X;
```

For this example, the corresponding bind call would look similar to

```
BIND_VARIABLE(cursor_name, ':X', 3500);
```

or

```
BIND_VARIABLE (cursor_name, 'X', 3500);
```

### 154.9.3 BIND_VARIABLE_PKG Procedure

This procedures binds a variable given value or set of values to a given variable in a cursor, based on the name of the variable in the statement. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

**Syntax**

```sql
DBMS_SQL.BIND_VARIABLE_PKG (
    c IN INTEGER,
    name IN VARCHAR2,
    value IN <datatype>);
```

Where `<datatype>` can be any one of the following data types:

- RECORD
- VARRAY
- NESTED TABLE
- INDEX BY PLS_INTEGER TABLE
- INDEX BY BINARY_INTEGER TABLE
Table 154-9  BIND_VARIABLE_PKG Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable in the statement for which you are retrieving the value.</td>
</tr>
</tbody>
</table>
| value     | - Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE_PKG.  
  - Array option: Local variable that has been declared <table_type> |

Example 154-2  Dynamic SQL using DBMS_SQL.BIND_VARIABLE_PKG to Bind a Package Variable

The variables types are declared in the package specification. The BIND_VARIABLE_PKG is used to bind the variable v1 in the cursor SQL statement.

```sql
CREATE OR REPLACE PACKAGE ty_pkg AS
  TYPE rec IS RECORD ( n1 NUMBER, n2 NUMBER);
  TYPE trec IS TABLE OF rec INDEX BY BINARY_INTEGER;
  TYPE trect IS TABLE OF NUMBER;
  TYPE trecv IS VARRAY(100) OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_ibbi AS
  dummy NUMBER;
  cur   NUMBER;
  v1 ty_pkg.trec;
  str VARCHAR2(3000);
  n1 NUMBER;
  n2 NUMBER;
BEGIN
  FOR i in 1..3 LOOP
    v1(i).n1 := i*10;
    v1(i).n2 := i*20;
  END LOOP;
  str := 'SELECT * FROM TABLE(:v1)';
  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE); DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
  dummy := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.DEFINE_COLUMN(cur, 1, n1);
  DBMS_SQL.DEFINE_COLUMN(cur, 2, n2);
  LOOP
    IF DBMS_SQL.FETCH_ROWS(cur) > 0 THEN
      -- get column values of the row
      DBMS_SQL.COLUMN_VALUE(cur, 1, n1);
      DBMS_SQL.COLUMN_VALUE(cur, 2, n2);
      DBMS_OUTPUT.PUT_LINE('n1 = '||n1||' n2 = '||n2);
    ELSE
      EXIT;
    END IF;
  END LOOP;
END dyn_sql_ibbi;
/
```

Chapter 154
Summary of DBMS_SQL Subprograms
-- No more rows
EXIT;
END IF;
END LOOP;
DBMS_SQL.CLOSE_CURSOR(cur);
END dyn_sql_ibbi;
/
EXEC dyn_sql_ibbi;

n1 = 10 n2 = 20
n1 = 20 n2 = 40
n1 = 30 n2 = 60

154.9.4 CLOSE_CURSOR Procedure

This procedure closes a given cursor.

Syntax

DBMS_SQL.CLOSE_CURSOR (  
c    IN OUT INTEGER);

Pragmas

pragma restrict_references(close_cursor,RNDS,WNDS);

Parameters

Table 154-10    CLOSE_CURSOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>IN</td>
<td>ID number of the cursor that you want to close.</td>
</tr>
<tr>
<td>c</td>
<td>OUT</td>
<td>Cursor is set to null. After you call CLOSE_CURSOR, the memory allocated to the cursor is released and you can no longer fetch from that cursor.</td>
</tr>
</tbody>
</table>

154.9.5 COLUMN_VALUE Procedure

This procedure returns the value of the cursor element for a given position in a given cursor. This procedure is used to access the data fetched by calling FETCH_ROWS.

Syntax

DBMS_SQL.COLUMN_VALUE (  
c, position, value [,column_error, actual_length]  
    IN INTEGER,  
    IN INTEGER,  
    OUT <datatype>  
    OUT NUMBER,  
    OUT INTEGER));

Where square brackets [] indicate optional parameters and <datatype> can be any one of the following types:

BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_TZ_UNCONSTRAINED
TIME_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
VARCHAR2 CHARACTER SET ANY_CS
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFS
Opaque types

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

```sql
DBMS_SQL.COLUMN_VALUE_CHAR (  
c               IN  INTEGER,
position        IN  INTEGER,
value           OUT CHAR CHARACTER SET ANY_CS
[,column_error    OUT NUMBER]
[,actual_length   OUT INTEGER]);
```

```sql
DBMS_SQL.COLUMN_VALUE_RAW (  
c               IN  INTEGER,
position        IN  INTEGER,
value           OUT RAW
[,column_error    OUT NUMBER]
[,actual_length   OUT INTEGER]);
```

```sql
DBMS_SQL.COLUMN_VALUE_ROWID (  
c               IN  INTEGER,
position        IN  INTEGER,
value           OUT ROWID
[,column_error    OUT NUMBER]
[,actual_length   OUT INTEGER]);
```

The following syntax enables the COLUMN_VALUE procedure to accommodate bulk operations:

```sql
DBMS_SQL.COLUMN_VALUE(  
c                 IN             INTEGER,
position          IN             INTEGER,
<param_name>      IN OUT NOCOPY  <table_type>);
```

Where the `<param_name>` and its corresponding `<table_type>` can be any one of these matching pairs:

```
bdbl_tab       Binary_Double_Table
bflt_tab       Binary_Float_Table
bf_tab         Bfile_Table
bl_tab         Blob_Table
c1_tab         Clob_Table
d_table        Date_Table
ids_tab        Interval_Day_To_Second_Table
```
iym_tab      Interval_Year_To_Month_Table
n_tab        Number_Table
tm_tab       Time_Table
ttz_tab      Time_With_Time_Zone_Table
tms_tab      Timestamp_Table
tstz_tab     Timestamp_With_Time_Zone_Table
tstz_tab     Timestamp_With_Time_Zone_Table
ur_tab       Urowid_Table
c_tab        Varchar2_Table

**Pragmas**

```
pragma restrict_references(column_value,RNDS,WNDS);
```

**Parameters**

**Table 154-11** COLUMN_VALUE Procedure Parameters (Single Row)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which you are fetching the values.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the cursor.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>

<td>Relative position of the column in the cursor.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>&lt;param_name&gt;</td>
<td>Local variable that has been declared &lt;table_type&gt;. &lt;param_name&gt; is an IN OUT NOCOPY parameter for bulk operations.</td>
</tr>
<tr>
<td></td>
<td>For bulk operations, the subprogram appends the new elements at the appropriate (implicitly maintained) index. For instance if on utilizing</td>
</tr>
<tr>
<td></td>
<td>the DEFINE_ARRAY Procedure a batch size (the cnt parameter) of 10 rows was specified and a start index (lower_bound) of 1 was specified, then</td>
</tr>
<tr>
<td></td>
<td>the first call to this subprogram after calling the FETCH_ROWS Function will populate elements at index 1..10, and the next call will populate</td>
</tr>
<tr>
<td></td>
<td>elements 11..20, and so on.</td>
</tr>
</tbody>
</table>

**Exceptions**

INCONSISTENT_TYPE (ORA-06562) is raised if the type of the given OUT parameter value is different from the actual type of the value. This type was the given type when the column was defined by calling procedure DEFINE_COLUMN.
154.9.6 COLUMN_VALUE_LONG Procedure

This procedure gets part of the value of a long column.

Syntax

DBMS_SQL.COLUMN_VALUE_LONG (  
  c               IN  INTEGER,  
  position        IN  INTEGER,  
  length          IN  INTEGER,  
  offset          IN  INTEGER,  
  value           OUT VARCHAR2,  
  value_length    OUT INTEGER);  

Pragmas

pragma restrict_references(column_value_long,RNDS,WNDS);  

Parameters

Table 154-13  COLUMN_VALUE_LONG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor from which to get the value.</td>
</tr>
<tr>
<td>position</td>
<td>Position of the column of which to get the value.</td>
</tr>
<tr>
<td>length</td>
<td>Number of bytes of the long value to fetch.</td>
</tr>
<tr>
<td>offset</td>
<td>Offset into the long field for start of fetch.</td>
</tr>
<tr>
<td>value</td>
<td>Value of the column as a VARCHAR2.</td>
</tr>
<tr>
<td>value_length</td>
<td>Number of bytes actually returned in value.</td>
</tr>
</tbody>
</table>

154.9.7 DEFINE_ARRAY Procedure

This procedure defines the collection for column into which you want to fetch rows (with a FETCH_ROWS call). This procedure lets you do batch fetching of rows from a single SELECT statement. A single fetch call brings over a number of rows into the PL/SQL aggregate object.

When you fetch the rows, they are copied into DBMS_SQL buffers until you run a COLUMN_VALUE call, at which time the rows are copied into the table that was passed as an argument to the COLUMN_VALUE call.

Scalar and LOB Types for Collections

You can declare a local variable as one of the following table-item types, and then fetch any number of rows into it using DBMS_SQL. (These are the same types as you can specify for the BIND_ARRAY procedure.)

```
TYPE binary_double_table  
  IS TABLE OF BINARY_DOUBLE  INDEX BY BINARY_INTEGER;

TYPE binary_float_table   
  IS TABLE OF BINARY_FLOAT  INDEX BY BINARY_INTEGER;

TYPE bfile_table          
  IS TABLE OF BFILE        INDEX BY BINARY_INTEGER;

TYPE blob_table           
  IS TABLE OF BLOB         INDEX BY BINARY_INTEGER;
```
TYPE clob_table IS TABLE OF CLOB INDEX BY BINARY_INTEGER;
TYPE date_table IS TABLE OF DATE INDEX BY BINARY_INTEGER;
TYPE interval_day_to_second_table IS TABLE OF dsinterval_unconstrained INDEX BY BINARY_INTEGER;
TYPE interval_year_to_MONTH_table IS TABLE OF yminterval_unconstrained INDEX BY BINARY_INTEGER;
TYPE number_table IS TABLE OF NUMBER INDEX BY BINARY_INTEGER;
TYPE time_table IS TABLE OF time_unconstrained INDEX BY BINARY_INTEGER;
TYPE time_with_time_zone_table IS TABLE OF time_tz_unconstrained INDEX BY BINARY_INTEGER;
TYPE timestamp_table IS TABLE OF timestamp_unconstrained INDEX BY BINARY_INTEGER;
TYPE timestamp_with_ltz_table IS TABLE OF timestamp_ltz_unconstrained INDEX BY BINARY_INTEGER;
TYPE timestamp_with_time_zone_table IS TABLE OF timestamp_tz_unconstrained INDEX BY BINARY_INTEGER;
TYPE urowid_table IS TABLE OF UROWID INDEX BY BINARY_INTEGER;
TYPE varchar2_table IS TABLE OF VARCHAR2(2000) INDEX BY BINARY_INTEGER;

Syntax

DBMS_SQL.DEFINE_ARRAY (c IN INTEGER,
position IN INTEGER,
<table_variable> IN <datatype>
cnt IN INTEGER,
lower_bnd IN INTEGER);

Where <table_variable> and its corresponding <datatype> can be any one of the
following matching pairs, DEFINE_ARRAY being overloaded to accept different datatypes:

<clob_tab> Clob_Table
<bflt_tab> Binary_Float_Table
<bdbl_tab> Binary_Double_Table
<blob_tab> Blob_Table
<bfile_tab> Bfile_Table
<date_tab> Date_Table
<num_tab> Number_Table
<urowid_tab> Urowid_Table
<vchr2_tab> Varchar2_Table
<tm_tab> Time_Table
<ttz_tab> Time_With_Time_Zone_Table
<ttms_tab> Timestamp_Table
<ttstz_tab> Timestamp_With_ltz_Table
<ttstz_tab> Timestamp_With_Time_Zone_Table
<ids_tab> Interval_Day_To_Second_Table
<ids_tab> Interval_Year_To_Month_Table

Pragmas

pragma restrict_references(define_array,RNDS,WNDS);

The subsequent FETCH_ROWS call fetch "count" rows. When the COLUMN_VALUE call is
made, these rows are placed in positions lower_bnd, lower_bnd+1, lower_bnd+2, and so
on. While there are still rows coming, the user keeps issuing FETCH_ROWS/COLUMN_VALUE calls. The rows keep accumulating in the table specified as an argument in the COLUMN_VALUE call.

Parameters

Table 154-14  DEFINE_ARRAY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to which you want to bind an array.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the array being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
<tr>
<td>table_variable</td>
<td>Local variable that has been declared as &lt;datatype&gt;.</td>
</tr>
<tr>
<td>cnt</td>
<td>Number of rows that must be fetched.</td>
</tr>
<tr>
<td>lower_bnd</td>
<td>Results are copied into the collection, starting at this lower bound index.</td>
</tr>
</tbody>
</table>

Usage Notes

The count (cnt) must be an integer greater than zero; otherwise an exception is raised. The lower_bnd can be positive, negative, or zero. A query on which a DEFINE_ARRAY call was issued cannot contain array binds.

Examples

PROCEDURE BULK_PLSQL(deptid NUMBER)
    TYPE namelist IS TABLE OF employees.last_name%TYPE;
    TYPE sallist IS TABLE OF employees.salary%TYPE;
    names  namelist;
    sals   sallist;
    c      NUMBER;
    r      NUMBER;
    sql_stmt VARCHAR2(32767) :=
        'SELECT last_name, salary FROM employees WHERE department_id = :b1';
    BEGIN
        c := DBMS_SQL.OPEN_CURSOR;
        DBMS_SQL.PARSE(c, sql_stmt, dbms_sql.native);
        DBMS_SQL.BIND_VARIABLE(c, 'b1', deptid);
        DBMS_SQL.DEFINE_ARRAY(c, 1, names, 5);
        DBMS_SQL.DEFINE_ARRAY(c, 2, sals, 5);
        r := DBMS_SQL.EXECUTE(c);
        LOOP
            r := DBMS_SQL.FETCH_ROWS(c);
            DBMS_SQL.COLUMN_VALUE(c, 1, names);
            DBMS_SQL.COLUMN_VALUE(c, 2, sals);
            EXIT WHEN r != 5;
        END LOOP;
        DBMS_SQL.CLOSE_CURSOR(c);
        -- loop through the names and sals collections
        FOR i IN names.FIRST .. names.LAST  LOOP
Example 154-3  Example: Defining an Array

The following examples show how to use the DEFINE_ARRAY procedure:

```sql
declare
    c NUMBER;
    d NUMBER;
    n_tab DBMS_SQL.NUMBER_TABLE;
    indx NUMBER := -10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    dBMS_SQL.PARSE(c, 'select n from t order by 1', DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab, 10, indx);
    d := DBMS_SQL.EXECUTE(c);
    loop
        d := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
        EXIT WHEN d != 10;
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(c);
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
/
```

Each time the preceding example calls FETCH_ROWS Function, it fetches 10 rows that are kept in DBMS_SQL buffers. When the COLUMN_VALUE Procedure is called, those rows move into the PL/SQL table specified (in this case n_tab), at positions -10 to -1, as specified in the DEFINE statements. When the second batch is fetched in the loop, the rows go to positions 0 to 9; and so on.

A current index into each array is maintained automatically. This index is initialized to "indx" at EXECUTE time and is updated every time COLUMN_VALUE is called. If you reexecute at any point, then the current index for each DEFINE is reinitialized to "indx".

In this way the entire result of the query is fetched into the table. When FETCH_ROWS cannot fetch 10 rows, it returns the number of rows actually fetched (if no rows could be fetched, then it returns zero) and exits the loop.

Here is another example of using the DEFINE_ARRAY procedure:

Consider a table MULTI_TAB defined as:

```sql
CREATE TABLE multi_tab (num NUMBER,
    dat1 DATE,
    var VARCHAR2(24),
    dat2 DATE)
```
To select everything from this table and move it into four PL/SQL tables, you could use the following simple program:

```sql
DECLARE
    c       NUMBER;
    d       NUMBER;
    n_tab  DBMS_SQL.NUMBER_TABLE;
    d_tab1 DBMS_SQL.DATE_TABLE;
    v_tab  DBMS_SQL.VARCHAR2_TABLE;
    d_tab2 DBMS_SQL.DATE_TABLE;
    indx NUMBER := 10;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'select * from multi_tab order by 1', DBMS_SQL.NATIVE);
    DBMS_SQL.DEFINE_ARRAY(c, 1, n_tab,  5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 2, d_tab1, 5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 3, v_tab,  5, indx);
    DBMS_SQL.DEFINE_ARRAY(c, 4, d_tab2, 5, indx);
    d := DBMS_SQL.EXECUTE(c);
    LOOP
        d := DBMS_SQL.FETCH_ROWS(c);
        DBMS_SQL.COLUMN_VALUE(c, 1, n_tab);
        DBMS_SQL.COLUMN_VALUE(c, 2, d_tab1);
        DBMS_SQL.COLUMN_VALUE(c, 3, v_tab);
        DBMS_SQL.COLUMN_VALUE(c, 4, d_tab2);
        EXIT WHEN d != 5;
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(c);
END;
```

The four tables can be used for anything. One usage might be to use `BIND_ARRAY` to move the rows to another table by using a statement such as `'INSERT into SOME_T values (:a, :b, :c, :d)`;

```sql
EXCEPTION WHEN OTHERS THEN
    IF DBMS_SQL.IS_OPEN(c) THEN
        DBMS_SQL.CLOSE_CURSOR(c);
    END IF;
    RAISE;
END;
```

### 154.9.8 DEFINE_COLUMN Procedures

This procedure defines a column to be selected from the given cursor. This procedure is only used with `SELECT` cursors.

The column being defined is identified by its relative position in the `SELECT` list of the statement in the given cursor. The type of the `COLUMN` value determines the type of the column being defined.
See also the DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

DBMS_SQL.DEFINE_COLUMN ( 
    c              IN INTEGER, 
    position       IN INTEGER, 
    column         IN <datatype>); 

Where <datatype> can be any one of the following types:

BINARY_DOUBLE
BINARY_FLOAT
BFILE
BLOB
CLOB CHARACTER SET ANY_CS
DATE
DSINTERVAL_UNCONSTRAINED
NUMBER
TIME_UNCONSTRAINED
TIME_TZ_UNCONSTRAINED
TIMESTAMP_LTZ_UNCONSTRAINED
TIMESTAMP_TZ_UNCONSTRAINED
TIMESTAMP_UNCONSTRAINED
UROWID
YMINTERVAL_UNCONSTRAINED
user-defined object types
collections (VARRAYs and nested tables)
REFS
Opaque types

Note that DEFINE_COLUMN is overloaded to accept different datatypes.

The following syntax is also supported for the DEFINE_COLUMN procedure:

DBMS_SQL.DEFINE_COLUMN ( 
    c              IN INTEGER, 
    position       IN INTEGER, 
    column         IN VARCHAR2 CHARACTER SET ANY_CS, 
    column_size    IN INTEGER); 

Pragmas

pragma restrict_references(define_column,RNDS,WNDS); 

Parameters

Table 154-15 DEFINE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
</tbody>
</table>
### Table 154-15 (Cont.) DEFINE_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in bytes for columns of type VARCHAR2.</td>
</tr>
</tbody>
</table>

### Usage Notes

When using character length semantics the maximum number of bytes that can be returned for a column value of type VARCHAR2 is calculated as: column_size * maximum character byte size for the current character set. For example, specifying the column_size as 10 means that a maximum of 30 (10*3) bytes can be returned when using character length semantics with a UTF8 character set regardless of the number of characters this represents.

### 154.9.9 DEFINE_COLUMN_CHAR Procedure

This procedure defines a column with CHAR data to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_LONG Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

### Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_CHAR (  
  c              IN INTEGER,  
  position       IN INTEGER,  
  column         IN CHAR CHARACTER SET ANY_CS,  
  column_size    IN INTEGER);
```

### Pragmas

```sql
pragma restrict_references(define_column,RNDS,WNDS);
```

### Parameters

#### Table 154-16 DEFINE_COLUMN_CHAR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in characters for columns of type CHAR.</td>
</tr>
</tbody>
</table>
154.9.10 DEFINE_COLUMN_LONG Procedure

This procedure defines a LONG column for a SELECT cursor. The column being defined is identified by its relative position in the SELECT list of the statement for the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_RAW Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_LONG ( 
  c              IN INTEGER, 
  position       IN INTEGER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined.</td>
</tr>
<tr>
<td></td>
<td>The first column in a statement has position 1.</td>
</tr>
</tbody>
</table>

154.9.11 DEFINE_COLUMN_RAW Procedure

This procedure defines a column of type RAW to be selected from the given cursor.

This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_ROWID Procedure.

Syntax

```
DBMS_SQL.DEFINE_COLUMN_RAW ( 
  c              IN INTEGER, 
  position       IN INTEGER, 
  column         IN RAW, 
  column_size    IN INTEGER);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```
Parameters

Table 154-18 DEFINE_COLUMN_RAW Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
<tr>
<td>column_size</td>
<td>Maximum expected size of the column value in bytes for columns of RAW type.</td>
</tr>
</tbody>
</table>

154.9.12 DEFINE_COLUMN_ROWID Procedure

This procedure defines a column of type ROWID to be selected from the given cursor. This procedure is only used with SELECT cursors.

The column being defined is identified by its relative position in the SELECT list of the statement in the given cursor. The type of the COLUMN value determines the type of the column being defined.

See also the DEFINE_COLUMN Procedures, DEFINE_COLUMN_CHAR Procedure, DEFINE_COLUMN_LONG Procedure and DEFINE_COLUMN_RAW Procedure.

Syntax

```sql
DBMS_SQL.DEFINE_COLUMN_ROWID ( c IN INTEGER,
                                position IN INTEGER,
                                column IN ROWID);
```

Pragmas

```
pragma restrict_references(define_column,RNDS,WNDS);
```

Parameters

Table 154-19 DEFINE_COLUMN_ROWID Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the row being defined to be selected.</td>
</tr>
<tr>
<td>position</td>
<td>Relative position of the column in the row being defined. The first column in a statement has position 1.</td>
</tr>
<tr>
<td>column</td>
<td>Value of the column being defined. The type of this value determines the type for the column being defined.</td>
</tr>
</tbody>
</table>
154.9.13 DESCRIBE_COLUMNS Procedure

This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.

Syntax

```sql
DBMS_SQL.DESCRIBE_COLUMNS (  
c              IN  INTEGER,
    col_cnt        OUT INTEGER,
    desc_t         OUT DESC_TAB);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>c</code></td>
<td>ID number of the cursor for the columns being described</td>
</tr>
<tr>
<td><code>col_cnt</code></td>
<td>Number of columns in the select list of the query</td>
</tr>
<tr>
<td><code>desc_t</code></td>
<td>Describe table to fill in with the description of each of the columns of the query</td>
</tr>
</tbody>
</table>

Example 154-4 Describe Columns

This code can be used as a substitute to the SQL*Plus `DESCRIBE` call by using a `SELECT *` query on the table that you want to describe.

```sql
DECLARE
    c           NUMBER;
    d           NUMBER;
    col_cnt     INTEGER;
    f           BOOLEAN;
    rec_tab     DBMS_SQL.DESC_TAB;
    col_num    NUMBER;
PROCEDURE print_rec(rec in DBMS_SQL.DESC_REC) IS
    BEGIN
        DBMS_OUTPUT.NEW_LINE;
        DBMS_OUTPUT.PUT_LINE('col_type            =    ' || rec.col_type);
        DBMS_OUTPUT.PUT_LINE('col_maxlen          =    ' || rec.col_max_len);
        DBMS_OUTPUT.PUT_LINE('col_name            =    ' || rec.col_name);
        DBMS_OUTPUT.PUT_LINE('col_name_len        =    ' || rec.col_name_len);
        DBMS_OUTPUT.PUT_LINE('col_schema_name     =    ' || rec.col_schema_name);
        DBMS_OUTPUT.PUT_LINE('col_schema_name_len =    ' || rec.col_schema_name_len);
        DBMS_OUTPUT.PUT_LINE('col_precision       =    ' || rec.col_precision);
        DBMS_OUTPUT.PUT_LINE('col_scale           =    ' || rec.col_scale);
        DBMS_OUTPUT.PUT('col_null_ok         =    ');
        IF (rec.col_null_ok) THEN
            DBMS_OUTPUT.PUT_LINE('true');
        ELSE
            DBMS_OUTPUT.PUT_LINE('false');
        END IF;
    END;
BEGIN
    c := DBMS_SQL.OPEN_CURSOR;
    DBMS_SQL.PARSE(c, 'SELECT * FROM scott.bonus', DBMS_SQL.NATIVE);
    DBMS_SQL.DESCRIBE_COLUMNS (c, col_cnt, desc_t);
    FOR i IN 1..col_cnt LOOP
        print_rec(rec_tab(i));
    END LOOP;
    DBMS_SQL.CLOSE_CURSOR(c);
END;
```

Chapter 154 Summary of DBMS_SQL Subprograms
d := DBMS_SQL.EXECUTE(c);

DBMS_SQL.DESCRIBE_COLUMNS(c, col_cnt, rec_tab);

/*
 * Following loop could simply be for j in 1..col_cnt loop.
 * Here we are simply illustrating some of the PL/SQL table
 * features.
 */

col_num := rec_tab.first;
IF (col_num IS NOT NULL) THEN
  LOOP
    print_rec(rec_tab(col_num));
    col_num := rec_tab.next(col_num);
    EXIT WHEN (col_num IS NULL);
    END LOOP;
END IF;

DBMS_SQL.CLOSE_CURSOR(c);
END;
/

154.9.14 DESCRIBE_COLUMN2 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

DBMS_SQL.DESCRIBE_COLUMN2 (  
c IN INTEGER,  
col_cnt OUT INTEGER,  
desc_t OUT DESC_TAB2);

Pragmas

PRAGMA RESTRICT_REFERENCES(describe_columns2,WNDS);

Parameters

Table 154-21  DESCRIBE_COLUMN2 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>

Related Topics

- **DESCRIBE_COLUMN2 Procedure**
  This procedure describes the columns for a cursor opened and parsed through DBMS_SQL.
154.9.15 DESCRIBE_COLUMNS3 Procedure

This procedure describes the specified column. This is an alternative to DESCRIBE_COLUMNS Procedure.

Syntax

```sql
DBMS_SQL.DESCRIBE_COLUMNS3 (  
c              IN  INTEGER,
col_cnt        OUT INTEGER,
desc_t         OUT DESC_TAB3);
```

```sql
BMS_SQL.DESCRIBE_COLUMNS3 (  
c              IN  INTEGER,
col_cnt        OUT INTEGER,
desc_t         OUT DESC_TAB4);
```

Pragmas

```sql
PRAGMA RESTRICT_REFERENCES(describe_columns3,WNDS);
```

Parameters

Table 154-22  DESCRIBE_COLUMNS3 Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor for the columns being described.</td>
</tr>
<tr>
<td>col_cnt</td>
<td>Number of columns in the select list of the query.</td>
</tr>
<tr>
<td>desc_t</td>
<td>Describe table to fill in with the description of each of the columns of the query. This table is indexed from one to the number of elements in the select list of the query.</td>
</tr>
</tbody>
</table>

Usage Notes

The cursor passed in by the cursor ID has to be OPENed and PARSED, otherwise an "invalid cursor id" error is raised.

Examples

```sql
CREATE TYPE PROJECT_T AS OBJECT  
   ( projname          VARCHAR2(20),
     mgr               VARCHAR2(20))
/
CREATE TABLE projecttab(deptno NUMBER, project HR.PROJECT_T)
/
DECLARE  
curid      NUMBER;  
desctab    DBMS_SQL.DESC_TAB3;  
colcnt     NUMBER;  
sql_stmt   VARCHAR2(200) := 'select * from projecttab';  
BEGIN  
curid := DBMS_SQL.OPEN_CURSOR;
```
DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);

DBMS_SQL.DESCRIBE_COLUMNS3(curid, colcnt, desctab);

FOR i IN 1 .. colcnt LOOP
    IF desctab(i).col_type = 109 THEN
        DBMS_OUTPUT.PUT(desctab(i).col_name || ' is user-defined type: ');
        DBMS_OUTPUT.PUT_LINE(desctab(i).col_schema_name || '.' ||
            desctab(i).col_type_name);
    END IF;
END LOOP;

DBMS_SQL.CLOSE_CURSOR(curid);
END;
/

Output:

PROJECT is user-defined type: HR.PROJECT_T

Related Topics

• DESCRIBE_COLUMNS Procedure
  This procedure describes the columns for a cursor opened and parsed through
  DBMS_SQL.

154.9.16 EXECUTE Function

This function executes a given cursor. This function accepts the ID number of the
cursor and returns the number of rows processed.

The return value is only valid for INSERT, UPDATE, and DELETE statements; for other types
of statements, including DDL, the return value is undefined and must be ignored.

Syntax

DBMS_SQL.EXECUTE (c IN INTEGER)
RETURN INTEGER;

Parameters

Table 154-23 EXECUTE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to execute.</td>
</tr>
</tbody>
</table>

Return Values

Returns number of rows processed

Usage Notes

The DBMS_SQL cursor that is returned by the TO_CURSOR_NUMBER Function
performs in the same way as a DBMS_SQL cursor that has already been executed.
Consequently, calling EXECUTE for this cursor will cause an error.
154.9.17 EXECUTE_AND_FETCH Function

This function executes the given cursor and fetches rows.

This function provides the same functionality as calling EXECUTE and then calling FETCH_ROWS. Calling EXECUTE_AND_FETCH instead, however, may reduce the number of network round-trips when used against a remote database.

The EXECUTE_AND_FETCH function returns the number of rows actually fetched.

Syntax

DBMS_SQL.EXECUTE_AND_FETCH (
    c              IN INTEGER,
    exact          IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;

Pragmas

pragma restrict_references(execute_and_fetch,WNDS);

Parameters

Table 154-24  EXECUTE_AND_FETCH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor to execute and fetch.</td>
</tr>
<tr>
<td>exact</td>
<td>Set to TRUE to raise an exception if the number of rows actually matching the query differs from one.</td>
</tr>
<tr>
<td></td>
<td>Note: Oracle does not support the exact fetch TRUE option with LONG columns.</td>
</tr>
<tr>
<td></td>
<td>Even if an exception is raised, the rows are still fetched and available.</td>
</tr>
</tbody>
</table>

Return Values

Returns designated rows

154.9.18 FETCH_ROWS Function

This function fetches a row from a given cursor.

You can call FETCH_ROWS repeatedly as long as there are rows remaining to be fetched. These rows are retrieved into a buffer, and must be read by calling COLUMN_VALUE, for each column, after each call to FETCH_ROWS.

The FETCH_ROWS function accepts the ID number of the cursor to fetch, and returns the number of rows actually fetched.

Syntax

DBMS_SQL.FETCH_ROWS (
    c              IN INTEGER)
RETURN INTEGER;
Pragmas

pragma restrict_references(fetch_rows,WNDS);

Parameters

Table 154-25 FETCH_ROWS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number.</td>
</tr>
</tbody>
</table>

Return Values

Returns a row from a given cursor

154.9.19 GET_NEXT_RESULT Procedures

This procedure gets the statement of the next result returned to the caller of the recursive statement or, if this caller sets itself as the client for the recursive statement, the next result returned to this caller as client.

The statements are returned in same order as they are returned by the RETURN_RESULT Procedures.

Syntax

DBMS_SQL.GET_NEXT_RESULT(
  c            IN          INTEGER,
  rc           OUT         SYS_REFCURSOR);

DBMS_SQL.GET_NEXT_RESULT(
  c            IN          INTEGER,
  rc           OUT         INTEGER);

Parameters

Table 154-26 GET_NEXT_RESULT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Recursive statement cursor</td>
</tr>
<tr>
<td>rc</td>
<td>Cursor or ref cursor of the statement of the next returned result</td>
</tr>
</tbody>
</table>

Exceptions

ORA-01403 no_data_found: This is raised when there is no further returned statement result.

Usage Notes

• After the cursor of a statement result is retrieved, the caller must close the cursor properly when it is no longer needed.

• The cursors for all unretrieved returned statements will be closed after the cursor of the recursive statement is closed.
Examples

DECLARE
  c  INTEGER;
  rc SYS_REFCURSOR;
BEGIN
  c := DBMS_SQL.OPEN_CURSOR(treat_as_client_for_results => TRUE);
  DBMS_SQL.PARSE(c                  => c,
                  statement          => 'begin proc; end;');
  DBMS_SQL.EXECUTE(c);
  LOOP
    BEGIN
      DBMS_SQL.GET_NEXT_RESULT(c, rc);
      EXCEPTIONS
        WHEN no_data_found THEN
          EXIT;
      END;
    END LOOP;
  END LOOP;
END;

154.9.20 IS_OPEN Function

This function checks to see if the given cursor is currently open.

Syntax

DBMS_SQL.IS_OPEN (  
  c              IN INTEGER)  
RETURN BOOLEAN;

Pragmas

pragma restrict_references(is_open,RNDS,WNDS);

Parameters

Table 154-27  IS_OPEN Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Cursor ID number of the cursor to check.</td>
</tr>
</tbody>
</table>

Return Values

Returns TRUE for any cursor number that has been opened but not closed, and FALSE for a NULL cursor number. Note that the CLOSE_CURSOR Procedure Procedure NULLs out the cursor variable passed to it.

Exceptions

ORA-29471 DBMS_SQL access denied: This is raised if an invalid cursor ID number is detected. Once a session has encountered and reported this error, every subsequent DBMS_SQL call in the same session will raise this error, meaning that DBMS_SQL is non-operational for this session.
154.9.21 LAST_ERROR_POSITION Function

This function returns the byte offset in the SQL statement text where the error occurred. The first character in the SQL statement is at position 0.

Syntax

DBMS_SQL.LAST_ERROR_POSITION
    RETURN INTEGER;

Pragmas

pragma restrict_references(last_error_position,RNDS,WNDS);

Return Values

Returns the byte offset in the SQL statement text where the error occurred

Usage Notes

Call this function after a PARSE call, before any other DBMS_SQL procedures or functions are called.

154.9.22 LAST_ROW_COUNT Function

This function returns the cumulative count of the number of rows fetched.

Syntax

DBMS_SQL.LAST_ROW_COUNT
    RETURN INTEGER;

Pragmas

pragma restrict_references(last_row_count,RNDS,WNDS);

Return Values

Returns the cumulative count of the number of rows fetched

Usage Notes

Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call. If called after an EXECUTE call, then the value returned is zero.

154.9.23 LAST_ROW_ID Function

This function returns the ROWID of the last row processed.

Syntax

DBMS_SQL.LAST_ROW_ID
    RETURN ROWID;

Pragmas

pragma restrict_references(last_row_id,RNDS,WNDS);
Return Values
Returns the ROWID of the last row processed

Usage Notes
Call this function after a FETCH_ROWS or an EXECUTE_AND_FETCH call.

154.9.24 LAST_SQL_FUNCTION_CODE Function
This function returns the SQL function code for the statement.
These codes are listed in the Oracle Call Interface Programmer's Guide.

Syntax
```
DBMS_SQL.LAST_SQL_FUNCTION_CODE
RETURN INTEGER;
```

Pragmas
```
pragma restrict_references(last_sql_function_code,RNDS,WNDS);
```

Return Values
Returns the SQL function code for the statement

Usage Notes
You must call this function immediately after the SQL statement is run; otherwise, the return value is undefined.

154.9.25 OPEN_CURSOR Functions
This function opens a new cursor.
The security_level parameter allows for application of fine-grained control to the security of the opened cursor.

Syntax
```
DBMS_SQL.OPEN_CURSOR (
   treat_as_client_for_results IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```
```
DBMS_SQL.OPEN_CURSOR (
   security_level IN INTEGER,
   treat_as_client_for_results IN BOOLEAN DEFAULT FALSE)
RETURN INTEGER;
```
Parameters

Table 154-28  OPEN_CURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>security_level</td>
<td>Specifies the level of security protection to enforce on the opened cursor. Valid security level values are 0, 1, and 2. When a NULL argument value is provided to this overload, as well as for cursors opened using the overload of open_cursor without the security_level parameter, the default security level value 1 will be enforced on the opened cursor.</td>
</tr>
<tr>
<td></td>
<td>• Level 0 - allows all DBMS_SQL operations on the cursor without any security checks. The cursor may be fetched from, and even re-bound and re-executed, by code running with a different effective userid or roles than those in effect at the time the cursor was parsed. This level of security is off by default.</td>
</tr>
<tr>
<td></td>
<td>• Level 1 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for bind and execute operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</td>
</tr>
<tr>
<td></td>
<td>• Level 2 - requires that the referenced container, effective userid, and roles of the caller to DBMS_SQL for all bind, execute, define, describe, and fetch operations on this cursor must be the same as those of the caller of the most recent parse operation on this cursor.</td>
</tr>
<tr>
<td>treat_as_client_for_results</td>
<td>Allows the caller of the recursive statement to set itself as the client to receive the statement results returned from the recursive statement to client. The statement results returned may be retrieved by the GET_NEXT_RESULT Procedures.</td>
</tr>
</tbody>
</table>

Pragmas

pragma restrict_references(open_cursor,RNDS,WNDS);

Return Values

Returns the cursor ID number of the new cursor

Usage Notes

• When you no longer need this cursor, you must close it explicitly by calling the CLOSE_CURSOR Procedure.
• You can use cursors to run the same SQL statement repeatedly or to run a new SQL statement. When a cursor is reused, the contents of the corresponding cursor data area are reset when the new SQL statement is parsed. It is never necessary to close and reopen a cursor before reusing it.

154.9.26 PARSE Procedures

This procedure parses the given statement in the given cursor. All statements are parsed immediately. In addition, DDL statements are run immediately when parsed.

There are multiple versions of the PARSE procedure:
• Taking a VARCHAR2 statement as an argument

• Taking a segmented string, one taking VARCHAR2, a TABLE OF VARCHAR2(32767), and another, taking VARCHAR2S, a TABLE OF VARCHAR2(256), as argument. These overloads concatenate elements of a PL/SQL table statement and parse the resulting string. You can use these procedures to parse a statement that is longer than the limit for a single VARCHAR2 variable by splitting up the statement.

• Taking a CLOB statement as an argument. You can use the CLOB overload version of the parse procedure to parse a SQL statement larger than 32K bytes.

Syntax

Each version has multiple overloads.

DBMS_SQL.PARSE (  
  c                           IN   INTEGER,  
  statement                   IN   VARCHAR2,  
  language_flag               IN   INTEGER[,  
  [,edition                     IN   VARCHAR2 DEFAULT NULL],  
  apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
  fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]  
[,schema                      IN   VARCHAR2 DEFAULT NULL]  
[,container                   IN   VARCHAR2]);

DBMS_SQL.PARSE (  
  c                           IN   INTEGER,  
  statement                   IN   CLOB,  
  language_flag               IN   INTEGER[,  
  [,edition                     IN   VARCHAR2 DEFAULT NULL],  
  apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
  fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]  
[,schema                      IN   VARCHAR2 DEFAULT NULL]  
[,container                   IN   VARCHAR2]);

DBMS_SQL.PARSE (  
  c                           IN   INTEGER,  
  statement                   IN   VARCHAR2A,  
  lb                          IN   INTEGER,  
  ub                          IN   INTEGER,  
  lfflg                       IN   BOOLEAN,  
  language_flag               IN   INTEGER[,  
  [,edition                     IN   VARCHAR2 DEFAULT NULL],  
  apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
  fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]  
[,schema                      IN   VARCHAR2 DEFAULT NULL]  
[,container                   IN   VARCHAR2]);

DBMS_SQL.PARSE (  
  c                           IN   INTEGER,  
  statement                   IN   VARCHAR2S,  
  lb                          IN   INTEGER,  
  ub                          IN   INTEGER,  
  lfflg                       IN   BOOLEAN,  
  language_flag               IN   INTEGER[,  
  [,edition                     IN   VARCHAR2 DEFAULT NULL],  
  apply_crossedition_trigger  IN   VARCHAR2 DEFAULT NULL,  
  fire_apply_trigger          IN   BOOLEAN DEFAULT TRUE]  
[,schema                      IN   VARCHAR2 DEFAULT NULL]  
[,container                   IN   VARCHAR2]);
Parameters

Table 154-29  PARSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor in which to parse the statement.</td>
</tr>
<tr>
<td>statement</td>
<td>SQL statement to be parsed. SQL statements larger than 32K that may be stored in CLOBs. Unlike a PL/SQL statement, your SQL statement must not include a final semicolon. For example:</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'BEGIN proc; END;', 2);</td>
</tr>
<tr>
<td></td>
<td>DBMS_SQL.PARSE(cursor1, 'INSERT INTO tab VALUES(1)', 2);</td>
</tr>
<tr>
<td>lb</td>
<td>Lower bound for elements in the statement</td>
</tr>
<tr>
<td>ub</td>
<td>Upper bound for elements in the statement</td>
</tr>
<tr>
<td>lfflg</td>
<td>If TRUE, then insert a linefeed after each element on concatenation.</td>
</tr>
<tr>
<td>language_flag</td>
<td>Specifies the behavior for the SQL statement. For more information about the possible values and its corresponding behaviors, see DBMS_SQL Constants</td>
</tr>
<tr>
<td>edition</td>
<td>Specifies the edition in which to run the statement under the following conditions:</td>
</tr>
<tr>
<td></td>
<td>• If NULL and container is NULL, the statement will be run in the current edition.</td>
</tr>
<tr>
<td></td>
<td>• If a valid container is specified, passing NULL indicates the statement is to run in the target container's default edition.</td>
</tr>
<tr>
<td></td>
<td>• Given the user and the edition with which the statement is to be executed, the user must have USE privilege on the edition.</td>
</tr>
<tr>
<td></td>
<td>The following general conditions apply. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the edition's actual name, and if double quotation marks are not used the contents will be uppercased.</td>
</tr>
<tr>
<td>apply_crosedition_trigger</td>
<td>Specifies the unqualified name of a forward crossedition trigger that is to be applied to the specified SQL. The name is resolved using the edition and current_schema setting in which the statement is to be executed. The trigger must be owned by the user that will execute the statement. If a non-NULL value is specified, the specified crossedition trigger will be executed assuming fire_apply_trigger is TRUE, the trigger is enabled, the trigger is defined on the table which is the target of the statement, the type of the statement matches the trigger's dml_event_clause, any effective WHEN and UPDATE OF restrictions are satisfied, and so on. Other forward crossedition triggers may also be executed, selected using the &quot;crossedition trigger DML rules&quot; applied as if the specified trigger was doing a further DML to the table that is the target of the statement. Non-crossedition triggers and reverse crossedition triggers will not be executed. The contents of the string are processed as a SQL identifier; double quotation marks must surround the remainder of the string if special characters or lowercase characters are present in the trigger's actual name, and if double quotation marks are not used, the contents will be uppercased.</td>
</tr>
</tbody>
</table>
Table 154-29  (Cont.) PARSE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fire_apply_trigger</td>
<td>Indicates whether the specified apply_crossedition_trigger is itself to be executed, or must only be a guide used in selecting other triggers. This is typically set FALSE when the statement is a replacement for the actions the apply_crossedition_trigger would itself perform. If FALSE, the specified trigger is not executed, but other triggers are still selected for firing as if the specified trigger was doing a DML to the table that is the target of the statement. The apply_crossedition_trigger and fire_apply_trigger parameters are ignored if the statement is not a DML.</td>
</tr>
<tr>
<td>schema</td>
<td>Specifies the schema in which to resolve unqualified object names. If NULL, the current schema is the effective user's schema.</td>
</tr>
<tr>
<td>container</td>
<td>Name of the target container in which the cursor is to run. If NULL or unspecified, the name of the target container is that of the calling container and no container switch is performed. If a valid container name is specified, the current user must be a common user with SET CONTAINER privilege to switch to the target container. If a container switch completes, the effective user will have its default roles.</td>
</tr>
</tbody>
</table>

Usage Notes

- Using DBMS_SQL to dynamically run DDL statements can cause the program to stop responding. For example, a call to a procedure in a package results in the package being locked until the execution returns to the user side. Any operation that results in a conflicting lock, such as dynamically trying to drop the package before the first lock is released, stops the program from running.

- Because client-side code cannot reference remote package variables or constants, you must explicitly use the values of the constants.

  For example, the following code does not compile on the client:

  ```sql
  DBMS_SQL.PARSE(cur_hdl, stmt_str, DBMS_SQL.NATIVE); -- uses constant DBMS_SQL.NATIVE
  ```

  The following code works on the client, because the argument is explicitly provided:

  ```sql
  DBMS_SQL.PARSE(cur_hdl, stmt_str, 1); -- compiles on the client
  ```

- The VARCHAR2S type is currently supported for backward compatibility of legacy code. However, you are advised to use VARCHAR2A both for its superior capability and because VARCHAR2S will be deprecated in a future release.

- To parse SQL statements larger than 32 KB, the new CLOB overload version of the PARSE procedure can be used instead of the VARCHAR2A overload.

- If the container parameter value is the same as the calling container, a container switch will not occur. However, the default roles of the current user will be in effect.

Exceptions

If you create a type, procedure, function, or package using DBMS_SQL that has compilation warnings, an ORA-24344 exception is raised, and the PL/SQL unit is still created.
154.9.27 RETURN_RESULT Procedures

This procedure returns the result of an executed statement to the client application.

The result can be retrieved later by the client. Alternatively, it can return the statement result to and be retrieved later by the immediate caller that executes a recursive statement in which this statement result will be returned.

The caller can be:

- A PL/SQL stored procedure executing the recursive statement using DBMS_SQL
- A Java stored procedure using JDBC
- A .NET stored procedure using ADO.NET
- An external procedure using the Oracle Call Interface (OCI)

Syntax

```sql
DBMS_SQL.RETURN_RESULT(
    rc           IN OUT      SYS_REFCURSOR,
    to_client    IN          BOOLEAN           DEFAULT TRUE);
```

```sql
DBMS_SQL.RETURN_RESULT(
    rc           IN OUT      INTEGER,
    to_client    IN          BOOLEAN           DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>Statement cursor or ref cursor</td>
</tr>
<tr>
<td>to_client</td>
<td>Returns (or does not return) the statement result to the client. If not, it is returned to the immediate caller.</td>
</tr>
</tbody>
</table>

Usage Notes

- Currently only a SQL query can be returned, and the return of statement results over remote procedure calls is not supported.
- Once the statement is returned, it is no longer accessible except by the client or the immediate caller to which it is returned.
- Statement results cannot be returned when the statement being executed by the client or any intermediate recursive statement is a SQL query and an error is raised.
- A ref cursor being returned can be strongly or weakly-typed.
- A query being returned can be partially fetched.
- Because EXECUTE IMMEDIATE statement provides no interface to retrieve the statement results returned from its recursive statement, the cursors of the statement results returned to the caller of the EXECUTE IMMEDIATE statement will be closed when the statement completes. To retrieve the returned statement results
from a recursive statement in PL/SQL, use DBMS_SQL to execute the recursive statement.

Examples

CREATE PROCEDURE proc AS
  rc1 sys_refcursor;
  rc2 sys_refcursor;
BEGIN
  OPEN rc1 FOR SELECT * FROM t1;
  DBMS_SQL.RETURN_RESULT(rc1);
  OPEN rc2 FOR SELECT * FROM t2;
  DBMS_SQL.RETURN_RESULT(rc2);
END;
/

154.9.28 TO_CURSOR_NUMBER Function

This function takes an OPENed strongly or weakly-typed ref cursor and transforms it into a DBMS_SQL cursor number.

Syntax

DBMS_SQL.TO_CURSOR_NUMBER(
  rc IN OUT SYS_REFCURSOR)
RETURN INTEGER;

Parameters

Table 154-31 TO_CURSOR_NUMBER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rc</td>
<td>REF CURSOR to be transformed into a cursor number</td>
</tr>
</tbody>
</table>

Return Values

Returns a DBMS_SQL manageable cursor number transformed from a REF CURSOR

Usage Notes

- The REF CURSOR passed in has to be OPENed, otherwise an error is raised.
- Once the REF CURSOR is transformed into a DBMS_SQL cursor number, the REF CURSOR is no longer accessible by any native dynamic SQL operations.
- The DBMS_SQL cursor that is returned by this subprogram performs in the same way as a DBMS_SQL cursor that has already been executed.

Examples

CREATE OR REPLACE PROCEDURE DO_QUERY(sql_stmt VARCHAR2) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  desctab         DBMS_SQL.DESC_TAB;
  colcnt          NUMBER;
  namevar         VARCHAR2(50);
  numvar          NUMBER;
datevar DATE;
empno NUMBER := 100;
BEGIN

-- sql_stmt := 'select .... from employees where employee_id = :b1';
OPEN src_cur FOR sql_stmt USING empno;

-- Switch from native dynamic SQL to DBMS_SQL
curid := DBMS_SQL.TO_CURSOR_NUMBER (src_cur);
DBMS_SQL.DESCRIBE_COLUMNS(curid, colcnt, desctab);

-- Define columns
FOR i IN 1 .. colcnt LOOP
  IF desctab(i).col_type = 2 THEN
    DBMS_SQL.DEFINE_COLUMN(curid, i, numvar);
  ELSIF desctab(i).col_type = 12 THEN
    DBMS_SQL.DEFINE_COLUMN(curid, i, datevar);
  END IF;
END LOOP;

-- Fetch Rows
WHILE DBMS_SQL.FETCH_ROWS(curid) > 0 LOOP
  FOR i IN 1 .. colcnt LOOP
    IF (desctab(i).col_type = 1) THEN
      DBMS_SQL.COLUMN_VALUE(curid, i, namevar);
    ELSIF (desctab(i).col_type = 2) THEN
      DBMS_SQL.COLUMN_VALUE(curid, i, numvar);
    ELSIF (desctab(i).col_type = 12) THEN
      DBMS_SQL.COLUMN_VALUE(curid, i, datevar);
    END IF;
  END LOOP;
  DBMS_SQL.CLOSE_CURSOR(curid);
END LOOP;
END;
/

154.9.29 TO_REFCURSOR Function

This function takes an OPENED, PARSED, and EXECUTED cursor and transforms/migrates it into a PL/SQL manageable REF CURSOR (a weakly-typed cursor) that can be consumed by PL/SQL native dynamic SQL switched to use native dynamic SQL.

This subprogram is only used with SELECT cursors.

Syntax

DBMS_SQL.TO_REFCURSOR(
  cursor_number IN OUT INTEGER)
RETURN SYS_REFCURSOR;
Parameters

Table 154-32  TO_REFCURSOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cursor_number</td>
<td>Cursor number of the cursor to be transformed into REF CURSOR</td>
</tr>
</tbody>
</table>

Return Values

Returns a PL/SQL REF CURSOR transformed from a DBMS_SQL cursor number

Usage Notes

- The cursor passed in by the cursor_number has to be OPENED, PARSED, and EXECUTED; otherwise an error is raised.
- Once the cursor_number is transformed into a REF CURSOR, the cursor_number is no longer accessible by any DBMS_SQL operations.
- After a cursor_number is transformed into a REF CURSOR, using DBMS_SQL.IS_OPEN to check to see if the cursor_number is still open results in an error.
- If the cursor number was last parsed with a valid container parameter, it cannot be converted to a REF CURSOR.

Examples

```sql
CREATE OR REPLACE PROCEDURE DO_QUERY(mgr_id NUMBER) IS
  TYPE CurType IS REF CURSOR;
  src_cur         CurType;
  curid           NUMBER;
  sql_stmt        VARCHAR2(200);
  ret             INTEGER;
  empnos          DBMS_SQL.Number_Table;
  depts           DBMS_SQL.Number_Table;
BEGIN
  -- DBMS_SQL.OPEN_CURSOR
  curid := DBMS_SQL.OPEN_CURSOR;

  sql_stmt := 'SELECT EMPLOYEE_ID, DEPARTMENT_ID from employees where MANAGER_ID = :b1';
  DBMS_SQL.PARSE(curid, sql_stmt, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE(curid, 'b1', mgr_id);
  ret := DBMS_SQL.EXECUTE(curid);

  -- Switch from DBMS_SQL to native dynamic SQL
  src_cur := DBMS_SQL.TO_REFCURSOR(curid);

  -- Fetch with native dynamic SQL
  FETCH src_cur BULK COLLECT INTO empnos, depts;
  IF empnos.COUNT > 0 THEN
    DBMS_OUTPUT.PUT_LINE('EMPNO DEPTNO');
    DBMS_OUTPUT.PUT_LINE('----- ------');
    -- Loop through the empnos and depts collections
    FOR i IN 1 .. empnos.COUNT LOOP
```
DBMS_OUTPUT.PUT_LINE(empnos(i) || '   ' || depts(i));
END LOOP;
END IF;
-- Close cursor
CLOSE src_cur;
END;
/

154.9.30 VARIABLE_VALUE Procedures

This procedure returns the value of the named variable for a given cursor. It is used to return the values of bind variables inside PL/SQL blocks or DML statements with returning clause.

Syntax

DBMS_SQL.VARIABLE_VALUE (c, name, value);

Where <datatype> can be any one of the following types:

- ADT (user-defined object types)
- BINARY_DOUBLE
- BINARY_FLOAT
- BFILE
- BLOB
- BOOLEAN
- CLOB CHARACTER SET ANY_CS
- DATE
- DSINTERVAL_UNCONSTRAINED
- NESTED table
- NUMBER
- OPAQUE types
- REF
- TIME_UNCONSTRAINED
- TIME_TZ_UNCONSTRAINED
- TIMESTAMP_LTZ_UNCONSTRAINED
- TIMESTAMP_TZ_UNCONSTRAINED
- TIMESTAMP_UNCONSTRAINED
- UROWID
- VARCHAR2 CHARACTER SET ANY_CS
- VARRAY
- YMINTERVAL_UNCONSTRAINED

For variables containing CHAR, RAW, and ROWID data, you can use the following variations on the syntax:

DBMS_SQL.VARIABLE_VALUE_CHAR (c, name, value);

DBMS_SQL.VARIABLE_VALUE_RAW (c, name, value);
DBMS_SQL.VARIABLE_VALUE_ROWID (
   c               IN  INTEGER,
   name            IN  VARCHAR2,
   value           OUT ROWID);

The following syntax enables the VARIABLE_VALUE procedure to accommodate bulk operations:

DBMS_SQL.VARIABLE_VALUE (
   c                 IN   INTEGER,
   name              IN   VARCHAR2,
   value             OUT NOCOPY <table_type>);

For bulk operations, <table_type> must be a supported DBMS_SQL predefined TABLE type.

See DBMS_SQL Data Structures

Pragmas

pragma restrict_references(variable_value,RNDS,WNDS);

Parameters

Table 154-33 VARIABLE_VALUE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable for which you are retrieving the value.</td>
</tr>
<tr>
<td>value</td>
<td></td>
</tr>
</tbody>
</table>
  - Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE.  
  - Array option: Local variable that has been declared <table_type>. For bulk operations, value is an OUT NOCOPY parameter. |

154.9.31 VARIABLE_VALUE_PKG Procedure

This procedure returns the value of the named variable for a given cursor.

It is used to return the values of bind variables of collection or record types inside PL/SQL blocks or DML statements with returning clause for a declared package. The type of the variable must be declared in the package specification. Bulk operations are not supported for these types.

Syntax

DBMS_SQL.VARIABLE_VALUE_PKG (
   c                 IN   INTEGER,
   name              IN   VARCHAR2,
   value             OUT NOCOPY <table_type>);

Where <datatype> can be any one of the following data types:

- RECORD
• VARRAY
• NESTED TABLE
• INDEX BY PLS_INTEGER TABLE
• INDEX BY BINARY_INTEGER TABLE

Parameters

Table 154-34 VARIABLE_VALUE_PKG Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>ID number of the cursor from which to get the values.</td>
</tr>
<tr>
<td>name</td>
<td>Name of the variable for which you are retrieving the value.</td>
</tr>
</tbody>
</table>
| value     | • Single row option: Returns the value of the variable for the specified position. Oracle raises the exception ORA-06562, inconsistent_type, if the type of this output parameter differs from the actual type of the value, as defined by the call to BIND_VARIABLE_PKG.  
  • Array option: Local variable that has been declared <table_type>. |

Example 154-5 Dynamic SQL using DBMS_SQL.VARIABLE_VALUE_PKG to Get the Value of a Bind Variable

The data types are declared in the package specification. The VARIABLE_VALUE_PKG is used to get the value of the bind variable v2 in the cursor SQL statement.

```sql
CREATE OR REPLACE PACKAGE ty_pkg AS
  TYPE rec IS RECORD
    ( n1 NUMBER,
      n2 NUMBER);
  TYPE trect IS TABLE OF NUMBER;
END ty_pkg;
/
CREATE OR REPLACE PROCEDURE dyn_sql_nt AS
  dummy NUMBER;
  cur NUMBER;
  v1 ty_pkg.trect;
  v2 ty_pkg.trect;
  str VARCHAR2(3000);
BEGIN
  v1 := ty_pkg.trect(1000);
  str := 'declare v1 ty_pkg.trect;  begin v1:=:v1;  v1(1) := 2000; :v2 := v1;
  end;' ;
  cur := DBMS_SQL.OPEN_CURSOR();
  DBMS_SQL.PARSE(cur, str, DBMS_SQL.NATIVE);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v1', v1);
  DBMS_SQL.BIND_VARIABLE_PKG(cur, ':v2', v2);
  dummy := DBMS_SQL.EXECUTE(cur);
  DBMS_SQL.VARIABLE_VALUE_PKG(cur, ':v2', v2);
  DBMS_OUTPUT.PUT_LINE('n = ' || V2(1));
  DBMS_SQL.CLOSE_CURSOR(cur);
```
n = 2000
The DBMS_SQL_MONITOR package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

This chapter contains the following topics:

- DBMS_SQL_MONITOR Overview
- DBMS_SQL_MONITOR Security Model
- DBMS_SQL_MONITOR Constants
- Summary of DBMS_SQL_MONITOR Subprograms

### See Also:

DBMS_SQLTUNE

### 155.1 DBMS_SQL_MONITOR Overview

The DBMS_SQL_MONITOR package provides information about Real-Time SQL Monitoring and Real-Time Database Operation Monitoring.

These features provide automatic monitoring of SQL statements, PL/SQL blocks, or composite database operations that are considered high-cost. A simple database operation is a single SQL statement or PL/SQL procedure or function. A composite database operation is activity between two defined points in time in a database session. The monitored data is collected in the V$SQL_MONITOR and V$SQL_PLAN_MONITOR views.

The following subprograms begin and end monitoring of a composite database operation:

- BEGIN_OPERATION Function
- END_OPERATION Procedure

The following subprograms report on monitoring data collected in V$SQL_MONITOR and V$SQL_PLAN_MONITOR:

- REPORT_SQL_MONITOR Function
- REPORT_SQL_MONITOR_XML Function
- REPORT_SQL_MONITOR_LIST Function
- REPORT_SQL_MONITOR_LIST_XML Function
155.2 DBMS_SQL_MONITOR Security Model

This package is available to PUBLIC and executes with invoker's rights privileges. The reporting functions require privileges to select data from the catalog as provided by the role SELECT_CATALOG_ROLE.

155.3 DBMS_SQL_MONITOR Constants

The DBMS_SQL_MONITOR package uses the constants shown in the following table.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FORCE_TRACKING</td>
<td>VARCHAR2(30)</td>
<td>'Y'</td>
<td>Force track the composite database operation when the operation starts.</td>
</tr>
<tr>
<td>NO_FORCE_TRACKING</td>
<td>VARCHAR2(30)</td>
<td>'N'</td>
<td>Do not force track the composite database operation when the operation starts. It is only tracked when it has consumed 5 seconds of CPU or I/O time.</td>
</tr>
</tbody>
</table>

155.4 Summary of DBMS_SQL_MONITOR Subprograms

This table lists and describes the DBMS_SQL_MONITOR package subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEGIN_OPERATION Function</td>
<td>This function starts a composite database operation in the current session.</td>
</tr>
<tr>
<td>END_OPERATION Procedure</td>
<td>This function ends a composite database operation in the current session. If the specified composite database operation does not exist, then this function has no effect.</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR Function</td>
<td>This function builds a detailed report with monitoring information for a simple or a composite database operation.</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR_XML Function</td>
<td>This function is identical to the REPORT_SQL_MONITOR function, except that the return type is XMLType.</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR_LIST Function</td>
<td>This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.</td>
</tr>
<tr>
<td>REPORT_SQL_MONITOR_LIST_XML Function</td>
<td>This function is identical to the REPORT_SQL_MONITOR_LIST function, except that it returns XMLType.</td>
</tr>
</tbody>
</table>
155.4.1 BEGIN_OPERATION Function

This function starts a composite database operation in the current session.

Syntax

```
DBMS_SQL_MONITOR.BEGIN_OPERATION (  
  dbop_name       IN VARCHAR2,  
  dbop_eid        IN NUMBER   := NULL,  
  forced_tracking IN VARCHAR2 := NO_FORCE_TRACKING,  
  attribute_list  IN VARCHAR2 := NULL,  
  session_id      IN NUMBER   := NULL,  
  session_serial  IN NUMBER   := NULL)  
RETURN NUMBER;
```

Parameters

Table 155-3  BEGIN_OPERATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbop_name</td>
<td>Name for the composite database operation.</td>
</tr>
<tr>
<td>dbop_eid</td>
<td>Unique identifier for the current execution of the composite database operation.</td>
</tr>
<tr>
<td>forced_tracking</td>
<td>Whether tracking is forced. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• FORCE_TRACKING - forces the composite database operation to be tracked when the operation starts. You can also use the string variable Y.</td>
</tr>
<tr>
<td></td>
<td>• NO_FORCE_TRACKING - tracks the operation only when it has consumed at least 5 seconds of CPU or I/O time. You can also use the string variable N.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>List of user-created attributes. It is a comma-separated list of name-value pairs (for example, 'table_name=emp, operation=load').</td>
</tr>
<tr>
<td>session_id</td>
<td>Session ID of the session to be monitored. If omitted (or null), then the database monitors the current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>Serial number of the session to be monitored. If omitted (or null), then the database uses only the session ID to determine the session.</td>
</tr>
</tbody>
</table>

Return Values

This function returns the database operation execution ID. If the value is null for dbop_eid, then the database generates a unique value.
155.4.2 END_OPERATION Procedure

This function ends a composite database operation in the current session. If the specified composite database operation does not exist, then this function has no effect.

Syntax

```
DBMS_SQL_MONITOR.END_OPERATION(
    dbop_name       IN VARCHAR2,
    dbop_eid        IN NUMBER)
RETURN NUMBER;
```

Parameters

Table 155-4  END_OPERATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dbop_name</td>
<td>Name of a composite database operation</td>
</tr>
<tr>
<td>dbop_eid</td>
<td>Unique identifier for the current execution of the composite database operation</td>
</tr>
</tbody>
</table>

155.4.3 REPORT_SQL_MONITOR Function

This function builds a detailed report with monitoring information for a simple or a composite database operation.

For each operation, it gives key information and associated global statistics. Use this function to get detailed monitoring information for a simple or a composite database operation.

The target database operation for this report can be:

- The last database operation monitored by Oracle Database (default, no parameter).
- The last database operation executed in the specified session and monitored by Oracle Database. The session is identified by its session ID and optionally its serial number (-1 is current session).
- The last execution of a specific database operation identified by its sql_id.
- A specific execution of a database operation identified by the combination sql_id, sql_exec_start, and sql_exec_id.
- The last execution of a specific composite database operation identified by dbop_name.
- The specific execution of a composite database operation identified by the combination dbop_name, dbop_exec_id.

Syntax

```
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR (
    sql_id                    IN VARCHAR2 DEFAULT  NULL,
    dbop_name                 IN VARCHAR2 DEFAULT  NULL,
    dbop_exec_id              IN NUMBER   DEFAULT  NULL,
```
Parameters

Table 155-5  REPORT_SQL_MONITOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last simple database operation monitored by Oracle.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed</td>
</tr>
<tr>
<td>dbop_exec_id</td>
<td>Execution ID for the composite database operation for which monitoring information is displayed</td>
</tr>
<tr>
<td>session_id</td>
<td>Targets only the subset of statements executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>sql_exec_start</td>
<td>Time at which execution of the monitored SQL was started. Only applicable when sql_id is specified. Used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.</td>
</tr>
<tr>
<td>sql_exec_id</td>
<td>A numeric ID generated internally by SQL monitor to identify different executions of the same SQL statement. Thus each execution will have the same sql_id but a different sql_exec_id. Only applicable when sql_id is specified and is used to display monitoring information for a particular execution of sql_id. When NULL (default), the last execution of sql_id is shown.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Looks only at queries started on the specified instance. Use -1 to target the current instance. The default, NULL will target all instances.</td>
</tr>
</tbody>
</table>
### Table 155-5  (Cont.) REPORT_SQL_MONITOR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_time_filter</td>
<td>If not NULL, the report shows activity from V$ACTIVE_SESSION_HISTORY started after this date. If NULL, the reported activity starts once the targeted database operation has started.</td>
</tr>
<tr>
<td>end_time_filter</td>
<td>If not NULL, the report shows activity from V$ACTIVE_SESSION_HISTORY started before this date. If NULL, the reported activity ends when the targeted database operation has ended or SYSDATE if the operation is still executing.</td>
</tr>
<tr>
<td>instance_id_filter</td>
<td>Only looks at activity for the specified instance. Use NULL (the default) to target all instances. Only relevant if the query runs in parallel.</td>
</tr>
<tr>
<td>parallel_filter</td>
<td>Parallel filter applies only to parallel execution and allows you to select only a subset of the processes involved in the parallel execution. The string parallel_filter can be:</td>
</tr>
<tr>
<td>plan_line_filter</td>
<td>Selects activity and execution statistics for the specified line number in the plan of a SQL.</td>
</tr>
<tr>
<td>event_detail</td>
<td>When set to NO, the activity is aggregated by wait_class only. Use YES (default) to aggregate by wait_class, event_name.</td>
</tr>
<tr>
<td>bucket_max_count</td>
<td>Specifies the maximum number of buckets to create in the report.</td>
</tr>
<tr>
<td>bucket_interval</td>
<td>Represents the exact time interval, in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</td>
</tr>
<tr>
<td>base_path</td>
<td>URL path for flex HTML resources since flex HTML format requires access to external files (Java scripts and the flash swf file).</td>
</tr>
<tr>
<td>last_refresh_time</td>
<td>If not NULL (default), the time when the report was last retrieved (SYSDATE attribute of the report tag). Use this option when you want to display the report of an running query and when that report is refreshed on a regular basis. This optimizes the size of the report since only the new changed information will be returned. In particular, the following will be optimized:</td>
</tr>
</tbody>
</table>

- SQL text will not be returned when this option is specified
- Activity histogram will start at the bucket that intersects that time. The entire content of the bucket is returned, even if last_refresh_time is after the start of that bucket
### Table 155-5  (Cont.) REPORT_SQL_MONITOR Procedure Parameters

<td>instance-activity_histogram-plan_histogram-metrics</td>
</tr>
<tr>
<td></td>
<td>where the token &quot;-&quot; implies that report section will not be included in the report.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: Everything but plan_histogram</td>
</tr>
<tr>
<td></td>
<td>• ALL: Everything</td>
</tr>
<tr>
<td></td>
<td>In addition, individual report sections can also be enabled or</td>
</tr>
<tr>
<td></td>
<td>disabled by using a +section_name. Several sections are defined:</td>
</tr>
<tr>
<td></td>
<td>• XPLAN: Shows explain plan. ON by default.</td>
</tr>
<tr>
<td></td>
<td>• PLAN: Shows plan monitoring statistics. ON by default.</td>
</tr>
<tr>
<td></td>
<td>• SESSIONS: Show session details. Applies only to parallel queries. ON by default.</td>
</tr>
<tr>
<td></td>
<td>• INSTANCE: Shows instance details. Applies only to parallel and</td>
</tr>
<tr>
<td></td>
<td>cross instance queries. ON by default.</td>
</tr>
<tr>
<td></td>
<td>• PARALLEL: An umbrella parameter for specifying sessions as well as</td>
</tr>
<tr>
<td></td>
<td>instance details</td>
</tr>
<tr>
<td></td>
<td>• ACTIVITY: Shows activity summary at global level, plan line level and</td>
</tr>
<tr>
<td></td>
<td>session</td>
</tr>
<tr>
<td></td>
<td>• INSTANCE LEVEL: (If applicable). ON by default.</td>
</tr>
<tr>
<td></td>
<td>• BINDS: Shows bind information when available. ON by default.</td>
</tr>
<tr>
<td></td>
<td>• METRICS: Shows metric data (such as CPU and IOs) over time. ON by default</td>
</tr>
<tr>
<td></td>
<td>• ACTIVITY_HISTOGRAM: Shows a histogram of the overall query activity. ON by default</td>
</tr>
<tr>
<td></td>
<td>• PLAN_HISTOGRAM: Shows activity histogram at plan line level. OFF by default</td>
</tr>
<tr>
<td></td>
<td>• OTHER: Other information. ON by default.</td>
</tr>
<tr>
<td></td>
<td>In addition, SQL text can be specified at different levels:</td>
</tr>
<tr>
<td></td>
<td>• -SQL_TEXT: No SQL text in report</td>
</tr>
<tr>
<td></td>
<td>• +SQL_TEXT: Alright with partial SQL text, that is, up to the first</td>
</tr>
<tr>
<td></td>
<td>2000 chars as stored in GV$SQL_MONITOR</td>
</tr>
<tr>
<td></td>
<td>• SQL_FULLTEXT: No full SQL text, that is, +sql_text</td>
</tr>
<tr>
<td></td>
<td>• +SQL_FULLTEXT: Show full SQL text (default)</td>
</tr>
<tr>
<td>type</td>
<td>Report type:</td>
</tr>
<tr>
<td></td>
<td>• TEXT: text report (default)</td>
</tr>
<tr>
<td></td>
<td>• HTML: simple HTML report</td>
</tr>
<tr>
<td></td>
<td>• ACTIVE: database active report. Some information (explain plan,</td>
</tr>
<tr>
<td></td>
<td>activity_histogram, metrics and plan_histogram) is only shown when this type is selected</td>
</tr>
<tr>
<td></td>
<td>• XML: raw data for the report</td>
</tr>
<tr>
<td>sql_plan_hash_value</td>
<td>Targets only those with the specified plan hash value. Default is NULL.</td>
</tr>
<tr>
<td>con_name</td>
<td>Container name in a multitenant database.</td>
</tr>
</tbody>
</table>
Return Values
SQL monitor report, an XML document.

Usage Notes
The user invoking this function must have privilege to access the following fixed views:

- GV$SQL_MONITOR
- GV$SQL_PLAN_MONITOR
- GV$ACTIVE_SESSION_HISTORY
- GV$SESSION_LONGOPS
- GV$SQL if SQL full text is requested and its length is greater than 2 KB

155.4.4 REPORT_SQL_MONITOR_XML Function

This function is identical to the REPORT_SQL_MONITOR function, except that the return type is XMLType.

Related Topics
- REPORT_SQL_MONITOR Function
  This function builds a detailed report with monitoring information for a simple or a composite database operation.

155.4.5 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.

For each database operation, it gives key information and associated global statistics.

Syntax

```sql
DBMS_SQL_MONITOR.REPORT_SQL_MONITOR_LIST (  
  sql_id                    IN VARCHAR2 DEFAULT  NULL,  
  dbop_name                 IN VARCHAR2 DEFAULT  NULL,  
  monitor_type              IN NUMBER   DEFAULT  MONITOR_TYPE_ALL,  
  session_id                IN NUMBER   DEFAULT  NULL,  
  session_serial            IN NUMBER   DEFAULT  NULL,  
  inst_id                   IN NUMBER   DEFAULT  NULL,  
  active_since_date         IN DATE     DEFAULT  NULL,  
  active_since_sec          IN NUMBER   DEFAULT  NULL,  
  last_refresh_time         IN DATE     DEFAULT  NULL,  
  report_level              IN VARCHAR2 DEFAULT 'TYPICAL',  
  auto_refresh              IN NUMBER   DEFAULT  NULL,  
  base_path                 IN VARCHAR2 DEFAULT NULL,  
  type                      IN VARCHAR2 DEFAULT 'TEXT',  
  con_name                  IN VARCHAR2 DEFAULT NULL)  
RETURN CLOB;
```
### Parameters

**Table 155-6  REPORT_SQL_MONITOR_LIST Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID of the simple database operation for which monitoring information should be displayed. Use NULL (default) to display monitoring information for the last operation monitored by Oracle Database.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed.</td>
</tr>
<tr>
<td>monitor_type</td>
<td>Monitor type:&lt;br&gt;• MONITOR_TYPE_SQL returns only simple database operations&lt;br&gt;• MONITOR_TYPE_DBOP returns composite database operations&lt;br&gt;• MONITOR_TYPE_ALL returns all types</td>
</tr>
<tr>
<td>session_id</td>
<td>Targets only the subset of database operations executed and monitored on behalf of the specified session. Default is NULL. Use -1 or USERENV('SID') for the current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to session_id, you can specify the session serial number to ensure the desired session incarnation is targeted. This is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Looks only at monitored database operations originating from the specified instance. Use -1 to target the instance where the report executed. To target all instances, use NULL (default).</td>
</tr>
<tr>
<td>active_since_date</td>
<td>If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified start time.</td>
</tr>
<tr>
<td>active_since_sec</td>
<td>If not NULL (default), returns monitored database operations that have been active since the specified time. This includes all operations that are executing, as well as all operations that have completed their execution after the specified date and time. In this case, the start time is specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to limit the report to all operations that have been active in the past 1 hour.</td>
</tr>
<tr>
<td>last_refresh_time</td>
<td>If not NULL (default), the time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report will show details about the execution of monitored queries that have been active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, and sql_exec_id). Also, for queries that have their first refresh time after the specified date, only the SQL execution key and statistics are returned.</td>
</tr>
<tr>
<td>report_level</td>
<td>Level of detail for the report. The level can be BASIC (SQL text up to 200 character), TYPICAL (which include full SQL text assuming that cursor has not aged out, in which case the SQL text is included up to 2000 characters), or ALL which is the same as TYPICAL.</td>
</tr>
</tbody>
</table>
Table 155-6  (Cont.) REPORT_SQL_MONITOR_LIST Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto_refresh</td>
<td>Specifies the duration in seconds after which report data will be automatically refreshed while the monitored SQL or database operation is still executing. This applies to active report types.</td>
</tr>
<tr>
<td>base_path</td>
<td>URL path for flex HTML resources since flex HTML format requires access to external files (java scripts and the flash swf file).</td>
</tr>
<tr>
<td>type</td>
<td>Report type:</td>
</tr>
<tr>
<td></td>
<td>• TEXT: text report (default)</td>
</tr>
<tr>
<td></td>
<td>• HTML: simple HTML report</td>
</tr>
<tr>
<td></td>
<td>• ACTIVE: database active report. Some information (explain plan, activity_histogram, metrics, and plan_histogram) is only shown when this type is selected.</td>
</tr>
<tr>
<td></td>
<td>• XML: raw data for the report</td>
</tr>
<tr>
<td>con_name</td>
<td>Container name in a multitenant database.</td>
</tr>
</tbody>
</table>

Return Values

A report in text, XML, or HTML format that contains the list of the database operations monitored.

Usage Notes

- Use the REPORT_SQL_MONITOR Function to get detailed monitoring information for a single database operation.
- The user invoking this function needs to have the privilege to access the fixed views GV$SQL_MONITOR and GV$SQL.

155.4.6 REPORT_SQL_MONITOR_LIST_XML Function

This function is identical to the REPORT_SQL_MONITOR_LIST function, except that it returns XMLType.

Related Topics

- REPORT_SQL_MONITOR_LIST Function
  This function builds a report for all or a subset of database operations that have been monitored by Oracle Database.
The `DBMS_SQL_TRANSLATOR` package provides an interface for creating, configuring, and using SQL translation profiles.

This chapter contains the following topics:

• Security Model
• Constants
• Operational Notes
• Exceptions
• Examples
• Summary of DBMS_SQL_TRANSLATOR Subprograms

See Also:

SQL Translation Framework Architecture and Overview in *Oracle Database Migration Guide*

### 156.1 DBMS_SQL_TRANSLATOR Security Model

`DBMS_SQL_TRANSLATOR` is a invoker's rights package.

When translating a SQL statement or error, the translator package procedure will be invoked with the same current user and current schema as those in which the SQL statement being parsed. The owner of the translator package must be granted the `TRANSLATE SQL` user privilege on the current user.

Additionally, the current user must be granted the `EXECUTE` privilege on the translator package.

### 156.2 DBMS_SQL_TRANSLATOR Constants

`DBMS_SQL_TRANSLATOR` defines several constants to use when specifying parameter values.

These are shown in the following table.
Table 156-1  DBMS_SQL_TRANSLATOR  Constants

<table>
<thead>
<tr>
<th>Constant</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ATTR_EDITIONABLE</td>
<td>'EDITIONABLE'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that specifies whether the SQL translation profile becomes an editioned or noneditioned object if editioning is later enabled for the schema object type SQL translation profile in the owner's schema (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_FOREIGN_SQL_SYNTAX</td>
<td>'FOREIGN_SQL_SYNTAX'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that indicates if the profile is for translation of foreign SQL syntax (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_LOG_TRANSLATION_ERROR</td>
<td>'TRANSLATION_ERROR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should log translation error in the database alert log (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_RAISE_TRANSLATION_ERROR</td>
<td>'TRANSLATION_ERROR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should raise translation error if a SQL statement or error fails to be translated (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_TRANSLATE_NEW_SQL</td>
<td>'TRANSLATE_NEW_SQL'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_TRACE_TRANSLATION</td>
<td>'TRACE_TRANSLATION'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that controls tracing (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_TRANSLATOR</td>
<td>'TRANSLATOR'</td>
<td>VARCHAR2(30)</td>
<td>Name of the SQL translation profile attribute that specifies the translator package (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_VALUE_TRUE</td>
<td>'TRUE'</td>
<td>VARCHAR2(30)</td>
<td>Value to set a SQL translation profile attribute to true (see Operational Notes)</td>
</tr>
<tr>
<td>ATTR_VALUE_FALSE</td>
<td>'FALSE'</td>
<td>VARCHAR2(30)</td>
<td>Value to set a SQL translation profile attribute to false (see Operational Notes)</td>
</tr>
</tbody>
</table>

156.3 DBMS_SQL_TRANSLATOR Operational Notes

The subprograms that modify a profile have DDL transaction semantics and when invoked will commit any open transaction in the session.

ATTR_EDITIONABLE Constant
Editionable is true by default.

ATTR_FOREIGN_SQL_SYNTAX Constant
Foreign SQL syntax is true by default.

ATTR_LOG_TRANSLATION_ERROR Constant
- If log translation is enabled in a SQL translation profile, an alert log is written to the database alert log if no custom translation is found for a SQL statement or error. This allows the user to catch any error in the custom translation in a profile.
• Log translation error is false by default.

**ATTR_RAISE_TRANSLATION_ERROR** Constant

Raise translation error is false by default.

**ATTR_TRANSLATE_NEW_SQL** Constant

• The name of the SQL translation profile attribute that controls if the profile should translate new SQL statements and errors. If so, the translator package, if registered, will translate a new SQL statement or error not already translated in custom translations, and also register the new translation as custom translation. If not, any new SQL statement or error encountered will result in a translation error.

• Translate new SQL statements and errors is true by default.

**ATTR_TRACE_TRANSLATION** Constant

• If tracing is enabled in a SQL translation profile, any SQL statement or error translated by the profile in a database session and its translation is written to the database session's trace file.

• Tracing is disabled by default.

**ATTR_TRANSLATOR** Constant

• The translator package must be a PL/SQL package with the following three procedures. The `TRANSLATE_SQL Procedure` and the `TRANSLATE_ERROR Procedure` are called to translate SQL statements and errors. The names of the parameters of the translate procedures must be followed.

  ```plsql
  PROCEDURE TRANSLATE_SQL(
    sql_text        IN  CLOB,
    translated_text OUT CLOB);
  
  PROCEDURE TRANSLATE_ERROR(
    error_code          IN  BINARY_INTEGER,
    translated_code     OUT BINARY_INTEGER,
    translated_sqlstate OUT VARCHAR2);
  
  Parameters:
  profile_name        - profile name
  sql_text            - SQL statement to be translated
  translated_text     - translated SQL statement
  error_code          - Oracle error code
  translated_code     - translated error code
  translated_sqlstate - translated SQLSTATE
  
  • When NULL is returned in translated_text, translated_code, or translated_sqlstate, it means that no translation is required and the original SQL statement, error code, or SQLSTATE is used instead.
  
• The name of the translator package follows the naming rules for database packages of the form `[schema.]package_name`. When the schema and package names are used, they are set to uppercase by default unless surrounded by double quotation marks. For example, setting a translator package, `translator => 'dbms_tsql_translator'` is the same as `translator => 'Dbms_Tsql_Translator'` and `translator => 'DBMS_TSQL_TRANSLATOR'`, but not the same as `translator => '"dbms_tsql_translator"'`. The default schema name is the profile owner.

• The translator attribute is not set by default.
ATTR_VALUE_TRUE Constant
The value to set a SQL translation profile attribute to true.

ATTR_VALUE_FALSE Constant
The value to set a SQL translation profile attribute to false.

156.4 DBMS_SQL_TRANSLATOR Exceptions

This table lists the exceptions raised by the DBMS_SQL_TRANSLATOR package.

Table 156-2 Exceptions Raised by DBMS_SQL_TRANSLATOR

<table>
<thead>
<tr>
<th>Exception</th>
<th>Error Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>29261</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>1031</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>24252</td>
<td>Profile does not exist</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>1918</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_TRANSLATION_FOUND</td>
<td>24253</td>
<td>No translation of the SQL statement or error code found</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>955</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>

156.5 DBMS_SQL_TRANSLATOR Examples

This is an example of basic SQL translation using DBMS_SQL_TRANSLATOR.

Basic SQL Translation

BEGIN
    DBMS_SQL_TRANSLATOR.CREATE_PROFILE(
        profile_name     => 'tsql_application');
    DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE(
        profile_name     =>  'tsql_application',
        attribute_name   =>  DBMS_SQL_TRANSLATOR.ATTR_TRANSLATOR,
        attribute_value  =>  'migration_repo.sybase_tsql_translator');
END;

156.6 Summary of DBMS_SQL_TRANSLATOR Subprograms

This table lists the DBMS_SQL_TRANSLATOR subprograms and briefly describes them.

Table 156-3 DBMS_SQL_TRANSLATOR Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE_PROFILE</td>
<td>Creates a SQL translation profile</td>
</tr>
</tbody>
</table>

<td>Translates an Oracle error code and an ANSI SQLSTATE using a SQL translation profile</td>
</tr>
<tr>
<td>Translate_SQL Procedure</td>
<td>Translates a SQL statement using a SQL translation profile</td>
</tr>
</tbody>
</table>

### 156.6.1 CREATE_PROFILE Procedure

This procedure creates a SQL translation profile.

**Syntax**

```sql
DBMS_SQL_TRANSLATOR.CREATE_PROFILE (
    profile_name    IN  VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
</tbody>
</table>
Exceptions

Table 156-5  CREATE_PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>

Usage Notes

• A SQL translation profile is a database schema object that resides in SQL translation profile namespace. Its name follows the naming rules for database objects of the form [schema.]name. When the schema and profile names are used in the DBMS_SQL_TRANSLATOR package, they are uppercased unless surrounded by double quotation marks. For example, the translation profile profile_name => 'tsql_application' is the same as profile_name => 'Tsql_Application' and profile_name => 'TSQL_APPLICATION', but not the same as profile_name => "tsql_application".

• A SQL translation profile is an editionable object type.

• A SQL translation profile cannot be created as a common object in a multitenant container database (CDB).

• To destroy a SQL translation profile, use the DROP_PROFILE Procedure.

Examples

BEGIN
  DBMS_SQL_TRANSLATOR.CREATE_PROFILE(profile_name => 'tsql_application');
END;

156.6.2 DEREGISTER_SQL_TRANSLATION Procedure

This procedure deregisters the custom translation of a SQL statement in a SQL translation profile.

Syntax

DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION (  
  profile_name IN VARCHAR2,  
  sql_text IN CLOB);

Parameters

Table 156-6  DEREGISTER_SQL_TRANSLATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>
Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>PROFILE_EXISTS</td>
<td>Profile already exists</td>
</tr>
</tbody>
</table>

Examples

BEGIN
   DBMS_SQL_TRANSLATOR.DEREGISTER_SQL_TRANSLATION(
      profile_name => 'tsql_application',
      sql_text     => 'select top 5 * from emp');
END;

156.6.3 DEREGISTER_ERROR_TRANSLATION Procedure

This procedure deregisters the translation of an Oracle error code and SQLSTATE in a SQL translation profile.

Syntax

DBMS_SQL_TRANSLATOR.DEREGISTER_ERROR_TRANSLATION (
   profile_name          IN   VARCHAR2,
   error_code            IN   PLS_INTEGER);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>
156.6.4 DROP_PROFILE Procedure

This procedure drops a SQL translation profile and its contents.

Syntax

DBMS_SQL_TRANSLATOR.DROP_PROFILE (profile_name IN VARCHAR2);

Parameters

Table 156-10 DROP_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
</tbody>
</table>

Exceptions

Table 156-11 DROP_PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

BEGIN
    DBMS_SQL_TRANSLATOR.DROP_PROFILE (profile_name => 'tsql_application');
END;

156.6.5 ENABLE_ERROR_TRANSLATION Procedure

This procedure enables or disables a custom translation of an Oracle error code in a SQL translation profile.

Syntax

DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION (profile_name IN VARCHAR2, sql_text IN CLOB, enable IN BOOLEAN DEFAULT TRUE);
Parameters

Table 156-12 ENABLE_ERROR_TRANSLATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_ERROR_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'SELECT TOP 5 * FROM emp',
    enable       => TRUE);
END;

156.6.6 ENABLE_SQL_TRANSLATION Procedure

This procedure enables or disables a custom translation of a SQL statement in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION (
  profile_name IN VARCHAR2,
  sql_text    IN CLOB,
  enable      IN BOOLEAN DEFAULT TRUE);
```

Parameters

Table 156-14 ENABLE_SQL_TRANSLATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>

<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>
Exceptions

Table 156-15  ENABLE_SQL_TRANSLATION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.ENABLE_SQL_TRANSLATION(
    profile_name => 'tsql_application',
    sql_text     => 'select top 5 * from emp',
    enable       => TRUE);
END;
```

156.6.7 EXPORT_PROFILE Procedure

This procedure exports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.EXPORT_PROFILE (    
  profile_name IN VARCHAR2,    
  content     OUT NOCOPY CLOB);
```

Parameters

Table 156-16  EXPORT_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>content</td>
<td>Content of profile</td>
</tr>
</tbody>
</table>

Exceptions

Table 156-17  EXPORT_PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>
Usage Notes

- The content of the SQL translation profile is exported in XML format as follows. Note that the profile name will not be exported.

```xml
SQLTranslationProfile Translator="translator package name"
   ForeignSQLSyntax="TRUE|FALSE"
   TranslateNewSQL="TRUE|FALSE"
   RaiseTranslationError="TRUE|FALSE"
   LogTranslationError="TRUE|FALSE"
   TraceTranslation="TRUE|FALSE"
   Editionable="TRUE|FALSE">
   <SQLTranslations>
     <SQLTranslation Enabled="TRUE|FALSE">
       <SQLText>original SQL text</SQLText>
       <TranslatedText>translated SQL text</TranslatedText>
     </SQLTranslation>
     ...
   </SQLTranslations>
   <ErrorTranslations>
     <ErrorTranslation Enabled="TRUE|FALSE">
       <ErrorCode>Oracle error code</ErrorCode>
       <TranslatedCode>translated error code</TranslatedCode>
       <TranslatedSQLSTATE>translated SQLSTATE</TranslatedSQLSTATE>
     </ErrorTranslation>
     ...
   </ErrorTranslations>
</SQLTranslationProfile>
```

- To import the content to a SQL translation profile, use the `IMPORT_PROFILE` Procedure.

Examples

```sql
DECLARE
  content CLOB;
BEGIN
  DBMS_SQL_TRANSLATOR.EXPORT_PROFILE(
    profile_name    =>  'tsql_application',
    content         =>  content);
END;
```

156.6.8 IMPORT_PROFILE Procedure

This procedure imports the content of a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.IMPORT_PROFILE (
  profile_name   IN   VARCHAR2,
  content        IN   CLOB);
```

Parameters

Table 156-18 IMPORT_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
</tbody>
</table>
### Table 156-18  IMPORT_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>content</td>
<td>Content of profile</td>
</tr>
</tbody>
</table>

### Exceptions

### Table 156-19  IMPORT_PROFILE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
</tbody>
</table>

### Usage Notes

- The content of the SQL translation profile must be in XML format as used by the `EXPORT_PROFILE` Procedure. All elements and attributes are optional.
- If the profile does not exist, it is created. If it exists, the content overrides any existing attribute, translator package, SQL or error translation registration.
- To export the content to a SQL translation profile, use the `EXPORT_PROFILE` Procedure.

### Examples

```sql
DECLARE
    content CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.IMPORT_PROFILE(
        profile_name    =>  'tsql_application',
        content         =>  content);
END;
```

### 156.6.9 REGISTER_ERROR_TRANSLATION Procedure

This procedure registers a custom translation of an Oracle error code and SQLSTATE in a SQL translation profile.

### Syntax

```sql
DBMS_SQL_TRANSLATOR.REGISTER_ERROR_TRANSLATION (
    profile_name           IN VARCHAR2,
    error_code             IN PLS_INTEGER,
    translated_code        IN PLS_INTEGER DEFAULT NULL,
    translated_sqlstate    IN VARCHAR2 DEFAULT NULL,
    enable                  IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 156-20  REGISTER_ERROR_TRANSLATION Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
<tr>
<td>translated_code</td>
<td>Translated error code</td>
</tr>
<tr>
<td>translated_sqlstate</td>
<td>Translated SQLSTATE</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

Table 156-21  REGISTER_ERROR_TRANSLATION Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- When the Oracle Database translates an Oracle error code using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- The old translation of the error code and SQLSTATE, if present, is replaced with the new translation.
- To deregister a translation, use the DEREGISTER_ERROR_TRANSLATION Procedure.

Examples

```
BEGIN
  DBMS_SQL_TRANSLATOR.register_error_translation(
    profile_name => 'tsql_application',
    error_code   => 1,
    translated_code => 2601);
END;
```
156.6.10 REGISTER_SQL_TRANSLATION Procedure

This procedure registers a custom translation of a SQL statement in a SQL translation profile.

Syntax

```
DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION (
    profile_name      IN VARCHAR2,
    sql_text          IN CLOB,
    translated_text   IN CLOB DEFAULT NULL,
    enable            IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>translated_text</td>
<td>Translated SQL statement</td>
</tr>
<tr>
<td>enable</td>
<td>Enable or disable the translation</td>
</tr>
</tbody>
</table>

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

- When the Oracle Database translates a statement using a translation profile, it searches for the registered custom translation first, and only invokes the translator package if no match is found.
- When a translation is registered in a profile, it may be disabled. Oracle Database does not search for disabled translations.
- When `translated_text` is `NULL`, no translation is required and the original statement is used.
- The old translation of the SQL statement, if present, is replaced with the new translation.
- To deregister a translation, use the Deregister_SQL_Translation Procedure.
Examples

```sql
BEGIN
    DBMS_SQL_TRANSLATOR.REGISTER_SQL_TRANSLATION(
        profile_name => 'tsql_application',
        sql_text => 'select top 5 * from emp',
        translated_text => 'SELECT * FROM emp WHERE rownum <= :SYS_N_001');
END;
```

156.6.11 SET_ATTRIBUTE Procedure

This procedure sets an attribute of a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SET_ATTRIBUTE (profile_name IN VARCHAR2,
attribute_name IN VARCHAR2,
attribute_value IN VARCHAR2;)
```

Parameters

Table 156-24  SET_ATTRIBUTE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>Name of profile</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of attribute</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Value of attribute</td>
</tr>
</tbody>
</table>

Exceptions

Table 156-25  SET_ATTRIBUTE Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Usage Notes

See Constants
156.6.12 SQL_HASH Function

This procedure computes the hash value of a SQL statement in the session's SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SQL_HASH (
    sql_text  IN  CLOB
) RETURN NUMBER DETERMINISTIC;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>

Return Values

Returns hash value of the SQL statement in the SQL translation profile

Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
</tbody>
</table>

Examples

```sql
DECLARE
    sqltext CLOB;
    txltext CLOB;
    sqlhash NUMBER;
BEGIN
    sqltext  := 'SELECT TOP 1 * FROM emp';
    sqlhash := DBMS_SQL_TRANSLATOR.SQL_HASH (sqltext);
    SELECT translated_text INTO txltext
    FROM user_sql_translations
    WHERE sql_hash = sqlhash
    AND DBMS_LOB.COMpare (sql_text, sqltext) = 0;
END;
```

156.6.13 SQL_ID Function

This procedure computes the SQL identifier of a SQL statement in a SQL translation profile.

Syntax

```sql
DBMS_SQL_TRANSLATOR.SQL_ID (
    sql_text  IN  CLOB
) RETURN VARCHAR2 DETERMINISTIC;
```
Parameters

Table 156-28  SQL_ID Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
</tbody>
</table>

Return Values

Returns the SQL ID of the SQL statement in the SQL translation profile

Exceptions

Table 156-29  SQL_ID Function Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    sqltext CLOB;
    sqlid   VARCHAR2(13);
BEGIN
    sqltext := 'SELECT TOP 1 * FROM emp';
    sqlid   := DBMS_SQL_TRANSLATOR.SQL_ID (sqltext);
END;

156.6.14 TRANSLATE_ERROR Procedure

This procedure translates an Oracle error code and an ANSI SQLSTATE using the session's SQL translation profile

Syntax

DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR (  
    error_code IN       PLS_INTEGER,  
    translated_code OUT PLS_INTEGER,  
    translated_sqlstate OUT NOCOPY VARCHAR2);  

Parameters

Table 156-30  TRANSLATE_ERROR Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_code</td>
<td>Oracle error code</td>
</tr>
<tr>
<td>translated_code</td>
<td>Translated error code</td>
</tr>
<tr>
<td>translated_sqlstate</td>
<td>Translated SQLSTATE</td>
</tr>
</tbody>
</table>
Exceptions

Table 156-31  TRANSLATE_ERROR Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
<tr>
<td>NO_TRANSLATION_FOUND</td>
<td>No translation of the SQL statement or error code is found</td>
</tr>
</tbody>
</table>

Examples

DECLARE
    translated_code      BINARY_INTEGER;
    translated_sqlstate  VARCHAR2(5);
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_ERROR(
        error_code           => 1,
        translated_code      => translated_code,
        translated_sqlstate  => translated_sqlstate);
END;

156.6.15 TRANSLATE_SQL Procedure

This procedure translates a SQL statement using a SQL translation profile.

Syntax

DBMS_SQL_TRANSLATOR.TRANSLATE_SQL (  
    sql_text          IN       CLOB,  
    translated_text   OUT  NOCOPY CLOB);

Parameters

Table 156-32  TRANSLATE_SQL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL statement</td>
</tr>
<tr>
<td>translated_text</td>
<td>Translated SQL statement</td>
</tr>
</tbody>
</table>

Exceptions

Table 156-33  TRANSLATE_SQL Procedure Exceptions

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD_ARGUMENT</td>
<td>Bad argument is passed to the PL/SQL interface</td>
</tr>
<tr>
<td>INSUFFICIENT_PRIVILEGE</td>
<td>User has insufficient privilege for the operation</td>
</tr>
<tr>
<td>NO_SUCH_USER</td>
<td>Profile owner does not exist</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Exception</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NO_SUCH_PROFILE</td>
<td>Profile does not exist</td>
</tr>
</tbody>
</table>

Examples

```sql
ALTER SESSION SET SQL_TRANSLATION_PROFILE = tsql_application;

DECLARE
    translated_text CLOB;
BEGIN
    DBMS_SQL_TRANSLATOR.TRANSLATE_SQL(
        sql_text => 'select top 5 * from emp',
        translated_text => translated_text);
END;
```
The DBMS_SQLDIAG package provides an interface to the SQL Diagnosability functionality.

This chapter contains the following topics:

- DBMS_SQLDIAG Overview
- DBMS_SQLDIAG Security Model
- DBMS_SQLDIAG Constants
- DBMS_SQLDIAG Examples
- Summary of DBMS_SQLDIAG Subprograms

See Also: Oracle Database Administrator's Guide for more information about "Managing Diagnostic Data"

157.1 DBMS_SQLDIAG Overview

In the rare case that a SQL statement fails with a critical error, you can run the SQL Repair Advisor to try to repair the failed statement.

This section covers the following topics:

- About the SQL Repair Advisor
- Running the SQL Repair Advisor
- Removing a SQL Patch

About the SQL Repair Advisor

You run the SQL Repair Advisor after a SQL statement fails with a critical error. The advisor analyzes the statement and in many cases recommends a patch to repair the statement. If you implement the recommendation, the applied SQL patch circumvents the failure by causing the query optimizer to choose an alternate execution plan for future executions.

Running the SQL Repair Advisor

You run the SQL Repair Advisor by creating and executing a diagnostic task using the create_diagnosis_task and execute_diagnosis_task respectively. The SQL Repair Advisor first reproduces the critical error and then tries to produce a workaround in the form of SQL patch.

1. Identify the problem SQL statement
Consider the SQL statement that gives a critical error:

```sql
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
WHERE t1.a = t2.a
AND t1.b = t2.b AND t1.d = t2.d)
```

You use the SQL Repair advisor to repair this critical error.

2. **Create a diagnosis task**

   Invoke `DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK`. You can specify an optional task name, an optional time limit for the advisor task, and problem type. In the example below, we specify the SQL text, the task name as 'error_task' and a problem type as 'DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR'.

   ```sql
   DECLARE
     rep_out CLOB;
     t_id VARCHAR2(50);
   BEGIN
     t_id := DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK(
       sql_text => 'DELETE FROM t t1 WHERE t1.a = ''a'' AND ROWID <> (SELECT MAX(ROWID) FROM t t2
       WHERE t1.a = t2.a AND t1.b = t2.b AND t1.d = t2.d)
     ,
     task_name => 'error_task',
     problem_type => 'DBMS_SQLDIAG.PROBLEM_TYPE_COMPILATION_ERROR');
   END;
   ```

3. **Execute the diagnosis task**

   To execute the workaround generation and analysis phase of the SQL Repair Advisor, you call `DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK` with the task ID returned by the CREATE_DIAGNOSIS_TASK. After a short delay, the SQL Repair Advisor returns. As part of its execution, the SQL Repair Advisor keeps a record of its findings which can be accessed through the reporting facilities of SQL Repair Advisor.

   ```sql
   DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (t_id);
   ```

4. **Report the diagnosis task**

   The analysis of the diagnosis task is accessed through `DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK`. If the SQL Repair Advisor was able to find a workaround, it recommends a SQL Patch. A SQL Patch is similar to a SQL profile but unlike the SQL Profile, it is used to workaround compilation or execution errors.

   ```sql
   rep_out := DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (t_id, DBMS_SQLDIAG.TYPE_TEXT);
   DBMS_OUTPUT.PUT_LINE ('Report : ' || rep_out);
   END;
   ```

5. **Applying the patch**

   If a patch recommendation is present in the report, you can run the `ACCEPT_SQL_PATCH` command to accept the patch by invoking `DBMS_SQLDIAG.ACCEPT_SQL_PATCH`. This procedure takes the task_name as an argument.

   ```sql
   EXECUTE DBMS_SQLDIAG.ACCEPT_SQL_PATCH(task_name => 'error_task', task_owner => 'SYS', replace => TRUE);
   ```

6. **Test the patch**
Now that you have accepted the patch, you can rerun the SQL statement. This time, it will not give you the critical error. If you run 'explain plan' for this statement, you will see that a SQL patch was used to generate the plan.

```
DELETE FROM t t1 WHERE t1.a = 'a' AND ROWID <> (select max(rowid) FROM t t2
WHERE t1.a = t2.a
AND t1.b = t2.b AND t1.d = t2.d);
```

Removing a SQL Patch

In a situation where you obtained an official patch from Oracle to fix an error, or upgraded to the next patchset or release of Oracle which included the fix for the error, you call `DBMS_SQLDIAG.DROP_SQL_PATCH` with the patch name to drop the SQL patch. The patch name can be obtained from the explain plan section or by querying the view `DBA_SQL_PATCHES`.

157.2 DBMS_SQLDIAG Security Model

You must have the `ADVISOR` role to execute the `DBMS_SQLDIAG` package.

157.3 DBMS_SQLDIAG Constants

`DBMS_SQLDIAG` defines constants to use when specifying parameter values.

These constants are shown in the following tables:

- Table 157-1 describes the name of SQL repair advisor as seen by the advisor framework
- Table 157-2 describes SQLDIAG advisor task scope parameter values
- Table 157-3 describes SQLDIAG advisor `time_limit` constants
- Table 157-4 describes possible formats for a report
- Table 157-5 describes possible levels of detail in the report
- Table 157-6 describes possible report sections (comma delimited)
- Table 157-7 describes possible values for the `problem_type` parameter of the `CREATE_DIAGNOSIS_TASK` Functions
- Table 157-8 describes possible values for the `_sql_findings_mode` parameter

### Table 157-1  DBMS_SQLDIAG Constants - SQLDIAG Advisor Name

<table>
<thead>
<tr>
<th>Constant</th>
<th>Type</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADV_SQL_DIAG_NAME</td>
<td>VARCHAR2(18)</td>

### 157.4 DBMS_SQLDIAG Examples

Patches can be exported out of one system and imported into another by means of a staging table, provided by subprograms in this package. Like with SQL diagnosis sets, the operation of inserting into the staging table is called a "pack", and the operation of creating patches from staging table data is termed the "unpack".

#### Patch Pack / Unpack

DBAs should perform a pack/unpack as follows:

1. Create a staging table owned by user 'SH' through a call to `CREATE_STGTAB_SQLPATCH`:

   ```sql
   EXEC DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH(
       table_name => 'STAGING_TABLE',
       schema_name => 'SH');
   ```

2. Call `PACK_STGTAB_SQLPATCH` one or more times to write SQL patch data into the staging table. In this case, copy data for all SQL patches in the DEFAULT category into a staging table owned by the current schema owner:

   ```sql
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
       staging_table_name => 'STAGING_TABLE');
   ```

3. In this case, only a single SQL patch `SP_FIND_EMPLOYEE` is copied into a staging table owned by the current schema owner:

   ```sql
   EXEC DBMS_SQLDIAG.PACK_STGTAB_SQLPATCH(
       patch_name => 'SP_FIND_EMPLOYEE',
       staging_table_name => 'STAGING_TABLE');
   ```

   The staging table can then be moved to another system using either datapump, import/export commands or through a databaselink.

4. Call `UNPACK_STGTAB_SQLPATCH` to create SQL patches on the new system from the patch data in the staging table. In this case, change the name in the data for the `SP_FIND_EMPLOYEE` patch stored in the staging table to 'SP_FIND_EMP_PROD':

   ```sql
   EXEC DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH(
       staging_table_name => 'STAGING_TABLE',
       new_patch_name => 'SP_FIND_EMP_PROD');
   ```
exec dbms_sqldiag.remap_stgtab_sqlpatch(
    old_patch_name      =>  'SP_FIND_EMPLOYEE',
    new_patch_name      =>  'SP_FIND_EMP_PROD',
)

157.5 Summary of DBMS_SQLDIAG Subprograms

This table lists the DBMS_SQLDIAG subprograms and briefly describes them.

Table 157-9  DBMS_SQLDIAG Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCEPT_SQL_PATCH Function &amp; Procedure</td>
<td>Accepts a recommended SQL patch as recommended by the specified SQL diagnosis task</td>

</tr>
</tbody>
</table>

157.5.1 ACCEPT_SQL_PATCH Function & Procedure

This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.

Syntax

```sql
DBMS_SQLDIAG.ACCEPT_SQL_PATCH (    task_name IN VARCHAR2,    object_id IN NUMBER := NULL,    name IN VARCHAR2 := NULL,    description IN VARCHAR2 := NULL,    category IN VARCHAR2 := NULL,    task_owner IN VARCHAR2 := NULL,    replace IN BOOLEAN := FALSE,    force_match IN BOOLEAN := FALSE) RETURN VARCHAR2;
```

Parameters

Table 157-10  ACCEPT_SQL_PATCH Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of the SQL diagnosis task</td>
</tr>
</tbody>
</table>
Table 157-10  (Cont.) ACCEPT_SQL_PATCH Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object representing the SQL statement associated to the diagnosis task</td>
</tr>
<tr>
<td>name</td>
<td>Name of the patch. It cannot contain double quotation marks. The name is case sensitive. If not specified, the system will generate a unique name for the SQL patch.</td>
</tr>
<tr>
<td>description</td>
<td>User specified string describing the purpose of this SQL patch. Maximum size of description is 500.</td>
</tr>
<tr>
<td>category</td>
<td>Category name which must match the value of the SQLDIAGNOSE_CATEGORY parameter in a session for the session to use this patch. It defaults to the value DEFAULT. This is also the default of the SQLDIAGNOSE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name create a unique key for a patch. An accept will fail if this combination is duplicated.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the diagnosis task. This is an optional parameter that has to be specified to accept a SQL Patch associated to a diagnosis task owned by another user. The current user is the default value.</td>
</tr>
<tr>
<td>replace</td>
<td>If the patch already exists, it will be replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL Patches to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the CURSOR_SHARING parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the CURSOR_SHARING parameter.</td>
</tr>
</tbody>
</table>

Return Values
Name of the SQL patch

Usage Notes
Requires CREATE ANY SQL PROFILE privilege

157.5.2 ALTER_SQL_PATCH Procedure

This procedure alters specific attributes of an existing SQL patch object.

Syntax

```
DBMS_SQLDIAG.ALTER_SQL_PATCH (  
    name      IN  VARCHAR2,  
    attribute_name IN  VARCHAR2,  
    value      IN  VARCHAR2);  
```
Parameters

Table 157-11  ALTER_SQL_PATCH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of SQL patch to alter.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Name of SQL patch to alter. Possible values:</td>
</tr>
<tr>
<td></td>
<td>• STATUS -&gt; can be set to ENABLED or DISABLED</td>
</tr>
<tr>
<td></td>
<td>• NAME -&gt; can be reset to a valid name (must be a valid Oracle identifier</td>
</tr>
<tr>
<td></td>
<td>and must be unique).</td>
</tr>
<tr>
<td></td>
<td>• DESCRIPTION -&gt; can be set to any string of size no more than 500</td>
</tr>
<tr>
<td></td>
<td>• CATEGORY -&gt; can be reset to a valid category name (must be valid Oracle</td>
</tr>
<tr>
<td></td>
<td>identifier and must be unique when combined with normalized SQL text)</td>
</tr>
<tr>
<td>value</td>
<td>New value of the attribute. See attribute_name for valid attribute values.</td>
</tr>
<tr>
<td></td>
<td>This parameter is mandatory and is case sensitive.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires ALTER ANY SQL PATCH privilege

157.5.3 CANCEL_DIAGNOSIS_TASK Procedure

This procedure cancels a diagnostic task.

Syntax

```
DBMS_SQLDIAG.CANCEL_DIAGNOSIS_TASK (  
    taskname        IN   VARCHAR2);  
```

Parameters

Table 157-12  CANCEL_DIAGNOSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>

157.5.4 CREATE_DIAGNOSIS_TASK Functions

This function creates a diagnostic task in order to diagnose a single SQL statement. It returns a SQL diagnosis task unique name.

Syntax

Prepares the diagnosis of a single statement given its text:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (  
    sql_text           IN   CLOB,  
    bind_list          IN   sql_binds := NULL,  
    user_name          IN   VARCHAR2    := NULL,  
```
Prepares the diagnosis of a single statement from the Cursor Cache given its identifier:

```
DBMS_SQLDIAG.CREATE_DIAGNOSIS_TASK (
    sql_id             IN   VARCHAR2,  
    plan_hash_value    IN   NUMBER    := NULL,  
    scope              IN   VARCHAR2  := SCOPE_COMPREHENSIVE,  
    time_limit         IN   NUMBER    := TIME_LIMIT_DEFAULT,  
    task_name          IN   VARCHAR2  := NULL,  
    description        IN   VARCHAR2  := NULL,  
    problem_type       IN   NUMBER    := PROBLEM_TYPE_PERFORMANCE)
RETURN VARCHAR2;
```

Prepares the diagnosis of a Sqlset:

```
DBMS_SQLDIAG.CREATE_DIAGNOSTICS_TASK (
    sqlset_name       IN VARCHAR2,  
    basic_filter      IN VARCHAR2 := NULL,  
    object_filter     IN VARCHAR2 := NULL,  
    rank1             IN VARCHAR2 := NULL,  
    rank2             IN VARCHAR2 := NULL,  
    rank3             IN VARCHAR2 := NULL,  
    result_percentage IN NUMBER   := NULL,  
    result_limit      IN NUMBER   := NULL,  
    scope             IN VARCHAR2 := SCOPE_COMPREHENSIVE,  
    time_limit        IN NUMBER   := TIME_LIMIT_DEFAULT,  
    task_name         IN VARCHAR2 := NULL,  
    description       IN VARCHAR2 := NULL,  
    plan_filter       IN VARCHAR2 := 'MAX_ELAPSED_TIME',  
    sqlset_owner      IN VARCHAR2 := NULL,  
    problem_type      IN NUMBER    := PROBLEM_TYPE_PERFORMANCE)  RETURN VARCHAR2;
```

Parameters

Table 157-13  CREATE_DIAGNOSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>Set of bind values</td>
</tr>
<tr>
<td>user_name</td>
<td>Username for who the statement/sqlset will be diagnosed</td>
</tr>
<tr>
<td>scope</td>
<td>Diagnosis scope (limited/comprehensive)</td>
</tr>
<tr>
<td>time_limit</td>
<td>Maximum duration in seconds for the diagnosis session</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional diagnosis task name</td>
</tr>
<tr>
<td>description</td>
<td>Maximum of 256 SQL diagnosis session description</td>
</tr>
<tr>
<td>problem_type</td>
<td>Determines the goal of the task. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>- PROBLEM_TYPE_WRONG_RESULTS</td>
</tr>
<tr>
<td></td>
<td>- PROBLEM_TYPE_COMPILATION_ERROR</td>
</tr>
<tr>
<td></td>
<td>- PROBLEM_TYPE_EXECUTION_ERROR</td>
</tr>
</tbody>
</table>
### CREATE_DIAGNOSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Identifier of the statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Sqlset name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set (STS)</td>
</tr>
<tr>
<td>object_filter</td>
<td>Object filter</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Percentage on the sum of a ranking measure</td>
</tr>
<tr>
<td>result_limit</td>
<td>Top L(limit) SQL from (filtered/ranked) SQL</td>
</tr>
<tr>
<td>plan_filter</td>
<td>Plan filter. It is applicable in case there are multiple plans (plan_hash_value). This filter allows selecting one plan (plan_hash_value) only. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• LAST_GENERATED: plan with most recent timestamp</td>
</tr>
<tr>
<td></td>
<td>• FIRST_GENERATED: opposite to LAST_GENERATED</td>
</tr>
<tr>
<td></td>
<td>• LAST_LOADED: plan with most recent first_load_time stat info</td>
</tr>
<tr>
<td></td>
<td>• FIRST_LOADED: opposite to LAST_LOADED</td>
</tr>
<tr>
<td></td>
<td>• MAX_ELAPSED_TIME: plan with maximum elapsed time</td>
</tr>
<tr>
<td></td>
<td>• MAX_BUFFER_GETS: plan with maximum buffer gets</td>
</tr>
<tr>
<td></td>
<td>• MAX_DISK_READS: plan with maximum disk reads</td>
</tr>
<tr>
<td></td>
<td>• MAX_DIRECT_WRITES: plan with maximum direct writes</td>
</tr>
<tr>
<td></td>
<td>• MAX_OPTIMIZER_COST: plan with maximum optimum cost</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Owner of the sqlset, or null for current schema owner</td>
</tr>
</tbody>
</table>

### 157.5.5 CREATE_SQL_PATCH Function

This function creates a SQL patch based on a set of user specified hints for specific statements identified by SQL text.

A SQL patch is usually created automatically by the SQL Repair Advisor to prevent any errors during the compilation or execution of a SQL statement. This function provides a way to manually create a SQL patch based on a set of hints that resolves the error.

**Syntax**

```sql
DBMS_SQLDIAG.CREATE_SQL_PATCH (  
  sql_text        IN   CLOB,  
  hint_text       IN   CLOB,  
  name            IN   VARCHAR2   := NULL,  
  description     IN   VARCHAR2   := NULL,  
  category        IN   VARCHAR2   := NULL,  
  validate        IN   BOOLEAN    := TRUE)  
RETURN VARCHAR2;
```

```sql
DBMS_SQLDIAG.CREATE_SQL_PATCH (  
  sql_id          IN   VARCHAR2,  
  hint_text       IN   CLOB,  
  name            IN   VARCHAR2   := NULL,  
  plan_filter     IN   VARCHAR2   := NULL,  
  sqlset_owner    IN   VARCHAR2   := NULL,  
  validate        IN   BOOLEAN    := TRUE)  
RETURN VARCHAR2;
```
CREATE_SQL_PATCH Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement</td>
</tr>
<tr>
<td>sql_id</td>
<td>The SQL identifier for the SQL statement</td>
</tr>
<tr>
<td>hint_text</td>
<td>Hints to include in the SQL patch</td>
</tr>
<tr>
<td>name</td>
<td>Optional SQL patch name</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL patch</td>
</tr>
<tr>
<td>category</td>
<td>Category name</td>
</tr>
<tr>
<td>validate</td>
<td>Whether to validate the provided hints</td>
</tr>
</tbody>
</table>

Return Values
Both functions return the SQL patch name.

157.5.6 CREATE_STGTAB_SQLPATCH Procedure

This procedure creates the staging table used for transporting SQL patches from one system to another.

Syntax

```sql
DBMS_SQLDIAG.CREATE_STGTAB_SQLPATCH (
    table_name       IN  VARCHAR2,
    schema_name      IN  VARCHAR2 := NULL,
    tablespace_name  IN  VARCHAR2 := NULL
);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>(Mandatory) Name of the table to create (case-sensitive)</td>
</tr>
<tr>
<td>schema_name</td>
<td>Schema to create the table in, or NULL for current schema (case-sensitive)</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Tablespace to store the staging table within, or NULL for current user's default tablespace (case-sensitive)</td>
</tr>
</tbody>
</table>
157.5.7 DROP_DIAGNOSIS_TASK Procedure

This procedure drops a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.DROP_DIAGNOSIS_TASK (taskname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>

157.5.8 DROP_SQL_PATCH Procedure

This procedure drops the named SQL patch from the database.

Syntax

```sql
DBMS_SQLDIAG.DROP_SQL_PATCH (name IN VARCHAR2, ignore IN BOOLEAN := FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Name of patch to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignore errors due to object not existing.</td>
</tr>
</tbody>
</table>

Usage Notes

Requires `DROP ANY SQL PATCH` privilege

157.5.9 EXECUTE_DIAGNOSIS_TASK Procedure

This procedure executes a diagnostic task.

Syntax

```sql
DBMS_SQLDIAG.EXECUTE_DIAGNOSIS_TASK (taskname IN VARCHAR2);
```
157.5.10 EXPLAIN_SQL_TESTCASE Function

This procedure explains a SQL test case.

Syntax

```sql
DBMS_SQLDIAG.EXPLAIN_SQL_TESTCASE (
    sqlTestCase        IN   CLOB)
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlTestCase</td>
<td>XML document describing the SQL test case</td>
</tr>
</tbody>
</table>

157.5.11 EXPORT_SQL_TESTCASE Procedures

This procedure exports a SQL test case to a directory.

Syntax

This variant has to be provided with the SQL information.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory                IN              VARCHAR2,
    sql_text                 IN              CLOB,
    user_name                IN              VARCHAR2  :=  NULL,
    bind_list                IN              sql_binds :=  NULL,
    exportEnvironment        IN              BOOLEAN   :=  TRUE,
    exportMetadata           IN              BOOLEAN   :=  TRUE,
    exportData               IN              BOOLEAN   :=  FALSE,
    exportPkgbody            IN              BOOLEAN   :=  FALSE,
    samplingPercent          IN              NUMBER    :=  100,
    ctrlOptions              IN              VARCHAR2  :=  NULL,
    timeLimit                IN              NUMBER    :=  0,
    testcase_name            IN              VARCHAR2  :=  NULL,
    testcase                 IN OUT NOCOPY   CLOB,
    preserveSchemaMapping    IN              BOOLEAN   :=  FALSE,
    version                  IN              VARCHAR2  :=  'COMPATIBLE');
```

This variant extracts the SQL information from an incident file.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (
    directory                IN              VARCHAR2,
    incident_id              IN              VARCHAR2,
    incidental_number        IN              NUMBER    :=  0,
    incident                IN OUT NOCOPY   CLOB,
    preserveMetadata         IN              BOOLEAN   :=  FALSE,
    preserveSchemaMapping    IN              BOOLEAN   :=  FALSE,
    version                  IN              VARCHAR2  :=  'COMPATIBLE');
```
This variant allows the SQL Test case to be generated from a cursor present in the cursor cache. Use `V$SQL` to get the SQL identifier and the SQL hash value.

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE (directory IN VARCHAR2,
sql_id IN VARCHAR2,
plan_hash_value IN NUMBER := NULL,
exportEnvironment IN BOOLEAN := TRUE,
exportMetadata IN BOOLEAN := TRUE,
exportData IN BOOLEAN := FALSE,
exportPkgbody IN BOOLEAN := FALSE,
samplingPercent IN NUMBER := 100,
ctrlOptions IN VARCHAR2 := NULL,
timeLimit IN NUMBER := DBMS_SQLDIAG.TIME_LIMIT_DEFAULT,
testcase_name IN VARCHAR2 := NULL,
testcase IN OUT NOCOPY CLOB,
preserveSchemaMapping IN BOOLEAN := FALSE,
version IN VARCHAR2 := 'COMPATIBLE');
```

### Parameters

**Table 157-20 EXPORT_SQL_TESTCASE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to export</td>
</tr>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of the statement in the cursor cache</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>bind_list</td>
<td>List of bind values associated to the statement</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportPkgbody</td>
<td>TRUE if the body of the packages referenced in the SQL are exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters. For example, to execute three times, set <code>ctrlOptions</code> with the following string: <code>&lt;parameter name=&quot;mexec_count&quot;&gt;3&lt;/parameter&gt;</code>.</td>
</tr>
<tr>
<td></td>
<td>• name=&quot;capture&quot; - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.</td>
</tr>
<tr>
<td></td>
<td>• BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</td>
</tr>
<tr>
<td></td>
<td>• WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</td>
</tr>
<tr>
<td></td>
<td>Note this must be the same value as used in the IMPORT_SQL_TESTCASE Procedures.</td>
</tr>
<tr>
<td></td>
<td>• name=&quot;mexec_count&quot; - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.</td>
</tr>
<tr>
<td></td>
<td>• name=&quot;stat_history_since&quot; - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.</td>
</tr>
<tr>
<td>timeLimit</td>
<td>How much time should we spend exporting the SQL test case</td>
</tr>
<tr>
<td>testCaseName</td>
<td>An optional name for the SQL test case. This is used to prefix all the generated scripts</td>
</tr>
<tr>
<td>testCase</td>
<td>Resulting testcase</td>
</tr>
<tr>
<td>preserveSchemaMapping</td>
<td>TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment</td>
</tr>
<tr>
<td>version</td>
<td>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</td>
</tr>
<tr>
<td></td>
<td>• COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.</td>
</tr>
<tr>
<td></td>
<td>• LATEST - the version of the metadata that specifies the current database version.</td>
</tr>
<tr>
<td></td>
<td>• A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0.</td>
</tr>
</tbody>
</table>

Usage Notes

- A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  - a dump file containing schemas objects and statistics (.dmp)
  - the explain plan for the statements (in advanced mode)
  - diagnostic information gathered on the offending statement
  - an import script to execute to reload the objects
– a SQL script to replay system statistics of the source
– a table of contents file describing the SQL test case
– metadata. (xxxxmain.xml)
– a README.txt file that explain the usage of the TCB
– the outlines used by the statement (ol.xml)
– a list of parameters set in the exporting db/env (prmimp.sql)
– a SQL monitor report, if any (smrpt.html)
– an AWR report, if any (awrrpt.html)
– a list of binds used in this statement (bndlst.xml)

• You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the DBA role.

• The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

• TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.

• To export objects statistics history, the database compatibility should be set to 12.0 or higher.

• This procedure does not export data and statistics on a Global Temporary Table (GTT).

Examples

The user can specify multiple parameters in the ctrlOptions encapsulated either by using the <parameters> parent tag or without the parent tag.

Using the <parameters> tag

<parameters>
<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>
</parameters>

Without the <parameters> tag

<parameter name="capture">with_runtime_info</parameter>
<parameter name="mexec_count">1</parameter>"
157.5.12 EXPORT_SQL_TESTCASE_DIR_BY_INC Function

This function generates a SQL test case corresponding to the incident ID passed as an argument. It creates a set of scripts and dump file in the directory passed as an argument.

Syntax

DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_INC (  
    incident_id        IN   NUMBER,  
    directory          IN   VARCHAR2,  
    exportEnvironment  IN   VARCHAR2 := 'TRUE',  
    exportMetadata     IN   VARCHAR2 := 'TRUE',  
    exportData         IN   VARCHAR2 := 'FALSE',  
    samplingPercent    IN   VARCHAR2 := '100',  
    ctrlOptions        IN   VARCHAR2 := NULL,  
    version            IN   VARCHAR2 := 'COMPATIBLE')  
RETURN BOOLEAN;

Parameters

Table 157-21  EXPORT_SQL_TESTCASE_DIR_BY_INC Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL. For more information about Incidents, see Oracle Database Performance Tuning Guide.</td>
</tr>
<tr>
<td>directory</td>
<td>Directory path to the generated files</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '&lt;parameter name=&quot;mexec_count&quot;&gt;3&lt;/parameter&gt;'.</td>
</tr>
</tbody>
</table>

- capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.  
  BASIC: runs as Oracle release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.  
  WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.  

- name=mexec_count - Value is any positive number (N). This parameter tells TCB to execute the statement for N time and capture runtime info at end of each execution.  

- name=stat_history_since - Value is date. The object statistics history is exported using this parameter. Statistics history after date specified will be exported.

| version       | Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.  
  - COMPATIBLE - (default) the version of the metadata corresponds to the database compatibility level and the compatibility release level for feature (as given in the V$COMPATIBILITY view). Database compatibility must be set to 9.2 or higher.  
  - LATEST - the version of the metadata that specifies the current database version.  
  - A specific database version. For example, if '10.0.0', this cannot be lower than Oracle Database release 10.0.0. |

157.5.13 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function

This function generates a SQL Test Case corresponding to the SQL passed as an argument. It creates a set of scripts and dump files in the directory passed as an argument.

Syntax

```sql
DBMS_SQLDIAG.EXPORT_SQL_TESTCASE_DIR_BY_TXT (  
  incident_id IN NUMBER,  
  directory IN VARCHAR2,  
  sql_text IN CLOB,  
  username IN VARCHAR2 := 'SYS',  
  exportEnvironment IN VARCHAR2 := 'TRUE',  
  exportMetadata IN VARCHAR2 := 'TRUE',  
  exportData IN VARCHAR2 := 'FALSE',  
  samplingPercent IN VARCHAR2 := '100',  
  ctrlOptions IN VARCHAR2 := NULL  
  version IN VARCHAR2 := 'COMPATIBLE')  
RETURN BOOLEAN;
```

Parameters

Table 157-22 EXPORT_SQL_TESTCASE_DIR_BY_TXT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Incident ID containing the offending SQL</td>
</tr>
<tr>
<td>directory</td>
<td>Directory to store the various generated files</td>
</tr>
<tr>
<td>sql_text</td>
<td>Text of the SQL statement to explain</td>
</tr>
<tr>
<td>username</td>
<td>Name of the user schema to use to parse the SQL, defaults to SYS</td>
</tr>
<tr>
<td>exportEnvironment</td>
<td>TRUE if the compilation environment should be exported</td>
</tr>
<tr>
<td>exportMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be exported</td>
</tr>
</tbody>
</table>

<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>exportData</td>
<td>TRUE if the data of the objects referenced in the SQL should be exported</td>
</tr>
<tr>
<td>samplingPercent</td>
<td>If is TRUE, specify the sampling percentage to use to create the dump file</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '&lt;parameter name=&quot;mexec_count&quot;&gt;3&lt;/parameter&gt;'.</td>
</tr>
<tr>
<td>version</td>
<td>Version of database objects to be extracted. This option is only valid for EXPORT. Database objects or attributes incompatible with the version will not be extracted.</td>
</tr>
</tbody>
</table>

157.5.14 GET_FIX_CONTROL Function

This function returns the value of fix control for a given bug number.

Syntax

```
DBMS_SQLDIAG.GET_FIX_CONTROL (  
    bug_number   IN    NUMBER)  
RETURN NUMBER;
```
Parameters

Table 157-23  GET_FIX_CONTROL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bug_number</td>
<td>Bug number</td>
</tr>
</tbody>
</table>

157.5.15 GET_SQL Function

This function loads a sql_setrow from the trace file associated to an the given incident ID.

Syntax

```sql
DBMS_SQLDIAG.GET_SQL (incident_id  IN   VARCHAR2)
RETURN SQLSET_ROW;
```

Parameters

Table 157-24  GET_SQL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
</tbody>
</table>

157.5.16 IMPORT_SQL_TESTCASE Procedures

This procedure imports a SQL test case into a schema.

Syntax

This variant requires a source directory and SQL Testcase metadata object (in XML format).

```sql
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (directory                IN   VARCHAR2,
sqlTestCase              IN   CLOB,
importEnvironment        IN   BOOLEAN   :=  TRUE,
importMetadata           IN   BOOLEAN   :=  TRUE,
importData               IN   BOOLEAN   :=  TRUE,
importPkgbody            IN   BOOLEAN   :=  FALSE,
importDiagnosis          IN   BOOLEAN   :=  TRUE,
ignoreStorage            IN   BOOLEAN   :=  TRUE,
ctrlOptions              IN   VARCHAR2  :=  NULL,
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);
```

This variant requires a source directory name of SQL Testcase metadata file.

```sql
DBMS_SQLDIAG.IMPORT_SQL_TESTCASE (directory                IN   VARCHAR2,
filename                 IN   VARCHAR2,
importEnvironment        IN   BOOLEAN   :=  TRUE,
importMetadata           IN   BOOLEAN   :=  TRUE,
importData               IN   BOOLEAN   :=  TRUE,
```
importPkgbody            IN   BOOLEAN   :=  FALSE,
importDiagnosis          IN   BOOLEAN   :=  TRUE,
ignoreStorage            IN   BOOLEAN   :=  TRUE,
ctrlOptions              IN   VARCHAR2  :=  NULL,
preserveSchemaMapping    IN   BOOLEAN   :=  FALSE);

Parameters

Table 157-25  IMPORT_SQL_TESTCASE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory containing test case files</td>
</tr>
<tr>
<td>filename</td>
<td>Name of a file containing an XML document describing the SQL test case</td>
</tr>
<tr>
<td>importEnvironment</td>
<td>TRUE if the compilation environment should be imported</td>
</tr>
<tr>
<td>importMetadata</td>
<td>TRUE if the definition of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importData</td>
<td>TRUE if the data of the objects referenced in the SQL should be imported</td>
</tr>
<tr>
<td>importPkgbody</td>
<td>TRUE if the body of the packages referenced in the SQL are imported</td>
</tr>
<tr>
<td>importDiagnosis</td>
<td>TRUE if the diagnostic information associated to the task should be imported</td>
</tr>
<tr>
<td>ignoreStorage</td>
<td>TRUE if the storage attributes should be ignored</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters, of which only capture is valid for this subprogram.</td>
</tr>
<tr>
<td></td>
<td>• capture - BASIC (default) or WITH_RUNTIME_INFO. This parameter defines the mode of TCB capture.</td>
</tr>
<tr>
<td></td>
<td>• BASIC: runs as Oracle Release 11g TCB and captures all the information that is captured in that release as well as AWR reports, SQL monitor reports and parameter information.</td>
</tr>
<tr>
<td></td>
<td>• WITH_RUNTIME_INFO: TCB captures runtime information for the SQL, such as dynamic sampling data, list of binds, Dynamic Plan info, along with information captured under BASIC mode.</td>
</tr>
<tr>
<td>preserveSchemaMapping</td>
<td>TRUE if the schema (or schemas) are not re-mapped from the original environment to the test environment (schema mapping in the target database will be identical to the source database).</td>
</tr>
<tr>
<td></td>
<td>Note that when an import is run with preservesSchemaMapping set to TRUE, if the objects in the schemas exists then the import will overwrite the existing objects.</td>
</tr>
</tbody>
</table>

Usage Notes

• A SQL test case generates a set of files needed to help reproduce a SQL failure on a different machine. It contains:
  • a dump file containing schemas objects and statistics (.dmp)
  • the explain plan for the statements (in advanced mode)
  • diagnostic information gathered on the offending statement
  • an import script to execute to reload the objects
• You should not run Test Case Builder (TCB) under user SYS. Instead, use another user who can be granted the SYSDBA privilege.

• The default setting for TCB is that data is not exported. However, in some cases data is required, such as to diagnose an outcome with a result that is not optimal. To export data, call EXPORT_SQL_TESTCASE Procedures with exportData=>TRUE and the data will be imported by default, unless turned OFF by importData=>FALSE.

• TCB includes PL/SQL package spec by default, but not the PL/SQL package body. However, you may need to have the package body as well, for example, to invoke the PL/SQL functions, or because you have a Virtual Private Database (VPD) function defined in a package. To export a PL/SQL package body, call EXPORT_SQL_TESTCASE Procedures with exportPkgbody=>TRUE. To import a PL/SQL package body, call IMPORT_SQL_TESTCASE Procedures with importPkgbody=>TRUE.

• The capture value used when invoking the EXPORT_SQL_TESTCASE Procedures must be used when calling this procedure.

157.5.17 INCIDENTID_2_SQL Procedure

This procedure initializes a sql_setrow from an incident ID.

Syntax

```sql
DBMS_SQLDIAG.INCIDENTID_2_SQL (  
    incident_id   IN     VARCHAR2,    
    sql_stmt      OUT    SQLSET_ROW,  
    problem_type  OUT    NUMBER,      
    err_code      OUT    BINARY_INTEGER,    
    err_mesg      OUT    VARCHAR2);  
```

Parameters

Table 157-26 INCIDENTID_2_SQL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>incident_id</td>
<td>Identifier of the incident</td>
</tr>
<tr>
<td>sql_stmt</td>
<td>Resulting SQL</td>
</tr>
<tr>
<td>problem_type</td>
<td>Tentative type of SQL problem (currently among PROBLEM_TYPE_COMPILATION_ERROR and PROBLEM_TYPE_EXECUTION_ERROR)</td>
</tr>
<tr>
<td>err_code</td>
<td></td>
</tr>
<tr>
<td>err_mesg</td>
<td></td>
</tr>
</tbody>
</table>
### Table 157-26 (Cont.) INCIDENTID_2_SQL Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>err_code</td>
<td>Error code if any otherwise it is set to NULL</td>
</tr>
<tr>
<td>err_msg</td>
<td>Error message if any otherwise it is set to NULL</td>
</tr>
</tbody>
</table>

#### 157.5.18 INTERRUPT_DIAGNOSIS_TASK Procedure

This procedure interrupts a diagnostic task.

**Syntax**

```sql
DBMS_SQLDIAG.INTERRUPT_DIAGNOSIS_TASK (
    taskname        IN   VARCHAR2);
```

**Parameters**

**Table 157-27 INTERRUPT_DIAGNOSIS_TASK Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>

#### 157.5.19 LOAD_SQLSET_FROM_TCB Function

This function loads a `SQLSET` from a Test Case Builder file.

**Syntax**

```sql
DBMS_SQLDIAG.LOAD_SQLSET_FROM_TCB (
    directory        IN     VARCHAR2,
    filename         IN     VARCHAR2,
    sqlset_name      IN     VARCHAR2 DEFAULT NULL
) RETURN VARCHAR2;
```

**Parameters**

**Table 157-28 LOAD_SQLSET_FROM_TCB Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Name of directory</td>
</tr>
<tr>
<td>filename</td>
<td>Name of file</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Name of <code>SQLSET</code></td>
</tr>
</tbody>
</table>
157.5.20 PACK_STGTAB_SQLPATCH Procedure

This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.

Syntax

```sql
DBMS_SQLDIAG.UPPACK_STGTAB_SQLPATCH (    
  patch_name            IN  VARCHAR2 := '%',    
  patch_category        IN  VARCHAR2 := 'DEFAULT',    
  staging_table_name    IN  VARCHAR2,    
  staging_schema_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 157-29  UPPACK_STGTAB_SQLPATCH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch_name</td>
<td>Name of patch to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>patch_category</td>
<td>Category to which to pack patches (% wildcards acceptable, case-insensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>(Mandatory) Name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Requires: ADMINISTER SQL PLAN MANAGEMENT OBJECT privilege and INSERT privilege on the staging table
- By default, we move all SQL patches in category DEFAULT. See the Examples for details. Note that the subprogram issues a COMMIT after packing each SQL patch, so if an error is raised in mid-execution, some patches may be in the staging table.

Related Topics

- CREATE_STGTAB_SQLPATCH Procedure
  This procedure creates the staging table used for transporting SQL patches from one system to another.

157.5.21 REPLAY_SQL_TESTCASE Function

This function automates the reproduction of the SQL Test Case.

Syntax

```sql
DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (    
  directory IN VARCHAR2,    
  filename IN VARCHAR2,    
  ctrlOptions IN VARCHAR2 := NULL,    
  format IN VARCHAR2 := 'TEXT')    
RETURN CLOB;
```

DBMS_SQLDIAG.REPLAY_SQL_TESTCASE (    
  directory IN VARCHAR2,    
  filename IN VARCHAR2,    
  ctrlOptions IN VARCHAR2 := NULL,    
  format IN VARCHAR2 := 'TEXT')
Parameters

Table 157-30  REPLAY_SQL_TESTCASE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Directory containing test case files</td>
</tr>
<tr>
<td>filename</td>
<td>Name of a file containing an XML document describing the SQL test case</td>
</tr>
<tr>
<td>ctrlOptions</td>
<td>Opaque control parameters. For example, to execute three times, set ctrlOptions with the following string: '&lt;&lt;parameter name=&quot;mexec_count&quot;&gt;3&lt;/parameter&gt;&gt;'.</td>
</tr>
<tr>
<td>sqlTestCase</td>
<td>SQL test case</td>
</tr>
<tr>
<td>format</td>
<td>Format of the replay report. Possible formats are: TEXT, XML and HTML.</td>
</tr>
</tbody>
</table>

Examples

TCB Replay Mode: Execute
SELECT /* tcbdynpl_1 */ /*+ gather_plan_statistics */ * FROM (SELECT * FROM emp WHERE emp.sal > 100) emp, dept WHERE emp.deptno = dept.deptno And emp.sal > 1000 /* tcbdynpl_1 */

</tr>
</tbody>
</table>
### 157.5.22 REPORT_DIAGNOSIS_TASK Function

This function reports on a diagnostic task. It returns a **CLOB** containing the desired report.

**Syntax**

```sql
DBMS_SQLDIAG.REPORT_DIAGNOSIS_TASK (    taskname IN VARCHAR2,    type IN VARCHAR2 := TYPE_TEXT,    level IN VARCHAR2 := LEVEL_TYPICAL,    section IN VARCHAR2 := SECTION_ALL,    object_id IN NUMBER := NULL,    result_limit IN NUMBER := NULL,    owner_name IN VARCHAR2 := NULL)    RETURN CLOB;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report. Possible values are: TEXT, HTML, XML (see Table 157-4).</td>
</tr>
</tbody>
</table>
Table 157-31  (Cont.) REPORT_DIAGNOSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>Format of the recommendations. Possible values are TYPICAL, BASIC, ALL (Table 157-5).</td>
</tr>
<tr>
<td>section</td>
<td>Particular section in the report. Possible values are: SUMMARY, FINDINGS, PLAN, INFORMATION, ERROR, ALL (Table 157-6).</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given statement in a SQL Tuning Set (STS).</td>
</tr>
<tr>
<td>result_limit</td>
<td>Number of statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>owner_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
</tbody>
</table>

157.5.23 RESET_DIAGNOSIS_TASK Procedure

This procedure resets a diagnostic task.

Syntax

```
DBMS_SQLDIAG.RESET_DIAGNOSIS_TASK (  
    taskname       IN   VARCHAR2);                         
```

Parameters

Table 157-32  RESET_DIAGNOSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>

157.5.24 RESUME_DIAGNOSIS_TASK Procedure

This procedure resumes a diagnostic path.

Syntax

```
DBMS_SQLDIAG.RESUME_DIAGNOSIS_TASK (  
    taskname       IN   VARCHAR2);                         
```

Parameters

Table 157-33  RESUME_DIAGNOSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Name of task</td>
</tr>
</tbody>
</table>
157.5.25 SET_DIAGNOSIS_TASK_PARAMETER Procedure

This procedure is called to update the value of a SQL diagnosis parameter of type VARCHAR2.

The task must be set to its initial state before calling this procedure. The diagnosis parameters that can be set by this procedure are:

- **MODE**: diag scope (comprehensive, limited)
- **_SQLDIAG_FINDING_MODE**: findings in the report (see "Table 157-8" for possible values)

**Syntax**

```
DBMS_SQLDIAG.SET_DIAGNOSIS_TASK_PARAMETER (  
    taskname           IN   VARCHAR2,  
    parameter          IN   VARCHAR2,    value              IN   NUMBER);
```

**Parameters**

```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>taskname</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set</td>
</tr>
<tr>
<td>value</td>
<td>New value of the specified parameter</td>
</tr>
</tbody>
</table>
```

157.5.26 UNPACK_STGTAB_SQLPATCH Procedure

This procedure unpacks from the staging table populated by a call to the PACK_STGTAB_SQLPATCH Procedure. It uses the patch data stored in the staging table to create patches on this system. Users can opt to replace existing patches with patch data when they exist already. In this case, note that it is only possible to replace patches referring to the same statement if the names are the same (see the ACCEPT_SQL_PATCH Function & Procedure).

**Syntax**

```
DBMS_SQLDIAG.UNPACK_STGTAB_SQLPATCH (  
    patch_name            IN  VARCHAR2 := '%',  
    patch_category        IN  VARCHAR2 := '%',  
    replace               IN  BOOLEAN,  
    staging_table_name    IN  VARCHAR2,  
    staging_schema_owner  IN  VARCHAR2 := NULL);
```

**Parameters**

```
Table 157-35    UNPACK_STGTAB_SQLPATCH Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>patch_name</td>
<td>Name of patch to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
</tbody>
</table>

</tr>
</thead>
<tbody>
<tr>
<td>patch_category</td>
<td>Category from which to unpack patches (% wildcards acceptable, case-insensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>Replace patches if they already exist. Note that patches cannot be replaced if there is one in the staging table with the same name as an active patch on different SQL. The subprogram raises an error if there an attempt to create a patch that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>(Mandatory) Name of the table to use (case-sensitive)</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Usage Notes

- Requires: ADMINISTER SQL MANAGEMENT OBJECT privilege and SELECT or READ privilege on the staging table.
- By default, all SQL patches in the staging table are moved. The function commits after successfully loading each patch. If it fails in creating an individual patch, it raises an error and does not proceed to those remaining in the staging table.

Related Topics

- PACK_STGTAB_SQLPATCH Procedure
  This procedure packs SQL patches into the staging table created by a call to the CREATE_STGTAB_SQLPATCH Procedure.
- ACCEPT_SQL_PATCH Function & Procedure
  This procedure accepts a recommended SQL patch as recommended by the specified SQL diagnosis task.
The DBMS_SQLPA package provides the interface to implement the SQL Performance Analyzer.

The chapter contains the following topics:

• Overview
• Security Model
• Summary of DBMS_SQLPA Subprograms

158.1 DBMS_SQLPA Overview

The DBMS_SQLPA package provides a capacity to help users predict the impact of system environment changes on the performance of a SQL workload. The interface lets users build and then compare two different versions of the workload performance, analyze the differences between the two versions, and unmask the SQL statements that might be impacted by the changes.

The package provides a task-oriented interface to implement the SQL Performance Analyzer. For example

1. You use the CREATE_ANALYSIS_TASK Functions to create an analysis task for a single statement or a group of SQL statements.
2. The EXECUTE_ANALYSIS_TASK Function & Procedure executes a previously created analysis task.
3. The REPORT_ANALYSIS_TASK Function displays the results of an analysis task.

158.2 DBMS_SQLPA Security Model

This package is available to PUBLIC and performs its own security checking. All analysis task interfaces (XXX_ANALYSIS_TASK) require privilege ADVISOR.

158.3 Summary of DBMS_SQLPA Subprograms

This table lists the DBMS_SQLPA subprograms and briefly describes them.

<table>

<tr>
<td>SET_ANALYSIS_DEFAULT_PARAMETER Procedures</td>
<td>Sets the SQL analysis task parameter default value</td>
</tr>
</tbody>
</table>

#### 158.3.1 CANCEL_ANALYSIS_TASK Procedure

This procedure cancels the currently executing analysis task. All intermediate result data is removed from the task.

**Syntax**

```sql
DBMS_SQLPA.CANCEL_ANALYSIS_TASK(
   task_name         IN VARCHAR2);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to cancel</td>
</tr>
</tbody>
</table>

**Examples**

Canceling a task when there is a need to stop it executing and it is not required to view any already-completed results:

```sql
EXEC DBMS_SQLPA.CANCEL_ANALYSIS_TASK(:my_task);
```

#### 158.3.2 CREATE_ANALYSIS_TASK Functions

These functions create an advisor task to process and analyze one or more SQL statements.

You can use different forms of this function to:

- Create an analysis task for a single statement given its text.
- Create an analysis task for a single statement from the cursor cache given its identifier.
• Create an analysis task for a single statement from the workload repository given a range of snapshot identifiers.

• Create an analysis task for a SQL tuning set.

In all cases, the function creates an advisor task and sets its parameters.

Syntax

SQL text format. This form of the function is called to prepare the analysis of a single statement given its text.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text         IN CLOB,
    bind_list        IN sql_binds := NULL,
    parsing_schema   IN VARCHAR2 := NULL,
    task_name        IN VARCHAR2 := NULL,
    description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQL ID format. This form of the function is called to prepare the analysis of a single statement from the cursor cache given its identifier.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id           IN VARCHAR2,
    plan_hash_value  IN NUMBER := NULL,
    task_name        IN VARCHAR2 := NULL,
    con_name         IN VARCHAR2 DEFAULT,
    description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Workload Repository format. This form of the function is called to prepare the analysis of a single statement from the workload repository given a range of snapshot identifiers.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    dbid             IN NUMBER DEFAULT,
    begin_snap       IN NUMBER,
    end_snap         IN NUMBER,
    sql_id           IN VARCHAR2,
    plan_hash_value  IN NUMBER := NULL,
    task_name        IN VARCHAR2 := NULL,
    con_name         IN VARCHAR2 DEFAULT,
    description      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

SQLSET format. This form of the function is called to prepare the analysis of a SQL tuning set.

```sql
DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sqlset_name       IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL,
    con_name          IN VARCHAR2 DEFAULT,
    order_by          IN VARCHAR2 := NULL,
    top_sql           IN VARCHAR2 := NULL,
    task_name         IN VARCHAR2 := NULL,
    sqlset_owner      IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```
Parameters

Table 158-3  CREATE_ANALYSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Text of a SQL statement</td>
</tr>
<tr>
<td>bind_list</td>
<td>A set of bind values</td>
</tr>
<tr>
<td>parsing_schema</td>
<td>Name of the schema where the statement can be compiled</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional analysis task name</td>
</tr>
<tr>
<td>dbid</td>
<td>The DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used</td>
</tr>
<tr>
<td>con_name</td>
<td>Container for the SPA task. The semantics depend on the function format:</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL analysis task to a maximum of 256 characters</td>
</tr>
<tr>
<td>sql_id</td>
<td>Identifier of a SQL statement</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Hash value of the SQL execution plan</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Begin snapshot identifier</td>
</tr>
<tr>
<td>end_snap</td>
<td>End snapshot identifier</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>SQL tuning set name</td>
</tr>
<tr>
<td>basic_filter</td>
<td>SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td>order_by</td>
<td>Order-by clause on the selected SQL</td>
</tr>
<tr>
<td>top_sql</td>
<td>Top N SQL after filtering and ranking</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>The owner of the SQL tuning set, or NULL for the current schema owner</td>
</tr>
</tbody>
</table>

Return Values

A SQL analysis task name that is unique by user (two different users can give the same name to their advisor tasks).
Examples

variable stmt_task VARCHAR2(64);
variable sts_task VARCHAR2(64);

-- Sql text format
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_text => 'select quantity_sold from sales s, times t where s.time_id =
    t.time_id and s.time_id = TO_DATE(''24-NOV-00''));

-- Sql id format (cursor cache)
EXEC :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    sql_id       => 'ay1m3ssvtrh24');

-- Workload repository format
exec :stmt_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
    begin_snap => 1,
    end_snap => 2,
    sql_id => 'ay1m3ssvtrh24');

-- Sql tuning set format (first we need to load an STS, then analyze it)
EXEC :sts_task := DBMS_SQLPA.CREATE_ANALYSIS_TASK( -
    sqlset_name => 'my_workload', -
    order_by => 'BUFFER_GETS', -
    description => 'process workload ordered by buffer gets');

158.3.3 DROP_ANALYSIS_TASK Procedure

This procedure drops a SQL analysis task. The task and all its result data are deleted.

Syntax

DBMS_SQLPA DROP_ANALYSIS_TASK(
    task_name IN VARCHAR2);

Parameters

Table 158-4  DROP_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the analysis task to drop</td>
</tr>
</tbody>
</table>

158.3.4 EXECUTE_ANALYSIS_TASK Function & Procedure

This function and procedure executes a previously created analysis task, the function version returning the new execution name.

Syntax

DBMS_SQLPA EXECUTE_ANALYSIS_TASK(
    task_name IN VARCHAR2,
    execution_type IN VARCHAR2 := 'test execute',
    execution_name IN VARCHAR2 := NULL,
    execution_params IN dbms_advisor.argList := NULL,
    execution_desc IN VARCHAR2 := NULL)
RETURN VARCHAR2;
DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
  task_name        IN VARCHAR2,
  execution_type   IN VARCHAR2 := 'test execute',
  execution_name   IN VARCHAR2 := NULL,
  execution_params IN dbms_advisor.argList   := NULL,
  execution_desc   IN VARCHAR2 := NULL);

Parameters

Table 158-5  EXECUTE_ANALYSIS_TASK Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>execution_type</td>
<td>Type of the action to perform by the function. If NULL it will default</td>
</tr>
<tr>
<td></td>
<td>to the value of the DEFAULT_EXECUTION_TYPE parameter. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• [TEST] EXECUTE - test-execute every SQL statement and collect its</td>
</tr>
<tr>
<td></td>
<td>execution plans and execution statistics. The resulting plans and</td>
</tr>
<tr>
<td></td>
<td>statistics will be stored in the advisor framework. This is default.</td>
</tr>
<tr>
<td></td>
<td>• EXPLAIN PLAN - generate explain plan for every statement in the SQL</td>
</tr>
<tr>
<td></td>
<td>workload. This is similar to the EXPLAIN PLAN command. The resulting</td>
</tr>
<tr>
<td></td>
<td>plans will be stored in the advisor framework in association with the task.</td>
</tr>
<tr>
<td></td>
<td>• COMPARE [PERFORMANCE] - analyze and compare two versions of SQL</td>
</tr>
<tr>
<td></td>
<td>performance data. The performance data is generated by test-executing or</td>
</tr>
<tr>
<td></td>
<td>generating explain plan of the SQL statements. Use this option when two</td>
</tr>
<tr>
<td></td>
<td>executions of type EXPLAIN_PLAN or TEST_EXECUTE already exist in the task.</td>
</tr>
<tr>
<td></td>
<td>• CONVERT SQLSET - used to read the statistics captured in a SQL Tuning</td>
</tr>
<tr>
<td></td>
<td>Set and model them as a task execution. This can be used when you wish to</td>
</tr>
<tr>
<td></td>
<td>avoid executing the SQL statements because valid data for the experiment</td>
</tr>
<tr>
<td></td>
<td>already exists in the SQL Tuning Set.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it will</td>
</tr>
<tr>
<td></td>
<td>be generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution</td>
</tr>
<tr>
<td></td>
<td>parameters have effect only on the execution for which they are specified.</td>
</tr>
<tr>
<td></td>
<td>They will override the values for the parameters stored in the task (set</td>
</tr>
<tr>
<td></td>
<td>through the SET_ANALYSIS_DEFAULT_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution</td>
</tr>
</tbody>
</table>

Usage Notes

SQL performance analyzer task can be executed multiples times without having to reset it. For example, when a task is created to perform a change impact analysis on a SQL workload, the created task has to be executed before making any change in the system environment to build a version of the workload that will be used as a reference for performance analysis. Once the change has been made, a second execution is required to build the post-change version of the workload. Finally, the task has to be executed a third time to let the advisor analyze and compare the performance of the workload in both versions.
Examples

1. Create a task with a purpose of change impact analysis

EXEC :tname := DBMS_SQLPA.CREATE_ANALYSIS_TASK(
  sqlset_name => 'my_sts');

2. Make baseline or the before change execution

EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
  task_name => :tname,
  execution_type => 'test execute',
  execution_name => 'before_change');

3. Make change

...

4. Make the after change version of the workload performance

EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
  task_name => :tname, -
  execution_type => 'test execute', -
  execution_name => 'after_change')

5. Compare the two versions of the workload

By default we always compare the results of the two last executions. The SQL Performance Analyzer uses the elapsed_time as a default metric for comparison. Here we are changing it to buffer_gets instead.

EXEC DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
  :tname,'comparison_metric', 'buffer_gets');
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
  task_name => :tname, -
  execution_type => 'compare performance', -
  execution_name => 'after_change');

Use the following call if you would like to explicitly specify the two executions to compare as well as the comparison metric to use.

EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(
  task_name => :tname, -
  execution_type => 'compare performance', -
  execution_params => dbms_advisor.arglist(
    'execution_name1',
    'before_change',
    'execution_name2',
    'after_change',
    'comparison_metric',
    'buffer_gets'));

158.3.5 INTERRUPT_ANALYSIS_TASK Procedure

This procedure interrupts the currently executing analysis task. All intermediate result data will not be removed from the task.

Syntax

```
DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(
    task_name         IN VARCHAR2);
```

Parameters

Table 158-6  INTERRUPT_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to interrupt</td>
</tr>
</tbody>
</table>

Examples

```
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:my_task);
```

158.3.6 REPORT_ANALYSIS_TASK Function

This procedure displays the results of an analysis task.

Syntax

```
DBMS_SQLPA.REPORT_ANALYSIS_TASK(
    task_name       IN   VARCHAR2,
    type            IN   VARCHAR2   := 'TEXT',
    level           IN   VARCHAR2   := 'TYPICAL',
    section         IN   VARCHAR2   := 'SUMMARY',
    object_id       IN   NUMBER     := NULL,
    top_sql         IN   NUMBER     := 100,
    execution_name  IN   VARCHAR2   := NULL,
    task_owner      IN   VARCHAR2   := NULL,
    order_by        IN   VARCHAR2   := NULL)
RETURN CLOB;
```

Parameters

Table 158-7  REPORT_ANALYSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task to report</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT (default), HTML, XML and ACTIVE (see Usage Notes).</td>
</tr>
</tbody>
</table>
### Table 158-7  (Cont.) REPORT_ANALYSIS_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>• ALL - details of all SQL</td>
</tr>
<tr>
<td></td>
<td>• BASIC - currently the same as typical</td>
</tr>
<tr>
<td></td>
<td>• CHANGED - only SQL with changed performance</td>
</tr>
<tr>
<td></td>
<td>• CHANGED_PLANS - only SQL with plan changes</td>
</tr>
<tr>
<td></td>
<td>• ERRORS - SQL with errors only</td>
</tr>
<tr>
<td></td>
<td>• IMPROVED - only improved SQL</td>
</tr>
<tr>
<td></td>
<td>• REGRESSED - only regressed SQL</td>
</tr>
<tr>
<td></td>
<td>• TIMEOUT - only SQL which timed-out during execution</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL (default) - show information about every statement analyzed, including changing and errors</td>
</tr>
<tr>
<td></td>
<td>• UNCHANGED - only SQL with unchanged performance</td>
</tr>
<tr>
<td></td>
<td>• UNCHANGED_PLANS - only SQL with unchanged plans</td>
</tr>
<tr>
<td></td>
<td>• UNSUPPORTED - only SQL not supported by SPAs</td>
</tr>
<tr>
<td>section</td>
<td>Optionally limit the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY (default) - workload summary only</td>
</tr>
<tr>
<td></td>
<td>• ALL - summary and details on SQL</td>
</tr>
<tr>
<td>object_id</td>
<td>Identifier of the advisor framework object that represents a given SQL in a tuning set (STS)</td>
</tr>
<tr>
<td>top_sql</td>
<td>Number of SQL statements in a STS for which the report is generated</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the report will be generated for the last task execution.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the relevant analysis task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>order_by</td>
<td>How to sort SQL statements in the report (summary and body). Possible values:</td>
</tr>
<tr>
<td></td>
<td>• CHANGE_DIFF - sort SQL statements by change difference in SQL performance in terms of the comparison Metric</td>
</tr>
<tr>
<td></td>
<td>• NULL (default) - order SQL statement by impact on workload</td>
</tr>
<tr>
<td></td>
<td>• SQL_IMPACT - order SQL statement by change impact on SQL</td>
</tr>
<tr>
<td></td>
<td>• WORKLOAD_IMPACT - same as NULL</td>
</tr>
<tr>
<td></td>
<td>• METRIC_DELTA - same as CHANGE_DIFF</td>
</tr>
</tbody>
</table>

### Return Values

A CLOB containing the desired report.

### Usage Notes

ACTIVE reports have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.
158.3.7 RESET_ANALYSIS_TASK Procedure

This procedure is called on an analysis task that is not currently executing to prepare it for re-execution.

All intermediate result data will be deleted.

Syntax

```
DBMS_SQLPA.RESET_ANALYSIS_TASK(
  task_name         IN VARCHAR2);
```

Parameters

Table 158-8  RESET_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to reset</td>
</tr>
</tbody>
</table>

Examples

-- reset and re-execute a task
EXEC DBMS_SQLPA.RESET_ANALYSIS_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLPA.EXECUTE_ANALYSIS_TASK(:sts_task);

158.3.8 RESUME_ANALYSIS_TASK Procedure

This procedure resumes a previously interrupted or FAILED (with a fatal error) task execution.

Syntax

```
DBMS_SQLPA.RESUME_ANALYSIS_TASK(
  task_name     IN VARCHAR2,
  basic_filter  IN VARCHAR2 := NULL);
```
Parameters

Table 158-9  RESUME_ANALYSIS_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the analysis task to resume</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter will be applied in conjunction with the basic filter (parameter basic_filter) that was specified when calling the CREATE_ANALYSIS_TASK Functions.</td>
</tr>
</tbody>
</table>

Usage Notes

Resuming a single SQL analysis task (a task that was created to analyze a single SQL statement as compared to a SQL Tuning Set) is not supported.

Examples

-- Interrupt the task
EXEC DBMS_SQLPA.INTERRUPT_ANALYSIS_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.
EXEC DBMS_SQLPA.RESUME_ANALYSIS_TASK(:conc_task);

158.3.9 SET_ANALYSIS_TASK_PARAMETER Procedures

This procedure sets the SQL analysis task parameter value.

Syntax

This form of the procedure updates the value of a SQL analysis parameter of type VARCHAR2.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN VARCHAR2,
    test_execute_dop IN NUMBER DEFAULT 0,
    compare_resultset IN BOOLEAN DEFAULT TRUE);
```

This form of the procedure updates the value of a SQL analysis parameter of type NUMBER.

```
DBMS_SQLPA.SET_ANALYSIS_TASK_PARAMETER(
    task_name IN VARCHAR2,
    parameter IN VARCHAR2,
    value IN NUMBER,
    test_execute_dop IN NUMBER DEFAULT 0,
    compare_resultset IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 158-10  SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</td>
</tr>
<tr>
<td></td>
<td>• APPLY_CAPTURED_COMPILENV: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</td>
</tr>
<tr>
<td></td>
<td>• BASIC_FILTER: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• CELL_SIMULATION_ENABLED: for more details, see the helper script tcellsim.sql in the ADMIN directory.</td>
</tr>
<tr>
<td></td>
<td>• COMPARISON_METRIC: specify an expression of execution statistics to use in performance comparison (Example: buffer_gets, cpu_time + buffer_gets * 10)</td>
</tr>
<tr>
<td></td>
<td>• DATABASE_LINK: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all TEST EXECUTE and EXPLAIN PLAN operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</td>
</tr>
<tr>
<td></td>
<td>• DAYS_TO_EXPIRE: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>• DEFAULT_EXECUTION_TYPE: the task will default to this type of execution when none is specified by the EXECUTE_ANALYSIS_TASK Function &amp; Procedure.</td>
</tr>
</tbody>
</table>
### Table 158-10  (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameter (contd.)</td>
<td>• DISABLE_MULTI_EXEC: SQL statements are executed multiple times and runtime statistics are then averaged. Set this parameter to <strong>TRUE</strong> to disable this capability. In this case, each SQL in the SQL tuning set is executed only once.</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE_TRIGGERS: Set this parameter to <strong>TRUE</strong> to execute all statement-level triggers in the FULLDML mode. If the parameter is set to <strong>FALSE</strong>, then the triggers will not be executed even in FULLDML mode of test execution. Any changes incurred due to potential execution of triggers are always rolled back by SPA. The default value of this parameter is <strong>FALSE</strong>.</td>
</tr>
<tr>
<td></td>
<td>• EXECUTION_DAYS_TO_EXPIRE: number of days until the tasks's executions will be deleted (without deleting the task)</td>
</tr>
<tr>
<td></td>
<td>• EXECUTE_FULLDML: <strong>TRUE</strong> to execute DML statement fully, including acquiring row locks and modifying rows; <strong>FALSE</strong> (default) to execute only the query part of the DML without modifying data. When <strong>TRUE</strong>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</td>
</tr>
<tr>
<td></td>
<td>• EXECUTION_NAME1: name of the first task execution to analyze</td>
</tr>
<tr>
<td></td>
<td>• EXECUTION_NAME2: name of the second task execution to analyze</td>
</tr>
<tr>
<td></td>
<td>• LOCAL_TIME_LIMIT: per-statement time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>• METRIC_DELTA_THRESHOLD: threshold of the difference between the SQL performance metric before and after the change. The default value is zero.</td>
</tr>
<tr>
<td></td>
<td>• NUM_ROWS_TO_FETCH: specifies the number of rows to be fetched for an SQL query. You can use one of the following values:</td>
</tr>
<tr>
<td></td>
<td>-- ALL_ROWS: Fetches all the rows for an SQL query</td>
</tr>
<tr>
<td></td>
<td>-- AVERAGE: Number of result rows is calculated as the ratio of total rows processed and total executions for each SQL in the STS</td>
</tr>
<tr>
<td></td>
<td>-- AUTO: Number of result rows is determined using the value of optimizer_mode parameter of the optimizer environment captured in the STS. If the value of optimizer_mode is ALL_ROWS, then all result rows will be fetched. If its value is FIRST_ROWS_n, then n result rows will be fetched by the SPA.</td>
</tr>
<tr>
<td></td>
<td>-- A valid number: Fetches the exact number of rows specified by in the SQL query</td>
</tr>
<tr>
<td></td>
<td>The default value is ALL_ROWS.</td>
</tr>
<tr>
<td></td>
<td>• PLAN_FILTER: plan filter for SQL tuning set (see SELECT_SQLSET for possible values)</td>
</tr>
<tr>
<td></td>
<td>• PLAN_LINES_COMPARISON:</td>
</tr>
<tr>
<td></td>
<td>- ALWAYS -- line by line comparison of plans in all scenarios.-</td>
</tr>
<tr>
<td></td>
<td>- AUTO -Line by Line comparison of plans only if phv2 is not available and phv1 is different- <strong>NONE</strong> (default) - line by line comparison of plans only if phv is unknown</td>
</tr>
<tr>
<td></td>
<td>• RANK_MEASURE1: first ranking measure for SQL tuning set</td>
</tr>
</tbody>
</table>
### Table 158-10  (Cont.) SET_ANALYSIS_TASK_PARAMETER Procedure

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>• RANK_MEASURE2: second possible ranking measure for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>• RANK_MEASURE3: third possible ranking measure for SQL tuning set</td>
<td></td>
</tr>
<tr>
<td>• REPLACE_SYSDATE_WITH: Returns a fixed date for all calls to SYSDATE within the SPA task execution. You can use one of the following values:</td>
<td></td>
</tr>
<tr>
<td>– CURRENT_SYSDATE: SYSDATE calls return the current date.</td>
<td></td>
</tr>
<tr>
<td>– SQLSET_SYSDATE: SYSDATE calls return the value of the column LAST_EXEC_START_TIME in the STS</td>
<td></td>
</tr>
<tr>
<td>The default value is CURRENT_SYSDATE.</td>
<td></td>
</tr>
<tr>
<td>• RESUME_FILTER: a extra filter for SQL tuning sets besides BASIC_FILTER</td>
<td></td>
</tr>
<tr>
<td>• SQL_IMPACT_THRESHOLD: threshold of a change impact on a SQL statement. Same as the previous parameter, but at the level of the SQL statement.</td>
<td></td>
</tr>
<tr>
<td>• SQL_LIMIT: maximum number of SQL statements to process</td>
<td></td>
</tr>
<tr>
<td>• SQL_PERCENTAGE: percentage filter of SQL tuning set statements</td>
<td></td>
</tr>
<tr>
<td>• SQLSET_NAME: name of the SQL tuning set to associate to the specified task or task execution. This parameter is mainly using in comparing two SQL tuning sets using SPA.</td>
<td></td>
</tr>
<tr>
<td>• SQLSET_OWNER: owner of the SQL tuning set specified using task parameter SQLSET_NAME.</td>
<td></td>
</tr>
<tr>
<td>• TIME_LIMIT: global time out (seconds)</td>
<td></td>
</tr>
<tr>
<td>parameter (contd.)</td>
<td></td>
</tr>
<tr>
<td>• WORKLOAD_IMPACT_THRESHOLD: threshold of a SQL statement impact on a workload. Statements which workload change impact is below the absolute value of this threshold will be ignored and not considered for improvement or regression.</td>
<td></td>
</tr>
<tr>
<td>• CON_DBID_MAPPING: provide a mapping of multitenant container database (CDB) IDs. When it is set, SQL Performance Analyzer uses the new CDB ID when it finds a match for the old CDB ID and executes the SQL in that container.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>value</th>
<th>New value of the specified parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>test_execute_dop</td>
<td>Specifies the requested level of concurrency with which a SPA task should be executed.</td>
</tr>
<tr>
<td>Values 0 or 1 indicate that the SPA task will run with no additional processes as it used to run in releases prior to Oracle Database 18c Release. A value of n (higher than 1) means that n background SPA processes are being requested to concurrently process the input workload.</td>
<td></td>
</tr>
<tr>
<td>compare_resultset</td>
<td>Directs SPA to detect if the result-sets between the two trials being compared are different. If differences are seen in the result-sets of any SQL statement between the two trials being compared, the SPA comparison report will indicate this for every such SQL statement.</td>
</tr>
<tr>
<td>• If set to TRUE the result set comparison will be performed</td>
<td></td>
</tr>
<tr>
<td>• If set to FALSE result set comparison will not be performed.</td>
<td></td>
</tr>
</tbody>
</table>
Usage Notes

The actual number of processes granted might be equal to or lower than the number requested using the `test_execute_dop` parameter. This parameter applies only to `test-execute` or `explain plan` type of trials that process a SQL Tuning set.

Examples

To request two concurrent processes to execute the SPA task:

```sql
dbms_sqlpa.set_analysis_task_parameter(:tname,'TEST_EXECUTE_DOP',2)
```

To enable result-set validation

```sql
exec dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','TRUE')
```

To disable result-set validation:

```sql
exec dbms_sqlpa.set_analysis_task_parameter(:atname,'COMPARE_RESULTSET','FALSE')
```

158.3.10 SET_ANALYSIS_DEFAULT_PARAMETER Procedures

This procedure sets the SQL analysis task parameter default value.

Syntax

This form of the procedure updates the default value of an analyzer parameter of type VARCHAR2.

```sql
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  VARCHAR2);
```

This form of the procedure updates the default value of an analyzer parameter of type NUMBER.

```sql
DBMS_SQLPA.SET_ANALYSIS_DEFAULT_PARAMETER(
    parameter    IN  VARCHAR2,
    value        IN  NUMBER);
```
### Parameters

**Table 158-11  SET_ANALYSIS_DEFAULT_PARAMETER Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>

</thead>
<tbody>
<tr>
<td>parameter</td>
<td>Name of the parameter to set. The possible analysis parameters that can be set by this procedure are:</td>
</tr>
<tr>
<td></td>
<td>• <code>APPLY_CAPTURED_COMPILENV</code>: indicates whether the advisor could use the compilation environment captured with the SQL statements. The default is 0 (that is, NO).</td>
</tr>
<tr>
<td></td>
<td>• <code>BASIC_FILTER</code>: basic filter for SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• <code>COMPARISON_METRIC</code>: specify an expression of execution statistics to use in performance comparison (Example: <code>buffer_gets, cpu_time + buffer_gets * 10</code>)</td>
</tr>
<tr>
<td></td>
<td>• <code>DATABASE_LINK</code>: can be set to the global name of a PUBLIC database link. When it is set, SQL Performance Analyzer will use the database link for all <code>TEST EXECUTE</code> and <code>EXPLAIN PLAN</code> operations by sending the SQL statements to the remote database to be processed remotely. The analysis results will still be stored on the local database.</td>
</tr>
<tr>
<td></td>
<td>• <code>DAYS_TO_EXPIRE</code>: number of days until the task is deleted</td>
</tr>
<tr>
<td></td>
<td>• <code>DEFAULT_EXECUTION_TYPE</code>: the task will default to this type of execution when none is specified by the <code>EXECUTE_ANALYSIS_TASK</code> Function &amp; Procedure.</td>
</tr>
<tr>
<td></td>
<td>• <code>EXECUTE_FULLDML</code>: <code>TRUE</code> to execute DML statement fully, including acquiring row locks and modifying rows; <code>FALSE</code> (default) to execute only the query part of the DML without modifying data. When <code>TRUE</code>, SQL Performance Analyzer will issue a rollback following DML execution to prevent persistent changes from being made by the DML.</td>
</tr>
<tr>
<td></td>
<td>• <code>EXECUTION_DAYS_TO_EXPIRE</code>: number of days until the task's executions will be deleted (without deleting the task)</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

value New value of the specified parameter
The DBMS_SQLTUNE package provides an interface to manage SQL tuning sets.

This package provides the same subprograms, although in some cases with slightly different names, as the SQL tuning set subprograms in DBMS_SQLTUNE. The difference is that DBMS_SQLSET does not require the Oracle Tuning Pack.

This chapter contains the following topics:

- DBMS_SQLSET Overview
- DBMS_SQLSET Security Model
- DBMS_SQLSET Data Structures
- Summary of DBMS_SQLSET Subprograms

### 159.1 DBMS_SQLSET Overview

Use this package to manage SQL tuning sets.

> Note:

All DBMS_SQLSET subprograms have equivalents in the DBMS_SQLTUNE package.

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the SELECT_CURSOR_CACHE Function
- Top SQL statements from the Automatic Workload Repository using the SELECT_WORKLOAD_REPOSITORY Function
- Other SQL tuning sets using the SELECT_SQLSET Function
- SQL Performance Analyzer task comparison results using the SELECT_SQLPA_TASK Function
- SQL Trace files using the SELECT_SQL_TRACE Function
- A user-defined workload
The complete group of subprograms listed in Summary of DBMS_SQLSET Subprograms facilitates this functionality. As examples:

- The CREATE_SQLSET Procedure and Function creates a SQL tuning set object in the database.
- The LOAD_SQLSET Procedure populates the SQL tuning set with a set of selected SQL.
- The CAPTURE_CURSOR_CACHE Procedure collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

159.2 DBMS_SQLSET Security Model

This package is available to PUBLIC and performs its own security checking.

SQL tuning set subprograms require either the ADMINISTER SQL TUNING SET or the ADMINISTER ANY SQL TUNING SET privilege. Users having the ADMINISTER SQL TUNING SET privilege can only create and modify a SQL tuning set that they own. The ADMINISTER ANY SQL TUNING SET privilege allows users to manipulate all SQL tuning sets, even those owned by other users. For example, you can use CREATE_SQLSET Procedure and Function to create a SQL tuning set to be owned by a different user. In this case, the different user need not have the ADMINISTER SQL TUNING SET privilege to manipulate the SQL tuning set.

159.3 DBMS_SQLSET Data Structures

The SELECT_* subprograms in the DBMS_SQLTUNE package return objects of the SQLSET_ROW type.

Object Types

- SQLSET_ROW Object Type

159.3.1 SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of SQLSET_ROW objects. Each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT_* subprograms each model a data source as a collection of SQLSET_ROW objects, with each object uniquely identified by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

```sql
CREATE TYPE sqlset_row AS object (
    sql_id                   VARCHAR(13),
    force_matching_signature NUMBER,
) IDENTIFIED BY VARCHAR(13) INCIDENTAL;
```
sql_text               CLOB,
object_list             sql_objects,
bind_data               RAW(2000),
parsing_schema_name     VARCHAR2(30),
module                  VARCHAR2(48),
action                  VARCHAR2(32),
ellapsed_time            NUMBER,
cpu_time                 NUMBER,
buffer_gets             NUMBER,
disk_reads              NUMBER,
direct_writes           NUMBER,
rows_processed          NUMBER,
fetches                 NUMBER,
extractions             NUMBER,
end_of_fetch_count      NUMBER,
optimizer_cost           NUMBER,
optimizer_env            RAW(2000),
priority                NUMBER,
command_type            NUMBER,
first_load_time         VARCHAR2(19),
stat_period             NUMBER,
active_stat_period      NUMBER,
other                   CLOB,
plan_hash_value         NUMBER,
sql_plan                sql_plan_table_type,
bind_list               sql_binds,
con_dbid                NUMBER,
last_exec_start_time    VARCHAR2(19)

Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>Unique SQL ID.</td>
</tr>
<tr>
<td>forcing_matching_signature</td>
<td>Signature with literals, case, and whitespace removed.</td>
</tr>
<tr>
<td>sql_text</td>
<td>Full text for the SQL statement.</td>
</tr>
<tr>
<td>object_list</td>
<td>Currently not implemented.</td>
</tr>
<tr>
<td>bind_data</td>
<td>Bind data as captured for this SQL. Note that you cannot stipulate an argument for this parameter and also for bind_list - they are mutually exclusive.</td>
</tr>
<tr>
<td>parsing_schema_name</td>
<td>Schema where the SQL is parsed.</td>
</tr>
<tr>
<td>module</td>
<td>Last application module for the SQL.</td>
</tr>
<tr>
<td>action</td>
<td>Last application action for the SQL.</td>
</tr>
<tr>
<td>elapsed_time</td>
<td>Sum total elapsed time for this SQL statement.</td>
</tr>
<tr>
<td>cpu_time</td>
<td>Sum total CPU time for this SQL statement.</td>
</tr>
<tr>
<td>buffer_gets</td>
<td>Sum total number of buffer gets.</td>
</tr>
<tr>
<td>disk_reads</td>
<td>Sum total number of disk reads.</td>
</tr>
<tr>
<td>direct_writes</td>
<td>Sum total number of direct path writes.</td>
</tr>
<tr>
<td>rows_processed</td>
<td>Sum total number of rows processed by this SQL.</td>
</tr>
<tr>
<td>fetches</td>
<td>Sum total number of fetches.</td>
</tr>
</tbody>
</table>
### Table 159-1  (Cont.) SQLSET_ROW Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>executions</td>
<td>Total executions of this SQL statement.</td>
</tr>
<tr>
<td>end_of_fetch_count</td>
<td>Number of times the SQL statement was fully executed with all of its rows fetched.</td>
</tr>
<tr>
<td>optimizer_cost</td>
<td>Optimizer cost for this SQL.</td>
</tr>
<tr>
<td>optimizer_env</td>
<td>Optimizer environment for this SQL statement.</td>
</tr>
<tr>
<td>priority</td>
<td>User-defined priority (1,2,3).</td>
</tr>
<tr>
<td>command_type</td>
<td>Statement type, such as INSERT or SELECT.</td>
</tr>
<tr>
<td>first_load_time</td>
<td>Load time of the parent cursor.</td>
</tr>
<tr>
<td>stat_period</td>
<td>Period of time (seconds) when the statistics of this SQL statement were collected.</td>
</tr>
<tr>
<td>active_stat_period</td>
<td>Effective period of time (in seconds) during which the SQL statement was active.</td>
</tr>
<tr>
<td>other</td>
<td>Other column for user-defined attributes.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan hash value of the plan.</td>
</tr>
<tr>
<td>sql_plan</td>
<td>Execution plan for the SQL statement.</td>
</tr>
<tr>
<td>bind_list</td>
<td>List of user-specified binds for the SQL statement. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.</td>
</tr>
<tr>
<td>con_dbid</td>
<td>DBID of the PDB or CDB root.</td>
</tr>
<tr>
<td>last_exec_start_time</td>
<td>Most recent execution start time of this SQL statement.</td>
</tr>
</tbody>
</table>

### 159.4 Summary of DBMS_SQLSET Subprograms

This table lists the DBMS_SQLSET subprograms and briefly describes them.

### Table 159-2  DBMS_SQLSET Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_REFERENCE Function</td>
<td>This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.</td>
</tr>
<tr>
<td>CAPTURE_CURSOR_CACHE Procedure</td>
<td>This procedure captures a workload from the shared SQL area into a SQL tuning set.</td>
</tr>
<tr>
<td>CREATE_SQLSET Procedure and Function</td>
<td>This procedure or function creates a SQL tuning set object in the database.</td>
</tr>
<tr>
<td>CREATE_STGTAB Procedure</td>
<td>This procedure creates a staging table through which SQL tuning sets are imported and exported.</td>
</tr>
<tr>
<td>DELETE_SQLSET Procedure</td>
<td>This procedure deletes a set of SQL statements from a SQL tuning set.</td>
</tr>
<tr>
<td>DROP_SQLSET Procedure</td>
<td>This procedure drops a SQL tuning set if it is not active.</td>
</tr>
</tbody>
</table>
### Table 159-2 (Cont.) DBMS_SQLSET Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD_SQLSET Procedure</td>
<td>This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.</td>
</tr>
<tr>
<td>PACK_STGTAB Procedure</td>
<td>This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.</td>
</tr>
<tr>
<td>REMAP_STGTAB Procedure</td>
<td>This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.</td>
</tr>
<tr>
<td>REMOVE_REFERENCE Procedure</td>
<td>This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.</td>
</tr>
<tr>
<td>SELECT_CURSOR_CACHE Function</td>
<td>This function collects SQL statements from the workload repository.</td>
</tr>
<tr>
<td>SELECT_SQL_TRACE Function</td>
<td>This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of sqlset_row.</td>
</tr>
<tr>
<td>SELECT_SQLPA_TASK Function</td>
<td>This function collects SQL statements from a SQL Performance Analyzer comparison task.</td>
</tr>
<tr>
<td>SELECT_SQLSET Function</td>
<td>This is a table function that reads the contents of a SQL tuning set.</td>
</tr>
<tr>
<td>SELECT_WORKLOAD_REPOSITORY Function</td>
<td>This function collects SQL statements from the workload repository.</td>
</tr>
<tr>
<td>UNPACK_STGTAB Procedure</td>
<td>This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.</td>
</tr>
<tr>
<td>UPDATE_SQLSET Procedures</td>
<td>This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.</td>
</tr>
</tbody>
</table>

### 159.4.1 ADD_REFERENCE Function

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

**Syntax**

```sql
DBMS_SQLSET.ADD_REFERENCE (  
    sqlset_name IN VARCHAR2,  
    description IN VARCHAR2 := NULL,  
    sqlset_owner IN VARCHAR2 := NULL)  
RETURN NUMBER;
```
Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

Table 159-3   ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>description</td>
<td>Provides an optional description of the usage of SQL tuning set.</td>
</tr>
<tr>
<td></td>
<td>The description is truncated if longer than 256 characters.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for the current schema owner.</td>
</tr>
</tbody>
</table>

Return Values

The identifier of the added reference.

Usage Notes

Adding a reference to a SQL tuning set prevents the tuning set from being modified while it is being used. Invoking SQL Tuning Advisor on the SQL tuning set adds a reference automatically, so use `ADD_REFERENCE` only when the automatically generated reference is not sufficient. The `ADD_REFERENCE` function returns a reference ID that you can later supply to the `REMOVE_SQLSET_REFERENCE` procedure. Query the `DBA_SQLSET_REFERENCES` view to find all references to a specified SQL tuning set.

Examples

This example generates a reference to the SQL tuning set named `my_workload` and stores it in the `b_rid` variable.

```sql
VARIABLE b_rid NUMBER;
EXEC :b_rid := DBMS_SQLSET.ADD_REFERENCE(sqlset_name => 'my_workload', description => 'my sts ref');
```

159.4.2 CAPTURE_CURSOR_CACHE Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.

The procedure polls the cache multiple times over a time period, and updates the workload data stored there. It can execute over as long a period as required to capture an entire system workload.

Syntax

```sql
DBMS_SQLSET.CAPTURE_CURSOR_CACHE(
    sqlset_name        IN VARCHAR2,
    time_limit         IN POSITIVE := 1800,
    repeat_interval    IN POSITIVE := 300,
    capture_option     IN VARCHAR2 := 'MERGE',
    capture_mode       IN NUMBER    := MODE_REPLACE_OLD_STATS,
    basic_filter       IN VARCHAR2 := NULL,
)```

Chapter 159
Summary of DBMS_SQLSET Subprograms
sqlset_owner  IN VARCHAR2 := NULL,
recursive_sql   IN VARCHAR2 := HAS_RECURSIVE_SQL);

Parameters

The parameters are the same for both DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET and DBMS_SQLSET.CAPTURE_CURSOR_CACHE.

Table 159-4   CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the SQL tuning set name</td>
</tr>
<tr>
<td>time_limit</td>
<td>Defines the total amount of time, in seconds, to execute.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>Defines the amount of time, in seconds, to pause between sampling.</td>
</tr>
<tr>
<td>capture_option</td>
<td>Specifies whether to insert new statements, update existing statements, or both.</td>
</tr>
<tr>
<td></td>
<td>Values are INSERT, UPDATE, or MERGE. The values are the same as for load_option in load_sqlset.</td>
</tr>
<tr>
<td>capture_mode</td>
<td>Specifies the capture mode (UPDATE and MERGE capture options). Possible values:</td>
</tr>
<tr>
<td></td>
<td>• MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set or NULL for current schema owner</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>

Examples

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the time_limit and repeat_interval parameters based on the workload time and shared SQL area turnover properties of your system.

EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
  sqlset_name     => 'my_workload', -
  time_limit      =>  30, -
  repeat_interval =>  5);
In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
  sqlset_name     => 'my_workload', -
  time_limit      => 30, -
  repeat_interval => 5, -
  capture_mode    => DBMS_SQLSET.MODE_ACCUMULATE_STATS);

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set.

EXEC DBMS_SQLSET.CAPTURE_CURSOR_CACHE( -
  sqlset_name     => 'my_workload', -
  time_limit      => 30, -
  repeat_interval => 5, -
  capture_option  => 'INSERT');

159.4.3 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

DBMS_SQLSET.CREATE_SQLSET ( -
  sqlset_name  IN  VARCHAR2,
  description  IN  VARCHAR2 := NULL
  sqlset_owner IN  VARCHAR2 := NULL);

DBMS_SQLSET.CREATE_SQLSET ( -
  sqlset_name  IN  VARCHAR2 := NULL,
  description  IN  VARCHAR2 := NULL,
  sqlset_owner IN  VARCHAR2 := NULL)
RETURN VARCHAR2;

Parameters

Table 159-5  CREATE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.</td>
</tr>
<tr>
<td>description</td>
<td>Provides an optional description of the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for the current schema owner.</td>
</tr>
</tbody>
</table>

Return Values

Specifies the name of the created SQL tuning set. The name is the name passed to the function. If no name is passed to the function, then the function generates an automatic name.
Examples

EXEC DBMS_SQLSET.CREATE_SQLSET(-
    sqlset_name => 'my_workload', -
    description => 'complete application workload');

159.4.4 CREATE_STGTAB Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

Syntax

DBMS_SQLSET.CREATE_STGTAB (
    table_name        IN VARCHAR2,
    schema_name       IN VARCHAR2 := NULL,
    tablespace_name   IN VARCHAR2 := NULL,
    db_version        IN NUMBER   := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the of the table to create. The name is case sensitive.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Defines the schema in which to create the table, or NULL for the current</td>
</tr>
<tr>
<td></td>
<td>schema. The name is case sensitive.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Specifies the tablespace in which to store the staging table, or NULL for</td>
</tr>
<tr>
<td></td>
<td>the default tablespace of the current user. The name is case sensitive.</td>
</tr>
<tr>
<td>db_version</td>
<td>Specifies the database version that determines the format of the staging</td>
</tr>
<tr>
<td></td>
<td>table. You can also create an older database version staging table to export</td>
</tr>
<tr>
<td></td>
<td>an STS to an older database version. Use one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• NULL (default) — Specifies the current database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.</td>
</tr>
</tbody>
</table>

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets:

EXEC DBMS_SQLSET.CREATE_STGTAB{table_name => 'STGTAB_SQLSET'};

Create a staging table to pack a SQL tuning set in Oracle Database 12c Release 1 (12.1.0.2) format:

BEGIN
    DBMS_SQLSET.CREATE_STGTAB(
        table_name => 'STGTAB_SQLSET_121'
    )
END;
159.4.5 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

```sql
DBMS_SQLSET.DELETE_SQLSET (
    sqlset_name IN VARCHAR2,
    basic_filter IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for current schema owner.</td>
</tr>
</tbody>
</table>

Examples

-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLSET.DELETE_SQLSET(sqlset_name   => 'my_workload',
                                basic_filter  => 'elapsed_time < 100000');

159.4.6 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

Syntax

```sql
DBMS_SQLSET.DROP_SQLSET (
    sqlset_name IN VARCHAR2,
    sqlset_owner IN VARCHAR2 := NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for current schema owner.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

-- Drop the sqlset.
EXEC DBMS_SQLSET.DROP_SQLSET ('my_workload');

159.4.7 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

Syntax

DBMS_SQLSET.LOAD_SQLSET (
    sqlset_name       IN  VARCHAR2,
    populate_cursor   IN  sqlset_cursor,
    load_option       IN VARCHAR2 := 'INSERT',
    update_option     IN VARCHAR2 := 'REPLACE',
    update_condition  IN VARCHAR2 := NULL,
    update_attributes IN VARCHAR2 := NULL,
    ignore_null       IN BOOLEAN  :=  TRUE,
    commit_rows       IN POSITIVE :=  NULL,
    sqlset_owner      IN VARCHAR2 := NULL);

Parameters

Table 159-9  LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of SQL tuning set to be loaded.</td>
</tr>
<tr>
<td>populate_cursor</td>
<td>Specifies the cursor reference to the SQL tuning set to be loaded.</td>
</tr>
<tr>
<td>load_option</td>
<td>Specifies which statements are loaded into the SQL tuning set. The possible values are:</td>
</tr>
<tr>
<td>update_option</td>
<td>Specifies how existing SQL statements are updated.</td>
</tr>
<tr>
<td>update_condition</td>
<td>This parameter is considered only if load_option is specified with update_option as an option. The possible values are:</td>
</tr>
<tr>
<td>ignore_null</td>
<td>Specifies the name of SQL tuning set to be loaded.</td>
</tr>
<tr>
<td>commit_rows</td>
<td>REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</td>
</tr>
</tbody>
</table>

Table 159-9  (Cont.) LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| update_condition| Specifies when to perform the update. The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:  
  • OLD — Refers to statement attributes from the SQL tuning set (destination).  
  • NEW — Refers to statement attributes from the input statements (source).  

| update_attributes| Specifies the list of SQL statement attributes to update during a merge or update. The possible values are:  
  • NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action.  
  • BASIC — Specifies statistics and binds only.  
  • TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list.  
  • ALL — Specifies all attributes, including the execution context attributes such as module and action.  
  • List of comma separated attribute names to update:  
    – EXECUTION_CONTEXT  
    – EXECUTION_STATISTICS  
    – SQL_BINDS  
    – SQL_PLAN  
    – SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics)  

| ignore_null     | Specifies whether to update attributes when the new value is NULL. If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional.  

| commit_rows     | Specifies whether to commit statements after DML. If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation. Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded.  

| sqlset_owner    | Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner).  

Exceptions

- This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.
• Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don't parse (for example, they refer to attributes not in sqlset_row), or because they violate the user's privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.

Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more, excluding statements that belong to SYS schema. You select all attributes of the SQL statements and load them in the tuning set using the default mode. The default mode loads only new statements because the SQL tuning set is empty.

```
-- create the tuning set
EXEC DBMS_SQLSET.CREATE_SQLSET('my_workload');

-- populate the tuning set from the shared SQL area
DECLARE
cur DBMS_SQLSET.SQLSET_CURSOR;
BEGIN
OPEN cur FOR
  SELECT VALUE(P)
  FROM table(
    DBMS_SQLSET.SELECT_CURSOR_CACHE(
      'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
      NULL, NULL, NULL, NULL, 1, NULL,
      'ALL')) P;
DBMS_SQLSET.LOAD_SQLSET(sqlset_name     => 'my_workload',
                        populate_cursor => cur);
END;
/
```

Now you want to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with 'ACCUMULATE' as your update_option because it is assumed the cursors currently in the cache have aged out since the snapshot was taken.

```

```
```
```
```
```
```
```
```
```
```
```
```
The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that 'INSERT' is the default value for the load_option argument of the LOAD_SQLSET procedure.

DECLARE
cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor => cur);
END;
/

The next example demonstrates a load with UPDATE option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

DECLARE
cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE) P;
DBMS_SQLSET.LOAD_SQLSET(sqlset_name => 'my_workload',
populate_cursor => cur,
load_option => 'UPDATE');
END;
/

159.4.8 PACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB procedure.

Syntax

DBMS_SQLSET.PACK_STGTAB (
sqlset_name IN VARCHAR2,
sqlset_owner IN VARCHAR2 := NULL,
staging_table_name IN VARCHAR2,
staging_schema_owner IN VARCHAR2 := NULL,
db_version IN NUMBER := NULL);

Parameters

The parameters are identical for the DBMS_SQLTUNE.PACK_STGTAB_SQLSET and DBMS_SQLSET.PACK_STGTAB procedures.
### Table 159-10  PACK_STGTAB_SQLSET and PACK_STGTAB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set to pack. The name is case sensitive. Wildcard characters (%) are permitted.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the category from which to pack SQL tuning sets. The name is case sensitive. Wildcard characters (%) are permitted.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>Specifies the name of the table to use. The value is case sensitive.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Specifies the schema where the table resides, or NULL for the current schema. The value is case sensitive.</td>
</tr>
<tr>
<td>db_version</td>
<td>Specifies the database version that determines the format of the staging table. You can also create an older database version staging table to export an STS to an older database version. Use any of the following values:</td>
</tr>
<tr>
<td></td>
<td>• NULL (default) — Specifies the current database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</td>
</tr>
</tbody>
</table>

### Usage Notes

- To move more than one SQL tuning set, call this procedure multiple times. You can then move the populated staging table to a destination database using any method, such as a database link or Oracle Data Pump, and then unpack the SQL tuning set in the destination database.
- This function issues a COMMIT after packing each SQL tuning set. If an error is raised mid-execution, then clear the staging table by deleting its rows.

### Examples

Put all SQL tuning sets on the database in the staging table:

```sql
BEGIN
    DBMS_SQLSET.PACK_STGTAB(
        sqlset_name        => '%',
        sqlset_owner       => '%',
        staging_table_name => 'STGTAB_SQLSET');
END;
```

Put only those SQL tuning sets owned by the current user in the staging table:

```sql
BEGIN
    DBMS_SQLSET.PACK_STGTAB(
        sqlset_name         => '%',
        staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack a specific SQL tuning set:

```sql
BEGIN
    DBMS_SQLSET.PACK_STGTAB(
        sqlset_name         => 'my_workload',
        staging_table_name  => 'STGTAB_SQLSET');
END;
```
Pack a second SQL tuning set:

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name         => 'workload_subset',
    staging_table_name  => 'STGTAB_SQLSET');
END;
```

Pack the STS `my_workload_subset` into a staging table `stgtab_sqlset` created for Oracle Database 11g Release 2 (11.2):

```
BEGIN
  DBMS_SQLSET.PACK_STGTAB(
    sqlset_name         => 'workload_subset',
    staging_table_name  => 'STGTAB_SQLSET',
    db_version           => DBMS_SQLSET.STS_STGTAB_11_2_VERSION);
END;
```

159.4.9 REMAP_STGTAB Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

**Syntax**

```
DBMS_SQLSET.REMAP_STGTAB (
  old_sqlset_name        IN VARCHAR2,
  old_sqlset_owner       IN VARCHAR2 := NULL,
  new_sqlset_name        IN VARCHAR2 := NULL,
  new_sqlset_owner       IN VARCHAR2 := NULL,
  staging_table_name     IN VARCHAR2,
  staging_schema_owner   IN VARCHAR2 := NULL,
  old_con_dbid           IN NUMBER   := NULL,
  new_con_dbid           IN NUMBER   := NULL);
```

**Parameters**

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

**Table 159-11  REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_sqlset_name</td>
<td>Specifies the name of the tuning set to target for a remap operation.</td>
</tr>
<tr>
<td></td>
<td>Wildcard characters (%) are not supported.</td>
</tr>
<tr>
<td>old_sqlset_owner</td>
<td>Specifies the new name of the tuning set owner to target for a remap</td>
</tr>
<tr>
<td></td>
<td>operation. NULL for current schema owner</td>
</tr>
<tr>
<td>new_sqlset_name</td>
<td>Specifies the new name for the tuning set, or NULL to keep the same tuning</td>
</tr>
<tr>
<td></td>
<td>set name.</td>
</tr>
<tr>
<td>new_sqlset_owner</td>
<td>Specifies the new owner for the tuning set, or NULL to keep the same owner</td>
</tr>
<tr>
<td></td>
<td>name.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>Specifies the name of the table on which to perform the remap operation.</td>
</tr>
<tr>
<td></td>
<td>The value is case sensitive.</td>
</tr>
</tbody>
</table>
Table 159-11  (Cont.) REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>staging_schema_owner</td>
<td>Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.</td>
</tr>
<tr>
<td>old_con_dbid</td>
<td>Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
<tr>
<td>new_con_dbid</td>
<td>Specifies the new container DBID to replace with the old container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
</tbody>
</table>

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name    => 'my_workload',
    old_sqlset_owner   => 'SH',
    new_sqlset_name    => 'imp_workload',
    staging_table_name => 'STGTAB_SQLSET');
END;

-- Change the owner of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLSET.REMAP_STGTAB(
    old_sqlset_name    => 'imp_workload',
    old_sqlset_owner   => 'SH',
    new_sqlset_owner   => 'SYS',
    staging_table_name => 'STGTAB_SQLSET');
END;

159.4.10 REMOVE_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

Syntax

DBMS_SQLSET.REMOVE_REFERENCE (
  sqlset_name  IN VARCHAR2,
  reference_id IN NUMBER,
  sqlset_owner IN VARCHAR2 := NULL,
  force_remove IN NUMBER   := 0);

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE and DBMS_SQLSET.REMOVE_REFERENCE procedures.
Table 159-12  REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>reference_id</td>
<td>Specifies the identifier of the reference to remove.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set (or NULL for the current schema owner).</td>
</tr>
<tr>
<td>force_remove</td>
<td>Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.</td>
</tr>
</tbody>
</table>

Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to my_workload:

EXEC DBMS_SQLSET.REMOVE_REFERENCE(sqlset_name => 'my_workload', reference_id => :rid);

Use the DBA_SQLSET_REFERENCES view to find all references to a given SQL tuning set.

159.4.11 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

Syntax

```
DBMS_SQLSET.SELECT_CURSOR_CACHE (  
  basic_filter        IN   VARCHAR2 := NULL,  
  object_filter       IN   VARCHAR2 := NULL,  
  ranking_measure1    IN   VARCHAR2 := NULL,  
  ranking_measure2    IN   VARCHAR2 := NULL,  
  ranking_measure3    IN   VARCHAR2 := NULL,  
  result_percentage   IN   NUMBER   := 1,  
  result_limit        IN   NUMBER   := NULL,  
  attribute_list      IN   VARCHAR2 := 'TYPICAL',  
  recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 159-13  SELECT_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
</tbody>
</table>
### Table 159-13  (Cont.) SELECT_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Defines an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top ( n )% according to the supplied ranking measure. The value applies only if one ranking measure is supplied.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Defines the top limit SQL from the filtered source ranked by the ranking measure.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>Specifies the list of SQL statement attributes to return in the result. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default).</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Specifies all attributes.</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names.</td>
</tr>
<tr>
<td></td>
<td>This value returns only a subset of SQL attributes:</td>
</tr>
<tr>
<td></td>
<td>– EXECUTION_STATISTICS</td>
</tr>
<tr>
<td></td>
<td>– BIND_LIST</td>
</tr>
<tr>
<td></td>
<td>– OBJECT_LIST</td>
</tr>
<tr>
<td></td>
<td>– SQL_PLAN</td>
</tr>
<tr>
<td></td>
<td>– SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>

#### Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

#### Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
- Users need privileges on the shared SQL area views.

#### Example 159-1  Statements with 500 or More Buffer Gets

This query obtains the SQL IDs and SQL text for statements with 500 buffer gets:

```sql
SELECT SQL_ID, SQL_TEXT
FROM   TABLE (DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```
Example 159-2  All Information About a Statement
The following query obtains all information about the SQL statement with the SQL ID 4rm4183czbs7j:

```sql
SELECT * FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''))
```

Example 159-3  Multiple Plans for a SQL Statement
A data source may store multiple plans for each SQL statement. The output of the SELECT_CURSOR_CACHE function is a SQL row set object that is uniquely identified by SQL ID and plan hash value. This example queries the plan hash values for the statement with the SQL ID ay1m3ssvtrh24:

```sql
SELECT sql_id, plan_hash_value
FROM table(DBMS_SQLSET.select_cursor_cache('sql_id = ''ay1m3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;
```

Example 159-4  Processing All Statements in the Shared SQL Area
This example processes all statements in the shared SQL area:

```sql
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE) p;

  -- Process each statement in cursor (or pass cursor to load_sqlset).

  CLOSE cur;
END;
/
```

Example 159-5  Process Statements Not Parsed by SYS
This example processes all statements not parsed in the SYS schema:

```sql
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur for
    SELECT VALUE(p)
    FROM TABLE(
      DBMS_SQLSET.SELECT_CURSOR_CACHE('parsing_schema_name <> ''SYS''')) p;

  -- Process each statement (or pass cursor to load_sqlset).

  CLOSE cur;
end;
/
```

Example 159-6  All Statements from an Application Module and Action
This example processes all statements from a specified application module and action:

```sql
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
```
Example 159-7  All Statements Whose Elapsed Time Is At Least Five Seconds

This example processes all statements that ran for at least five seconds:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(P)
        FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE('elapsed_time > 5000000')) P;

    -- Process each statement (or pass cursor to load_sqlset)
    CLOSE cur;
END;/
```

Example 159-8  StatementsParsed in the APPS Schema

This example processes all SQL statements that were parsed in the APPS schema and had more than 100 buffer gets:

```
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE('buffer_gets > 100 and parsing_schema_name = ''APPS''')) p;

    -- Process each statement (or pass cursor to load_sqlset)
    CLOSE cur;
END;/
```

Example 159-9  Plans and SQL Statements

This example processes all SQL statements exceeding 5 seconds. It also selects the plans for these statements. For performance reasons, the example selects execution statistics and SQL binds. The SQL_PLAN attribute of sqlset_row is NULL.

```
-- select all statements exceeding 5 seconds in elapsed time, but also
-- select the plans (by default we only select execution stats and binds
-- for performance reasons - in this case the SQL_PLAN attribute of sqlset_row
-- is NULL)
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE(p)
        FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
            'module = ''MY_APPLICATION'' and action = ''MY_ACTION''')) p;

    -- Process each statement (or pass cursor to load_sqlset)
    CLOSE cur;
END;/
```
-- Process each statement (or pass cursor to load_sqlset)
CLOSE cur;
END;/

Example 159-10  Top 100 Statements Ordered by Elapsed Time

This example selects the top 100 statements in the shared SQL area, ordered by elapsed time:

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(p)
    FROM TABLE(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => 'elapsed_time > 5000000',
      object_filter     => NULL,
      ranking_measure1  => 'ELAPSED_TIME',
      ranking_measure2  => NULL,
      ranking_measure3  => NULL,
      result_percentage => 1,
      result_limit      => 100,
      attribute_list    => 'TYPICAL',
      recursive_sql     => HAS_RECURSIVE_SQL)) p;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
/

Example 159-11  Statements Responsible for Most Buffer Gets

This example processes statements that cumulatively account for 90% of the buffer gets in the shared SQL area. The buffer gets of all statements added together is approximately 90% of the sum of all statements currently in the shared SQL area.

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE(P)
    FROM table(DBMS_SQLSET.SELECT_CURSOR_CACHE(
      basic_filter      => NULL,
      object_filter     => NULL,
      ranking_measure1  => 'BUFFER_GETS',
      ranking_measure2  => NULL,
      ranking_measure3  => NULL,
      result_percentage => .9,
      result_limit      => NULL,
      attribute_list    => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN',
      recursive_sql     => 'EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN')) p;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
attribute_list => 'TYPICAL',
recursive_sql => HAS_RECURSIVE_SQL)) p;

-- Process each statement (or pass cursor to load_sqlset).
CLOSE cur;
END;
/

159.4.12 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of sqlset_row.

Syntax

DBMS_SQLSET.SELECT_SQL_TRACE ( 
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
  result_limit           IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;

Parameters

Table 159-14  SELECT_SQL_TRACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Defines the directory object containing the trace files. This field is mandatory.</td>
</tr>
<tr>
<td>file_name</td>
<td>Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. ‘%’ wildcards are supported for matching trace file names.</td>
</tr>
<tr>
<td>mapping_table_name</td>
<td>Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.</td>
</tr>
<tr>
<td>mapping_table_owner</td>
<td>Specifies the mapping table owner. If it is NULL, then the function uses the current user.</td>
</tr>
<tr>
<td>select_mode</td>
<td>Specifies the mode for selecting SQL from the trace. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• SINGLE_EXECUTION — Returns one execution of a SQL. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• ALL_EXECUTIONS — Returns all executions.</td>
</tr>
</tbody>
</table>
Table 159-14  (Cont.) SELECT_SQL_TRACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>options</td>
<td>Specifies which types of SQL statements are returned.</td>
</tr>
<tr>
<td></td>
<td>• <strong>LIMITED_COMMAND_TYPE</strong> — Returns the SQL statements with the command types <strong>CREATE</strong>, <strong>INSERT</strong>, <strong>SELECT</strong>, <strong>UPDATE</strong>, <strong>DELETE</strong>, and <strong>MERGE</strong>. This value is the default.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ALL_COMMAND_TYPE</strong> — Returns the SQL statements with all command types.</td>
</tr>
<tr>
<td>pattern_start</td>
<td>Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>pattern_end</td>
<td>Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.</td>
</tr>
</tbody>
</table>

Return Values

This function returns a **SQLSET_ROW** object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with **SELECT** privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the **PATH_PREFIX** clause of the **CREATE PLUGGABLE DATABASE** statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```sql
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';

-- create mapping table from the capture database
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
FROM dba_objects
WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
'LOB', 'OPERATOR', 'PACKAGE',
'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
```
UNION ALL
SELECT user_id id, username owner, NULL name
FROM dba_users;

-- create the directory object where the SQL traces are stored
CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

-- create the STS
EXEC DBMS_SQLSET.CREATE_SQLSET('my_sts', 'test purpose');

-- load the SQL statements into STS from SQL TRACE
DECLARE
cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT value(p)
    FROM TABLE(
       DBMS_SQLSET.SELECT_SQL_TRACE(
          directory=>'SQL_TRACE_DIR',
          file_name=>'%trc',
          mapping_table_name=>'mapping')) p;
  DBMS_SQLSET.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/

159.4.13 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison task.

See Also:
Oracle Database Testing Guide for a SELECT_SQLPA_TASK example

Syntax

DBMS_SQLSET.SELECT_SQLPA_TASK(
    task_name         IN VARCHAR2,
    task_owner        IN VARCHAR2 := NULL,
    execution_name    IN VARCHAR2 := NULL,
    level_filter      IN VARCHAR2 := 'REGRESSED',
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;
Parameters

Table 159-15  SELECT_SQLPA_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Specifies the name of the SQL Performance Analyzer task.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Specifies the name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.</td>
</tr>
<tr>
<td>level_filter</td>
<td>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL in addition to the level filters.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>Defines the SQL statement attributes to return in the result. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Returns all attributes.</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</td>
</tr>
</tbody>
</table>

Return Values

This function returns a SQL tuning set object.

Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.
159.4.14 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

Syntax

```sql
DBMS_SQLSET.SELECT_SQLSET (
    sqlset_name         IN   VARCHAR2,
    basic_filter        IN   VARCHAR2 := NULL,
    object_filter       IN   VARCHAR2 := NULL,
    ranking_measure1    IN   VARCHAR2 := NULL,
    ranking_measure2    IN   VARCHAR2 := NULL,
    ranking_measure3    IN   VARCHAR2 := NULL,
    result_percentage   IN   NUMBER   := 1,
    result_limit        IN   NUMBER   := NULL,
    attribute_list      IN   VARCHAR2 := 'TYPICAL',
    plan_filter         IN   VARCHAR2 := NULL,
    sqlset_owner        IN   VARCHAR2 := NULL,
    recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 159-16  SELECT_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set to query.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the SQL tuning set defined on attributes of the SQLSET_ROW.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Specifies an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top n% according to the supplied ranking measure. Note that this parameter applies only if one ranking measure is supplied.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top limit SQL from the filtered source, ranked by the ranking measure.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>Defines the SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Returns all attributes.</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes:</td>
</tr>
<tr>
<td></td>
<td>– EXECUTION_STATISTICS</td>
</tr>
<tr>
<td></td>
<td>– SQL_BINDS</td>
</tr>
<tr>
<td></td>
<td>– SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics)</td>
</tr>
</tbody>
</table>
Table 159-16  (Cont.) SELECT_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| plan_filter    | Specifies the plan filter. This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:  
|                | • LAST_GENERATED — Returns the plan with the most recent timestamp.          |
|                | • FIRST_GENERATED — Returns the plan with the least recent timestamp.        |
|                | • LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistic information. |
|                | • FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistic information. |
|                | • MAX_ELAPSED_TIME — Returns the plan with the maximum elapsed time.         |
|                | • MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets.           |
|                | • MAX_DISK_READS — Returns the plan with the maximum disk reads.             |
|                | • MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes.       |
|                | • MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value. |
| sqlset_owner   | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |
| recursive_sql  | Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL). |

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```sql
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(DBMS_SQLSET.SELECT_SQLSET('my_workload')) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
```
159.4.15 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- Snapshots between `begin_snap` and `end_snap`
- A workload repository baseline

**Syntax**

```
DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
    begin_snap        IN NUMBER,
    end_snap          IN NUMBER,
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    ranking_measure1  IN VARCHAR2 := NULL,
    ranking_measure2  IN VARCHAR2 := NULL,
    ranking_measure3  IN VARCHAR2 := NULL,
    result_percentage IN NUMBER   := 1,
    result_limit      IN NUMBER   := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL',
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid              IN NUMBER   := NULL)
RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY (
    baseline_name     IN VARCHAR2,
    basic_filter      IN VARCHAR2 := NULL,
    object_filter     IN VARCHAR2 := NULL,
    ranking_measure1  IN VARCHAR2 := NULL,
    ranking_measure2  IN VARCHAR2 := NULL,
    ranking_measure3  IN VARCHAR2 := NULL,
    result_percentage IN NUMBER   := 1,
    result_limit      IN NUMBER   := NULL,
    attribute_list    IN VARCHAR2 := 'TYPICAL',
    recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
    dbid              IN NUMBER   := NULL)
RETURN sys.sqlset PIPELINED;
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>begin_snap</code></td>
<td>Defines the beginning AWR snapshot (non-inclusive).</td>
</tr>
<tr>
<td><code>end_snap</code></td>
<td>Defines the ending AWR snapshot (inclusive).</td>
</tr>
<tr>
<td><code>baseline_name</code></td>
<td>Specifies the name of the AWR baseline period.</td>
</tr>
</tbody>
</table>
Table 159-17  (Cont.) SELECT_WORKLOAD_REPOSITORY Function

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the workload repository. The filter is defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Defines an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top n% according to the supplied ranking measure. Note that this percentage applies only if one ranking measure is given.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Specifies the top limit SQL from the source according to the supplied ranking measure.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>Specifies the SQL statement attributes to return in the result. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Returns BASIC plus SQL plan (without row source statistics) and without object reference list. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Returns all attributes (such as execution statistics and binds) are returned except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Returns all attributes</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics).</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Specifies the filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
<tr>
<td>dbid</td>
<td>Specifies the DBID for imported or PDB-level AWR data. If NULL, then the function uses the current database DBID.</td>
</tr>
</tbody>
</table>

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user’s security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select statements from snapshots 1-2
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
        SELECT VALUE (P)
        FROM table(DBMS_SQLSET.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
```
159.4.16 UNPACK_STGTAB Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

Syntax

```
DBMS_SQLSET.UNPACK_STGTAB (
    sqlset_name          IN VARCHAR2 := '%',
    sqlset_owner         IN VARCHAR2 := NULL,
    replace              IN BOOLEAN,
    staging_table_name   IN VARCHAR2,
    staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.</td>
</tr>
<tr>
<td>replace</td>
<td>Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>Specifies the name of the staging table, moved after a call to the <code>DBMS_SQLTUNE.PACK_STGTAB_SQLSET</code> or <code>DBMS_SQLSET.PACK_STGTAB</code> procedure (case-sensitive).</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).</td>
</tr>
</tbody>
</table>

Examples

```
-- unpack all STS in the staging table
EXEC DBMS_SQLSET.UNPACK_STGTAB(sqlset_name => '%', -
                                 sqlset_owner  => '%', -
                                 replace       => FALSE, -
                                 staging_table_name  => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the same name/owner as STS on the system. In this case, users should call -- remap_stgtab_sqlset to patch the staging table and with which to call unpack
```
159.4.17 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

Syntax

```
DBMS_SQLSET.UPDATE_SQLSET(
    sqlset_name      IN  VARCHAR2,
    sql_id           IN  VARCHAR2,
    plan_hash_value  IN  NUMBER := NULL,
    attribute_name   IN  VARCHAR2,
    attribute_value  IN  VARCHAR2 := NULL,
    sqlset_owner     IN  VARCHAR2 := NULL);
```

Parameters

**Table 159-19  UPDATE_SQLSET Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the identifier of the SQL statement to be updated.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the hash value of the execution plan for a SQL statement.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the name of the attribute to be modified.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the new value of the attribute.</td>
</tr>
</tbody>
</table>

You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY.

If a statement has multiple plans, then the procedure changes the attribute value for all plans.
The `DBMS_SQLTUNE` package is the interface for tuning SQL on demand. The related package `DBMS_AUTO_SQLTUNE` package provides the interface for SQL Tuning Advisor run as an automated task.

The chapter contains the following topics:

- DBMS_SQLTUNE Overview
- DBMS_SQLTUNE Security Model
- DBMS_SQLTUNE Data Structures
- DBMS_SQLTUNE Subprogram Groups
- Summary of DBMS_SQLTUNE Subprograms

See Also:

"DBMS_AUTO_SQLTUNE Overview"

### 160.1 DBMS_SQLTUNE Overview

The `DBMS_SQLTUNE` package provides a number of interrelated areas of functionality.

This section contains the following topics:

- DBMS_SQLTUNE SQL Tuning Advisor Subprograms
- DBMS_SQLTUNE SQL Profile Subprograms
- DBMS_SQLTUNE SQL Tuning Set Subprograms

**SQL Tuning Advisor**

SQL Tuning Advisor is one of a suite of advisors, a set of expert systems that identifies and helps resolve database performance problems. Specifically, SQL Tuning Advisor automates tuning of problematic SQL statements. It takes one or more SQL statements as input and gives precise advice on how to tune the statements. The advisor provides the advice in the form of SQL actions for tuning the SQL along with their expected performance benefit.

The group of `DBMS_SQLTUNE SQL Tuning Advisor Subprograms` provide a task-oriented interface that enables you to access the advisor. You can call the following subprograms in the order given to use some of SQL Tuning Advisor's features:

1. **CREATE_TUNING_TASK Functions** creates a tuning task for tuning one or more SQL statements.
2. The **EXECUTE_TUNING_TASK Function and Procedure** executes a previously created tuning task.
3. The **REPORT_TUNING_TASK Function** displays the results of a tuning task.

4. You use the **SCRIPT_TUNING_TASK Function** to create a SQL*Plus script which can then be executed to implement a set of Advisor recommendations.

**SQL Profile Subprograms**

SQL Tuning Advisor may recommend the creation of a SQL profile to improve the performance of a statement. SQL profiles consist of auxiliary statistics specific to the statement. The query optimizer makes estimates about cardinality, selectivity, and cost that can sometimes be off by a significant amount, resulting in poor execution plans. The SQL profile addresses this problem by collecting additional information using sampling and partial execution techniques to adjust these estimates.

The group of **DBMS_SQLTUNE SQL Profile Subprograms** provides a mechanism for delivering statistics to the optimizer that targets one particular SQL statement, and helps the optimizer make good decisions for that statement by giving it the most accurate statistical information possible. For example:

- You can use the **ACCEPT_SQL_PROFILE Procedure and Function** to accept a SQL profile recommended by SQL Tuning Advisor.
- You can alter the **STATUS**, **NAME**, **DESCRIPTION**, and **CATEGORY** attributes of an existing SQL profile with the **ALTER_SQL_PROFILE Procedure**.
- You can drop a SQL profile with the **DROP_SQL_PROFILE Procedure**.

**SQL Tuning Sets**

SQL tuning sets store SQL statements along with the following information:

- The execution context, such as the parsing schema name and bind values
- Execution statistics such as average elapsed time and execution count
- Execution plans, which are the sequence of operations that the database performs to run SQL statements
- Row source statistics such as the number of rows processed for each operation executed within the plan

You can create SQL tuning sets by filtering or ranking SQL statements from several sources:

- The shared SQL area using the **SELECT_CURSOR_CACHE Function**
- Top SQL statements from the Automatic Workload Repository using the **SELECT_WORKLOAD_REPOSITORY Function**
- Other SQL tuning sets using the **SELECT_SQLSET Function**
- SQL Performance Analyzer task comparison results using the **SELECT_SQLPA_TASK Function**
- SQL Trace files using the **SELECT_SQL_TRACE Function**
- A user-defined workload

The complete group of **DBMS_SQLTUNE SQL Tuning Set Subprograms** facilitates this functionality. As examples:

- The **CREATE_SQLSET Procedure and Function** creates a SQL tuning set object in the database.
• The **LOAD_SQLSET Procedure** populates the SQL tuning set with a set of selected SQL.

• The **CAPTURE_CURSOR_CACHE_SQLSET Procedure** collects SQL statements from the shared SQL area over a specified time interval, attempting to build a realistic picture of database workload.

---

**Note:**

When manipulating SQL tuning sets, you can use **DBMS_SQLSET** as an alternative to **DBMS_SQLTUNE**.

---

**Import and Export of SQL Tuning Sets and SQL Profiles**

Use **DBMS_SQLTUNE** subprograms to move SQL profiles and SQL tuning sets from one system to another using a common programmatic model. In both cases, you create a staging table on the source database and populate this staging table with the relevant data. You then move that staging table to the destination system following the method of your choice (such as Oracle Data Pump, or a database link), where it is used to reconstitute the objects in their original form. The following steps are implemented by means of subprograms included in this package:

1. To create the staging table on the source system, call the **CREATE_STGTAB_SQLPROF Procedure** or the **CREATE_STGTAB_SQLSET Procedure**.

2. To populate the staging table with information from the source system, call the **PACK_STGTAB_SQLPROF Procedure** or **PACK_STGTAB_SQLSET Procedure**.

3. Move the staging table to the destination system.

4. To re-create the object on the new system, call the **UNPACK_STGTAB_SQLPROF Procedure** or the **UNPACK_STGTAB_SQLSET Procedure**.

---

**See Also:**

*Oracle Database SQL Tuning Guide* for more information about programmatic flow

---

**Automatic Tuning Task Functions**

The automated system task **SYS_AUTO_SQL_TUNING_TASK** is created by the database as part of the catalog scripts. This task automatically chooses a set of high-load SQL from AWR and runs SQL Tuning Advisor on this SQL. The automated task performs the same comprehensive analysis as any other SQL Tuning task.

You can obtain a report on the activity of the Automatic SQL Tuning task through the **DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK API**.
See Also:

DBMS_AUTO_SQLTUNE for the list of subprograms that you can use to manage the automated SQL tuning task.

Real-Time SQL Monitoring

Real-time SQL Monitoring enables DBAs or performance analysts to monitor the execution of long-running SQL statements while they are executing. Both cursor statistics (such as CPU times and IO times) and execution plan statistics (such as number of output rows, memory and temp space used) are updated in almost real time during statement execution. The V$SQL_MONITOR and V$SQL_PLAN_MONITOR views expose these statistics. In addition, DBMS_SQLTUNE provides the REPORT_SQL_MONITOR and REPORT_SQL_MONITOR_LIST functions to report monitoring information.

Note:

DBMS_SQL_MONITOR also contains the REPORT_SQL_MONITOR and REPORT_SQL_MONITOR_LIST functions.

Tuning a Standby Database Workload

In some cases, a standby database can assume a reporting role in addition to its data protection role. The standby database can have its own workload of queries, some of which may require tuning. You can issue SQL Tuning Advisor statements on a standby database, which is read-only. A standby-to-primary database link enables DBMS_SQLTUNE to write data to and read data from the primary database. The procedures that are eligible for tuning standby workloads include the database_link_to parameter.

160.2 DBMS_SQLTUNE Security Model

This package is available to PUBLIC and performs its own security checking.

Note the following:

• Because SQL Tuning Advisor relies on the advisor framework, all tuning task interfaces (*_TUNING_TASK) require the ADVISOR privilege.

• SQL tuning set subprograms (*_SQLSET) require either of the following privileges:
  — ADMINISTER SQL TUNING SET
    You can only create and modify a SQL tuning set that you own.
  — ADMINISTER ANY SQL TUNING SET
    You can operate on all SQL tuning sets, even those owned by other users.

• In earlier releases, three different privileges were needed to invoke subprograms involving SQL profiles:
  — CREATE ANY SQL PROFILE
  — ALTER ANY SQL PROFILE
The preceding privileges have been deprecated in favor of ADMINISTER SQL MANAGEMENT OBJECT.

160.3 DBMS_SQLTUNE Data Structures

The SELECT_.* subprograms in the DBMS_SQLTUNE package return objects of the SQLSET_ROW type.

Object Types

• SQLSET_ROW Object Type

160.3.1 SQLSET_ROW Object Type

The SQLSET_ROW object models the content of a SQL tuning set for the user.

Logically, a SQL tuning set is a collection of SQLSET_ROW objects. Each SQLSET_ROW contains a single SQL statement along with its execution context, statistics, binds, and plan. The SELECT_.* subprograms each model a data source as a collection of SQLSET_ROW objects, with each object uniquely identified by (sql_id, plan_hash_value). Similarly, the LOAD_SQLSET procedure takes as input a cursor whose row type is SQLSET_ROW, treating each SQLSET_ROW in isolation according to the policies requested by the user.

Several subprograms package accept basic filters on the content of a SQL tuning set or data source. These filters are expressed in terms of the attributes within the SQLSET_ROW as defined.

Syntax

CREATE TYPE sqlset_row AS object {
    sql_id                   VARCHAR(13),
    force_matching_signature NUMBER,
    sql_text                 CLOB,
    object_list              sql_objects,
    bind_data                RAW(2000),
    parsing_schema_name      VARCHAR2(30),
    module                   VARCHAR2(48),
    action                   VARCHAR2(32),
    elapsed_time             NUMBER,
    cpu_time                 NUMBER,
    buffer_gets              NUMBER,
    disk_reads               NUMBER,
    direct_writes            NUMBER,
    rows_processed           NUMBER,
    fetches                  NUMBER,
    executions               NUMBER,
    end_of_fetch_count       NUMBER,
    optimizer_cost           NUMBER,
    optimizer_env            RAW(2000),
    priority                 NUMBER,
    command_type             NUMBER,
    first_load_time          VARCHAR2(19),
    stat_period              NUMBER,
    active_stat_period       NUMBER,
    other                    CLOB,
}
Attributes

Table 160-1  SQLSET_ROW Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>

<td>Period of time (seconds) when the statistics of this SQL statement were</td>
</tr>
<tr>
<td></td>
<td>collected.</td>
</tr>
<tr>
<td>active_stat_period</td>
<td>Effective period of time (in seconds) during which the SQL statement</td>
</tr>
<tr>
<td></td>
<td>was active.</td>
</tr>
<tr>
<td>other</td>
<td>Other column for user-defined attributes.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Plan hash value of the plan.</td>
</tr>
<tr>
<td>sql_plan</td>
<td>Execution plan for the SQL statement.</td>
</tr>
</tbody>
</table>
Table 160-1  (Cont.) SQLSET_ROW Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bind_list</td>
<td>List of user-specified binds for the SQL statement. This is used for user-specified workloads. Note that you cannot stipulate an argument for this parameter and also for bind_data: they are mutually exclusive.</td>
</tr>
<tr>
<td>con_dbid</td>
<td>DBID of the PDB or CDB root.</td>
</tr>
<tr>
<td>last_exec_start_time</td>
<td>Most recent execution start time of this SQL statement.</td>
</tr>
</tbody>
</table>

160.4 DBMS_SQLTUNE Subprogram Groups

DBMS_SQLTUNE subprograms are grouped by function.

- DBMS_SQLTUNE SQL Tuning Advisor Subprograms
- DBMS_SQLTUNE SQL Profile Subprograms
- DBMS_SQLTUNE SQL Tuning Set Subprograms
- DBMS_SQLTUNE Real-Time SQL Monitoring Subprograms
- DBMS_SQLTUNE SQL Performance Reporting Subprograms

160.4.1 DBMS_SQLTUNE SQL Tuning Advisor Subprograms

This subprogram group provides an interface to manage SQL tuning tasks.

Table 160-2  SQL Tuning Task Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;CANCEL_TUNING_TASK Procedure&quot;</td>
<td>Cancels the currently executing tuning task</td>
</tr>
<tr>
<td>&quot;CREATE_SQL_PLAN_BASELINE Procedure&quot;</td>
<td>Creates a SQL plan baseline for an existing plan</td>
</tr>
<tr>
<td>&quot;CREATE_TUNING_TASK Functions&quot;</td>
<td>Creates a tuning of a single statement or SQL tuning set for either SQL Tuning Advisor</td>
</tr>
<tr>
<td>&quot;DROP_TUNING_TASK Procedure&quot;</td>
<td>Drops a SQL tuning task</td>
</tr>
<tr>
<td>&quot;EXECUTE_TUNING_TASK Function and Procedure&quot;</td>
<td>Executes a previously created tuning task</td>
</tr>
<tr>
<td>&quot;IMPLEMENT_TUNING_TASK Procedure&quot;</td>
<td>Implements a set of SQL profile recommendations made by SQL Tuning Advisor</td>
</tr>
<tr>
<td>&quot;INTERRUPT_TUNING_TASK Procedure&quot;</td>
<td>Interrupts the currently executing tuning task</td>
</tr>
<tr>
<td>&quot;REPORT_AUTO_TUNING_TASK Function&quot;</td>
<td>Displays a report from the automatic tuning task, reporting on a range of executions</td>
</tr>
<tr>
<td>&quot;REPORT_TUNING_TASK Function&quot;</td>
<td>Displays the results of a tuning task</td>
</tr>
<tr>
<td>&quot;RESET_TUNING_TASK Procedure&quot;</td>
<td>Resets the currently executing tuning task to its initial state</td>
</tr>
<tr>
<td>&quot;RESUME_TUNING_TASK Procedure&quot;</td>
<td>Resumes a previously interrupted task that was created to process a SQL tuning set</td>
</tr>
</tbody>
</table>
Table 160-2  (Cont.) SQL Tuning Task Subprograms

<table>
<thead>

160.5.1 ACCEPT_ALL_SQL_PROFILES Procedure

This procedure accepts all SQL profiles recommended by a specific execution of a tuning task, and sets the attributes of the SQL profiles according to the parameter values passed by the user.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group
Syntax

DBMS_SQLTUNE.ACCEPT_ALL_SQL_PROFILES (
    task_name         IN VARCHAR2,
    category          IN VARCHAR2 := NULL,
    replace           IN BOOLEAN  := FALSE,
    force_match       IN BOOLEAN  := FALSE,
    profile_type      IN VARCHAR2 := REGULAR_PROFILE,
    autotune_period   IN NUMBER   := NULL,
    execution_name    IN VARCHAR2 := NULL,
    task_owner        IN VARCHAR2 := NULL,
    description       IN VARCHAR2 := NULL,
    database_link_to  IN VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The (mandatory) name of the SQL tuning task</td>
</tr>
<tr>
<td>category</td>
<td>This is the category name which must match the value of the SQLTUNE_CATEGORY parameter in a session for the session to use this SQL profile. It defaults to the value &quot;DEFAULT&quot;. This is also the default of the SQLTUNE_CATEGORY parameter. The category must be a valid Oracle identifier. The category name specified is always converted to upper case. The combination of the normalized SQL text and category name creates a unique key for a SQL profile. An ACCEPT_SQL_PROFILE fails if this combination is duplicated.</td>
</tr>
<tr>
<td>replace</td>
<td>If the profile already exists, it is replaced if this argument is TRUE. It is an error to pass a name that is already being used for another signature/category pair, even with replace set to TRUE.</td>
</tr>
<tr>
<td>force_match</td>
<td>If TRUE this causes SQL profiles to target all SQL statements which have the same text after normalizing all literal values into bind variables. (Note that if a combination of literal values and bind values is used in a SQL statement, no bind transformation occurs.) This is analogous to the matching algorithm used by the FORCE option of the cursor_sharing parameter. If FALSE, literals are not transformed. This is analogous to the matching algorithm used by the EXACT option of the cursor_sharing parameter.</td>
</tr>
<tr>
<td>profile_type</td>
<td>Options:</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------</td>
</tr>
<tr>
<td></td>
<td>• REGULAR_PROFILE - profile without a change to parallel execution (Default, equivalent to NULL). Note that if the SQL statement currently has a parallel execution plan, the regular profile will cause the optimizer to choose a different, but still parallel, execution plan.</td>
</tr>
<tr>
<td></td>
<td>• PX_PROFILE - regular profile with a change to parallel execution</td>
</tr>
</tbody>
</table>
Table 160-8  (Cont.) ACCEPT_ALL_SQL_PROFILES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autotune_period</td>
<td>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• null or negative value (default) - all or full. The result includes all task executions.</td>
</tr>
<tr>
<td></td>
<td>• 0 - result of the current or most recent task execution.</td>
</tr>
<tr>
<td></td>
<td>• 1 - result for the most recent 24-hour period.</td>
</tr>
<tr>
<td></td>
<td>• 7 - result for the most recent 7-day period.</td>
</tr>
<tr>
<td></td>
<td>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If null, then the procedure generates the report for the most recent task execution.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Owner of the tuning task. This is an optional parameter that must be specified to accept a SQL profile associated to a tuning task owned by another user. The current user is the default value.</td>
</tr>
<tr>
<td>description</td>
<td>A user specified string describing the purpose of the SQL profile. The description is truncated if longer than 256 characters. The maximum size is 500 characters.</td>
</tr>
<tr>
<td>database_link_to</td>
<td>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</td>
</tr>
</tbody>
</table>

Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.

The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named `lnk_to_pri`:

```
CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';
```

Security Model

The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.

160.5.2 ACCEPT_SQL_PROFILE Procedure and Function

This subprogram creates a SQL profile recommended by SQL Tuning Advisor.

The SQL text is normalized for matching purposes although it is stored in the data dictionary in denormalized form for readability. SQL text is provided through a reference to the SQL Tuning task. If the referenced SQL statement does not exist, then the database reports an error.

<tr>
<td>database_link_to</td>
<td>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</td>
</tr>
</tbody>
</table>

Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.

The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri:

```
CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';
```

Return Values
The name of the SQL profile.

Usage Notes
The ADMINISTER SQL MANAGEMENT OBJECT privilege is required. The CREATE ANY SQL PROFILE privilege is deprecated.
Examples

You use both the procedure and the function versions of the subprogram in the same way except you must specify a return value to invoke the function. Here we give examples of the procedure only.

In this example, you tune a single SQL statement form the workload repository and you create the SQL profile recommended by SQL Tuning Advisor.

```sql
VARIABLE stmt_task VARCHAR2(64);
VARIABLE sts_task VARCHAR2(64);

-- create a tuning task tune the statement
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    begin_snap => 1, -
    end_snap   => 2, -
    sql_id     => 'ay1m3ssvtrh24');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);
EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE(:stmt_task);

Note that you do not have to specify the ID (that is, object_id) for the advisor framework object created by SQL Tuning Advisor to represent the tuned SQL statement.

You might also want to accept the recommended SQL profile in a different category, (for example, TEST), so that it is not used by default.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
    category => 'TEST');

You can use command ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile behaves.

The following call creates a SQL profile that targets any SQL statement with the same force_matching_signature as the tuned statement.

EXEC DBMS_SQLTUNE.ACCEPT_SQL_PROFILE (task_name => :stmt_task, -
    force_match => TRUE);

In the following example, you tune a SQL tuning set, and you create a SQL profile for only one of the SQL statements in the SQL tuning set. The SQL statement is represented by an advisor framework object with ID equal to 5. You must pass an object ID to the ACCEPT_SQL_PROFILE procedure because there are potentially many SQL profiles for the tuning task. This object ID is given along with the report.

EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK (sqlset_name => 'my_workload', -
    rank1 => 'ELAPSED_TIME', -
    time_limit => 3600, -
    description => 'my workload ordered by elapsed time');

-- execute the resulting task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);

-- create the profile for the sql statement corresponding to object_id = 5.
**160.5.3 ADD_SQLSET_REFERENCE Function**

This procedure adds a new reference to an existing SQL tuning set to indicate its use by a client.

### Syntax

```sql
DBMS_SQLTUNE.ADD_SQLSET_REFERENCE (
    sqlset_name  IN  VARCHAR2,
    description  IN  VARCHAR2 := NULL)
RETURN NUMBER;
```

### Parameters

The parameters are identical for `DBMS_SQLTUNE.ADD_SQLSET_REFERENCE` and `DBMS_SQLSET.ADD_REFERENCE`.

### Table 160-10  ADD_SQLSET_REFERENCE and ADD_REFERENCE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>description</td>
<td>Provides an optional description of the usage of SQL tuning set. The description is truncated if longer than 256 characters.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for the current schema owner.</td>
</tr>
</tbody>
</table>

### Return Values

The identifier of the added reference.

### Examples

You can add reference to a SQL tuning set. This prevents the tuning set from being modified while it is being used. References are automatically added when you invoke SQL Tuning Advisor on the SQL tuning set, so you should use this function for custom purposes only. The function returns a reference ID that is used to remove it later. You use the `REMOVE_SQLSET_REFERENCE` procedure to delete references to a SQL tuning set.

```sql
VARIABLE rid NUMBER;
EXEC :rid := DBMS_SQLTUNE.ADD_SQLSET_REFERENCE( -
    sqlset_name => 'my_workload', -
    description => 'my sts reference');
```
You can use the `DBA_SQLSET_REFERENCES` view to find all references on a given SQL tuning set.

### 160.5.4 ALTER_SQL_PROFILE Procedure

This procedure alters specific attributes of an existing SQL profile object.

The following attributes can be altered (using these attribute names):

- **STATUS** can be set to **ENABLED** or **DISABLED**.
- **NAME** can be reset to a valid name which must be a valid Oracle identifier and must be unique.
- **DESCRIPTION** can be set to any string of size no more than 500 characters.
- **CATEGORY** can be reset to a valid category name which must be a valid Oracle identifier and must be unique when combined with normalized SQL text).

#### See Also:

[DBMS_SQLTUNE SQL Profile Subprograms](#) for other subprograms in this group

#### Syntax

```sql
DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name                 IN  VARCHAR2,  
    attribute_name       IN  VARCHAR2,  
    value                IN  VARCHAR2);
```

#### Parameters

**Table 160-11  ALTER_SQL_PROFILE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of the existing SQL profile to alter</td>
</tr>
<tr>
<td>attribute_name</td>
<td>The (mandatory) attribute name to alter (case insensitive) using valid attribute names</td>
</tr>
<tr>
<td>value</td>
<td>The (mandatory) new value of the attribute using valid attribute values</td>
</tr>
</tbody>
</table>

#### Usage Notes

Requires the **ALTER ANY SQL PROFILE** privilege.

#### Examples

-- Disable a profile, so it is not be used by any sessions.
```sql
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name => :pname,  
    attribute_name => 'STATUS',  
    value => 'DISABLED');
```

-- Enable it back:
```sql
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE (  
    name => :pname,  
```
attribute_name => 'STATUS', -
value => 'ENABLED');

-- Change the category of the profile so it is used only by sessions
-- with category set to TEST.
-- Use ALTER SESSION SET SQLTUNE_CATEGORY = 'TEST' to see how this profile
-- behaves.
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -
attribute_name => 'CATEGORY', -
value => 'TEST');

-- Change it back:
EXEC DBMS_SQLTUNE.ALTER_SQL_PROFILE ( name => :pname, -
attribute_name => 'CATEGORY', -
value => 'DEFAULT');

160.5.5 CANCEL_TUNING_TASK Procedure

This procedure cancels the currently executing tuning task. All intermediate result data
is deleted.

See Also:
DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms
in this group

Syntax

DBMS_SQLTUNE.CANCEL_TUNING_TASK ( -
task_name IN VARCHAR2);

Parameters

Table 160-12  CANCEL_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Specifies the name of the task to cancel</td>
</tr>
</tbody>
</table>

Examples

You cancel a task when you need to stop it executing and do not require to view any
already-completed results.

EXEC DBMS_SQLTUNE.CANCEL_TUNING_TASK(:my_task);

160.5.6 CAPTURE_CURSOR_CACHE_SQLSET Procedure

This procedure captures a workload from the shared SQL area into a SQL tuning set.
The procedure polls the cache multiple times over a time period, and updates the
workload data stored there. It can execute over as long a period as required to capture
an entire system workload.
See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET (  
sqlset_name IN VARCHAR2,  
time_limit IN POSITIVE := 1800,  
repeat_interval IN POSITIVE := 300,  
capture_option IN VARCHAR2 := 'MERGE',  
capture_mode IN NUMBER := MODE_REPLACE_OLD_STATS,  
basic_filter IN VARCHAR2 := NULL,  
sqlset_owner IN VARCHAR2 := NULL,  
recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL);
```

Parameters

The parameters are the same for both `DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET` and `DBMS_SQLSET.CAPTURE_CURSOR_CACHE`.

Table 160-13  CAPTURE_CURSOR_CACHE_SQLSET and CAPTURE_CURSOR_CACHE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the SQL tuning set name</td>
</tr>
<tr>
<td>time_limit</td>
<td>Defines the total amount of time, in seconds, to execute.</td>
</tr>
<tr>
<td>repeat_interval</td>
<td>Defines the amount of time, in seconds, to pause between sampling.</td>
</tr>
<tr>
<td>capture_option</td>
<td>Specifies whether to insert new statements, update existing statements, or both. Values are INSERT, UPDATE, or MERGE. The values are the same as for load_option in load_sqlset.</td>
</tr>
<tr>
<td>capture_mode</td>
<td>Specifies the capture mode (UPDATE and MERGE capture options). Possible values:</td>
</tr>
<tr>
<td></td>
<td>• MODE_REPLACE_OLD_STATS — Replaces statistics when the number of executions is greater than the number stored in the SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>• MODE_ACCUMULATE_STATS — Adds new values to current values for SQL that is already stored. Note that this mode detects if a statement has been aged out, so the final value for a statistics is the sum of the statistics of all cursors that statement existed under.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Defines a filter to apply to the shared SQL area for each sample. If basic_filter is not set by the caller, then the subprogram captures only statements of type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set or NULL for current schema owner</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Defines a filter that includes recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>
**Examples**

In this example capture takes place over a 30-second period, polling the cache once every five seconds. This captures all statements run during that period but not before or after. If the same statement appears a second time, the process replaces the stored statement with the new occurrence.

Note that in production systems the time limit and repeat interval would be set much higher. You should tune the `time_limit` and `repeat_interval` parameters based on the workload time and shared SQL area turnover properties of your system.

```sql
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5);
```

In the following call you accumulate execution statistics as you go. This option produces an accurate picture of the cumulative activity of each cursor, even across age-outs, but it is more expensive than the previous example.

```sql
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5, -
    capture_mode    => dbms_sqltune.MODE_ACCUMULATE_STATS);
```

This call performs a very inexpensive capture where you only insert new statements and do not update their statistics once they have been inserted into the SQL tuning set.

```sql
EXEC DBMS_SQLTUNE.CAPTURE_CURSOR_CACHE_SQLSET( -
    sqlset_name     => 'my_workload', -
    time_limit      =>  30, -
    repeat_interval =>  5, -
    capture_option  => 'INSERT');
```

### 160.5.7 CREATE_SQL_PLAN_BASELINE Procedure

This procedure creates a SQL plan baseline for an execution plan. It can be used in the context of an Alternative Plan Finding made by SQL Tuning Advisor.

See Also:

[DBMS_SQLTUNE SQL Tuning Advisor Subprograms](#) for other subprograms in this group

**Syntax**

```sql
DBMS_SQLTUNE.CRE ATE_SQL_PLAN_BASELINE ( -
    task_name            IN VARCHAR2, -
    object_id            IN NUMBER   := NULL,
    plan_hash_value      IN NUMBER, -
    owner_name           IN VARCHAR2 := NULL,
    database_link_to     IN VARCHAR2 := NULL);
```
Parameters

<tr>
<td></td>
<td>link must be owned by SYS and accessed by the default privileged user</td>
</tr>
<tr>
<td></td>
<td>SYS$UMF. The following sample statement creates a link named lnk_to_pri:</td>
</tr>
<tr>
<td></td>
<td>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password</td>
</tr>
<tr>
<td></td>
<td>USING 'inst1';</td>
</tr>
</tbody>
</table>

160.5.8 CREATE_SQLSET Procedure and Function

This procedure or function creates a SQL tuning set object in the database.

Syntax

```sql
DBMS_SQLTUNE.CREATE_SQLSET (  
sqlset_name IN VARCHAR2,  
description IN VARCHAR2 := NULL  
sqlset_owner IN VARCHAR2 := NULL);
```

```sql
DBMS_SQLTUNE.CREATE_SQLSET (  
sqlset_name IN VARCHAR2 := NULL,  
description IN VARCHAR2 := NULL,  
sqlset_owner IN VARCHAR2 := NULL)  
RETURN VARCHAR2;
```

Parameters

Table 160-15 CREATE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the created SQL tuning set. The name is the name</td>
</tr>
<tr>
<td></td>
<td>passed to the function. If no name is passed to the function, then the</td>
</tr>
<tr>
<td></td>
<td>function generates an automatic name.</td>
</tr>
</tbody>
</table>

<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>Provides an optional description of the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for the current schema owner.</td>
</tr>
</tbody>
</table>

Examples

EXEC DBMS_SQLTUNE.CREATE_SQLSET(-sqlset_name => 'my_workload', -description => 'complete application workload');

160.5.9 CREATE_STGTAB_SQLPROF Procedure

This procedure creates the staging table used for copying SQL profiles from one system to another.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name            IN VARCHAR2,
schema_name           IN VARCHAR2 := NULL,
tablespace_name       IN VARCHAR2 := NULL);

Parameters

Table 160-16  CREATE_STGTAB_SQLPROF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>The name of the table to create (case-insensitive unless double quoted).</td>
</tr>
<tr>
<td>schema_name</td>
<td>The schema to create the table in, or NULL for the current schema (case-insensitive unless double quoted).</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>The tablespace to store the staging table within, or NULL for the default tablespace of the current user (case-insensitive unless double quoted).</td>
</tr>
</tbody>
</table>

Usage Notes

- Call this procedure once before issuing a call to the PACK_STGTAB_SQLPROF Procedure.
- To put different SQL profiles in different staging tables, you can call this procedure multiple times.
This is a DDL operation, so it does not occur within a transaction.

Examples

Create a staging table to store profile data that can be moved to another system.

EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLPROF (table_name => 'PROFILE_STGTAB');

160.5.10 CREATE_STGTAB_SQLSET Procedure

This procedure creates a staging table through which SQL tuning sets are imported and exported.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.CREATE_STGTAB_SQLSET (
    table_name IN VARCHAR2,
    schema_name IN VARCHAR2 := NULL,
    tablespace_name IN VARCHAR2 := NULL,
    db_version IN NUMBER := NULL);

Parameters

Table 160-17 CREATE_STGTAB_SQLSET and CREATE_STGTAB Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>table_name</td>
<td>Specifies the name of the table to create. The name is case sensitive.</td>
</tr>
<tr>
<td>schema_name</td>
<td>Defines the schema in which to create the table, or NULL for the current</td>
</tr>
<tr>
<td></td>
<td>schema. The name is case sensitive.</td>
</tr>
<tr>
<td>tablespace_name</td>
<td>Specifies the tablespace in which to store the staging table, or NULL for</td>
</tr>
<tr>
<td></td>
<td>the default tablespace of the current user. The name is case sensitive.</td>
</tr>
<tr>
<td>db_version</td>
<td>Specifies the database version that determines the format of the staging</td>
</tr>
<tr>
<td></td>
<td>table.</td>
</tr>
<tr>
<td></td>
<td>You can also create an older database version staging table to export an</td>
</tr>
<tr>
<td></td>
<td>STS to an older database version. Use one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• NULL (default) — Specifies the current database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_10_2_VERSION — Specifies the 10.2 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_1_VERSION — Specifies the 11.1 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_11_2_VERSION — Specifies the 11.2 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_12_1_VERSION — Specifies the 12.1 database version.</td>
</tr>
<tr>
<td></td>
<td>• STS_STGTAB_12_2_VERSION — Specifies the 12.2 database version.</td>
</tr>
</tbody>
</table>

Security Model

You must have CREATE TABLE permissions in the specified schema and tablespace.
Usage Notes

• Call this procedure once before packing the SQL set.
• To have different tuning sets in different staging tables, you can call this procedure multiple times.
• This is a DDL operation, so it does not occur within a transaction.
• The staging table contains nested table columns and indexes, so it should not be renamed.

Examples

Create a staging table for packing and eventually exporting a SQL tuning sets

EXEC DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(table_name => 'STGTAB_SQLSET');

Create a staging table to pack a SQL tuning set in Oracle Database 11g Release 2 (11.2) format

BEGIN
  DBMS_SQLTUNE.CREATE_STGTAB_SQLSET(
    table_name => 'STGTAB_SQLSET',
    db_version => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION );
END;

160.5.11 CREATE_TUNING_TASK Functions

This function creates a SQL Tuning Advisor task.

You can use different forms of this function to:

• Create a tuning task for a single statement given its text.
• Create a tuning task for a single statement from the shared SQL area given its identifier.
• Create a tuning task for a single statement from the workload repository given a range of snapshot identifiers.
• Create a tuning task for a SQL tuning set.
• Create a tuning task for SQL Performance Analyzer.

In all cases, the function mainly creates a SQL Tuning Advisor task and sets its parameters.

See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

SQL text format:

DBMS_SQLTUNE.CREATE_TUNING_TASK (sql_text IN CLOB,
bind_list  IN sql_binds := NULL,
user_name  IN VARCHAR2 := NULL,
scope      IN VARCHAR2 := SCOPE_COMPREHENSIVE,
time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
task_name  IN VARCHAR2 := NULL,
description IN VARCHAR2 := NULL,
con_name   IN VARCHAR2 := NULL,
database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

SQL ID format:

DBMS_SQLTUNE.CREATE_TUNING_TASK {
  sql_id IN VARCHAR2,
  plan_hash_value IN NUMBER := NULL,
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
  task_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  con_name IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

AWR format:

DBMS_SQLTUNE.CREATE_TUNING_TASK {
  begin_snap IN NUMBER,
  end_snap IN NUMBER,
  sql_id IN VARCHAR2,
  plan_hash_value IN NUMBER := NULL,
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
  task_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  con_name IN VARCHAR2 := NULL,
  dbid IN NUMBER := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

SQL tuning set format:

DBMS_SQLTUNE.CREATE_TUNING_TASK {
  sqlset_name IN VARCHAR2,
  basic_filter IN VARCHAR2 := NULL,
  object_filter IN VARCHAR2 := NULL,
  rank1 IN VARCHAR2 := NULL,
  rank2 IN VARCHAR2 := NULL,
  rank3 IN VARCHAR2 := NULL,
  result_percentage IN NUMBER := NULL,
  result_limit IN NUMBER := NULL,
  scope IN VARCHAR2 := SCOPE_COMPREHENSIVE,
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,
  task_name IN VARCHAR2 := NULL,
  description IN VARCHAR2 := NULL,
  plan_filter IN VARCHAR2 := 'MAX_ELAPSED_TIME',
  sqlset_owner IN VARCHAR2 := NULL,
  database_link_to IN VARCHAR2 := NULL)
RETURN VARCHAR2;

SQL Performance Analyzer format:
DBMS_SQLTUNE.CREATE_TUNING_TASK (  
  spa_task_name IN VARCHAR2,  
  spa_task_owner IN VARCHAR2 := NULL,  
  spa_compare_exec IN VARCHAR2 := NULL,  
  basic_filter IN VARCHAR2 := NULL,  
  time_limit IN NUMBER := TIME_LIMIT_DEFAULT,  
  task_name IN VARCHAR2 := NULL,  
  description IN VARCHAR2 := NULL)  
RETURN VARCHAR2;

Parameters

Table 160-18 CREATE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>Specifies the text of a SQL statement.</td>
</tr>
<tr>
<td>begin_snap</td>
<td>Specifies the begin snapshot identifier.</td>
</tr>
<tr>
<td>end_snap</td>
<td>Specifies the end snapshot identifier.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the identifier of a SQL statement.</td>
</tr>
<tr>
<td>bind_list</td>
<td>Defines an ordered list of bind values in ANYDATA type.</td>
</tr>
<tr>
<td>NOTE:</td>
<td>This parameter is not supported on a standby database.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>Specifies the hash value of the SQL execution plan.</td>
</tr>
<tr>
<td>sqlset_name</td>
<td>Specifies the SQL tuning set name.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the predicate used to filter the SQL from the SQL tuning set.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Specifies the object filter.</td>
</tr>
<tr>
<td>rank(i)</td>
<td>Specifies an ORDER BY clause on the selected SQL statement.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies the percentage on the sum of a ranking measure.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Specifies the top L(imit) SQL from the filtered or ranked SQL.</td>
</tr>
<tr>
<td>user_name</td>
<td>Specifies the user name for whom the statement is to be tuned.</td>
</tr>
<tr>
<td>scope</td>
<td>Specifies the tuning scope:</td>
</tr>
<tr>
<td></td>
<td>• LIMITED: SQL Tuning Advisor produces recommendations based on statistical checks, access path analysis, and SQL structure analysis. SQL profile recommendations are not generated.</td>
</tr>
<tr>
<td></td>
<td>• COMPREHENSIVE: SQL Tuning Advisor carries out all the analysis it performs under limited scope plus SQL profiling.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Specifies the maximum duration in seconds for the tuning session.</td>
</tr>
<tr>
<td>task_name</td>
<td>Specifies an optional tuning task name.</td>
</tr>
<tr>
<td>description</td>
<td>Provides a description of the SQL tuning session, up to a maximum of 256 characters.</td>
</tr>
</tbody>
</table>
### Table 160-18  CREATE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **plan_filter** | Specifies the plan filter. It is applicable when multiple plans (plan_hash_value) are associated with the same statement. This filter allows for selecting one plan (plan_hash_value) only. Possible values are:  
  • LAST_GENERATED: most recent timestamp  
  • FIRST_GENERATED: earliest timestamp, the opposite to LAST_GENERATED  
  • LAST_LOADED: most recent first_load_time statistics information  
  • FIRST_LOADED: earliest first_load_time statistics information, the opposite to LAST_LOADED  
  • MAX_ELAPSED_TIME: maximum elapsed time  
  • MAX_BUFFER_GETS: maximum buffer gets  
  • MAX_DISK_READS: maximum disk reads  
  • MAX_DIRECT_WRITES: maximum direct writes  
  • MAX_OPTIMIZER_COST: maximum optimizer cost |
| **sqlset_owner** | Specifies the owner of the SQL tuning set, or NULL for the current schema owner.                                                           |
| **spa_task_name** | Specifies the name of the SQL Performance Analyzer task whose regressions are to be tuned.                                                   |
| **spa_task_owner** | Specifies the owner of specified SQL Performance Analyzer task or NULL for current user.                                                     |
| **spa_compare_exec** | Specifies the execution name of the Compare Performance trial of SQL Performance Analyzer task. If NULL, then the advisor uses the most recent execution of the given SQL Performance Analyzer task, of type COMPARE PERFORMANCE. |
| **dbid** | Specifies the DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used. |

Chapter 160  
Summary of DBMS_SQLTUNE Subprograms
Table 160-18  (Cont.) CREATE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>con_name</td>
<td>Specifies the container for the tuning task. The semantics depend on the function format:</td>
</tr>
<tr>
<td></td>
<td>• For the SQL text format, this parameter specifies the container in which SQL Tuning Advisor tunes the SQL statement. If null (default), then SQL Tuning Advisor uses the current container.</td>
</tr>
<tr>
<td></td>
<td>• For the SQL ID format, this parameter specifies the container from which the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the cursor cache of all valid containers executing the SQL statement, and tunes the most expensive statement in its container.</td>
</tr>
<tr>
<td></td>
<td>• For the AWR format, this parameter specifies the container from whose AWR data the database fetches the SQL statement for tuning. SQL Tuning Advisor tunes the statement in this container. If null, then the database uses the current PDB for tuning, fetches the statement from the AWR of all valid containers that have this SQL statement, and tunes the most expensive statement in its container.</td>
</tr>
<tr>
<td></td>
<td>The following statements are true of all function formats:</td>
</tr>
<tr>
<td></td>
<td>• In a non-CDB, this parameter is ignored.</td>
</tr>
<tr>
<td></td>
<td>• In a PDB, this parameter must be null or match the container name of the PDB. Otherwise, an error occurs.</td>
</tr>
<tr>
<td></td>
<td>• In a CDB root, this parameter must be null or match the container name of a container in this CDB. Otherwise, an error occurs.</td>
</tr>
<tr>
<td>database_link_to</td>
<td>The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local.</td>
</tr>
<tr>
<td></td>
<td>Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database.</td>
</tr>
<tr>
<td></td>
<td>The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri:</td>
</tr>
<tr>
<td></td>
<td>CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';</td>
</tr>
</tbody>
</table>

Return Values

A SQL tuning task name that is unique by user (two different users can give the same name to their advisor tasks).

Usage Notes

With regard to the form of this subprogram that takes a SQL tuning set, filters provided to this function are evaluated as part of a SQL run by the current user. As such, they
Example 160-1  Examples

The following examples assume the following variable definitions:

```sql
VAR stmt_task VARCHAR2(64);
VAR sts_task VARCHAR2(64);
VAR spa_tune_task VARCHAR2(64);
```

Example 160-2  Create Tuning Task with SQL Text Format

```sql
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sql_text => 'SELECT quantity_sold FROM sales s, times t WHERE s.time_id = t.time_id AND s.time_id = TO_DATE(''24-NOV-00'')');
```

Example 160-3  Create Tuning Task with SQL ID Format

```sql
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3svtrh24');
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3svtrh24', -
    scope => 'LIMITED');
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_id => 'aylm3svtrh24', -
    time_limit => 600);
```

Example 160-4  Create Tuning Task with AWR Snapshot Format

```sql
EXEC :stmt_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(begin_snap => 1, -
    end_snap => 2, sql_id => 'aylm3svtrh24');
```

Example 160-5  Create Tuning Task with SQL Tuning Set Format

This example creates a task that tunes SQL statements in order by buffer gets, and
also sets a time limit of one hour. The default ranking measure is elapsed time.

```sql
EXEC :sts_task := DBMS_SQLTUNE.CREATE_TUNING_TASK( -
    sqlset_name => 'my_workload', -
    rank1 => 'BUFFER_GETS', -
    time_limit => 3600, -
    description => 'tune my workload ordered by buffer gets');
```

Example 160-6  Create Tuning Task with SPA Task Format

This example tunes the SQL statement that were reported as having regressed from
the compare performance execution of the SQL Performance Analyzer task named
task_123.

```sql
EXEC :spa_tune_task := DBMS_SQLTUNE.CREATE_TUNING_TASK(
    spa_task_name     => 'task_123',
    spa_task_owner    => 'SCOTT',
    spa_compare_exec  => 'exec1');
```

Example 160-7  Creating SQL Tuning Task on Standby Database

This example creates a tuning task on the standby database. The `tune_stby_wkld` task
uses the `lnk_to_primary` database link to write data to the primary database, which is
open read/write.

```sql
VAR tname VARCHAR2(30);
VAR query VARCHAR2(500);
```
EXEC :tname := 'tune_stby_wkld';
EXEC :query := 'SELECT /*+ FULL(t)*/ col1 FROM table1 t WHERE col1=9000';
EXEC :tname := DBMS_SQLTUNE.CREATE_TUNING_TASK(sql_text => :query,-
    task_name => :tname, database_link_to => 'lnk_to_primary');

160.5.12 DELETE_SQLSET Procedure

This procedure deletes a set of SQL statements from a SQL tuning set.

Syntax

DBMS_SQLTUNE.DELETE_SQLSET (  
    sqlset_name IN VARCHAR2,
    basic_filter IN VARCHAR2 := NULL,
    sqlset_owner IN VARCHAR2 := NULL);

Parameters

Table 160-19  DELETE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for current schema owner.</td>
</tr>
</tbody>
</table>

Examples

-- Delete all statements in a sql tuning set.
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload');

-- Delete all statements in a sql tuning set which ran for less than a second
EXEC DBMS_SQLTUNE.DELETE_SQLSET(sqlset_name   => 'my_workload', -
    basic_filter  => 'elapsed_time < 1000000');

160.5.13 DROP_SQL_PROFILE Procedure

This procedure drops the named SQL profile from the database.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.DROP_SQL_PROFILE (  
    name IN VARCHAR2,
    ignore IN BOOLEAN := FALSE);
Parameters

Table 160-20 DROP_SQL_PROFILE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The (mandatory) name of SQL profile to be dropped. The name is case sensitive.</td>
</tr>
<tr>
<td>ignore</td>
<td>Ignores errors due to object not existing</td>
</tr>
</tbody>
</table>

Usage Notes

Requires the DROP ANY SQL PROFILE privilege.

Examples

```sql
-- Drop the profile:
EXEC DBMS_SQLTUNE.DROP_SQL_PROFILE(:pname);
```

160.5.14 DROP_SQLSET Procedure

This procedure drops a SQL tuning set if it is not active.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.DROP_SQLSET (
    sqlset_name   IN  VARCHAR2,
    sqlset_owner  IN  VARCHAR2 := NULL);
```

Parameters

Table 160-21 DROP_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set, or NULL for current schema owner.</td>
</tr>
</tbody>
</table>

Usage Notes

You cannot drop a SQL tuning set when it is referenced by one or more clients.

Examples

```sql
-- Drop the sqlset.
EXEC DBMS_SQLTUNE.DROP_SQLSET ('my_workload');
```
160.5.15 DROP_TUNING_TASK Procedure

This procedure drops a SQL tuning task. The task and all its result data are deleted.

Syntax

```sql
DBMS_SQLTUNE.DROP_TUNING_TASK (  
    task_name   IN VARCHAR2);
```

Parameters

Table 160-22  DROP_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Specifies name of the tuning task to drop.</td>
</tr>
</tbody>
</table>

160.5.16 EXECUTE_TUNING_TASK Function and Procedure

This function and procedure executes a previously created tuning task. Both the function and the procedure run in the context of a new task execution. The difference is that the function version returns that new execution name.

Syntax

```sql
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (  
    task_name     IN VARCHAR2,  
    execution_name IN VARCHAR2 := NULL,  
    execution_params IN dbms_advisor.argList := NULL,  
    execution_desc  IN VARCHAR2 := NULL,  
    database_link_to IN VARCHAR2 := NULL)  
  RETURN VARCHAR2;
```

```sql
DBMS_SQLTUNE.EXECUTE_TUNING_TASK (  
    task_name     IN VARCHAR2,  
    execution_name IN VARCHAR2 := NULL,  
    execution_params IN dbms_advisor.argList := NULL,  
    execution_desc  IN VARCHAR2 := NULL,  
    database_link_to IN VARCHAR2 := NULL);
```
Parameters

Table 160-23  EXECUTE_TUNING_TASK Function & Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to execute.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name to qualify and identify an execution. If not specified, it is</td>
</tr>
<tr>
<td></td>
<td>generated by the advisor and returned by function.</td>
</tr>
<tr>
<td>execution_params</td>
<td>List of parameters (name, value) for the specified execution. The execution</td>
</tr>
<tr>
<td></td>
<td>parameters have effect only on the execution for which they are specified.</td>
</tr>
<tr>
<td></td>
<td>They override the values for the parameters stored in the task (set through</td>
</tr>
<tr>
<td></td>
<td>the SET_TUNING_TASK_PARAMETER Procedures).</td>
</tr>
<tr>
<td>execution_desc</td>
<td>A 256-length string describing the execution.</td>
</tr>
<tr>
<td>database_link_to</td>
<td>Name of a database link that exists on a standby database. The link</td>
</tr>
<tr>
<td></td>
<td>specifies the connection to a primary database. By default, the value is</td>
</tr>
<tr>
<td></td>
<td>null, which means that the SQL Tuning Advisor session is local.</td>
</tr>
</tbody>
</table>

Usage Notes

A tuning task can be executed multiples times without having to reset it.

Examples

EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:stmt_task);

160.5.17 IMPLEMENT_TUNING_TASK Procedure

This procedure implements a set of SQL profile recommendations made by SQL Tuning Advisor.

Executing IMPLEMENT_TUNING_TASK is equivalent to executing the SCRIPT_TUNING_TASK Function and then running the script.
See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.IMPLEMENT_TUNING_TASK(
    task_name         IN  VARCHAR2,
    rec_type          IN  VARCHAR2 := REC_TYPE_SQL_PROFILES,
    owner_name        IN  VARCHAR2 := NULL,
    execution_name    IN  VARCHAR2 := NULL,
    database_link_to  IN  VARCHAR2 := NULL);
```

Parameters

Table 160-24 IMPLEMENT_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to implement recommendations.</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the types of recommendations to implement. Only 'PROFILES' is supported.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task or NULL for the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, then the procedure implements recommendations from the last task execution.</td>
</tr>
</tbody>
</table>
| database_link_to| Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri:

```
CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';
```
160.5.18 INTERRUPT_TUNING_TASK Procedure

This procedure interrupts the currently executing tuning task. The task ends its operations as it would at normal exit so that the user can access the intermediate results.

See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.INTERRUPT_TUNING_TASK (  
    task_name         IN VARCHAR2);
```

Parameters

Table 160-25  INTERRUPT_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task to interrupt</td>
</tr>
</tbody>
</table>

Examples

```
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:my_task);
```

160.5.19 LOAD_SQLSET Procedure

This procedure populates the SQL tuning set with a set of selected SQL statements. You can call the procedure multiple times to add new SQL statements or replace attributes of existing statements.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.LOAD_SQLSET (  
    sqlset_name       IN  VARCHAR2,  
    populate_cursor   IN  sqlset_cursor,  
    load_option       IN VARCHAR2 := 'INSERT',  
    update_option     IN VARCHAR2 := 'REPLACE',  
    update_condition  IN VARCHAR2 := NULL,  
    update_attributes IN VARCHAR2 := NULL,  
    ignore_null       IN BOOLEAN  := TRUE, 
)
```
Parameters

Table 160-26  LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of SQL tuning set to be loaded.</td>
</tr>
<tr>
<td>populate_cursor</td>
<td>Specifies the cursor reference to the SQL tuning set to be loaded.</td>
</tr>
<tr>
<td>load_option</td>
<td>Specifies which statements are loaded into the SQL tuning set. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• INSERT (default) — Adds only new statements.</td>
</tr>
<tr>
<td></td>
<td>• UPDATE — Updates existing the SQL statements and ignores any new statements.</td>
</tr>
<tr>
<td></td>
<td>• MERGE — Inserts new statements and updates the information of the existing ones.</td>
</tr>
<tr>
<td>update_option</td>
<td>Specifies how existing SQL statements are updated.</td>
</tr>
<tr>
<td></td>
<td>This parameter is considered only if load_option is specified with UPDATE or MERGE as an option. The possible values are:</td>
</tr>
<tr>
<td></td>
<td>• REPLACE (default) — Updates the statement using the new statistics, bind list, object list, and so on.</td>
</tr>
<tr>
<td></td>
<td>• ACCUMULATE — Combines attributes when possible (for example, statistics such as elapsed_time), and otherwise replaces the existing values (for example, module and action) with the provided values. The SQL statement attributes that can be accumulated are: elapsed_time, buffer_gets, direct_writes, disk_reads, row_processed, fetches, executions, end_of_fetch_count, stat_period and active_stat_period.</td>
</tr>
<tr>
<td>update_condition</td>
<td>Specifies when to perform the update.</td>
</tr>
<tr>
<td></td>
<td>The procedure only performs the update when the specified condition is satisfied. The condition can refer to either the data source or destination. The condition must use the following prefixes to refer to attributes from the source or the destination:</td>
</tr>
<tr>
<td></td>
<td>• OLD — Refers to statement attributes from the SQL tuning set (destination).</td>
</tr>
<tr>
<td></td>
<td>• NEW — Refers to statement attributes from the input statements (source).</td>
</tr>
</tbody>
</table>
Table 160-26  (Cont.) LOAD_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| update_attributes | Specifies the list of SQL statement attributes to update during a merge or update.  
The possible values are:  
• NULL (default) — Specifies the content of the input cursor except the execution context. On other terms, it is equivalent to ALL without execution contexts such as module and action.  
• BASIC — Specifies statistics and binds only.  
• TYPICAL — Specifies BASIC with SQL plans (without row source statistics) and without an object reference list.  
• ALL — Specifies all attributes, including the execution context attributes such as module and action.  
• List of comma separated attribute names to update:  
  – EXECUTION_CONTEXT  
  – EXECUTION_STATISTICS  
  – SQL_BINDS  
  – SQL_PLAN  
  – SQL_PLAN_STATISTICS (similar to SQL_PLAN with added row source statistics) |
| ignore_null     | Specifies whether to update attributes when the new value is NULL.  
If TRUE, then the procedure does not update an attribute when the new value is NULL. That is, do not override with NULL values unless intentional. |
| commit_rows     | Specifies whether to commit statements after DML.  
If a value is provided, then the load commits after each specified number of statements is inserted. If NULL is provided, then the load commits only once, at the end of the operation.  
Providing a value for this argument enables you to monitor the progress of a SQL tuning set load operation in the DBA_SQLSET views. The STATEMENT_COUNT value increases as new SQL statements are loaded. |
| sqlset_owner    | Defines the owner of the SQL tuning set, or the current schema owner (or NULL for the current owner). |

Exceptions

• This procedure returns an error when sqlset_name is invalid, or a corresponding SQL tuning set does not exist, or the populate_cursor is incorrect and cannot be executed.

• Exceptions are also raised when invalid filters are provided. Filters can be invalid either because they don’t parse (for example, they refer to attributes not in sqlset_row), or because they violate the user’s privileges.

Usage Notes

Rows in the input populate_cursor must be of type SQLSET_ROW.
Examples

In this example, you create and populate a SQL tuning set with all shared SQL area statements with an elapsed time of 5 seconds or more excluding statements that belong to \texttt{SYS} schema (to simulate an application user workload). You select all attributes of the SQL statements and load them in the tuning set using the default mode, which loads only new statements, since the SQL tuning set is empty.

```sql
-- create the tuning set
EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_workload');
-- populate the tuning set from the shared SQL area
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(
    DBMS_SQLTUNE.SELECT_CURSOR_CACHE(
        'parsing_schema_name <> ''SYS'' AND elapsed_time > 5000000',
        NULL, NULL, NULL, NULL, 1, NULL,
        'ALL')) P;
DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor => cur);
END;
/
```

Suppose now you wish to augment this information with what is stored in the workload repository (AWR). You populate the tuning set with \texttt{ACCUMULATE} as your \texttt{update_option} because it is assumed the cursors currently in the cache had aged out since the snapshot was taken.

You omit the \texttt{elapsed_time} filter because it is assumed that any statement captured in AWR is important, but still you throw away the \texttt{SYS}-parsed cursors to avoid recursive SQL.

```sql
DECLARE
cur DBMS_SQLTUNE.SQLSET_CURSOR;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(
    DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1, 2,
        'parsing_schema_name <> ''SYS'''',
        NULL, NULL, NULL, NULL, 1,
        NULL,
        'ALL')) P;
DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
    populate_cursor => cur,
    Using DBMS_SQLTUNE
    load_option => 'MERGE',
    update_option => 'ACCUMULATE');
END;
```

The following example is a simple load that only inserts new statements from the workload repository, skipping existing ones (in the SQL tuning set). Note that \texttt{INSERT} is the default value for the \texttt{load_option} argument of the \texttt{LOAD_SQLSET} procedure.
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY(1,2)) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload', populate_cursor => cur);
END;
/

The next example demonstrates a load with UPDATE option. This updates statements that already exist in the SQL tuning set but does not add new ones. By default, old statistics are replaced by their new values.

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT VALUE(P)
  FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;
  DBMS_SQLTUNE.LOAD_SQLSET(sqlset_name => 'my_workload',
                            populate_cursor => cur,
                            load_option => 'UPDATE');
END;
/

160.5.20 PACK_STGTAB_SQLPROF Procedure

This procedure copies profile data from the SYS. schema into the staging table.

See Also:
DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (
  profile_name          IN VARCHAR2 := '%',
  profile_category      IN VARCHAR2 := 'DEFAULT',
  staging_table_name    IN VARCHAR2,
  staging_schema_owner  IN VARCHAR2 := NULL);

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to pack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category to pack profiles from (% wildcards acceptable, case-sensitive)</td>
</tr>
</tbody>
</table>

Chapter 160
Summary of DBMS_SQLTUNE Subprograms
Table 160-27  (Cont.) PACK_STGTAB_SQLPROF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>staging_table_name</td>
<td>The name of the table to use (case-insensitive unless double quoted).</td>
</tr>
<tr>
<td></td>
<td>Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-</td>
</tr>
<tr>
<td></td>
<td>insensitive unless double quoted).</td>
</tr>
</tbody>
</table>

Security Model

This procedures requires ADMINISTER SQL MANAGEMENT OBJECT privilege and INSERT privilege on the staging table.

Usage Notes

This function issues a COMMIT after packing each SQL profile. If an error is raised mid-execution, then clear the staging table by deleting its rows.

Examples

Put only those profiles in the DEFAULT category into the staging table. This corresponds to all profiles used by default on this system.

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (staging_table_name => 'PROFILE_STGTAB');

This is another example where you put all profiles into the staging table. Note this moves profiles that are not currently being used by default but are in other categories, such as for testing purposes.

EXEC DBMS_SQLTUNE.PACK_STGTAB_SQLPROF (profile_category => '%', -
  staging_table_name => 'PROFILE_STGTAB');

160.5.21 PACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the SYS schema to a staging table created by the CREATE_STGTAB_SQLSET procedure.

See Also:

| DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group |

Syntax

DBMS_SQLTUNE.PACK_STGTAB_SQLSET (sqlset_name IN VARCHAR2,
  sqlset_owner IN VARCHAR2 := NULL,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL,
  db_version IN NUMBER := NULL);
Examples

Put all SQL tuning sets on the database in the staging table:

BEGIN
    DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
        sqlset_name        => '%',
        sqlset_owner       => '%',
        staging_table_name => 'STGTAB_SQLSET');
END;

Put only those SQL tuning sets owned by the current user in the staging table:

BEGIN
    DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
        sqlset_name        => '%',
        staging_table_name => 'STGTAB_SQLSET');
END;

Pack a specific SQL tuning set:

BEGIN
    DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
        sqlset_name         => 'my_workload',
        staging_table_name  => 'STGTAB_SQLSET');
END;

Pack a second SQL tuning set:

BEGIN
    DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
        sqlset_name         => 'workload_subset',
        staging_table_name  => 'STGTAB_SQLSET');
END;

Pack the STS my_workload_subset into a staging table stgtab_sqlset created for Oracle Database 11g Release 1 (11.2):

BEGIN
    DBMS_SQLTUNE.PACK_STGTAB_SQLSET(
        sqlset_name          => 'workload_subset',
        staging_table_name   => 'STGTAB_SQLSET',
        db_version           => DBMS_SQLTUNE.STS_STGTAB_11_2_VERSION);
END;

160.5.22 REMAP_STGTAB_SQLPROF Procedure

This procedure changes the profile data values kept in the staging table prior to performing an unpack operation.

You can use this procedure to change the category of a profile. You can also use it to change the name of a profile if one already exists on the system with the same name.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group
Syntax

```sql
DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (  
  old_profile_name   IN VARCHAR2,  
  new_profile_name   IN VARCHAR2 := NULL,  
  new_profile_category IN VARCHAR2 := NULL,  
  staging_table_name IN VARCHAR2,  
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

Table 160-28 REMAP_STGTAB_SQLPROF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_profile_name</td>
<td>The name of the profile to target for a remap operation (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_name</td>
<td>The new name of the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>new_profile_category</td>
<td>The new category for the profile, or NULL to remain the same (case-sensitive)</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-sensitive). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-sensitive)</td>
</tr>
</tbody>
</table>

Security Model

This procedure requires the `UPDATE` privilege on the staging table.

Examples

Change the name of a profile before we unpack, to avoid conflicts

```sql
BEGIN  
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (  
    old_profile_name => :pname,  
    new_profile_name => 'IMP' || :pname,  
    staging_table_name => 'PROFILE_STGTAB');  
END;
```

Change the SQL profile in the staging table to be 'TEST' category before we import it. This way users can test the profile on the new system before it is active.

```sql
BEGIN  
  DBMS_SQLTUNE.REMAP_STGTAB_SQLPROF (  
    old_profile_name => :pname,  
    new_profile_category => 'TEST',  
    staging_table_name => 'PROFILE_STGTAB');  
END;
```
160.5.23 REMAP_STGTAB_SQLSET Procedure

This procedure changes the tuning set names and owners in the staging table so that they can be unpacked with different values.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.REMAP_STGTAB_SQLSET (  
  old_sqlset_name        IN VARCHAR2,  
  old_sqlset_owner       IN VARCHAR2 := NULL,  
  new_sqlset_name        IN VARCHAR2 := NULL,  
  new_sqlset_owner       IN VARCHAR2 := NULL,  
  staging_table_name     IN VARCHAR2,  
  staging_schema_owner   IN VARCHAR2 := NULL,  
  old_con_dbid           IN NUMBER   := NULL,  
  new_con_dbid           IN NUMBER   := NULL);  
```

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMAP_STGTAB_SQLSET and DBMS_SQLSET.REMAP_SQLSET procedures.

Table 160-29 REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>old_sqlset_name</td>
<td>Specifies the name of the tuning set to target for a remap operation. Wildcard characters (%) are not supported.</td>
</tr>
<tr>
<td>old_sqlset_owner</td>
<td>Specifies the new name of the tuning set owner to target for a remap operation. NULL for current schema owner.</td>
</tr>
<tr>
<td>new_sqlset_name</td>
<td>Specifies the new name for the tuning set, or NULL to keep the same tuning set name.</td>
</tr>
<tr>
<td>new_sqlset_owner</td>
<td>Specifies the new owner for the tuning set, or NULL to keep the same owner name.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>Specifies the name of the table on which to perform the remap operation. The value is case sensitive.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Specifies the name of staging table owner, or NULL for the current schema owner. The value is case sensitive.</td>
</tr>
<tr>
<td>old_con_dbid</td>
<td>Specifies the old container DBID to be remapped to a new container DBID. Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
</tbody>
</table>
Table 160-29 (Cont.) REMAP_STGTAB_SQLSET and REMAP_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_con_dbid</td>
<td>Specifies the new container DBID to replace with the old container DBID.</td>
</tr>
<tr>
<td></td>
<td>Specify NULL to use the same container DBID. You must provide both old_con_dbid and new_con_dbid for the remap to succeed.</td>
</tr>
</tbody>
</table>

Usage Notes

Call this procedure multiple times to remap more than one tuning set name or owner. This procedure only handles one tuning set per call.

Examples

-- Change the name of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
    old_sqlset_name => 'my_workload',
    old_sqlset_owner => 'SH',
    new_sqlset_name => 'imp_workload',
    staging_table_name => 'STGTAB_SQLSET');
END;

-- Change the owner of an STS in the staging table before unpacking it.
BEGIN
  DBMS_SQLTUNE.REMAP_STGTAB_SQLSET(
    old_sqlset_name => 'imp_workload',
    old_sqlset_owner => 'SH',
    new_sqlset_owner => 'SYS',
    staging_table_name => 'STGTAB_SQLSET');
END;

160.5.24 REMOVE_SQLSET_REFERENCE Procedure

This procedure deactivates a SQL tuning set to indicate that it is no longer used by the client.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE (  
  sqlset_name IN VARCHAR2,  
  reference_id IN NUMBER,  
  sqlset_owner IN VARCHAR2 := NULL,  
  force_remove IN NUMBER := 0);

Parameters

The parameters are identical for the DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE and DBMS_SQLSET.REMOVE_REFERENCE procedures.
### Table 160-30  REMOVE_SQLSET_REFERENCE and REMOVE_REFERENCE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>reference_id</td>
<td>Specifies the identifier of the reference to remove.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the owner of the SQL tuning set (or NULL for the current schema owner).</td>
</tr>
<tr>
<td>force_remove</td>
<td>Specifies whether references can be removed for other users (1) or whether they cannot be removed (0). Setting this parameter to 1 only takes effect when the user has the ADMINISTER ANY SQL TUNING SET privilege. Otherwise, the database only removes references owned by the user.</td>
</tr>
</tbody>
</table>

### Examples

You can remove references on a given SQL tuning set when you finish using it and want to make it writable again. The following example removes the reference to my_workload:

```sql
EXEC DBMS_SQLTUNE.REMOVE_SQLSET_REFERENCE( -
    sqlset_name   => 'my_workload', -
    reference_id  => :rid,
    sqlset_owner  => NULL,
    force_remove  => 0);
```

To find all references to a given SQL tuning set, query the `DBA_SQLSET_REFERENCES` view.

### 160.5.25 REPORT_AUTO_TUNING_TASK Function

This function displays a report from the automatic tuning task.

This function reports on a range of task executions, whereas the `REPORT_TUNING_TASK Function` reports on a single execution. Note that this function is deprecated with Oracle Database 11g Release 2 (11.2) in favor of `DBMS_AUTO_SQLTUNE.REPORT_AUTO_TUNING_TASK`.

#### See Also:

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group
- [REPORT_AUTO_TUNING_TASK Function](#)

#### Syntax

```sql
DBMS_SQLTUNE.REPORT_AUTO_TUNING_TASK(
    begin_exec IN VARCHAR2 := NULL,
    end_exec   IN VARCHAR2 := NULL,
    type       IN VARCHAR2 := TYPE_TEXT,
    level      IN VARCHAR2 := LEVEL_TYPICAL,
)
```
Parameters

Table 160-31  REPORT_AUTO_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_exec</td>
<td>Specifies the name of the execution from which to begin the report. NULL retrieves a report on the most recent run.</td>
</tr>
<tr>
<td>end_exec</td>
<td>Specifies the name of the execution at which to end the report. NULL retrieves a report on the most recent run.</td>
</tr>
<tr>
<td>type</td>
<td>Specifies the type of the report to produce. Possible values are TYPE_TEXT which produces a text report</td>
</tr>
<tr>
<td>level</td>
<td>Specifies the level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>• LEVEL_BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>• LEVEL_TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>• LEVEL_ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Limits the report to a single section (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>• SECTION_SUMMARY - summary information</td>
</tr>
<tr>
<td></td>
<td>• SECTION_FINDINGS - tuning findings</td>
</tr>
<tr>
<td></td>
<td>• SECTION_PLAN - explain plans</td>
</tr>
<tr>
<td></td>
<td>• SECTION_INFORMATION - general information</td>
</tr>
<tr>
<td></td>
<td>• SECTION_ERROR - statements with errors</td>
</tr>
<tr>
<td></td>
<td>• SECTION_ALL - all statements</td>
</tr>
<tr>
<td>object_id</td>
<td>Specifies the advisor framework object ID that represents a single statement to restrict reporting to. Specify NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Specifies the maximum number of SQL statements to show in the report.</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.

160.5.26 REPORT_SQL_DETAIL Function

This function builds a report for a specific SQLID. For each SQLID it gives various statistics and details as obtained from the V$ views and AWR.

See Also:

DBMS_SQLTUNE SQL Performance Reporting Subprograms for other subprograms in this group
Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_DETAIL (  
    sql_id                   IN  VARCHAR2   DEFAULT NULL,  
    sql_plan_hash_value      IN  NUMBER     DEFAULT NULL,  
    start_time               IN  DATE       DEFAULT NULL,  
    duration                 IN  NUMBER     DEFAULT NULL,  
    inst_id                  IN  NUMBER     DEFAULT NULL,  
    dbid                     IN  NUMBER     DEFAULT NULL,  
    event_detail             IN  VARCHAR2   DEFAULT 'YES',  
    bucket_max_count         IN  NUMBER     DEFAULT 128,  
    bucket_interval          IN  NUMBER     DEFAULT NULL,  
    top_n                    IN  NUMBER     DEFAULT 10,  
    report_level             IN  VARCHAR2   DEFAULT 'TYPICAL',  
    type                     IN  VARCHAR2   DEFAULT 'ACTIVE',  
    data_source              IN  VARCHAR2   DEFAULT 'AUTO',  
    end_time                 IN  DATE       DEFAULT NULL,  
    duration_stats           IN  NUMBER     DEFAULT NULL,  
    con_name                 IN  VARCHAR2   DEFAULT NULL)  
RETURN CLOB;
```

Parameters

Table 160-32  REPORT_SQL_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQLID for which monitoring information should be displayed. If NULL (the default), display statistics for the SQLID of the last SQL statement executed in the current session.</td>
</tr>
<tr>
<td>sql_plan_hash_value</td>
<td>Displays SQL statistics and details for a specific plan_hash_value. If NULL (default), displays statistics and details for all plans of the SQL_ID.</td>
</tr>
<tr>
<td>start_time</td>
<td>If specified, shows SQL activity (from GV$ACTIVE_SESSION_HISTORY) starting at this time. On Oracle RAC, the minimum start_time is the earliest sample_time of the in-memory ASH buffers across all instances. If NULL (default), one hour before the current time.</td>
</tr>
<tr>
<td>duration</td>
<td>Duration of activity in seconds for the report. If NULL (default) uses a value of 1 hour.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Target instance to get SQL details from. If NULL, uses data from all instances. If 0 or -1, uses current instance.</td>
</tr>
<tr>
<td>dbid</td>
<td>DBID from which to get SQL details. If NULL, uses current DBID.</td>
</tr>
<tr>
<td>event_detail</td>
<td>When set to 'NO', the activity is aggregated by wait_class only. Use 'YES' (the default) to aggregate by (wait_class, event_name).</td>
</tr>
<tr>
<td>bucket_max_count</td>
<td>If specified, this should be the maximum number of histogram buckets created in the report. If not specified, a value of 128 is used.</td>
</tr>
<tr>
<td>bucket_interval</td>
<td>If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, bucket_max_count is ignored.</td>
</tr>
<tr>
<td>top_n</td>
<td>Controls the number of entries to display per dimension in the top dimensions section. If not specified, a default value of 10 is used.</td>
</tr>
</tbody>
</table>
## Table 160-32  (Cont.) REPORT_SQL_DETAIL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>report_level</td>
<td>Level of detail for the report, either 'BASIC', 'TYPICAL' or 'ALL'. Default assumes 'TYPICAL'. Their meanings are explained below. In addition, individual report sections can also be enabled or disabled by using a +/- section_name. Several sections are defined:</td>
</tr>
<tr>
<td></td>
<td>- 'TOP' - Show top values for the ASH dimensions for a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'SPM' - Show existing plan baselines for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'MISMATCH' - Show reasons for creating new child cursors (sharing criteria violations); OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'STATS' - Show SQL execution statistics per plan from GV$SQLAREA_PLAN_HASH; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'ACTIVITY' - Show top activity from ASH for each plan of a SQL statement; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'ACTIVITY_ALL' - Show top activity from ASH for each line of the plan for a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'HISTOGRAM' - Show activity histogram for each plan of a SQL statement (plan time line histogram); ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'SESSIONS' - Show activity for top sessions for each plan of a SQL statement; OFF by default</td>
</tr>
<tr>
<td></td>
<td>- 'MONITOR' - Show show one monitored SQL execution per execution plan; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'XPLAN' - Show execution plans; ON by default</td>
</tr>
<tr>
<td></td>
<td>- 'BINDS' - Show captured bind data; ON by default</td>
</tr>
<tr>
<td></td>
<td>In addition, SQL text can be specified at different levels:</td>
</tr>
<tr>
<td></td>
<td>- -SQL_TEXT - No SQL text in report</td>
</tr>
<tr>
<td></td>
<td>+SQL_TEXT - OK with partial SQL text up to the first 2000 chars as stored in GV$SQL_MONITOR</td>
</tr>
<tr>
<td></td>
<td>-SQL_FULLTEXT - No full SQL text (+SQL_TEXT)</td>
</tr>
<tr>
<td></td>
<td>+SQL_FULLTEXT - Show full SQL text (default value)</td>
</tr>
<tr>
<td></td>
<td>The meanings of the three top-level report levels are:</td>
</tr>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>duration_stats</td>
<td>Duration of additional SQL execution statistics from AWR (in hours), for the report. If NULL (default), then the duration of 24 hours is considered.</td>
</tr>
<tr>
<td>con_name</td>
<td>Name of the multitenant container database (CDB).</td>
</tr>
</tbody>
</table>

Security Model

The invoker needs the EXECUTE privilege on the DBMS_XPLAN package.

Return Values

A CLOB containing the desired report.

Usage Notes

- **ACTIVE reports** have a rich, interactive user interface similar to Enterprise Manager while not requiring any EM installation. The report file built is in HTML format, so it can be interpreted by most modern browsers. The code powering the active report is downloaded transparently by the web browser when the report is first viewed, hence viewing it requires outside connectivity.

- The invoker needs the SELECT or READ privilege on the following views:
  - V$SESSION
  - DBA_ADVISOR_FINDINGS
  - V$DATABASE
  - GV$ASH_INFO
  - GV$ACTIVE_SESS_HISTORY
  - GV$SQLAREA_PLAN_HASH
  - GV$SQL
  - DBA_HIST_SNAPSHOT
  - DBA_HIST_WR_CONTROL
  - DBA_HIST_ACTIVE_SESS_HISTORY
  - DBA_HIST_SQLSTAT
  - DBA_HIST_SQL_BIND_METADATA
  - DBA_HIST_SQLTEXT
  - DBA_SQL_PLAN_BASELINES
  - DBA_SQL_PROFILES
  - DBA_ADVISOR_TASKS
  - DBA_SERVICES
  - DBA_USERS
  - DBA_OBJECTS
160.5.27 REPORT_SQL_MONITOR Function

This function builds a report (text, simple HTML, active HTML, XML) for the monitoring information collected on behalf of the targeted statement execution.

See Also:
Real-Time SQL Monitoring for other subprograms in this group

Syntax

DBMS_SQLTUNE.REPORT_SQL_MONITOR(
    sql_id                    IN VARCHAR2  DEFAULT  NULL,
    dbop_name                 IN VARCHAR2  DEFAULT  NULL,
    dbop_exec_id              IN NUMBER    DEFAULT  NULL,
    session_id                IN NUMBER    DEFAULT  NULL,
    session_serial            IN NUMBER    DEFAULT  NULL,
    sql_exec_start            IN DATE      DEFAULT  NULL,
    sql_exec_id               IN NUMBER    DEFAULT  NULL,

</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DBOP_NAME for which monitoring information of the composite database operation is displayed.</td>
</tr>
<tr>
<td>dbop_exec_id</td>
<td>Execution ID for the composite database operation for which monitoring information is displayed.</td>
</tr>
</tbody>
</table>
Table 160-33  (Cont.) REPORT_SQL_MONITOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>If not NULL, this parameters targets only the sub-set of statements executed by the specified session. Default is NULL. Use USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, one can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>sql_exec_start</td>
<td>This parameter, along with sql_exec_id, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.</td>
</tr>
<tr>
<td>sql_exec_id</td>
<td>This parameter, along with sql_exec_start, is only applicable when sql_id is also specified. Jointly, they can be used to display monitoring information associated to any execution of the statement identified by sql_id, assuming that this statement was monitored. When NULL (the default), the last monitored execution of SQL sql_id is shown.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.</td>
</tr>
<tr>
<td>start_time_filter</td>
<td>If not NULL, the report considers only the activity (from GV$ACTIVE_SESSION_HISTORY) recorded after the specified date. If NULL, the reported activity starts when the execution of the targeted SQL statement has started.</td>
</tr>
<tr>
<td>end_time_filter</td>
<td>If not NULL, the report shows only the activity (from GV$ACTIVE_SESSION_HISTORY) collected before the date end_time_filter. If NULL, the reported activity ends when the targeted SQL statement execution has ended or is the current time if the statement is still executing.</td>
</tr>
<tr>
<td>instance_id_filter</td>
<td>Only applies when the execution runs parallel across multiple Oracle Real Application Cluster (Oracle RAC) instances. This parameter allows to only report the activity of the specified instance. Use a NULL value (the default) to include the activity on all instances where the parallel query was executed.</td>
</tr>
</tbody>
</table>
Table 160-33  (Cont.) REPORT_SQL_MONITOR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| parallel_filter    | Applies only to parallel execution and allows reporting the activity of only a subset of the processes involved in the parallel execution (Query Coordinator and/or Parallel eXecution servers). The value of this parameter can be:  
  • NULL to target all processes  
  • `{qc}[servers(<svr_grp>[,] <svr_set>[,] <srv_num>)]`:  
    - `{qc}` stands for query coordinator and `servers()` stipulate which PX servers to consider.  
  The following examples show how to target a subset of the parallel processes:  
  • `qc`: targets only the query coordinator  
  • `servers(1)`: targets all parallel execution servers in group number 1. Note that statement running parallel have one main server group (group number 1) plus one additional group for each nested sub-query running parallel.  
  • `servers(2)`: targets all parallel execution servers from any group but only running in set 1 of each group (each group has at most two set of parallel execution servers)  
  • `servers(1,1)`: consider only group 1, set 1  
  • `servers(1,2,4)`: consider only group 1, set 2, server number 4. This reports for a single parallel server process  
  • `qc servers(1,2,4)`: same as above by also including the query coordinator |
| event_detail       | When value is `"YES"` (the default), reported activity from `GV$ACTIVE_SESSION_HISTORY` is aggregated by `(wait_class, event_name)`. Use `"NO"` to only aggregate by `wait_class`.                                                                                                                                                               |
| bucket_max_count   | If specified, this should be the maximum number of histogram buckets created in the report                                                                                                                                                                                                                                               |
| bucket_interval    | If specified, this represents the exact time interval in seconds, of all histogram buckets. If specified, `bucket_max_count` is ignored.                                                                                                                                                                                                  |
| base_path          | URL path for flex HTML resources since flex HTML format is required to access external files (java scripts and the flash SWF file itself)                                                                                                                                                                                                   |
| last_refresh_time  | If not `NULL` (default is `NULL`), the time when the report was last retrieved (see `SYSDATE` attribute of the report tag). Use this option to display the report of a running query, and when the report is refreshed on a regular basis. This optimizes the size of the report since only the new or changed information is returned. In particular, the following are optimized:  
  • SQL text is not returned when this option is specified  
  • activity histogram starts at the bucket that intersect at that time. The entire content of the bucket is returned, even if `last_refresh_time` is after the start of that bucket |

<td>Name of the multitenant container database (CDB).</td>
</tr>
<tr>
<td>report_id</td>
<td>ID of the report in auto-report repository. Report IDs can be found in DBA_HIST_REPORTS.</td>
</tr>
</tbody>
</table>
Return Values

A CLOB containing the desired report.

Usage Notes

- The target SQL statement for this report can be:
  - The most recent SQL statement monitored by Oracle Database. This is the default behavior, so there is no need to specify any parameter.
  - The most recent SQL statement executed by a specific session and monitored by Oracle. The session is identified by its session id and optionally its serial number. For example, use `session_id => 20, session_serial => 103` for session ID 20, serial number 103.
  - The most recent execution of a specific statement identified by its `sql_id`.
  - A specific execution of a SQL statement identified by its execution key (`sql_id`, `sql_exec_start` and `sql_exec_id`).

- This report produces performance data exposed by several fixed views, listed below. For this reason, the invoker of the report function must have privilege to select data from these fixed views (such as the `SELECT_CATALOG` role).
  - `GV$SQL_MONITOR`
  - `GV$SQL_PLAN_MONITOR`
  - `GV$SQL_PLAN`
  - `GV$ACTIVE_SESSION_HISTORY`
  - `GV$SESSION_LONGOPS`
  - `GV$SQL`

- The `bucket_max_count` and `bucket_interval` parameters control the activity histogram.

  By default, the maximum number of buckets is set to 128. The database derives the `bucket_interval` value based on this count. The `bucket_interval` (value in seconds) is computed such that it is the smallest possible power of 2 value (starting at 1 second) without exceeding the maximum number of buckets. For example, if the query has executed for 600 seconds, then the database selects a `bucket_interval` of 8 seconds (a power of two). The database chooses the value of 8 because 600/8 = 74, which is less than 128 buckets maximum. Smaller than 8 seconds would be 4 seconds, which would lead to more buckets than the 128 maximum. If `bucket_interval` is specified, then the database uses the specified value instead of deriving it from `bucket_max_count`.

- `ACTIVE` reports have a rich, interactive user interface similar to Enterprise Manager, while not requiring any EM installation.

  The report file is in HTML format. The code powering the active report is downloaded transparently by the web browser when the report is first viewed. Therefore, viewing the report requires outside connectivity.
160.5.28 REPORT_SQL_MONITOR_LIST Function

This function builds a report for all or a subset of statements monitored by Oracle Database. For each statement, the subprogram gives key information and associated global statistics.

Use the REPORT_SQL_MONITOR Function to get detailed monitoring information for a single SQL statement.

Syntax

```sql
DBMS_SQLTUNE.REPORT_SQL_MONITOR_LIST(
    sql_id                    IN VARCHAR2  DEFAULT  NULL,
    session_id                IN NUMBER    DEFAULT  NULL,
    session_serial            IN NUMBER    DEFAULT  NULL,
    inst_id                   IN NUMBER    DEFAULT  NULL,
    active_since_date         IN DATE      DEFAULT  NULL,
    active_since_sec          IN NUMBER    DEFAULT  NULL,
    active_before_date        IN DATE      DEFAULT  NULL,
    last_refresh_time         IN DATE      DEFAULT  NULL,
    dbop_name                 IN VARCHAR2  DEFAULT  NULL,
    monitor_type              IN NUMBER    DEFAULT  MONITOR_TYPE_ALL,
    max_sqltext_length        IN NUMBER    DEFAULT  NULL,
    top_n_count               IN NUMBER    DEFAULT  NULL,
    top_n_rankby              IN VARCHAR2  DEFAULT 'LAST_ACTIVE_TIME',
    report_level              IN VARCHAR2  DEFAULT 'TYPICAL',
    auto_refresh              IN NUMBER    DEFAULT  NULL,
    base_path                 IN VARCHAR2  DEFAULT  NULL,
    type                      IN VARCHAR2  DEFAULT 'TEXT',
    con_name                  IN VARCHAR2  DEFAULT  NULL,
    top_n_detail_count        IN NUMBER    DEFAULT  NULL)
RETURN CLOB;
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_id</td>
<td>SQL_ID for which monitoring information should be displayed. Use NULL (the default) to report on the last statement monitored by Oracle.</td>
</tr>
</tbody>
</table>
### Table 160-34  (Cont.) REPORT_SQL_MONITOR_LIST Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>session_id</td>
<td>If not NULL, then this parameter targets only the subset of statements executed by the specified session. Default is NULL. Use -1 or USERENV('SID') for current session.</td>
</tr>
<tr>
<td>session_serial</td>
<td>In addition to the session_id parameter, you can also specify its session serial to ensure that the desired session incarnation is targeted. This parameter is ignored when session_id is NULL.</td>
</tr>
<tr>
<td>inst_id</td>
<td>Only considers statements started on the specified instance. Use -1 to target the login instance. NULL (default) targets all instances.</td>
</tr>
<tr>
<td>active_since_date</td>
<td>If not NULL (default), returns only monitored statements active since the specified time. This includes all statements that are still executing along with all statements that have completed their execution after the specified date and time.</td>
</tr>
<tr>
<td>active_since_sec</td>
<td>Same as active_since_date but with the date specified relative to the current SYSDATE minus a specified number of seconds. For example, use 3600 to apply a limit of 1 hour.</td>
</tr>
<tr>
<td>active_before_date</td>
<td>If not NULL (default), returns only monitored statements that have been active before the specified date and time.</td>
</tr>
<tr>
<td>last_refresh_time</td>
<td>If not NULL (default), the date and time when the list report was last retrieved. This optimizes the case where an application shows the list and refreshes the report on a regular basis (such as once every 5 seconds). In this case, the report shows detail about the execution of monitored queries that active since the specified last_refresh_time. For other queries, the report returns the execution key (sql_id, sql_exec_start, sql_exec_id). For queries with a first refresh time after the specified date, the function returns only the SQL execution key and statistics.</td>
</tr>
<tr>
<td>dbop_name</td>
<td>DB operation name. Specify NULL to display all the monitored DB operations.</td>
</tr>
<tr>
<td>monitor_type</td>
<td>Type of the monitor operation. It can have one of the following values:</td>
</tr>
</tbody>
</table>
|                 | • MONITOR_TYPE_SQL - Returns only SQLs  
|                 | • MONITOR_TYPE_DBOP - Returns only DB operations  
|                 | • MONITOR_TYPE_ALL - Returns SQLs as well as DB operations                                                                                                                                                                    |
| max_sqltext_length | Maximum length of the SQL text. Default is NULL (no limit).                                                                                                                                                                       |
| top_n_count     | Limits the number of top-N SQL statements that need to be included in the report.                                                                                                                                                 |
| top_n_rankby    | Specifies the attribute to rank the SQL statements. Specify this value when top_n_count value is not NULL. The ranking of an SQL statement is done based on one of the following values:                                                  |
|                 | • LAST_ACTIVE_TIME - Last active date and time (top N most recent)  
|                 | • DURATION - Total duration of execution  
|                 | • DB_TIME - DB time used  
|                 | • CPU_TIME - CPU time used  
|                 | • IO_REQUESTS - Number of I/O requests  
|                 | • IO_BYTES - Number of I/O bytes                                                                                                                                                                                              |

</tbody>
</table>

### Return Values

A report (XML, text, HTML) for the list of SQL statements that have been monitored.

### Usage Notes

You must have the privilege to access the following fixed views: GV$SQL_MONITOR and GV$SQL.

---

### 160.5.29 REPORT_TUNING_TASK Function

This function displays the results of a tuning task. By default the report is in text format.

---

### See Also:

- *Oracle Database SQL Tuning Guide* for more information about SQL real-time monitoring.

---

### Syntax

```sql
DBMS_SQLTUNE.REPORT_TUNING_TASK(  
  task_name        IN   VARCHAR2,  
  type             IN   VARCHAR2   := 'TEXT',
```
Parameters

Table 160-35  REPORT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task.</td>
</tr>
<tr>
<td>type</td>
<td>Type of the report to produce. Possible values are TEXT which produces a text report.</td>
</tr>
<tr>
<td>level</td>
<td>Level of detail in the report:</td>
</tr>
<tr>
<td></td>
<td>• BASIC: simple version of the report. Just show info about the actions taken by the advisor.</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: show information about every statement analyzed, including requests not implemented.</td>
</tr>
<tr>
<td></td>
<td>• ALL: highly detailed report level, also provides annotations about statements skipped over.</td>
</tr>
<tr>
<td>section</td>
<td>Section of the report to include. You can limit the report to any of the following single sections (ALL for all sections):</td>
</tr>
<tr>
<td></td>
<td>• SUMMARY - Summary information</td>
</tr>
<tr>
<td></td>
<td>• FINDINGS - Tuning findings</td>
</tr>
<tr>
<td></td>
<td>• PLAN - Explain plans</td>
</tr>
<tr>
<td></td>
<td>• INFORMATION - General information</td>
</tr>
<tr>
<td></td>
<td>• ERROR - Statements with errors</td>
</tr>
<tr>
<td></td>
<td>• ALL - All statements</td>
</tr>
<tr>
<td>object_id</td>
<td>Advisor framework object ID that represents a single statement to restrict reporting to. NULL for all statements. Only valid for reports that target a single execution.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Maximum number of SQL statements to show in the report.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. The default is the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, then the function generates the report for the last task execution.</td>
</tr>
</tbody>
</table>
Table 160-35 (Cont.) REPORT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database_link_to</td>
<td>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.

Examples

-- Display the report for a single statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:stmt_task)
FROM   DUAL;

-- Display the summary for a SQL tuning set.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'SUMMARY')
FROM   DUAL;

-- Display the findings for a specific statement.
SELECT DBMS_SQLTUNE.REPORT_TUNING_TASK(:sts_task, 'TEXT', 'TYPICAL', 'FINDINGS', 5)
FROM   DUAL;

160.5.30 REPORT_TUNING_TASK_XML Function

This function displays an XML report of a tuning task.

See Also:

DBMS_SQLTUNE SQL Performance Reporting Subprograms for other subprograms in this group

Syntax

<td>• No findings</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. The default is the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, then the function generates the report for the most recent task execution.</td>
</tr>
</tbody>
</table>
Table 160-36  (Cont.) REPORT_TUNING_TASK_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autotune_period</td>
<td>The time period for the automatic SQL tuning. This setting applies only to the automatic SQL Tuning Advisor task. Possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Null or negative value (default) — All or full. The result includes all task executions.</td>
</tr>
<tr>
<td></td>
<td>• 0 — Result of the current or most recent task execution.</td>
</tr>
<tr>
<td></td>
<td>• 1 — Result for the most recent 24-hour period.</td>
</tr>
<tr>
<td></td>
<td>• 7 — Result for the most recent 7-day period.</td>
</tr>
<tr>
<td></td>
<td>The procedure interprets any other value as the time of the most recent task execution minus the value of this argument.</td>
</tr>
<tr>
<td>report_tag</td>
<td>The name of the root XML tag. By default, the tag is the report reference generated by the reporting framework.</td>
</tr>
</tbody>
</table>

Return Values

A CLOB containing the desired report.

160.5.31 RESET_TUNING_TASK Procedure

This procedure is called on a tuning task that is not currently executing to prepare it for re-execution.

See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.RESET_TUNING_TASK(
    task_name    IN VARCHAR2);

Parameters

Table 160-37  RESET_TUNING_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to reset</td>
</tr>
</tbody>
</table>

Examples

-- reset and re-execute a task
EXEC DBMS_SQLTUNE.RESET_TUNING_TASK(:sts_task);

-- re-execute the task
EXEC DBMS_SQLTUNE.EXECUTE_TUNING_TASK(:sts_task);
### 160.5.32 RESUME_TUNING_TASK Procedure

This procedure resumes a previously interrupted task that was created to process a SQL tuning set.

#### See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

#### Syntax

```sql
DBMS_SQLTUNE.RESUME_TUNING_TASK(
  task_name         IN VARCHAR2,
  basic_filter      IN VARCHAR2 := NULL);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the tuning task to resume.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>A SQL predicate to filter the SQL from the SQL tuning set. Note that this filter is applied in conjunction with the basic filter (i.e., parameter basic_filter) when calling CREATE_TUNING_TASK Functions.</td>
</tr>
</tbody>
</table>

#### Usage Notes

Resuming a single SQL tuning task (a task that was created to tune a single SQL statement as compared to a SQL tuning set) is not supported.

#### Examples

```sql
-- Interrupt the task
EXEC DBMS_SQLTUNE.INTERRUPT_TUNING_TASK(:conc_task);

-- Once a task is interrupted, we can elect to reset it, resume it, or check -- out its results and then decide. For this example we will just resume.
EXEC DBMS_SQLTUNE.RESUME_TUNING_TASK(:conc_task);
```

### 160.5.33 SCHEDULE_TUNING_TASK Function

This function creates a tuning task for a single SQL statement and schedules a DBMS_SCHEDULER job to execute the tuning task. One form of the function finds the
information about the statement to be tuned in the shared SQL area, whereas the other finds the information in AWR.

See Also:

DBMS_SQLTUNE SQL Tuning Advisor Subprograms for other subprograms in this group

Syntax

Shared SQL Area Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER                   := NULL,
    start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
    scope           IN VARCHAR2                 := SCOPE_COMPREHENSIVE,
    time_limit      IN NUMBER                   := TIME_LIMIT_DEFAULT,
    task_name       IN VARCHAR2                 := NULL,
    description     IN VARCHAR2                 := NULL,
    con_name        IN VARCHAR2                 := NULL)
RETURN VARCHAR2;
```

AWR Format:

```
DBMS_SQLTUNE.SCHEDULE_TUNING_TASK(
    begin_snap      IN NUMBER,
    end_snap        IN NUMBER,
    sql_id          IN VARCHAR2,
    plan_hash_value IN NUMBER                   := NULL,
    start_date      IN TIMESTAMP WITH TIME ZONE := NULL,
    scope           IN VARCHAR2                 := SCOPE_COMPREHENSIVE,
    time_limit      IN NUMBER                   := TIME_LIMIT_DEFAULT,
    task_name       IN VARCHAR2                 := NULL,
    description     IN VARCHAR2                 := NULL,
    con_name        IN VARCHAR2                 := NULL,
    dbid            IN NUMBER                   := NULL)
RETURN VARCHAR2;
```

Parameters

Table 160-39  SCHEDULE_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>The beginning snapshot identifier. The range is exclusive, which means that SQL statements in this snapshot ID are not included.</td>
</tr>
<tr>
<td>end_snap</td>
<td>The end snapshot identifier. The range is inclusive, which means that SQL statements in this snapshot ID are included.</td>
</tr>
<tr>
<td>sql_id</td>
<td>The SQL ID of the statement to be tuned.</td>
</tr>
<tr>
<td>plan_hash_value</td>
<td>The plan hash value of the statement to be tuned. For example, the tuning job fetches captured binds for this SQL plan.</td>
</tr>
<tr>
<td>start_date</td>
<td>The date on which the schedule becomes valid. If null, then SQL Tuning Advisor immediately executes the task.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>scope</td>
<td>The scope of the tuning job: limited, or comprehensive.</td>
</tr>
<tr>
<td>time_limit</td>
<td>The maximum duration in seconds for the SQL tuning session.</td>
</tr>
<tr>
<td>task_name</td>
<td>Optional SQL tuning task name.</td>
</tr>
<tr>
<td>description</td>
<td>Description of the SQL tuning session. The description can contain a maximum of 256 characters.</td>
</tr>
<tr>
<td>con_name</td>
<td>The container from which SQL Tuning Advisor accesses the SQL statement information.</td>
</tr>
<tr>
<td>dbid</td>
<td>DBID for imported or PDB-level AWR data. If NULL, then the current database DBID is used.</td>
</tr>
</tbody>
</table>

Security Model

The caller must possess the `CREATE JOB` privilege for the job.

Return Values

A SQL tuning task name that is unique for each user. Multiple users can assign the same name to their advisor tasks.

Usage Notes

- The task is scheduled only once.
- The name of the scheduler job is created as follows:
  sqltune_job_taskid_orahash(systimestamp).

160.5.34 SCRIPT_TUNING_TASK Function

This function creates a SQL*Plus script which can then be executed to implement a set of SQL Tuning Advisor recommendations.

See Also:

`DBMS_SQLTUNE SQL Tuning Advisor Subprograms` for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SCRIPT_TUNING_TASK(
    task_name IN VARCHAR2,
    rec_type IN VARCHAR2 := REC_TYPE_ALL,
    object_id IN NUMBER := NULL,
    result_limit IN NUMBER := NULL,
    owner_name IN VARCHAR2 := NULL,
    execution_name IN VARCHAR2 := NULL,
    database_link_to IN VARCHAR2 := NULL)
RETURN CLOB;
```
Parameters

Table 160-40  SCRIPT_TUNING_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the tuning task for which to apply a script.</td>
</tr>
<tr>
<td>rec_type</td>
<td>Filter the script by types of recommendations to include. You can use any subset of the following values, separated by commas: 'ALL', 'PROFILES', 'STATISTICS', 'INDEXES'. For example, a script with profiles and statistics would use the filter 'PROFILES,STATISTICS'.</td>
</tr>
<tr>
<td>object_id</td>
<td>Optionally filters by a single object ID.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Optionally shows commands for only top n SQL (ordered by object_id and ignored if an object_id is also specified).</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the relevant tuning task. Defaults to the current schema owner.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Name of the task execution to use. If NULL, the script is generated for the last task execution.</td>
</tr>
</tbody>
</table>
| database_link_to| Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri:

```
CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';
```

Return Values

Returns a script in the form of a CLOB.

Usage Notes

- After the script is returned, check it before executing it.
- Wrap with a call to DBMS_ADVISOR.CREATE_FILE to put it into a file.

Examples

```
SET LINESIZE 140

-- Get a script for all actions recommended by the task.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task) FROM DUAL;

-- Get a script of only the sql profiles we should create.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'PROFILES') FROM DUAL;
```
-- Get a script of only stale / missing stats
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:stmt_task, 'STATISTICS') FROM DUAL;

-- Get a script with recommendations about only one SQL statement when we have
-- tuned an entire STS.
SELECT DBMS_SQLTUNE.SCRIPT_TUNING_TASK(:sts_task, 'ALL', 5) FROM DUAL;

160.5.35 SELECT_CURSOR_CACHE Function

This function collects SQL statements from the shared SQL area.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.SELECT_CURSOR_CACHE (  
basic_filter        IN   VARCHAR2 := NULL,  
object_filter       IN   VARCHAR2 := NULL,  
ranking_measure1    IN   VARCHAR2 := NULL,  
ranking_measure2    IN   VARCHAR2 := NULL,  
ranking_measure3    IN   VARCHAR2 := NULL,  
result_percentage   IN   NUMBER   := 1,  
result_limit        IN   NUMBER   := NULL,  
attribute_list      IN   VARCHAR2 := NULL,  
recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)  
RETURN sys.sqlset PIPELINED;

Parameters

Table 160-41  SELECT_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate that filters the SQL from the shared SQL area defined on attributes of the SQLSET_ROW. If basic_filter is not set by the caller, then the subprogram captures only statements of the type CREATE TABLE, INSERT, SELECT, UPDATE, DELETE, and MERGE.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Defines an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top n% according to the supplied ranking measure. The value applies only if one ranking measure is supplied.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Defines the top limit SQL from the filtered source ranked by the ranking measure.</td>
</tr>
</tbody>
</table>
### Table 160-41 (Cont.) SELECT_CURSOR_CACHE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>attribute_list</td>
<td>Specifies the list of SQL statement attributes to return in the result. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Specifies BASIC plus SQL plan (without row source statistics) and without object reference list (default).</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Specifies all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Specifies all attributes.</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names.</td>
</tr>
<tr>
<td></td>
<td>This values returns only a subset of SQL attributes:</td>
</tr>
<tr>
<td></td>
<td>– EXECUTION_STATISTICS</td>
</tr>
<tr>
<td></td>
<td>– BIND_LIST</td>
</tr>
<tr>
<td></td>
<td>– OBJECT_LIST</td>
</tr>
<tr>
<td></td>
<td>– SQL_PLAN</td>
</tr>
<tr>
<td></td>
<td>– SQL_PLAN_STATISTICS — Similar to SQL_PLAN plus row source statistics</td>
</tr>
<tr>
<td>recursive_sql</td>
<td>Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL).</td>
</tr>
</tbody>
</table>

### Return Values

This function returns a one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

### Usage Notes

- Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

- Users need privileges on the shared SQL area views.

### Examples

-- Get sql ids and sql text for statements with 500 buffer gets.
```
SELECT sql_id, sql_text
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('buffer_gets > 500'))
ORDER BY sql_id;
```

-- Get all the information we have about a particular statement.
```
SELECT *
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE('sql_id = ''4rm4183czbs7j'''));
```

-- Notice that some statements can have multiple plans. The output of the -- SELECT_XXX table functions is unique by (sql_id, plan_hash_value). This is -- because a data source can store multiple plans per SQL statement.
```
SELECT sql_id, plan_hash_value
FROM table(dbms_sqltune.select_cursor_cache('sql_id = ''aylm3ssvtrh24'''))
ORDER BY sql_id, plan_hash_value;
```

-- PL/SQL examples: load_sqlset is called after opening a cursor, along the
-- lines given below

-- Select all statements in the shared SQL area.
DECLARE
    cur sys_refcursor;
BEGIN
    OPEN cur FOR
    SELECT value(P)
    FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE) P;

    -- Process each statement (or pass cursor to load_sqlset).
    CLOSE cur;
END;/

-- Look for statements not parsed by SYS.
DECLARE

      NULL, 'ELAPSED_TIME', NULL, NULL,
      1, 100)) P;
  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
end;/

-- Select the set of statements which cumulatively account for 90% of the
-- buffer gets in the shared SQL area. This means that the buffer gets of all
-- of these statements added up is approximately 90% of the sum of all
-- statements currently in the cache.
DECLARE
  cur sys_refcursor;
BEGIN
OPEN cur FOR
SELECT VALUE(P)
FROM table(DBMS_SQLTUNE.SELECT_CURSOR_CACHE(NULL,
  NULL,
  'BUFFER_GETS', NULL, NULL,
  .9)) P;

-- Process each statement (or pass cursor to load_sqlset).

CLOSE cur;
END;
/

### 160.5.36 SELECT_SQL_TRACE Function

This table function reads the content of one or more trace files and returns the SQL statements it finds in the format of sqlset_row.

#### See Also:

- [DBMS_SQLTUNE SQL Tuning Set Subprograms](#) for other subprograms in this group

#### Syntax

```
DBMS_SQLTUNE.SELECT_SQL_TRACE (
  directory              IN VARCHAR2,
  file_name              IN VARCHAR2 := NULL,
  mapping_table_name     IN VARCHAR2 := NULL,
  mapping_table_owner    IN VARCHAR2 := NULL,
  select_mode            IN POSITIVE := SINGLE_EXECUTION,
  options                IN BINARY_INTEGER := LIMITED_COMMAND_TYPE,
  pattern_start          IN VARCHAR2 := NULL,
  pattern_end            IN VARCHAR2 := NULL,
  result_limit           IN POSITIVE := NULL)
RETURN sys.sqlset PIPELINED;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>directory</td>
<td>Defines the directory object containing the trace files. This field is mandatory.</td>
</tr>
<tr>
<td>file_name</td>
<td>Specifies all or part of the name of the trace files. If NULL, then the function uses the current or most recent file in the specified location or path. '*' and '?' wildcards are supported for matching trace file names.</td>
</tr>
<tr>
<td>mapping_table_name</td>
<td>Specifies the mapping table name. Note that the mapping table name is case insensitive. If the mapping table name is NULL, then the function uses the mappings in the current database.</td>
</tr>
<tr>
<td>mapping_table_owner</td>
<td></td>
</tr>
<tr>
<td>select_mode</td>
<td></td>
</tr>
<tr>
<td>options</td>
<td></td>
</tr>
<tr>
<td>pattern_start</td>
<td></td>
</tr>
<tr>
<td>pattern_end</td>
<td></td>
</tr>
<tr>
<td>result_limit</td>
<td></td>
</tr>
</tbody>
</table>
Table 160-42  (Cont.) SELECT_SQL_TRACE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mapping_table_owner</td>
<td>Specifies the mapping table owner. If it is NULL, then the function uses the current user.</td>
</tr>
<tr>
<td>select_mode</td>
<td>Specifies the mode for selecting SQL from the trace. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• SINGLE_EXECUTION — Returns one execution of a SQL. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• ALL_EXECUTIONS — Returns all executions.</td>
</tr>
<tr>
<td>options</td>
<td>Specifies which types of SQL statements are returned.</td>
</tr>
<tr>
<td></td>
<td>• LIMITED_COMMAND_TYPE — Returns the SQL statements with the command types CREATE, INSERT, SELECT, UPDATE, DELETE, and MERGE. This value is the default.</td>
</tr>
<tr>
<td></td>
<td>• ALL_COMMAND_TYPE — Returns the SQL statements with all command types.</td>
</tr>
<tr>
<td>pattern_start</td>
<td>Specifies the delimiting pattern of the trace file sections to consider. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>pattern_end</td>
<td>Specifies the closing delimiting pattern of the trace file sections to process. CURRENTLY INOPERABLE.</td>
</tr>
<tr>
<td>result_limit</td>
<td>Specifies the top SQL from the filtered source. Default to MAXSB4 if NULL.</td>
</tr>
</tbody>
</table>

Return Values

This function returns a SQLSET_ROW object.

Usage Notes

The ability to create a directory object for the system directory creates a potential security issue. For example, in a CDB, all containers write trace files to the same directory. A local user with SELECT privileges on this directory can read the contents of trace files belonging to any container.

To prevent this type of unauthorized access, copy the files from the default SQL trace directory into a different directory, and then create a directory object. Use the PATH_PREFIX clause of the CREATE PLUGGABLE DATABASE statement to ensure that all directory object paths associated with the PDB are restricted to the specified directory or its subdirectories.

Examples

The following code shows how to enable SQL trace for a few SQL statements and load the results into a SQL tuning set:

```sql
-- turn on the SQL trace in the capture database
ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT FOREVER, LEVEL 4'

-- run sql statements
SELECT 1 FROM DUAL;
SELECT COUNT(*) FROM dba_tables WHERE table_name = :mytab;

ALTER SESSION SET EVENTS '10046 TRACE NAME CONTEXT OFF';
```
CREATE TABLE mapping AS
SELECT object_id id, owner, substr(object_name, 1, 30) name
FROM dba_objects
WHERE object_type NOT IN ('CONSUMER GROUP', 'EVALUATION CONTEXT',
'FUNCTION', 'INDEXTYPE', 'JAVA CLASS',
'JAVA DATA', 'JAVA RESOURCE', 'LIBRARY',
'LOB', 'OPERATOR', 'PACKAGE',
'PACKAGE BODY', 'PROCEDURE', 'QUEUE',
'RESOURCE PLAN', 'TRIGGER', 'TYPE',
'TYPE BODY')
UNION ALL
SELECT user_id id, username owner, NULL name
FROM dba_users;

CREATE DIRECTORY SQL_TRACE_DIR as '/home/foo/trace';

EXEC DBMS_SQLTUNE.CREATE_SQLSET('my_sts', 'test purpose');

DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
  SELECT value(p)
  FROM TABLE(
    DBMS_SQLTUNE.SELECT_SQL_TRACE(
      directory=>'SQL_TRACE_DIR',
      file_name=>'%trc',
      mapping_table_name=>'mapping')) p;
  DBMS_SQLTUNE.LOAD_SQLSET('my_sts', cur);
  CLOSE cur;
END;
/

PATH_PREFIX clause

160.5.37 SELECT_SQLPA_TASK Function

This function collects SQL statements from a SQL Performance Analyzer comparison
task.

See Also:
- DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group
- Oracle Database Testing Guide for a SELECT_SQLPA_TASK example
Syntax

DBMS_SQLTUNE.SELECT_SQLPA_TASK(
    task_name        IN VARCHAR2,
    task_owner       IN VARCHAR2 := NULL,
    execution_name   IN VARCHAR2 := NULL,
    level_filter     IN VARCHAR2 := 'REGRESSED',
    basic_filter     IN VARCHAR2 := NULL,
    object_filter    IN VARCHAR2 := NULL,
    attribute_list   IN VARCHAR2 := 'TYPICAL')
RETURN sys.sqlset PIPELINED;

Parameters

Table 160-43  SELECT_SQLPA_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Specifies the name of the SQL Performance Analyzer task.</td>
</tr>
<tr>
<td>task_owner</td>
<td>Specifies the owner of the SQL Performance Analyzer task. If NULL, then assume the current user.</td>
</tr>
<tr>
<td>execution_name</td>
<td>Specifies the name of the SQL Performance Analyzer task execution (type COMPARE PERFORMANCE) from which the provided filters will be applied. If NULL, then assume the most recent COMPARE PERFORMANCE execution.</td>
</tr>
<tr>
<td>level_filter</td>
<td>Specifies which subset of SQL statements to include. Same format as DBMS_SQLPA.REPORT_ANALYSIS_TASK.LEVEL, with some possible strings removed.</td>
</tr>
<tr>
<td></td>
<td>• IMPROVED includes only improved SQL.</td>
</tr>
<tr>
<td></td>
<td>• REGRESSED includes only regressed SQL (default).</td>
</tr>
<tr>
<td></td>
<td>• CHANGED includes only SQL with changed performance.</td>
</tr>
<tr>
<td></td>
<td>• UNCHANGED includes only SQL with unchanged performance.</td>
</tr>
<tr>
<td></td>
<td>• CHANGED_PLANS includes only SQL with plan changes.</td>
</tr>
<tr>
<td></td>
<td>• UNCHANGED_PLANS includes only SQL with unchanged plans.</td>
</tr>
<tr>
<td></td>
<td>• ERRORS includes only SQL with errors only.</td>
</tr>
<tr>
<td></td>
<td>• MISSING_SQL includes only missing SQL statements (across STS).</td>
</tr>
<tr>
<td></td>
<td>• NEW_SQL includes only new SQL statements (across STS).</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL in addition to the level filters.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>attribute_list</td>
<td>Defines the SQL statement attributes to return in the result.</td>
</tr>
<tr>
<td></td>
<td>Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL — Returns BASIC plus the SQL plan (without row source statistics) and without an object reference list. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is always part of the result.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Returns all attributes.</td>
</tr>
<tr>
<td></td>
<td>• Comma-separated list of attribute names this allows to return only a subset of SQL attributes: EXECUTION_STATISTICS, SQL_BINDS, SQL_PLAN_STATISTICS (similar to SQL_PLAN + row source statistics).</td>
</tr>
</tbody>
</table>

Return Values

This function returns a SQL tuning set object.
Usage Notes

For example, you can use this function to create a SQL tuning set containing the subset of SQL statements that regressed during a SQL Performance Analyzer (SPA) experiment. You can also specify other arbitrary filters.

160.5.38 SELECT_SQLSET Function

This is a table function that reads the contents of a SQL tuning set.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```sql
DBMS_SQLTUNE.SELECT_SQLSET (
    sqlset_name         IN   VARCHAR2,
    basic_filter        IN   VARCHAR2 := NULL,
    object_filter       IN   VARCHAR2 := NULL,
    ranking_measure1    IN   VARCHAR2 := NULL,
    ranking_measure2    IN   VARCHAR2 := NULL,
    ranking_measure3    IN   VARCHAR2 := NULL,
    result_percentage   IN   NUMBER   := 1,
    result_limit        IN   NUMBER   := NULL,
    attribute_list      IN   VARCHAR2 := NULL,
    plan_filter         IN   VARCHAR2 := NULL,
    sqlset_owner        IN   VARCHAR2 := NULL,
    recursive_sql       IN   VARCHAR2 := HAS_RECURSIVE_SQL)
RETURN sys.sqlset PIPELINED;
```

Parameters

Table 160-44   SELECT_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set to query.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the SQL tuning set</td>
</tr>
<tr>
<td></td>
<td>defined on attributes of the SQLSET_ROW.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Specifies an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top n% according to the supplied ranking measure.</td>
</tr>
<tr>
<td></td>
<td>Note that this parameter applies only if one ranking measure is supplied.</td>
</tr>
<tr>
<td>result_limit</td>
<td>The top limit SQL from the filtered source, ranked by the ranking measure.</td>
</tr>
</tbody>
</table>
### Table 160-44  (Cont.) SELECT_SQLSET Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| attribute_list| Defines the SQL statement attributes to return in the result. The possible values are:  
  • BASIC — Returns all attributes (such as execution statistics and binds) except the plans. The execution context is included in the result.  
  • TYPICAL — Returns BASIC plus the SQL plan, but without row source statistics and without the object reference list. This is the default.  
  • ALL — Returns all attributes.  
  • Comma-separated list of attribute names. This value enables the function to return only a subset of SQL attributes:  
    – EXECUTION_STATISTICS  
    – SQL_BINDS  
    – SQL_PLAN_STATISTICS (similar to SQL_PLAN plus row source statistics) |
| plan_filter   | Specifies the plan filter. This parameter enables you to select a single plan when a statement has multiple plans. Possible values are:  
  • LAST_GENERATED — Returns the plan with the most recent timestamp.  
  • FIRST_GENERATED — Returns the plan with the least recent timestamp.  
  • LAST_LOADED — Returns the plan with the most recent FIRST_LOAD_TIME statistical information.  
  • FIRST_LOADED — Returns the plan with the least recent FIRST_LOAD_TIME statistical information.  
  • MAX_ELAPSED_TIME — Returns the plan with the maximum elapsed time.  
  • MAX_BUFFER_GETS — Returns the plan with the maximum buffer gets.  
  • MAX_DISK_READS — Returns the plan with the maximum disk reads.  
  • MAX_DIRECT_WRITES — Returns the plan with the maximum direct writes.  
  • MAX_OPTIMIZER_COST — Returns the plan with the maximum optimizer cost value. |
| sqlset_owner  | Specifies the owner of the SQL tuning set, or NULL for the current schema owner. |
| recursive_sql | Specifies that the filter must include recursive SQL in the SQL tuning set (HAS_RECURSIVE_SQL, which is the default) or exclude it (NO_RECURSIVE_SQL). |

### Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.
Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.

Examples

```
-- select from a sql tuning set
DECLARE
  cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_sqlset('my_workload'))) P;

  -- Process each statement (or pass cursor to load_sqlset)
  CLOSE cur;
END;
/
```

160.5.39 SELECT_WORKLOAD_REPOSITORY Function

This function collects SQL statements from the workload repository.

The overloaded forms enable you to collect SQL statements from the following sources:

- **Snapshots between** `begin_snap` and `end_snap`
- **A workload repository baseline**

Syntax

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (begin_snap        IN NUMBER,
                                          end_snap          IN NUMBER,
                                          basic_filter      IN VARCHAR2 := NULL,
                                          object_filter     IN VARCHAR2 := NULL,
                                          ranking_measure1  IN VARCHAR2 := NULL,
                                          ranking_measure2  IN VARCHAR2 := NULL,
                                          ranking_measure3  IN VARCHAR2 := NULL,
                                          result_percentage IN NUMBER   := 1,
                                          result_limit      IN NUMBER   := NULL,
                                          attribute_list    IN VARCHAR2 := NULL,
                                          recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
                                          dbid              IN NUMBER   := NULL)
  RETURN sys.sqlset PIPELINED;
```

```
DBMS_SQLTUNE.SELECT_WORKLOAD_REPOSITORY (baseline_name     IN VARCHAR2,
                                          basic_filter      IN VARCHAR2 := NULL,
                                          object_filter     IN VARCHAR2 := NULL,
                                          ranking_measure1  IN VARCHAR2 := NULL,
                                          ranking_measure2  IN VARCHAR2 := NULL,
                                          ranking_measure3  IN VARCHAR2 := NULL,
                                          result_percentage IN NUMBER   := 1,
                                          result_limit      IN NUMBER   := NULL,
                                          attribute_list    IN VARCHAR2 := NULL,
                                          recursive_sql     IN VARCHAR2 := HAS_RECURSIVE_SQL,
                                          dbid              IN NUMBER   := NULL)
  RETURN sys.sqlset PIPELINED;
```
recursive_sql IN VARCHAR2 := HAS_RECURSIVE_SQL,
dbid IN NUMBER := NULL)
RETURN sys.sqlset PIPELINED;

Parameters

Table 160-45 SELECT_WORKLOAD_REPOSITORY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>begin_snap</td>
<td>Defines the beginning AWR snapshot (non-inclusive).</td>
</tr>
<tr>
<td>end_snap</td>
<td>Defines the ending AWR snapshot (inclusive).</td>
</tr>
<tr>
<td>baseline_name</td>
<td>Specifies the name of the AWR baseline period.</td>
</tr>
<tr>
<td>basic_filter</td>
<td>Specifies the SQL predicate to filter the SQL from the workload repository.</td>
</tr>
<tr>
<td>object_filter</td>
<td>Currently not supported.</td>
</tr>
<tr>
<td>ranking_measure(n)</td>
<td>Defines an ORDER BY clause on the selected SQL.</td>
</tr>
<tr>
<td>result_percentage</td>
<td>Specifies a filter that picks the top n% according to the supplied ranking</td>
</tr>
<tr>

<tr>
<td></td>
<td>(HAS_RECURSIVE_SQL) or excludes it (NO_RECURSIVE_SQL).</td>
</tr>
<tr>
<td>dbid</td>
<td>Specifies the DBID for imported or PDB-level AWR data. If NULL, then the</td>
</tr>
<tr>
<td></td>
<td>function uses the current database DBID.</td>
</tr>
</tbody>
</table>

Return Values

This function returns one SQLSET_ROW per SQL_ID or PLAN_HASH_VALUE pair found in each data source.

Usage Notes

Filters provided to this function are evaluated as part of a SQL run by the current user. As such, they are executed with that user's security privileges and can contain any constructs and subqueries that user can access, but no more.
Examples

```-- select statements from snapshots 1-2
DECLARE
cur sys_refcursor;
BEGIN
  OPEN cur FOR
    SELECT VALUE (P)
    FROM table(dbms_sqltune.select_workload_repository(1,2)) P;

  -- Process each statement (or pass cursor to load_sqlset)

  CLOSE cur;
END;
/```

160.5.40 SET_TUNING_TASK_PARAMETER Procedures

This procedure updates the value of a SQL tuning parameter of type `VARCHAR2` or `NUMBER`.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (  
task_name        IN  VARCHAR2,  
parameter        IN  VARCHAR2,  
value            IN  VARCHAR2,  
database_link_to IN  VARCHAR2);  
DBMS_SQLTUNE.SET_TUNING_TASK_PARAMETER (  
task_name        IN  VARCHAR2,  
parameter        IN  VARCHAR2,  
value            IN  NUMBER,  
database_link_to IN  VARCHAR2);  
);```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Identifier of the task to execute</td>
</tr>
</tbody>
</table>
### Table 160-46  (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tr>
<tr>
<td></td>
<td>• TEST_EXECUTE: FULL/AUTO/OFF.</td>
</tr>
<tr>
<td></td>
<td>* FULL: test-execute for as much time as necessary, up to the local time limit for the SQL (or the global task time limit if no SQL time limit is set)</td>
</tr>
<tr>
<td></td>
<td>* AUTO: test-execute for an automatically-chosen time proportional to the tuning time</td>
</tr>
<tr>
<td></td>
<td>* OFF: do not test-execute</td>
</tr>
<tr>
<td></td>
<td>• TIME_LIMIT: global time out (seconds)</td>
</tr>
<tr>
<td></td>
<td>• USERNAME: username under which the statement is parsed</td>
</tr>
</tbody>
</table>
Table 160-46 (Cont.) SET_TUNING_TASK_PARAMETER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>database_link_to</td>
<td>Name of a database link that exists on a standby database. The link specifies the connection to a primary database. By default, the value is null, which means that the SQL Tuning Advisor session is local. Use DBMS_SQLTUNE to tune high-load SQL statements running on a standby database in an Active Data Guard scenario. When you execute REPORT_TUNING_TASK locally on the standby database, the function uses the database link to obtain the data from the primary database, and then constructs it locally on the standby database. The database_link_to parameter must specify a private database link. This link must be owned by SYS and accessed by the default privileged user SYS$UMF. The following sample statement creates a link named lnk_to_pri: CREATE DATABASE LINK lnk_to_pri CONNECT TO SYS$UMF IDENTIFIED BY password USING 'inst1';</td>
</tr>
</tbody>
</table>

Usage Notes

When setting automatic tuning task parameters, use the SET_AUTO_TUNING_TASK_PARAMETER Procedures in the DBMS_AUTO_SQLTUNE package.

160.5.41 SQLTEXT_TO_SIGNATURE Function

This function returns a SQL text’s signature. The signature can be used to identify SQL text in dba_sql_profiles.

🔗 See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.SQLTEXT_TO_SIGNATURE (sql_text IN CLOB, force_match IN BOOLEAN := FALSE) RETURN NUMBER;

Parameters

Table 160-47 SQLTEXT_TO_SIGNATURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sql_text</td>
<td>SQL text whose signature is required. Required.</td>
</tr>
</tbody>
</table>
Table 160-47  (Cont.) SQLTEXT_TO_SIGNATURE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force_match</td>
<td>If TRUE, this returns a signature that supports SQL matching with literal values transformed into bind variables. If FALSE, returns the signature based on the text with literals not transformed</td>
</tr>
</tbody>
</table>

Return Values

This function returns the signature of the specified SQL text.

160.5.42 UNPACK_STGTAB_SQLPROF Procedure

This procedure copies profile data stored in the staging table to create profiles on the system.

See Also:

DBMS_SQLTUNE SQL Profile Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF (  
    profile_name          IN VARCHAR2 := '%',  
    profile_category      IN VARCHAR2 := 'DEFAULT',  
    replace               IN BOOLEAN,  
    staging_table_name    IN VARCHAR2,  
    staging_schema_owner  IN VARCHAR2 := NULL);  

Parameters

Table 160-48  UNPACK_STGTAB_SQLPROF Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile_name</td>
<td>The name of the profile to unpack (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>profile_category</td>
<td>The category from which to unpack profiles (% wildcards acceptable, case-sensitive)</td>
</tr>
<tr>
<td>replace</td>
<td>The option to replace profiles if they already exist. Note that profiles cannot be replaced if one in the staging table has the same name as an active profile in a different SQL statement. If FALSE, this function raises errors if you try to create a profile that already exists</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>The name of the table on which to perform the remap operation (case-insensitive unless double quoted). Required.</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>The schema where the table resides, or NULL for current schema (case-insensitive unless double quoted)</td>
</tr>
</tbody>
</table>
Usage Notes

Using this procedure requires the `CREATE ANY SQL PROFILE` privilege and the `SELECT` privilege on staging table.

Examples

```
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace => FALSE,
    staging_table_name => 'PROFILE_STGTAB');
END;
```

```
BEGIN
  DBMS_SQLTUNE.UNPACK_STGTAB_SQLPROF(
    replace => TRUE,
    staging_table_name => 'PROFILE_STGTAB');
END;
```

160.5.43 UNPACK_STGTAB_SQLSET Procedure

This procedure copies one or more SQL tuning sets from their location in the staging table into the SQL tuning sets schema, making them proper SQL tuning sets.

See Also:

- DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

```
DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET (
  sqlset_name IN VARCHAR2 := '%',
  sqlset_owner IN VARCHAR2 := NULL,
  replace IN BOOLEAN,
  staging_table_name IN VARCHAR2,
  staging_schema_owner IN VARCHAR2 := NULL);
```

Parameters

The parameters are identical for `DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET` and `DBMS_SQLSET.UNPACK_STGTAB`.
Table 160-49  UNPACK_STGTAB_SQLSET and UNPACK_STGTAB Procedure

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the tuning set to unpack (not null). Wildcard characters (%) are supported to unpack multiple tuning sets in a single call. For example, specify % to unpack all tuning sets from the staging table.</td>
</tr>
<tr>
<td>sqlset_owner</td>
<td>Specifies the name of tuning set owner, or NULL for the current schema owner. Wildcard characters (%) are supported.</td>
</tr>
<tr>
<td>replace</td>
<td>Specifies whether to replace an existing SQL tuning set. If FALSE, then this procedure raises errors when you try to create a tuning set that already exists.</td>
</tr>
<tr>
<td>staging_table_name</td>
<td>Specifies the name of the staging table, moved after a call to the DBMS_SQLTUNE.PACK_STGTAB_SQLSET or DBMS_SQLSET.PACK_STGTAB procedure (case-sensitive).</td>
</tr>
<tr>
<td>staging_schema_owner</td>
<td>Specifies the name of staging table owner, or NULL for the current schema owner (case-sensitive).</td>
</tr>
</tbody>
</table>

Examples

-- unpack all STS in the staging table
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
  sqlset_owner  => '%', -
  replace       => FALSE, -
  staging_table_name => 'STGTAB_SQLSET');

-- errors can arise during STS unpack when a STS in the staging table has the same name/owner as STS on the system. In this case, users should call -- remap_stgtab_sqlset to patch the staging table and with which to call unpack -- Replace set to TRUE.
EXEC DBMS_SQLTUNE.UNPACK_STGTAB_SQLSET(sqlset_name => '%', -
  sqlset_owner  => '%', -
  replace       => TRUE, -
  staging_table_name => 'STGTAB_SQLSET');

160.5.44 UPDATE_SQLSET Procedures

This overloaded procedure updates selected fields for SQL statements in a SQL tuning set.

See Also:

DBMS_SQLTUNE SQL Tuning Set Subprograms for other subprograms in this group

Syntax

DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name IN VARCHAR2,
  sql_id     IN VARCHAR2,
attribute_name   IN  VARCHAR2,
attribute_value  IN  VARCHAR2 := NULL);

DBMS_SQLTUNE.UPDATE_SQLSET (
  sqlset_name IN VARCHAR2,
  sql_id IN VARCHAR2,
  attribute_name IN VARCHAR2,
  attribute_value IN NUMBER := NULL);

Parameters

Table 160-50  UPDATE_SQLSET Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Specifies the name of the SQL tuning set.</td>
</tr>
<tr>
<td>sql_id</td>
<td>Specifies the identifier of the SQL statement to be updated.</td>
</tr>
<tr>
<td>plan_hash value</td>
<td>Specifies the hash value of the execution plan for a SQL statement. Use this parameter when you want to update the attribute for a specific plan for a statement, but not all plans for the statement.</td>
</tr>
<tr>
<td>attribute_name</td>
<td>Specifies the name of the attribute to be modified. You can update the text field for MODULE, ACTION, PARSING_SCHEMA_NAME, and OTHER. The only numerical field that you can update is PRIORITY. If a statement has multiple plans, then the procedure changes the attribute value for all plans.</td>
</tr>
<tr>
<td>attribute_value</td>
<td>Specifies the new value of the attribute.</td>
</tr>
</tbody>
</table>
The DBMS_STAT_FUNCS package provides statistical functions.

This chapter contains the following topic:

- Summary of DBMS_STAT_FUNCS Subprograms

### 161.1 Summary of DBMS_STAT_FUNCS Subprograms

This table lists and briefly describes the DBMS_STAT_FUNCS subprograms.

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>Procedure</td>
<td></td>
</tr>
</tbody>
</table>

### 161.1.1 EXPONENTIAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits an exponential distribution.

**Syntax**

```sql
DBMS_STAT_FUNCS.EXPONENTIAL_DIST_FIT (  
    ownername IN VARCHAR2,  
    tablename IN VARCHAR2,  
    columnname IN VARCHAR2,  
    test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',  
    lambda IN NUMBER,  
    mu IN NUMBER,  
    sig OUT NUMBER);
```
Parameters

Table 161-2  EXPONENTIAL_DIST_FIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The scale parameter.</td>
</tr>
<tr>
<td>mu</td>
<td>The location parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the exponential distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>

161.1.2 NORMAL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a normal distribution.

Syntax

```
DBMS_STAT_FUNCS.NORMAL_DIST_FIT (
  ownername    IN    VARCHAR2,
  tablename    IN    VARCHAR2,
  columnname   IN    VARCHAR2,
  test_type    IN    VARCHAR2 DEFAULT 'SHAPIRO_WILKS',
  mean         IN    NUMBER,
  stdev        IN    NUMBER,
  sig          OUT   NUMBER);
```

Parameters

Table 161-3  NORMAL_DIST_FIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV', 'ANDERSON_DARLING' or 'SHAPIRO_WILKS'.</td>
</tr>
<tr>
<td>mean</td>
<td>The mean of the distribution against which to compare.</td>
</tr>
<tr>
<td>stdev</td>
<td>The standard deviation of the distribution against which to compare.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the normal distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>
161.1.3 POISSON_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Poisson distribution.

Syntax

```sql
DBMS_STAT_FUNCS.POISSON_DIST_FIT (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV',
    lambda       IN    NUMBER,
    sig          OUT   NUMBER);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>lambda</td>
<td>The lambda parameter is the shape parameter.</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the Poisson distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>

161.1.4 SUMMARY Procedure

This procedure summarizes the numerical column specified in the `columnname` of `tablename`.

The summary is returned as a Summary Type. Note that most of the output of `SUMMARY` can be obtained with currently available SQL.

Syntax

```sql
DBMS_STAT_FUNCS.SUMMARY (
    ownername    IN    VARCHAR2,
    tablename    IN    VARCHAR2,
    columnname   IN    VARCHAR2,
    sigma_value  IN    NUMBER DEFAULT 3,
    s            OUT   SummaryType);
```
Parameters

Table 161-5 SUMMARY Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table to be summarized.</td>
</tr>
<tr>
<td>sigma_value</td>
<td>The number of sigmas for the set of extreme values, defaults to 3.</td>
</tr>
<tr>
<td>s</td>
<td>The Record containing summary information about given column.</td>
</tr>
</tbody>
</table>

Definition of SummaryType

TYPE n_arr IS VARRAY(5) of NUMBER;
TYPE num_table IS TABLE of NUMBER;
TYPE summaryType IS RECORD (count NUMBER, min NUMBER, max NUMBER, range NUMBER, mean NUMBER, cmode num_table, variance NUMBER, stddev NUMBER, quantile_5 NUMBER, quantile_25 NUMBER, median NUMBER, quantile_75 NUMBER, quantile_95 NUMBER, plus_x_sigma NUMBER, minus_x_sigma NUMBER, extreme_values num_table, top_5_values n_arr, bottom_5_values n_arr);

161.1.5 UNIFORM_DIST_FIT Procedure

This procedure tests well a sample of values fits a uniform distribution.

Syntax

DBMS_STAT_FUNCS.UNIFORM_DIST_FIT (ownername IN VARCHAR2, tablename IN VARCHAR2, columnname IN VARCHAR2, var_type IN VARCHAR2 DEFAULT 'CONTINUOUS', test_type IN VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV', paramA IN NUMBER, paramB IN NUMBER, sig OUT NUMBER);
Parameters

Table 161-6  UNIFORM_DIST_FIT Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownername</td>
<td>The schema where the table resides.</td>
</tr>
<tr>
<td>tablename</td>
<td>The table where the column resides.</td>
</tr>
<tr>
<td>columnname</td>
<td>The column of the table against which to run the test.</td>
</tr>
<tr>
<td>var_type</td>
<td>The type of distribution: 'CONTINUOUS' (the default) or 'DISCRETE'.</td>
</tr>
<tr>
<td>test_type</td>
<td>The type of test to use: 'CHI_SQUARED', 'KOLMOGOROV_SMIRNOV' or 'ANDERSON_DARLING'.</td>
</tr>
<tr>
<td>paramA</td>
<td>Parameter A estimated from the sample (the location parameter).</td>
</tr>
<tr>
<td>paramB</td>
<td>Parameter B estimated from the sample (the scale parameter).</td>
</tr>
<tr>
<td>sig</td>
<td>The goodness of fit value, based on test type. A small value indicates a significant difference between the sample and the uniform distribution. A number close to 1 indicates a close match.</td>
</tr>
</tbody>
</table>

161.1.6 WEIBULL_DIST_FIT Procedure

This procedure tests how well a sample of values fits a Weibull distribution.

Syntax

```sql
DBMS_STAT_FUNCS.WEIBULL_DIST_FIT ( 
    ownername    IN    VARCHAR2, 
    tablename    IN    VARCHAR2, 
    columnname   IN    VARCHAR2, 
    test_type    IN    VARCHAR2 DEFAULT 'KOLMOGOROV_SMIRNOV', 
    alpha        IN    NUMBER, 
    mu           IN    NUMBER, 
    beta         IN    NUMBER, 
    sig          OUT   NUMBER);
```

Parameters

Table 161-7  WEIBULL_DIST_FIT Procedure Parameters

DBMS_STATS

With the DBMS_STATS package you can view and modify optimizer statistics gathered for database objects.

Users can also collect statistics on Global Temporary Tables (GTTs) using the DBMS_STATS package. However, DBMS_STATS cannot collect statistics on Private Temporary Tables (PTTs).

This chapter contains the following topics:

• DBMS_STATS Overview
• DBMS_STATS Deprecated Subprograms
• DBMS_STATS Types
• DBMS_STATS Constants
• DBMS_STATS Operational Notes
• DBMS_STATS Data Structures
• Summary of DBMS_STATS Subprograms

See Also:

• Oracle Database SQL Tuning Guide
• Oracle Database Administrator’s Guide

162.1 DBMS_STATS Overview

To improve performance, the database enables you to collect statistics of many different types. This package is concerned with optimizer statistics only. By default, the database collects statistics automatically, so this package is intended only for specialized cases.

Optimizer statistics can reside in the data dictionary or in a table created in the user's schema. You can also collect and manage user-defined statistics for tables and domain indexes using this package. For example, if you invoke the DELETE_COLUMN_STATS procedure on a column for which an association is defined, the database deletes both user-defined and standard statistics for this column.

Only statistics stored in the dictionary have an effect on the cost-based optimizer. You can also use DBMS_STATS to gather statistics in parallel.

Starting in Oracle Database 12c Release 2 (12.2), Optimizer Statistics Advisor inspects the statistics gathering process, automatically diagnoses problems in the existing practices for gathering statistics, and then generates a report of findings and
recommendations. The advisor task runs automatically in the maintenance window, but you can also run it on demand.

See Also:
Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics

162.2 DBMS_STATS Deprecated Subprograms

Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

Starting with Oracle Database 11g Release 2 (11.2), the following subprograms are obsolete:

- GET_PARAM Function
  Instead, use GET_PREFS Function
- SET_PARAM Procedure
  Instead, use SET_GLOBAL_PREFS Procedure
- RESET_PARAM_DEFAULTS Procedure
  Instead use RESET_GLOBAL_PREF_DEFAULTS Procedure

The following subprogram is deprecated with Oracle Database 12c and later:

- GENERATE_STATS
  This procedure is replaced by the GATHER_INDEX_STAT procedure.

See Also:
"GATHER_INDEX_STATS Procedure"

162.3 DBMS_STATS Types

Histograms

Types for the minimum and maximum values and histogram endpoints include the following:

```sql
TYPE numarray IS VARRAY(2050) OF NUMBER;
TYPE datearray IS VARRAY(2050) OF DATE;
TYPE chararray IS VARRAY(2050) OF VARCHAR2(4000);
TYPE rawarray  IS VARRAY(2050) OF RAW(2000);
TYPE fltarray  IS VARRAY(2050) OF BINARY_FLOAT;
TYPE dblarray  IS VARRAY(2050) OF BINARY_DOUBLE;
```
Stale Tables

Types for listing stale tables include the following:

```sql
TYPE ObjectElem IS RECORD (
  ownname     VARCHAR2(30),     -- owner
  objtype     VARCHAR2(6),      -- 'TABLE' or 'INDEX'
  objname     VARCHAR2(30),     -- table/index
  partname    VARCHAR2(30),     -- partition
  subpartname VARCHAR2(30));    -- subpartition

TYPE ObjectTab IS TABLE OF ObjectElem;
```

Statistics Difference Reports

Use the following type to display a statistics difference report:

```sql
TYPE DiffRepElem IS RECORD (
  report      CLOB,            -- stats difference report
  maxdiffpct  NUMBER);         -- max stats difference (percentage)

TYPE DiffRepTab IS TABLE OF DiffRepElem;
```

Optimizer Statistics Advisor

The following type represents database objects for which you can gather statistics:

```sql
TYPE ObjectElem IS RECORD (
  ownname     dbms_quoted_id, -- owner
  objtype     VARCHAR2(6), -- 'TABLE' or 'INDEX'
  objname     dbms_quoted_id, -- table/index
  partname    dbms_quoted_id, -- partition
  subpartname dbms_quoted_id -- subpartition
);

TYPE ObjectTab IS TABLE OF ObjectElem;
```

**Note:**

Make sure to maintain `satisfy_obj_filter` when the `ObjectElem` type is changed.

The following type represents an operation:

```sql
TYPE StatsAdvOpr IS RECORD (
  name  VARCHAR2(64), -- name of the operation
  param VARCHAR2(4000) -- XML containing parameters and their values
);

TYPE StatsAdvOprTab IS TABLE OF StatsAdvOpr;
```

The following type represents a filter list:

```sql
TYPE StatsAdvFilter IS RECORD (
  rulename VARCHAR2(64),   -- rule name
  objlist  ObjectTab,      -- object filter list
  oprlist  StatsAdvOprTab, -- operation filter list
  include  BOOLEAN);       -- include/exclude elements in the list

TYPE StatsAdvFilterTab IS TABLE OF StatsAdvFilter;
```
162.4 DBMS_STATS Constants

The DBMS_STATS package defines several constants to use specifying parameter values.

Table 162-1 DBMS_STATS Constants

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADD_GLOBAL_PREFS</td>
<td>NUMBER</td>
<td>Copies global preferences</td>
</tr>
<tr>
<td>AUTO_CASCADE</td>
<td>BOOLEAN</td>
<td>Lets Oracle decide whether to collect statistics for indexes or not</td>
</tr>
<tr>
<td>AUTO_DEGREE</td>
<td>NUMBER</td>
<td>Lets Oracle select the degree of parallelism based on size of the object, number of CPUs and initialization parameters</td>
</tr>
<tr>
<td>AUTO_INVALIDATE</td>
<td>BOOLEAN</td>
<td>Lets Oracle decide when to invalidate dependent cursors</td>
</tr>
<tr>
<td>AUTO_SAMPLE_SIZE</td>
<td>NUMBER</td>
<td>Indicates that auto-sample size algorithms should be used</td>
</tr>
<tr>
<td>PURGE_ALL</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>A flag that can be passed to the PURGE_STATS Procedure and unconditionally deletes all the history statistics. The deletion uses TRUNCATE statements on the various dictionary statistics tables holding the history of statistics.</td>
</tr>
<tr>
<td>RECLAIM_SYNOPSIS</td>
<td>TIMESTAMP WITH TIME ZONE</td>
<td>A constant used for reclaiming synopsis table space.</td>
</tr>
</tbody>
</table>

162.5 DBMS_STATS Operational Notes

Observe these operational notes when using the DBMS_STATS package.

The DBMS_STATS subprograms perform the following general operations:

- Gathering Optimizer Statistics
- Setting or Getting Statistics
- Deleting Statistics
- Transferring Statistics
- Locking or Unlocking Statistics
- Restoring and Purging Statistics History
- User-Defined Statistics
- Pending Statistics
- Comparing Statistics
- Extended Statistics
- Optimizer Statistics Advisor
Most of the DBMS_STATS procedures include the three parameters statown, stattab, and statid. These parameters enable you to store statistics in your own tables (outside of the dictionary), which does not affect the optimizer. Therefore, you can maintain and experiment with sets of statistics.

The stattab parameter specifies the name of a table in which to hold statistics, and it is assumed that it resides in the same schema as the object for which statistics are collected (unless the statown parameter is specified). You can create multiple tables with different stattab identifiers to hold separate sets of statistics.

Additionally, you can maintain different sets of statistics within a single stattab by using the statid parameter, which avoids cluttering the user’s schema.

For the SET and GET procedures, if stattab is not provided (that is, NULL), then the operation works directly on the dictionary statistics; therefore, you do not need to create these statistics tables if they only plan to modify the dictionary directly. However, if stattab is not NULL, then the SET or GET operation works on the specified user statistics table, and not the dictionary.

You can change the default values of some of the parameters of DBMS_STATS procedures using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.

Most procedures in this package commit the current transaction, perform the operation, and then commit again.

Most of the procedures have a force parameter that enables you to override a lock on statistics. Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring.

Gathering Optimizer Statistics

Use the following subprograms to gather certain classes of optimizer statistics, with possible performance improvements over the ANALYZE command:

- GATHER_DATABASE_STATS Procedures
- GATHER_DICTIONARY_STATS Procedure
- GATHER_FIXED_OBJECTS_STATS Procedure
- GATHER_INDEX_STATS Procedure
- GATHER_SCHEMA_STATS Procedures
- GATHER_SYSTEM_STATS Procedure
- GATHER_TABLE_STATS Procedure

The GATHER_* procedures also collect user-defined statistics for columns and domain indexes.

The statown, stattab, and statid parameters instruct the package to back up current statistics in the specified table before gathering new statistics.

Oracle also provides the following procedure for generating statistics for derived objects when you have sufficient statistics on related objects:

GENERATE_STATS Procedure

Setting or Getting Statistics

Use the following subprograms to store and retrieve individual column-related, index-related, and table-related statistics:
In the special versions of the `SET_*_STATS` procedures for setting user-defined statistics, the following, if provided, are stored in the dictionary or user statistics table:

- User-defined statistics
- Owner of statistics type
- Name of statistics type

The user-defined statistics and the corresponding statistics type are inserted into the `USTATS$` dictionary table. You can specify user-defined statistics without specifying the statistics type name.

The special versions of the `GET_*_STATS` procedures return user-defined statistics and the statistics type owner and name as `OUT` arguments corresponding to the schema object specified. If user-defined statistics are not collected, `NULL` values are returned.

Deleting Statistics

The `DELETE_*` procedures delete both user-defined statistics and the standard statistics for the given schema object.

- `DELETE_COLUMN_STATS` Procedure
- `DELETE_DATABASE_STATS` Procedure
- `DELETE_DICTIONARY_STATS` Procedure
- `DELETE_FIXED_OBJECTS_STATS` Procedure
- `DELETE_INDEX_STATS` Procedure
- `DELETE_SCHEMA_STATS` Procedure
- `DELETE_SYSTEM_STATS` Procedure
- `DELETE_TABLE_STATS` Procedure

Note that `DELETE_TABLE_STATS`, `DELETE_DICTIONARY_STATS`, `DELETE_DATABASE_STATS` and `DELETE_SCHEMA_STATS` have a parameter `stat_category` which specifies which statistics to delete. The parameter accepts multiple values separated by comma. The supported values are 'OBJECT_STATS' (table statistics, column statistics and index statistics) and 'SYNOPSIS' (auxiliary statistics created when statistics are incrementally maintained). The default is 'OBJECT_STATS, SYNOPSIS'.

Transferring Statistics

Use the following procedures for creating and dropping the user statistics table.

- `CREATE_STAT_TABLE` Procedure
- `DROP_STAT_TABLE` Procedure
Use the following procedures to transfer statistics

• from the dictionary to a user statistics table (EXPORT_*)
• from a user statistics table to the dictionary (IMPORT_*)

EXPORT_COLUMN_STATS Procedure
EXPORT_DATABASE_STATS Procedure
EXPORT_DICTIONARY_STATS Procedure
EXPORT_FIXED_OBJECTS_STATS Procedure
EXPORT_INDEX_STATS Procedure
EXPORT_SCHEMA_STATS Procedure
EXPORT_SYSTEM_STATS Procedure
EXPORT_TABLE_STATS Procedure

IMPORT_COLUMN_STATS Procedure
IMPORT_DATABASE_STATS Procedure
IMPORT_DICTIONARY_STATS Procedure
IMPORT_FIXED_OBJECTS_STATS Procedure
IMPORT_INDEX_STATS Procedure
IMPORT_SCHEMA_STATS Procedure
IMPORT_SYSTEM_STATS Procedure
IMPORT_TABLE_STATS Procedure

Note:
Oracle does not support export or import of statistics across databases of different character sets.

Locking or Unlocking Statistics

Use the following procedures to lock and unlock statistics on objects.

LOCK_PARTITION_STATS Procedure
LOCK_SCHEMA_STATS Procedure
LOCK_TABLE_STATS Procedure
UNLOCK_PARTITION_STATS Procedure
UNLOCK_SCHEMA_STATS Procedure
UNLOCK_TABLE_STATS Procedure

The LOCK_* procedures either freeze the current set of the statistics or to keep the statistics untouched. When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

Restoring and Purging Statistics History

Use the following procedures to restore statistics as of a specified timestamp. This is useful in case newly collected statistics leads to some sub-optimal execution plans and the administrator wants to revert to the previous set of statistics.

RESET_GLOBAL_PREF_DEFAULTS Procedure
RESTORE_DATABASE_STATS Procedure
Whenever statistics in dictionary are modified, old versions of statistics are saved automatically for future restoring. The old statistics are purged automatically at regular intervals based on the statistics history retention setting and the time of recent statistics gathering performed in the system. Retention is configurable using the ALTER_STATS_HISTORY_RETENTION Procedure.

The other DBMS_STATS procedures related to restoring statistics are:

- **PURGE_STATS Procedure**: This procedure lets you manually purge old versions beyond a time stamp.
- **GET_STATS_HISTORY_RETENTION Function**: This function gets the current statistics history retention value.
- **GET_STATS_HISTORY_AVAILABILITY Function**: This function gets the oldest time stamp where statistics history is available. Users cannot restore statistics to a time stamp older than the oldest time stamp.

RESTORE_* operations are not supported for user defined statistics.

**User-Defined Statistics**

The DBMS_STATS package supports operations on user-defined statistics. When a domain index or column is associated with a statistics type (using the associate statement), operations on the index or column manipulate user-defined statistics. For example, gathering statistics for a domain index (for which an association with a statistics type exists) using the GET_INDEX_STATS Procedures invokes the user-defined statistics collection method of the associated statistics type. Similarly, delete, transfer, import, and export operations manipulate user-defined statistics.

**SET_* and GET_* operations for user-defined statistics are also supported using a special version of the SET and GET interfaces for columns and indexes.**

**EXPT_***, **IMPORT_* and RESTORE_* operations are not supported for user defined statistics.**

**Pending Statistics**

The package gathers statistics and stores it in the dictionary by default. User’s can store these statistics in the system’s private area instead of the dictionary by turning the PUBLISH option to FALSE using the SET*PREFS procedures. The default value for PUBLISH is TRUE. The statistics stored in private area are not used by Cost Based Optimizer unless parameter optimizer_use_pending_statistics is set to TRUE. The default value of this parameter is FALSE and this boolean parameter can be set at the session/system level. Users can verify the impact of the new statistics on query plans by using the pending statistics on a session.

Pending statistics provide a mechanism to verify the impact of the new statistics on query plans before making them available for general use. There are two scenarios to verify the query plans:

- Export the pending statistics (use the EXPORT_PENDING_STATS Procedure) to a test system, then run the query workload and check the performance or plans.
- Set `optimizer_use_pending_statistics` to `TRUE` in a session on the system where pending statistics have been gathered, run the workload, and check the performance or plans.

After the performance or query plans have been verified, you can publish the pending statistics using the `PUBLISH_PENDING_STATS Procedure` if the performance is acceptable, or delete the pending statistics using `DELETE_PENDING_STATS Procedure` if it is not.

Pending statistics can be published, exported, or deleted. The following procedures are provided to manage pending statistics:

- `DELETE_PENDING_STATS Procedure`
- `EXPORT_PENDING_STATS Procedure`
- `PUBLISH_PENDING_STATS Procedure`

### Comparing Statistics

You can use the `DIFF_TABLE_STATS_*` statistics to compare statistics for a table from two different sources. The statistics can be from:

- Two different user statistics tables
- A single user statistics table containing two sets of statistics that can be identified using `statids`
- A user statistics table and dictionary history
- Pending statistics

The functions also compare the statistics of the dependent objects (indexes, columns, partitions). They display statistics of the objects from both sources if the difference between those statistics exceeds a certain threshold. The threshold can be specified as an argument to the function, with a default of 10%. The database uses the statistics corresponding to the first source (`stattab1` or `time1`) as a basis for computing the differential percentage.

### Extended Statistics

This package enables you to collect statistics for column groups and expressions. The statistics collected for column groups and expressions are called "extended statistics".

Statistics on column groups are used by optimizer for accounting correlation between columns. For example, if a query has predicates `c1=1` and `c2=1` and if there are statistics on column group `(c1, c2)`, the optimizer uses these statistics for estimating the combined cardinality of the predicates. The optimizer uses the expression statistics to estimate cardinality of predicates on those expressions. The extended statistics are similar to column statistics. The procedures that take columns names accept extended statistics names in place of column names.

Related subprograms:

- `CREATE_EXTENDED_STATS Function`
- `DROP_EXTENDED_STATS Procedure`
- `SHOW_EXTENDED_STATS_NAME Function`
- `REPORT_COL_USAGE Function`
- `SEED_COL_USAGE Procedure`
Optimizer Statistics Advisor

Optimizer Statistics Advisor is built-in diagnostic software that helps use to use best practices to manage optimizer statistics. The advisor analyzes how you are currently gathering statistics (using manual scripts, explicitly setting parameters, and so on), the effectiveness of existing statistics gathering jobs, and the quality of the gathered statistics. The advisor generates findings for any issues it finds. Based on these findings, the advisor provides recommendations, which it stores in DBA_ADVISOR_RECOMMENDATIONS.

The advisor organizes rules into the following classes:

- **System**
  This class checks the preferences for statistics collection, status of the automated statistics gathering job, use of SQL plan directives, and so on. Rules in this class have the value SYSTEM in V$STATS_ADVISOR_RULES.RULE_TYPE.

- **Operation**
  This class checks whether statistics collection uses the defaults, test statistics are created using the SET_*_STATS procedures, and so on. Rules in this class have the value OPERATION in V$STATS_ADVISOR_RULES.RULE_TYPE.

- **Object**
  This class checks for the quality of the statistics, staleness of statistics, unnecessary collection of statistics, and so on. Rules in this class have the value OBJECT in V$STATS_ADVISOR_RULES.RULE_TYPE.

All Optimizer Statistics Advisor subprograms require the ADVISOR privilege. All procedures and functions execute using the invoker's privilege for the operation instead of the task owner's privilege. For example, if a user without the ANALYZE ANY DICITIONARY privilege creates a task t1, and if a DBA then executes this task, then the task execution checks for SYS objects. Another example is a task that is executed by user1, interrupted, and then resumed by user2. In this case, the checks of the resumed execution are based on the privilege of user2 rather than user1.

You can use the following subprograms to manage Optimizer Statistics Advisor:

- CANCEL_ADVISOR_TASK Procedure
- CONFIGURE_ADVISOR_FILTER Function
- CONFIGURE_ADVISOR_OPR_FILTER Functions
- CONFIGURE_ADVISOR_OBJ_FILTER Function
- CONFIGURE_ADVISOR_RULE_FILTER Function
- CREATE_ADVISOR_TASK Function
- DROP_ADVISOR_TASK Procedure
- EXECUTE_ADVISOR_TASK Function
- GET_ADVISOR_OPR_FILTER Procedure
- GET_ADVISOR_RECS Function
- IMPLEMENT_ADVISOR_TASK Function
- INTERRUPT_ADVISOR_TASK Procedure
162.6 DBMS_STATS Data Structures

The DBMS_STATS package defines a RECORD type.

RECORD Types

- STAT_REC Record Type

162.6.1 DBMS_STATS STAT_REC Record Type

This record type is provided for users in case they want to set column statistics manually. Its fields allow specifying column min/max values, as well as a histogram for a column.

Syntax

```
TYPE STATREC IS RECORD (  
  epc NUMBER,  
  minval RAW(2000),  
  maxval RAW(2000),  
  bkvals NUMARRAY,  
  novals NUMARRAY,  
  chvals CHARARRAY,  
  eavals RAWARRAY,  
  rpcnts NUMARRAY,  
  eavs NUMBER);  
```

Fields of the Record type COMPARISON_TYPE (STAT_REC Attributes)

Table 162-2 STAT_REC Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>epc</td>
<td>Number of buckets in histogram</td>
</tr>
<tr>
<td>minval</td>
<td>Minimum value</td>
</tr>
<tr>
<td>maxval</td>
<td>Maximum value</td>
</tr>
<tr>
<td>bkvals</td>
<td>Array of bucket numbers</td>
</tr>
<tr>
<td>novals</td>
<td>Array of normalized end point values</td>
</tr>
</tbody>
</table>
Table 162-2  (Cont.) STAT_REC Attributes

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>chvals</td>
<td>Array of dumped end point values</td>
</tr>
<tr>
<td>eavals</td>
<td>Array of end point actual values</td>
</tr>
<tr>
<td>rpcnts</td>
<td>Array of end point value frequencies</td>
</tr>
<tr>
<td>eavs</td>
<td>A number indicating whether actual end point values are needed in the histogram. If using the PREPARE_COLUMN_VALUES Procedures, this field will be automatically filled.</td>
</tr>
</tbody>
</table>

162.7 Summary of DBMS_STATS Subprograms

This table lists the DBMS_STATS subprograms and briefly describes them.

Table 162-3  DBMS_STATS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER_STATS_HISTORY _RETENTION Procedure</td>
<td>Changes the statistics history retention value</td>
</tr>
<tr>
<td>CANCEL_ADVISOR_TAS K Procedure</td>
<td>Cancels an Optimizer Statistics Advisor execution</td>
</tr>
<tr>
<td>CONFIGURE_ADVISOR_FILTER Function</td>
<td>Configures the filter list for an Optimizer Statistics Advisor task</td>
</tr>
<tr>
<td>CONFIGURE_ADVISOR_OBJ_FILTER Function</td>
<td>Configures an object filter for an Optimizer Statistics Advisor task</td>
</tr>
<tr>
<td>CONFIGURE_ADVISOR_OPR_FILTER Functions</td>
<td>Configures an operation filter for an Optimizer Statistics Advisor task</td>
</tr>
<tr>
<td>CONFIGURE_ADVISOR_RULE_FILTER Function</td>
<td>Configures a rule filter for an Optimizer Statistics Advisor task</td>
</tr>
<tr>
<td>CREATE_ADVISOR_TAS K Function</td>
<td>Creates an advisor task for the Optimizer Statistics Advisor</td>
</tr>
<tr>
<td>CONVERT_RAW_VALUE Procedures</td>
<td>Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value</td>
</tr>
<tr>
<td>CONVERT_RAW_VALUE_NVARCHAR Procedure</td>
<td>Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value</td>
</tr>
<tr>
<td>CONVERT_RAW_VALUE_ROWID Procedure</td>
<td>Converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value</td>
</tr>
<tr>
<td>COPY_TABLE_STATS Procedure</td>
<td>Copies the statistics of the source [sub] partition to the destination [sub] partition after scaling</td>
</tr>
<tr>
<td>CREATE_EXTENDED_STATS Function</td>
<td>Creates a virtual column for a user specified column group or an expression in a table</td>
</tr>
<tr>
<td>CREATE_STAT_TABLE Procedure</td>
<td>Creates a table with name stattab in ownname’s schema which is capable of holding statistics</td>
</tr>
</tbody>

<tr>
<td>UNLOCK_TABLE_STATS Procedure</td>
<td>Unlocks the statistics on the table</td>
</tr>
<tr>
<td>UPGRADE_STAT_TABLE Procedure</td>
<td>Upgrades user statistics on an older table</td>
</tr>
</tbody>
</table>

### 162.7.1 ALTER_STATS_HISTORY_RETENTION Procedure

This procedure changes the statistics history retention value.

Statistics history retention is used by both the automatic purge and PURGE_STATS Procedure.

**Syntax**

```sql
DBMS_STATS.ALTER_STATS_HISTORY_RETENTION (
   retention       IN     NUMBER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| retention      | The retention time in days. The statistics history will be retained for at least these many number of days. The valid range is [1,365000]. Also you can use the following values for special purposes:
   - -1: Statistics history is never purged by automatic purge
   - 0: Old statistics are never saved. The automatic purge will delete all statistics history
   - NULL: Change statistics history retention to default value |

**Usage Notes**

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

**Exceptions**

ORA-20000: Insufficient privileges
162.7.2 CANCEL_ADVISOR_TASK Procedure

This procedure cancels an Optimizer Statistics Advisor execution. The advisor removes all intermediate results of the current execution from the task.

Syntax

```
DBMS_STATS.CANCEL_ADVISOR_TASK (
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

• To execute this subprogram, you must have the ADVISOR privilege.
• You must be the owner of the task.
• This subprogram executes using invoker’s rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

• ORA-20000: Insufficient privileges
• ORA-20001: Invalid input values
• ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

To be canceled or interrupted, the specified task must be currently executing.

Example 162-1  Canceling an Optimizer Statistics Advisor

In this example, you start a SQL*Plus session, and then create and execute an advisor task named my_task:

```
DECLARE
    v_tname   VARCHAR2(128) := 'my_task';
    v_ename   VARCHAR2(128) := NULL;
BEGIN
    -- create a task
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

    -- execute the task
    v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

```
EXEC DBMS_STATS.CANCEL_ADVISOR_TASK('my_task');
```

The first session returns an ORA-13632 to indicate the cancelation of the task:

```
ORA-13632: The user cancelled the current operation.
```

### 162.7.3 CONFIGURE_ADVISOR_FILTER Function

This function configures the filter list for an Optimizer Statistics Advisor task. Filters are useful for excluding irrelevant findings from a report.

#### Syntax

```sql
DBMS_STATS.CONFIGURE_ADVISOR_FILTER (
  task_name           IN   VARCHAR2,
  stats_adv_opr_type  IN   VARCHAR2,
  configuration_type  IN   VARCHAR2,
  filter              IN   StatsAdvFilterTab   := NULL)
RETURN CLOB;
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>stats_adv_opr_type</td>
<td>The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. The function permits you to specify a combination of operation types by using the plus (+) operator, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of advisor operations.</td>
</tr>
<tr>
<td>configuration_type</td>
<td>The type of configuration. Possible values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• SET: Sets the specified filter list values. The submitted filter overrides existing filter values.</td>
</tr>
<tr>
<td></td>
<td>• CLEAR: Clears the existing values for the specified filter.</td>
</tr>
<tr>
<td></td>
<td>• SHOW: Shows the current values of the specified filter.</td>
</tr>
<tr>
<td>filter</td>
<td>The list of filter items for the script.</td>
</tr>
</tbody>
</table>

#### Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

#### Return Values

This function returns a CLOB that contains the configuration of the provided filter in XML format.
Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

To provide fine-grained control and a unified interface across all procedures, `DBMS_STATS` provides the `StatsAdvFilter` type. You can use this data type to instantiate and construct a table of filters. You can then pass a parameter of type `StatsAdvFilter` to `CONFIGURE_ADVISOR_FILTER` along with a Boolean variable that specifies either of the following:

- Inclusion list
  Only include these objects in the check.
- Exclusion list
  Do not include these objects in the check.

You can also pass in a parameter specifying whether to replace the existing list. This list only filters object-level and operation-level items. The advisor always checks system-level rules.

You can create the following types of filters:

- Rule filter
  This filter takes a rule name as input. Obtain rule names from the `V$STATS_ADVISOR_RULES` view.

- Operation filter
  This filter is an exact match filter that takes in the name of the operation and an XML string representation of all the parameter values in the call. To obtain the XML, see the notes section of the `DBA_OPTSTAT_OPERATIONS` view. To obtain the filter for an operation, use `DBMS_STATS.GET_ADVISOR_OPR_FILTER`.

- Object filter
  This filter accept an owner name and an object name. Wildcards (%) are supported in the owner name and object name. When an object name is null or %, it means a filter for all the objects in the specified schema. If the owner name is also null or %, it means a default filter for all objects in the system.

If none of the filters is specified, then the function recognizes the filter as setting the global default value of filtering (include or exclude). During the check, if no filter has been specified for a rule, operation, or object, then the function uses the default value to determine whether to include or exclude it.

Example 162-2  Enabling and Disabling Rules

You may want to turn off checks for all rules except for a specific rule. In this example, you want to check whether SQL plan directives have been disabled.

```sql
DECLARE
  v_task_name    VARCHAR2(128) := 'my_task';
  v_ret          VARCHAR2(128);
  filter         DBMS_STATS.StatsAdvFilter := null;
```
filterTab      DBMS_STATS.StatsAdvFilterTab := null;
v_counter     NUMBER                       := 0;
v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize the filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();

  -- First filter: set filters to be FALSE by default
  filter.include := FALSE;

  -- Add this filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  -- Second filter: turn on filter for one rule
  filter.include := TRUE;
  filter.rulename := 'TurnOnSQLPlanDirective';

  -- Add the SQL plan directive filter to the filter table
  v_counter := v_counter + 1;
  filterTab.extend;
  filterTab(v_counter) := filter;

  v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter             => filterTab);

  -- Drop the task
  DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;

Example 162-3  Configuring an Operations Filter

In this example, your shop uses customized scripts to gather statistics for a table. If you do not want to see a specific statistics operation in the report, then you can specify an operations filter.

DECLARE
  v_task_name    VARCHAR2(128)                := 'my_task';
  v_ret          VARCHAR2(128);                
  filter         DBMS_STATS.StatsAdvFilter    := null;
  filterTab      DBMS_STATS.StatsAdvFilterTab := null;
  opr            DBMS_STATS.StatsAdvOpr;
  oprTab         DBMS_STATS.StatsAdvOprTab;
  v_oprCnt       NUMBER                       := 0;
  TYPE numTab IS TABLE OF NUMBER;
  opr_tab        numTab;
  v_filterReport CLOB;
BEGIN
  -- Create the advisor task
  v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);

  -- Initialize filter table
  filterTab := DBMS_STATS.StatsAdvFilterTab();
-- Initialize operations filter
oprTab := DBMS_STATS.StatsAdvOprTab();

SELECT ID
  BULK COLLECT INTO opr_tab
FROM   WRI$_OPTSTAT_OPR
WHERE  OPERATION = 'set_table_stats'
  AND    TARGET = 'HR.EMPLOYEES';

-- Populate the operations table
FOR i IN 1..opr_tab.count LOOP
    DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);
    v_oprCnt := v_oprCnt + 1;
    oprTab.extend;
    oprTab(v_oprCnt) := opr;
END LOOP;

filter.include := FALSE;
filter.oprlist := oprTab;

-- Add to filter table
filterTab.extend;
filterTab(1) := filter;

v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
  task_name          => v_task_name,
  stats_adv_opr_type => NULL,
  configuration_type => 'SET',
  filter             => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;

Example 162-4 Reporting on a Specific Schema

In this example, you want to generate a report only for the sh schema. Also, you want to skip the sh.products table. You create an object filter as follows:

DECLARE
  v_task_name     VARCHAR2(128)                := 'my_task';
  v_ret           VARCHAR2(128);
  filter          DBMS_STATS.StatsAdvFilter    := null;
  filterTab       DBMS_STATS.StatsAdvFilterTab := null;
  v_filterReport  CLOB;
  v_counter       NUMBER                       := 0;
  obj             DBMS_STATS.ObjectElem;
  objTab          DBMS_STATS.ObjectTab;
  v_objCnt        NUMBER                       := 0;
BEGIN
    -- Create the advisor task
    v_ret := DBMS_STATS.CREATE_ADVISOR_TASK(v_task_name);
    -- Initialize filter table
    filterTab := DBMS_STATS.StatsAdvFilterTab();

    -- Initialize operations filter
    oprTab := DBMS_STATS.StatsAdvOprTab();

    SELECT ID
      BULK COLLECT INTO opr_tab
    FROM   WRI$_OPTSTAT_OPR
    WHERE  OPERATION = 'set_table_stats'
    AND    TARGET = 'HR.EMPLOYEES';

    -- Populate the operations table
    FOR i IN 1..opr_tab.count LOOP
        DBMS_STATS.GET_ADVISOR_OPR_FILTER(opr_tab(i), opr);
        v_oprCnt := v_oprCnt + 1;
        oprTab.extend;
        oprTab(v_oprCnt) := opr;
    END LOOP;

    filter.include := FALSE;
    filter.oprlist := oprTab;

    -- Add to filter table
    filterTab.extend;
    filterTab(1) := filter;

    v_filterReport := DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
      task_name          => v_task_name,
      stats_adv_opr_type => NULL,
      configuration_type => 'SET',
      filter             => filterTab);

    -- Drop the task
    DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);

END;
-- Set object filter to be off by default
filter.include := FALSE;

objTab := DBMS_STATS.ObjectTab();

obj.ownname := NULL;
obj.objname := NULL;

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 1, turn on the check only for schema SH
filter.include := TRUE;

objTab := DBMS_STATS.ObjectTab();
v_objCnt := 0;

obj.ownname := 'SH';
obj.objname := NULL;

-- add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;

filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

-- In filter 2, exclude the check for object sh.products
filter.include := FALSE;

objTab := dbms_stats.ObjectTab();
v_objCnt := 0;

-- Specify another object filter for sh.products
obj.ownname := 'SH';
obj.objname := 'PRODUCTS';

-- Add to the object table
v_objCnt := v_objCnt + 1;
objTab.extend;
objTab(v_objCnt) := obj;
filter.objlist := objTab;

-- Add the object filter to the filter table
v_counter := v_counter + 1;
filterTab.extend;
filterTab(v_counter) := filter;

v_filterReport :=
DBMS_STATS.CONFIGURE_ADVISOR_FILTER(
    task_name          => v_task_name,
    stats_adv_opr_type => NULL,
    configuration_type => 'SET',
    filter             => filterTab);

-- Drop the task
DBMS_STATS.DROP_ADVISOR_TASK(v_task_name);
END;

162.7.4 CONFIGURE_ADVISOR_OBJ_FILTER Function

This function configures an object filter for an Optimizer Statistics Advisor task.

Syntax

DBMS_STATS.CONFIGURE_ADVISOR_OBJ_FILTER ( 
    task_name             IN VARCHAR2,
    stats_adv_opr_type    IN VARCHAR2,
    rule_name             IN VARCHAR2,
    ownname               IN VARCHAR2,
    tabname               IN VARCHAR2,
    action                IN VARCHAR2)
RETURN CLOB;

Parameters

Table 162-7  CONFIGURE_ADVISOR_OBJ_FILTER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>stats_adv_opr_type</td>
<td>The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. See &quot;CONFIGURE_ADVISOR_RULE_FILTER Function&quot;.</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule to configure. If null, the function applies the filter to all operation-level rules.</td>
</tr>
<tr>
<td>ownname</td>
<td>The owner name of the operation target. If null, the function applies the filter to all owner names.</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name of the operation target.</td>
</tr>
<tr>
<td>action</td>
<td>The configuration action to take for the specified rule. See &quot;CONFIGURE_ADVISOR_RULE_FILTER Function&quot;.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:
• To execute this subprogram, you must have the ADVISOR privilege.
• You must be the owner of the task.
• This subprogram executes using invoker's rights.

Return Values
This function returns an XML CLOB that contains the updated values of the filter.

Exceptions
• ORA-20000: Insufficient privileges
• ORA-20001: Invalid input values
• ORA-20012: Optimizer Statistics Advisor errors

162.7.5 CONFIGURE_ADVISOR_OPR_FILTER Functions

This overloaded function configures an operation filter for an Optimizer Statistics Advisor task.

Syntax

DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (task_name IN VARCHAR2, stats_adv_opr_type IN VARCHAR2, rule_name IN VARCHAR2, operation_name IN VARCHAR2, action IN VARCHAR2) RETURN CLOB;

DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (task_name IN VARCHAR2, stats_adv_opr_type IN VARCHAR2, rule_name IN VARCHAR2, operation_name IN VARCHAR2, ownname IN VARCHAR2, tabname IN VARCHAR2, action IN VARCHAR2) RETURN CLOB;

DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER (task_name IN VARCHAR2, stats_adv_opr_type IN VARCHAR2, rule_name IN VARCHAR2, operation_id IN NUMBER, action IN VARCHAR2) RETURN CLOB;

Parameters

Table 162-8  CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>
Table 162-8  (Cont.) CONFIGURE_ADVISOR_OPR_FILTER Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats_adv_opr_type</td>
<td>The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT.</td>
</tr>
<tr>
<td></td>
<td>See “CONFIGURE_ADVISOR_RULE_FILTER Function”.</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule to configure. If null, the function applies the filter to all operation-level rules.</td>
</tr>
<tr>
<td>operation_name</td>
<td>The name of the operation. For example, an operation name could be gather_table_stats. This value cannot be null.</td>
</tr>
<tr>
<td>operation_id</td>
<td>The ID of the operation to configure. The filter applies to any operation with the same signature as the specified operation ID. If two operations have the same signature, then they have the same value for every parameter. View the operation ID in DBA_OSTAT_OPERATIONS.ID. This value cannot be null.</td>
</tr>
<tr>
<td>ownname</td>
<td>The owner name of the operation target. This value cannot be null.</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name of the operation target.</td>
</tr>
<tr>
<td>action</td>
<td>The configuration action to take for the specified rule. See “CONFIGURE_ADVISOR_RULE_FILTER Function”.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

• To execute this subprogram, you must have the ADVISOR privilege.
• You must be the owner of the task.
• This subprogram executes using invoker’s rights.

Return Values

This function returns an XML CLOB that contains the updated values of the filter.

Exceptions

• ORA-20000: Insufficient privileges
• ORA-20001: Invalid input values
• ORA-20012: Optimizer Statistics Advisor errors

Example 162-5  Excluding Operations for Gathering Table Statistics

In this example, your goal is to exclude operations that gather table statistics in the hr schema. User account stats has been granted the DBA role, ADVISOR privilege, and SELECT ON DBA_OSTAT_OPERATIONS privilege. You perform the following steps:

1. Log in to the database as stats.
2. Drop any existing task named opt_adv_task1.

```sql
DECLARE
  v_tname VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
  DBMS_STATS.DROP_ADVISOR_TASK(v_tname);
```

---

162-27
3. Create a procedure named `opr_filter` that configures a task to advise on all operations except those that gather statistics for tables in the `hr` schema.

```sql
CREATE OR REPLACE PROCEDURE opr_filter(p_tname IN VARCHAR2) IS
  v_retc CLOB;
BEGIN
  -- For all rules, prevent the advisor from operating
  -- on the operations selected in the following query
  FOR rec IN (SELECT ID FROM DBA_OPTSTAT_OPERATIONS WHERE OPERATION = 'gather_table_stats' AND TARGET LIKE 'HR.%') LOOP
    v_retc := DBMS_STATS.CONFIGURE_ADVISOR_OPR_FILTER(
      task_name => p_tname,
      stats_adv_opr_type => NULL,
      rule_name => NULL,
      operation_id => rec.id,
      action => 'DISABLE');
  END LOOP;
END;
/
SHOW ERRORS
```

4. Create a task named `opt_adv_task1`, and then execute the `opr_filter` procedure for this task.

```sql
DECLARE
  v_tname VARCHAR2(32767);
  v_ret VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
  v_ret   := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  opr_filter(v_tname);
END;
/
SHOW ERRORS
```

5. Execute the task `opt_adv_task1`.

```sql
DECLARE
  v_tname VARCHAR2(32767);
  v_ret VARCHAR2(32767);
BEGIN
  v_tname := 'opt_adv_task1';
  v_ret   := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

6. Print the report.

```sql
SPOOL /tmp/rep.txt
SET LONG 1000000
COLUMN report FORMAT A200
SET LINESIZE 250
SET PAGESIZE 1000
SELECT DBMS_STATS.REPORT_ADVISOR_TASK(
  task_name => 'opt_adv_task1',
  execution_name => NULL,
  type => 'TEXT',
  section => 'ALL') AS report
```

---

Chapter 162
Summary of DBMS_STATS Subprograms

162-28
162.7.6 CONFIGURE_ADVISOR_RULE_FILTER Function

This function configures a rule filter for an Optimizer Statistics Advisor task.

Syntax

```sql
DBMS_STATS.CONFIGURE_ADVISOR_RULE_FILTER (  
task_name            IN   VARCHAR2,  
stats_adv_opr_Type   IN   VARCHAR2,  
rule_name            IN   VARCHAR2,  
action               IN   VARCHAR2)  
RETURN CLOB;
```

Parameters

Table 162-9  SCRIPT_ADVISOR_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>stats_adv_opr_type</td>
<td>The type of operation to configure. Possible values are EXECUTE, REPORT, SCRIPT, and IMPLEMENT. You can specify a combination of operation types, for example, EXECUTE +REPORT. If this parameter is null, then the filter applies to all types of Optimizer Statistics Advisor operations.</td>
</tr>
<tr>
<td>rule_name</td>
<td>The name of the rule to configure. If null, the function applies the filter to all rules.</td>
</tr>
</tbody>
</table>
| action          | The configuration action to take for the specified rule. Possible values are:  
|                 | - ENABLE: Enables the filter  
|                 | - DISABLE: Disables the filter  
|                 | - DELETE: Deletes the filter  
|                 | - SHOW: Shows the current filter value                                                                                                       |

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.
Return Values
This function returns an XML CLOB that contains the updated values of the filter.

Exceptions
- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

162.7.7 CONVERT_RAW_VALUE Procedures
This procedure converts the internal representation of a minimum value, maximum value, or histogram endpoint actual value into a datatype-specific value.

The minval, maxval, and eavals fields of the StatRec structure as filled in by GET_COLUMN_STATS or PREPARE_COLUMN_VALUES are appropriate values for input.

Syntax
```sql
DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_FLOAT);

DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT BINARY_DOUBLE);

DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT DATE);

DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT NUMBER);

DBMS_STATS.CONVERT_RAW_VALUE (
    rawval    RAW,
    resval OUT VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rawval</td>
<td>Raw representation of a column minimum, maximum, histogram endpoint actual value</td>
</tr>
<tr>
<td>resval</td>
<td>Converted, type-specific value</td>
</tr>
</tbody>
</table>

Usage Notes
No special privilege or role is needed to invoke this procedure.
162.7.8 CONVERT_RAW_VALUE_NVARCHAR Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The \texttt{minval}, \texttt{maxval} and \texttt{eavals} fields of the \texttt{StatRec} structure as filled in by \texttt{GET_COLUMN_STATS} or \texttt{PREPARE_COLUMN_VALUES} are appropriate values for input.

Syntax

\begin{verbatim}
DBMS_STATS.CONVERT_RAW_VALUE_NVARCHAR (    
  rawval RAW,    
  resval OUT NVARCHAR2);
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
\texttt{rawval} & The raw representation of a column minimum or maximum \\
                 & datatype-specific output parameters \\
\texttt{resval} & The converted, type-specific value \\
\hline
\end{tabular}
\caption{CONVERT_RAW_VALUE_NVARCHAR Procedure Parameters}
\end{table}

Usage Notes

No special privilege or role is needed to invoke this procedure.

162.7.9 CONVERT_RAW_VALUE_ROWID Procedure

This procedure converts the internal representation of a a minimum value, maximum value, or histogram end point actual value.

The \texttt{minval}, \texttt{maxval} and \texttt{eavals} fields of the \texttt{StatRec} structure as filled in by \texttt{GET_COLUMN_STATS} or \texttt{PREPARE_COLUMN_VALUES} are appropriate values for input.

Syntax

\begin{verbatim}
DBMS_STATS.CONVERT_RAW_VALUE_ROWID (    
  rawval RAW,    
  resval OUT ROWID);
\end{verbatim}

Pragmas

\begin{verbatim}
pragma restrict_references(convert_raw_value_rowid, WNDS, RNDS, WNPS, RNPS);
\end{verbatim}

Parameters

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Parameter & Description \\
\hline
\texttt{rawval} & The raw representation of a column minimum or maximum \\
                 & datatype-specific output parameters \\
\texttt{resval} & The converted, type-specific value \\
\hline
\end{tabular}
\caption{CONVERT_RAW_VALUE_ROWID Procedure Parameters}
\end{table}
Usage Notes

No special privilege or role is needed to invoke this procedure.

162.7.10 COPY_TABLE_STATS Procedure

This procedure copies statistics of all dependent object such as columns and local indexes. If the statistics for source are not available then nothing is copied. It can optionally scale the statistics (such as the number of `blks`, or number of rows) based on the given `scale_factor`.

Syntax

```sql
DBMS_STATS.COPY_TABLE_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  srcpartname      VARCHAR2,
  dstpartname      VARCHAR2,
  scale_factor     VARCHAR2 DEFAULT 1,
  flags            NUMBER DEFAULT NULL,
  force            BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the table of source and destination [sub] partitions</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name of source and destination [sub] partitions</td>
</tr>
<tr>
<td>srcpartname</td>
<td>Source [sub] partition</td>
</tr>
<tr>
<td>dstpartname</td>
<td>Destination [sub] partition</td>
</tr>
<tr>
<td>scale_factor</td>
<td>Scale factor to scale <code>nbks</code>, <code>nrows</code> etc. in <code>dstpartname</code></td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is <code>TRUE</code> copy statistics even if the destination [sub]partition is locked</td>
</tr>
</tbody>
</table>

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Invalid [sub]partition name

ORA-20001: Bad input value

Usage Notes

This procedure updates the minimum and maximum values of destination partition for the first partitioning column as follows:
• If the partitioning type is **HASH**, then the minimum and maximum values of the destination partition are same as that of the source partition.

• If the partitioning type is **LIST**, then the behavior depends on the setting of the destination partition:
  
  – If the destination partition is a **NOT DEFAULT** partition, then the following statements are true:
    
    * The minimum value of the destination partition is set to the minimum value of the value list that describes the destination partition.
    
    * The maximum value of the destination partition is set to the maximum value of the value list that describes the destination partition.

  – Alternatively, if the destination partition is a **DEFAULT** partition, then the following statements are true:
    
    * The minimum value of the destination partition is set to the minimum value of the source partition.
    
    * The maximum value of the destination partition is set to the maximum value of the source partition.

• If the partitioning type is **RANGE**, then the following statements are true:
  
  – The minimum value of the destination partition is set to the high bound of previous partition unless the destination partition is the first partition. For the first partition, the minimum value is set to the high bound of the destination partition.

  – The maximum value of the destination partition is set to the high bound of the destination partition unless the high bound of the destination partition is **MAXVALUE**, in which case the maximum value of the destination partition is set to the high bound of the previous partition.

  – If the source partition column's minimum value is equal to its maximum value, and if both are equal to the source partition's lower bound, and if it has a single distinct value, then the destination partition column's minimum and maximum values are both set to the destination partition's lower bound. This is done for all partitioning columns.

    If the above condition does not apply, second and subsequent partitioning columns are updated as follows. The destination partition column's maximum value is set to the greater of the destination partition upper bound and the source partition column's maximum value, with one exception. If the destination partition is **D** and its preceding partition is **D-1** and the key column to be adjusted is **Cn**, the maximum value for **Cn** is set to the upper bound of **D** (ignoring the maximum value of the source partition column) provided that the upper bounds of the previous key column **Cn-1** are the same in partitions **D** and **D-1**.

• If the minimum and maximum values are different for a column after modifications, and if the number of distinct values is less than 1, then the number of distinct values is updated as 2.

• If the source or destination is a partition of a composite partitioned table, then this procedure does not copy statistics of the underlying subpartitions.
162.7.11 CREATE_ADVISOR_TASK Function

This function creates an advisor task for the Optimizer Statistics Advisor.

Syntax

```sql
DBMS_STATS.CREATE_ADVISOR_TASK (    task_name   IN   VARCHAR2   := NULL)    RETURN VARCHAR2;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the task. If the task name is already specified, then the function uses the specified task name. Otherwise, the function generates a new task name automatically.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- This subprogram executes using invoker's rights.

Return Values

This function returns the unique name of the Optimizer Statistics Advisor task.

Exceptions

ORA-20000: Insufficient privileges / creating extension is not supported
ORA-20001: Error when processing extension
ORA-20012: Optimizer Statistics Advisor errors

Example 162-6 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```sql
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```
162.7.12 CREATE_EXTENDED_STATS Function

This function creates a column statistics entry in the system for a user-specified column group or an expression in a table.

The database gathers statistics for this extension when a user-initiated or automatic statistics gathering job gathers statistics for the table. Statistics for such an extension are called extended statistics. This function returns the name of this newly created entry for the extension.

This second form of this function creates statistics extensions based on the column group usage recorded by the SEED_COL_USAGE Procedure. This function returns a report of extensions created.

**Syntax**

```sql
DBMS_STATS.CREATE_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2,  
    extension  VARCHAR2)  
RETURN VARCHAR2;
```

```sql
DBMS_STATS.CREATE_EXTENDED_STATS (  
    ownname    VARCHAR2,  
    tabname    VARCHAR2)  
RETURN CLOB;
```

**Parameters**

**Table 162-15  CREATE_EXTENDED_STATS Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group is “(c1, c2)”. An example expression is “(c1 + c2)”.</td>
</tr>
</tbody>
</table>

**Return Values**

This function returns the name of this newly created entry for the extension.

**Exceptions**

ORA-20000: Insufficient privileges / creating extension is not supported
ORA-20001: Error when processing extension
ORA-20007: Extension already exists
ORA-20008: Reached the upper limit on number of extensions

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

There are nine restrictions on the extension:

• The extension cannot contain a virtual column.
• Extensions cannot be created on tables owned by SYS.
• Extensions cannot be created on cluster tables, index organized tables, temporary tables or external tables.
• The total number of extensions in a table cannot be greater than a maximum of (20, 10% of number of non-virtual columns in the table).
• The number of columns in a column group must be in the range [2, 32].
• A column can not appear more than once in a column group.
• A column group can not contain expressions.
• An expression must contain at least one column.
• An expression can not contain a subquery.
• The COMPATIBLE parameter must be 11.0.0.0.0 or greater.

162.7.13 CREATE_STAT_TABLE Procedure

This procedure creates a table with name stattab in ownname's schema which is capable of holding statistics. The columns and types that compose this table are not relevant as it should be accessed solely through the procedures in this package.

Syntax

DBMS_STATS.CREATE_STAT_TABLE (  
  ownname             VARCHAR2,  
  stattab             VARCHAR2,  
  tblspace            VARCHAR2 DEFAULT NULL,  
  global_temporary    BOOLEAN DEFAULT FALSE);  

Parameters

Table 162-16    CREATE_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table to create. This value should be passed as the stattab parameter to other procedures when the user does not want to modify the dictionary statistics directly.</td>
</tr>
<tr>
<td>tblspace</td>
<td>Tablespace in which to create the statistics tables. If none is specified, then they are created in the user's default tablespace.</td>
</tr>
<tr>
<td>global_temporary</td>
<td>Whether or not the table should be created as a global temporary table</td>
</tr>
</tbody>
</table>
Security Model
To invoke this procedure you need whichever privileges are required for creating a table in the specified schema.

Exceptions
ORA-20000: Table already exists or insufficient privileges
ORA-20001: Tablespace does not exist

162.7.14 DELETE_COLUMN_STATS Procedure

This procedure deletes column-related statistics.

Syntax

```sql
DBMS_STATS.DELETE_COLUMN_STATS (  
  ownname        VARCHAR2,  
  tabname        VARCHAR2,  
  colname        VARCHAR2,  
  partname       VARCHAR2 DEFAULT NULL,  
  stattab        VARCHAR2 DEFAULT NULL,  
  statid         VARCHAR2 DEFAULT NULL,  
  cascade_parts  BOOLEAN  DEFAULT TRUE,  
  statown        VARCHAR2 DEFAULT NULL,  
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force          BOOLEAN  DEFAULT FALSE,  
  col_stat_type  VARCHAR2 DEFAULT 'ALL');
```

Parameters

Table 162-17  DELETE_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition for which to delete the statistics. If the table</td>
</tr>
<tr>
<td></td>
<td>is partitioned and if partname is NULL, then global column statistics are</td>
</tr>
<tr>
<td></td>
<td>deleted.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the</td>
</tr>
<tr>
<td></td>
<td>statistics. If stattab is NULL, then the statistics are deleted directly</td>
</tr>
<tr>
<td></td>
<td>from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td></td>
<td>(Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>cascade_parts</td>
<td>If the table is partitioned and if partname is NULL, then setting this to</td>
</tr>
<tr>
<td></td>
<td>true causes the deletion of statistics for this column for all underlying</td>
</tr>
<tr>
<td></td>
<td>partitions as well.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>
Table 162-17  (Cont.) DELETE_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes column statistics even if locked</td>
</tr>
<tr>
<td>col_stat_type</td>
<td>Type of column statistics to be deleted. This argument takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• HISTOGRAM - delete column histogram only</td>
</tr>
<tr>
<td></td>
<td>• ALL - delete base column statistics and histogram</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.15 DELETE_DATABASE_PREFS Procedure

This procedure deletes the statistics preferences set for all non-system tables. You can include system tables by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```
### Parameters

#### Table 162-18  DELETE_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pname     | Preference name. The existing value for following preferences can be deleted and default preference values will be used:  
• APPROXIMATE_NDV_ALGORITHM  
• AUTO_STAT_EXTENSIONS  
• CASCADE  
• DEGREE  
• ESTIMATE_PERCENT  
• GLOBAL_TEMP_TABLE_STATS  
• GRANULARITY  
• INCREMENTAL  
• INCREMENTAL_LEVEL  
• INCREMENTAL_STALENESS  
• METHOD_OPT  
• NO_INVALIDATE  
• OPTIONS  
• PREFERENCE_OVERRIDES_PARAMETER  
• PUBLISH  
• STALE_PERCENT  
• STAT_CATEGORY  
• TABLE_CACHED_BLOCKS |
| add_sys   | Determines whether SYS tables will be included. |
Table 162-19  Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| APPROXIMATE_NDV_ALGORITHM   | Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can delete the following preferences:  
  • REPEAT OR HYPERLOGLOG  
    This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.  
  • ADAPTIVE_SAMPLING  
    The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.  
  • HYPERLOGLOG  
    The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:  
    – The accuracy of the new algorithm is similar to the original algorithm.  
    – The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS        | Controls the automatic creation of extensions when database statistics are gathered. You can set the following values:  
  • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.  
  • OFF — The database does not create column group statistics automatically. The database creates them only when the `CREATE_EXTENDED_STATS` function is executed, or when extended statistics are specified explicitly in the `METHOD_OPT` clause of `DBMS_STATS`. This is the default. |
| CASCADE                    | Determines whether index statistics are collected as part of gathering table statistics.                                                                                                                                                                             |
| DEGREE                     | Determines degree of parallelism used for gathering statistics.                                                                                                                                                                                                           |
| ESTIMATE_PERCENT           | Determines the percentage of rows to estimate.                                                                                                                                                                                                                          |
### Table 162-19  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>Determines the granularity of statistics to collect. This value is only relevant for partitioned tables.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>Controls which synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
</tbody>
</table>
Table 162-19 (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• <strong>USE_STALE_PERCENT</strong>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the <strong>STALE_PERCENT</strong> preference. For example, assume that <strong>STALE_PERCENT</strong> is 10. You specify <strong>USE_STALE_PERCENT</strong> for <strong>INCREMENTAL_STALENESS</strong>. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which <strong>STALE_PERCENT</strong> is 10. You specify <strong>USE_STALE_PERCENT</strong> for <strong>INCREMENTAL_STALENESS</strong>. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• <strong>USE_LOCKED_STATS</strong>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that <strong>STALE_PERCENT</strong> is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• <strong>ALLOW_MIXED_FORMAT</strong>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td>• <strong>NULL</strong>—A partition or subpartition is considered stale when it has any DML changes. For example, assume that <strong>STALE_PERCENT</strong> is 10. You specify the value 'NULL' for <strong>INCREMENTAL_STALENESS</strong>. The partition has 5% of DML changes. The database regathers statistics. Note that the following two executions are different:</td>
</tr>
<tr>
<td></td>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');</td>
</tr>
<tr>
<td></td>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</td>
</tr>
<tr>
<td></td>
<td>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is <strong>ALLOW_MIXED_FORMAT</strong>.</td>
</tr>
</tbody>
</table>
Table 162-19  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</td>
</tr>
</tbody>
</table>
| PREFERENCE_OVERRIDES_PARAMETER      | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:  
• TRUE — Ignores input parameter values, and uses the value of the corresponding preference.  
• FALSE — Obey input parameter values.  
Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH                             | Determines whether the database publishes newly gathered statistics after the gathering job completes. You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them. |
| STALE_PERCENT                       | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered.                                                                 |
| STAT_CATEGORY                       | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:  
• OBJECT_STATS - table statistics, column statistics and index statistics (default)  
• SYNOPTES - information to support incremental statistics  
The value 'OBJECT_STATS, SYNOPTES' specifies table statistics, column statistics, index statistics, and synopses. |
| TABLE_CACHED_BLOCKS                 | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.                                                                               |

Security Model

To run this procedure, you must have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or Illegal input values
Usage Notes

All `pname` arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.

Example 162-7 Examples

```sql
DBMS_STATS.DELETE_DATABASE_PREFS('CASCADE', FALSE);
DBMS_STATS.DELETE_DATABASE_PREFS('ESTIMATE_PERCENT', TRUE);
```

See Also:

*Oracle Database SQL Tuning Guide* to learn how to manage optimizer statistics preferences

162.7.16 DELETE_DATABASE_STATS Procedure

This procedure deletes statistics for all the tables in a database.

Syntax

```sql
DBMS_STATS.DELETE_DATABASE_STATS (  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE')),  
  force            BOOLEAN  DEFAULT FALSE,  
  stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);  
```

Parameters

Table 162-20 DELETE_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When the value of this argument is TRUE, deletes statistics of tables in a database even if they are locked</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The default is 'OBJECT_STATS, SYNOPSES'</td>
</tr>
</tbody>
</table>

Exceptions
ORA-20000: Object does not exist or insufficient privileges

Usage Notes
To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

162.7.17 DELETE_DICTIONARY_STATS Procedure

This procedure deletes statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas).

Syntax

```sql
DBMS_STATS.DELETE_DICTIONARY_STATS ( 
    stattab VARCHAR2 DEFAULT NULL, 
    statid VARCHAR2 DEFAULT NULL, 
    statown VARCHAR2 DEFAULT NULL, 
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type ( 
        get_param('NO_INVALIDATE') ), 
    stattype VARCHAR2 DEFAULT 'ALL', 
    force BOOLEAN DEFAULT FALSE, 
    stat_category VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY);
```

Parameters

<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSIS - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The default is 'OBJECT_STATS, SYNOPSIS'</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

162.7.18 DELETE_FIXED_OBJECTS_STATS Procedure

This procedure deletes statistics of all fixed tables.

Syntax

**DBMS_STATS.DELETE_FIXED_OBJECTS_STATS (****

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>The user statistics table identifier describing from where to delete the current statistics. If stattab is NULL, the statistics will be deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab. This only applies if stattab is not NULL.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Parameters
Table 162-22  (Cont.) DELETE_FIXED_OBJECTS_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Ignores the statistics lock on objects and deletes the statistics if set to TRUE.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.

Exceptions

ORA-20000: Insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it

162.7.19 DELETE_INDEX_STATS Procedure

This procedure deletes index-related statistics.

Syntax

```
DBMS_STATS.DELETE_INDEX_STATS ( 
    ownname          VARCHAR2, 
    indname          VARCHAR2, 
    partname         VARCHAR2 DEFAULT NULL, 
    stattab          VARCHAR2 DEFAULT NULL, 
    statid           VARCHAR2 DEFAULT NULL, 
    cascade_parts    BOOLEAN  DEFAULT TRUE, 
    statown          VARCHAR2 DEFAULT NULL, 
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type ( 
                        get_param('NO_INVALIDATE')), 
    stattype         VARCHAR2 DEFAULT 'ALL', 
    force            BOOLEAN  DEFAULT FALSE), 
    stat_category    VARCHAR2 DEFAULT DEFAULT_DEL_STAT_CATEGORY); 
```

<tr>
<td>stat_category</td>
<td>Statistics to delete. It accepts multiple values separated by comma:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The default is 'OBJECT_STATS, SYNOPSES'</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20005: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
162.7.20 DELETE_PENDING_STATS Procedure

This procedure is used to delete the pending statistics that have been collected but have not been published.

Syntax

```sql
DBMS_STATS.DELETE_PENDING_STATS (ownname IN VARCHAR2 DEFAULT USER, tabname IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
</tbody>
</table>

Security Model

To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be affected by this procedure. The default owner is the user who runs the procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

If the parameter `tabname` is NULL delete applies to all tables of the specified schema.

Examples

```sql
DBMS_STATS.DELETE_PENDING_STATS('SH', 'SALES');
```

162.7.21 DELETE_PROCESSING_RATE Procedure

This procedure deletes the processing rate of a given statistics source. If the source is not specified, it deletes the statistics of all the sources.

Syntax

```sql
DBMS_STATS.DELETE_PROCESSING_RATE (stat_source IN VARCHAR2 DEFAULT NULL);
```
Parameters

Table 162-25  DELETE_PROCESSING_RATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stat_source</td>
<td>Source of processing rates:</td>
</tr>
<tr>
<td></td>
<td>• 'MANUAL': values set by the user manually using the</td>
</tr>
<tr>
<td></td>
<td>SET_PROCESSING_RATE Procedure</td>
</tr>
<tr>
<td></td>
<td>• 'CALIBRATION': values collected by the calibration</td>
</tr>
<tr>
<td></td>
<td>GATHER_PROCESSING_RATE Procedure run explicitly by the user</td>
</tr>
<tr>
<td></td>
<td>• 'FEEDBACK': values obtained by time feedback</td>
</tr>
</tbody>
</table>

Usage Notes

You require the OPTIMIZER_PROCESSING_RATE role to run this procedure since AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

162.7.22 DELETE_SCHEMA_PREFS Procedure

This procedure is used to delete the statistics preferences of all the tables owned by the specified owner name.

Syntax

DBMS_STATS.DELETE_SCHEMA_PREFS (ownname IN VARCHAR2, pname IN VARCHAR2);

Parameters

Table 162-26  DELETE_SCHEMA_PREFS Procedure Parameters

<tr>
<td>AUTO_STAT_EXTENSIONS</td>
<td>Controls the automatic creation of extensions when database statistics are gathered. You can set the following values:</td>
</tr>
<tr>
<td></td>
<td>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</td>
</tr>
<tr>
<td></td>
<td>• OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Determines whether index statistics are collected as part of gathering table statistics.</td>
</tr>
<tr>
<td>COORDINATOR_TRIGGER_SHARD</td>
<td>User of each shard uses this preference to determine whether to allow shard coordinator to interact with the statistics gathering in each shards. While gathering the statistics in shard coordinator, if the statistics in one of the shards are not up to date, the shard coordinator will try to trigger the statistics gathering in that shard. By using this preference, user can execute or ignore that command from the shard coordinator. You can set the following values:</td>
</tr>
<tr>
<td></td>
<td>• TRUE — Allows the shard coordinator trigger the statistics gathering on sharded table in local shard if the statistics on local shard are stale.</td>
</tr>
<tr>
<td></td>
<td>• FALSE — Ignores the statistics gathering command triggered from the shard coordinator.</td>
</tr>
<tr>
<td></td>
<td>The default value is FALSE.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>Determines the degree of parallelism used for gathering statistics.</td>
</tr>
<tr>
<td>ESTIMATE_PERCENT</td>
<td>The value determines the percentage of rows to estimate.</td>
</tr>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>The value determines granularity of statistics to collect (only pertinent if the table is partitioned)</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>This value determines whether or not newly gathered statistics will be published once the gather job has completed.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
</tbody>
</table>
Table 162-27  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td>• NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

EXEC DBMS_STATS.SET_TABLE_PREFS
('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');

EXEC DBMS_STATS.SET_TABLE_PREFS
('sh', 'sales', 'INCREMENTAL_STALENESS', null);

The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.
Table 162-27  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| ROOT_TRIGGER_PDB      | The application PDB user, uses this preference to determine whether to allow the application root to interact with the statics gathering in PDB. During the statistics gathering of a metadata linked table in the application root, if the statistics in a PDB are in stale state, the application root triggers the statistics gathering for the particular PDB. Using this preference, the user can either execute or ignore the command from the application root. You can set the following values:  
  • TRUE—Allows the application root trigger the statistics gathering on metadata linked table in application PDB if the statistics on PDB are stale.  
  • FALSE—Ignores the statistics gathering command triggered from application root.  
  The default value is FALSE. |
| STALE_PERCENT         | This value determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. |
| GLOBAL_TEMP_TABLE_STATS | This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. |
| TABLE_CACHED_BLOCKS   | The average number of blocks cached in the buffer cache for any table we can assume when gathering the index clustering factor. |
| OPTIONS               | Determines the options parameter used in the GATHER_TABLE_STATS Procedure. |

**Note:**
CDB root, different from application root, never triggers statistics gathering on the PDBs and it is not controlled by this preference.

Security Model

To run this procedure, you must be the object owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.

Exceptions

ORA-20000: Insufficient privileges / Schema "<schema>" does not exist
ORA-20001: Invalid or Illegal input values
Usage Notes

All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'CASCADE');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT');
DBMS_STATS.DELETE_SCHEMA_PREFS('SH', 'DEGREE');

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences.

162.7.23 DELETE_SCHEMA_STATS Procedure

This procedure deletes statistics for an entire schema.

Syntax

DBMS_STATS.DELETE_SCHEMA_STATS (  
  ownname          VARCHAR2,  
  stattab          VARCHAR2 DEFAULT NULL,  
  statid           VARCHAR2 DEFAULT NULL,  
  statown          VARCHAR2 DEFAULT NULL,  
  no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (  
    get_param('NO_INVALIDATE') ),  
  force            BOOLEAN DEFAULT FALSE);  

Parameters

Table 162-28  DELETE_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to delete the statistics. If stattab is NULL, then the statistics are deleted directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes statistics of tables in a schema even if locked</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

#### 162.7.24 DELETE_SYSTEM_STATS Procedure

This procedure deletes workload statistics (collected using the 'INTERVAL' or 'START' and 'STOP' options) and resets the default to `noworkload` statistics (collected using 'NOWORKLOAD' option), if `stattab` is not specified. If `stattab` is specified, the subprogram deletes all system statistics with the associated `statid` from the `stattab`.

### Syntax

```sql
DBMS_STATS.DELETE_SYSTEM_STATS (
    stattab       VARCHAR2 DEFAULT NULL,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL);
```

### Parameters

#### Table 162-29  DELETE_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be saved</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table; may need to be upgraded

### Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.
162.7.25 DELETE_TABLE_PREFS Procedure

This procedure deletes the optimizer statistics preferences of the specified table in the specified schema.

Syntax

DBMS_STATS.DELETE_TABLE_PREFS (  
    ownname    IN  VARCHAR2,  
    tabname    IN  VARCHAR2,  
    pname      IN  VARCHAR2);  

Parameters

### Table 162-31  Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPROXIMATE_NDV_ALGORITHM</td>
<td>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can delete the following preferences: • <strong>REPEAT OR HYPERLOGLOG</strong> This is the default. If <strong>INCREMENTAL</strong> is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content. • <strong>ADAPTIVE SAMPLING</strong> The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option. • <strong>HYPERLOGLOG</strong> The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:  – The accuracy of the new algorithm is similar to the original algorithm.  – The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</td>
</tr>
<tr>
<td>AUTO_STAT_EXTENSIONS</td>
<td>Controls the automatic creation of extensions when database statistics are gathered. You can set the following values: • <strong>ON</strong> — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload. • <strong>OFF</strong> — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Determines whether index statistics are collected as part of gathering table statistics.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>Determines the degree of parallelism used for gathering statistics.</td>
</tr>
<tr>
<td>ESTIMATE_PERCENT</td>
<td>Determines the percentage of rows to estimate.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>Determines granularity of statistics to collect. This value is only relevant for partitioned tables.</td>
</tr>
<tr>
<td>Preference</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>This value determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE.</td>
</tr>
</tbody>
</table>
### Table 162-31  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td><strong>USE_STALE_PERCENT</strong>—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td><strong>USE_LOCKED_STATS</strong>—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td><strong>ALLOW_MIXED_FORMAT</strong>—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td><strong>NULL</strong>—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

```sql
EXEC DBMS_STATS.SET_TABLE_PREFS
  ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');

EXEC DBMS_STATS.SET_TABLE_PREFS
  ('sh', 'sales', 'INCREMENTAL_STALENESS', null);
```

The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.
<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. When setting preference at the global, schema, database, or dictionary level, only <code>FOR ALL</code> syntax is allowed.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS Procedure.</td>
</tr>
</tbody>
</table>
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:  
  • TRUE — Ignores input parameter values, and uses the value of the corresponding preference.  
  • FALSE — Obey input parameter values.  
  Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH                    | Determines whether newly gathered statistics will be published after the statistics gathering job has completed. |
| STALE_PERCENT              | Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. |
| STAT_CATEGORY              | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:  
  • OBJECT_STATS - table statistics, column statistics and index statistics (default)  
  • SYNOPSES - information to support incremental statistics  
  The value `'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. |
| TABLE_CACHED_BLOCKS        | Specifies the average number of blocks assumed to be in the buffer cache when calculating the index clustering factor. |

**Exceptions**

ORA-20000: Insufficient privileges  
ORA-20001: Invalid or Illegal input values

**Usage Notes**

- To run this procedure, you need to connect as owner of the table, be granted ANALYZE privilege on the table, or ANALYZE ANY system privilege.  
- All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.
Examples

DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'CASCADE');
DBMS_STATS.DELETE_TABLE_PREFS('SH', 'SALES', 'DEGREE');

See Also:

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

162.7.26 DELETE_TABLE_STATS Procedure

This procedure deletes table-related statistics.

Syntax

```
DBMS_STATS.DELETE_TABLE_STATS {
    ownname          VARCHAR2,
    tabname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    cascade_parts    BOOLEAN  DEFAULT TRUE,
    cascade_columns  BOOLEAN  DEFAULT TRUE,
    cascade_indexes  BOOLEAN  DEFAULT TRUE,
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type {
        get_param('NO_INVALIDATE'),
    },
    force            BOOLEAN DEFAULT FALSE);
```

<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>When value of this argument is TRUE, deletes table statistics even if locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table, may need to upgrade it
ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.27 DIFF_TABLE_STATS_IN_HISTORY Function

This function can be used to compare statistics for a table from two timestamps in past and compare the statistics as of that timestamps.

Syntax

```
DBMS_STATS.DIFF_TABLE_STATS_IN_HISTORY(
    ownname    IN VARCHAR2,
    tabname    IN VARCHAR2,
    time1      IN TIMESTAMP WITH TIME ZONE,
    time2      IN TIMESTAMP WITH TIME ZONE DEFAULT NULL,
    pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 162-33 DIFF_TABLE_STATS_IN_HISTORY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
</tbody>
</table>
Table 162-33  (Cont.) DIFF_TABLE_STATS_IN_HISTORY Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time1</td>
<td>First timestamp 1</td>
</tr>
<tr>
<td>time2</td>
<td>Second timestamp 2</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
</tbody>
</table>

Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Usage Notes

If the second timestamp is `NULL`, then the function compares the current statistics in dictionary with the statistics as of the other timestamp.

162.7.28 DIFF_TABLE_STATS_IN_PENDING Function

This function compares pending statistics to either the current statistics in the data dictionary, or user-specified historical statistics.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_PENDING(
    ownname IN VARCHAR2,
    tabname IN VARCHAR2,
    timestamp IN TIMESTAMP WITH TIME ZONE,
    pctthreshold IN NUMBER DEFAULT 10)
RETURN DiffRepTab pipelined;
```

Parameters

Table 162-34  DIFF_TABLE_STATS_IN_PENDING Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify <code>NULL</code> for the current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared.</td>
</tr>
<tr>
<td>timestamp</td>
<td>Timestamp in the statistics history that corresponds to the desired statistics. If the timestamp is <code>NULL</code>, then this function compares the current statistics in the dictionary with the pending statistics (default).</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>Limit for reporting. The function reports difference in statistics only if it exceeds the specified limit. The default value is 10.</td>
</tr>
</tbody>
</table>

Security Model

To invoke this procedure you must be owner of the table, or you must have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or you must have either the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
162.7.29 DIFF_TABLE_STATS_IN_STATTAB Function

This function can be used to compare statistics for a table from two different sources.

The statistics can be drawn from

- two different user statistics tables
- a single user statistics table containing 2 sets of statistics that can be identified using statids
- a user statistics table and dictionary

The function also compares the statistics of the dependent objects (indexes, columns, partitions) as well. It displays statistics of the object(s) from both sources if the difference between those statistics exceeds a certain threshold (%). The threshold can be specified as an argument to the function. The statistics corresponding to the first source (stattab1 or time1) will be used as basis for computing the difference percentage.

Syntax

```sql
DBMS_STATS.DIFF_TABLE_STATS_IN_STATTAB(
    ownname        IN  VARCHAR2,
    tabname        IN  VARCHAR2,
    stattab1       IN  VARCHAR2,
    stattab2       IN  VARCHAR2 DEFAULT NULL,
    pctthreshold   IN  NUMBER  DEFAULT 10,
    statid1        IN  VARCHAR2 DEFAULT NULL,
    statid2        IN  VARCHAR2 DEFAULT NULL,
    stattab1own    IN  VARCHAR2 DEFAULT NULL,
    stattab2own    IN  VARCHAR2 DEFAULT NULL) RETURN DiffRepTab pipelined;
```

Parameters

Table 162-35  DIFF_TABLE_STATS_IN_STATTAB Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the table. Specify NULL for current schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table for which statistics are to be compared</td>
</tr>
<tr>
<td>stattab1</td>
<td>User statistics table 1</td>
</tr>
<tr>
<td>stattab2</td>
<td>User statistics table 2. If NULL, statistics in stattab1 is compared with current statistics in dictionary. This is the default. Specify same table as stattab1 to compare two sets within the statistics table (see statid below).</td>
</tr>
<tr>
<td>pctthreshold</td>
<td>The function reports difference in statistics only if it exceeds this limit. The default value is 10.</td>
</tr>
<tr>
<td>statid1</td>
<td>(optional) Identifies statistics set within stattab1.</td>
</tr>
<tr>
<td>statid2</td>
<td>(optional) Identifies statistics set within stattab2</td>
</tr>
<tr>
<td>stattab1own</td>
<td>Schema containing stattab1 (if other than ownname)</td>
</tr>
<tr>
<td>stattab2own</td>
<td>Schema containing stattab2 (if other than ownname)</td>
</tr>
</tbody>
</table>
Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.30 DROP_ADVISOR_TASK Procedure

This procedure drops the specified Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.DROP_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

Table 162-36  DROP_ADVISOR_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Example 162-8  Dropping an Optimizer Statistics Advisor Task

This example drops the Optimizer Statistics Advisor task named `my_task`:

```
EXEC DBMS_STATS.DROP_ADVISOR_TASK('my_task');
```

162.7.31 DROP_EXTENDED_STATS Procedure

This function drops the statistics entry that is created for the user specified extension. This cancels the effects of the `CREATE_EXTENDED_STATS` Function.

Syntax

```
DBMS_STATS.DROP_EXTENDED_STATS (  
    ownname VARCHAR2,
```
tabname VARCHAR2,
extension VARCHAR2);

Parameters

Table 162-37  DROP_EXTENDED_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Exceptions

• ORA-20000: Insufficient privileges or extension does not exist
• ORA-20001: Error when processing extension

Usage Notes

• To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
• If no extended statistics set is created for the extension, this function throws an error.

162.7.32 DROP_STAT_TABLE Procedure

This procedure drops a user statistics table.

Syntax

DBMS_STATS.DROP_STAT_TABLE (  
onname VARCHAR2,  
stattab VARCHAR2);

Parameters

Table 162-38  DROP_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Table does not exists or insufficient privileges.

Usage Notes

To invoke this procedure you need the privileges for dropping the specified table.
162.7.33 EXECUTE_ADVISOR_TASK Function

This function executes a previously created Optimizer Statistics Advisor task.

Syntax

```sql
DBMS_STATS.EXECUTE_ADVISOR_TASK (
    task_name IN VARCHAR2,
    execution_name IN VARCHAR2 := NULL)
RETURN VARCHAR2;
```

Parameters

Table 162-39  EXECUTE_ADVISOR_TASK Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>Name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name that qualifies and identifies an advisor execution. If not specified,</td>
</tr>
<tr>
<td></td>
<td>then the advisor automatically generates it.</td>
</tr>
<tr>
<td></td>
<td>If the specified execution conflicts with the name of an existing execution,</td>
</tr>
<tr>
<td></td>
<td>then the function returns an error.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
  - Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.

- **Operation level**
  - The results depend on the following privileges:
    - Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.
    - Users with the ANALYZE ANY privilege but not the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.
    - Users with the ANALYZE ANY DICTIONARY privilege but not the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.
Users with neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege can only perform this operation for statistics operations relating to their own schema.

- Object level
  Users can perform this task for any object for which they have statistics collection privileges.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Returns

This function returns the name of the new execution.

Usage Notes

The results of the execution depend on user privileges and the type of rules:

- System
  To perform the operation on system-level rules, you must have both the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges.

- Operation
  If you have the `ANALYZE ANY` and `ANALYZE ANY DICTIONARY` privileges, then you can execute this function for all operations. If you have only the `ANALYZE ANY` privilege, then you can execute this function for operations related to any schemas except `SYS`. If you have only the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function for operations related to any schemas, including `SYS`. If you have neither the `ANALYZE ANY` nor the `ANALYZE ANY DICTIONARY` privilege, then you can execute this function only for operations in your own schema.

- Object
  If you have the privilege to collect statistics for an object, then you can execute this function for the object.

Example 162-9 Creating and Executing a Task

This example creates an Optimizer Statistics Advisor task named `my_task`, and then executes it.

```sql
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
  -- execute the task
  v_tname := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
```
162.7.34 EXPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_COLUMN_STATS (  
    ownname  VARCHAR2,
    tabname  VARCHAR2,
    colname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 162-40  EXPORT_COLUMN_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if <code>partname</code> is <code>NULL</code>, then global and partition column statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within <code>stattab</code></td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different than <code>ownname</code>)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE` ANY privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- Oracle does not support export or import of statistics across databases of different character sets.
162.7.35 EXPORT_DATABASE_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing `TRUE` for the `add_sys` parameter.

**Syntax**

```sql
DBMS_STATS.EXPORT_DATABASE_PREFS (
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL,
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Statistics table name to where statistics should be exported</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value <code>TRUE</code> will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Insufficient privileges

**Usage Notes**

- To run this procedure, you need to have the SYSDBA role, or both `ANALYZE ANY DICTIONARY` and `ANALYZE ANY system privileges`.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

**Examples**

```sql
DBMS_STATS.EXPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```

162.7.36 EXPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database and stores them in the user statistics tables identified by `statown.stattab`.

**Syntax**

```sql
DBMS_STATS.EXPORT_DATABASE_STATS (
    stattab         VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```
Parameters

Table 162-42  EXPORT_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated</td>
</tr>
<tr>
<td></td>
<td>by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics</td>
</tr>
<tr>
<td></td>
<td>(Default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>If 'OBJECT_STATS, SYNOPSES' is specified, table statistics,</td>
</tr>
<tr>
<td></td>
<td>column statistics, index statistics and synopses are deleted.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

• To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

• Oracle does not support export or import of statistics across databases of different character sets.

162.7.37 EXPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_DICTIONARY_STATS (
    stattab VARCHAR2,  
    statid VARCHAR2 DEFAULT NULL, 
    statown VARCHAR2 DEFAULT NULL, 
    stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

Table 162-43  EXPORT_DICTIONARY_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
</tbody>
</table>
Table 162-43  (Cont.) EXPORT_DICTIONARY_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>
| stat_category | Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:  
  • OBJECT_STATS - table statistics, column statistics and index statistics (Default)  
  • SYNOPSES - information to support incremental statistics  
  If 'OBJECT_STATS, SYNOPSES' is specified, table statistics, column statistics, index statistics and synopses are deleted. |

Usage Notes

• You must have the SYSDBA or ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.

• Oracle does not support export or import of statistics across databases of different character sets.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

162.7.38 EXPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables and stores them in the user statistics table identified by stattab.

Syntax

```
DBMS_STATS.EXPORT_FIXED_OBJECTS_STATS (  
  stattab VARCHAR2,  
  statid VARCHAR2 DEFAULT NULL,  
  statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-44  EXPORT_FIXED_OBJECTS_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>
Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table, may need to upgrade it

Usage Notes

• To invoke this subprogram you need to be connected as SYS or have the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege

• Oracle does not support export or import of statistics across databases of different character sets.

162.7.39 EXPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index and stores them in the user statistics table identified by `stattab`.

Syntax

```sql
DBMS_STATS.EXPORT_INDEX_STATS (
    ownname  VARCHAR2,
    indname  VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab  VARCHAR2,
    statid   VARCHAR2 DEFAULT NULL,
    statown  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-45  EXPORT_INDEX_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

• To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
Oracle does not support export or import of statistics across databases of different character sets.

### 162.7.40 EXPORT_PENDING_STATS Procedure

This procedure is used to export the statistics gathered and stored as pending.

**Syntax**

```sql
DBMS_STATS.EXPORT_PENDING_STATS(
    ownname IN VARCHAR2 DEFAULT USER,
    tabname IN VARCHAR2,
    stattab IN VARCHAR2,
    statid IN VARCHAR2 DEFAULT NULL,
    statown IN VARCHAR2 DEFAULT USER);
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: Object does not exist or insufficient privileges

**Usage Notes**

- If the parameter `tabname` is `NULL` then export applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.
- To run this procedure, you need to have the same privilege for gathering statistics on the tables that will be touched by this procedure.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

**Examples**

```sql
DBMS_STATS.EXPORT_PENDING_STATS(NULL, NULL, 'MY_STAT_TABLE');
```
162.7.41 EXPORT_SCHEMA_PREFS Procedure

This procedure is used to export the statistics preferences of all the tables owned by the specified owner name.

Syntax

```sql
DBMS_STATS.EXPORT_SCHEMA_PREFS (  
  ownname   IN  VARCHAR2,  
  stattab   IN  VARCHAR2,  
  statid    IN  VARCHAR2 DEFAULT NULL,  
  statown   IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name to where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.EXPORT_SCHEMA_PREFS('SH', 'STAT');
```

162.7.42 EXPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname and stores them in the user statistics tables identified by stattab.

Syntax

```sql
DBMS_STATS.EXPORT_SCHEMA_STATS (  
  ownname         VARCHAR2,  
  stattab         VARCHAR2,  
  statid          VARCHAR2 DEFAULT NULL,  
  statown         VARCHAR2 DEFAULT NULL,  
  stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Chapter 162 Summary of DBMS_STATS Subprograms

ORA-20000: Object does not exist or insufficient privileges
Parameters

Table 162-48  EXPORT_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSIS - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>If 'OBJECT_STATS, SYNOPSIS' is specified, table statistics, column statistics, index statistics and synopses are deleted.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

• To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

• Oracle does not support export or import of statistics across databases of different character sets.

162.7.43 EXPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics and stores them in the user statistics table, identified by stattab.

Syntax

DBMS_STATS.EXPORT_SYSTEM_STATS (  
    stattab VARCHAR2,  
    statid VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL);  

Parameters

Table 162-49  EXPORT_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table that describes where the statistics will be stored</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics stored from the stattab</td>
</tr>
</tbody>
</table>
Table 162-49  (Cont.) EXPORT_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Security Model

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to export system statistics

Usage Notes

Oracle Database does not support the export or import of statistics across databases of different character sets.

162.7.44 EXPORT_TABLE_PREFS Procedure

This procedure is used to export the statistics preferences of the specified table in the specified schema into the specified statistics table.

Syntax

```sql
DBMS_STATS.EXPORT_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    stattab    IN  VARCHAR2,
    statid     IN  VARCHAR2 DEFAULT NULL,
    statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-50  EXPORT_TABLE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name where to export the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
Usage Notes

• To run this procedure, you need to connect as owner of the table, or have the 
  ANALYZE ANY system privilege.

• All arguments are of type VARCHAR2 and values are enclosed in quotes.

• Oracle does not support export or import of statistics across databases of different 
  character sets.

Examples

DBMS_STATS.EXPORT_TABLE_PREFS('SH', 'SALES', 'STAT');

162.7.45 EXPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table and stores them in the user 
statistics table. Cascade results in all index statistics associated with the specified 
table being exported as well.

Syntax

DBMS_STATS.EXPORT_TABLE_STATS ( 
    ownname VARCHAR2, 
    tabname VARCHAR2, 
    partname VARCHAR2 DEFAULT NULL, 
    stattab VARCHAR2, 
    statid VARCHAR2 DEFAULT NULL, 
    cascade BOOLEAN DEFAULT TRUE, 
    statown VARCHAR2 DEFAULT NULL, 
    stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);

Parameters

Table 162-51  EXPORT_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are exported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, then column and index statistics for this table are also exported.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>
Table 162-51  (Cont.) EXPORT_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| stat_category | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:  
  • OBJECT_STATS - table statistics, column statistics and index statistics (default)  
  • SYNOPSES - information to support incremental statistics  
  The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. |

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

• To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

• Oracle does not support export or import of statistics across databases of different character sets.

162.7.46 FLUSH_DATABASE_MONITORING_INFO Procedure

This procedure saves monitoring information for all tables in the dictionary. The database immediately updates corresponding entries in the *_TAB_MODIFICATIONS, *_TAB_STATISTICS and *_IND_STATISTICS views.

Syntax

DBMS_STATS.FLUSH_DATABASE_MONITORING_INFO;

Security Model

The ANALYZE_ANY system privilege is required to run this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

Starting in Oracle Database 12c Release 2 (12.2), you do not need to call FLUSH_DATABASE_MONITORING_INFO to view the latest information in *_TAB_STATISTICS and *_IND_STATISTICS because these views show statistics cached in the SGA and stored on disk. Because the GATHER_*_STATS procedures internally save monitoring information to disk, it is not necessary to run this procedure before gathering statistics.
162.7.47 GATHER_DATABASE_STATS Procedures

This procedure gathers statistics for all objects in the database.

Syntax

```sql
DBMS_STATS.GATHER_DATABASE_STATS (  
estimate_percent NUMBER DEFAULT to_estimate_percent_type  
(block_sample BOOLEAN DEFAULT FALSE,  
method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),  
granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
options VARCHAR2 DEFAULT 'GATHER',  
objlist OUT ObjectTab,  
statown VARCHAR2 DEFAULT NULL,  
gather_sys BOOLEAN DEFAULT TRUE,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),  
obj_filter_list ObjectTab DEFAULT NULL);
```

```sql
DBMS_STATS.GATHER_DATABASE_STATS (  
estimate_percent NUMBER DEFAULT to_estimate_percent_type  
(block_sample BOOLEAN DEFAULT FALSE,  
method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),  
granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
options VARCHAR2 DEFAULT 'GATHER',  
statown VARCHAR2 DEFAULT NULL,  
gather_sys BOOLEAN DEFAULT TRUE,  
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),  
obj_filter_list ObjectTab DEFAULT NULL);
```
Parameters

Table 162-52  GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</td>
</tr>
</tbody>
</table>
| method_opt     | When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed.:

  - FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]

  size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}

  - integer: Number of histogram buckets. Must be in the range [1,2048].
  - REPEAT: Collects histograms only on the columns that already have histograms.
  - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.
  - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.

  The default is FOR ALL COLUMNS SIZE AUTO. The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
Table 162-52  (Cont.) GATHER_DATABASE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>degree</strong></td>
<td>Determines the degree of parallelism used for gathering statistics. The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</td>
</tr>
<tr>
<td><strong>granularity</strong></td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics</td>
</tr>
<tr>
<td><strong>cascade</strong></td>
<td>Determines whether to collect index statistics as part of gathering table statistics. Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO_CASCADE to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</td>
</tr>
<tr>
<td><strong>stattab</strong></td>
<td>User statistics table identifier describing where to save the current statistics. The statistics table is assumed to reside in the same schema as the object being analyzed, so there must be one such table in each schema to use this option.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab.</td>
</tr>
<tr>
<td>options</td>
<td>Specifies which objects require statistics to be gathered. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics on all objects in the database. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameter is</td>
</tr>
<tr>
<td></td>
<td>• GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale.</td>
</tr>
<tr>
<td></td>
<td>• GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</td>
</tr>
<tr>
<td></td>
<td>• LIST AUTO — Returns a list of objects to be processed with GATHER AUTO.</td>
</tr>
<tr>
<td></td>
<td>• LIST STALE — Returns list of stale objects as determined by looking at the *_TAB_MODIFICATIONS views.</td>
</tr>
<tr>
<td></td>
<td>• LIST EMPTY — Returns a list of objects that currently have no statistics.</td>
</tr>
<tr>
<td>objlist</td>
<td>List of objects found to be stale or empty</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>gather_sys</td>
<td>Gathers statistics on the objects owned by the SYS user.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</td>
</tr>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, GATHER_DATABASE_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) or (o.a2 like s2) or ... is true.</td>
</tr>
</tbody>
</table>

**Exceptions**

ORA-20000: insufficient privileges
ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM ... This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

162.7.48 GATHER_DICTIONARY_STATS Procedure

This procedure gathers statistics for dictionary schemas SYS, SYSTEM and schemas of RDBMS components.

Syntax

```sql
DBMS_STATS.GATHER_DICTIONARY_STATS (comp_id VARCHAR2 DEFAULT NULL,
estimate_percent NUMBER DEFAULT to_estimate_percent_type (get_param('ESTIMATE_PERCENT')),
block_sample BOOLEAN DEFAULT FALSE,
method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),
degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),
granularity VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),
stattab VARCHAR2 DEFAULT NULL,
statid VARCHAR2 DEFAULT NULL,
options VARCHAR2 DEFAULT 'GATHER AUTO',
objlist OUT ObjectTab,
statown VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
obj_filter_list ObjectTab DEFAULT NULL);
```

162-85
Parameters

Table 162-53  GATHER_DICTIONARY_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>comp_id</td>
<td>Component id of the schema to analyze. NULL results in the analysis of schemas for all RDBMS components. Refer to the COMP_ID column of DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute). The valid range is [0.000001, 100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Determines whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>The method options. This parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>- integer : Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT : Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>- AUTO : Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY : Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>

Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true. See Applying an Object Filter List.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM ..... This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Index does not exist or insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it

162.7.49 GATHER_FIXED_OBJECTS_STATS Procedure

This procedure gathers statistics for all fixed objects (dynamic performance tables).

Syntax

DBMS_STATS.GATHER_FIXED_OBJECTS_STATS (
stattab VARCHAR2 DEFAULT NULL,
statid VARCHAR2 DEFAULT NULL,
statown VARCHAR2 DEFAULT NULL,
no_invalidate BOOLEAN DEFAULT to_no_invalidate_type {
    get_param('NO_INVALIDATE')
});

Parameters

Table 162-54 GATHER_FIXED_OBJECTS_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier to associate with these statistics within stattab (optional)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

You must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege to execute this procedure.
Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Bad input value
ORA-20002: Bad user statistics table, may need to upgrade it

162.7.50 GATHER_INDEX_STATS Procedure

This procedure gathers index statistics. It attempts to parallelize as much of the work as possible.

Restrictions are described in the individual parameters. This operation will not parallelize with certain types of indexes, including cluster indexes, domain indexes, and bitmap join indexes. The granularity and no_invalidate arguments are not relevant to these types of indexes.

Syntax

```sql
DBMS_STATS.GATHER_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type
                         (GET_PARAM('ESTIMATE_PERCENT')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL,
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type
                         (GET_PARAM('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE);
```

<td><strong>granularity</strong></td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.</td>
</tr>
<tr>
<td><strong>no_invalidate</strong></td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS</code> Procedure, <code>SET_GLOBAL_PREFS</code> Procedure, <code>SET_SCHEMA_PREFS</code> Procedure and <code>SET_TABLE_PREFS</code> Procedure.</td>
</tr>
<tr>
<td><strong>force</strong></td>
<td>Gather statistics on object even if it is locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Index does not exist or insufficient privileges

ORA-20001: Bad input value

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
162.7.51 GATHER_PROCESSING_RATE Procedure

This procedure starts the job of gathering the processing rates which end after an interval defined in minutes.

Syntax

```
DBMS_STATS.GATHER_PROCESSING_RATE (  
gathering_mode IN VARCHAR2 DEFAULT 'START',  
interval IN NUMBER DEFAULT NULL);
```

Parameters

**Table 162-56  GATHER_PROCESSING_RATE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gathering_mode</td>
<td>Mode: 'START' or 'END'. The mode is based on the Active Session History (ASH) data when invoked with 'START' option. It stops gathering when invoked with 'END' option. When invoked with 'START', 'interval' option can be specified optionally. If interval is not specified, its default value is set to 60 minutes.</td>
</tr>
<tr>
<td>interval</td>
<td>Time interval (number of minutes) for which the processing must be gathered</td>
</tr>
</tbody>
</table>

Usage Notes

- You require the OPTIMIZER_PROCESSING_RATE role to run this procedure.
- **AUTO DOP** uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or illegal input value

162.7.52 GATHER_SCHEMA_STATS Procedures

This procedure gathers statistics for all objects in a schema.

Syntax

```
DBMS_STATS.GATHER_SCHEMA_STATS (  
  ownname VARCHAR2,  
  estimate_percent NUMBER DEFAULT to_estimate_percent_type  
  (get_param('ESTIMATE_PERCENT')),  
  block_sample BOOLEAN DEFAULT FALSE,  
  method_opt VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree NUMBER DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity VARCHAR2 DEFAULT get_param('GRANULARITY'),  
  cascade BOOLEAN DEFAULT to_cascade_type(get_param('CASCADE')),  
  stattab VARCHAR2 DEFAULT NULL,  
  statid VARCHAR2 DEFAULT NULL,  
  options VARCHAR2 DEFAULT 'GATHER',  
  objlist OUT ObjectTab,
```

Chapter 162  Summary of DBMS_STATS Subprograms
```sql
statown          VARCHAR2 DEFAULT NULL,
no_invalidate    BOOLEAN DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
force            BOOLEAN DEFAULT FALSE,
obj_filter_list  ObjectTab DEFAULT NULL);
```

```sql
DBMS_STATS.GATHER_SCHEMA_STATS (    
    ownname          VARCHAR2,
    estimate_percent NUMBER   DEFAULT to_estimate_percent_type (get_param('ESTIMATE_PERCENT')),
    block_sample     BOOLEAN  DEFAULT FALSE,
    method_opt       VARCHAR2 DEFAULT get_param('METHOD_OPT'),
    degree           NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),
    granularity      VARCHAR2 DEFAULT get_param('GRANULARITY'),
    cascade          BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    options          VARCHAR2 DEFAULT 'GATHER',
    statown          VARCHAR2 DEFAULT NULL,
    no_invalidate    BOOLEAN  DEFAULT to_no_invalidate_type (get_param('NO_INVALIDATE')),
    force            BOOLEAN DEFAULT FALSE,
    obj_filter_list  ObjectTab DEFAULT NULL);
```

### Parameters

**Table 162-57  GATHER_SCHEMA_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema to analyze (NULL means current schema)</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
Table 162-57 (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>method_opt</td>
<td>Accepts:</td>

<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE {integer</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td></td>
<td>NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement.</td>
</tr>
<tr>
<td></td>
<td>Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned).</td>
</tr>
<tr>
<td></td>
<td>'ALL' - Gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td></td>
<td>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</td>
</tr>
<tr>
<td></td>
<td>'GLOBAL' - Gathers global statistics</td>
</tr>
<tr>
<td></td>
<td>'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td></td>
<td>'PARTITION' - Gathers partition-level statistics</td>
</tr>
<tr>
<td></td>
<td>'SUBPARTITION' - Gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
Table 162-57  (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade</td>
<td>Gather statistics on the indexes as well. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>options</td>
<td>Specifies which objects require statistics to be gathered. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics on all objects in the schema. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</td>
</tr>
<tr>
<td></td>
<td>• GATHER STALE — Gathers statistics on stale objects by querying the *_TAB_MODIFICATIONS views. Also, the database returns a list of objects found to be stale.</td>
</tr>
<tr>
<td></td>
<td>• GATHER EMPTY — Gathers statistics on objects that currently have no statistics. Also, the database returns a list of objects found to have no statistics.</td>
</tr>
<tr>
<td></td>
<td>• LIST AUTO — Returns a list of objects to be processed with GATHER AUTO.</td>
</tr>
<tr>
<td></td>
<td>• LIST STALE — Returns list of stale objects as determined by looking at the * _TAB_MODIFICATIONS views.</td>
</tr>
<tr>
<td></td>
<td>• LIST EMPTY — Returns a list of objects that currently have no statistics.</td>
</tr>
<tr>
<td>objlist</td>
<td>List of objects found to be stale or empty</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO Invalidate to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Gather statistics on objects even if they are locked</td>
</tr>
</tbody>
</table>
Table 162-57  (Cont.) GATHER_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. When provided, GATHER_SCHEMA_STATS will gather statistics only on objects which satisfy at least one object filter in the list as needed. In a single object filter, we can specify the constraints on the object attributes. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcard is allowed in the attribute values. Suppose non-NULL values s1, s2, ... are specified for attributes a1, a2, ... in one object filter. An object o is said to satisfy this object filter if (o.a1 like s1) and (o.a2 like s2) and ... is true.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you must be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER AUTO is used:

- A table is created like this: CREATE TABLE NEWTAB as SELECT * FROM .... This will create statistics on NEWTAB but no histograms.
- Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.
- The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges
ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that the tables SH.SALES and SH.COSTS, if stale, will have statistics gathered upon them.

DECLARE
    filter_lst DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SH';
    filter_lst(1).objname := 'SALES';
    filter_lst(2).ownname := 'SH';
    filter_lst(2).objname := 'COSTS';
    DBMS_STATS.GATHER_SCHEMA_STATS(ownname=>'SH',obj_filter_list=>filter_lst);
END;
162.7.53 GATHER_SYSTEM_STATS Procedure

This procedure gathers system statistics.

Syntax

```sql
DBMS_STATS.GATHER_SYSTEM_STATS (  
gathering_mode VARCHAR2 DEFAULT 'NOWORKLOAD',  
interval INTEGER DEFAULT NULL,  
stattab VARCHAR2 DEFAULT NULL,  
statid VARCHAR2 DEFAULT NULL,  
statown VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-58  GATHER_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gathering_mode</td>
<td>Specifies the mode in which the database gathers system statistics. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• NOWORKLOAD</td>
</tr>
<tr>
<td></td>
<td>The database captures performance characteristics of the I/O system. Gathering may take a few minutes and depends on the size of the database. During this period, the database estimates the average read seek time and transfer speed for the I/O system. This mode is suitable for the all workloads. To fine tune system statistics for the workload, use START and STOP or the INTERVAL option. If you gather both NOWORKLOAD and workload-specific statistics (statistics collected using INTERVAL or START and STOP), the optimizer uses the workload statistics. Collected components include cpuspeednw, ioseektim, and iotfrspeed.</td>
</tr>
<tr>
<td></td>
<td>• INTERVAL</td>
</tr>
<tr>
<td></td>
<td>The database captures system activity during a specified interval in minutes. This parameter works in combination with the interval parameter. The database creates or updates system statistics in the dictionary or stattab. You can use GATHER_SYSTEM_STATS (gathering_mode=&gt;'STOP') to stop gathering earlier than scheduled. Collected components include maxthr, slavethr, cpuspeed, sreadtim, mreadtim, and mbrc.</td>
</tr>
<tr>
<td></td>
<td>• EXADATA</td>
</tr>
<tr>
<td></td>
<td>In this mode, gathered system statistics take into account the unique capabilities of Oracle Exadata, such as large I/O size and high I/O throughput. The database sets multiblock read count and I/O throughput statistics along with CPU speed.</td>
</tr>
<tr>
<td>interval</td>
<td>Specifies the number of minutes in which to gather system statistics. This parameter applies only when gathering_mode='INTERVAL'.</td>
</tr>
<tr>
<td>stattab</td>
<td>Specifies the table in which the database stores the statistics.</td>
</tr>
</tbody>
</table>
Table 162-58  (Cont.) GATHER_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statid</td>
<td>Specifies an optional identifier associated with the statistics saved in stattab.</td>
</tr>
<tr>
<td>statown</td>
<td>Specifies the schema containing stattab, if different from the current schema.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Error in the INTERVAL mode: system parameter job_queue_processes must be >0

Usage Notes

To run this procedure, you must have the GATHER_SYSTEM_STATISTICS role.

Examples

Assume that you want to perform database application processing OLTP transactions during the day and run reports at night.

To collect daytime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab => 'mystats',
    statid => 'OLTP');
END;

To collect nighttime system statistics, gather statistics for 720 minutes. Store the statistics in the MYSTATS table.

BEGIN
  DBMS_STATS.GATHER_SYSTEM_STATS (
    interval => 720,
    stattab => 'mystats',
    statid => 'OLAP');
END;

Update the dictionary with the gathered statistics.

VARIABLE   jobno   number;
BEGIN
  DBMS_JOB.SUBMIT (:jobno, 'DBMS_STATS.IMPORT_SYSTEM_STATS (''mystats'', ''OLTP'');'
    sysdate, 'sysdate + 1');
  COMMIT;
162.7.54 GATHER_TABLE_STATS Procedure

This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

Syntax

```
DBMS_STATS.GATHER_TABLE_STATS (  
  ownname        VARCHAR2,  
  tabname        VARCHAR2,  
  partname       VARCHAR2 DEFAULT NULL,  
  estimate_percent NUMBER   DEFAULT to_estimate_percent_type  
                   (get_param('ESTIMATE_PERCENT')),  
  block_sample   BOOLEAN  DEFAULT FALSE,  
  method_opt     VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree         NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity    VARCHAR2 DEFAULT get_param('GRANULARITY'),  
  cascade        BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),  
  stattab        VARCHAR2 DEFAULT NULL,  
  statid         VARCHAR2 DEFAULT NULL,  
  statown        VARCHAR2 DEFAULT NULL,  
  no_invalidate  BOOLEAN  DEFAULT to_no_invalidate_type (  
                   get_param('NO_INVALIDATE')),  
  stattype       VARCHAR2 DEFAULT 'DATA',  
  force          BOOLEAN  DEFAULT FALSE,  
  context        DBMS_STATS.CCONTEXT DEFAULT NULL, -- non operative  
  options        VARCHAR2 DEFAULT get_param('OPTIONS'));  
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema containing the table.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the partition.</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. You can change the default value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>
Table 162-59  (Cont.) GATHER_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>block_sample</td>
<td>Determines whether the database uses random block sampling (TRUE) or random row sampling (FALSE). The default is FALSE. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>METHOD_OPT - When setting preference on global, schema, database or dictionary level, only 'FOR ALL' syntax is allowed. Other than that, method_opt accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>• FOR COLUMNS [column_clause] [size_clause]</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE (integer</td>
</tr>
<tr>
<td></td>
<td>column_clause is defined as column_clause := column_name</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>- column_name: Name of a column</td>
</tr>
<tr>
<td></td>
<td>- extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression</td>
</tr>
</tbody>
</table>

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
### Table 162-59  (Cont.) GATHER_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>degree</td>
<td>Determines the degree of parallelism used for gathering statistics. The default for degree is NULL. NULL means to use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. The degree is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters), according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution when the size of the object does not warrant parallel execution.</td>
</tr>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
Table 162-59 (Cont.) GATHER_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade</td>
<td>Determines whether to collect index statistics as part of gathering table statistics. Specifying this option is equivalent to running the GATHER_INDEX_STATS procedure on each index of the table. Use the constant DBMS_STATS.AUTO.Cascade to enable the database to determine whether index statistics need to be collected. This is the default. You can change the default using the SET_DATABASE_PREFS, SET_GLOBAL_PREFS, SET_SCHEMA_PREFS, and SET_TABLE_PREFS procedures.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</td>
</tr>
<tr>
<td>stattype</td>
<td>Statistics type. The only value allowed is DATA.</td>
</tr>
<tr>
<td>force</td>
<td>Gather statistics of table even if it is locked</td>
</tr>
<tr>
<td>context</td>
<td>Not used.</td>
</tr>
<tr>
<td>options</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values: • GATHER — Gathers statistics for all objects in the table. This is the default. • GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Index statistics collection can be parallelized except for cluster, domain and join indexes.

If the GATHER AUTO option is used then frequency histograms will be created using a sample rather than a full scan. The following scenario shows where GATHER_AUTO is used:
• A table is created like this:

```
CREATE TABLE NEWTAB as SELECT * FROM ..... 
```

This will create statistics on NEWTAB but no histograms.

• Next, the DBA creates the histograms using GATHER AUTO on gather_table_stats.

• The FREQUENCY histograms on NEWTAB will be created using a sample rather than a full table scan.

Exceptions

ORA-20000: Table does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

An extension can be either a column group (see Example 1) or an expression (see Example 2).

Example 1

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (empno, deptno)');
```

Example 2

```
DBMS_STATS.GATHER_TABLE_STATS(
    'SH', 'SALES', method_opt => 'FOR COLUMNS (sal+comm)');
```

162.7.55 GENERATE_STATS Procedure

This deprecated procedure generates object statistics from previously collected statistics of related objects. The currently supported objects are b-tree and bitmap indexes.

> **Note:**

This subprogram has been deprecated and replaced by improved technology. It is maintained only for purposes of backward compatibility. As an alternative, use the GATHER_INDEX_STATS procedure. See "GATHER_INDEX_STATS Procedure".

Syntax

```
DBMS_STATS.GENERATE_STATS ( 
    ownname VARCHAR2, 
    objname VARCHAR2, 
    organized NUMBER DEFAULT 7, 
    force BOOLEAN default FALSE); 
```
Parameters

Table 162-60 GENERATE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of object</td>
</tr>
<tr>
<td>objname</td>
<td>Name of object</td>
</tr>
<tr>
<td>organized</td>
<td>Amount of ordering associated between the index and its underlying table. A heavily organized index would have consecutive index keys referring to consecutive rows on disk for the table (the same block). A heavily disorganized index would have consecutive keys referencing different table blocks on disk. This parameter is only used for b-tree indexes. The number can be in the range of 0-10, with 0 representing a completely organized index and 10 a completely disorganized one.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, generates statistics for the target object even if it is locked</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

For fully populated schemas, the gather procedures should be used instead when more accurate statistics are desired.

Exceptions

ORA-20000: Unsupported object type of object does not exist
ORA-20001: Invalid option or invalid statistics

162.7.56 GET_ADVISOR_OPR_FILTER Procedure

This procedure creates an operation filter for an Optimizer Statistics Advisor task.

Syntax

`DBMS_STATS.GET_ADVISOR_OPR_FILTER (opr_id IN NUMBER, opr_filter IN OUT NOCOPY StatsAdvOpr);`

Parameters

Table 162-61 GET_ADVISOR_OPR_FILTER Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opr_id</td>
<td>The ID of the statistics operation stored in the DBA_OPTSTAT_OPERATIONS view.</td>
</tr>
<tr>
<td>opr_filter</td>
<td>The Optimizer Statistics Advisor filter that is generated based on the specified statistics operation.</td>
</tr>
</tbody>
</table>
Security Model

Note the following:

• To execute this subprogram, you must have the ADVISOR privilege.
• You must be the owner of the task.
• This subprogram executes using invoker's rights.

Exceptions

• ORA-20000: Insufficient privileges
• ORA-20001: Invalid input values
• ORA-20012: Optimizer Statistics Advisor errors

Usage Notes

You can specify the filter using either the operation ID or the filter ID, but not both at the same time.

162.7.57 GET_ADVISOR_RECS Function

This function generates a recommendation report for the specified item.

Syntax

```sql
DBMS_STATS.GET_ADVISOR_RECS(
  ownname IN VARCHAR2,
  tabname IN VARCHAR2,
  rec IN VARCHAR2,
  type IN VARCHAR2 := 'TEXT')
RETURN CLOB;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The owner of the table.</td>
</tr>
<tr>
<td>tabname</td>
<td>The name of the table.</td>
</tr>
</tbody>
</table>
Table 162-62  (Cont.) GET_ADVISOR_RECS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| rec       | The Optimizer Statistics Advisor recommendation.  
|           | • INCREMENTAL  
|           | When only a small number of range partitions are modified, this option improves the performance of statistics gathering dramatically. However, it requires additional space to store synopses for maintaining incremental statistics. The report analyzes this trade-off.  
|           | • CONCURRENT  
|           | The report recommends either setting the CONCURRENT preference, or specifying AUTO_DEGREE for individual tables. If the system resources and usage satisfies the conditions, the advisor always recommends setting CONCURRENT first. The advisor only recommends AUTO_DEGREE when statistics gathering on an individual table take a long time and the CONCURRENT preference is already set. |
| type      | Type of the report: TEXT, HTML, or XML. |

Security Model

Note the following:

• To execute this subprogram, you must have the ADVISOR privilege.
• You must have the privileges to gather statistics for the objects for which recommendations are generated.
• You must be the owner of the task.
• This subprogram executes using invoker's rights.

Usage Notes

The advisor does not make recommendations for manual statistics gathering. The database only make recommendations for automatic statistics gathering jobs, with the main goal of finishing the job within the maintenance window. As long as the automatic job finishes, the database does not make further recommendations.

Exceptions

• ORA-20000: Insufficient privileges
• ORA-20001: Invalid input values
• ORA-20012: Optimizer Statistics Advisor errors
162.7.58 GET_COLUMN_STATS Procedures

These procedures get all column-related information. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

Syntax

```sql
DBMS_STATS.GET_COLUMN_STATS (
  ownname     VARCHAR2,
  tabname     VARCHAR2,
  colname     VARCHAR2,
  partname    VARCHAR2 DEFAULT NULL,
  stattab     VARCHAR2 DEFAULT NULL,
  statid      VARCHAR2 DEFAULT NULL,
  distcnt OUT NUMBER,
  density OUT NUMBER,
  nullcnt OUT NUMBER,
  srec    OUT StatRec,
  avgclen OUT NUMBER,
  statown     VARCHAR2 DEFAULT NULL);
```

Use the following for user-defined statistics:

```sql
DBMS_STATS.GET_COLUMN_STATS (
  ownname          VARCHAR2,
  tabname          VARCHAR2,
  colname          VARCHAR2,
  partname         VARCHAR2 DEFAULT NULL,
  stattab          VARCHAR2 DEFAULT NULL,
  statid           VARCHAR2 DEFAULT NULL,
  ext_stats   OUT  RAW,
  stattypown  OUT  VARCHAR2 DEFAULT NULL,
  stattypname OUT  VARCHAR2 DEFAULT NULL,
  statown          VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 162-63 GET_COLUMN_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>The user-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
</tbody>
</table>
### Table 162-63 (Cont.) GET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattypname</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values</td>
</tr>
<tr>
<td>density</td>
<td>Column density</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs</td>
</tr>
<tr>
<td>srec</td>
<td>Structure holding internal representation of column minimum, maximum, and histogram values</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length of the column (in bytes)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>

### Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

### Usage Notes

Before invoking this procedure, ensure that the table exists.

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

### 162.7.59 GET_INDEX_STATS Procedures

This overloaded procedure gets all index-related statistics. In the form of this procedure that deals with user-defined statistics, the statistics type returned is the type stored, in addition to the user-defined statistics.

#### Syntax

```sql
DBMS_STATS.GET_INDEX_STATS (  
    ownname VARCHAR2,  
    indname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    numrows OUT NUMBER,  
    numblks OUT NUMBER,  
    numdist OUT NUMBER,  
    avgbblk OUT NUMBER,  
    avgdblk OUT NUMBER,  
    clstfct OUT NUMBER,  
    indlevel OUT NUMBER,  
    statown VARCHAR2 DEFAULT NULL);  
```
Use the following form of the procedure for user-defined statistics:

```sql
DBMS_STATS.GET_INDEX_STATS (
    ownname          VARCHAR2,
    indname          VARCHAR2,
    partname         VARCHAR2 DEFAULT NULL,
    stattab          VARCHAR2 DEFAULT NULL,
    statid           VARCHAR2 DEFAULT NULL,
    ext_stats   OUT  RAW,
    stattypown  OUT  VARCHAR2 DEFAULT NULL,
    stattypname OUT  VARCHAR2 DEFAULT NULL,
    statown          VARCHAR2 DEFAULT NULL);
```

### Parameters

**Table 162-64 GET_INDEX_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition for which to get the statistics. If the index is partitioned and if partname is NULL, then the statistics are retrieved for the global index level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>User-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
<tr>
<td>stattypname</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the index (partition)</td>
</tr>
<tr>
<td>numlblks</td>
<td>Number of leaf blocks in the index (partition)</td>
</tr>
<tr>
<td>numdist</td>
<td>Number of distinct keys in the index (partition)</td>
</tr>
<tr>
<td>avglblk</td>
<td>Average integral number of leaf blocks in which each distinct key appears for this index (partition)</td>
</tr>
<tr>
<td>avgdblk</td>
<td>Average integral number of data blocks in the table pointed to by a distinct key for this index (partition)</td>
</tr>
<tr>
<td>clstfct</td>
<td>Clustering factor for the index (partition)</td>
</tr>
<tr>
<td>indlevel</td>
<td>Height of the index (partition)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
</tbody>
</table>
Table 162-64 (Cont.) GET_INDEX_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>guessq</td>
<td>Guess quality for the index (partition)</td>
</tr>
</tbody>
</table>

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- The database maintains cachedblk and cachehit at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for automatic mode or DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each cachehit and a cachedblk for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.

- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  - When not enough data has been analyzed, such as when an object has been recently created
  - When the system does not have one major workload resulting in averages not corresponding to real values

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics
162.7.60 GET_PARAM Function

This function returns the default value of parameters of DBMS_STATS procedures.

Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the GET_PREFS Function.

See also DBMS_STATS Deprecated Subprograms.

Syntax

```
DBMS_STATS.GET_PARAM (  
   pname     IN   VARCHAR2)  
RETURN VARCHAR2;
```

Parameters

Table 162-65  GET_PARAM Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>Parameter name</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid input values

162.7.61 GET_PREFS Function

This function returns the default value of the specified preference.

Syntax

```
DBMS_STATS.GET_PREFS (  
   pname     IN   VARCHAR2,  
   ownname   IN   VARCHAR2 DEFAULT NULL,  
   tabname   IN   VARCHAR2 DEFAULT NULL)  
RETURN VARCHAR2;
```
### Table 162-66  GET_PREFS Function Parameters

<table>
<thead>
<tr>

### Table 162-67 Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPROXIMATE_NDV_ALGORITHM</td>
<td>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values.</td>
</tr>
<tr>
<td></td>
<td>You can delete the following preferences:</td>
</tr>
<tr>
<td></td>
<td>• REPEAT OR HYPERLOGLOG</td>
</tr>
<tr>
<td></td>
<td>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</td>
</tr>
<tr>
<td></td>
<td>• ADAPTIVE_SAMPLING</td>
</tr>
<tr>
<td></td>
<td>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</td>
</tr>
<tr>
<td></td>
<td>• HYPERLOGLOG</td>
</tr>
<tr>
<td></td>
<td>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</td>
</tr>
<tr>
<td></td>
<td>- The accuracy of the new algorithm is similar to the original algorithm.</td>
</tr>
<tr>
<td></td>
<td>- The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</td>
</tr>
<tr>
<td>AUTO_STAT_EXTENSIONS</td>
<td>Controls the automatic creation of extensions when database statistics are gathered.</td>
</tr>
<tr>
<td></td>
<td>You can set the following values:</td>
</tr>
<tr>
<td></td>
<td>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</td>
</tr>
<tr>
<td></td>
<td>• OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Determines whether index statistics are collected as part of gathering table statistics.</td>
</tr>
<tr>
<td>Preference Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CONCURRENT</td>
<td>Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• MANUAL — Concurrency is enabled only for manual statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• ALL — Concurrency is enabled for both manual and automatic statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• OFF — Concurrency is disabled for both manual and automatic statistics.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>Determines degree of parallelism used for gathering statistics.</td>
</tr>
<tr>
<td>ESTIMATE_PERCENT</td>
<td>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</td>
</tr>
<tr>
<td></td>
<td>• SHARED — All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>• SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</td>
</tr>
</tbody>
</table>
### Table 162-67  (Cont.) Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>GRANULARITY</strong></td>
<td>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td>• <strong>ALL</strong> — Gathers all statistics: subpartition, partition, and global.</td>
</tr>
<tr>
<td></td>
<td>• <strong>AUTO</strong> — Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• <strong>DEFAULT</strong> — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use <strong>GLOBAL AND PARTITION</strong> for this functionality.</td>
</tr>
<tr>
<td></td>
<td>• <strong>GLOBAL</strong> — Gathers global statistics.</td>
</tr>
<tr>
<td></td>
<td>• <strong>GLOBAL AND PARTITION</strong> — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td></td>
<td>• <strong>PARTITION</strong> — Gathers partition-level statistics.</td>
</tr>
<tr>
<td></td>
<td>• <strong>SUBPARTITION</strong> — Gathers subpartition-level statistics.</td>
</tr>
<tr>
<td><strong>INCREMENTAL</strong></td>
<td>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</td>
</tr>
<tr>
<td></td>
<td>• The <strong>INCREMENTAL</strong> value for the partitioned table is set to <strong>TRUE</strong>.</td>
</tr>
<tr>
<td></td>
<td>• The <strong>PUBLISH</strong> value for the partitioned table is set to <strong>TRUE</strong>.</td>
</tr>
<tr>
<td></td>
<td>• The user specifies <strong>AUTO_SAMPLE_SIZE</strong> for <strong>ESTIMATE_PERCENT</strong> and <strong>AUTO</strong> for <strong>GRANULARITY</strong> when gathering statistics on the table. If the <strong>INCREMENTAL</strong> value for the partitioned table was set to <strong>FALSE</strong> (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</td>
</tr>
</tbody>
</table>
Table 162-67  (Cont.) Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</td>
</tr>
<tr>
<td></td>
<td>• TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</td>
</tr>
</tbody>
</table>
Table 162-67  (Cont.) Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% of DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td>• NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics. Note that the following two executions are different:</td>
</tr>
<tr>
<td></td>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL'));</td>
</tr>
<tr>
<td></td>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</td>
</tr>
<tr>
<td></td>
<td>The first execution uses single quotes to set the preference to the value NULL, whereas the second</td>
</tr>
</tbody>
</table>
### Table 162-67  (Cont.) Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **METHOD_OPT**  | Sets the preference to the default, which is ALLOW_MIXED_FORMAT. Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:  
  - FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]  
  The size_clause is defined as size_clause :=  
  SIZE (integer | REPEAT | AUTO | SKEWONLY)  
  integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.  
  REPEAT — Collects histograms only on the columns that already have histograms.  
  AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.  
  SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.  
  The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
| **NO_INVALIDATE** | Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors.  
  If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately. |
| **OPTIONS** | Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:  
  - GATHER — Gathers statistics for all objects in the table. This is the default.  
  - GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics. |
Table 162-67  (Cont.) Preference Descriptions

<table>
<thead>
<tr>
<th>Preference Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| PREFERENCE_OVERRIDES_PARAMETER | Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:  
  • TRUE — Ignores input parameter values, and uses the value of the corresponding preference.  
  • FALSE — Obeys input parameter values.  
Specifying this preference does not change the order of precedence of table, global, and default. |
| PUBLISH | Determines whether the database publishes newly gathered statistics after the gathering job completes.  
You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them. |
| STALE_PERCENT | Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.  
The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale. |
| STAT_CATEGORY | Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:  
  • OBJECT_STATS - table statistics, column statistics and index statistics (default)  
  • SYNOPSES - information to support incremental statistics  
The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses. |
| TABLE_CACHED_BLOCKS | Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor. |
| WAIT_TIME_TO_UPDATE_STATS | Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode. |

Security Model

No special privilege or role is needed to invoke this procedure. To gather statistics concurrently, however, you must either have the DBA role, or have the following privileges in addition to privileges that are required for gathering statistics: CREATE JOB, MANAGE SCHEDULER, and MANAGE ANY QUEUE.
Exceptions

- ORA-20000: Unable to gather statistics concurrently: Resource Manager is not enabled.
- ORA-20001: Invalid input values

Usage Notes

Note the following guidelines:

- The CONCURRENT preference determines whether statistics are gathered concurrently when the user issues GATHER_*_STATS procedures. DBMS_STATS can collect statistics for a single object in parallel based on the value of the DEGREE parameter. However, parallelism is limited to one object. The CONCURRENT preference extends the scope of parallelism to multiple database objects. This approach is primarily intended for multi-CPU systems, and may not be suitable for small databases on single-CPU computers.

  To gather statistics concurrently, Resource Manager must be enabled, and the setting for the JOB_QUEUE_PROCESSES initialization parameter must be at least 4.

- If the ownname and tabname are provided, and if a preference has been entered for the table, then the function returns the preference as specified for the table. In all other cases, it returns the global preference if it has been specified, otherwise it returns the default value.

Oracle Database SQL Tuning Guide to learn how to get optimizer statistics preferences

162.7.62 GET_STATS_HISTORY_AVAILABILITY Function

This function returns oldest timestamp where statistics history is available. Users cannot restore statistics to a timestamp older than this one.

Syntax

DBMS_STATS.GET_STATS_HISTORY_AVAILABILITY
RETURN TIMESTAMP WITH TIMEZONE;

Usage Notes

No special privilege or role is needed to invoke this procedure.

162.7.63 GET_STATS_HISTORY_RETENTION Function

This function returns the current statistics history retention value.

Syntax

DBMS_STATS.GET_STATS_HISTORY_RETENTION
RETURN NUMBER;
Usage Notes

No special privilege or role is needed to invoke this procedure.

162.7.64 GET_SYSTEM_STATS Procedure

This procedure gets system statistics from `stattab`, or from the dictionary if `stattab` is NULL.

Syntax

```sql
DBMS_STATS.GET_SYSTEM_STATS (    status    OUT  VARCHAR2,
   dstart    OUT  DATE,
   dstop     OUT  DATE,
   pname     IN   VARCHAR2,
   pvalue    OUT  NUMBER,
   stattab   IN   VARCHAR2 DEFAULT NULL,
   statid    IN   VARCHAR2 DEFAULT NULL,
   statown   IN   VARCHAR2 DEFAULT NULL);
```

Parameters

Table 162-68  GET_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Output is one of the following:</td>
</tr>
<tr>
<td></td>
<td>•  COMPLETED:</td>
</tr>
<tr>
<td></td>
<td>•  AUTOGATHERING:</td>
</tr>
<tr>
<td></td>
<td>•  MANUALGATHERING:</td>
</tr>
<tr>
<td></td>
<td>•  BADSTATS:</td>
</tr>
<tr>
<td>dstart</td>
<td>Date when statistics gathering started.</td>
</tr>
<tr>
<td></td>
<td>If <code>status</code> = MANUALGATHERING, the start date is returned.</td>
</tr>
<tr>
<td>dstop</td>
<td>Date when statistics gathering stopped.</td>
</tr>
<tr>
<td></td>
<td>•  If <code>status</code> = COMPLETE, the finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>•  If <code>status</code> = AUTOGATHERING, the future finish date is returned.</td>
</tr>
<tr>
<td></td>
<td>•  If <code>status</code> = BADSTATS, the must-finished-by date is returned.</td>
</tr>
</tbody>
</table>
Table 162-68 (Cont.) GET_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pname</td>
<td>The parameter name to get, which can have one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• iotfrspeed - I/O transfer speed in bytes for each millisecond</td>
</tr>
<tr>
<td></td>
<td>• ioseektim - seek time + latency time + operating system overhead time, in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• sreadtim - average time to read single block (random read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• mreadtim - average time to read an mbrc block at once (sequential read), in milliseconds</td>
</tr>
<tr>
<td></td>
<td>• cpuspeed - average number of CPU cycles for each second, captured for the workload (statistics collected using 'INTERVAL' or 'START' and 'STOP' options)</td>
</tr>
<tr>
<td></td>
<td>• cpuspeednw - average number of CPU cycles for each second, in millions, captured for the no-workload (statistics collected using 'NOWORKLOAD' option)</td>
</tr>
<tr>
<td></td>
<td>• mbrc - average multiblock read count for sequential read, in blocks</td>
</tr>
<tr>
<td></td>
<td>• maxthr - maximum I/O system throughput, in bytes/second</td>
</tr>
<tr>
<td></td>
<td>• slavethr - average slave I/O throughput, in bytes/second</td>
</tr>
<tr>
<td>pvalue</td>
<td>Parameter value to get</td>
</tr>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be obtained. If stattab is NULL, the statistics will be obtained from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20002: Bad user statistics table; may need to be upgraded

ORA-20003: Unable to gather system statistics

ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.

162.7.65 GET_TABLE_STATS Procedure

This overloaded procedure gets all table-related statistics.

Syntax

```sql
DBMS_STATS.GET_TABLE_STATS ( 
    ownname VARCHAR2, 
    tabname VARCHAR2, 
    partname VARCHAR2 DEFAULT NULL, 
```
Parameters

Table 162-69  GET_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition from which to get the statistics. If the table is partitioned and if partname is NULL, then the statistics are retrieved from the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics. If stattab is NULL, then the statistics are retrieved directly from the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL).</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table or partition.</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks in the table or partition.</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table or partition.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from ownname).</td>
</tr>
<tr>
<td>im_imcu_count</td>
<td>The number of In-Memory Compression Units (IMCUs) in the table or partition.</td>
</tr>
</tbody>
</table>
Table 162-69  (Cont.) GET_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>im_block_count</td>
<td>The number of In-Memory blocks in the table or partition. An In-Memory block corresponds to a specific data block on disk. If the table is fully populated in the IM column store, then the number of In-Memory blocks equals the number of data blocks.</td>
</tr>
<tr>
<td>scanrate</td>
<td>The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.</td>
</tr>
<tr>
<td>cachedblk</td>
<td>For internal use only.</td>
</tr>
<tr>
<td>cachehit</td>
<td>For internal use only.</td>
</tr>
</tbody>
</table>

Security Model

Before invoking this procedure, ensure that the table exists. To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` or `SYSDBA` privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges or no statistics have been stored for requested object

ORA-20002: Bad user statistics table; may need to upgrade it

Usage Notes

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence factor” for each `cachehit` and a `cachedblk` for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.

- The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other “minor” workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.

- The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations
  - When not enough data has been analyzed, such as when an object has been recently created
- When the system does not have one major workload resulting in averages not corresponding to real values
- The database does not support export or import of statistics across databases of different character sets.

Oracle Database SQL Tuning Guide to learn how to manage optimizer statistics preferences

162.7.66 IMPLEMENT_ADVISOR_TASK Function

This function implements the recommendations made by Optimizer Statistics Advisor.

Syntax

```
DBMS_STATS.IMPLEMENT_ADVISOR_TASK (  
    task_name      IN   VARCHAR2,  
    execution_name IN   VARCHAR2 := NULL,  
    level          IN   VARCHAR2 := 'TYPICAL')  
RETURN CLOB;
```

Parameters

Table 162-70 IMPLEMENT_ADVISOR_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.</td>
</tr>
</tbody>
</table>
| level            | The level of the implementation. Possible values are  
                    - ALL: Ignores the filters and implements all recommendations.  
                    - TYPICAL: Implements the recommendations according to the filters in place. |

Security Model

Note the following:
- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:
- SYSTEM level
Only users with both the **ANALYZE ANY** and **ANALYZE ANY DICTIONARY** privileges can perform this task on system-level rules.

**Operation level**

The results depend on the following privileges:

- Users with both the **ANALYZE ANY** and **ANALYZE ANY DICTIONARY** privileges can perform this task for all statistics operations.
- Users with the **ANALYZE ANY** privilege but **not** the **ANALYZE ANY DICTIONARY** privilege can perform this task for statistics operations related to any schema except SYS.
- Users with the **ANALYZE ANY DICTIONARY** privilege but **not** the **ANALYZE ANY** privilege can perform this task for statistics operations related to their own schema and the SYS schema.
- Users with neither the **ANALYZE ANY** nor the **ANALYZE ANY DICTIONARY** privilege can only perform this operation for statistics operations relating to their own schema.

**Object level**

Users can perform this task for any object for which they have statistics collection privileges.

**Return Values**

This function returns an XML CLOB that indicates which recommendations were successfully implemented.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

**Example 162-10 Implementing Optimizer Statistics Advisor Recommendations**

This script illustrates a basic Optimizer Statistics Advisor session. It creates a task, executes it, generates a report, and then implements the recommendations.

```sql
DECLARE
  v_tname      VARCHAR2(128) := 'my_task';
  v_ename      VARCHAR2(128) := NULL;
  v_report     CLOB := null;
  v_script     CLOB := null;
  v_imp_result CLOB;
BEGIN
  -- create a task
  v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

  -- execute the task
  v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);

  -- view the task report
  v_report := DBMS_STATS.REPORT_ADVISOR_TASK(v_tname);
  DBMS_OUTPUT.PUT_LINE(v_report);

  -- implement all recommendations
  v_imp_result := DBMS_STATS.IMPLEMENT_ADVISOR_TASK(v_tname);
END;
```

---

**Chapter 162**

**Summary of DBMS_STATS Subprograms**

**162-126**
162.7.67 IMPORT_COLUMN_STATS Procedure

This procedure retrieves statistics for a particular column from the user statistics table identified by `stattab` and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_COLUMN_STATS (
  ownname       VARCHAR2,
  tabname       VARCHAR2,
  colname       VARCHAR2,
  partname      VARCHAR2 DEFAULT NULL,
  stattab       VARCHAR2,
  statid        VARCHAR2 DEFAULT NULL,
  statown       VARCHAR2 DEFAULT NULL,
  no_invalidate BOOLEAN DEFAULT to_no_invalidate_type {
    get_param('NO_INVALIDATE'),
  } BOOLEAN DEFAULT FALSE);
```

Parameters

**Table 162-71 IMPORT_COLUMN_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition column statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier to associate with these statistics within stattab (optional)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS Procedure</code>, <code>SET_GLOBAL_PREFS Procedure</code>, <code>SET_SCHEMA_PREFS Procedure</code> and <code>SET_TABLE_PREFS Procedure</code>.</td>
</tr>
<tr>
<td>force</td>
<td>If set to TRUE, imports statistics even if statistics are locked</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20005: Object statistics are locked

Usage Notes

Oracle does not support export or import of statistics across databases of different character sets.

162.7.68 IMPORT_DATABASE_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables, excluding the tables owned by Oracle. These tables can be included by passing TRUE for the add_sys parameter.

Syntax

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS (  
    stattab    IN  VARCHAR2,  
    statid     IN  VARCHAR2 DEFAULT NULL, 
    statown    IN  VARCHAR2 DEFAULT NULL,  
    add_sys    IN  BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Statistics table name where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>add_sys</td>
<td>Value TRUE will include the Oracle-owned tables</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges.

Usage Notes

- To run this procedure, you need to have the SYSDBA role, or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.IMPORT_DATABASE_PREFS('STATTAB', statown=>'SH');
```
162.7.69 IMPORT_DATABASE_STATS Procedure

This procedure retrieves statistics for all objects in the database from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_DATABASE_STATS (
    stattab VARCHAR2,
    statid VARCHAR2 DEFAULT NULL,
    statown VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE'),
    ),
    force BOOLEAN DEFAULT FALSE,
    stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>• TRUE - Ignores the statistics lock and imports the statistics</td>
</tr>
<tr>
<td></td>
<td>• FALSE - The statistics will be imported only if they are not locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table

Usage Notes

• To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.
Oracle does not support export or import of statistics across databases of different character sets.

162.7.70 IMPORT_DICTIONARY_STATS Procedure

This procedure retrieves statistics for all dictionary schemas ('SYS', 'SYSTEM' and RDBMS component schemas) from the user statistics table and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_DICTIONARY_STATS (
    stattab         VARCHAR2,
    statid          VARCHAR2 DEFAULT NULL,
    statown         VARCHAR2 DEFAULT NULL,
    no_invalidate   BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force           BOOLEAN DEFAULT FALSE,
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>The (optional) identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock at the object (table) level:</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.
Exceptions

ORA-20000: **Object does not exist or insufficient privileges**
ORA-20001: **Invalid or inconsistent values in the user statistics table**
ORA-20002: **Bad user statistics table, may need to upgrade it**

162.7.71 IMPORT_FIXED_OBJECTS_STATS Procedure

This procedure retrieves statistics for fixed tables from the user statistics table(s) and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_FIXED_OBJECTS_STATS (
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics lock:</td>
</tr>
<tr>
<td></td>
<td>• TRUE - Ignores the statistics lock and imports the statistics</td>
</tr>
<tr>
<td></td>
<td>• FALSE - The statistics will be imported only if there is no lock</td>
</tr>
</tbody>
</table>

Usage Notes

- You must have the **SYSDBA** or **ANALYZE ANY DICTIONARY** system privilege to execute this procedure.
- Oracle does not support export or import of statistics across databases of different character sets.
Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table
ORA-20002: Bad user statistics table, may need to upgrade it

162.7.72 IMPORT_INDEX_STATS Procedure

This procedure retrieves statistics for a particular index from the user statistics table identified by stattab and stores them in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_INDEX_STATS (
    ownname       VARCHAR2,
    indname       VARCHAR2,
    partname      VARCHAR2 DEFAULT NULL,
    stattab       VARCHAR2,
    statid        VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(
        get_param('NO_INVALIDATE')),
    force         BOOLEAN DEFAULT FALSE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>indname</td>
<td>Name of the index</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the index partition. If the index is partitioned and if partname is NULL, then global and partition index statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if index statistics are locked</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values in the user statistics table

ORA-20005: Object statistics are locked

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

162.7.73 IMPORT_SCHEMA_PREFS Procedure

This procedure is used to import the statistics preferences of all the tables owned by the specified owner name.

Syntax

```
DBMS_STATS.IMPORT_SCHEMA_PREFS (ownname    IN  VARCHAR2,
stattab    IN  VARCHAR2,
statid     IN  VARCHAR2 DEFAULT NULL,
statown    IN  VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner, or have the `SYSDBA` privilege, or have the `ANALYZE ANY` system privilege.
- All arguments are of type `VARCHAR2` and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```
DBMS_STATS.IMPORT_SCHEMA_PREFS('SH', 'STAT');
```
162.7.74 IMPORT_SCHEMA_STATS Procedure

This procedure retrieves statistics for all objects in the schema identified by ownname from the user statistics table and stores them in the dictionary.

Syntax

```sql
DBMS_STATS.IMPORT_SCHEMA_STATS (  
    ownname         VARCHAR2,  
    stattab         VARCHAR2,  
    statid          VARCHAR2 DEFAULT NULL,  
    statown         VARCHAR2 DEFAULT NULL,  
    no_invalidate   BOOLEAN DEFAULT TRUE,  
    force           BOOLEAN DEFAULT FALSE,  
    stat_category   VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Overrides statistics locked at the object (table) level:</td>
</tr>
<tr>
<td></td>
<td>• TRUE - Ignores the statistics lock and imports the statistics.</td>
</tr>
<tr>
<td></td>
<td>• FALSE - Statistics will be imported only if there is no lock.</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

162.7.75 IMPORT_SYSTEM_STATS Procedure

This procedure retrieves system statistics from the user statistics table, identified by `stattab`, and stores the statistics in the dictionary.

Syntax

```
DBMS_STATS.IMPORT_SYSTEM_STATS (  
  stattab       VARCHAR2,  
  statid        VARCHAR2 DEFAULT NULL,  
  statown       VARCHAR2 DEFAULT NULL);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattab</td>
<td>Identifier of the user statistics table where the statistics will be retrieved</td>
</tr>
<tr>
<td>statid</td>
<td>Optional identifier associated with the statistics retrieved from the <code>stattab</code></td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing <code>stattab</code> (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: `Object does not exist or insufficient privileges`

ORA-20001: `Invalid or inconsistent values in the user statistics table`

ORA-20002: `Bad user statistics table; may need to be upgraded`

ORA-20003: `Unable to import system statistics`

Usage Notes

To run this procedure, you need the `GATHER_SYSTEM_STATISTICS` role.

Oracle does not support export or import of statistics across databases of different character sets.
162.7.76 IMPORT_TABLE_PREFS Procedure

This procedure is used to set the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.IMPORT_TABLE_PREFS (    ownname IN VARCHAR2,    tabname IN VARCHAR2,    stattab IN VARCHAR2,    statid IN VARCHAR2 DEFAULT NULL,    statown IN VARCHAR2 DEFAULT NULL);
```

Parameters

**Table 162-80 IMPORT_TABLE_PREFS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name</td>
</tr>
<tr>
<td>stattab</td>
<td>Statistics table name from where to import the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>(Optional) Identifier to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if other than ownname)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

Usage Notes

- To run this procedure, you need to connect as owner of the table, or have the ANALYZE ANY system privilege.
- All arguments are of type VARCHAR2 and values are enclosed in quotes.
- Oracle does not support export or import of statistics across databases of different character sets.

Examples

```sql
DBMS_STATS.IMPORT_TABLE_PREFS('SH', 'SALES', 'STAT');
```

162.7.77 IMPORT_TABLE_STATS Procedure

This procedure retrieves statistics for a particular table from the user statistics table identified by stattab and stores them in the dictionary.

Cascade results in all index statistics associated with the specified table being imported as well.
Syntax

DBMS_STATS.IMPORT_TABLE_STATS (  
    ownname VARCHAR2,  
    tabname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2,  
    statid VARCHAR2 DEFAULT NULL,  
    cascade BOOLEAN DEFAULT TRUE,  
    statown VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),  
    force BOOLEAN DEFAULT FALSE,  
    stat_category VARCHAR2 DEFAULT DEFAULT_STAT_CATEGORY);  

Parameters

Table 162-81  IMPORT_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition. If the table is partitioned and if partname is NULL, then global and partition table statistics are imported.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing from where to retrieve the statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>cascade</td>
<td>If true, column and index statistics for this table are also imported</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure</td>
</tr>
<tr>
<td>force</td>
<td>Imports statistics even if table statistics are locked</td>
</tr>
<tr>
<td>stat_category</td>
<td>Specifies what statistics to import, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics (Default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values in the user statistics table
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Oracle does not support export or import of statistics across databases of different character sets.

162.7.78 INTERRUPT_ADVISOR_TASK Procedure

This procedure interrupts a currently executing Optimizer Statistics Advisor task.

The task ends its operations as it does when at a normal exit, at which point you can access intermediate results. You can also resume the task using the "RESUME_ADVISOR_TASK Procedure".

Syntax

```sql
DBMS_STATS.INTERRUPT_ADVISOR_TASK (task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 162-11 Interrupting an Optimizer Statistics Advisor Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```sql
DECLARE
  v_tname   VARCHAR2(128) := 'my_task';
  v_ename   VARCHAR2(128) := NULL;
```
BEGIN
   -- create a task
   v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);

   -- execute the task
   v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:

EXEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');

The first session returns an ORA-13632 to indicate the cancelation of the task:

ORA-13638: The user interrupted the current operation.

162.7.79 LOCK_PARTITION_STATS Procedure

This procedure enables the user to lock statistics for a partition.

Syntax

DBMS_STATS.LOCK_PARTITION_STATS (   ownname VARCHAR2,
   tabname VARCHAR2,
   partname VARCHAR2);

Parameters

Table 162-83  LOCK_PARTITION_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>[Sub]Partition name</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.80 LOCK_SCHEMA_STATS Procedure

This procedure locks the statistics of all tables of a schema.

Syntax

DBMS_STATS.LOCK_SCHEMA_STATS (   ownname VARCHAR2);
Table 162-84  LOCK_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to lock</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `sys`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.

- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.

- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.

- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`.

162.7.81 LOCK_TABLE_STATS Procedure

This procedure locks the statistics on the table.

Syntax

```
DBMS_STATS.LOCK_TABLE_STATS (  
    ownname VARCHAR2,  
    tabname VARCHAR2);  
```

Parameters

Table 162-85  LOCK_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>Parameter</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

**Usage Notes**

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by **SYS**, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

- When statistics on a table are locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.

- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.

- Procedures that operate on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.

- This procedure either freezes the current set of the statistics or keeps the statistics empty (uncollected) to use dynamic statistics.

- The locked or unlocked state is not exported along with the table statistics when using `EXPORT_*_STATS` procedures.

- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`.

### 162.7.82 MERGE_COL_USAGE Procedure

This procedure merges column usage information from a source database by means of a `dblink` into the local database.

If column usage information already exists for a given table or column `MERGE_COL_USAGE` will combine both the local and the remote information.

**Syntax**

```sql
DBMS_STATS.MERGE_COL_USAGE (    dblink IN VARCHAR2);
```
Parameters

Table 162-86 MERGE_COL_USAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dblink</td>
<td>Name of dblink</td>
</tr>
</tbody>
</table>

Usage Notes

User must be SYS to execute this procedure. In addition the user specified during the creation of the dblink is expected to have privileges to select from tables in the SYS schema.

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Parameter dblink cannot be NULL
ORA-20002: Unable to create a TEMP table

162.7.83 PREPARE_COLUMN_VALUES Procedures

These procedures convert user-specified minimum, maximum, and histogram endpoint actual values into Oracle’s internal representation for future storage using SET_COLUMN_STATS.

Syntax

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, charvals CHARARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, datevals DATEARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, dblvals DBLARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, fltvals FLTARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, numvals NUMARRAY);

DBMS_STATS.PREPARE_COLUMN_VALUES (srec IN OUT StatRec, rawvals RAWARRAY);
Parameters

Table 162-87  PREPARE_COLUMN_VALUES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>srec.epc</td>
<td>Number of values specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. This value must be between 2 and 2050, inclusive, and it should be set to 2 for procedures which do not allow histogram information (nchar and rowid). The first corresponding array entry should hold the minimum value for the column, and the last entry should hold the maximum. If there are more than two entries, then all the others hold the remaining height-balanced or frequency histogram endpoint values (with in-between values ordered from next-smallest to next-largest). This value may be adjusted to account for compression, so the returned value should be left as is for a call to SET_COLUMN_STATS.</td>
</tr>
<tr>
<td>srec.bkvals</td>
<td>If you want a frequency or hybrid histogram, this array contains the number of occurrences of each distinct value specified in charvals, datevals, dblvals, fltvals, numvals, or rawvals. Otherwise, it is merely an output parameter, and it must be set to NULL when this procedure is called.</td>
</tr>
<tr>
<td>srec.rpcnts</td>
<td>If you want a hybrid histogram, this array contains the total frequency of values that are less than or equal to each distinct value specified in charvals, datevals, numvals, or rawvals. Otherwise, it is merely an output argument and must be set to NULL when this procedure is called. As an example, for a given array numvals with numvals(i)=4, rpcnts(i)=13 means that there are 13 rows in the column which are less than or equal to 4.</td>
</tr>
</tbody>
</table>

Note:
- Whenever srec.rpcnts is populated, srec.bkvals must be populated as described above.
- Whenever bkvals and/or rpcnts are populated, there should not be any duplicates in charvals, datevals, numvals, or rawvals.

Datatype-specific input parameters (use one) are shown in Table 162-88.

Table 162-88  Datatype-Specific Input Parameters

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>charvals</td>
<td>The array of values when the column type is character-based. Up to the first 64 bytes of each string should be provided. Arrays must have between 2 and 2050 entries, inclusive. If the datatype is fixed CHAR, the strings must be space-padded to 15 characters for correct normalization.</td>
</tr>
<tr>
<td>datevals</td>
<td>Array of values when the column type is date-based</td>
</tr>
<tr>
<td>dblvals</td>
<td>Array of values when the column type is double-based</td>
</tr>
<tr>
<td>fltvals</td>
<td>Array of values when the column type is float-based</td>
</tr>
<tr>

<tr>
<td>srec.rpcnts</td>
<td>Array suitable for use in a call to SET_COLUMN_STATS</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20001: Invalid or inconsistent input values

Usage Notes

No special privilege or role is needed to invoke this procedure.

162.7.84 PREPARE_COLUMN_VALUES_NVARCHAR Procedure

This procedure converts user-specified minimum, maximum, and histogram endpoint actual values into Oracle's internal representation for future storage using the SET_COLUMN_STATS Procedures.

Syntax

```sql
DBMS_STATS.PREPARE_COLUMN_VALUES_NVARCHAR (srec IN OUT StatRec, nvmin NVARCHAR2, nvmax NVARCHAR2);
```
Parameters

Table 162-90  PREPARE_COLUMN_VALUES_NVARCHAR Procedure Parameters

<table>

</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>Do not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>If TRUE, will override the lock</td>
</tr>
</tbody>
</table>

Security Model

To run this procedure, you must have the same privilege for gathering statistics on the tables that will be touched by this procedure.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

- If the parameter tabname is NULL then publish applies to all tables of the specified schema.
- The default owner/schema is the user who runs the procedure.

Examples

DBMS_STATS.PUBLISH_PENDING_STATS ('SH', null);

162.7.87 PURGE_STATS Procedure

This procedure purges old versions of statistics saved in the dictionary.

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Syntax

```sql
DBMS_STATS.PURGE_STATS(
    before_timestamp TIMESTAMP WITH TIME ZONE);
```
Parameters

Table 162-96  PURGE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>before_timestamp</td>
<td>Versions of statistics saved before this timestamp are purged. If NULL, it uses the purging policy used by automatic purge. The automatic purge deletes all history older than the older of (current time - statistics history retention) and (time of recent analyze in the system - 1). The statistics history retention value can be changed using ALTER_STATS_HISTORY_RETENTION Procedure. The default is 31 days.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or inconsistent values

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

162.7.88 REMAP_STAT_TABLE Procedure

This procedure remaps the names of objects in the user statistics table. It allows you to import the statistics to objects with same definition but with different names.

Syntax

DBMS_STATS.REMAP_STAT_TABLE (  
  ownname  IN  VARCHAR2,  
  stattab  IN  VARCHAR2,  
  src_own  IN  VARCHAR2,  
  src_tab  IN  VARCHAR2,  
  tgt_own  IN  VARCHAR2,  
  tgt_tab  IN  VARCHAR2);  

Parameters

Table 162-97  REMAP_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner of the statistics table. NULL means the current schema.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier</td>
</tr>
<tr>
<td>src_own</td>
<td>Owner of the table to be renamed. This argument cannot be NULL.</td>
</tr>
<tr>
<td>src_tab</td>
<td>Name of the table to be renamed. If NULL, all tables are owned by src_own.</td>
</tr>
</tbody>
</table>
Table 162-97 (Cont.) REMAP_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tgt_own</td>
<td>New name of the owner of the table. The owner name is also updated for the dependent objects such as columns and indexes. Note that an index of src_tab not owned by src_own is not renamed. This argument cannot be NULL.</td>
</tr>
<tr>
<td>tgt_tab</td>
<td>New name of the table. This argument is valid only if src_tab is not NULL.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Invalid input

Examples

The following statement remaps all objects of sh to shsave in user statistics table sh.ustat:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', NULL, 'shsave', NULL);
```

The following statement can be used to import statistics into objects of shsave once the preceding remap procedure is completed:

```
DBMS_STATS.IMPORT_SCHEMA_STATS ('shsave', 'ustat', statown => 'sh');
```

The following statement remaps sh.customers to shsave.customers_sav:

```
DBMS_STATS.REMAP_STAT_TABLE ('sh', 'ustat', 'sh', 'customers', 'shsave', 'customers_sav');
```

162.7.89 REPORT_ADVISOR_TASK Function

This function reports the results of an Optimizer Statistics Advisor task.

Syntax

```
DBMS_STATS.REPORT_ADVISOR_TASK(
    task_name          IN   VARCHAR2,
    execution_name     IN   VARCHAR2   := NULL,
    type               IN   VARCHAR2   := 'TEXT',
    section            IN   VARCHAR2   := 'ALL',
    level              IN   VARCHAR2   := 'TYPICAL')
RETURN CLOB;
```

Parameters

Table 162-98 REPORT_ADVISOR_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>
Table 162-98  (Cont.) REPORT_ADVISOR_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>execution_name</td>
<td>A name that qualifies and identifies an advisor task execution. If not specified, the function uses the latest execution of the specified task.</td>
</tr>
<tr>
<td>type</td>
<td>The type of the Optimizer Statistics Advisor report. Possible values are TEXT, HTML, and XML.</td>
</tr>
<tr>
<td>section</td>
<td>A section in the report. Possible values are SUMMARY, FINDINGS, ERRORS, and ALL. You can specify combinations of different values can be using the plus (+) and minus (-) operator, as in 'SUMMARY +FINDINGS +ERRORS', and 'ALL -ERRORS'.</td>
</tr>
<tr>
<td>level</td>
<td>The format of the report. Possible values are BASIC, TYPICAL, ALL, and SHOW_HIDDEN. You can specify SHOW_HIDDEN together with the other three input values, as in 'BASIC +SHOW_HIDDEN' and 'TYPICAL +SHOW_HIDDEN'.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.
- This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
  - Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.

- **Operation level**
  - The results depend on the following privileges:
    - Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.
    - Users with the ANALYZE ANY privilege but not the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.
    - Users with the ANALYZE ANY DICTIONARY privilege but not the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.
    - Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**
  - Users can perform this task for any object for which they have statistics collection privileges.
Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: User input errors
- ORA-20012: Optimizer Statistics Advisor errors

Returns

This function returns a CLOB that contains the report.

Examples

(Optional) List and briefly describe the examples for using the API or subprogram here.

Example 162-12 Generating an HTML Report

This example creates a procedure named `myrep`, and then calls this procedure to generate an HTML report.

```sql
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300
EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2, which VARCHAR2) IS
  v_report CLOB := null;
  v_script CLOB := null;
  v_ftype VARCHAR2(400) := p_ftype;
  v_tname VARCHAR2(400) := p_tname;
  v_len NUMBER(10);
  v_ps NUMBER(10) := 10000;
  v_pn NUMBER(10) := 1;
  v_ret VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
    THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type => v_ftype,
      section => 'ALL',
      level => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
    ELSE
    -- generate a script
    v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
    v_len := DBMS_LOB.getlength(v_script);
    WHILE (v_pn < v_len)
  END IF;
END;
```

Chapter 162
Summary of DBMS_STATS Subprograms
Example 162-13 Generating a Textual Report for AUTO_STATS_ADVISOR_TASK

The following example invokes the myrep procedure created in the preceding example for AUTO_STATS_ADVISOR_TASK:

EXEC myrep('AUTO_STATS_ADVISOR_TASK','TEXT','REPORT');

The following sample output shows part of the report:

GENERAL INFORMATION

Task Name : AUTO_STATS_ADVISOR_TASK
Execution Name : EXEC_97
Created : 07-08-16 10:18:10
Last Modified : 07-11-16 03:02:30

SUMMARY

For execution EXEC_97 of task AUTO_STATS_ADVISOR_TASK, the Statistics Advisor has 10 finding(s). The findings are related to the following rules: COMPLETEAUTOJOB, MAINTAINSTATS HISTORY, USEDEFAULTPREFERENCE, AVOIDSETPROCEDURES, USEDEFAULTPARAMS, USEGATHERSCHEMA STATS, AVOIDSTATESTATS, UNLOCKNONVOLATILETABLE, USEINCREMENTAL, AVOIDANALYZETABLE. Please refer to the finding section for detailed information.

FINDINGS

Rule Name: MaintainStatsHistory
Rule Description: Maintain Statistics History
Finding: Statistics history tables are too big.
Recommendation: Check the other findings of this rule, as well as the findings for the rules AvoidFrequentStatsCollection, UseDefaultPreference, UseDefaultParams for possible causes and recommendations.
Rationale: The size of the statistics history table could be big because of violations of other rules.

Rule Name: UseDefaultPreference
Rule Description: Use Default Preference for Stats Collection
Finding: Global preference SYS_FLAGS is set to a non-default value '1'.
Recommendation: Set the value of preference SYS_FLAGS to '0'.

Example:
```
-- Setting preference cascade to default value:
dbms_stats.set_global_prefs('CASCADE', NULL);
```

Rationale: Preference SYS_FLAGS is for Oracle internal use only, setting it to nondefault value '1' could cause unforeseen consequences.

162.7.90 REPORT_COL_USAGE Function

This function reports the recorded column (group) usage information.

Syntax
```
DBMS_STATS.REPORT_COL_USAGE (
    ownname    IN    VARCHAR2,
    tabname    IN    VARCHAR2)
RETURN CLOB;
```

Parameters

Table 162-99 REPORT_COL_USAGE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name. If NULL it reports column usage information for tables in all schemas in the database.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name. If NULL it reports column usage information for all tables of ownname.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

162.7.91 REPORT_GATHER_AUTO_STATS Function

This function runs the auto statistics gathering job in reporting mode. That is, statistics are not actually collected, but all the objects that will be affected when auto statistics gathering is invoked are reported.

Syntax
```
DBMS_STATS.REPORT_GATHER_AUTO_STATS (
    detail_level VARCHAR2 DEFAULT 'TYPICAL',
    format       VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```
### Parameters

#### Table 162-100  REPORT_GATHER_AUTO_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail_level</td>
<td>Detail level for the content of the report</td>
</tr>
</tbody>
</table>
|             | - BASIC: The report includes  
|             |   - operation ID  
|             |   - operation name  
|             |   - operation target object  
|             |   - start time  
|             |   - end time  
|             |   - completion status (such as: succeeded, failed)  
|             | - TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details:  
|             |   - total number of target objects  
|             |   - total number of successfully completed objects  
|             |   - total number of failed objects  
|             |   - total number of timed-out objects (applies to only auto statistics gathering)  
|             | With regard to target objects:  
|             |   - owner and name of each target object  
|             |   - target object type (such as: table, index)  
|             |   - start time  
|             |   - end time  
|             |   - completion status  
|             | - ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details:  
|             |   - job name  
|             |   - session ID  
|             |   - parameter values  
|             |   - error message if the operation failed  
|             | With regard to target objects:  
|             |   - job name  
|             |   - batching details  
|             |   - estimated cost  
|             |   - rank in the target list  
|             |   - columns for which histograms were collected  
|             |   - list of collected extended statistics (if any)  
|             |   - reason for including the object in the target list  
|             |   - additional error details if the task has failed. |

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
Table 162-100  (Cont.) REPORT_GATHER_AUTO_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>format</td>
<td>Report format:</td>
</tr>
<tr>
<td></td>
<td>• XML</td>
</tr>
<tr>
<td></td>
<td>• HTML</td>
</tr>
<tr>
<td></td>
<td>• TEXT (Default)</td>
</tr>
</tbody>
</table>

Usage Notes

Only user SYS can run the REPORT_GATHER_AUTO_STATS function.

162.7.92 REPORT_GATHER_DATABASE_STATS Functions

This function runs the GATHER_DATABASE_STATS function in reporting mode.

The database does not collect statistics, but reports all objects that would be affected when invoking GATHER_DATABASE_STATS. The input set of parameters is the same as in GATHER_DATABASE_STATS, with two extra parameters.

Syntax

```sql
DBMS_STATS.REPORT_GATHER_DATABASE_STATS (  
  estimate_percent IN NUMBER DEFAULT to_estimate_percent_type (  
    GET_PARAM('ESTIMATE_PERCENT')
  ),  
  block_sample IN BOOLEAN DEFAULT FALSE,  
  method_opt IN VARCHAR2 DEFAULT GET_PARAM('METHOD_OPT'),  
  degree IN NUMBER DEFAULT TO_DEGREE_TYPE(  
    GET_PARAM('DEGREE'))
  ),  
  granularity IN VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
  cascade IN BOOLEAN DEFAULT TO_CASCADE_TYPE (  
    GET_PARAM('CASCADE'))
  ),  
  stattab IN VARCHAR2 DEFAULT NULL,  
  statid IN VARCHAR2 DEFAULT NULL,  
  options IN VARCHAR2 DEFAULT 'GATHER',  
  statown IN VARCHAR2 DEFAULT NULL,  
  gather_sys IN BOOLEAN DEFAULT TRUE,  
  no_invalidate IN BOOLEAN DEFAULT TO_NO_INVALIDATE_TYPE (  
    GET_PARAM('NO_INVALIDATE'))
  ),  
  gather_temp IN BOOLEAN DEFAULT FALSE,  
  gather_fixed IN BOOLEAN DEFAULT FALSE,  
  stattype IN VARCHAR2 DEFAULT DATA,  
  obj_filter_list IN ObjectTab DEFAULT NULL,  
  detail_level IN VARCHAR2 DEFAULT 'TYPICAL',  
  format IN VARCHAR2 DEFAULT 'TEXT')
RETURN CLOB;
```
Parameters

Table 162-101  REPORT_GATHER_DATABASE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>estimate_percent</td>
<td>The percentage of rows to use for the sample size. The valid range is between 0.000001 and 100. The null value means to compute. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. This parameter is only relevant when estimating statistics.</td>
</tr>
<tr>
<td>method_opt</td>
<td>Method options. This parameter accepts the following values: FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO.The value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
</tbody>
</table>
Table 162-101  (Cont.) REPORT_GATHER_DATABASE_STATS Function

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| granularity | Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:  
- **ALL** — Gathers all statistics: subpartition, partition, and global.  
- **AUTO** — Determines the granularity based on the partitioning type. This is the default value.  
- **DEFAULT** — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use **GLOBAL AND PARTITION** for this functionality.  
- **GLOBAL** — Gathers global statistics.  
- **GLOBAL AND PARTITION** — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.  
- **PARTITION** — Gathers partition-level statistics.  
- **SUBPARTITION** — Gathers subpartition-level statistics. |
| cascade | Gather statistics on the indexes as well. Using this option is equivalent to running the `GATHER_INDEX_STATS Procedure` on each of the indexes in the database in addition to gathering table and column statistics. Use the constant `DBMS_STATS.AUTO_CASCADE` to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the `SET_DATABASE_PREFS Procedure`, `SET_GLOBAL_PREFS Procedure`, `SET_SCHEMA_PREFS Procedure` and `SET_TABLE_PREFS Procedure`. |
| stattab | User statistics table identifier describing where to save the current statistics. The database assumes that the statistics table resides in the same schema as the object being analyzed. Thus, to use this option, one such table must exist in each schema. |
| statid | Identifier (optional) to associate with these statistics within stattab. |
### Table 162-101 (Cont.) REPORT_GATHER_DATABASE_STATS Function

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>options</strong></td>
<td>Further specification of which objects to gather statistics for:</td>
</tr>
<tr>
<td></td>
<td>GATHER: Gathers statistics on all objects in the schema.</td>
</tr>
<tr>
<td></td>
<td>GATHER AUTO: Gathers all necessary statistics automatically. Oracle implicitly determines which objects need new statistics, and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are stattab, statid, objlist and statown; all other parameter settings are ignored. Returns a list of processed objects.</td>
</tr>
<tr>
<td></td>
<td>GATHER STALE: Gathers statistics on stale objects as determined by looking at the *_tab_modifications views. Also, return a list of objects found to be stale.</td>
</tr>
<tr>
<td></td>
<td>GATHER EMPTY: Gathers statistics on objects which currently have no statistics. Return a list of objects found to have no statistics.</td>
</tr>
<tr>
<td></td>
<td>LIST AUTO: Returns a list of objects to be processed with GATHER AUTO</td>
</tr>
<tr>
<td></td>
<td>LIST STALE: Returns a list of stale objects as determined by looking at the *_tab_modifications views</td>
</tr>
<tr>
<td></td>
<td>LIST EMPTY: Returns a list of objects which currently have no statistics</td>
</tr>
<tr>
<td><strong>stattown</strong></td>
<td>Schema containing stattab, if different from current schema.</td>
</tr>
<tr>
<td><strong>gather_sys</strong></td>
<td>Gathers statistics on the objects owned by the SYS user.</td>
</tr>
<tr>
<td><strong>no_invalidate</strong></td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td><strong>gather_temp</strong></td>
<td>Gathers statistics on global temporary tables when TRUE. The default is FALSE. The temporary table must be created with the ON COMMIT PRESERVE ROWS clause. Also, the statistics collected are based on the data in the session in which this procedure is run, but they are shared across all sessions.</td>
</tr>
<tr>
<td><strong>gather_fixed</strong></td>
<td>Gather statistics on fixed tables when TRUE. The default is FALSE. Only user SYS can collect statistics for fixed tables. The ownname must be SYS or null. When gathering statistics for fixed tables, the database ignores specified values for the following arguments:</td>
</tr>
<tr>
<td></td>
<td>• estimate_percent</td>
</tr>
<tr>
<td></td>
<td>• block_sample</td>
</tr>
<tr>
<td></td>
<td>• stattab</td>
</tr>
<tr>
<td></td>
<td>• statid</td>
</tr>
<tr>
<td></td>
<td>• statown</td>
</tr>
<tr>
<td></td>
<td>The database does not invalidate the dependent cursors on fixed tables on which stats is collected. This option is meant for internal use only.</td>
</tr>
</tbody>
</table>
Table 162-101  (Cont.) REPORT_GATHER_DATABASE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattype</td>
<td>The type of statistics:</td>
</tr>
<tr>
<td></td>
<td>• DATA — Data statistics only</td>
</tr>
<tr>
<td></td>
<td>• CACHE — Cache statistics only</td>
</tr>
<tr>
<td></td>
<td>• ALL — All statistics</td>
</tr>
<tr>
<td>obj_filter_list</td>
<td>A list of object filters. The attribute values specified in the object filter are case-insensitive unless double-quoted. Wildcards are allowed in the attribute values. When specified, REPORT_GATHER_DATABASE_STATS gathers statistics only on objects that satisfy at least one object filter in the list as needed. In a single-object filter, the database can specify the constraints on the object attributes. For example, non-NULL values s1 and s2 are specified for attributes a1 and a2 in one object filter. An object o is said to satisfy this object filter when (o.a1 LIKE s1) AND (o.a2 LIKE s2) is true.</td>

Return Values

A CLOB object that contains the report

Exceptions

ORA-20000: Insufficient privileges
ORA-20001: Bad input value

Usage Notes

To run this procedure, you need to have the SYSDBA role or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privileges.

162.7.93 REPORT_GATHER_DICTIONARY_STATS Functions

This function runs the GATHER_DICTIONARY_STATS procedure in reporting mode.

The database does not collect statistics, but reports all objects affected when invoking GATHER_DICTIONARY_STATS. The detail level for the report is defined by the detail_level input parameter. See the descriptions of detail_level and format in REPORT_GATHER_DICTIONARY_STATS Functions. For all other input parameters, see GATHER_DICTIONARY_STATS Procedure.

Syntax

```sql
DBMS_STATS.REPORT_GATHER_DICTIONARY_STATS (comp_id               IN    VARCHAR2   DEFAULT NULL,
estimate_percent      IN    NUMBER     DEFAULT TO_ESTIMATE_PERCENT_TYPE
                               (GET_PARAM('ESTIMATE_PERCENT')),
block_sample          IN    BOOLEAN    DEFAULT FALSE,
method_opt            IN    VARCHAR2   DEFAULT GET_PARAM('METHOD_OPT'),
degree                IN    NUMBER     DEFAULT TO_DEGREE_TYPE
                               (GET_PARAM('DEGREE')),
granularity           IN    VARCHAR2   DEFAULT GET_PARAM('GRANULARITY'),
cascade               IN    BOOLEAN    DEFAULT TO_CASCADE_TYPE
                               (GET_PARAM('CASCADE')),
stattab               IN    VARCHAR2   DEFAULT NULL,
options               IN    VARCHAR2   DEFAULT 'GATHER AUTO',
no_invalidate         IN    BOOLEAN    DEFAULT TO_NO_INVALIDATE_TYPE
                               (GET_PARAM('NO_INVALIDATE')),
stattype              IN    VARCHAR2   DEFAULT 'DATA',
obj_filter_list       IN    ObjectTab  DEFAULT NULL,
detail_level          IN    VARCHAR2   DEFAULT 'TYPICAL',
format                IN    VARCHAR2   DEFAULT 'TEXT')
RETURN CLOB;
```
## Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>comp_id</strong></td>
<td>Component ID of the schema to analyze. NULL results in analyzing schemas of all RDBMS components. Refer to the COMP_ID column of the DBA_REGISTRY view. The procedure always gather statistics on SYS and SYSTEM schemas regardless of this argument.</td>
</tr>
<tr>
<td><strong>estimate_percent</strong></td>
<td>Percentage of rows to sample (NULL means compute). The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to let the database determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td><strong>block_sample</strong></td>
<td>Determines whether to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk then the sample values may be somewhat correlated. Only pertinent when performing estimate statistics.</td>
</tr>
</tbody>
</table>
| **method_opt** | The method options. This parameter accepts the following values:  

* FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause]  

size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}  

  - integer: Number of histogram buckets. Must be in the range [1,2048].  
  - REPEAT: Collects histograms only on the columns that already have histograms.  
  - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns.  
  - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns.  

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
Table 162-102   (Cont.) REPORT_GATHER_DICTIONARY_STATS Function

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
</tbody>
</table>
| granularity | Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:  
  - ALL — Gathers all statistics: subpartition, partition, and global.
  - AUTO — Determines the granularity based on the partitioning type. This is the default value.
  - DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.
  - GLOBAL — Gathers global statistics.
  - GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.
  - PARTITION — Gathers partition-level statistics.
  - SUBPARTITION — Gathers subpartition-level statistics. |
| cascade   | Gathers statistics on indexes also. Index statistics gathering will not be parallelized. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the indexes in the schema in addition to gathering table and column statistics. Use the constant DBMS_STATS.AUTO_CASCADE to have Oracle determine whether index statistics to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. |
| stattab   | User statistics table identifier describing where to save the current statistics. |

</tr>
<tr>
<td></td>
<td>• TEXT (Default)</td>
</tr>
</tbody>
</table>
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY`

privilege. For objects owned by `SYS`, you need to be either the owner of the table, or

you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

Exceptions

ORA-20000: Schema does not exist or insufficient privileges

ORA-20001: Bad input value

Examples

Applying an Object Filter List

The following example specifies that any table with a "T" prefix in the `SAMPLE` schema or

any table in the `SYS` schema, if stale, will have statistics gathered upon it.

```sql
DECLARE
    filter_lst  DBMS_STATS.OBJECTTAB := DBMS_STATS.OBJECTTAB();
BEGIN
    filter_lst.extend(2);
    filter_lst(1).ownname := 'SAMPLE';
    filter_lst(1).objname := 'T%';
    filter_lst(2).ownname := 'SYS';
    DBMS_STATS.GATHER_SCHEMA_STATS(NULL, obj_filter_list => filter_lst,
                                  options => 'GATHER STALE');
END;
```

162.7.96 REPORT_GATHER_TABLE_STATS Function

This procedure runs the `GATHER_TABLE_STATS` Procedure in reporting mode.

That is, statistics are not actually collected, but all the objects that will be affected

when `GATHER_TABLE_STATS` is invoked are reported.

Syntax

```sql
DBMS_STATS.REPORT_GATHER_TABLE_STATS (  
  ownname            VARCHAR2,  
  tabname            VARCHAR2,  
  partname           VARCHAR2 DEFAULT NULL,  
  estimate_percent   NUMBER   DEFAULT to_estimate_percent_type     
                           (get_param('ESTIMATE_PERCENT')),  
  block_sample       BOOLEAN  DEFAULT FALSE,  
  method_opt         VARCHAR2 DEFAULT get_param('METHOD_OPT'),  
  degree             NUMBER   DEFAULT to_degree_type(get_param('DEGREE')),  
  granularity        VARCHAR2 DEFAULT GET_PARAM('GRANULARITY'),  
  cascade            BOOLEAN  DEFAULT to_cascade_type(get_param('CASCADE')),  
  stattab            VARCHAR2 DEFAULT NULL,  
  statid             VARCHAR2 DEFAULT NULL,  
  statown            VARCHAR2 DEFAULT NULL,  
  no_invalidate      BOOLEAN  DEFAULT to_no_invalidate_type (     
                           get_param('NO_INVALIDATE')),  
  stattype           VARCHAR2 DEFAULT 'DATA',  
  force              BOOLEAN  DEFAULT FALSE)  
                           'TYPICAL',  
      format             VARCHAR2 DEFAULT NULL)
```

Chapter 162

Summary of DBMS_STATS Subprograms

162-174
Parameters

Table 162-105  REPORT_GATHER_TABLE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of table to analyze</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of table</td>
</tr>
<tr>
<td>partname</td>
<td>Name of partition</td>
</tr>
<tr>
<td>estimate_percent</td>
<td>Percentage of rows to estimate (NULL means compute) The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>block_sample</td>
<td>Whether or not to use random block sampling instead of random row sampling. Random block sampling is more efficient, but if the data is not randomly distributed on disk, then the sample values may be somewhat correlated. Only pertinent when doing an estimate statistics.</td>
</tr>
</tbody>
</table>
| method_opt  | Accepts either of the following options, or both in combination: 
  • FOR ALL [INDEXED | HIDDEN] COLUMNS [size_clause] 
  • FOR COLUMNS [column_clause] [size_clause] 
  size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY} 
  column_clause is defined as column_clause := column_name | extension name | extension 
  - integer: Number of histogram buckets. Must be in the range [1,2048]. 
  - REPEAT: Collects histograms only on the columns that already have histograms 
  - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns. 
  - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns. 
  - column_name: Name of a column 
  - extension: can be either a column group in the format of (column_name, Column_name [, ...]) or an expression |

The default is FOR ALL COLUMNS SIZE AUTO. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>degree</td>
<td>Degree of parallelism. The default for degree is NULL. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure. NULL means use the table default value specified by the DEGREE clause in the CREATE TABLE or ALTER TABLE statement. Use the constant DBMS_STATS.DEFAULT_DEGREE to specify the default value based on the initialization parameters. The AUTO_DEGREE value determines the degree of parallelism automatically. This is between 1 (serial execution) and DEFAULT_DEGREE (the system default value based on number of CPUs and initialization parameters) according to the size of the object. When using DEGREE=&gt;NULL, DEGREE=&gt;n, or DEGREE=&gt;DBMS_STATS.DEFAULT_DEGREE, the current implementation of DBMS_STATS may use serial execution if the size of the object does not warrant parallel execution.</td>
</tr>
<tr>
<td>granularity</td>
<td>Granularity of statistics to collect (only pertinent if the table is partitioned). 'ALL' - Gathers all (subpartition, partition, and global) statistics 'APPROX_GLOBAL AND PARTITION' - Similar to 'GLOBAL AND PARTITION' but in this case the global statistics are aggregated from partition level statistics. This option will aggregate all statistics except the number of distinct values for columns and number of distinct keys of indexes. The existing histograms of the columns at the table level are also aggregated. The aggregation will use only partitions with statistics, so to get accurate global statistics, users should make sure to have statistics for all partitions. Global statistics are gathered if partname is NULL or if the aggregation cannot be performed (for example, if statistics for one of the partitions is missing). 'AUTO' - Determines the granularity based on the partitioning type. This is the default value. 'DEFAULT' - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'. 'GLOBAL' - Gathers global statistics 'GLOBAL AND PARTITION' - Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object. 'PARTITION' - Gathers partition-level statistics 'SUBPARTITION' - Gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
Table 162-105  (Cont.) REPORT_GATHER_TABLE_STATS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade</td>
<td>Gathers statistics on the indexes for this table. Using this option is equivalent to running the GATHER_INDEX_STATS Procedure on each of the table's indexes. Use the constant DBMS_STATS.AUTO.Cascade to have Oracle determine whether index statistics are to be collected or not. This is the default. The default value can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to save the current statistics</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>stattype</td>
<td>Statistics type. The only value allowed is DATA.</td>
</tr>
<tr>
<td>force</td>
<td>Gather statistics of table even if it is locked</td>
</tr>
</tbody>
</table>

<td>- HTML</td>
</tr>
<tr>
<td></td>
<td>- TEXT (Default)</td>
</tr>
</tbody>
</table>

Note that several fields (such as job name, estimated task cost) in the report are populated only when an operation is executed concurrently (CONCURRENT preference is turned on).
Return Values

A CLOB object that contains the report

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

Related Topics

• GATHER_TABLE_STATS Procedure
  This procedure gathers table, column, and index statistics. It attempts to parallelize as much work as possible, but there are some restrictions, which are described in the individual parameters.

162.7.97 REPORT_SINGLE_STATS_OPERATION Function

This function generates a report for the provided operation optionally in a particular pluggable database (PDB) in a multitenant environment.

Syntax

```sql
DBMS_STATS.REPORT_SINGLE_STATS_OPERATIONS (  
opid              NUMBER,
detail_level      VARCHAR2  DEFAULT 'TYPICAL',
format            VARCHAR2  DEFAULT 'TEXT'
container_id      NUMBER    DEFAULT NULL)
RETURN CLOB;
```

Parameters

<tr>
<td>container_id</td>
<td>ID of the pluggable database (PDB) on which this operation was performed. Note that in a multitenant environment, operation ID does not uniquely identify an operation. That is, different operations from distinct PDBs may have the same operation ID. Hence, in a multitenant environment, if a PDB ID is not provided, then the report may contain multiple operations. In a typical (non-CDB) database environment, operation ID is unique to each operation.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you need the `ANALYZE ANY` privilege and the `ANALYZE ANY DICTIONARY` privilege.

162.7.98 REPORT_STATS_OPERATIONS Function

This function generates a report of all statistics operations that take place between two timestamps which may or may not have been provided.

It allows the scope of the report to be narrowed down so that report will include only auto statistics gathering runs. Furthermore, in a multitenant environment, users may optionally provide a set of pluggable database (PDB) IDs so that only statistics operations from the specified pluggable databases will be reported.

Syntax

```sql
DBMS_STATS.REPORT_STATS_OPERATIONS (  
    detail_level VARCHAR2 DEFAULT 'TYPICAL',  
    format VARCHAR2 DEFAULT 'TEXT',  
    latestN NUMBER DEFAULT NULL,  
    since TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    until TIMESTAMP WITH TIME ZONE DEFAULT NULL,  
    auto_only BOOLEAN DEFAULT FALSE,  
    container_ids DBMS_UTILITY.NUMBER_ARRAY DEFAULT DBMS_STATS.NULL_NUMTAB)  
RETURN CLOB;
```
Parameters

Table 162-107 REPORT_STATS_OPERATIONS Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| detail_level | Detail level for the content of the report  
  • BASIC: The report includes  
    - operation ID  
    - operation name  
    - operation target object  
    - start time  
    - end time  
    - completion status (such as: succeeded, failed)  
  • TYPICAL: In addition to the information provided at level BASIC, the report includes individual target objects for which statistics are gathered in this operation. Specifically, with regard to operation related details:  
    - total number of target objects  
    - total number of successfully completed objects  
    - total number of failed objects  
    - total number of timed-out objects (applies to only auto statistics gathering)  
  • ALL: In addition to the information provided at level TYPICAL, the report includes further information on each target object. Specifically, with regard to operation-related details:  
    - job name (if the operation was run in a job)  
    - session ID  
    - parameter values  
    - additional error details if the operation has failed |
| format      | Report format:  
  • XML  
  • HTML  
  • TEXT (Default) |
| latestN     | Restricts the report to contain only the latest N operations that took place between the provided time points (since and until). The default value is NULL, meaning that all qualifying operations will be reported. |
| since       | The report will include only statistics operations that started after this timestamp. |
| until       | The report will include only statistics operations that before after this timestamp. |
| auto_only   | When TRUE, the report will contain only auto statistics gathering job runs. |
| container_ids | A multitenant environment contains one or more pluggable databases (PDBs). container_ids represents a set of PDB IDs so that only statistics operations from the specified PDBs are reported (applies to only multitenant environments). |
Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

Examples

Note that the type for container_ids input parameter is DBMS_UTILITY.NUMBER_ARRAY which is an associative PL/SQL array collection. Although associative array type allows for more flexible harvals table-like organization of entries, this function treats container_ids as a regular table collection with the first ID located at index 1 and the last id located at index container_ids.count without any empty array slot left between any two IDs. An example for 3 container ids is provided.

DECLARE
    conid_tab  DBMS_UTILITY.NUMBER_ARRAY;
    report clob;
BEGIN
    conid_tab(1) := 124;
    conid_tab(2) := 63;
    conid_tab(3) := 98;
    report := DBMS_STATS.REPORT_STATS_OPERATIONS (container_ids => conid_tab);
END;

162.7.99 RESET_ADVISOR_TASK Procedure

This procedure resets an Optimizer Statistics Advisor task execution to its initial state. Only reset a task that is not currently executing.

Syntax

DBMS_STATS.RESET_ADVISOR_TASK (task_name IN VARCHAR2);

Parameters

Table 162-108  RESET_ADVISOR_TASK Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors
162.7.100 RESET_COL_USAGE Procedure

This procedure deletes the recorded column (group) usage information.

This procedure should only be used in very rare cases when the seed column usage needs to be initialized.

Syntax

```
DBMS_STATS.RESET_COL_USAGE (
    ownname   IN   VARCHAR2,
    tabname   IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name. If NULL it deletes column usage information for tables in all schemas in the database.</td>
</tr>
<tr>
<td>tabname</td>
<td>Table name. If NULL it deletes column usage information for all tables of owner. If both the owner and tabname is NULL, the seed column usage is stopped if applicable. See :SEED_COL_USAGE Procedure for more information.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you need to have the SYSDBA administrative privilege, or both the ANALYZE ANY DICTIONARY and the ANALYZE ANY system privileges.

162.7.101 RESET_GLOBAL_PREF_DEFAULTS Procedure

This procedures sets global preference, such as CASCADE, ESTIMATE_PERCENT and GRANULARITY, to default values.

This reverses the global preferences set by the SET_GLOBAL_PREFS Procedure.

Syntax

```
DBMS_STATS.RESET_GLOBAL_PREF_DEFAULTS;
```

Usage Notes

To invoke this procedure you need the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.
162.7.102 RESET_PARAM_DEFAULTS Procedure

This deprecated procedure resets the default values of all parameters to Oracle recommended values.

**Note:**

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. Instead of this procedure, use the **RESET_GLOBAL_PREF_DEFAULTS** Procedure.

See also [DBMS_STATS Deprecated Subprograms](#).

**Syntax**

```
DBMS_STATS.RESET_PARAM_DEFAULTS;
```

162.7.103 RESTORE_DATABASE_STATS Procedure

This procedure restores statistics of all tables of the database as of a specified timestamp (`as_of_timestamp`).

**Syntax**

```
DBMS_STATS.RESTORE_DATABASE_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                            (GET_PARAM('NO_INVALIDATE')));
```

**Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>as_of_timestamp</code></td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td><code>force</code></td>
<td>Restores statistics even if their statistics are locked.</td>
</tr>
<tr>
<td><code>no_invalidate</code></td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use <code>DBMS_STATS.AUTO_INVALIDATE</code> to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the <code>SET_DATABASE_PREFS Procedure</code>, <code>SET_GLOBAL_PREFS Procedure</code>, <code>SET_SCHEMA_PREFS Procedure</code> and <code>SET_TABLE_PREFS Procedure</code>.</td>
</tr>
</tbody>
</table>

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

162.7.104 RESTORE_DICTIORY_STATS Procedure

This procedure restores statistics of all dictionary tables (tables of 'SYS', 'SYSTEM' and RDBMS component schemas) as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_DICTIONARY_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                       {GET_PARAM('NO_INVALIDATE')});
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>Timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or both ANALYZE ANY DICTIONARY and ANALYZE ANY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

162.7.105 RESTORE_FIXED_OBJECTS_STATS Procedure

This procedure restores statistics of all fixed tables as of a specified timestamp (as_of_timestamp).

Syntax

```sql
DBMS_STATS.RESTORE_FIXED_OBJECTS_STATS(
    as_of_timestamp        TIMESTAMP WITH TIME ZONE,
    force                  BOOLEAN DEFAULT FALSE,
    no_invalidate          BOOLEAN DEFAULT to_no_invalidate_type
                       {GET_PARAM('NO_INVALIDATE')});
```
Parameters

Table 162-112  RESTORE_FIXED_OBJECTS_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Usage Notes

To run this procedure, you must have the SYSDBA or ANALYZE ANY DICTIONARY system privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

162.7.106 RESTORE_SCHEMA_STATS Procedure

This procedure restores statistics of all tables of a schema as of a specified timestamp (as_of_timestamp).

Syntax

DBMS_STATS.RESTORE_SCHEMA_STATS(
    ownname VARCHAR2,
    as_of_timestamp TIMESTAMP WITH TIME ZONE,
    force BOOLEAN DEFAULT FALSE,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type
) (GET_PARAM('NO_INVALIDATE'));

Parameters

Table 162-113  RESTORE_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Schema of the tables for which the statistics are to be restored</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if their statistics are locked</td>
</tr>
</tbody>
</table>
Table 162-113  (Cont.) RESTORE_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE. to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.107 RESTORE_SYSTEM_STATS Procedure

This procedure restores system statistics as of a specified timestamp (as_of_timestamp).

Syntax

DBMS_STATS.RESTORE_SCHEMA_STATS(
    as_of_timestamp TIMESTAMP WITH TIME ZONE);

Parameters

Table 162-114  RESTORE_SYSTEM_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid or inconsistent values
ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.
162.7.108 RESTORE_TABLE_STATS Procedure

This procedure restores statistics of a table as of a specified timestamp (as_of_timestamp). It also restores statistics of associated indexes and columns.

If the table statistics were locked at the specified timestamp the procedure will lock the statistics. The procedure will not restore user defined statistics.

Syntax

```sql
DBMS_STATS.RESTORE_TABLE_STATS (
    ownname                   VARCHAR2,
    tabname                   VARCHAR2,
    as_of_timestamp           TIMESTAMP WITH TIME ZONE,
    restore_cluster_index     BOOLEAN DEFAULT FALSE,
    force                     BOOLEAN DEFAULT FALSE,
    no_invalidate             BOOLEAN DEFAULT to_no_invalidate_type
                   (GET_PARAM('NO_INVALIDATE')));
```

Parameters

**Table 162-115  RESTORE_TABLE_STATS Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>The schema of the table for which the statistics are to be restored</td>
</tr>
<tr>
<td>tabname</td>
<td>The table name</td>
</tr>
<tr>
<td>as_of_timestamp</td>
<td>The timestamp to which to restore statistics</td>
</tr>
<tr>
<td>restore_cluster_index</td>
<td>If the table is part of a cluster, restore statistics of the cluster index if set to TRUE</td>
</tr>
<tr>
<td>force</td>
<td>Restores statistics even if the table statistics are locked. If the table statistics were not locked at the specified timestamp, it unlocks the statistics.</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
</tbody>
</table>

Exceptions

- ORA-20000: Object does not exist or insufficient privileges
- ORA-20001: Invalid or inconsistent values
- ORA-20006: Unable to restore statistics, statistics history not available

Usage Notes

To invoke this procedure you must be owner of the table, or you need the **ANALYZE ANY** privilege. For objects owned by **SYS**, you need to be either the owner of the table, or you need the **ANALYZE ANY DICTIONARY** privilege or the **SYSDBA** privilege.
162.7.109 RESUME_ADVISOR_TASK Procedure

This procedure resumes an interrupted task. It only resumes the execution that was most recently interrupted.

Syntax

```
DBMS_STATS.RESUME_ADVISOR_TASK (  
    task_name IN VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the `ADVISOR` privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Consider a case in which a task is executed by one user, interrupted, and then resumed by a different user. In this case, Optimizer Statistics Advisor bases its checks of the resumed execution on the privilege of the user who resumed the task.

Exceptions

- `ORA-20000`: Insufficient privileges
- `ORA-20001`: Invalid input values
- `ORA-20012`: Optimizer Statistics Advisor errors

Example 162-14  Resuming an Interrupted Task

In this example, you start a SQL*Plus session, and then create and execute an advisor task named `my_task`:

```
DECLARE
    v_tname   VARCHAR2(128) := 'my_task';
    v_ename   VARCHAR2(128) := NULL;
BEGIN
    -- create a task
    v_tname := DBMS_STATS.CREATE_ADVISOR_TASK(v_tname);
    -- execute the task
    v_ename := DBMS_STATS.EXECUTE_ADVISOR_TASK(v_tname);
END;
/
```

In a separate terminal, you start a second SQL*Plus session, and then execute the following program:
XEC DBMS_STATS.INTERRUPT_ADVISOR_TASK('my_task');

The first session returns an ORA-13632 to indicate the cancelation of the task:
ORA-13638: The user interrupted the current operation.

In the second SQL*Plus session, you resume the task execution as follows:
XEC DBMS_STATS.RESUME_ADVISOR_TASK('my_task');

162.7.110 SCRIPT_ADVISOR_TASK Function

Retrieves the script that implements the recommended actions for the problems found by Optimizer Statistics Advisor.

The generated script contains PL/SQL statements that you can choose to execute. Preceding the commands for each action are comments that list the potential side effects. You can review the comments, and choose to execute only the desired sections.

Syntax

DBMS_STATS.SCRIPT_ADVISOR_TASK (
  task_name          IN   VARCHAR2,
  execution_name     IN   VARCHAR2    := NULL,
  dir_name           IN   VARCHAR2    := NULL,
  level              IN   VARCHAR2    := 'TYPICAL')
RETURN CLOB;

Parameters

Table 162-117  SCRIPT_ADVISOR_TASK Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>execution_name</td>
<td>A name that qualifies and identifies an advisor execution. If not specified, then the advisor automatically generates it. If the specified execution conflicts with the name of an existing execution, then the function returns an error.</td>
</tr>
<tr>
<td>dir_name</td>
<td>Directory name to which to write the generated script. If the name is not specified (NULL), then the function includes the script in the returned CLOB. If the name is specified, then the function returns the script as a CLOB and as a new file in the specified directory.</td>
</tr>
<tr>
<td>level</td>
<td>The level of the script to generate. Possible values are</td>
</tr>
<tr>
<td></td>
<td>• ALL: Ignores the filter and generates a script for all findings</td>
</tr>
<tr>
<td></td>
<td>• TYPICAL: Generates a script according to the filters in place</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

• To execute this subprogram, you must have the ADVISOR privilege.
• You must be the owner of the task.
You can execute this subprogram for AUTO_STATS_ADVISOR_TASK, which is predefined.

This subprogram executes using invoker's rights.

The results of performing this task depend on the privileges of the executing user:

- **SYSTEM level**
  
  Only users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task on system-level rules.

- **Operation level**
  
  The results depend on the following privileges:
  
  - Users with both the ANALYZE ANY and ANALYZE ANY DICTIONARY privileges can perform this task for all statistics operations.
  
  - Users with the ANALYZE ANY privilege but not the ANALYZE ANY DICTIONARY privilege can perform this task for statistics operations related to any schema except SYS.
  
  - Users with the ANALYZE ANY DICTIONARY privilege but not the ANALYZE ANY privilege can perform this task for statistics operations related to their own schema and the SYS schema.
  
  - Users with neither the ANALYZE ANY nor the ANALYZE ANY DICTIONARY privilege can only perform this operation for statistics operations relating to their own schema.

- **Object level**
  
  Users can perform this task for any object for which they have statistics collection privileges.

**Return Values**

This function returns a CLOB that contains the script.

**Exceptions**

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

**Example 162-15 Creating an Optimizer Statistics Advisor Script**

This example creates a procedure named myrep, and then calls this procedure to print the script the implements the recommendations.

```
SET ECHO ON
SET FEEDBACK ON
SET SERVEROUTPUT ON
SET TRIMS ON
SET LINESIZE 300

EXECUTE DBMS_OUTPUT.ENABLE (buffer_size => 10000000);

CREATE OR REPLACE PROCEDURE myrep(p_tname VARCHAR2, p_ftype VARCHAR2, which VARCHAR2)
IS
  v_report CLOB := null;
```
v_script CLOB := null;
v_ftype  VARCHAR2(400) := p_ftype;
v_tname  VARCHAR2(400) := p_tname;
v_len    NUMBER(10);
v_ps     NUMBER(10)    := 10000;
v_pn     NUMBER(10)    := 1;
v_ret    VARCHAR2(32767);
BEGIN
  IF which = 'REPORT'
  THEN
    -- generate a report
    v_report := DBMS_STATS.REPORT_ADVISOR_TASK(
      task_name => v_tname,
      type      => v_ftype,
      section   => 'ALL',
      level     => 'ALL');
    v_len := DBMS_LOB.getlength(v_report);
    WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_report, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
  ELSE
    -- generate a script
    v_script := DBMS_STATS.SCRIPT_ADVISOR_TASK(v_tname);
    v_len := DBMS_LOB.getlength(v_script);
    WHILE (v_pn < v_len)
      LOOP
        DBMS_OUTPUT.PUT_LINE(DBMS_LOB.SUBSTR(v_script, v_ps, v_pn));
        v_pn := v_pn + v_ps;
      END LOOP;
  END IF;
END;
/

SHOW ERRORS
SPOOL report.txt
EXECUTE myrep('my_task','-','SCRIPT');
SPOOL OFF

162.7.111 SEED_COL_USAGE Procedure

This procedure seeds column usage information from statements in the specified SQL tuning set, or in the database.

The procedure iterates over the SQL statements, compiles them, and then seeds column usage information for the columns that appear in these statements. You can monitor the workload on the system for a given amount of time and seed the column usage information based on the columns that appear in statements executed during the monitoring window.
Syntax

DBMS_STATS.SEED_COL_USAGE (  
    sqlset_name     IN    VARCHAR2,  
    owner_name      IN    VARCHAR2,  
    time_limit      IN    POSITIVE DEFAULT NULL);

Parameters

Table 162-118  SEED_COL_USAGE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sqlset_name</td>
<td>Name of the SQL tuning set that contains the statements to be monitored.</td>
</tr>
<tr>
<td></td>
<td>If this parameter and owner_name are both null, then the procedure monitors</td>
</tr>
<tr>
<td></td>
<td>all statements in the database for the specified time limit.</td>
</tr>
<tr>
<td>owner_name</td>
<td>Owner of the SQL tuning set that contains the statements to be monitored.</td>
</tr>
<tr>
<td></td>
<td>If this parameter and sqlset_name are both null, then the procedure</td>
</tr>
<tr>
<td></td>
<td>monitors all statements in the database for the specified time limit.</td>
</tr>
<tr>
<td>time_limit</td>
<td>Time limit (in seconds).</td>
</tr>
</tbody>
</table>

Security Model

To invoke this procedure you must have the ANALYZE ANY privilege and the ANALYZE ANY DICTIONARY privilege.

Exceptions

ORA-20000: Insufficient privileges

Usage Notes

This procedure also records group of columns. You can create extensions for the recorded group of columns using the CREATE_EXTENDED_STATS Function procedure. If sqlset_name and owner_name are NULL, then the procedure records the column (group) usage information for the statements executed in the system in next time_limit seconds.

This monitoring procedure records different information from the traditional column usage information that is visible in SYS.COL_USAGES. The procedure stores information in SYS.COL_GROUP_USAGES.

Examples

The following example turns on monitoring for 5 minutes or 300 seconds.

BEGIN  
    DBMS_STATS.SEED_COL_USAGE (null,null,300);  
END;
162.7.112 SET_ADVISOR_TASK_PARAMETER Procedure

This procedure updates the value of an Optimizer Statistics Advisor task parameter.

Syntax

```
DBMS_STATS.SET_ADVISOR_TASK_PARAMETER (  
  task_name     IN   VARCHAR2,  
  parameter     IN   VARCHAR2,  
  value         IN   VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>task_name</td>
<td>The name of the Optimizer Statistics Advisor task.</td>
</tr>
<tr>
<td>parameter</td>
<td>The name of the parameter to set. The function returns an error if the specified parameter does not exist.</td>
</tr>
<tr>
<td>value</td>
<td>The new value of the parameter.</td>
</tr>
</tbody>
</table>

Security Model

Note the following:

- To execute this subprogram, you must have the ADVISOR privilege.
- You must be the owner of the task.
- This subprogram executes using invoker's rights.

Exceptions

- ORA-20000: Insufficient privileges
- ORA-20001: Invalid input values
- ORA-20012: Optimizer Statistics Advisor errors

Oracle Database SQL Tuning Guide to learn how to manage Optimizer Statistics Advisor

162.7.113 SET_COLUMN_STATS Procedures

This procedure sets column-related information.

In the version of this procedure that deals with user-defined statistics, the statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is NULL, the statistics type associated with the index or column is stored.
Syntax

DBMS_STATS.SET_COLUMN_STATS (  
    ownname VARCHAR2,  
    tabname VARCHAR2,  
    colname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    distcnt NUMBER DEFAULT NULL,  
    density NUMBER DEFAULT NULL,  
    nullcnt NUMBER DEFAULT NULL,  
    srec StatRec DEFAULT NULL,  
    avgclen NUMBER DEFAULT NULL,  
    flags NUMBER DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),  
    force BOOLEAN DEFAULT FALSE);

Use the following for user-defined statistics:

DBMS_STATS.SET_COLUMN_STATS (  
    ownname VARCHAR2,  
    tabname VARCHAR2,  
    colname VARCHAR2,  
    partname VARCHAR2 DEFAULT NULL,  
    stattab VARCHAR2 DEFAULT NULL,  
    statid VARCHAR2 DEFAULT NULL,  
    ext_stats RAW,  
    stattypown VARCHAR2 DEFAULT NULL,  
    stattypname VARCHAR2 DEFAULT NULL,  
    statown VARCHAR2 DEFAULT NULL,  
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type(  
        get_param('NO_INVALIDATE')),  
    force BOOLEAN DEFAULT FALSE);

Parameters

Table 162-120 SET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table to which this column belongs.</td>
</tr>
<tr>
<td>colname</td>
<td>Name of the column or extension</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>User statistics table identifier describing where to store the statistics. If stattab is NULL, then the statistics are stored directly in the dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab (Only pertinent if stattab is not NULL)</td>
</tr>
<tr>
<td>ext_stats</td>
<td>User-defined statistics</td>
</tr>
<tr>
<td>stattypown</td>
<td>Schema of the statistics type</td>
</tr>
</tbody>
</table>
### Table 162-120 (Cont.) SET_COLUMN_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stattypname</td>
<td>Name of the statistics type</td>
</tr>
<tr>
<td>distcnt</td>
<td>Number of distinct values</td>
</tr>
<tr>
<td>density</td>
<td>Column density. If this value is NULL and if distcnt is not NULL, then density is derived from distcnt.</td>
</tr>
<tr>
<td>nullcnt</td>
<td>Number of NULLs</td>
</tr>
<tr>
<td>srec</td>
<td>StatRec structure filled in by a call to PREPARE_COLUMN_VALUES or GET_COLUMN_STATS</td>
</tr>
<tr>
<td>avgclen</td>
<td>Average length for the column (in bytes)</td>
</tr>
<tr>
<td>flags</td>
<td>For internal Oracle use (should be left as NULL)</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname)</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default. The default can be changed using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>force</td>
<td>Sets the values even if statistics of the column are locked</td>
</tr>
</tbody>
</table>

### Exceptions

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid or inconsistent input values
- **ORA-20005**: Object statistics are locked

### Usage Notes

To invoke this procedure you must be owner of the table, or you need the **ANALYZE ANY** privilege. For objects owned by **SYS**, you need to be either the owner of the table, or you need the **ANALYZE ANY DICTIONARY** privilege or the **SYSDBA** privilege.

#### 162.7.114 SET_DATABASE_PREFS Procedure

This procedure sets the statistics preferences of all the tables, excluding the tables owned by the database. These tables can by included by passing **TRUE** for the `add_sys` parameter.

**Syntax**

```sql
DBMS_STATS.SET_DATABASE_PREFS (
    pname            IN   VARCHAR2,
    pvalue           IN   VARCHAR2,
    add_sys          IN   BOOLEAN DEFAULT FALSE);
```
### Parameters

#### Table 162-121  SET_DATABASE_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| pname     | Preference name. The existing value for following preferences can be deleted and default preference values will be used:  
- APPROXIMATE_NDV_ALGORITHM  
- AUTO_STAT_EXTENSIONS  
- CASCADE  
- DEGREE  
- ESTIMATE_PERCENT  
- GLOBAL_TEMP_TABLE_STATS  
- GRANULARITY  
- INCREMENTAL  
- INCREMENTAL_STALENESS  
- INCREMENTAL_LEVEL  
- METHOD_OPT  
- NO_INVALIDATE  
- OPTIONS  
- PREFERENCE_OVERRIDES_PARAMETER  
- PUBLISH  
- STALE_PERCENT  
- STAT_CATEGORY  
- TABLE_CACHED_BLOCKS |
| pvalue    | Preference value. If NULL is specified, it will set the Oracle default values |
| add_sys   | Value `TRUE` will include the Oracle-owned tables |
Table 162-122  Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPROXIMATE_NDV_ALGORITHM</td>
<td>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can delete the following preferences:</td>
</tr>
<tr>
<td></td>
<td>• REPEAT OR HYPERLOGLOG</td>
</tr>
<tr>
<td></td>
<td>This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformattting legacy content.</td>
</tr>
<tr>
<td></td>
<td>• ADAPTIVE SAMPLING</td>
</tr>
<tr>
<td></td>
<td>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</td>
</tr>
<tr>
<td></td>
<td>• HYPERLOGLOG</td>
</tr>
<tr>
<td></td>
<td>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</td>
</tr>
<tr>
<td></td>
<td>– The accuracy of the new algorithm is similar to the original algorithm.</td>
</tr>
<tr>
<td></td>
<td>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</td>
</tr>
<tr>
<td>AUTO_STAT_EXTENSIONS</td>
<td>Controls the automatic creation of extensions when database statistics are gathered.</td>
</tr>
<tr>
<td></td>
<td>You can set the following values:</td>
</tr>
<tr>
<td></td>
<td>• ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.</td>
</tr>
<tr>
<td></td>
<td>• OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default.</td>
</tr>
<tr>
<td>CASCADE</td>
<td>Determines whether to collect index statistics as part of gathering table statistics.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>Determines the degree of parallelism used for gathering statistics.</td>
</tr>
</tbody>
</table>
### Table 162-122  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESTIMATE_PERCENT</td>
<td>Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:</td>
</tr>
<tr>
<td></td>
<td>• SHARED — All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>• SESSION — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables. The following values are valid:</td>
</tr>
<tr>
<td></td>
<td>• ALL — Gathers all statistics: subpartition, partition, and global.</td>
</tr>
<tr>
<td></td>
<td>• AUTO — Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• DEFAULT — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.</td>
</tr>
<tr>
<td></td>
<td>• GLOBAL — Gathers global statistics.</td>
</tr>
<tr>
<td></td>
<td>• GLOBAL AND PARTITION — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td></td>
<td>• PARTITION — Gathers partition-level statistics.</td>
</tr>
<tr>
<td></td>
<td>• SUBPARTITION — Gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
### Table 162-122  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</td>
</tr>
<tr>
<td></td>
<td>• The INCREMENTAL value for the partitioned table is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>• The PUBLISH value for the partitioned table is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>• The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</td>
</tr>
<tr>
<td></td>
<td>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• PARTITION — Gathers partition-level synopses.</td>
</tr>
<tr>
<td></td>
<td>This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</td>
</tr>
<tr>
<td></td>
<td>• TABLE — Gathers table-level synopses.</td>
</tr>
<tr>
<td></td>
<td>Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</td>
</tr>
</tbody>
</table>
Table 162-122  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td>• USE_STALE_PERCENT</td>
<td>A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td>• USE_LOCKED_STATS</td>
<td>Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td>• ALLOW_MIXED_FORMAT</td>
<td>Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td>• NULL</td>
<td>A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

```
EXEC DBMS_STATS.SET_TABLE_PREFS
  ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');

EXEC DBMS_STATS.SET_TABLE_PREFS
  ('sh', 'sales', 'INCREMENTAL_STALENESS', null);
```

The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.
Table 162-122  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. When setting preferences at the global, schema, database, or dictionary level, only FOR ALL syntax is allowed:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>The size_clause is defined as size_clause := SIZE {integer</td>
</tr>
<tr>
<td></td>
<td>integer — Specifies the number of histogram buckets. The number must be between 1 and 2048.</td>
</tr>
<tr>
<td></td>
<td>REPEAT — Collects histograms only on the columns that already have histograms.</td>
</tr>
<tr>
<td></td>
<td>AUTO — Determines the columns on which to collect histograms based on data distribution and the workload of the columns.</td>
</tr>
<tr>
<td></td>
<td>SKEWONLY — Determines the columns on which to collect histograms based on the data distribution of the columns.</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO. You can change the value using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors. If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.</td>
</tr>
<tr>
<td>OPTIONS</td>
<td>Specifies which objects require statistics to be gathered. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics on all objects in the database. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. This is the default.</td>
</tr>
<tr>
<td></td>
<td>The database implicitly determines which objects need new statistics and determines how to gather those statistics. When GATHER AUTO is specified, the only additional valid parameters are comp_id, no_invalidate, stattab, statid, and statown; all other parameter settings will be ignored. Also, the database returns a list of objects processed.</td>
</tr>
</tbody>

<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</td>
</tr>
</tbody>
</table>

### Security Model

To run this procedure, you must have the **SYSDBA** role or both **ANALYZE ANY DICTIONARY** and **ANALYZE ANY system privileges**.

### Exceptions

- **ORA-20000**: Insufficient privileges
- **ORA-20001**: Invalid or illegal input values

### Usage Notes

Both arguments are of type `VARCHAR2` and values are enclosed in quotes, even when they represent numbers.
Examples

DBMS_STATS.SET_DATABASE_PREFS('CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_DATABASE_PREFS('ESTIMATE_PERCENT','9');
DBMS_STATS.SET_DATABASE_PREFS('DEGREE','99');

Table 162-124  Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPROXIMATE_NDV_ALGORITHM</td>
<td>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can delete the following preferences:</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>• REPEAT OR HYPERLOGLOG</td>
<td>This is the default. If <code>INCREMENTAL</code> is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.</td>
</tr>
<tr>
<td>• ADAPTIVE_SAMPLING</td>
<td>The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.</td>
</tr>
<tr>
<td>• HYPERLOGLOG</td>
<td>The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:</td>
</tr>
<tr>
<td></td>
<td>– The accuracy of the new algorithm is similar to the original algorithm.</td>
</tr>
<tr>
<td></td>
<td>– The memory required is significantly lower, which typically leads to huge reductions in synopsis size.</td>
</tr>
</tbody>
</table>
Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| AUTO_STAT_EXTENSIONS | Controls the automatic creation of extensions when database statistics are gathered. You can set the following values:
  • ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.
  • OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| AUTOSTATS_TARGET  | Controls the objects considered for statistics collection. It takes the following values:
  • 'ALL' - Statistics collected for all objects in system
  • 'ORACLE' - Statistics collected for all Oracle owned objects
  • 'AUTO' - Oracle decides on which objects to collect statistics
  This preference is applicable only for automatic statistics collection. |
| CASCADE           | Determines whether to collect index statistics as part of gathering table statistics. |
| CONCURRENT        | Determines whether statistics are gathered concurrently on multiple objects, or serially, one object at a time. Valid values are:
  • MANUAL — Concurrency is enabled only for manual statistics gathering.
  • AUTOMATIC — Concurrency is enabled only for the automatic statistics gathering.
  • ALL — Concurrency is enabled for both manual and automatic statistics gathering.
  • OFF — Concurrency is disabled for both manual and automatic statistics. |
| DEGREE            | Determines the degree of parallelism used for gathering statistics. |
| ESTIMATE_PERCENT  | Determines the percentage of rows to sample. The valid range is between 0.000001 and 100. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to enable the database to determine the appropriate sample size for optimal statistics. This is the default. |
### Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| GLOBAL_TEMP_TABLE_STATS            | Controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. This preference takes two values:  
  - **SHARED** — All sessions see the same set of statistics  
  - **SESSION** — Statistics gathered by the GATHER_TABLE_STATS procedure on a global temporary table are session-specific. Thus, the database only uses them for queries issued in the same session as the statistics gathering process. The database deletes session-specific statistics when a session terminates. |
| GRANULARITY                        | Determines the granularity of statistics to collect. This preference is only relevant for partitioned tables.  
  The following values are valid:  
  - **ALL** — Gathers all statistics: subpartition, partition, and global.  
  - **AUTO** — Determines the granularity based on the partitioning type. This is the default value.  
  - **DEFAULT** — Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. Use GLOBAL AND PARTITION for this functionality.  
  - **GLOBAL** — Gathers global statistics.  
  - **GLOBAL AND PARTITION** — Gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.  
  - **PARTITION** — Gathers partition-level statistics.  
  - **SUBPARTITION** — Gathers subpartition-level statistics. |
Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether the global statistics for a partitioned table are maintained without performing a full table scan. When a table is partitioned, an application typically loads data into a new partition. As new partitions are added and data is loaded, global table statistics must be kept up to date. If the following conditions are met, then the database updates the global table statistics by scanning only the changed partitions instead of the entire table:</td>
</tr>
<tr>
<td></td>
<td>- The INCREMENTAL value for the partitioned table is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>- The PUBLISH value for the partitioned table is set to TRUE.</td>
</tr>
<tr>
<td></td>
<td>- The user specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.</td>
</tr>
<tr>
<td></td>
<td>If the INCREMENTAL value for the partitioned table was set to FALSE (default value), then the database uses a full table scan to maintain the global statistics. This technique is a much more resource-intensive and time-consuming operation for large tables.</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes the following values:</td>
</tr>
<tr>
<td></td>
<td>- PARTITION — Gathers partition-level synopses. This is the default value. If PARTITION is set on a nonpartitioned table, then the database does not gather synopses.</td>
</tr>
<tr>
<td></td>
<td>- TABLE — Gathers table-level synopses. Specify this value when you want to exchange this table with a partition. Before the exchange, you can run GATHER_TABLE_STATS on this table with INCREMENTAL set to TRUE and INCREMENTAL_LEVEL to TABLE. The result is that the database gathers table-level synopses on this table. After the exchange, the partition has synopses that come from the table-level synopses of the table before the exchange. You can only use preference value in the SET_TABLE_PREFS procedure: this value is not allowed in the other SET_*_PREFS procedures.</td>
</tr>
</tbody>
</table>
Table 162-124 (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT', 'USE_LOCKED_STATS', 'ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS', USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td>• NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

```
EXEC DBMS_STATS.SET_TABLE_PREFS
  ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');
```
Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</td>
<td>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</td>
</tr>
</tbody>
</table>

**METHOD_OPT**

Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:

- FOR ALL [INDEXED | HIDDEN] COLUMNS
  - size_clause is defined as size_clause := SIZE {integer | REPEAT | AUTO | SKEWONLY}
    - integer: Number of histogram buckets. Must be in the range [1,2048].
    - REPEAT: Collects histograms only on the columns that already have histograms
    - AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns
    - SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns
  - column_name: name of a column
  - extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression

The default is FOR ALL COLUMNS SIZE AUTO.

**NO_INVALIDATE**

Controls the invalidation of dependent cursors of the tables for which statistics are being gathered. The default is DBMS_STATS.AUTO_INVALIDATE, which means the database decides when to invalidate dependent cursors.

If set to TRUE, then the database not invalidate dependent cursors. If set to FALSE, then the procedure invalidates dependent cursors immediately.
### Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics for all objects in the table. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.</td>
</tr>
<tr>
<td>PREFERENCE_OVERRIDES_PARAMETER</td>
<td>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</td>
</tr>
<tr>
<td></td>
<td>• FALSE — Obeys input parameter values.</td>
</tr>
<tr>
<td></td>
<td>Specifying this preference does not change the order of precedence of table, global, and default.</td>
</tr>
<tr>

<td>Determines whether the database publishes newly gathered statistics after the gathering job completes.</td>
</tr>
<tr>
<td></td>
<td>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</td>
</tr>
<tr>
<td></td>
<td>The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</td>
</tr>
<tr>
<td>STAT_CATEGORY</td>
<td>Specifies which statistics to import or export, accepting multiple values separated by a comma. Values supported:</td>
</tr>
<tr>
<td></td>
<td>• OBJECT_STATS - table statistics, column statistics and index statistics (default)</td>
</tr>
<tr>
<td></td>
<td>• SYNOPSES - information to support incremental statistics</td>
</tr>
<tr>
<td></td>
<td>The value 'OBJECT_STATS, SYNOPSES' specifies table statistics, column statistics, index statistics, and synopses.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>Specifies the average number of blocks assumed to be cached in the buffer cache when calculating the index clustering factor.</td>
</tr>
</tbody>
</table>
Table 162-124  (Cont.) Global Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>WAIT_TIME_TO_UPDATE_STATS</td>
<td>Specifies the number of minutes before timing out for locks and pins required for updating statistics. It accepts values in the range 0 to 65535. The default value is 15 minutes. The value 0 gets the locks and pins in no-wait mode.</td>
</tr>
</tbody>
</table>

Security Model

To run this procedure, you must have the **SYSDBA** or both **ANALYZE ANY DICTIONARY** and **ANALYZE ANY** system privilege.

Exceptions

ORA-20000: Insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

- This setting is honored only if there is no preference specified for the table to be analyzed.
- Both arguments are of type **VARCHAR2** and values are enclosed in quotes, even when they represent numbers.

Example 162-16   Overriding Statistics Preferences at the Global Level

You use the **SET_GLOBAL_PREFS** procedure to set the **ESTIMATE_PERCENT** preference to 5 for every table in the database that does not have a table preference set. Because **sh.costs** does not have a preference set, the global setting applies to this table.

SQL> EXEC DBMS_STATS.SET_GLOBAL_PREFS ('ESTIMATE_PERCENT', '5');

PL/SQL procedure successfully completed.

You use **SET_TABLE_PREFS** to set the **PREFERENCE_OVERRIDES_PARAMETER** preference to true for the **sh.sales** table only.

SQL> EXEC DBMS_STATS.SET_TABLE_PREFS('sh','sales','PREFERENCE_OVERRIDES_PARAMETER','TRUE');

PL/SQL procedure successfully completed.

A script attempts to set **ESTIMATE_PERCENT** to 10 when gathering statistics for **sh.sales**. However, because **PREFERENCE_OVERRIDES_PARAMETER** is **TRUE** for this table, and because a global preference is defined, Oracle Database gathers statistics using the global setting of 5 rather than the specified setting of 10:

SQL> EXEC DBMS_STATS.GATHER_TABLE_STATS ('sh', 'costs', ESTIMATE_PERCENT=>10);

PL/SQL procedure successfully completed.
162.7.116 SET_INDEX_STATS Procedures

These procedures set index-related statistics.

The version of this procedure that accepts `ext_stats` sets statistics for use with domain indexes. The statistics type specified is the type to store in the dictionary, in addition to the actual user-defined statistics. If this statistics type is null, then the database stores the statistics type associated with the index or column.

**Syntax**

```sql
DBMS_STATS.SET_INDEX_STATS ( 
    ownname       VARCHAR2,
    indname       VARCHAR2,
    partname      VARCHAR2 DEFAULT NULL,
    stattab       VARCHAR2 DEFAULT NULL,
    statid        VARCHAR2 DEFAULT NULL,
    numrows       NUMBER   DEFAULT NULL,
    numblks       NUMBER   DEFAULT NULL,
    numdist       NUMBER   DEFAULT NULL,
    avglblk       NUMBER   DEFAULT NULL,
    avgdblk       NUMBER   DEFAULT NULL,
    clstfct       NUMBER   DEFAULT NULL,
    indlevel      NUMBER   DEFAULT NULL,
    flags         NUMBER   DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type( 
        get_param('NO_INVALIDATE')),
    guessq        NUMBER   DEFAULT NULL,
    cachedblk     NUMBER   DEFAULT NULL,
    cachehit      NUMBER   DEFAULT NULL,
    force         BOOLEAN DEFAULT FALSE);
```

Use the following syntax for user-defined domain index statistics:

```sql
DBMS_STATS.SET_INDEX_STATS ( 
    ownname       VARCHAR2,
    indname       VARCHAR2,
    partname      VARCHAR2 DEFAULT NULL,
    stattab       VARCHAR2 DEFAULT NULL,
    statid        VARCHAR2 DEFAULT NULL,
    ext_stats     RAW,
    stattypown    VARCHAR2 DEFAULT NULL,
    stattypname   VARCHAR2 DEFAULT NULL,
    statown       VARCHAR2 DEFAULT NULL,
    no_invalidate BOOLEAN DEFAULT to_no_invalidate_type( 
        get_param('NO_INVALIDATE')),
    force         BOOLEAN DEFAULT FALSE);
```
### Parameters

<td>Sets the values even if statistics of the index are locked</td>
</tr>
</tbody>
</table>
Security Model

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY privilege or the `SYSDBA privilege.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid input value

ORA-20005: Object statistics are locked

Usage Notes

• The Optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The total cost of the operation will be combined from the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.

• Oracle maintains `cachedblk and `cachehit at all times but uses correspondent caching statistics for optimization as part of the table and index statistics only when the user calls `DBMS_STATS.GATHER_[TABLE/INDEX/SCHEMA/DATABASE]_STATS procedure for auto mode or `DBMS_STATS.GATHER_SYSTEM_STATS for manual mode. In order to prevent the user from utilizing inaccurate and unreliable data, the optimizer will compute a ‘confidence factor’ for each `cachehit and a `cachedblk for each object. If the ‘confidence factor’ for the value meets confidence criteria, this value will be used, otherwise the defaults will be used.

• The automatic maintenance algorithm for object caching statistics assumes that there is only one major workload for the system and adjusts statistics to this workload, ignoring other “minor” workloads. If this is not the case, you must use manual mode for maintaining object caching statistics.

• The object caching statistics maintenance algorithm for auto mode prevents you from using statistics in the following situations
  – When not enough data has been analyzed, such as when an object has been recently create
  – When the system does not have one major workload resulting in averages not corresponding to real values.

162.7.117 SET_PARAM Procedure

This deprecated procedure sets default values for parameters of `DBMS_STATS` procedures.

### Note:

This subprogram has been replaced by improved technology and is maintained only for purposes of backward compatibility. In this case, use the `SET_GLOBAL_PREFS Procedure`. See also `DBMS_STATS Deprecated Subprograms`.

You can use the `GET_PARAM` Function to get the current default value of a parameter.

#### Syntax

```sql
DBMS_STATS.SET_PARAM (
    pname    IN    VARCHAR2,
    pval     IN    VARCHAR2);
```

#### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pname</code></td>
<td>The parameter name The default value for following parameters can be set.</td>
</tr>
<tr>
<td></td>
<td>• <strong>CASCADE</strong> - The default value for <strong>CASCADE</strong> set by <code>SET_PARAM</code> is not used by export/import procedures. It is used only by gather procedures.</td>
</tr>
<tr>
<td></td>
<td>• <strong>DEGREE</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>ESTIMATE_PERCENT</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>METHOD_OPT</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>NO_INVALIDATE</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>GRANULARITY</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>AUTOSTATS_TARGET</strong> - This parameter is applicable only for auto statistics collection. The value of this parameter controls the objects considered for statistics collection (see <code>pval</code>)</td>
</tr>
<tr>
<td><code>pval</code></td>
<td>The parameter value. If NULL is specified, it will set the default value determined by Oracle. When <code>pname</code> IS <code>AUTOSTATS_TARGET</code>, the following are valid values:</td>
</tr>
<tr>
<td></td>
<td>• 'ALL' - Statistics are collected for all objects in the system</td>
</tr>
<tr>
<td></td>
<td>• 'ORACLE' - Statistics are collected for all Oracle owned objects</td>
</tr>
<tr>
<td></td>
<td>• 'AUTO' - Oracle decides for which objects to collect statistics</td>
</tr>
</tbody>
</table>

#### Usage Notes

- To run this procedure, you must have the `SYSDBA` or both the `ANALYZE ANY DICTIONARY` and `ANALYZE ANY SYSTEM` privileges.
• Note that both arguments are of type VARCHAR2 and the values need to be enclosed in quotes even when they represent numbers.

• Note also the difference between NULL and 'NULL':
  – When NULL is unquoted, this sets the parameter to the value Oracle recommends.
  – In the case of the quoted 'NULL', this sets the value of the parameter to NULL.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

Examples

DBMS_STATS.SET_PARAM('CASCADE','DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_PARAM('ESTIMATE_PERCENT','5');
DBMS_STATS.SET_PARAM('DEGREE','NULL');

162.7.118 SET_PROCESSING_RATE Procedure

This procedure sets the value of rate of processing for a given operation.

Syntax

DBMS_STATS.SET_PROCESSING_RATE (  
opname   IN   VARCHAR2,
procrate  IN   NUMBER);

Parameters

Table 162-127   SET_PROCESSING_RATE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>opname</td>
<td>Name of the operation.</td>
</tr>
</tbody>
</table>

<tr>
<td></td>
<td>• IO_SEQUENTIAL_ACCESS</td>
</tr>
<tr>
<td></td>
<td>• MEMCMP</td>
</tr>
<tr>
<td></td>
<td>• MEMCPY</td>
</tr>
</tbody>
</table>

Security Model

You must have the OPTIMIZER_PROCESSING_RATE role to run this procedure.

Usage Notes

AUTO DOP uses processing rates to determine the optimal degree of parallelism for a SQL statement.

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input value

162.7.119 SET_SCHEMA_PREFS Procedure

This procedure sets the statistics preferences of all tables owned by the specified user.

Syntax

```sql
DBMS_STATS.SET_SCHEMA_PREFS ( 
    ownname IN VARCHAR2, 
```
Parameters

Table 162-128  SET_SCHEMA_PREFS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name</td>
</tr>
</tbody>
</table>
| pname     | Preference name. You can set the default value for the following preferences:  
  • AUTO_STAT_EXTENSIONS  
  • CASCADE  
  • DEGREE  
  • ESTIMATE_PERCENT  
  • GLOBAL_TEMP_TABLE_STATS  
  • GRANULARITY  
  • INCREMENTAL  
  • INCREMENTAL_LEVEL  
  • INCREMENTAL_STALENESS  
  • METHOD_OPT  
  • NO_INVALIDATE  
  • OPTIONS  
  • PREFERENCE_OVERRIDES_PARAMETER  
  • PUBLISH  
  • STALE_PERCENT  
  • TABLE_CACHED_BLOCKS  
| pvalue    | Preference value. If NULL is specified, it sets the database default value. |
Table 162-129  Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTO_STAT_EXTENSIONS</td>
<td>Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. You can consider a synopsis as an internal management structure that samples distinct values. You can set the following preferences:</td>
</tr>
</tbody>
</table>
|                       | • **REPEAT OR HYPERLOGLOG**  
                        | This is the default. If **INCREMENTAL** is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformatting legacy content.  |
|                       | • **ADAPTIVE SAMPLING**  
                        | The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.  |
|                       | • **HYPERLOG**  
                        | The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of the HyperLogLog algorithm over adaptive sampling are:  |
|                       |   - The accuracy of the new algorithm is similar to the original algorithm.  |
|                       |   - The memory required is significantly lower, which typically leads to huge reductions in synopsis size.  |
| CASCADE               | Determines whether index statistics are collected as part of gathering table statistics.  |
| DEGREE                | Determines degree of parallelism used for gathering statistics.  |
| ESTIMATE_PERCENT      | Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant **DBMS_STATS.AUTO_SAMPLE_SIZE** to have Oracle determine the appropriate sample size for good statistics. This is the default. |
Table 162-129  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This preference takes the following values:</td>
</tr>
<tr>
<td></td>
<td>•  SHARED - All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>•  SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</td>
</tr>
<tr>
<td>GRANULARITY</td>
<td>Determines the granularity of statistics to collect (only pertinent if the table is partitioned). Possible values are:</td>
</tr>
<tr>
<td></td>
<td>'ALL' - Gathers all (subpartition, partition, and global) statistics</td>
</tr>
<tr>
<td></td>
<td>'AUTO' - Determines the granularity based on the partitioning type. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>'DEFAULT' - gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the 'GLOBAL AND PARTITION' for this functionality. Note that the default value is now 'AUTO'.</td>
</tr>
<tr>
<td></td>
<td>'GLOBAL' - Gathers global statistics</td>
</tr>
<tr>
<td></td>
<td>'GLOBAL AND PARTITION' - gathers the global and partition level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.</td>
</tr>
<tr>
<td></td>
<td>'PARTITION' - gathers partition-level statistics</td>
</tr>
<tr>
<td></td>
<td>'SUBPARTITION' - gathers subpartition-level statistics.</td>
</tr>
</tbody>
</table>
### Table 162-129  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| INCREMENTAL        | Determines whether the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:  
  - INCREMENTAL value for the partitioned table is set to TRUE  
  - PUBLISH value for the partitioned table is set to TRUE;  
  - User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table  
  If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables. |
| INCREMENTAL_LEVEL  | Controls which synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:  
  - TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.  
  - PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered. |
Table 162-129  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. Assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• ALLOW_MIXED_FORMAT—Partitions with synopses in adaptive sampling format are not considered stale, even when the APPROXIMATE_NDV_ALGORITHM preference is set to HYPERLOGLOG. The database uses existing synopses to derive global NDV. This is the default setting.</td>
</tr>
<tr>
<td></td>
<td>• NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');
EXEC DBMS_STATS.SET_TABLE_PREFS
Table 162-129  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>('sh', 'sales', 'INCREMENTAL_STALENESS', null);</td>
<td>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</td>
</tr>
<tr>
<td>METHOD_OPT</td>
<td>Controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>size_clause is defined as size_clause := SIZE {integer</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</td>
</tr>
<tr>
<td></td>
<td>- column_name: name of a column</td>
</tr>
<tr>
<td></td>
<td>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>Controls the invalidation of dependent cursors of the tables for which statistics are gathered. If set to TRUE, then this parameter does not invalidate the dependent cursors. If set to FALSE, then this procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default.</td>
</tr>
</tbody>
</table>
Table 162-129  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics for all objects in the table. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.</td>
</tr>
<tr>
<td>PREFERENCE_OVERRIDES_PARAMETER</td>
<td>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</td>
</tr>
<tr>
<td></td>
<td>• FALSE — Obeys input parameter values.</td>
</tr>
<tr>
<td></td>
<td>Specifying this preference does not change the order of precedence of table, global, and default.</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>Determines whether newly gathered statistics will be published after the statistics gathering job completes. In releases before Oracle Database 11g Release 1 (11.1), when a statistic gathering job completed, the new statistics were automatically published in the dictionary tables. In subsequent releases, you can gather statistics without publishing them immediately. Thus, you can test new statistics before publishing them.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that have to change before the statistics on that table are deemed stale and should be regathered. The valid domain for stale_percent is non-negative numbers. The default value is 10%. Note that if you set stale_percent to zero the AUTO STATS gathering job will gather statistics for this table every time a row in the table is modified.</td>
</tr>
<tr>
<td>TABLE_CACHED_BLOCKS</td>
<td>Specifies the average number of blocks cached in the buffer cache for any table when calculating the index clustering factor.</td>
</tr>
</tbody>
</table>

Security Model

To run this procedure, you must be the schema owner, or have the SYSDBA privilege, or have the ANALYZE ANY system privilege.
Exceptions

ORA-20000: **Object does not exist or insufficient privileges**

ORA-20001: **Invalid or illegal input value**

Usage Notes

Both arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.

Examples

```sql
DBMS_STATS.SET_SCHEMA_PREFS('SH','CASCADE', 'DBMS_STATS.AUTO.Cascade');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'ESTIMATE_PERCENT','9');
DBMS_STATS.SET_SCHEMA_PREFS('SH', 'DEGREE','99');
```

<td>Optional identifier associated with the statistics saved in the stattab</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different from current schema)</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Invalid input value
ORA-20002: Bad user statistics table; may need to be upgraded
ORA-20003: Unable to set system statistics
ORA-20004: Parameter does not exist

Usage Notes

To run this procedure, you need the GATHER_SYSTEM_STATISTICS role.
162.7.121 SET_TABLE_PREFS Procedure

This procedure sets the statistics preferences of the specified table in the specified schema.

Syntax

```sql
DBMS_STATS.SET_TABLE_PREFS (
    ownname    IN  VARCHAR2,
    tabname    IN  VARCHAR2,
    pname      IN  VARCHAR2,
    pvalue     IN  VARCHAR2);
```

<td>Preference value. If NULL is specified, it will set the Oracle default value.</td>
</tr>
</tbody>
</table>
### Table 162-132  Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
</table>
| APPROXIMATE_NDV_ALGORITHM      | Specifies the synopsis generation algorithm. A synopsis is special type of statistic that tracks the number of distinct values (NDV) for each column in a partition. Consider a synopsis as an internal management structure that samples distinct values. You can delete the following preferences:  
  - REPEAT OR HYPERLOGLOG  
    This is the default. If INCREMENTAL is enabled on the table, then the database preserves the format of any existing synopses that use the adaptive sampling algorithm. However, the database creates any new synopses in HyperLogLog format. This approach is attractive when existing performance is acceptable, and you do not want to incur the performance cost of reformattting legacy content.  
  - ADAPTIVE SAMPLING  
    The database uses the adaptive sampling algorithm for all synopses. This is the most conservative option.  
  - HYPERLOGLOG  
    The database uses the HyperLogLog algorithm for all new and stale synopses. In contrast to dynamic sampling, the HyperLogLog algorithm uses a randomization technique. The advantages of HyperLogLog over adaptive sampling are:  
    - The accuracy of the new algorithm is similar to the original algorithm.  
    - The memory required is significantly lower, which typically leads to huge reductions in synopsis size. |
| AUTO_STAT_EXTENSIONS            | Controls the automatic creation of extensions when database statistics are gathered. You can set the following values:  
  - ON — When applicable, a SQL plan directive can trigger the creation of column group statistics based on usage of columns in the predicates in the workload.  
  - OFF — The database does not create column group statistics automatically. The database creates them only when the CREATE_EXTENDED_STATS function is executed, or when extended statistics are specified explicitly in the METHOD_OPT clause of DBMS_STATS. This is the default. |
| CASCADE                        | Determines whether to collect index statistics as part of gathering table statistics. |
Table 162-132  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CONCURRENT</td>
<td>This preference determines whether statistics will be gathered concurrently on multiple objects, or serially, one object at a time:</td>
</tr>
<tr>
<td></td>
<td>• 'MANUAL' - Concurrency will be turned on only for manual statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• 'AUTOMATIC' - Concurrency will be turned on only for the automatic statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• 'ALL' - Concurrency will be turned on for both manual and automatic statistics gathering.</td>
</tr>
<tr>
<td></td>
<td>• 'OFF' - Concurrency will be turned off for both manual and automatic statistics.</td>
</tr>
<tr>
<td>DEGREE</td>
<td>Determines degree of parallelism used for gathering statistics.</td>
</tr>
<tr>
<td>ESTIMATE_PERCENT</td>
<td>Determines the percentage of rows to estimate. The valid range is [0.000001,100]. Use the constant DBMS_STATS.AUTO_SAMPLE_SIZE to have Oracle determine the appropriate sample size for good statistics. This is the default.</td>
</tr>
<tr>
<td>GLOBAL_TEMP_TABLE_STATS</td>
<td>This controls whether the statistics gathered for a global temporary table should be stored as shared statistics or session statistics. It takes two values:</td>
</tr>
<tr>
<td></td>
<td>• SHARED - All sessions see the same set of statistics</td>
</tr>
<tr>
<td></td>
<td>• SESSION - Statistics gathered by the GATHER_TABLE_STATS Procedure on a global temporary table are session specific, and hence are only going to be used by the queries issued in the same session as the statistics gathering process. Session-specific statistics are deleted when a session is ended.</td>
</tr>
</tbody>
</table>
Table 162-132  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANULARITY</td>
<td>Determines granularity of statistics to collect (only pertinent if the table is partitioned).&lt;br&gt;‘ALL’ - Gathers all (subpartition, partition, and global) statistics&lt;br&gt;‘AUTO’ - Determines the granularity based on the partitioning type. This is the default value.&lt;br&gt;‘DEFAULT’ - Gathers global and partition-level statistics. This option is obsolete, and while currently supported, it is included in the documentation for legacy reasons only. You should use the ‘GLOBAL AND PARTITION’ for this functionality. Note that the default value is now ‘AUTO’.&lt;br&gt;‘GLOBAL’ - Gathers global statistics&lt;br&gt;‘GLOBAL AND PARTITION’ - Gathers the global and partition-level statistics. No subpartition level statistics are gathered even if it is a composite partitioned object.&lt;br&gt;‘PARTITION’ - Gathers partition-level statistics&lt;br&gt;‘SUBPARTITION’ - Gathers subpartition-level statistics.</td>
</tr>
<tr>
<td>INCREMENTAL</td>
<td>Determines whether or not the global statistics of a partitioned table will be maintained without doing a full table scan. With partitioned tables it is very common to load new data into a new partition. As new partitions are added and data loaded, the global table statistics need to be kept up to date. Oracle will update the global table statistics by scanning only the partitions that have been changed instead of the entire table if the following conditions hold:&lt;br&gt;• INCREMENTAL value for the partitioned table is set to TRUE;&lt;br&gt;• PUBLISH value for the partitioned table is set to TRUE;&lt;br&gt;• User specifies AUTO_SAMPLE_SIZE for ESTIMATE_PERCENT and AUTO for GRANULARITY when gathering statistics on the table.&lt;br&gt; If the INCREMENTAL value for the partitioned table was set to FALSE (default value), a full table scan is used to maintain the global statistics which is a much more resource intensive and time-consuming operation for large tables.</td>
</tr>
<tr>
<td>Preference</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>INCREMENTAL_LEVEL</td>
<td>This value controls what synopses to collect when INCREMENTAL preference is set to TRUE. It takes two values:</td>
</tr>
<tr>
<td></td>
<td>* TABLE - table level synopses are gathered. This is used when you want to exchange this table with a partition. You can run GATHER_TABLE_STATS on this table with INCREMENTAL to TRUE and INCREMENTAL_LEVEL to TABLE before the exchange. The result is that table level synopses are gathered on this table (currently Oracle supports only table level synopses on non-predestined tables). Once the exchange occurs, the partition will have synopses which come from the table level synopses of the table before exchange. This preference value can be only used in the SET_TABLE_PREFS Procedure. It is not allowed in the SET_GLOBAL/DATABASE/SCHEMA_PREFS procedures.</td>
</tr>
<tr>
<td></td>
<td>* PARTITION - partition level synopses are gathered. This is the default value. If PARTITION is set on a non partitioned table, no synopses are gathered.</td>
</tr>
</tbody>
</table>
### Table 162-132  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>INCREMENTAL_STALENESS</td>
<td>Specifies when a partition or subpartition is considered stale. This parameter takes an enumeration of values, such as 'USE_STALE_PERCENT' and 'USE_LOCKED_STATS'. You can also specify multiple values, such as 'USE_STALE_PERCENT, USE_LOCKED_STATS, ALLOW_MIXED_FORMAT'. The parameter accepts the following values:</td>
</tr>
<tr>
<td></td>
<td>• USE_STALE_PERCENT—A partition or subpartition is not considered stale when DML changes are below the threshold set by the STALE_PERCENT preference. For example, assume that STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. The partition has 5% DML changes. The database does not regather statistics. Assume a different case in which STALE_PERCENT is 10. You specify USE_STALE_PERCENT for INCREMENTAL_STALENESS. However, in this case the partition is locked and has 20% of DML changes. Because the partition is locked, the database does not regather statistics.</td>
</tr>
<tr>
<td></td>
<td>• USE_LOCKED_STATS—Locked partitions or subpartitions statistics are never considered stale, regardless of DML changes. For example, assume that STALE_PERCENT is 10. You specify 'USE_LOCKED_STATS, USE_STALE_PERCENT'. The partition, which is locked, has 20% DML changes. The partition is not considered stale. The database uses existing statistics to derive global statistics.</td>
</tr>
<tr>
<td></td>
<td>• ALLOW_MIXED_FORMAT—Adaptive sampling synopses and HyperLogLog synopses are permitted to coexist.</td>
</tr>
<tr>
<td></td>
<td>• NULL—A partition or subpartition is considered stale when it has any DML changes. For example, assume that STALE_PERCENT is 10. You specify the value 'NULL' for INCREMENTAL_STALENESS. The partition has 5% of DML changes. The database regathers statistics.</td>
</tr>
</tbody>
</table>

Note that the following two executions are different:

```sql
EXEC DBMS_STATS.SET_TABLE_PREFS
('sh', 'sales', 'INCREMENTAL_STALENESS', 'NULL');
```
Table 162-132  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'sales', 'INCREMENTAL_STALENESS', null);</td>
<td>The first execution uses single quotes to set the preference to the value NULL, whereas the second sets the preference to the default, which is ALLOW_MIXED_FORMAT.</td>
</tr>
<tr>
<td>METHOD_OPT</td>
<td>The value controls column statistics collection and histogram creation. It accepts either of the following options, or both in combination:</td>
</tr>
<tr>
<td></td>
<td>• FOR ALL [INDEXED</td>
</tr>
<tr>
<td></td>
<td>- integer: Number of histogram buckets. Must be in the range [1,2048].</td>
</tr>
<tr>
<td></td>
<td>- REPEAT: Collects histograms only on the columns that already have histograms</td>
</tr>
<tr>
<td></td>
<td>- AUTO: Oracle determines the columns on which to collect histograms based on data distribution and the workload of the columns</td>
</tr>
<tr>
<td></td>
<td>- SKEWONLY: Oracle determines the columns on which to collect histograms based on the data distribution of the columns</td>
</tr>
<tr>
<td></td>
<td>- column_name: name of a column</td>
</tr>
<tr>
<td></td>
<td>- extension: can be either a column group in the format of (column_name, column_name [, ...]) or an expression</td>
</tr>
<tr>
<td></td>
<td>The default is FOR ALL COLUMNS SIZE AUTO.</td>
</tr>
<tr>
<td>NO_INVALIDATE</td>
<td>The value controls the invalidation of dependent cursors of the tables for which statistics are being gathered. Does not invalidate the dependent cursors if set to TRUE. The procedure invalidates the dependent cursors immediately if set to FALSE. Use DBMS_STATS.AUTO_INVALIDATE to have Oracle decide when to invalidate dependent cursors. This is the default.</td>
</tr>
</tbody>
</table>
Table 162-132  (Cont.) Statistics Preferences

<table>
<thead>
<tr>
<th>Preference</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OPTIONS</td>
<td>Determines the options parameter used in the GATHER_TABLE_STATS procedure. The preference takes the following values:</td>
</tr>
<tr>
<td></td>
<td>• GATHER — Gathers statistics for all objects in the table. This is the default.</td>
</tr>
<tr>
<td></td>
<td>• GATHER AUTO — Gathers all necessary statistics automatically. Oracle recommends setting GATHER AUTO on tables that undergo bulk load operations that gather statistics. This option is only applicable to tables that do not have INCREMENTAL enabled. Running GATHER_TABLE_STATS procedure on these tables with the GATHER AUTO option skips regathering the already fresh statistics.</td>
</tr>
<tr>
<td>PREFERENCE_OVERRIDES_PARAMETER</td>
<td>Determines whether to override the input value of a parameter with the preference value of that parameter for a statistics operation. Possible values are:</td>
</tr>
<tr>
<td></td>
<td>• TRUE — Ignores input parameter values, and uses the value of the corresponding preference.</td>
</tr>
<tr>
<td></td>
<td>• FALSE — Obey input parameter values. Specifying this preference does not change the order of precedence of table, global, and default.</td>
</tr>
<tr>
<td>PUBLISH</td>
<td>Determines whether the database publishes newly gathered statistics after the gathering job completes.</td>
</tr>
<tr>
<td></td>
<td>You can gather statistics without publishing them immediately. This technique enables you to test new statistics before publishing them.</td>
</tr>
<tr>
<td>STALE_PERCENT</td>
<td>Determines the percentage of rows in a table that must change before the statistics on that table are stale and need to be regathered.</td>
</tr>
<tr>
<td></td>
<td>The valid domain for stale_percent is non-negative numbers. The default value is 10, which means that a table having more than 10% of changes is considered stale.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges

ORA-20001: Invalid or illegal input values

Usage Notes

• To run this procedure, you must connect as owner of the table or have the ANALYZE ANY SYSTEM privilege.
• All arguments are of type VARCHAR2 and values are enclosed in quotes, even when they represent numbers.
Examples

DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'CASCADE', 'DBMS_STATS.AUTO_CASCADE');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'ESTIMATE_PERCENT', '9');
DBMS_STATS.SET_TABLE_PREFS('SH', 'SALES', 'DEGREE', '99');

Example 162-17 Overriding Statistics Preferences

In this example, legacy scripts set ESTIMATE_PERCENT explicitly rather than using the recommended AUTO_SAMPLE_SIZE. Your goal is to prevent users from using these scripts to set preferences on the sh.costs table.

No preference for ESTIMATE_PERCENT is set for sh.costs or at the global level, so the preference defaults to AUTO_SAMPLE_SIZE:

SELECT DBMS_STATS.GET_PREFS ('ESTIMATE_PERCENT', 'sh','costs') AS "STAT_PREFS" FROM DUAL;

STAT_PREFS
----------
DBMS_STATS.AUTO_SAMPLE_SIZE

By default, Oracle Database accepts preferences that are passed to the statistics gathering procedures. To override these parameters, use SET_TABLE_PREFS to set the PREFERENCE_OVERRIDES_PARAMETER preference to TRUE for the costs table only:

EXEC DBMS_STATS.SET_TABLE_PREFS ('sh', 'costs', 'PREFERENCE_OVERRIDES_PARAMETER', 'TRUE');

A user-created script attempts to set estimate_percent to 100 when gathering statistics for sh.costs.

EXEC DBMS_STATS.GATHER_TABLE_STATS('sh', 'costs', ESTIMATE_PERCENT=>100);

However, because PREFERENCE_OVERRIDES_PARAMETER is TRUE for this table, Oracle Database gathers statistics using AUTO_SAMPLE_SIZE, which is the default, rather than the specified value of 100.

Oracle Database SQL Tuning Guide to learn how to set optimizer statistics preferences

162.7.122 SET_TABLE_STATS Procedure

This procedure creates artificial table statistics for testing purposes.

Syntax

DBMS_STATS.SET_TABLE_STATS (
    ownname VARCHAR2,
    tabname VARCHAR2,
    partname VARCHAR2 DEFAULT NULL,
    stattab VARCHAR2 DEFAULT NULL,
    statid VARCHAR2 DEFAULT NULL,
);
Parameters

Table 162-133  SET_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table.</td>
</tr>
<tr>
<td>partname</td>
<td>Name of the table partition in which to store the statistics. If the table is partitioned and partname is NULL, then the statistics are stored at the global table level.</td>
</tr>
<tr>
<td>stattab</td>
<td>Table in which to store the statistics. If stattab is NULL, then the database stores the statistics in the data dictionary.</td>
</tr>
<tr>
<td>statid</td>
<td>Identifier (optional) to associate with these statistics within stattab. This identifier is only relevant if stattab is not NULL.</td>
</tr>
<tr>
<td>numrows</td>
<td>Number of rows in the table or partition.</td>
</tr>
<tr>
<td>numblks</td>
<td>Number of blocks that the table or partition occupies.</td>
</tr>
<tr>
<td>avgrlen</td>
<td>Average row length for the table or partition.</td>
</tr>
<tr>
<td>flags</td>
<td>For internal use only. Do not set.</td>
</tr>
<tr>
<td>statown</td>
<td>Schema containing stattab (if different than ownname).</td>
</tr>
<tr>
<td>no_invalidate</td>
<td>The validation setting for dependent cursors. If set to TRUE, then the procedure does not invalidate the dependent cursors. If set to FALSE, then the procedure invalidates the dependent cursors immediately. Use DBMS_STATS.AUTO_INVALIDATE to let the database decide when to invalidate dependent cursors. This is the default. You can change the default using the SET_DATABASE_PREFS Procedure, SET_GLOBAL_PREFS Procedure, SET_SCHEMA_PREFS Procedure and SET_TABLE_PREFS Procedure.</td>
</tr>
<tr>
<td>cachedblk</td>
<td>For internal use only. Do not set.</td>
</tr>
<tr>
<td>cachehit</td>
<td>For internal use only. Do not set.</td>
</tr>
<tr>
<td>force</td>
<td>A flag that determines the behavior when statistics are locked. If TRUE, then the procedure sets the values even if the table statistics are locked. By default, the setting is FALSE.</td>
</tr>
<tr>
<td>im_imcu_count</td>
<td>The number of In-Memory Compression Units (IMCUs) in the table or partition.</td>
</tr>
<tr>
<td>im_block_count</td>
<td>The number of In-Memory blocks in the table or partition.</td>
</tr>
</tbody>
</table>
Table 162-133  (Cont.) SET_TABLE_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scanrate</td>
<td>The rate, in MB/s, at which the database scans external tables. This parameter is relevant only for external tables.</td>
</tr>
</tbody>
</table>

**Security Model**

To invoke this procedure you must be owner of the table, or have the `ANALYZE ANY` privilege. For objects owned by `SYS`, you must be either the owner of the table, or have the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

**Exceptions**

- **ORA-20000**: Object does not exist or insufficient privileges
- **ORA-20001**: Invalid input value
- **ORA-20002**: Bad user statistics table; may need to upgrade it
- **ORA-20005**: Object statistics are locked

**Usage Notes**

For testing purposes, you can manually create artificial statistics for a table, index, or the system using the `DBMS_STATS.SET_*_STATS` procedures. These procedures insert the artificial statistics into the data dictionary directly (when `stattab` is null) or into a user-created table.

**Note:**

The `DBMS_STATS.SET_*_STATS` procedures are intended for development testing only. Do not use them in a production database. If you set statistics in the data dictionary, then Oracle Database considers the set statistics as the “real” statistics, which means that statistics gathering jobs may not re-gather artificial statistics when they do not meet the criteria for staleness.

The most typical use cases for the `DBMS_STATS.SET_*_STATS` procedures are showing how execution plans change as the numbers of rows or blocks in a table change, or creating realistic statistics for temporary tables.

- The optimizer uses the cached data to estimate number of cached blocks for index or statistics table access. The database calculates the total cost of the operation by combining the I/O cost of reading not cached blocks from disk, the CPU cost of getting cached blocks from the buffer cache, and the CPU cost of processing the data.
- The database maintains `cachedblk` and `cachehit` at all times. However, the database uses the corresponding caching statistics for optimization as part of the table and index statistics only when the user calls the `DBMS_STATS.GATHER_[TABLE/INDEX/SHEMA/DATABASE]_STATS` procedure for automatic mode or `DBMS_STATS.GATHER_SYSTEM_STATS` for manual mode. To prevent the user from utilizing inaccurate and unreliable data, the optimizer computes a “confidence
factor" for each cachehit and a cachedblk for each object. If the confidence factor for the value meets confidence criteria, then the database uses this value; otherwise, the database uses defaults.

• The automatic maintenance algorithm for object caching statistics assumes that only one major database workload exists. The algorithm adjusts statistics to this workload, ignoring other "minor" workloads. If this assumption is false, then you must use manual mode for maintaining object caching statistics.

• The object caching statistics maintenance algorithm for automatic mode prevents you from using statistics in the following situations:
  – When not enough data has been analyzed, such as when an object has been recently created
  – When the database does not have one major workload, resulting in averages that do not correspond to real values

Oracle Database SQL Tuning Guide to learn how to set artificial statistics

162.7.123 SHOW_EXTENDED_STATS_NAME Function

This function returns the name of the statistics entry that is created for the user-specified extension. It raises an error if no extension has been created.

Syntax

DBMS_STATS.SHOW_EXTENDED_STATS_NAME (
  ownname VARCHAR2,
  tabname VARCHAR2,
  extension VARCHAR2)
RETURN VARCHAR2;

Parameters

Table 162-134  SHOW_EXTENDED_STATS_NAME Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>extension</td>
<td>Can be either a column group or an expression. Suppose the specified table has two column c1, c2. An example column group can be &quot;(c1, c2)&quot; and an example expression can be &quot;(c1 + c2)&quot;.</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Object does not exist or insufficient privileges
ORA-20001: Error when processing extension
Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

162.7.124 TRANSFER_STATS Procedure

This procedure transfers statistics for specified table(s) from a remote database specified by `dblink` to the local database.

The statistics at the source database are retained. It likewise transfers statistics-related structures such as synopses and DML monitoring information.

Syntax

```
DBMS_STATS.TRANSFER_STATS (
  ownname     IN     VARCHAR2,
  tabname     IN     VARCHAR2,
  dblink      IN     VARCHAR2,
  options     IN     NUMBER DEFAULT NULL);
```

Parameters

Table 162-135 TRANSFER_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Owner name of a table. If NULL all schemas in the database. If NULL, the procedure will transfer global preferences as well.</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table. If NULL, all tables in <code>OWNNAME</code>.</td>
</tr>
<tr>
<td>dblink</td>
<td>Database link name</td>
</tr>
<tr>
<td>options</td>
<td>By default the procedure does not transfer the global preferences. Specifying <code>ADD_GLOBAL_PREFS</code> copies global preferences.</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.

162.7.125 UNLOCK_PARTITION_STATS Procedure

This procedure enables the user to unlock statistics for a partition.

Syntax

```
DBMS_STATS.UNLOCK_PARTITION_STATS (  
  ownname   VARCHAR2,  
  tabname   VARCHAR2,  
  partname  VARCHAR2);
```
Parameters

Table 162-136  UNLOCK_PARTITION_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema to unlock</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
<tr>
<td>partname</td>
<td>[Sub]Partition name</td>
</tr>
</tbody>
</table>

Usage Notes

To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.

162.7.126 UNLOCK_SCHEMA_STATS Procedure

This procedure unlocks the statistics on all the tables in schema.

Syntax

```sql
DBMS_STATS.UNLOCK_SCHEMA_STATS (ownname VARCHAR2);
```

Parameters

Table 162-137  UNLOCK_SCHEMA_STATS Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the ANALYZE ANY privilege. For objects owned by SYS, you need to be either the owner of the table, or you need the ANALYZE ANY DICTIONARY privilege or the SYSDBA privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The SET_* , DELETE_* , IMPORT_* , GATHER_* procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as GATHER_SCHEMA_STATS) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the UNLOCK_SCHEMA_STATS Procedure nor the UNLOCK_TABLE_STATS Procedure is designed to unlock statistics of corresponding partitions. When you invoke the LOCK_TABLE_STATS Procedure, it sets the statistics lock bit at the table level. In that case, you cannot gather...
statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the LOCK_PARTITION_STATS Procedure.

162.7.127 UNLOCK_TABLE_STATS Procedure

This procedure unlocks the statistics on the table.

Syntax

```sql
DBMS_STATS.UNLOCK_TABLE_STATS (ownname VARCHAR2, tabname VARCHAR2);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>tabname</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Usage Notes

- To invoke this procedure you must be owner of the table, or you need the `ANALYZE ANY` privilege. For objects owned by `SYS`, you need to be either the owner of the table, or you need the `ANALYZE ANY DICTIONARY` privilege or the `SYSDBA` privilege.
- When statistics on a table is locked, all the statistics depending on the table, including table statistics, column statistics, histograms and statistics on all dependent indexes, are considered to be locked.
- The `SET_*`, `DELETE_*`, `IMPORT_*`, `GATHER_*` procedures that modify statistics in the dictionary of an individual table, index or column will raise an error if statistics of the object is locked.
- Procedures that operates on multiple objects (such as `GATHER_SCHEMA_STATS`) will skip modifying the statistics of an object if it is locked. Many procedures have force argument to override the lock.
- Neither the `UNLOCK_SCHEMA_STATS Procedure` nor the `UNLOCK_TABLE_STATS Procedure` is designed to unlock statistics of corresponding partitions. When you invoke the `LOCK_TABLE_STATS Procedure`, it sets the statistics lock bit at the table level. In that case, you cannot gather statistics on dependent objects such as partitions and indexes. By the same token, if table statistics are locked, the dependents are locked and you do not need to explicitly invoke the `LOCK_PARTITION_STATS Procedure`. 
162.7.128 UPGRADE_STAT_TABLE Procedure

This procedure upgrades a user statistics table from an older version.

Syntax

DBMS_STATS.UPGRADE_STAT_TABLE (ownname VARCHAR2, stattab VARCHAR2);

Parameters

Table 162-139 UPGRADE_STAT_TABLE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ownname</td>
<td>Name of the schema</td>
</tr>
<tr>
<td>stattab</td>
<td>Name of the table</td>
</tr>
</tbody>
</table>

Exceptions

ORA-20000: Unable to upgrade table

Usage Notes

To invoke this procedure you need the privileges to drop and create a table.
With the `DBMS_STORAGE_MAP` package, you can communicate with the Oracle background process FMON to invoke mapping operations that populate mapping views. FMON communicates with operating and storage system vendor-supplied mapping libraries.

This chapter contains the following topics:

- **Overview**
- **Operational Notes**
- **Summary of DBMS_STORAGE_MAP Subprograms**

### 163.1 DBMS_STORAGE_MAP Overview

This terminology and descriptions will help you understand the `DBMS_STORAGE_MAP` API.

- **Mapping libraries**
  Mapping libraries help you map the components of I/O processing stack elements. Examples of I/O processing components include files, logical volumes, and storage array I/O targets. The mapping libraries are identified in `filemap.ora`.

- **Mapping files**
  A mapping file is a mapping structure that describes a file. It provides a set of attributes, including file size, number of extents that the file is composed of, and file type.

- **Mapping elements and sub-elements**
  A mapping element is the abstract mapping structure that describes a storage component within the I/O stack. Examples of elements include mirrors, stripes, partitions, raid5, concatenated elements, and disks—structures that are the mapping building blocks. A mapping sub-element describes the link between an element and the next elements in the I/O mapping stack.

- **Mapping file extents**
  A mapping file extent describes a contiguous chunk of blocks residing on one element. This includes the device offset, the extent size, the file offset, the type (data or parity), and the name of the element where the extent resides. In the case of a raw device or volume, the file is composed of only one file extent component. A mapping file extent is different from Oracle extents.

See Also:

- Oracle Database Administrator’s Guide for more information
- Oracle Database Reference for `V$MAP_FILE`, `V$MAP_ELEMENT`, `V$MAP_SUBELEMENT`, `V$MAP_FILE_EXTENT`
163.2 DBMS_STORAGE_MAP Operational Notes

Invoking the MAP_ELEMENT, MAP_FILE, and MAP_ALL functions when mapping information already exists will refresh the mapping, if configuration IDs are supported. If configuration IDs are not supported, invoking these functions again will rebuild the mapping.

See Also:

Oracle Database Administrator's Guide for a discussion of the configuration ID, an attribute of the element or file that is changed.

163.3 Summary of DBMS_STORAGE_MAP Subprograms

This table lists the DBMS_STORAGE_MAP subprograms and briefly describes them.

Table 163-1  DBMS_STORAGE_MAP Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DROP_ALL Function</td>
<td>Drops all mapping information in the shared memory of the instance</td>
</tr>
<tr>
<td>DROP_ELEMENT Function</td>
<td>Drops the mapping information for the element defined by elemname</td>
</tr>
<tr>
<td>DROP_FILE Function</td>
<td>Drops the file mapping information defined by filename</td>
</tr>
<tr>
<td>LOCK_MAP Procedure</td>
<td>Locks the mapping information in the shared memory of the instance</td>
</tr>
<tr>
<td>MAP_ALL Function</td>
<td>Builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements</td>
</tr>
<tr>
<td>MAP_ELEMENT Function</td>
<td>Builds mapping information for the element identified by elemname</td>
</tr>
<tr>
<td>MAP_FILE Function</td>
<td>Builds mapping information for the file identified by filename</td>
</tr>
<tr>
<td>MAP_OBJECT Function</td>
<td>Builds the mapping information for the Oracle object identified by the object name, owner, and type</td>
</tr>
<tr>
<td>RESTORE Function</td>

</tbody>
</table>
163.3.1 DROP_ALL Function

This function drops all mapping information in the shared memory of the instance.

Syntax

```
DBMS_STORAGE_MAP.DROP_ALL(
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

**Table 163-2 DROP_ALL Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

163.3.2 DROP_ELEMENT Function

This function drops the mapping information for the element defined by `elemname`.

Syntax

```
DBMS_STORAGE_MAP.DROP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

**Table 163-3 DROP_ELEMENT Function Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elemname</td>
<td>The element for which mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then DROP_ELEMENT is invoked recursively on all elements of the DAG defined by <code>elemname</code>, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

163.3.3 DROP_FILE Function

This function drops the file mapping information defined by `filename`.

Syntax

```
DBMS_STORAGE_MAP.DROP_FILE(
    filename          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```
Parameters

Table 163-4  DROP_FILE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which file mapping information is dropped.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, then the mapping DAGs for the elements where the file resides are also dropped, if possible.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

163.3.4 LOCK_MAP Procedure

This procedure locks the mapping information in the shared memory of the instance.

This is useful when you need a consistent snapshot of the V$MAP tables. Without locking the mapping information, V$MAP_ELEMENT and V$MAP_SUBELEMENT, for example, may be inconsistent.

Syntax

DBMS_STORAGE_MAP.LOCK_MAP;

163.3.5 MAP_ALL Function

This function builds the entire mapping information for all types of Oracle files (except archive logs), including all directed acyclic graph (DAG) elements. It obtains the latest mapping information because it explicitly synchronizes all mapping libraries.

Syntax

DBMS_STORAGE_MAP.MAP_ALL(
    max_num_fileext IN NUMBER DEFAULT 100,
    dictionary_update IN BOOLEAN DEFAULT TRUE);

Parameters

Table 163-5  MAP_ALL Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max_num_fileext</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

You must explicitly call MAP_ALL in a cold startup scenario.
163.3.6 MAP_ELEMENT Function

This function builds mapping information for the element identified by elemname. It may not obtain the latest mapping information if the element being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_ELEMENT(
    elemname          IN VARCHAR2,
    cascade           IN BOOLEAN,
    dictionary_update IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>elemname</td>
<td>The element for which mapping information is built.</td>
</tr>
<tr>
<td>cascade</td>
<td>If TRUE, all elements within the elemname I/O stack DAG are mapped.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

163.3.7 MAP_FILE Function

This function builds mapping information for the file identified by filename. Use this function if the mapping of one particular file has changed. The Oracle database server does not have to rebuild the entire mapping.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_FILE(
    filename           IN VARCHAR2,
    filetype           IN VARCHAR2,
    cascade            IN BOOLEAN,
    max_num_fileextent IN NUMBER DEFAULT 100,
    dictionary_update  IN BOOLEAN DEFAULT TRUE);
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>The file for which mapping information is built.</td>
</tr>
<tr>
<td>filetype</td>
<td>Defines the type of the file to be mapped. It can be &quot;DATAFILE&quot;, &quot;SPFILE&quot;, &quot;TEMPFILE&quot;, &quot;CONTROLFILE&quot;, &quot;LOGFILE&quot;, or &quot;ARCHIVEFILE&quot;.</td>
</tr>
</tbody>
</table>
Table 163-7 (Cont.) MAP_FILE Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cascade</td>
<td>Should be TRUE only if a storage reconfiguration occurred. For all other instances, such as file resizing (either through an ALTER SYSTEM command or DML operations on extended files), cascade can be set to FALSE because the mapping changes are limited to the file extents only. If TRUE, mapping DAGs are also built for the elements where the file resides.</td>
</tr>
<tr>
<td>max_num_fileextent</td>
<td>Defines the maximum number of file extents to be mapped. This limits the amount of memory used when mapping file extents. The default value is 100; max_num_fileextent is an overloaded argument.</td>
</tr>
<tr>
<td>dictionary_update</td>
<td>If TRUE, mapping information in the data dictionary is updated to reflect the changes. The default value is TRUE; dictionary_update is an overloaded argument.</td>
</tr>
</tbody>
</table>

Usage Notes

This function may not obtain the latest mapping information if the file being mapped, or any one of the elements within its I/O stack (if cascade is TRUE), is owned by a library that must be explicitly synchronized.

163.3.8 MAP_OBJECT Function

This function builds the mapping information for the Oracle object identified by the object name, owner, and type.

Syntax

```sql
DBMS_STORAGE_MAP.MAP_OBJECT(
    objname  IN  VARCHAR2,
    owner    IN  VARCHAR2,
    objtype  IN  VARCHAR2);
```

Parameters

Table 163-8 MAP_OBJECT Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>objname</td>
<td>The name of the object.</td>
</tr>
<tr>
<td>owner</td>
<td>The owner of the object.</td>
</tr>
<tr>
<td>objtype</td>
<td>The type of the object.</td>
</tr>
</tbody>
</table>
163.3.9 RESTORE Function

This function loads the entire mapping information from the data dictionary into the shared memory of the instance.

You can invoke RESTORE only after a SAVE operation. You must explicitly call RESTORE in a warm startup scenario.

Syntax

DBMS_STORAGE_MAP.RESTORE;

163.3.10 SAVE Function

This function saves information needed to regenerate the entire mapping into the data dictionary.

Syntax

DBMS_STORAGE_MAP.SAVE;

163.3.11 UNLOCK_MAP Procedure

This procedure unlocks the mapping information in the shared memory of the instance.

Syntax

DBMS_STORAGE_MAP.UNLOCK_MAP;
The DBMS_STREAMS package, one of a set of Oracle Streams packages, provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag.

This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

This chapter contains the following topics:

- Overview
- Security Model
- Summary of DBMS_STREAMS Subprograms

164.1 DBMS_STREAMS Overview

This package provides subprograms to convert ANYDATA objects into logical change record (LCR) objects, to return information about Oracle Streams attributes and Oracle Streams clients, and to annotate redo entries generated by a session with a binary tag.

This tag affects the behavior of a capture process, a propagation, or an apply process whose rules include specifications for these binary tags in redo entries or LCRs.

See Also:

Oracle Streams Concepts and Administration and Oracle Streams Replication Administrator’s Guide for more information about this package and Oracle Streams

164.2 DBMS_STREAMS Security Model

PUBLIC is granted EXECUTE privilege on this package.

See Also:

Oracle Database Security Guide for more information about user group PUBLIC
164.3 Summary of DBMS_STREAMS Subprograms

This table lists the DBMS_STREAMS subprograms and briefly describes them.

Table 164-1  DBMS_STREAMS Package Subprograms

<table>
<thead>
<tr>
<th>Subprogram</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMPATIBLE_12_2 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_12_2 constant</td>
</tr>
<tr>
<td>COMPATIBLE_12_1 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_12_1 constant</td>
</tr>
<tr>
<td>COMPATIBLE_11_2 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_11_2 constant</td>
</tr>
<tr>
<td>COMPATIBLE_11_1 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_11_1 constant</td>
</tr>
<tr>
<td>COMPATIBLE_10_2 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_10_2 constant</td>
</tr>
<tr>
<td>COMPATIBLE_10_1 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_10_1 constant</td>
</tr>
<tr>
<td>COMPATIBLE_9_2 Function</td>
<td>Returns the DBMS_STREAMS.COMPATIBLE_9_2 constant</td>
</tr>
<tr>

<td>GET_STREAMS_TYPE Function</td>
<td>Returns the type of the invoker</td>
</tr>
<tr>
<td>GET_TAG Function</td>
<td>Gets the binary tag for all redo entries generated by the current session</td>
</tr>
<tr>
<td>MAX_COMPATIBLE Function</td>
<td>Returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database</td>
</tr>
<tr>
<td>SET_TAG Procedure</td>
<td>Sets the binary tag for all redo entries subsequently generated by the current session</td>
</tr>
</tbody>
</table>

Note:
The subprograms in this package do not commit.
164.3.1 COMPATIBLE_12_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_12_2` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_12_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 12.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

- GET_COMPATIBLE Member Function
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

164.3.2 COMPATIBLE_12_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_12_1` constant.

Syntax

```
DBMS_STREAMS.COMPATIBLE_12_1
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 12.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.
164.3.3 COMPATIBLE_11_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_2` constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_11_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

164.3.4 COMPATIBLE_11_1 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_11_1` constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_11_1
RETURN INTEGER;
```
Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 11.1.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- `GET_COMPATIBLE` Member Function
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter

### 164.3.5 COMPATIBLE_10_2 Function

This function returns the `DBMS_STREAMS.COMPATIBLE_10_2` constant.

Syntax

```sql
DBMS_STREAMS.COMPATIBLE_10_2
RETURN INTEGER;
```

Usage Notes

You can use this function with the `GET_COMPATIBLE` member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.2.0 compatibility in a database. You control the compatibility of an Oracle database using the `COMPATIBLE` initialization parameter.

See Also:

- `GET_COMPATIBLE` Member Function
- *Oracle Streams Concepts and Administration* for information about creating rules that discard changes that are not supported by Oracle Streams
- *Oracle Database Reference* and *Oracle Database Upgrade Guide* for more information about the `COMPATIBLE` initialization parameter
164.3.6 COMPATIBLE_10_1 Function

This function returns the DBMS_STREAMS.COMPATIBLE_10_1 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_10_1
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 10.1.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.

See Also:

• GET_COMPATIBLE Member Function
• Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
• Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

164.3.7 COMPATIBLE_9_2 Function

This function returns the DBMS_STREAMS.COMPATIBLE_9_2 constant.

Syntax

DBMS_STREAMS.COMPATIBLE_9_2
RETURN INTEGER;

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The constant value returned by this function corresponds to 9.2.0 compatibility in a database. You control the compatibility of an Oracle database using the COMPATIBLE initialization parameter.
164.3.8 CONVERT_ANYDATA_TO_LCR_DDL Function

This function converts a ANYDATA object into a SYS.LCR$_DDL_RECORD object.

Syntax

```sql
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_DDL(
    source IN ANYDATA
) RETURN SYS.LCR$_DDL_RECORD;
```

Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a DDL logical change record (DDL LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

Usage Notes

You can use this function in a transformation created by the CREATE_TRANSFORMATION procedure in the DBMS_TRANSFORM package. Use the transformation you create when you add a subscriber for propagation of DDL LCRs from a ANYDATA queue to a SYS.LCR$_DDL_RECORD typed queue.

See Also:

Oracle Database Advanced Queuing User's Guide

164.3.9 CONVERT_ANYDATA_TO_LCR_ROW Function

This function converts a ANYDATA object into a SYS.LCR$_ROW_RECORD object.

Syntax

```sql
DBMS_STREAMS.CONVERT_ANYDATA_TO_LCR_ROW(
    source IN ANYDATA
) RETURN SYS.LCR$_ROW_RECORD;
```
### Parameters

#### Table 164-3  CONVERT_ANYDATA_TO_LCR_ROW Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>The ANYDATA object to be converted. If this object is not a row logical change record (row LCR), then the function raises an exception.</td>
</tr>
</tbody>
</table>

#### Usage Notes

You can use this function in a transformation created by the `CREATE_TRANSFORMATION` procedure in the `DBMS_TRANSFORM` package. Use the transformation you create when you add a subscriber for propagation of row LCRs from an ANYDATA queue to a `SYS.LCR$_ROW_RECORD` typed queue.

#### See Also:

*Oracle Database Advanced Queuing User's Guide*

### 164.3.10 CONVERT_LCR_TO_XML Function

This function converts a logical change record (LCR) encapsulated in an ANYDATA object into an XML object that conforms to the XML schema for LCRs. The LCR can be a row LCR or a DDL LCR.

#### See Also:

*Oracle Streams Concepts and Administration* for more information about the XML schema for LCRs

#### Syntax

```
DBMS_STREAMS.CONVERT_LCR_TO_XML(
    anylcr IN ANYDATA)
RETURN SYS.XMLTYPE;
```

#### Parameters

#### Table 164-4  CONVERT_LCR_TO_XML Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>anylcr</td>
<td>The ANYDATA encapsulated LCR to be converted. If this object is not an ANYDATA encapsulated LCR, then the function raises an exception.</td>
</tr>
</tbody>
</table>
164.3.11 CONVERT_XML_TO_LCR Function

This function converts an XML object that conforms to the XML schema for logical change records (LCRs) into an LCR encapsulated in a ANYDATA object. The LCR can be a row or DDL LCR.

See Also:

Oracle Streams Concepts and Administration for more information about the XML schema for LCRs

Syntax

DBMS_STREAMS.CONVERT_XML_TO_LCR(
    xmldat  IN  SYS.XMLTYPE)
RETURN ANYDATA;

Parameters

Table 164-5    CONVERT_XML_TO_LCR Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>xmldat</td>
<td>The XML LCR object to be converted. If this object does not conform to XML schema for LCRs, then the function raises an exception.</td>
</tr>
</tbody>
</table>

164.3.12 GET_INFORMATION Function

This function returns information about various Oracle Streams attributes.

Syntax

DBMS_STREAMS.GET_INFORMATION(
    name  IN  VARCHAR2)
RETURN ANYDATA;
Parameters

Table 164-6  GET_INFORMATION Function Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| name      | The type of information you want to retrieve. Currently, the following names are available:  
  • SENDER: Returns the name of the sender for the current logical change record (LCR) from its AQ message properties. This function is called inside a procedure DML handler, a DDL handler, an error handler, or a message handler. Returns NULL if called outside of an apply handler. The return value is to be interpreted as a VARCHAR2.  
  • CONSTRAINT_NAME: Returns the name of the constraint that was violated for an LCR that raised an error. This function is called inside a procedure DML handler or error handler for an apply process. Returns NULL if called outside of a procedure DML handler or error handler. The return value is to be interpreted as a VARCHAR2. |

164.3.13 GET_STREAMS_NAME Function

This function gets the Oracle Streams name of the invoker if the invoker is one of the following Oracle Streams types: CAPTURE, APPLY, or ERROR_EXECUTION.

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_NAME
RETURN VARCHAR2;
```

Usage Notes

You can use this function in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, if you use one error handler for multiple apply processes, then you can use the GET_STREAMS_NAME function to determine the name of the apply process that raised the error.

164.3.14 GET_STREAMS_TYPE Function

This function gets the Oracle Streams type of the invoker and returns one of the following types: CAPTURE, APPLY, or ERROR_EXECUTION.

If the invoker is not one of these types, then this function returns a NULL.

Syntax

```
DBMS_STREAMS.GET_STREAMS_TYPE
RETURN VARCHAR2;
```

Usage Notes

This function can be used in rule conditions, rule-based transformations, apply handlers, and error handlers. For example, you can use the GET_STREAMS_TYPE function to instruct a procedure DML handler to operate differently if it is processing messages
from the error queue (ERROR_EXECUTION type) instead of the apply process's queue (APPLY type).

164.3.15 GET_TAG Function

This function gets the binary tag for all redo entries generated by the current session.

Note:

- To execute this function, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- Instead of using the DBMS_STREAMS.GET_TAG function, Oracle recommends that you use the DBMS_STREAMS_ADM.GET_TAG function. See GET_TAG Function.

See Also:

Oracle Streams Replication Administrator's Guide for more information about tags

Syntax

DBMS_STREAMS.GET_TAG
RETURN RAW;

Examples

The following example illustrates how to display the current logical change record (LCR) tag as output:

SET SERVEROUTPUT ON
DECLARE
    raw_tag RAW(2000);
BEGIN
    raw_tag := DBMS_STREAMS.GET_TAG();
    DBMS_OUTPUT.PUT_LINE('Tag Value = ' || RAWTOHEX(raw_tag));
END;
/

You can also display the value by querying the DUAL view:

SELECT DBMS_STREAMS.GET_TAG FROM DUAL;
164.3.16 MAX_COMPATIBLE Function

This function returns an integer that is greater than the highest possible compatibility constant for the current release of Oracle Database.

Syntax

```
DBMS_STREAMS.MAX_COMPATIBLE
RETURN INTEGER;
```

Usage Notes

You can use this function with the GET_COMPATIBLE member function for logical change records (LCRs) to specify behavior based on compatibility.

The MAX_COMPATIBLE function always returns the maximum compatibility for the release of Oracle Database on which it is run. Therefore, when you use this function in rule conditions, the rule conditions do not need to be changed when you upgrade to a later release of Oracle Database.

See Also:

- GET_COMPATIBLE Member Function
- Oracle Streams Concepts and Administration for information about creating rules that discard changes that are not supported by Oracle Streams
- Oracle Database Reference and Oracle Database Upgrade Guide for more information about the COMPATIBLE initialization parameter

164.3.17 SET_TAG Procedure

This procedure sets the binary tag for all redo entries subsequently generated by the current session.

Each redo entry generated by DML or DDL statements in the current session has this tag. This procedure affects only the current session.

Note:

- To execute this procedure, a user must be granted either EXECUTE_CATALOG_ROLE or EXECUTE privilege on the DBMS_STREAMS_ADM package.
- Instead of using the DBMS_STREAMS_SET_TAG procedure, Oracle recommends that you use the DBMS_STREAMS_ADM.SET_TAG procedure. See SET_TAG Procedure.
See Also:

*Oracle Streams Replication Administrator's Guide* for more information about tags

Syntax

```sql
DBMS_STREAMS.SET_TAG(
  tag  IN  RAW  DEFAULT NULL);
```

Parameters

**Table 164-7** SET_TAG Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag</td>
<td>The binary tag for all subsequent redo entries generated by the current session. A raw value is a sequence of bytes, and a byte is a sequence of bits. By default, the tag for a session is NULL. The size limit for a tag value is 2000 bytes.</td>
</tr>
</tbody>
</table>

Usage Notes

To set the tag to the hexadecimal value of '17' in the current session, run the following procedure:

```sql
EXEC DBMS_STREAMS.SET_TAG(tag => HEXTORAW('17'));
```

The following are considerations for the SET_TAG procedure:

- This procedure is not transactional. That is, the effects of SET_TAG cannot be rolled back.
- If the SET_TAG procedure is run to set a non-NULL session tag before a data dictionary build has been performed on the database, then the redo entries for a transaction that started before the dictionary build might not include the specified tag value for the session. Therefore, perform a data dictionary build before using the SET_TAG procedure in a session. A data dictionary build happens when the DBMS_CAPTURE_ADM.BUILD procedure is run. The BUILD procedure can be run automatically when a capture process is created.

See Also:

BUILD Procedure
The `DBMS_STREAMS_ADM` package, one of a set of Oracle Streams packages, provides subprograms for configuring Oracle Streams environments.

This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. This package also includes subprograms for configuring and managing XStream outbound servers and inbound servers.

This chapter contains the following topics:

- Overview
- Deprecated Subprograms
- Security Model
- Procedures That Create Rules for Oracle Streams Clients and XStream Clients
- Procedures That Configure an Oracle Streams Environment
- Summary of `DBMS_STREAMS_ADM` Subprograms

### 165.1 DBMS_STREAMS_ADM Overview

The `DBMS_STREAMS_ADM` package, one of a set of Oracle Streams packages, provides subprograms for configuring an Oracle Streams environment.

This package also includes subprograms for adding and removing simple rules for capture, propagation, apply, and dequeue at the table, schema, and database level. These rules support logical change records (LCRs), which include row LCRs and data definition language (DDL) LCRs. This package also contains subprograms for creating message rules for specific message types. This package also contains subprograms for creating queues, and for managing Oracle Streams metadata, such as data dictionary information.

If you require more sophisticated rules, then refer to `DBMS_RULE` package.

**See Also:**

- *Oracle Streams Concepts and Administration, Oracle Streams Replication Administrator's Guide* for more information about this package and Oracle Streams
- `DBMS_RULE`
165.2 DBMS_STREAMS_ADM Deprecated Subprograms

These DBMS_STREAMS_ADM subprograms have been deprecated.

Note:
Oracle recommends that you do not use deprecated subprograms. Support for deprecated features is for backward compatibility only.

The following subprograms are deprecated with Oracle Database 10g Release 2 and later:

- MAINTAIN_SIMPLE_TABLESPACE
  This procedure is replaced by the MAINTAIN_SIMPLE_TTS procedure.

See Also:
MAINTAIN_SIMPLE_TTS Procedure

- MAINTAIN_TABLESPACES
  This procedure is replaced by the MAINTAIN_TTS procedure.

See Also:
MAINTAIN_TTS Procedure

165.3 DBMS_STREAMS_ADM Security Model

Security on this package can be controlled by either granting EXECUTE on this package to selected users or roles, or by granting EXECUTE_CATALOG_ROLE to selected users or roles.

If subprograms in the package are run from within a stored procedure, then the user who runs the subprograms must be granted EXECUTE privilege on the package directly. It cannot be granted through a role.

A user is associated with each Oracle Streams client.
Note:
The user must be granted additional privileges to perform some administrative tasks using the subprograms in this package, such as creating a synchronous capture. If additional privileges are required for a subprogram, then the privileges are documented in the section that describes the subprogram.

Oracle Streams Administrator
To ensure that the user who runs the subprograms in this package has the necessary privileges, configure an Oracle Streams administrator and connect as the Oracle Streams administrator when using this package.

See Also:
Oracle Streams Replication Administrator's Guide for information about configuring an Oracle Streams administrator

Capture User
The following procedures can create a capture process:
• ADD_GLOBAL_RULES Procedure
• ADD_SCHEMA_RULES Procedure
• ADD_SUBSET_RULES Procedure
• ADD_TABLE_RULES Procedure
The following procedures can create a synchronous capture:
• ADD_SUBSET_RULES Procedure
• ADD_TABLE_RULES Procedure
If one of these procedures creates a capture process or a synchronous capture, then it configures the current user as the capture user. The capture user is the user in whose security domain a capture process or synchronous capture captures changes that satisfy its rule set(s) and runs custom rule-based transformations configured for these rules. This user must have the necessary privileges to capture changes. The procedure grants the capture user ENQUEUE privilege on the queue used by the capture process or synchronous capture and configures the user as a secure queue user of the queue.

See Also:
CREATE_CAPTURE Procedure and CREATE_SYNC_CAPTURE Procedure for information about the privileges required to capture changes (refer to the capture_user parameter)
Propagation User

The following procedures can create a propagation:

- ADD_GLOBAL_PROPAGATION_RULES Procedure
- ADD_MESSAGE_PROPAGATION_RULE Procedure
- ADD_SCHEMA_PROPAGATION_RULES Procedure
- ADD_SUBSET_PROPAGATION_RULES Procedure
- ADD_TABLE_PROPAGATION_RULES Procedure

When a propagation is created, a propagation job also might be created. If a propagation job is created when one of these procedures is run, then the user who runs the procedure owns the propagation job. Each propagation job is an Oracle Scheduler job. You can adjust the schedule of a propagation job using Oracle Scheduler.

Note:

- The source queue owner performs the propagation, but the propagation job is owned by the user who creates it. These two users might or might not be the same.
- For a propagation to work properly, the owner of the source queue must have the necessary privileges to propagate messages.

See Also:

- CREATE_PROPAGATION Procedure for more information about the required privileges
- "* Procedures That Create Rules for Oracle Streams Clients and XStream Clients" for information about when a propagation job is created

Apply User for an Oracle Streams Apply Process

The following procedures can create an apply process:

- ADD_GLOBAL_RULES Procedure
- ADD_MESSAGE_RULE Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

If one of these procedures creates an apply process, then it configures the current user as the apply user. For an apply process, the apply user is the user in whose security domain an apply process dequeues messages that satisfy its rule sets.
An apply user applies messages directly to database objects, runs custom rule-based transformations configured for apply process rules, and runs apply handlers configured for the apply process. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the apply process and configures the user as a secure queue user of the queue.

See Also:

CREATE_APPLY Procedure for information about the privileges required to apply changes (refer to the `apply_user` parameter)

Apply User for an XStream Inbound Server

The following procedures can create an XStream inbound server:

- ADD_GLOBAL_RULES Procedure
- ADD_SCHEMA_RULES Procedure
- ADD_SUBSET_RULES Procedure
- ADD_TABLE_RULES Procedure

Note:

- Oracle recommends using procedures in the `DBMS_XSTREAM_ADM` package to create or add rules to an XStream inbound server. See `DBMS_XSTREAM_ADM`.
- These procedures cannot create an outbound server.

If the `streams_name` parameter is set to `NULL` and no relevant apply process, inbound server, or outbound server exists, then the procedure creates an apply process automatically with a system-generated name.

The apply process remains an apply process if it receives captured logical change records (LCRs) from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives captured LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

If one of these procedures creates an inbound server, then it configures the current user as the apply user. The apply user is the user in whose security domain an XStream client application attaches to an Oracle database.

An apply user applies changes directly to database objects, runs custom rule-based transformations configured for inbound server rules, and runs apply handlers configured for the inbound server. This user must have the necessary privileges to apply changes. The procedure grants the apply user `DEQUEUE` privilege on the queue used by the inbound server and configures the user as a secure queue user.
Each inbound server must have a unique name. The name cannot be used by an apply process, outbound server, or messaging client in the same database, and the name cannot be used by another inbound server in the same database.

If a relevant apply process, inbound server, or outbound server exists, then the procedure does not create an inbound server. Instead, the procedure uses the relevant apply process, inbound server, or outbound server. If the `streams_name` parameter specifies an existing apply process, inbound server, or outbound server, then the specified client is used.

When `streams_name` parameter is `NULL` and the `streams_type` parameter is set to `apply`, the relevant apply process, inbound server, or outbound server is identified in one of the following ways:

- If one existing apply process or outbound server has the source database specified in the `source_database` parameter and uses the queue specified in the `queue_name` parameter, then the procedure uses this apply process or outbound server.
- If the `source_database` parameter is set to `NULL` and one existing apply process, inbound server, or outbound server is using the queue specified in the `queue_name` parameter, then the procedure uses this apply process, inbound server, or outbound server.

If the `streams_name` parameter is set to `NULL` and multiple relevant apply processes, inbound servers, or outbound servers exist, then the procedure raises an error.

**Note:**
Using XStream requires purchasing a license for the Oracle GoldenGate product. See *Oracle Database XStream Guide*.

**Messaging Client User**

The following procedures can create a messaging client:

- `ADD_GLOBAL_RULES Procedure`
- `ADD_MESSAGE_RULE Procedure`
- `ADD_SCHEMA_RULES Procedure`
- `ADD_SUBSET_RULES Procedure`
- `ADD_TABLE_RULES Procedure`

If one of these procedures creates a messaging client, then the user who runs this procedure is granted the privileges to dequeue from the queue using the messaging client. The procedure configures this user as a secure queue user of the queue, and only this user can use the messaging client.

**165.4 Procedures That Create Rules for Oracle Streams Clients and XStream Clients**

Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients. XStream clients include
XStream outbound servers and inbound servers. Some of the procedures in the DBMS_STREAMS_ADM package add rules to the rule sets of Oracle Streams clients and XStream clients. The rules can pertain to changes in the redo log, to data manipulation language (DML) changes made to a table, to logical change records (LCRs), or to user messages.

An LCR represents either a row change that results from a DML operation or a data definition language (DDL) change. An LCR that represents a row change is a row LCR, and an LCR that represents a DDL change is a DDL LCR. LCRs can either represent changes that were captured by a capture process or a synchronous capture, or they can represent changes created by a user or application. A user message is a custom message that is based on a user-defined type and created by users or applications.

A capture process, propagation, apply process, messaging client, outbound server, or inbound server can have both positive and negative rule sets. A synchronous capture can have only a positive rule set.

For all of the procedures except the ones that create subset rules, and for all clients except for synchronous captures, you use the inclusion_rule parameter to specify the type of rule set (either positive or negative) for the created rules. If the client does not have a rule set of the specified type, then a rule set is created automatically, and the rules are added to the rule set. Other rules in an existing rule set for the client are not affected. Additional rules can be added to a rule set using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package. If an client has both a positive and a negative rule set, then the negative rule set is always evaluated first.

Note:
Using XStream requires purchasing a license for the Oracle GoldenGate product. See Oracle Database XStream Guide.

See Also:
Oracle Streams Concepts and Administration for more information about how rules are used in Oracle Streams

Capture Process Rules for Changes in the Redo Log
The following procedures add rules to a rule set of a capture process when you specify capture for the streams_type parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all changes made to a source database. See ADD_GLOBAL_RULES Procedure.
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for changes made to a specified schema. See ADD_SCHEMA_RULES Procedure.
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for DML changes made to a subset of rows in a specified table. See ADD_SUBSET_RULES Procedure.
• The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for changes made to a specified table. See [ADD_TABLE_RULES Procedure](#).

If one of these procedures adds rules to the positive rule set for a capture process, then the capture process captures row changes resulting from DML changes, or DDL changes, or both from a source database and enqueues these changes into the specified queue. If one of these procedures adds rules to the negative rule set for a capture process, then the capture process discards row changes, or DDL changes, or both from a source database.

A capture process can capture changes locally at a source database or remotely at a downstream database. Therefore, for capture process rules, you should execute the procedure either at the source database or at a downstream database.

If the capture process is a local capture process, or if the capture process is a downstream capture process that uses a database link to the source database, then these procedures automatically prepare the appropriate database objects for instantiation:

• `ADD_GLOBAL_RULES` invokes the `PREPARE_GLOBAL_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

• `ADD_SCHEMA_RULES` invokes the `PREPARE_SCHEMA_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

• `ADD_SUBSET_RULES` and `ADD_TABLE_RULES` invoke the `PREPARE_TABLE_INSTANTIATION` procedure in the `DBMS_CAPTURE_ADM` package at the source database.

These procedures also enable supplemental logging for the primary key, unique key, foreign key, and bitmap index columns in the tables prepared for instantiation. The primary key columns are unconditionally logged. The unique key, foreign key, and bitmap index columns are conditionally logged.

If the capture process is a downstream capture process that does not use a database link to the source database, then you must prepare the appropriate objects for instantiation and specify the necessary supplemental logging manually at the source database.

If one of these procedures is executed at a downstream database, then you specify the source database using the `source_database` parameter, and the specified capture process must exist. The procedure cannot create a capture process if it is run at a downstream database. You can create a capture process at a downstream database using the `CREATE_CAPTURE` procedure in the `DBMS_CAPTURE_ADM` package.

![See Also:](#)

*Summary of DBMS_CAPTURE_ADM Subprograms* for more information about the `CREATE_CAPTURE` procedure and the procedures that prepare database objects for instantiation

---

**Synchronous Capture Rules for DML Changes to Tables**

The following procedures add rules to the rule set of a synchronous capture when you specify `sync_capture` for the `streams_type` parameter:
• The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for DML changes made to a subset of rows in a specified table. See `ADD_SUBSET_RULES Procedure`.

• The `ADD_TABLE_RULES` procedure adds a rule whose rule condition evaluates to `TRUE` for DML changes made to a specified table. See `ADD_TABLE_RULES Procedure`.

If one of these procedures adds rules to the positive rule set for a synchronous capture, then the synchronous capture captures row changes resulting from DML changes to the table at the source database and enqueues these changes into the specified queue. A synchronous capture cannot have a negative rule set.

A synchronous capture captures changes locally at the database where it is configured. This database is the source database for changes captured by the synchronous capture. Therefore, for synchronous capture rules, you should execute the procedure at the source database.

These procedures automatically prepare the appropriate tables for instantiation by invoking the `PREPARE_SYNC_INSTANTIATION` function in the `DBMS_CAPTURE_ADM` package at the source database.

**Note:**

- A synchronous capture ignores rules in its rule set that were created by a procedure other than `ADD_SUBSET_RULES` or `ADD_TABLE_RULES`.
- When the `ADD_TABLE_RULES` or the `ADD_SUBSET_RULES` procedure adds rules to a synchronous capture rule set, the procedure must obtain an exclusive lock on the specified table. If there are outstanding transactions on the specified table, then the procedure waits until it can obtain a lock.

Propagation Rules for LCRs

The following procedures add propagation rules for LCRs to a rule set of a propagation:

• The `ADD_GLOBAL_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in a source queue. See `ADD_GLOBAL_PROPAGATION_RULES Procedure`.

• The `ADD_SCHEMA_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified schema. See `ADD_SCHEMA_PROPAGATION_RULES Procedure`.

• The `ADD_SUBSET_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in a source queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_PROPAGATION_RULES Procedure".

• The `ADD_TABLE_PROPAGATION_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in a source queue containing changes made to a specified table. See "ADD_TABLE_PROPAGATION_RULES Procedure".

If one of these procedures adds rules to the positive rule set for the propagation, then the rules specify that the propagation propagates LCRs in a source queue to a destination queue. If one of these procedures adds rules to the negative rule set for
the propagation, then the rules specify that the propagation discards LCRs in a source queue. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database.

Propagation Rules for User Messages

The ADD_MESSAGE_PROPAGATION_RULE procedure adds a message rule to a rule set of a propagation. If this procedure adds a rule to the positive rule set for the propagation, then the rule specifies that the propagation propagates the user messages of a specific message type that evaluate to TRUE for the rule condition from a source queue to a destination queue. If this procedure adds a rule to the negative rule set for the propagation, then the rule specifies that the propagation discards the user messages in a source queue of a specific message type that evaluate to TRUE for the rule condition. This procedure generates a rule name for the rule.

See Also:
"ADD_MESSAGE_PROPAGATION_RULE Procedure"

Apply Process Rules for LCRs

The following procedures add rules to a rule set of an apply process when you specify apply for the streams_type parameter and an apply process for the streams_name parameter:

- The ADD_GLOBAL_RULES procedure adds rules whose rule condition evaluates to TRUE for all LCRs in the apply process's queue. See "ADD_GLOBAL_RULES Procedure".
- The ADD_SCHEMA_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure".
- The ADD_SUBSET_RULES procedure adds rules whose rule condition evaluates to TRUE for row LCRs in the apply process's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure".
- The ADD_TABLE_RULES procedure adds rules whose rule condition evaluates to TRUE for LCRs in the apply process's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure".

If one of these procedures adds rules to the positive rule set for the apply process, then the rules specify that the apply process applies LCRs in its queue. If one of these procedures adds rules to the negative rule set for the apply process, then the rules specify that the apply process discards LCRs in its queue. For apply process rules, you should execute these procedures at the destination database.

Changes applied by an apply process created by one of these procedures generate tags in the redo log at the destination database with a value of '00' (double zero). You can use the ALTER_APPLY procedure in the DBMS_APPLY_ADM package to alter the tag value after the apply process is created, if necessary.

An apply process can apply captured LCRs from only one source database. If one of these procedures creates an apply process, then specify the source database for the
apply process using the source_database parameter. If the source_database parameter is
NULL, and one of these procedures creates an apply process, then the source
database name of the first LCR received by the apply process is used for the source
database.

The rules in the apply process rule sets determine which messages are dequeued by
the apply process. When you create rules with one of these procedures, and you
specify a value for the source_database parameter, then the rules include conditions for
the specified source database. If the apply process dequeues an LCR with a source
database that is different from the source database for the apply process, then an
error is raised. In addition, when adding rules to an existing apply process, the
database specified in the source_database parameter cannot be different from the
source database for the apply process. You can determine the source database for an
apply process by querying the DBA_APPLY_PROGRESS data dictionary view.

An apply process created by one of these procedures can apply messages only at the
local database and can apply only captured messages. To create an apply process
that applies messages at a remote database or an apply process that applies user
messages, use the CREATE_APPLY procedure in the DBMS_APPLY_ADM package.

You can also use the DBMS_APPLY_ADM.CREATE_APPLY procedure to specify nondefault
values for the apply_captured, apply_user, apply_database_link, and apply_tag
parameters when you run that procedure. You can use one of the procedures in the
DBMS_STREAMS_ADM package to add rules to a rule set used by the apply process after
you create it.

See Also:

- "ALTER_APPLY Procedure"
- "CREATE_APPLY Procedure"

Apply Process Rules for User Messages

The ADD_MESSAGE_RULE procedure adds a message rule to a rule set of an apply process
when you specify apply for the streams_type parameter. For an apply process rule, you
should execute this procedure at the destination database.

If this procedure adds a rule to the positive rule set for an apply process, then the
apply process dequeues user messages of a specific message type that satisfy the
apply process rule and sends these messages to its message handler. If no message
handler is specified for the apply process, then use the ALTER_APPLY procedure in the
DBMS_APPLY_ADM package to set the message handler. If this procedure adds a rule to
the negative rule set for an apply process, then the apply process discards user
messages of a specific message type that satisfy the apply process rule.

See Also:

- ADD_MESSAGE_RULE Procedure
- ALTER_APPLY Procedure
Messaging Client Rules for LCRs

The following procedures add rules to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for all LCRs in the messaging client's queue. See "ADD_GLOBAL_RULES Procedure".

- The `ADD_SCHEMA_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified schema. See "ADD_SCHEMA_RULES Procedure".

- The `ADD_SUBSET_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for row LCRs in the messaging client's queue containing the results of DML changes made to a subset of rows in a specified table. See "ADD_SUBSET_RULES Procedure".

- The `ADD_TABLE_RULES` procedure adds rules whose rule condition evaluates to `TRUE` for LCRs in the messaging client's queue containing changes made to a specified table. See "ADD_TABLE_RULES Procedure".

If one of these procedures adds rules to the positive rule set for a messaging client, then the messaging client can dequeue persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. If one of these procedures adds rules to the negative rule set for a messaging client, then the messaging client discards persistent row LCRs, or DDL LCRs, or both that originated at the source database that matches the `source_database` parameter. You should execute these procedures at the database where you want to dequeue the messages with the messaging client.

Messaging Client Rules for User Messages

The `ADD_MESSAGE_RULE` procedure adds a message rule to a rule set of a messaging client when you specify `dequeue` for the `streams_type` parameter. You should execute this procedure at the database that will dequeue messages.

If this procedure adds a rule to the positive rule set for a messaging client, then the messaging client dequeues user messages of a specific message type that satisfy the message rule. If this procedure adds a rule to the negative rule set for a messaging client, then the messaging client discards user messages of a specific message type that satisfy the message rule.

See Also:

"ADD_MESSAGE_RULE Procedure"

XStream Outbound Server Rules for LCRs

When you specify `apply` for the `streams_type` parameter and an XStream outbound server for the `streams_name` parameter, the following procedures add rules to a rule set of the specified outbound server:

- The `ADD_GLOBAL_RULES` procedure adds rules whose rule conditions evaluate to `TRUE` for all LCRs.
- The ADD_SCHEMA_RULES procedure adds rules whose rule conditions evaluate to TRUE for LCRs that contain changes made to a specified schema.
- The ADD_SUBSET_RULES procedure adds rules whose rule conditions evaluate to TRUE for row LCRs that contain the results of DML changes made to a subset of rows in a specified table.
- The ADD_TABLE_RULES procedure adds rules whose rule conditions evaluate to TRUE for LCRs that contain changes made to a specified table.

These rules are evaluated against LCRs in the outbound server's queue.

If one of the preceding procedures adds rules to the positive rule set for the outbound server, then the rules specify that the outbound server sends LCRs in its queue to the XStream client application. If one of these procedures adds rules to the negative rule set for the outbound server, then the rules specify that the outbound server discards LCRs in its queue. For outbound server rules, execute these procedures at the database to which the XStream client application attaches.

An outbound server can process captured LCRs from only one source database. The source database is the database where the changes originated. If one of these procedures adds rules to the rule set of an outbound server, then specify the source database for the outbound server using the source_database parameter.

The rules in the outbound server's rule sets determine which LCRs are dequeued by the outbound server. When you create rules with one of these procedures, and you specify a value for the source_database parameter, then the rules include conditions for the specified source database. If the outbound server dequeues an LCR with a source database that is different from the source database for the outbound server, then an error is raised. In addition, when adding rules to an existing outbound server, the database specified in the source_database parameter cannot be different from the source database for the outbound server. You can determine the source database for an outbound server by querying the DBA_XSTREAM_OUTBOUND data dictionary view.

**Note:**

These procedures cannot create an XStream outbound server. You can use one of the procedures in the DBMS_STREAMS_ADM package to add rules to a rule set used by the outbound server after you create it.

**See Also:**

*Oracle Database XStream Guide* for information about creating an outbound server.

### XStream Inbound Server Rules for LCRs

When you specify apply for the streams_type parameter and an XStream inbound server for the streams_name parameter, the following procedures add rules to a rule set of the specified inbound server:

- The ADD_GLOBAL_RULES procedure adds rules whose rule conditions evaluate to TRUE for all LCRs sent to the inbound server.
The **ADD_SCHEMA_RULES** procedure adds rules whose rule conditions evaluate to **true** for LCRs sent to the inbound server that contain changes made to a specified schema.

The **ADD_SUBSET_RULES** procedure adds rules whose rule condition evaluates to **true** for row LCRs sent to the inbound server that contain the results of data definition language (DML) changes made to a subset of rows in a specified table.

The **ADD_TABLE_RULES** procedure adds rules whose rule condition evaluates to **true** for LCRs sent to the inbound server that contain changes made to a specified table.

If one of the preceding procedures adds rules to the positive rule set for the inbound server, then the rules specify that the inbound server applies LCRs sent to it by the XStream client application. If one of these procedures adds rules to the negative rule set for the inbound server, then the rules specify that the inbound server discards LCRs sent to it by the XStream client application. For inbound server rules, execute these procedures at the database to which the XStream client application attaches. If an inbound server has no rule sets, then it applies all of the LCRs sent to it by the XStream client application.

Changes applied by an inbound server created by one of these procedures generate tags in the redo log at the destination database with a value of `00` (double zero). You can use the **ALTER_APPLY** procedure in the **DBMS_APPLY_ADM** package to alter the tag value after the inbound server is created, if necessary.

The rules in the XStream inbound server rule sets determine which LCRs are either applied or discarded after the LCRs are received from the XStream client application. An inbound server can only process LCRs sent from an XStream client application.

When one of these procedures creates rules for an inbound server, the procedure ignores the **source_database** parameter.

---

**Note:**

If the name specified in the **streams_name** parameter does not exist, then these procedures always create an apply process. The apply process remains an apply process if it receives captured LCRs from a capture process. The apply process can become an inbound server if an XStream client application attaches to it before it receives LCRs from a capture process. After the initial contact, an apply process cannot be changed into an inbound server, and an inbound server cannot be changed into an apply process.

---

**See Also:**

*Oracle Database XStream Guide* for information about creating an inbound server.
165.5 Procedures That Configure an Oracle Streams Environment

These procedures in this package configure an environment that is maintained by Oracle Streams.

- **MAINTAIN_CHANGE_TABLE Procedure** configures an Oracle Streams environment that records in a change table the data manipulation language (DML) changes made to a source table. Optionally, this procedure can also configure one-way replication of the table from the source database to the destination database.

- **MAINTAIN_GLOBAL Procedure** configures an Oracle Streams environment that replicates changes at the database level between two databases.

- **MAINTAIN_SCHEMAS Procedure** configures an Oracle Streams environment that replicates changes to specified schemas between two databases.

- **MAINTAIN_SIMPLE_TTS Procedure** clones a simple tablespace from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespace between these two databases.

- **MAINTAIN_TABLES Procedure** configures an Oracle Streams environment that replicates changes to specified tables between two databases.

- **MAINTAIN_TTS Procedure** clones a set of tablespaces from a source database at a destination database and configures an Oracle Streams environment that replicates changes to specified tablespaces between these two databases.

- **PRE_INSTANTIATION_SETUP Procedure** and **POST_INSTANTIATION_SETUP Procedure**

  The **PRE_INSTANTIATION_SETUP** and **POST_INSTANTIATION_SETUP** procedures must be used together to complete the Oracle Streams replication configuration. Typically, the **PRE_INSTANTIATION_SETUP** and **POST_INSTANTIATION_SETUP** procedures are used to perform database maintenance operations with little or no down time. See *Oracle Streams Concepts and Administration* for more information.

**See Also:**

*Oracle Streams Replication Administrator's Guide* for more information about using these procedures

### Automatic Platform Conversion

If the source and destination databases run on different platforms, then these procedures, or the scripts generated by these procedures, convert transferred datafiles to the appropriate platform automatically.

### Actions Performed by These Procedures

To view all of the actions performed by one of these procedures in detail, use the procedure to generate a script, and view the script in a text editor.
Configuration Progress and Recoverability

When one of these procedures is run with the `perform_actions` parameter set to `TRUE`, metadata about its configuration actions is recorded in the following data dictionary views: `DBA_RECOVERABLE_SCRIPT`, `DBA_RECOVERABLE_SCRIPT_PARAMS`, `DBA_RECOVERABLE_SCRIPT_BLOCKS`, and `DBA_RECOVERABLE_SCRIPT_ERRORS`. If the procedure stops because it encounters an error, then you can use the `RECOVER_OPERATION` procedure to complete the configuration after you correct the conditions that caused the error.

**Note:**

When one of these procedures is run with the `perform_actions` parameter set to `FALSE`, these views are not populated. Also, the views are not populated when a script generated by one of these procedures is run.

**See Also:**

"RECOVER_OPERATION Procedure"

Requirements for Running These Procedures

Meet the following requirements when you use one of these procedures:

- Run the procedure at the capture database. The capture database is the database that will contain the capture process that captures changes made to the source database. If the capture database is the same as the source database, then a local capture process is configured. If the capture database is different from the source database, then a downstream capture process is configured. See Oracle Streams Replication Administrator's Guide for more information about the capture database.

- The user who runs the procedure must be able to use a database link from the source database to the destination database. This database link should have the same name as the global name of the destination database.

- If the procedure configures downstream capture, then the corresponding user at the capture database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

- If the procedure configures downstream capture, and the capture database is different from the destination database, then the corresponding user at the capture database must be able to use a database link to access the destination database. This database link should have the same name as the global name of the destination database.

- Both databases must be open during configuration. If the procedure is generating a script only, then the database specified in the `destination_database` parameter does not need to be open when you run the procedure, but both databases must be open when you run the generated script.
• Grant the user who runs the procedure the DBA role. This user must have the necessary privileges to complete the following actions:
  – Create ANYDATA queues, capture processes, propagations, and apply processes.
  – Specify supplemental logging
  – Run subprograms in the DBMS_STREAMS_ADM and DBMS_AQADM packages.
  – Access the database specified in the destination_database parameter through a database link. This database link should have the same name as the global name of the destination database.

Typically, the DBA role can be revoked from the user, if necessary, after the configuration is complete.

• The procedure, or the scripts generated by these procedure, must be run at an Oracle Database 10g Release 2 or later database.

• If the perform_actions parameter is set to TRUE in the procedure to configure the Oracle Streams environment directly, then all of the databases configured by the procedure must be Oracle Database 10g Release 2 or later databases.

• If the perform_actions parameter is set to FALSE in the procedure, and the environment is configured with a generated script, then the databases configured by the script must be Oracle Database 10g Release 1 or later databases. If the script configures an Oracle Database 10g Release 1 database, then the script must be modified so that it does not configure features that are available only in Oracle Database 10g Release 2 or later, such as queue-to-queue propagation.

• Each specified directory object must be created using the SQL statement CREATE DIRECTORY, and the user who invokes the procedure must have READ and WRITE privilege on each one.

• For procedures that include the bi_directional parameter, if the bi_directional parameter is set to TRUE, or if the source database is not the capture database, then the source_database parameter must specify a database that contains the database objects to be shared. The database specified in the destination_database parameter might or might not contain these database objects. If the destination database does not contain the shared database objects, then the procedure instantiates the database objects at the destination database (excluding the PRE_INSTANTIATION_SETUP and POST_INSTANTIATION_SETUP procedures).

• For procedures that include the bi_directional parameter, if the bi_directional parameter is set to TRUE or if a network instantiation will be performed, then the corresponding user at the destination database must be able to use a database link to access the source database. This database link should have the same name as the global name of the source database.

To ensure that the user who runs these procedures has the necessary privileges, you should configure an Oracle Streams administrator at each database, and each database link should be created in the Oracle Streams administrator's schema.
Common Parameters for the Configuration Procedures

Table 165-1 describes the common parameters for the procedures in this package that configure an Oracle Streams environment. Some of the procedures do not include all of the parameters in Table 165-1.

Table 165-1 Common Parameters for Configuration Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| perform_actions      | If TRUE, then the procedure performs the necessary actions to configure the environment directly. If FALSE, then the procedure does not perform the necessary actions to configure the environment directly. Specify FALSE when this procedure is generating a script that you can edit and then run. The procedure raises an error if you specify FALSE and either of the following parameters is NULL:  
  • script_name  
  • script_directory_object |
| script_name          | If non-NULL and the perform_actions parameter is FALSE, then specify the name of the script generated by this procedure. The script contains all of the statements used to configure the environment. If a file with the specified script name exists in the specified directory for the script_directory_object parameter, then the procedure appends the statements to the existing file. If non-NULL and the perform_actions parameter is TRUE, then the procedure generates the specified script and performs the actions to configure the environment directly. If NULL and the perform_actions parameter is TRUE, then the procedure performs the actions to configure the environment directly and does not generate a script. If NULL and the perform_actions parameter is FALSE, then the procedure raises an error. |
| script_directory_object | The directory object for the directory on the local computer system into which the generated script is placed. If the script_name parameter is NULL, then the procedure ignores this parameter and does not generate a script. If NULL and the script_name parameter is non-NULL, then the procedure raises an error. |

Note: The specified directory object cannot point to an Oracle Automatic Storage Management (ASM) disk group.

**Note:**

All subprograms commit unless specified otherwise.
165.6.1 ADD_COLUMN Procedure

This procedure either adds or removes a declarative rule-based transformation which adds a column to a row logical change record (row LCR) that satisfies the specified rule.

For the transformation to be performed when the specified rule evaluates to TRUE, the rule must be in the positive rule set of an Oracle Streams client. Oracle Streams clients include capture processes, synchronous captures, propagations, apply processes, and messaging clients.

This procedure is overloaded. The column_value and column_function parameters are mutually exclusive.

Note:

- ADD_COLUMN transformations cannot add columns of the following data types: BLOB, CLOB, NCLOB, BFILE, LONG, LONG RAW, ROWID, user-defined types (including object types, REFS, varrays, nested tables), and Oracle-supplied types (including any types, XML types, spatial types, and media types).

- Declarative transformations can transform row LCRs only. These row LCRs can be captured by a capture process, captured by a synchronous capture, or constructed and enqueued by an application. Therefore, a DML rule must be specified when you run this procedure. If a DDL is specified, then the procedure raises an error.

See Also:

Oracle Streams Concepts and Administration for more information about declarative rule-based transformations

Syntax

DBMS STREAMS ADM.ADD_COLUMN(
    rule_name IN VARCHAR2,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2,
    column_value IN ANYDATA,
    value_type IN VARCHAR2 DEFAULT 'NEW',
    step_number IN NUMBER DEFAULT 0,
    operation IN VARCHAR2 DEFAULT 'ADD');

DBMS STREAMS ADM.ADD_COLUMN(
    rule_name IN VARCHAR2,
    table_name IN VARCHAR2,
    column_name IN VARCHAR2,
    column_function IN VARCHAR2,
    value_type IN VARCHAR2 DEFAULT 'NEW',
    value_in IN ANYDATA,
    step_number IN NUMBER DEFAULT 0,
    operation IN VARCHAR2 DEFAULT 'ADD');
Parameters

Table 165-3  ADD_COLUMN Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>The name of the rule, specified as [schema_name.]rule_name. If NULL, then the procedure raises an error. For example, to specify a rule in the hr schema named employees12, enter hr.employees12. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>table_name</td>
<td>The name of the table to which the column is added in the row LCR, specified as [schema_name.]object_name. For example, hr.employees. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>column_name</td>
<td>The name of the column added to each row LCR that satisfies the rule.</td>
</tr>
<tr>
<td>column_value</td>
<td>The value of the added column. Specify the appropriate ANYDATA function for the column datatype and the column value. For example, if the datatype of the column being added is NUMBER and the value is NULL, then specify the ANYDATA.ConvertNumber(NULL) function. This parameter cannot be specified if the column_function parameter is specified.</td>
</tr>
<tr>
<td>column_function</td>
<td>Either the 'SYSDATE' or the 'SYSTIMESTAMP' SQL function. The 'SYSDATE' SQL function places the current date and time set for the operating system on which the database resides. The datatyp of the returned value is DATE, and the format returned depends on the value of the NLS_DATE_FORMAT initialization parameter. The 'SYSTIMESTAMP' SQL function returns the system date, including fractional seconds and time zone, of the system on which the database resides. The return type is TIMESTAMP WITH TIME ZONE. The function executes when the rule evaluates to TRUE. This parameter cannot be specified if the column_value parameter is specified.</td>
</tr>
<tr>
<td>value_type</td>
<td>Specify 'NEW' to add the column to the new values in the row LCR. Specify 'OLD' to add the column to the old values in the row LCR.</td>
</tr>
<tr>
<td>step_number</td>
<td>The order of execution of the transformation.</td>
</tr>
<tr>
<td>operation</td>
<td>Specify 'ADD' to add the transformation to the rule. Specify 'REMOVE' to remove the transformation from the rule.</td>
</tr>
</tbody>
</table>

Usage Notes

When 'REMOVE' is specified for the operation parameter, all of the add column declarative rule-based transformations for the specified rule are removed that match the specified table_name, column_name, and step_number parameters. Nulls specified for these parameters act as wildcards. The following table lists the behavior of the ADD_COLUMN procedures when one or more of these parameters is NULL.
165.6.2 ADD_GLOBAL_PROPAGATION_RULES Procedure

This procedure either adds global rules to the positive rule set for a propagation, or adds global rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two `OUT` parameters, and the other does not.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```

```sql
DBMS_STREAMS_ADM.ADD_GLOBAL_PROPAGATION_RULES(
    streams_name            IN   VARCHAR2  DEFAULT NULL,
    source_queue_name       IN   VARCHAR2,
    destination_queue_name  IN   VARCHAR2,
    include_dml             IN   BOOLEAN   DEFAULT TRUE,
    include_ddl             IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr      IN   BOOLEAN   DEFAULT FALSE,
    source_database         IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name           OUT  VARCHAR2,
    ddl_rule_name           OUT  VARCHAR2,
    inclusion_rule          IN   BOOLEAN   DEFAULT TRUE,
    and_condition           IN   VARCHAR2  DEFAULT NULL,
    queue_to_queue          IN   BOOLEAN   DEFAULT NULL);
```
Parameters

Table 165-4  ADD_GLOBAL_PROPAGATION_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the propagation. Do not specify an owner. If the specified propagation does not exist, then the procedure creates it automatically. If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation. If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name.</td>
</tr>
<tr>
<td>source_queue_name</td>
<td>The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type. For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as [schema_name.]queue_name[@dblink_name], if the destination queue is in a remote database. The queue must be ANYDATA type. For example, to specify a destination queue named streams_queue in the strmadmin schema and use a database link named dbs2.net, enter <a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a> for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. <strong>Note:</strong> Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
</tbody>
</table>
Table 165-4  (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a logical change record (LCR) has a non-NULL tag. If the rules are added to the positive rule set for the propagation, then an LCR is always considered for propagation, regardless of whether it has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the propagation, then whether an LCR is discarded does not depend on the tag for the LCR. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if an LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the propagation, then an LCR is considered for propagation only when the LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the propagation, then an LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. <strong>See Also:</strong> Oracle Streams Replication Administrator's Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. The source database is where the changes originated. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically. Oracle recommends that you specify a source database for propagation rules.</td>
</tr>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the propagation. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
Table 165-4  (Cont.) ADD_GLOBAL_PROPAGATION_RULES Procedure
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| and_condition | If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way:  
\[(\text{system\_condition}) \text{ AND } (\text{and\_condition})\]  
The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of ‘02’, specify the following condition:  
:\text{lcr.get\_tag()} = \text{HEXTORAW}('02')  
The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure the procedure only generates the appropriate rule.  
Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.  
See Also: Logical Change Record TYPES  
|
| queue_to_queue | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database.  
If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment.  
The procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:  
• If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.  
• If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.  
• If NULL, then the procedure does not change the queue to queue property of the propagation.  
See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations |
Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on `include_dml` and `include_ddl` parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A propagation uses the rules for filtering.

- "DBMS_STREAMS_ADM Security Model"

Examples

The following is an example of a global rule condition created for DML changes:

```sql
:dm.l.is_null_tag() = 'Y' and :dm.l.get_source_database_name() = 'DBS1.NET'
```

165.6.3 ADD_GLOBAL_RULES Procedure

This procedure adds rules to an Oracle Streams client rule set.

It adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `stream_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to an entire database.
- When the `stream_type` parameter is set to `apply` and the `stream_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying all logical change records (LCRs) in a queue. The rules can specify that the LCRs must be from a particular source database.
- When the `stream_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing all persistent LCRs from a queue. The rules can specify that the LCRs must be from a particular source database.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.
**Note:**

If you add global rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects that are not supported by Oracle Streams. Query the DBA_STREAMS_UNSUPPORTED data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

**Note:**

Currently, messaging clients cannot dequeue buffered messages.

**Syntax**

```
DBMS_STREAMS_ADM.ADD_GLOBAL_RULES(
    streams_type        IN   VARCHAR2,
    streams_name        IN   VARCHAR2  DEFAULT NULL,
    queue_name          IN   VARCHAR2  DEFAULT 'streams_queue',
    include_dml         IN   BOOLEAN   DEFAULT TRUE,
    include_ddl         IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr  IN   BOOLEAN   DEFAULT FALSE,
    source_database     IN   VARCHAR2  DEFAULT NULL,
    dml_rule_name       OUT  VARCHAR2,
    ddl_rule_name       OUT  VARCHAR2,
    inclusion_rule      IN   BOOLEAN   DEFAULT TRUE,
    and_condition       IN   VARCHAR2  DEFAULT NULL);
```

Table 165-5  (Cont.) ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. See Also: Oracle Streams Replication Administrator's Guide for more information about tags</td>
</tr>
<tr>
<td>source_database</td>
<td>The global name of the source database. If NULL, then the procedure does not add a condition regarding the source database to the generated rules. For capture process rules, specify NULL or the global name of the local database if you are creating a capture process locally at the source database. If you are adding rules to a downstream capture process rule set at a downstream database, then specify the source database of the changes that will be captured. For apply process rules, specify the source database of the changes that will be applied by the apply process. The source database is the database where the changes originated. If an apply process applies captured messages, then the apply process can apply messages from only one capture process at one source database. For messaging client rules, specify NULL if you do not want the rules created by this procedure to have a condition for the source database. Specify a source database if you want the rules created by this procedure to have a condition for the source database. The source database is part of the information in an LCR, and user-constructed LCRs might or might not have this information. If you do not include the domain name, then the procedure appends it to the database name automatically. For example, if you specify DBS1 and the domain is .NET, then the procedure specifies DBS1.NET automatically.</td>
</tr>
</tbody>
</table>
Table 165-5   (Cont.) ADD_GLOBAL_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dml_rule_name</td>
<td>If include_dml is TRUE, then this parameter contains the DML rule name. If include_dml is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>ddl_rule_name</td>
<td>If include_ddl is TRUE, then this parameter contains the DDL rule name. If include_ddl is FALSE, then this parameter contains a NULL.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rules to the positive rule set for the Oracle Streams client. If inclusion_rule is FALSE, then the procedure adds the rules to the negative rule set for the Oracle Streams client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
</tbody>
</table>
| and_condition| If non-NULL, appends the specified condition to the system-generated rule condition using an AND clause in the following way: 

\[(system\_condition) \ AND \ (and\_condition)\]

The variable in the specified condition must be :lcr. For example, to specify that the global rules generated by the procedure evaluate to TRUE only if the Oracle Streams tag is the hexadecimal equivalent of '02', specify the following condition:

:lc.get_tag() = HEXTORAW('02')

The :lcr in the specified condition is converted to :dml or :ddl, depending on the rule that is being generated. If you are specifying an LCR member subprogram that is dependent on the LCR type (row or DDL), then make sure this procedure only generates the appropriate rule.

Specifically, if you specify an LCR member subprogram that is valid only for row LCRs, then specify TRUE for the include_dml parameter and FALSE for the include_ddl parameter. If you specify an LCR member subprogram that is valid only for DDL LCRs, then specify FALSE for the include_dml parameter and TRUE for the include_ddl parameter.

See Also: Logical Change Record TYPES

Usage Notes

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the database name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the database name plus the sequence number is too long, then the database name is truncated. A capture process, apply process, or messaging client uses the rules for filtering.
Examples

The following is an example of a global rule condition created for DML changes:

\[ (:\text{dml\_is\_null\_tag}() = 'Y' \text{ and } \text{:dml\_get\_source\_database\_name}() = 'DBS1.NET' ) \]

165.6.4 ADD_MESSAGE_PROPAGATION_RULE Procedure

This procedure adds a message rule to the positive rule set for a propagation, or adds a message rule to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains the \texttt{OUT} parameter \texttt{rule\_name}, and the other does not.

Syntax

\begin{verbatim}
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
message_type IN VARCHAR2,
rule_condition IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
source_queue_name IN VARCHAR2,
destination_queue_name IN VARCHAR2,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
rule_name OUT VARCHAR2,
queue_to_queue IN BOOLEAN DEFAULT NULL);
\end{verbatim}

\begin{verbatim}
DBMS_STREAMS_ADM.ADD_MESSAGE_PROPAGATION_RULE(
message_type IN VARCHAR2,
rule_condition IN VARCHAR2,
streams_name IN VARCHAR2 DEFAULT NULL,
source_queue_name IN VARCHAR2,
destination_queue_name IN VARCHAR2,
inclusion_rule IN BOOLEAN DEFAULT TRUE,
queue_to_queue IN BOOLEAN DEFAULT NULL);
\end{verbatim}
### Parameters

**Table 165-6  ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| **message_type**| The type of the message. The type can be an Oracle built-in type, such as VARCHAR2 or NUMBER, or it can be a user-defined type.  
If the type is not an Oracle built-in type, then it is specified as [schema_name.]type_name. If the schema is not specified, then the current user is the default.  
For example, to specify VARCHAR2, enter VARCHAR2(n), where n is the size specification. To specify a type named usr_msg in the strmadmin schema, enter strmadmin.usr_msg for this parameter.  
The following data types require a size specification: VARCHAR2, NVARCHAR2, and RAW.  
See Also: Oracle Database SQL Language Reference for more information about data types |
| **rule_condition**| The rule condition for this message type. The rule variable name specified in the rule condition must be the following: :msg  
See Also: "Examples" |
| **streams_name**| The name of the propagation. Do not specify an owner.  
If the specified propagation does not exist, then the procedure creates it automatically.  
If NULL and a propagation exists for the same source queue and destination queue (including database link), then the procedure uses this propagation.  
If NULL and no propagation exists for the same source queue and destination queue (including database link), then the procedure creates a propagation automatically with a system-generated name. |
| **source_queue_name**| The name of the source queue, specified as [schema_name.]queue_name. The current database must contain the source queue, and the queue must be ANYDATA type.  
For example, to specify a source queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter.  
If the schema is not specified, then the current user is the default. |
### Table 165-6  (Cont.) ADD_MESSAGE_PROPAGATION_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>destination_queue_name</td>
<td>The name of the destination queue, including a database link, specified as \texttt{[schema_name.]queue_name[@dblink_name]}, if the destination queue is in a remote database. The queue must be \texttt{ANYDATA} type. For example, to specify a destination queue named \texttt{streams_queue} in the \texttt{strmadmin} schema and use a database link named \texttt{dbs2.net}, enter \texttt{<a href="mailto:strmadmin.streams_queue@dbs2.net">strmadmin.streams_queue@dbs2.net</a>} for this parameter. If the schema is not specified, then the current user is the default. If the database link is omitted, then the procedure uses the global name of the current database, and the source queue and destination queue must be in the same database. \textbf{Note:} Connection qualifiers are not allowed.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If \texttt{inclusion_rule} is \texttt{TRUE}, then the procedure adds the rule to the positive rule set for the propagation. If \texttt{inclusion_rule} is \texttt{FALSE}, then the procedure adds the rule to the negative rule set for the propagation. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>rule_name</td>
<td>Contains the rule name</td>
</tr>
</tbody>
</table>
| queue_to_queue      | If \texttt{TRUE} or \texttt{NULL}, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If \texttt{FALSE}, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting: \begin{itemize} 
   \item If \texttt{TRUE} and the specified propagation is not a queue to queue propagation, then the procedure raises an error.
   \item If \texttt{FALSE} and the specified propagation is a queue to queue propagation, then the procedure raises an error.
   \item If \texttt{NULL}, then the procedure does not change the queue to queue property of the propagation. \end{itemize} \textbf{See Also:} \textit{Oracle Streams Concepts and Administration} for more information about queue-to-queue propagations |

### Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.
When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.

See Also:

• "* Procedures That Create Rules for Oracle Streams Clients and XStream Clients"
• "DBMS_STREAMS_ADM Security Model"

Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

':msg = ''HQ'''

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' || ':msg.name = ''EMPLOYEES''

This rule condition evaluates to TRUE if a user message of type usr_msg has DBS1.NET for its source_dbname attribute, HR for its owner attribute, and EMPLOYEES for its name attribute.

Note:

The quotation marks in the preceding examples are all single quotation marks.

165.6.5 ADD_MESSAGE_RULE Procedure

This procedure adds a message rule to a rule set of one of the following types of Oracle Streams clients:

• When the streams_type parameter is set to apply, this procedure adds an apply process rule for dequeuing user messages of a specific message type from a queue.
• When the streams_type parameter is set to dequeue, this procedure adds a messaging client rule for dequeuing user messages of a specific message type from a queue.
This procedure also creates the specified Oracle Streams client if it does not exist.

This procedure is overloaded. One version of this procedure contains the OUT parameter `rule_name`, and the other does not.

Note:
Currently, messaging clients cannot dequeue buffered messages.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
  message_type    IN   VARCHAR2,
  rule_condition  IN   VARCHAR2,
  streams_type    IN   VARCHAR2,
  streams_name    IN   VARCHAR2  DEFAULT NULL,
  queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
  inclusion_rule  IN   BOOLEAN   DEFAULT TRUE,
  rule_name       OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_MESSAGE_RULE(
  message_type    IN   VARCHAR2,
  rule_condition  IN   VARCHAR2,
  streams_type    IN   VARCHAR2,
  streams_name    IN   VARCHAR2  DEFAULT NULL,
  queue_name      IN   VARCHAR2  DEFAULT 'streams_queue',
  inclusion_rule  IN   BOOLEAN   DEFAULT TRUE);
```

Parameters

Table 165-7  ADD_MESSAGE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>message_type</code></td>
<td>The type of the message. The type can be an Oracle built-in type, such as <code>VARCHAR2</code> or <code>NUMBER</code>, or it can be a user-defined type. If the type is not an Oracle built-in type, then it is specified as <code>[schema_name.]type_name</code>. If the schema is not specified, then the current user is the default. For example, to specify <code>VARCHAR2</code>, enter <code>VARCHAR2(n)</code>, where n is the size specification. To specify a type named <code>usr_msg</code> in the <code>strmadmin</code> schema, enter <code>strmadmin.usr_msg</code> for this parameter. The following data types require a size specification: <code>VARCHAR2</code>, <code>NVARCHAR2</code>, and <code>RAW</code>. See Also: Oracle Database SQL Language Reference for more information about data types</td>
</tr>
<tr>
<td><code>rule_condition</code></td>
<td>The rule condition for this message type. The rule variable name specified in the rule condition must be the following: <code>:msg</code></td>
</tr>
<tr>
<td><code>streams_type</code></td>
<td>The type of message consumer, either apply for apply process or dequeue for messaging client</td>
</tr>
</tbody>
</table>

### Table 165-7  (Cont.) ADD_MESSAGE_RULE Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>streams_name</td>
<td>The name of the Oracle Streams apply process or messaging client. If the specified streams_type is apply, then specify the name of the apply process. Do not specify an owner. If the specified apply process does not exist, then the procedure creates it automatically with a system-generated name. If the specified streams_type is dequeue, then specify the messaging client. For example, if the user strmadmin is the messaging client, then specify strmadmin. If NULL and a relevant apply process or messaging client for the queue exists, then the procedure uses the relevant apply process or messaging client. If NULL and multiple relevant apply processes or messaging clients for the queue exist, then the procedure raises an error. If NULL and no Oracle Streams client of the specified streams_type exists for the queue, then the procedure creates an apply process or messaging client automatically with a system-generated name. An apply process and a messaging client cannot have the same name.</td>
</tr>
<tr>
<td>queue_name</td>
<td>The name of the local queue from which messages will be dequeued, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If inclusion_rule is TRUE, then the procedure adds the rule to the positive rule set for the apply process or messaging client. If inclusion_rule is FALSE, then the procedure adds the rule to the negative rule set for the apply process or messaging client. In either case, the system creates the rule set if it does not exist.</td>
</tr>
<tr>
<td>rule_name</td>
<td>Contains the rule name</td>
</tr>
</tbody>
</table>

### Usage Notes

If an apply process rule is added, then this procedure creates the apply process if it does not exist. An apply process created by this procedure can apply only user messages, and dequeued messages are sent to the message handler for the apply process. If a messaging client rule is added, then this procedure creates a messaging client if it does not exist.

When you use this procedure to create a rule set for a message rule, the new rule set does not have an evaluation context. If no evaluation context exists for the specified message type, then this procedure creates a new evaluation context and associates it with the new rule. The evaluation context also has a system-generated name. If you create new rules that use an existing message type, then the new rules use the existing evaluation context for the message type.
Examples

Suppose the message type is VARCHAR2(128). Given this type, the following rule condition can be specified:

'':msg = ''HQ''''

This rule condition evaluates to TRUE if a user message of type VARCHAR2(128) has HQ for its value.

Suppose the message type is usr_msg, and that this type has the following attributes: source_dbname, owner, name, and message. Given this type, the following rule condition can be specified:

'':msg.source_dbname = ''DBS1.NET'' AND ' || ':msg.owner = ''HR'' AND ' || ':msg.name = ''EMPLOYEES''

This rule condition evaluates to TRUE if a user message of type usr_msg has DBS1.NET for its source_dbname attribute, HR for its owner attribute, and EMPLOYEES for its name attribute.

Note:

The quotation marks in the preceding examples are all single quotation marks.

165.6.6 ADD_SCHEMA_PROPAGATION_RULES Procedure

This procedure either adds schema rules to the positive rule set for a propagation, or adds schema rules to the negative rule set for a propagation, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

Syntax

```
DBMS STREAMS ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    source_queue_name IN VARCHAR2,
    destination_queue_name IN VARCHAR2,
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
)
```
DBMS_STREAMS_ADM.ADD_SCHEMA_PROPAGATION_RULES(
    schema_name   IN   VARCHAR2,
    streams_name  IN   VARCHAR2  DEFAULT NULL,
    source_queue_name IN   VARCHAR2,
    destination_queue_name IN   VARCHAR2,
    include_dml    IN   BOOLEAN   DEFAULT TRUE,
    include_ddl    IN   BOOLEAN   DEFAULT FALSE,
    include_tagged_lcr IN   BOOLEAN   DEFAULT FALSE,
    source_database IN   VARCHAR2  DEFAULT NULL,
    inclusion_rule OUT  VARCHAR2,
    and_condition  OUT  VARCHAR2  DEFAULT NULL,
    queue_to_queue IN   BOOLEAN   DEFAULT NULL);

Table 165-8  (Cont.) ADD_SCHEMA_PROPAGATION_RULES Procedure
Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
</table>
| queue_to_queue | If TRUE or NULL, then a new propagation created by this procedure is a queue to queue propagation. A queue-to-queue propagation always has its own propagation job and uses a service for automatic failover when the destination queue is a buffered queue in an Oracle Real Application Clusters (Oracle RAC) database. If FALSE, then a new propagation created by this procedure is a queue-to-dblink propagation. A queue-to-dblink propagation can share a propagation job with other propagations that use the same database link and does not support automatic failover in an Oracle RAC environment. This procedure cannot change the queue to queue property of an exiting propagation. If the specified propagation exists, then the procedure behaves in the following way for each setting:  
  • If TRUE and the specified propagation is not a queue to queue propagation, then the procedure raises an error.  
  • If FALSE and the specified propagation is a queue to queue propagation, then the procedure raises an error.  
  • If NULL, then the procedure does not change the queue to queue property of the propagation.  

See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations

Usage Notes
This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

This procedure creates DML and DDL rules automatically based on include_dml and include_ddl parameter values, respectively. Each rule has a system-generated rule name that consists of the schema name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the schema name plus the sequence number is too long, then the schema name is truncated. A propagation uses the rules for filtering.

See Also:
• “* Procedures That Create Rules for Oracle Streams Clients and XStream Clients”
• “DBMS_STREAMS_ADM Security Model”

Examples
The following is an example of a schema rule condition created for DML changes:

```sql
((:dml.get_object_owner() = 'HR') and :dml.is_null_tag() = 'Y' and :dml.get_source_database_name() = 'DBS1.NET')
```
165.6.7 ADD_SCHEMA_RULES Procedure

This procedure adds rules to Oracle Streams clients rule sets.

It adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the streams_type parameter is set to capture, this procedure adds capture process rules for capturing changes to a specified schema.
- When the streams_type parameter is set to apply and the streams_name parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.
- When the streams_type parameter is set to dequeue, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a specified schema. The rules can specify that the LCRs must be from a particular source database.

This procedure creates the specified capture process, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains two OUT parameters, and the other does not.

**Note:**

If you add schema rules to the positive rule set for a capture process, then make sure you add rules to the negative capture process rule set to exclude database objects in the schema that are not support by Oracle Streams. Query the `DBA_STREAMS_UNSUPPORTED` data dictionary view to determine which database objects are not supported by Oracle Streams. If unsupported database objects are not excluded, then capture errors will result.

**Note:**

Currently, messaging clients cannot dequeue buffered messages.

**Syntax**

```sql
DBMS_STREAMS_ADM.ADD_SCHEMA_RULES(
    schema_name IN VARCHAR2,
    streams_type IN VARCHAR2,
    streams_name IN VARCHAR2 DEFAULT NULL,
    queue_name IN VARCHAR2 DEFAULT 'streams_queue',
    include_dml IN BOOLEAN DEFAULT TRUE,
    include_ddl IN BOOLEAN DEFAULT FALSE,
    include_tagged_lcr IN BOOLEAN DEFAULT FALSE,
    source_database IN VARCHAR2 DEFAULT NULL,
    dml_rule_name OUT VARCHAR2,
    ddl_rule_name OUT VARCHAR2,
)
```

<tr>
<td>streams_name</td>
<td>The name of the capture process, apply process, or messaging client. Do not specify an owner.</td>
</tr>
<tr>
<td>source_database</td>
<td>If NULL, if streams_type is capture or dequeue, and if one relevant capture process or messaging client for the queue exists, then the relevant Oracle Streams client is used. If no relevant Oracle Streams client exists for the queue, then an Oracle Streams client is created automatically with a system-generated name. If NULL and multiple Oracle Streams clients of the specified streams_type for the queue exist, then the procedure raises an error.</td>
</tr>
<tr>
<td>inclusion_rule</td>
<td>If NULL, if streams_type is apply, and if one relevant apply process exists, then the procedure uses the relevant apply process. The relevant apply process is identified in one of the following ways:</td>
</tr>
<tr>
<td>and_condition</td>
<td>• If one existing apply process has the source database specified in source_database and uses the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>• If source_database is NULL and one existing apply process is using the queue specified in queue_name, then the procedure uses this apply process.</td>
</tr>
<tr>
<td></td>
<td>If NULL and no relevant apply process exists, then the procedure creates an apply process automatically with a system-generated name.</td>
</tr>
<tr>
<td></td>
<td>If NULL and multiple relevant apply processes exist, then the procedure raises an error. Each apply process and messaging client must have a unique name.</td>
</tr>
</tbody>
</table>
Table 165-9  (Cont.) ADD_SCHEMA_RULES Procedure Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>queue_name</td>
<td>The name of the local queue, specified as [schema_name.]queue_name. The current database must contain the queue, and the queue must be ANYDATA type. For example, to specify a queue named streams_queue in the strmadmin schema, enter strmadmin.streams_queue for this parameter. If the schema is not specified, then the current user is the default. For capture process rules, this is the queue into which a capture process enqueues LCRs. For apply process rules, this is the queue from which an apply process dequeues messages. For messaging client rules, this is the queue from which a messaging client dequeues messages.</td>
</tr>
<tr>
<td>include_dml</td>
<td>If TRUE, then the procedure creates a rule for DML changes. If FALSE, then the procedure does not create a DML rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_ddl</td>
<td>If TRUE, then the procedure creates a rule for DDL changes. If FALSE, then the procedure does not create a DDL rule. NULL is not permitted.</td>
</tr>
<tr>
<td>include_tagged_lcr</td>
<td>If TRUE, then the procedure does not add a condition regarding Oracle Streams tags to the generated rules. Therefore, these rules can evaluate to TRUE regardless of whether a redo entry or LCR has a non-NULL tag. If the rules are added to the positive rule set for the process, then a redo entry is always considered for capture, and an LCR is always considered for apply, regardless of whether the redo entry or LCR has a non-NULL tag. If the rules are added to a positive rule set, then setting this parameter to TRUE is appropriate for a full (for example, standby) copy of a database. If the rules are added to the negative rule set for the process, then whether a redo entry or LCR is discarded does not depend on the tag. If FALSE, then the procedure adds a condition to each generated rule that causes the rule to evaluate to TRUE only if a redo entry or LCR has a NULL Oracle Streams tag. If the rules are added to the positive rule set for the process, then a redo entry is considered for capture, and an LCR is considered for apply, only when the redo entry or LCR contains a NULL tag. If the rules are added to a positive rule set, then setting this parameter to FALSE might be appropriate in update-anywhere configurations to avoid sending a change back to its source database. If the rules are added to the negative rule set for the process, then a redo entry or LCR can be discarded only if it has a NULL tag. Usually, specify TRUE for this parameter if the inclusion_rule parameter is set to FALSE. See Also: Oracle Streams Replication Administrator's Guide for more information about tags</td>
</tr>
</tbody>
</table>

Examples

The following is an example of a schema rule condition created for DML changes:

\n\{(dml.get_object_owner() = 'HR') and dml.is_null_tag() = 'Y' and dml.get_source_database_name() = 'DBS1.NET' \}
165.6.8 ADD_SUBSET_PROPAGATION_RULES Procedure

This procedure adds propagation rules that propagate the logical change records (LCRs) related to a subset of the rows in the specified table in a source queue to a destination queue, and creates the specified propagation if it does not exist.

This procedure is overloaded. One version of this procedure contains three OUT parameters, and the other does not.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name               IN   VARCHAR2,
  dml_condition            IN   VARCHAR2,
  streams_name             IN   VARCHAR2  DEFAULT NULL,
  source_queue_name        IN   VARCHAR2,
  destination_queue_name   IN   VARCHAR2,
  include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
  source_database          IN   VARCHAR2  DEFAULT NULL,
  insert_rule_name         OUT  VARCHAR2,
  update_rule_name         OUT  VARCHAR2,
  delete_rule_name         OUT  VARCHAR2,
  queue_to_queue           IN   BOOLEAN   DEFAULT NULL);

DBMS_STREAMS_ADM.ADD_SUBSET_PROPAGATION_RULES(
  table_name               IN   VARCHAR2,
  dml_condition            IN   VARCHAR2,
  streams_name             IN   VARCHAR2  DEFAULT NULL,
  source_queue_name        IN   VARCHAR2,
  destination_queue_name   IN   VARCHAR2,
  include_tagged_lcr       IN   BOOLEAN   DEFAULT FALSE,
  source_database          IN   VARCHAR2  DEFAULT NULL,
  queue_to_queue           IN   BOOLEAN   DEFAULT NULL);
```

<td>• If NULL, then the procedure does not change the queue to queue property of the propagation.</td>
</tr>
<tr>
<td></td>
<td>See Also: Oracle Streams Concepts and Administration for more information about queue-to-queue propagations</td>
</tr>
</tbody>
</table>

Usage Notes

This procedure configures propagation using the current user. Only one propagation is allowed between a particular source queue and destination queue.

Running this procedure generates three rules for the specified propagation: one for INSERT statements, one for UPDATE statements, and one for DELETE statements. For INSERT and DELETE statements, only row LCRs that satisfy the condition specified for the
The dml_condition parameter are propagated. For UPDATE statements, the following variations are possible:

- If both the new and old values in a row LCR satisfy the specified dml_condition, then the row LCR is propagated without any changes.
- If neither the new or old values in a row LCR satisfy the specified dml_condition, then the row LCR is not propagated.
- If the old values for a row LCR satisfy the specified dml_condition, but the new values do not, then the update row LCR is converted into a delete row LCR.
- If the new values for a row LCR satisfy the specified dml_condition, but the old values do not, then the update row LCR is converted to an insert row LCR.

When an update is converted into an insert or a delete, it is called row migration.

A propagation uses the rules for filtering. If the propagation does not have a positive rule set, then the procedure creates a positive rule set automatically, and the rules for propagating changes to the table are added to the positive rule set. A subset rule can be added to positive rule set only, not to a negative rule set. Other rules in an existing positive rule set for the propagation are not affected. Additional rules can be added using either the DBMS_STREAMS_ADM package or the DBMS_RULE_ADM package.

Rules for INSERT, UPDATE, and DELETE statements are created automatically when you run this procedure, and these rules are given a system-generated rule name. Each rule has a system-generated rule name that consists of the table name with a sequence number appended to it. The sequence number is used to avoid naming conflicts. If the table name plus the sequence number is too long, then the table name is truncated. The ADD_SUBSET_RULES procedure is overloaded, and the system-generated rule names for INSERT, UPDATE, and DELETE statements are returned.

When you create propagation subset rules for a table, you should create an unconditional supplemental log group at the source database with all the columns in the table. Supplemental logging is required if an update must be converted to an insert. The propagation rule must have all the column values to be able to perform this conversion correctly.

---

**Note:**

Subset rules should only reside in positive rule sets. You should not add subset rules to negative rule sets. Doing so might have unpredictable results because row migration would not be performed on LCRs that are not discarded by the negative rule set.

---

**See Also:**

- “Procedures That Create Rules for Oracle Streams Clients and XStream Clients”
- “DBMS_STREAMS_ADM Security Model”
Examples

The following is an example of a rule condition created for filtering a row LCR containing an update operation when the dml_condition is `region_id = 2`, the table_name is `hr.regions`, and the source_database is `dbs1.net`:

```sql
:dml.get_object_owner()='HR' AND :dml.get_object_name()='REGIONS'
AND :dml.is_null_tag()='Y' AND :dml.get_source_database_name()='DBS1.NET'
AND :dml.get_command_type()='UPDATE'
AND (:dml.get_value('NEW','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"') IS NOT NULL)
AND (:dml.get_value('OLD','"REGION_ID"').AccessNumber()=2)
AND (:dml.get_value('NEW','"REGION_ID"').AccessNumber()=2)
```

165.6.9 ADD_SUBSET_RULES Procedure

This procedure adds rules to an Oracle Streams client. It adds rules to a rule set of one of the following types of Oracle Streams clients:

- When the `streams_type` parameter is set to `capture`, this procedure adds capture process rules for capturing changes to a subset of rows in a specified table.
- When the `streams_type` parameter is set to `sync_capture`, this procedure adds rules for capturing changes to a subset of rows in a specified table.
- When the `streams_type` parameter is set to `apply` and the `streams_name` parameter specifies the name of an apply process, this procedure adds apply process rules for applying logical change records (LCRs) in a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.
- When the `streams_type` parameter is set to `dequeue`, this procedure adds messaging client rules for dequeuing persistent LCRs from a queue that contain changes to a subset of rows in a specified table. The rules can specify that the LCRs must be from a particular source database.

This procedure creates the specified capture process, synchronous capture, apply process, or messaging client if it does not exist.

This procedure is overloaded. One version of this procedure contains three `OUT` parameters, and the other does not.

**Note:**

- Currently, messaging clients cannot dequeue buffered messages.
- The invoking user must be granted the `DBA` role to create a synchronous capture.

Syntax

```sql
DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
    table_name          IN   VARCHAR2,
    dml_condition       IN   VARCHAR2,
    streams_type        IN   VARCHAR2 DEFAULT 'apply',
)```
streams_name   IN   VARCHAR2 DEFAULT NULL,
queue_name     IN   VARCHAR2 DEFAULT 'streams_queue',
include_tagged_lcr IN   BOOLEAN  DEFAULT FALSE,
source_database IN   VARCHAR2 DEFAULT NULL,
insert_rule_name OUT  VARCHAR2,
update_rule_name OUT  VARCHAR2,
delete_rule_name OUT  VARCHAR2);

DBMS_STREAMS_ADM.ADD_SUBSET_RULES(
  table_name          IN   VARCHAR2,
  dml_condition       IN   VARCHAR2,
  streams_type        IN   VARCHAR2 DEFAULT 'apply',
  streams_name        IN   VARCHAR2 DEFAULT NULL,
  queue_name          IN   VARCHAR2 DEFAULT 'streams_queue',
  include_tagged_lcr  IN   BOOLEAN  DEFAULT FALSE,
  source_database     IN   VARCHAR2 DEFAULT NULL);
